

# Citrix ADC 12.1

## Contents

<b>Citrix ADC Release Notes</b>	<b>3</b>
<b>Getting started with Citrix ADC</b>	<b>4</b>
<b>Where does a Citrix ADC appliance fit in the network?</b>	<b>7</b>
<b>How a Citrix ADC appliance communicates with clients and servers</b>	<b>10</b>
<b>Introduction to the Citrix ADC product line</b>	<b>17</b>
<b>Install the hardware</b>	<b>19</b>
<b>Access a Citrix ADC appliance</b>	<b>20</b>
<b>Configure the ADC for the first time</b>	<b>24</b>
<b>Secure your Citrix ADC deployment</b>	<b>24</b>
<b>Configure high availability</b>	<b>25</b>
<b>Change an RPC node password</b>	<b>29</b>
<b>Configure a FIPS appliance for the first time</b>	<b>31</b>
<b>Common network topologies</b>	<b>34</b>
<b>System management settings</b>	<b>39</b>
<b>System settings</b>	<b>39</b>
<b>Packet forwarding modes</b>	<b>41</b>
<b>Network interfaces</b>	<b>48</b>
<b>Clock synchronization</b>	<b>49</b>
<b>DNS configuration</b>	<b>50</b>
<b>SNMP configuration</b>	<b>52</b>
<b>Verify configuration</b>	<b>56</b>
<b>Load balance traffic on a Citrix ADC appliance</b>	<b>59</b>
<b>Load balancing</b>	<b>60</b>

<b>Persistence settings</b>	<b>64</b>
<b>Configure features to protect the load balancing configuration</b>	<b>70</b>
<b>A typical load balancing scenario</b>	<b>73</b>
<b>Accelerate load balanced traffic by using compression</b>	<b>77</b>
<b>Secure load balanced traffic by using SSL</b>	<b>84</b>
<b>Features at a glance</b>	<b>102</b>
<b>Application switching and traffic management features</b>	<b>102</b>
<b>Application acceleration features</b>	<b>107</b>
<b>Application security and firewall features</b>	<b>108</b>
<b>Application visibility feature</b>	<b>111</b>
<b>Citrix ADC Solutions</b>	<b>112</b>
<b>Setting up Citrix ADC for Citrix Virtual Apps and Desktops</b>	<b>112</b>
<b>Global Server Load Balancing (GSLB) Powered Zone Preference</b>	<b>114</b>
<b>Anycast support in Citrix ADC</b>	<b>115</b>
<b>Citrix ADC in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI</b>	<b>119</b>
<b>Creating a Citrix ADC Load Balancer in a Plan in the Service Management Portal (Admin Portal)</b>	<b>121</b>
<b>Configuring a Citrix ADC Load Balancer by Using the Service Management Portal (Tenant Portal)</b>	<b>123</b>
<b>Deleting a Citrix ADC Load Balancer from the Network</b>	<b>129</b>
<b>Deploy a Citrix ADC VPX instance</b>	<b>131</b>
<b>Support matrix and usage guidelines</b>	<b>132</b>
<b>Install a Citrix ADC VPX instance on a bare metal server</b>	<b>138</b>
<b>Install a Citrix ADC VPX instance on XenServer</b>	<b>139</b>
<b>Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces</b>	<b>143</b>

<b>Install a Citrix ADC VPX instance on VMware ESX</b>	<b>145</b>
<b>Configure a Citrix ADC VPX instance to use VMXNET3 network interface</b>	<b>150</b>
<b>Configure a Citrix ADC VPX instance to use SR-IOV network interface</b>	<b>162</b>
<b>Migrating the Citrix ADC VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces</b>	<b>180</b>
<b>Configure a Citrix ADC VPX instance to use PCI passthrough network interface</b>	<b>181</b>
<b>Install a Citrix ADC VPX instance on Microsoft Hyper-V server</b>	<b>184</b>
<b>Install a Citrix ADC VPX instance on Linux-KVM platform</b>	<b>189</b>
<b>Prerequisites for installing a Citrix ADC VPX instance on Linux-KVM platform</b>	<b>190</b>
<b>Provision the Citrix ADC VPX instance by using OpenStack</b>	<b>195</b>
<b>Provision the Citrix ADC VPX instance by using the Virtual Machine Manager</b>	<b>204</b>
<b>Configure a Citrix ADC VPX instance to use SR-IOV network interfaces</b>	<b>218</b>
<b>Configure a Citrix ADC VPX instance to use PCI passthrough network interfaces</b>	<b>229</b>
<b>Provision the Citrix ADC VPX instance by using the virsh program</b>	<b>233</b>
<b>Manage the Citrix ADC VPX guest VMs</b>	<b>237</b>
<b>Provision the Citrix ADC VPX instance with SR-IOV, on OpenStack</b>	<b>240</b>
<b>Configure a Citrix ADC VPX instance on KVM to use OVS DPDK-based host interfaces</b>	<b>246</b>
<b>Deploy a Citrix ADC VPX instance on AWS</b>	<b>256</b>
<b>Limitations and usage guidelines</b>	<b>260</b>
<b>Prerequisites</b>	<b>262</b>
<b>Deploy a Citrix ADC VPX standalone instance on AWS</b>	<b>263</b>
<b>Scenario: standalone instance</b>	<b>268</b>
<b>Download a Citrix ADC VPX license</b>	<b>276</b>
<b>Load balancing servers in different availability zones</b>	<b>282</b>
<b>Deploy a high availability pair on AWS</b>	<b>282</b>

<b>High availability across AWS availability zones</b>	<b>288</b>
<b>Add back-end AWS Autoscaling service</b>	<b>293</b>
<b>Configure a Citrix ADC VPX instance to use SR-IOV network interface</b>	<b>301</b>
<b>Upgrade a Citrix ADC VPX instance on AWS</b>	<b>304</b>
<b>Troubleshoot a VPX instance on AWS</b>	<b>309</b>
<b>AWS FAQs</b>	<b>309</b>
<b>Deploy a Citrix ADC VPX instance on Microsoft Azure</b>	<b>310</b>
<b>Network architecture for Citrix ADC VPX instances on Microsoft Azure</b>	<b>314</b>
<b>Configure a Citrix ADC VPX standalone instance</b>	<b>317</b>
<b>Configure multiple IP addresses for a Citrix ADC VPX standalone instance</b>	<b>330</b>
<b>Configure a high-availability setup with multiple IP addresses and NICs</b>	<b>337</b>
<b>Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands</b>	<b>346</b>
<b>Configure HA-INC nodes by using the Citrix high availability template with Azure ILB</b>	<b>359</b>
<b>Add Azure autoscale settings</b>	<b>372</b>
<b>Configure GSLB on Citrix ADC VPX instances</b>	<b>379</b>
<b>Configure GSLB on an active-standby high-availability setup</b>	<b>388</b>
<b>Configure address pools (IIP) for a Citrix Gateway appliance</b>	<b>392</b>
<b>Configure multiple IP addresses for a Citrix ADC VPX standalone instance by using PowerShell commands</b>	<b>395</b>
<b>Additional PowerShell scripts for Azure deployment</b>	<b>403</b>
<b>Azure terminology</b>	<b>420</b>
<b>Azure FAQs</b>	<b>424</b>
<b>Deploy a Citrix ADC VPX instance on Google Cloud Platform</b>	<b>425</b>
<b>Jumbo frames on Citrix ADC VPX instances</b>	<b>436</b>

<b>Licensing</b>	<b>438</b>
<b>Citrix ADC licensing overview</b>	<b>438</b>
<b>Citrix ADC Pooled Capacity</b>	<b>448</b>
<b>Data governance</b>	<b>448</b>
<b>Introduction to Citrix ADM service connect for Citrix ADC appliances</b>	<b>451</b>
<b>Upgrade and downgrade a Citrix ADC appliance</b>	<b>454</b>
<b>Before you begin</b>	<b>455</b>
<b>Upgrade considerations - SNMP configuration</b>	<b>456</b>
<b>Download a Citrix ADC release package</b>	<b>458</b>
<b>Upgrade a Citrix ADC standalone appliance</b>	<b>459</b>
<b>Downgrade a Citrix ADC standalone appliance</b>	<b>464</b>
<b>Upgrade a high availability pair</b>	<b>468</b>
<b>Downgrade a high availability pair</b>	<b>474</b>
<b>Troubleshooting issues related to the installation, upgrade, and downgrade processes</b>	<b>474</b>
<b>FAQs</b>	<b>479</b>
<b>New and deprecated commands, parameters, and SNMP OIDs</b>	<b>480</b>
<b>Solutions for Telecom Service Providers</b>	<b>486</b>
<b>Large Scale NAT</b>	<b>487</b>
<b>Points to Consider before Configuring LSN</b>	<b>493</b>
<b>Configuration Steps for LSN</b>	<b>494</b>
<b>Sample LSN Configurations</b>	<b>513</b>
<b>Configuring Static LSN Maps</b>	<b>523</b>
<b>Configuring Application Layer Gateways</b>	<b>526</b>
<b>Application Layer Gateway for FTP, ICMP, and TFTP Protocols</b>	<b>526</b>

<b>Application Layer Gateway for PPTP Protocol</b>	<b>528</b>
<b>Application Layer Gateway for SIP Protocol</b>	<b>531</b>
<b>Application Layer Gateway for RTSP Protocol</b>	<b>546</b>
<b>Application Layer Gateway for IPSec Protocol</b>	<b>551</b>
<b>Logging and Monitoring LSN</b>	<b>555</b>
<b>STUN Timeout</b>	<b>581</b>
<b>TCP SYN Idle Timeout</b>	<b>583</b>
<b>Overriding LSN configuration with Load Balancing Configuration</b>	<b>584</b>
<b>Clearing LSN Sessions</b>	<b>585</b>
<b>Load Balancing SYSLOG Servers</b>	<b>588</b>
<b>Port Control Protocol</b>	<b>590</b>
<b>LSN44 in a cluster setup</b>	<b>593</b>
<b>Dual-Stack Lite</b>	<b>594</b>
<b>Points to Consider before Configuring DS-Lite</b>	<b>599</b>
<b>Configuring DS-Lite</b>	<b>599</b>
<b>Configuring DS-Lite Static Maps</b>	<b>608</b>
<b>Configuring Deterministic NAT Allocation for DS-Lite</b>	<b>610</b>
<b>Configuring Application Layer Gateways for DS-Lite</b>	<b>613</b>
<b>Application Layer Gateway for FTP, ICMP, and TFTP Protocols</b>	<b>613</b>
<b>Application Layer Gateway for SIP Protocol</b>	<b>614</b>
<b>Application Layer Gateway for RTSP Protocol</b>	<b>616</b>
<b>Logging and Monitoring DS-Lite</b>	<b>619</b>
<b>Port Control Protocol for DS-Lite</b>	<b>627</b>
<b>Large Scale NAT64</b>	<b>630</b>

<b>Points to Consider for Configuring Large Scale NAT64</b>	<b>635</b>
<b>Configuring DNS64</b>	<b>635</b>
<b>Configuring Large Scaler NAT64</b>	<b>637</b>
<b>Configuring Application Layer Gateways for Large Scale NAT64</b>	<b>643</b>
<b>Application Layer Gateway for FTP, ICMP, and TFTP Protocols</b>	<b>643</b>
<b>Application Layer Gateway for SIP Protocol</b>	<b>644</b>
<b>Application Layer Gateway for RTSP Protocol</b>	<b>646</b>
<b>Configuring Static Large Scale NAT64 Maps</b>	<b>649</b>
<b>Logging and Monitoring Large Scale NAT64</b>	<b>651</b>
<b>Port Control Protocol for Large Scale NAT64</b>	<b>664</b>
<b>LSN64 in a cluster setup</b>	<b>666</b>
<b>Mapping Address and Port using Translation</b>	<b>668</b>
<b>Telco subscriber management</b>	<b>670</b>
<b>Subscriber aware traffic steering</b>	<b>696</b>
<b>Subscriber aware service chaining</b>	<b>702</b>
<b>Subscriber aware traffic steering with TCP optimization</b>	<b>709</b>
<b>Policy based TCP profile selection</b>	<b>714</b>
<b>Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols</b>	<b>715</b>
<b>Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers</b>	<b>717</b>
<b>Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider</b>	<b>717</b>
<b>Bandwidth Utilization Using Cache Redirection Functionality</b>	<b>718</b>
<b>Citrix ADC TCP Optimization</b>	<b>719</b>
<b>Getting Started</b>	<b>719</b>

<b>Management Network</b>	<b>722</b>

<b>Multi-Factor (nFactor) authentication</b>	<b>1008</b>
<b>How to configure nFactor authentication</b>	<b>1011</b>
<b>How nFactor authentication works</b>	<b>1012</b>
<b>Configuring nFactor authentication</b>	<b>1013</b>
<b>reCaptcha configuration for nFactor authentication</b>	<b>1015</b>
<b>Configuring the OpenID Connect protocol</b>	<b>1021</b>
<b>Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud</b>	<b>1026</b>
<b>Troubleshoot authentication issues in Citrix ADC and Citrix Gateway with aad.debug module</b>	<b>1029</b>
<b>Admin Partitioning</b>	<b>1036</b>
<b>Supported Citrix ADC configurations</b>	<b>1043</b>
<b>Configure admin partitions</b>	<b>1048</b>
<b>VLAN configuration for admin partitions</b>	<b>1057</b>

<b>VXLAN support for admin partitions</b>	<b>1065</b>
<b>SNMP support for admin partitions</b>	<b>1067</b>
<b>Audit log support for admin partitions</b>	<b>1069</b>
<b>Display configured PMAC addresses for shared VLAN configuration</b>	<b>1072</b>
<b>AppExpert</b>	<b>1073</b>
<b>Action analytics</b>	<b>1074</b>
<b>Configure a selector</b>	<b>1075</b>
<b>Configure a stream identifier</b>	<b>1077</b>
<b>View statistics</b>	<b>1078</b>
<b>Grouping records on attribute values</b>	<b>1081</b>
<b>Clearing a stream session</b>	<b>1084</b>
<b>Configure policy for optimizing traffic</b>	<b>1085</b>
<b>How to limit bandwidth consumption per user or client device</b>	<b>1086</b>
<b>AppExpert applications and templates</b>	<b>1089</b>
<b>How appExpert application works</b>	<b>1091</b>
<b>Get started with appExpert</b>	<b>1092</b>
<b>Downloading an application template</b>	<b>1093</b>
<b>Importing an application template</b>	<b>1093</b>
<b>Verifying and testing application configuration</b>	<b>1094</b>
<b>Customizing the configuration</b>	<b>1096</b>
<b>Configure public endpoints</b>	<b>1096</b>
<b>Configure services and service groups for an application unit</b>	<b>1097</b>
<b>Create application units</b>	<b>1098</b>
<b>Configuring application unit rules</b>	<b>1098</b>

<b>Configuring policies for application units</b>	<b>1099</b>
<b>Configuring Application Units</b>	<b>1104</b>
<b>Configuring Public Endpoints for an application</b>	<b>1105</b>
<b>Specifying the order of evaluation of application units</b>	<b>1106</b>
<b>Configuring persistency groups for application units</b>	<b>1106</b>
<b>Viewing AppExpert applications and configuring entities by using the application visualizer</b>	<b>1107</b>
<b>Configuring user authentication, authorization, and auditing</b>	<b>1108</b>
<b>Monitoring a Citrix ADC application</b>	<b>1108</b>
<b>Deleting an application</b>	<b>1110</b>
<b>Configure application authentication, authorization, and auditing</b>	<b>1110</b>
<b>Setting up a custom Citrix ADC application</b>	<b>1113</b>
<b>Creating and managing template files</b>	<b>1117</b>
<b>Exporting an AppExpert Application to a Template File</b>	<b>1117</b>
<b>Exporting a Content Switching Virtual Server Configuration to a Template File</b>	<b>1118</b>

## Citrix ADC Release Notes

October 21, 2021

Release notes describe how the software has changed in a particular build, and the issues known to exist in that build.

The release notes document includes all or some of the following sections:

- **What's New:** The enhancements and other changes released in the build.
- **Fixed Issues:** The issues that are fixed in the build.
- **Known Issues:** The issues that exist in the build.
- **Points to Note:** The important aspects to keep in mind while using the build.
- **Limitations:** The limitations that exist in the build.

### Note

- The [# XXXXXX] labels under the issue descriptions are internal tracking IDs used by the Citrix ADC team.
- These release notes do not document security related fixes. For a list of security related fixes and advisories, see the Citrix security bulletin.

To view the release notes document for a specific build of release 12.1, click the corresponding link in the following table. When the release notes are updated for a build, the version number of the release notes and the publish date are also updated. The release notes publish date might not be the same as the build GA date.

## Getting started with Citrix ADC

September 21, 2020

This topic describes the basic features and configuration details of a Citrix ADC appliance. System and network administrators who install and configure network equipment can refer to the content.

### Understanding Citrix ADC

The Citrix ADC appliance is an application switch which performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4-L7) network traffic for web applications. For example, a Citrix ADC appliance load balances decisions on individual HTTP requests instead of long-lived TCP connections. The load balancing feature helps slowing down the failure of a server with less disruption to clients. The ADC features can be broadly classified as:

1. Data switching
2. Firewall security
3. Optimization
4. Policy infrastructure
5. Packet flow
6. System limitation

### Data switching

When deployed in front of application servers, a Citrix ADC ensures optimal distribution of traffic by how it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and based on L4-L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

## **Firewall security**

The Citrix ADC security and protection protect web applications from Application Layer attacks. An ADC appliance allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

## **Optimization**

Optimization offloads resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. An ADC appliance supports several transparent TCP optimizations which mitigate problems caused by high latency and congested network links. Thereby accelerating the delivery of applications while requiring no configuration changes to clients or servers.

## **Policy infrastructure**

A policy defines specific details of traffic filtering and management on a Citrix ADC. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the ADC appliance what to do when a request matches the expression. For example, the expression might be to match a specific URL pattern for a security attack with the configured to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

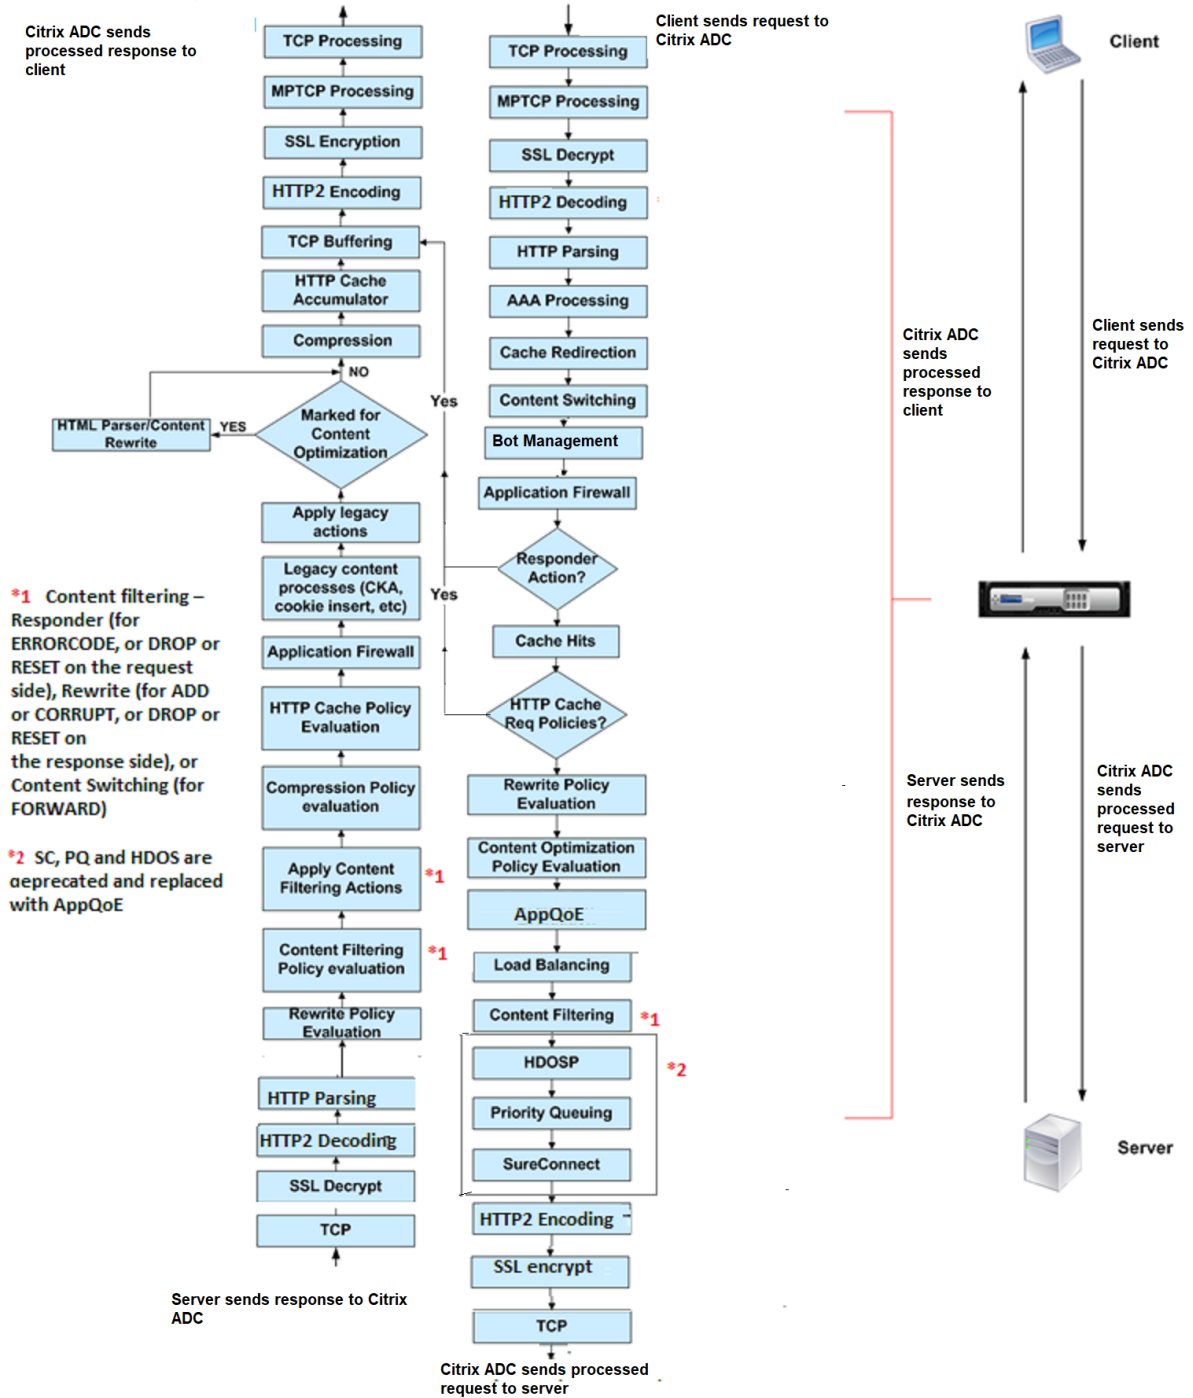

When an ADC appliance receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except rewrite, the appliance implements only the first policy that has a request match. For Rewrite policies, the ADC appliance evaluates the policies in order and performs the associated actions in the same order. Policy priority is important for getting the results you want.

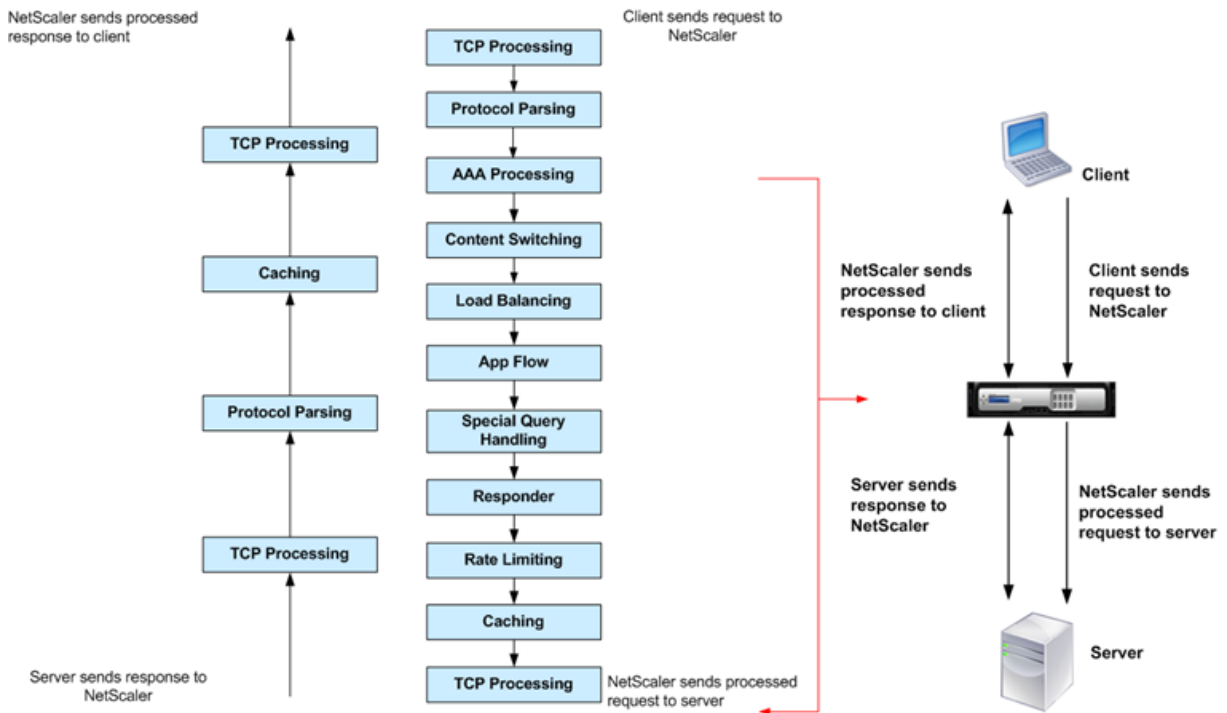

## **Packet flow**

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the DataStream packet flow in the Citrix ADC appliance. DataStream is supported for MySQL and MS SQL databases.

The following figure shows the DataStream packet flow in the Citrix ADC appliance. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see DataStream.

**Note:** If the traffic is for a content switching virtual server, the appliance evaluates policies in the following order:

1. bound to global override.
2. bound to load balancing virtual server.
3. bound to content switching virtual server.
4. bound to global default.

This way, if a policy rule is true and gotopriorityexpression is END, we stop further policy evaluation.

In content switching, if no load balancing virtual server is selected or bound to the content switching virtual server, then we evaluate responder policies bound only to the content switching virtual server.

### System limitation

There are system limitations for each Citrix ADC feature when you install Citrix ADC software 9.2 or later. For more information, see Citrix article, [CTX118716](#).

## Where does a Citrix ADC appliance fit in the network?

September 21, 2020

A Citrix ADC appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

### **Physical deployment modes**

A Citrix ADC appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment

In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for Citrix ADC installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see [“Understanding Common Network Topologies.”](#)

### **Citrix ADC as an L2 device**

A Citrix ADC appliance functioning as an L2 device is said to operate in L2 mode. In L2 mode, the ADC appliance forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device’s media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the Citrix ADC appliance.

For information about how the L2 and L3 modes interact, see [Packet forwarding modes](#).

For information about configuring L2 mode, see the “Enable and disable layer 2 mode” section in [Packet forwarding modes](#).

## **Citrix ADC as a packet forwarding device**

A Citrix ADC appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for an appliance’s MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see [Packet forwarding modes](#).

For information about configuring the L3 mode, see [Packet forwarding modes](#).

## **How a Citrix ADC appliance communicates with clients and servers**

September 21, 2020

A Citrix ADC appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of Citrix ADC functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as Citrix ADC-owned IP addresses. To manage your network traffic, you assign Citrix ADC-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

## Understanding Citrix ADC-owned IP addresses

To function as a proxy, a Citrix ADC appliance uses a variety of IP addresses. The key Citrix ADC-owned IP addresses are:

- Citrix ADC IP (NSIP) address

The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

- Virtual server IP (VIP) address

A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.

- Subnet IP (SNIP) address

A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

- IP Set

An IP set is a set of IP addresses, which are configured on the appliance as SNIP. An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

- Net Profile

A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

## How Traffic flows are managed

Because a Citrix ADC appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the Citrix ADC appliance instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 1. Virtual Server Based Connections

In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

### Traffic management building blocks

The configuration of a Citrix ADC appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure

an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How traffic management building blocks work

## A simple load balancing configuration

In the example shown in the following figure, the Citrix ADC appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a Citrix ADC appliance. When the appliance receives client requests sent to the VIP address, it sends

them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load balancing virtual server, services, and monitors

In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

### Understanding virtual servers

A virtual server is a named Citrix ADC entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol. The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications

that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address

The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS\_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS\_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP

request at the VIP address, it processes the request as specified by the settings of VS\_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS\_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

- **Load balancing virtual server**  
Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.
- **Cache redirection virtual server**  
Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.
- **Content switching virtual server**  
Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.
- **Virtual private network (VPN) virtual server**  
Decrypts tunneled traffic and sends it to intranet applications.
- **SSL virtual server**  
Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

## **Understanding services**

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a Citrix ADC appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the source IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state. If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

## Introduction to the Citrix ADC product line

September 21, 2020

The Citrix ADC product line optimizes delivery of applications over the internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You can install a Citrix ADC appliance in your server room and route all connections to your managed servers through it. The Citrix ADC features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A Citrix ADC appliance can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the Citrix ADC web-based GUI and CLI configuration utilities.

This topic includes the following sections:

- Citrix ADC Hardware Platforms
- Citrix ADC Editions
- Supported Releases on ADC Hardware
- Supported Browsers

### Citrix ADC Hardware Platforms

Citrix ADC hardware is available in a variety of platforms that have a range of hardware specifications:

[Citrix ADC MPX hardware platform](#)

[Citrix ADC SDX hardware platform](#)

## Citrix ADC Editions

The Citrix ADC operating system is available in three editions:

- Standard
- Advanced
- Premium

The Standard and Advanced editions have limited features available. Feature licenses are required for all editions.

For more information about Citrix ADC software editions, see the [Citrix ADC Editions datasheet](#).

For information about how to obtain and install licenses, see [Licensing](#).

## Supported releases on Citrix ADC hardware

See the following compatibility matrix tables for all Citrix ADC hardware platforms and the software releases supported on these platforms:

[Citrix ADC MPX Hardware-Software Compatibility Matrix](#)

[Citrix ADC SDX Hardware-Software Compatibility Matrix](#)

## Supported browsers

To access the Citrix ADC GUI, your workstation must have a supported web browser.

The following table lists the compatible browsers for NetScaler GUI version 12.0, 12.1, and 13.0:

Operating System	Browser	Versions
Windows 7 & later	Internet Explorer	11, Edge, & later
Windows 7 & later	Mozilla Firefox	45 & later
Windows 7 & later	Chrome	60 & later
MAC	Mozilla Firefox	45 & later
MAC	Safari	10.1.1 & later

The compatible browser versions for Citrix ADC 11.1 are as follows:

<b>Operating System</b>	<b>Browser</b>	<b>Versions</b>
Windows 7 & later	Internet Explorer	8,9,10, 11, Edge
Windows 7 & later	Mozilla Firefox	45 & later
Windows 7 & later	Chrome	60 & later
MAC	Mozilla Firefox	45 & later
MAC	Safari	10.1.1 & later

## Install the hardware

September 21, 2020

Before installing a Citrix ADC appliance, review the pre-installation checklist.

To use the SDX appliance, you must complete the following tasks by following the instructions given in the resources provided in table. Complete the tasks in the sequence given.

Task

Description

1. Read safety, cautions, warnings, and other information

Read the caution and danger information you need to know, before installing the product.

2. Prepare for installation

Unpack your appliance and ensure all parts were delivered, prepare the site and rack, and follow basic electrical safety precautions before you install your new appliance.

3. Install the hardware

Rack mount the appliance, install transceivers (if available), and connect the appliance to the network and a power source.

4. Configure the appliance.

Configure the initial settings of the Citrix ADC appliance by using the GUI or the serial console.

Follow the steps given in the following documentations to complete these tasks:

- [Citrix ADC MPX hardware documentation](#)
- [Citrix ADC SDX hardware documentation](#)

## Access a Citrix ADC appliance

September 23, 2020

A Citrix ADC appliance has both a command line interface (CLI) and a GUI. The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default Citrix ADC IP address (NSIP) of 192.168.100.1 and the default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple Citrix ADC units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple Citrix ADC appliances?
- The NSIP is reachable on all physical ports. The ports on a Citrix ADC are host ports, not switch ports.

The following table summarizes the available access methods.

Access Method	Port	Default IP Address Required? (Y/N)
CLI	Console	N
CLI and GUI	Ethernet	Y

### Command line interface

You can access the CLI locally, by connecting a workstation to the console port, or remotely, by connecting through the secure shell (SSH) from any workstation on the same network.

#### Log on to the Command Line Interface through the Console Port

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port, follow these steps:

1. Connect the console port to a serial port on the workstation. For more information, see [Connect the console cable](#).
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you might have to press ENTER one or more times to display it.

3. In User Name, type `nsroot`. In Password, type `nsroot` and if that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

### Log on to the Command Line Interface by using SSH

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- PuTTY

Open Source software supported on multiple platforms. Available at:

[“http://www.chiark.greenend.org.uk/~sgtatham/putty/”](http://www.chiark.greenend.org.uk/~sgtatham/putty/)

- Vandyke Software SecureCRT

Commercial software supported on the Windows platform. Available at:

[“http://www.vandyke.com/products/securecrt/”](http://www.vandyke.com/products/securecrt/)

These programs are tested by the Citrix ADC team, who have verified that they work correctly with a Citrix ADC appliance. Other programs might also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a Citrix ADC appliance by using an SSH client, follow these steps:

1. On your workstation, start the SSH client.
2. For initial configuration, use the default IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.
3. In User Name, type `nsroot`. In Password, type `nsroot` and if that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance. For example.

```
1 login as: nsroot
2
3
4 Using keyboard-interactive authentication.
5
6
7 Password:
8
```

```
9
10 Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9

```

## Citrix ADC GUI

### Important:

A certificate-key pair is required for HTTPS access to the Citrix ADC GUI. On the ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Also, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on a Citrix ADC for HTTPS access to the GUI. Also, install an appropriate license before starting the ADC.

The GUI includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance.

The system requirements for the workstation running the GUI are as follows:

- For Windows-based workstations, a Pentium 166 MHz or faster processor.
- For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and `glibc` version 2.12–11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation must support 16-bit color mode, KDE, and KWM window managers used in conjunction, with displays set to local hosts.
- For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8.

Your workstation must have a supported web browser to access the configuration utility and Dashboard.

The following browsers are supported.

**Operating System:**

Windows 7

**Browser:** Internet Explorer (version 9, 10, and 11), Mozilla Firefox (version 3.6.25 and above), Google Chrome (latest).

**Operating System:**

Windows 64 bit

**Browser:** Internet Explorer (version 8, 9, 10, and 11), Google Chrome (version latest)

**Operating System:**

MAC

**Browser:** Mozilla Firefox (version 3.6.25 and above), Safari (version 5.1.3 and above), Google Chrome (version latest)

**Use the Citrix ADC GUI**

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

To log on to the GUI, follow these steps:

1. Open your web browser and enter the Citrix ADC IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (<http://192.168.100.1>). The Citrix Logon page appears.

Note: If you have two Citrix ADC appliances in a high availability setup, do not access the GUI by entering the IP address of the secondary Citrix ADC appliance. If you do so and use the GUI to configure the secondary appliance, your configuration changes are not applied to the primary Citrix ADC appliance.

2. In the User Name text box, type `nsroot`.
3. In the Password text box, type the administrative password you assigned to the `nsroot` account during initial configuration and click **Login**. If that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

To access the online help, select Help from the Help menu at the top right corner.

**Use the Statistical Utility**

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a Citrix ADC appliance.

To log on to Dashboard, follow these steps:

1. Open your web browser and enter the NSIP as an HTTP address. The Citrix Logon page appears.

2. In the **User Name** text box, type `nsroot`.
3. In the **Password** text box, type the administrative password you assigned to the `nsroot` account during initial configuration. If that password does not work, try typing the serial number of the appliance. The serial number bar code is available at the back of the appliance.

## Configure the ADC for the first time

September 21, 2020

For initial configuration of a Citrix ADC MPX appliance, see [Initial Configuration of a Citrix MPX appliance](#).

For initial configuration of a Citrix SDX appliance, see [Initial Configuration of a Citrix SDX appliance](#).

### NITRO API

You can use the NITRO API to configure the Citrix ADC appliance. NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs). For more information, see [NITRO API](#).

## Secure your Citrix ADC deployment

September 21, 2020

To maintain security through the deployment life cycle of Citrix ADC appliance, Citrix recommends you to consider the following security aspects:

- Physical Security
- Appliance Security
- Network Security
- Administration and Management

Different deployments might require different security considerations. The Citrix ADC secure deployment guidelines provide general security guidance to help you decide on an appropriate secure deployment based on your specific security requirements.

For more information on guidelines for securely deploying the Citrix ADC appliance, see [Citrix ADC secure deployment guidelines](#).

## Configure high availability

September 21, 2020

You can deploy two Citrix ADC appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The Citrix ADC appliance that is actively accepting connections and managing the servers is called a primary unit and the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each Citrix ADC appliance in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see [High Availability](#). If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

Figure 1. High availability in one-arm mode

Figure 2. High availability in two-arm mode

In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one ADC appliance as primary and another as secondary. Perform the following tasks on each of the ADC appliances:

- Add a node.
- Disable high availability monitoring for unused interfaces.

### **Add a Node**

A node is a logical representation of a peer Citrix ADC appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

## Through CLI

To add a node by using the command line interface, follow these steps:

At the command prompt, type the following commands to add a node and verify that the node has been added:

- add HA node <id> <IPAddress>
- show HA node <id>

### Example

```
1  add HA node 0 10.102.29.170
2  Done
3  > show HA node 0
4  1)      Node ID:      0
5          IP:      10.102.29.200 (NS200)
6          Node State: UP
7          Master State: Primary
8          SSL Card Status: UP
9          Hello Interval: 200 msec
10         Dead Interval: 3 sec
11         Node in this Master State for: 1:0:41:50 (days:hrs:min:
           sec)
12  <!--NeedCopy-->
```

## Through GUI

To add a node by using the GUI, follow these steps:

1. Navigate to **System > High Availability**.
2. Click **Add** on the **Nodes** tab.
3. On the **Create HA Node** page, in the **Remote Node IP Address** text box, type the NSIP Address (for example, 10.102.29.170) of the remote node.
4. Ensure that the **Configure remote system to participate in High Availability setup** check box is selected. Provide the login credentials of the remote node in the text boxes under **Remote System Login Credentials**.
5. Select the **Turn off HA monitor on interfaces/channels that are down** check box to disable the HA monitor on interfaces that are down.

Verify that the node you added appears in the list of nodes in the Nodes tab.

## Disable high availability monitoring for unused interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly

### Through CLI

To disable the high availability monitor for an unused interface by using the command line interface, follow these steps:

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- `set interface <id> -haMonitor OFF`
- `show interface <id>`

### Example

```
1 > set interface 1/8 -haMonitor OFF
2 Done
3 > show interface 1/8
4 Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
5 flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
6 MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime
7 238h55m44s
8 Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF,
9 throughput 0
10 RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
11 TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
12 NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)
13 Muted(0)
14 Bandwidth thresholds are not set.
15 <!--NeedCopy-->
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include “HAMON.”

## Through GUI

To disable the high availability monitor for unused interfaces by using the GUI, follow these steps:

1. Navigate to System > Network > Interfaces.
2. Select the interface for which the monitor must be disabled.
3. Click Open. The Modify Interface dialog box appears.
4. In HA Monitoring, select the OFF option.
5. Click OK.
6. Verify that, when the interface is selected, “HA Monitoring: OFF” appears in the details at the bottom of the page.

## Change an RPC node password

October 14, 2020

To communicate with other Citrix ADC appliances, each appliance requires knowledge of the other appliances, including how to authenticate on Citrix ADC appliance. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each Citrix ADC appliance and stores information, such as the IP addresses of the other Citrix ADC appliance and the passwords used for authentication. The Citrix ADC appliance that contacts the other Citrix ADC appliance checks the password within the RPC node.

### To change an RPC node password by using the GUI

1. Navigate to **System > Network > RPC**.
2. In the **RPC** pane, select the node and then click **Edit**.
3. In **Configure RPC Node**, type the new password.
4. In **Source IP Address**, type the existing node’s IP address to be used to communicate with the peer system node.

The screenshot shows the 'Configure RPC Node' configuration page in the Citrix ADC web interface. The page has a dark header with 'Dashboard' and 'Configuration' tabs. Below the header, there is a back arrow and the title 'Configure RPC Node'. The form contains the following fields and options:

- Node IP Address:** A text input field containing '10.106.177.5'.
- Password:** A password input field with a visibility icon and a help icon.
- Confirm Password:** A password input field with a visibility icon.
- Reset Password:** An unchecked checkbox.
- Source IP Address\*:** A text input field containing an asterisk (\*).
- Secure:** A checked checkbox.

At the bottom of the form, there are two buttons: 'OK' (highlighted in blue) and 'Close'.

5. Select **Secure** and then click **OK**.

#### Note

When you enable the **Secure** option, the appliance encrypts all communication sent from the node to other RPC nodes thus securing the RPC communication.

### To change an RPC node password by using the CLI

At the command line, type the following commands:

```

1 set ns rpcNode <IPAddress> {
2   -password }
3   [-secure ( YES | NO )]
4 show ns rpcNode
5 <!--NeedCopy-->

```

#### Example:

```

1 > set ns rpcNode 192.0.2.4 -password mypassword -secure YES
2   Done
3 > show rpcNode
4 .
5 .
6 .

```

```
7  IPAddress: 192.0.2.4 Password: d336004164d4352ce39e
8      SrcIP: *          Secure: ON
9  Done
10 >
11
12 <!--NeedCopy-->
```

## Configure a FIPS appliance for the first time

October 14, 2021

### Notes

- FIPS FAQ can be found here: [FIPS FAQ](#).
- VPX FIPS configuration can be found here: [Citrix ADC VPX FIPS certified appliances](#).

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other Citrix ADC appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other Citrix ADC appliances and the passwords used to authenticate on each.

On a Citrix ADC MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

### Configure secure HTTPS by using the CLI

To configure secure HTTPS by using the CLI, follow these steps

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see [Configure the HSM](#).
2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see “[Configure FIPS appliances in a high availability setup](#).”
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

```
import ssl fipskey serverkey -key ns-server.key -inform PEM
```

4. Add a certificate-key pair. At the command prompt, type:

```
add certkey server -cert ns-server.cert -fipskey serverkey
```

5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:

```
bind ssl service nshttps-127.0.0.1-443 -certkeyname server
```

```
bind ssl service nshttps-:::11-443 -certkeyname server
```

## Configure secure HTTPS by using the GUI

To configure secure HTTPS by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see [Configure the HSM](#).
2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see [Configure FIPS appliances in a high availability setup](#).
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see the [Import an existing FIPS key](#) section.
4. Navigate to **Traffic Management > SSL > Certificates**.
5. In the details pane, click **Install**.
6. In the Install Certificate dialog box, type the certificate details.
7. Click **Create**, and then click **Close**.
8. Navigate to **Traffic Management > Load Balancing > Services**.
9. In the details pane, on the **Action** tab, click **Internal Services**.
10. Select `nshttps-127.0.0.1-443` from the list, and then click **Open**.
11. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
12. Select `nshttps-:::11-443` from the list, and then click **Open**.
13. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
14. Click **OK**.

## Configure secure RPC by using the CLI

To configure secure RPC by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see [Configure the HSM](#).
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see [Configure FIPS appliances in a high availability setup](#).
3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

```
import ssl fipskey serverkey -key ns-server.key -inform PEM
```

4. Add a certificate-key pair. At the command prompt, type:

```
add certkey server -cert ns-server.cert -fipskey serverkey
```

5. Bind the certificate-key pair to the following internal services. At the command prompt, type:

```
bind ssl service nsrpcs-127.0.0.1-3008 -certkeyname server
```

```
bind ssl service nskrpcs-127.0.0.1-3009 -certkeyname server
```

```
bind ssl service nsrpcs-:::11-3008 -certkeyname server
```

6. Enable secure RPC mode. At the command prompt, type:

```
set ns rpcnode <IP address> -secure YES
```

For more information about changing an RPC node password, see [Change an RPC node password](#).

## Configure secure RPC by using the GUI

To configure secure RPC by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see [Configure the HSM](#).
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, [Configure FIPS appliances in a high availability setup](#).
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, the [Import an existing FIPS key](#) section.
4. Navigate to **Traffic Management > SSL > Certificates**.
5. In the details pane, click **Install**.
6. In the **Install Certificate** dialog box, type the certificate details.
7. Click **Create**, and then click **Close**.
8. Navigate to **Traffic Management > Load Balancing > Services**.

9. In the details pane, on the **Action** tab, click **Internal Services**.
10. Select `nsrpcs-127.0.0.1-3008` from the list, and then click **Open**.
11. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
12. Select `nskrpcs-127.0.0.1-3009` from the list, and then click **Open**.
13. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
14. Select `nsrpcs-: :11-3008` from the list, and then click **Open**.
15. On the **SSL Settings** tab, in the **Available** pane, select the certificate created in step 7, click **Add**, and then click **OK**.
16. Click **OK**.
17. Navigate to **System > Network > RPC**.
18. In the details pane, select the IP address, and click **Open**.
19. In the **Configure RPC Node** dialog box, select **Secure**.
20. Click **OK**.

## Common network topologies

September 21, 2020

As described in the “Physical deployment mode” section in [Where does a Citrix ADC appliance fit in the network?](#), you can deploy the Citrix ADC appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

### Set up a common two-arm topology

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

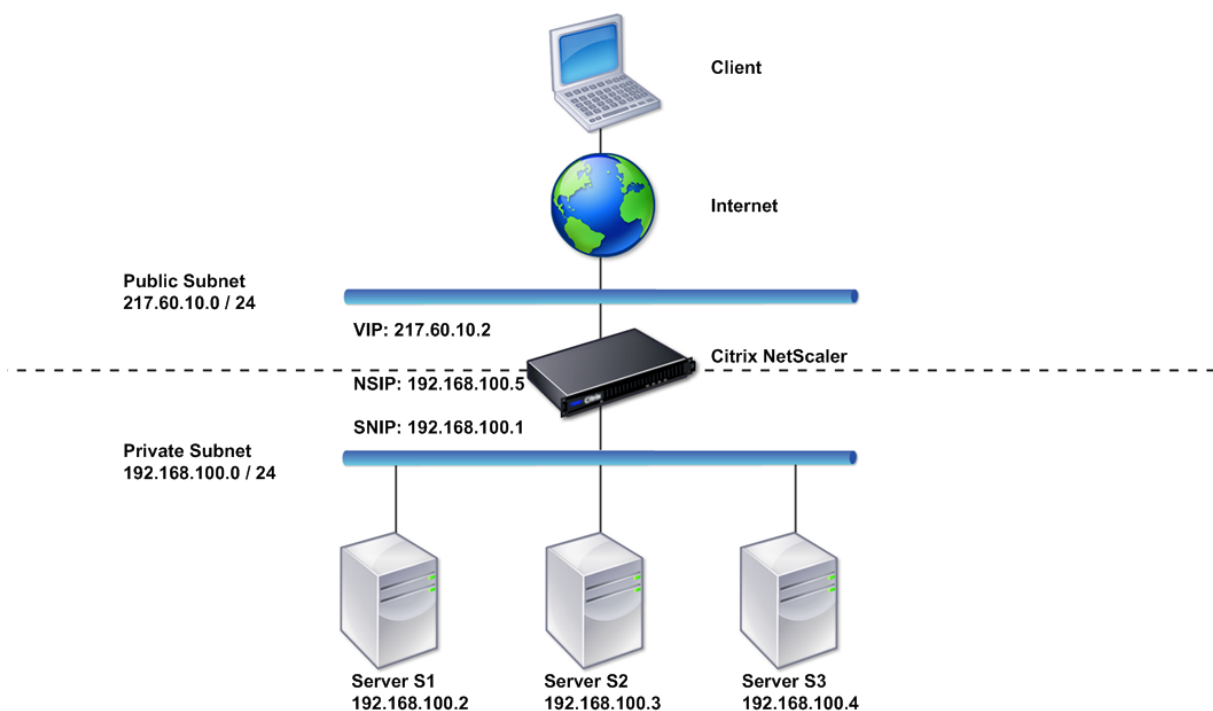

### Set up a simple two-arm multiple subnet topology

One of the most commonly used topologies has the Citrix ADC appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets

To deploy a Citrix ADC appliance in two-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and default gateway, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Configure the SNIP, as described in [Configuring Subnet IP Addresses](#).
3. Enable the USNIP option, as described in [To enable or disable USNIP mode](#) section.
4. Configure the virtual server and the services, as described in [Creating a Virtual Server](#) section and [Configuring Services](#) section.
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

## Set up a simple two-arm transparent topology

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a Citrix ADC appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode

To deploy a Citrix ADC appliance in two-arm, transparent mode, follow these steps

1. Configure the NSIP and default gateway, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Enable L2 mode, as described in [Enabling and Disabling Layer 2 Mode](#).
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

## Set up common one-arm topologies

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

### Set up a simple one-arm single subnet topology

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a Citrix ADC appliance deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on an ADC appliance, and HTTP services are running on the servers. As shown in the following figure, the Citrix ADC IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet

To deploy a Citrix ADC appliance in one-arm mode with a single subnet, follow these steps:

1. Configure the NSIP and the default gateway, as described in, as described in [Configuring the Citrix ADC IP Address \(NSIP\)](#).
2. Configure the virtual server and the services, as described in [Creating a Virtual Server](#) section and [Configuring Services](#) section.
3. Connect one of the network interfaces to the switch.

### Set up a simple one-arm multiple subnet topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a Citrix ADC appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets

To deploy a Citrix ADC appliance in one-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and the default gateway, as described in [Configuring the NetScaler IP Address \(NSIP\)](#).
2. Configure the SNIP and enable the USNIP option, as described in [Configuring Subnet IP Addresses](#).
3. Configure the virtual server and the services, as described in [Creating a Virtual Server](#) section and [Configuring Services](#) section.

4. Connect one of the network interfaces to the switch.

## System management settings

September 21, 2020

Once your initial configuration is in place, you can configure settings to define the behavior of the Citrix ADC appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the Citrix ADC appliance. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the Citrix clock with a Network Time Protocol (NTP) server. The Citrix ADC appliance can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

## System settings

September 21, 2020

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a Citrix ADC appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the Citrix ADC GUI.

You can modify the types of HTTP parameters described in the following table.

**Parameter Type:** HTTP Port Information

**Specifies:** The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port.

Note: If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.

**Parameter Type:** Limits

**Specifies:** The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set Max Connections to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set Max Requests to 0.

Note: If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.

**Parameter Type:** Client IP Insertion

**Specifies:** Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a subnet IP address, the server identifies it as the client's IP address. Some applications need the client's IP address for logging purposes or to dynamically determine the content to be served by the web server.

You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).

**Parameter Type:** Cookie Version

**Specifies:** The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

**Parameter Type:** Requests/Responses

**Specifies:** Options for handling certain types of requests, and enable/disable logging of HTTP error responses.

**Parameter Type:** Server Header Insertion

**Specifies:** Insert a server header in Citrix ADC-generated HTTP responses.

To configure HTTP parameters by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.

2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

To set the FTP port range by using the GUI, follow these steps:

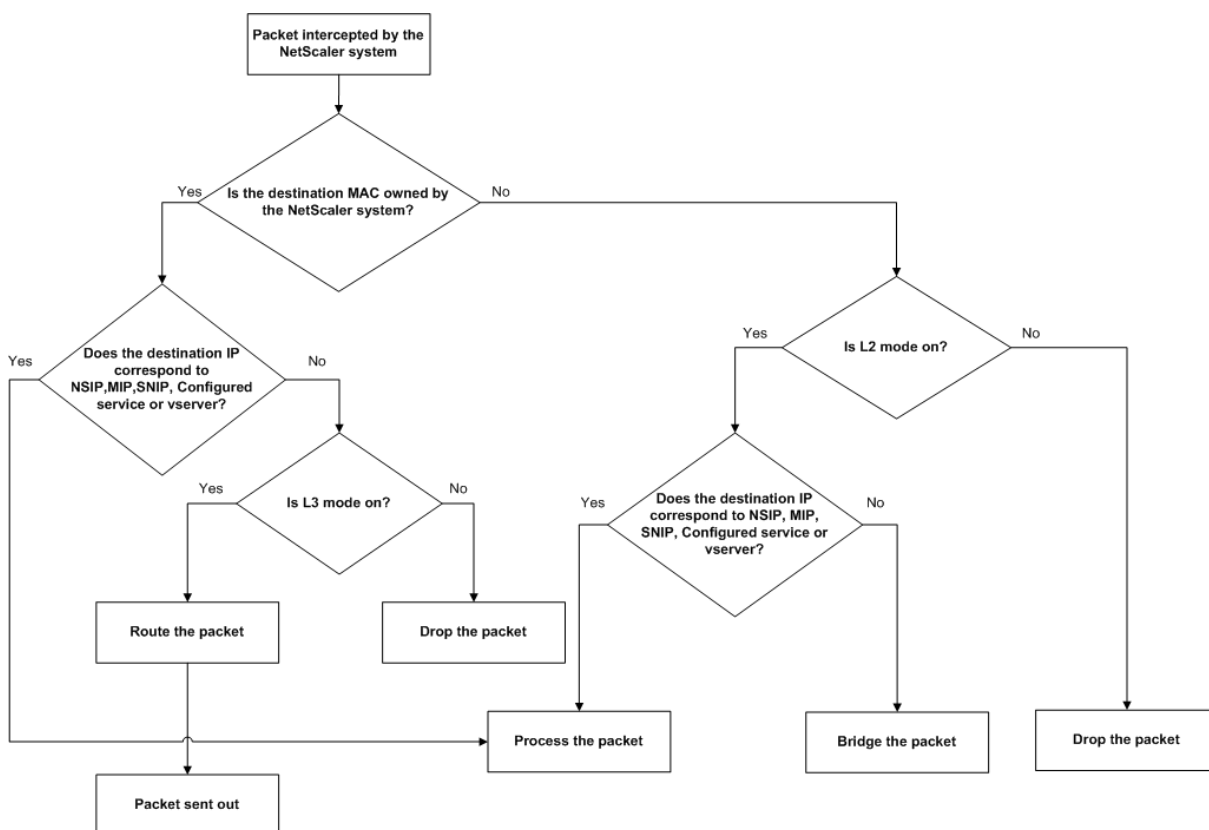

1. In the navigation pane, expand **System**, and then click **Settings**
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

## Packet forwarding modes

September 21, 2020

The Citrix ADC appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes

An appliance can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

### Enable and disable layer 2 mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a Citrix ADC appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

**To enable or disable Layer 2 mode by using the CLI**

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

**Examples**

```
> enable ns mode l2
Done
> show ns mode

Mode Acronym Status
---- ----
1) Fast Ramp FR ON
2) Layer 2 mode L2 ON
.
.
.
Done
>

> disable ns mode l2
Done
> show ns mode

Mode Acronym Status
---- ----
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
Done
>
```

To enable or disable Layer 2 mode by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes** and **Features**, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.

4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

### **Enable and disable layer 3 mode**

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a Citrix ADC appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

### **To enable or disable Layer 3 mode by using the CLI**

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

#### **Examples**

```
> enable ns mode l3
Done
> show ns mode

Mode Acronym Status
---- -
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
9) Layer 3 mode (ip forwarding) L3 ON
.
.
.
Done
>

> disable ns mode l3
Done
> show ns mode
```

Mode Acronym Status

---- ---- ----

1) Fast Ramp FR ON

2) Layer 2 mode L2 OFF

.

.

.

9) Layer 3 mode (ip forwarding) L3 OFF

.

.

.

Done

>

### To enable or disable Layer 3 mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 3 mode, select the Layer 3 Mode (IP Forwarding) check box. To disable Layer 3 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

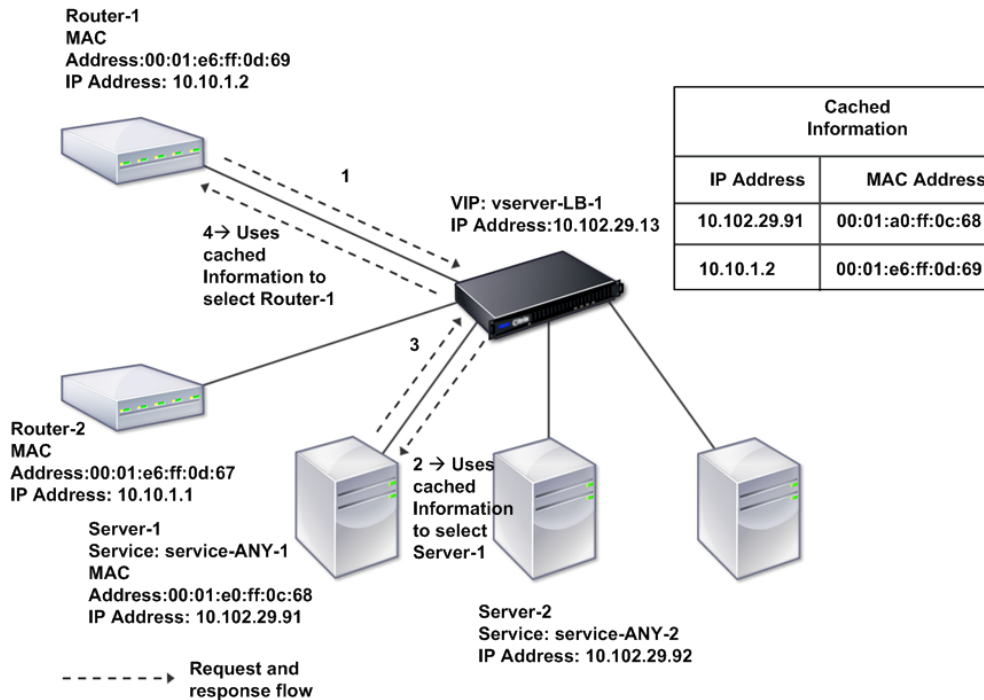

### Enable and disable MAC based forwarding mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the Citrix ADC appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

Figure 2. MAC-Based Forwarding Process

When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- <The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- <The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance's default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

**To enable or disable MAC-based forwarding by using the CLI**

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- <enable ns mode <Mode>
- <disable ns mode <Mode>
- <show ns mode

**Example**

“ pre codeblock

```
enable ns mode mbf
Done
show ns mode
```

1	Mode	Acronym	Status	
2	-----	-----	-----	1) Fast
	Ramp	FR	ON	2) Layer 2
	mode	L2	OFF	. . . 6)
	MAC-based forwarding	MBF	ON	. . .
	Done	>		

```
disable ns mode mbf
Done
show ns mode
```

1	Mode	Acronym	Status	
2	-----	-----	-----	1) Fast
	Ramp	FR	ON	2) Layer 2
	mode	L2	OFF	. . . 6)
	MAC-based forwarding	MBF	OFF	. . .
	Done	>	<!--NeedCopy-->	``

To enable or disable MAC-based forwarding by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

## Network interfaces

September 21, 2020

The Citrix ADC interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

### Virtual LANs

The Citrix ADC appliance supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The ADC appliance (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs.

The Citrix ADC appliance supports the following types of VLANs.

- Default VLAN

By default, the network interfaces on a Citrix ADC appliance are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

- Port-Based VLANs

A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

- Tagged VLAN

A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the ADC appliance and therefore must be done during initial network configuration.

## Link aggregate channels

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a Citrix ADC appliance and other connected devices. An aggregated link is also referred to as a channel.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see [Configuring Link Aggregation by Using the Link Aggregation Control Protocol](#).

## Clock synchronization

September 21, 2020

You can configure your Citrix ADC appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at <http://www.ntp.org>.

To configure clock synchronization on your appliance, follow these steps:

1. Log on to the command line and enter the shell command.
2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:

```
restrict localhost  
restrict 127.0.0.2
```

These entries are required only if you want to run the device as a time server. However, this feature is not supported on the Citrix ADC appliance.

3. Edit `/nsconfig/ntp.conf` by typing the IP address for the desired NTP server under the file's server and restrict entries.
4. Create a file named `rc.netscaler` in the `/nsconfig` directory, if the file does not already exist in the directory.
5. Edit `/nsconfig/rc.netscaler` by adding the following entry: `/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &`

This entry starts the `ntpd` service, checks the `ntp.conf` file, and logs messages in the `/var/log` directory.

Note: If the time difference between the Citrix ADC appliance and the time server is more than 1000 sec, the `ntpd` service terminates with a message to the ADC log. To avoid this, you need to start `ntpd` with the `-g` option, which forcibly syncs the time. Add the following entry in `/nsconfig/rc.netscaler`:

```
/usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
```

If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start `ntpd` again. You can check the time difference between the appliance and the time server by running the following command in the shell:

```
1 ntpdate -q <IP address or domain name of the NTP server>
2 <!--NeedCopy-->
```

6. Reboot the appliance to enable clock synchronization.

Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the `rc.netscaler` file in step 5) at the shell prompt:

```
1 /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ ntpd.log &
2 <!--NeedCopy-->
```

## DNS configuration

September 21, 2020

You can configure a Citrix ADC appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records,

AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.

### Add a name server by using the CLI

At the command prompt, type the following commands to add a name server and verify the configuration:

- `<add dns nameServer <IP>`
- `<show dns nameServer <IP>`

#### Example

```
““ pre codeblock
add dns nameServer 10.102.29.10
Done
show dns nameServer 10.102.29.10
1) 10.102.29.10 - State: DOWN
Done
““
```

### Add a name server by using the GUI

1. Navigate to **Traffic Management > DNS > Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, 10.102.29.10).  
If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

## SNMP configuration

September 21, 2020

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the Citrix ADC appliance. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a Citrix ADC appliance that has SNMP enabled and configured.

Figure 1. SNMP on the Citrix ADC appliance

The SNMP agent on a Citrix ADC appliance supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the ADC appliance) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The Citrix ADC appliance supports the following enterprise-specific MIBs:

- A subset of standard MIB-2 groups. Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- A system enterprise MIB. Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

### Add SNMP managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks. To add an SNMP manager by using the CLI

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

```
add snmp manager <IPAddress> ... [-netmask <netmask>]
```

```
s*****show snmp manager***** <IPAddress>
```

#### Example:

```
add snmp manager 10.102.29.5 -netmask 255.255.255.255
```

```
show snmp manager 10.102.29.5
```

```
10.102.29.5 255.255.255.255
```

#### To add an SNMP manager by using the GUI:

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

### Add SNMP traps listeners

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

### To add an SNMP trap listener by using the CLI

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- `add snmp trap specific <IP>`
- `show snmp trap`

#### Example:

```
1 Trap type: SPECIFIC
2 Destination IP: 10.102.29.3
3 TD: 0
4 Destination Port: 162
5 Source IP: NetScaler IP
6 Version: V2
7 Min-Severity: -
8 AllPartition: DISABLED
9 Community: public
10 <!--NeedCopy-->
```

### To add an SNMP trap listener by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Traps.
2. In the details pane, click Add.
3. In the Create SNMP Trap Destination dialog box, in the Destination IP Address text box, type the IP address (for example, 10.102.29.3).
4. Click Create and then click Close.
5. Verify that the SNMP trap you added appears in the Details section at the bottom of the pane.

### Configure SNMP alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

**To enable or disable an alarm by using the CLI**

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

```
set snmp alarm <trapName> [-state ENABLED  DISABLED ]
```

- 
- show snmp alarm <trapName>

**Example**

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
Done
> show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
-----
1) LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
Done
>
```

**To set the severity of the alarm by using the CLI**

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- set snmp alarm <trapName> [-severity <severity>]
- show snmp alarm <trapName>

**Example**

```
> set snmp alarm LOGIN-FAILURE -severity Major
Done
> show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
-----
1) LOGIN-FAILURE N/A N/A N/A ENABLED Major ENABLED
Done
>
```

**To configure alarms by using the GUI**

1. In the navigation pane, expand System, expand SNMP, and then click Alarms.

2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click Open.
3. In the Configure SNMP Alarm dialog box, to enable the alarm, select Enabled in the State drop-down list. To disable the alarm, select Disabled.
4. In the Severity drop-down list, select a severity option (for example, Major).
5. Click OK, and then click Close.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the Details section at the bottom of the pane.

## Verify configuration

September 21, 2020

After you've finished configuring your system, complete the following checklists to verify your configuration.

### Configuration checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough SNIP IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured SNIP IP addresses is:\_\_\_\_\_
  - The expected number of simultaneous server connections is:  
[ ] 62,000 [ ] 124,000 [ ] Other\_\_\_\_\_

### Topology configuration checklist

The routes have been used to resolve servers on other subnets.

The routes entered are:

\_\_\_\_\_

- If the Citrix ADC appliance is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the ADC appliance resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

\_\_\_\_\_

- If the ADC appliance is placed behind an external load balancer, then the load balancing policy on the external load balancer is not “least connection.”

The load balancing policy configured on the external load balancer is:

\_\_\_\_\_

- If the ADC appliance is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

Note: The TCP idle connection timeout on a Citrix ADC appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

The value configured for the session time-out is: \_\_\_\_\_

### **Server configuration checklist**

- “Keep-alive” has been enabled on all the servers.

The value configured for the keep-alive time-out is: \_\_\_\_\_

- The default gateway has been set to the correct value. (The default gateway should either be a Citrix ADC appliance or upstream router.) The default gateway is:

\_\_\_\_\_

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

\_\_\_\_\_

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.
- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the Citrix ADC appliance.

The MaxConn (maximum number of connections) value that has been set is:

\_\_\_\_\_

- If a Netscape Enterprise Server is used, the maximum requests per connection parameter is set on the Citrix ADC appliance. The maximum requests per connection value that has been set is:

\_\_\_\_\_

### **Software features configuration checklist**

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a Citrix ADC appliance.)

Reason for enabling or disabling:

\_\_\_\_\_

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)

Reason for enabling or disabling:

\_\_\_\_\_

- <Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)

Reason for enabling or disabling:

\_\_\_\_\_

- Do the default settings of the surge protection feature need to be changed?

Reason for changing or not changing:

\_\_\_\_\_

### Access checklist

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the Citrix ADC.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

### Firewall checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

## Load balance traffic on a Citrix ADC appliance

September 21, 2020

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A Citrix ADC appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.

When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The Citrix ADC appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture

The entities function as follows:

- **Virtual server.** An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service.** A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object.** An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.
- **Monitor.** An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

## Load balancing

September 21, 2020

To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the Citrix ADC appliance binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the `stat lb vserver <vserverName>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing

## Enable load balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

### To enable load balancing by using the CLI

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- enable feature lb
- show feature

#### Example

““ pre codeblock

```
enable feature lb
Done
show feature
```

1	Feature	Acronym	Status	
2	-----	-----	-----	1) Web
	Logging	WL	OFF	2) Surge
	Protection	SP	OFF	3) Load Balancing
	LB	ON	.	9) SSL
	Offloading	SSL	ON	. . . Done
	<!--NeedCopy--> ` ` `			

### To enable load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click OK.
4. In the Enable/Disable Feature(s)? message, click Yes.

## Configure services and a virtual server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

## To implement the initial load balancing configuration by using the CLI

At the command prompt, type the following commands to implement and verify the initial configuration:

- `<add service <name> <IPAddress> <serviceType> <port>`
- `<add lb vserver <vServerName> <serviceType> [<IPAddress> <port>]`
- `<bind lb vserver <name> <serviceName>`
- `<show service bindings <serviceName>`

### Example

```
1 > add service service-HTTP-1 10.102.29.5 HTTP 80
2 Done
3 > add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
4 Done
5 > bind lb vserver vserver-LB-1 service-HTTP-1
6 Done
7 > show service bindings service-HTTP-1
8     service-HTTP-1 (10.102.29.5:80) - State : DOWN
9
10     1)     vserver-LB-1 (10.102.29.60:80) - State : DOWN
11 Done
12 <!--NeedCopy-->
```

## To implement the initial load balancing configuration by using the GUI

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.

## Persistence settings

September 21, 2020

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

Table 1. Limitations on Number of Simultaneous Persistent Connections

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

Persistence Type	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom Server ID	YES	YES	NO	NO	NO
Rule	YES	YES	NO	NO	NO

<b>Persistence</b>						
<b>Type</b>	<b>Header</b>	<b>HTTP</b>	<b>HTTPS</b>	<b>TCP</b>	<b>UDP/IP</b>	<b>SSL_Bridge</b>
<b>1</b>						
SRCIPDESTIP		N/A	N/A	YES	YES	N/A
DESTIP		N/A	N/A	YES	YES	N/A

Table 2. Persistence Types Available for Each Type of Virtual Server

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs.

### Configure persistence based on cookies

When you enable persistence based on cookies, the Citrix ADC appliance adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the ADC uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The Citrix ADC appliance inserts the cookie `<NSC_XXXX>= <ServiceIP> <ServicePort>`

where:

- `<<NSC_XXXX>` is the virtual server ID that is derived from the virtual server name.
- `<<ServiceIP>` is the hexadecimal value of the IP address of the service.
- `<<ServicePort>` is the hexadecimal value of the port of the service.

The ADC encrypts `ServiceIP` and `ServicePort` when it inserts a cookie, and decrypts them when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the ADC appliance sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- <If HTTP cookie version 0 is used, the Citrix ADC appliance inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on an ADC appliance, and the timeout value.
- <If an HTTP cookie version 1 is used, the ADC appliance inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can change the HTTP cookie version.

### To change the HTTP cookie version by using the CLI

At the command prompt, type;

```
1 set ns param [-cookieversion ( 0 | 1 )]  
2 <!--NeedCopy-->
```

#### Example:

```
1 set ns param -cookieversion 1  
2 <!--NeedCopy-->
```

### To change the HTTP cookie version by using the GUI

1. <Navigate to System > Settings.
2. <In the details pane, click Change HTTP Parameters.
3. <In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see Configure persistence based on cookies.

### To configure persistence based on cookies by using the CLI

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

```
1 set lb vserver <name> -persistenceType COOKIEINSERT
2
3 show lb vserver <name>
4 <!--NeedCopy-->
```

**Example:**

```
1 set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
2 Done
3 show lb vserver vserver-LB-1
4     vserver-LB-1 (10.102.29.60:80) - HTTP    Type: ADDRESS
5     .
6     .
7     .
8     Persistence: COOKIEINSERT (version 0)
9     Persistence Timeout: 2 min
10    .
11    .
12    .
13 Done
14 <!--NeedCopy-->
```

**To configure persistence based on cookies by using the GUI**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

**Configure persistence based on server IDs in URLs**

The Citrix ADC appliance can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the ADC extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The ADC extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see [Policy Configuration and Reference](#).

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

**Example:** Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL <http://www.citrix.com/index.asp?\\&sid;=c0a864100050> is directed to the server with the IP address 10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see [Load Balancing](#).

**To configure persistence based on server IDs in URLs by using the CLI**

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

```
1 set lb vserver <name> -persistenceType URLPASSIVE
2
3 <show lb vserver <name>
4 <!--NeedCopy-->
```

**Example:**

```
1 set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
2 Done
3 show lb vserver vserver-LB-1
4     vserver-LB-1 (10.102.29.60:80) - HTTP    Type: ADDRESS
5     .
6     .
7     .
8     Persistence: URLPASSIVE
9     Persistence Timeout: 2 min
10    .
11    .
12    .
13 Done
```

**To configure persistence based on server IDs in URLs by using the GUI**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

**Configure features to protect the load balancing configuration**

September 21, 2020

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

**Configure URL redirection**

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

### To configure a virtual server to redirect client requests to a URL by using the CLI

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:

- `<set lb vserver <name> -redirectURL <URL>`
- `<show lb vserver <name>`

#### Example

```
1 > set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
2 Done
3 > show lb vserver vserver-LB-1
4 vserver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
5 State: DOWN
6 Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)
7 .
8 .
9 .
10 Redirect URL: http://www.newdomain.com/mysite/maintenance
11 .
12 .
13 .
14 Done
15 >
16 <!--NeedCopy-->
```

### To configure a virtual server to redirect client requests to a URL by using the GUI

1. <Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. <In the details pane, select the virtual server for which you want to configure URL redirection (for example, vserver-LB-1), and then click Open.
3. <In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, <http://www.newdomain.com/mysite/maintenance>), and then click OK.
4. <Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

### Configure backup virtual servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can

also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.

You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

### To configure a backup virtual server by using the CLI

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- `<set lb vserver <name> [-backupVserver <string>]`
- `<show lb vserver <name>`

#### Example

““ pre codeblock

```
set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
Done
show lb vserver vserver-LB-1
vserver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
State: DOWN
Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
.
.
.
Backup: vserver-LB-2
.
.
.
Done
““
```

### **To set up a backup virtual server by using the GUI**

1. <Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. <In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.
3. <In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2, and then click OK.
4. <Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.

Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the Disable Primary When Down check box.

## **A typical load balancing scenario**

September 21, 2020

In a load balancing setup, the Citrix ADC appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology

The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 1. LB Configuration Parameter Values

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model

The following tables list the commands used to configure this load balancing setup by using the command line interface.

Task	Command
To enable load balancing	<code>enable feature lb</code>
To create a service named service-HTTP-1	<code>add service service-HTTP-1 10.102.29.5 HTTP 80</code>
To create a service named service-HTTP-2	<code>add service service-HTTP-2 10.102.29.6 HTTP 80</code>
To create a virtual server named vserver-LB-1	<code>add lb vserver vserver-LB-1 HTTP 10.102.29.60 80</code>
To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1	<code>bind lb vserver vserver-LB-1 service-HTTP-1</code>
To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1	<code>bind lb vserver vserver-LB-1 service-HTTP-2</code>

Table 2. Initial Configuration Tasks

For more information about the initial configuration tasks, see [Setting Up Basic Load Balancing](#).

Task	Command
To view the properties of a virtual server named vserver-LB-1	<code>show lb vserver vserver-LB-1</code>
To view the statistics of a virtual server named vserver-LB-1	<code>stat lb vserver vserver-LB-1</code>
To view the properties of a service named service-HTTP-1	<code>show service service-HTTP-1</code>
To view the statistics of a service named service-HTTP-1	<code>stat service service-HTTP-1</code>
To view the bindings of a service named service-HTTP-1	<code>show service bindings service-HTTP-1</code>

Table 3. Verification Tasks

Task	Command
To configure persistence on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2</code>
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT</code>
To configure URLPassive persistence on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -persistenceType URLPASSIVE</code>
To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -redirectURL <a href="http://www.newdomain.com/mysite/maintenance">http://www.newdomain.com/mysite/maintenance</a></code>
To set a backup virtual server on a virtual server named vserver-LB-1	<code>set lb vserver vserver-LB-1 -backupVserver vserver-LB-2</code>

Table 4. Customization Tasks

For more information about configuring persistence, see [Choosing and Configuring Persistence Settings](#). For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see [Configuring Features to Protect the Load Balancing Configuration](#).

## Accelerate load balanced traffic by using compression

September 21, 2020

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the Citrix ADC appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

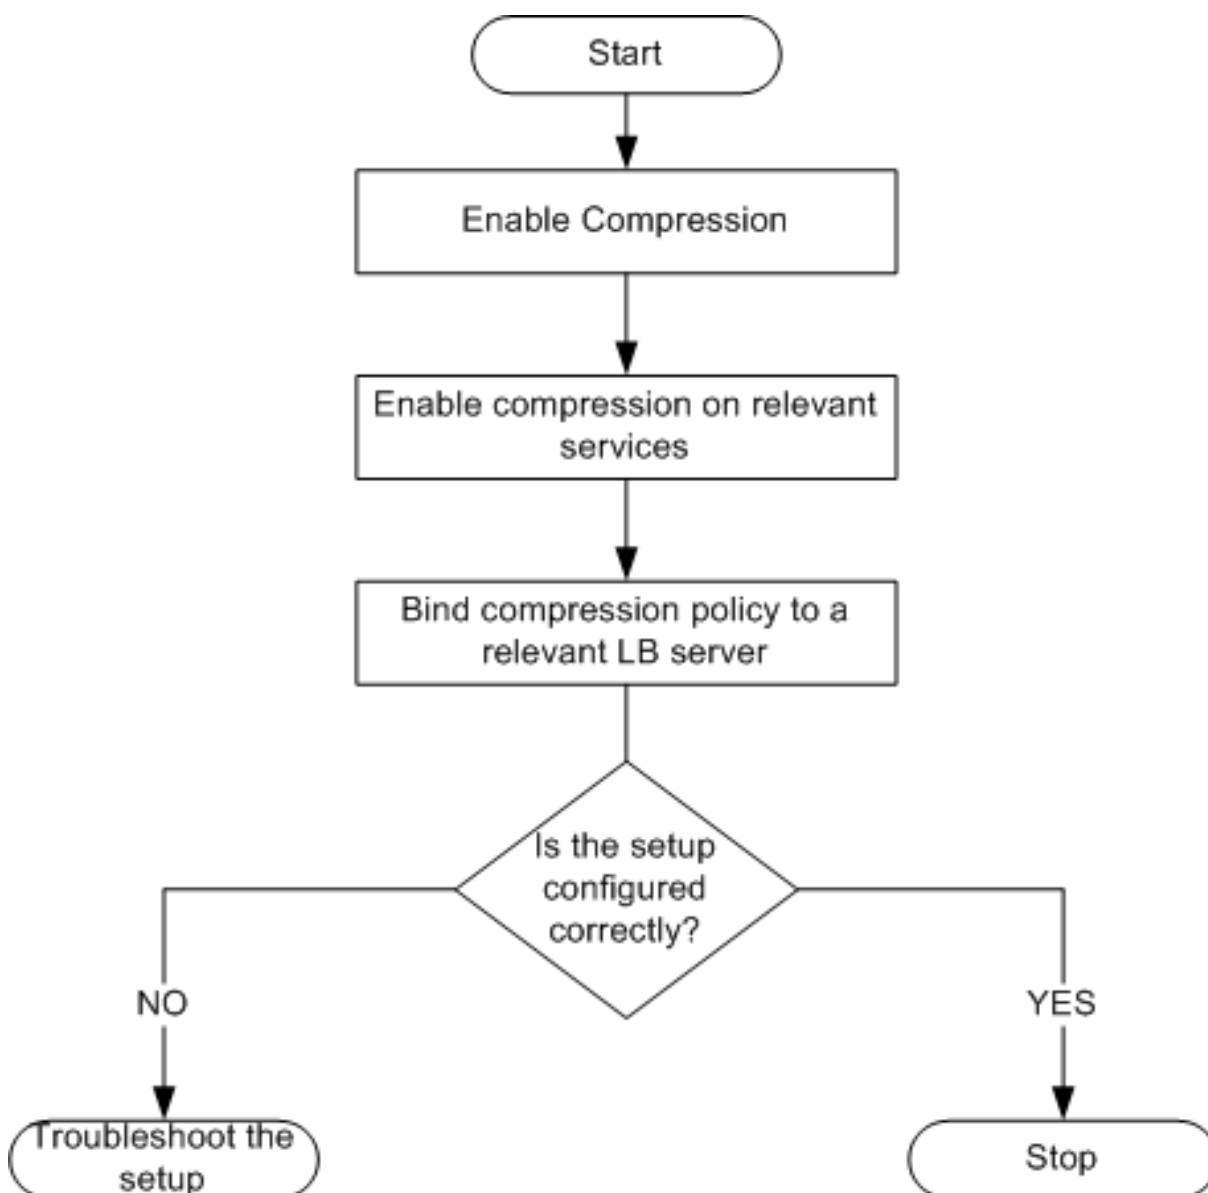

Citrix ADC compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the policies to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

### Compression configuration task sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression

Note: The steps in the above figure assume that load balancing has already been configured.

### Enable compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

#### To enable compression by using the CLI

At the command prompt, type the following commands to enable compression and verify the configuration:

- enable ns feature CMP
- show ns feature

```
1 > enable ns feature CMP
2
3
4
5
6 Done

**To enable compression by using the GUI**

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

**Configure services to compress data**

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

**To enable compression on a service by using the CLI**

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- `set service <name> -CMP YES`
- `show service <name>`

```
1 > show service SVC_HTTP1

### To enable compression on a service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the **Details** section at the bottom of the pane.

### Bind a compression policy to a virtual server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see [Configuring and Binding Policies with the Policy Manager](#).

### To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

```
(bind                               unbind) lb vserver <name> -policyName
                                     <string>
```

- 
- show lb vserver <name>

### Example:

```
1      bind lb vserver lbvip -policyName ns_cmp_msapp
2  Done
3  > show lb vserver lbvip
4  lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
5  State: UP
6  Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
7  Time since last state change: 19 days, 04:26:50.470
8  Effective State: UP
9  Client Idle Timeout: 180 sec
10 Down state flush: ENABLED
11 Disable Primary Vserver On Down : DISABLED
12 Port Rewrite : DISABLED
13 No. of Bound Services : 1 (Total) 1 (Active)
14 Configured Method: LEASTCONNECTION
15 Current Method: Round Robin, Reason: Bound service's state changed to
    UP
16 Mode: IP
17 Persistence: NONE
18 Vserver IP and Port insertion: OFF
19 Push: DISABLED Push VServer:
20 Push Multi Clients: NO
21 Push Label Rule:
22
23 Bound Service Groups:
24 1) Group Name: Service-Group-1
25
26 1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP Weight: 1
27
28 1) Policy : ns_cmp_msapp Priority:0
29 Done
30 <!--NeedCopy-->
```

### To bind or unbind a compression policy to a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
  - To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.

- To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

## Secure load balanced traffic by using SSL

October 14, 2020

The Citrix ADC SSL offload feature transparently improves the performance of websites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

For detailed information about SSL offloading, see [SSL offload and acceleration](#).

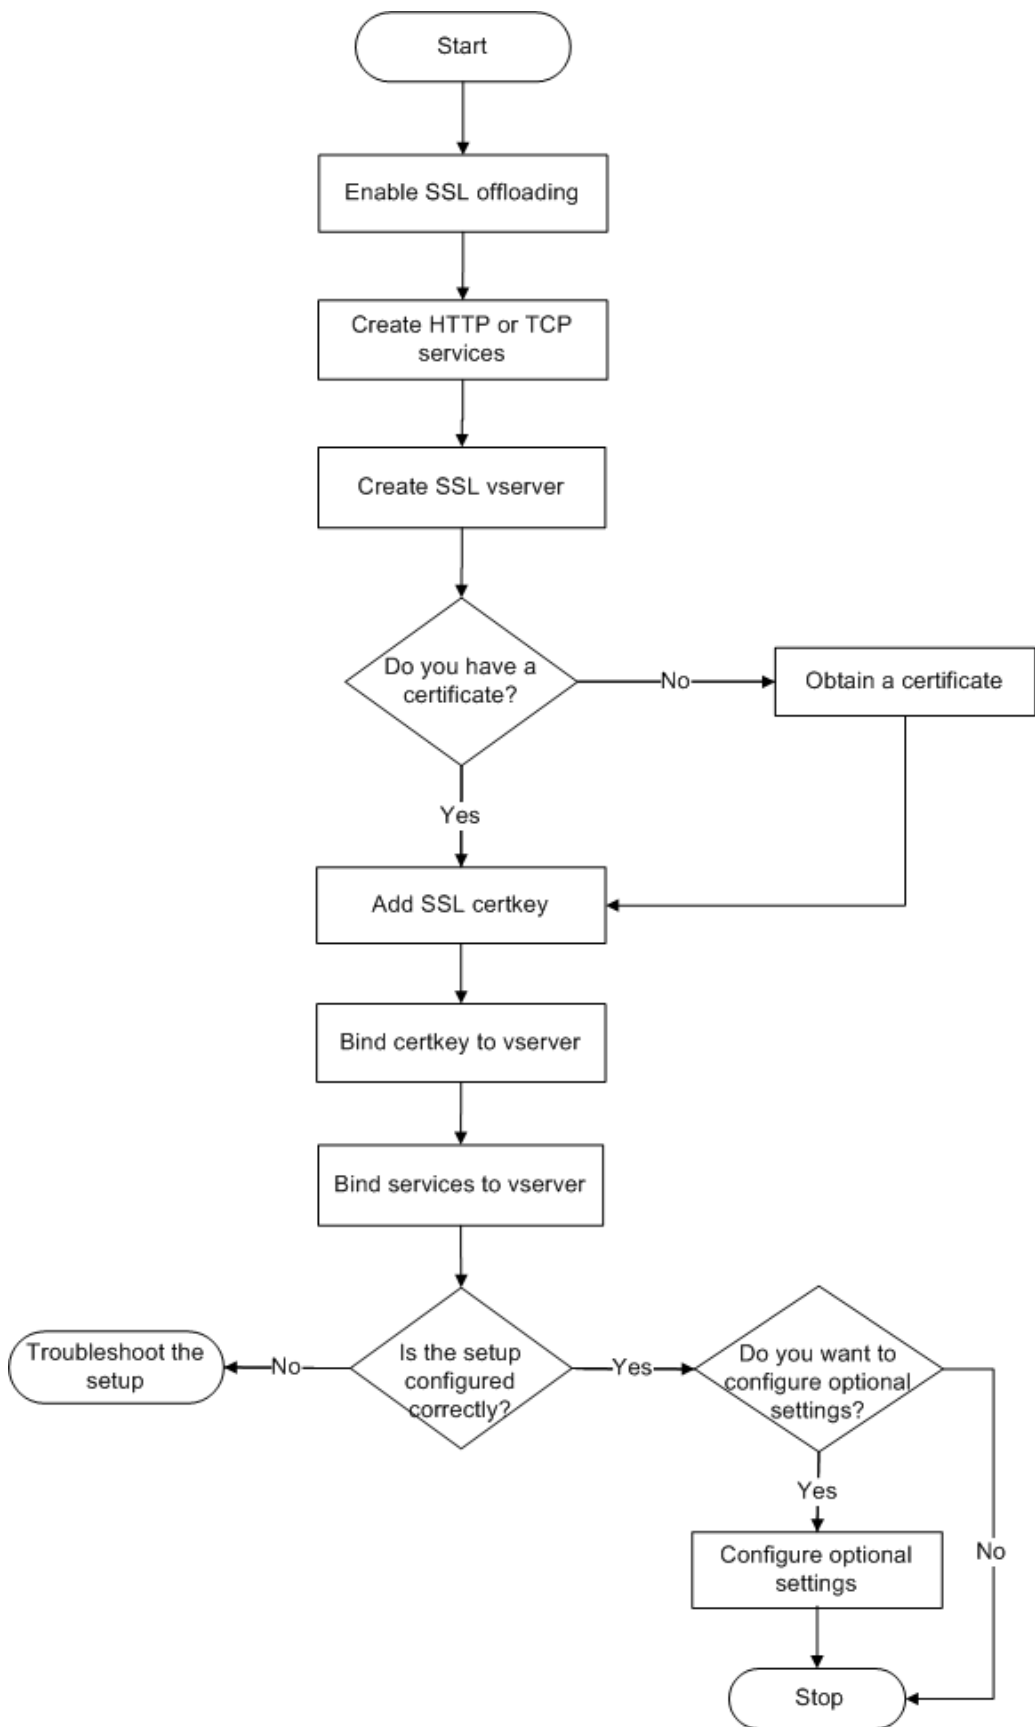

### SSL configuration task sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the Citrix ADC appliance. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the Citrix ADC appliance for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading

## Enable SSL offload

You must enable the SSL feature before configuring SSL offloading. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

### Enable SSL by using the CLI

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- enable ns feature SSL
- show ns feature

```
1 > enable ns feature ssl
2
3
4
5
6 Done
7
8
9 > show ns feature

28
29
30 10) Global Server Load Balancing GSLB ON . .
31
32
```

```
33 Done >
34 <!--NeedCopy-->
```

### Enable SSL by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. Select the **SSL Offloading** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message box, click **Yes**.

### Create HTTP services

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

### Add an HTTP service by using the CLI

At the command prompt, type the following commands to add an HTTP service and verify the configuration:

```
1 - add service <name> (<IP> | <serverName>) <serviceType> <port>
2 - show service <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > add service SVC_HTTP1 10.102.29.18 HTTP 80
2
3
4 Done
5
6
7 > show service SVC_HTTP1
8
9
10 SVC_HTTP1 (10.102.29.18:80) - HTTP
11
12
13 State: UP
```

```

### Add an HTTP service by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Services**.
2. In the details pane, click **Add**.
3. In the **Create Service** dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC\_HTTP1, 10.102.29.18, and 80).
4. In the **Protocol** list, select the type of the service (for example, HTTP).
5. Click **Create**, and then click **Close**. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

## Add an SSL based virtual server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

### Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

```
1 - add lb vserver <name> <serviceType> [<IPAddress> <port>]
2 - show lb vserver <name>
3 <!--NeedCopy-->
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

### Example:

```
1 > add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
2
3
4
5
6 Done
7
8
9 > show lb vserver vserver-SSL-1
10
11
12 vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS
13
14
15 State: DOWN[Certkey not bound] Last state change was at Tue Jun 16
    06:33:08 2009 (+176 ms)

40
41
42   Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule:
    Done
43 <!--NeedCopy-->
```

### Add an SSL-based virtual server by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. In the details pane, click **Add**.
3. In the **Create Virtual Server (SSL Offload)** dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the **Protocol** list, select the type of the virtual server, for example, SSL.
5. Click **Create**, and then click **Close**.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

## Bind services to the SSL virtual server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see [\[sSSL offload and acceleration\]](#).

## Bind a service to a virtual server by using the CLI

At the command prompt, type the following commands to bind a service to the SSL virtual server and verify the configuration:

```
1 - bind lb vserver <name> <serviceName>
2 - show lb vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > bind lb vserver vserver-SSL-1 SVC_HTTP1
2
3
4
5
6 Done
7
8
9 > show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) -
  SSL Type:
10
11

43
44
45 State: DOWN Weight: 1
46
47
48 Done
49 <!--NeedCopy-->
```

### Bind a service to a virtual server by using the GUI

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. In the details pane, select a virtual server, and then click **Open**.
3. On the **Services** tab, in the **Active** column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click **OK**.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

## Add a certificate key pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during the SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the Citrix ADC appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

**Note:** Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

### Add a certificate key pair by using the CLI

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

```
1 - add ssl certKey <certkeyName> -cert <string> [-key <string>]
2 - show sslcertkey <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
2 Done
3
4
5 > show sslcertkey CertKey-SSL-1
6
7
8 Name: CertKey-SSL-1 Status: Valid,
9
10
11 Days to expiration:4811 Version: 3
12
13
14 Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer:

25
26    Algorithm: rsaEncryption Public Key
27
28
29    size: 1024
30
31
32    Done
33 <!--NeedCopy-->
```

### Add a certificate key pair by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL > Certificates**.
2. In the details pane, click **Add**.
3. In the **Install Certificate** dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under **Details**, in **Certificate File Name**, click **Browse (Appliance)** to locate the certificate. Both the certificate and the key are stored in the `/nsconfig/ssl/` folder on the appliance. To use a certificate present on the local system, select **Local**.
5. Select the certificate you want to use, and then click **Select**.
6. In **Private Key File Name**, click **Browse (Appliance)** to locate the private key file. To use a private key present on the local system, select **Local**.
7. Select the key you want to use and click **Select**. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.
8. Click **Install**.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

### Bind an SSL certificate key pair to the virtual server

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance.

SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

### **Bind an SSL certificate key pair to a virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

```
1 - bind ssl vserver <vServerName> -certkeyName <string>
2 - show ssl vserver <name>
3 <!--NeedCopy-->
```

### **Example:**

```
1 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
2
3
4
5
6 Done
7
8
9 > show ssl vserver Vserver-SSL-1

### Bind an SSL certificate key pair to a virtual server by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, on the **SSL Settings** tab, under **Available**, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click **Add**.

4. Click **OK**.
5. Verify that the certificate key pair that you selected appears in the Configured area.

### Configure support for Outlook web access

If you use Outlook Web Access (OWA) servers on your Citrix ADC appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as `https://` instead of `http://`.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

### Create an SSL action to enable OWA support

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

### Create an SSL action to enable OWA support by using the CLI

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

```
1 - add ssl action <name> -OWASupport ENABLED
2 - show SSL action <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > add ssl action Action-SSL-OWA -OWASupport enabled
2
3
4
5
6 Done
7
8
9 > show SSL action Action-SSL-OWA
10
```

```
11
12     Name: Action-SSL-OWA
13
14
15     Data Insertion Action: OWA
16
17
18     Support: ENABLED
19
20
21     Done
22 <!--NeedCopy-->
```

### Create an SSL action to enable OWA support by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL > Policies**.
2. In the details pane, on the **Actions** tab, click **Add**.
3. In the **Create SSL Action** dialog box, in the **Name** text box, type `Action-SSL-OWA`.
4. Under Outlook Web Access, select **Enabled**.
5. Click **Create**, and then click **Close**.
6. Verify that Action-SSL-OWA appears in the **SSL Actions** page.

### Create SSL policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

### Create an SSL policy by using the CLI

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

```
1 - add ssl policy <name> -rule <expression> -reqAction <string>
2 - show ssl policy <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
2
```

```
3 Done
4
5 > show ssl policy Policy-SSL-1
6
7 Name: Policy-SSL-1 Rule: ns_true
8
9 Action: Action-SSL-OWA Hits: 0
10
11 Policy is bound to following entities
12
13 1) PRIORITY : 0
14
15 Done
16 <!--NeedCopy-->
```

### Create an SSL policy by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL > Policies**.
2. In the details pane, click **Add**.
3. In the **Create SSL Policy** dialog box, in the **Name** text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In **Request Action**, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The `ns_true` general expression applies the policy to all successful SSL handshake traffic. However, if you must filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see [SSL actions and policies](#).
5. In **Named Expressions**, choose the built-in general expression `ns_true` and click **Add Expression**. The expression `ns_true` now appears in the Expression text box.
6. Click **Create**, and then click **Close**.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

### Bind the SSL policy to the SSL virtual server

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

**Bind an SSL policy to an SSL virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

```
1 - bind ssl vserver <vServerName> -policyName <string>
2 - show ssl vserver <name>
3 <!--NeedCopy-->
```

**Example:**

```
1 > bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
2
3 Done
4
5 > show ssl vserver Vserver-SSL-1
6
7 Advanced SSL configuration for VServer Vserver-SSL-1:
8
9 DH: DISABLED
10
11 Ephemeral RSA: ENABLED
12
13 Refresh Count: 0
14
15 Session Reuse: ENABLED
16
17 Timeout: 120 seconds
18
19 Cipher Redirect: ENABLED
20
21 SSLv2 Redirect: ENABLED
22
23 ClearText Port: 0
24

## Bind an SSL policy to an SSL virtual server by using the GUI

Follow these steps:

1. Navigate to **Traffic Management > SSL Offload > Virtual Servers**.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click **Open**.
3. In the Configure Virtual Server (SSL Offload) dialog box, click **Insert Policy**, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click **OK**.

## Features at a glance

September 21, 2020

Citrix ADC features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous Citrix ADC features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see [Processing Order of Features](#) section.

## Application switching and traffic management features

September 21, 2020

Below are the application switching and traffic management features.

### SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render

many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see [SSL offload and acceleration](#).

## Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the Citrix ADC appliance to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. An ADC appliance does not compare incoming packets to disabled ACLs.

For more information, see [Access Control List](#).

## Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the Citrix ADC appliance can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the ADC appliance can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.

To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through Citrix ADC appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see [Load Balancing](#).

## Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single Citrix ADC appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic,

within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an address is not duplicated within the same domain.

For more information, see [Traffic Domains](#).

## Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the Citrix ADC appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the Citrix ADC appliance.

The Citrix ADC appliance supports the following types of network address translation:

**INAT:** In Inbound NAT (INAT), an IP address (usually public) configured on the Citrix ADC appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the ADC replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the Citrix ADC appliance and the IP address of the server.

**RNAT:** In Reverse Network Address Translation (RNAT), for a session initiated by a server, the Citrix ADC appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

**Stateless NAT46 Translation:** Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the Citrix ADC appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

**Stateful NAT64 Translation:** The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the Citrix ADC appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see [Configuring Network Address Translation](#).

## **Multipath TCP Support**

Citrix ADC appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

For more information, see [MPTCP \(Multi-Path TCP\)](#).

## **Content Switching**

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see [Content Switching](#).

## **Global Server Load Balancing (GSLB)**

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see [Global Server Load Balancing](#).

## **Dynamic Routing**

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see [Configuring Dynamic Routes](#).

## Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

<sup>1</sup> For more information, see [\[Link Load Balancing\] \(/en-us/citrix-adc/12-1/link-load-balancing.html\)](/en-us/citrix-adc/12-1/link-load-balancing.html).

## TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)— Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling— Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see [Configuring TCP Profiles](#).

## CloudBridge Connector

The Citrix NetScaler CloudBridge

Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more Citrix ADC appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a Citrix ADC appliance or NetScaler virtual appliance on a cloud instance to a Citrix ADC appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over

another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see [CloudBridge](#).

## **DataStream**

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the Citrix ADC appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see [DataStream](#).

## **Application acceleration features**

September 21, 2020

- AppCompress

Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

- Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin

servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the Citrix ADC appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see “[Cache Redirection](#).”

- AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see “[Integrated Caching](#).”

- TCP Buffering

Buffers the server’s response and delivers it to the client at the client’s speed, thus offloading the server faster and thereby improving the performance of web sites.

## Application security and firewall features

September 21, 2020

Below are the security and firewall features.

### Denial of service (DoS) attack defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The Citrix ADC appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see [HTTP Denial-of-Service Protection](#).

## **Content Filtering**

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see [Content Filtering](#).

## **Responder**

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see [Responder](#).

## **Rewrite**

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.

When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see [Rewrite](#).

## Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see [Priority Queuing](#).

## Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see [Surge Protection](#).

## Citrix Gateway

1 Citrix Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data **while** allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized **for** roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's **mobile workforce**.

For more information, see [Citrix Gateway](#).

## Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see [Application Firewall](#).

## Application visibility feature

September 21, 2020

- NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.

HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird's eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

- Enhanced Application Visibility Using AppFlow

The Citrix ADC appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL\_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see [“AppFlow.”](#)

- Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery

of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the Citrix ADC appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single Citrix ADC appliance and collects run-time statistics on the basis of criteria that you define. When used with Citrix ADC policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see “[Action Analytics](#).”

## Citrix ADC Solutions

September 21, 2020

Citrix ADC solutions simplify the task of setting up frequently deployed configurations. Check this space from time to time for additional solutions.

This section includes the following solutions

- [Setting up Citrix ADC for Citrix Virtual Apps and Desktops](#)
- [Global Server Load Balancing \(GSLB\) Powered Zone Preference](#)
- [Anycast support in Citrix ADC](#)
- [NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI](#)

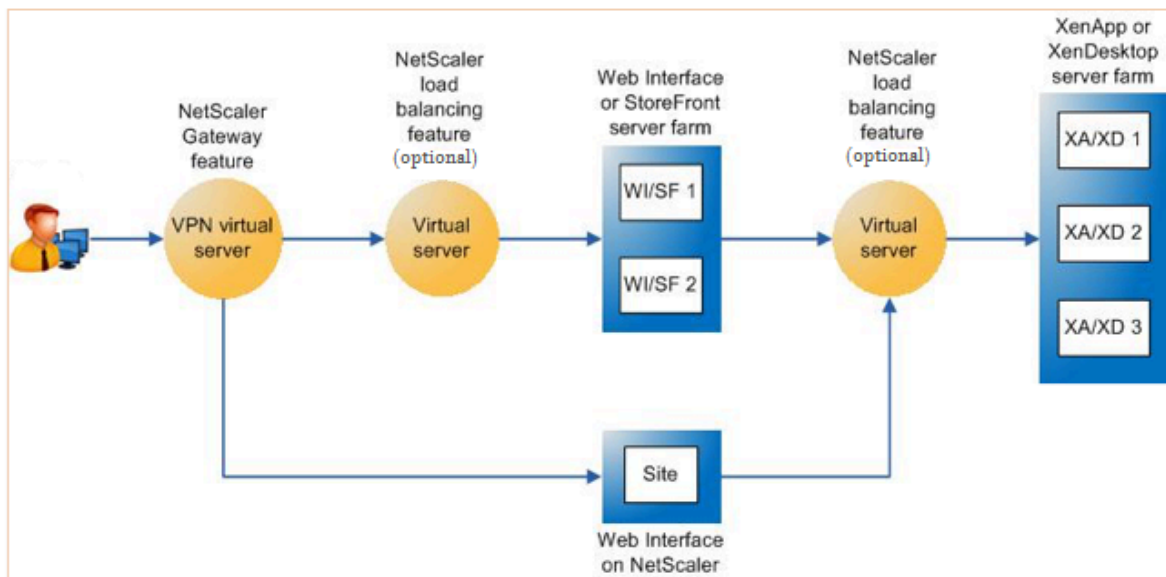

## Setting up Citrix ADC for Citrix Virtual Apps and Desktops

September 21, 2020

A Citrix ADC appliance can provide load balanced, secure remote access to your Citrix Virtual Apps and Desktops applications. You can use the Citrix ADC load balancing feature to distribute traffic across the Citrix Virtual Apps and Desktops server, and the Citrix Gateway feature to provide secure remote access to the servers. Citrix ADC can also accelerate and optimize the traffic flow and offer visibility features that are useful for Citrix Virtual Apps and Desktops deployments.

Figure 1. Citrix ADC appliance in Citrix Virtual Apps and Desktops setup

The above figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.
- **Citrix ADC load balancing virtual server.** Load balances the traffic for the Web Interface or StoreFront servers. You can also deploy a load balancing virtual server in front of the Citrix Virtual Apps and Desktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.
- **Web Interface or StoreFront or Web Interface on Citrix ADC.** Provides the interface through which you can access the applications.

Note: Web Interface on Citrix ADC (WIonNS) is a customization of the Web Interface product, hosted on the Citrix ADC appliance.

- **Citrix Virtual Apps and Desktops.** Provides the applications that your users want to access.

To set up the Citrix ADC for Citrix Virtual Apps and Desktops by using the Citrix ADC GUI

## Prerequisites

- Citrix Virtual Apps and Desktop servers are configured and available.
- Web Interface, StoreFront, or Web Interface on Citrix ADC servers are configured and available.
- You have a working knowledge of Citrix Gateway, Citrix ADC, Citrix Virtual Apps and Desktops, and StoreFront/Web Interface/Web Interface on Citrix ADC.
- Make sure that you have configured a virtual server and a service and bound the service to the virtual server. For more information, see:
  - [Load balance XenDesktops](#)
  - [Load balance XenApps](#)

## Procedure:

1. Log on to the Citrix ADC appliance and on the **Configuration** tab click **XenApp and XenDesktop**.
2. On the **Details** pane, click **Get Started**. If the setup exists on the Citrix ADC, click the **Edit** link corresponding to each of the section that you want to modify.
3. Select the product (StoreFront, Web Interface, or Web Interface on Citrix ADC) that in your deployment provides the interface for access to the Citrix Virtual Apps and Desktops applications.
4. Set up secure remote access.
  - a) In the **NetScaler Gateway Settings** section, specify the details for the VPN virtual server and click **Continue**.
  - b) In the **Server Certificate** section, choose an existing certificate or install a new certificate and click **Continue**.
  - c) In the **Authentication** section, configure the primary authentication mechanism to be used and specify the server details or use an existing server and click **Continue**.
  - d) In the **StoreFront** section, specify the details of the server that provides the interface for accessing the applications and click **Continue**.
  - e) You can use one of the following as your StoreFront server.
    - i. LB vserver pointing to multiple SF servers.
    - ii. Web Interface or StoreFront server directly reachable from the Citrix ADC appliance.
    - iii. Web Interface on Citrix ADC.
5. Click **Done** to complete the configuration.

## Global Server Load Balancing (GSLB) Powered Zone Preference

September 21, 2020

GSLB powered zone preference is a feature that integrates Citrix Virtual Apps and Desktops, StoreFront, and Citrix ADC to provide clients access to the most optimized data center on the basis of the client location.

In a distributed Citrix Virtual Apps and Desktops deployment, StoreFront might not select an optimal datacenter when multiple equivalent resources are available from multiple datacenters. In such cases, StoreFront randomly selects a datacenter. It can send the request to any of the Citrix Virtual Apps and Desktops servers in any datacenter, regardless of proximity to the client making the request.

With this enhancement, the client IP address is examined when an HTTP request arrives at the Citrix Gateway appliance, and the real client IP address is used to create the datacenter preference list that is forwarded to StoreFront. If the Citrix ADC appliance is configured to insert the zone preference header, StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers and connect to an optimal delivery controller in the same zone as the client. StoreFront selects the optimal gateway VPN virtual server for the selected datacenter zone, adds this information to the ICA file with appropriate IP addresses, and sends it to the client. Storefront then tries to launch applications hosted on the preferred datacenter's delivery controllers before trying to contact equivalent controllers in other datacenters.

For more information about configuring this solution, click [here](#).

For a video overview about GSLB powered zone preference solution, click <https://www.youtube.com/watch?v=Y8DELum0Xp0>.

## **Anycast support in Citrix ADC**

September 21, 2020

Anycast is a type of network where a set of servers shares the same IP address. The client request is directed to the topographically closest server based on their routing tables. This routing reduces latency issues, ensures high availability, and minimizes downtime.

Citrix ADC supports anycast network with Global Server Load Balancing (GSLB) and DNS features.

The following diagram illustrates a topology diagram of Anycast in Citrix ADC.

## Anycast GSLB

The Citrix ADC GSLB feature provides load balancing across globally distributed sites along with disaster recovery and ensures continuous availability of applications.

During an outage, GSLB provides immediate disaster recovery by routing traffic to the closest or the best performing data center. However, GSLB cannot control the following:

- How the DNS traffic is routed to GSLB nodes located in different geographical locations.
- How much latency is getting added while DNS queries get routed to GSLB nodes.

In a typical GSLB setup, each data center has a GSLB node configured with the site-specific Authoritative Domain Name Server (ADNS) to receive DNS queries. Each site's ADNS is configured as the nameserver in the DNS resolver. As the number of GSLB nodes increases, the number of nameserver records also increase. In such cases, if there is a failure of a datacenter, LDNS has to retry resolution with a different nameserver which would add to the latency in DNS resolution.

Also, every time a GSLB node is added, the nameserver records must be updated.

To overcome these drawbacks, you can use Anycast ADNS. In Anycast ADNS, a single ADNS IP address is used for all GSLB nodes and the DNS traffic is routed to GSLB nodes using dynamic routing.

For example if a GSLB site is DOWN, the routing table is updated and route to this site is removed. Hence, the DNS queries are not sent to the sites that are DOWN. As a result, there are no retries.

Also, if a new GSLB node is added, the new node is assigned the same ADNS IP address. The dynamic routing automatically updates the routing tables with routes to new sites based on the routing algorithms. Hence, you do not have to update the DNS name server records. The rollout of new GSLB sites is made simpler and faster with Anycast.

### How to configure ADNS IP address in an anycast mode

You must enable host routing on the ADNS IP in Citrix ADC and set the appropriate Route Health Injection (RHI) level. Mostly, there would not be any virtual servers on the ADNS IP and therefore RHI level must be selected as NONE. Enabling host route on the ADNS IP makes it a kernel route. You can then enable the dynamic routing of choice and configure the routing protocol to redistribute the kernel routes.

### ADNS IP configuration – Example

At the command prompt, type;

```
1 add service adns_public 5.5.5.5 ADNS 53
2
3 set ip 5.5.5.5 -hostRoute ENABLED -vserverRHILevel ALL_VSERVERS
4 <!--NeedCopy-->
```

### BGP configuration in GSLB site – Example

```
1 Site1#sh run
2 !
3 hostname Site1
4 !
5 log syslog
6 log record-priority
7 !
8 ns route-install bgp
9 !
10 interface lo0
11 ip address 127.0.0.1/8
12 ipv6 address fe80::1/64
13 ipv6 address ::1/128
14 !
15 interface vlan0
16 ip address 10.102.148.94/25
```

```

17  ipv6 address fe80::e84c:f4ff:fe74:4588/64
18  !
19  interface vlan2
20  ip address 172.18.30.15/24
21  !
22  router bgp 5
23  redistribute kernel -----> redistributing the kernel routes
24  neighbor 172.18.30.30 remote-as 4
25  neighbor 172.18.30.30 advertisement-interval 1
26  neighbor 172.18.30.30 timers 4 16
27  !
28  End
29
30  Site1#
31  <!--NeedCopy-->

```

### GSLB site routing table - Example

```

1  Site1#sh ip route
2  Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
3          O - OSPF, IA - OSPF inter area
4          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
5          E1 - OSPF external type 1, E2 - OSPF external type 2
6          i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2
7          ia - IS-IS inter area, I - Intranet
8          * - candidate default
9
10 K       5.5.5.5/32 via 0.0.0.0 ----->
        Kernel Route for ADNS
11 C       10.102.148.0/25 is directly connected, vlan0
12 C       127.0.0.0/8 is directly connected, lo0
13 B       172.18.10.0/24 [20/0] via 172.18.30.30, vlan2, 01w5d22h

```

## Anycast DNS

You can use Anycast DNS for DNS proxy virtual servers on Citrix ADC. When there are multiple DNS name servers configured, the DNS resolver responds based on round robin method. For example, if the resolver does not receive any response from the first server, it switches to the second server after the configured timeout value expires and so on. The switching from first server to second server adds to the latency in DNS resolution. If the DNS resolvers are configured with Anycast, then this latency can be eliminated.

### DNS configuration – Example

At the command prompt, type;

```
1 add lb vserver dns DNS 5.5.5.50 53
2
3 set ip 5.5.5.50 -hostRoute ENABLED -vserverRHILevel ALL_VSERVERS
4 <!--NeedCopy-->
```

## Citrix ADC in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

September 21, 2020

You can use a Citrix ADC appliance for load balancing in a private cloud that is managed through Microsoft Windows Azure Pack. The network for the private cloud is automated by using Cisco ACI and Citrix ADC.

This solution involves many integration points, such as Windows Azure Pack (WAP) to Cisco APIC, Cisco APIC to System Center Virtual Machine Manager (SCVMM), and Cisco APIC to Citrix ADC. As a tenant in the private cloud, you can enable NAT, provision network services, and add a load balancer.

WAP supports tenant and administrator portals where an administrator can perform administrative tasks such as ACI registration, VIP range, Citrix ADC device association with virtual machine cloud, tenant user account creation, and so on. Tenants can log on to the WAP Tenant Portal and configure the network, bridge domains, and Virtual Routing and Forwarding (VRFs), and make use of the Citrix ADC load balancing and RNAT features.

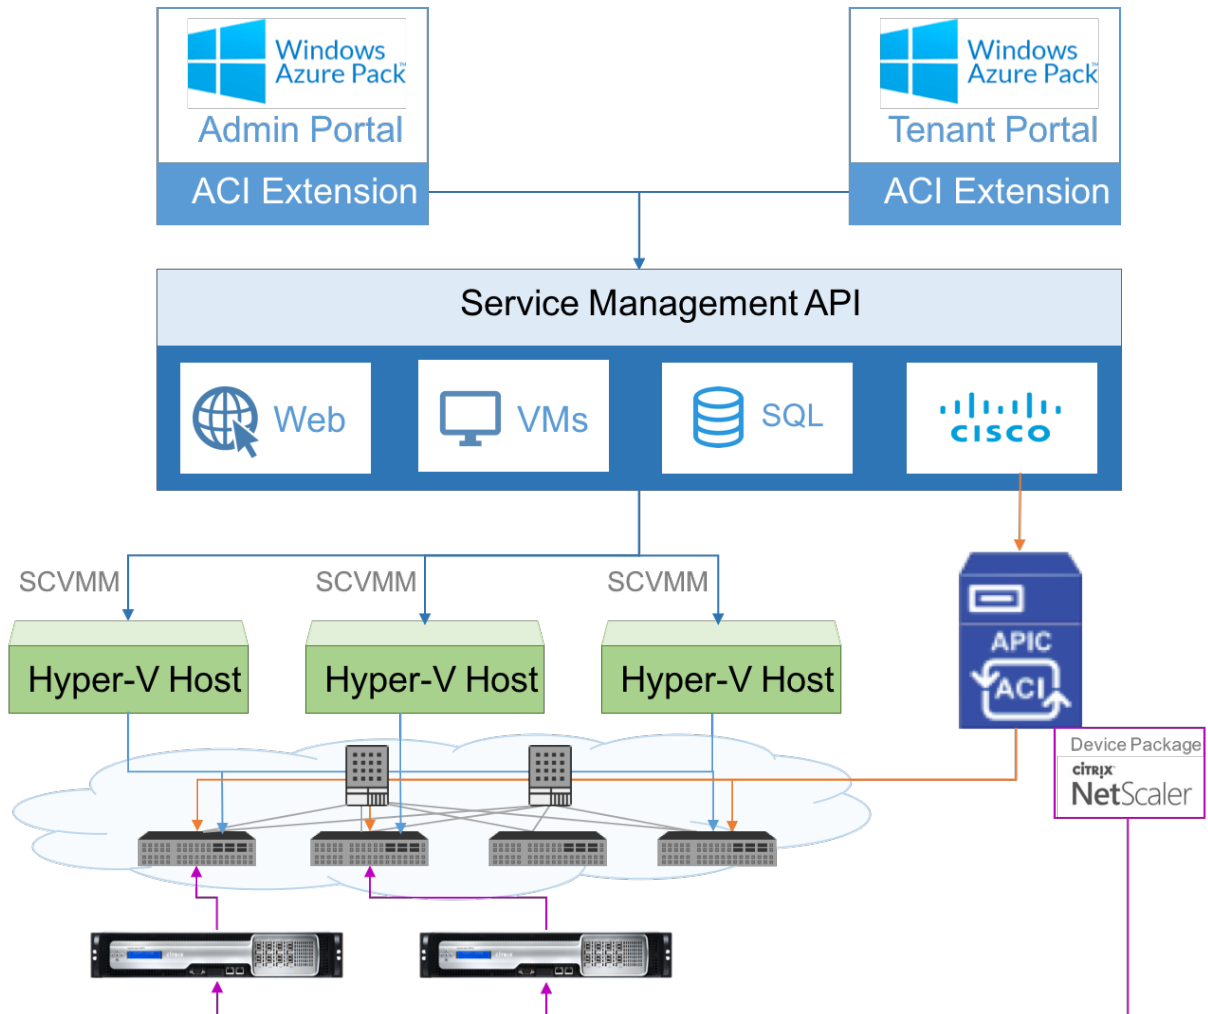

### Important

- In this solution, the Citrix ADC appliance provides only basic load balancing.
- Tenants can deploy multiple VIP addresses with different ports for the same network, but

must ensure that the IP and port combination is unique.

- The Citrix ADC device package supports only single-context deployment. Each Tenant gets a dedicated Citrix ADC instance.
- WAP supports Citrix ADC MPX appliances and Citrix ADC VPX virtual appliances, including Citrix ADC VPX instances deployed on the Citrix ADC SDX platform.

The following illustration provides an overview of the solution:

## Prerequisites

Make sure that:

- You have conceptual knowledge of Cisco ACI components and Citrix ADCs.
  - For more information about Cisco ACI and its components, see the product documentation at: <http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html>.

- For more information about the Citrix ADCs, see the Citrix ADC product documentation at <http://docs.citrix.com/>.
- All the required components of Cisco ACI, including Cisco APIC in the datacenter, are set up and configured. For more information about Cisco ACI and its components, see the product documentation at: <http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html>.
- You know how to integrate Cisco ACI with Microsoft Windows Azure Pack. See the product documentation at: [http://www.cisco.com/c/en/us/td/docs/switches/datacenter/aci/apic/sw/2-x/virtualization/b\\_ACI\\_Virtualization\\_Guide\\_2\\_2\\_1.html](http://www.cisco.com/c/en/us/td/docs/switches/datacenter/aci/apic/sw/2-x/virtualization/b_ACI_Virtualization_Guide_2_2_1.html).
- You have conceptual knowledge of Microsoft Windows Azure Pack. See the product documentation at: <https://www.microsoft.com/en-in/cloud-platform/windows-azure-pack>.
- You have installed Citrix ADC software release 11.1 or later.
- You configure Citrix ADCs in Cisco ACI, so that they can be managed by using Cisco APIC.
- From Cisco APIC, make sure that:
  - Management connectivity of Cisco APIC to Citrix ADC are established.
  - You upload the Citrix ADC device package version 11.1-52.3 and register the Citrix ADC device in Cisco ACI by using Cisco APIC.
  - You configure the Citrix ADC appliance in Cisco APIC's common tenant and make sure that there are no faults in Cisco APIC.
  - You have configured all the APIC specific configurations such as, VLAN pool, L3OutServicesDom, L3ExtOut, resource pool, and so on. For more information, see *Cisco documentation*.

## Creating a Citrix ADC Load Balancer in a Plan in the Service Management Portal (Admin Portal)

September 21, 2020

The Service Management Portal in WAP allows an administrator to register Cisco APIC with WAP and also create a hosting plan. As part of the plan, you can specify the VIP range, associate the Citrix ADC load balancer with the plan, create tenant user accounts, and so on.

### To create a Citrix ADC Load Balancer in a Plan in the Admin Portal:

1. Log in to the Service Management Portal (Admin Portal).
2. In the Navigation pane, select **PLANS**.

Service Management Portal | APIC\Administrator

## plans

PLANS ADD-ONS SUBSCRIPTIONS

NAME	STATUS	STATE	POPULARITY	SUBSCRIPTIONS	PLAN IDENTI...
MyPlan_1	Private	Configured	1	2	MyPlaixvt56x
MyPlan_2	Private	Configured	2	1	MyPlaixm0rc7h
name1	Private	Configured	3	0	nameixq2zrsa

NEW CHANGE ACCESS CLONE DELETE

3. In the plans pane, select the plan that you want to add a load balancer.

4. In the selected plan's pane, select **Networking (ACI)**.

5. On the **Networking (ACI)** pane, in the **L4-L7 SERVICE POOL** drop-down list, select the L4-L7 resource pool that you had created in Cisco APIC.

The screenshot shows the Service Management Portal interface. The top navigation bar includes 'Service Management Portal' and the user 'APIC\Administrator'. The left sidebar contains various icons, with 'Networking (ACI)' selected. The main content area displays the configuration for a 'basic' tenant. Key fields include:

- VMM MANAGEMENT SERVER: INFRAV-SCVMM
- VIRTUAL MACHINE CLOUD: SCVMM1
- PLAN TYPE: Virtual Private Cloud
- L4-L7 SERVICES POOL: mininet\_resource\_pool (highlighted with a red box)
- MAXIMUM EPG ALLOWED PER TENANT: 200
- MAXIMUM BD ALLOWED PER TENANT: 200

6. Create a tenant user account and associate the user with the plan you have created.

## Configuring a Citrix ADC Load Balancer by Using the Service Management Portal (Tenant Portal)

September 21, 2020

In WAP, once the Tenant creates the Bridge Domain (BD), VRF, and a Network, the Tenant can configure Citrix ADC Load Balancer through the Service Management Portal (Tenant Portal).

To configure Citrix ADC Load Balancer in Service Management Portal (Tenant Portal)

1. Log on to the Service Management Portal (Tenant Portal).
2. Create a bridge domain and VRF, as follows:
  - a. In the navigation pane, select **ACI**.
  - b. Click **NEW**.
  - c. In the **NEW** pane, select **BRIDGE DOMAIN**.

d. In the **BRIDGE DOMAIN** field, enter the bridge domain name (for example, BD01).

e. (Optional) In the **SUBNET'S GATEWAY** field, enter the subnet's gateway (for example, 192.168.1.1/24).

f. In the **VRF** field, select a VRF that is already part of the subscription or select **Create One** to create a VRF.

g. Click **CREATE**.

3. Create a network and associate it with the bridge domain that you created. Do the following:

a. In the navigation pane, select **ACI**.

b. Click **NEW**.

c. In the **NEW** pane, select **NETWORK**.

The screenshot shows the Citrix ADC configuration interface for creating a new network. The interface is dark-themed and includes a sidebar on the left with navigation options: VIRTUAL MACHINE ROLE, STANDALONE VIRTUAL MACHINE, VIRTUAL NETWORK, MY ACCOUNT, and ACI. The main area is divided into two columns of icons: BRIDGE DOMAIN, NETWORK, FIREWALL, LOAD BALANCER, and SHARED SERVICE. The 'NETWORK' option is selected. The main form contains the following fields:

- NETWORK NAME:** EPG2
- BRIDGE DOMAIN:** BD1 (selected from a drop-down list)
- SUBNET'S GATEWAY (I.E. 172.23.2.1/24):** 100.1.1.1/24
- DNS SERVER IP/IPS (I.E. 172.23.2.1,172.23.2.2):** (empty)

A 'CREATE' button with a checkmark is located at the bottom right of the form.

d. In the **NETWORK NAME** field, enter the network name (for example, S01).

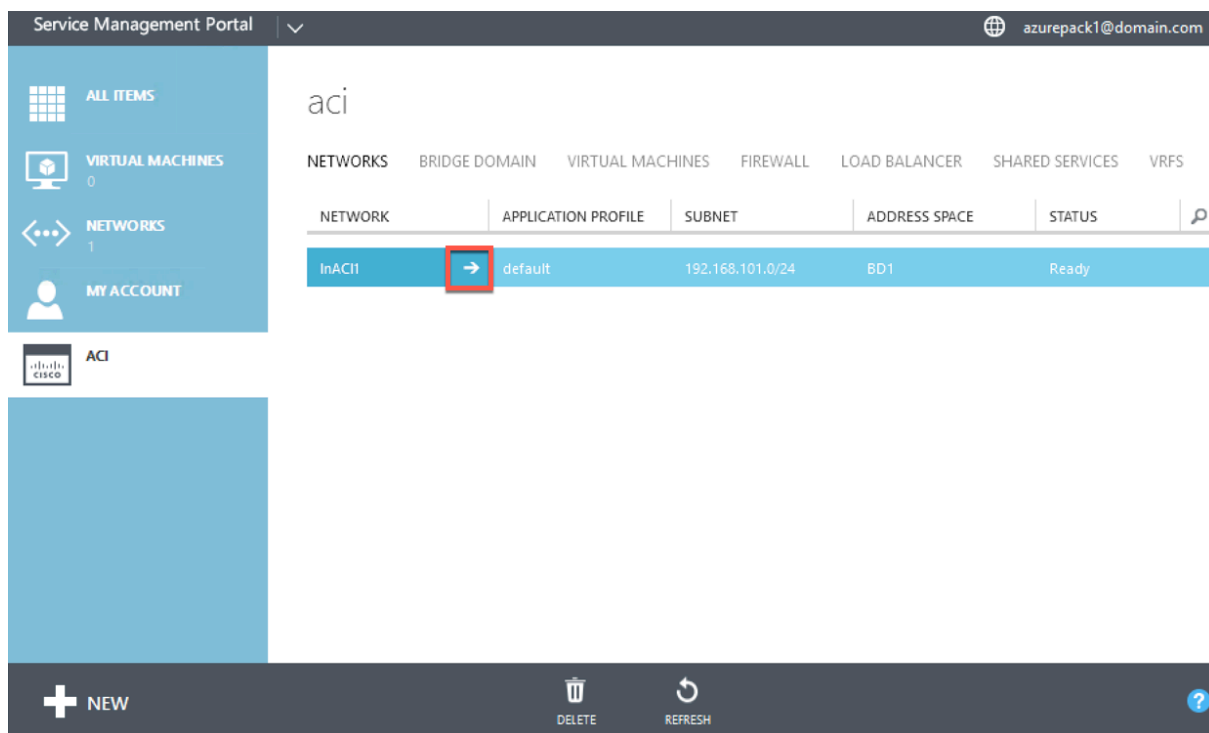

e. In the **BRIDGE DOMAIN** drop-down list, select the bridge domain you have created. (for example, BD01).

f. In the subnet's **GATEWAY** field, enter the subnet's gateway address (for example, 172.23.2.1/24).

g. (Optional) In the **DNS SERVER IP/IPS** field, enter the DNS server details.

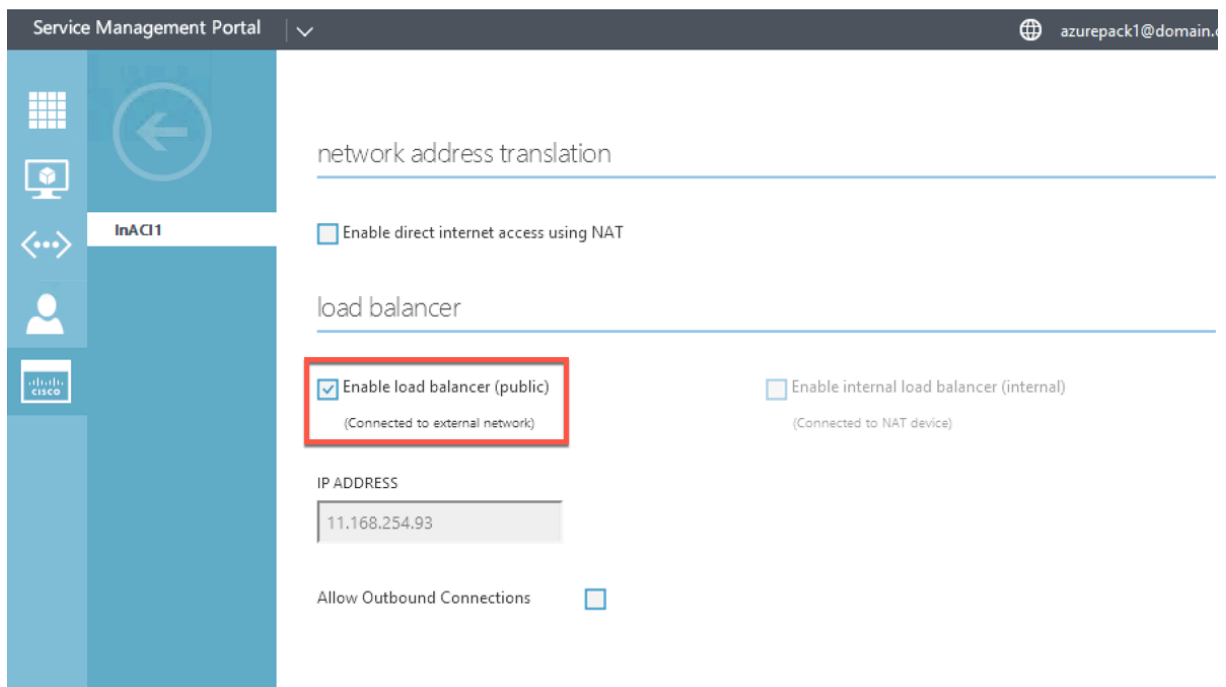

h. Click **CREATE**.

4. In the **ACI** pane, select **NETWORKS**.

5. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a Citrix ADC Load Balancer to a Plan in Service Management Portal (Admin Portal)].

6. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a Citrix ADC Load Balancer to a Plan in Service Management Portal Admin Portal]

6. In the network pane, select the **Load Balancers** tab, and click **ADD**.

×

ADD NETWORK LOAD BALANCER

## Add a load balancer to the virtual network

NAME

VIRTUAL IP ADDRESS

11.168.254.93▼

PROTOCOL

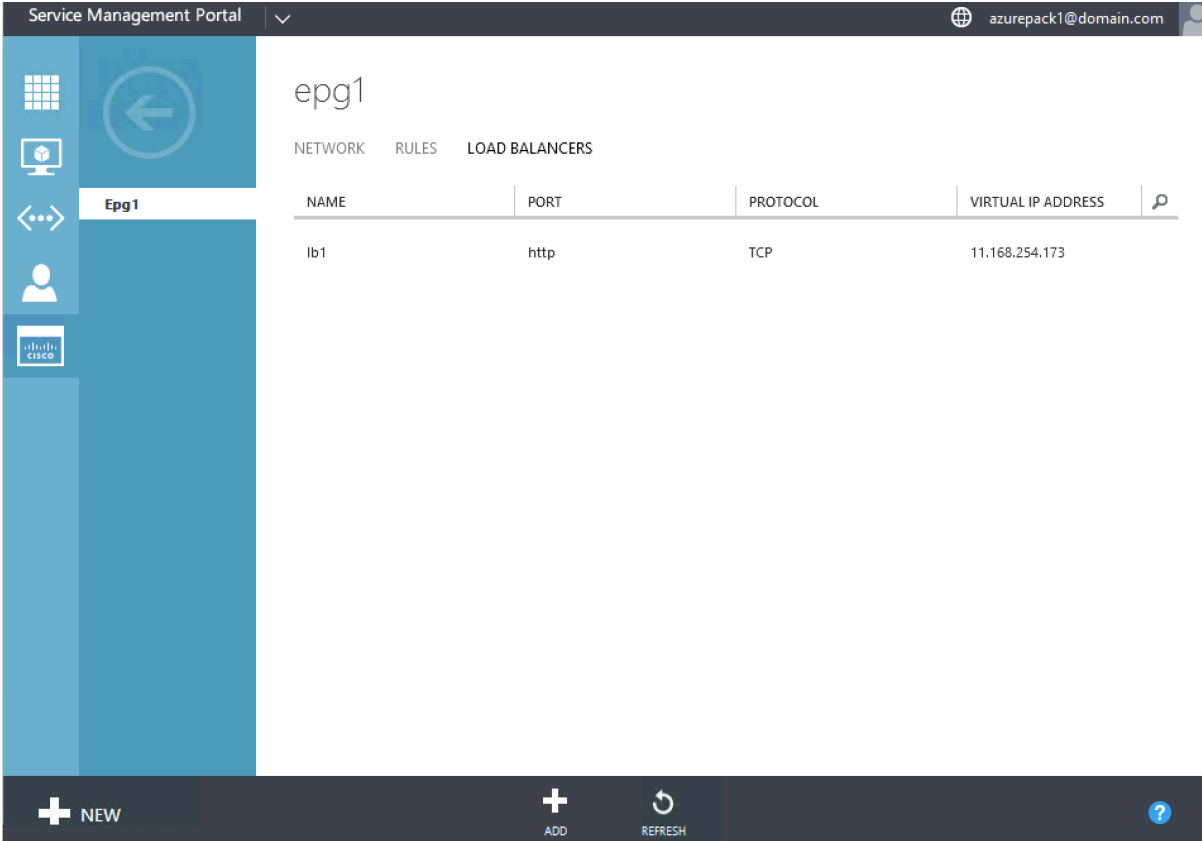

TCP▼

PORT

7. In the **ADD NETWORK LOAD BALANCER** pane, do the following:
  - a. In the **NAME** field, enter the name for the load balancer.
  - b. Optionally, in the **VIRTUAL IP ADDRESS** field, assign the load balancer a VIP address from the VIP range that you defined earlier.
  - c. Optionally, in the **PROTOCOL** field, select **TCP**.
  - d. In the **PORT** field, enter the port number.
8. Click **CREATE**.

The Citrix ADC Load Balancer is displayed in the **LOAD BALANCERS** tab and the Citrix ADC Load Balancer is data path ready.

The screenshot displays the Service Management Portal interface. The top navigation bar includes the text 'Service Management Portal' and a user profile icon with the email 'azurepack1@domain.com'. The main content area is titled 'epg1' and features three tabs: 'NETWORK', 'RULES', and 'LOAD BALANCERS'. The 'LOAD BALANCERS' tab is active, showing a table with the following data:

NAME	PORT	PROTOCOL	VIRTUAL IP ADDRESS
lb1	http	TCP	11.168.254.173

At the bottom of the interface, there is a dark blue bar with icons for '+ NEW', '+ ADD', a refresh icon labeled 'REFRESH', and a help icon.

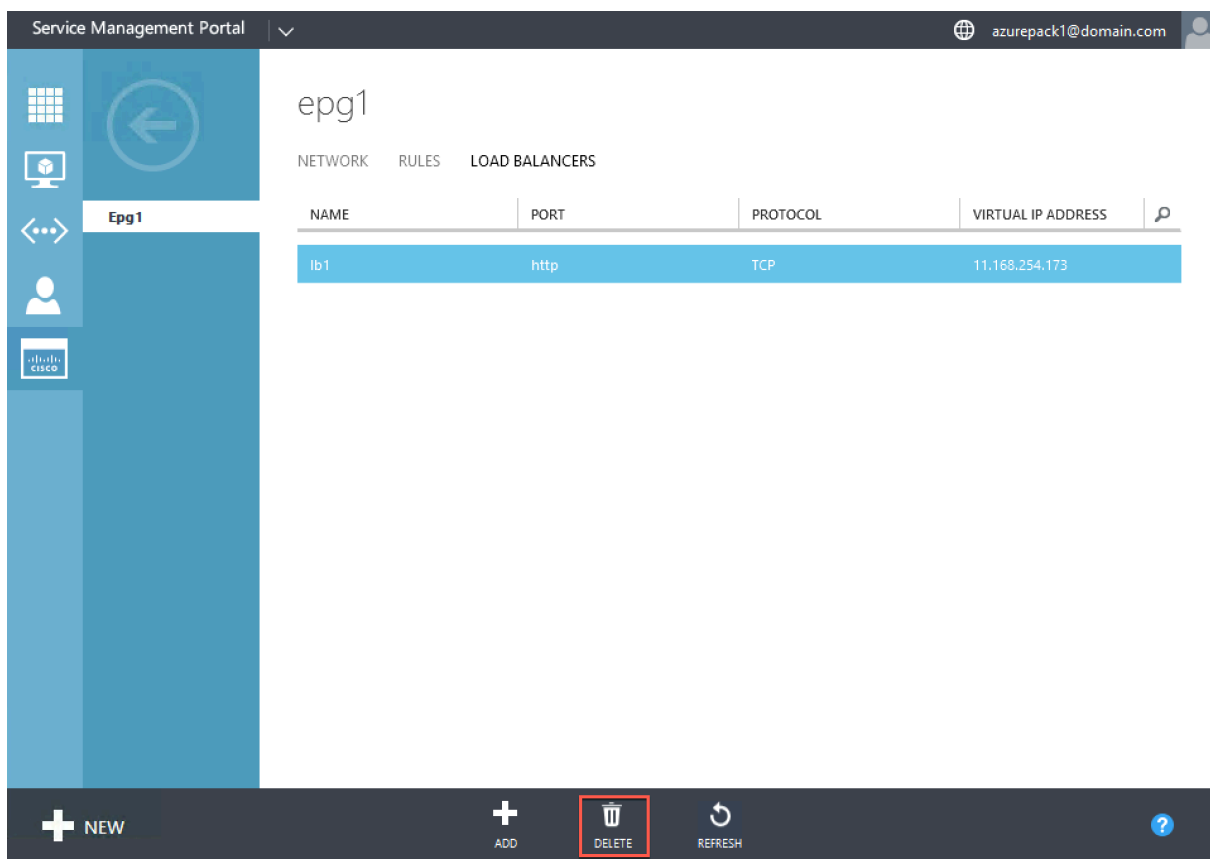

## Deleting a Citrix ADC Load Balancer from the Network

September 21, 2020

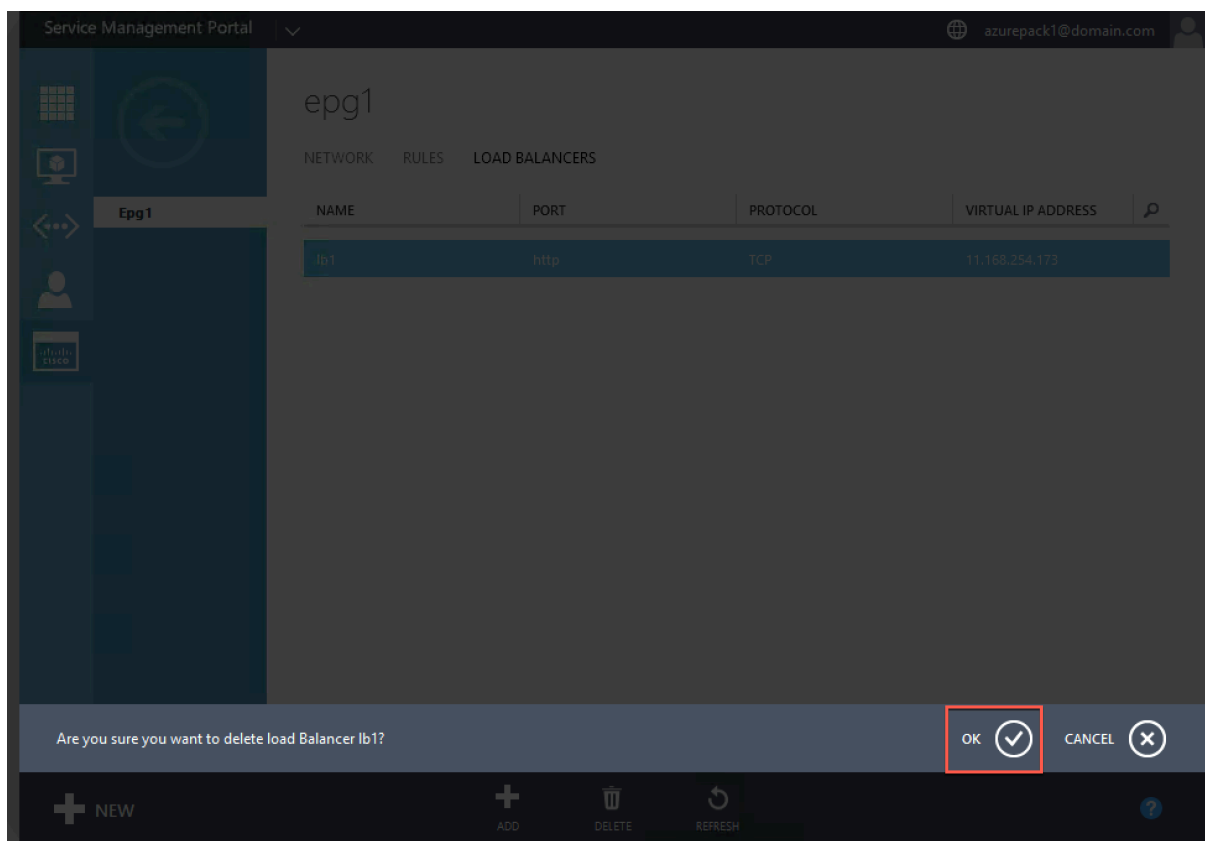

Using Service Management Portal (Tenant Portal), from the Network, you can delete the Citrix ADC load balancer that you created.

### To delete a Citrix ADC load balancer from the Network:

1. Log on to the Service Management Portal (Tenant Portal).
2. In the navigation pane, select **ACI**.
3. In the **ACI** pane, on the **NETWORKS** tab, click the network that you created.
4. In the selected network's pane, select the Citrix ADC load balancer and click **DELETE**.

5. Click **OK** to delete the Citrix ADC load balancer.

## Deploy a Citrix ADC VPX instance

September 21, 2020

### Note

Citrix ADM service connect is enabled by default, after you install or upgrade Citrix ADC or Citrix Gateway to release 12.1 build 57.xx and above. For more information see, [Data governance](#) and [Citrix ADM Service Connect](#).

The Citrix ADC VPX product is a virtual appliance that can be hosted on a wide variety of virtualization and cloud platforms:

- [Citrix XenServer](#)
- [VMware ESX](#)
- [Microsoft Hyper-V](#)
- [Linux KVM](#)
- [Amazon Web Services](#)

- [Microsoft Azure](#)
- [Google Cloud Platform](#)

For more information, see the [Citrix ADC VPX data sheet](#).

For more information about provisioning a Citrix ADC VPX instance on an SDX appliance, see [Provisioning Citrix ADC instances](#).

For information about Citrix ADC VPX FIPS appliances, see [Citrix ADC VPX FIPS appliance](#).

## Support matrix and usage guidelines

July 26, 2021

This document lists the different hypervisors and features supported on a Citrix ADC VPX instance, and their usage guidelines and limitations.

Table 1. VPX instance on Citrix Hypervisor

Citrix Hypervisor version	SysID	VPX models
7.1	450000	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G

Table 2. VPX instance on VMware ESXi server

VMware ESXi version	SysID	VPX models
ESXi 7.0 update 2a, build number 17867351 (supported from Citrix ADC release 12.1 build 62.x onwards)	450010	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G
ESXi 7.0 update 1d, build number 17551050 (supported from Citrix ADC release 12.1 build 62.x onwards)	450010	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G

VMware ESXi version	SysID	VPX models
ESXi 7.0 update 1c, build number 17325551 (supported from Citrix ADC release 12.1 build 62.x onwards)	450010	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G
ESXi 6.0, build numbers 3620759, 5050593 (supported from Citrix ADC release 12.0 build 51.24 onwards), 6765062 (supported from Citrix ADC release 12.0 build 56.20 onwards). 6.5, build number 4564106 and patch 7967591. 6.5, build number 8294253 (supported from Citrix ADC release 12.1 build 55.13 onwards). 6.7, build number 8941472, 13006603 (supported from Citrix ADC release 12.1 build 55.13 onwards).	450010	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G

Table 3. VPX on Microsoft Hyper-V

Hyper-V version	SysID	VPX models
2012, 2012R2	450020	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000

Table 4. VPX instance on generic KVM

Generic KVM version	SysID	VPX models
RHEL 7.4, RHEL 7.5 (from Citrix ADC version 12.1 50.x onwards) Ubuntu 16.04	450070	VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G

Note:

The VPX instance is qualified for hypervisor release versions mentioned in table 1–4, and not for patch releases within a version. However, the VPX instance is expected to work seamlessly with patch releases of a supported version. If it does not, log a support case for troubleshooting and debugging.

Table 5. VPX instance on AWS

AWS version	SysID	VPX models
N/A	450040	VPX 10, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 15G, VPX BYOL

Table 6. VPX instance on Azure

Azure version	SysID	VPX models
N/A	450020	VPX 10, VPX 200, VPX 1000, VPX 3000, VPX BYOL

Table 7. VPX feature matrix

Features	VPX on XenServer		VPX on VMware ESX				VPX on Microsoft Hyper-V	VPX on generic KVM			VPX on AWS	VPX on Azure
	PV	SR-IOV	PV	SR-IOV	Emulated	PCI Passthrough	PV	PV	SR-IOV	PCI Passthrough		
Multi-PE Support	√	√	√	√	√	√	√	√	√	√	√	√
Clustering Support	√	*√	√	*√	√	√	√	√	*√	√	X	X
VLAN Tagging	√	√	√	√	√	√	√ ((Only on 2012R2))	√	√	√	X	X
Detecting Link Events	**X	***√	**X	***√	**X	***√	**X	**X	***√	***√	**X	**X
Interface Parameter Configuration	X	X	X	X	X	√	X	X	X	√	X	X
Static LA	**√	***√	**√	X	**√	***√	**√	**√	***√	***√	X	X
LACP	X	***√	**√	X	**√	***√	X	**√	***√	***√	X	X
Static CLAG	X	X	X	X	X	X	X	X	X	X	X	X
LACP CLAG	X	X	**√	X	**√	***√	X	**√	***√	***√	X	X
Hot-Plug	X	X	X	X	X	X	X	X	X	X	√	X

- Clustering support is available on SRIOV for client- and server-facing interfaces and not for the backplane.
- Interface DOWN events are not recorded in Citrix ADC VPX instances.
- For Static LA, traffic might still be sent on the interface whose physical status is DOWN.
- For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.
  - Short timeout: 3 seconds
  - Long timeout: 90 seconds
- For LACP, interfaces should not be shared across VMs.
- For Dynamic routing, convergence time depends on the Routing Protocol since link events are not detected.
- Monitored static Route functionality fails if monitors are not bound to static routes since Route state depends on the VLAN status. The VLAN status depends on the link status.
- Partial failure detection does not happen in high availability if there's link failure. High availability-split brain condition might happen if there is link failure.
- When any link event (disable/enable, reset) is generated from a VPX instance, the physical status of the link does not change. For static LA, any traffic initiated by the peer gets dropped on the instance.
- For the VLAN tagging feature to work, do the following:

On the VMware ESX, set the port group's VLAN ID to 1–4095 on the vSwitch of the VMware ESX server. For more information about setting a VLAN ID on the vSwitch of VMware ESX server, see [VMware ESX Server 3 802.1Q VLAN Solutions](#).

Table 8. Supported browsers

Operating system	Browser and versions
Windows 7	Internet Explorer- 8, 9, 10, and 11; Mozilla Firefox 3.6.25 and above; Google Chrome- 15 and above
Windows 64 bit	Internet Explorer - 8, 9; Google Chrome - 15 and above
MAC	Mozilla Firefox - 12 and above; Safari - 5.1.3; Google Chrome - 15 and above

## Usage guidelines

Follow these usage guidelines:

- See the **VMware ESXi CPU Considerations** section in the document [Performance Best Practices for VMware vSphere 6.5](#). Here's an extract:

It is not recommended that virtual machines with high CPU/Memory demand sit on a Host/Cluster that is overcommitted.

In most environments ESXi allows significant levels of CPU overcommitment (that is, running more vCPUs on a host than the total number of physical processor cores in that host) without impacting virtual machine performance.

If an ESXi host becomes CPU saturated (that is, the virtual machines and other loads on the host demand all the CPU resources the host has), latency-sensitive workloads might not perform well. In this case you

might want to reduce the CPU load, for example by powering off some virtual machines or migrating them to a different host (or allowing DRS to migrate them automatically).

- Citrix recommends the latest hardware compatibility version to avail latest feature sets of the ESXi hypervisor for the virtual machine. For more information about the hardware and ESXi version compatibility, see [VMware documentation](#).
- The Citrix ADC VPX is a latency-sensitive, high-performance virtual appliance. To deliver its ex-

pected performance, the appliance requires vCPU reservation, memory reservation, vCPU pinning on the host. Also, hyper threading must be disabled on the host. If the host does not meet these requirements, issues such as high-availability failover, CPU spike within the VPX instance, sluggishness in accessing the VPX CLI, pitboss daemon crash, packet drops, and low throughput occur.

- A hypervisor is considered over-provisioned if one of the following two conditions is met:
  - The total number of virtual cores (vCPU) provisioned on the host is greater than the total number of physical cores (pCPUs).
  - The total number of provisioned VMs consume more vCPUs than the total number of pCPUs.

At times, if an instance is over-provisioned, the hypervisor might not be able to guarantee the resources reserved (such as CPU, memory, and others) for the instance due to hypervisor scheduling over-heads or bugs or limitations with the hypervisor. This can cause lack of CPU resource for Citrix ADC and might lead to issues mentioned in the first point under **Usage guidelines**. As administrators, you're recommended to reduce the tenancy on the host so that the total number of vCPUs provisioned on the host is lesser or equal to the total number of pCPUs.

#### **Example**

For ESX hypervisor, if the `%RDY%` parameter of a VPX vCPU is greater than 0 in the `esxtop` command output, the ESX host is said to be having scheduling overheads, which can cause latency related issues for the VPX instance.

In such a situation, reduce the tenancy on the host so that `%RDY%` returns to 0 always. Alternatively, contact the hypervisor vendor to triage the reason for not honoring the resource reservation done.

- Hot adding is supported only for PV and SRIOV interfaces on Citrix ADC.
- Hot removing either through the AWS Web console or AWS CLI is not supported for PV and SRIOV interfaces on Citrix ADC. The behavior of the instances can be unpredictable if hot-removal is attempted.
- You can use two commands (`set ns vpxparam` and `show ns vpxparam`) to control packet engine(non-management) CPU usage behavior of VPX instances in hypervised and cloud environments:
  - `set ns vpxparam -cpuyield (YES | NO | DEFAULT)`  
Allow each VM to use CPU resources that have been allocated to another VM but are not being used.  
  
Set ns vpxparam parameters:  
  
**-cpuyield:** Release or do not release of allocated but unused CPU resources.

- \* **YES:** Allow allocated but unused CPU resources to be used by another VM.
- \* **NO:** Reserve all CPU resources for the VM to which they have been allocated. This option shows higher percentage in hypervisor and cloud environments for VPX CPU usage.
- \* **DEFAULT:** No.

**Note**

On all the Citrix ADC VPX platforms, the vCPU usage on the host system is 100 percent. Type the `set ns vpxparam -cpuyield YES` command to override this usage.

If you want to set the cluster nodes to “yield”, you must perform the following additional configurations on CCO:

- \* If a cluster is formed, all the nodes come up with “yield=DEFAULT”.
- \* If a cluster is formed using the nodes that are already set to “yield=YES”, then the nodes are added to cluster using “DEFAULT” yield.

**Note:**

If you want to set the cluster nodes to “yield=YES”, you can perform suitable configurations only after forming the cluster but not before the cluster is formed.

- `show ns vpxparam`  
Display the current vpxparam settings.

## Install a Citrix ADC VPX instance on a bare metal server

September 21, 2020

A bare metal is a fully dedicated physical server that delivers physical isolation, fully integrated into the cloud environment. It is also known as a single-tenant server. Single tenancy allows you to avoid the noisy neighbor effect. With bare metal, you do not witness the noisy neighbor effect because you are the sole user.

A bare metal server installed with a hypervisor provides you a management suite to create virtual machines on the server. The hypervisor does not run applications natively. Its purpose is to virtualize your workloads into separate virtual machines to gain the flexibility and reliability of virtualization.

### Prerequisites for installing Citrix ADC VPX instance on bare metal servers

A bare metal server must be obtained from a cloud vendor that meets all the system requirements for the respective hypervisor.

## Install the Citrix ADC VPX instance on bare metal servers

To install Citrix ADC VPX instances on a bare metal server, you must first obtain a bare metal server with adequate system resources from a cloud vendor. On that bare metal server, any of the supported hypervisors such as Linux KVM, VMware ESX, Citrix Hypervisor, or Microsoft Hyper-V must be installed and configured before deploying the ADC VPX instance.

For more information on the list of different hypervisors and features supported on a Citrix ADC VPX instance, see [Support matrix and usage guidelines](#).

For more information on installing Citrix ADC VPX instances on different hypervisors, see the respective documentation.

- **Citrix Hypervisor:** See [Install a Citrix ADC VPX instance on Citrix Hypervisor](#).
- **VMware ESX:** See [Install a Citrix ADC VPX instance on VMware ESX](#).
- **Microsoft Hyper-V:** See [Install a Citrix ADC VPX instance on Microsoft Hyper-V server](#).
- **Linux KVM platform:** See [Install a Citrix ADC VPX instance on Linux-KVM platform](#).

## Install a Citrix ADC VPX instance on XenServer

September 21, 2020

To install VPX instances on Citrix XenServer, you must first install XenServer on a machine with adequate system resources. To perform the Citrix ADC VPX instance installation, you use Citrix XenCenter, which must be installed on a remote machine that can connect to the XenServer host through the network.

For more information about XenServer, see [XenServer documentation](#).

The following figure shows the bare-metal solution architecture of Citrix ADC VPX instance on XenServer.

**Figure.** A Citrix ADC VPX instance on XenServer

### Prerequisites for installing a Citrix ADC VPX instance on XenServer

Before you begin installing a virtual appliance, do the following:

- Install XenServer version 6.0 or later on hardware that meets the minimum requirements.
- Install XenCenter on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the *Citrix ADC VPX Licensing Guide* at <http://support.citrix.com/article/ctx122426>.

### XenServer hardware requirements

The following table describes the minimum hardware requirements for a XenServer platform running a Citrix ADC VPX instance.

**Table 1.** Minimum system requirements for XenServer running a nCore VPX instance

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. AMD processor is not supported. To run Citrix ADC VPX instance, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. For more details, see BIOS documentation.
RAM	3 GB
Disk space	Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space. Note: XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for Citrix ADC VPX instance and other virtual machines.
NIC	One 1-Gbps NIC; recommended: two 1-Gbps NICs

For information about installing XenServer, see the XenServer documentation at <http://support.citrix.com/product/xens/>.

The following table lists the virtual computing resources that XenServer must provide for each nCore VPX virtual appliance.

**Table 2.** Minimum virtual computing resources required for running a ncore VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2
Virtual network interfaces	2

Note: For production use of Citrix ADC VPX instance, Citrix recommends that CPU priority (in virtual machine properties) be set to the highest level, in order to improve scheduling behavior and network latency.

## XenCenter system requirements

XenCenter is a Windows client application. It cannot run on the same machine as the XenServer host. For more information about minimum system requirements and installing XenCenter, see the following XenServer documents:

- [System requirements](#)
- [Install](#)

## Install Citrix ADC VPX instances on XenServer by using XenCenter

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial Citrix ADC VPX instance (.xva image) on XenServer, you have the option to use Command Center to provision Citrix ADC VPX instance. For more information, see the [Command Center](#) documentation.

To install Citrix ADC VPX instances on XenServer by using XenCenter, follow these steps:

1. Start XenCenter on your workstation.
2. On the Server menu, click Add.
3. In the Add New Server dialog box, in the Hostname text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the User Name and Password text boxes, type the administrator credentials, and then click Connect. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install Citrix ADC VPX instance.
6. On the VM menu, click Import.
7. In the Import dialog box, in Import file name, browse to the location at which you saved the Citrix ADC VPX instance .xva image file. Make sure that the Exported VM option is selected, and then click Next.
8. Select the XenServer on which you want to install the virtual appliance, and then click Next.
9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.
10. You can add, modify, or delete virtual network interfaces as required. When finished, click Next.
11. Click Finish to complete the import process.  
Note: To view the status of the import process, click the **Log** tab.
12. If you want to install another virtual appliance, repeat steps 5 through 11.

#### Note

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see [Upgrading or Downgrading the System Software](#).

## Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces

September 21, 2020

After you have installed and configured a Citrix ADC VPX instance on XenServer, you can configure the virtual appliance to use SR-IOV network interfaces.

### Limitations

XenServer does not support the following features on SRIOV interfaces:

- L2 mode switching
- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active - Active mode]
- Jumbo frames
- IPv6 protocol in Cluster environment

### Prerequisites

On the XenServer host, ensure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the host.
- Blacklist the ixgbev driver by adding the following entry to the **/etc/modprobe.d/blacklist.conf** file:  
**blacklist ixgbev**
- Enable SR-IOV Virtual Functions (VFs) by adding the following entry to the **/etc/modprobe.d/ixgbe** file:  
**options ixgbe max\_vfs=<number\_of\_VFs>**  
where **<number\_of\_VFs>** is the number of SR-IOV VFs that you want to create.
- Verify that SR-IOV is enabled in BIOS.

IXGBE driver version 3.22.3 is recommended.

## Assign SR-IOV VFs to the VPX instance by using the XenServer host

To assign SR-IOV network interfaces to Citrix ADC VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the Citrix ADC VPX instance:

```
xe host-call-plugin plugin=iovirt host-uuid=<Xen host UUID> fn=assign_free_vf args:uuid=<Netscalar VM UUID> args:ethdev=<interface name> args:mac=<mac addr>
```

Where:

- <Xen host UUID> is the UUID of the XenServer host.
- <Netscalar VM UUID> is the UUID of the Citrix ADC VPX instance.
- <interface name> is the interface for the SR-IOV VFs.
- <mac addr > is the mac address of the SR-IOV VF.

### Note

Specify the mac address that you want use in the args:mac= parameter, if not specified, the iovirt script randomly generates and assigns a mac address. Also, if you want use the SR-IOV VFs in Link Aggregation mode, make sure that you specify the mac address as 00:00:00:00:00:00.

2. Boot the Citrix ADC VPX instance.

## Unassign SR-IOV VFs to the VPX instance by using the XenServer host

If you have assigned an incorrect SR-IOV VFs or if you want modify the a assigned SR-IOV VFs, you need to unassign and reassign the SR-IOV VFs to the Citrix ADC VPX instance.

To unassign SR-IOV network interface assigned to a Citrix ADC VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the Citrix ADC VPX instance and reboot the Citrix ADC VPX instance:

```
xe host-call-plugin plugin=iovirt host-uuid=<Xen_host_UUID> fn=unassign_all args:uuid=<Netscalar_VM_UUID>
```

Where:

- <Xen\_host\_UUID> - The UUID of the XenServer host.
- <Netscalar\_VM\_UUID> - The UUID of the Citrix ADC VPX instance

2. Boot the Citrix ADC VPX instance.

## Configuring VLAN on the SR-IOV Interface

**Important**

While you are assigning the SR-IOV VFs to the Citrix ADC VPX instance, make sure that you specify MAC address 00:00:00:00:00:00 for the VFs.

To use the SR-IOV virtual functions in link aggregation mode, you need to disable spoof checking for virtual functions that you have created. On the XenServer host, use the following command to disable spoof checking:

```
ip link set <interface_name> vf <VF_id> spoofchk off
```

Where:

- <interface\_name> is the interface name.
- <VF\_id> is the virtual function ID.

After disabling spoof checking for all the Virtual Function that you have created, restart the Citrix ADC VPX instance and configure link aggregation. For instructions, see [Configure link aggregation](#).

**Configure VLAN on the SR-IOV interface**

You can configure VLAN on the SR-IOV Virtual Functions, for instructions, see [Configuring a VLAN](#).

**Important**

Make sure that the XenServer host does not contain VLAN settings for the VF interface.

**Install a Citrix ADC VPX instance on VMware ESX**

September 21, 2020

Before installing

Citrix ADC VPX instances on VMware ESX, make sure that VMware ESX Server is installed on a machine with adequate system resources. To install a Citrix ADC VPX instance on VMware ESXi, you use the VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

This section includes the following topics:

- Prerequisites
- Installing a Citrix ADC VPX instance on VMware ESX

**Important**

You cannot install standard VMware Tools or upgrade the VMware Tools version available on a Citrix ADC VPX instance. VMware Tools for a Citrix ADC VPX instance are delivered as part of the

Citrix ADC software release.

## Prerequisites

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the Citrix ADC VPX appliance setup files.
- Label the physical network ports of VMware ESX.
- Obtain VPX license files. For more information about Citrix ADC VPX instance licenses, see the *Citrix ADC VPX Licensing Guide* at <http://support.citrix.com/article/ctx131110>.

## VMware ESX hardware requirements

The following table describes the minimum system requirements for VMware ESX servers running Citrix ADC VPX ncore virtual appliance.

Table 1. Minimum system requirements for a VMware ESX server running a Citrix ADC VPX instance

Component	Requirement
-	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. To run Citrix ADC VPX instance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.
RAM	3 GB
Disk space	40 GB of disk space available
Network	One 1-Gbps NIC. Two 1-Gbps NICs recommended

For information about installing VMware ESX, see <http://www.vmware.com/>.

The following table lists the virtual computing resources that the VMware ESX server must provide for each VPX ncore virtual appliance.

Table 2. Minimum virtual computing resources required for running a Citrix ADC VPX instance

Component	Requirement
Memory	2 GB
Virtual CPU (vCPU)	2
Virtual network interfaces	1. Note that with ESX, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded version to 7 or higher.
Disk space	20 GB

Note that this is in addition to any disk requirements for the hypervisor.

For production use of VPX virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX must be reserved.

### VMware vSphere client system requirements

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum system requirements for VMware vSphere client installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “vSphere Compatibility Matrixes” PDF file at <a href="http://kb.vmware.com/">http://kb.vmware.com/</a> .
CPU	750 megahertz (MHz); 1 gigahertz (GHz) or faster recommended
RAM	1 GB. 2 GB recommended
Network Interface Card (NIC)	100 Mbps or faster NIC

### OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 4. Minimum system requirements for OVF tool installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the “OVF Tool User Guide” PDF file at <a href="http://kb.vmware.com/">http://kb.vmware.com/</a> .
CPU	750 MHz minimum, 1 GHz or faster recommended
RAM	1 GB Minimum, 2 GB recommended
Network Interface Card (NIC)	100 Mbps or faster NIC

For information about installing OVF, search for the “OVF Tool User Guide” PDF file at <http://kb.vmware.com/>.

### Downloading the Citrix ADC VPX setup files

The Citrix ADC VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from the Citrix website. You need a Citrix account to log on. If you do not have a Citrix account, access the home page at <http://www.citrix.com>, click the **New Users link**, and follow the instructions to create a new Citrix account.

Once logged on, navigate the following path from the Citrix home page:

Citrix.com > **Downloads** > **Citrix ADC** > **Virtual Appliances**.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf)

### Label the physical network ports of VMware ESX

Before installing a VPX virtual appliance, label all the interfaces that you plan to assign to virtual appliances, in a unique format, for example, NS\_NIC\_1\_1, NS\_NIC\_1\_2, and so on. In large deployments, labeling in a unique format helps in quickly identifying the interfaces that are allocated to the VPX virtual appliance among other interfaces used by other virtual machines, such as Windows and Linux. Such labeling is especially important when different types of virtual machines share interfaces.

To label the physical network ports of VMware ESX server, follow these steps:

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vSphere client, select the Configuration tab, and then click Networking.
3. At the top-right corner, click Add Networking.
4. In the Add Network Wizard, for **Connection Type**, select **Virtual Machine**, and then click Next.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that maps to interface 1/1 on the virtual appliances.
6. Enter the label of the interface, for example, **NS\_NIC\_1\_1** as the name of the vSwitch that is associated with interface 1/1 of the virtual appliances.
7. Click Next to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, NS\_NIC\_1\_2).

### Install a Citrix ADC VPX instance on VMware ESX

After you have installed and configured VMware ESX, you can use the VMware vSphere client to install virtual appliances on the VMware ESX server. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install Citrix ADC VPX instances on VMware ESX by using VMware vSphere Client, follow these steps:

1. Start the VMware vSphere client on your workstation.
2. In the **IP address / Name** text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click Login.
4. On the **File** menu, click **Deploy OVF Template**.
5. In the **Deploy OVF Template** dialog box, in **Deploy from file**, browse to the location at which you saved the Citrix ADC VPX instance setup files, select the .ovf file, and click **Next**.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click **Next** to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the Citrix ADC VPX instance. In the navigation pane, select the Citrix ADC VPX instance that you have installed and, from the right-click menu, select **Power On**. Click the **\*\*Console** tab to emulate a console port.
8. If you want to install another virtual appliance, repeat through step 6.

#### Note

By default, the Citrix ADC VPX instance uses E1000 network interfaces.

After the installation, you can use vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX.

For the VLAN tagging feature to work, on the VMware ESX, set the port group's VLAN ID to 1-4095 on the VSwitch of VMware ESX server. For more information about setting a VLAN ID on the VSwitch of VMware ESX server, see [http://www.vmware.com/pdf/esx3\\_vlan\\_wp.pdf](http://www.vmware.com/pdf/esx3_vlan_wp.pdf).

## Migrate a Citrix ADC VPX instance by using VMware vMotion

You can migrate a Citrix ADC VPX instance by using VMware vSphere vMotion.

Follow these usage guidelines:

- VMware does not support the vMotion feature on virtual machines configured with PCI Passthrough and SR-IOV interfaces.
- Supported interfaces are E1000 and VMXNET3. To use vMotion on your VPX instance, ensure that the instance is configured with a supported interface.
- For more information about how to migrate an instance by using VMware vMotion, see VMware documentation.

## Configure a Citrix ADC VPX instance to use VMXNET3 network interface

March 16, 2021

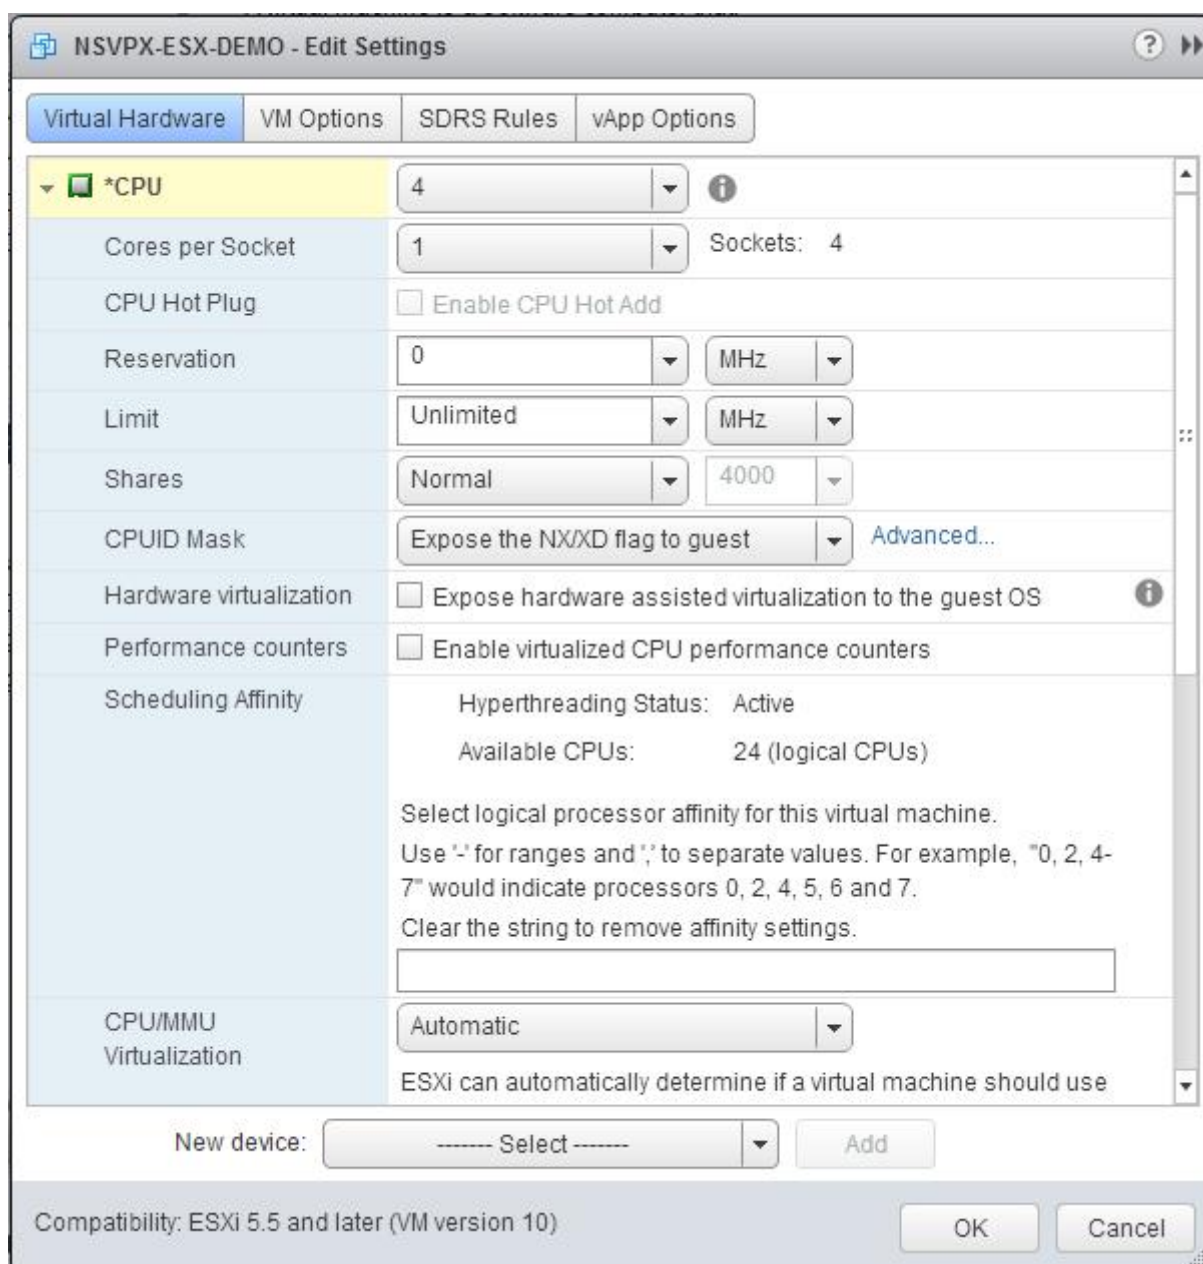

After you have installed and configured the Citrix ADC VPX instance on the VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use VMXNET3 network interfaces.

To configure Citrix ADC VPX instances to use VMXNET3 network interfaces by using the VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.
2. Upgrade the Compatibility setting of the Citrix ADC VPX instance to ESX, as follows:
  - a. Power off the Citrix ADC VPX instance.
  - b. Right-click the Citrix ADC VPX instance and select Compatibility > Upgrade VM Compatibility.
  - c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.
3. Right-click on the Citrix ADC VPX instance and click Edit Settings.

4. In the <virtual\_appliance> - Edit Settings dialog box, click the CPU section.

5. In the CPU section, update the following:

- Number of CPUs
- Number of Sockets
- Reservations
- Limit
- Shares

Set the values as follows:

- a. In the CPU drop-down list, select the number of CPUs to assign to the virtual appliance.

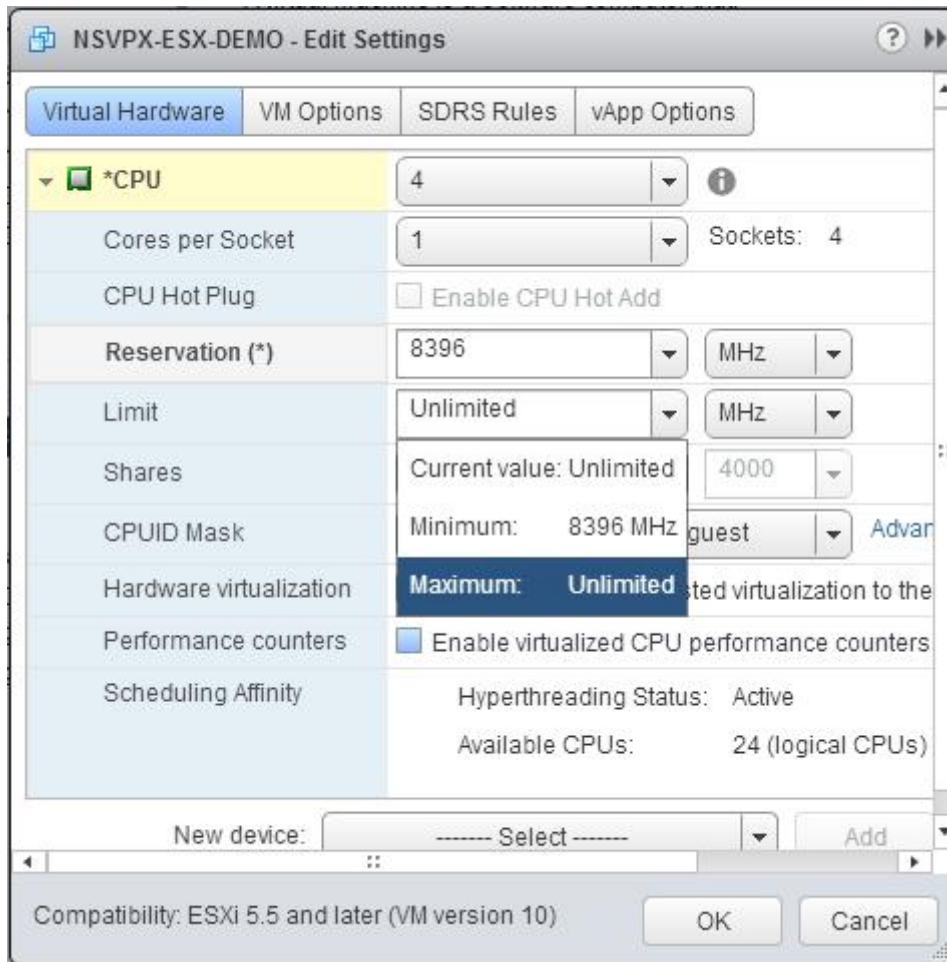

- b. In the Cores per Socket drop-down list, select the number of sockets.
- c. (Optional) In the CPU Hot Plug field, select or unselect the Enable CPU Hot Add checkbox.

Note: Citrix recommends accepting the default (disabled).

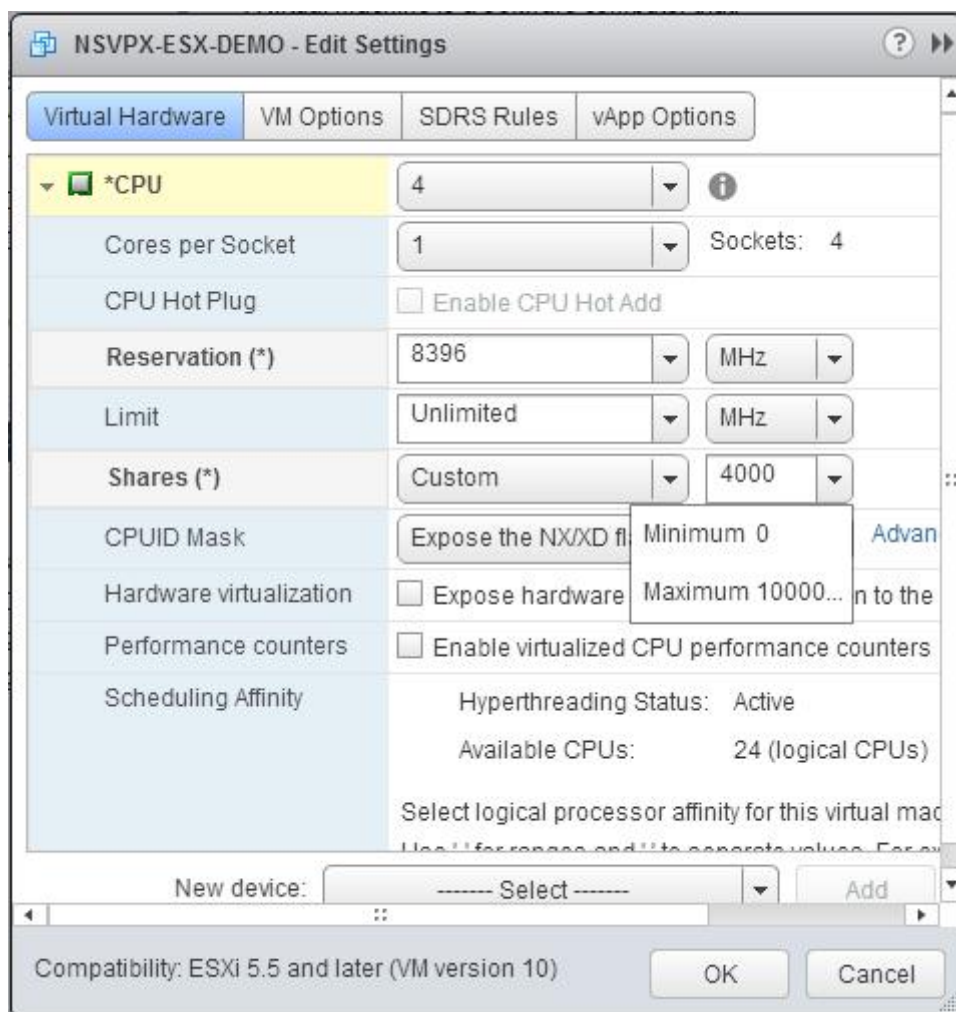

- d. In the Reservation drop-down list, select the number that is shown as the maximum value.

- e. In the Limit drop-down list, select the number that is shown as the maximum value.

f. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

6. In the Memory section, update the following:

- Size of RAM
- Reservations
- Limit
- Shares

Set the values as follows:

a. In the RAM drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the RAM should be 4 x 2 GB = 8 GB.

Note: For an Advanced or Premium edition of the Citrix ADC VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

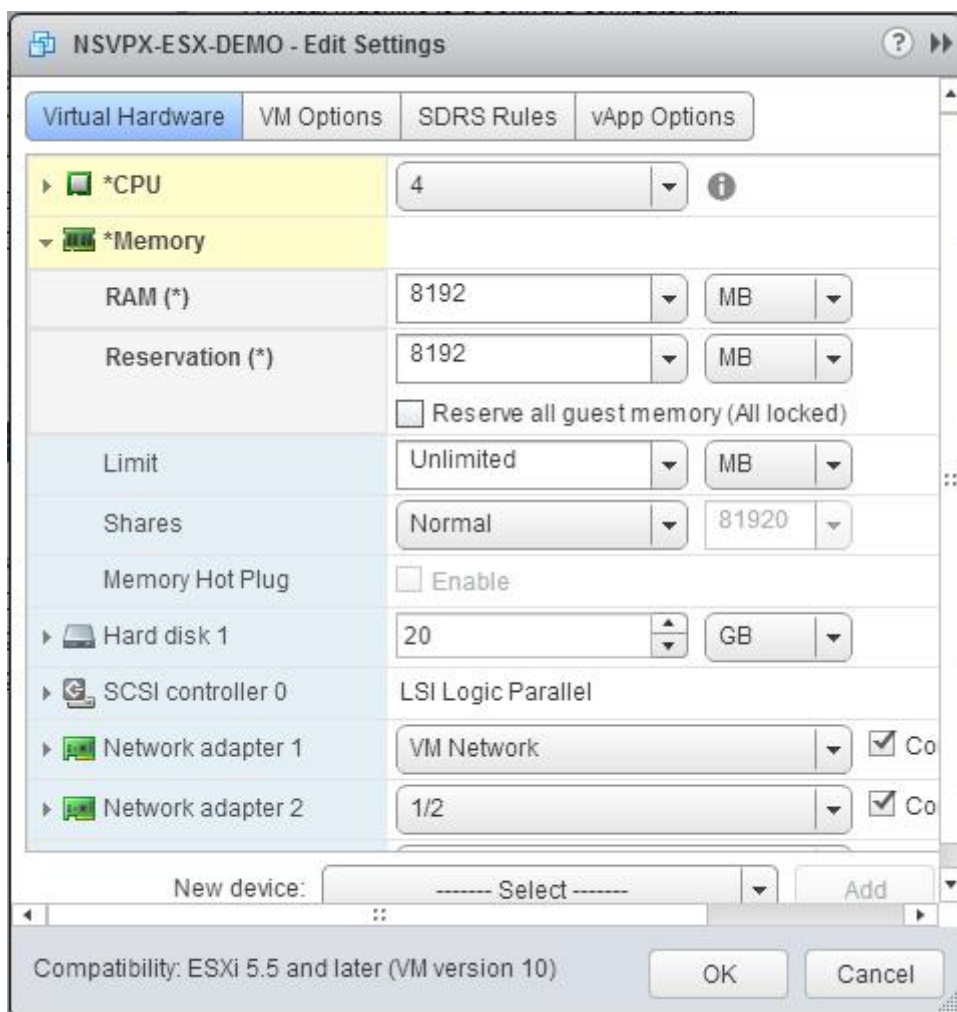

b. In the Reservation drop-down list, enter the value for the memory reservation, and select the Reserve all guest memory (All locked) checkbox. The memory reservation should be the number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be 4 x 2 GB = 8 GB.

Note: For an Advanced or Premium edition of the Citrix ADC VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

c. In the Limit drop-down list, select the number that is shown as the maximum value.

d. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

7. Add a VMXNET3 network interface. From the New device drop-down list, select Network and click Add.

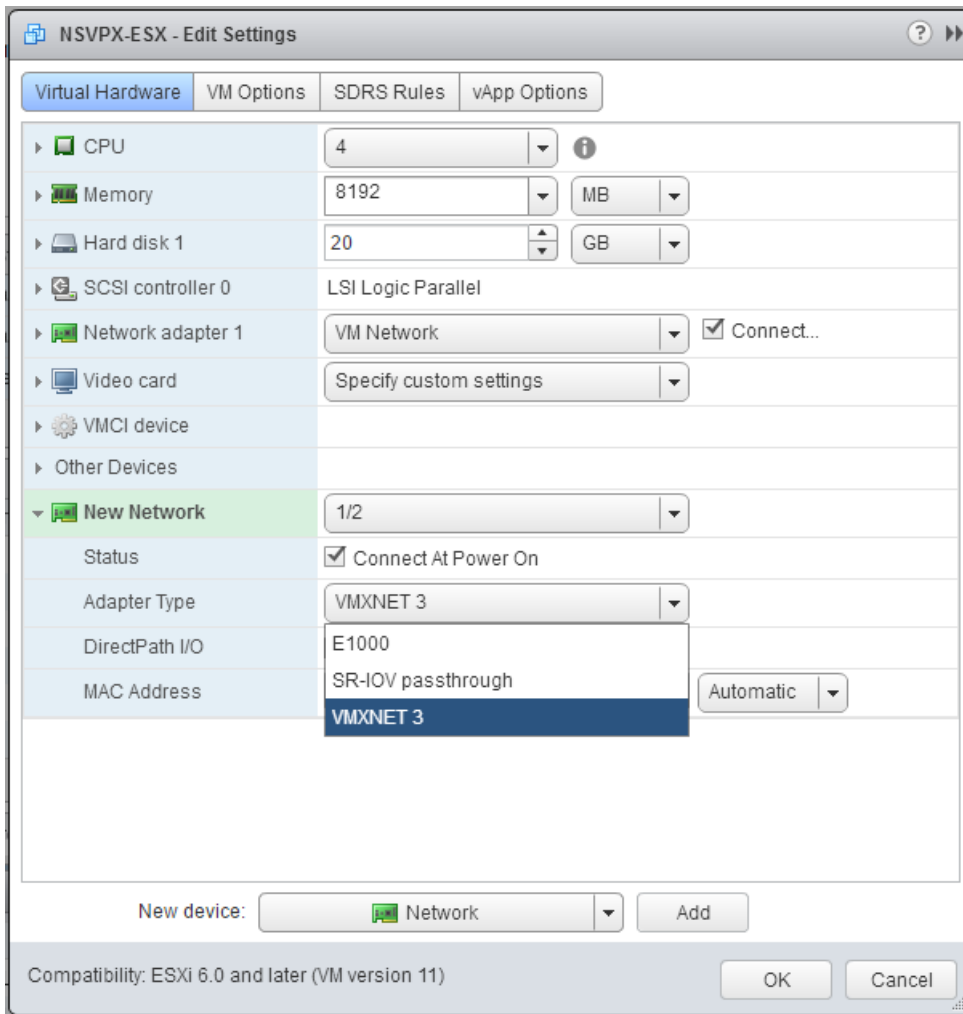

8. In the New Network section, from the drop-down list, select the network interface, and do the following:

a. In the Adapter Type drop-down list, select VMXNET3.

#### **Important**

The default E1000 network interface and VMXNET3 cannot coexist, make sure that you remove the E1000 network interface and use VMXNET3 (0/1) as the management interface.

9. Click OK.

10. Power on the Citrix ADC VPX instance.

11. Once the Citrix ADC VPX instance powers on, you can use the following command to verify the configuration:

```
1 > show interface summary
```

The output should show all the interfaces that you configured:

```
1 > show interface summary
2 -----
3      Interface  MTU      MAC                Suffix
4 -----
5  1      0/1      1500      00:0c:29:89:1d:0e  NetScaler Vir...rface,
      VMXNET3
```

6	2	1/1 VMXNET3	9000	00:0c:29:89:1d:18	NetScaler Vir...rface,
7	3	1/2 VMXNET3	9000	00:0c:29:89:1d:22	NetScaler Vir...rface,
8	4	LO/1 interface	9000	00:0c:29:89:1d:0e	Netscaler Loopback

**Note**

After you add a VMXNET3 interface and restart the Citrix ADC VPX appliance, the VMWare ESX hypervisor might change the order in which the NIC is presented to the VPX appliance. So, network adapter 1 might not always remain 0/1, resulting in loss of management connectivity to the VPX appliance. To avoid this issue, change the virtual network of the network adapter accordingly.

This is a VMWare ESX hypervisor limitation.

## Configure a Citrix ADC VPX instance to use SR-IOV network interface

March 16, 2021

After you have installed and configured the Citrix ADC VPX instance on VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use single root I/O virtualization (SR-IOV) network interfaces.

### Limitations

A Citrix ADC VPX configured with SR-IOV network interface has the following limitations:

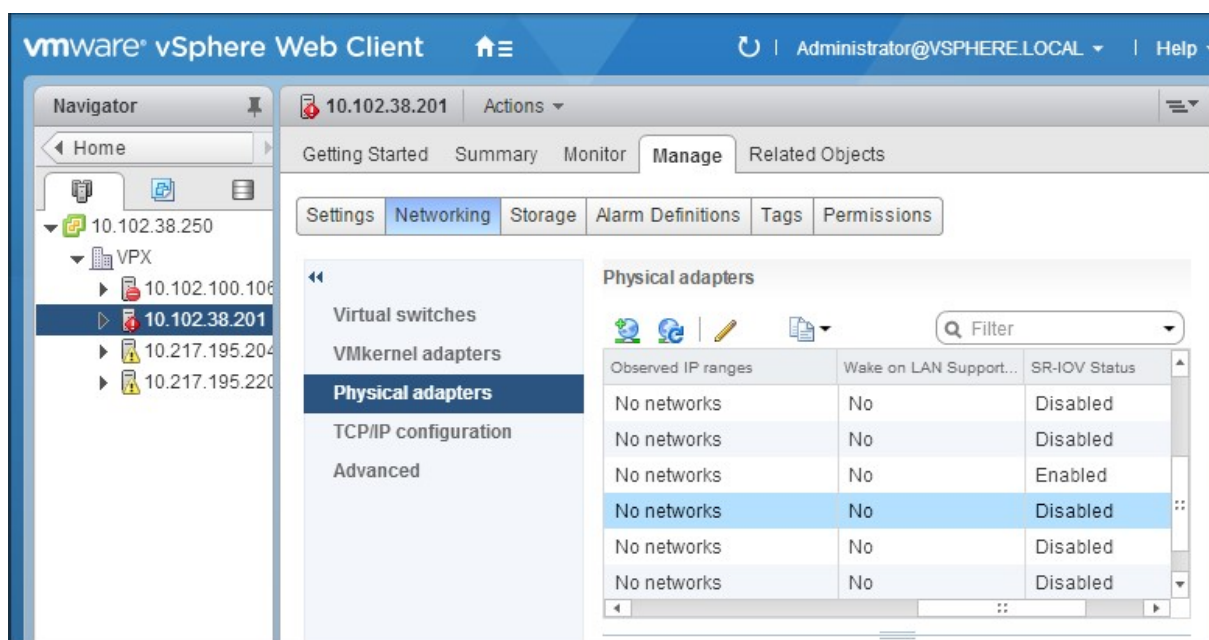

- The following features are not supported on SR-IOV interfaces using Intel 82599 10G NIC on ESX VPX:
  - L2 mode switching
  - Static Link Aggregation and LACP
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active - Active mode]
  - Jumbo frames
  - IPv6
- The following features are not supported for on SR-IOV interface with an Intel 82599 10G NIC on KVM VPX:
  - Static Link Aggregation and LACP
  - L2 mode switching

- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active – Active mode]
- Jumbo frames
- IPv6
- VLAN configuration on Hypervisor for SR-IOV VF interface through “ip link” command is not supported

## Prerequisite

Make sure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the ESX Host. IXGBE driver version 3.7.13.7.14iov is recommended.
- Enable SR-IOV on the host physical adapter, as follows:
  1. In the vSphere Web Client, navigate to the Host.
  2. On the **Manage > Networking** tab, select **Physical adapters**. The SR-IOV Status field shows whether a physical adapter supports SR-IOV.

3. Select the physical adapter, and then click the pencil icon to open the **Edit Settings** dialog box.

4. Under SR-IOV, select **Enabled** from the **Status** drop-down list.

5. In the **Number of virtual functions** field, enter the number of virtual functions that you want to

configure for the adapter.

6. Click **OK**.

7. Restart the host.

- Create a Distributed Virtual Switch (DVS) and Portgroups. For instructions, see the VMware Documentation.

#### Note

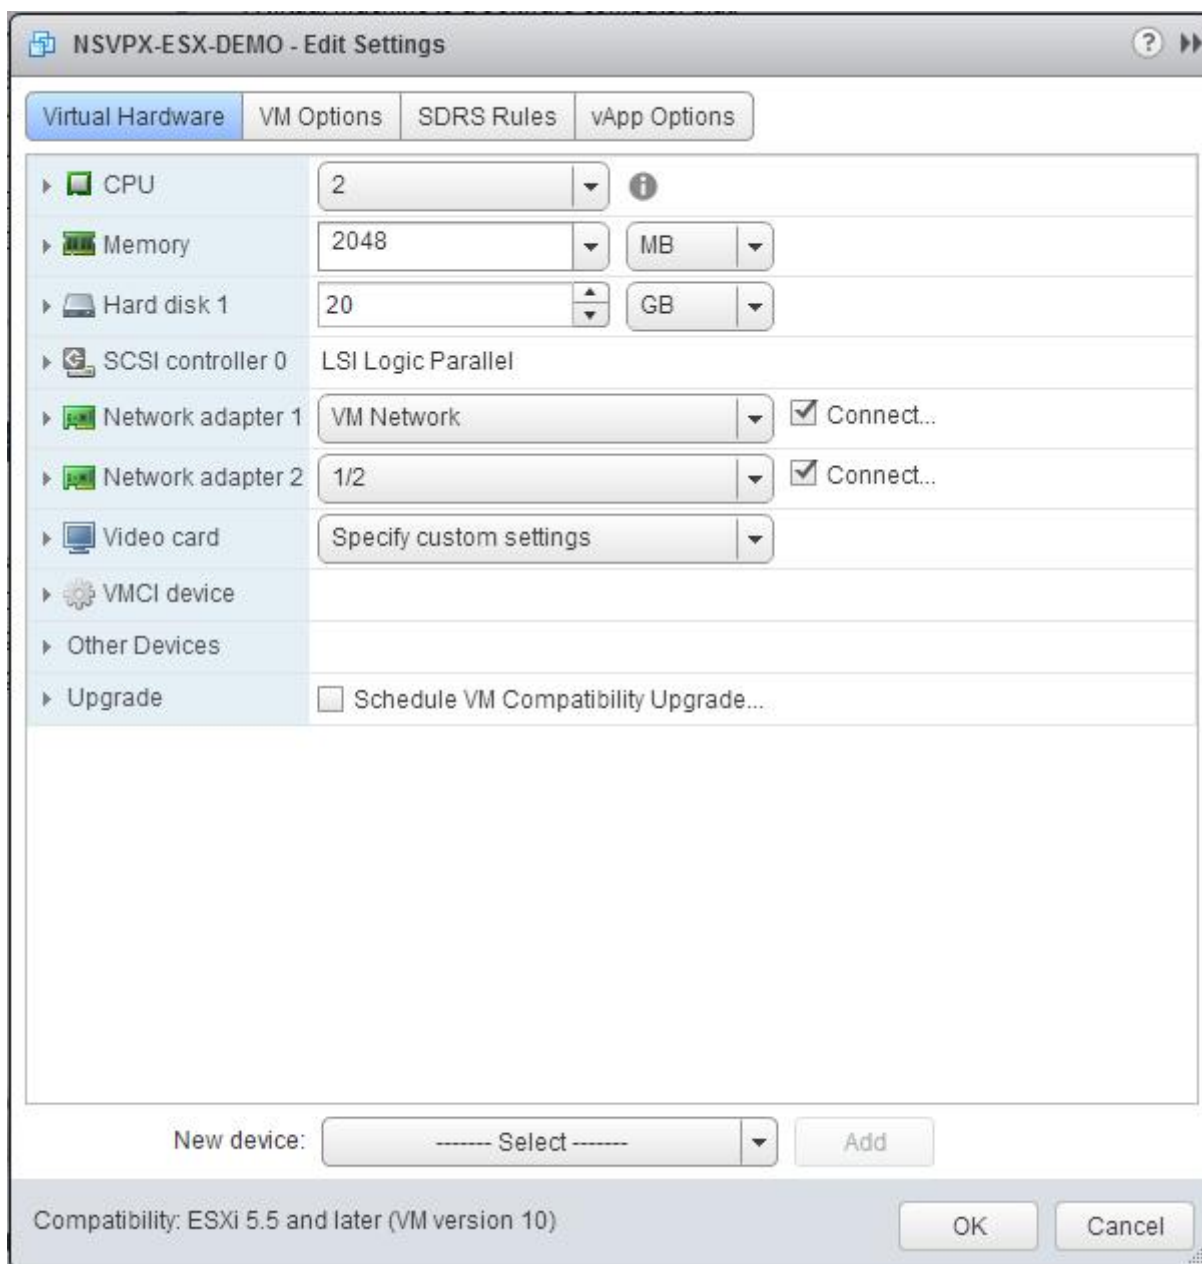

Citrix has qualified the SR-IOV configuration on DVS and Portgroups only.

#### To configure Citrix ADC VPX instances to use SR-IOV network interface by using VMware vSphere Web Client:

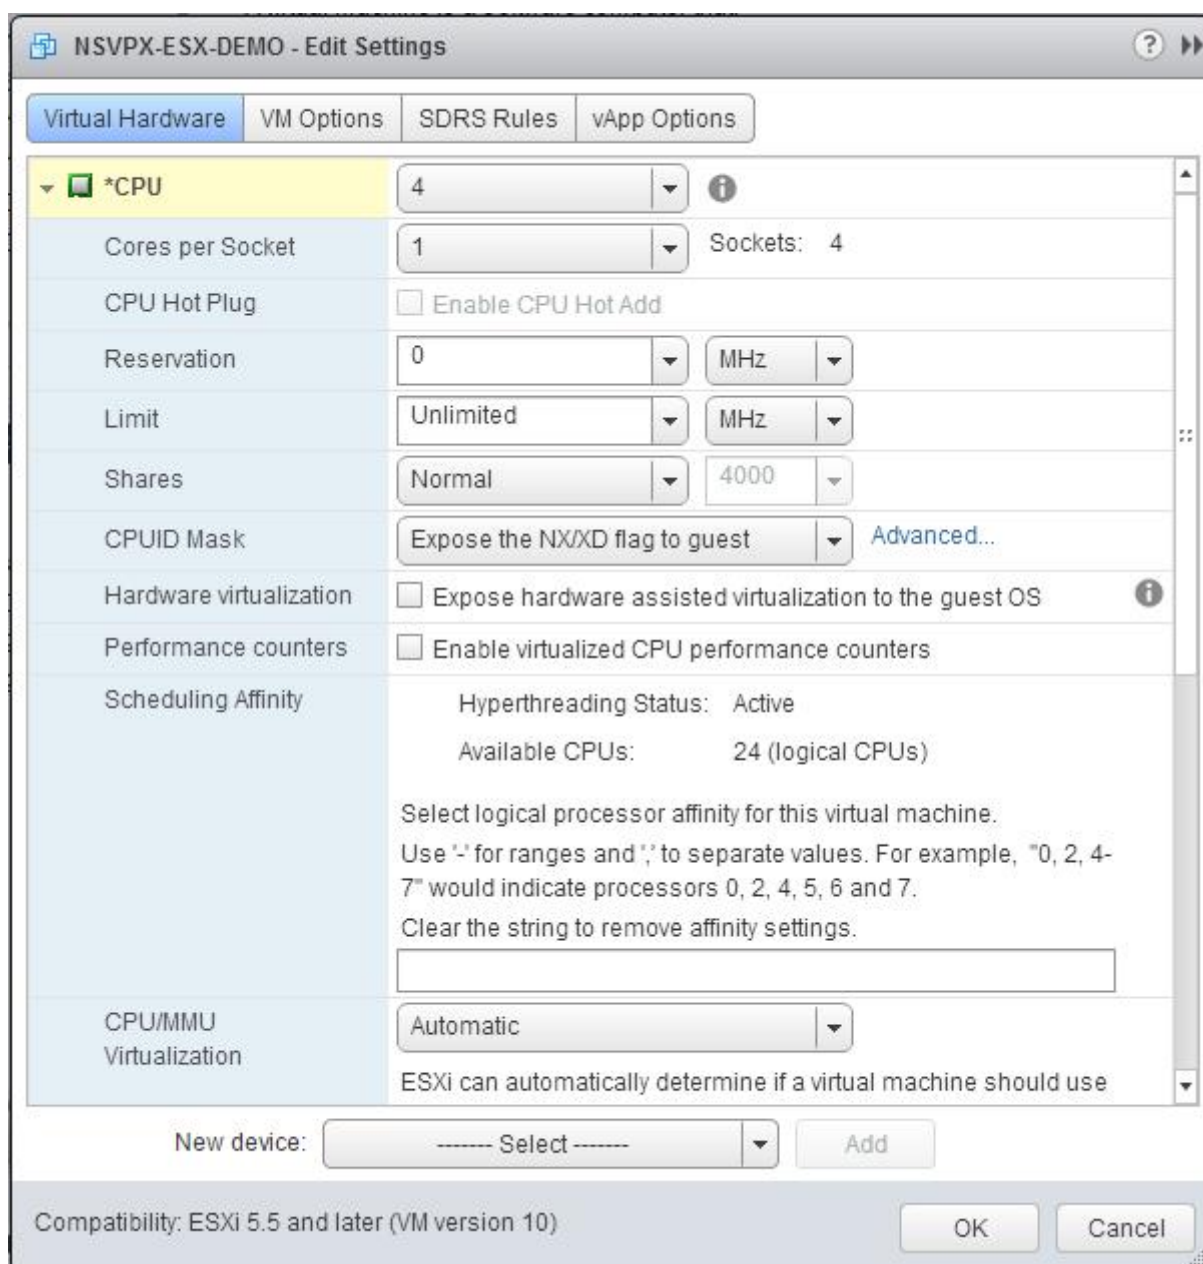

1. In the vSphere Web Client, select **Hosts and Clusters**.
2. Upgrade the Compatibility setting of the Citrix ADC VPX instance to ESX 5.5 or later, as follows:
  - a. Power off the Citrix ADC VPX instance.
  - b. Right-click the Citrix ADC VPX instance and select **Compatibility > Upgrade VM Compatibility**.
  - c. In the **Configure VM Compatibility** dialog box, select **ESXi 5.5 and later** from the **Compatible with** drop-down list and click **OK**.

3. Right-click on the Citrix ADC VPX instance and click **Edit Settings**.

4. In the **<virtual\_appliance> - Edit Settings** dialog box, click the **CPU** section.

5. In the **CPU** section, update the following settings:

- Number of CPUs
- Number of Sockets
- Reservations
- Limit
- Shares

Set the values as follows:

- a. In the **CPU** drop-down list, select the number of CPUs to assign to the virtual appliance.

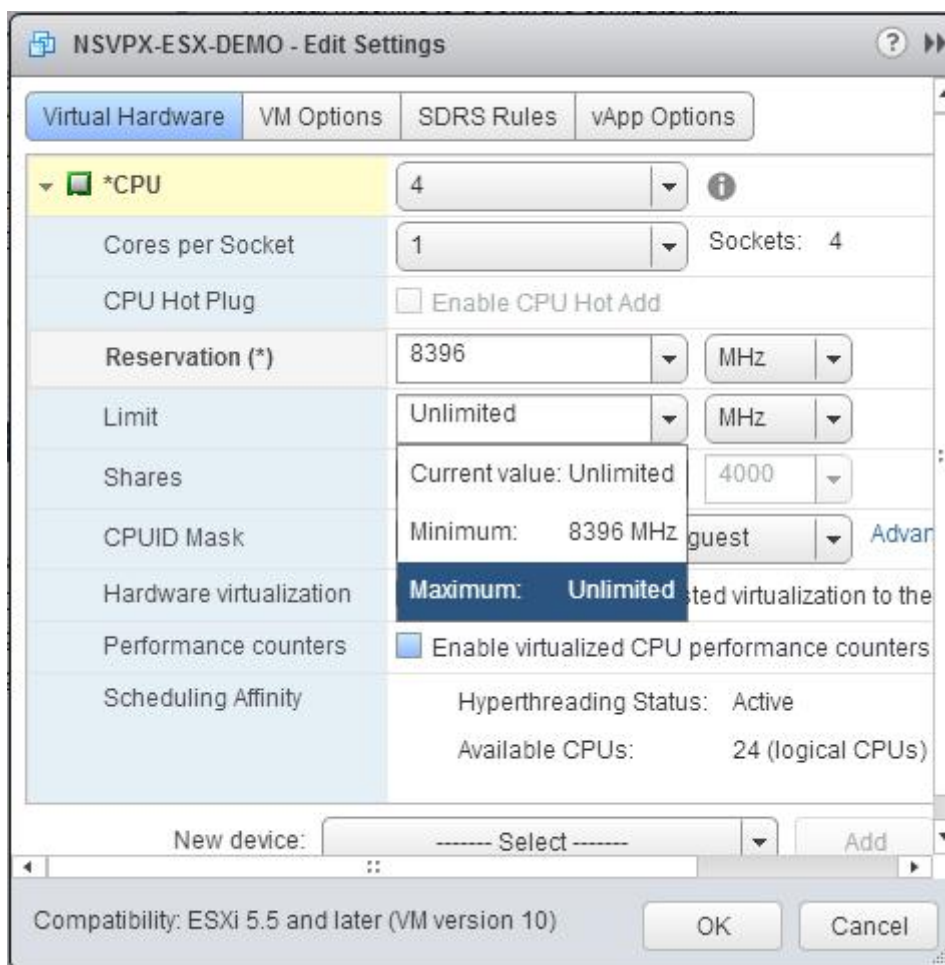

- b. In the **Cores per Socket** drop-down list, select the number of sockets.
- c. (Optional) In the **CPU Hot Plug** field, select or clear the **Enable CPU Hot Add** check box.

**Note:** Citrix recommends accepting the default (disabled).

- d. In the **Reservation** drop-down list, select the number that is shown as the maximum value.

- e. In the **Limit** drop-down list, select the number that is shown as the maximum value.

f. In the **Shares** drop-down lists, select **Custom** and the number that is shown as the maximum value.

6. In the **Memory** section, update the following settings:

- Size of RAM
- Reservations
- Limit
- Shares

Set the values as follows:

a. In the **RAM** drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPU is 4 then RAM = 4 x 2 GB = 8 GB.

**Note:** For Advanced or Premium edition of the Citrix ADC VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

b. In the **Reservation** drop-down list, enter the value for the memory reservation, and select the **Reserve all guest memory (All locked)** check box. The memory reservation should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be  $4 \times 2 \text{ GB} = 8 \text{ GB}$ .

**Note:** For Advanced or Premium edition of the Citrix ADC VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then  $\text{RAM} = 4 \times 4 \text{ GB} = 16 \text{ GB}$ .

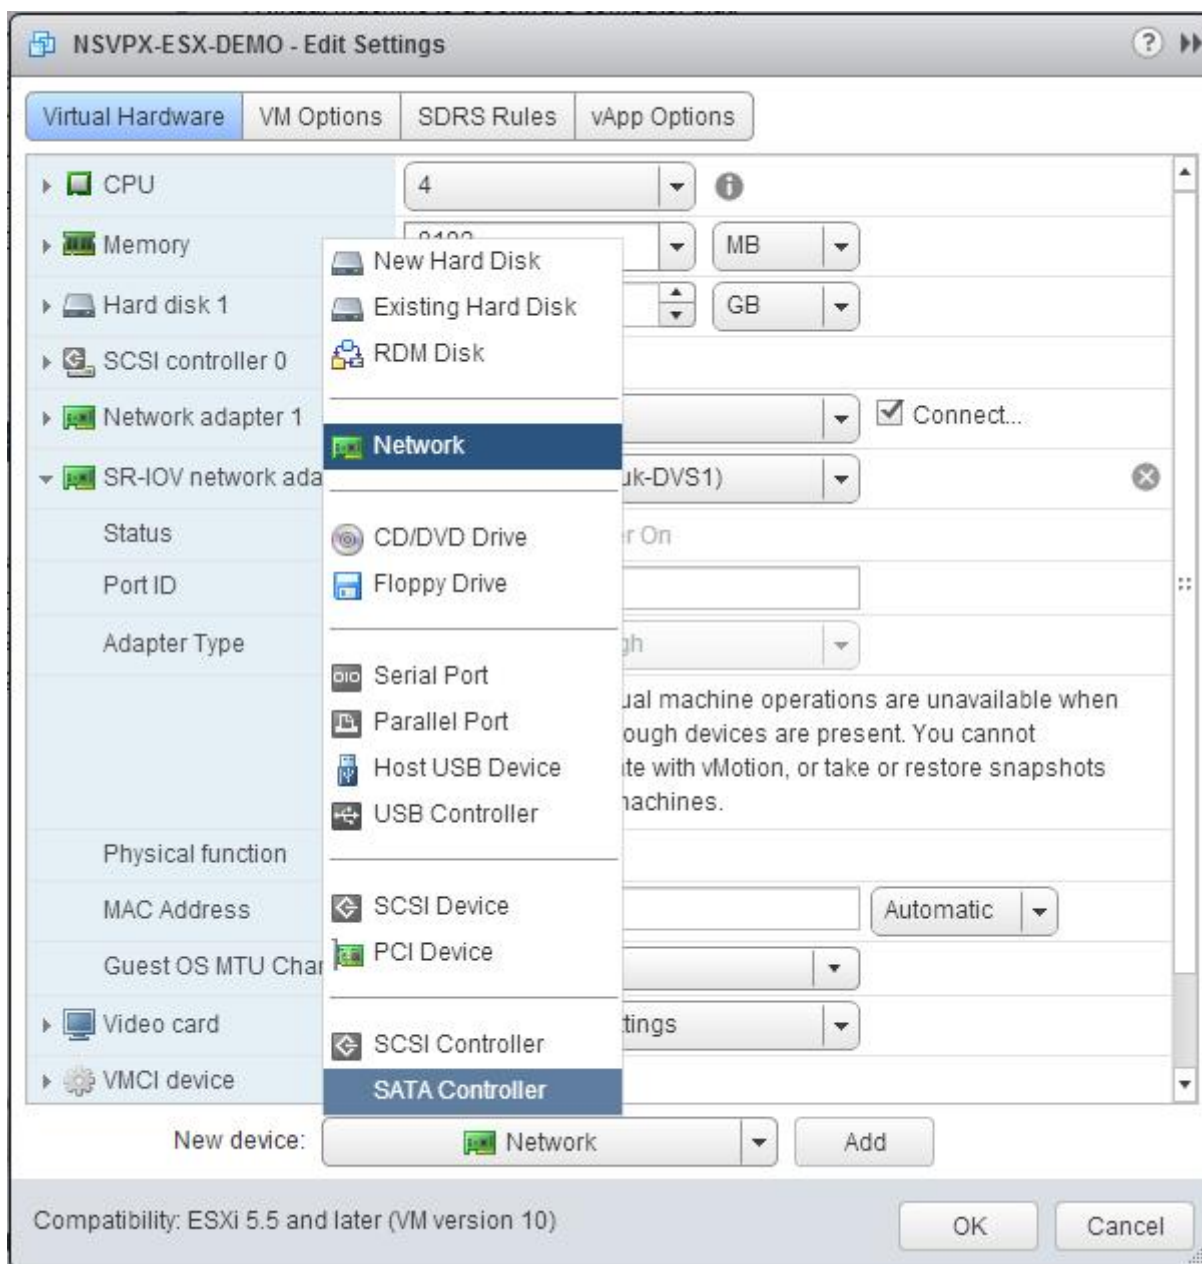

c. In the **Limit** drop-down list, select the number that is shown as the maximum value.

d. In the **Shares** drop-down lists, select **Custom**, and select the number that is shown as the maximum value.

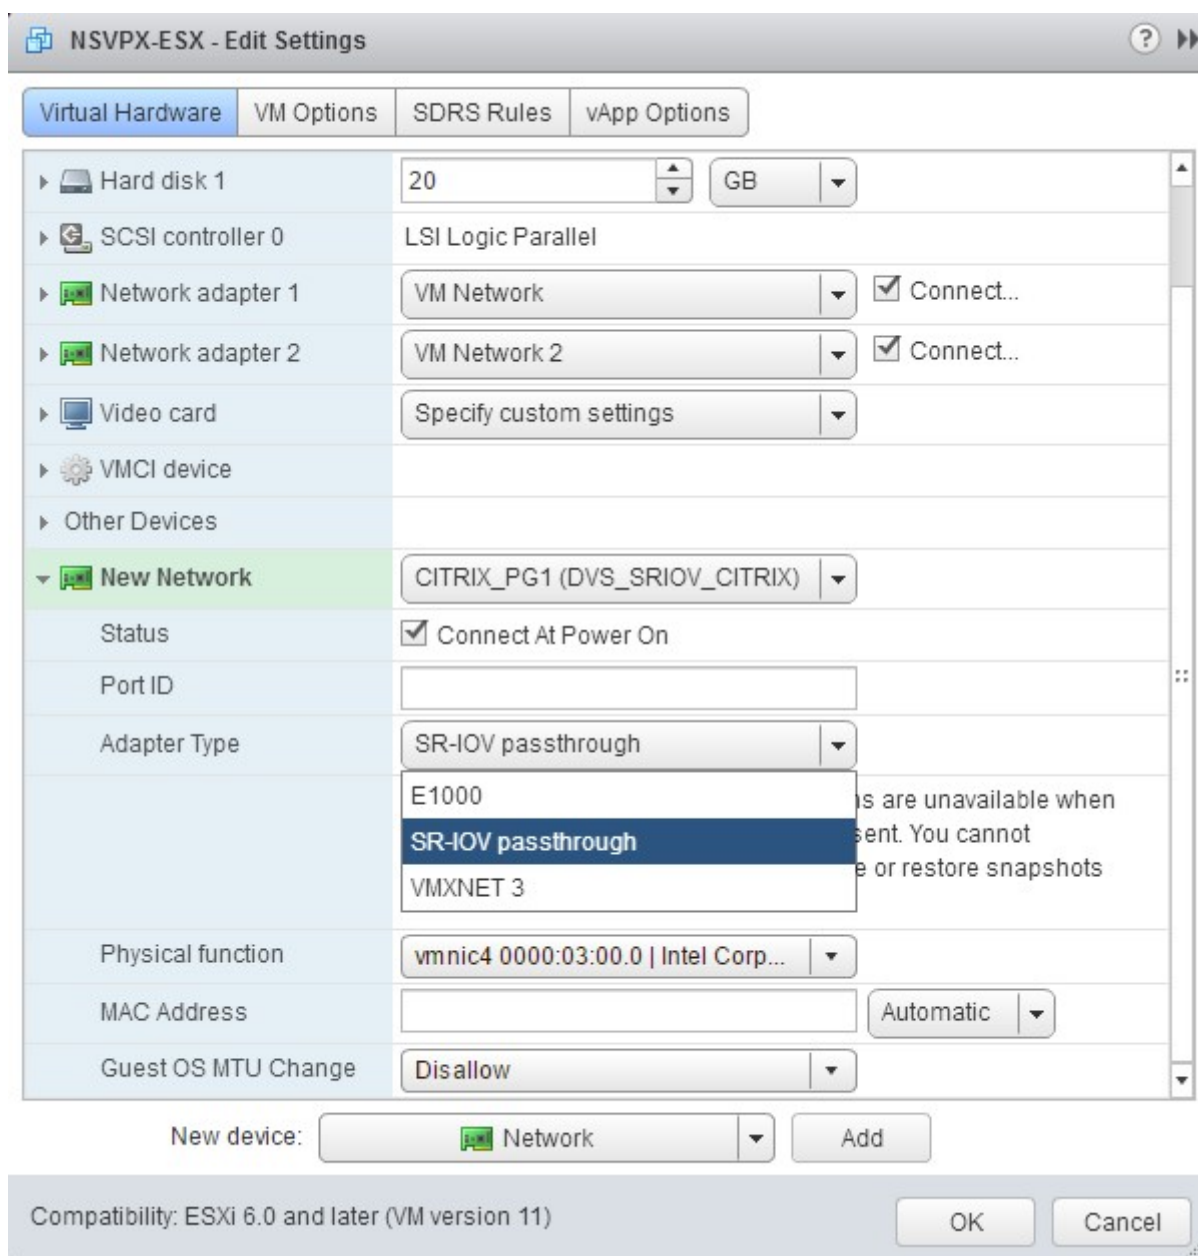

7. Add an SR-IOV network interface. From the **New device** drop-down list, select **Network** and click **Add**.

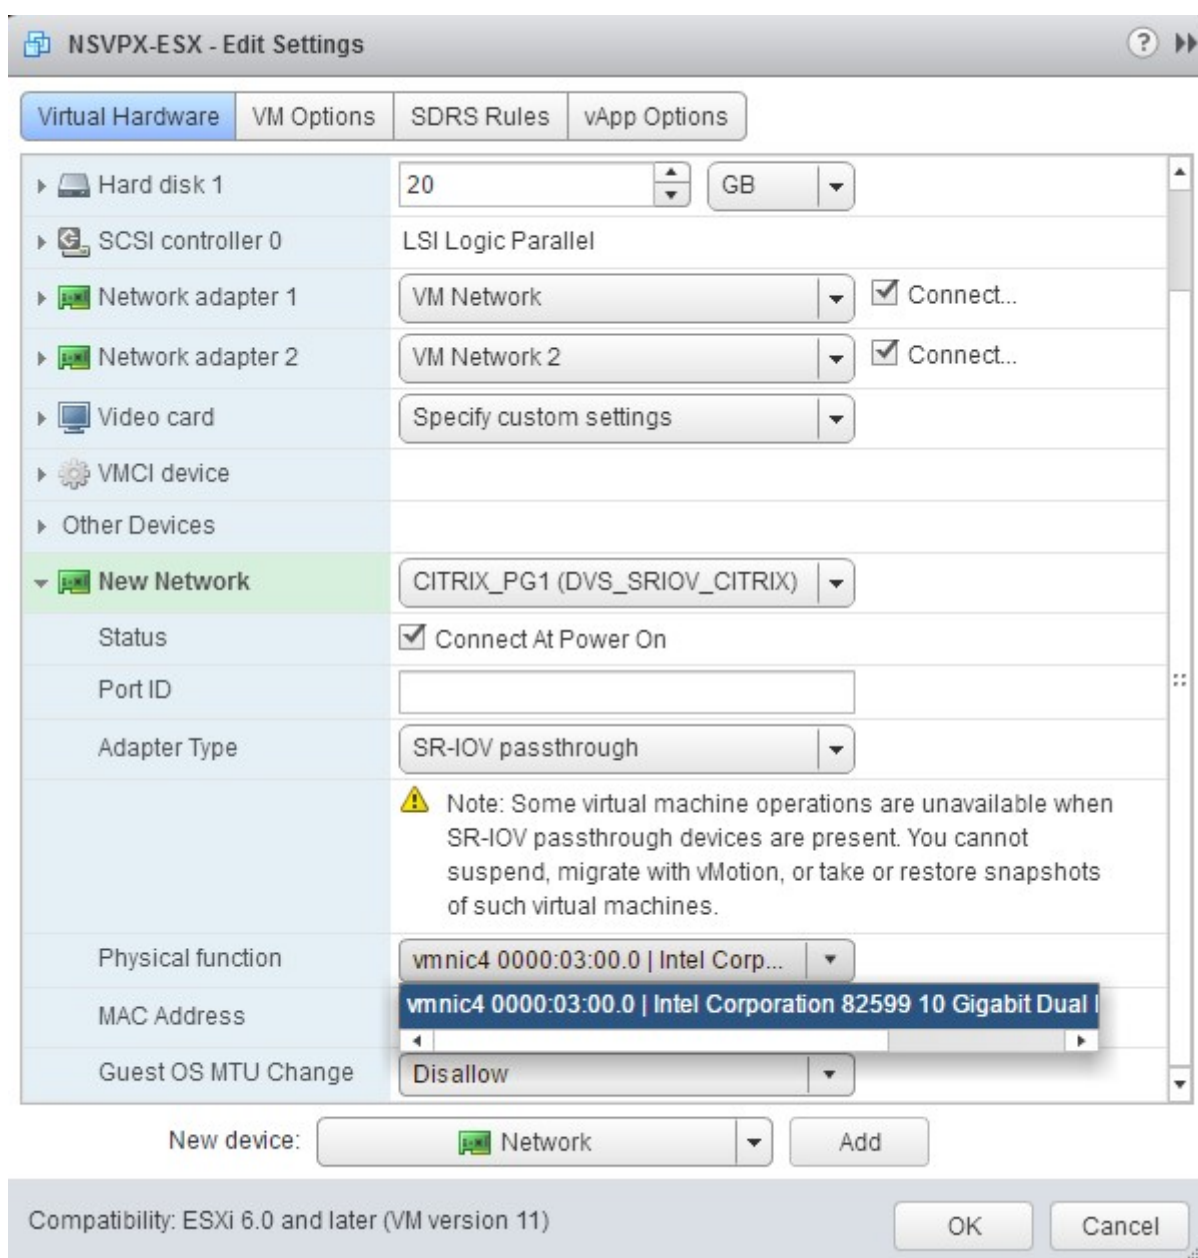

8. In the **New Network** section. From the drop-down list, select the Portgroup that you created, and do the following:
  - a. In the **Adapter Type** drop-down list, select **SR-IOV passthrough**.

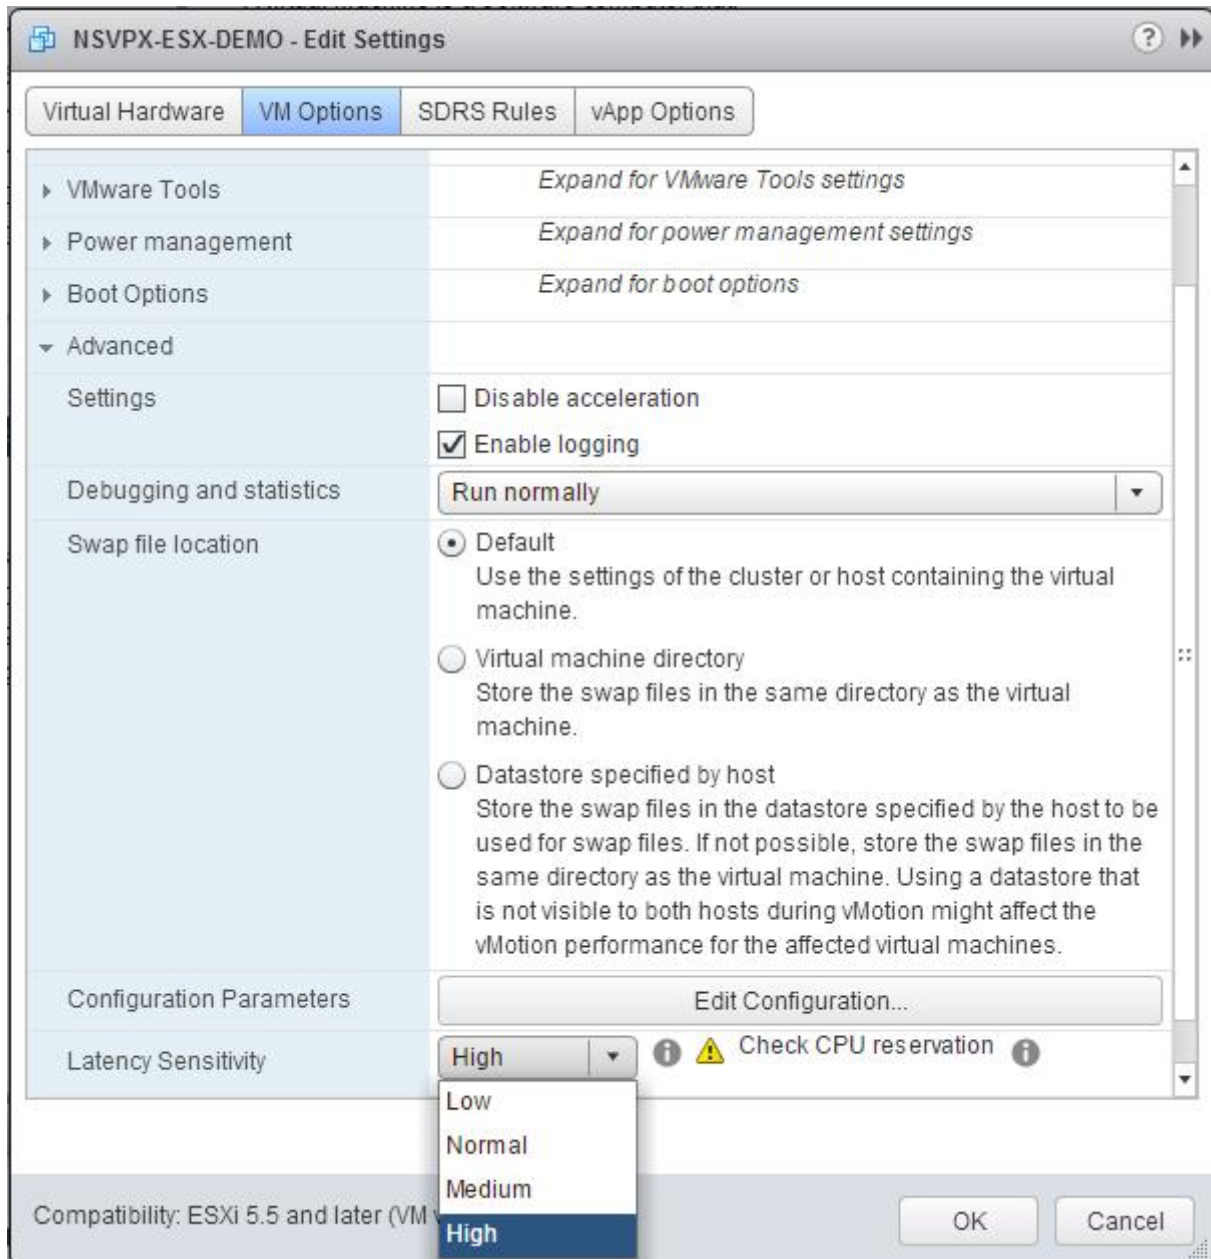

b. In the **Physical function** drop-down list, select the physical adapter mapped with the Port-group.

c. In the **Guest OS MTU Change** drop-down list, select **Disallow**.

9. In the **<virtual\_appliance> - Edit Settings** dialog box, click the **VM Options** tab.

10. On the **VM Options** tab, select the **Advanced** section. From the **Latency Sensitivity** drop-down list, select **High**.

11. Click **OK**.

12. Power on the Citrix ADC VPX instance.

13. Once the Citrix ADC VPX instance powers on, you can use the following command to verify the configuration:

```
1 > show interface summary
```

The output should show all the interfaces that you configured:

```
1 > show interface summary
```

```

2 -----
3      Interface  MTU      MAC      Suffix
4 -----

```

## Migrating the Citrix ADC VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces

September 21, 2020

May 24, 2018

You can configure your existing Citrix ADC VPX instances that use E1000 network interfaces to use SR-IOV or VMXNET3 network interfaces.

To configure an existing Citrix ADC VPX instance to use SR-IOV network interfaces, see [Configure a Citrix ADC VPX instance to use SR-IOV network interface](#).

To configure an existing Citrix ADC VPX instance to use VMXNET3 network interfaces, see [Configure a Citrix ADC VPX instance to use VMXNET3 network interface](#).

## Configure a Citrix ADC VPX instance to use PCI passthrough network interface

September 21, 2020

### Overview

After you have installed and configured a Citrix ADC VPX instance on VMware ESX Server, you can use the vSphere Web Client to configure the virtual appliance to use PCI passthrough network interfaces.

The PCI passthrough feature allows a guest virtual machine to directly access physical PCI and PCIe devices connected to a host.

### Prerequisites

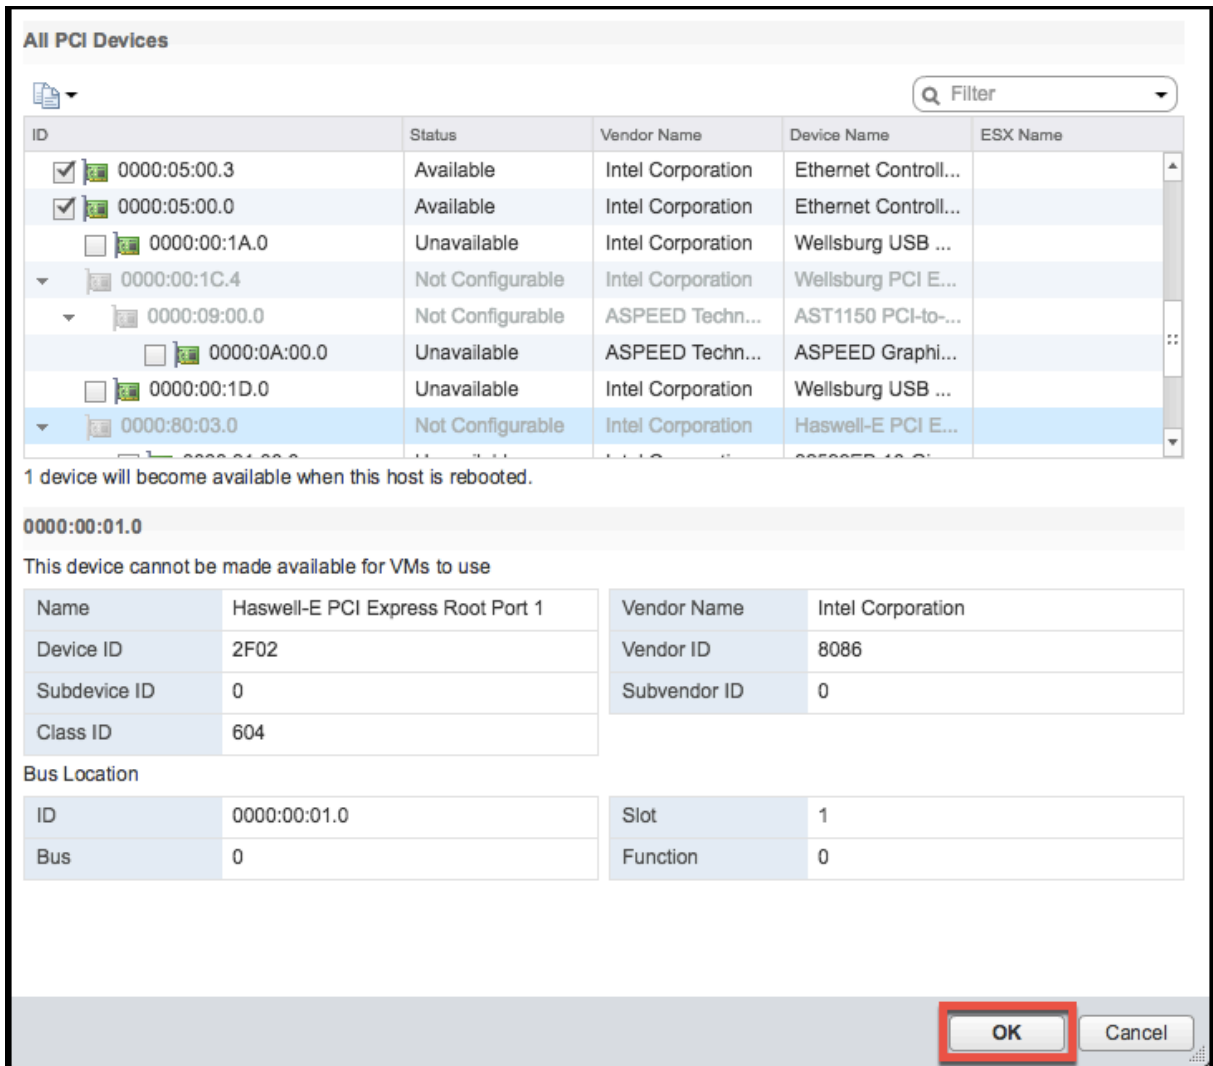

- The firmware version of the Intel XL710 NIC on the host is 5.04.
- A PCI passthrough device connected to and configured on the host
- Supported NICs:
  - Intel X710 10G NIC
  - Intel XL710 Dual Port 40G NIC
  - Intel XL710 Single Port 40G NIC

### Configure passthrough devices on a host

Before configuring a passthrough PCI device on a virtual machine, you should configure it on the host machine. Follow these steps to configure passthrough devices on a host.

1. Select the host from the Navigator panel of the vSphere Web Client.
2. Click **Manage > Settings > PCI Devices**. All available passthrough devices are displayed.
3. Right-click the device that you want to configure and click **Edit**.

4. The **Edit PCI Device Availability** window appears.
5. Select the devices to be used for passthrough and click **OK**.

6. Restart the host machine.

### Configure passthrough devices on a Citrix ADC VPX instance

Follow these steps to configure a passthrough PCI device on a Citrix ADC VPX instance.

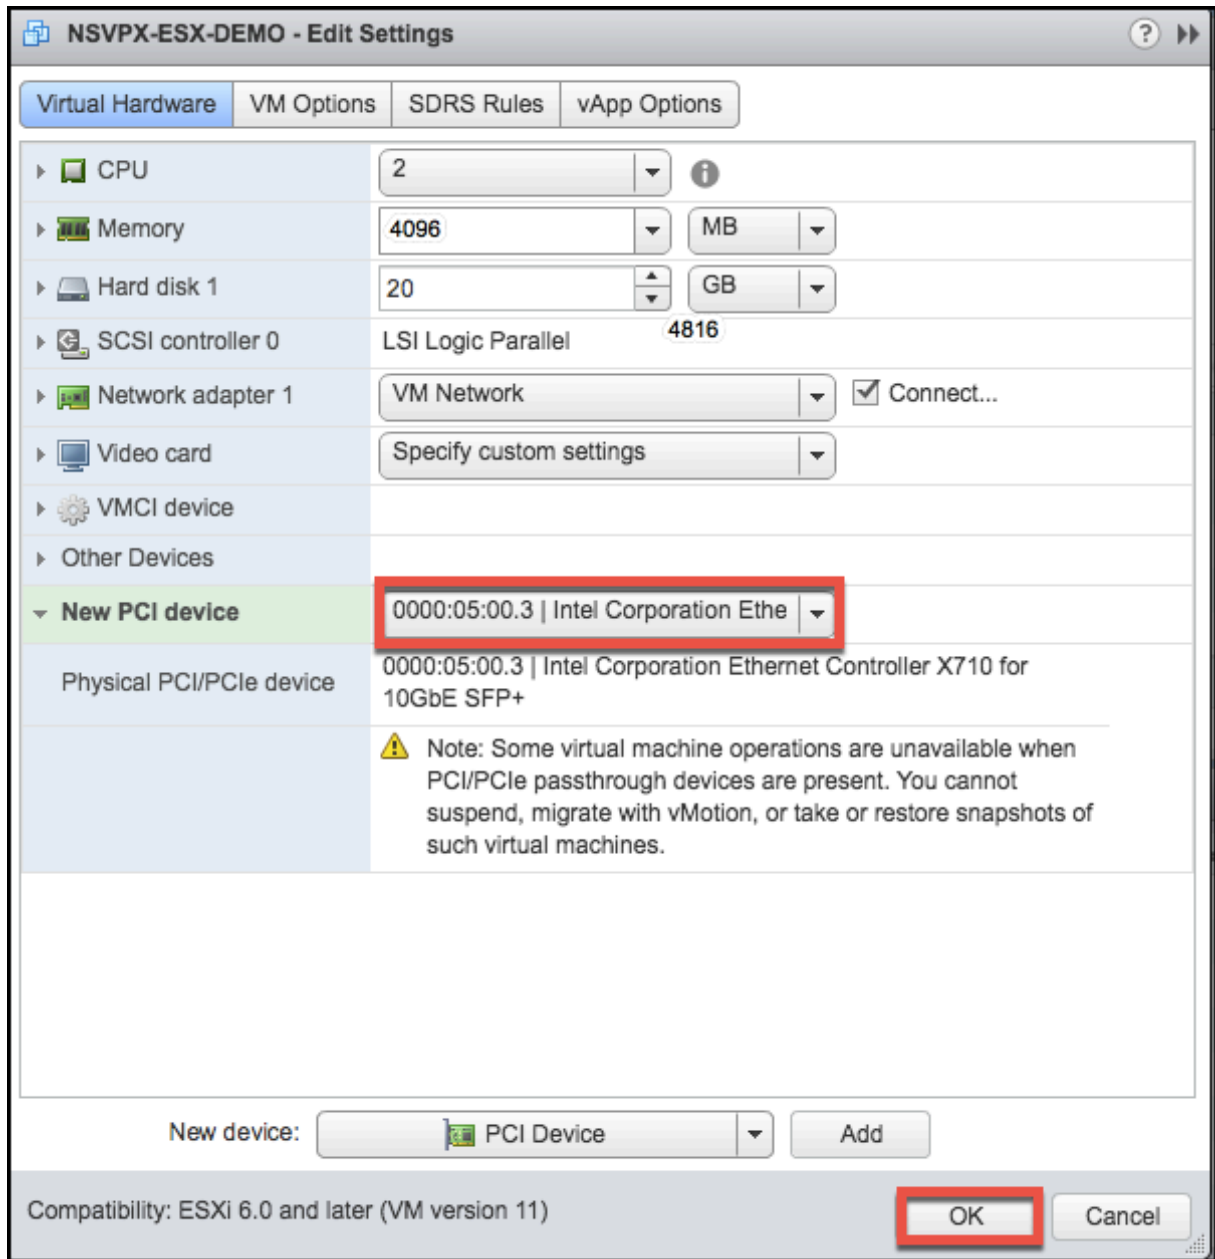

1. Power off the virtual machine.
2. Right-click the virtual machine and select **Edit Settings**.
3. On the **Virtual Hardware** tab, select **PCI Device** from the **New Device** drop-down menu, and click **Add**.

4. Expand **New PCI device** and select the passthrough device to connect to the virtual machine from the drop-down list and click **OK**.

**Note**

VMXNET3 network interface and PCI Passthrough Network Interface cannot coexist.

6. Power on the guest virtual machine.

You have completed the steps to configuring Citrix ADC VPX to use PCI passthrough network interfaces.

## Install a Citrix ADC VPX instance on Microsoft Hyper-V server

September 21, 2020

To install Citrix

Citrix ADC VPX instances on Microsoft Windows Server, you must first install Windows Server, with the

Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the network interface cards (NICs) on the server that Hyper-V will use to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the Citrix ADC VPX instance installation.

Citrix ADC VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install Citrix ADC VPX instance, you can configure the network adapters on virtual appliance, add virtual NICs, and then assign the Citrix ADC IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see [Upgrade a Citrix ADC VPX standalone appliance](#)

**Note**

Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the Citrix ADC VPX virtual appliance hosted on the HyperV-2012 platform.

### Prerequisites for installing Citrix ADC VPX instance on Microsoft servers

Before you begin installing a virtual appliance, do the following:

- Enable the Hyper-V role on Windows Servers . For more information, see [http://technet.microsoft.com/en-us/library/ee344837\(WS.10\).aspx](http://technet.microsoft.com/en-us/library/ee344837(WS.10).aspx).
- Download the virtual appliance setup files.
- Obtain Citrix ADC VPX instance license files. For more information about Citrix ADC VPX instance licenses, see the *Citrix ADC VPX Licensing Guide* at <http://support.citrix.com/article/ctx131110>.

### Microsoft server hardware requirements

The following table describes the minimum system requirements for Microsoft Servers.

Table 1. Minimum system requirements for Microsoft servers

Component	Requirement
CPU	1.4 GHz 64-bit processor
RAM	3 GB
Disk Space	32 GB or greater

The following table lists the virtual computing resources for each Citrix ADC VPX instance.

Table 2. Minimum virtual computing resources required for running a Citrix ADC VPX instance

Component	Requirement
RAM	2 GB
Virtual CPU	2
Disk Space	20 GB
Virtual Network Interfaces	1

### Download the Citrix ADC VPX setup files

The Citrix ADC VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from the Citrix website. You need a Citrix account to log in. If you do not have a Citrix account, access the home page at <http://www.citrix.com>, click **Sign In > My account > Create Citrix Account**, and follow the instructions to create a Citrix account.

To download the Citrix ADC VPX instance setup files, follow these steps:

1. In a web browser, go to <http://www.citrix.com/>.
2. Sign in with your user name and password.
3. Click **Downloads**.
4. In **Select a Product** drop-down menu, select **Citrix ADC (NetScaler ADC)**.
5. Under **Citrix ADC Release X.X > Virtual Appliances**, click **Citrix ADC VPX Release X.X**
6. Download the compressed file to your server.

### Install the Citrix ADC VPX instance on Microsoft servers

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install Citrix ADC VPX instance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

#### Note

You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

### To install Citrix ADC VPX instance on Microsoft Server by using Hyper-V Manager:

1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.
2. In the navigation pane, under **Hyper-V Manager**, select the server on which you want to install Citrix ADC VPX instance.
3. On the **Action** menu, click **Import Virtual Machine**.
4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the Citrix ADC VPX instance software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.
5. Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
6. Click **Import**.
7. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.
8. To install another virtual appliance, repeat steps **2** through **6**.

**Important**

Make sure that you extract the files to a different folder in step **4**.

**Auto-provision a Citrix ADC VPX instance on Hyper-V**

Auto-provisioning of Citrix ADC VPX instance is optional. If auto-provisioning is not done, the virtual appliance provides an option to configure the IP address and so on.

To auto-provision Citrix ADC VPX instance on Hyper-V, follow these steps.

1. Create an ISO9660 compliant ISO image using the xml file as depicted in the example. Make sure that the name of the xml file is **userdata**.

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id=""
xmlns="http://schemas.dmtf.org/ovf/environment/1">
<PlatformSection>
<Kind>HYPER-V</Kind>
<Version>2013.1</Version>
<Vendor>CISCO</Vendor>
<Locale>en</Locale>
```

```
</PlatformSection>
<PropertySection>
<Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
<Property oe:key="com.citrix.netscaler.platform" oe:value="NS1000V"/>
<Property oe:key="com.citrix.netscaler.orch_env" oe:value="cisco-orch-env"/>
<Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.102.100.122"/>
<Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.128"/>
<Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.102.100.67"/></PropertySection>
</Environment>
```

2. Copy the ISO image to hyper-v server.
3. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**. You can also select the virtual appliance and then right click and select **Settings**. The **Settings** window for the selected virtual appliance is displayed.
4. In the **Settings** window, under the hardware section, click on **IDE Controller**.
5. In the right window pane, select **DVD Drive** and click on **Add**. The DVD Drive is added under the **IDE Controller** section in the left window pane.
6. Select the **DVD Drive** added in step 5. In the right window pane, select the Image file radio button and click on Browse and select the ISO image that you copied on Hyper-V server, in step 2.
7. Click **Apply**.

**Note**

The virtual appliance instance comes up in the default IP address, when:

- The DVD drive is attached and the ISO file is not provided.
- The ISO file does not include the userdata file.
- The userdata file name or format is not correct.

To configure virtual NICs on the Citrix ADC VPX instance, follow these steps:

1. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**.
2. In the **Settings for <virtual appliance name>** dialog box, click **Add Hardware** in the left pane.
3. In the right pane, from the list of devices, select **Network Adapter**.
4. Click **Add**.
5. Verify that **Network Adapter (not connected)** appears in the left pane.
6. Select the network adapter in the left pane.

7. In the right pane, from the **Network** drop-down list, select the virtual network to connect the adapter to.
8. To select the virtual network for additional network adapters that you want to use, repeat steps **6** and **7**.
9. Click **Apply**, and then click **OK**.

#### To configure the Citrix ADC VPX instance:

1. Right-click the virtual appliance that you previously installed, and then select **Start**.
2. Access the console by double-clicking the virtual appliance.
3. Type the Citrix ADC IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

#### Note

You can also use virtual machine (VM) template to provision Citrix ADC VPX instance using SCVMM. If you use Microsoft Hyper-V NIC teaming solution with NetScaler VPX instances, see article [CTX224494](#) for more information.

## Install a Citrix ADC VPX instance on Linux-KVM platform

September 21, 2020

To set up a Citrix ADC VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virt-Manager) application. If you prefer the Linux-KVM command line, you can use the `virsh` program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a Citrix ADC VPX instance, you can add additional interfaces.

### Limitations and usage guidelines

#### General recommendations

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the `vnet` interface associated with the VPX VM. Shut down the VPX VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the VPX VM. That is, do not use the **Force off** command.

- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
- The Citrix ADC package has to be unique for each of the Citrix ADC VPX instance provisioned.

### Limitations

- Live migration of a VPX instance that runs on KVM is not supported.

## Prerequisites for installing a Citrix ADC VPX instance on Linux-KVM platform

March 30, 2021

Check the minimum system requirements for a Linux-KVM server running a Citrix ADC VPX instance.

### CPU requirement:

- 64-bit x86 processors with the hardware virtualization features included in the AMD-V and Intel VT-X processors.

To test whether your CPU supports Linux host, enter the following command at the host Linux shell prompt:

```
1 *.egrep '^flags.*(vmx|svm)' /proc/cpuinfo*
2 <!--NeedCopy-->
```

If the BIOS settings for the above extension are disabled, you must enable them in BIOS.

- Provide at least 2 CPU cores to Host Linux.
- There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.

### Memory (RAM) requirement:

Minimum 4 GB for the host Linux kernel. Add additional memory as required by the VMs.

### Hard disk requirement:

Calculate the space for Host Linux kernel and VM requirements. A single Citrix ADC VPX VM requires 20 GB of disk space.

## Software requirements

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, Centos, and Fedora, have tested kernel versions and associated virtualization tools.

## Guest VM hardware requirements

Citrix ADC VPX supports IDE and virtIO hard disk type. The Hard Disk Type has been configured in the XML file, which is a part of the Citrix ADC package.

## Networking requirements

Citrix ADC VPX supports virtIO para-virtualized, SR-IOV, and PCI Passthrough network interfaces.

For more information about the supported network interfaces, see:

- [Provision the Citrix ADC VPX instance by using the Virtual Machine Manager](#)
- [Configure a Citrix ADC VPX instance to use SR-IOV network interfaces](#)
- [Configure a Citrix ADC VPX instance to use PCI passthrough network interfaces](#)

## Source Interface and Modes

The source device type can be either Bridge or MacVTap. In case of MacVTap, four modes are possible - VEPA, Bridge, Private and Pass-through.

Check the types of interfaces that you can use and the supported traffic types, as given below.

### Bridge:

- Linux Bridge.
- Ebtables and iptables settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable IPTable services.

### MacVTap (VEPA mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same
- lower device is possible only if upstream or downstream switch supports VEPA mode.

### MacVTap (private mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.

- Inter-VM communication using the same lower device is not possible.

**MacVTap (bridge mode):**

- Better as compared to bridge.
- Interfaces out of same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible, if lower device link is UP.

**MacVTap (Pass-through mode):**

- Better as compared to bridge.
- Interfaces out of same lower device cannot be shared across the VMs.
- Only one VM can use the lower device.

Note: For best performance by the VPX instance, ensure that the gro and lro capabilities are switched off on the source interfaces.

**Properties of source interfaces**

Make sure that you switch off the generic-receive-offload (gro) and large-receive-offload (lro) capabilities of the source interfaces. To switch off the gro and lro capabilities, run the following commands at the host Linux shell prompt.

```
ethtool -K eth6 gro off
```

```
ethtool -K eth6 lro off
```

**Example:**

```
1 [root@localhost ~]# ethtool -K eth6
2
3           Offload parameters for eth6:
4
5                       rx-checksumming: on
6
7                       tx-checksumming: on
8
9           scatter-gather: on
10
11           tcp-segmentation-offload: on
12
13           udp-fragmentation-offload: off
14
15           generic-segmentation-offload: on
16
17           generic-receive-offload: off
18
```

```
19         large-receive-offload: off
20
21         rx-vlan-offload: on
22
23         tx-vlan-offload: on
24
25         ntuple-filters: off
26
27         receive-hashing: on
28
29     [root@localhost ~]#
30 <!--NeedCopy-->
```

**Example:**

If the host Linux bridge is used as a source device, as in the following example, gro and lro capabilities must be switched off on the vnet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```
1     [root@localhost ~]# brctl show eth6_br
2
3     bridge name      bridge id           STP enabled interfaces
4
5     eth6_br          8000.00e0ed1861ae   no           eth6
6
7                                     vnet0
8
9                                     vnet2
10
11     [root@localhost ~]#
12 <!--NeedCopy-->
```

In the above example, the two virtual interfaces are derived from the eth6\_br and are represented as vnet0 and vnet2. Run the following commands to switch off gro and lro capabilities on these interfaces.

```
1     ethtool -K vnet0 gro off
2         ethtool -K vnet2 gro off
3         ethtool -K vnet0 lro off
4         ethtool -K vnet2 lro off
5 <!--NeedCopy-->
```

## Promiscuous mode

The promiscuous mode has to be enabled for the following features to work:

- L2 mode
- Multicast traffic processing
- Broadcast
- IPV6 traffic
- Virtual MAC
- Dynamic routing

Use the following command to enable the promiscuous mode.

```
1 [root@localhost ~]# ifconfig eth6 promisc
2 [root@localhost ~]# ifconfig eth6
3 eth6      Link encap:Ethernet  HWaddr 78:2b:cb:51:54:a3
4           inet6 addr: fe80::7a2b:cbff:fe51:54a3/64 Scope:Link
5           UP BROADCAST RUNNING PROMISC MULTICAST  MTU:9000  Metric
6           :1
7           RX packets:142961 errors:0 dropped:0 overruns:0 frame:0
8           TX packets:2895843 errors:0 dropped:0 overruns:0 carrier
9           :0
10          collisions:0 txqueuelen:1000
11          RX bytes:14330008 (14.3 MB)  TX bytes:1019416071 (1.0 GB)
12 [root@localhost ~]#
13 <!--NeedCopy-->
```

## Module required

For better network performance, make sure the `vhost_net` module is present in the Linux host. To check the existence of `vhost_net` module, run the following command on the Linux host :

```
1 lsmod | grep "vhost\_net"
2 <!--NeedCopy-->
```

If `vhost_net` is not yet running, enter the following command to run it:

```
1 modprobe vhost\_net
2 <!--NeedCopy-->
```

## Provision the Citrix ADC VPX instance by using OpenStack

September 21, 2020

You can provision a Citrix ADC VPX instance in an Openstack environment either by using the Nova boot command (OpenStack CLI) or Horizon (OpenStack dashboard) .

Provisioning a VPX instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance as a CD-ROM device when it boots. This configuration drive can be used to pass networking configuration such as management IP address, network mask, default gateway, and to inject customer scripts.

In a Citrix ADC appliance, the default authentication mechanism is password based. Now, SSH key-pair authentication mechanism is supported for Citrix ADC VPX instances on OpenStack environment.

The key-pair (public key and private key) needs to be generated before using Public Key Cryptography mechanism. You can use different mechanisms, such as Horizon, Puttygen.exe for Windows, and ssh-keygen for Linux environment, to generate the key pair. Refer to online documentation of respective mechanisms for more information about generating key pair.

Once a key pair is available, copy the private key to a secure location to which authorized persons will have access. In OpenStack, public key can be deployed on a VPX instance by using Horizon or Nova boot command. When a VPX instance is provisioned by using OpenStack, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string. This string is "OpenStack Foundation" and for Red Hat Linux distributions it is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hypervisor platform. The drive should have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the network configuration, custom scripts, and SSH key pair if provided.

### Userdata file

The Citrix ADC VPX instance uses a customized OVF file, also known as userdata file, to inject network configuration, custom scripts. This file is provided as part of config drive. Here is an example of a customized OVF file.

```
1 <?xml version="1.0" encoding="UTF-8" standalone="no"?>
2 <Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
3 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
4 oe:id=""
5 xmlns="http://schemas.dmtf.org/ovf/environment/1"
6 xmlns:cs="http://schemas.citrix.com/openstack">
7 <PlatformSection>
```

```
8 <Kind></Kind>
9 <Version>2016.1</Version>
10 <Vendor>VPX</Vendor>
11 <Locale>en</Locale>
12 </PlatformSection>
13 <PropertySection>
14 <Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
15 <Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
16 <Property oe:key="com.citrix.netscaler.orch_env" oe:value="openstack-
    orch-env"/>
17 <Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
18 <Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="
    255.255.255.0"/>
19 <Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1
    "/>
20 </PropertySection>
21 <cs:ScriptSection>
22   <cs:Version>1.0</cs:Version>
23   <ScriptSettingSection xmlns="http://schemas.citrix.com/openstack"
    xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
24     <Scripts>
25       <Script>
26         <Type>shell</Type>
27         <Parameter>X Y</Parameter>
28         <Parameter>Z</Parameter>
29         <BootScript>before</BootScript>
30         <Text>
31           #!/bin/bash
32           echo "Hi, how are you" $1 $2 >> /var/sample.txt
33         </Text>
34       </Script>
35       <Script>
36         <Type>python</Type>
37         <BootScript>after</BootScript>
38         <Text>
39           #!/bin/python
40           print("Hello");
41         </Text>
42       </Script>
43       <Script>
44         <Type>perl</Type>
45         <BootScript>before</BootScript>
46         <Text>
47           !/usr/bin/perl
48         my $name = "VPX";
```

```
49 print "Hello, World $name !\n" ;
50     </Text>
51     </Script>
52     <Script>
53         <Type>nscli</Type>
54         <BootScript>after</BootScript>
55         <Text>
56             add vlan 33
57 bind vlan 33 -ifnum 1/2
58         </Text>
59     </Script>
60 </Scripts>
61 </ScriptSettingSection>
62 </cs:ScriptSection>
63 </Environment>
```

In the OVF file above “PropertySection” is used for NetScaler networking configuration while `<cs:ScriptSection>` is used to enclose all scripts. `<Scripts></Scripts>` tags are used to bundle all scripts together. Each script is defined in between `<Script> </Script>` tags. Each script tag has following fields/tags:

- a) `<Type>`: Specifies value for script type. Possible values: Shell/Perl/Python/NSCLI (for NetScaler CLI scripts)
- b) `<Parameter>`: Provides parameters to the script. Each script can have multiple `<Parameter>` tags.
- c) `<BootScript>`: Specifies script execution point. Possible values for this tag: before/after. “before” specifies script will be executed before PE comes up. “after” specifies that the script will be executed after PE comes up.
- d) `<Text>`: Pastes content of a script.

**Note**

Currently the VPX instance does not take care of sanitization of scripts. As an administrator, you should check the validity of the script.

Not all sections need to be present. Use an empty “PropertySection” to only define scripts to execute on first boot or an empty `<cs:ScriptSection>` to only define networking configuration.

After the required sections of the OVF file (userdata file) are populated, use that file to provision the VPX instance.

**Network configuration**

As part of network configuration, the VPX instance reads:

- Management IP address
- Network mask
- Default gateway

After the parameters are successfully read, they are populated in the NetScaler configuration, to allow managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

### Customer script

The VPX instance allows to execute a custom script during initial provisioning. The appliance supports script of type Shell, Perl, Python, and Citrix ADC CLI commands.

### SSH key pair authentication

The VPX instance copies public key, available within the configuration drive as part of instance meta data, into its “authorized\_keys” file. This allows the user to access the instance with private key.

#### Note

When an SSH key is provided, the default credentials (nsroot/nsroot) no longer work. If password-based access is needed, log on with the respective SSH private key and manually set a password.

### Before you begin

Before you provision a VPX instance on OpenStack environment, extract the .qcow2 file from the .tgz file and build

an OpenStack image from the qcow2 image. Follow these steps:

1. Extract the .qcow2 file from the .tgz file by typing the following command.

```
1 tar xvzf <TAR file>
2
3 tar xvzf <NSVPX-KVM-12.0-26.2_nc.tgz>
4 NSVPX-KVM.xml
5 NSVPX-KVM-12.0-26.2_nc.qcow2
```

2. Build an OpenStack image using the .qcow2 file extracted in step 1 by typing the following command.

```

1 openstack image create --container-format bare --property hw_disk_bus=
  ide --disk-format qcow2 --file <path to qcow2 file> --public <name
  of the OpenStack image>
2
3 glance image-create --name="NS-VPX-12-0-26-2" --property hw_disk_bus=
  ide --ispublic=
4 true --container-format=bare --disk-format=qcow2< NSVPX-KVM-12.0-26.2
  _nc.qcow2

```

**Figure 1:** The following illustration provides a sample output for the glance image-create command.

Field	Value
checksum	154ade3fc7dca7d1706b1d03d7d97552

## Provisioning the VPX instance

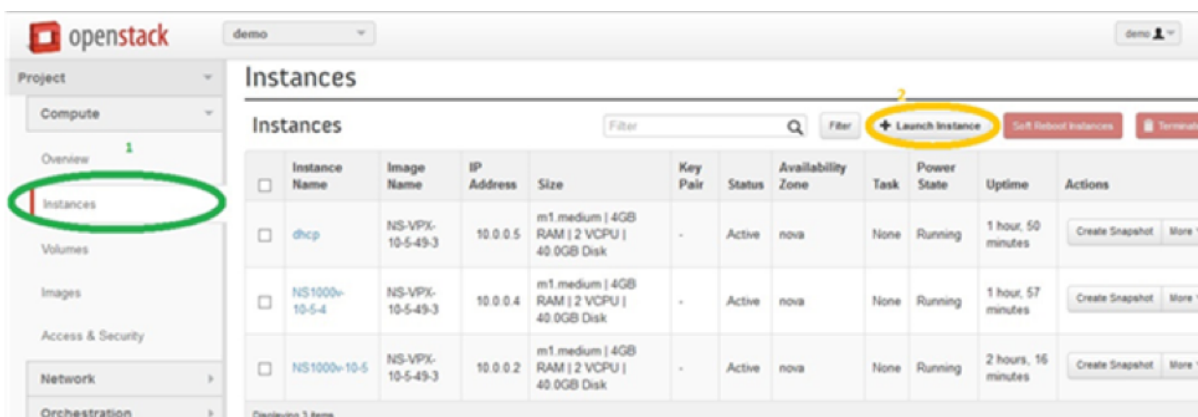

You can provision a VPX instance in two ways by using one of the options:

- Horizon (OpenStack dashboard)
- Nova boot command (OpenStack CLI)

### Provision a VPX instance by using the OpenStack dashboard

Follow these steps to provision the VPX instance by using Horizon:

1. Log on to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select **Instances**.
3. In the Instances panel, click **Launch Instance** to open the Instance Launching wizard.

4. In the Launch Instance wizard, fill in the details, like:

1. Instance Name
2. Instance Flavor
3. Instance Count
4. Instance Boot Source
5. Image Name

## Launch Instance ✕

**Total RAM** 24,576 of 51,200 MB Used  

Cancel
Launch

5. Deploy a new key pair or an existing key pair through Horizon by completing the following steps:
  - a) If you don't have an existing key pair, create the key by using any existing mechanisms. If you've an existing key, skip this step.
  - b) Copy the content of public key.
  - c) Go to **Horizon > Instances > Create New Instances**.
  - d) Click **Access & Security**.
  - e) Click the + sign next to the **Key Pair** drop-down menu and provide values for shown parameters.
  - f) Paste public key content in *Public key* box, give a name to the key and click **Import Key Pair**.

## Import Key Pair

Key Pair Name \*

Public Key \*

```
ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAQACjZih

5UY0IYyGk7aW/2SXjzkWRqZ8cX1Oba0XoDiCYN
apRVOT6FB//ykrwu+BSVF4v0og3
```

**Description:**

Key Pairs are how you login to your instance after it is launched.

Choose a key pair name you will recognise and paste your SSH public key into the space provided.

SSH key pairs can be generated with the ssh-keygen command:

```
ssh-keygen -t rsa -f cloud.key
```

This generates a pair of keys: a key you keep private (cloud.key) and a public key (cloud.key.pub). Paste the contents of the public key file here.

After launching an instance, you login using the private key (the username might be different depending on the image you launched):

```
ssh -i cloud.key <username>@<instance_ip>
```

Cancel Import Key Pair

6. Click the **Post Creation** tab in the wizard. In Customization Script, add the content of the userdata file. The userdata file contains the IP address, Netmask and Gateway details, and customer scripts of the VPX instance.

7. After a key pair is selected or imported, check config-drive option and click **Launch**.

### Provision the VPX instance by using OpenStack CLI

Follow these steps to provision a VPX instance by using OpenStack CLI.

1. To create an image from qcow2, type the following command:

```
1 openstack image create --container-format bare --property hw_disk_bus=
   ide --diskformat qcow2 --file NSVPX-OpenStack.qcow2 --public VPX-
   ToT-Image
```

2. To select an image for creating an instance, type the following command:

```
1 openstack image list | more
```

3. To create an instance of a particular flavor, type the following command to choose a flavor ID/Name of from a list:

```
1 openstack flavor list
```

4. To attach a NIC to a particular network, type the following command to choose a network ID from a network list:

```
1 openstack network list
```

5. To create an instance, type the following command:

```
1 openstack server create --flavor FLAVOR_ID --image IMAGE_ID --key-name
   KEY_NAME
2 --user-data USER_DATA_FILE_PATH --config-drive True --nic net-id=net-
   uuid
3 INSTANCE_NAME
4 openstack server create --image VPX-ToT-Image --flavor m1.medium --user
   -data
5 ovf.xml --config-drive True --nic net-id=2734911b-ee2b-48d0-a1b6-3
   efd44b761b9
6 VPX-ToT
```

## Provision the Citrix ADC VPX instance by using the Virtual Machine Manager

September 21, 2020

The Virtual Machine Manager is a desktop tool for managing VM guests. It enables you to create new VM guests and various types of storage, and manage virtual networks. You can access the graphical console of VM guests with the built-in VNC viewer and view performance statistics, either locally or remotely.

After installing your preferred Linux distribution, with KVM virtualization enabled, you can proceed with provisioning virtual machines.

While using the Virtual Machine Manager to provision a Citrix ADC VPX instance, you have two options:

- Enter the IP address, gateway, and netmask manually
- Assign the IP address, gateway, and netmask automatically (auto-provisioning)

You can use two kinds of images to provision a Citrix ADC VPX instance:

- RAW
- QCOW2

You can convert a Citrix ADC VPX RAW image to a QCOW2 image and provision the Citrix ADC VPX instance. To convert the RAW image to a QCOW2 image, type the following command:

```
qemu-img convert -O qcow2 original-image.raw image-converted.qcow
```

**For example:**

```
qemu-img convert -O qcow2 NSVPX-KVM-11.1-12.5_nc.raw NSVPX-KVM-11.1-12.5_nc.qcow
```

A typical Citrix ADC VPX deployment on KVM includes the following steps:

- Checking prerequisites for Auto-Provisioning a Citrix ADC VPX Instance
- Provisioning the Citrix ADC VPX Instance by Using a RAW Image
- Provisioning the Citrix ADC VPX Instance by Using a QCOW2 Image
- Adding Additional Interfaces to a VPX Instance by using Virtual Machine Manager

**Check prerequisites for auto-provisioning a Citrix ADC VPX instance**

Auto-provisioning is an optional feature, and it involves using data from the CDROM drive. If this feature is enabled, you need not enter the management IP address, network mask, and default gateway of the Citrix ADC VPX instance during initial setup.

You need to complete the following tasks before you can auto-provision a VPX instance:

1. Create a customized Open Virtualization Format (OVF) XML file or userdata file.
2. Convert the OVF file into an ISO image by using an online application (for example PowerISO).
3. Mount the ISO image on the the KVM host by using any secure copy (SCP)-based tools.

**Sample OVF XML file:**

Here's is an example of the contents an OVF XML file, which you can use as a sample to create your file.

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id=""
xmlns="http://schemas.dmtf.org/ovf/environment/1"
xmlns:cs="http://schemas.citrix.com/openstack">
<PlatformSection>
<Kind></Kind>
<Version>2016.1</Version>
<Vendor>VPX</Vendor>
<Locale>en</Locale>
</PlatformSection>
<PropertySection>
```

```
<Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
<Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
<Property oe:key="com.citrix.netscaler.orch_env" oe:value="KVM"/>
<Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
<Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.0"/>
<Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1"/>
</PropertySection>
</Environment>
```

In the OVF XML file above, “PropertySection” is used for NetScaler networking configuration. When you create the file, specify values for the parameters that are highlighted at the end of the example:

- Management IP address
- Netmask
- Gateway

#### **Important**

If the OVF file is not properly XML formatted, the VPX instance is assigned the default network configuration, not the values specified in the file.

### **Provision the Citrix ADC VPX instance by using a RAW image**

The Virtual Machine Manager enables you to provision a Citrix ADC VPX instance by using a RAW image.

To provision a Citrix ADC VPX instance by using the Virtual Machine Manager, follow these steps:

1. Open the Virtual Machine Manager (**Application > System Tools > Virtual Machine Manager**) and enter the logon credentials in the **Authenticate** window.

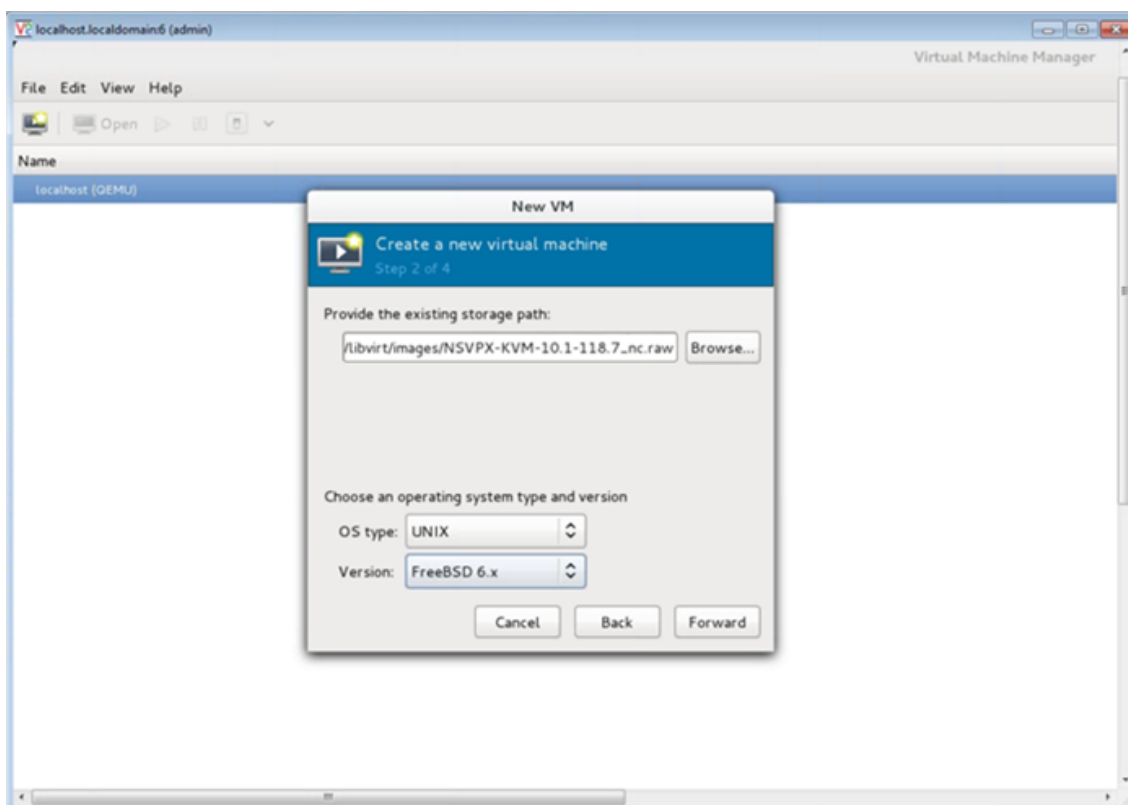

2. Click the  icon or right-click **localhost (QEMU)** to create a new Citrix ADC VPX instance.

3. In the **Name** text box, enter a name for the new VM (for example, NetScaler-VPX).
4. In the **New VM** window, under “Choose how you would like to install the operating system,” select **Import existing disk image**, and then click **Forward**.

5. In the **Provide the existing storage path** field, navigate the path to the image. Choose the OS type as UNIX and Version as FreeBSD 6.x. Then, click **Forward**.

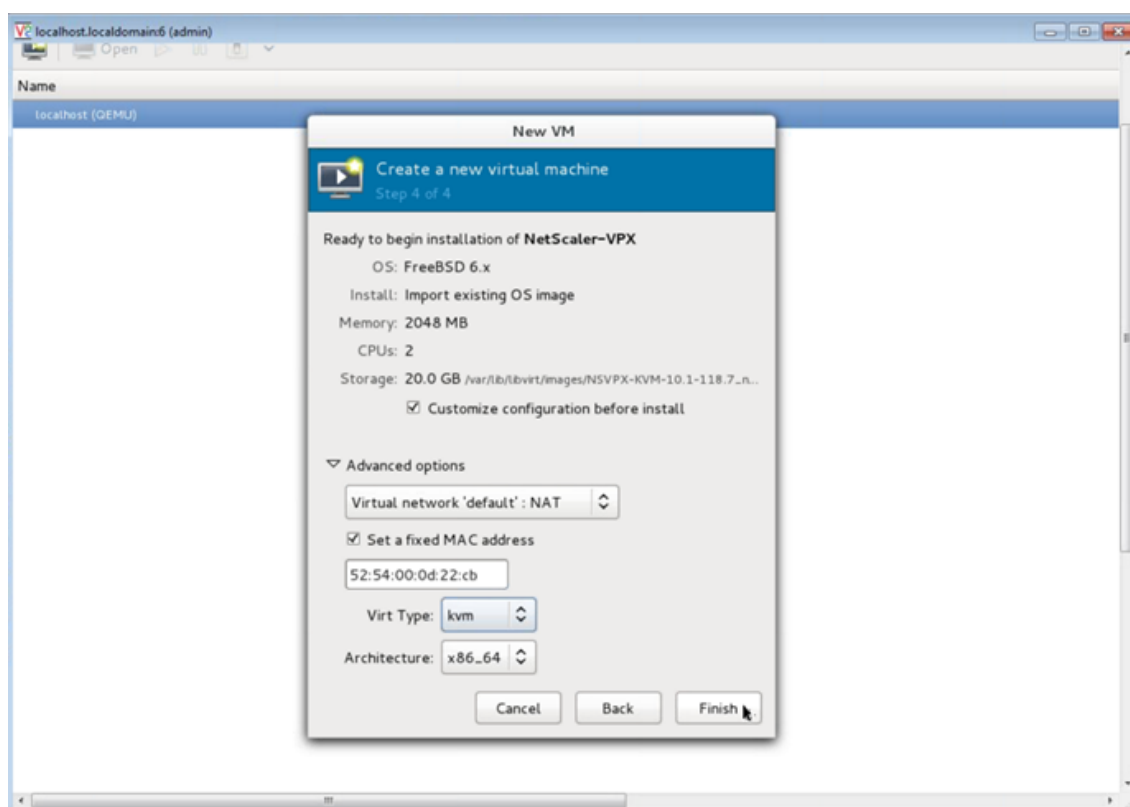

6. Under **Choose Memory and CPU** settings select the following settings, and then click **Forward**:
  - Memory (RAM)— 2048 MB
  - CPUs— 2

7. Select the **Customize configuration before install** check box. Optionally, under **Advanced options** you can you can customize the MAC address. Make sure the **Virt Type** selected is kvm and the Architecture selected is x86\_64. Click **Finish**.

8. Select a NIC and provide the following configuration:

- Source device— ethX macvtap or Bridge
- Device model— virtio
- Source mode— Bridge

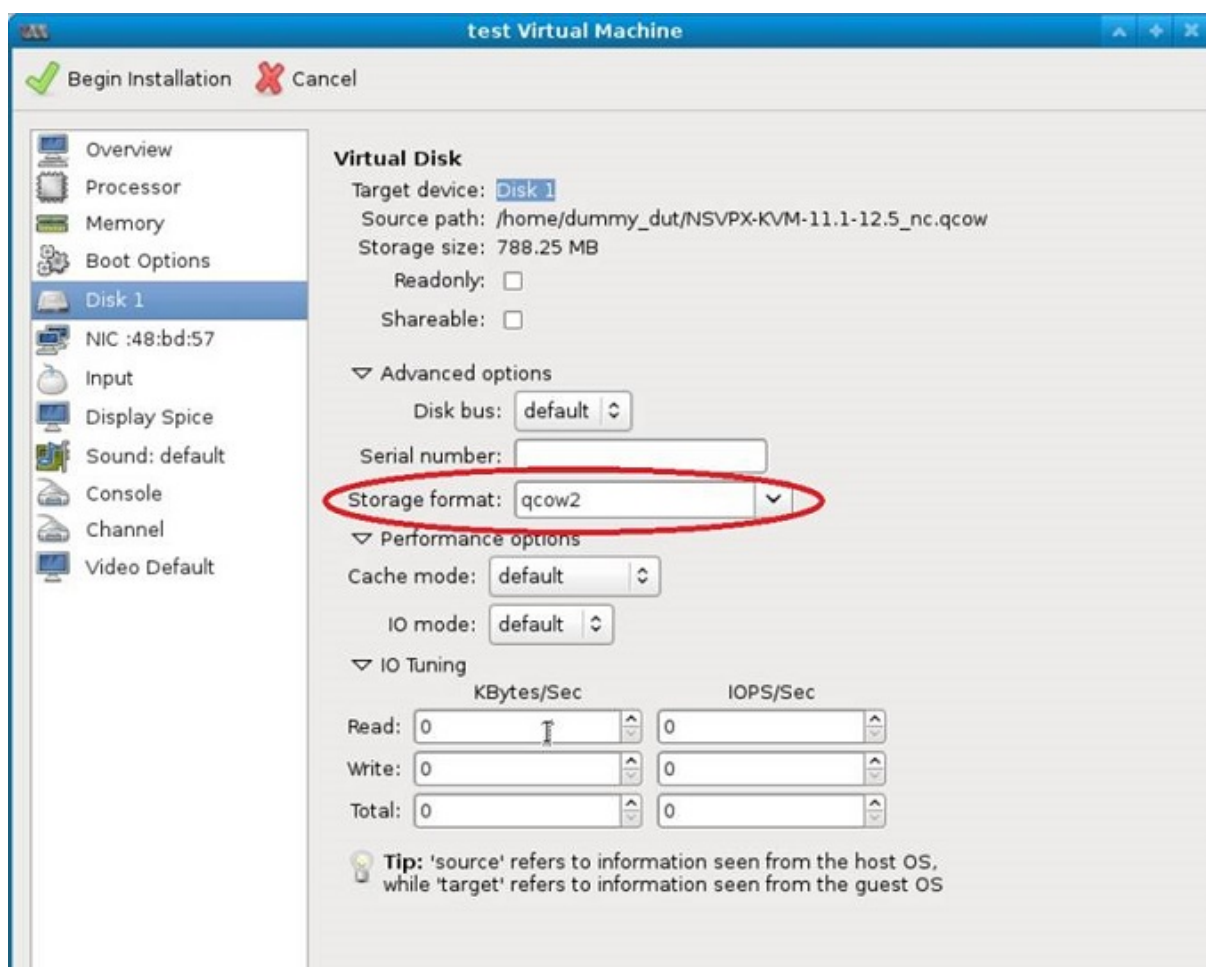

9. Click **Apply**.
10. If you want to auto-provision the VPX instance, see the section “**Enabling Auto-Provisioning by Attaching a CDROM Drive**” in this document. Otherwise, click **Begin Installation**. After you have provisioned the Citrix ADC VPX on KVM, you can add additional interfaces.

### Provision the Citrix ADC VPX instance by using a QCOW2 image

Using the Virtual Machine Manager, you can provision the Citrix ADC VPX instance by using a QCOW2 image.

To provision a Citrix ADC VPX instance by using a QCOW2 image, follow these steps:

1. Follow **step 1 to step 8** in Provision the Citrix ADC VPX instance by using a RAW image.  
**Note:** Ensure that you select **qcow2** image in **step 5**.
2. Select **Disk 1** and click **Advanced options**.
3. Select **qcow2** from the Storage format drop-down list.

4. Click **Apply**, and then click

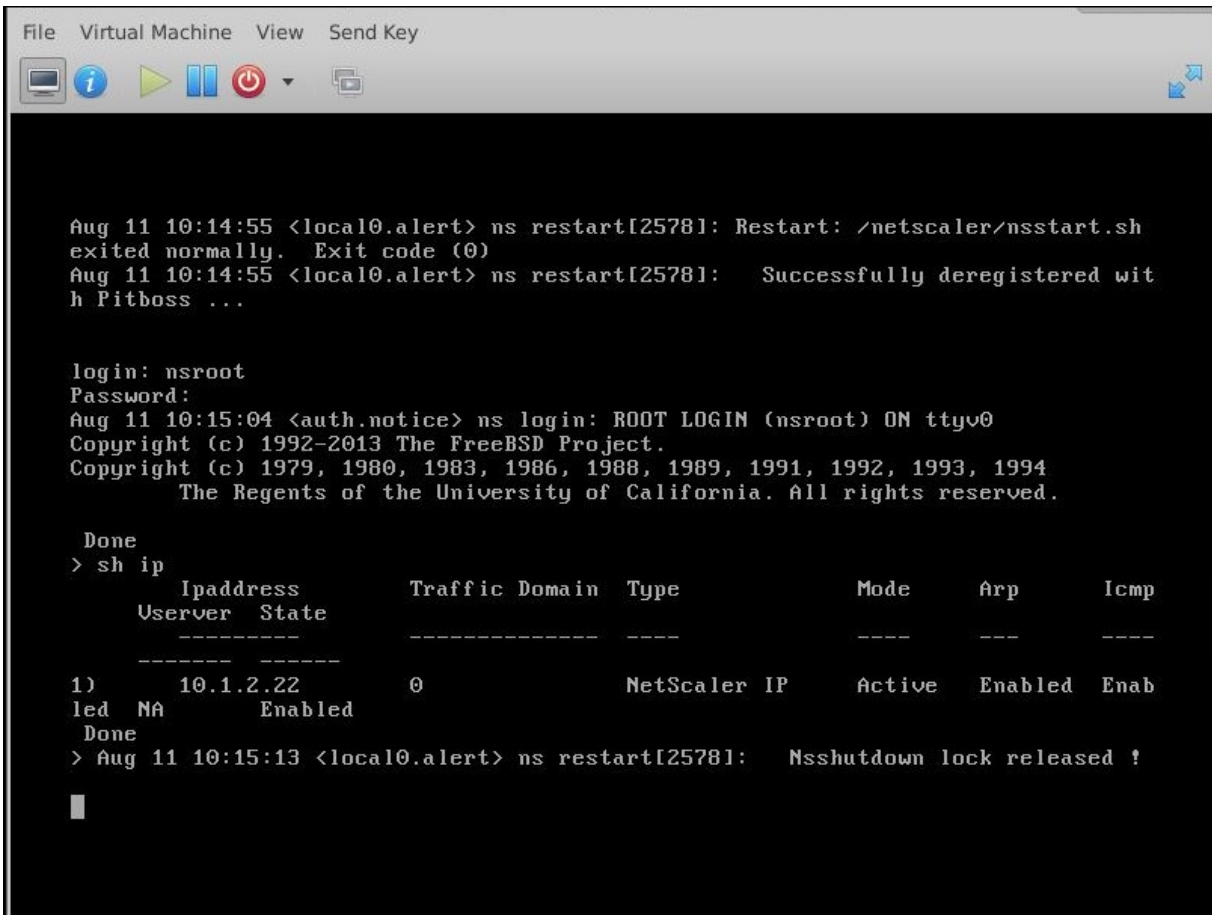

**Begin Installation**. After you have provisioned the Citrix ADC VPX on KVM, you can add additional interfaces.

### Enable auto-provisioning by attaching a CDROM drive

1. Click Add **Hardware** > **Storage** > **Device type** > **CDROM device**.
2. Click **Manage** and select the correct ISO file that you mounted in the “Prerequisites for Auto-Provisioning a Citrix ADC VPX Instance” section, and click **Finish**. A new CDROM under Resources on your Citrix ADC VPX instance is created.

3. Power on the VPX instance, and it auto-provisions with the network configuration provided in the OVF file, as shown in the example screen capture.

```

File Virtual Machine View Send Key

Aug 11 10:14:55 <local0.alert> ns restart[2578]: Restart: /netscaler/nsstart.sh
exited normally. Exit code (0)

```

4. If auto-provision fails, the instance comes up with the default IP address (192.168.100.1). In that case, you need to complete the initial configuration manually. For more information, see [Configuring a NetScaler for the First Time](#).

### Add additional interfaces to the Citrix ADC VPX instance by using Virtual Machine Manager

After you have provisioned the NetScaler VPX instance on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps.

1. Shut down the NetScaler VPX instance running on the KVM.
2. Right-click the VPX instance and choose **Open** from the pop-up menu.

3. Click the  icon in the header to view the virtual hardware details.
4. Click **Add Hardware**. In the **Add New Virtual Hardware window**, select **Network** from the navigation menu.

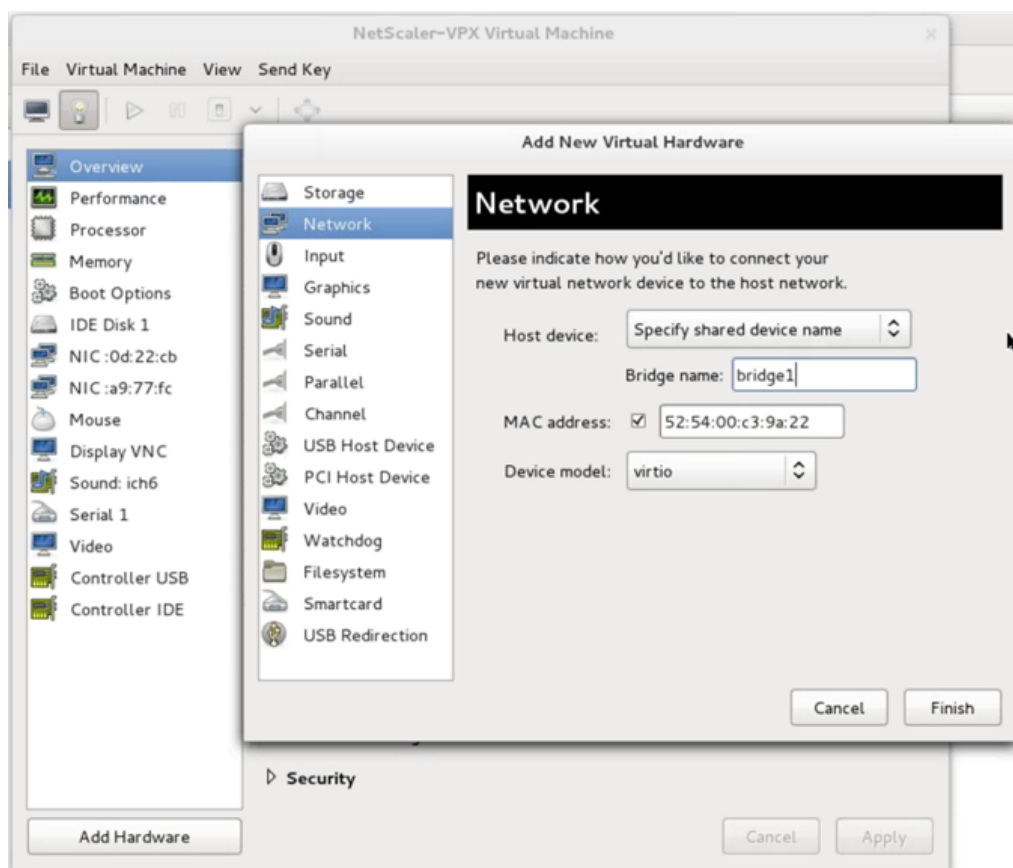

5. In **Host Device** field, select the physical interface type. The host device type can be either Bridge or MacVTap. In case of MacVTap, four modes possible are VEPA, Bridge, Private and Pass-through.

a) For Bridge

- i. Host device— Select the “Specify shared device name” option.
- ii. Provide the Bridge name that is configured in the KVM host.

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- iii. Device model—virtio.
- iv. Click Finish.
- b) For MacVTap
  - i. Host device—Select the physical interface from the menu.
  - ii. Device model—virtio.

iii. Click Finish. You can view the newly added NIC in the navigation pane.

- iv. Select the newly added NIC and select the Source mode for this NIC. The available modes are VEPA, Bridge, Private, and Passthrough. For more details on the interface and modes, see Source Interface and Modes.
  - v. Click Apply.
6. If you want to auto-provision the VPX instance, see the section “Adding a Config Drive to Enable Auto-Provisioning” in this document. Otherwise, power on the VPX instance to complete the initial configuration manually.

#### Important

Interface parameter configurations such as speed, duplex, and autonegotiation are not supported.

## Configure a Citrix ADC VPX instance to use SR-IOV network interfaces

September 21, 2020

You can configure a Citrix ADC VPX instance running on Linux-KVM platform using single root I/O virtu-

alization (SR-IOV) with the following NICs:

- Intel 82599 10G
- Intel X710 10G
- Intel XL710 40G
- Intel X722 10G

This section describes how to:

- Configure a Citrix ADC VPX Instance to Use SR-IOV Network Interface
- Configure Static LA/LACP on the SR-IOV Interface
- Configure VLAN on the SR-IOV Interface

## Limitations

Keep the limitations in mind while using Intel 82599, X710, XL710, and X722 NICs. The following features not supported.

### Limitations for Intel 82599 NIC:

- L2 mode switching.
- Admin partitioning (shared VLAN mode).
- High availability (active-active mode).
- Jumbo frames.
- IPv6: You can configure only up to 30 unique IPv6 addresses in a VPX instance if you've at least one SR-IOV interface.
- VLAN configuration on Hypervisor for SRIOV VF interface through "ip link" command is not supported.
- Interface parameter configurations such as speed, duplex, and autonegotiations are not supported.

### Limitations for Intel X710 10G, Intel XL710 40G, and Intel X722 10G NICs:

- L2 mode switching.
- Admin partitioning (shared VLAN mode).
- In a cluster, Jumbo frames are not supported when the XL710 NIC is used as a data interface.
- Interface list reorders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- Interface name is 40/X for Intel X710 10G, Intel XL710 40G, and Intel X722 10G NICs
- Up to 16 Intel XL710/X710/X722 SRIOV or PCI passthrough interfaces can be supported on a VPX instance.

**Note:** For Intel X710 10G, Intel XL710 40G, and Intel X722 10G NICs to support IPv6, you need to enable trust mode on the Virtual Functions (VFs) by typing the following command on the KVM host:

```
## ip link set <PNIC> <VF> trust on
```

Example:

```
## ip link set ens785f1 vf 0 trust on
```

## Prerequisites

Before you configure a Citrix ADC VPX instance to use SR-IOV network interfaces, complete the following prerequisite tasks. See the NIC column for details about how to complete the corresponding tasks.

Task	Intel 82599 NIC	Intel X710, XL710, and X722 NICs
1. Add the NIC to the KVM host.	-	-
2. Download and install the latest Intel driver.	IXGBE driver	I40E driver
3. Blacklist the driver on the KVM host.	Add the following entry in the <code>/etc/modprobe.d/blacklist.conf</code> file: <i>blacklist ixgbevf</i> . Use IXGBE driver version 4.3.15 (recommended).	Add the following entry in the <code>/etc/modprobe.d/blacklist.conf</code> file: <i>blacklist i40evf</i> . Use i40e driver version 2.0.26 (recommended).
4. Enable SR-IOV Virtual Functions (VFs) on the KVM host. In both the commands in the next two columns: <i>number_of_VFs</i> = the number of Virtual VFs that you want to create. <i>device_name</i> = the interface name.	If you are using earlier version of kernel 3.8, then add the following entry to the <code>/etc/modprobe.d/ixgbe</code> file and restart the KVM host: <i>*options ixgbe max_vfs=*</i> . If you are using kernel 3.8 version or later, create VFs using the following command: <code>*echo &gt; /sys/class/net//device/sriov_numvfs*</code> . See example in figure 1.	If you are using earlier version of kernel 3.8, then add the following entry to the <code>/etc/modprobe.d/i40e.conf</code> file and restart the KVM host: <i>*options i40e max_vfs=*</i> . If you are using kernel 3.8 version or later, create VFs using the following command: <code>*echo &gt; /sys/class/net//device/sriov_numvfs*</code> . See example in figure 2.

Task	Intel 82599 NIC	Intel X710, XL710, and X722 NICs
5. Make the VFs persistent by adding the commands that you used to create VFs, to the rc.local file.	See example in figure 3.	See example in figure 3.

### Important

When you create the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

**Figure 1:** Enable SR-IOV VFs on the KVM host for Intel 82599 10G NIC.

```

```

root@ubuntu:~# lspci | grep "37cd"
84:02.0 Ethernet controller: Intel Corporation Device 37cd (rev 04)
84:0a.0 Ethernet controller: Intel Corporation Device 37cd (rev 04)

```

**Figure 4:** Make the VFs persistent.

A terminal window titled "Terminal - root@ubuntu: /etc" showing the output of the command "cat /etc/rc.local". The output is a shell script for rc.local, which includes instructions on how to enable or disable it and two echo commands for setting sriov\_numvfs on network interfaces ens3f0 and ens3f1.

```
root@ubuntu:/etc# cat /etc/rc.local
#!/bin/sh -e
#
# rc.local
#
# This script is executed at the end of each multiuser runlevel.
# Make sure that the script will "exit 0" on success or any other
# value on error.
#
# In order to enable or disable this script just change the execution
# bits.
#
# By default this script does nothing.
echo 1 > /sys/class/net/ens3f0/device/sriov_numvfs
echo 1 > /sys/class/net/ens3f1/device/sriov_numvfs
exit 0
root@ubuntu:/etc#
```

### **Configure a Citrix ADC VPX instance to use SR-IOV network interface**

To configure Citrix ADC VPX instance to use SR-IOV network interface by using Virtual Machine Manager, complete these steps:

1. Power off the Citrix ADC VPX instance.
2. Select the Citrix ADC VPX instance and then select Open.

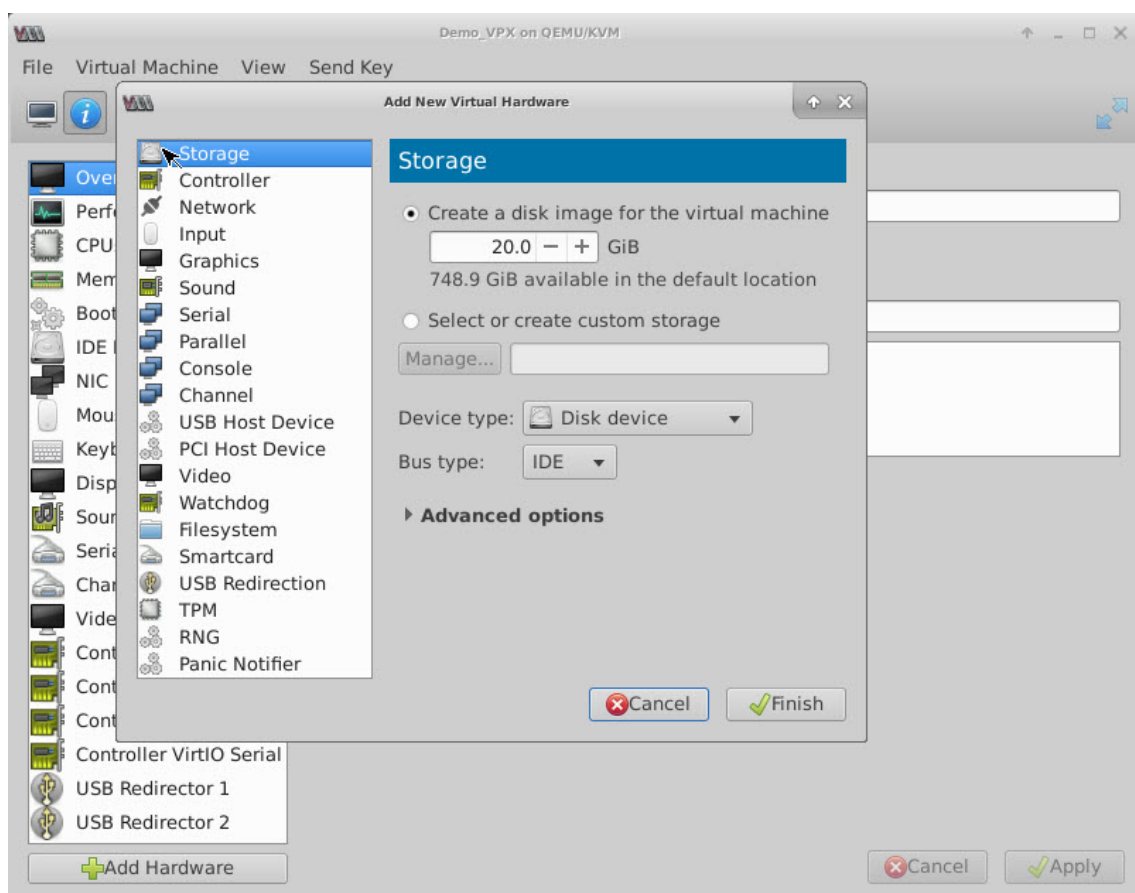

3. In the <virtual\_machine on KVM> window, select the **i** icon.

4. Select **Add Hardware**.

5. In the **Add New Virtual Hardware** dialog box, do the following:
  - a) Select PCI Host Device.
  - b) In the Host Device section, select the VF you have created and click Finish.

**Figure 4:** VF for Intel 82599 10G NIC

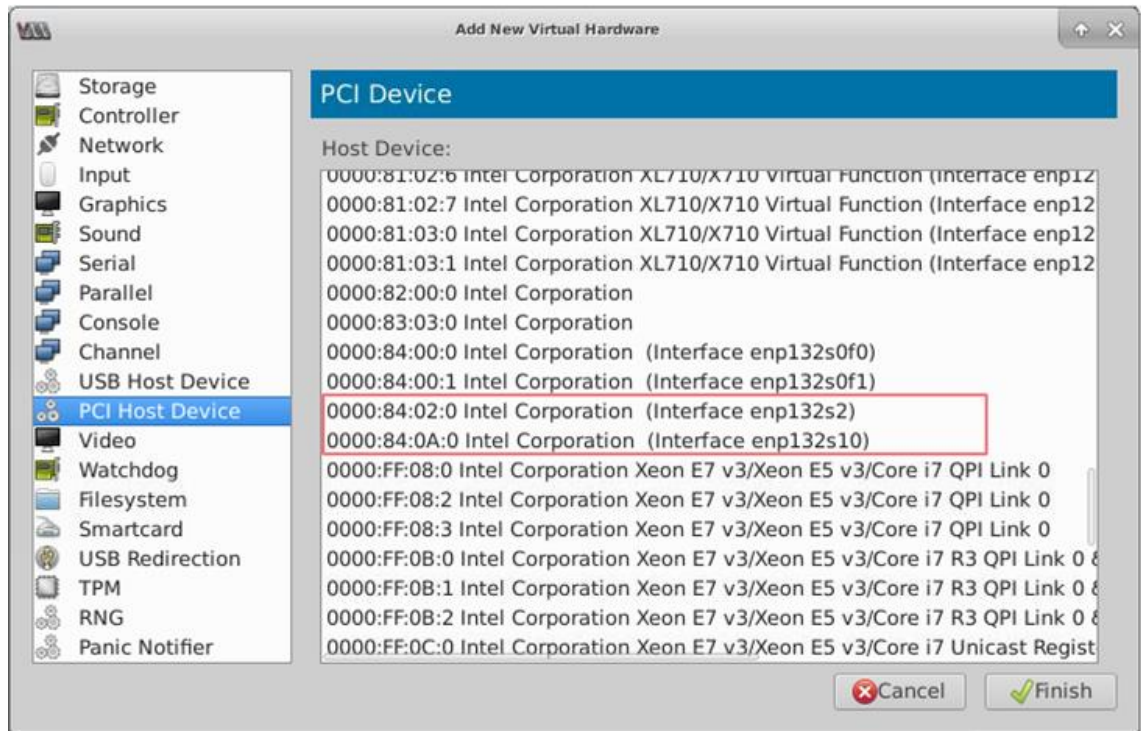

Figure 5: VF for Intel XL710 40G NIC

**Figure 6:** VF for Intel X722 10G NIC

6. Repeat Step 4 and 5 to add the VFs that you have created.
7. Power on the Citrix ADC VPX instance.
8. After the Citrix ADC VPX instance powers on, use the following command to verify the configuration:

```

1 show interface summary
2 <!--NeedCopy-->

```

The output shows all the interfaces that you configured.

**Figure 6:** output summary for Intel 82599 NIC.

```

> show interface summary
-----
      Interface  MTU      MAC                               Suffix

## Configure static LA/LACP on the SR-IOV interface

### Important

When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

To use the SR-IOV VFs in link aggregation mode, disable spoof checking for VFs that you have created. On the KVM host, use the following command to disable spoof checking:

```
*ip link set \<interface\_name\> vf \<VF\_id\> spoofchk off*
```

Where:

- Interface\_name – is the interface name.
- VF\_id – is the Virtual Function id.

### Example:

```
Terminal - root@ubuntu: /etc
File Edit View Terminal Tabs Help
root@ubuntu:/etc# ip link show ens3f0
6: ens3f0: <BROADCAST,MULTICAST,UP,LOWER UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7e brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:e7:e7:06:50:3f, spoof checking on, link-state auto
root@ubuntu:/etc#
root@ubuntu:/etc#
root@ubuntu:/etc# ip link show ens3f1
7: ens3f1: <BROADCAST,MULTICAST,UP,LOWER UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7f brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:1a:71:cc:a8:3e, spoof checking on, link-state auto
root@ubuntu:/etc#
root@ubuntu:/etc# ip link set ens3f0 vf 0 spoofchk off
root@ubuntu:/etc# ip link show ens3f0
6: ens3f0: <BROADCAST,MULTICAST,UP,LOWER UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7e brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:e7:e7:06:50:3f, spoof checking off, link-state auto
root@ubuntu:/etc# ip link set ens3f1 vf 0 spoofchk off
root@ubuntu:/etc# ip link show ens3f1
7: ens3f1: <BROADCAST,MULTICAST,UP,LOWER UP> mtu 1500 qdisc mq state UP mode DEFAULT group default qlen 1000
    link/ether 0c:c4:7a:bd:50:7f brd ff:ff:ff:ff:ff:ff
    vf 0 MAC 8e:1a:71:cc:a8:3e, spoof checking off, link-state auto
root@ubuntu:/etc#
```

After you disable spoof checking for all the VFs that you have created. Restart the Citrix ADC VPX instance and configure link aggregation. For detailed instructions, see [Configuring Link Aggregation](#).

### Configuring VLAN on the SR-IOV Interface

You can configure VLAN on SR-IOV VFs. For detailed instructions, see [Configuring a VLAN](#).

#### Important

Ensure that the KVM host does not contain VLAN settings for the VF interface.

## Configure a Citrix ADC VPX instance to use PCI passthrough network interfaces

September 21, 2020

After you have installed and configured a Citrix ADC VPX instance on the Linux-KVM platform, you can use the Virtual Machine Manager to configure the virtual appliance to use PCI passthrough network interfaces.

### Prerequisites

- The firmware version of the Intel XL710 Network Interface Card (NIC) on the KVM Host is 5.04.
- The KVM Host supports input-output memory management unit (IOMMU) and Intel VT-d, and they are enabled in the BIOS of the KVM Host. On the KVM Host, to enable IOMMU, add the following entry to the **/boot/grub2/grub.cfg** file:

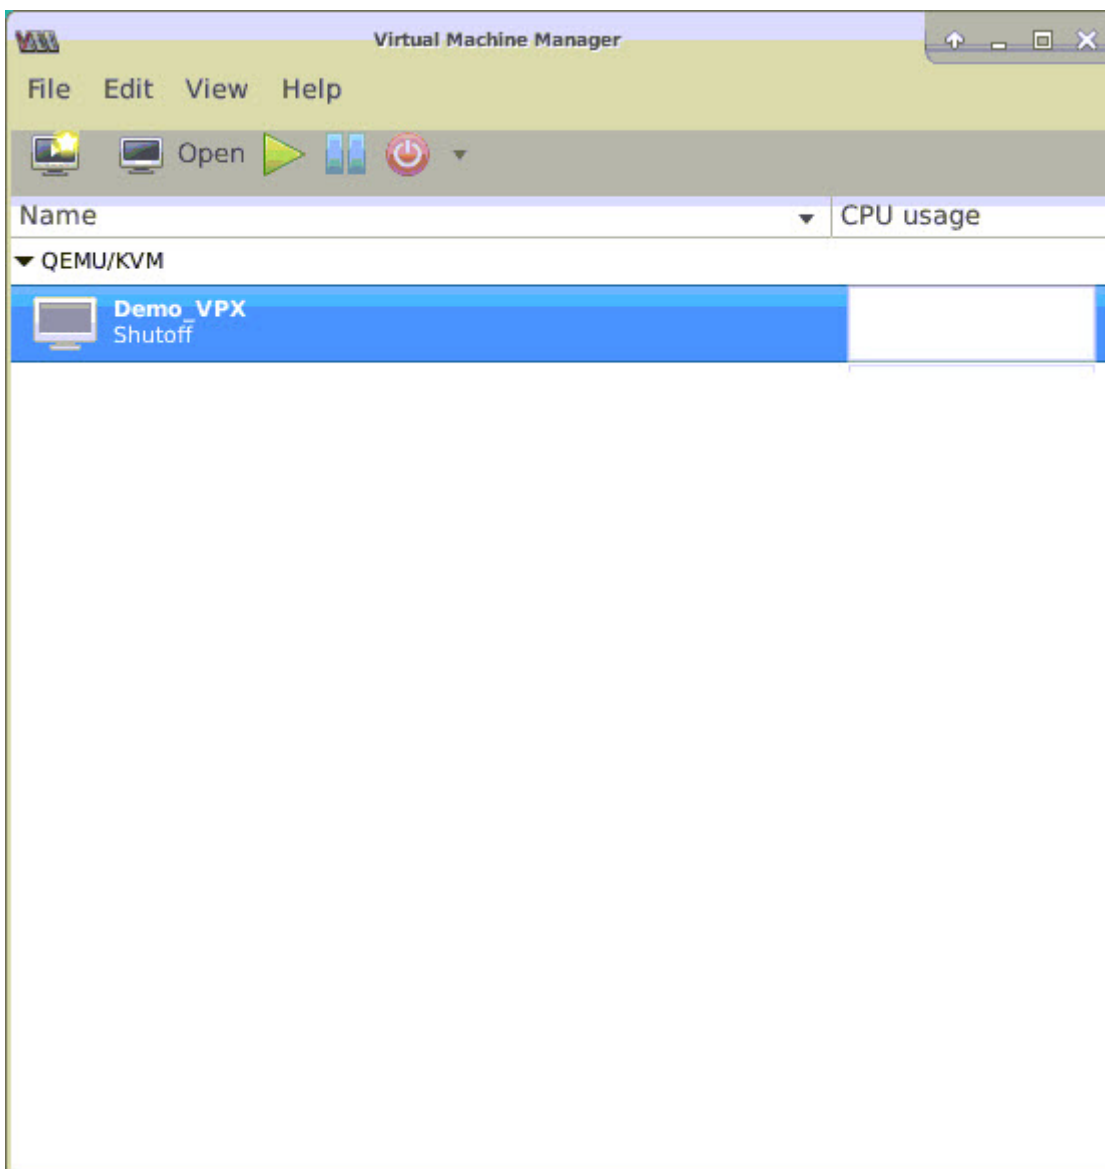

```
intel_iommu=1
```

- Execute the following command and reboot the KVM Host:

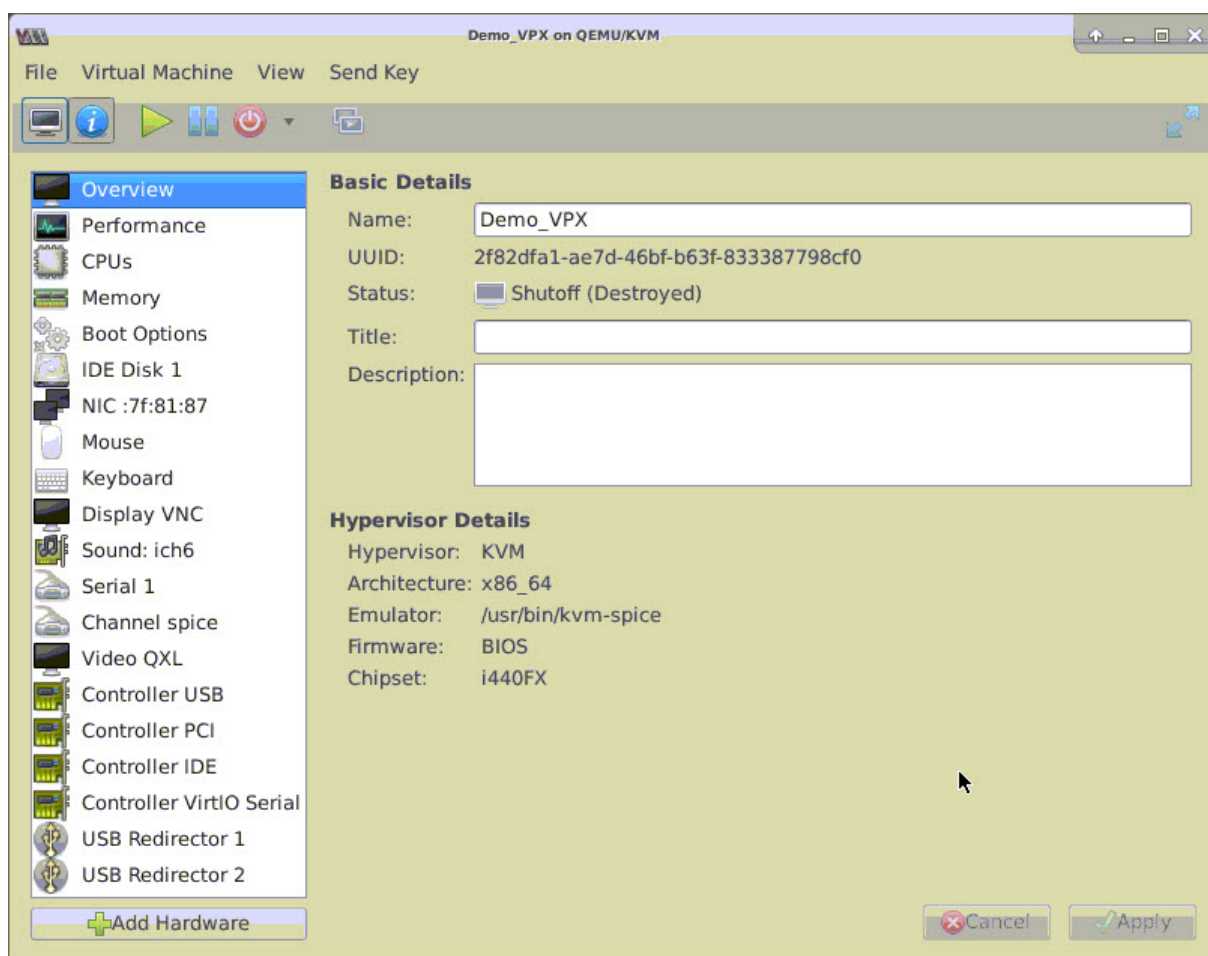

**Grub2-mkconfig -o /boot/grub2/grub.cfg**

**To configure Citrix ADC VPX instances to use PCI passthrough network interfaces by using the Virtual Machine Manager:**

1. Power off the Citrix ADC VPX instance.
2. Select the Citrix ADC VPX instance and click **Open**.

3. In the **<virtual\_machine on KVM>** window, click the **i** icon.

4. Click **Add Hardware**.
5. In the **Add New Virtual Hardware** dialog box, do the following:
  - a. Select **PCI Host Device**.
  - b. In the **Host Device** section, select the Intel XL710 physical function.
  - c. Click **Finish**.

6. Repeat steps 4 and 5 to add any additional Intel XL710 physical functions.
7. Power on the Citrix ADC VPX instance.
8. Once the Citrix ADC VPX instance powers on, you can use the following command to verify the configuration:

```

COMMAND
> show interface summary
    
```

The output should show all the interfaces that you configured:

```

Press Control_L+Alt_L to release pointer. NetScaler-VPX on QEMU/KVM
File Virtual Machine View Send Key
> show interface summary
-----
      Interface  MTU      MAC                               Suffix
-----
1      0/1        1500    52:54:00:3f:57:7c    NetScaler Virtual Interface
2      10/1        1500    0c:c4:7a:8e:b8:2d    Intel XL710, SR, 10 Gbit
3      10/2        1500    0c:c4:7a:8e:b8:2e    Intel XL710, SR, 10 Gbit
4      40/1        1500    3c:fd:fe:9e:d8:d9    Intel XL710 40Gbit Interface
5      L0/1        1500    52:54:00:3f:57:7c    Netscaler Loopback interface
Done
> █

```

## Provision the Citrix ADC VPX instance by using the virsh program

September 21, 2020

The virsh program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest's status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The virsh program is also useful for scripting VM Guest management operations.

To provision Citrix ADC VPX by using the virsh program, follow these steps:

1. Use the tar command to untar the the Citrix ADC VPX package. The NSVPX-KVM-\*\_nc.tgz package contains following components:
  - The Domain XML file specifying VPX attributes [NSVPX-KVM-\*\_nc.xml]
  - Check sum of NS-VM Disk Image [Checksum.txt]
  - NS-VM Disk Image [NSVPX-KVM-\*\_nc.raw]

Example:

```

1 tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
2 NSVPX-KVM-10.1-117_nc.xml
3 NSVPX-KVM-10.1-117_nc.raw
4 checksum.txt
5 <!--NeedCopy-->

```

- Copy the NSVPX-KVM-\*\_nc.xml XML file to a file named <DomainName>-NSVPX-KVM-\*\_nc.xml. The <DomainName> is also the name of the virtual machine. Example:

```
1 cp NSVPX-KVM-10.1-117_nc.xml NetScaler-VPX-NSVPX-KVM-10.1-117_nc.xml
2 <!--NeedCopy-->
```

- Edit the <DomainName>-NSVPX-KVM-\*\_nc.xml file to specify the following parameters:

- name— Specify the name.
- mac— Specify the MAC address.  
Note: The domain name and the MAC address have to be unique.
- sourcefile— Specify the absolute disk-image source path. The file path has to be absolute. You can specify the path of the RAW image file or a QCOW2 image file.  
If you want to specify a RAW image file, specify the disk image source path as shown in the following example:

Example:

```
<name>NetScaler-VPX</name>
  <mac address='52:54:00:29:74:b3' />
  <source file='/root/NSVPX-KVM-10.1-117_nc.raw' />
```

Specify the absolute QCOW2 disk-image source path and define the driver type as **qcow2**, as shown in the following example:

Example:

```
<name>NetScaler-VPX</name>
  <mac address='52:54:00:29:74:b3' />
  <driver name='qemu' type='qcow2' />
  <source file='/root/NSVPX-KVM-10.1-117_nc.qcow' />
```

- Edit the <DomainName>-NSVPX-KVM-\*\_nc.xml file to configure the networking details:
  - source dev— specify the interface.
  - mode— specify the mode. The default interface is **Macvtap Bridge**.

Example: Mode: MacVTap Bridge Set target interface as ethx and mode as bridge Model type as virtio

```
1 <interface type='direct'>
2   <mac address='52:54:00:29:74:b3' />
3   <source dev='eth0' mode='bridge' />
4   <target dev='macvtap0' />
5   <model type='virtio' />
6   <alias name='net0' />
7   <address type='pci' domain='0x0000' bus='0x00' slot='0x03'
   function='0x0' />
```

```

8     </interface>
9     <!--NeedCopy-->

```

Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the <DomainName>-NSVPX-KVM-\*\_nc.xml file by using the following command: `virsh define <DomainName>-NSVPX-KVM-*_nc.xml` Example:

```

1  virsh define NS-VPX-NSVPX-KVM-10.1-117_nc.xml
2  <!--NeedCopy-->

```

Start the VM by entering following command: `<DomainUUID>]` Example:  
`virsh start [<DomainName>`

```

1  virsh start NetScaler-VPX
2  <!--NeedCopy-->

```

Connect the Guest VM `<DomainUUID>` `<DomainID>` ] Example:  
through the console `virsh`  
console [<DomainName>

```

1  virsh console NetScaler-VPX
2  <!--NeedCopy-->

```

## Add additional interfaces to Citrix ADC VPX instance using virsh program

After you have provisioned the Citrix ADC VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the Citrix ADC VPX instance running on the KVM.

Edit the <DomainName>-NSVPX-KVM-\*\_nc.xml `<DomainUUID>]`  
file using the command: `virsh edit`  
[<DomainName>

- 2.
3. In the <DomainName>-NSVPX-KVM-\*\_nc.xml file, append the following parameters:

**a) For MacVTap**

- Interface type— Specify the interface type as 'direct'.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source dev— Specify the interface name.
- mode— Specify the mode; the modes supported are - Bridge, VEPA, Private, and Pass-through
- model type— Specify the model type as virtio

Example:

Mode: MacVTap Pass-through

Set target interface as  
ethx, Mode as  
bridge, and model type as  
virtio

```
1 <interface type='direct'>
2     <mac address='52:54:00:29:74:b3' />
3     <source dev='eth1' mode='passthrough' />
4     <model type='virtio' />
5 </interface>
6 <!--NeedCopy-->
```

Here eth1 is the physical interface attached to the VM.

**b) For Bridge Mode**

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- Interface type— Specify the interface type as 'bridge'.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source bridge— Specify the bridge name.
- model type— Specify the model type as virtio

Example: Bridge Mode

```
1 <interface type='bridge'>
2     <mac address='52:54:00:2d:43:a4' />
3     <source bridge='br0' />
4     <model type='virtio' />
5 </interface>
6 <!--NeedCopy-->
```

## Manage the Citrix ADC VPX guest VMs

September 21, 2020

You can use the Virtual Machine Manager and the virsh program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).

### Manage the VPX guest VMs by using Virtual Machine Manager

- List the VM guests

The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine's name, along with its status (Running, Paused, or Shutoff) displayed as icon.

- Open a graphical console

Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

- Start and shut down a guest

You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.

- Reboot a guest

You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then select Shut Down > Reboot from the pop-up menu.

- Delete a guest

Deleting a VM Guest removes its XML configuration by default. You can also delete a guest's storage files. Doing so completely erases the guest.

1. In the Virtual Machine Manager, right-click the VM Guest entry.
2. Select Delete from the pop-up menu. A confirmation window opens.  
Note: The Delete option is enabled only when the VM Guest is shut down.
3. Click Delete.
4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

### Manage the Citrix ADC VPX guest VMs using the virsh program

- List the VM Guests and their current states.

To use virsh to display information about the Guests

```
virsh list --all
```

The command output displays all domains with their states.

Example output:

1	Id	Name	State
2	-----		
3	0	Domain-0	running
4	1	Domain-1	paused
5	2	Domain-2	inactive
6	3	Domain-3	crashed
7	<!--NeedCopy-->		

- Open a virsh console.

Connect the Guest VM through the console

```
virsh console [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh console NetScaler-VPX
```

- Start and shut down a guest.

Guests can be started using the DomainName or Domain-UUID.

```
virsh start [<DomainName> | <DomainUUID>]
```

Example

```
virsh start NetScaler-VPX
```

#### **To shut down a guest:**

```
virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh shutdown NetScaler-VPX
```

- Reboot a guest

```
virsh reboot [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh reboot NetScaler-VPX
```

Delete a guest

To delete a Guest VM you need to shut-down the Guest and un-define the <DomainName>-NSVPX-KVM-\*\_nc.xml before you run the delete command.

```
1 virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
2 virsh undefine [<DomainName> | <DomainUUID>]
3
4 <!--NeedCopy-->
```

Example:

```
1 virsh shutdown NetScaler-VPX
2 virsh undefine NetScaler-VPX
3
4 <!--NeedCopy-->
```

Note: The delete command doesn't remove disk image file which needs to be removed manually.

## Provision the Citrix ADC VPX instance with SR-IOV, on OpenStack

September 21, 2020

You can deploy high-performance Citrix ADC VPX instances that use single-root I/O virtualization (SR-IOV) technology, on OpenStack.

You can deploy a Citrix ADC VPX instance that uses SR-IOV technology, on OpenStack, in three steps:

- Enable SR-IOV Virtual Functions (VFs) on the host.
- Configure and make the VFs available to OpenStack.
- Provision the Citrix ADC VPX on OpenStack.

### Prerequisites

Ensure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the host.
- Download and Install the latest IXGBE driver from Intel.
- Blacklist the IXGBEVF driver on the host. Add the following entry in the `/etc/modprobe.d/blacklist.conf` file: `blacklist ixgbevf`

#### Note

The ixgbe driver version should be minimum 5.0.4.

### Enable SR-IOV VFs on the host

Do one of the following steps to enable SR-IOV VFs:

- If you are using a kernel version earlier than 3.8, add the following entry to the `/etc/modprobe.d/ixgbe` file and restart the host: `options ixgbe max_vfs=<number_of_VFs>`
- If you are using kernel 3.8 version or later, create VFs by using the following command:

```

1     echo <number_of_VFs> > /sys/class/net/<device_name>/device/
      sriov_numvfs
2 <!--NeedCopy-->

```

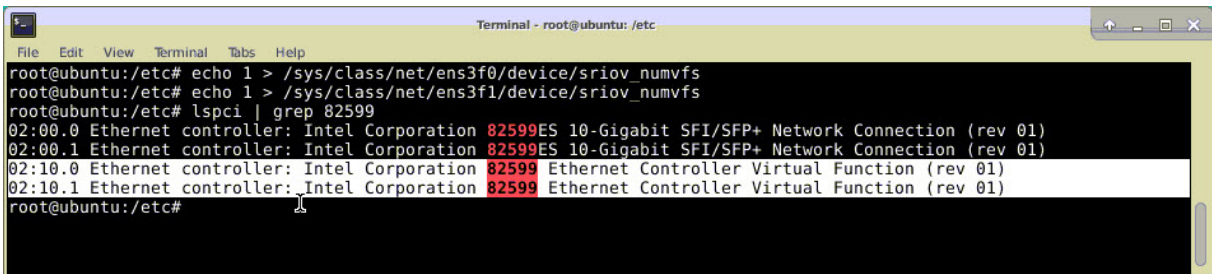

Where:

- number\_of\_VFs is the number of Virtual Functions that you want to create.
- device\_name is the interface name.

### Important

While you are creating the SR-IOV VFs, make sure that you do not assign MAC addresses to the VFs.

Here is an example of four VFs being created.

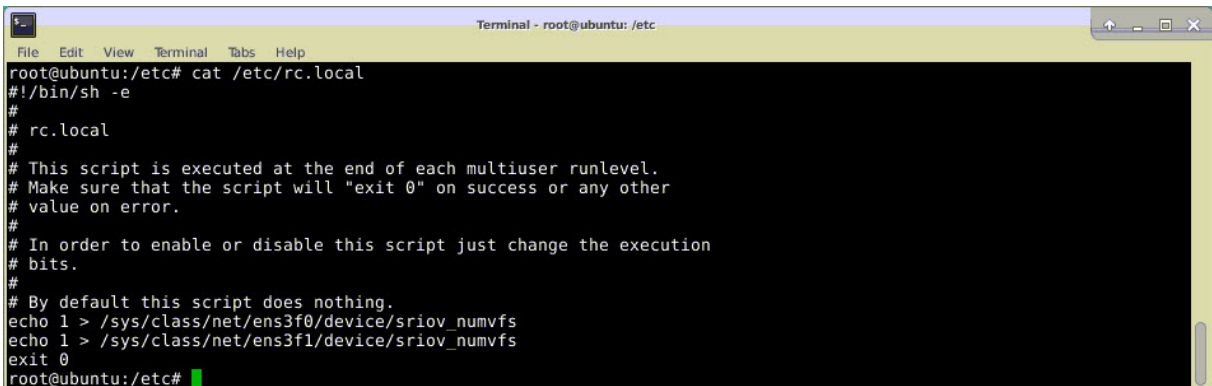

```

Terminal - root@ubuntu: /etc
File Edit View Terminal Tabs Help
root@ubuntu:/etc# echo 1 > /sys/class/net/ens3f0/device/sriov_numvfs
root@ubuntu:/etc# echo 1 > /sys/class/net/ens3f1/device/sriov_numvfs
root@ubuntu:/etc# lspci | grep 82599
02:00.0 Ethernet controller: Intel Corporation 82599ES 10-Gigabit SFI/SFP+ Network Connection (rev 01)
02:00.1 Ethernet controller: Intel Corporation 82599ES 10-Gigabit SFI/SFP+ Network Connection (rev 01)
02:10.0 Ethernet controller: Intel Corporation 82599 Ethernet Controller Virtual Function (rev 01)
02:10.1 Ethernet controller: Intel Corporation 82599 Ethernet Controller Virtual Function (rev 01)
root@ubuntu:/etc#

```

Make the VFs persistent, add the commands that you used to create VFs to the **rc.local** file. Here is an example showing contents of rc.local file.

```

Terminal - root@ubuntu: /etc
File Edit View Terminal Tabs Help
root@ubuntu:/etc# cat /etc/rc.local
#!/bin/sh -e
#
# rc.local
#
# This script is executed at the end of each multiuser runlevel.
# Make sure that the script will "exit 0" on success or any other
# value on error.
#
# In order to enable or disable this script just change the execution
# bits.
#
# By default this script does nothing.
echo 1 > /sys/class/net/ens3f0/device/sriov_numvfs
echo 1 > /sys/class/net/ens3f1/device/sriov_numvfs
exit 0
root@ubuntu:/etc#

```

For more information, see this [Intel SR-IOV Configuration Guide](#).

## Configure and make the VFs available to OpenStack

Follow the steps given at the link below to configure SR-IOV on OpenStack: <https://wiki.openstack.org/wiki/SR-IOV-Passthrough-For-Networking>.

## Provision the Citrix ADC VPX instance on OpenStack

You can provision a Citrix ADC VPX instance in an OpenStack environment by using the OpenStack CLI.

Provisioning a VPX instance, optionally involves using data from the config drive. The config drive is a special configuration drive that attaches to the instance when it boots. This configuration drive can be used to pass networking configuration information such as management IP address, network mask, and default gateway etc. to the instance before you configure the network settings for the instance.

When OpenStack provisions a VPX instance, it first detects that the instance is booting in an OpenStack environment, by reading a specific BIOS string (OpenStack Foundation) that indicates OpenStack. For Red Hat Linux distributions, the string is stored in `/etc/nova/release`. This is a standard mechanism that is available in all OpenStack implementations based on KVM hyper-visor platform. The drive should have a specific OpenStack label. If the config drive is detected, the instance attempts to read the following information from the file name specified in the nova boot command. In the procedures below, the file is called “userdata.txt.”

- Management IP address
- Network mask
- Default gateway

Once the parameters are successfully read, they are populated in the NetScaler stack. This helps in managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

## Provision the Citrix ADC VPX instance on OpenStack through CLI

You can provision a VPX instance in an OpenStack environment by using the OpenStack CLI. Here's the summary of the steps to provision a Citrix ADC VPX instance on OpenStack:

1. Extracting the .qcow2 file from the .tgz file
2. Building an OpenStack image from the qcow2 image
3. Provisioning a VPX instance

To provision a VPX instance in an OpenStack environment, do the following steps.

1. Extract the .qcow2 file from the .tgz file by typing the command:

```
1 tar xvzf <TAR file>
2
3 tar xvzf NSVPX-KVM-12.0-26.2_nc.tgz
```

```

4     NSVPX-KVM.xml
5     NSVPX-KVM-12.0-26.2_nc.qcow2
6
7 <!--NeedCopy-->

```

2. Build an OpenStack image using the .qcow2 file extracted in step 1 by typing the following command:

```

1     glance image-create --name="<name of the OpenStack image>" --
2     property hw_disk_bus=ide --is-public=
3     true --container-format=bare --disk-format=qcow2< <name of the
4     qcow2 file>
5
6     glance image-create --name="NS-VPX-12-0-26-2" --property
7     hw_disk_bus=ide --is-public=
8     true --container-format=bare --disk-format=qcow2< NSVPX-KVM-12.0-
9     26.2_nc.qcow2
10
11 <!--NeedCopy-->

```

The following illustration provides a sample output for the `glance image-create` command.

Property	Value
checksum	735dae4ea6e46e39ed3f0acfba02e755
container_format	bare
created_at	2017-02-16T10:03:29Z
disk_format	qcow2
hw_disk_bus	ide
id	aeea13e9-b49b-411c-ab54-c61820a8e2f3
min_disk	0
min_ram	0
name	NSVPX-KVM-12.0-26.2
owner	06c41a73b32f4b48af55359fd7d3502c
protected	False
size	717946880

updated_at	2017-02-16T10:03:38Z
virtual_size	None
visibility	private

3. After an OpenStack image is created, provision the Citrix ADC VPX instance instance.

```

1    nova boot --image NSVPX-KVM-12.0-26.2 --config-drive=true --
      userdata
2    ./userdata.txt --flavor m1.medium --nic net-id=3b258725-eaae-
3    455e-a5de-371d6d1f349f --nic port-id=218ba819-9f55-4991-adb6-
4    02086a6bdee2 NSVPX-10
5
6    <!--NeedCopy-->

```

In the above command, userdata.txt is the file which contains the details like, IP address, netmask, and default gateway for the VPX instance. The userdata file is a user customizable file. NSVPX-KVM-12.0-26.2 is the name of the virtual appliance that you want to provision. --nic port-id=218ba819-9f55-4991-adb6-02086a6bdee2 is the OpenStack VF.

The following illustration gives a sample output of the nova boot command.

Property	Value
OS-DCF:diskConfig	MANUAL
OS-EXT-AZ:availability_zone	
OS-EXT-SRV-ATTR:host	-
OS-EXT-SRV-ATTR:hypervisor_hostname	-
OS-EXT-SRV-ATTR:instance_name	instance-0000003c
OS-EXT-STS:power_state	0
OS-EXT-STS:task_state	scheduling
OS-EXT-STS:vm_state	building
OS-SRV-USG:launched_at	-
OS-SRV-USG:terminated_at	-
accessIPv4	
accessIPv6	
adminPass	43EjPdM5shLz

### Additional supported Configurations: Creating and Deleting VLANs on SR-IOV VFs from the Host

Type the following command to create a VLAN on the SR-IOV VF:

```
1   ip link show enp8s0f0 vf 6 vlan 10
2
3  <!--NeedCopy-->
```

In the above command “enp8s0f0” is the name of the physical function.

**Example:** vlan 10, created on vf 6

```

4: enp8s0f0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT qlen 1000
   link/ether 00:1b:21:7b:d7:88 brd ff:ff:ff:ff:ff:ff
   vf 0 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 1 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 2 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 3 MAC fa:16:3e:1e:0b:ee, spoof checking on, link-state auto, trust off
   vf 4 MAC fa:16:3e:0d:05:62, spoof checking on, link-state auto, trust off
   vf 5 MAC 5e:46:0d:79:de:f8, spoof checking on, link-state auto, trust off
   vf 6 MAC fa:16:3e:db:ea:b3, vlan 10, spoof checking on, link-state auto, trust off
   vf 7 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off

```

Type the following command to delete a VLAN on the SR-IOV VF:

```

1 ip link show enp8s0f0 vf 6 vlan 0
2
3 <!--NeedCopy-->

```

**Example:** vlan 10, removed from vf 6

```

[root@localhost ~]# ip link show enp8s0f0
4: enp8s0f0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP mode DEFAULT qlen 1000
   link/ether 00:1b:21:7b:d7:88 brd ff:ff:ff:ff:ff:ff
   vf 0 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 1 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 2 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off
   vf 3 MAC fa:16:3e:1e:0b:ee, spoof checking on, link-state auto, trust off
   vf 4 MAC fa:16:3e:0d:05:62, spoof checking on, link-state auto, trust off
   vf 5 MAC 5e:46:0d:79:de:f8, spoof checking on, link-state auto, trust off
   vf 6 MAC fa:16:3e:db:ea:b3, spoof checking on, link-state auto, trust off
   vf 7 MAC 00:00:00:00:00:00, spoof checking on, link-state auto, trust off

```

These steps complete the procedure for deploying a Citrix ADC VPX instance that uses SRIOV technology, on OpenStack.

## Configure a Citrix ADC VPX instance on KVM to use OVS DPDK-based host interfaces

October 23, 2020

You can configure a Citrix ADC VPX instance running on KVM (Fedora and RHOS) to use Open vSwitch (OVS) with Data Plane Development Kit (DPDK) for better network performance. This document describes how to configure the Citrix ADC VPX instance to operate on the vhost-user ports exposed by OVS-DPDK on KVM host.

[OVS](#) is a multilayer virtual switch licensed under the open-source Apache 2.0 license. [DPDK](#) is a set of libraries and drivers for fast packet processing.

The following Fedora, RHOS, OVS, and DPDK versions are qualified for configuring a Citrix ADC VPX instance:

Fedora	RHOS
Fedora 25	RHOS 7.4
OVS 2.7.0	OVS 2.6.1
DPDK 16.11.12	DPDK 16.11.12

## Prerequisites

Before you install DPDK, make sure the host has 1 GB hugepages.

For more information, see this [DPDK system requirements documentation](#).

Here is the summary of the steps required to configuring a Citrix ADC VPX Instance on KVM to use OVS DPDK-based host interfaces:

- Install DPDK.
- Build and Install OVS.
- Create an OVS bridge.
- Attach a physical interface to the OVS bridge.
- Attach vhost-user ports to the OVS data path.
- Provision a KVM-VPX with OVS-DPDK based vhost-user ports.

## Install DPDK

To install DPDK, follow the instruction given at this [Open vSwitch with DPDK](#) document .

## Build and install OVS

Download OVS from the OVS [download page](#). Next, build and install OVS by using a DPDK datapath. Follow the instructions given in the [Installing Open vSwitch](#) document.

For more detailed information, [DPDK Getting Started Guide for Linux](#).

## Create an OVS bridge

Depending on your need, type the Fedora or RHOS command to create an OVS bridge:

### Fedora command:

```
1 > $OVS_DIR/utilities/ovs-vsctl add-br ovs-br0 -- set bridge ovs-br0
   datapath_type=netdev
2 <!--NeedCopy-->
```

**RHOS command:**

```
1 ovs-vsctl add-br ovs-br0 -- set bridge ovs-br0 datapath_type=netdev
2 <!--NeedCopy-->
```

**Attach physical interface to the OVS bridge**

Bind the ports to DPDK and then attach them to the OVS bridge by typing the following Fedora or RHOS commands:

**Fedora command:**

```
1 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 dpdk0 -- set Interface
    dpdk0 type=dpdk options:dpdk-devargs=0000:03:00.0
2
3 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 dpdk1 -- set Interface
    dpdk1 type=dpdk options:dpdk-devargs=0000:03:00.1
4 <!--NeedCopy-->
```

**RHOS command:**

```
1 ovs-vsctl add-port ovs-br0 dpdk0 -- set Interface dpdk0 type=dpdk
    options:dpdk-devargs=0000:03:00.0
2
3
4 ovs-vsctl add-port ovs-br0 dpdk1 -- set Interface dpdk1 type=dpdk
    options:dpdk-devargs=0000:03:00.1
5 <!--NeedCopy-->
```

The dpdk-devargs shown as part of options specifies the PCI BDF of the respective physical NIC.

**Attach vhost-user ports to the OVS data path**

Type the following Fedora or RHOS commands to attach vhost-user ports to the OVS data path:

**Fedora command:**

```
1 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 vhost-user1 -- set
    Interface vhost-user1 type=dpdkvhostuser -- set Interface vhost-
    user1 mtu_request=9000
2
3 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 vhost-user2 -- set
    Interface vhost-user2 type=dpdkvhostuser -- set Interface vhost-
    user2 mtu_request=9000
4
```

```

5  chmod g+w /usr/local/var/run/openvswitch/vhost*
6  <!--NeedCopy-->

```

**RHOS command:**

```

1  ovs-vsctl add-port ovs-br0 vhost-user1 -- set Interface vhost-user1
   type=dpdkvhostuser -- set Interface vhost-user1 mtu_request=9000
2
3  ovs-vsctl add-port ovs-br0 vhost-user2 -- set Interface vhost-user2
   type=dpdkvhostuser -- set Interface vhost-user2 mtu_request=9000
4
5  chmod g+w /var/run/openvswitch/vhost*
6  <!--NeedCopy-->

```

**Provision a KVM-VPX with OVS-DPDK-based vhost-user ports**

You can provision a VPX instance on Fedora KVM with OVS-DPDK-based vhost-user ports only from CLI by using the following QEMU commands:

**Fedora command:**

```

1  qemu-system-x86_64 -name KVM-VPX -cpu host -enable-kvm -m 4096M \
2
3  -object memory-backend-file,id=mem,size=4096M,mem-path=/dev/hugepages,
   share=on -numa node,memdev=mem \
4
5  -mem-prealloc -smp sockets=1,cores=2 -drive file=<absolute-path-to-disc
   -image-file>,if=none,id=drive-ide0-0-0,format=<disc-image-format> \
6
7  -device ide-drive,bus=ide.0,unit=0,drive=drive-ide0-0-0,id=ide0-0-0,
   bootindex=1 \
8
9  -netdev type=tap,id=hostnet0,script=no,downscript=no,vhost=on \
10
11 -device virtio-net-pci,netdev=hostnet0,id=net0,mac=52:54:00:3c:d1:ae,
   bus=pci.0,addr=0x3 \
12
13 -chardev socket,id=char0,path=</usr/local/var/run/openvswitch/vhost-
   user1> \
14
15 -netdev type=vhost-user,id=mynet1,chardev=char0,vhostforce -device
   virtio-net-pci,mac=00:00:00:00:00:01,netdev=mynet1,mrg_rxbuf=on \
16
17 -chardev socket,id=char1,path=</usr/local/var/run/openvswitch/vhost-
   user2> \

```

```
18
19 -netdev type=vhost-user,id=mynet2,chardev=char1,vhostforce -device
    virtio-net
20
21 pci,mac=00:00:00:00:00:02,netdev=mynet2,mrg_rxbuf=on \
22
23 --nographic
24 <!--NeedCopy-->
```

For RHOS, use the following sample XML file to provision the Citrix ADC VPX instance, by using virsh.

```
<domain type='kvm'>
  <name>dpdk-vpx1</name>
  <uuid>aedb844b-f6bc-48e6-a4c6-36577f2d68d6</uuid>

  <address type='pci' domain='0x0000' bus='0x00' slot='0x08' function='0x0'/>
</memballoon>
</devices>
</domain>
```

**Points to note**

In the XML file, the hugepage size must be 1 GB, as shown in the sample file.

```
<memoryBacking>
  <hugepages>
    <page size='1048576' unit='KiB'/>
  </hugepages>
```

Also, in the sample file vhost-user1 is the vhostuser port bound to ovs-br0.

```
<interface type='vhostuser'>
```

```
<mac address='52:54:00:55:55:56' />  
<source type='unix' path='/var/run/openvswitch/vhost-user1' mode='client' />  
<model type='virtio' />  
<address type='pci' domain='0x0000' bus='0x00' slot='0x04' function='0x0' />  
</interface>
```

To bring up the Citrix ADC VPX instance, start using virsh command.

## Deploy a Citrix ADC VPX instance on AWS

May 7, 2021

You can launch a Citrix ADC VPX instance on Amazon Web Services (AWS). The Citrix ADC VPX appliance is available as an Amazon Machine Image (AMI) in AWS marketplace. A Citrix ADC VPX instance on AWS enables customer like you to leverage AWS Cloud computing capabilities and use Citrix ADC load balancing and traffic management features for their business needs. The VPX instance supports all the traffic management features of a physical Citrix ADC appliance, and they can be deployed as standalone instances or in HA pairs.

This section includes the following topics:

- AWS terminology
- How a Citrix ADC VPX instance on AWS works
- Supported instance type, ENI, and IP addresses

### AWS terminology

Here is a brief description of the terms used in this document. For more information, see [AWS Glossary](#).

---

Term	Defintion
Amazon Machine Image (AMI)	A machine image, which provides the information required to launch an instance, which is a virtual server in the cloud.
Elastic Block Store	Provides persistent block storage volumes for use with Amazon EC2 instances in the AWS Cloud.
Simple Storage Service (S3)	Storage for the Internet. It is designed to make web-scale computing easier for developers.

---

Term	Defintion
Elastic Compute Cloud (EC2)	A web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers.
Elastic Load Balancing (ELB)	Distributes incoming application traffic across multiple EC2 instances, in multiple Availability Zones. This increases the fault tolerance of your applications.
Elastic network interface (ENI)	A virtual network interface that you can attach to an instance in a VPC.
Elastic IP (EIP) address	A static, public IPv4 address that you have allocated in Amazon EC2 or Amazon VPC and then attached to an instance. Elastic IP addresses are associated with your account, not a specific instance. They are elastic because you can easily allocate, attach, detach, and free them as your needs change.
Instance type	Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instance types comprise varying combinations of CPU, memory, storage, and networking capacity and give you the flexibility to choose the appropriate mix of resources for your applications.
Identity and Access Management (IAM)	An AWS identity with permission policies that determine what the identity can and cannot do in AWS. You can use an IAM role to enable applications running on an EC2 instance to securely access your AWS resources. IAM role is required for deploying VPX instances in a high-availability setup.
Internet Gateway	Connects a network to the Internet. You can route traffic for IP addresses outside your VPC to the Internet gateway.

Term	Defintion
Key pair	A set of security credentials that you use to prove your identity electronically. A key pair consists of a private key and a public key.
Route tables	A set of routing rules that controls the traffic leaving any subnet that is associated with the route table. You can associate multiple subnets with a single route table, but a subnet can be associated with only one route table at a time.
Security groups	A named set of allowed inbound network connections for an instance.
Subnets	A segment of the IP address range of a VPC that EC2 instances can be attached to. You can create subnets to group instances according to security and operational needs.
Virtual Private Cloud (VPC)	A web service for provisioning a logically isolated section of the AWS cloud where you can launch AWS resources in a virtual network that you define.
Auto Scaling	A web service to launch or terminate Amazon EC2 instances automatically based on user-defined policies, schedules, and health checks.
CloudFormation	A service for writing or changing templates that create and delete related AWS resources together as a unit.

### **How a Citrix ADC VPX instance on AWS works**

The Citrix ADC VPX instance is available as an AMI in AWS marketplace, and it can be launched as an EC2 instance within an AWS VPC. The Citrix ADC VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Each VPX instance requires at least three IP subnets:

- A management subnet
- A client-facing subnet (VIP)

- A back-end facing subnet (SNIP,MIP, etc.)

Citrix recommends three network interfaces for a standard VPX instance on AWS installation.

AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances. An Amazon VPC allows you to create and control a virtual networking environment, including your own IP address range, subnets, route tables, and network gateways.

Note: By default, you can create up to 5 VPC instances per AWS region for each AWS account. You can request higher VPC limits by submitting Amazon’s request form <http://aws.amazon.com/contact-us/vpc-request>.

**Figure 1.** A Sample Citrix ADC VPX Instance Deployment on AWS Architecture

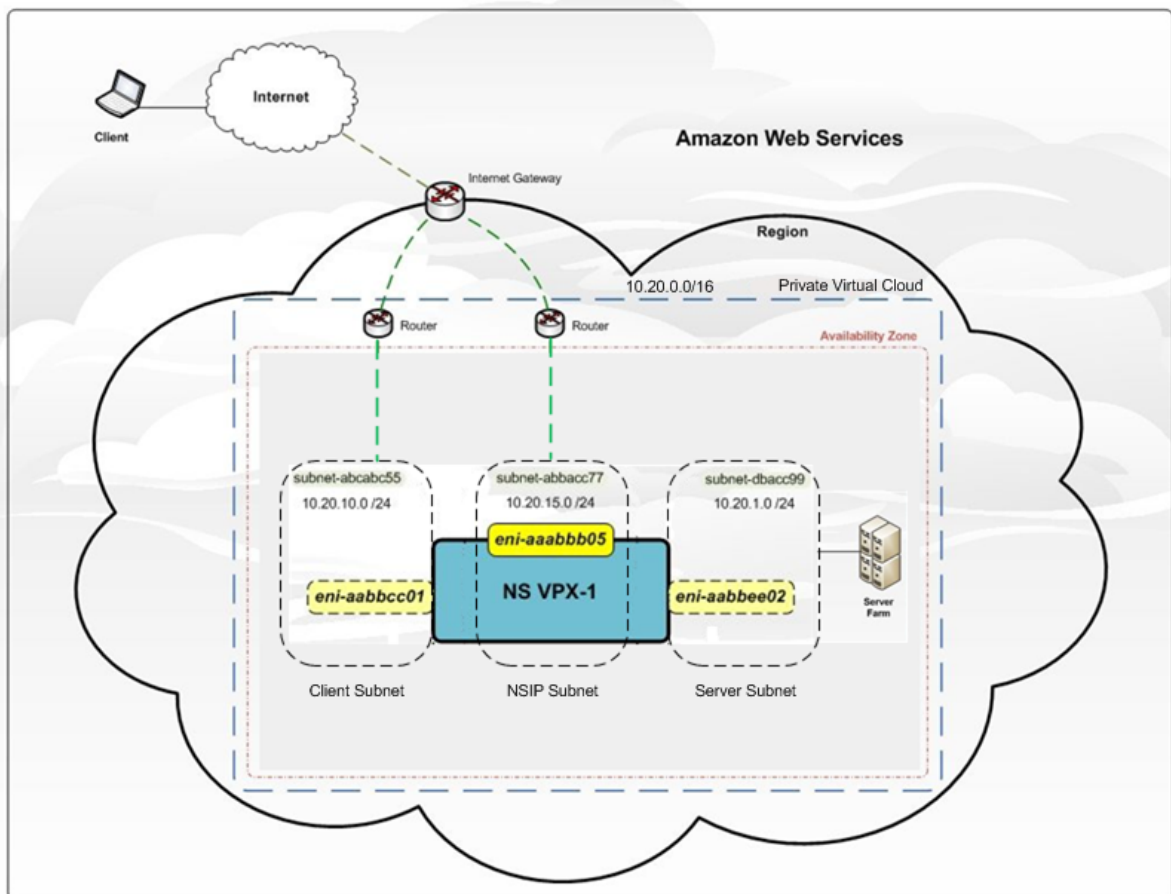

Figure 1 shows a simple topology of an AWS VPC with a Citrix ADC VPX deployment. The AWS VPC has:

1. A single Internet gateway to route traffic in and out of the VPC.
2. Network connectivity between the Internet gateway and the Internet.
3. Three subnets, one each for management, client, and server.

4. Network connectivity between the Internet gateway and the two subnets (management and client).
5. A standalone Citrix ADC VPX instance deployed within the VPC. The VPX instance has three ENIs, one attached to each subnet.

### Supported instance type, ENI, and IP addresses

For more information about Amazon EC2 instances and IP addresses supported per NIC per instance type:

- [Instance types](#)
- [IP addresses per network interface per instance type](#)

For higher bandwidth, Citrix recommends the following instance types:

Instance type	Bandwidth	Enhanced networking (SR-IOV)
M4.10x large	3 Gbps and 5 Gbps	Yes
C4.8x large	3 Gbps and 5 Gbps	Yes

### Limitations and usage guidelines

September 21, 2020

The following limitations and usage guidelines apply when deploying a Citrix ADC VPX instance on AWS:

- Before you start, read the AWS terminology section in [Deploy a Citrix ADC VPX instance on AWS](#).
- The clustering feature is not supported for VPX.
- For the high availability setup to work effectively, associate a dedicated NAT device to management Interface or associate EIP to NSIP. For more information on NAT, in the AWS documentation, see [NAT Instances](#).
- Data traffic and management traffic must be segregated with ENIs belonging to different subnets.
- Only the NSIP address must be present on the management ENI.
- If a NAT instance is used for security instead of assigning an EIP to the NSIP, appropriate VPC level routing changes are required. For instructions on making VPC level routing changes, in the AWS documentation, see [Scenario 2: VPC with Public and Private Subnets](#).

- A VPX instance can be moved from one EC2 instance type to another (for example, from m3.large to an m3.xlarge).
- For storage options for VPX on AWS, Citrix recommends EBS, because it is durable and the data is available even after it is detached from instance.
- Dynamic addition of ENIs to VPX is not supported. Restart the VPX instance to apply the update. Citrix recommends you to stop the standalone or HA instance, attach the new ENI, and then restart the instance.
- You can assign multiple IP addresses to an ENI. The maximum number of IP addresses per ENI is determined by the EC2 instance type, see the section “IP Addresses Per Network Interface Per Instance Type” in [Elastic Network Interfaces](#). You must allocate the IP addresses in AWS before you assign them to ENIs. For more information, see [Elastic Network Interfaces](#).
- Citrix recommends that you avoid using the enable and disable interface commands on Citrix ADC VPX interfaces.
- The Citrix ADC `set ha node \<NODE\_ID\> -haStatus STAYPRIMARY` and `set ha node \<NODE\_ID\> -haStatus STAYSECONDARY` commands are disabled by default.
- IPv6 is not supported for VPX.
- Due to AWS limitations, these features are not supported:
  - Gratuitous ARP (GARP)
  - L2 mode
  - Tagged VLAN
  - Dynamic Routing
  - Virtual MAC (VMAC)
- For RNAT to work, ensure **Source/Destination Check** is disabled. For more information, see “Changing the Source/Destination Checking” in [Elastic Network Interfaces](#).
- In a Citrix ADC VPX deployment on AWS, in some AWS regions, the AWS infrastructure might not be able to resolve AWS API calls. This happens if the API calls are issued through a nonmanagement interface on the Citrix ADC VPX instance.  
As a workaround, restrict the API calls to the management interface only. To do that, create a NSVLAN on the VPX instance and bind the management interface to the NSVLAN by using the appropriate command.  
For example:  

```
set ns config -nsvlan <vlan id> -ifnum 1/1 -tagged NO
save config
```

  
Restart the VPX instance at the prompt. For more information about configuring NSVLAN, see [Configuring NSVLAN](#).

- In the AWS console, the vCPU usage shown for a VPX instance under the **Monitoring** tab might be high (up to 100 percent), even when the actual usage is much lower. To see the actual vCPU usage, use the VPX GUI or CLI.

## Prerequisites

November 11, 2020

Before attempting to create a VPX instance in AWS, ensure you have the following:

- **An AWS account:** to launch a Citrix ADC VPX AMI in an Amazon Web Services (AWS) Virtual Private Cloud (VPC). You can create an AWS account for free at [www.aws.amazon.com](http://www.aws.amazon.com).
- **An AWS Identity and Access Management (IAM) user account:** to securely control access to AWS services and resources for your users. For more information about how to create an IAM user account, see the topic [Creating IAM Users \(Console\)](#).

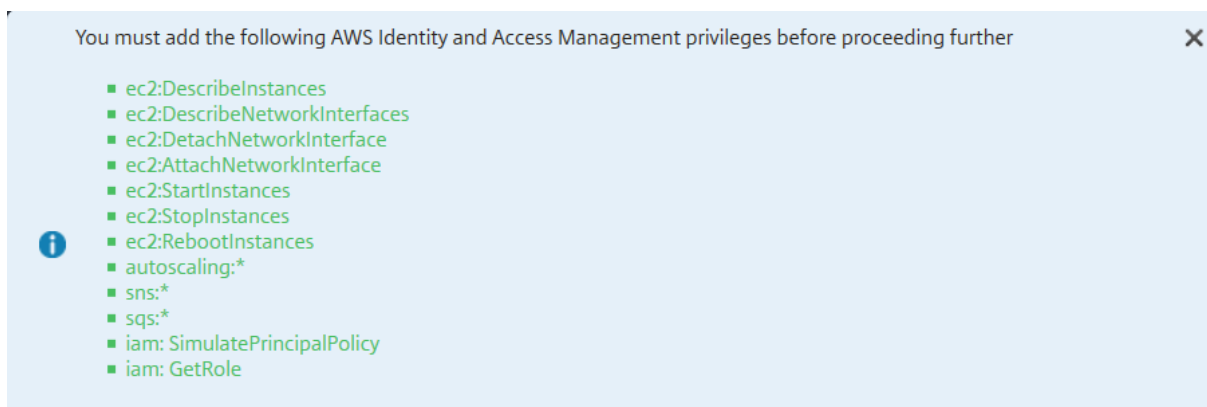

An IAM role is mandatory for both standalone and high availability deployments. The IAM role must have the following privileges:

```
1 ec2:DescribeInstances
2 ec2:DescribeNetworkInterfaces
3 ec2:DetachNetworkInterface
4 ec2:AttachNetworkInterface
5 ec2:StartInstances
6 ec2:StopInstances
7 ec2:RebootInstances
8 ec2:DescribeAddresses
9 ec2:AssociateAddress
10 ec2:DisassociateAddress
11 ec2:AssignPrivateIpAddresses
12 ec2:UnassignPrivateIpAddresses
13 autoscaling:*
14 sns:CreateTopic
15 sns>DeleteTopic
16 sns:ListTopics
17 sns:Subscribe
18 sqs:CreateQueue
19 sqs:ListQueues
20 sqs>DeleteMessage
21 sqs:GetQueueAttributes
22 sqs:SetQueueAttributes
23 iam:SimulatePrincipalPolicy
24 iam:GetRole
```

25 &lt;!--NeedCopy--&gt;

If you use the Citrix CloudFormation template, the IAM role is automatically created. The template does not allow selecting an already created IAM role.

Note: When you log on the VPX instance through GUI, a prompt to configure the required privileges for IAM role appears. Ignore the prompt if you've already configured the privileges.

- **AWS CLI:** to use all the functionality provided by the AWS Management Console from your terminal program. For more information, see the [AWS CLI user guide](#). You also need the AWS CLI to change the network interface type to SR-IOV.
- **Elastic Network Adapter (ENA):** For ENA driver-enabled instance type, the firmware version must be 13.0 and above.

## Deploy a Citrix ADC VPX standalone instance on AWS

September 21, 2020

You can deploy a Citrix ADC VPX standalone instance on AWS by using the following options:

- AWS web console
- Citrix-authored CloudFormation template
- AWS CLI

This topic describes the procedure for deploying a Citrix ADC VPX instance on AWS.

Before you start your deployment, read the following topics:

- [Prerequisites](#)
- [Limitation and usage guidelines](#)

## Deploy a Citrix ADC VPX instance on AWS by using the AWS web console

You can deploy a Citrix ADC VPX instance on AWS through the AWS web console. The deployment process includes the following steps:

1. Create a Key Pair
2. Create a Virtual Private Cloud (VPC)
3. Add additional subnets
4. Create security groups and security rules
5. Add route tables
6. Create an internet gateway
7. Create a Citrix ADC VPX instance
8. Create and attach additional network interfaces
9. Attach elastic IPs to the management NIC
10. Connect to the VPX instance

### Step 1: Create a key pair.

Amazon EC2 uses a key pair to encrypt and decrypt logon information. To log on to your instance, you must create a key pair, specify the name of the key pair when you launch the instance, and provide the private key when you connect to the instance.

When you review and launch an instance by using the AWS Launch Instance wizard, you are prompted to use an existing key pair or create a new key pair. More information about how to create a key pair, see [Amazon EC2 Key Pairs](#).

### Step 2: Create a VPC.

A Citrix ADC VPC instance is deployed inside an AWS VPC. A VPC allows you to define virtual network dedicated to your AWS account. For more information about AWS VPC, see [Getting Started With Amazon VPC](#).

While creating a VPC for your Citrix ADC VPX instance, keep the following points in mind.

- Use the VPC with a Single Public Subnet Only option to create a AWS VPC in an AWS availability zone.
- Citrix recommends that you create at least **three subnets**, of the following types:
  - One subnet for management traffic. You place the management IP(NSIP) on this subnet. By default elastic network interface (ENI) eth0 is used for management IP.
  - One or more subnets for client-access (user-to-Citrix ADC VPX) traffic, through which clients connect to one or more virtual IP (VIP) addresses assigned to Citrix ADC load balancing virtual servers.
  - One or more subnets for the server-access (VPX-to-server) traffic, through which your servers connect to VPX-owned subnet IP (SNIP) addresses. For more information about Citrix ADC load balancing and virtual servers, virtual IP addresses (VIPs), and subnet IP

addresses (SNIPs), see:

- All subnets must be in the same availability zone.

### **Step 3: Add subnets.**

When you used the VPC wizard, only one subnet was created. Depending on your requirement, you might want to create additional subnets. For more information about how to create additional subnets, see [Adding a Subnet to Your VPC](#).

### **Step 4: Create security groups and security rules.**

To control inbound and outbound traffic, create security groups and add rules to the groups. For more information how to create groups and add rules, see [Security Groups for Your VPC](#).

For Citrix ADC VPX instances, the EC2 wizard gives default security groups, which are generated by AWS Marketplace and is based on recommended settings by Citrix. However, you can create additional security groups based on your requirements.

#### **Note**

Port 22, 80, 443 to be opened on the Security group for SSH, HTTP, and HTTPS access respectively.

### **Step 5: Add route tables.**

Route table contains a set of rules, called routes, that are used to determine where network traffic is directed. Each subnet in your VPC must be associated with a route table. For more information about how to create a route table, see [Route Tables](#).

### **Step 6: Create an internet gateway.**

An internet gateway serves two purposes: to provide a target in your VPC route tables for internet-routable traffic, and to perform network address translation (NAT) for instances that have been assigned public IPv4 addresses.

Create an internet gateway for internet traffic. For more information about how to create an Internet Gateway, see the section [Attaching an Internet Gateway](#).

### **Step 7: Create a Citrix ADC VPX instance by using the AWS EC2 service.**

To create a Citrix ADC VPX instance by using the AWS EC2 service, complete the following steps.

1. From the AWS dashboard, go to **Compute > EC2 > Launch Instance > AWS Marketplace**.

Before you click **Launch Instance**, ensure your region is correct by checking the note that appears under Launch Instance.

2. In the Search AWS Marketplace bar, search with the keyword Citrix ADC VPX.
3. Select the version you want to deploy and then click **Select**. For the Citrix ADC VPX version, you the following options:
  - A licensed version
  - Citrix ADC VPX Express appliance (This is a free virtual appliance, which is available from Citrix ADC 12.0 56.20.)
  - Bring your own device

The Launch Instance wizard starts. Follow the wizard to create an instance. The wizard prompts you to:

- Choose Instance Type
- Configure Instance
- Add Storage
- Add Tags
- Configure Security Group
- Review

### **Step 8: Create and attach additional network interfaces.**

Create two additional network interfaces for VIP and SNIP. For more information about how to create additional network interfaces, see the [Creating a Network Interface](#) section.

After you've created the network interfaces, you must attach them to the VPX instance. Before attaching the interface, shut down the VPX instance, attach the interface, and power on the instance. For more information about how to attach network interfaces, see the [Attaching a Network Interface When Launching an Instance](#) section.

### **Step 9: Allocate and associate elastic IPs.**

If you assign a public IP address to an EC2 instance, it remains assigned only until the instance is stopped. After that, the address is released back to the pool. When you restart the instance, a new public IP address is assigned.

In contrast, an elastic IP (EIP) address remains assigned until the address is disassociated from an instance.

Allocate and associate an elastic IP for the management NIC. For more information about how to allocate and associate elastic IP addresses, see these topics:

- [Allocating an Elastic IP Address](#)
- [Associating an Elastic IP Address with a Running Instance](#)

These steps complete the procedure to create a Citrix ADC VPX instance on AWS. It can take a few minutes for the instance to be ready. Check that your instance has passed its status checks. You can view this information in the **Status Checks** column on the Instances page.

### **Step 10: Connect to the VPX instance.**

After you've created the VPX instance, you connect the instance by using the GUI and an SSH client.

- GUI

The following are the default administrator credentials to access a Citrix ADC VPX instance

User name: `nsroot`

Password: The default password for the `nsroot` account is set to the AWS instance-ID of the Citrix ADC VPX instance.

- SSH client

From the AWS management console, select the Citrix ADC VPX instance and click **Connect**. Follow the instructions given on the **Connect to Your Instance** page.

For more information about how to deploy a Citrix ADC VPX standalone instance on AWS by using the AWS web console, see:

- [Scenario: standalone instance](#)
- [How to configure a Citrix NetScaler VPX instance on AWS by using Citrix CloudFormation template](#)

### **Configure a Citrix ADC VPX instance by using the Citrix CloudFormation template**

You can use the Citrix-provided CloudFormation template to automate VPX instance launch. The template provides functionality to launch a single Citrix ADC VPX instance, or to create a high availability environment with a pair of Citrix ADC VPX instances.

You can launch the template from AWS Marketplace or GitHub.

The CloudFormation template requires an existing VPC environment, and it launches a VPX instance with three elastic network interfaces (ENIs). Before you start the CloudFormation template, ensure that you complete the following requirements:

- An AWS virtual private cloud (VPC)
- Three subnets within the VPC: one for management, one for client traffic, and one for back-end servers
- An EC2 key pair to enable SSH access to the instance
- A security group with UDP 3003, TCP 3009–3010, HTTP, SSH ports open

See the “Deploy a Citrix ADC VPX Instance on AWS by Using the AWS Web Console” section or AWS documentation for more information about how to complete the prerequisites.

Watch this [video](#) to learn about how to configure and launch a Citrix ADC VPX standalone instance by using the Citrix CloudFormation template available in the AWS Marketplace.

Further, you configure and launch a Citrix ADC VPX Express standalone instance by using the Citrix CloudFormation template available in GitHub:

<https://github.com/citrix/citrix-adc-aws-cloudformation/tree/master/templates/standalone/1nic/express-single-nic>

An IAM role is not mandatory for a standalone deployment. However, Citrix recommends that you create and attach an IAM role with the required privileges to the instance, for future need. The IAM role ensures that the standalone instance is easily converted to a high availability node with SR-IOV, when required.

For more information about the required privileges, see [Configuring Citrix ADC VPX instances to use the SR-IOV Network Interface](#).

## Configure a Citrix ADC VPX instance by using the AWS CLI

You can use the AWS CLI to launch instances. For more information, see the [AWS Command Line Interface Documentation](#).

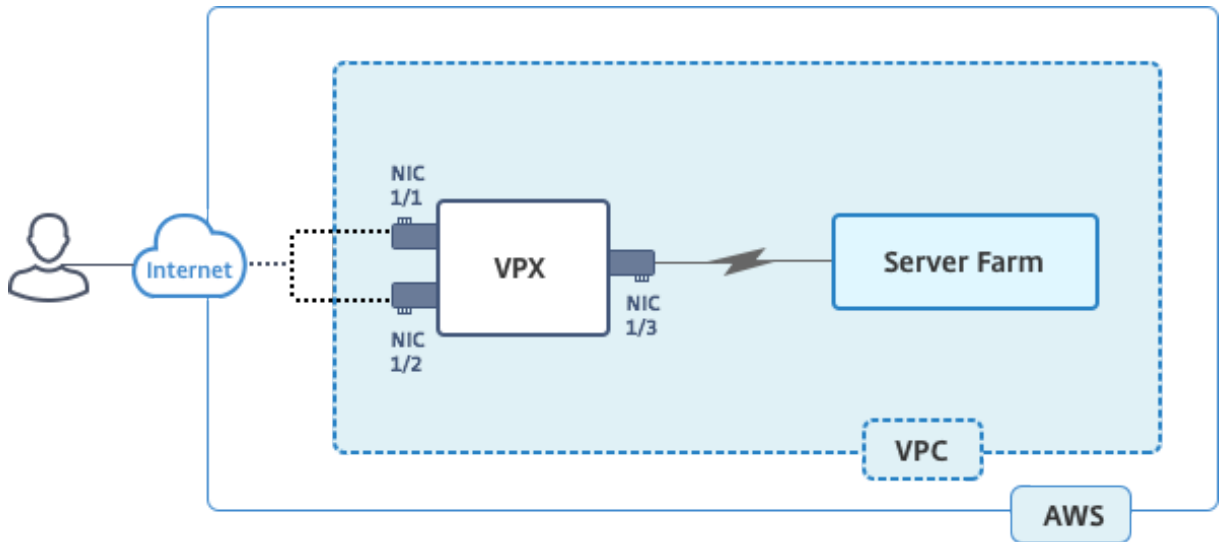

## Scenario: standalone instance

September 21, 2020

May 24, 2018

This scenario illustrates how to deploy a Citrix ADC VPX standalone EC2 instance in AWS by using the AWS GUI. Create a standalone VPX instance with three NICs. The instance, which is configured as a load balancing virtual server, communicates with backend servers (the server farm). For this configuration, set up the required communication routes between the instance and the back-end servers, and between the instance and the external hosts on the public internet.

For more details about the procedure for deploying a VPX instance., see [Deploy a Citrix ADC VPX standalone instance on AWS.](#)

Create three NICs. Each NIC can be configured with a pair of IP addresses (public and private). The NICs serve the following purposes.

NIC	Purpose	Associated with
eth0	Serves management traffic (NSIP)	A public IP address and a private IP address
eth1	Serves client-side traffic (VIP)	A public IP address and a private IP address
eth1	Communicates with backend servers (SNIP)	A public IP address (Private IP address not mandatory)

Step 1: Create a VPC.

1. Log on to the AWS web console and navigate to **Networking & Content Delivery > VPC**. Click **Start VPC Wizard**.
2. Select **VPC with a Single Public Subnet** and click **Select**.
3. Set the IP CIDR Block to 10.0.0.0/16, for this scenario.
4. Give a name for the VPC.
5. Set the public subnet to 10.0.0.0/24. (This is the management network).
6. Select an availability zone.
7. Give a give a name for the subnet.

8. Click Create **VPC**.

Step 2: Create additional subnets.

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose Subnets, Create Subnet after you enter the following details.
  - Name tag: Provide a name for your subnet.
  - VPC: Choose the VPC for which you’re creating the subnet.
  - Availability Zone: Choose the availability zone in which you created the VPC in step 1.
  - IPv4 CIDR block: Specify an IPv4 CIDR block for your subnet. For this scenario, choose 10.0.1.0/24.

CIDR	Status	Status Reason
10.0.0.0/16	associated	

3. Repeat the steps to create one more subnet for back-end servers.

### Create Subnet ✕

Use the CIDR format to specify your subnet's IP address block (e.g., 10.0.0.0/24). Note that block sizes must be between a /16 netmask and /28 netmask. Also, note that a subnet can be the same size as your VPC. An IPv6 CIDR block must be a /64 CIDR block.

**Name tag**  ⓘ

**VPC**  ⓘ

**VPC CIDRs**

CIDR	Status	Status Reason
10.0.0.0/16	associated	

**Availability Zone**  ⓘ

**IPv4 CIDR block**  ⓘ

Cancel
Yes, Create

Step 3: Create a route table.

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Route Tables** > **Create Route Table**.
3. In the Create Route Table window, add a name and select the VPC that you created in step 1.
4. Click **Yes, Create**.

### Create Route Table ✕

A route table specifies how packets are forwarded between the subnets within your VPC, the Internet, and your VPN connection.

**Name tag**  ⓘ

**VPC**  ⓘ

Cancel
Yes, Create

The route table is assigned to all the subnets that you created for this VPC, so that routing of traffic from instance in one subnet can reach an instance in another subnet.

5. Click Subnet Associations, and then click Edit.
6. Click the management and client subnet and click Save. This creates a route table for internet traffic only.

rtb-4329082a | NSDoc-internet-traffic

Summary Routes **Subnet Associations** Route Propagation Tags

Cancel Save

Associate	Subnet	IPv4 CIDR	IPv6 CIDR	Current Route Table
<input checked="" type="checkbox"/>	subnet-c4ce9aad   NSDoc-MGMT	10.0.0.0/24	-	rtb-735a7b1a
<input checked="" type="checkbox"/>	subnet-31ce9a58   NSDoc-client	10.0.1.0/24	-	Main
<input type="checkbox"/>	subnet-d0cd99b9   NSDoc-server	10.0.2.0/24	-	Main

7. Click Routes > Edit > Add another route.

8. In the Destination field add 0.0.0.0/0, and click the Target field to select igw-<xxxx> the Internet Gateway that the VPC Wizard created automatically.

9. Click Save.

rtb-4329082a | NSDoc-internet-traffic

Summary **Routes** Subnet Associations Route Propagation Tags

Cancel Save

View: All rules

Destination	Target	Status	Propagated	Remove
10.0.0.0/16	local	Active	No	
<input type="text" value="0.0.0.0/0"/>	<input type="text" value="igw-9fbe2df6"/>		No	<input type="button" value="✕"/>

10. Follow the steps to create a route table for server-side traffic.

Step 4: Create a Citrix ADC VPX instance.

1. Log on the AWS management console and click **EC2** under **Compute**.
2. Click AWS Marketplace. In the Search AWS Marketplace bar, type Citrix ADC VPX and press Enter. The available Citrix ADC VPX editions are displayed.
3. Click **Select** to choose the desired Citrix ADC VPX edition. The EC2 instance wizard starts.
4. In the **Choose Instance Type** page, select **m4. Xlarge** (recommended) and click **Next: Configure Instance Details**.
5. In the Configure Instance Details page, select the following, and then click Next: Add Storage.

- Number of instances: 1
- Network: the VPC that created in Step 1
- Subnet: the management subnet
- Auto-assign Public IP: Enable

The screenshot shows the 'Step 3: Configure Instance Details' page in the AWS Management Console. The page is titled 'Step 3: Configure Instance Details' and includes a sub-header 'Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the lower pricing, assign an access management role to the instance, and more.' The page contains several configuration sections: 'Number of instances' (1), 'Purchasing option' (Request Spot instances), 'Network' (vpc-ac9ad2c5 | NSDoc), 'Subnet' (subnet-c4ce9aad | NSDoc-MGMT | ap-south-1a), 'Auto-assign Public IP' (Enable), 'Placement group' (No placement group), 'IAM role' (None), 'Shutdown behavior' (Stop), 'Enable termination protection' (Protect against accidental termination), 'Monitoring' (Enable CloudWatch detailed monitoring), 'EBS-optimized instance' (Launch as EBS-optimized instance), and 'Tenancy' (Shared - Run a shared hardware instance). The 'Review and Launch' button is highlighted in blue.

6. In the Add Storage page, select the default option, and click Next: Add Tags.
7. In the Add Tags page, add a name for the instance, and click Next: Configure Security Group.
8. In the Configure Security Group page, select the default option (which is generated by AWS Marketplace and is based on recommended settings by Citrix Systems) and then click Review and Launch > Launch.
9. You are prompted to select an existing key pair or create a new key pair. From the Select a key pair drop-down list, select the key pair that you created as a prerequisite (See the Prerequisite section.)
10. Check the box to acknowledge the key pair and click Launch Instances.

### Select an existing key pair or create a new key pair ✕

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Note: The selected key pair will be added to the set of keys authorized for this instance. Learn more about [removing existing key pairs from a public AMI](#).

Choose an existing key pair ⌵

**Select a key pair**

NSDOCKeypair ⌵

I acknowledge that I have access to the selected private key file (NSDOCKeypair.pem), and that without this file, I won't be able to log into my instance.

[Cancel](#) [Launch Instances](#)

Launch Instance Wizard displays the Launch Status, and the instance appears in the list of instances when it is fully launched.

The check instance, go the AWS console click EC2 > Running Instances. Select the instance and add a name. Make sure the Instance State is running and Status Checks is complete.

Step 5: Create and attach more network interfaces.

When you created the VPC, only one network interface associated with it. Now add two more network interfaces to the VPC, for the VIP and SNIP.

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose Network Interfaces.
3. Choose Create Network Interface.
4. For Description, enter a descriptive name.
5. For Subnet, select the subnet that you created previously for the VIP.
6. For Private IP, leave the default option.
7. For Security groups, select the group.
8. Click **Yes, Create**.

9. After the network interface is created, add a name to the interface.

10. Repeat the steps to create a network interface for server-side traffic.

#### Attach the network interfaces:

1. In the navigation pane, choose Network Interfaces.
2. Select the network interface and choose Attach.
3. In the Attach Network Interface dialog box, select the instance and choose Attach.

Name	Network interface ID	Subnet ID	VPC ID	Zone	Security groups
NSDoc-VIP-...	eni-3c843657	subnet-31ce9a...	vpc-ac9ad2c5	ap-south-1a	default
<input checked="" type="checkbox"/> NSDoc-SNIP	eni-3e8b3955	subnet-d0cd99...	vpc-ac9ad2c5	ap-south-1a	default
<input type="checkbox"/>	eni-dd1cacb6	subnet-9d43f6f4	vpc-52ab033b	ap-south-1a	FreeBSD 11-11-0-R
<input type="checkbox"/> NSDoc-NSIP	eni-878133ec	subnet-c4ce9aad	vpc-ac9ad2c5	ap-south-1a	NetScaler VPX - Cu
<input type="checkbox"/>	eni-2da8a261	subnet-fa6882b3	vpc-52ab033b	ap-south-1a	All
<input type="checkbox"/>	eni-e0f9128b				
<input type="checkbox"/>	eni-0e55e565				
<input type="checkbox"/>	eni-1fa9ef53				
<input type="checkbox"/>	eni-23ff4a48				
<input type="checkbox"/>	eni-45fb4e2e				
<input type="checkbox"/>	eni-76f84d1d				
<input type="checkbox"/>	eni-72ff183d				

Step 6: Attach elastic IP to the NSIP.

1. From the AWS management console, go to **NETWORK & SECURITY > Elastic IPs**.
2. Check for available free EIP to attach. If none, click **Allocate new address**.
3. Select the newly allocated IP address and choose **Actions > Associate address**.
4. Click the **Network interface** radio button.

5. From the Network interface drop-down list, select the management NIC.
6. From the **Private IP** drop-down menu, select the AWS-generated IP address.
7. Select the **Reassociation** check box.
8. Click **Associate**.

#### Access the VPX instance:

After you've configured a standalone Citrix ADC VPX instance with three NICs, log on to the VPX instance to complete the Citrix ADC-side configuration. Use of the following options:

- GUI: Type the public IP of the management NIC in the browser. Log on by using nsroot as the user name and the instance ID (i-0c1ffe1d987817522) as the password.
- SSH: Open an ssh client and type:

```
ssh -i <location of your private key> nsroot@<public DNS of the instance>
```

To find the public DNS, click the instance, and click Connect.

#### Related information:

- To configure the Citrix ADC-owned IP addresses (NSIP, VIP, and SNIP), see [Configuring Citrix ADC-Owned IP Addresses](#).
- You've configured a BYOL version of the Citrix ADC VPX appliance, for more information see the VPX Licensing Guide at <http://support.citrix.com/article/CTX122426>

## Download a Citrix ADC VPX license

July 26, 2021

After the launch of Citrix ADC VPX-customer licensed instance from the AWS marketplace, a license is required. For more information on VPX licensing, see [Licensing overview](#).

You have to:

1. Use the licensing portal within Citrix website to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance activate automatically.

If you use a Citrix ADC VPX instance with a model number higher than VPX 5000, the network throughput might not be the same as specified by the instance's license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

5 Gbps network bandwidth is observed in the `c4.8xlarge` instance type.

## How to migrate the AWS subscription to BYOL

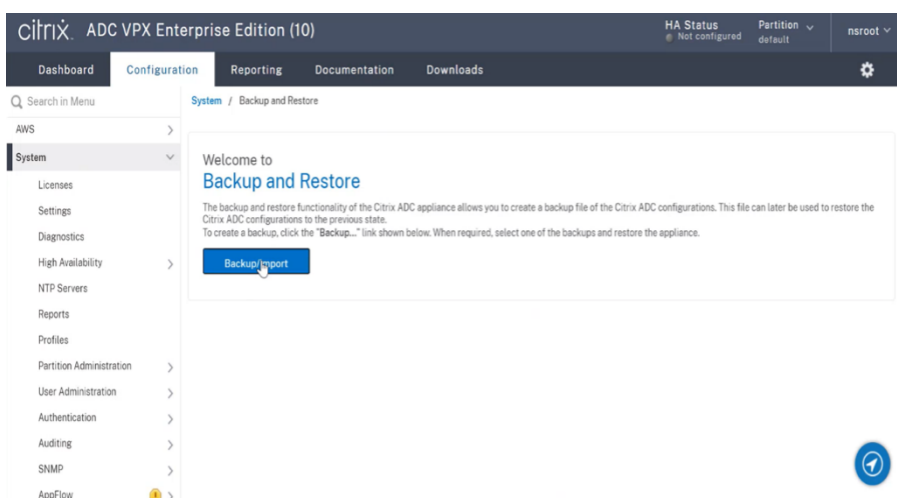

This section describes the procedure to migrate from AWS subscription to Bring your own license (BYOL), and conversely.

Do the following steps to migrate an AWS subscription to BYOL:

### Note

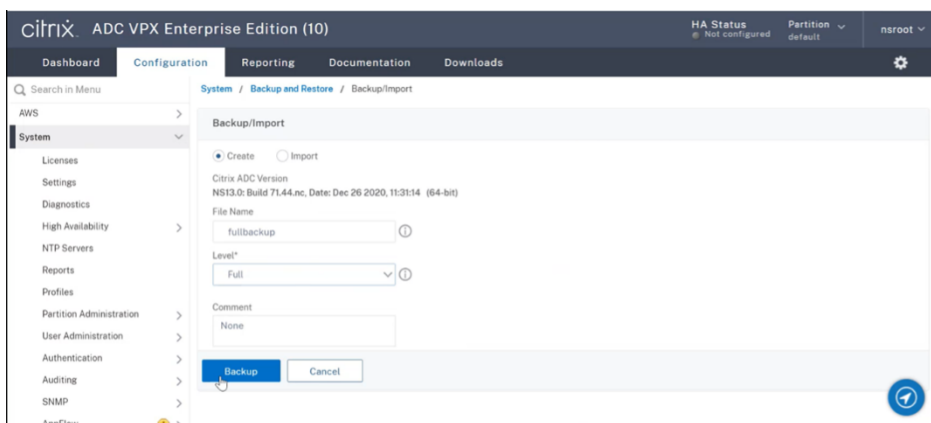

The **Step 2** and **Step 3** are done on the Citrix ADC VPX instance, and all other steps are done on the AWS portal.

1. Create a BYOL EC2 instance using [Citrix ADC VPX - Customer Licensed](#) in the same availability zone as the old EC2 instance that has the same security group, IAM role, and subnet. The new EC2 instance must have only one ENI interface.
2. To back up the data on the old EC2 instance using the Citrix ADC GUI, follow these steps.
  - a) Navigate to **System > Backup and Restore**.
  - b) In the **Welcome** page, click **Backup/Import** to start the process.

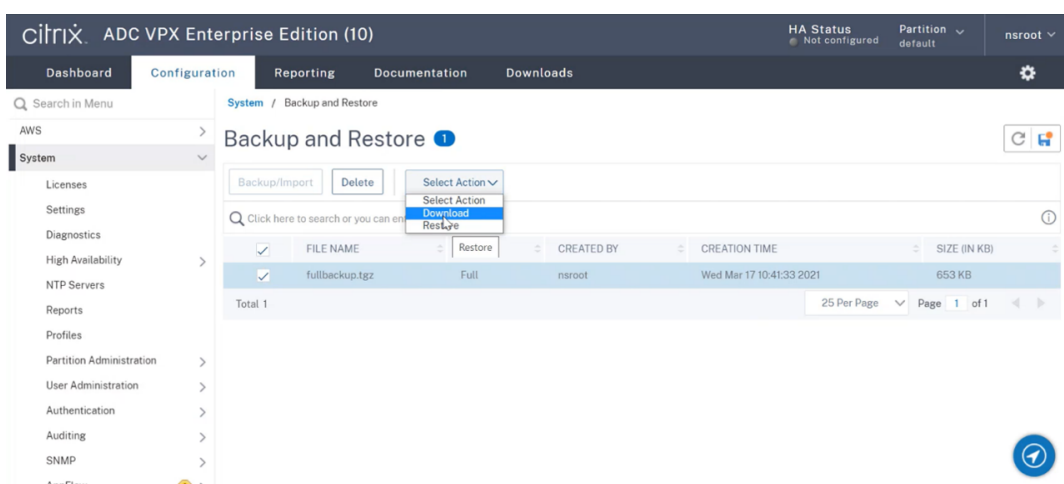

- c) In the **Backup/Import** page, fill in the following details:

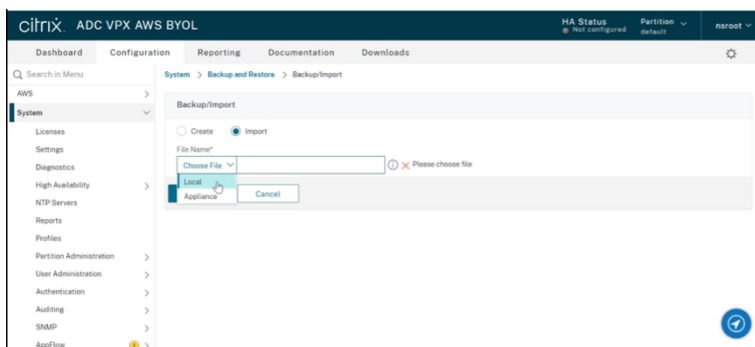

- **Name** – Name of the backup file.
- **Level** – Select the backup level as **Full**.
- **Comment** – Provide a brief description of the backup.

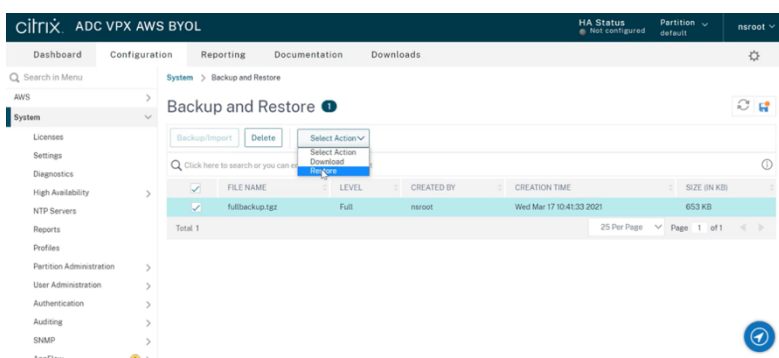

- d) Click **Backup**. Once the backup is complete, you can select the file and download it to your local machine.

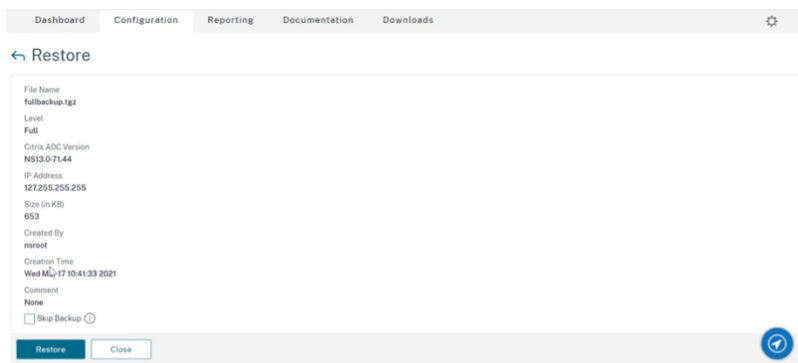

- To restore the data on the new EC2 instance using the Citrix ADC GUI, follow these steps:
  - Navigate to **System > Backup and Restore**.
  - Click **Backup/Import** to start the process.
  - Select the **Import** option and upload the backup file.

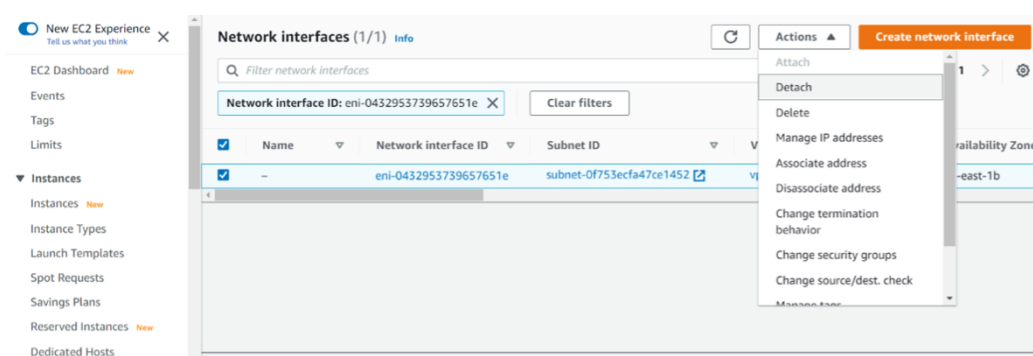

- d) Select the file.
- e) From the **Select Action** drop-down menu, select **Restore**.

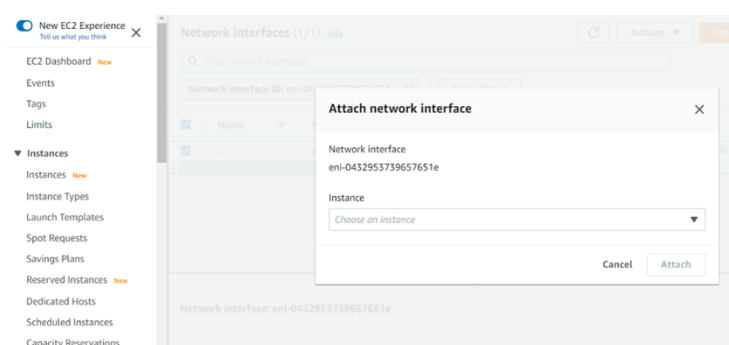

- f) On the **Restore** page, verify the file details, and click **Restore**.

- g) After the restore, reboot the EC2 instance.
4. Move all interfaces (except the management interface to which the NSIP address is bound) from the old EC2 instance to the new EC2 instance. To move a network interface from one EC2 instance to another, follow these steps:
- a) In the **AWS Portal**, stop both the old and new EC2 instances.
  - b) Navigate to **Network Interfaces**, and select the network interface attached to the old EC2 instance.
  - c) Detach the EC2 instance by clicking **Actions > Detach**.

- d) Attach the network interface to the new EC2 instance by clicking **Actions > Attach**. Enter the EC2 instance name to which the network interface must be attached.

- e) Do the **Step 1 to Step 4** for all other interfaces that are attached. Make sure to follow the sequence and maintain the interface order. That is, first detach interface 2 and attach it, and then detach interface 3 and attach it, and so on.
5. You can't detach the management interface from an old EC2 instance. So, move all the secondary IP addresses (if any) on the management interface (primary network interface) of the old EC2 instance to the new EC2 instance. To move an IP address from one interface to another, follow these steps:
- In the **AWS Portal**, make sure that both the old and new EC2 instances are in **Stop** state.
  - Navigate to **Network Interfaces**, and select the management network interface attached to the old EC2 instance.
  - Click **Actions > Manage IP Address**, and make note of all the secondary IP addresses assigned (if any).
  - Navigate to the management network interface or primary interface of the new EC2 instance.
  - Click **Actions > Manage IP Addresses**.
  - Under **IPv4 Addresses**, click **Assign new IP address**.
  - Enter the IP addresses, which are noted in the **Step 3**.

- h) Select **Allow secondary private IP addresses to be reassigned** check box.
- i) Click **Save**.

6. Start the new EC2 instance and verify the configuration. After all the configuration is moved, you can delete or keep the old EC2 instance as per your requirement.
7. If any EIP address is attached to the NSIP address of the old EC2 instance, move the old instance NSIP address to the new instance NSIP address.
8. If you want to revert to the old instance, then follow the same steps in the opposite way between the old and new instance.
9. After you move from subscription instance to BYOL instance, a license is required. To install a license follow these steps:
  - Use the licensing portal in the Citrix website to generate a valid license.
  - Upload the license to the instance. For more information, see [VPX ADC - Install a new license](#).

#### Note

When you move BYOL instance to subscription instance (paid marketplace instance), you need not install the license. The correct feature set and performance is automatically activated.

### Limitations

The management interface can't be moved to the new EC2 instance. So Citrix recommends you manually configure the management interface. For more information, see **Step 5** in the preceding procedure. A new EC2 instance is created with the exact replica of the old EC2 instance but only the NSIP address has a new IP address.

## Load balancing servers in different availability zones

September 21, 2020

A VPX instance can be used to load balance servers running in the same availability zone, or in:

- A different availability zone (AZ) in the same AWS VPC
- A different AWS region
- AWS EC2 in a VPC

To enable a VPX instance to load balance servers running outside the AWS VPC that the VPX instance is in, configure the instance to use EIPs to route traffic through the Internet gateway, as follows:

1. Configure a SNIP on the Citrix ADC VPX instance by using the Citrix ADC CLI or the GUI.
2. Enable traffic to be routed out of the AZ, by creating a public facing subnet for the server-side traffic.
3. Add an Internet gateway route to the routing table, using the AWS GUI console.
4. Associate the routing table you just updated with the server-side subnet.
5. Associate an EIP with the server-side private IP address that is mapped to a Citrix ADC SNIP address.

## Deploy a high availability pair on AWS

May 7, 2021

You can configure two Citrix ADC VPX instances on AWS as a high availability (HA) active-passive pair. When you configure one instance as the primary node and the other as the secondary node, the primary node accepts connections and manages servers. The secondary node monitors the primary. If for any reason, the primary node is unable to accept connections, the secondary node takes over.

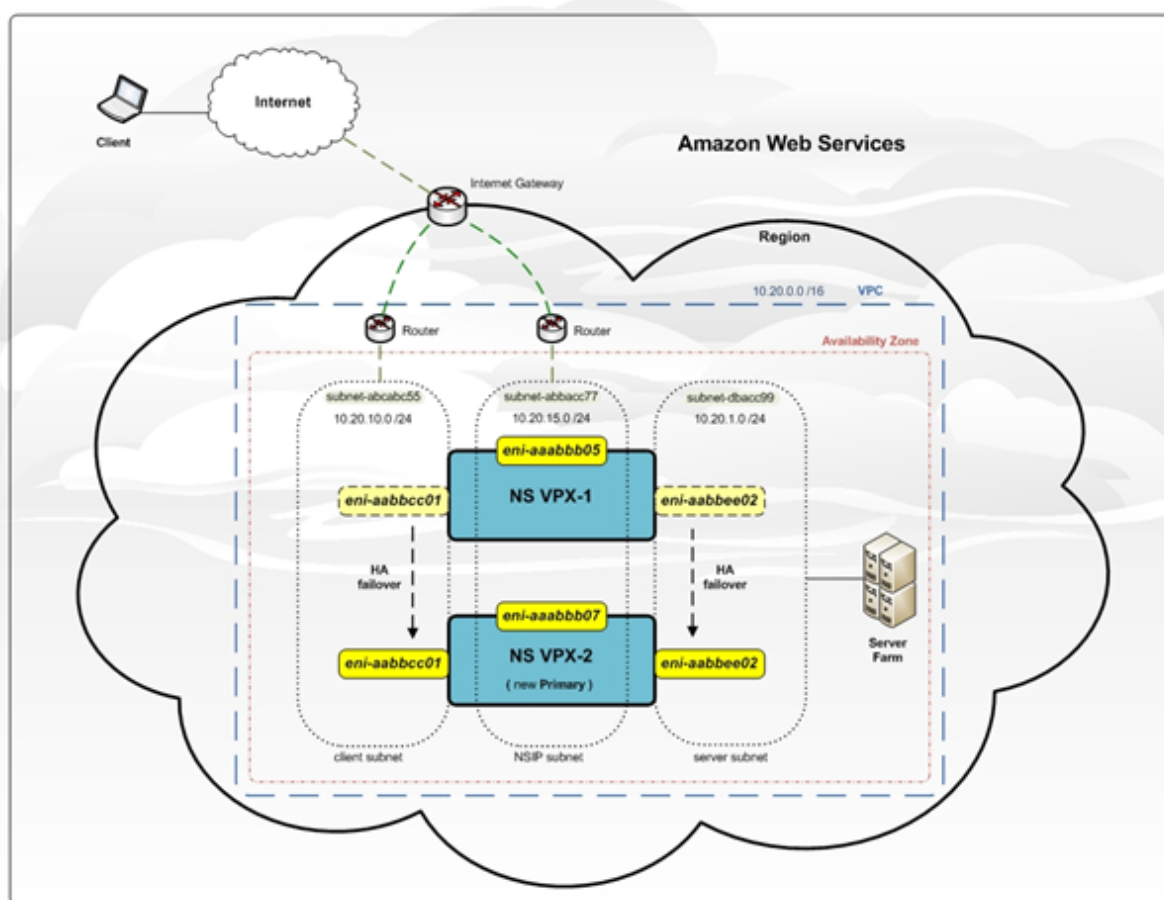

For more information on HA, see [High availability](#).

Before you start your deployment, read the following topics:

- [Prerequisites](#) for the required IAM role privileges.
- [Limitations and usage guidelines](#)

The following figure shows an example of the HA deployment architecture for Citrix ADC VPX instances on AWS.

Figure 1. A Citrix ADC VPX HA Pair on AWS

You can deploy two VPX instances on AWS as an HA pair by using one of the following options:

- Create the instances with IAM Role manually by using the AWS Management Console and then configure HA on them.
- Or automate the high availability deployment by using the Citrix CloudFormation template.

The CloudFormation template significantly decreases the number of steps involved for creating an HA pair, and it automatically creates an IAM Role. This section shows how to deploy a Citrix ADC VPX HA (active-passive) pair by using the Citrix CloudFormation template.

Keep the following points in mind while deploying two Citrix ADC VPX instances as an HA pair.

### Points to note

- HA on AWS requires the primary node to have at least two ENIs (one for management and the other for data traffic), and the secondary node to have one management ENI. However, for security purposes, create three ENIs on the primary node, because this setup allows you to segregate private and public network (recommended).
- The secondary node always has one ENI interface (for management) and the primary node can have up to four ENIs.

- The NSIP addresses for each VPX instance in a high availability pair must be configured on the default ENI of the instance.
- Because Amazon does not allow any broadcast/multicast packets in AWS, HA is implemented by migrating data-plane ENIs from the primary to the secondary (new primary) VPX instance when the primary VPX instance fails.
- Because the default (management) ENI cannot be moved to another VPX instance, do not use the default ENI for client and server traffic (data-plane traffic).
- The message `AWSCONFIG_IOCTL_NSAPI_HOTPLUG_INTF success output 0` in the `/var/log/ns.log` indicates that the two data ENIs have successfully attached to the secondary instance (the new primary).
- Failover might take up to 20 seconds due to the AWS detach/attach ENI mechanism.
- Upon failover, the failed instance always restarts.
- The heartbeat packets are received only on the management interface.
- The configuration file of the primary and secondary VPX instances is synchronized, including the nsroot password. The nsroot password of the secondary node is set to that of the primary node after the HA configuration synchronization.
- To have access to the AWS API servers, either the VPX instance must have a public IP address assigned or routing must be set up correctly at VPC subnet level pointing to internet gateway of the VPC
- Nameservers/DNS servers are configured at VPC level using DHCP options.
- The Citrix CloudFormation template does not create an HA setup between different availability zones.
- The Citrix CloudFormation template does not create an INC mode.
- The AWS debug messages are available in the log file, `/var/log/ns.log`, on the VPX instance.

### **Deploy a high availability pair by using the Citrix CloudFormation template**

Before start the CloudFormation template, ensure that you complete the following requirements:

- A VPC
- Three subnets within the VPC
- A security group with UDP 3003, TCP 3009–3010, HTTP, SSH ports open
- A key pair
- Create an internet gateway
- Edit route tables for client and management networks to point to the internet gateway

#### **Note**

The Citrix CloudFormation template automatically creates an IAM Role. Existing IAM Roles do not appear in the template.

#### **To launch the Citrix CloudFormation template:**

1. Log on to the [AWS marketplace](#) by using your AWS credentials.
2. In the search field, type **NetScaler ADC VPX** to search for the Citrix ADC AMI, and click **Go**.
3. On the search result page, click the desired Citrix ADC VPX offering.
4. Click the **Pricing** tab, to go to **Pricing Information**.
5. Select the region and **Fulfillment Option** as **Netscaler AWS-VPX Cluster**.
6. Click **Continue to Subscribe**.
7. Check the details in the **Subscribe** page and click **Continue to Subscribe**.
8. Select **Fulfillment Option** as **CloudFormation Template**.
9. Select **Software Version** and click **Continue to Launch**.
10. Under **Choose Action**, select **Launch CloudFormation**, and click **Launch**.
11. The **Select Template** page appears. Click **Next**.
12. The **Specify Details** appears. Enter the following details.
  - a. Type a **Stack name**. The name must be within 25 characters.
  - b. Under **High Availability Configuration**  
Select **Yes** from the menu for **Create HA pair?**
  - c. Under **Virtual Private Network Configuration**  
Select the VPC that you've already created for **VPC ID**.  
Type **Remote SSH CIDR IP**.  
Type **Remote HTTP CIDR IP**.  
Type **Remote HTTPS CIDR IP**.  
Select the key pair that you've already created from the drop-down menu for **Key Pair**.
  - d. Under **Network Interface Configuration**  
Select **Management Subnetwork**, **Client Subnetwork**, and **Server Subnetwork**. Ensure that you select the correct subnetworks you created within the VPC that you selected under VPC ID in step c.  
Add **Primary Management IP**, **Secondary Management IP**, **Client IP**, and **Server IP**. The IP addresses must belong to the same subnets of the respective subnetworks. Alternatively, you can let the template assign the IP addresses automatically.
  - e. Under **Other Parameters**  
Select **m4.large** for **Instant Type**.  
Select **default** for **Tenancy Type**.

f. Click **Next**.

13. The **Options** page appears. (This is an optional page.). Click **Next**.

1. The **Review** page appears. Take a moment to review the settings and make necessary changes if necessary.
2. Select the **I acknowledge that AWS CloudFormation might create IAM resources.** check box, and then click **Create**.

16. The **CREATE-IN-PROGRESS** status appears. Wait until the status is **CREATE-COMplete**. If the status does not change to “COMPLETE,” check the **Events** tab for the reason of failure and recreate the instance with proper configurations.

The screenshot shows the CloudFormation Stacks page in the Citrix ADC console. At the top, there are navigation tabs for 'Services' and 'Resource Groups'. Below that, the 'CloudFormation' section is active, showing a 'Stacks' view. There are buttons for 'Create Stack', 'Actions', and 'Design template'. A filter is set to 'Active' and the view is sorted 'By Stack Name'. A table lists the stacks, with one stack named 'AWSMPNetscalerAWSVPXC...' having a status of 'CREATE\_COMPLETE' and a description of 'Netscaler AWS-...'. Below the table, there are tabs for 'Overview', 'Outputs', 'Resources', 'Events', 'Template', 'Parameters', 'Tags', 'Stack Policy', and 'Change'. The 'Events' tab is selected, showing a list of events for the stack on 2017-01-05. The events include 'CREATE\_COMPLETE' for the stack itself and several 'CREATE\_IN\_PROGRESS' events for EC2 instances, followed by 'CREATE\_COMPLETE' events for IAM Instance Profile, EIP Association, and another EIP Association.

Stack Name	Created Time	Status	Description

1. After an IAM resource is created, go to EC2 **Management Console** > **Instances**. You will find two VPX instances created with IAM role. The primary node is created with three private IP addresses and three network interfaces.

Name	Instance ID	Instance Type	Availability Zone	Instance State	Status Checks	Alarm Status	Public DNS	Public IP	Key Name
VPXPrimary	i-0157291b19440ae61	m4.xlarge	us-east-1a	running	2/2 checks ...	None		34.196.27.108	Fresh
VPXSecondary	i-0c6e6c4c5749271bd	m4.xlarge	us-east-1a	running	2/2 checks ...	None		34.195.5.71	Fresh

Instance: i-0157291b19440ae61 (VPXPrimary)		Elastic IP: 34.196.27.108
<b>Description</b>	<p>Instance ID: i-0157291b19440ae61</p> <p>Instance state: running</p> <p>Instance type: m4.xlarge</p> <p>Private DNS: -</p> <p>Private IPs: 11.0.0.136, 11.0.0.86, 11.0.0.249</p> <p>Secondary private IPs: -</p> <p>VPC ID: vpc-4462d59f</p> <p>Subnet ID: subnet-c262d5a9</p> <p>Network interfaces: eth0, eth1, eth2</p> <p>Source/dest. check: True</p> <p>ClassicLink: -</p> <p>EBS-optimized: False</p> <p>Root device type: ebs</p> <p>Root device: /dev/sda1</p> <p>Block devices: /dev/sda1</p>	
	<p>Public DNS: -</p> <p>Public IP: 34.196.27.108</p> <p>Elastic IPs: 34.196.27.108*</p> <p>Availability zone: us-east-1a</p> <p>Security groups: SecGrp. view inbound rules</p> <p>Scheduled events: No scheduled events</p> <p>AMI ID: Citrix NetScaler and CloudBridge Connector 11.1-50.10-0f7c03e9-ccf7-4b68-815f-0696e1e5770f-ami-0fd4f718.3 (ami-129eab05)</p> <p>Platform: -</p> <p>IAM role: AWSMPNetScalerAWSVPXCluste-CitrixNodesInstanceRole-17YPPTG19LW8K</p> <p>Key pair name: Fresh</p> <p>Owner: 804980019029</p> <p>Launch time: January 5, 2017 at 4:32:15 PM UTC+5:30 (less than one hour)</p> <p>Termination protection: False</p> <p>Lifecycle: normal</p> <p>Monitoring: basic</p> <p>Alarm status: None</p> <p>Kernel ID: -</p> <p>RAM disk ID: -</p> <p>Placement group: -</p>	

The secondary node is created with one private IP address and one network interface.

### Note

The secondary node is created with one interface by default in AWS. During failover, the interface from the primary node gets attached to the secondary node (the new primary node) and gets detached from the original primary node (the new secondary node).

18./ Log on to the primary node with user name nsroot and the instance ID as the password. From the GUI, go to **System** > **High Availability**. The Citrix ADC VPX HA pair appears.

Next, configure the HA pairing on both the instances. Configure the instance with three ENIs before configuring HA on the instance with one ENI). Use the add HA node command, from within the VPX CLI, or from the GUI.

```
add HA node <private IP of the first instance>
```

```
add HA node <private IP of the second instance>
```

After you run the “add HA node” commands, the two nodes form an HA pair, and configuration information is synchronized between the two VPX instances.

## Configuring SR-IOV on a high availability setup

Support for SR-IOV interfaces in a high availability setup is available from Citrix ADC release 12.0 57.19 onwards. For more information about how to configure SR-IOV, see [Configuring Citrix ADC VPX instances to Use SR-IOV Network Interface](#).

### Related resources

[High availability across AWS availability zones](#)

## High availability across AWS availability zones

September 21, 2020

You can configure two Citrix ADC VPX instances on two different subnets or two different AWS availability zones, as a high availability active-passive pair in Independent Network Configuration (INC) mode. If for any reason, the primary node is unable to accept connections, the secondary node takes over.

For more information about high availability, see [High availability](#). For more information about INC, see [Configuring high availability nodes in different subnets](#).

### Points to note

- Read the following documents before you start your deployment:
  - [AWS terminology](#)
  - [Prerequisites](#)
  - [Limitations and usage guidelines](#)
- The VPX high availability pair can either reside in the same availability zone in a different subnet or in two different AWS availability zones.
- Citrix recommends that you use different subnets for management (NSIP), client traffic (VIP), and back-end server (SNIP).
- High availability must be set in Independent Network Configuration (INC) mode for a failover to work.
- The two instances also should have port 3003 open for UDP traffic as that is used for heartbeats.
- The management subnets of both the nodes should also have access to internet or to AWS API server through internal NAT so that the rest APIs are functional.
- IAM role should have E2 permission for the public IP or elastic IP (EIP) migration.

## How high availability across AWS availability zones works

Upon failover, the EIP of the VIP of the primary instance migrates to the secondary, which takes over as the new primary. In the failover process, AWS API

1. Checks the virtual servers that have IP sets attached to them.
2. Finds the IP address that has an associated public IP, from the two IP addresses the virtual server is listening on. One that is directly attached to the virtual server, and one that is attached through the IP set.
3. Reassociates the public IP (EIP) to the private IP belonging to the new primary VIP.

### Note

To protect your network from attacks such as denial-of-service (DoS), when using an EIP, you can create security groups in AWS to restrict the IP access. For high availability, you can switch from EIP to a private IP movement solution as per your deployments.

## How to deploy a VPX high availability pair across different AWS zones

The following is the summary of steps for deploying a VPX pair on two different subnets or two different AWS availability zones.

1. Create an Amazon virtual private cloud.
2. Deploy two VPX instances in two different availability zones or in the same zone but in different subnets.
3. Configure high availability
  - a) Set up high availability in INC mode in both the instances.
  - b) Add IP set in both the instances.
  - c) Bind IP set in both the instances to the VIP.
  - d) Add a virtual server in the primary instance.

For steps 1 and 2, use the AWS console. For steps 3, use the Citrix ADC VPX GUI or the CLI.

**Step 1.** Create an Amazon virtual private cloud (VPC).

**Step 2.** Deploy two VPX instances in two different availability zones or in the same zone but in different subnets. Attach an EIP to the VIP of the primary VPX.

For more information about how to create a VPC and deploy a VPX instance on AWS, see [Deploy a Citrix ADC VPX standalone instance on AWS](#) and [Scenario: standalone instance](#).

**Step 3.** Configure high availability. You can use the Citrix ADC VPX CLI or the GUI to set up high availability.

### Configure high availability by using the CLI

1. Set up high availability in INC mode in both the instances.

**On the primary node:**

```
add ha node 1 <sec_ip> -inc ENABLED
```

**On the secondary node:**

```
add ha node 1 <prim_ip> -inc ENABLED
```

<sec\_ip> refers to the private IP address of the management NIC of the secondary node

<prim\_ip> refers to the private IP address of the management NIC of the primary node

2. Add IP set in both the instances.

Type the following command on both the instances.

```
add ipset <ipsetname>
```

1. Bind IP set to the VIP set on both the instances.

Type the following command on both the instances:

```
add ns ip <secondary vip> <subnet> -type VIP
```

```
bind ipset <ipsetname> <secondary VIP>
```

**Note**

You can bind the IP set to the primary VIP or to the secondary VIP. However, if you bind the IP set to the primary VIP, use the secondary VIP to add to the virtual server, and conversely.

2. Add a virtual server on the primary instance.

Type the following command:

```
add <server_type> vserver <vserver_name> <protocol> <primary_vip> <port> -ipset <ipset_name>
```

### Configure high availability by using the GUI

1. Set up high availability in INC mode on both the instances
2. Log on to the primary node with user name nsroot and instance ID as password.
3. From the GUI, go to **Configuration > System > High Availability**. Click **Add**.
4. At the **Remote Node IP address** field, add the private IP address of the management NIC of the secondary node.
5. Select **Turn on NIC (Independent Network Configuration)** mode on self node.

6. Under **Remote System Login Credential**, add the user name and password for the secondary node and click **Create**.
7. Repeat the steps in the secondary node.
8. Add IP set and bind IP set to the VIP set on both the instances.
9. From the GUI, navigate to **System > Network > IPs > Add**.
10. Add the required values for IP Address, Netmask, IP Type (virtual IP) and click **Create**.
11. Navigate to **System > Network > IP Sets > Add**. Add an IP set name and click **Insert**.
12. From the IPV4s page, select the virtual IP and click **Insert**. Click **Create** to create the IP set.
13. Add a virtual server in the primary instance

From the GUI, go to **Configuration > Traffic Management > Virtual Servers > Add**.

Load Balancing Virtual Server | [Export as a Template](#)

Basic Settings

## Scenario

In this scenario, a single VPC is created. In that VPC, two VPX instances are created in two availability zones. Each instance has three subnets - one for management, one for client, and one for back-end server. An EIP is attached to the VIP of the primary node.

Diagram: This diagram illustrates the Citrix ADC VPX high availability setup in INC mode, on AWS

For this scenario, use CLI to configure high availability.

1. Set up high availability in INC mode on both the instances.

Type the following commands on the primary and the secondary nodes.

**On primary:**

```
add ha node 1 192.168.6.82 -inc enabled
```

Here, 192.168.6.82 refers to the private IP address of the management NIC of the secondary node.

**On secondary:**

```
add ha node 1 192.168.1.108 -inc enabled
```

Here, 192.168.1.108 refers to the private IP address of the management NIC of the primary node.

2. Add an IP set and bind the IP set to the VIP on both the instances

**On primary:**

```
add ipset ipset123
```

```
add ns ip 192.168.7.68 255.255.255.0 -type VIP
```

```
bindipset ipset123 192.168.7.68
```

**On secondary:**

```
add ipset ipset123
```

```
add ns ip 192.168.7.68 255.255.255.0 -type VIP
```

```
bind ipset ipset123 192.168.7.68
```

3. Add a virtual server on the primary instance.

Type the following command:

```
add lbserver vserver1 http 192.168.2.129 80 -ipset ipset123
```

4. Save the configuration.

<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Delete"/> <input type="button" value="Statistics"/> <input type="button" value="Select Action"/>

## Add back-end AWS Autoscaling service

September 21, 2020

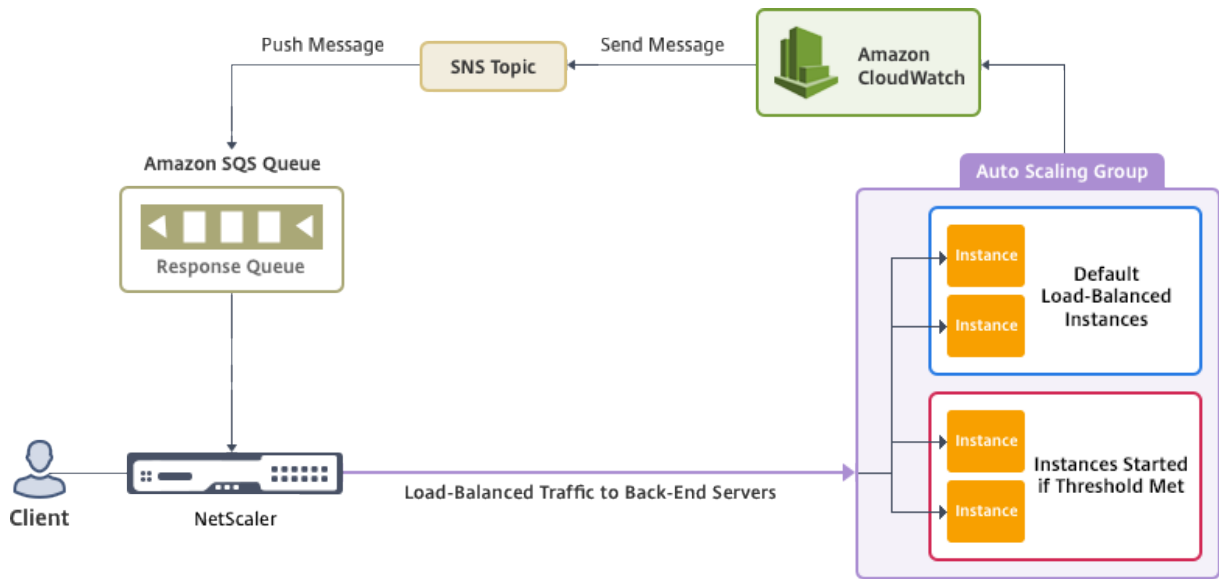

Efficient hosting of applications in a cloud involves easy and cost-effective management of resources depending on the application demand. To meet increasing demand, you have to scale network resources upward. Whether demand subsides, you need to scale down to avoid the unnecessary cost of idle resources. To minimize the cost of running the application by deploying only as many instances as are necessary during any given time, you constantly have to monitor traffic, memory and CPU use, and so on. However, monitoring traffic manually is cumbersome. For the application environment to scale up or down dynamically, you must automate the processes of monitoring traffic and of scaling resources up and down whenever necessary.

Integrated with AWS Auto Scaling service, the Citrix ADC VPX instance provides the following advantages:

- **Load balance and management:** Auto configures servers to scale up and scale down, depending on demand. The VPX instance auto detects Autoscale groups in the back-end subnet and allows a user to select the Autoscale groups to balance the load. All of this is done by auto configuring the virtual and subnet IP addresses on the VPX instance.

- **High availability:** Detects Autoscale groups that span multiple availability zones and load-balance servers.
- **Better network availability:** The VPX instance supports:
  - Back-end servers on different VPCs, by using VPC peering
  - Back-end servers on same placement groups
  - Back-end servers on different availability zones
- **Graceful connection termination:** Removes Autoscale servers gracefully, avoiding loss of client connections when scale-down activity occurs, by using the Graceful Timeout feature.

**Diagram:** AWS Autoscaling service with a Citrix ADC VPX Instance

This diagram illustrates how the AWS Autoscaling service is compatible with a Citrix ADC VPX instance (Load balancing virtual server). For more information, see the following AWS topics.

- [Autoscaling groups](#)
- [CloudWatch](#)
- [Simple Notification Service \(SNS\)](#)
- [Simple Queue Service \(Amazon SQS\)](#)

## Before you begin

Before you start using Autoscaling with your Citrix ADC VPX instance, you must complete the following tasks.

1. Read the following topics:
  - [Prerequisites](#)
  - [Limitation and usage guidelines](#)
2. Create a Citrix ADC VPX instance on AWS according to your requirement.

- For more information about how to create a Citrix ADC VPX standalone instance, see [Deploy a Citrix ADC VPX standalone instance on AWS](#) and [Scenario: standalone instance](#)
- For more information about how to deploy VPX instances in HA mode, see [Deploy a high availability pair on AWS](#).

**Note**

Citrix recommends the CloudFormation template for creating Citrix ADC VPX instances on AWS.

Citrix recommends you create three interfaces: one for management (NSIP), one for client-facing LB virtual server (VIP), and one for subnet IP (NSIP).

3. Create an AWS Autoscale group. If you don't have an existing Autoscaling configuration, you must:
  - a) Create a Launch Configuration
  - b) Create an Autoscaling Group
  - c) Verify the Autoscaling GroupFor more information, see <http://docs.aws.amazon.com/autoscaling/latest/userguide/GettingStartedTutorial.html>.
4. In the AWS Autoscale group, you must specify at least one scale-down policy. The Citrix ADC VPX instance supports only the Step scaling policy. The Simple scaling policy and Target tracking scaling policy are not supported for Autoscale group.

**Add the AWS Autoscaling service to a Citrix ADC VPX instance**

You can add the Autoscaling service to a VPX instance with a single click by using the GUI. Complete these steps to add the Autoscaling service to the VPX instance:

1. Log on to the VPX instance by using your credentials for `nsroot`.
2. When you log on to the Citrix ADC VPX instance for the first time, you see the default Cloud Profile page. Select the AWS Autoscaling group from the drop-down menu and click **Create** to create a cloud profile. Click **Skip** if you want to create the cloud profile later.

**Points to keep in mind while creating a Cloud Profile:** By default the CloudFormation Template creates and attaches the below IAM Role.

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {
```

```
    "Action": [  
      "ec2:DescribeInstances",  
      "ec2:DescribeNetworkInterfaces",  
      "ec2:DetachNetworkInterface",  
      "ec2:AttachNetworkInterface",  
      "ec2:StartInstances",  
      "ec2:StopInstances",  
      "ec2:RebootInstances",  
      "autoscaling:*",  
      "sns:*",  
      "sqs:*",  
      "iam: SimulatePrincipalPolicy",  
      "iam: GetRole",  
    ],  
    "Resource": "*",  
    "Effect": "Allow",  
  }  
]  
}
```

Ensure the IAM Role of instance has proper permissions.

- The virtual server IP address is autopopulated from the free IP address available to the VPX instance. <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/MultipleIP.html#ManageMultipleIP>
- Autoscale group is prepopulated from the Autoscale group configured on your AWS account. <http://docs.aws.amazon.com/autoscaling/latest/userguide/AutoScalingGroup.html>.
- While selecting the Autoscaling Group protocol and port, ensure your servers listen on those protocol and ports, and you bind the correct monitor in the service group. By default, TCP monitor is used.
- For SSL Protocol type Autoscaling, after you create the Cloud Profile the load balance virtual server or service group is down because of a missing certificate. You can bind the certificate to the virtual server or service group manually.

- Select the Graceful Timeout option to remove Autoscale servers gracefully. If this option is not selected the server is the Autoscale group is removed immediately after the load goes down, which might cause service interruption for the existing connected clients. Selecting Graceful and giving a timeout means in the event of scale down. The VPX instance does not remove the server immediately but marks one of the servers for graceful deletion. During this period, the instance does not allow new connections to this server. Existing connection are served until the timeout occurs, and after timeout the VPX instance removes the server.

## Configure a Citrix ADC VPX instance to use SR-IOV network interface

September 21, 2020

**Note**

Support for SR-IOV interfaces in a high availability setup is available from Citrix ADC release 12.0 57.19 onwards.

After you have created a Citrix ADC VPX instance on AWS, you can configure the virtual appliance to use SR-IOV network interfaces, by using AWS CLI.

In all Citrix ADC VPX models, except Citrix ADC VPX AWS Marketplace Editions of 3G and 5G, SR-IOV is not enabled in the default configuration of a network interface.

Before you start the configuration, read the following topics:

- [Prerequisites](#)
- [Limitations and Usage Guidelines](#)

This section includes the following topics:

- [Change the Interface Type to SR-IOV](#)
- [Configure SR-IOV on a High Availability Setup](#)

### Change the interface type to SR-IOV

You can run the show interface summary command to check the default configuration of a network interface.

**Example 1:** The following CLI screen capture shows the configuration of a network interface where SR-IOV is enabled by default on Citrix ADC VPX AWS Marketplace Editions of 3G and 5G.

```
> show interface summary
-----
Interface  MTU      MAC                Suffix
-----
1    1/1      1500              0a:1e:2e:17:a2:37  Intel 82599 10G VF Interface
2    L0/1     1500              0a:1e:2e:17:a2:37  Netscaler Loopback interface
Done
```

**Example 2:** The following CLI screen capture shows the default configuration of a network interface where SR-IOV is not enabled.

```

Done
[> sh int s
-----
Interface  MTU      MAC              Suffix
-----
1  1/1        1500             12:fc:04:c5:d0:12  NetScaler Virtual Interface
2  L0/1       1500             12:fc:04:c5:d0:12  Netscaler Loopback interface
Done
>

```

For more information about changing the interface type to SR-IOV, see <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/sriov-networking.html>

#### To change the interface type to SR-IOV:

1. Shut down the Citrix ADC VPX instance running on AWS.
2. To enable SR-IOV on the network interface, type the following command in the AWS CLI.  
\$ aws ec2 modify-instance-attribute --instance-id <instance\_id> --sriov-net-support simple
3. To check if SR-IOV has been enabled, type the following command in the AWS CLI.  
\$ aws ec2 describe-instance-attribute --instance-id <instance\_id> --attribute sriovNetSupport

**Example 3:** Network interface type changed to SR-IOV, by using AWS CLI.

```

aws ec2 modify-instance-attribute --instance-id i-000c1230aaf303bee --sriov-net-support simple
aws ec2 describe-instance-attribute --instance-id i-000c1230aaf303bee --attribute sriovNetSupport
{
  "InstanceId": "i-000c1230aaf303bee",
  "SriovNetSupport": {
    "Value": "simple"
  }
}

```

If SR-IOV is not enabled, value for SriovNetSupport is absent.

**Example 4:** In the following example, SR-IOV support is not enabled.

```

{
  "InstanceId": "i-0c3e84cfa65b04cc8",
  "SriovNetSupport": {}
}

```

3. Power on the VPX instance. To see the changed status of the network interface, type “show interface summary” in CLI.

**Example 5:** The following screen capture shows the network interfaces with SR-IOV enabled. The interfaces 10/1, 10/2, 10/3 are SR-IOV enabled.

```
> show interface summary
-----
Interface  MTU      MAC              Suffix
-----
1    10/1    1500    0a:1e:2e:17:a2:37    Intel 82599 10G VF Interface
2    10/2    1500    0a:df:17:0a:fe:83    Intel 82599 10G VF Interface
3    10/3    1500    0a:de:5d:31:bf:c3    Intel 82599 10G VF Interface
4    LO/1    1500    0a:1e:2e:17:a2:37    Netscaler Loopback interface
Done
```

These steps complete the procedure to configure VPX instances to use SR-IOV network interfaces.

### Configure SR-IOV on a high availability setup

High availability is supported with SR-IOV interfaces from Citrix ADC release 12.0 build 57.19 onwards.

If the high availability setup was deployed manually or by using the Citrix CloudFormation template for Citrix ADC version 12.0 56.20 and lower, the IAM role attached to the high availability setup must have the following privileges:

- ec2:DescribeInstances
- ec2:DescribeNetworkInterfaces
- ec2:DetachNetworkInterface
- ec2:AttachNetworkInterface
- ec2:StartInstances
- ec2:StopInstances
- ec2:RebootInstances
- autoscaling:\*
- sns:\*
- sqs:\*
- iam:SimulatePrincipalPolicy
- iam:GetRole

By default, the Citrix CloudFormation template for Citrix ADC version 12.0 57.19 automatically adds the required privileges to the IAM role.

#### Note

A high availability setup with SR-IOV Interfaces take around 100 seconds of down time.

#### Related resources:

For more information about IAM roles, see [AWS documentation](#).

## Upgrade a Citrix ADC VPX instance on AWS

March 16, 2021

You can upgrade the EC2 instance type, throughput, software edition, and the system software of a Citrix ADC VPX running on AWS. For certain types of upgrades, Citrix recommends using the High Availability Configuration method to minimize downtime.

### Note:

- Citrix ADC software release 10.1.e-124.1308.e or later for a Citrix ADC VPX AMI (including both utility license and customer license) does not support the M1 and M2 instance families.
- Because of changes in VPX instance support, downgrading from 10.1.e-124 or a later release to 10.1.123.x or an earlier release is not supported.
- Most of the upgrades do not require the launch of a new AMI, and the upgrade can be done on the current Citrix ADC AMI instance. If you do want to upgrade to a new Citrix ADC AMI instance, use the high availability configuration method.

## Change the EC2 instance type of a Citrix ADC VPX instance on AWS

If your Citrix ADC VPX instances are running release 10.1.e-124.1308.e or later, you can change the EC2 instance type from the AWS console as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

You can also use the above procedure to change the EC2 instance type for a release, earlier than 10.1.e-124.1308.e, unless you want to change the instance type to M3. In that case, you must first follow the standard Citrix ADC upgrade procedure, at [Citrix ADC Upgrade Procedure](#), to upgrade the Citrix ADC software to 10.1.e-124 or a later release, and then follow the above steps.

## Upgrade the throughput or software edition of a Citrix ADC VPX instance on AWS

To upgrade the software edition (for example, to upgrade from Standard to Premium edition) or throughput (for example, to upgrade from 200 mbps to 1000mbps), the method depends on the instance's license.

### Using a customer license (Bring-Your-Own-License)

If you are using a customer license, you can purchase and download the new license from the Citrix website, and then install the license on the VPX instance. For more information about downloading and installing a license from the Citrix website, see the VPX Licensing Guide.

### **Using a utility license (Utility license with hourly fee)**

AWS does not support direct upgrades for fee-based instances. To upgrade the software edition or throughput of a fee based Citrix ADC VPX instance, launch a new AMI with the desired license and capacity and migrate the older instance configuration to the new instance. This can be achieved by using a Citrix ADC high availability configuration as described in [Upgrade to a new Citrix ADC AMI instance by using a Citrix ADC high availability configuration](#) subsection in this page.

### **Upgrade the system software of a Citrix ADC VPX instance on AWS**

If you need to upgrade a VPX instance running 10.1.e-124.1308.e or a later release, follow the standard Citrix ADC upgrade procedure at [Upgrade and downgrade a Citrix ADC appliance](#).

If you need to upgrade a VPX instance running a release older than 10.1.e-124.1308.e to 10.1.e-124.1308.e or a later release, first upgrade the system software, and then change the instance type to M3 as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

### **Upgrade to a new Citrix ADC AMI instance by using a Citrix ADC high availability configuration**

To use the high availability method of upgrading to a new Citrix ADC AMI instance, perform the following tasks:

- Create a new instance with the desired EC2 instance type, software edition, throughput, or software release from the AWS marketplace.
- Configure high availability between the old instance (to be upgraded) and the new instance. After high availability is configured between the old and the new instance, configuration from the old instance is synchronized to the new instance.
- Force an HA failover from the old instance to the new instance. As a result, the new instance becomes primary and starts receiving traffic.
- Stop, and reconfigure or remove the old instance from AWS.

### **Prerequisites and points to consider**

- Ensure you understand how high availability works between two Citrix ADC VPX instances on AWS. For more information about high availability configuration between two Citrix ADC VPX instances on AWS, see [Deploy a high availability pair on AWS](#).

- You must create the new instance in the same availability zone as the old instance, having the exact same security group and subnet.
- High availability setup requires access and secret keys associated with the user's AWS Identity and Access Management (IAM) account for both instances. If the correct key information is not used when creating VPX instances, the HA setup fails. For more information about creating an IAM account for a VPX instance, see [Prerequisites](#).
  - You must use the EC2 console to create the new instance. You cannot use the AWS 1-click launch, because it does not accept the access and secret keys as the input.
  - The new instance should have only one ENI interface.

To upgrade a Citrix ADC VPX Instance by using a high availability configuration, follow these steps:

1. Configure high availability between the old and the new instance. To configure high availability between two Citrix ADC VPX instances, at the command prompt of each instance, type:
  - `add ha node <nodeID> <IPaddress of the node to be added>`
  - `save config`

**Example:**

At the command prompt of the old instance, type:

```
1 add ha node 30 192.0.2.30
2 Done
3 <!--NeedCopy-->
```

At the command prompt of the new instance, type:

```
1 add ha node 10 192.0.2.10
2 Done
3 <!--NeedCopy-->
```

Note the following:

- In the HA setup, the old instance is the primary node and the new instance is the secondary node.
- The NSIP IP address is not copied from the old instance to the new instance. Therefore, after the upgrade, your new instance has a different management IP address from the previous one.
- The nsroot account password of the new instance is set to that of the old instance after HA synchronization.

For more information about high availability configuration between two Citrix ADC VPX instances on AWS, see [Deploy a high availability pair on AWS](#).

2. Force an HA failover. To force a failover in a high availability configuration, at the command prompt of either of the instances, type:

```
1 force HA failover
2 <!--NeedCopy-->
```

As the result of forcing a failover, the ENIs of the old instance are migrated to the new instance and traffic flows through the new instance (the new primary node). The old instance (the new secondary node) restarts.

If the following warning message appears, type N to abort the operation:

```
1 [WARNING]:Force Failover may cause configuration loss, peer health
   not optimum. Reason(s):
2 HA version mismatch
3 HA heartbeats not seen on some interfaces
4 Please confirm whether you want force-failover (Y/N)?
5 <!--NeedCopy-->
```

The warning message appears because the system software of the two VPX instances is not HA compatible. As a result, the configuration of the old instance cannot be automatically synced to the new instance during a forced failover.

Following is the workaround for this issue:

1. At the Citrix ADC shell prompt of the old instance, type the following command to create a backup of the configuration file (ns.conf):

```
copy /nsconfig/ns.conf to /nsconfig/ns.conf.bkp
```

2. Remove the following line from the backup configuration file (ns.conf.bkp):

```
set ns config -IPAddress \<IP\> -netmask \<MASK\>
```

For example, set ns config -IPAddress 192.0.2.10 -netmask 255.255.255.0

3. Copy the old instance's backup configuration file (ns.conf.bkp) to the /nsconfig directory of the new instance.
4. At the Citrix ADC shell prompt of the new instance, type the following command to load the old instance's configuration file (ns.conf.bkp) on the new instance:

```
batch -f /nsconfig/ns.conf.bkp
```

5. Save the configuration on the new instance.

```
Save conifg
```

6. At the command prompt of either of the nodes, type the following command to force a failover. Then type Y, for the warning message to confirm the force failover operation:

```
force ha failover
```

**Example:**

```
1 force ha failover
2
3 [WARNING]:Force Failover may cause configuration loss, peer health
   not optimum.
4 Reason(s):
5 HA version mismatch
6 HA heartbeats not seen on some interfaces
7 Please confirm whether you want force-failover (Y/N)? Y
8 <!--NeedCopy-->
```

7. Remove the HA configuration, so that the two instances are no longer in an HA configuration. First remove the HA configuration from the secondary node and then remove the HA configuration from the primary node.

To remove an HA configuration between two Citrix ADC VPX instances, at the command prompt of each instance, type:

```
1 > remove ha node \<nodeID\>
2 > save config
3 <!--NeedCopy-->
```

For more information about high availability configuration between two VPX instances on AWS, see [Deploy a high availability pair on AWS](#).

**Example:**

At the command prompt of the old instance (new secondary node), type:

```
1 > remove ha node 30
2 Done
3 > save config
4 Done
5 <!--NeedCopy-->
```

At the command prompt of the new instance (new primary node), type:

```
1 > remove ha node 10
2 Done
3 > save config
4 Done
5 <!--NeedCopy-->
```

## Troubleshoot a VPX instance on AWS

September 21, 2020

Amazon does not provide console access to a Citrix ADC VPX instance. To troubleshoot, you have to use the AWS GUI to view the activity log. You can debug only if the network is connected. To view an instance's system log, right-click the instance and select system log.

Citrix provides support for fee based Citrix ADC VPX instances (utility license with hourly fee) on AWS. To file a support case, find your AWS account number and support PIN code, and call Citrix support. You will also be asked for your name and email address. To find the support PIN, log on to the VPX GUI and navigate to the System page.

Here is an example of a system page showing the support PIN.

**Citrix ADC VPX Standard Edition (10)**

## AWS FAQs

September 21, 2020

- **Does a Citrix ADC VPX instance support the encrypted volumes in AWS?**

Encryption and decryption happen at the hypervisor level, and hence it works seamlessly with

any instance. For more information about the encrypted volumes see the following AWS document:

<https://docs.aws.amazon.com/kms/latest/developerguide/services-ebs.html>

- **What is the best way to provision Citrix ADC VPX instance on AWS?**

You can provision a Citrix ADC VPX instance on AWS by any of the following ways:

- AWS CloudFormation Template (CFT) in AWS marketplace
- Citrix ADM
- AWS Quick Starts
- Citrix AWS CFTs in Git hub
- Citrix Terraform Scripts in Git hub
- Citrix Ansible Playbooks in Git hub
- AWS EC2 launch workflow

You can choose any of the listed options based on the automation tool that you use.

For more details about the options, see [Citrix ADC VPX on AWS](#).

## Deploy a Citrix ADC VPX instance on Microsoft Azure

June 23, 2021

When you deploy a Citrix ADC VPX instance on Microsoft Azure Resource Manager (ARM), you can use the Azure cloud computing capabilities and use Citrix ADC load balancing and traffic management features for your business needs. You can deploy Citrix ADC VPX instances on Azure Resource Manager either as standalone instances or as high availability pairs in active-standby modes.

You can deploy a Citrix ADC VPX instance on the Microsoft Azure in two ways:

- Through Azure Marketplace. The Citrix ADC VPX virtual appliance is available as an image in the Microsoft Azure Marketplace.
- Using the Citrix ADC Azure Resource Manager (ARM) json template available on GitHub. For more information, see the [GitHub repository for Citrix ADC solution templates](#).

### Prerequisite

You need some prerequisite knowledge before deploying a Citrix VPX instance on Azure.

- Familiarity with Azure terminology and network details. For information, see [Azure terminology](#).

- Knowledge of a Citrix ADC appliance. For detailed information the Citrix ADC appliance, see [Citrix ADC](#)
- Knowledge of Citrix ADC networking. See the [Networking](#) topic.

### How a Citrix ADC VPX instance works on Azure

In an on-premises deployment, a Citrix ADC VPX instance requires at least three IP addresses:

- Management IP address, called NSIP address
- Subnet IP (SNIP) address for communicating with the server farm
- Virtual server IP (VIP) address for accepting client requests

For more information, see [Network architecture for Citrix ADC VPX instances on Microsoft Azure](#).

#### Note

VPX virtual appliances can be deployed on any instance type that has two or more Intel VT-X cores and more than 2 GB memory. For more information on system requirements, see [Citrix ADC VPX data sheet](#). Currently, Citrix ADC VPX instance supports only the Intel processors.

In an Azure deployment, you can provision a Citrix ADC VPX instance on Azure in three ways:

- Multi-NIC multi-IP architecture
- Single NIC multi IP architecture
- Single NIC single IP

Depending on your need, you can use any of these supported architecture types.

### Multi-NIC multi-IP architecture

In this deployment type, you can have more than one network interfaces (NICs) attached to a VPX instance. Any NIC can have one or more IP configurations - static or dynamic public and private IP addresses assigned to it.

For more information, see the following use cases:

- [Configure a high-availability setup with multiple IP addresses and NICs](#)
- [Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands](#)

#### Note

To avoid MAC moves and interface mutes on Azure environments, Citrix recommends you to create a VLAN per data interface (without tag) of ADC VPX instance and bind the primary IP of NIC in Azure. For more information, see [CTX224626](#) article.

### Single NIC multi IP architecture

In this deployment type, one network interfaces (NIC) associated with multiple IP configurations - static or dynamic public and private IP addresses assigned to it.

For more information, see the following use cases:

- [Configure multiple IP addresses for a Citrix ADC VPX standalone instance](#)
- [Configure multiple IP addresses for a Citrix ADC VPX standalone instance by using PowerShell commands](#)

### Single NIC single IP

In this deployment type, one network interfaces (NIC) associated with a single IP address, which is used to perform the functions of NSIP, SNIP, and VIP.

For more information, see the following use case:

- [Configure a Citrix ADC VPX standalone instance](#)

#### Note

The single IP mode is available only in Azure deployments. This mode is not available for a Citrix ADC VPX instance on your premises, on AWS, or in other type of deployment.

### Citrix ADC VPX licensing

A Citrix ADC VPX instance on Azure requires a license. The following licensing options are available for Citrix ADC VPX instances running on Azure.

- **Subscription-based licensing:** Citrix ADC VPX appliances are available as paid instances on Azure Marketplace. Subscription-based licensing is a pay-as-you-go option. Users are charged hourly. The following VPX models and license types are available on Azure Marketplace.

VPX model	License Type
VPX10	Standard, Advanced, Premium
VPX200	Standard, Advanced, Premium
VPX1000	Standard, Advanced, Premium
VPX3000	Standard, Advanced, Premium

Citrix provides technical support for subscription-based license instances. To file a support case, see [Support for Citrix ADC on Azure – Subscription license with hourly price](#).

- **Bring your own license (BYOL):** If you bring your own license (BYOL), see the VPX Licensing Guide at <http://support.citrix.com/article/CTX122426>. You have to:
  - Use the licensing portal within Citrix website to generate a valid license.
  - Upload the license to the instance.
- **Citrix ADC VPX Check-In/Check-Out licensing:** For more information, see [Citrix ADC VPX Check-In/Check-Out Licensing](#).

Starting with Citrix ADC release 12.0 56.20, VPX Express for on-premises and cloud deployments does not require a license file. For more information on Citrix ADC VPX Express see the “Citrix ADC VPX Express license” section in [Citrix ADC Licensing Overview](#).

#### Note

Regardless of the subscription-based hourly license bought from Azure Marketplace, in rare cases, the Citrix ADC VPX instance deployed on Azure might come up with a default Citrix ADC license. This happens due to issues with Azure Instance Metadata Service (IMDS).

Do a warm restart before making any configuration change on the Citrix ADC VPX instance, to enable the correct Citrix ADC VPX license.

## Limitations

Running the Citrix ADC VPX load balancing solution on ARM imposes the following limitations:

- The Azure architecture does not accommodate support for the following Citrix ADC features:
  - Clustering
  - IPv6
  - Gratuitous ARP (GARP)
  - L2 Mode
  - Tagged VLAN
  - Dynamic Routing
  - Virtual MAC (VMAC)
  - USIP
  - Jumbo Frames
- If you expect that you might have to shut down and temporarily deallocate the Citrix ADC VPX virtual machine at any time, assign a static Internal IP address while creating the virtual machine. If you do not assign a static internal IP address, Azure might assign the virtual machine a different IP address each time it restarts, and the virtual machine might become inaccessible.
- In an Azure deployment, only the following Citrix ADC VPX models are supported: VPX 10, VPX 200, VPX 1000, and VPX 3000. For for information, see the Citrix ADC VPX Data Sheet.

If you use a Citrix ADC VPX instance with a model number higher than VPX 3000, the network

throughput might not be the same as specified by the instance's license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

- The “deployment ID” that is generated by Azure during virtual machine provisioning is not visible to the user in ARM. You cannot use the deployment ID to deploy Citrix ADC VPX appliance on ARM.
- The Citrix ADC VPX instance supports 20 Mb/s throughput and standard edition features when it's initialized.
- Citrix ADC VPX instances lower than D16sv3 that are configured for ICA Proxy can experience a high degree of latency. Hence, Citrix recommends you to use the instance size of D16sv3 or D32sv3.
- For a XenApp and XenDesktop deployment, a VPN virtual server on a VPX instance can be configured in the following modes:
  - Basic mode, where the ICAOnly VPN virtual server parameter is set to ON. The Basic mode works fully on an unlicensed Citrix ADC VPX instance.
  - SmartAccess mode, where the ICAOnly VPN virtual server parameter is set to OFF. The SmartAccess mode works for only 5 Citrix ADC AAA session users on an unlicensed Citrix ADC VPX instance.

**Note**

To configure the SmartControl feature, you must apply a Premium license to the Citrix ADC VPX instance.

## Network architecture for Citrix ADC VPX instances on Microsoft Azure

September 21, 2020

In Azure Resource Manager (ARM), a Citrix ADC VPX virtual machine (VM) resides in a virtual network. A single network interface can be created in a given subnet of the Virtual Network and can be attached to the VPX instance. You can filter network traffic to and from a VPX instance in an Azure virtual network with a network security group. A network security group contains security rules that allow or deny inbound network traffic to or outbound network traffic from a VPX instance. For more information, see [Security groups](#).

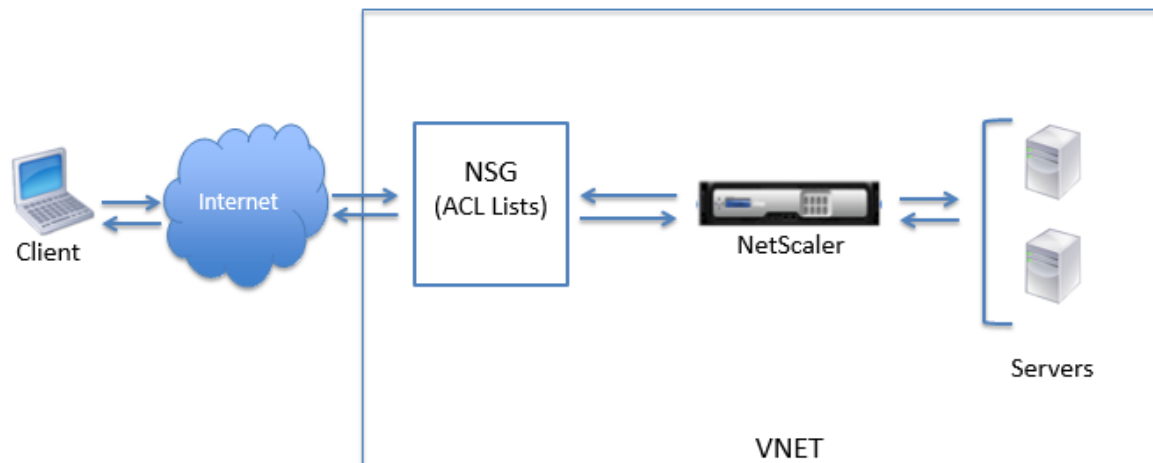

Network security group filters the requests to the Citrix ADC VPX instance, and the VPX instance sends them to the servers. The response from a server follows the same path in reverse. The Network security group can be configured to filter a single VPX VM, or, with subnets and virtual networks, can filter traffic in deployment of multiple VPX instances.

The NIC contains network configuration details such as the virtual network, subnets, internal IP address, and Public IP address.

While on ARM, it is good to know the following IP addresses that are used to access the VMs deployed with a single NIC and a single IP address:

- Public IP (PIP) address is the internet-facing IP address configured directly on the virtual NIC of the NetScaler VM. This allows you to directly access a VM from the external network.
- Citrix ADC IP (also known as NSIP) address is internal IP address configured on the VM. It is non-routable.
- Virtual IP address (VIP) is configured by using the NSIP and a port number. Clients access NetScaler services through the PIP address, and when the request reaches the NIC of the NetScaler VPX VM or the Azure load balancer, the VIP gets translated to internal IP (NSIP) and internal port number.
- Internal IP address is the private internal IP address of the VM from the virtual network's address space pool. This IP address cannot be reached from the external network. This IP address is by default dynamic unless you set it to static. Traffic from the internet is routed to this address according to the rules created on the NSG. The NSG works with the NIC to selectively send the right type of traffic to the right port on the NIC, which depends on the services configured on the VM.

The following figure shows how traffic flows from a client to a server through a NetScaler VPX instance provisioned in ARM.

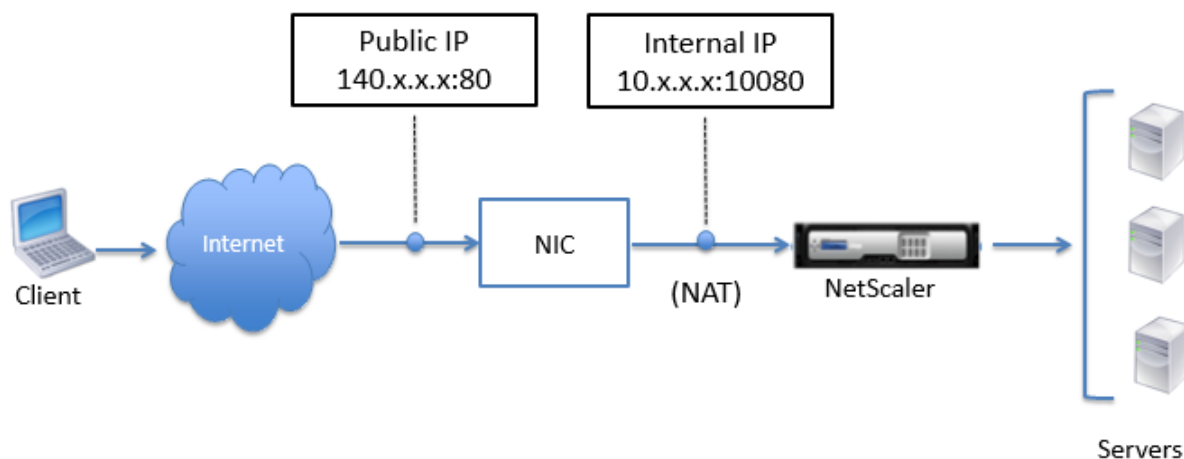

### Traffic flow through network address translation

You can also request a public IP (PIP) address for your Citrix ADC VPX instance (instance level). If you use this direct PIP at the VM level, you need not define inbound and outbound rules to intercept the network traffic. The incoming request from the Internet is received on the VM directly. Azure per-

forms network address translation (NAT) and forwards the traffic to the internal IP address of the VPX instance.

The following figure shows how Azure performs network address translation to map the NetScaler internal IP address.

In this example, the Public IP assigned to the NSG is 140.x.x.x and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the Citrix ADC VPX instance listens. The client request is received on the Public IP address (140.x.x.x). Azure performs network address translation to map the PIP to the internal IP address 10.x.x.x on port 10080, and forwards the client request.

#### Note

Citrix ADC VPX VMs in high availability are controlled by external or internal load balancers that have inbound rules defined on them to control the load balancing traffic. The external traffic is first intercepted by these load balancers and the traffic is diverted according to the load balancing rules configured, which has back-end pools, NAT rules, and health probes defined on the load balancers.

### Port usage guidelines

You can configure more inbound and outbound rules in NSG while creating the Citrix ADC VPX instance or after the virtual machine is provisioned. Each inbound and outbound rule is associated with a public port and a private port.

Before configuring NSG rules, note the following guidelines regarding the port numbers you can use:

1. The Citrix ADC VPX instance reserves the following ports. You cannot define these as private ports when using the Public IP address for requests from the internet.

Ports 21, 22, 80, 443, 8080, 67, 161, 179, 500, 520, 3003, 3008, 3009, 3010, 3011, 4001, 5061, 9000, 7000.

However, if you want internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.

For example, a VIP service might be running on port 8443 on the VPX instance but be mapped to public port 443. So, when the user accesses port 443 through the Public IP, the request is directed to private port 8443.

2. Public IP address does not support protocols in which port mapping is opened dynamically, such as passive FTP or ALG.
3. High availability does not work for traffic that uses a public IP address (PIP) associated with a VPX instance, instead of a PIP configured on the Azure load balancer.

#### Note

In Azure Resource Manager, a Citrix ADC VPX instance is associated with two IP addresses - a public IP address (PIP) and an internal IP address. While the external traffic connects to the PIP, the internal IP address or the NSIP is non-routable. To configure VIP in VPX, use the internal IP address and any of the free ports available. Do not use the PIP to configure VIP.

## Configure a Citrix ADC VPX standalone instance

September 21, 2020

You can provision a single Citrix ADC VPX instance in Azure Resource Manager (ARM) portal in a standalone mode by creating the virtual machine and configuring other resources.

### Before you begin

Ensure that you have the following:

- A Microsoft Azure user account
- Access to Microsoft Azure Resource Manager
- Microsoft Azure SDK
- Microsoft Azure PowerShell

On the [Microsoft Azure Portal](#) page, log on to the Azure Resource Manager portal by providing your user name and password.

#### Note

In ARM portal, clicking an option in one pane opens a new pane to the right. Navigate from one pane to another to configure your device.

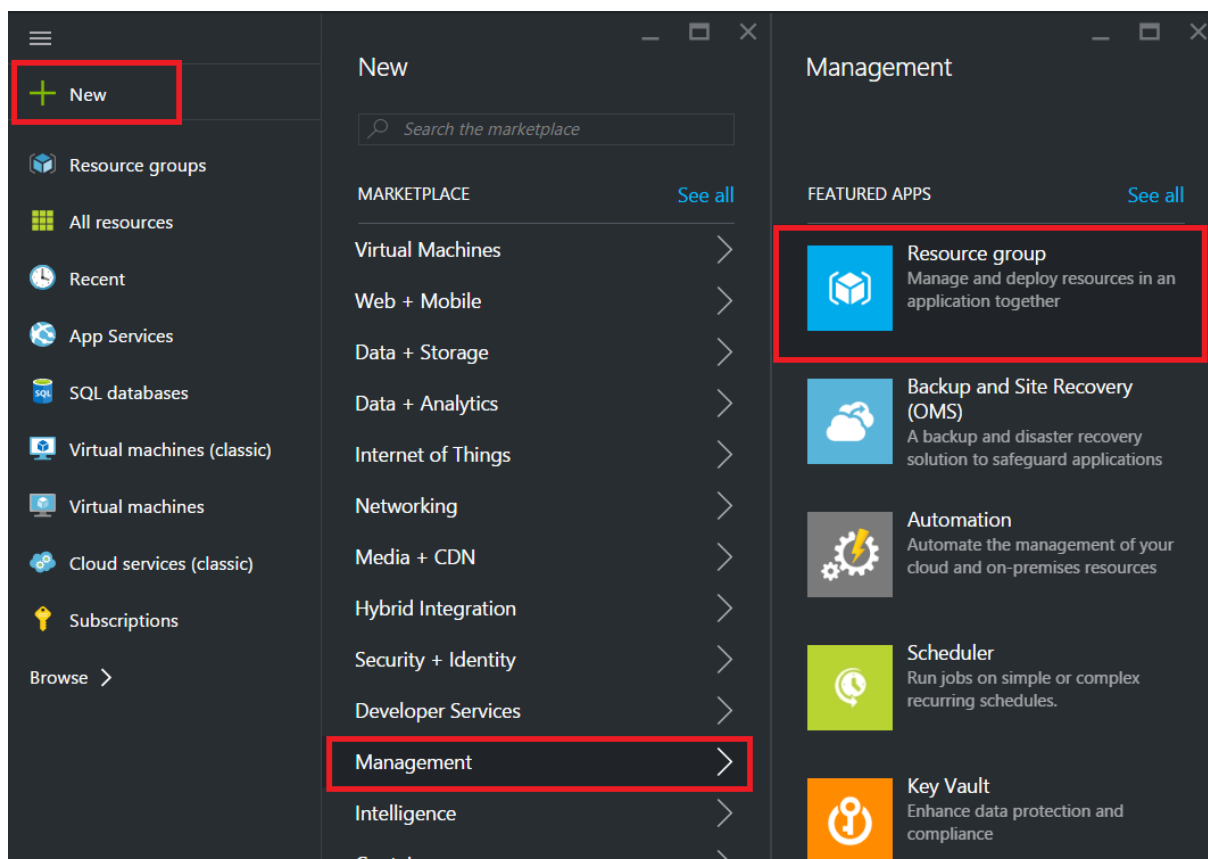

### Summary of configuration steps

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a Citrix ADC VPX instance.

### Configure a resource group

Create a new resource group that is a container for all your resources. Use the resource group to deploy, manage, and monitor your resources as a group.

1. Click **New > Management > Resource group**.
2. In the **Resource group** pane, enter the following details:
  - Resource group name
  - Resource group location
3. Click **Create**.

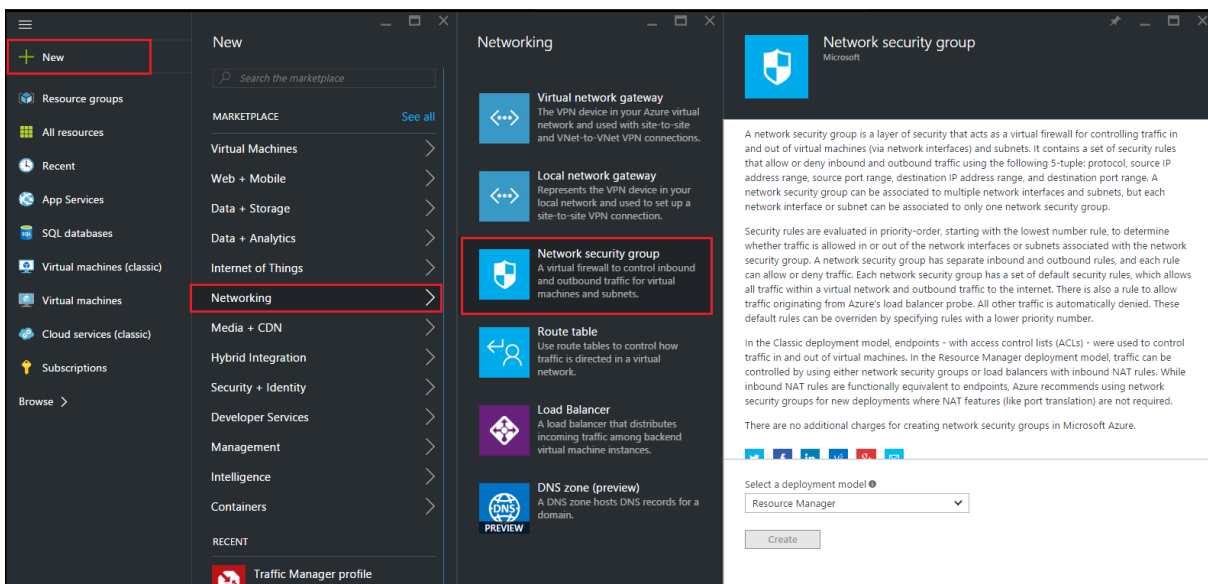

## Configure a network security group

Create a network security group (NSG) to assign inbound and outbound rules to control the incoming and outgoing traffic within the virtual network. NSG allows you to define security rules for a single virtual machine and also to define security rules for a virtual network subnet.

1. Click **New > Networking > Network security group**.
2. In the **Create network security group** pane, enter the following details, and then click **Create**.
  - Name - type a name for the security group
  - Resource group - select the resource group from the drop-down list

### Note

Ensure that you have selected the correct location. The list of resources that appear in the drop-down list is different for different locations.

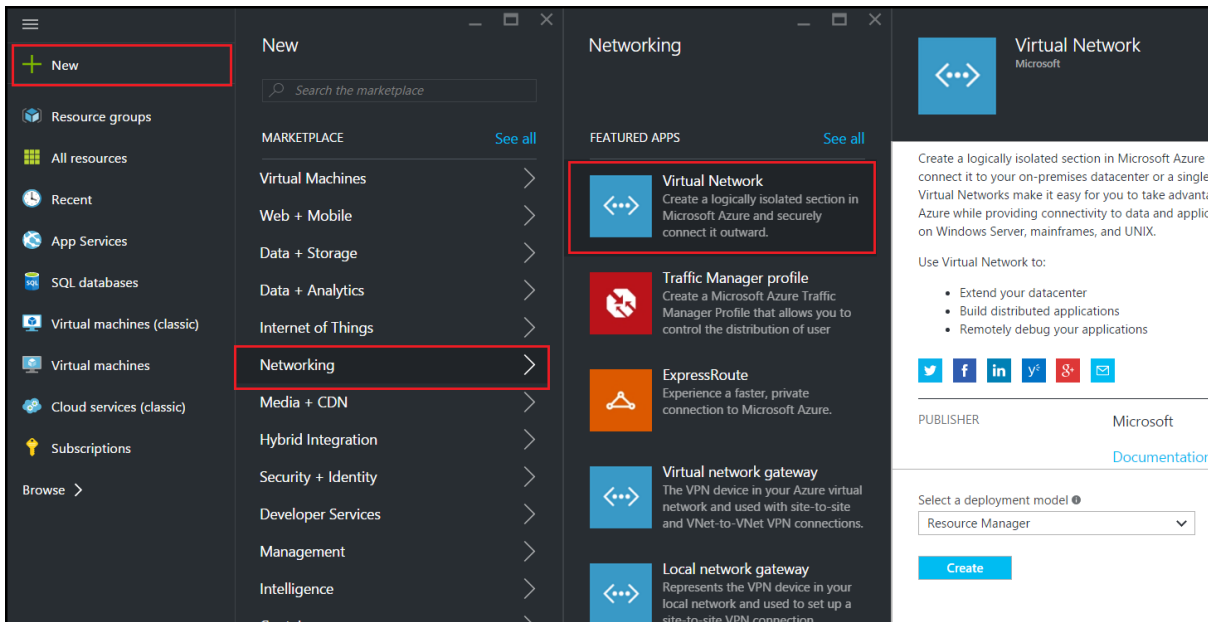

### Configure a virtual network and subnets

Virtual networks in ARM provide a layer of security and isolation to your services. VMs and services that are part of the same virtual network can access each other.

For these steps to create a virtual network and subnets.

1. Click **New > Networking > Virtual Network**.
2. In the **Virtual Network** pane, ensure the deployment mode is **Resource Manager** and click **Create**.

3. In the **Create virtual network** pane, enter the following values, and then click **Create**.

- Name of the virtual network

- Address space - type the reserved IP address block for the virtual network
- Subnet - type the name of the first subnet (you will create the second subnet later in this step)
- Subnet address range - type the reserved IP address block of the subnet
- Resource group - select the resource group created earlier from the drop-down list

## Create virtual network

Pin to dashboard

**Create** [Automation options](#)

## Configure the second subnet

1. Select the newly created virtual network from **All resources** pane and in the **Settings** pane, click **Subnets**.

2. Click **+Subnet** and create the second subnet by entering the following details.
  - Name of the second subnet
  - Address range - type the reserved IP address block of the second subnet
  - Network security group - select the NSG from the drop-down list
3. Click **Create**.

### Add subnet

OK

## Configure a storage account

The ARM IaaS infrastructure storage includes all services where we can store data in the form of blobs, tables, queues, and files. You can also create applications using these forms of storage data in ARM.

Create a storage account to store all your data.

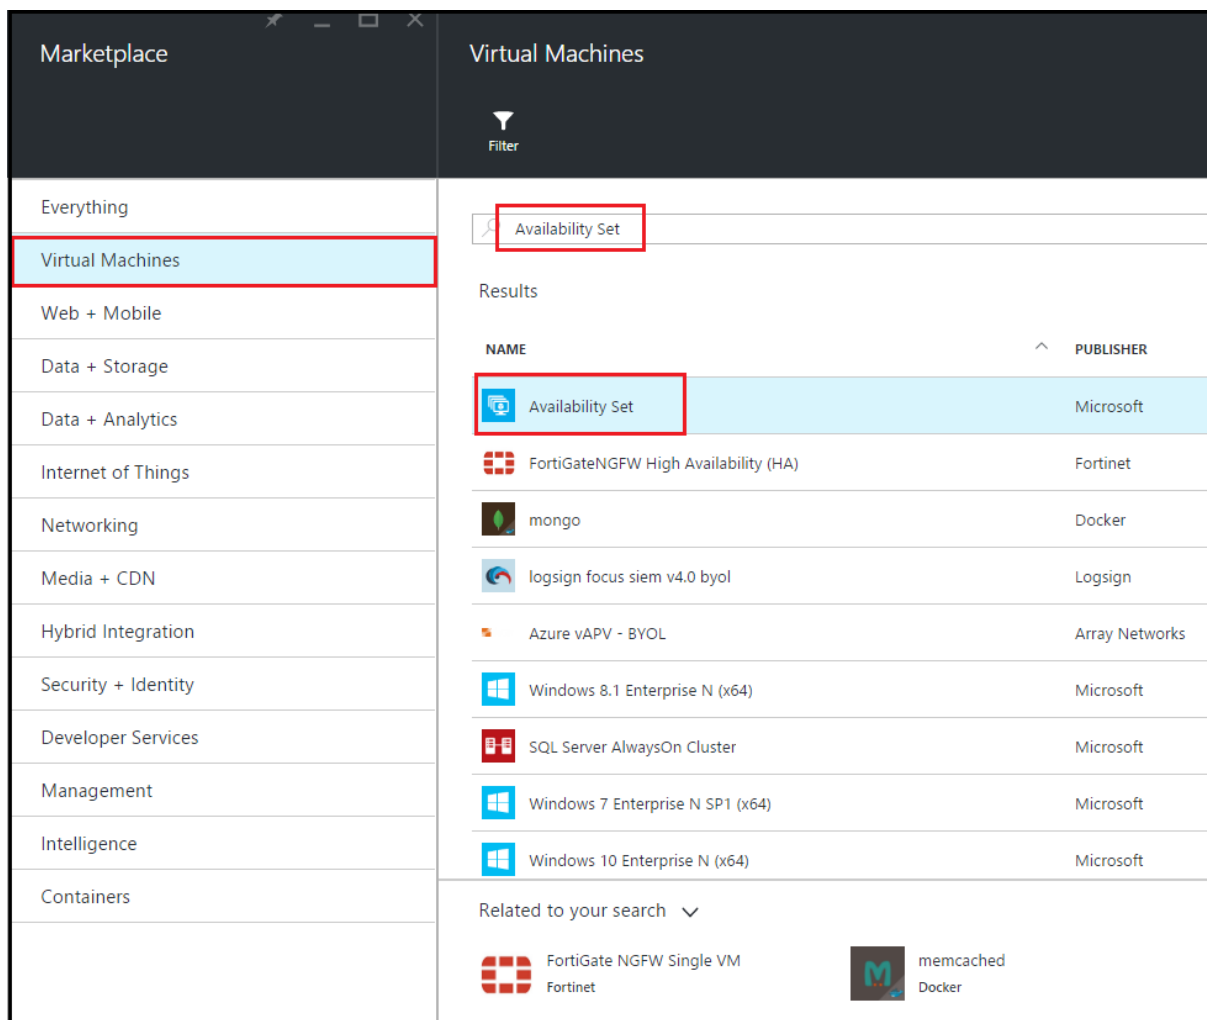

1. Click **+New > Data + Storage > Storage account**.
2. In the **Create storage account** pane, enter the following details:
  - Name of the account
  - Deployment mode - make sure to select **Resource Manager**
  - Account kind - select **General purpose** from the drop-down list
  - Replication - select **Locally redundant storage** from the drop-down list
  - Resource group - select the newly created resource group from the drop-down list
3. Click **Create**.

## Configure an availability set

An availability set guarantees that at least one VM is kept up and running in case of planned or unplanned maintenance. Two or more VMs under the same 'availability set' are placed on different fault domains to achieve redundant services.

1. Click **+New**.
2. Click **See all** in the MARKETPLACE pane and click **Virtual Machines**.
3. Search for availability set, and then select **Availability set** entity from the list displayed.

4. Click **Create**, and in the **Create availability set** pane, enter the following details:
  - Name of the set
  - Resource group - select the newly created resource group from the drop-down list
5. Click **Create**.

**Create availability set**

### Configure a Citrix ADC VPX instance

Create an instance of Citrix ADC VPX in the virtual network. Obtain the Citrix ADC VPX image from the Azure marketplace, and then use the Azure Resource Manager portal to create a Citrix ADC VPX instance.

Before you begin creating the Citrix ADC VPX instance, make sure that you have created a virtual network with required subnets in which the instance will reside. You can create virtual networks during

VM provisioning, but without the flexibility to create different subnets. For information about creating virtual networks, see <http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/>.

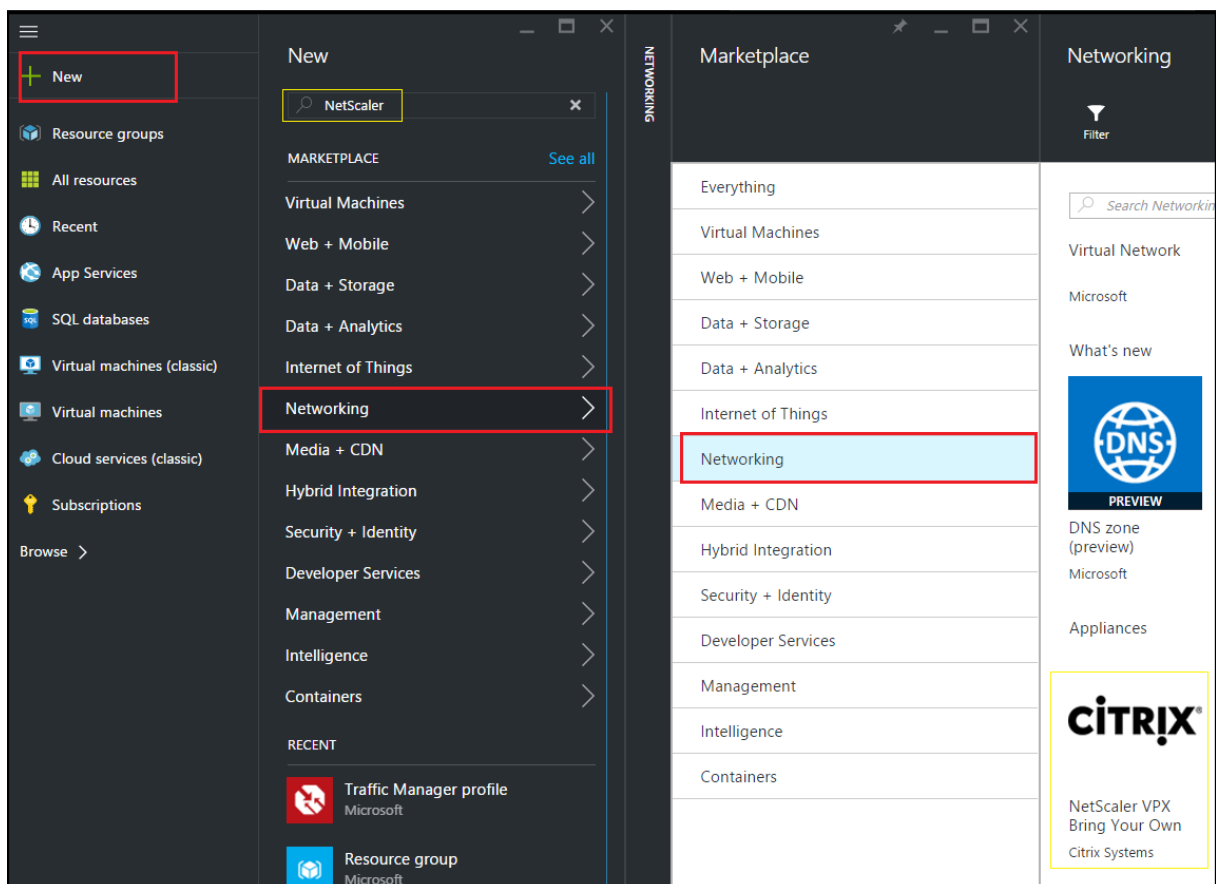

Optionally, configure DNS server and VPN connectivity that allows a virtual machine to access Internet resources.

### Note

Citrix recommends that you create resource group, network security group, virtual network, and other entities before you provision the Citrix ADC VPX VM, so that the network information is available during provisioning.

1. Click **+New > Networking**.
2. Click **See All** and in the Networking pane, click **Citrix ADC VPX Bring Your Own License**.

As a quick way to find any entity on ARM portal, you can also type the name of the entity in the Azure Marketplace search box and press <Enter>. Type NetScaler in the search box to find the Citrix NetScaler images.

### Note

Ensure to select the latest image. Your Citrix NetScaler image might have the release number in

the name.

- On the **Citrix ADC VPX Bring Your Own License** page, from the drop-down list, select **Resource Manager** and click **Create**.

The screenshot shows the 'Create virtual machine' dialog box with the 'Basics' tab selected. The progress bar on the left indicates the current step is '1 Basics: Configure basic settings'. The main configuration area includes the following fields:

- Name:** Citrix-NetScaler-User (with a green checkmark)
- VM disk type:** SSD (with a dropdown arrow)
- User name:** CitrixUser1 (with a green checkmark)
- Authentication type:** SSH public key (with 'Password' selected in a sub-menu)
- Password:** [Redacted] (with a green checkmark)
- Confirm password:** [Redacted] (with a green checkmark)
- Subscription:** Microsoft Azure Enterprise (with a dropdown arrow)
- Resource group:** Use existing (selected) with NetScalerResGroup (with a dropdown arrow)
- Location:** Southeast Asia (with a dropdown arrow)

An 'OK' button is located at the bottom of the dialog.

- In the **Create virtual machine** pane, specify the required values in each section to create a virtual machine. Click **OK** in each section to save your configuration.

**Basic:**

- Name - specify a name for the Citrix ADC VPX instance
- VM disk type - select SSD (default value) or HDD from the drop-down menu

- User name and Password - specify a user name and password to access the resources in the resource group that you have created
- Authentication Type - select SSH Public Key or Password
- Resource group - select the resource group you have created from the drop-down list

You can create a resource group here, but Citrix recommends that you create a resource group from Resource groups in Azure Resource Manager and then select the group from the drop-down list.

**Size:**

Depending on the VM disk type, SDD or HDD, you selected in Basic settings, the disk sizes are displayed.

- Select a disk size according to your requirement and click **Select**.

**Settings:**

- Select the default (Standard) disk type
- Storage account - select the storage account
- Virtual network - select the virtual network
- Subnet - set the subnet address
- Public IP address - select the type of IP address assignment
- Network security group - select the security group that you have created. Ensure that inbound and outbound rules are configured in the security group.
- Availability Set - select the availability set from the drop-down box

**Summary:**

The configuration settings are validated and the Summary page displays the result of the validation. If the validation fails, the Summary page displays the reason of the failure. Go back to the particular section and make changes as required. If the validation passes, click **OK**.

**Buy:**

Review the offer details and legal terms on the Purchase page and click **Purchase**.

For high availability deployment, create two independent instances of Citrix ADC VPX in the same availability set and in the same resource group to deploy them in active-standby configuration.

## **Configure multiple IP addresses for a Citrix ADC VPX standalone instance**

September 21, 2020

This section explains how to configure a standalone Citrix ADC VPX instance with multiple IP addresses, in Azure Resource Manager (ARM). The VPX instance can have one or more NIC attached to it,

and each NIC can have one or more static or dynamic public and private IP addresses assigned to it. You can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.

For more information, see the Azure documentation [Assign multiple IP addresses to virtual machines using the Azure portal](#).

If you want to use PowerShell commands, see [Configuring multiple IP addresses for a Citrix ADC VPX instance in standalone mode by using PowerShell commands](#).

### Use case

In this use case, a standalone Citrix ADC VPX appliance is configured with a single NIC that is connected to a virtual network (VNET). The NIC is associated with three IP configurations (ipconfig), each servers a different purpose - as shown in the table.

IPconfig	Associated with	Purpose
ipconfig1	Static public IP address; static private IP address	Serves management traffic
ipconfig2	Static public IP address; static private address	Serves client-side traffic
ipconfig3	Static private IP address	Communicates with back-end servers

#### Note

IPConfig-3 is not associated with any public IP address.

#### Diagram: Topology

Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure Citrix ADC VPX deployment, the private IP associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP of the appliance. The remaining private IP addresses associated with IPConfigs need to be added in the VPX instance as a VIP or SNIP by using the “add ns ip” command, according to your requirement.

**Before you begin**

Before you begin, create a VPX instance by following the steps given at this link:

[Configure a Citrix ADC VPX standalone instance](#)

For this use case, the NSDoc0330VM VPX instance is created.

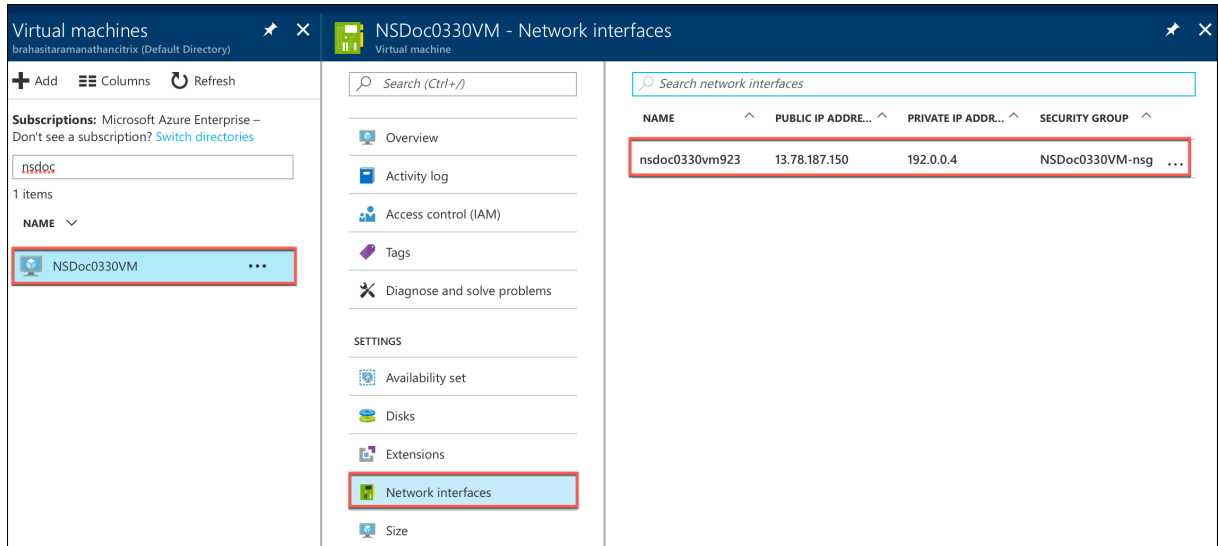

**Procedure to configure multiple IP addresses for a Citrix ADC VPX instance in standalone mode.**

For configuring multiple IP addresses for a Citrix ADC VPX appliance in standalone mode:

1. Add IP addresses to the VM
2. Configure Citrix ADC -owned IP addresses

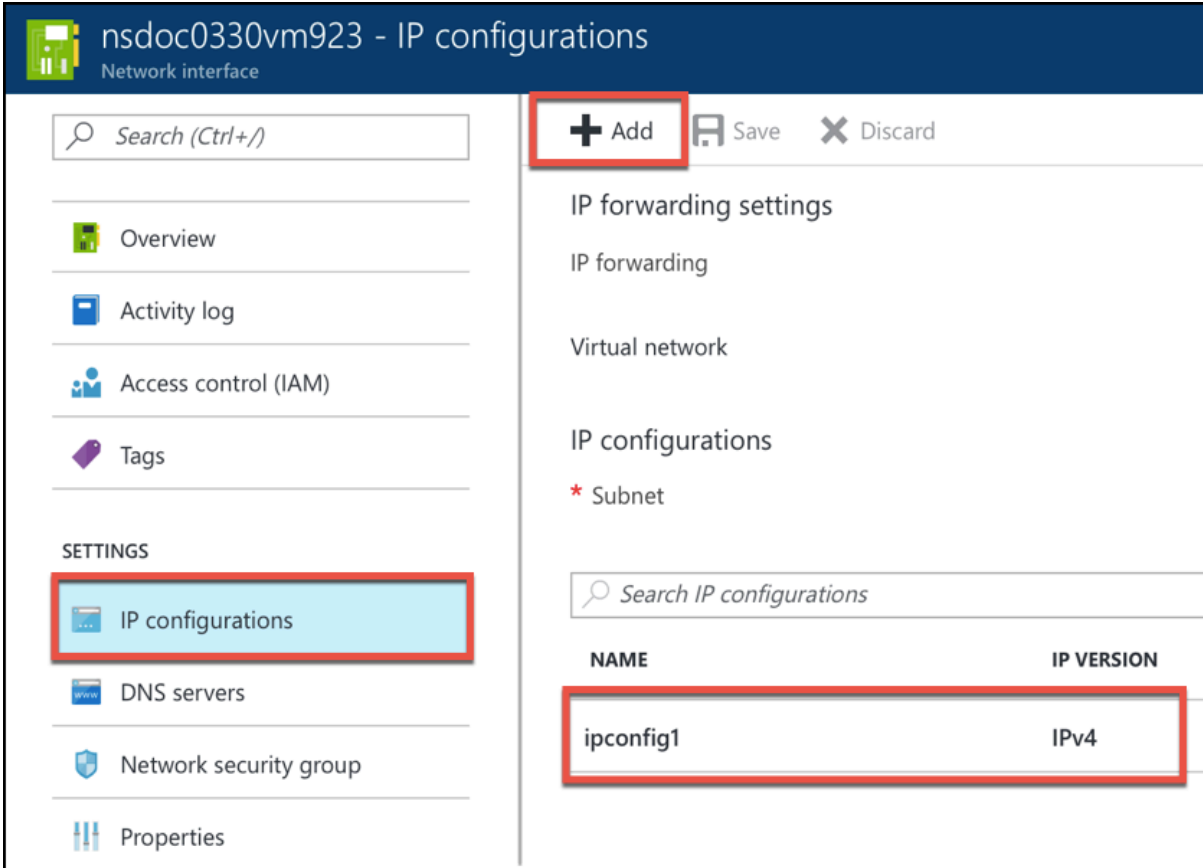

**Step 1:** Add IP addresses to the VM

1. In the portal, click **More services > type virtual machines** in the filter box, and then click **Virtual machines**.
2. In the **Virtual machines** blade, click the VM you want to add IP addresses to. Click **Network interfaces** in the virtual machine blade that appears, and then select the network interface.

In the blade that appears for the NIC you selected, click **IP configurations**. The existing IP configuration that was assigned when you created the VM, **ipconfig1**, is displayed. For this use case, make sure the IP addresses associated with ipconfig1 are static. Next, create two more IP configurations: ipconfig2 (VIP) and ipconfig3 (SNIP).

To create additional ipconfigs, create **Add**.

The screenshot shows the Citrix ADC management console interface for IP configurations. The page title is "nsdoc0330vm923 - IP configurations" with a sub-header "Network interface". On the left, there is a navigation menu with options: Overview, Activity log, Access control (IAM), Tags, SETTINGS (highlighted), DNS servers, Network security group, and Properties. The main content area has a top bar with "+ Add", "Save", and "Discard" buttons. Below this, there are sections for "IP forwarding settings", "IP forwarding", "Virtual network", and "IP configurations". Under "IP configurations", there is a search bar and a table with two columns: "NAME" and "IP VERSION". The table contains one entry: "ipconfig1" with "IPv4".

NAME	IP VERSION
ipconfig1	IPv4

In the **Add IP configuration** window, enter a **Name**, specify allocation method as **Static**, enter an IP address (192.0.0.5 for this use case), and enable **Public IP address**.

#### Note

Before adding a static private IP address, check for IP address availability and make sure the IP address belongs to the same subnet to which the NIC is attached.

**Add IP configuration**  
nsdoc0330vm923

\* Name  
ipconfig2 ✓

Type  
Primary Secondary

**i** Primary IP configuration already exists

Private IP address settings

Allocation  
Dynamic Static

\* IP address  
192.0.0.5 ✓

Public IP address  
Disabled Enabled

\* IP address  
*Configure required settings* >

Next, click **Configure required settings** to create a static public IP address for ipconfig2.

By default, public IPs are dynamic. To make sure that the VM always uses the same public IP address, create a static Public IP.

In the Create public IP address blade, add a Name, under Assignment click **Static**. And then click **OK**.

**Create public IP address**

\* Name  
 ✓

Assignment  
 Dynamic  Static

**Note**

Even when you set the allocation method to static, you cannot specify the actual IP address assigned to the public IP resource. Instead, it gets allocated from a pool of available IP addresses in the Azure location the resource is created in.

Follow the steps to add one more IP configuration for ipconfig3. Public IP is not mandatory.

Search IP configurations				
NAME	IP VERSION	TYPE	PRIVATE IP ADDRESS	PUBLIC IP ADDRESS
ipconfig1	IPv4	Primary	192.0.0.4 (Static)	13.78.187.150 (NSDoc0330VM-ip)
ipconfig2	IPv4	Secondary	192.0.0.5 (Static)	13.78.183.123 (ipconfig2_PIP2)
ipconfig3	IPv4	Secondary	192.0.0.6 (Static)	-

## Step 2: Configure Citrix ADC-owned IP addresses

Configure the Citrix ADC-owned IP addresses by using the GUI or the command “add ns ip.” For more information, see [Configuring Citrix ADC-Owned IP Addresses](#).

You’ve now configured multiple IP addresses for a Citrix ADC VPX instance in standalone mode.

## Configure a high-availability setup with multiple IP addresses and NICs

January 5, 2021

In a Microsoft Azure deployment, a high-availability configuration of two Citrix ADC VPX instances is achieved by using the Azure Load Balancer (ALB). This is achieved by configuring a health probe on ALB, which monitors each VPX instance by sending health probe at every 5 seconds to both primary and secondary instances.

In this setup, only the primary node responds to health probes and secondary does not. Once the primary sends the response to the health probe, the ALB starts sending the data traffic to the instance. If the primary instance misses two consecutive health probes, ALB does not redirect traffic to that instance. On failover, the new primary starts responding to health probes and the ALB redirects traffic to it. The standard VPX high availability failover time is three seconds. The total failover time that might take for traffic switching can be maximum of 13 seconds.

You can deploy a pair of Citrix ADC VPX instances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain multiple IP addresses.

The following options are available for a multi-NIC high availability deployment:

- High availability using Azure availability set
- High availability using Azure availability zones

For more information about Azure Availability Set and Availability Zones, see the Azure documentation [Manage the availability of Linux virtual machines](#).

### High availability using availability set

A high availability setup using availability set must meet the following requirements:

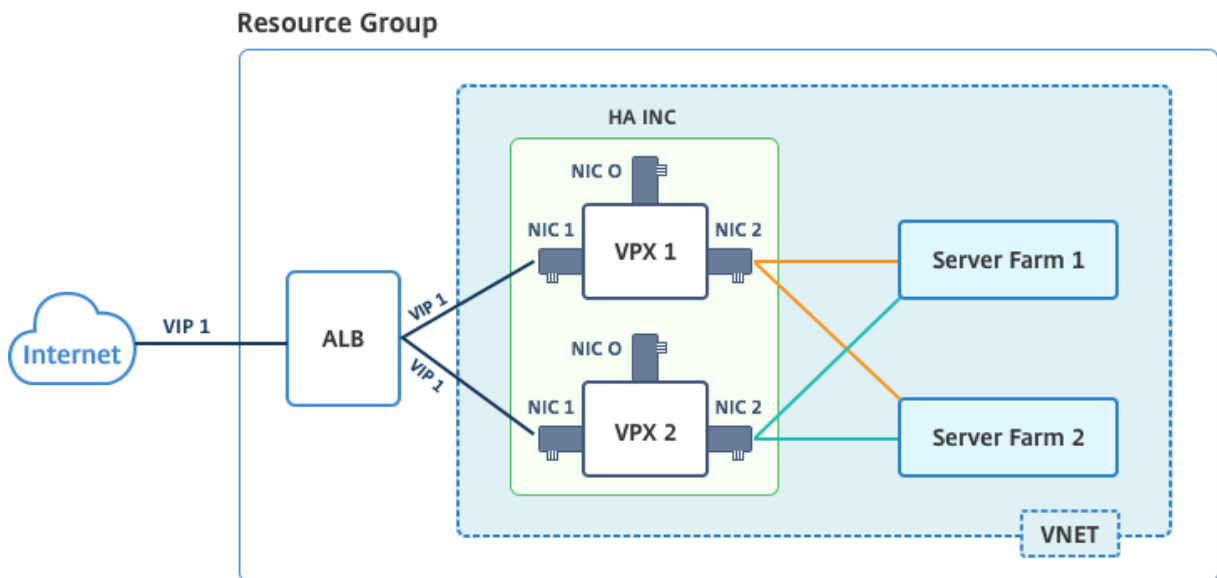

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) in Direct Server Return (DSR) mode

All traffic goes through the primary node. The secondary node remains in standby mode until the primary node fails.

**Note**

For a Citrix VPX high availability deployment on Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two VPX nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

**Diagram:** Example of a high availability deployment architecture, using Azure Availability Set

In an active-passive deployment, the ALB floating public IP (PIP) addresses are added as the VIP addresses in each VPX node. In HA-INC configuration, the VIP addresses are floating and SNIP addresses are instance specific.

You can deploy a VPX pair in active-passive high availability mode in two ways by using:

- **Citrix ADC VPX standard high availability template:** use this option to configure an HA pair with the default option of three subnets and six NICs.
- **Windows PowerShell commands:** use this option to configure an HA pair according to your subnet and NIC requirements.

This topic describes how to deploy a VPX pair in active-passive HA setup by using the Citrix template. If you want to use PowerShell commands, see [Configuring an HA Setup with Multiple IP Addresses and NICs by Using PowerShell Commands](#).

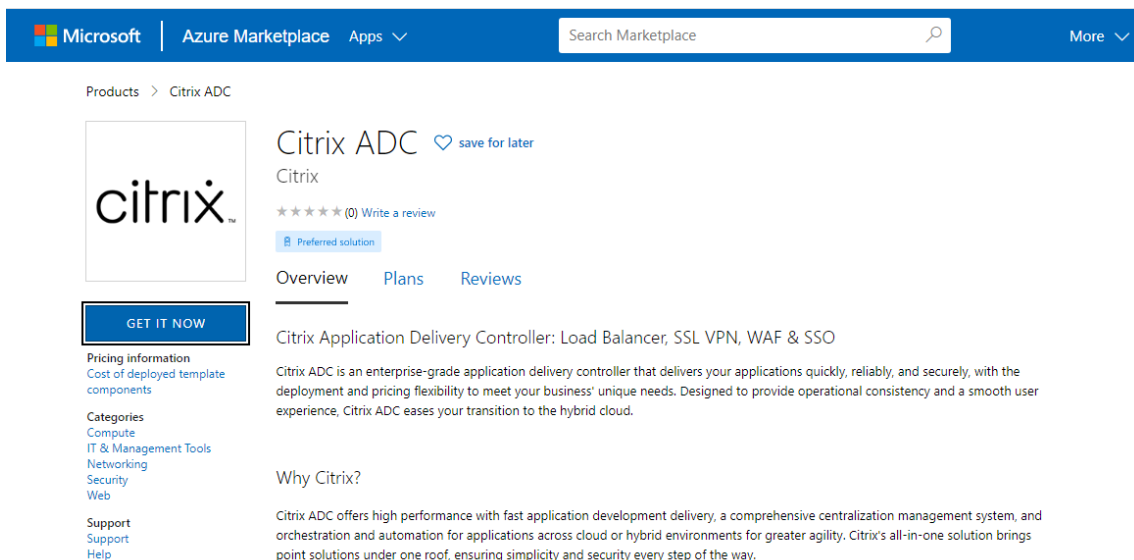

### Configure HA-INC nodes by using the Citrix high availability template

You can quickly and efficiently deploy a pair of VPX instances in HA-INC mode by using the standard template. The template creates two nodes, with three subnets and six NICs. The subnets are for management, client, and server-side traffic, and each subnet has two NICs for both the VPX instances.

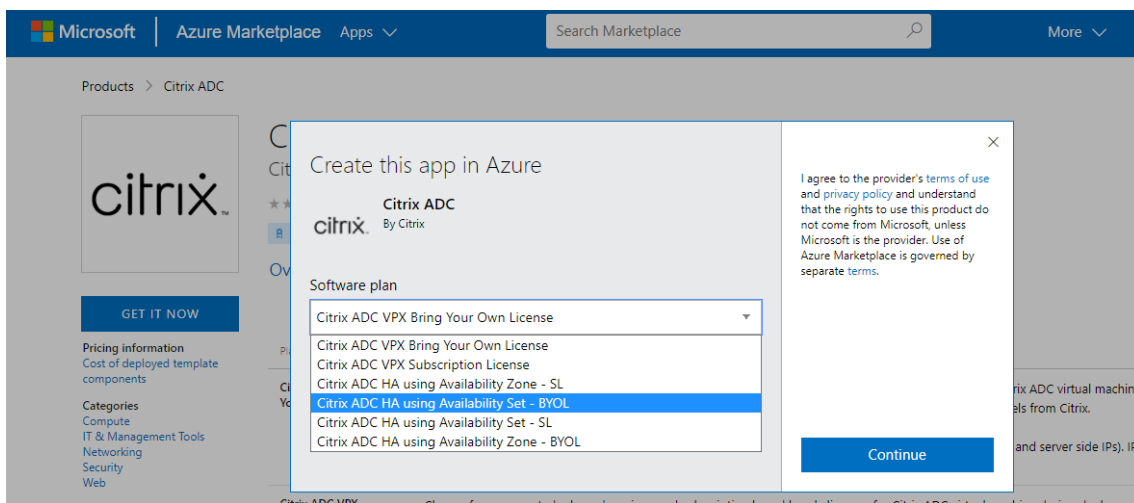

You can get the Citrix ADC HA Pair template at the [Azure Marketplace](#).

Complete the following steps to launch the template and deploy a high availability VPX pair, by using Azure availability sets.

1. From Azure Marketplace, search **Citrix ADC**.

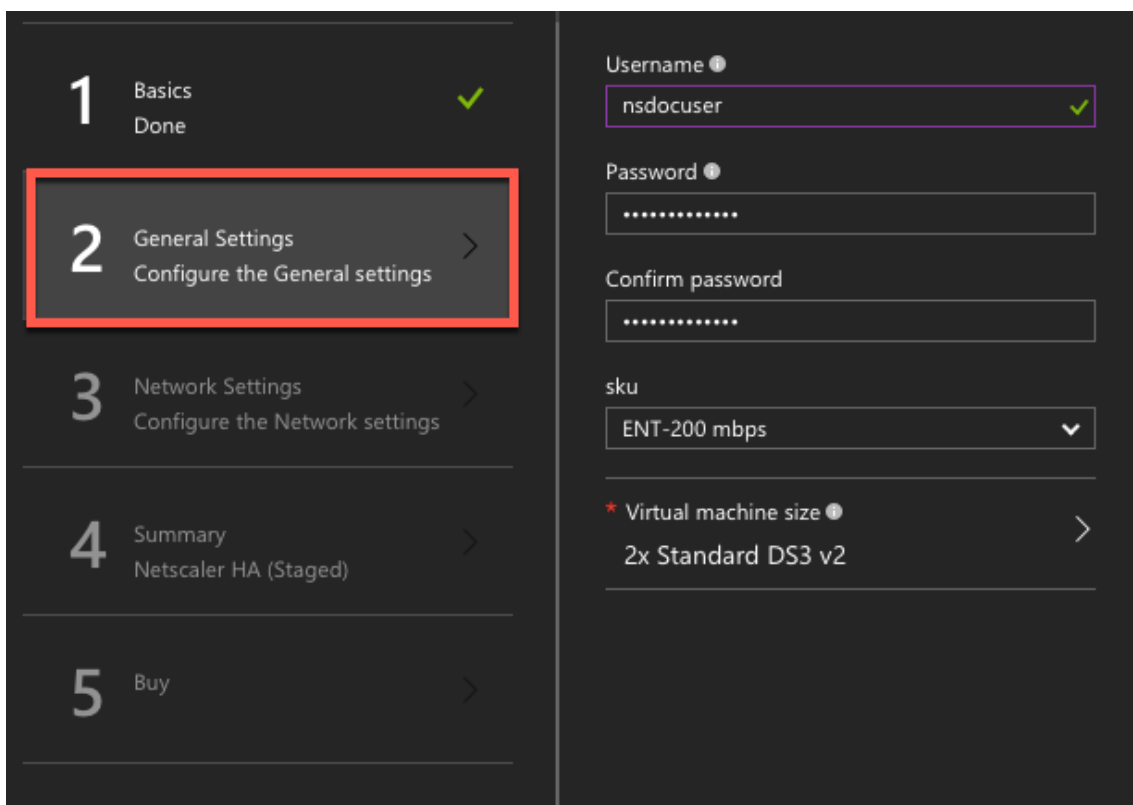

2. Click **GET IT NOW**.
3. Select the required HA deployment along with license, and click **Continue**.

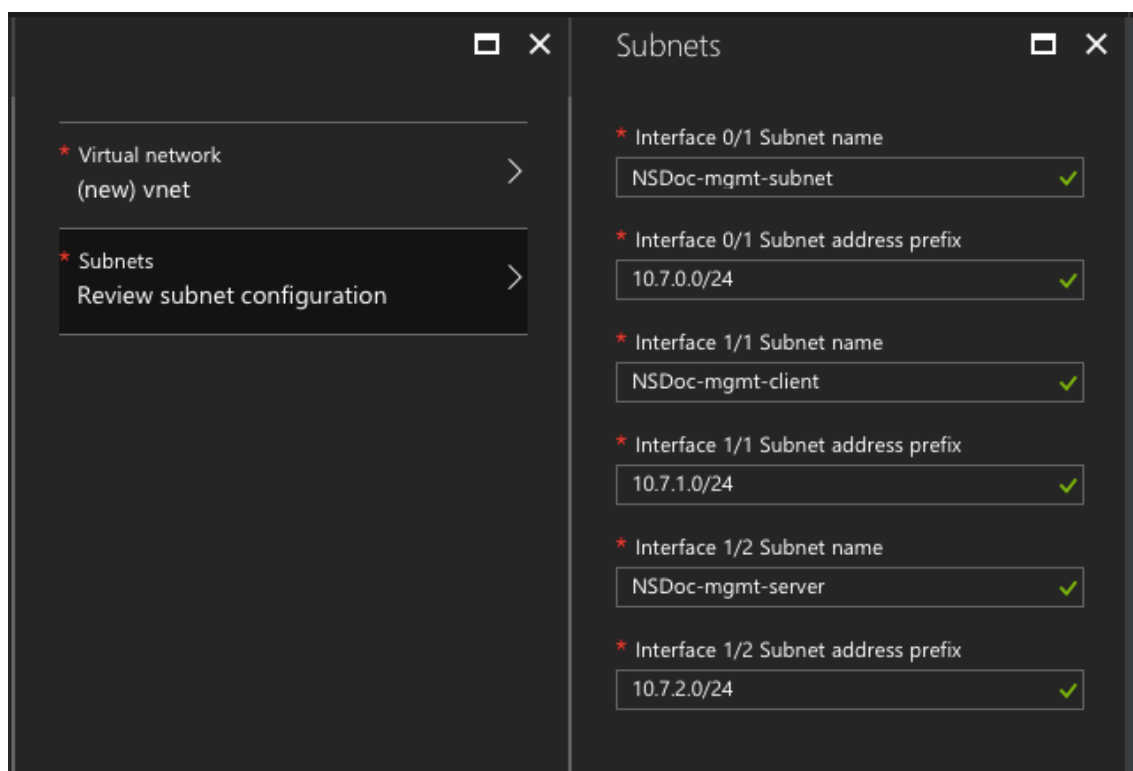

4. The **Basics** page appears. Create a Resource Group and select **OK**.

5. The **General Settings** page appears. Type the details and select **OK**.

- The **Network Setting** page appears. Check the vnet and subnet configurations, edit the required settings, and select **OK**.

- The **Summary** page appears. Review the configuration and edit accordingly. Select **OK** to confirm.
- The **Buy** page appears. Select **Purchase** to complete the deployment.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the Resource Group in the Azure portal to see the configuration details, such as LB rules, back-end pools, health probes, and so on. The high availability pair appears as ns-vpx0 and ns-vpx1.

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

23 items  Show hidden types ⓘ

<input type="checkbox"/>	 vnet01	Virtual network
<input type="checkbox"/>	 vpxhamd7fi3wouvrk	Storage account

Next, you need to configure the load-balancing vserver with the ALB public IP (PIP) address, on each node. To find the ALB PIP, select ALB > **Frontend IP configuration**.

See the Resources section for more information about how to configure the load-balancing vserver.

#### Resources:

The following links provide additional information related to HA deployment and virtual server (vserver) configuration:

- [Configuring high availability nodes in different subnets](#)
- [Set up basic load balancing](#)

#### Related resources:

- [Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands](#)

### High availability using availability zones

Azure Availability Zones are fault-isolated locations within an Azure region, providing redundant power, cooling, and networking and increasing resiliency. Only specific Azure regions support Availability Zones. For more information, see the Azure documentation [What are Availability Zones in Azure?](#).

Diagram: Example of a high availability deployment architecture, using Azure Availability Zones

You can deploy a VPX pair in high availability mode by using the template called “NetScaler 12.1 HA using Availability Zones,” available in Azure Marketplace.

Complete the following steps to launch the template and deploy a high availability VPX pair, by using Azure Availability Zones.

1. From Azure Marketplace, select and initiate the Citrix solution template.

2. Ensure deployment type is Resource Manager and select **Create**.
3. The **Basics** page appears. Enter the details and click **OK**.

Note: Ensure that you select an Azure region that supports Availability Zones. For more information about regions that support Availability Zones, see Azure documentation [What are Availability Zones in Azure?](#)

4. The **General Settings** page appears. Type the details and select **OK**.
5. The **Network Setting** page appears. Check the vnet and subnet configurations, edit the required settings, and select **OK**.
6. The **Summary** page appears. Review the configuration and edit accordingly. Select **OK** to confirm.
7. The **Buy** page appears. Select **Purchase** to complete the deployment.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the **Resource Group** to see the configuration details, such as LB rules, back-end pools, health probes, and so on, in the Azure portal. The high availability pair appears as ns-vpx0 and ns-vpx1. Also, you can see the location under the **Location** column.

NAME	TYPE	LOCATION
alb	Load balancer	East US 2
alb-publicip	Public IP address	East US 2
ns-vpx0	Virtual machine	East US 2
ns-vpx0_OsDisk_1_d7b757b8aa804bf1991a083f319e553a	Disk	East US 2
ns-vpx0-mgmt-publicip	Public IP address	East US 2
ns-vpx1	Virtual machine	East US 2
ns-vpx1_OsDisk_1_0c2364d43e2b47fa896bf14b02090ee0	Disk	East US 2
ns-vpx1-mgmt-publicip	Public IP address	East US 2
ns-vpx-nic0-01	Network interface	East US 2
ns-vpx-nic0-11	Network interface	East US 2
ns-vpx-nic0-12	Network interface	East US 2

ns-vpx-nic-nsg0-11	Network security group	East US 2
ns-vpx-nic-nsg0-12	Network security group	East US 2
ns-vpx-nic-nsg1-01	Network security group	East US 2
ns-vpx-nic-nsg1-11	Network security group	East US 2
ns-vpx-nic-nsg1-12	Network security group	East US 2
test1	Virtual network	East US 2
vpxhavdosvod3v5jeu	Storage account	East US 2

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

## Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands

October 5, 2020

You can deploy a pair of Citrix ADC VPX instances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain multiple IP addresses.

An active-passive deployment requires:

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) in Direct Server Return (DSR) mode

All traffic goes through the primary node. The secondary node remains in standby mode until the primary node fails.

### Note

For a Citrix ADC VPX high availability deployment on Azure cloud to work, you need a floating

public IP (PIP) that can be moved between the two high-availability nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

**Diagram:** Example of an active-passive deployment architecture

In an active-passive deployment, the ALB floating public IP (PIP) addresses are added as the VIP addresses in each VPX node. In HA-INC configuration, the VIP addresses are floating and SNIP addresses are instance specific.

ALB monitors each VPX instances by sending health probe at every 5 seconds and redirects traffic to that instance only that sends health probes response on regular interval. So in an HA setup, the primary node responds to health probes and secondary does not. If the primary instances misses two consecutive health probes, ALB does not redirect traffic to that instance. On failover, the new primary starts responding to health probes and the ALB redirects traffic to it. The standard VPX high availability failover time is three seconds. The total failover time that might take for traffic switching can be maximum of 13 seconds.

You can deploy a VPX pair in active-passive HA setup in two ways by using:

- **Citrix ADC VPX Standard high availability template:** use this option to configure an HA pair with the default option of three subnets and six NICs.
- **Windows PowerShell commands:** use this option to configure an HA pair according to your subnet and NIC requirements.

This topic describes how to deploy a VPX pair in active-passive HA setup by using PowerShell commands. If you want to use the Citrix ADC VPX Standard HA template, see [Configuring an HA Setup with Multiple IP Addresses and NICs](#).

## Configure HA-INC nodes by using PowerShell Ccmmands

### Scenario: HA-INC PowerShell deployment

In this scenario, you deploy a Citrix ADC VPX pair by using the topology given in the table. Each VPX instance contains three NICs, with each NIC is deployed in a different subnet. Each NIC is assigned an IP configuration.

ALB	VPX1	VPX2
ALB is associated with public IP 3 (pip3)	Management IP is configured with IPConfig1, which includes one public IP (pip1) and one private IP (12.5.2.24); nic1; Mgmtsubnet=12.5.2.0/24	Management IP is configured with IPConfig5, which includes one public IP (pip3) and one private IP (12.5.2.26);nic4;Mgmtsubnet=12.5.2.0/24
LB rules and port configured are HTTP (80),SSL (443), health probe (9000)	Client-side IP is configured with IPConfig3, which includes one private IP(12.5.1.27);nic2; FrontEndsubnet=12.5.1.0/24	Client-side IP is configured with IPConfig7, which includes one private IP (12.5.1.28);nic5;FrontEndsubnet=12.5.1.0/24
-	Server-side IP is configured with IPConfig4, which includes one private IP(12.5.3.24); nic3;BackendSubnet=12.5.3.0/24	Server-side IP is configured with IPConfig8, which includes one private IP(12.5.3.28);nic6;BackendSubnet=12.5.3.0/24
-	Rules and ports for NSG areSSH (22),HTTP (80),HTTPS (443)	-

### Parameter settings

The following parameter settings are used in this scenario.

\$locName= "South east Asia"

\$rgName = "MulitIP-MultiNIC-RG"

\$nicName1= "VM1-NIC1"

\$nicName2 = "VM1-NIC2"

\$nicName3= "VM1-NIC3"

```
$nicName4 = "VM2-NIC1"  
$nicName5 = "VM2-NIC2"  
$nicName6 = "VM2-NIC3"  
$vNetName = "Azure-MultiIP-ALB-vnet"  
$vNetAddressRange = "12.5.0.0/16"  
$frontEndSubnetName = "frontEndSubnet"  
$frontEndSubnetRange = "12.5.1.0/24"  
$mgmtSubnetName = "mgmtSubnet"  
$mgmtSubnetRange = "12.5.2.0/24"  
$backEndSubnetName = "backEndSubnet"  
$backEndSubnetRange = "12.5.3.0/24"  
$prmStorageAccountName = "multiipmultinicbstorage"  
$avSetName = "multiple-avSet"  
$vmSize = "Standard_DS4_V2"  
$publisher = "citrix"  
$offer = "netscalervpx-120"  
$sku = "netscalerbyol"  
$version = "latest"  
$pubIPName1 = "VPX1MGMT"  
$pubIPName2 = "VPX2MGMT"  
$pubIPName3 = "ALBPIP"  
$domName1 = "vpx1dns"  
$domName2 = "vpx2dns"  
$domName3 = "vpxalbdns"  
$vmNamePrefix = "VPXMultiIPALB"  
$osDiskSuffix1 = "osmultiipalbdiskdb1"  
$osDiskSuffix2 = "osmultiipalbdiskdb2"  
$lbName = "MultiIPALB"  
$frontEndConfigName1 = "FrontEndIP"
```

```
$backendPoolName1= "BackendPoolHttp"
```

```
$lbRuleName1= "LBRuleHttp"
```

```
$healthProbeName= "HealthProbe"
```

```
$nsgName="NSG-MultiIP-ALB"
```

```
$rule1Name="Inbound-HTTP"
```

```
$rule2Name="Inbound-HTTPS"
```

```
$rule3Name="Inbound-SSH"
```

To complete the deployment, complete the following steps by using PowerShell commands:

1. Create a resource group, storage account, and availability set
2. Create a network security group and add rules
3. Create a virtual network and three subnets
4. Create public IP addresses
5. Create IP configurations for VPX1
6. Create IP configurations for VPX2
7. Create NICs for VPX1
8. Create NICs for VPX2
9. Create VPX1
10. Create VPX2
11. Create ALB

#### **Create a resource group, storage account, and availability set.**

```
1 New-AzureRmResourceGroup -Name $rgName -Location $locName
2
3
4 $prmStorageAccount=New-AzureRMStorageAccount -Name
   $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS
   -Location $locName
5
6
7 $avSet=New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName
   $rgName -Location $locName
```

#### **Create a network security group and add rules.**

```
1 $rule1 = New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -
   Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction
   Inbound -Priority 101
2
3
```

```
4 -SourceAddressPrefix Internet -SourcePortRange * -
   DestinationAddressPrefix * -DestinationPortRange 80
5
6
7 $rule2 = New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -
   Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction
   Inbound -Priority 110
8
9
10 -SourceAddressPrefix Internet -SourcePortRange * -
    DestinationAddressPrefix * -DestinationPortRange 443
11
12
13 $rule3 = New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name -
   Description "Allow SSH" -Access Allow -Protocol Tcp -Direction
   Inbound -Priority 120
14
15
16 -SourceAddressPrefix Internet -SourcePortRange * -
    DestinationAddressPrefix * -DestinationPortRange 22
17
18
19 $nsg = New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -
    Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

### Create a virtual network and three subnets.

```
1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
   $frontEndSubnetName -AddressPrefix $frontEndSubnetRange (this
   parameter value should be as per your requirement)
2
3
4 $mgmtSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name $mgmtSubnetName
   -AddressPrefix $mgmtSubnetRange
5
6
7 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
   $backEndSubnetName -AddressPrefix $backEndSubnetRange
8
9
10 $vnet =New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName
    $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet
    $frontendSubnet,$backendSubnet, $mgmtSubnet
11
12
```

```
13 $subnetName ="frontEndSubnet"
14
15
16 $subnet1=$vnet.Subnets|?{
17   $_.Name -eq $subnetName }
18
19
20
21 $subnetName="backEndSubnet"
22
23
24 $subnet2=$vnet.Subnets|?{
25   $_.Name -eq $subnetName }
26
27
28
29 $subnetName="mgmtSubnet"
30
31
32 $subnet3=$vnet.Subnets|?{
33   $_.Name -eq $subnetName }
```

### Create public IP addresses.

```
1 $pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName
   $rgName -DomainNameLabel $domName1 -Location $locName -
   AllocationMethod Dynamic
2
3 $pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName
   $rgName -DomainNameLabel $domName2 -Location $locName -
   AllocationMethod Dynamic
4
5 $pip3=New-AzureRmPublicIpAddress -Name $pubIPName3 -ResourceGroupName
   $rgName -DomainNameLabel $domName3 -Location $locName -
   AllocationMethod Dynamic
```

### Create IP configurations for VPX1.

```
1 $IpConfigName1 = "IPConfig1"
2
3
4 $IPAddress = "12.5.2.24"
5
6
7 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
```

```
        Subnet $subnet3 -PrivateIpAddress $IPAddress -PublicIpAddress $pip1
        -Primary
8
9
10 $IPConfigName3="IPConfig-3"
11
12
13 $IPAddress="12.5.1.27"
14
15
16 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
        Subnet $subnet1 -PrivateIpAddress $IPAddress -Primary
17
18
19 $IPConfigName4 = "IPConfig-4"
20
21
22 $IPAddress = "12.5.3.24"
23
24
25 $IPConfig4 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -
        Subnet $subnet2 -PrivateIpAddress $IPAddress -Primary
```

### Create IP configurations for VPX2.

```
1 $IPConfigName5 = "IPConfig5"
2
3
4 $IPAddress="12.5.2.26"
5
6
7 $IPConfig5=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName5 -
        Subnet $subnet3 -PrivateIpAddress $IPAddress -PublicIpAddress $pip2
        -Primary
8
9
10 $IPConfigName7="IPConfig-7"
11
12
13 $IPAddress="12.5.1.28"
14
15
16 $IPConfig7=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName7 -
        Subnet $subnet1 -PrivateIpAddress $IPAddress -Primary
17
```

```
18
19 $IPConfigName8="IPConfig-8"
20
21
22 $IPAddress="12.5.3.28"
23
24
25 $IPConfig8=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName8 -
    Subnet $subnet2 -PrivateIpAddress $IPAddress -Primary
```

### Create NICs for VPX1.

```
1 $nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig1 -
    NetworkSecurityGroupId $nsg.Id
2
3
4 $nic2=New-AzureRmNetworkInterface -Name $nicName2 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig3 -
    NetworkSecurityGroupId $nsg.Id
5
6
7 $nic3=New-AzureRmNetworkInterface -Name $nicName3 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig4 -
    NetworkSecurityGroupId $nsg.Id
```

### Create NICs for VPX2.

```
1 $nic4=New-AzureRmNetworkInterface -Name $nicName4 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig5 -
    NetworkSecurityGroupId $nsg.Id
2
3
4 $nic5=New-AzureRmNetworkInterface -Name $nicName5 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig7 -
    NetworkSecurityGroupId $nsg.Id
5
6
7 $nic6=New-AzureRmNetworkInterface -Name $nicName6 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig8 -
    NetworkSecurityGroupId $nsg.Id
```

### Create VPX1.

This step includes the following substeps:

- Create VM config object
- Set credentials, OS, and image
- Add NICs
- Specify OS disk and create VM

```
1 $suffixNumber = 1
2
3
4 $vmName=$vmNamePrefix + $suffixNumber
5
6
7 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
  AvailabilitySetId $avSet.Id
8
9
10 $cred=Get-Credential -Message "Type the name and password for VPX login
  ."
11
12
13 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
  ComputerName $vmName -Credential $cred
14
15
16 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
  $publisher -Offer $offer -Skus $sku -Version $version
17
18
19 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -
  Primary
20
21
22 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id
23
24
25 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id
26
27
28 $osDiskName=$vmName + "-" + $osDiskSuffix1
29
30
31 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
  + $osDiskName + ".vhd"
32
33
34 $vmConfig=Set-AzureRMVMOsdisk -VM $vmConfig -Name $osDiskName -VhdUri
```

```
    $osVhdUri -CreateOption fromImage
35
36
37 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -
    Name $sku
38
39
40 New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location
    $locName
```

## Create VPX2.

```
1 $suffixNumber=2
2
3
4 $vmName=$vmNamePrefix + $suffixNumber
5
6
7 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avSet.Id
8
9
10 $cred=Get-Credential -Message "Type the name and password for VPX login
    ."
11
12
13 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
    ComputerName $vmName -Credential $cred
14
15
16 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
    $publisher -Offer $offer -Skus $sku -Version $version
17
18
19 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic4.Id -
    Primary
20
21
22 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic5.Id
23
24
25 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic6.Id
26
27
28 $osDiskName=$vmName + "-" + $osDiskSuffix2
```

```
29
30
31 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
    + $osDiskName + ".vhd"
32
33
34 $vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri
    $osVhdUri -CreateOption fromImage
35
36
37 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -
    Name $sku
38
39
40 New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location
    $locName
```

To view private and public IP addresses assigned to the NICs, type the following commands:

```
1 $nic1.IPConfig
2
3
4 $nic2.IPConfig
5
6
7 $nic3.IPConfig
8
9
10 $nic4.IPConfig
11
12
13 $nic5.IPConfig
14
15
16 $nic6.IPConfig
```

### **Create Azure load balance (ALB).**

This step includes the following substeps:

- Create frontend IP config
- Create health probe
- Create backend address pool
- Create load-balancing rules (HTTP and SSL)
- Create ALB with frontend IP config, backend address pool, and LB rule

- Associate IP config with backend pools

```
1 $frontEndIP1=New-AzureRmLoadBalancerFrontendIpConfig -Name
   $frontEndConfigName1 -PublicIpAddress $pip3
2
3
4 $healthProbe=New-AzureRmLoadBalancerProbeConfig -Name $healthProbeName
   -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
5
6
7 $beAddressPool1=New-AzureRmLoadBalancerBackendAddressPoolConfig -Name
   $backendPoolName1
8
9
10 $lbRule1=New-AzureRmLoadBalancerRuleConfig -Name $lbRuleName1 -
    FrontendIpConfiguration $frontEndIP1 -BackendAddressPool
    $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -
    BackendPort 80 -EnableFloatingIP
11
12
13 $lb=New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -
    Location $locName -FrontendIpConfiguration $frontEndIP1 -
    LoadBalancingRule $lbRule1 -BackendAddressPool $beAddressPool1 -
    Probe $healthProbe
14
15
16 $nic2.IpConfigurations[0].LoadBalancerBackendAddressPools.Add($lb.
    BackendAddressPools[0])
17
18
19 $nic5.IpConfigurations[0].LoadBalancerBackendAddressPools.Add($lb.
    BackendAddressPools[0])
20
21
22 $lb=$lb | Set-AzureRmLoadBalancer
23
24
25 $nic2=$nic2 | Set-AzureRmNetworkInterface
26
27
28 $nic5=$nic5 | Set-AzureRmNetworkInterface
```

After you've successfully deployed the Citrix ADC VPX pair, log on to each VPX instance to configure HA-INC, and SNIP and VIP addresses.

1. Type the following command to add HA nodes.

```
1 add ha node 1 PeerNodeNSIP -inc Enabled
```

2. Add private IP addresses of client-side NICs as SNIPs for VPX1 (NIC2) and VPX2 (NIC5)

```
1 add nsip privateIPofNIC2 255.255.255.0 -type SNIP
2
3
4 add nsip privateIPofNIC5 255.255.255.0 -type SNIP
```

3. Add load-balancing vserver on the primary node with front-end IP address (public IP) of ALB.

```
1 add lb vserver v1 HTTP FrontEndIPofALB 80
```

## Configure HA-INC nodes by using the Citrix high availability template with Azure ILB

March 24, 2021

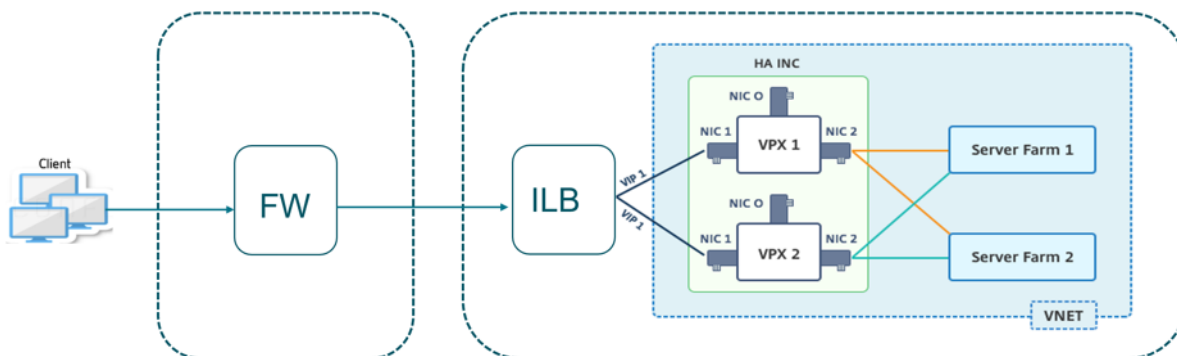

You can quickly and efficiently deploy a pair of VPX instances in HA-INC mode by using the standard template for intranet applications. The Azure internal load balancer (ILB) uses an internal or private IP address for the front end as shown in Figure 1. The template creates two nodes, with three subnets and six NICs. The subnets are for management, client, and server-side traffic with each subnet belonging to a different NIC on each device.

Figure 1: Citrix ADC HA pair for clients in an internal network

You can also use this deployment when the Citrix ADC HA pair is behind a firewall as shown in Figure 2. The public IP address belongs to the firewall and is NAT'd to the front-end IP address of the ILB.

Figure 2: Citrix ADC HA pair with firewall having public IP address

You can get the Citrix ADC HA pair template for intranet applications at the [Azure portal](#).

Complete the following steps to launch the template and deploy a high availability VPX pair by using Azure Availability Sets.

1. From the Azure portal, navigate to the **Custom deployment** page.
2. The **Basics** page appears. Create a Resource Group. Under the **Parameters** tab, enter details for the Region, Admin user name, Admin Password, license type (VM sku), and other fields.

## Custom deployment

Deploy from a custom template

[Review + create](#) [< Previous](#) [Next : Review + create >](#)

3. Click **Next : Review + create >**.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the Resource Group in the Azure portal to see the configuration details, such as LB rules, back-end pools, health probes. The high availability pair appears as ADC-VPX-0 and ADC-VPX-1.

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

Once the required configuration is complete, the following resources are created.

HA-ILB Resource group

ADC-VPX-NSG-1-01	Network security group	West US 2

4. You must log on to **ADC-VPX-0** and **ADC-VPX-1** nodes, and validate the following configuration:

- NSIP addresses for both nodes must be in the management subnet.
- On the primary (ADC-VPX-0) and secondary (ADC-VPX-1) nodes, you must see two SNIP addresses. One SNIP (client subnet) is used for responding to ILB probes and the other SNIP (server subnet) is used for back-end server communication.

#### Note

In the HA-INC mode, the SNIP address of ADC-VPX-0 and ADC-VPX-1 VMs are different, unlike with the classic on-premises ADC HA deployment.

## On the Primary node (ADC-VPX-0)

```
> sh ip
-----
Ipaddress      Traffic Domain  Type           Mode   Arp   Icmp   Vserver  State
-----
1)  10.11.0.5     0               NetScaler IP   Active Enabled Enabled NA       Enabled
2)  10.11.1.5     0               SNIP           Active Enabled Enabled NA       Enabled
3)  10.11.3.4     0               SNIP           Active Enabled Enabled NA       Enabled
Done
>
>
```

```
> sh ha node
1)  Node ID:      0
    IP:          10.11.0.5 (ADC-VPX-0)

   Interfaces causing Partial Failure: None
   SSL Card Status: NOT PRESENT

Done
> █
```

5. After the primary and secondary nodes are UP and the Synchronization status is **SUCCESS**, you must configure the load balancing virtual server or the gateway virtual server on the primary node (ADC-VPX-0) with the private floating IP (FIP) address of the ADC Azure load balancer. For more information, see the [Sample configuration](#) section.
6. To find the private IP address of ADC Azure load balancer, navigate to **Azure portal > ADC Azure Load Balancer > Frontend IP configuration**.

7. In the **Azure Load Balancer** configuration page, the ARM template deployment helps create the LB rule, back-end pools, and health probes.

- The LB Rule (LbRule1) uses port 80, by default.

**lbRule1**  
ADC-Azure-Load-Balancer

Save Discard Delete

**i** A load balancing rule distributes incoming traffic that is sent to a selected IP address and port combination across a group of backend pool instances. Only backend instances that the health probe considers healthy receive new traffic.

Name \*  
lbRule1

IP Version \*  
 IPv4  IPv6

Frontend IP address \* ⓘ  
10.11.1.4 (ADC-Load-Balancer-Frontend-IP-Configuration-rule) ✓

Protocol  
 TCP  UDP

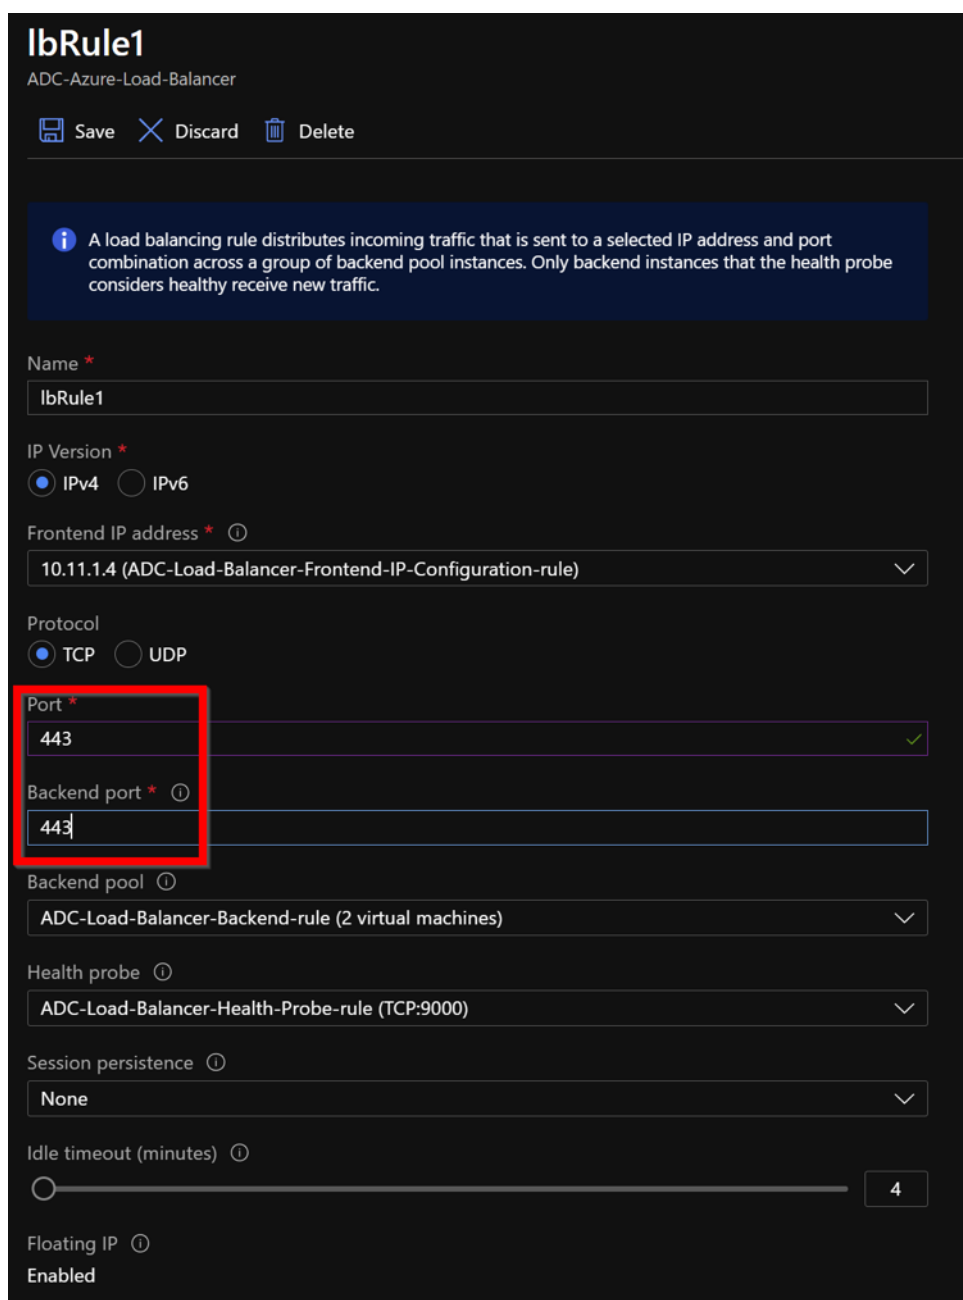

Port \*  
80

Backend port \* ⓘ  
80

- Edit the rule to use port 443, and save the changes.

Note

For enhanced security, Citrix recommends you to use SSL port 443 for LB virtual server or Gateway virtual server.

**lbRule1**  
ADC-Azure-Load-Balancer

Save Discard Delete

**i** A load balancing rule distributes incoming traffic that is sent to a selected IP address and port combination across a group of backend pool instances. Only backend instances that the health probe considers healthy receive new traffic.

Name \*  
lbRule1

IP Version \*  
 IPv4  IPv6

Frontend IP address \* ⓘ  
10.11.1.4 (ADC-Load-Balancer-Frontend-IP-Configuration-rule) ▼

Protocol  
 TCP  UDP

Port \*  
443 ✓

Backend port \* ⓘ  
443

Backend pool ⓘ  
ADC-Load-Balancer-Backend-rule (2 virtual machines) ▼

Health probe ⓘ  
ADC-Load-Balancer-Health-Probe-rule (TCP:9000) ▼

Session persistence ⓘ  
None ▼

Idle timeout (minutes) ⓘ  
4

Floating IP ⓘ  
Enabled

To add more VIP addresses on the ADC, perform the following steps:

1. Navigate to **Azure Load Balancer > Frontend IP configuration**, and click **Add** to create a new internal load balancer IP address.

2. In the **Add frontend IP address** page, enter a name, choose the client subnet, assign either dynamic or static IP address, and click **Add**.

3. The front-end IP address is created but an LB Rule is not associated. Create a new load balancing rule, and associate it with the front-end IP address.

4. In the **Azure Load Balancer** page, select **Load balancing rules**, and then click **Add**.

5. Create a new LB Rule by choosing the new front-end IP address and the port. **Floating IP** field must be set to **Enabled**.

Home > HA-ILB > ADC-Azure-Load-Balancer >

## Add load balancing rule

ADC-Azure-Load-Balancer

**i** A load balancing rule distributes incoming traffic that is sent to a selected IP address and port combination across a group of backend pool instances. Only backend instances that the health probe considers healthy receive new traffic.

**1** Name \*  
lbrule2 ✓

IP Version \*  
 IPv4  IPv6

**2** Frontend IP address \* ⓘ  
10.11.1.7 (ILB-Front-End-IP-2) ✓

Protocol  
 TCP  UDP

**3** Port \* **3**  
443 ✓

**4** Backend port \* ⓘ **4**  
443 ✓

**5** Backend pool ⓘ **5**  
ADC-Load-Balancer-Backend-rule (2 virtual machines) ✓

Health probe ⓘ  
ADC-Load-Balancer-Health-Probe-rule (TCP:9000) ✓

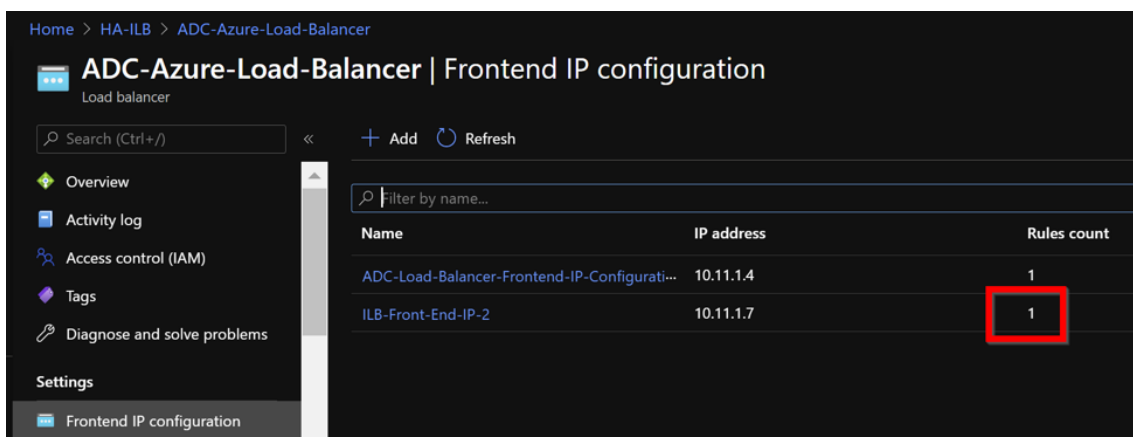

Session persistence ⓘ  
None ✓

Idle timeout (minutes) ⓘ  
0 4

**6** Floating IP ⓘ **6**  
Disabled Enabled

**7** OK **7**

6. Now the **Frontend IP configuration** shows the LB rule that is applied.

## Sample configuration

To configure a gateway VPN virtual server and load balancing virtual server, run the following commands on the primary node (ADC-VPX-0). The configuration auto synchronizes to the secondary node (ADC-VPX-1).

### Gateway sample configuration

```

1 Enable feature aaa LB SSL SSLVPN
2 add ip 10.11.1.4 255.255.255.0 -type VIP
3 add vpn vserver vpn_ssl SSL 10.11.1.4 443
4 add ssl certKey ckp -cert wild-cgwsanity.cer -key wild-cgwsanity.key
5 bind ssl vserver vpn_ssl -certkeyName ckp
6 <!--NeedCopy-->

```

### Load balancing sample configuration

```

1 add ip 10.11.1.7 255.255.255.0 -type VIP
2 add lb vserver lb_vs1 SSL 10.11.1.7 443
3 bind ssl vserver lb_vs1 -certkeyName ckp
4 <!--NeedCopy-->

```

You can now access the load balancing or VPN virtual server using the fully qualified domain name (FQDN) associated with the internal IP address of ILB.

See the **Resources** section for more information about how to configure the load-balancing virtual server.

## Add Azure autoscale settings

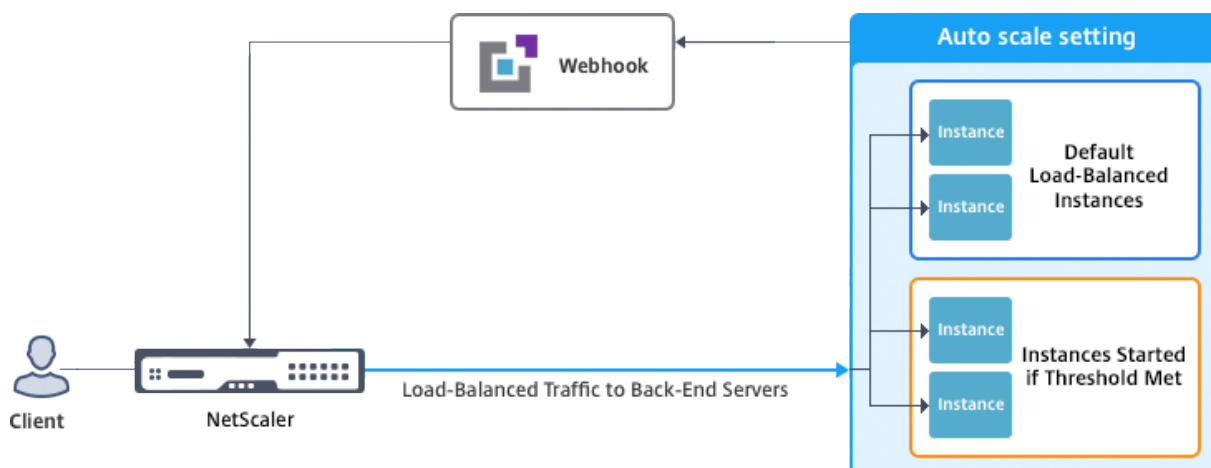

September 21, 2020

Efficient hosting of applications in a cloud involves easy and cost-effective management of resources depending on the application demand. To meet increasing demand, you have to scale network resources upward. Whether demand subsides, you must scale down to avoid the unnecessary cost of idle resources. To minimize the cost of running the application, you have to constantly monitor traffic, memory and CPU use, and so on. However, monitoring traffic manually is cumbersome. For the application environment to scale up or down dynamically, you must automate the processes of monitoring traffic and of scaling resources up and down whenever necessary.

You can use autoscale with Azure virtual machine scale sets (VMSS) for VPX multi-IP standalone and high availability deployment on Azure.

Integrated with Azure virtual machine scale sets (VMSS) and autoscale feature, the Citrix ADC VPX instance provides the following advantages:

- **Load balance and management:** Auto configures servers to scale up and scale down, depending on demand. The VPX instance auto detects VMSS autoscale setting in the back-end subnet in the same resource group as the VPX instance and allows user to select the VMSS autoscale setting to balance the load. All of this is done by auto configuring Citrix ADC virtual and subnet IP addresses on the VPX instance.
- **High availability:** Detects autoscale groups in the same resource group and load-balance servers.
- **Better network availability:** The VPX instance supports back-end servers on different virtual networks (VNETs).

For more information, see the following Azure topic

- [Virtual Machine Scale Sets Documentation](#)
- [Overview of autoscale in Microsoft Azure Virtual Machines, Cloud Services, and Web Apps](#)

## Before you begin

1. Read Azure-related usage guidelines. For more information, see [Deploy a Citrix ADC VPX instance on Microsoft Azure](#).
2. Create one or more Citrix ADC VPX instances with three network interfaces on Azure according to your requirement (standalone or high availability deployment).
3. Open the TCP 9001 port on the network security group of the 0/1 interface of the VPX instance. The VPX instance uses this port to receive the scale-out and scale-in notification.
4. Create an Azure virtual machine scale set (VMSS) in the same resource group. If you don't have an existing VMSS configuration, complete the following tasks:
  - a) Create a VMSS
  - b) Enable autoscale on VMSS
  - c) Create scale-in and scale-out policy in VMSS autoscale setting

For more information, see [Overview of autoscale with Azure virtual machine scale sets](#).

5. Create an Azure Active Directory (ADD) application and service principal that can access resources. Assign contributor role to the newly created AAD application. For more information, see [Use portal to create an Azure Active Directory application and service principal that can access resources](#).

## Add VMSS to a Citrix ADC VPX instance

You can add the autoscale setting to a VPX instance with a single click by using the GUI. Complete these steps to add the autoscale setting to the VPX instance:

1. Log on to the VPX instance.
2. When you log on to the Citrix ADC VPX instance for the first time, you see the Set Credentials page. Add the required Azure credentials for the autoscale feature to work.

The screenshot shows the Citrix NetScaler VPX AZURE Configuration page. At the top, there is a dark blue header with the text "Citrix NetScaler VPX AZURE". Below the header, there are two tabs: "Dashboard" and "Configuration". The "Configuration" tab is selected. Below the tabs, there is a blue circular icon with a white left-pointing arrow, followed by the text "Set Credentials". Below this, there are three input fields: "Tenant ID", "Application ID", and "Application Secret". At the bottom of the form, there are two buttons: "OK" and "Cancel".

The Set Credential page appears only when the application ID and API access key is not set or the correct application ID and API access keys (same as application secret) is not set in the Azure portal.

When you deploy the “NetScaler 12.1 HA with backend autoscale” offer from the Azure market place, the Azure portal prompts for Azure service principal credentials (application ID and API access key).

For information about how to create an application ID see [Adding an application](#) and to create an access key or application secret see [Configure a client application to access web APIs](#).

3. In the default cloud profile page, enter the details, as shown in the following example, and click Create.

**Dashboard** Configuration

Name  
 ?

Virtual Server IP Address\*  
 ▼

Load Balancing Server Protocol\*  
 ▼

Load Balancing Server Port\*

Auto Scale Setting\*  
 ▼

Auto Scale Setting Protocol  
 ▼

Auto Scale Setting Port\*

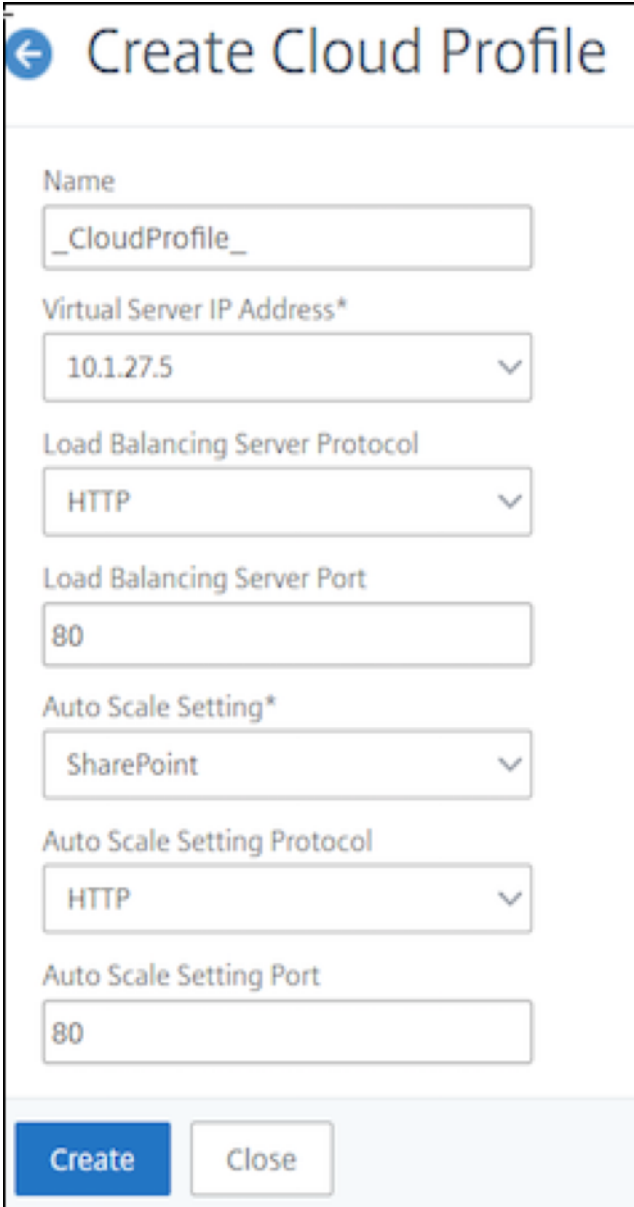

### Points to keep in mind while creating a cloud profile

- The virtual server IP address is auto-populated from the free IP address available to the VPX instance. For more information, see [Assign multiple IP addresses to virtual machines using the Azure portal](#).
- Autoscale setting is prepopulated from the VMSS auto scale setting configured in current resource group on your Azure account. For more information, see [Overview of autoscale with Azure virtual machine scale sets](#).
- While selecting the Auto Scaling Group protocol and port, ensure your servers listen on those protocol and ports and you bind the correct monitor in the service group. By default, TCP monitor is used.
- For SSL Protocol type Autos Scaling, after you create the Cloud Profile the load balance virtual server or service group will be down because of a missing certificate. You can bind the certificate to the virtual server or service group manually.

After first time logon, if you want to create a cloud profile, on the GUI go to System > Azure > Cloud Profile and click Add.

The Create Cloud Profile configuration page appears.

**Create Cloud Profile**

Name  
\_CloudProfile\_

Virtual Server IP Address\*  
10.1.27.5

Load Balancing Server Protocol  
HTTP

Load Balancing Server Port  
80

Auto Scale Setting\*  
SharePoint

Auto Scale Setting Protocol  
HTTP

Auto Scale Setting Port  
80

**Create** Close

Cloud Profile creates a Citrix ADC load-balancing (LB) virtual server (virtual server) and a service group with members (servers) as the servers of the Auto Scaling Group. Your back-end servers should be reachable through the SNIP configured on the VPX instance.

To view autoscale-related information in the Azure portal, go to All service > Virtual machine scale set > Select Virtual machine scale set > Scaling.

## Configure GSLB on Citrix ADC VPX instances

September 21, 2020

Citrix ADC appliances configured for global server load balancing (GSLB) provide disaster recovery and continuous availability of applications by protecting against points of failure in a wide area network (WAN). GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers in case of an outage.

This section describes how to enable GSLB on VPX instances on two sites in a Microsoft Azure environment, by using Windows PowerShell commands.

#### Note

For more information about GSLB, see [Global Server Load Balancing](#).

You can configure GSLB on a Citrix ADC VPX instances on Azure, in two steps:

1. Create a VPX instance with multiple NICs and multiple IP addresses, on each site.
2. Enable GSLB on the VPX instances.

#### Note

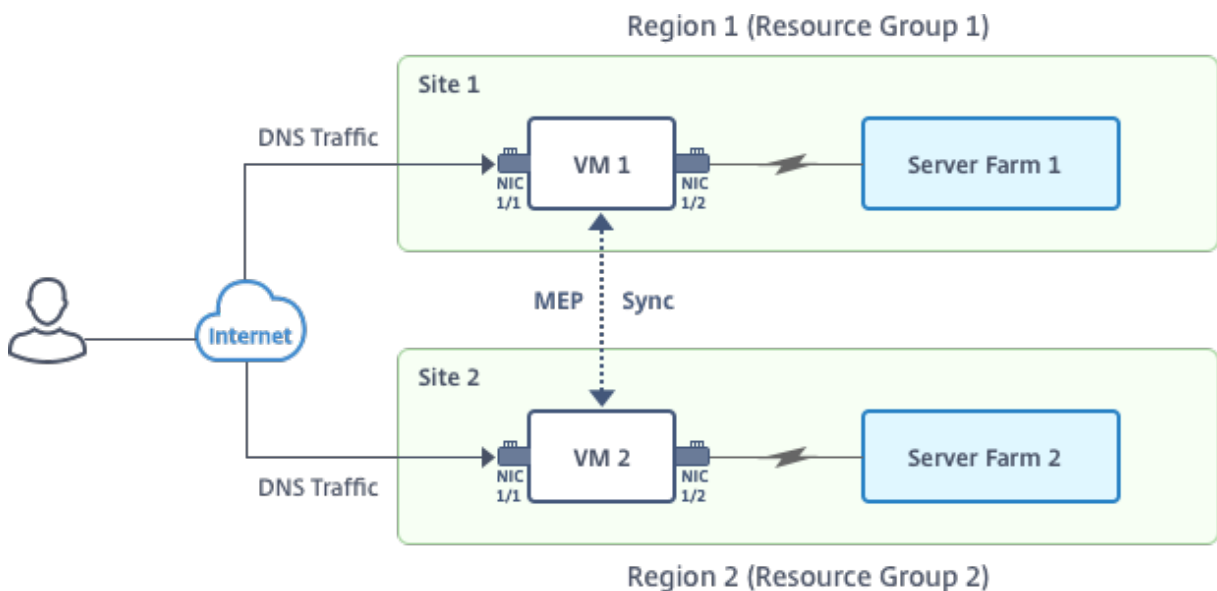

For more information about configuring multiple NICs and IP addresses see:

[Configure multiple IP addresses for a Citrix ADC VPX instance standalone mode by using PowerShell commands](#)

## Scenario

This scenario includes two sites - Site 1 and Site 2. Each site has a VM (VM1 and VM2) configured with multiple NICs, multiple IP addresses, and GSLB.

**Figure.** GSLB setup implemented across two sites - Site 1 and Site 2.

In this scenario, each VM has three NICs - NIC 0/1, 1/1, and 1/2. Each NIC can have multiple private and public IP addresses. The NICs are configured for the following purposes.

- NIC 0/1: to serve management traffic
- NIC 1/1: to serve client-side traffic
- NIC 1/2: to communicate with back-end servers

For information about the IP addresses configured on each NIC in this scenario, see the IP configuration details section.

## Parameters

Following are sample parameters settings for this scenario in this document. You can use different settings if you wish.

\$location="West Central US"

\$vnetName="NSVPX-vnet"

\$RGName="multiIP-RG"

\$prmStorageAccountName="multiipstorageacctnt"

\$avSetName="MultiIP-avset"

\$vmSize="Standard\_DS3\_V2"

**Note:** The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

\$publisher="citrix"

\$offer="netscalervpx111"

\$sku="netscalerbyol"

\$version="latest"

\$vmNamePrefix="MultiIPVPX"

\$nicNamePrefix="MultiipVPX"

\$osDiskSuffix="osdiskdb"

\$numberOfVMs=1

\$ipAddressPrefix="10.0.0."

\$ipAddressPrefix1="10.0.1."

\$ipAddressPrefix2="10.0.2."

\$pubIPName1="MultiIP-pip1"

\$pubIPName2="MultiIP-pip2"

\$IpConfigName1="IPConfig1"

```
$IPConfigName2="IPConfig-2"  
$IPConfigName3="IPConfig-3"  
$IPConfigName4="IPConfig-4"  
$frontendSubnetName="default"  
$backendSubnetName1="subnet_1"  
$backendSubnetName2="subnet_2"  
$suffixNumber=10
```

### **Create a VM**

Follow steps 1-10 to create VM1 with multiple NICs and multiple IP addresses, by using PowerShell commands:

1. Create resource group
2. Create storage account
3. Create availability set
4. Create virtual network
5. Create public IP address
6. Create NICs
7. Create VM config object
8. Get credentials and set OS properties for the VM
9. Add NICs
10. Specify OS disk and create VM

After you complete all the steps and commands to create VM1, repeat these steps to create VM2 with parameters specific to it.

### **Create resource group**

```
1 New-AzureRMResourceGroup -Name $RGName -Location $location  
2 <!--NeedCopy-->
```

### Create storage account

```
1 $prmStorageAccount=New-AzureRMStorageAccount -Name
   $prmStorageAccountName -ResourceGroupName $RGName -Type Standard_LRS
   -Location $location
2 <!--NeedCopy-->
```

### Create availability set

```
1 $avSet=New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName
   $RGName -Location $location
2 <!--NeedCopy-->
```

### Create virtual network

#### 1. Add subnets.

```
1 $subnet1=New-AzureRmVirtualNetworkSubnetConfig -Name
   $frontendSubnetName -AddressPrefix "10.0.0.0/24"
2 $subnet2=New-AzureRmVirtualNetworkSubnetConfig -Name
   $backendSubnetName1 -AddressPrefix "10.0.1.0/24"
3 $subnet3=New-AzureRmVirtualNetworkSubnetConfig -Name
   $backendSubnetName2 -AddressPrefix "10.0.2.0/24"
4 <!--NeedCopy-->
```

#### 2. Add virtual network object.

```
1 $vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
   $RGName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet
   $subnet1, $subnet2, $subnet3
2 <!--NeedCopy-->
```

#### 3. Retrieve subnets.

```
1 $frontendSubnet=$vnet.Subnets|?{
2   $_.Name -eq $frontendSubnetName }
3
4 $backendSubnet1=$vnet.Subnets|?{
5   $_.Name -eq $backendSubnetName1 }
6
7 $backendSubnet2=$vnet.Subnets|?{
8   $_.Name -eq $backendSubnetName2 }
9
```

```
10 <!--NeedCopy-->
```

### Create public IP address

```
1 $pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName
  $RGName -Location $location -AllocationMethod Dynamic
2 $pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName
  $RGName -Location $location -AllocationMethod Dynamic
3 <!--NeedCopy-->
```

### Create NICs

#### Create NIC 0/1

```
1 $nic1Name=$nicNamePrefix + $suffixNumber + "-Mgmt"
2 $ipAddress1=$ipAddressPrefix + $suffixNumber
3 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
  SubnetId $frontendSubnet.Id -PublicIpAddress $pip1 -PrivateIpAddress
  $ipAddress1 -Primary
4 $nic1=New-AzureRMNetworkInterface -Name $nic1Name -ResourceGroupName
  $RGName -Location $location -IpConfiguration $IpConfig1
5 <!--NeedCopy-->
```

#### Create NIC 1/1

```
1 $nic2Name $nicNamePrefix + $suffixNumber + "-frontend"
2 $ipAddress2=$ipAddressPrefix1 + ($suffixNumber)
3 $ipAddress3=$ipAddressPrefix1 + ($suffixNumber + 1)
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -
  PublicIpAddress $pip2 -SubnetId $backendSubnet1.Id -
  PrivateIpAddress $ipAddress2 -Primary
5 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
  SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress3
6 nic2=New-AzureRMNetworkInterface -Name $nic2Name -ResourceGroupName
  $RGName -Location $location -IpConfiguration $IpConfig2, $IpConfig3
7 <!--NeedCopy-->
```

#### Create NIC 1/2

```
1 $nic3Name=$nicNamePrefix + $suffixNumber + "-backend"
2 $ipAddress4=$ipAddressPrefix2 + ($suffixNumber)
3 $IPConfig4=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -
  SubnetId $backendSubnet2.Id -PrivateIpAddress $ipAddress4 -Primary
```

```

4 $nic3=New-AzureRMNetworkInterface -Name $nic3Name -ResourceGroupName
   $RGName -Location $location -IpConfiguration $IpConfig4
5 <!--NeedCopy-->

```

### Create VM config object

```

1 $vmName=$vmNamePrefix
2 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
   AvailabilitySetId $avSet.Id
3 <!--NeedCopy-->

```

### Get credentials and set OS properties

```

1 $cred=Get-Credential -Message "Type the name and password for VPX login
   ."
2 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
   ComputerName $vmName -Credential $cred
3 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
   $publisher -Offer $offer -Skus $sku -Version $version
4 <!--NeedCopy-->

```

### Add NICs

```

1 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -
   Primary
2 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id
3 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id
4 <!--NeedCopy-->

```

### Specify OS disk and create VM

```

1 $osDiskName=$vmName + "-" + $osDiskSuffix
2 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
   + $osDiskName + ".vhd"
3 $vmConfig=Set-AzureRMVMOsdisk -VM $vmConfig -Name $osDiskName -VhdUri
   $osVhdUri -CreateOption fromImage
4 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -
   Name $sku
5 New-AzureRMVM -VM $vmConfig -ResourceGroupName $RGName -Location
   $location

```

6 &lt;!--NeedCopy--&gt;

**Note**

Repeat steps 1-10 listed in “Create Multi-NIC VMs by Using PowerShell Commands” to create VM2 with parameters specific to VM2.

**IP configuration details**

The following IP addresses are used.

**Table 1.** IP addresses used in VM1

NIC	Private IP	Public IP (PIP)	Description
0/1	10.0.0.10	PIP1	Configured as NSIP (management IP)
1/1	10.0.1.10	PIP2	Configured as SNIP/GSLB Site IP
-	10.0.1.11	-	Configured as LB server IP
Public IP is not mandatory			
1/2	10.0.2.10	-	Configured as SNIP for sending monitor probes to services; public IP is not mandatory

**Table 2.** IP addresses used in VM2

NIC	Internal IP	Public IP (PIP)	Description
0/1	20.0.0.10	PIP4	Configured as NSIP (management IP)
1/1	20.0.1.10	PIP5	Configured as SNIP/GSLB Site IP
-	20.0.1.11	-	Configured as LB server IP

NIC	Internal IP	Public IP (PIP)	Description
Public IP is not mandatory			
1/2	20.0.2.10	-	Configured as SNIP for sending monitor probes to services; public IP is not mandatory

Here are sample configurations for this scenario, showing the IP addresses and initial LB configurations as created through the Citrix ADC VPX CLI for VM1 and VM2.

Here's an example configuration on VM1.

```

1 add ns ip 10.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2 Add nsip 10.0.2.10 255.255.255.0
3 add service svc1 10.0.1.10 ADNS 53
4 add lb vserver v1 HTTP 10.0.1.11 80
5 add service s1 10.0.2.120 http 80
6 Add service s2 10.0.2.121 http 80
7 Bind lb vs v1 s[1-2]
8 <!--NeedCopy-->

```

Here's an example configuration on VM2.

```

1 add ns ip 20.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2 Add nsip 20.0.2.10 255.255.255.0
3 add service svc1 20.0.1.10 ADNS 53
4 add lb vserver v1 HTTP 20.0.1.11 80
5 Add service s1 20.0.2.90 http 80
6 Add service s2 20.0.2.91 http 80
7 Bind lb vs v1 s[1-2]
8 <!--NeedCopy-->

```

## Configure GSLB sites and other settings

Perform the tasks described in the following topic to configure the two GSLB sites and other necessary settings:

[Global Server Load Balancing](#)

For more information, see this support article:

<https://support.citrix.com/article/CTX110348>

Here's an example GSLB configuration on VM1 and VM2.

```
1 enable ns feature LB GSLB
2 add gslb site site1 10.0.1.10 -publicIP PIP2
3 add gslb site site2 20.0.1.10 -publicIP PIP5
4 add gslb service site1_gslb_http_svc1 10.0.1.11 HTTP 80 -publicIP PIP3
  -publicPort 80 -siteName site1
5 add gslb service site2_gslb_http_svc1 20.0.1.11 HTTP 80 -publicIP PIP6
  -publicPort 80 -siteName site2
6 add gslb vserver gslb_http_vip1 HTTP
7 bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
8 bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
9 bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
10 <!--NeedCopy-->
```

You've configured GSLB on Citrix ADC VPX instances running on Azure.

For additional information about how to configure GSLB on Citrix ADC VPX instances, click the following image to watch the video about Configuring Citrix ADC GSLB in Microsoft Azure.

## Configure GSLB on an active-standby high-availability setup

September 21, 2020

You can configure global server load balancing (GSLB) on active-standby HA deployment on Azure in three steps:

1. Create a VPX HA pair on each GSLB site. See [Configure a high-availability setup with multiple IP addresses and NICs](#) for information about how to create an HA pair.
2. Configure the Azure Load Balancer (ALB) with the front-end IP address and rules to allow GSLB and DNS traffic.

This step involves the following substeps. See the scenario in this section for the PowerShell commands used to complete these substeps.

```

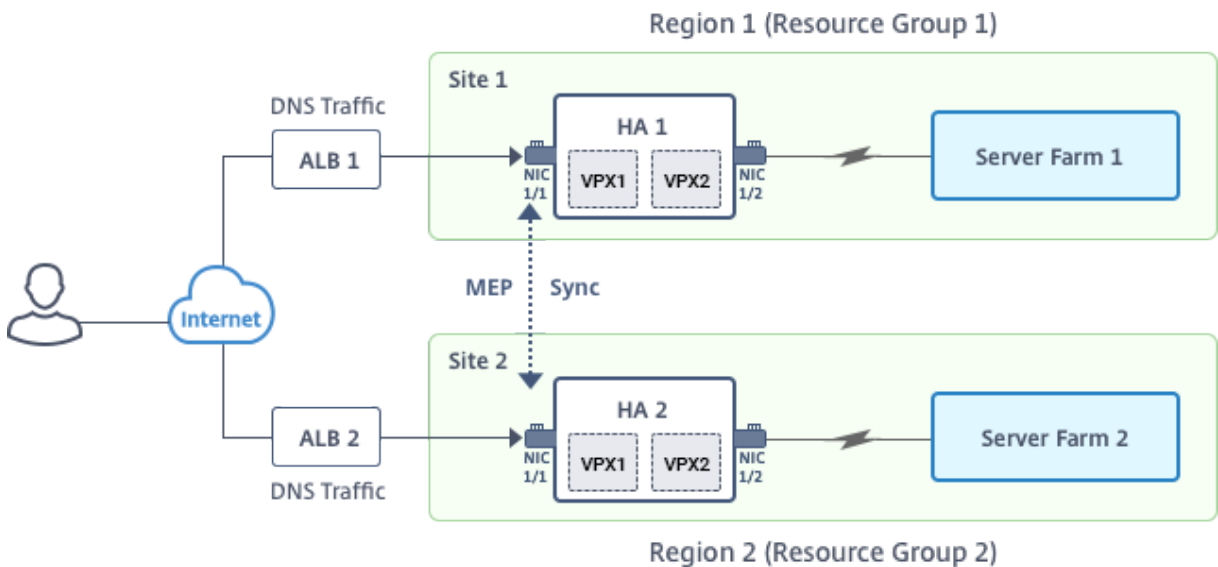

1 a. Create a front-end IPconfig for GSLB site.
2
3 b. Create back-end address pool with IP address of NIC 1/1 of nodes in
  HA.
4
5 c. Create load-balancing rules for following:
6
7     TCP/3011 - gslb communication
8     TCP/3010 - gslb communication
9     UDP/53 - DNS communication
10
11 d. Associate back-end address pool with the LB rules created in step c.
12
13 e. Update the network security group (NSG) of NIC 1/1 of nodes in both
    the HA pair to allow the traffic for TCP 3010, TCP 3011 and UDP 53
    ports.
  
```

1. Enable GSLB on each HA pair.

**Scenario**

This scenario includes two sites - Site 1 and Site 2. Each site has an HA pair (HA1 and HA2) configured with multiple NICs, multiple IP addresses, and GSLB.

**Figure:** GLSB on Active-Standy HA Deployment on Azure

In this scenario, each VM has three NICs - NIC 0/1, 1/1, and 1/2. The NICs are configured for the following purposes.

NIC 0/1: to serve management traffic

NIC 1/1: to serve client-side traffic

NIC 1/2: to communicate with back-end servers

## Parameter Settings

Following are sample parameters settings for the ALB. You can use different settings if you want.

\$locName="South east Asia"

\$rgName="MulitIP-MultiNIC-RG"

\$pubIPName4="PIPFORGSLB1"

\$domName4="vpxgslbdns"

\$lbName="MultiIPALB"

\$frontEndConfigName2="FrontEndIP2"

\$backendPoolName1="BackendPoolHttp"

\$lbRuleName2="LBRuleGSLB1"

\$lbRuleName3="LBRuleGSLB2"

\$lbRuleName4="LBRuleDNS"

\$healthProbeName="HealthProbe"

## Configure ALB with the front-end IP address and rules to allow GSLB and DNS traffic

### Step 1. Create a public IP for GSLB site IP

```
1 $pip4=New-AzureRmPublicIpAddress -Name $pubIPName4 -ResourceGroupName
   $rgName -DomainNameLabel $domName4 -Location $locName -
   AllocationMethod Dynamic
2
3
4 Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName | Add-
   AzureRmLoadBalancerFrontendIpConfig -Name $frontEndConfigName2 -
   PublicIpAddress $pip4 | Set-AzureRmLoadBalancer
```

### Step 2. Create LB rules and update the existing ALB.

```
1 $alb = get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
2
3
4 $frontendipconfig2=Get-AzureRmLoadBalancerFrontendIpConfig -
   LoadBalancer $alb -Name $frontEndConfigName2
```

```
5
6
7 $backendPool=Get-AzureRmLoadBalancerBackendAddressPoolConfig -
  LoadBalancer $alb -Name $backendPoolName1
8
9
10 $healthprobe=Get-AzureRmLoadBalancerProbeConfig -LoadBalancer $alb -
  Name $healthProbeName
11
12
13 $alb | Add-AzureRmLoadBalancerRuleConfig -Name $lbRuleName2 -
  BackendAddressPool $backendPool -FrontendIPConfiguration
  $frontendipconfig2 -Protocol "Tcp" -FrontendPort 3011 -BackendPort
  3011 -Probe $healthprobe -EnableFloatingIP | Set-
  AzureRmLoadBalancer
14
15
16 $alb | Add-AzureRmLoadBalancerRuleConfig -Name $lbRuleName3 -
  BackendAddressPool $backendPool -FrontendIPConfiguration
  $frontendipconfig2 -Protocol "Tcp" -FrontendPort 3010 -BackendPort
  3010 -Probe $healthprobe -EnableFloatingIP | Set-
  AzureRmLoadBalancer
17
18
19 $alb | Add-AzureRmLoadBalancerRuleConfig -Name $lbRuleName4 -
  BackendAddressPool $backendPool -FrontendIPConfiguration
  $frontendipconfig2 -Protocol "Udp" -FrontendPort 53 -BackendPort 53
  -Probe $healthprobe -EnableFloatingIP | Set-AzureRmLoadBalancer
```

### Enable GSLB on each high availability pair

Now you've two front-end IP addresses for each ALB: ALB 1 and ALB 2. One IP address is for the LB virtual server and the other for the GSLB site IP.

HA 1 has the following front-end IP addresses:

- FrontEndIPofALB1 (for LB virtual server)
- PIPFORGSLB1 (GSLB IP)

HA 2 has the following front-end IP addresses:

- FrontEndIPofALB2 (for LB virtual server)
- PIPFORGSLB2 (GSLB IP)

The following commands are used for this scenario.

```
1 enable ns feature LB GSLB
2
3
4 add service dnssvc PIPFORGSLB1 ADNS 53
5
6
7 add gslb site site1 PIPFORGSLB1 -publicIP PIPFORGSLB1
8
9
10 add gslb site site2 PIPFORGSLB2 -publicIP PIPFORGSLB2
11
12
13 add gslb service site1_gslb_http_svc1 FrontEndIPofALB1 HTTP 80 -
    publicIP FrontEndIPofALB1 -publicPort 80 -siteName site1
14
15
16 add gslb service site2_gslb_http_svc1 FrontEndIPofALB2 HTTP 80 -
    publicIP FrontEndIPofALB2 -publicPort 80 -siteName site2
17
18
19 add gslb vserver gslb_http_vip1 HTTP
20
21
22 bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
23
24
25 bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
26
27
28 bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
```

[Global Server Load Balancing](#)

## Configure address pools (IIP) for a Citrix Gateway appliance

September 21, 2020

In some situations, users who connect with the Citrix Gateway Plug-in need a unique IP address for a Citrix ADC Gateway appliance. When you enable address pools (also known as IP pooling) for a group,

the Citrix Gateway appliance can assign a unique IP address alias to each user. You configure address pools by using intranet IP (IIP) addresses.

You can configure address pools on a Citrix Gateway appliance deployed on Azure by following this 2-step procedure:

- Registering the private IP addresses that will be used in the address pool, in Azure
- Configuring address pools in the Citrix Gateway appliance

### **Register a private IP address in the Azure portal**

In Azure, you can deploy a Citrix ADC VPX instance with multiple IP addresses. You can add IP addresses to a VPX instance in two ways:

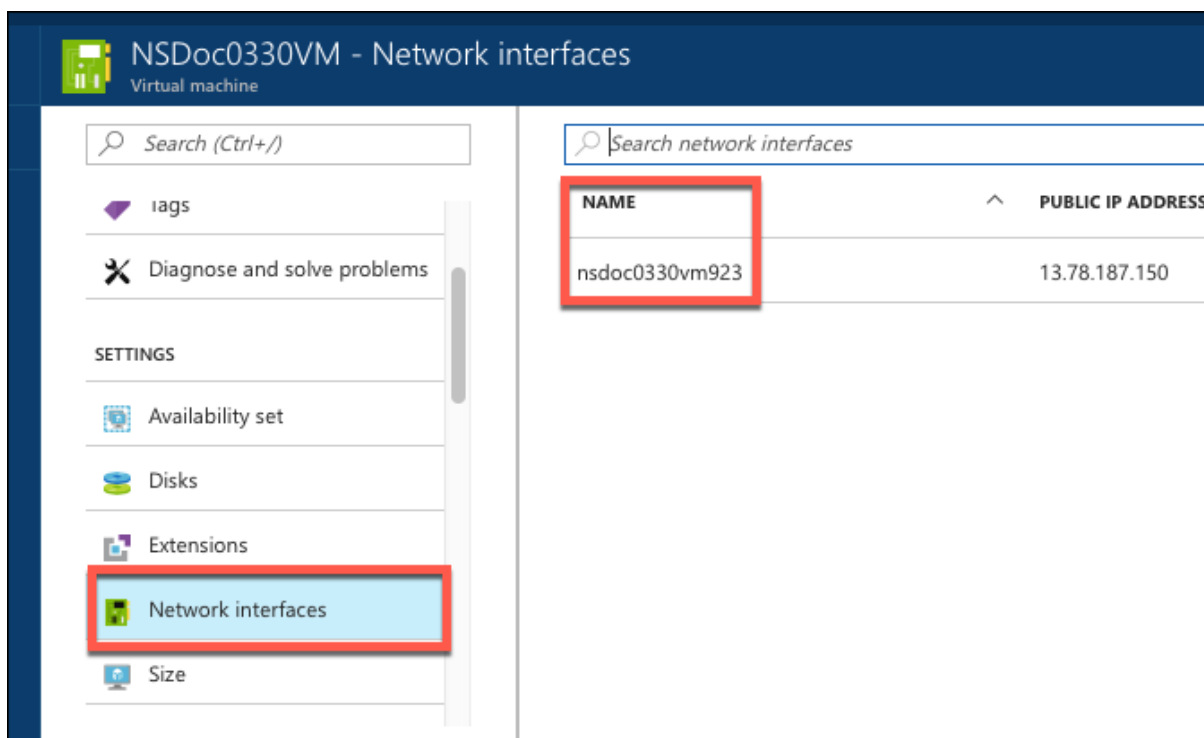

a. While provisioning a VPX instance

For more information about how to add multiple IP addresses while provisioning a VPX instance, see [Configure multiple IP addresses for a Citrix ADC standalone instance](#). To add IP addresses by using PowerShell commands while provisioning a VPX instance, see [Configure multiple IP addresses for a Citrix ADC VPX instance in standalone mode by using PowerShell commands](#).

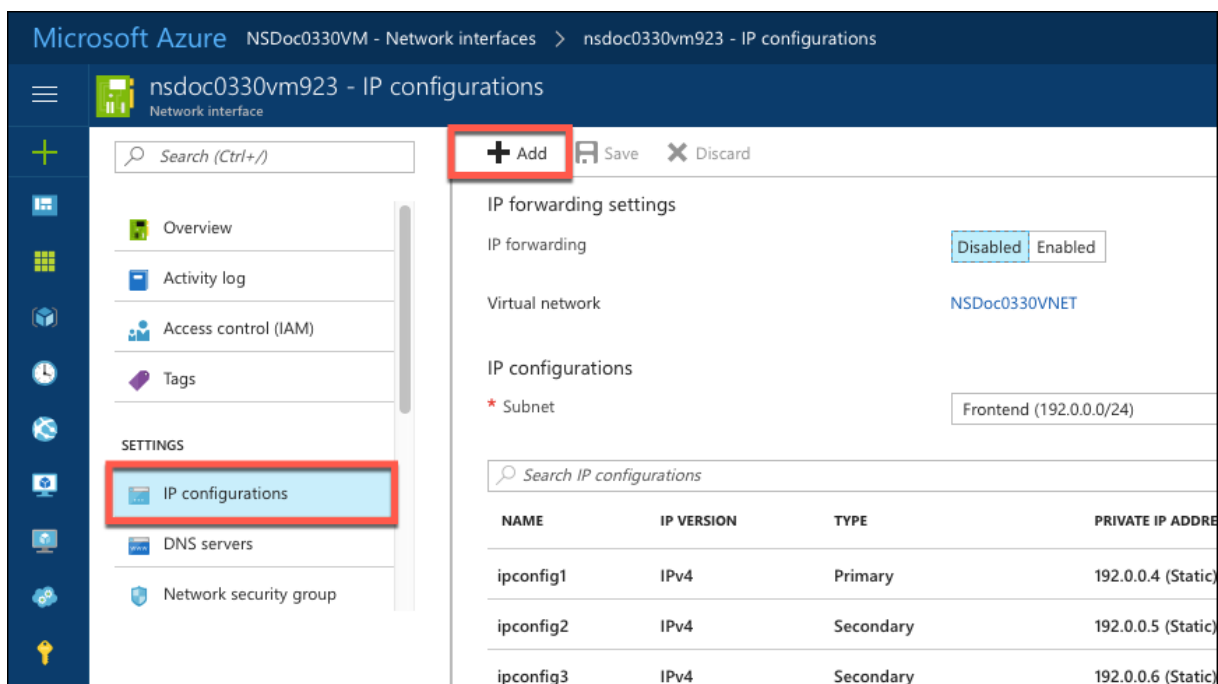

b. After provisioning a VPX instance

After you've provisioned a VPX instance, follow these steps to register a private IP address in the Azure portal, which you configure as an address pool in the Citrix Gateway appliance.

1. From Azure Resource Manager (ARM), go to the already created Citrix ADC VPX instance > **Network interfaces**. Choose the network interface which is bound to a subnet to which the IIP that you want to register belongs.

2. Click **IP Configurations**, and then click **Add**.

3. Provide the required details as shown in the example below and click **OK**.

**Add IP configuration**  
nsdoc0330vm923

\* Name  
PrivateIP5 ✓

Type  
Primary Secondary

**i** Primary IP configuration already exists

Private IP address settings

Allocation  
Dynamic Static

\* IP address  
192.0.0.8 ✓

Public IP address  
Disabled Enabled

OK

## Configure address pools in the Citrix Gateway appliance

For more information about how to configure address pools on the Citrix Gateway, see this [Configuring Address Pools](#).

**Limitation:** You can not bind a range of IIP addresses to users. Every IIP address that is used in an address pool should be registered.

## Configure multiple IP addresses for a Citrix ADC VPX standalone instance by using PowerShell commands

September 2, 2021

In an Azure environment, a Citrix ADC VPX virtual appliance can be deployed with multiple NICs. Each NIC can have multiple IP addresses. This section describes how to deploy a Citrix ADC VPX instance with a single NIC and multiple IP addresses, by using PowerShell commands. You can use the same script for multi-NIC and multi-IP deployment.

**Note**

In this document, IP-Config refers to a pair of IP addresses, public IP and private IP, that is associated with an individual NIC. For more information, see the [Azure terminology](#) section.

**Use case**

In this use case, a single NIC is connected to a virtual network (VNET). The NIC is associated with three IP configurations, as shown in the following table.

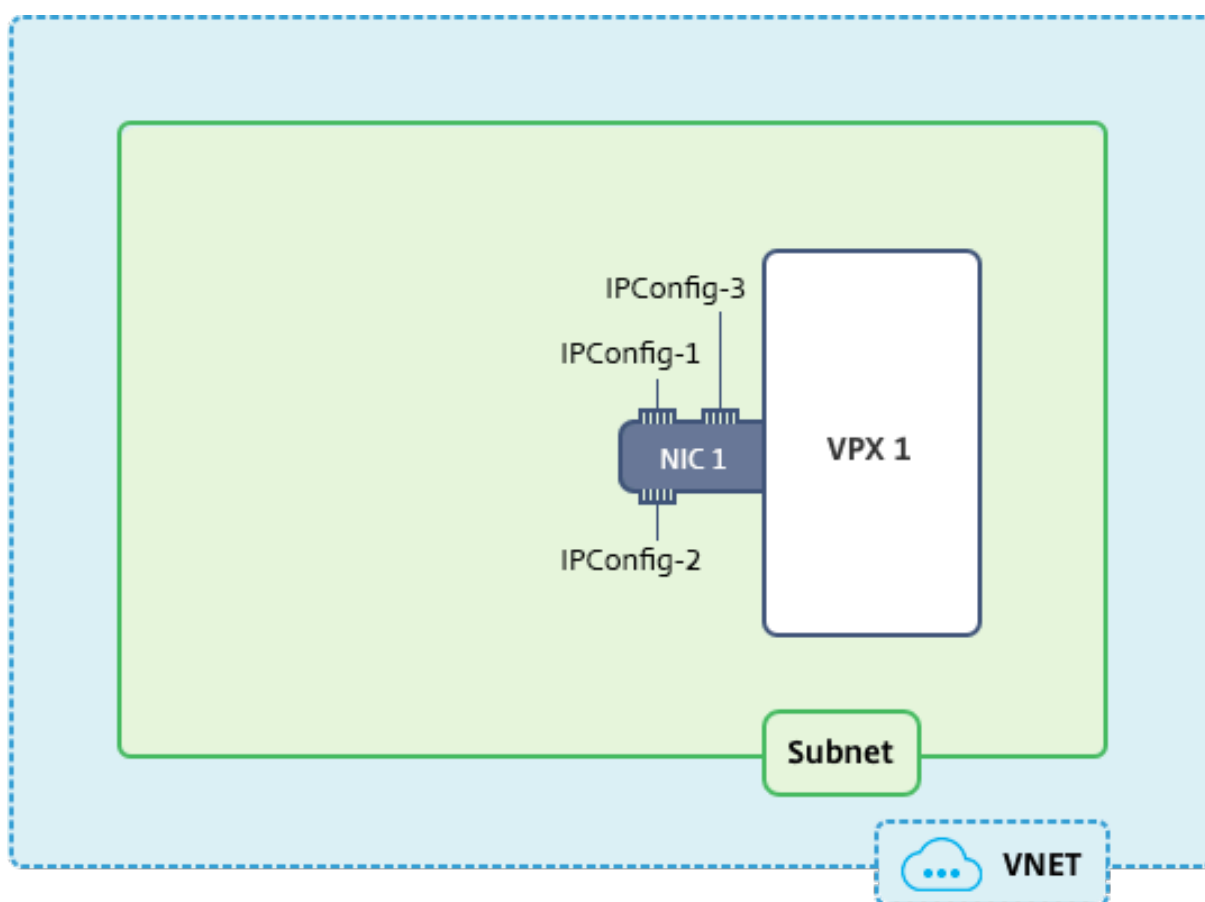

IPConfig	Associated with
IPConfig-1	Static public IP address; static private IP address
IPConfig-2	Static public IP address; static private address
IPConfig-3	Static private IP address

**Note**

IPConfig-3 is not associated with any public IP address.

**Diagram:** Topology

Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure Citrix ADC VPX deployment, the private IP address associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP address of the appliance. The remaining private IP addresses associated with IPConfigs must be added in the VPX instance as VIPs or SNIPs by using the “add ns ip” command, as determined by your requirements.

Here is the summary of the steps required for configuring multiple IP addresses for a Citrix ADC VPX virtual appliance in standalone mode:

1. Create Resource Group
2. Create Storage Account
3. Create Availability Set
4. Create NSG
5. Create Virtual Network
6. Create Public IP Address
7. Assign IP Configuration
8. Create NIC
9. Create Citrix ADC VPX Instance

10. Check NIC Configurations
11. Check VPX-side Configurations

## Script

### Parameters

Following are sample parameters settings for the use case in this document. You can use different settings if you wish.

`$locName="westcentralus"`

`$rgName="Azure-MultiIP"`

`$nicName1="VM1-NIC1"`

`$vNetName="Azure-MultiIP-vnet"`

`$vNetAddressRange="11.6.0.0/16"`

`$frontEndSubnetName="frontEndSubnet"`

`$frontEndSubnetRange="11.6.1.0/24"`

`$prmStorageAccountName="multiipstorage"`

`$avSetName="multiip-avSet"`

`$vmSize="Standard_DS4_V2"` (This parameter creates a VM with upto four NICs.)

**Note:** The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

`$publisher="citrix"`

`$offer="netscalervpx110-6531"` (You can use different offers.)

`$sku="netscalerbyol"` (According to your offer, the SKU can be different.)

`$version="latest"`

`$pubIPName1="PIP1"`

`$pubIPName2="PIP2"`

`$domName1="multiipvpx1"`

`$domName2="multiipvpx2"`

`$vmNamePrefix="VPXMultiIP"`

`$osDiskSuffix="osmultiipalbdiskdb1"`

### Network Security Group (NSG)-related information:

`$nsgName="NSG-MultiIP"`

```
$rule1Name="Inbound-HTTP"
```

```
$rule2Name="Inbound-HTTPS"
```

```
$rule3Name="Inbound-SSH"
```

```
$IpConfigName1="IPConfig1"
```

```
$IPConfigName2="IPConfig-2"
```

```
$IPConfigName3="IPConfig-3"
```

### 1. Create Resource Group

```
1 New-AzureRmResourceGroup -Name $rgName -Location $locName
```

### 2. Create Storage Account

```
1 $prmStorageAccount = New-AzureRMStorageAccount -Name  
    $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS  
    -Location $locName
```

### 3. Create Availability Set

```
1 $avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName  
    $rgName -Location $locName
```

### 4. Create Network Security Group (NSG)

1. Add rules. You must add a rule to the NSG for any port that serves traffic.

```
1 $rule1=New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -  
    Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction  
    Inbound -Priority 101 -SourceAddressPrefix Internet -  
    SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange  
    80  
2 $rule2=New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -  
    Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction  
    Inbound -Priority 110 -SourceAddressPrefix Internet -  
    SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange  
    443
```

```
3 $rule3=New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name -
  Description "Allow SSH" -Access Allow -Protocol Tcp -Direction
  Inbound -Priority 120 -SourceAddressPrefix Internet -SourcePortRange
  * -DestinationAddressPrefix * -DestinationPortRange 22
```

## 2. Create NSG object.

```
1 $nsg=New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -
  Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

## 5. Create Virtual Network

### 1. Add subnets.

```
1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  $frontEndSubnetName -AddressPrefix $frontEndSubnetRange
```

### 2. Add virtual network object.

```
1 $vnet=New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName
  $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet
  $frontendSubnet
```

### 3. Retrieve subnets.

```
1 $subnetName="frontEndSubnet"
2 $subnet1=$vnet.Subnets|?{
3   $_.Name -eq $subnetName }
```

## 6. Create Public IP Address

```
1 $pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName
  $rgName -DomainNameLabel $domName1 -Location $locName -
  AllocationMethod Static
2 $pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName
  $rgName -DomainNameLabel $domName2 -Location $locName -
  AllocationMethod Static
```

### Note

Check availability of domain names before using.

Allocation method for IP addresses can be dynamic or static.

## 7. Assign IP Configuration

In this use case, consider the following points before assigning IP addresses:

- IPConfig-1 belongs to subnet1 of VPX1.
- IPConfig-2 belongs to subnet 1 of VPX1.
- IPConfig-3 belongs to subnet 1 of VPX1.

### Note

When you assign multiple IP configurations to a NIC, one configuration must be assigned as primary.

```

1 $IPAddress1="11.6.1.27"
2 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress1 -PublicIpAddress $pip1
    - Primary
3 $IPAddress2="11.6.1.28"
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress2 -PublicIpAddress $pip2
5 $IPAddress3="11.6.1.29"
6 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -
    Subnet $subnet1 -PrivateIpAddress $IPAddress3 -Primary

```

Use a valid IP address that meets your subnet requirements and check its availability.

## 8. Create NIC

```

1 $nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName
    $rgName -Location $locName -IpConfiguration $IpConfig1,$IpConfig2,
    $IpConfig3 -NetworkSecurityGroupId $nsg.Id

```

## 9. Create Citrix ADC VPX Instance

1. Initialize variables.

```

1 $suffixNumber = 1
2 $vmName = $vmNamePrefix + $suffixNumber

```

2. Create VM config object.

```

1 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avSet.Id

```

3. Set credentials, OS, and image.

```

1 $cred=Get-Credential -Message "Type the name and password for VPX login
  ."
2 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
  ComputerName $vmName -Credential $cred
3 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName
  $publisher -Offer $offer -Skus $sku -Version $version

```

#### 4. Add NIC.

```

1 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -
  Primary

```

#### Note

In a multi-NIC VPX deployment, one NIC should be primary. So, “-Primary” needs to be appended while adding that NIC to the VPX instance.

#### 5. Specify OS disk and create VM.

```

1 $osDiskName=$vmName + "-" + $osDiskSuffix1
2 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
  + $osDiskName + ".vhd"
3 $vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri
  $osVhdUri -CreateOption fromImage
4 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -
  Name $sku
5 New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location
  $locName

```

## 10. Check NIC Configurations

After the VPX instance starts, you can check the IP addresses allocated to IPConfigs of the VPX NIC by using the following command.

```

1 $nic.IPConfig

```

## 11. Check VPX-side Configurations

When the Citrix ADC VPX instance starts, a private IP address associated with primary IPconfig of the primary NIC is added as the NSIP address. The remaining private IP addresses must be added as VIP or SNIP addresses, as determined by your requirements. Use the following command.

```

1 add nsip <Private IPAddress><netmask> -type VIP/SNIP

```

You've now configured multiple IP addresses for a Citrix ADC VPX instance in standalone mode.

## Additional PowerShell scripts for Azure deployment

September 21, 2020

This section provides the PowerShell cmdlets with which you can perform the following configurations in Azure PowerShell:

- Provision a Citrix ADC VPX standalone instance
- Provision a Citrix ADC VPX pair in a high availability setup with an Azure external load balancer
- Provision a Citrix ADC VPX pair in a high availability setup with Azure internal load balancer

Also see the following topics for configurations that you can perform by using PowerShell commands:

- [Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands](#)
- [Configure GSLB on Citrix ADC VPX instances](#)
- [Configure GSLB on a NetScaler active-standby high-availability setup](#)
- [Configure multiple IP addresses for a Citrix ADC VPX instance in standalone mode by using PowerShell commands](#)
- [Configure multiple Azure VIPs for a standalone VPX instance](#)

### Provision a Citrix ADC VPX standalone instance

#### 1. Create a resource group

The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

`$rgName="<resource group name>"`

`$locName="<location name, such as West US>"`

`New-AzureRmResourceGroup -Name $rgName -Location $locName`

*For example:*

```
1 $rgName = "ARM-VPX"
2
3 $locName = "West US"
4
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
6 <!--NeedCopy-->
```

## 2. Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

`$saName="<storage account name>"`

`$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"`

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType  
-Location $locName
```

*For example:*

```
1 $saName="vpxstorage"  
2  
3 $saType="Standard\_LRS"  
4  
5 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -  
  Type $saType -Location $locName  
6 <!--NeedCopy-->
```

## 3. Create an availability set

Availability set helps to keep your virtual machines available during downtime, such as during maintenance. A load balancer configured with an availability set ensures that your application is always available.

`$avName="<availability set name>"`

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

## 4. Create a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

`$FrontendAddressPrefix="10.0.1.0/24"`

`$BackendAddressPrefix="10.0.2.0/24"`

`$vnetAddressPrefix="10.0.0.0/16"`

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix  
$FrontendAddressPrefix
```

```
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $Back-  
endAddressPrefix
```

```
New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -  
AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

*For example:*

```

1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
   frontendSubnet -AddressPrefix $FrontendAddressPrefix
2
3 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
   backendSubnet -AddressPrefix $BackendAddressPrefix
4
5 New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -
   Location $locName -AddressPrefix $vnetAddressPrefix -Subnet
   $frontendSubnet,$backendSubnet
6 <!--NeedCopy-->

```

## 5. Create a NIC

Create a NIC and associate the NIC with the Citrix ADC VPX instance. The front end Subnet created in the above procedure is indexed at 0 and the back end Subnet is indexed at 1. Now create NIC in one of the three following ways:

### a) NIC with Public IP address

\$nicName="<name of the NIC of the VM>"

\$pip = New-AzureRmPublicIpAddress -Name \$nicName -ResourceGroupName \$rgName -Location \$locName -AllocationMethod Dynamic

\$nic = New-AzureRmNetworkInterface -Name \$nicName -ResourceGroupName \$rgName -Location \$locName -SubnetId \$vnet.Subnets[\$subnetIndex].Id -PublicIpAddressId \$pip.Id

### b) NIC with Public IP and DNS label

\$nicName="<name of the NIC of the VM>"

\$domName="<domain name label>"

\$pip = New-AzureRmPublicIpAddress -Name \$nicName -ResourceGroupName \$rgName -DomainNameLabel \$domName -Location \$locName -AllocationMethod Dynamic

Before assigning \$domName, check it is available or not by using command:

Test-AzureRmDnsAvailability -DomainQualifiedName \$domName -Location \$locName

\$nic = New-AzureRmNetworkInterface -Name \$nicName -ResourceGroupName \$rgName -Location \$locName -SubnetId \$vnet.Subnets[\$subnetIndex].Id -PublicIpAddressId \$pip.Id

For example:

```

1 $nicName="frontendNIC"
2
3 $domName="vpxazure"
4

```

```

5 $pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName
    $rgName -DomainNameLabel $domName -Location $locName -
    AllocationMethod Dynamic
6
7 $nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName
    $rgName -Location $locName -SubnetId $vnet.Subnets\[0\].Id -
    PublicIpAddressId $pip.Id
8 <!--NeedCopy-->

```

### c) NIC with Dynamic Public Address and Static Private IP address

Make sure that the private (static) IP address you add to the VM should be the same range as that of the subnet specified.

\$nicName="<name of the NIC of the VM>"

\$staticIP="<available static IP address on the subnet>"

```
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location
$locName -AllocationMethod Dynamic
```

```
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location
$locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id -PrivateIpAddress
$staticIP
```

### 6. Create a virtual object

\$vmName="<VM name>"

\$vmSize="<VM size string>"

```
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
```

```
$vm=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
```

### 7. Get the Citrix ADC VPX image

\$pubName="<Image publisher name>"

\$offerName="<Image offer name>"

\$skuName="<Image SKU name>"

```
$cred=Get-Credential -Message "Type the name and password of the local administrator account."
```

Provide your credentials that is used to login into VPX

```
$vm=Set-AzureRmVMOperatingSystem -VM $vm -Linux -ComputerName $vmName -Credential $cred
-Verbose
```

```
$vm=Set-AzureRmVMSourceImage -VM $vm -PublisherName $pubName -Offer $offerName -Skus
$skuName -Version "latest"
```

```
$vm=Add-AzureRmVMNetworkInterface -VM $vm -Id $nic.Id
```

*For example:*

```
1 $pubName="citrix"  
2 <!--NeedCopy-->
```

The following command is used for displaying all offers from Citrix:

```
1 Get-AzureRMVMImageOffer -Location $locName -Publisher $pubName | Select  
   Offer  
2  
3 $offerName="netscalervpx110-6531"  
4 <!--NeedCopy-->
```

The following command is used to know sku offered by publisher for specific offer name:

```
Get-AzureRMVMImageSku -Location $locName   Select Skus  
-Publisher $pubName -Offer $offerName
```

## 8. Create a virtual machine

\$diskName=""<name identifier for the disk in Azure storage, such as OSDisk>"

*For example:*

```
1 $diskName="dynamic"  
2  
3 $pubName="citrix"  
4  
5 $offerName="netscalervpx110-6531"  
6  
7 $skuName="netscalerbyol"  
8  
9 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name  
   $saName  
10  
11 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds/" +  
   $diskName + ".vhd"  
12  
13 $vm=Set-AzureRmVMOSDisk -VM $vm -Name $diskName -VhdUri $osDiskUri -  
   CreateOption fromImage  
14 <!--NeedCopy-->
```

When you create VM from Images present in marketplace, use the following command to specify the

VM plan:

```
Set-AzureRmVMPlan -VM $vm -Publisher $pubName -Product $offerName -Name $skuName
```

```
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm
```

## Provision a Citrix ADC VPX pair in a high availability setup with an Azure external load balancer

Log on to AzureRmAccount using your Azure user credentials.

### 1) Create a resource group

The location specified here is the default location for resources in that resource group. Make sure that all commands used to create a load balancer use the same resource group.

```
$rgName="<resource group name>"
```

```
$locName="<location name, such as West US>"
```

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

*For example:*

```
1 $rgName = "ARM-LB-NS"
2
3 $locName = "West US"
4
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
6 <!--NeedCopy-->
```

### 2) Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="<storage account name>"
```

```
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
```

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType
-Location $locName
```

*For example:*

```
1 $saName="vpxstorage"
2
3 $saType="Standard\_LRS"
4
```

```

5 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -
  Type $saType -Location $locName
6 <!--NeedCopy-->

```

### 3) Create an availability set

A load balancer configured with an availability set ensures that your application is always available.

\$avName="<availability set name>"

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

### 4) Create a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```

1 $vnetName = "LBVnet"
2
3 $FrontendAddressPrefix="10.0.1.0/24"
4
5 $BackendAddressPrefix="10.0.2.0/24"
6
7 $vnetAddressPrefix="10.0.0.0/16"
8
9 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  frontendSubnet -AddressPrefix $FrontendAddressPrefix
10
11 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  backendSubnet -AddressPrefix $BackendAddressPrefix
12
13 $vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
  $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet
  $frontendSubnet,$backendSubnet
14 <!--NeedCopy-->

```

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be \$vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId should be \$vnet.Subnets[1].Id, and so on..

### 5) Configure front end IP address and create back end address pool

Configure a front end IP address for the incoming load balancer network traffic and create a back end address pool to receive the load balanced traffic.

```
1 $pubName="PublicIp1"
2
3 $publicIP1 = New-AzureRmPublicIpAddress -Name $pubName -
    ResourceGroupName $rgName -Location $locName -AllocationMethod
    Static -DomainNameLabel nsvpx
4 <!--NeedCopy-->
```

**Note:** Check for the availability of the value for DomainNameLabel.

```
1 $FIPName = "ELBFIP"
2
3 $frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName -
    PublicIpAddress $publicIP1
4
5 $BEPool = "LB-backend-Pool"
6
7 $beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name
    $BEPool
8
9 <!--NeedCopy-->
```

#### 8) Create a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```
1 $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -
    Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
2 <!--NeedCopy-->
```

#### 9) Create a load balancing rule

Create a LB rule for each service that you are load balancing.

*For example:*

You can use the following example to load balance http service.

```
1 $lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP-LB" -
    FrontendIpConfiguration $frontendIP1 -BackendAddressPool
    $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -
    BackendPort 80
2 <!--NeedCopy-->
```

#### 10) Create inbound NAT rules

Create NAT rules for services that you are not load balancing.

For example, when creating a SSH access to a Citrix ADC VPX instance.

**Note:** Protocol-FrontEndPort-BackendPort triplet should not be the same for two NAT rules.

```

1 $inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name
   SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -
   FrontendPort 22 -BackendPort 22
2
3 $inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name
   SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -
   FrontendPort 10022 -BackendPort 22
4 <!--NeedCopy-->

```

### 11) Create a load balancer entity

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```

1 $lbName="ELB"
2
3 $NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name
   $lbName -Location $locName -InboundNatRule $inboundNATRule1,
   $inboundNATRule2 -FrontendIpConfiguration $frontendIP1 -
   LoadBalancingRule $lbrule1 -BackendAddressPool $beAddressPool1 -
   Probe $healthProbe
4 <!--NeedCopy-->

```

### 12) Create a NIC

Create two NICs and associate each NIC with each VPX instance

a) NIC1 with VPX1

*For example:*

```

1 $nicName="NIC1"
2
3 $lbName="ELB"
4
5 $bePoolIndex=0
6
7 \* Rule indexes starts from 0.
8
9 $natRuleIndex=0
10
11 $subnetIndex=0
12
13 \* Frontend subnet index

```

```

14
15 $lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
16
17 $nic1=New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName
    $rgName -Location $locName -Subnet $vnet.Subnets\[ $subnetIndex\] -
    LoadBalancerBackendAddressPool $lb.BackendAddressPools\[ $bePoolIndex
    \] -LoadBalancerInboundNatRule $lb.InboundNatRules\[ $natRuleIndex\]
18 <!--NeedCopy-->

```

#### b) NIC2 with VPX2

For example:

```

1 $nicName="NIC2"
2
3 $lbName="ELB"
4
5 $bePoolIndex=0
6
7 $natRuleIndex=1
8 <!--NeedCopy-->

```

\* Second Inbound NAT (SSH) rule we need to use

\$subnetIndex=0

\* Frontend subnet index

```

1 $lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
2
3 $nic2=New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName
    $rgName -Location $locName -Subnet $vnet.Subnets\[ $subnetIndex\] -
    LoadBalancerBackendAddressPool $lb.BackendAddressPools\[ $bePoolIndex
    \] -LoadBalancerInboundNatRule $lb.InboundNatRules\[ $natRuleIndex\]
4 <!--NeedCopy-->

```

### 13) Create Citrix ADC VPX instances

Create two Citrix ADC VPX instances as part of the same resource group and availability set, and attach it to the external load balancer.

#### a) Citrix ADC VPX instance 1

For example:

```

1 $vmName="VPX1"
2
3 $vmSize="Standard\_A3"

```

```
4
5 $pubName="citrix"
6
7 $offerName="netscalervpx110-6531"
8
9 $skuName="netscalerbyol"
10
11 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
    $rgName
12
13 $vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avset.Id
14
15 $cred=Get-Credential -Message "Type Credentials which will be used to
    login to VPX instance"
16
17 $vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName
    -Credential $cred -Verbose
18
19 $vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer
    $offerName -Skus $skuName -Version "latest"
20
21 $vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
22
23 $diskName="dynamic"
24
25 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name
    $saName
26
27 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" +
    $diskName + ".vhd"
28
29 $vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri -
    CreateOption fromImage
30
31 Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -
    Name $skuName
32
33 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
34 <!--NeedCopy-->
```

b) Citrix ADC VPX instance 2

*For example:*

```
1 $vmName="VPX2"
2
3 $vmSize="Standard\_A3"
4
5 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
   $rgName
6
7 $vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
   AvailabilitySetId $avset.Id
8
9 $cred=Get-Credential -Message " Type Credentials which will be used to
   login to VPX instance "
10
11 $vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName
   -Credential $cred -Verbose
12
13 $vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer
   $offerName -Skus $skuName -Version "latest"
14
15 $vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
16
17 $diskName="dynamic"
18
19 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name
   $saName
20
21 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/" +
   $diskName + ".vhd"
22
23 $vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri -
   CreateOption fromImage
24
25 Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -
   Name $skuName
26
27 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
28 <!--NeedCopy-->
```

#### 14) Configure the virtual machines

When both the Citrix ADC VPX instances start, then connect to both Citrix ADC VPX instances using the SSH protocol to configure the virtual machines.

- a) Active-Active: Run the same set of configuration commands on the command line of both the Citrix ADC VPX instances.

- b) Active-Passive: Run this command on the command line of both the Citrix ADC VPX instances.

```
1 add ha node #nodeID <nsip of other Citrix ADC VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

## Provision a Citrix ADC VPX pair in a high availability setup with Azure internal load balancer

Log on to AzureRmAccount using your Azure user credentials.

### 1) Create a resource group

The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

\$rgName="<resource group name>"

\$locName="<location name, such as West US>"

New-AzureRmResourceGroup -Name \$rgName -Location \$locName

*For example:*

```
1 $rgName = "ARM-LB-NS"
2
3 $locName = "West US"
4
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
6 <!--NeedCopy-->
```

### 2) Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

\$saName="<storage account name>"

\$saType="<storage account type, specify one: Standard\_LRS, Standard\_GRS, Standard\_RAGRS, or Premium\_LRS>"

New-AzureRmStorageAccount -Name \$saName -ResourceGroupName \$rgName -Type \$saType  
-Location \$locName

*For example:*

```
1 $saName="vpxstorage"
2
3 $saType="Standard\_LRS"
4
```

```

5 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -
  Type $saType -Location $locName
6 <!--NeedCopy-->

```

### 3) Create an availability set

A load balancer configured with an availability set ensures that your application is always available..

\$avName="<availability set name>"

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

### 4) Create a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```

1 $vnetName = "LBVnet"
2
3 $vnetAddressPrefix="10.0.0.0/16"
4
5 $FrontendAddressPrefix="10.0.1.0/24"
6
7 $BackendAddressPrefix="10.0.2.0/24"
8
9 $vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName
  $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet
  $frontendSubnet,$backendSubnet\`
10
11 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  frontendSubnet -AddressPrefix $FrontendAddressPrefix
12
13 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name
  backendSubnet -AddressPrefix $BackendAddressPrefix
14 <!--NeedCopy-->

```

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be \$vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId should be \$vnet.Subnets[1].Id, and so on..

### 5) Create an back end address pool

```

1 $beaddresspool= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name "
  LB-backend"
2 <!--NeedCopy-->

```

## 6) Create NAT rules

Create NAT rules for services that you are not load balancing.

```

1 $inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name "
    Inboundnatrule1" -FrontendIpConfiguration $frontendIP -Protocol TCP
    -FrontendPort 3441 -BackendPort 3389
2
3 $inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name "
    RDP2" -FrontendIpConfiguration $frontendIP -Protocol TCP -
    FrontendPort 3442 -BackendPort 3389
4 <!--NeedCopy-->

```

Use front end and back end ports as per your requirement.

## 7) Create a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```

1 $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name "HealthProbe"
    " -Protocol tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
2 <!--NeedCopy-->

```

## 8) Create a load balancing rule

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

```

1 $lbrule = New-AzureRmLoadBalancerRuleConfig -Name "lbrule1" -
    FrontendIpConfiguration $frontendIP -BackendAddressPool
    $beAddressPool -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -
    BackendPort 80
2 <!--NeedCopy-->

```

Use front end and back end ports as per your requirement.

## 9) Create a load balancer entity

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```

1 $NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgname -Name "
    InternalLB" -Location $locName -FrontendIpConfiguration $frontendIP
    -InboundNatRule $inboundNATRule1,$inboundNatRule2 -LoadBalancingRule
    $lbrule -BackendAddressPool $beAddressPool -Probe $healthProbe
2 <!--NeedCopy-->

```

## 10) Create a NIC

Create two NICs and associate each NIC with each Citrix ADC VPX instance

```

1 $backendnic1= New-AzureRmNetworkInterface -ResourceGroupName $rgName -
  Name lb-nic1-be -Location $locName -PrivateIpAddress 10.0.2.6 -
  Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.
  BackendAddressPools\[0\] -LoadBalancerInboundNatRule $nrplb.
  InboundNatRules\[0\]
2 <!--NeedCopy-->

```

This NIC is for Citrix ADC VPX 1. The Private IP should be in same subnet as that of subnet added.

```

1 $backendnic2= New-AzureRmNetworkInterface -ResourceGroupName $rgName -
  Name lb-nic2-be -Location $locName -PrivateIpAddress 10.0.2.7 -
  Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.
  BackendAddressPools\[0\] -LoadBalancerInboundNatRule $nrplb.
  InboundNatRules\[1\].
2 <!--NeedCopy-->

```

This NIC is for Citrix ADC VPX 2. The parameter Private IP Address can have any private IP as per your requirement.

## 11) Create Citrix ADC VPX instances

Create two VPX instances part of same resource group and availability set and attach it to the internal load balancer.

a) Citrix ADC VPX instance 1

*For example:*

```

1 $vmName="VPX1"
2
3 $vmSize="Standard\_A3"
4
5 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
  $rgName
6
7 $vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
  AvailabilitySetId $avset.Id
8
9 $cred=Get-Credential -Message "Type Credentials which will be used to
  login to VPX instance"
10
11 $vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName
  -Credential $cred -Verbose

```

```

12
13 $vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer
    $offerName -Skus $skuName -Version "latest"
14
15 $vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $backendnic1.Id
16
17 $diskName="dynamic"
18
19 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name
    $saName
20
21 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" +
    $diskName + ".vhd"
22
23 $vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri -
    CreateOption fromImage
24
25 Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -
    Name $skuName
26
27 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
28 <!--NeedCopy-->

```

## b) Citrix ADC VPX instance 2

*For example:*

```

1 $vmName="VPX2"
2
3 $vmSize="Standard\_A3"
4
5 $avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName
    $rgName
6
7 $vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -
    AvailabilitySetId $avset.Id
8
9 $cred=Get-Credential -Message " Type Credentials which will be used to
    login to VPX instance "
10
11 $vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName
    -Credential $cred -Verbose
12
13 $vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer
    $offerName -Skus $skuName -Version "latest"

```

```
14
15 $vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $backendnic2.Id
16
17 $diskName="dynamic"
18
19 $storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name
    $saName
20
21 $osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/" +
    $diskName + ".vhd"
22
23 $vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri -
    CreateOption fromImage
24
25 Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -
    Name $skuName
26
27 New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
28 <!--NeedCopy-->
```

## 12) Configure the virtual machines

When both the Citrix ADC VPX instances start, then connect to both Citrix ADC VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the Citrix ADC VPX instances.

b) Active-Passive: Run this command on the command line of both the Citrix ADC VPX instances.

```
add ha node #nodeID <nsip of other Citrix ADC VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

## Azure terminology

September 21, 2020

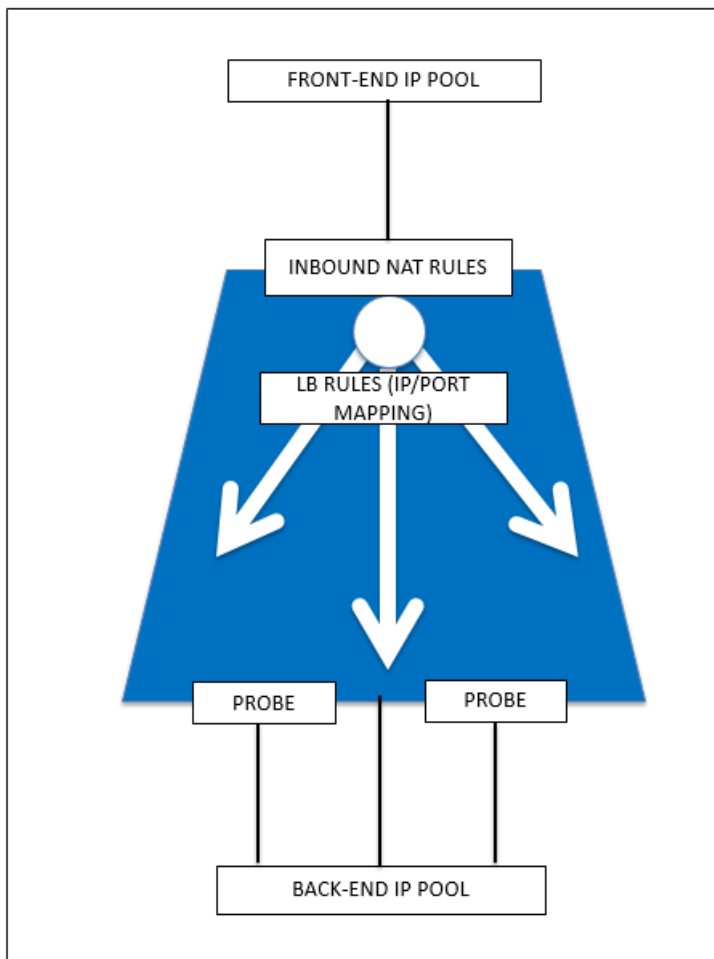

Some of the Azure terms that are used in the Citrix ADC VPX Azure documentation are listed below.

1. Azure Load Balancer – Azure load balancer is a resource that distributes incoming traffic among computers in a network. Traffic is distributed among virtual machines defined in a load-balancer set. A load balancer can be external or internet-facing, or it can be internal.
2. Azure Resource Manager (ARM) – ARM is the new management framework for services in Azure. Azure Load Balancer is managed using ARM-based APIs and tools.

3. Back-End Address Pool – These are IP addresses associated with the virtual machine Network Interface Card (NIC) to which load will be distributed.
4. BLOB - Binary Large Object – Any binary object like a file or an image that can be stored in Azure storage.
5. Front-End IP Configuration – An Azure Load balancer can include one or more front-end IP addresses, also known as a virtual IPs (VIPs). These IP addresses serve as ingress for the traffic.
6. Instance Level Public IP (ILPIP) – An ILPIP is a public IP address that you can assign directly to your virtual machine or role instance, rather than to the cloud service that your virtual machine or role instance resides in. This does not take the place of the VIP (virtual IP) that is assigned to your cloud service. Rather, it's an additional IP address that you can use to connect directly to your virtual machine or role instance.

**Note:** In the past, an ILPIP was referred to as a PIP, which stands for public IP.

7. Inbound NAT Rules – This contains rules mapping a public port on the load balancer to a port for a specific virtual machine in the back end address pool.
8. IP-Config - It can be defined as an IP address pair (public IP and private IP) associated with an individual NIC. In an IP-Config, the public IP address can be NULL. Each NIC can have multiple IP-Config associated with it, which can be upto 255.
9. Load Balancing Rules – A rule property that maps a given front-end IP and port combination to a set of back-end IP addresses and port combination. With a single definition of a load balancer resource, you can define multiple load balancing rules, each rule reflecting a combination of a front end IP and port and back end IP and port associated with virtual machines.

10. Network Security Group (NSG) – NSG contains a list of Access Control List (ACL) rules that allow or deny network traffic to your virtual machine instances in a virtual network. NSGs can be associated with either subnets or individual virtual machine instances within that subnet. When a NSG is associated with a subnet, the ACL rules apply to all the virtual machine instances in that subnet. In addition, traffic to an individual virtual machine can be restricted further by associating a NSG directly to that virtual machine.

11. Private IP addresses – Used for communication within an Azure virtual network, and your on-premises network when you use a VPN gateway to extend your network to Azure. Private IP addresses allow Azure resources to communicate with other resources in a virtual network or an on-premises network through a VPN gateway or ExpressRoute circuit, without using an Internet-reachable IP address. In the Azure Resource Manager deployment model, a private IP address is associated with the following types of Azure resources – virtual machines, internal load balancers (ILBs), and application gateways.

12. Probes – This contains health probes used to check availability of virtual machines instances in the back end address pool. If a particular virtual machine does not respond to health probes for some time, then it is taken out of traffic serving. Probes enable you to keep track of the health of virtual

instances. If a health probe fails, the virtual instance will be taken out of rotation automatically.

13. **Public IP Addresses (PIP)** – PIP is used for communication with the Internet, including Azure public-facing services and is associated with virtual machines, Internet-facing load balancers, VPN gateways, and application gateways.

14. **Region** - An area within a geography that does not cross national borders and that contains one or more datacenters. Pricing, regional services, and offer types are exposed at the region level. A region is typically paired with another region, which can be up to several hundred miles away, to form a regional pair. Regional pairs can be used as a mechanism for disaster recovery and high availability scenarios. Also referred to generally as location.

15. **Resource Group** - A container in Resource Manager holds related resources for an application. The resource group can include all of the resources for an application, or only those resources that are logically grouped together

16. **Storage Account** – An Azure storage account gives you access to the Azure blob, queue, table, and file services in Azure Storage. Your storage account provides the unique namespace for your Azure storage data objects.

17. **Virtual Machine** – The software implementation of a physical computer that runs an operating system. Multiple virtual machines can run simultaneously on the same hardware. In Azure, virtual machines are available in a variety of sizes.

18. **Virtual Network** - An Azure virtual network is a representation of your own network in the cloud. It is a logical isolation of the Azure cloud dedicated to your subscription. You can fully control the IP address blocks, DNS settings, security policies, and route tables within this network. You can also further segment your VNet into subnets and launch Azure IaaS virtual machines and cloud services (PaaS role instances). Additionally, you can connect the virtual network to your on-premises network using one of the connectivity options available in Azure. In essence, you can expand your network to Azure, with complete control on IP address blocks with the benefit of enterprise scale Azure provides.

## Azure FAQs

June 23, 2021

- **Is the upgrade procedure of Citrix ADC VPX instance installed from Azure Marketplace different from the on-premises upgrade procedure?**

No. You can upgrade your Citrix ADC VPX instance in the Microsoft Azure cloud to Citrix ADC VPX release 11.1 or later, using standard Citrix ADC VPX upgrade procedures. You can upgrade either using GUI or CLI procedures. For any new installations, use the Citrix ADC VPX image for Microsoft Azure cloud.

To download the Citrix ADC VPX upgrade builds, go to **Citrix Downloads** > [Citrix ADC Firmware](#).

- **How to correct MAC moves and interface mutes observed on Citrix ADC VPX instances hosted on Azure?**

In Azure Multi-NIC environment, by default, all data interfaces might show MAC moves and interface mutes. To avoid MAC moves and interface mutes on Azure environments, Citrix recommends you to create a VLAN per data interface (without tag) of the ADC VPX instance and bind the primary IP of the NIC in Azure.

For more information, see [CTX224626](#) article.

## Deploy a Citrix ADC VPX instance on Google Cloud Platform

September 21, 2020

You can deploy a Citrix ADC VPX instance on Google Cloud Platform (GCP). A VPX instance in GCP enables you to take advantage of GCP cloud computing capabilities and use Citrix load balancing and traffic management features for your business needs. You can deploy VPX instances in GCP as standalone instances. Both single NIC and multi NIC configurations are supported.

**Note:** VPX high availability deployment is not yet supported on GCP.

### Supported features

A VPX instance running in GCP supports the following features:

- Load Balancing
- ICA Proxy
- Content Switching
- AAA
- Rewrite
- Responder
- RDP Proxy
- nFactor
- LDAP
- VPN (CVPN/Full)
- GSLB

### Limitation

- IPv6 is not supported

### Hardware requirements

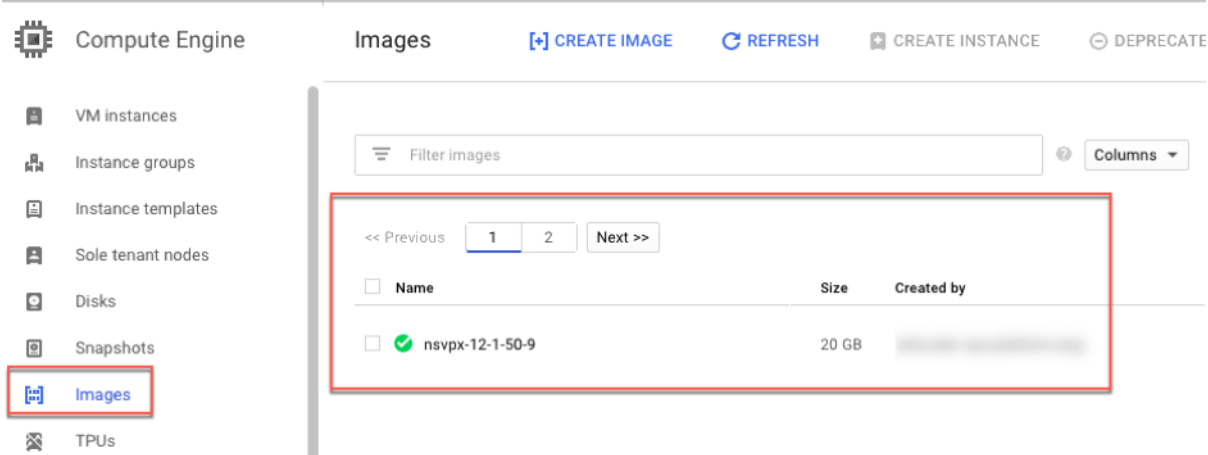

VPX instance in GCP must have minimum of 2 vCPUs and 4 GB RAM.

## Prerequisites

1. Install the “gcloud” utility on your device. You can find the utility at this link: <https://cloud.google.com/sdk/install>
2. Download the NSVPX-GCP image from the Citrix download site.
3. Upload the file(for example, NSVPX-GCP-12.1-50.9\_nc\_64.tar.gz) to a storage bucket on Google by following the steps given at <https://cloud.google.com/storage/docs/uploading-objects>.
4. Run the following command on the gcloud utility to create an image.

```
1 gcloud compute images create <IMAGE_NAME> --source-uri=gs://<
  STORAGE_BUCKET_NAME>/<FILE_NAME>.tar.gz --guest-os-features=
  MULTI_IP_SUBNET
2 <!--NeedCopy-->
```

It might take a moment for the image to be created. After the image is created, it appears under **Compute > Compute Engine** in the GCP console.

## Points to note

Consider the following GCP-specific points before you begin your deployment.

- After creating the instance, you cannot add or remove any network interfaces.
- For a multi-NIC deployment, create separate VPC networks for each NIC. One NIC can be associated with only one network.
- For a single-NIC instance the GCP console creates a network by default.
- Minimum 4 VPCUs are required for an instance with more than two network interfaces.
- If IP forwarding is required, you must enable IP forwarding while creating the instance and configuring the NIC.

### Scenario: deploy a multi-NIC, multi-IP standalone VPX instance

This scenario illustrates how to deploy a Citrix VPX standalone instance in GCP. In this scenario, you create a standalone VPX instance with multiple NICs. The instance communicates with back-end servers (the server farm).

Create three NICs to serve the following purposes.

NIC	Purpose	Associated with VPC network
NIC 0	Serves management traffic (Citrix ADC IP)	Management network
NIC 1	Serves client-side traffic (VIP)	Client network
NIC 2	Communicates with back-end servers (SNIP)	Back-end server network

Also, set up the required communication routes between the instance and the back-end servers, and between the instance and the external hosts on the public internet.

#### Summary of deployment steps

1. Create three VPC networks for three different NICs.
2. Create firewall rules for ports 22, 80, and 443
3. Create an instance with three NICs

**Note:** Create instance in the same region where you've created the VPC networks.

#### Create VPC Networks

Create three VPC networks that will be associated with management NIC, client NIC, and server NIC. To create a VPC network, log on the Google console > **Networking** > **VPC network** > **Create VPC Network**. Complete the required fields, as shown in the screen capture, and click **Create**.

netscaler-vpx-platform-eng

## ← Create a VPC network

**Name** ?

### Create the VPX instance

1. Log on to the GCP console.
2. Under **Compute**, hover over Compute Engine, and select **Images**.
3. Select the image, and click **Create Instance**.

4. Select an instance with 4 VPCUs, to support multiple NICs.
5. Click the networking option from Management, security, disks, networking, sole tenancy to add the additional NICs.

**Note:** Container image is not supported on VPX instances on GCP.

**i** You have a draft that wasn't submitted, click Restore to keep working on it Restore

**Name** ?  
vpctest1

**Region** ? **Zone** ?

**Network interfaces** ?

vpxmgmt vpxmgmtsubnet ( )	
vpxclient vpxclientsubnet ( )	
vpxbackend vpxbackendsubnet ( )	

[+ Add network interface](#)

The instance appears under **VM instances**.

Use the GCP SSH or the serial console to configure and manage the VPX instance.

Points to note after you've deployed the VPX instance on GCP.

- Log on to the VPX with user name `nsroot` and instance ID as password.
- After first logon, change the default password.
- For collecting tech support bundle, run the command shell `/netscaler/showtech_cloud.pl` instead of the customary `show techsupport`.

### GDM templates to deploy a Citrix ADC VPX instance

You can use a Citrix ADC VPX Google Deployment Manager (GDM) template to deploy a VPX instance on GCP. For details, see [Citrix ADC GDM Templates](#).

- [Creating and Starting a VM Instance](#)

## Jumbo frames on Citrix ADC VPX instances

September 21, 2020

Citrix ADC VPX appliances support receiving and transmitting jumbo frames containing up to 9216 bytes of IP data. Jumbo frames can transfer large files more efficiently than it is possible with the standard IP MTU size of 1500 bytes.

A Citrix ADC appliance can use jumbo frames in the following deployment scenarios:

- Jumbo to Jumbo. The appliance receives data as jumbo frames and sends it as jumbo frames.
- Non-Jumbo to Jumbo. The appliance receives data as regular frames and sends it as jumbo frames.
- Jumbo to Non-Jumbo. The appliance receives data as jumbo frames and sends it as regular frames.

For more information, see [Configuring Jumbo Frames Support on a Citrix ADC Appliance](#).

Jumbo Frames support is available on Citrix ADC VPX appliances running on the following virtualization platforms:

- VMware ESX
- Linux-KVM Platform
- Citrix XenServer
- Amazon Web Services (AWS)

Jumbo frames on VPX appliances works similar to Jumbo frames on MPX appliances. For more information on Jumbo Frames and its use cases, see [Configuring Jumbo Frames on MPX appliances](#). The use cases of Jumbo Frames on MPX appliances also apply to VPX appliances.

### **Configure jumbo frames for a VPX instance running on VMware ESX**

Perform the following tasks for configuring Jumbo Frames on a Citrix ADC VPX appliance running on VMware ESX server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9000. Use the CLI or GUI to set the MTU size. Note that Citrix ADC VPX appliances running on VMware ESX support receiving and transmitting jumbo frames containing up to only 9000 bytes of IP data.
2. Set the same MTU size on the corresponding physical interfaces of the VMware ESX server by using its management applications. For more information about setting the MTU size on the physical interfaces of VMware ESX, see <http://vmware.com/>.

### **Configure jumbo frames for a VPX instance running on Linux-KVM server**

Perform the following tasks for configuring Jumbo Frames on a Citrix ADC VPX appliance running on a Linux-KVM Server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9216. Use the Citrix ADC VPX CLI or GUI to set the MTU size.
2. Set the same MTU size on the corresponding physical interfaces of a Linux-KVM Server by using its management applications. For more information about setting the MTU size on the physical interfaces of Linux-KVM, see <http://www.linux-kvm.org/>.

## Configure jumbo frames for a VPX instance running on Citrix XenServer

Perform the following tasks to configure jumbo frames on a Citrix ADC VPX appliance running on Citrix XenServer:

1. Connect to the XenServer using XenCenter.
2. Shut down all the VPX instances that use the Networks for which the MTU must be changed.
3. On the **Networking** tab, select the network - network 0/1/2.
4. Select **Properties** and edit MTU.

After configuring jumbo frames on the XenServer, you can configure the jumbo frames on the ADC appliance. For more information, see [Configuring Jumbo Frames Support on a Citrix ADC Appliance](#).

## Configure jumbo frames for a VPX instance running on AWS

Host-level configuration is not required for VPX on Azure. To configure Jumbo Frames on VPX, follow the steps given in [Configuring Jumbo Frames Support on a Citrix ADC Appliance](#).

## Licensing

September 21, 2020

The following topics describe the migration instructions for setting up a new version of a Citrix ADC appliance with a list of all new and deprecated commands, parameters, and SNMP OIDs.

This document includes the following information:

- Citrix ADC Licensing Overview

## Citrix ADC licensing overview

March 16, 2021

The process of allocating your Citrix ADC licenses has been greatly simplified. The new licensing framework allows you to focus on getting maximum value from Citrix products.

In the Citrix ADC GUI, you can use your hardware serial number (HSN) or your license access code to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see <http://support.citrix.com/article/CTX131110>.

**Note:** Purchase separate licenses for each appliance in a high availability pair. Ensure that the same types of licenses are installed on both the appliances. For example, if you purchase a Premium license for one appliance, you must purchase another Premium license for the other appliance.

This document includes the following topics:

- Prerequisites
- Allocate a license by using the GUI
- Install a license
- Verify licensed features
- Enable or disable a feature
- Check license expiration information
- Citrix ADC VPX Express license

## Prerequisites

To use the hardware serial number or license access code to allocate your licenses:

- You must be able to access public domains through the appliance. For example, the appliance should be able to access [www.citrix.com](http://www.citrix.com). The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain:
  - Use a proxy server or set up a DNS server.
  - Configure a Citrix ADC IP (NSIP) address or a subnet IP (SNIP) address on your Citrix ADC appliance.
- Your license must be linked to your hardware, or you must have a valid license access code. Citrix sends your license access code by email when you purchase a license.

## Allocate a license by using the GUI

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license access code.

You can partially allocate licenses as required for your deployment. For example, if your license file contains 10 licenses, but your current requirement is for only six licenses, you can allocate six licenses now, and allocate more licenses later. You cannot allocate more than the total number of licenses present in your license file.

## To allocate your license

1. In a web browser, type the IP address of the Citrix ADC appliance (for example, <http://192.168.100.1>).

2. In User Name and Password, type the administrator credentials.
3. On the **Configuration** tab, navigate to **System \ > Licenses**.
4. In the details pane, click **Manage Licenses**, click **Add New License**, and then select one of the following options:

- **Use Serial Number.** The software internally fetches the serial number of your appliance and uses this number to display your licenses.
- **Use license access code.** Citrix emails the license access code for the license that you purchased. Enter the license access code in the text box.

If you do not want to configure internet connectivity on the Citrix ADC appliance, you can use a proxy server. Select the **Connect through Proxy Server** check box and specify the IP address and port of your proxy server.

5. Click **Get Licenses**. Depending on the option that you selected, one of the following dialog boxes appears.

- The following dialog box appears if you selected Hardware Serial Number.

**Serial No:** HW-47EGM28S8V

<input type="checkbox"/>	Name	Total count	Allocate	Id
<input type="checkbox"/>	▶ Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
<input type="checkbox"/>	▶ Citrix Access Gateway Platform License	1	0	key002
<input type="checkbox"/>	▶ Citrix Access Gateway Universal License	10	0	key003
<input type="checkbox"/>	▶ Citrix EasyCall	10	0	key004
<input type="checkbox"/>	▶ Citrix EasyCall Unlimited License	10	0	key005
<input type="checkbox"/>	▶ Citrix Branch Repeater VPX 45 Mbps	1	0	key006
<input type="checkbox"/>	▶ Citrix Repeater Plug-in	10	0	key007

- The following dialog box appears if you selected license access code.

✕

**License Activation code:** HW-47EGM28S8V

<input type="checkbox"/>	Name	Total count	Allocate	Id
<input type="checkbox"/>	▶ Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
<input type="checkbox"/>	▶ Citrix Access Gateway Platform License	1	0	key002
<input type="checkbox"/>	▶ Citrix Access Gateway Universal License	10	0	key003
<input type="checkbox"/>	▶ Citrix EasyCall	10	0	key004
<input type="checkbox"/>	▶ Citrix EasyCall Unlimited License	10	0	key005
<input type="checkbox"/>	▶ Citrix Branch Repeater VPX 45 Mbps	1	0	key006
<input type="checkbox"/>	▶ Citrix Repeater Plug-in	10	0	key007

6. Select the license file that you want to use to allocate your licenses.
7. In the **Allocate** column, enter the number of licenses to be allocated. Then click **Get**.
  - If you selected **Hardware Serial Number**, enter the number of licenses, as shown in the following screenshot.

✕

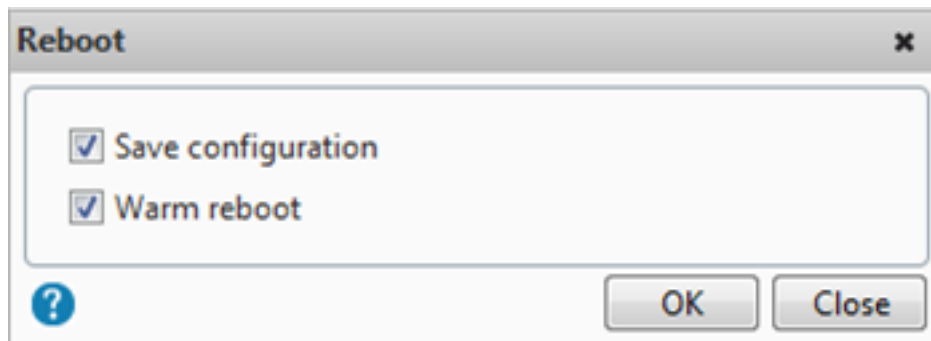

**Serial No:** HW-47EGM28S8V

<input type="checkbox"/>	Name	Total count	Allocate	Id
<input type="checkbox"/>	▶ Citrix NetScaler MPX 7500 - Platinum Edition	1	0	key001
<input type="checkbox"/>	▶ Citrix Access Gateway Platform License	1	0	key002
<input checked="" type="checkbox"/>	▶ Citrix Access Gateway Universal License	10	6	key003
<input type="checkbox"/>	▶ Citrix EasyCall	10	0	key004
<input type="checkbox"/>	▶ Citrix EasyCall Unlimited License	10	0	key005
<input type="checkbox"/>	▶ Citrix Branch Repeater VPX 45 Mbps	1	0	key006
<input type="checkbox"/>	▶ Citrix Repeater Plug-in	10	0	key007

- If you selected **license access code**, enter the number of licenses, as shown in the following screenshot.

8. Click restart for the license to take effect.
9. In the restart dialog box, click **OK** to proceed with the changes, or click **Close** to cancel the changes.

## Install a license

If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

### To install a license file by using the GUI

1. In a web browser, type the IP address of the Citrix ADC appliance (for example, <http://192.168.100.1>).
2. In User Name and Password, type the administrator credentials.

3. On the **Configuration** tab, navigate to System Licenses.
4. In the details pane, click **Manage Licenses**.
5. Click **Add New License**, then select **Upload license files from a local computer**.
6. Click **Browse**. Navigate to the location of the license files, select the license file, and then click **Open**.
7. Click restart to apply the license.
8. In the restart dialog box, click **OK** to proceed with the changes, or click **Close** to cancel the changes.

#### To install the licenses by using the CLI:

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy one or more new license files to this directory.

#### Example

```
1 login: nsroot
2 Password: nsroot
3 Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
4 Done
5 > shell
6 Last login: Mon Aug  4 03:51:42 from 10.103.25.64
7 root@ns# mkdir /nsconfig/license
8 root@ns# cd /nsconfig/license
9 <!--NeedCopy-->
```

Copy one or more new license files to this directory.

**Note:** The Citrix ADC appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the `reboot -w` command to warm restart the system, or run the `restart` command to restart the system normally.

## Verify licensed features

Before using a feature, ensure that your license supports the feature.

#### To verify the licensed features by using the CLI

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.

3. At the command prompt, enter the `sh ns license` command to display the features supported by the license.

**Example**

```
1 sh ns license
2     License status:
3         Web Logging: YES
4         Surge Protection: YES
5         .....
6         HTML Injection: YES
8 Done
9 <!--NeedCopy-->
```

**To verify the licensed features by using the GUI**

1. In a web browser, type the IP address of the ADC appliance, such as <http://192.168.100.1>.
2. In User Name and Password, type the administrator credentials.
3. Provide the User name and Password and click **Login**.
4. In the navigation pane, expand **System**, and then click **Licenses**. You see a green check mark next to the licensed features.

**Enable or disable a feature**

When you use the Citrix ADC appliance for the first time, you must enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it applies only after the feature is enabled.

**To enable a feature by using the CLI**

At the command prompt, type the following commands to enable a feature and verify the configuration:

- `enable feature <FeatureName>`
- `show feature`

**Example**

```
1 enable feature lb cs
2 done
3 >show feature
4
```

```

5          Feature                               Acronym
          Status
6          -----
          -----
7  1)     Web Logging                           WL           OFF
8  2)     Surge Protection                       SP           ON
9  3)     Load Balancing                        LB           ON
10 4)     Content Switching                     CS           ON
11 5)     Cache Redirection                     CR           ON
12 .
13 .
14 .
15 24)    NetScaler Push                         push          OFF
16 Done
17 <!--NeedCopy-->

```

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key is not available for a particular feature, the following error message appears for that feature:

ERROR: feature(s) not licensed

Note: To enable an optional feature, you must have a feature-specific license. For example, you have purchased and installed the Citrix NetScaler Advanced Edition license. However, to enable the Integrated Caching feature, you must purchase and install the AppCache license.

### To disable a feature by using the CLI

At the command prompt, type the following commands to disable a feature and verify the configuration:

- `disable feature <FeatureName>`
- `show feature`

#### Example

The following example shows how to disable load balancing (LB).

```

1  > disable feature lb
2  Done
3  > show feature
4
5          Feature                               Acronym
          Status

```

```

6          -----
          |
          |          |
7      1)  Web Logging      WL      OFF
8      2)  Surge Protection  SP      ON
9      3)  Load Balancing   LB      OFF
10     4)  Content Switching CS      ON
11     .
12     .
13     .
14    24)  NetScaler Push   push     OFF
15    Done
16    >
17    <!--NeedCopy-->
    
```

### Check license expiration information

You can check Citrix ADC license expiration information through GUI or CLI.

#### To check Citrix ADC license expiration information through GUI.

Go to **Configuration > System \> Licenses**.

A GUI alert appears when the NetScaler license expiration date is less than or equal to 30 days.

#### To check license expiration information through CLI:

Type the command “show ns license”.

```
1 show license
2
3 License status:
4
5 Web Logging: YES
6 Surge Protection: YES
7 Days to expiration: 204
8
9 Done
10 <!--NeedCopy-->
```

After the license expires, the Citrix ADC appliance generates an SNMP alarm “NS\_LICENSE\_EXPIRY”, and an expiry event is logged to console.

Upon license expiration, the Citrix ADC appliance automatically restarts to revoke the license. If Citrix ADC appliance uses Citrix service provider (CSP) licenses, the appliance does not restart automatically to revoke the license. However, if the user restarts the appliance, it restarts as unlicensed.

### **Citrix ADC VPX Express license**

Starting with Citrix ADC release 12.0 56.20, VPX Express for on-premises and cloud deployments does not require a license file and it comes with the following features:

- 20 Mbps bandwidth
- All ADC standard license features, except Citrix Gateway and L4 and L7 defenses
- Maximum 250 SSL sessions
- 20 Mbps SSL throughput

You can upgrade the VPX Express License to the following two options:

1. A standalone Citrix ADC VPX license
2. Citrix ADC Pooled Capacity license for VPX instances. For more information, see [Citrix ADC Pooled Capacity](#).

### **Related resources**

[The Citrix Licensing System](#)

[How to Allocate Citrix ADC VPX Licenses](#)

## Citrix ADC Pooled Capacity

September 21, 2020

Citrix ADC pooled capacity is a licensing framework that comprises a common bandwidth and instance pool that is hosted on and served by Citrix Application Delivery Management.

For complete information, see [Citrix ADC Pooled Capacity](#).

## Data governance

February 19, 2021

### What is Citrix ADM service connect?

Citrix Application Delivery Management (ADM) service connect is a feature to enable seamless onboarding of Citrix ADC MPX, SDX, and VPX instances, and Citrix Gateway appliances onto Citrix ADM service. This feature lets the Citrix ADC instance or Citrix Gateway appliance automatically, securely connect with Citrix ADM service, and send system, usage, and telemetry data to it. Based on this data, you get insights and recommendations for your Citrix ADC infrastructure on Citrix ADM service.

By using the Citrix ADM service connect feature and onboarding your Citrix ADC instances or Citrix Gateway appliances to Citrix ADM service. You can also manage all your Citrix ADC and Citrix Gateway assets whether on-premises or in the cloud. In addition, you benefit from access to a rich set of visibility features that help in quick identification of performance issues, high resource usage, critical errors, and so on. Citrix ADM service provides a wide range of capabilities for your Citrix ADC instances and applications. For more information on Citrix ADM service, see [Citrix Application Delivery Management Service](#)

#### Important

- Citrix Gateway appliance also supports the Citrix ADM service connect feature. For better ease, the Citrix Gateway appliance is not called explicitly in the consecutive sections.
- Citrix ADM service connect feature is released for Citrix ADC MPX, SDX, and VPX instances, and Citrix Gateway appliances. However, the corresponding functionality on the Citrix ADM service is yet to go live. Citrix updates this note once it happens. The benefits of this new capability can be used once released on Citrix ADM service.

## **What is Citrix ADM service?**

Citrix ADM service is a cloud-based solution that helps you manage, monitor, orchestrate, automate, and troubleshoot your Citrix ADC instances. It also provides you analytical insights and curated machine learning based recommendations about Citrix ADC instances and about application health, performance, and security. For more information, see [Citrix ADM service Overview](#)

## **How the Citrix ADM service connect is enabled?**

Citrix ADM service connect is enabled by default, after you install or upgrade Citrix ADC or Gateway to release 12.1 build 57.xx and above.

## **What data is captured using Citrix ADM service connect?**

The following details are captured using Citrix ADM service connect:

- **Citrix ADC details**
  - Serial ID
  - Encoded Serial ID
  - Host ID
  - UUID
  - Management IP address
  - Host name
  - Version
  - Build type
  - Build
  - License type
  - Hypervisor
  - Deployment type(standalone/HA)
  - Platform type
  - Platform description
  - System ID
  - Modes enabled on ADC
  - Features enabled on ADC
- **License Information**
  - Features licensed on Citrix ADC
  - License number
- **Key usage metrics**
  - System date time

- CPU usage percentage
- Management CPU percentage
- Throughput
- SSL new sessions
- SSL encryption throughput
- SSL decryption throughput
- System Uptime

- **Configuration**

- ns.conf file

**Note**

Before the Citrix ADM service connect sends the `ns.conf` file from Citrix ADC appliance to the Citrix ADM service, it anonymizes the encrypted or hashed passwords. The Citrix ADM service connect checks for “-encrypted” or “-passcrypt” parameters and replaces the associated encrypted or hashed value with ‘XXXX’. The Citrix ADM service connect then encodes and compresses the `ns.conf` file, and sends it to the Citrix ADM service endpoint.

- **Critical error details**

- Hard disk failures
  - SSL card failures
  - Power Supply Unit (PSU) failures
  - Flash drive failure
  - Warm reboot
  - Sustained memory usage above 90% or a memory leak
  - Sustained rate limit drops

## How the data is used?

By collecting the data, Citrix can provide you timely and in-depth insights about your Citrix ADC installations, which include the following:

- **Key metrics.** Details of key metrics pertaining to CPU, memory, throughput, SSL throughput, and highlight anomalous behavior on Citrix ADC instances.
- **Critical errors.** Any critical errors that might have occurred on your Citrix ADC instances.
- **Deployment advisory.** Identify Citrix ADC instances that are deployed in standalone mode but have high throughput and are vulnerable to a single point of failure.

## How long the collected data is retained?

Any Data collected is retained for no longer than 13 months.

If you decide to terminate the use of the service by disabling the Citrix ADM service connect feature from the Citrix ADC, any previously collected data is deleted after a period of 30 days.

### **Where the data is stored and how secure is it?**

All data collected by Citrix ADM service connect is stored in one of the three regions—United States, European Union, and Australia and New Zealand (ANZ). For more information, see [Geographical Considerations](#).

The data is stored securely with strict tenant isolation at the database layer.

### **How to disable Citrix ADM service connect?**

If you want to disable data collection through Citrix ADM service connect, see [How to enable and disable Citrix ADM service connect](#).

## **Introduction to Citrix ADM service connect for Citrix ADC appliances**

June 10, 2021

Citrix ADM service is a cloud-based solution that helps you manage, monitor, orchestrate, automate, and troubleshoot your Citrix ADC instances. It also provides analytical insights and curated machine learning based recommendations for your applications health, performance, and security. For more information, see [Citrix Application Delivery Management Service](#).

Citrix Application Delivery Management (ADM) service connect is a feature to enable seamless onboarding of Citrix ADC instances onto Citrix ADM service. This feature helps Citrix ADC instances and Citrix ADM service to function as a holistic solution, which offers customers multi fold benefits.

Citrix ADM service connect feature lets the Citrix ADC instance automatically connect with the Citrix ADM service and send system, usage, and telemetry data to it. Based on this data, the Citrix ADM service gives you some insights and recommendations on your Citrix ADC and Gateway infrastructure like the following:

- Security advisory insight highlighting your vulnerable ADC appliances.
- Upgrade advisory insight highlighting ADC appliances that have reached or about to reach end of maintenance and end of life.
- Quick identification of performance issues, high resource usage, and critical errors.

To harness the power of Citrix ADM service, you can choose to onboard your Citrix ADC instances to Citrix ADM service. The onboarding process uses ADM service connect, and makes the experience smooth and faster for you.

### Points to note

- Citrix ADM service connect is now available on Citrix ADC MPX, SDX, and VPX instances and Citrix Gateway appliances.
- The initiative in a Citrix ADM service that uses this Citrix ADM service connect feature is ADM service connect based low-touch onboarding. For more information, see [Low-touch onboarding of Citrix ADC instances using Citrix ADM service connect](#)

For more information, see [Data governance](#).

### How does Citrix ADM service connect support with Citrix ADM service?

Here is the high-level workflow of how the Citrix ADM service connect feature on Citrix ADC interacts with Citrix ADM service.

1. Citrix ADM service connect feature on Citrix ADC appliance auto connects with Citrix ADM service using a periodic probe request.
2. This request has system, usage and telemetry data, using which the Citrix ADM service gives you some insights and recommendations on your Citrix ADC infrastructure. Like; quick identification of performance issues, high resource usage, and critical errors.
3. You can view the insights and recommendations and decide to onboard your ADC instances to the Citrix ADM service to start managing your Citrix ADC instances.
4. When you decide to onboard, the Citrix ADM service connect feature helps complete the onboarding seamlessly.

### What versions of Citrix ADC is Citrix ADM service connect supported on?

Citrix ADM service connect is supported on all Citrix ADC platforms and all appliance models (MPX, VPX, and SDX). Starting from Citrix ADC release 12.1 build 57.xx, Citrix ADM service connect is enabled by default for Citrix ADC appliances.

### How to enable Citrix ADM service connect?

If you are an existing Citrix ADC customer, and upgrade to Citrix ADC release 12.1 build 57.xx, Citrix ADM service connect is enabled by default as part of the upgrade process.

If you are a new Citrix ADC customer, installing Citrix ADC release 12.1 build 57.xx, Citrix ADM service connect is enabled by default as part of the install process.

### Note

Unlike the new Citrix ADC appliances, existing Citrix ADC appliances find the route through Citrix Insight Service (CIS) or Call Home.

## How to enable and disable Citrix ADM service connect?

You can enable and disable Citrix ADM service connect from CLI, GUI, or NITRO API methods.

### Using CLI

To enable the Citrix ADM service connect by using the CLI

At the command prompt, type:

```
1 set adm parameter - admserviceconnect ENABLED
```

To disable the Citrix ADM service connect by using the CLI

At the command prompt, type:

```
1 set adm parameter - admserviceconnect DISABLED
```

### Important

If your Citrix ADC is on release 12.1 build 57.xx, the parameter name to enable or disable Citrix ADC service connect is “autoconnect.” For example, to enable service connect, use the `set adm parameter - autoconnect ENABLED` command.

### Using the GUI

To disable the Citrix ADM service connect by using the Citrix ADC GUI

1. In a web browser, type the IP address of the Citrix ADC appliance (for example, <http://192.0.2.10>).
2. In **User Name** and **Password**, enter the administrator credentials.
3. Navigate to **System > Settings > Configure ADM Parameters**.
4. On the **Configure ADM Parameters** page, clear the **Enable Citrix ADM service connect** dialog box, and click **OK**.

## Using the NITRO API

You can disable Citrix ADM service connect by using the **NITRO** command.

- In Citrix ADC release 12.1 build 57.xx, you can enable or disable the Citrix ADM service connect by using the following command:

```
- curl -X PUT -H "Content-Type:application/json" http://192.0.2.10/nitro/v1/config/admparameter> -d '{ "admparameter":{ "autoconnect": "enabled" } } ' -u nsroot:Test@1
```

- From Citrix ADC release 12.1 build 58.xx, the “autoconnect” parameter name is renamed to `admserviceconnect`. You can disable the Citrix ADM service connect by using the following command:

```
- curl -X PUT -H "Content-Type:application/json" http://192.0.2.10/nitro/v1/config/admparameter -d '{ "admparameter":{ "admserviceconnect": "disabled" } } ' -u nsroot:Test@1
```

## Citrix ADM built-in agent behavior

From Citrix ADC release 12.1 build 57.xx and higher, the Citrix ADM built-in agent available on Citrix ADC instances communicates with ADM service without the need for manual initialization on the respective ADC instance. After communication with ADM service is established, the built-in agent stays evergreen by auto-upgrading itself to the latest software version regularly.

Previously, you had to initialize the built-in agent on the ADC instances, using `mastools` commands, to establish communication with ADM service and for regular auto-upgrades.

For more information, see [Configure the ADC built-in agent to manage instances](#).

- Citrix ADM service: [Citrix Application Delivery Management Service](#).

## Upgrade and downgrade a Citrix ADC appliance

September 21, 2020

### Note

Citrix ADM service connect is enabled by default, after you install or upgrade Citrix ADC or Citrix Gateway to release 12.1 build 57.xx and above. For more information see, [Data governance](#) and [Citrix ADM service connect](#).

Citrix ADC 12.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Read the release notes document before you upgrade your software.

This section provides information about **upgrading and downgrading a Citrix ADC appliance** (MPX and VPX) firmware **by using the Citrix ADC GUI or CLI**.

You can also **use Citrix ADM to upgrade a Citrix ADC appliance**. For more information, see:

- [10 ways Citrix ADM service supports easier Citrix ADC upgrades](#)
- [Use Citrix ADM service to upgrade Citrix ADC instances](#)
- [Use Citrix ADM software to upgrade Citrix ADC instances](#)

For information about **upgrading a Citrix ADC SDX appliance**, see [Single Bundle Upgrade](#).

## Before you begin

March 16, 2021

Before you start the upgrade or downgrade process, make sure you check the following:

- The licensing framework and types of licenses. A software edition upgrade might require new licenses, such as upgrading from the standard edition to the Advanced edition, the standard edition to the Premium edition, or the Advanced edition to the Premium edition. Existing Citrix ADC licenses continue to work when you upgrade to version 12.1. For more information, see [Licensing](#)
- Check for [New and deprecated commands, parameters, and SNMP OIDs](#).
- Check for [Citrix ADC MPX Hardware and Software Compatibility Matrix](#).
- If the Citrix ADC Gateway logon page is customized, then make sure that the UI theme is set to default.
- Review the LOM Firmware Upgrade page, if you are upgrading LOM.
- Download the Citrix ADC firmware from the [Citrix ADC Downloads](#). For the detailed steps to download the Citrix ADC firmware, see the [Download a Citrix ADC release package](#).

- Perform a back up of the configuration file, customization file, certificates, monitor scripts, license files, and so on either manually or refer to the following documentation for back up using Citrix ADC CLI or GUI - [Backup and restore](#).
- Validate the integrity of the Citrix ADC and check available space before performing an upgrade. For more information about how to free up storage space, see [How to free space on /var directory](#).
- Check the Citrix ADC VPX [Support matrix and usage guidelines](#).
- Check the [FAQ](#) section.

For more information about prerequisites for upgrading or downgrading the Citrix ADC firmware, see these support articles:

- CTX126793: [Best Practices for Upgrading Citrix ADC or Citrix ADC Gateway Appliances](#)
- CTX220371: [Must Read Articles Before and After Upgrading Citrix ADC](#)

## Upgrade considerations - SNMP configuration

September 21, 2020

The timeout parameter for an SNMP alarm is an internal option that has no impact on the alarm configuration.

Timeout parameter might appear in the SNMP alarm configurations in the running configuration (sh running) and the saved configuration (ns.conf) even if you have not made any changes to these SNMP alarm configurations.

On upgrading to a release build with the fix for the timeout setting issue, the SNMP configurations are erroneously reset to default values.

The following SNMP alarms (if configured) are impacted during an upgrade:

- APPFW-BUFFER-OVERFLOW
- APPFW-COOKIE
- APPFW-CSRF-TAG
- APPFW-DENY-URL
- APPFW-FIELD-CONSISTENCY
- APPFW-FIELD-FORMAT
- APPFW-POLICY-HIT
- APPFW-REFERER-HEADER
- APPFW-SAFE-COMMERCE
- APPFW-SAFE-OBJECT

- APPFW-SQL
- APPFW-START-URL
- APPFW-VIOLATIONS-TYPE
- APPFW-XML-ATTACHMENT
- APPFW-XML-DOS
- APPFW-XML-SCHEMA-COMPILE
- APPFW-XML-SOAP-FAULT
- APPFW-XML-SQL
- APPFW-XML-VALIDATION
- APPFW-XML-WSI
- APPFW-XML-XSS
- APPFW-XSS
- CLUSTER-BACKPLANE-HB-MISSING
- CLUSTER-NODE-HEALTH
- CLUSTER-NODE-QUORUM
- CLUSTER-VERSION-MISMATCH
- COMPACT-FLASH-ERRORS
- CONFIG-CHANGE
- CONFIG-SAVE
- HA-BAD-SECONDARY-STATE
- HA-NO-HEARTBEATS
- HA-SYNC-FAILURE
- HA-VERSION-MISMATCH
- HARD-DISK-DRIVE-ERRORS
- HA-STATE-CHANGE
- HA-STICKY-PRIMARY
- PORT-ALLOC-FAILED
- SYNFLOOD

These SNMP alarms configurations are impacted when you upgrade the Citrix ADC to the following release builds:

- Release 11.1 build 61.2 or later
- Release 12.0 build 61.0 or later
- Release 12.1 build 30.1 or later
- Release 13.0 build 51.4 or later

### **Example**

Let's consider an example of CLUSTER-NODE-HEALTH SNMP alarm.

---

```
1 CLUSTER-NODE-HEALTH SNMP alarm is set up by using the Citrix ADC
  command line:
2
3 > set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -
  severity Major
4
5 > save config
6 <!--NeedCopy-->
```

This SNMP alarm configuration appears in the saved configuration file (`ns.conf`) as:

```
1 set snmp alarm CLUSTER-NODE-HEALTH -time 111 -state DISABLED -severity
  Major -timeout 86400
2
3 <!--NeedCopy-->
```

During an upgrade to any of the release builds mentioned above, the following error appears in `ns.log` file:

```
1 May 23 09:14:46 <local0.err> ns nsconfigd: __init_config_filter(): (
  null) line 0: No such argument [-timeout]>> set snmp alarm CLUSTER-
  NODE-HEALTH -time 111 -state DISABLED -severity Major -timeout
  86400.
2 <!--NeedCopy-->
```

After the upgrade, the SNMP alarm configurations are reset to the default values.

## Workaround

Use one of the following workarounds:

- Before the upgrade, remove the timeout setting from the SNMP configurations in the saved configuration file (`ns.conf`).
- After the upgrade, reconfigure the SNMP alarms without the timeout parameter.

## Download a Citrix ADC release package

September 21, 2020

Complete the following steps to download a Citrix ADC release package:

1. Open [Citrix ADC Downloads](#) page in a Web browser.

2. On the Citrix ADC Downloads page, expand the **Citrix ADC release** that you want to update to.
3. Expand one of the appropriate categories, and click the Citrix ADC build link. For example, for downloading a version of Citrix ADC firmware, expand **Firmware**, and click the Citrix ADC build that you want to download.
4. On the selected Citrix ADC build page, expand the **Build** section, click **Download File** to download the Citrix ADC build package.

**Note:**

The checksum is provided to ensure that you match the downloaded build package with the actual package which is hosted on the website. Checksum is an important check to ensure that you have the correct bits.

## Upgrade a Citrix ADC standalone appliance

October 19, 2020

Before upgrading the system software, make sure that you read the [Before you begin](#) section and complete the necessary prerequisites such as backing up the necessary files and downloading the Citrix ADC firmware.

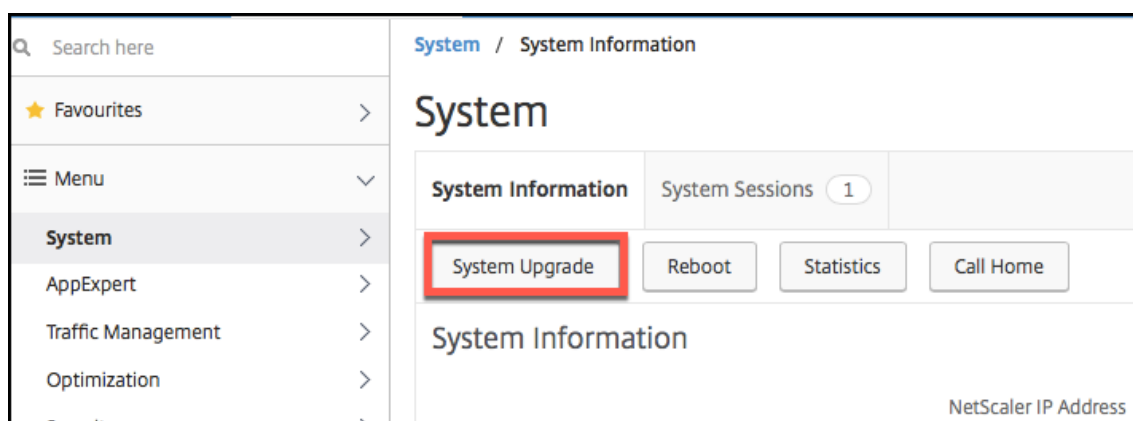

**Note**

Starting with release 12.1, 64-bit Citrix ADC MPX and VPX images are supported, along with 32-bit images. For more information, see the Citrix Downloads site.

### Upgrade a Citrix ADC standalone appliance by using the GUI

Follow these steps to upgrade a standalone Citrix ADC to release 12.1 by using the GUI.

1. In a web browser, type the IP address of the Citrix ADC, for example <http://10.102.29.50>.
2. In User Name and Password, type the administrator credentials (nsroot/nsroot) and then click **Log On**.
3. From the GUI, click **System Upgrade**.

4. From the **Choose File** drop-down menu choose the appropriate option: **Local** or **Appliance**. If you want to use the Appliance option, the firmware needs to be uploaded to the Citrix ADC first. You can use any file transfer method such as WinSCP to upload the Citrix ADC firmware to the appliance.
5. Select the correct file and click **Upgrade**.
6. Follow the instructions to upgrade the software.
7. When prompted, select **Reboot**.

After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

### Upgrade a Citrix ADC standalone appliance by using the CLI

Follow these steps to upgrade a standalone Citrix ADC to release 12.1 by using the CLI:

In the following procedure, <release> and <releasenum> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

1. Use an SSH client, such as PuTTY, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials. Save the running configuration. At the prompt, type:

```
save config
```

3. Switch to the shell prompt by running the following command:

```
shell
```

4. Create a copy of the ns.conf file. At the shell prompt, type:

```
• cd /nsconfig
```

- `cp ns.conf ns.conf.NS<currentreleasenum><currentbuildnum>`

You should backup the configuration file to another computer.

5. (Optional) If you have modified some of the following files in the /etc directory, and copied them to /nsconfig to maintain persistency, any updates that are pushed to the /etc directory during the upgrade might be lost:

- ttys
- resolv.conf
- sshd\_config
- host.conf
- newsyslog.conf
- host.conf
- httpd.conf
- rc.conf
- syslog.conf
- crontab
- monitrc

To avoid losing these updates, create a /var/nsconfig\_backup directory, and move the customized files to this directory. That is, move any files that you modified in /etc directory and copied to /nsconfig by running the following command:

```
cp /nsconfig/<filename> /var/nsconfig_backup
```

Example:

```
cp /nsconfig/syslog.conf /var/nsconfig_backup
```

6. Create a location for the installation package. At the shell prompt type:

- `cd /var/nsinstall`
- `cd <releasenum>`

**Note:**

If the desired release number directory is not present, create one using the following command:

```
mkdir <releasenum>
```

**Example:**

```
mkdir 13.0
```

- `mkdir build_<targetbuildnum>`
- `cd build_<targetbuildnum>`

7. Copy the already downloaded Citrix ADC firmware to the build directory that you have created in the above step, by using any file transferring method such as WinSCP. See the [Before You Begin](#) section for more information about downloading the Citrix ADC firmware.
8. Extract the contents of the installation package. Example:

```
tar -xvzf build-12.1-32.2_nc_64.tgz
tar -xvzf build-12.1-32.2_nc_32.tgz
```
9. Run the installns script to install the new version of the system software.

```
./installns
```
10. When prompted, restart the Citrix ADC.
11. (Optionally) If you've created a copy of the ns.conf file in the Before You Begin section, do the following:
  - a) Manually compare the files in /var/nsconfig\_backup and /etc and make appropriate changes in /etc.
  - b) To maintain persistency, move the updated files in /etc to /nsconfig.
  - c) Restart the appliance to put the changes into effect.

Below is an example of Citrix ADC firmware upgrade.

```

## Upgrade a Citrix ADC standalone appliance by using NITRO API

To use NITRO API to upgrade or downgrade a Citrix ADC, see [Automate Citrix ADC Upgrade and Downgrade with a Single API](#).

## Check and install Citrix ADC 12.1 software update

Update the Citrix ADC software when an update is available, for better performance. A Citrix ADC update can include feature improvements, performance fixes, or enhancements. Make sure you read the release notes to see what fixes and enhancements are available in the update. To check and install a software update, do the following.

1. In the Citrix ADC home page, click **Check for Update** from the **nsroot** drop-down menu at the top right corner of the page.
2. In the **Latest System Software Updates Available** page, check the available software update that you can install.
3. Click **Download** to download the installation package from the [Citrix download](#) website.
4. After you have downloaded the software package, install the update through either CLI or GUI procedure.

**Note**

The **Check for Update** link is accessible only if you log into the GUI through HTTP protocol and not through HTTPS protocol.

## Downgrade a Citrix ADC standalone appliance

September 21, 2020

You can downgrade to any earlier release on a standalone Citrix ADC by using the CLI. Downgrading using the GUI is not supported.

**Note**

Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually reenter any missing entries.

### Procedure to downgrade a standalone Citrix ADC

Follow the steps given below to downgrade a Citrix ADC standalone appliance running release 12.1 to an earlier release.

In this procedure, <release> and <releasenum> represent the release version you are downgrading to, and <targetbuildnumber> represents the build number that you are downgrading to.

1. Open an SSH connection to the Citrix ADC by using an SSH client, such as PuTTY.
2. Log on to the Citrix ADC by using the administrator credentials. Save the running configuration. At the prompt, type:

```
save config
```

3. Create a copy of the ns.conf file. At the shell prompt, type:

- a) `cd /nsconfig`
- b) `cp ns.conf ns.conf.NS<currentbuildnumber>`

You should backup a copy of the configuration file on another computer.

4. Copy the <releasenum> configuration file (ns.conf.NS<releasenum>) to ns.conf. At the shell prompt, type:

```
cp ns.conf.NS<releasenum> ns.conf
```

Note: ns.conf.NS<releasenum> is the backup configuration file that is automatically created when the system software is upgraded from release version <releasenum> to the current release version. There may be some loss in configuration when downgrading. After the appliance

restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

Important: If routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:
  - a) `cd /nsconfig`
  - b) `cp ZebOS.conf ZebOS.conf.NS`
  - c) `cp ZebOS.conf.NS<targetreleasenum> ZebOS.conf`
6. Change directory to `/var/nsinstall/<releasenum>nsinstall`, or create one if it does not exist.
7. Change directory to `build_<targetbuildnum>`, or create one if it does not exist.
8. Download or copy the installation package (`build-<release>-<targetbuildnum>.tgz`) to this directory and extract the contents of the installation package.
9. Run the `installns` script to install the new version of the system software. The script updates the `/etc` directory.

If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

Figure 1. Downgrade menu if configuration file exists

version	build	size	last modified	file name
Copied to ns.conf		72545	Jun 18 04:42	ns.conf.NS10.1-112.13
NS10.1	112.13	72545	Jun 18 04:42	ns.conf.NS10.1
NS10.1	112.13	72545	Jun 18 04:42	ns.conf.4
NS10.1	109.1	87219	Jun 18 04:42	ns.conf.NS10.1-109.1
NS10.1	93.051	74443	Jun 18 04:42	ns.conf.NS10.1-93.051
NS10.0	29.1.	62849	Jun 18 04:42	ns.conf.NS10.0-29.1.

Listed above are 5 configuration files, found in /nsconfig, that are appropriate for use with build 112.13.

Use the arrow keys to select an item in the menu above, then type:

- 'c' - copy file over ns.conf
- 'v' - view file (with vi; type ':q!' to exit vi)
- '>' - more files
- '<' - fewer files
- 'd' - done

If the free space available on the flash drive is insufficient to install the new build, the Citrix ADC aborts the installation. Manually clean up the flash drive and restart the installation.

**Example:**

```
1 login: nsroot
2
3 Password: nsroot
4

## Upgrade a high availability pair

December 10, 2020

One of the requirements of Citrix ADC appliances in a high availability setup is to install the same Citrix ADC software release on both appliances of the setup. Therefore, when software on one appliance is upgraded, ensure that the software is upgraded on both the appliances.

You can follow the same procedure to upgrade a standalone appliance or each appliance in a high availability pair, although additional considerations apply to upgrading a high availability pair.

Before you start a Citrix ADC firmware upgrade on an HA pair, read the prerequisites mentioned in the [Before you begin](#) section. Also, you need to consider a few HA-specific points.

### Points to note

- First upgrade the secondary node, and then the primary node. Upgrading software on the secondary appliance before the primary appliance ensures that the upgrade process is completed without any issues.
- If both the nodes in a high availability (HA) setup are running different Citrix ADC software releases, the following functionalities are disabled:
  - HA config synchronization
  - HA command propagation
  - HA synchronization of states services information
  - Connection mirroring (connection failover) of sessions
  - HA synchronization of persistence sessions information

- The above mentioned functionalities are disabled, if both the nodes in a high availability (HA) setup are running different builds of the same release but both the builds have different internal HA versions. The above mentioned functionalities works fine if both the nodes in a high availability (HA) setup are running different builds of the same release but both the builds have the same internal HA versions.

Refer to the Points to note section of the release notes to check if the internal HA version has changed in Citrix ADC build.

- Synchronization of the files in the All mode of the Sync HA files command works successfully if the two nodes in an HA configuration are running different Citrix ADC software releases, or the two nodes are running different builds of the same release. For more information, see [Synchronising Configuration Files in High Availability Setup](#).
- Synchronization of the files in the All mode of the Sync HA files command works successfully if the two nodes in an HA configuration are running different Citrix ADC software releases, or the two nodes are running different builds of the same release. For more information, see [Synchronising Configuration Files in High Availability Setup](#).

**Figure.** Upgrade a high availability pair

You can upgrade using the Citrix ADC CLI or GUI.

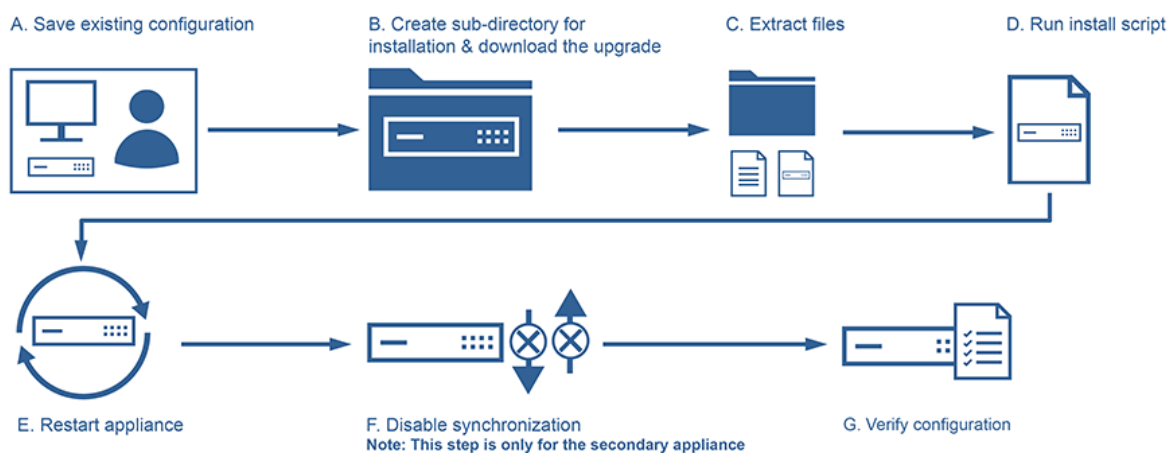

### Upgrade a high availability pair by using the CLI

The upgrade process includes the following steps:

1. Upgrade software on the secondary appliance
2. Upgrade software on the primary appliance
3. Synchronize secondary appliance

## Upgrade software on the secondary appliance

The following illustration depicts the procedure to upgrade software on the secondary appliance:

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY and specifying the NetScaler IP (NSIP). Use the nsroot credentials to log on to the appliance.
2. From the command line interface of the appliance, type the following command to save the existing configuration: `save config`
3. Switch to the shell prompt.

```

1 login as: username
2 Using keyboard-interactive authentication.
3 Password:
4 Last login: Wed Jun 24 14:59:16 2015 from 10.252.252.65
5 Done
6 > shell
7 Copyright (c) 1992-20
8
9 <!--NeedCopy-->

```

4. Run the following command to change to the default installation directory: `# cd /var/nsinstall`
5. Run the following command to create a temporary subdirectory of the nsinstall directory: `# mkdir x_xnsinstall`

Note: The text `x_x` is used to name the NetScaler version for future configurations. For example, the directory for the installation files of NetScaler 9.3 is called `9_3nsinstall`. Do not use a period (.) in the folder name, it can cause failed upgrades.

6. Change to the `x_xnsinstall` directory.
7. Download the required installation package and documentation bundle, such as “`ns-x.0-xx.x-doc.tgz`,” to the temporary directory created in Step 4.

**Notes:**

- Some builds do not have a documentation bundle as it does not have to be installed.
- Click the **Documentation** tab from the GUI to access the documentation.

8. Before you run the install script, the files must be extracted and placed on the appliance. Use the following command to uncompress the bundle downloaded from Citrix website: **tar -zxvf ns-x.0-xx.x-doc.tgz**. The following is a quick explanation of the parameters used.

x: Extract files

v: Print the file names as they are extracted one by one

z: The file is a “gzipped” file

f: Use the following tar archive for the operation

9. Run the following command to install the downloaded software: # ./installns

Note: If the appliance does not have sufficient disk space to install the new kernel files, the installation process performs an automatic cleanup of the flash drive.

10. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.
11. Log on to the appliance Command Line Interface using the nsroot credentials.
12. Run the following command from to display the state of the NetScaler appliance: **show ha node**  
The output of the preceding command should indicate that the appliance is a secondary node and synchronization is disabled.
13. Run the following command to disable synchronization on the appliance if synchronization is not disabled: **set ha node -hasync disabled**
14. Ensure that the configuration is complete and as expected.
15. Run the following command to perform a force failover and takeover as primary appliance: **force failover**

Here's a sample configuration in the new primary node.

```
1 login: nsroot
2 Password: nsroot
3 Last login: Monday Apr 17 08:37:26 2017 from 10.102.29.9
4 Done
5 show ha node
6     2 nodes:
7 1)   Node ID:      0
8     IP:          10.0.4.2
9     Node State: UP
```

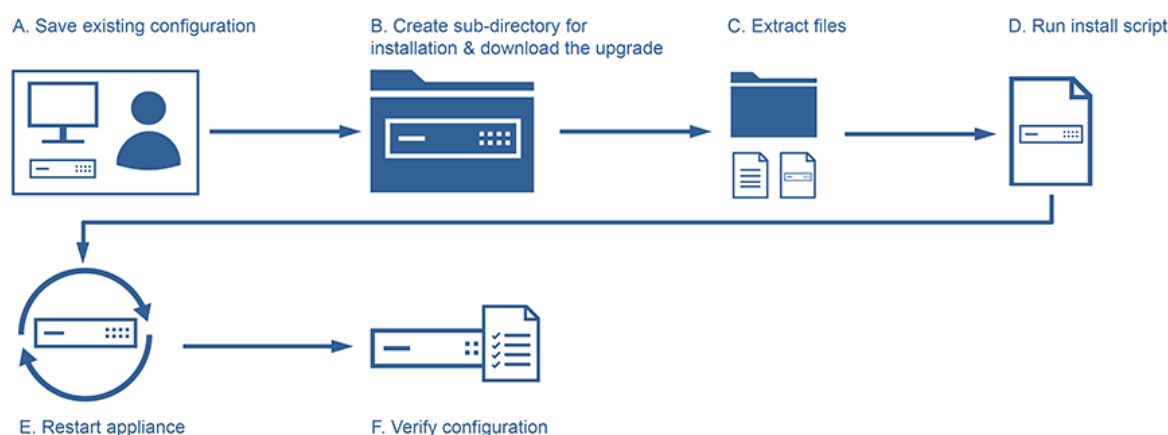

```

10      Master State: Primary
11      ...
12      Sync State: AUTO DISABLED
13      Propagation: AUTO DISABLED
14      ...
15 Done
16 <!--NeedCopy-->

```

## Upgrade software on the primary appliance

The following illustration depicts the procedure to upgrade software on the primary appliance:

Note: After completing the “Upgrade software on the secondary appliance” procedure, the original primary appliance is now a secondary appliance.

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY. Use the nsroot credentials to log on to the appliance. Follow the same steps as mentioned in the above section to complete the installation process. We have to follow the same steps as mentioned in step 2 to step 9 in the previous section(Upgrade software of the secondary appliance)
2. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.
3. Log on to the appliance Command Line Interface using the nsroot credentials.
4. Run the following command to display the state of the NetScaler appliance: **show ha node**. The output of the preceding command should indicate that the appliance is a secondary node and the status of the node state is marked as UP.
5. Run the following command to perform a force failover to ensure that the appliance is a primary appliance: **force failover**
6. Verify that the appliance is a primary appliance.

## Enable synchronization on the secondary appliance

To enable synchronization on the secondary appliance, complete the following procedure:

1. Run the following command to verify that the appliance is a secondary appliance: **show node**
2. Run the following command to enable synchronization on the appliance: **set ha node -hasync enabled**
3. Run the following command to verify that the configuration of the secondary appliance is synchronized with that of the primary appliance: **show ns runningconfig**

Here's an example configuration of the new primary node and the new secondary node.

```
1 show ha node
2     Node ID:      0
3     IP:    10.0.4.11
4     Node State: UP
5     Master State: Primary
6     ...
7     ...
8     INC State: DISABLED
9     Sync State: ENABLED
10    Propagation: ENABLED
11    Enabled Interfaces : 1/1
12    Disabled Interfaces : None
13    HA MON ON Interfaces : 1/1
14    ...
15    ...
16    Local node information
17    Critical Interfaces: 1/1
18 Done
19
20 Show ha node
21     Node ID:      0
22     IP:    10.0.4.2
23     Node State: UP
24     Master State: Secondary
25     ..
26     ..
27     INC State: DISABLED
28     Sync State: SUCCESS
29     Propagation: ENABLED
30     Enabled Interfaces : 1/1
31     Disabled Interfaces : None
32     HA MON ON Interfaces : 1/1
33     . . .
```

```
34      . . .
35      Local node information:
36      Critical Interfaces: 1/1
37 Done
38 <!--NeedCopy-->
```

## Upgrade a high availability pair by using the GUI

Follow these steps to upgrade a Citrix ADC pair in a high availability setup, by using the GUI:

1. Log on to the secondary node and perform the upgrade as described in the section “Upgrade a Citrix ADC standalone appliance by using the GUI” in [Upgrade a Citrix ADC standalone appliance](#).
2. Log on to the primary node and perform the upgrade as described in the section “Upgrade a Citrix ADC standalone appliance by using the GUI” in [Upgrade a Citrix ADC standalone appliance](#).

## Downgrade a high availability pair

September 21, 2020

You can downgrade to any release on a high availability pair by using the command line interface. The GUI does not support the downgrade process.

To downgrade the system software on a Citrix ADC pair in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see [Downgrade a Citrix ADC standalone appliance](#).

### Important

Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually re-enter any missing entries.

## Troubleshooting issues related to the installation, upgrade, and downgrade processes

November 4, 2020

If the appliance does not work as expected after you complete the installation, upgrade, or downgrade process, the first thing to do is to check for the most common causes of the problem.

## Resources for troubleshooting

For best results, use the following resources to troubleshoot an issue related to installing, upgrading, or downgrading a Citrix ADC:

- The configuration files from the appliance. In case of a High Availability pair, the configuration files from both appliances.
- The following files from the appliance(s):
  - The relevant newslog files.
  - The ns.log file.
  - The messages file.
- A network topology diagram.

## Issues and resolutions

Following are the most common installation, upgrade, and downgrade issues, and tips for resolving them:

### 1. Issue

Upgrading a Citrix ADC MPX appliance fails due to hardware and software incompatibility.

#### Resolution

See the [Citrix ADC MPX hardware-software compatibility matrix](#) and check whether the software release is supported on the Citrix ADC MPX hardware.

### 2. Issue

Upgrading a Citrix ADC VPX appliance fails due to Citrix ADC VPX appliance and hypervisor incompatibility.

#### Resolution

See the [Citrix ADC VPX appliance and hypervisor compatibility matrix](#) and check whether the Citrix ADC VPX appliance model is supported on the hypervisor.

### 3. Issue

Upgrading a Citrix ADC appliance fails due to hardware errors.

#### Resolution

Validate the integrity of the Citrix ADC appliance. If you have a Citrix ADC hardware appliance, Citrix recommends running `fsck` for running a disk check and validating the integrity of the Citrix ADC hard drive.

For more information, see [How to Verify the File System Integrity of a Citrix ADC appliance](#).

#### 4. **Issue**

Upgrading a Citrix ADC appliance by using the GUI stalls.

##### **Resolution**

Refresh the browser to check whether the upgrade is progressing or not.

#### 5. **Issue**

Upgrading a Citrix ADC appliance fails due to low Space in /var Directory

##### **Resolution**

Free up space on the /var directory. For more information, see

Refer to [How to free space on /var directory](#).

#### 6. **Issue**

The Citrix ADC is not accessible after the software downgrade

##### **Cause**

During the software downgrade process, if the configuration file of the existing release and build does not match the configuration file of the earlier release and build, the appliance cannot load the configuration, and the default IP address is assigned to the appliance.

##### **Resolution**

- Verify that the appliance is accessible from the console.
- Verify the NSIP address and the routes on the appliance.
  - If the IP address has changed to the default 192.168.100.1 IP address, change the IP address as required.
  - Verify that the appliance is accessible.

#### 7. **Issue**

During an upgrade, if I run the command for synchronizing, the following message appears:

Command failed on the secondary node but succeeded on the primary node.

##### **Resolution**

Do not run any dependent commands (set /unset /bind /unbind) when High Availability (HA) synchronization is in progress.

#### 8. **Issue**

During an upgrade process, traffic does not pass through the new primary node when you run the force failover command.

##### **Resolution**

- Check for problems with the network topology and the switch configurations.

- Run the `set L2param -garpreply ENABLED` command to enable the GARP reply.
- Try using Virtual MAC if not already used.
- Run the `sendarp -a` command from the primary node.

#### 9. Issue

After upgrading or downgrading a Citrix ADC appliance, connecting to the appliance fails through SSH.

#### Resolution

Perform the following operations in the Citrix ADC appliance:

- Remove old or insecure host keys at `/nsconfig/ssh/ssh_host_*`.
- Review the custom SSHD configuration at `/nsconfig/sshd_config` and check if it is still relevant and compatible. Rename or remove the custom SSHD configuration accordingly.
- Cold reboot the Citrix ADC appliance

#### 10. Issue

In an HA pair, after you run the `force HA failover` command the devices keep rebooting. The secondary device does not come up after an upgrade.

#### Resolution

Check to see if the `/var` directory is full. If so, remove the old installation files. Run the `df -h` command to show the available disk space.

#### 11. Issue

After upgrading an HA pair, one of the nodes is listed as state UNKNOWN.

#### Resolution

- Check to see if both nodes are running the same build. If the builds are not same and HA nodes have a version mismatch, some of the fields are shown as UNKNOWN when you run the `show ha node` command.
- Check to see if the secondary appliance is reachable.

#### 12. Issue

After you upgrade the Citrix ADC, the interface shows most of the load balancing virtual servers and services are DOWN.

#### Resolution

Verify that the SNIP address is active on the secondary appliance. Also, type the `show service` command to see if the service is running.

#### 13. Issue

After performing an upgrade, all virtual servers are down on the secondary appliance.

**Resolution**

Enable the HA state and HA synchronization by running the following commands:

- set node hastate enable
- set node hasync enable

Disabling HA is not recommended.

**14. Issue**

After performing a downgrade, the Citrix ADC does not boot up properly.

**Resolution**

Check to see if the correct license has been installed.

**15. Issue**

In an HA pair, some features do not get synchronized after an upgrade is performed.

**Resolution**

Run the sync ha file misc command to synchronize the configurations files from the primary node to secondary node.

**16. Issue**

During reboot, the following error message appears:

One or more commands in ns.conf failedWhat should I do?

**Resolution**

Make sure that no command in the ns.conf file exceeds the 255 byte limit. In commands that create policies that are too long for the 255-byte limit, you can use pattern sets to shorten the policies.

Example:

```
1 add cs policy p11 -rule 'HTTP.REQ.URL.ENDSWITH_ANY("
   ctx_file_extensions")'
2 Done
3 <!--NeedCopy-->
```

ctx\_file\_extensions is a default patset that covers a large number of extensions. In addition to the default pattern sets, you can create user-defined pattern sets. Add a patset by running the following command:

```
1 add patset <name>
2 <!--NeedCopy-->
```

Note: Patsets are supported only in release 9.3 or later.

#### 17. Issue

When upgrading a Citrix ADC VPX appliance, I am told to free up space in /var. What files do I remove?

##### Resolution

Remove the old installation files from /var/tmp/ directory. Also remove unwanted files from /flash.

#### 18. Issue

There is no connectivity to the graphical user interface (GUI) when you run the force HA failover command on the secondary appliance.

##### Resolution

Log on to the secondary appliance using the command line interface and enable the access to GUI by running the set ns ip <IP> -gui enabled command.

#### 19. Issue

After performing an upgrade, and when I click on any link on the GUI that has to load a java applet (Upgrade Wizard or license Wizard), the following error message appears: **GUI version does not match with the kernel version. Please close this instance, clear java plug-in cache and reopen.**

##### Resolution

- Log on to the Citrix ADC using the GUI.
- Navigate to Citrix ADC Gateway > Global Settings.
- Click Change Global Settings under Settings.
- In the details pane, under Client Experience, select Default from the UI theme list.
- Click OK.

##### Note

These troubleshooting steps also apply to issues with configuration loss when downgrading the software across multiple releases.

For any other issue, see the release notes, Knowledge Center articles, and FAQs.

## FAQs

September 21, 2020

For answers to the questions that you might have about upgrading the Citrix ADC firmware, see the [Installing, Upgrading, and Downgrading FAQs](#).

## New and deprecated commands, parameters, and SNMP OIDs

February 8, 2021

This section lists the new and deprecated commands, parameters, and SNMP OIDs.

### New commands

The following table lists the new commands in release 12.1.

Command group	Command
-	
GSLB	rename gslb seviceGroup
LSN	stat lsn pool
Network	stat rnat6 and stat MapBmr
User	enable user vserver and disable user vserver

### New parameters

**Command group:** AAA

**Command:**

- show aaa session [-sessionKey]
- kill aaa session [-sessionKey]
- set aaa radiusParams {-tunnelEndpointClientIP}
- show aaa radiusParams [-tunnelEndpointClientIP]
- set aaa parameter [-maxSamIDeflateSize] [-persistentLoginAttempts] [-pwdExpiryNotificationDays]
- unset aaa parameter [-maxSamIDeflateSize] [-persistentLoginAttempts] [pwdExpiryNotificationDays]
- show aaa parameter [maxSamIDeflateSize] [persistentLoginAttempts][pwdExpiryNotificationDays]

**Command group:** AppFlow

**Command:**

- set appflow param [-lsnLogging] [-emailAddress]
- show appflow param [lsnLogging] [-emailAddress]

**Command group:** Application Firewall

**Command:**

- bind appfw [-logExpression]
- unbind appfw profile [-logExpression]
- show appfw profile [-logExpression] [expression]
- show appfw xmlerrorpage [-src]
- show appfw signatures [-src]

**Command group:** Audit**Command:**

- add audit syslogAction [-urlFiltering]
- set audit syslogAction [-urlFiltering]
- unset audit syslogAction [-urlFiltering]
- show audit syslogAction [-urlFiltering]
- add audit nslogAction [-urlFiltering]
- set audit nslogAction [-urlFiltering]
- unset audit nslogAction [-urlFiltering]
- show audit nslogAction [-urlFiltering]
- set audit syslogParams [-urlFiltering]
- unset audit syslogParams [-urlFiltering]
- show audit syslogParams [-urlFiltering]
- set audit nslogParams [-urlFiltering]
- unset audit nslogParams [-urlFiltering]
- show audit nslogParams [-urlFiltering]

**Command group:** Authentication**Command:**

- dd authentication radiusAction [-tunnelEndpointClientIP]
- set authentication radiusAction [-tunnelEndpointClientIP]
- show authentication radiusAction [-tunnelEndpointClientIP]
- add authentication ldapAction [-Attributes] [-sshPublicKey] [-email]
- set authentication ldapAction [-Attributes] [-sshPublicKey] [-pushService] [-email]
- show authentication ldapAction [-Attributes] [-sshPublicKey] [-pushService] [-email]
- add authentication samlAction [-groupNameField] [-audience] [-metadataUrl] [-metadataRefreshInterval]
- set authentication samlAction [-groupNameField] [-audience] [-metadataUrl] [-metadataRefreshInterval]
- show authentication samlAction [-groupNameField] [-audience] [-metadataUrl] [-metadataRefreshInterval] [-metadataImportStatus]
- add authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
- set authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
- set authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
- show authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval] [-metadataImportStatus]
- add authentication OAuthAction [-UserInfoURL] [-CertFilePath] [-grantType]

- set authentication OAuthAction [-UserInfoURL] [-CertFilePath] [-grantType]
- show authentication OAuthAction [-UserInfoURL] [-CertFilePath] [-grantType]
- add authentication OAuthIDPProfile [-relyingPartyMetadataURL] [-refreshInterval][[-encryptToken]
- set authentication OAuthIDPProfile [-relyingPartyMetadataURL] [-refreshInterval][[-encryptToken]
- how authentication OAuthIDPProfile [-relyingPartyMetadataURL] [-refreshInterval][[-encryptToken] [-OAuthStatus]

**Command group:** Cache Redirection

**Command:**

- show cr vserver [-ipset]

**Command group:** Content Switching

**Command:**

- add cs vserver [-ipset]
- set cs vserver [-ipset]
- bind cs vserver [-analyticsProfile]
- unbind cs vserver [-analyticsProfile]
- show cs vserver [-ipset] [-analyticsProfile]

**Command group:** GSLB

**Command:**

- show gslb site [-svcmnum] [-svcgrnm]
- bind gslb vserver [-serviceName]
- unbind gslb vserver [-serviceName]
- show gslb vserver [-svcmnum] [-svcgrnm] [-serverName] [-serviceName]
- show gslb domain [-serviceName]
- show gslb syncStatus [-summary]
- add gslb serviceGroup [-sitePersistence]
- set gslb serviceGroup [-sitePersistence]
- unset gslb serviceGroup [-sitePersistence]
- bind gslb serviceGroup [-sitePrefix]
- show gslb serviceGroup [-sitePersistence] [-sitePrefix]

**Command group:** Load Balancing

**Command:**

- add lb vserver [-ipset]
- set lb vserver [-ipset]
- bind lb vserver [-analyticsProfile]
- unbind lb vserver [-analyticsProfile]

- show lb vserver [-ipset] [-analyticsProfile]

**Command group:** LSN

**Command:**

- add lsn pool [-total|poolipsbound]
- bind lsn pool [-ownerNode] [-lastip]
- unbind lsn pool [-ownerNode] [-firstip] [-lastip]
- show lsn pool [-ownerNode] [-firstip] [-lastip] [-total|poolipsbound]
- add lsn client [-clientType]
- show lsn client [-clientType]
- add lsn logprofile [-logipfix]
- set lsn logprofile [-logipfix]
- show lsn logprofile [-logipfix]
- bind lsn appsprofile [-firstport] [-lastport]
- unbind lsn appsprofile [-firstport] [-lastport]
- show lsn appsprofile [-firstport] [-lastport]

**Command group:** Network

**Command:**

- add netProfile [-MBF]
- set netProfile [-MBF]
- show netProfile [-MBF]
- set L3Param [-allowClassEIPv4]
- show L3Param [-allowClassEIPv4]

**Command group:** Network

**Command:**

- add ns acl [-type] [-dfdhash] [-stateful]
- set ns acl [-dfdhash] [-stateful]
- unset ns acl [-stateful]
- show ns acl [-type] [-dfdhash] [-stateful]
- add ns acl6 [-type] [-dfdhash] [-dfdprefix] [-stateful] [-logstate] [-ratelimit]
- set ns acl6 [-logstate] ratelimit] [-dfdhash] [-dfdprefix] [-stateful]
- unset ns acl6 [-logstate] [-ratelimit] [-stateful]
- show ns acl6 [-type] [-logstate] [-ratelimit] [-dfdhash] [-dfdprefix] [-stateful]
- add ns ip6 [-decrementHopLimit]
- set ns ip6 [-decrementHopLimit]
- show ns ip6 [-decrementHopLimit]
- add ns ip [-decrementTTL]

- set ns ip [-decrementTTL]
- show ns ip [-decrementTTL]
- add ns tcpProfile [-tcpFastOpenCookieSize]
- set ns tcpProfile [-tcpFastOpenCookieSize]
- show ns tcpProfile [-tcpFastOpenCookieSize]
- renumber ns acls [-type]
- clear ns acls [-type]
- apply ns acls [-type]
- show ns license [-isSWGLic] [-RemoteContentInspection]
- show ns config [-primaryIP6]
- clear ns acls6 [-type]
- apply ns acls6 [-type]
- renumber ns acls6 [-type]
- show ns feature [-CI]
- set ns diameter [-ownerNode]
- show ns diameter [-ownerNode]
- show ns hardware [-bmcRevision]
- set ns capacity [-vcpu]
- unset ns capacity [-vcpu]
- show ns capacity [-vcpuCount] [-maxVcpuCount]

**Command group:** RDP**Command:**

- add rdp clientprofile [-randomizeRDPFilename] [-rdpLinkAttribute]
- set rdp clientprofile [-randomizeRDPFilename] [-rdpLinkAttribute]
- show rdp clientprofile [-randomizeRDPFilename] [-rdpLinkAttribute]
- add rdp serverprofile [-rdpRedirection]
- set rdp serverprofile [-rdpRedirection]
- show rdp serverprofile [-rdpRedirection]

**Command group:** SSL**Command:**

```
1 - show ssl certKey [-ocspBindReferences]
2 - add ssl action [-ssllogProfile]
3 - show ssl action [-ssllogProfile]
4 - add ssl ocspResponder [-ocspUrlResolveTimeout] [-httpMethod]
5 - set ssl ocspResponder [-ocspUrlResolveTimeout] [-httpMethod]
6 - show ssl ocspResponder [-ocspUrlResolveTimeout] [-httpMethod]
7 - create ssl certReq [-subjectAltName]
8 - create ssl cert [-subjectAltName]
```

```
9 - set ssl vserver [-zeroRttEarlyData] [-  
    tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]  
10 - show ssl vserver [-zeroRttEarlyData] [-  
    tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]  
11 - add ssl profile [-ssllogProfile] [-zeroRttEarlyData] [-  
    tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]  
12 - set ssl profile [-ssllogProfile] [-zeroRttEarlyData] [-  
    tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]  
13 - show ssl profile [-ssllogProfile] [-zeroRttEarlyData] [-  
    tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]  
14 <!--NeedCopy-->
```

**Command group:** Stream**Command:**

- add stream identifier [-trackAckOnlyPackets]
- set stream identifier [-trackAckOnlyPackets]
- show stream identifier [-trackAckOnlyPackets]

**Command group:** System**Command:**

- set system parameter [-allowDefaultPartition] [-reauthOnAuthParamChange] [-removeSensitiveFiles]
- show system parameter [-allowDefaultPartition] [-reauthOnAuthParamChange] [-removeSensitiveFiles]

**Command group:** Subscriber**Command:**

- add subscriber profile [-vlan]
- set subscriber profile [-vlan]
- rm subscriber profile [-vlan]
- show subscriber profile [-vlan]
- clear subscriber sessions [-vlan]
- show subscriber sessions [-vlan]

**Command group:** Tunnel**Command:**

- show tunnel trafficPolicy [-piTxBytes] [-piRxBytes] [-piClTTLB] [-piClTTransactions] [-piSvrTTLB] [-piSvrTransactions]

**Command group:** User**Command:**

- add user vserver [-state]

- enable user vserver [-state]
- disable user vserver [-state]
- show user vserver [-state]

**Command group:** User

**Command:**

- bind vpn vserver [-analyticsProfile]
- unbind vpn vserver [-analyticsProfile]
- show vpn vserver [-ipset] [-analyticsProfile]
- show vpn trafficPolicy [-piHits]

## New SNMP OIDs

For more information, see the [SNMP OID Reference](#) guide.

## Solutions for Telecom Service Providers

September 21, 2020

Information and Communication Technology (ICT) is about bringing the Internet user closer to the apps and data. The latest datacenter technologies have enabled the user, apps and data to be located anywhere. A user can access apps and data from the office or from home, or from a location such as an airport. The apps and data can be located either on the enterprise's premises, in a public or private cloud, or on a hybrid host. The result has been on only increased productivity, but also reduced costs of ownership and maintenance.

Service providers offer the core infrastructure needed for carrying the user's apps and data over the network. Because the core infrastructure serves millions of subscribers and a wide variety of apps and data, requirements for scale and protocol support are very high. The core infrastructure handles two major types of traffic: data plane and control plane. Each of these planes has its own scale and protocol-support requirements.

The data plane is the part of the core infrastructure that carries user apps and data from end to end, that is, between end-user equipment and the application server. The number of users accessing apps and data is in the thousands of millions, so throughput and IP-addressing requirements are very high. Every user in the network must be uniquely identifiable. Only then can the service provider control the traffic, monitor network usage, deliver user-specific services, and log information correctly. Many of today's client devices and application servers support IPv6 natively. The core infrastructure must not only support a mix of IPv4 and IPv6 clients and servers, but also provide the technologies for cross-communication between IPv4 and IPv6. Finally, a service provider is measured by the quality of service (directly related to end-user experience) and the availability of service without disruptions. The data plane should be resilient enough to provide both quality and availability at the same time.

The control-plane infrastructure manages user traffic and maintains the business and network operations services. The most important of the many protocols that run in this plane are Diameter, Radius, and SMPP. Diameter is a base protocol over which several other function-specific protocols have been developed. For example:

- Gx interface between the Policy and Charging Enforcement Function (PCEF) and the Policy and Charging Rules Function (PCRF)
- Gy interface between the Online Charging System (OCS) and the Cisco Packet Data Network Gateway (PGW)/Policy and Charging Enforcement Function (PCEF)

The volume of control plane traffic is in direct proportion to user activity. To manage the control plane traffic, service providers use several ADC functionalities, such as load balancing and content switching. They need fine-grain control of control plane traffic, which equals data-plane traffic in complexity.

Service providers must meet demanding service-level agreements (SLAs), and are scrutinized thoroughly by regulators for compliance. Adhering to requirements while managing the data and control plane traffic requires a service provider to keep its infrastructure nimble, within budget, easily upgradable, and flexible. As the most powerful and advanced ADCs in the market today, Citrix ADC products are a natural fit for the service-provider environment.

## Large Scale NAT

September 21, 2020

**Note**

This feature is available with a Citrix ADC Advanced or Premium edition license.

The Internet's phenomenal growth has resulted in a shortage of public IPv4 addresses. Large Scale NAT (LSN/CGNAT) provides a solution to this issue, maximizing the use of available public IPv4 addresses by sharing a few public IPv4 addresses among a large pool of Internet users.

LSN translates private IPv4 addresses into public IPv4 addresses. It includes network address and port translation methods to aggregate many private IP addresses into fewer public IPv4 addresses. LSN is designed to handle NAT on a large scale. The Citrix ADC LSN feature is very useful for Internet Service Providers (ISPs) and carriers providing millions of translations to support a large number of users (subscribers) and at very high throughput.

### **LSN Architecture**

The LSN architecture of an ISP using Citrix products consists of subscribers (Internet users) in private address spaces accessing the Internet through a Citrix ADC appliance deployed in ISP's core network. Subscribers are connected to the ISP through the ISP's access network. Usually, subscribers for commercial use of the Internet are directly connected to the ISP's access network. Serving those subscribers requires only one level of NAT (NAT44).

Noncommercial subscribers, however, are typically behind customer-premises equipment (CPE), such as routers and modems, that also implements NAT. These two levels of NAT create the NAT444 model. Deploying a Citrix ADC appliance in an ISP's core network for LSN functionality is transparent to the subscribers and requires no configuration changes to subscribers or the CPEs.

The Citrix ADC appliance receives all subscriber packets destined to the Internet. The appliance is configured with a pool of pre-defined NAT IP addresses to use for LSN. The Citrix ADC appliance uses its LSN feature to translate the source IP address (private) and port of the packet to the NAT IP address (public) and NAT port, and then sends the packet to its destination on the Internet. The appliance maintains a record of all active sessions that use the LSN feature. These sessions are called LSN sessions. The Citrix ADC appliance also maintains the mappings between subscriber IP address and port, and NAT IP address and port, for each session. These mappings are called LSN mappings. From LSN sessions and LSN mappings, the Citrix ADC appliance recognizes a response packet (received from the Internet) belonging to a particular session. The appliance translates the destination IP address and port of the response packet from NAT IP address:port to the subscriber IP address:port, and sends the translated packet to the subscriber.

### **LSN Features Supported on Citrix ADC appliance**

The following describes some of the LSN features supported on Citrix ADC appliance:

#### **NAT Resource Allocation**

The Citrix ADC appliance allocates NAT IP addresses and ports, from its pre-defined NAT resource pool, to subscribers to translate their packets for transmission to external hosts (Internet). The Citrix ADC

appliance supports the following types of NAT IP address and port allocation for subscribers:

- **Deterministic.** The Citrix ADC appliance allocates a NAT IP address and a block of ports to each subscriber. The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The Citrix ADC appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the Citrix ADC appliance does not log any LSN session created or deleted. If the entire block of ports is being used, the Citrix ADC appliance drops any new connection from the subscriber.

- **Dynamic.** The Citrix ADC appliance allocates a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. When port block allocation is enabled in the configuration, the appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The Citrix ADC appliance then allocates this NAT IP address and one of the ports from the allocated block to each subsequent connection from this subscriber. If the entire block of ports is being used, the appliance allocates a new random port block to the subscriber when it initiates a new connection. One of the port in the new port block is allocated for the new connection.

### IP Pooling

The following NAT resource allocation options are available for subsequent sessions of a subscriber who was allocated a random NAT IP address and port for an existing session.

- **Paired.** The Citrix ADC appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When no more ports are available for that address, the appliance drops any new connections from the subscriber. This option is needed for proper functioning of certain applications that require creation of multiple sessions on the same source IP address (for example in peer-to-peer applications that use RTP or RTCP protocol).
- **Random.** The Citrix ADC appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

### Reusing LSN Mappings

The Citrix ADC appliance can reuse an existing LSN map for new connections originating from the same subscriber IP address and port. The Citrix ADC LSN feature supports the following types of LSN mapping reuse:

1. **Endpoint Independent.** The Citrix ADC appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port. This type of LSN map reuse is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The Citrix ADC appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
3. **Address port dependent.** The Citrix ADC appliance reuses the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

### LSN Filtering

The Citrix ADC appliance can filter packets from external hosts based on the active LSN sessions and LSN mappings. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). The Citrix ADC LSN feature supports the following types of filtering:

1. **Endpoint Independent.** The Citrix ADC appliance filters out only those packets that are not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x), regardless of the external host IP address and port source (Z:z). The Citrix ADC appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external host to the subscriber. This type of filtering is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The Citrix ADC appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
3. **Address port dependent.** The Citrix ADC appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external IP address and port.

### Quotas

The Citrix ADC appliance can limit the number of NAT ports and sessions for each subscriber to ensure fair distribution of resources among subscribers. The Citrix ADC appliance can also limit the number

of session for a subscriber group to ensure fair distribution of resources among different subscriber groups.

- **Port quota.** The Citrix ADC appliance can limit the LSN NAT ports to be used at a time by each subscriber for a specified protocol. For example, you could limit each subscriber to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the Citrix ADC appliance does not allocate additional NAT ports of the specified protocol to that subscriber.
- **Subscriber Session Limit.** The number of concurrent session for a subscriber can be more than its port quota. The Citrix ADC appliance can limit the LSN sessions allowed for each subscriber for a specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the Citrix ADC appliance does not allow the subscriber to open additional sessions of the specified protocol.
- **Group Session Limit.** The Citrix ADC appliance can limit the total number of LSN sessions allowed for a subscriber group for a specified protocol. When the total number of LSN sessions reaches the limit for a group for a specified protocol, the Citrix ADC appliance does not allow any subscriber of the group to open additional sessions of the specified protocol. For example, You limit a group to a maximum of 10000 UDP sessions. When the total number of UDP sessions for this group reaches 10000, the Citrix ADC appliance does not allow any subscriber of the group to open additional UDP sessions.

### Application Layer Gateways

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over LSN.

The Citrix ADC appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

### Hairpin Support

The Citrix ADC appliance supports communication between subscribers or internal hosts using NAT IP addresses. This type of communication between two subscribers using NAT IP addresses is called hairpin flow. Hairpin flow is enabled by default, and you cannot disable it.

## Points to Consider before Configuring LSN

September 21, 2020

Consider the following points before configuring LSN on a Citrix ADC appliance:

- Make sure that you understand the different components of Large Scale NAT, described in RFCs 6888, 5382, 5508, and 4787.
- Endpoint independent mapping (EIM) and endpoint independent filtering (EIF) are disabled by default. These options must be enabled for proper functioning of VoIP and peer-to-peer (P2P) applications.
- **Logging LSN:** Following are the consideration points for logging LSN information:
  - Citrix recommends logging the LSN information on external log servers instead of on the Citrix ADC appliance. Logging on external servers facilitates optimal performance when the appliance creates large numbers of LSN log entries (in order of millions).
  - Citrix recommends using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.
  - The following limitations apply to SYSLOG over TCP:
    - \* The Syslog over TCP solution does not provide authentication, integrity check, and privacy.
    - \* The Citrix ADC appliance relies on the TCP protocol to provide confirmation of SYSLOG message delivery to external log servers.
- **High Availability:** Following are the consideration points for high availability of Citrix ADC appliances for LSN:
  - Citrix recommends configuring the LSN feature in a high availability deployment of two Citrix ADC appliances for uninterrupted and seamless operation of all LSN sessions.
  - In a high availability deployment, Citrix recommends:
    - \* Setting the SYNC VLAN parameter for dedicating a VLAN for all HA related communication.
    - \* Synchronizing the symmetric RSS key of the primary node to the secondary node for stateful synchronization of a large number of LSN mappings and sessions.
    - \* Binding the subnet of LSN IP addresses to a VLAN to avoid flooding of GARP broadcasts on all VLANs after a failover.
  - In a high availability deployment of Citrix ADC appliances, ALG-related sessions are not mirrored to the secondary appliance.
- **Application Layer Gateways (ALGs):** Following are the consideration points related for ALGs on a Citrix ADC appliance:
  - The following are not supported for SIP ALG:
    - \* Multicast IP addresses

- \* Encrypted SDP
- \* SIP messages over TLS
- \* FQDN translation in SIP messages
- \* Authentication of SIP messages
- \* Traffic domains, admin partitions, and Citrix ADC clusters.
- \* SIP messages with multipart bodies.
- The following are not supported for RTSP ALG:
  - \* Multicast RTSP sessions
  - \* RTSP session over UDP
  - \* Citrix ADC traffic domains, admin partitions, and Citrix ADC clusters
- The Citrix ADC appliance does not support ALG for the IPsec protocol.
- If you disable the LSN feature when some LSN sessions exist on the Citrix ADC appliance, these sessions continue to exist for the duration of the configured timeout interval.
- LSN takes precedence over RNAT. If a packet from a specified LSN subscriber also matches a RNAT rule, the packet is translated according to the LSN configuration.
- Forwarding of packets related only to the LSN sessions is based on the Citrix ADC appliance's routing table.
- Unlike with subnet IP addresses, selection of an LSN NAT IP address for a subscriber's connection is not based on the routing entry for the destination IP address.
- For inbound packets, static LSN mappings take precedence over dynamic LSN mappings.
- For outbound packets, LSN application profiles take precedence over static mapping.
- When a large number of LSN sessions (> 1 million) exist on the Citrix ADC appliance, Citrix recommends displaying selected LSN sessions instead of all of them. In the command line interface or the configuration utility, use the selection parameters for showing LSN session operation.
- To reduce the amount of active memory allocated to the LSN feature, you must warm restart the Citrix ADC appliance after changing the configured-memory setting. Without a warm restart, you can only increase the amount of active memory.

## Configuration Steps for LSN

September 21, 2020

Configuring LSN on a Citrix ADC appliance consists of the following tasks:

1. **Set the global LSN parameters.** Global parameters include the amount of Citrix ADC memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
2. **Create an LSN client entity and bind subscribers to it.** An LSN client entity is a set of subscribers on whose traffic you want the Citrix ADC appliance to perform LSN. The client entity includes IPv4 addresses and extended ACL rules for identifying subscribers. An LSN client can

be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.

3. **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the Citrix ADC appliance to perform LSN. The pool is assigned parameters, such as port block allocation and NAT type (Deterministic or Dynamic). An LSN pool bound to an LSN group applies to all subscribers of an LSN client entity bound to the same group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.
4. **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage, that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
5. **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.
6. **Create an LSN Group and bind LSN pools, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to

all the subscribers of an LSN client bound to the LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

The following table lists the maximum numbers of different LSN entities and bindings that can be created on a Citrix ADC appliance. These limits are also subject to memory available on the Citrix ADC appliance.

LSN entities and bindings	Limit
LSN clients	1024
LSN pools	128
LSN groups	1024
Subscriber networks that can be bound to an LSN client	64
Extended ACLs that can be bound to an LSN client	1024
NAT IP addresses in a Pool	4096
LSN pools that can be bound to an LSN group	8
LSN groups that can use the same LSN pool	16
LSN transport profiles that can be bound to an LSN group	3 (one each for TCP, UDP, and ICMP protocols )
LSN groups that can use same LSN transport profile	8
LSN application profiles that can be bound to an LSN group	64
LSN groups that can use same LSN application profile	8
Port ranges that can be bound to an LSN application profile	8

## Configuration Using the Command Line Interface

### To create an LSN client by using the command line interface

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
4 <!--NeedCopy-->
```

### To bind a network address or an ACL rule to an LSN client by using the command line interface

At the command prompt, type:

```
1 bind lsn client <clientname> ((-network <ip_addr> [-netmask <netmask>]
   [-td<positive_integer>]) | -aclname <string>)
2
3 show lsn client
4 <!--NeedCopy-->
```

### To create an LSN pool by using the command line interface

At the command prompt, type:

```
1 add lsn pool <poolname> [-nattype ( DYNAMIC | DETERMINISTIC )] [-
   portblockallocation ( ENABLED | DISABLED )] [-portrealloctimeout <
   secs>] [-maxPortReallocTmq <positive_integer>]
2
3 show lsn pool
4 <!--NeedCopy-->
```

### To bind an IP address range to an LSN pool by using the command line interface

At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
4 <!--NeedCopy-->
```

**Note:** For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

**To create an LSN transport profile by using the command line interface**

At the command prompt, type:

```
1 add lsn transportprofile <transportprofilename> <transportprotocol> [-  
  sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <  
  positive_integer>] [-sessionquota <positive_integer>] [-  
  portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (   
  ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]  
2  
3 show lsn transportprofile  
4 <!--NeedCopy-->
```

**To create an LSN application profile by using the command line interface**

At the command prompt, type:

```
1 add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (   
  PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-  
  tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]  
2  
3 show lsn appsprofile  
4 <!--NeedCopy-->
```

**To bind an application protocol port range to an LSN application profile by using the command line interface**

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>  
2  
3 show lsn appsprofile  
4 <!--NeedCopy-->
```

**To create an LSN group by using the command line interface**

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC |   
  DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging (   
  ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-  
  sessionSync (ENABLED | DISABLED )] [-snmptraplimit <positive_integer  
  >] [-ftp ( ENABLED | DISABLED )]
```

```
2
3 show lsn group
4 <!--NeedCopy-->
```

### To bind LSN profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> (-poolname <string> | -transportprofilename
   <string> | -appsprofilename <string>)
2
3 show lsn group
4 <!--NeedCopy-->
```

### Configuration Using the Configuration Utility

To configure an LSN client and bind an IPv4 network address or an ACL rule by using the configuration utility

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv4 network address or an ACL rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility

Navigate to **System > Large Scale NAT > Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN transport profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport** tab, and then add a transport profile.

To configure an LSN application profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application** tab, and then add an application profile.

To configure an LSN group and bind an LSN client, pools, transport profiles, and application profiles by using the configuration utility

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, pools, transport profiles, and application profiles to the group.

### Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn client

- clientname

Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn client1" or 'lsn client1').

This is a mandatory argument. Maximum Length: 127

### **Parameter Descriptions (of commands listed in the CLI procedure)**

- bind lsn client

- clientname

Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn client1" or 'lsn client1').

This is a mandatory argument. Maximum Length: 127

- network

IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the Citrix ADC appliance to perform Large Scale NAT.

- netmask

Subnet mask for the IPv4 address specified in the Network parameter.

Default value: 255.255.255.255

- td

ID of the traffic domain on which this subscriber or the subscriber network (as specified by the network parameter) belongs.

If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain.

Default value: 0

Minimum value: 0

Maximum value: 4094

- aclname

Name(s) of any configured extended ACL(s) whose action is ALLOW. The condition specified in the extended ACL rule identifies the traffic from an LSN subscriber for which the Citrix ADC appliance is to perform large scale NAT. Maximum Length: 127

### Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn pool

- poolname

Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1').

This is a mandatory argument. Maximum Length: 127

- nattype

Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group):

Available options function as follows:

- \* **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The Citrix ADC appliance sequentially allocates NAT resources to these subscribers. The Citrix ADC appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
- \* **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscribers connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the Citrix ADC appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection

for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

– portblockallocation

Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the Citrix ADC appliance allocates a NAT port from the subscribers allocated NAT port block to create the LSN session.

You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the Citrix ADC appliance allocates a new random port block for the subscriber.

For Deterministic NAT, this parameter is enabled by default, and you cannot disable it.

Possible values: ENABLED, DISABLED

Default value: DISABLED

– portrealloctimeout

The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:

- \* Deterministic NAT
- \* Address-Dependent filtering and Address-Port-Dependent filtering
- \* Dynamic NAT with port block allocation

In these cases, ports are immediately reallocated.

Default value: 0

Maximum value: 600

– maxPortReallocTmq

Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address.

When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session.

Default value: 65536

Maximum value: 65536

### **Parameter Descriptions (of commands listed in the CLI procedure)**

- bind lsn pool

- poolname

Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore ( \_ ) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1').

This is a mandatory argument. Maximum Length: 127

- lsnip

IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN.

After the pool is created, these IPv4 addresses are added to the Citrix ADC appliance as Citrix ADC owned IP address of type LSN. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the Citrix ADC appliance as any Citrix ADC owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool.

### **Parameter Descriptions (of commands listed in the CLI procedure)**

- add lsn transportprofile

- transportprofilename

Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore ( \_ ) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn transport profile1" or 'lsn transport profile1').

This is a mandatory argument. Maximum Length: 127

- transportprotocol

Protocol for which to set the LSN transport profile parameters.

This is a mandatory argument.

Possible values: TCP, UDP, ICMP

- sessiontimeout

Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the Citrix ADC appliance removes the session.

This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints.

Default value: 120

Minimum value: 60

- firrsttimeout

Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints.

If a TCP LSN session is idle (after the Citrix ADC appliance receives a FIN or RST message) for a time that exceeds this value, the Citrix ADC appliance removes the session.

Since the LSN feature of the Citrix ADC appliance does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection.

Default value: 30

- portquota

Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the Citrix ADC appliance does not allocate additional NAT ports for that subscriber.

Default value: 0

Minimum value: 0

Maximum value: 65535

- sessionquota

Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the Citrix ADC appliance does not allow the subscriber to open additional sessions.

Default value: 0

Minimum value: 0

Maximum value: 65535

– portpreserveparity

Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the Citrix ADC appliance allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol.

Possible values: ENABLED, DISABLED

Default value: DISABLED

– portpreserverange

If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the Citrix ADC appliance can allocate port 100 as the NAT port for this connection.

This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports.

When all the well-known ports of all the available NAT IP addresses are used in different subscribers connections (LSN sessions), and a subscriber initiates a connection from a well-known port, the Citrix ADC appliance drops this connection.

Possible values: ENABLED, DISABLED

Default value: DISABLED

– syncheck

Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the Citrix ADC appliance.

If you disable this parameter, the Citrix ADC appliance accepts any non-SYN packets and creates a new LSN session entry for this connection.

Following are some reasons for the Citrix ADC appliance to receive such packets:

- \* LSN session for a connection existed but the Citrix ADC appliance removed this session because the LSN session was idle for a time that exceeded the configured session timeout.
- \* Such packets can be a part of a DoS attack.

Possible values: ENABLED, DISABLED

Default value: ENABLED

### Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn appsprofile

- appsprofilename

Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1').

This is a mandatory argument. Maximum Length: 127

- transportprotocol

Name of the protocol for which the parameters of this LSN application profile applies.

This is a mandatory argument.

Possible values: TCP, UDP, ICMP

- ippooling

NAT IP address allocation options for sessions associated with the same subscriber.

Available options function as follows:

- \* **Paired**—The Citrix ADC appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the Citrix ADC appliance drops any new connection from the subscriber.
- \* **Random**—The Citrix ADC appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

This parameter is applicable to dynamic NAT allocation only.

Possible values: PAIRED, RANDOM

Default value: RANDOM

- mapping

Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port.

Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

- \* **ENDPOINT-INDEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.
- \* **ADDRESS-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
- \* **ADDRESS-PORT-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- filtering

Type of filter to apply to packets originating from external hosts.

Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

- \* **ENDPOINT INDEPENDENT**—Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The Citrix ADC appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber.
- \* **ADDRESS DEPENDENT**—Filters out packets not destined to subscriber IP address and port X:x. In addition, the appliance filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
- \* **ADDRESS PORT DEPENDENT** (the default)—Filters out packets not destined to subscriber IP address and port (X:x). In addition, the Citrix ADC appliance filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent

packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- tcpproxy

Enable TCP proxy, which enables the Citrix ADC appliance to optimize the TCP traffic by using Layer 4 features.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- td

ID of the traffic domain through which the Citrix ADC appliance sends the outbound traffic after performing LSN.

If you do not specify an ID, the appliance sends the outbound traffic through the default traffic domain, which has an ID of 0.

Default value: 65535

Maximum value: 65535

### **Parameter Descriptions (of commands listed in the CLI procedure)**

- bind lsn appspfile

- appspfilename

Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1').

This is a mandatory argument. Maximum Length: 127

- lsnport

Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90.

**Parameter Descriptions (of commands listed in the CLI procedure)**

## • add lsn group

## – groupname

Name for the LSN group. Must begin with an ASCII alphanumeric or underscore ( \_ ) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).

This is a mandatory argument. Maximum Length: 127

## – clientname

Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group. You cannot remove this association or replace with another LSN client entity once the LSN group is created.

This is a mandatory argument. Maximum Length: 127

## – nattype

Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers:

Available options function as follows:

- \* **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The Citrix ADC appliance sequentially allocates NAT resources to these subscribers. The Citrix ADC appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
- \* **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the Citrix ADC appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports

are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

- portblocksize

Size of the NAT port block to be allocated for each subscriber.

To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always enabled, and you cannot disable it.

In Dynamic NAT, the Citrix ADC appliance allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

- logging

Log mapping entries and sessions created or deleted for this LSN group. The Citrix ADC appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the Citrix ADC appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities.

A log message for an LSN mapping entry consists of the following information:

- \* NSIP address of the Citrix ADC appliance
- \* Time stamp
- \* Entry type (MAPPING or SESSION)
- \* Whether the LSN mapping entry is created or deleted
- \* Subscriber's IP address, port, and traffic domain ID
- \* NAT IP address and port
- \* Protocol name
- \* Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping

- Only Destination IP address (and not port) is logged for Address-Dependent mapping
- Destination IP address and port are logged for Address-Port-Dependent mapping

Possible values: ENABLED, DISABLED

Default value: DISABLED

– sessionLogging

Log sessions created or deleted for the LSN group. The Citrix ADC appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

A log message for an LSN session consists of the following information:

- \* NSIP address of the Citrix ADC appliance
- \* Time stamp
- \* Entry type (MAPPING or SESSION)
- \* Whether the LSN session is created or removed
- \* Subscriber's IP address, port, and traffic domain ID
- \* NAT IP address and port
- \* Protocol name
- \* Destination IP address, port, and traffic domain ID

Possible values: ENABLED, DISABLED

Default value: DISABLED

– sessionSync

In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary).

For this setting to work, you must enable the global session synchronization parameter.

Possible values: ENABLED, DISABLED

Default value: ENABLED

– snmptraplimit

Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute.

Default value: 100

Minimum value: 0

Maximum value: 10000

- ftp

Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually communicated in the packets payload. When acting as an ALG, the appliance changes the packets payload to ensure that the protocol continues to work over LSN.

**Note:** The Citrix ADC appliance also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

### Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn group

- groupname

Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1').

This is a mandatory argument. Maximum Length: 127

- poolname

Name of the LSN pool to bind to the specified LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. For Dynamic NAT, pools bound to an LSN group can be bound to multiple LSN groups. Maximum Length: 127

- transportprofilename

Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.

By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol. Maximum Length: 127

- appsprofilename

Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. Maximum Length: 127

## Sample LSN Configurations

September 21, 2020

The following are examples of configuring LSN through command line interface.

**Create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and default settings:**

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
```

```
18
19 Done
20
21 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
22
23 Done
24 <!--NeedCopy-->
```

**Create an LSN configuration with an extended ACL for identifying LSN subscribers:**

```
1 add ns acl LSN-ACL-2 ALLOW -srcIP 192.0.2.10-192.0.2.20
2
3 Done
4
5 apply acls
6
7 Done
8
9 add lsn client LSN-CLIENT-2
10
11 Done
12
13 bind lsn client LSN-CLIENT-2 -aclname LSN-ACL-2
14
15 Done
16
17 add lsn pool LSN-POOL-2
18
19 Done
20
21 bind lsn pool LSN-POOL-2 203.0.113.5-203.0.113.10
22
23 Done
24
25 add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2
26
27 Done
28
29 bind lsn group LSN-GROUP-2 -poolname LSN-POOL-2
30
31 Done
32 <!--NeedCopy-->
```

**Create an LSN configuration with endpoint-independent mapping for HTTP protocol (port 80) and address-port dependent mapping for SSH protocol (port 22). Also, restrict each subscriber**

**to use a maximum of 1000 NAT ports for TCP protocol and 100 NAT ports for UDP protocol. Restrict each subscriber to have a maximum of 2000 concurrent sessions for TCP protocol. Restrict the group to have a maximum of 30000 concurrent sessions for TCP protocol:**

```
1 add lsn client LSN-CLIENT-3
2
3 Done
4
5 bind lsn client LSN-CLIENT-3 -network 192.0.3.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-3
10
11 Done
12
13 bind lsn pool LSN-POOL-3 203.0.113.11
14
15 Done
16
17 add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-3
18
19 Done
20
21 bind lsn group LSN-GROUP-3 -poolname LSN-POOL-3
22
23 Done
24
25 add lsn appsprofile LSN-APPS-HTTPPROFILE-3 TCP -mapping ENDPOINT-
    INDEPENDENT
26
27 Done
28
29 bind lsn appsprofile LSN-APPS-HTTPPROFILE-3 80
30
31 Done
32
33 bind lsn group LSN-GROUP-3 -applicationfilename LSN-APPS-HTTPPROFILE
    -3
34
35 Done
36
37 add lsn appsprofile LSN-APPS-SSHPROFILE-3 TCP -mapping ADDRESS-PORT-
    DEPENDENT
38
```

```
39 Done
40
41 bind lsn appprofile LSN-APPS-SSHPROFILE-3 22
42
43 Done
44
45 bind lsn group LSN-GROUP-3 -applicationfilename LSN-APPS-SSHPROFILE
    -3
46
47 Done
48
49 add lsn transportprofile LSN-TRANS-PROFILE-TCP-3 TCP -portquota 1000 -
    sessionquota 2000 -groupSessionLimit 30000
50
51 Done
52
53 bind lsn group LSN-GROUP-3 -transportfilename LSN-TRANS-PROFILE-TCP
    -3
54
55 Done
56
57 add lsn transportprofile LSN-TRANS-PROFILE-UDP-3 UDP -portquota 100
58
59 Done
60
61 bind lsn group LSN-GROUP-3 -transportfilename LSN-TRANS-PROFILE-UDP
    -3
62
63 Done
64 <!--NeedCopy-->
```

**Create an LSN configuration for a large set of subscribers:**

```
1 add lsn client LSN-CLIENT-4
2
3 Done
4
5 bind lsn client LSN-CLIENT-4 -network 192.0.4.0 -netmask 255.255.255.0
6
7 Done
8
9 bind lsn client LSN-CLIENT-4 -network 192.0.5.0 -netmask 255.255.255.0
10
11 Done
12
```

```
13 bind lsn client LSN-CLIENT-4 -network 192.0.6.0 -netmask 255.255.255.0
14
15 Done
16
17 bind lsn client LSN-CLIENT-4 -network 192.0.7.0 -netmask 255.255.255.0
18
19 Done
20
21 bind lsn client LSN-CLIENT-4 -network 192.0.8.0 -netmask 255.255.255.0
22
23 Done
24
25 add lsn pool LSN-POOL-4
26
27 Done
28
29 bind lsn pool LSN-POOL-4 203.0.113.30-203.0.113.40
30
31 Done
32
33 bind lsn pool LSN-POOL-4 203.0.113.45-203.0.113.50
34
35 Done
36
37 bind lsn pool LSN-POOL-4 203.0.113.55-203.0.113.60
38
39 Done
40
41 add lsn group LSN-GROUP-4 -clientname LSN-CLIENT-4
42
43 Done
44
45 bind lsn group LSN-GROUP-4 -poolname LSN-POOL-4
46
47 Done
48
49 add lsn appspfile LSN-APPS-WELLKNOWNPROFILE-4 TCP -mapping ENDPOINT-
    INDEPENDENT
50
51 Done
52
53 bind lsn appspfile LSN-APPS-WELLKNOWN-PORTS-PROFILE-4 1- 1023
54
55 Done
56
```

```
57 bind lsn group LSN-GROUP-4 -applicationfilename LSN-APPS-WELLKNOWN-
    PORTS-PROFILE-4
58
59 Done
60 <!--NeedCopy-->
```

**Create an LSN configuration with sharing of NAT resources among multiple LSN groups. In this example, LSN pool LSN-POOL-5 is shared with LSN groups LSN-GROUP-5 and LSN-GROUP-6:**

```
1 add lsn client LSN-CLIENT-5
2
3 Done
4
5 bind lsn client LSN-CLIENT-5 -network 192.0.15.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-5
10
11 Done
12
13 bind lsn pool LSN-POOL-5 203.0.113.12-203.0.113.14
14
15 Done
16
17 add lsn group LSN-GROUP-5 -clientname LSN-CLIENT-5
18
19 Done
20
21 bind lsn group LSN-GROUP-5 -poolname LSN-POOL-5
22
23 Done
24
25 add lsn client LSN-CLIENT-6
26
27 Done
28
29 bind lsn client LSN-CLIENT-6 -network 192.0.16.0 -netmask 255.255.255.0
30
31 Done
32
33 add lsn pool LSN-POOL-6
34
35 Done
36
```

```
37 bind lsn pool LSN-POOL-6 203.0.113.15-203.0.113.18
38
39 Done
40
41 add lsn group LSN-GROUP-6 -clientname LSN-CLIENT-6
42
43 Done
44
45 bind lsn group LSN-GROUP-6 -poolname LSN-POOL-6
46
47 Done

49 bind lsn group LSN-GROUP-6 -poolname LSN-POOL-5
50
51 Done
52 <!--NeedCopy-->
```

**Create an LSN configuration with deterministic NAT resource allocation:**

```
1 add lsn client LSN-CLIENT-7
2
3 Done
4
5 bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
10
11 Done
12
13 bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
14
15 Done
16
17 add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype
    DETERMINISTIC -portblocksize 1024
18
19 Done
20
21 bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
22
23 Done
24 <!--NeedCopy-->
```

**Create an LSN configuration with multiple subscriber networks having the same network address but each network belonging to a different traffic domain. Also, restrict the outbound traffic related to HTTP protocol (port 80), sending it through a particular traffic domain (td 5):**

```
1 add lsn client LSN-CLIENT-8
2
3 Done
4
5 bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0
   -td 1
6
7 Done
8
9 bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0
   -td 2
10
11 Done
12
13 bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0
   -td 3
14
15 Done
16
17 add lsn pool LSN-POOL-8
18
19 Done
20
21 bind lsn pool LSN-POOL-8 203.0.113.80-203.0.113.86
22
23 Done
24
25 add lsn group LSN-GROUP-8 -clientname LSN-CLIENT-8
26
27 Done
28
29 bind lsn group LSN-GROUP-8 -poolname LSN-POOL-8
30
31 Done
32
33 add lsn appsprofile LSN-APPS-HTTP-PROFILE-8 TCP -td 5
34
35 Done
36
37 bind lsn appsprofile LSN-APPS-HTTP-PROFILE-8 80
38
```

```
39 Done
40
41 bind lsn group LSN-GROUP-8 -applicationprofile LSN-APPS-HTTP-
    PROFILE-8
42
43 Done
44 <!--NeedCopy-->
```

**Create an LSN configuration that restricts the outbound traffic of a specific protocol (TCP), sending it through a particular traffic domain (td 5). With endpoint-independent filtering, receive inbound traffic related to this protocol (TCP) on any traffic domain:**

```
1 add lsn client LSN-CLIENT-9
2
3 Done
4
5 bind lsn client LSN-CLIENT-9 -network 192.0.9.0 -netmask 255.255.255.0
    -td 1
6
7 Done
8
9 add lsn pool LSN-POOL-9
10
11 Done
12
13 bind lsn pool LSN-POOL-9 203.0.113.90
14
15 Done
16
17 add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
18
19 Done
20
21 bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
22
23 Done
24
25 add lsn appsprofile LSN-APPS-PROFILE-9 TCP -filtering ENDPOINT-
    INDEPENDENT -td 5
26
27 Done
28
29 bind lsn group LSN-GROUP-9 -appprofile LSN-APPS-PROFILE-9
30
31 Done
```

```
32 <!--NeedCopy-->
```

**Create an LSN configuration that restricts outbound HTTP (port 80) traffic, sending it through a particular traffic domain (td 10). With address-dependent filtering, receive inbound traffic related to this protocol (HTTP) on the specified traffic domain (td 10):**

```
1 add lsn client LSN-CLIENT-10
2
3 Done
4
5 bind lsn client LSN-CLIENT-10 -network 192.0.10.0 -netmask
   255.255.255.0 -td 1
6
7 Done
8
9 add lsn pool LSN-POOL-10
10
11 Done
12
13 bind lsn pool LSN-POOL-10 203.0.113.100
14
15 Done
16
17 add lsn group LSN-GROUP-10 -clientname LSN-CLIENT-10
18
19 Done
20
21 bind lsn group LSN-GROUP-10 -poolname LSN-POOL-10
22
23 Done
24
25 add lsn appsprofile LSN-APPS-PROFILE-10 TCP -mapping ENDPOINT -
   INDEPENDENT -filtering ADDRESS-DEPENDENT -td 10
26
27 Done
28
29 bind lsn appsprofile LSN-APPS-PROFILE-10 80

```

## Configuring Static LSN Maps

September 21, 2020

The Citrix ADC appliance supports manual creation of a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. Static LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP:Port maps to the subscriber IP address:Port. For example, Web servers located in the internal network.

### To create a static LSN mapping by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td
   <positive_integer>] [<natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd
   <positive_integer>]]
2 - show lsn static
3 <!--NeedCopy-->
```

### To create a static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new static mapping.

### Parameter Descriptions (of commands listed in the CLI procedure)

#### **add lsn static name**

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn static1" or 'lsn static1'). This is a mandatory argument. Maximum Length: 127

#### **transportprotocol**

Protocol for the LSN mapping entry. This is a mandatory argument. Possible values: TCP, UDP, ICMP

#### **subscrIP**

IPv4 address of an LSN subscriber for the LSN mapping entry. This is a mandatory argument.

**subscrPort**

Port of the LSN subscriber for the LSN mapping entry. This is a mandatory argument. Maximum value: 65535

**td**

ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0, Minimum value: 0, Maximum value: 4094

**natIP**

IPv4 address, already existing on the Citrix ADC appliance as type LSN, to be used as NAT IP address for this mapping entry.

**natPort**

NAT port for this LSN mapping entry.

**destIP**

Destination IP address for the LSN mapping entry.

**dsttd**

ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the Citrix ADC appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0, Minimum value: 0, Maximum value: 4094

**Wildcard Port Static Maps**

A static mapping entry is usually a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. A one-to-one static LSN mapping entry exposes only one port of the subscriber to the Internet.

Some situations might require exposing all ports (64K) of a subscriber to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64K one-to-one static mapping entries, one mapping entry for each port. Creating 64K entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the Citrix ADC appliance.

Another simple method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (\*), and the protocol parameter set to ALL, to expose all the ports of a subscriber to the Internet. For a subscriber's inbound or outbound connections matching a wildcard static mapping entry, the subscriber's port does not change after the NAT operation.

When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the Citrix ADC appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber's port by connecting to the NAT port that has the same number as the subscriber's port.

### **Configuring the Citrix ADC appliance to Provide Access to All Ports of an IPv4 Subscriber**

To configure the Citrix ADC appliance to provide access to all ports of an IPv4 subscriber, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = \*
- NAT port = \*

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <
    positive_integer>] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
4 <!--NeedCopy-->
```

### **Sample Configuration**

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 192.0.2.10 are made accessible through NAT IP 203.0.11.33.

#### **Sample configuration:**

```
1 add lsn static NAT44-WILDCARD-STATIC-1 ALL 192.0.2.10 * 203.0.113.33 *
2
3 Done
4 <!--NeedCopy-->
```

## Configuring Application Layer Gateways

September 21, 2020

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over LSN.

The Citrix ADC appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

## Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for an LSN configuration by enabling or disabling the FTP option of the LSN group of the LSN configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an LSN configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

### Sample LSN Configuration for FTP ALG:

In the following sample LSN configuration, FTP ALG is enabled for subscribers that have IP address in the range 192.0.2.30-192.0.2.100.

```
1 add ns acl LSN-ACL-1 ALLOW -srcIP 192.0.2.30-192.0.2.100
2
```

```
3 Done
4
5 apply acs
6
7 Done
8
9 add lsn client LSN-CLIENT-1
10
11 Done
12
13 bind lsn client LSN-CLIENT-1 - aclname LSN-ACL
14
15 Done
16
17 add lsn pool LSN-POOL-1
18
19 Done
20
21 bind lsn pool LSN-POOL-1 203.0.113.10
22
23 Done
24
25 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -FTP ENABLED
26
27 Done
28
29 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
30
31 Done
32 <!--NeedCopy-->
```

**Sample LSN Configuration for TFTP ALG:**

In the following sample LSN configuration, endpoint-independent mapping and endpoint-independent filtering are enabled for TFTP protocol (UDP port 69). The Citrix ADC appliance automatically enables TFTP ALG for this LSN configuration.

```
1 add lsn client LSN-CLIENT-2
2
3 Done
4
5 bind lsn client LSN-CLIENT-2 -network 198.51.100.0 -netmask 255
   .255.255.0
6
7 Done
```

```
8
9 add lsn pool LSN-POOL-2
10
11 Done
12
13 bind lsn pool LSN-POOL-2 203.0.113.10-203.0.113.11
14
15 Done
16
17 add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2
18
19 Done
20
21 bind lsn group LSN-GROUP-2 -poolname pool1 LSN-POOL-2
22
23 Done
24
25 add lsn appspfile LSNAPPSPROFILE-TFTP-2 UDP -mapping ENDPOINT-
    INDEPENDENT - filtering ENDPOINT-INDEPENDENT
26
27 Done
28
29 bind lsn appspfile LSNAPPSPROFILE-TFTP-2 69
30
31 Done
32
33 bind lsn group LSN-GROUP-1 -applicationfilename LSNAPPSPROFILE-TFTP
    -2
34
35 Done
36 <!--NeedCopy-->
```

## Application Layer Gateway for PPTP Protocol

September 21, 2020

The Citrix ADC appliance supports Application Layer Gateways (ALGs) for the Point-to-Point Tunneling Protocol (PPTP).

PPTP is a network protocol that enables secure transfer of data from a remote client to an enterprise server by creating a tunnel across TCP/IP-based data networks. PPTP encapsulates PPP packets into IP packets for transmission over the Internet. PPTP establishes a tunnel for each communicating

PPTP network server (PNS)-PPTP Access Concentrator (PAC) pair. After the tunnel is set up, enhanced generic routing encapsulation (GRE) is used to exchange PPP packets. A call ID in the GRE header indicates the session to which a particular PPP packet belongs.

The Citrix ADC appliance recognizes PPTP packets that arrive on the default TCP port, 1723. The appliance parses PPTP control packets, translates the call ID, and assigns a NAT IP address. For two-way data communication between the client and server, the Citrix ADC appliance creates an LSN session entry based on the server call ID, and an LSN session based on the client call ID. The appliance then parses the GRE data packets and translates call IDs on the basis of the two LSN session entries.

For PPTP protocol, the Citrix ADC appliance also includes timeout setting for any idle PPTP LSN sessions. If a PPTP LSN session is idle for a time that exceeds the timeout setting, the Citrix ADC appliance removes the session.

**Limitations:**

The following are the limitations of PPTP ALG on a Citrix ADC appliance:

- PPTP ALG is not supported for hairpin LSN flow.
- PPTP ALG is not supported to work with any RNAT configuration.
- PPTP ALG is not supported in Citrix ADC clusters.

**Configuring PPTP ALG**

Configuring PPTP ALG on the Citrix ADC appliance consist of the following tasks:

- Create an LSN configuration and enable PPTP ALG on it. In an LSN configuration, the LSN group includes the PPTP ALG setting. For instructions on creating an LSN configuration, see [Configuration Steps for LSN](#).
- (Optional) Set the global timeout for idle PPTP LSN sessions.

**To enable PPTP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-pptp ( ENABLED |  
    DISABLED )]  
2  
3 show lsn group  
4 <!--NeedCopy-->
```

**To set the global timeout for idle PPTP LSN sessions by using the CLI**

At the command prompt, type:

```
1 set appAlgParam -pptpGreIdleTimeout <positive_integer>
2
3 show appAlgParam
4 <!--NeedCopy-->
```

**Example:**

In the following sample LSN configuration, PPTP ALG is enabled for subscribers in the 192.0.2.0/24 network.

Also idle PPTP LSN session timeout is set to 200 secs.

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -pptp ENABLED
18
19 Done
20
21 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
22
23 Done
24
25 set appAlgParam -pptpGreIdleTimeout 200
26
27 Done
28 <!--NeedCopy-->
```

## Application Layer Gateway for SIP Protocol

September 21, 2020

Using Large Scale NAT (LSN) with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media.

SIP ALG adheres to the following RFCs:

- RFC 3261
- RFC 3581
- RFC 4566
- RFC 4475

### How SIP ALG Works

How IP address translation is performed depends on the type and direction of the message. A message can be any of the following:

- Inbound request
- Outbound response
- Outbound request
- Inbound response

For an outgoing message, the private IP address and port number of the SIP client are replaced with the Citrix ADC owned public IP address and port number, called the *LSN pool IP address and port number*, specified during LSN configuration. For an incoming message, the LSN pool IP address and the port number are replaced with the private address of the client. If the message contains any public IP addresses, the Citrix ADC SIP ALG retains them. Also, a pinhole is created on the:

- LSN pool IP address and port on behalf of the private client, so that the messages that arrive at this IP address and port from the public network are treated as SIP messages.
- Public IP address and port on behalf of the public clients, so that the messages that arrive at this IP address and port from the private network are treated as SIP messages.

When a SIP message is sent out across the network, the SIP Application Layer Gateway (ALG) collects information from the message and translates the IP addresses in the following headers into LSN pool IP addresses:

- Via
- Contact

- Route
- Record-Route

In the following sample SIP request message, LSN replaces the IP addresses in the header fields to hide them from the outside network.

```
1 INVITE adam@10.102.185.156 SIP/2.0 Via: SIP/2.0/UDP 192.170.1.161:62914
  From: eve@10.120.210.3 To: adam@10.102.185.156 Call-ID: a12abcde@10
  .120.210.3 Contact: adam@10.102.185.156 Route: <sip:netscreen@10
  .150.20.3:5060> Record-Route: <sip:netscreen@10.150.20.3:5060>
2 <!--NeedCopy-->
```

When a message containing SDP information arrives, the SIP ALG collects information from the message and translates the IP addresses in the following fields into LSN pool IP addresses and port numbers:

- c= (connection information)

This field can appear at the session or media level. It appears in the following format:

```
c=<network-type><address-type><connection-address>
```

If the destination IP address is a unicast IP address, the SIP ALG creates pinholes by using the IP address and port numbers specified in the m= field.

- m= (media announcement)

This field appears at the media level and contains the description of the media. It appears in the following format:

```
m=<media><port><transport><fmt list>
```

- a= (information about the media field)

This field can appear at the session or media level, in the following format:

```
a=<attribute>
```

```
a=<attribute>:<value>
```

The following excerpt from a sample SDP section shows the fields that are translated for resource allocation.

```
1 o=user 2344234 55234434 IN IP4 10.150.20.3
2
3 c=IN IP4 10.150.20.3
4
5 m=audio 43249 RTP/AVP 0
6 <!--NeedCopy-->
```

The following table shows how SIP payload is translated.

	Contact:	Retain public IP address, if present
	Record-Route	None
	Route:	None

---

### Limitations of SIP ALG

A SIP ALG has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - TD/partitioning/cluster
  - Multipart body
  - SIP messages over IPv6 network
  - Line folding

### Tested SIP Clients and Proxy Servers

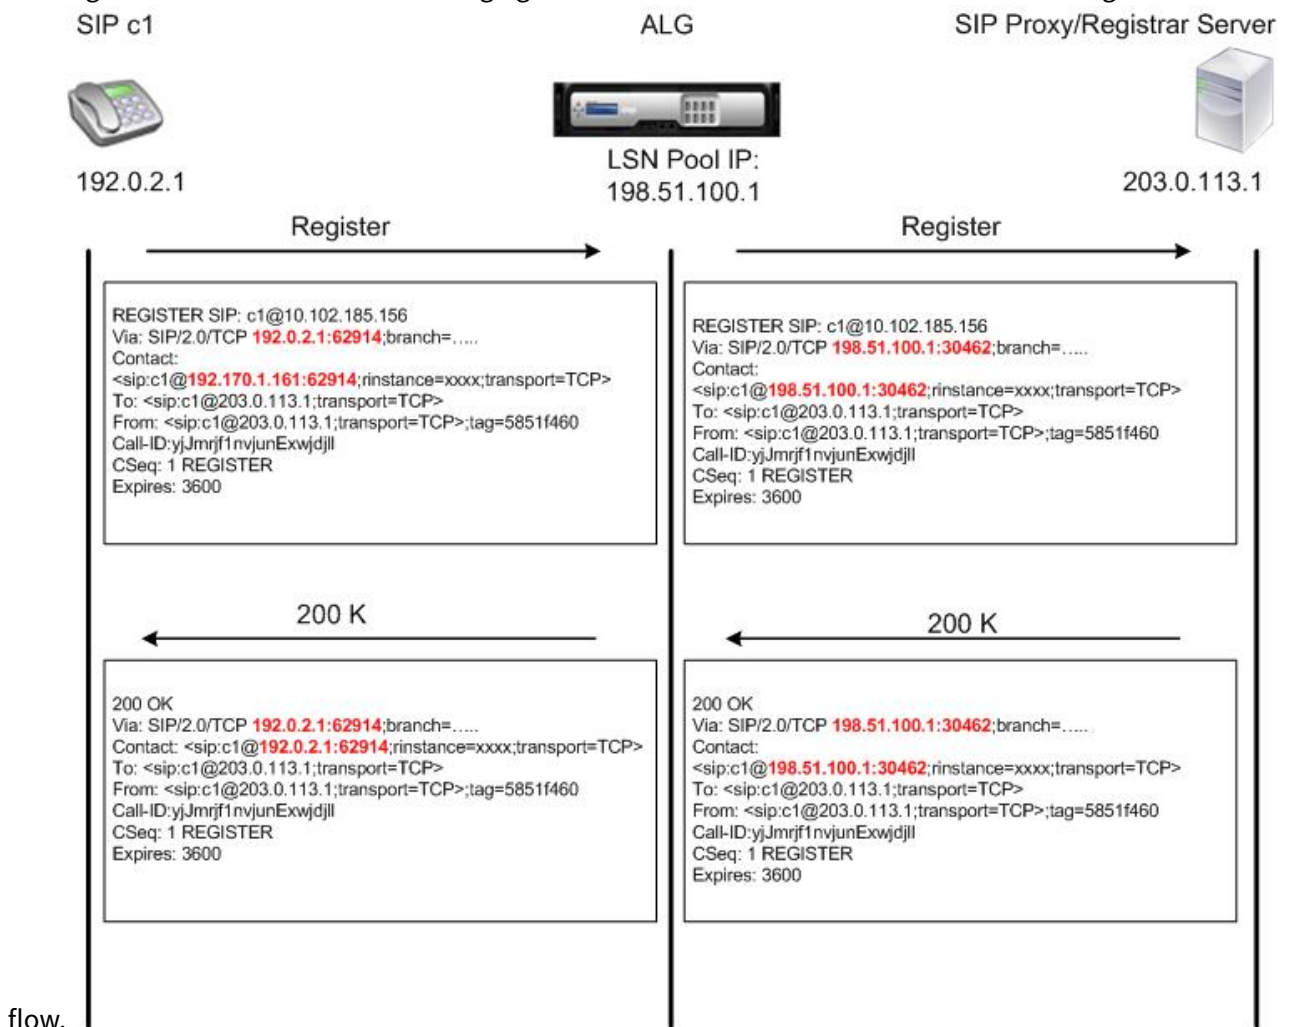

The following SIP clients and proxy server have been tested with SIP ALG:

- **SIP Clients:** X-Lite, Zoiper, Ekiga, Avaya
- **Proxy Server:** openSIPS

## LSN SIP Scenario: SIP Proxy Outside the Private Network (Public Network)

### SIP Client Registration

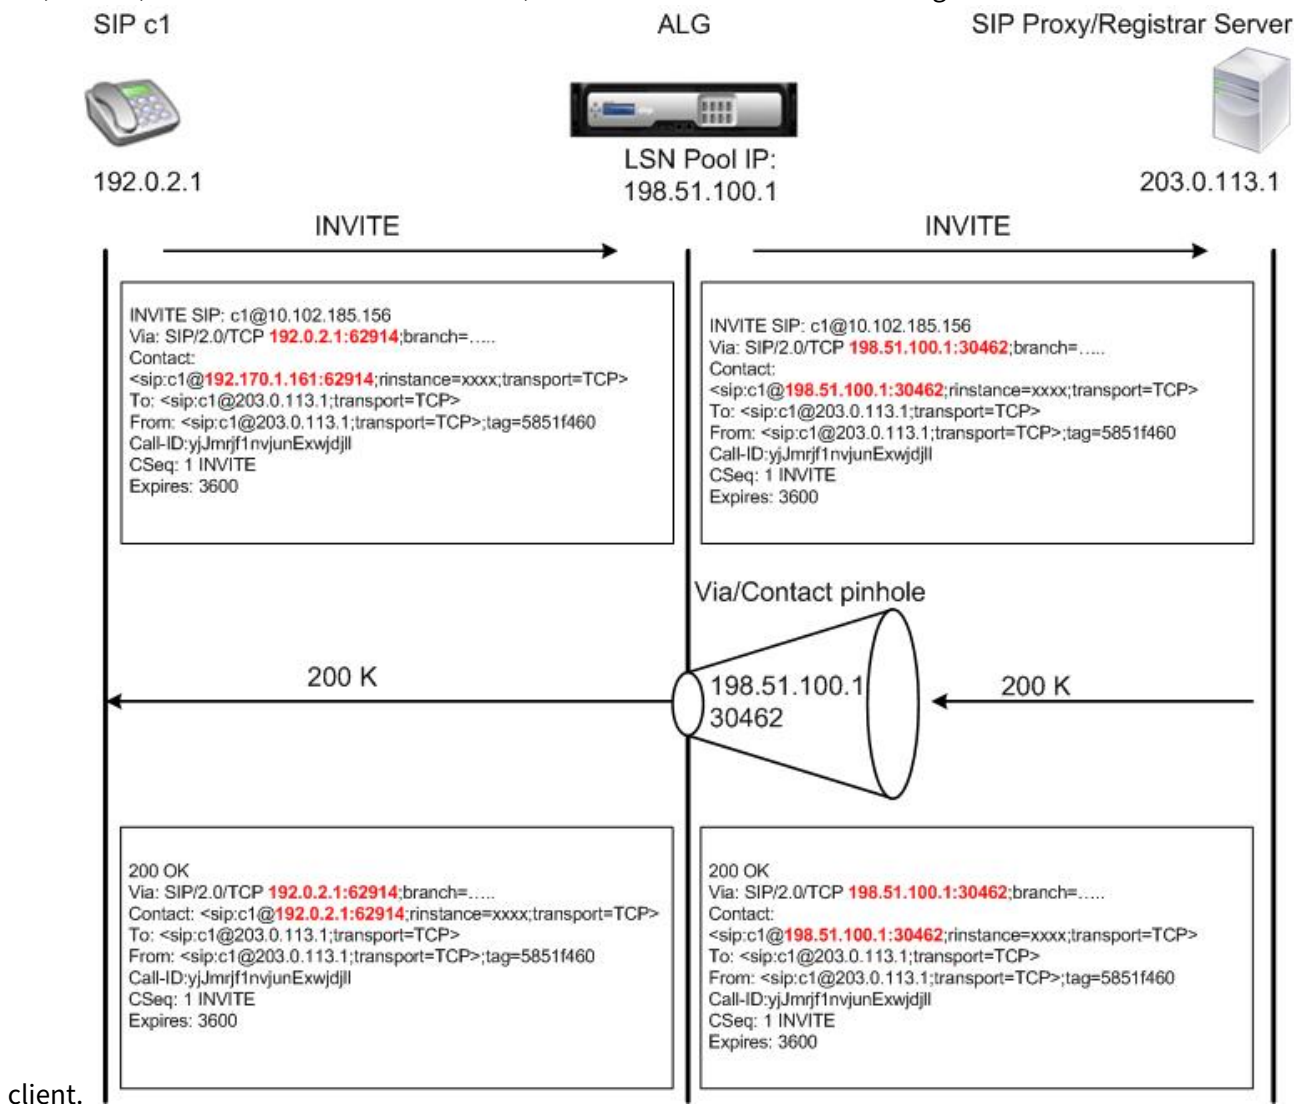

For a typical SIP call, SIP client must register with the SIP registrar by composing a REGISTER request and sending it to the SIP registrar. The Citrix ADC appliance's SIP ALG intercepts the request, replaces the IP address and port number in the request with the LSN pool IP address and port number provided in the LSN configuration, and forwards the request to the SIP registrar. The SIP ALG then opens a pinhole in the Citrix ADC configuration to allow further SIP communication between the SIP client and the SIP registrar. The SIP registrar sends a 200 OK response to the SIP client over the LSN pool IP address and port number. The Citrix ADC appliance captures this response in the pinhole, and the SIP ALG replaces the SIP header, putting the original Contact, Via, Route, and Record-Route SIP fields back into the message. The SIP ALG then forwards the message to the SIP client. The following figure shows how SIP ALG uses LSN in a SIP call registration

### Outgoing Calls

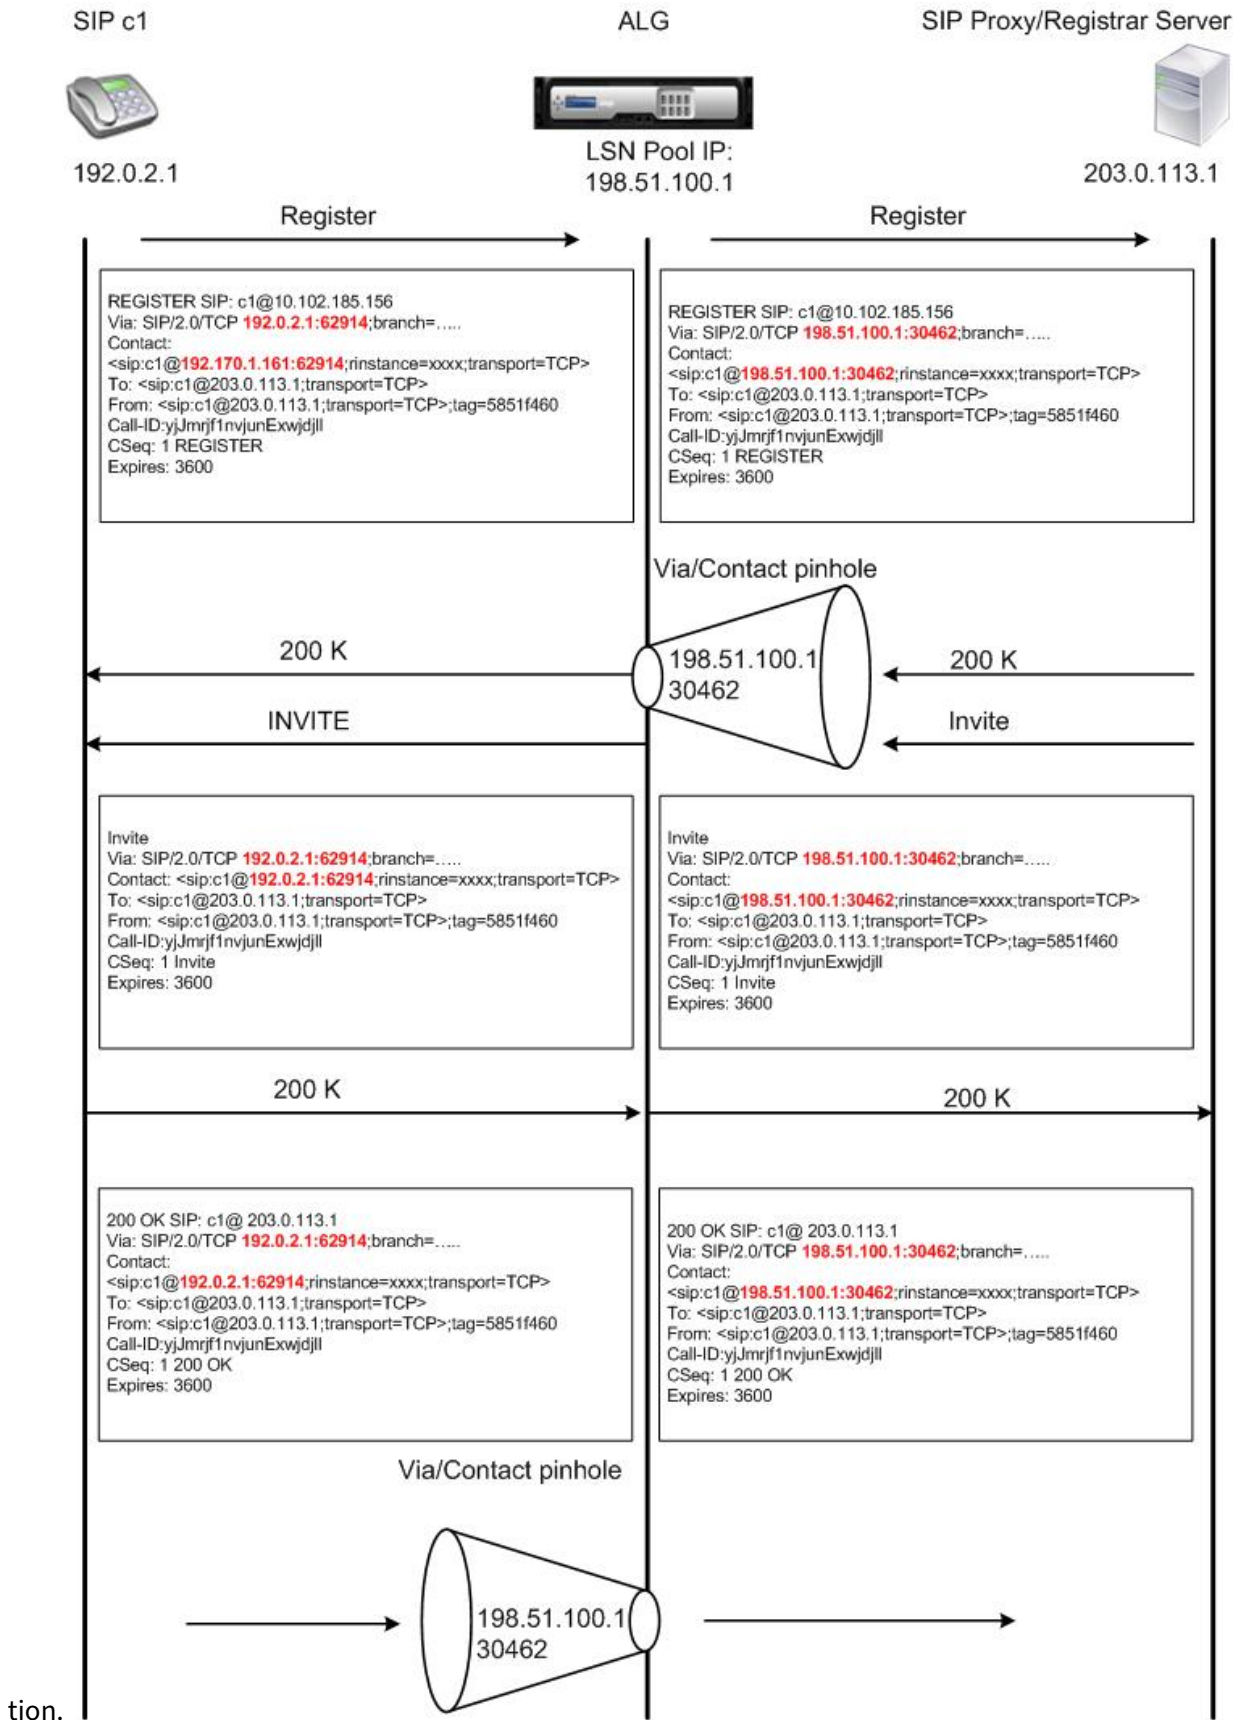

A SIP call is initiated with a SIP INVITE message sent from the internal to the external network. The SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, replacing them with the LSN pool IP address and port number. LSN stores these mappings for subsequent SIP messages in the SIP call. The SIP ALG then opens separate pinholes in the Citrix ADC configuration to allow SIP and media through the Citrix ADC appliance on the dynamically assigned ports specified in the SDP and SIP headers. When a 200 OK message arrives at the Citrix ADC, it is captured by one of the created pinholes. The SIP ALG replaces the SIP header, restoring the original Contact, Via, Route, and Record-Route SIP fields, and then forwards the message to the internal SIP

## **Incoming Calls**

A SIP incoming call is initiated with a SIP INVITE message from the external client to the internal network. The SIP registrar forwards the INVITE message to the SIP client in the internal network, using the pinhole that was created when the Internal SIP client registered with the SIP registrar.

The SIP ALG performs NAT on the LSN IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the IP address and port number of the internal SIP client, and forwards the request to the SIP client. When the 200 OK response message sent by the internal SIP client arrives at the Citrix ADC appliance, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the LSN pool IP address and port number, forwards the response message to the SIP registrar, and then opens a pinhole in the outbound direction for further SIP communica-

tion.

### **Call Termination**

The BYE message terminates a call. When the device receives a BYE message, it translates the header fields in the message just as it does for any other message. But because a BYE message must be acknowledged by the receiver with a 200 OK, the ALG delays call teardown for 15 seconds to allow time for transmission of the 200 OK.

### **Call Between Clients in the Same Network**

When both client A and client B in the same network initiate a call, the SIP messages are routed through the SIP proxy in the outside network. The SIP ALG processes the INVITE from client A as a normal outgoing call. Since client B is in the same network, the SIP proxy sends the INVITE back to the Citrix ADC appliance. The SIP ALG examines the INVITE message, determines that it contains the NAT IP address of client A, and replaces that address with the private IP address of client A before sending the message to client B. Once the call is established between the clients, the Citrix ADC is not involved in the media transmission between the clients.

### **More LSN SIP Scenarios: SIP Proxy Inside the Private Network**

If you want to host the SIP Proxy server inside the private network, Citrix recommends that you do one of the following:

- Configure a static LSN Mapping for the private SIP proxy. For more information, see [Configuring Static LSN Maps](#). Make sure that the NAT port is the same as the port configured in the SIP ALG profile.
- Configure the SIP Proxy server inside a demilitarized zone (DMZ).

Figure 1. SIP Call Registration

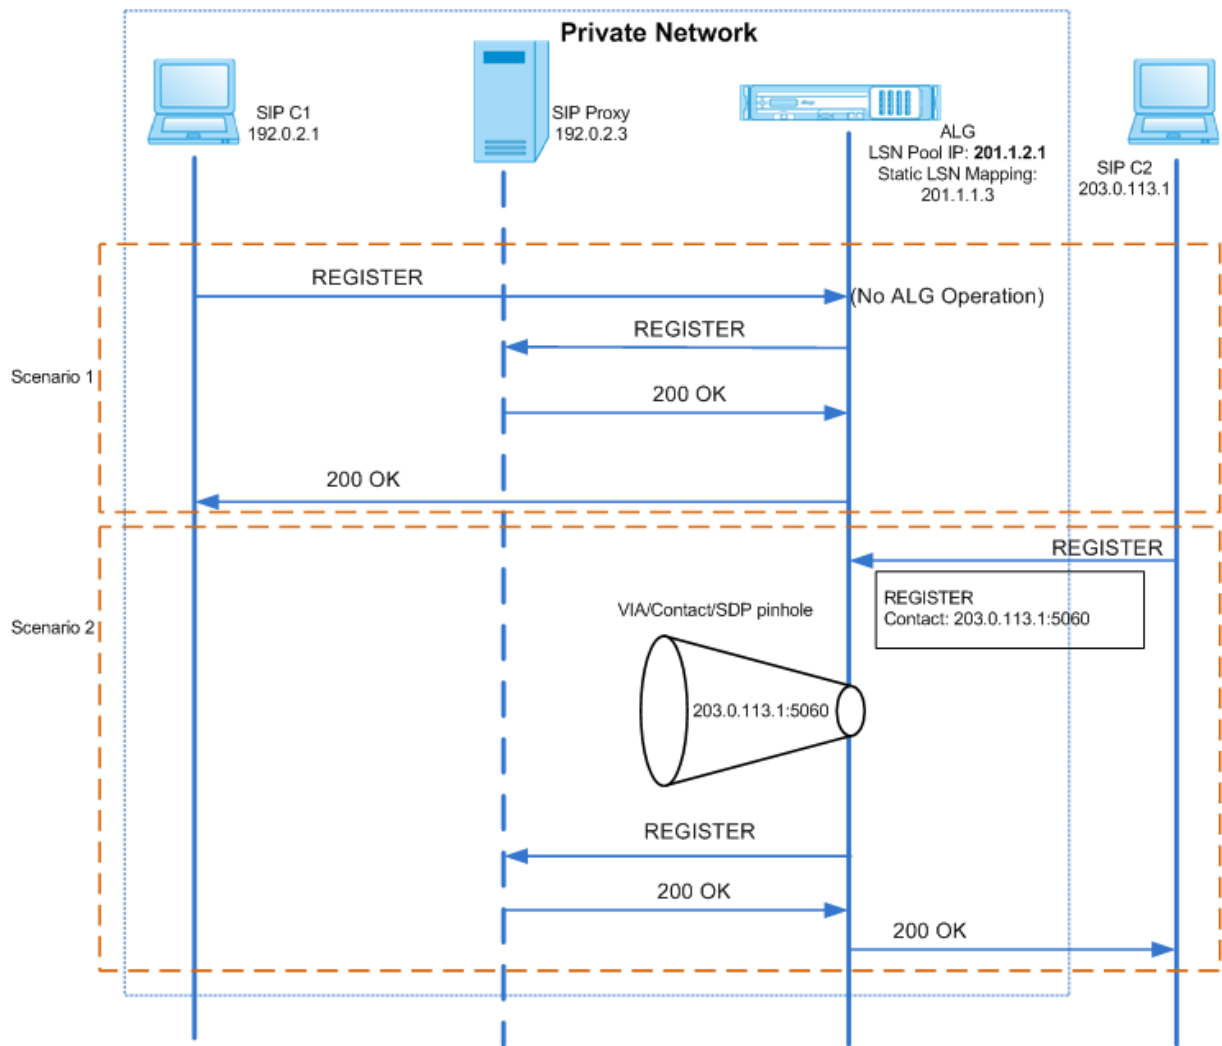

Figure 2. SIP Incoming Call Flow

Figures 1 and 2 show the following scenarios:

- Scenario 1—SIP client in the private network registers with the SIP proxy server in the same network. ALG operations are not performed, because the SIP client and SIP proxy server are in the same network.
- Scenario 2—SIP client in the public network registers with the SIP proxy server in the private network. The REGISTER message from the public SIP client is sent to the Citrix ADC appliance by using the static LSN mapping configured on the appliance, and the appliance creates a pinhole

for further SIP operations.

- Scenario 3— SIP Incoming call flow. A SIP incoming call is initiated with a SIP INVITE message from the external to the internal network. The Citrix ADC appliance receives the INVITE message from SIP client C2, which is in the external network, through the static LSN maps configured on the Citrix ADC appliance.

The appliance creates a pinhole and forwards the INVITE message to the SIP proxy. The SIP proxy then forwards the INVITE message to SIP client C1 in the internal network. SIP client C1 then sends 180 and 200 OK messages to the SIP proxy, which in turn forwards the message to SIP client C2 through the Citrix ADC appliance.

When the 200 OK response message sent by internal SIP client C1 arrives at the Citrix ADC, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, and in the SDP fields, replacing them with the LSN pool IP address and port number. The SIP ALG then forwards the response message to SIP client C2 and opens a pinhole in the outbound direction for further SIP communication.

## Support for Audit Logs

You can log ALG information as part of LSN logging by enabling ALG in the LSN audit logging configuration. For more information on LSN logging, see [Logging and Monitoring LSN](#). A log message for an ALG entry in the LSN log consists of the following information:

- Time stamp
- Type of SIP message (for example, SIP request)
- Source IP address and port of the SIP client
- Destination IP address and port of the SIP proxy
- NAT IP address and port
- SIP method
- Sequence number
- Whether or not the SIP client is registered
- Caller's user name and domain
- Receiver's user name and domain

### Sample audit log:

#### Request:

```
1 07/19/2013:09:49:19 GMT Informational 0-PPE-0 : default ALG
  ALG_SIP_INFO_PACKET_EVENT 169 0 : Infomsg: "SIP request" - Group: g2
  - Call_ID: NTY0YjYwMTJmYjNhNDU5ZjlhMmQxOTM5ZTE3Zjc3NjM. - Transport
  : TCP - Source_IP: 192.169.1.165 - Source_port: 57952 -
  Destination_IP: 10.102.185.156 - Destination_port: 5060 - Natted_IP:
  10.102.185.191 - Natted_port: 10313 - Method: REGISTER -

```

**Configuring SIP ALG**

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuration Steps for LSN](#). While configuring LSN, make sure that you:

- Set the following parameters while adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT

Important: For the SIP ALG to work, a full cone NAT configuration is mandatory.

**Example:**

```

1 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-
  INDEPENDENT -filtering ENDPOINT-INDEPENDENT
2 <!--NeedCopy-->

```

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range.

**Example:**

```

1 add lsn sipalgprofile sipalgprofile_tcp -sipsrcportrange 1-65535 -
  sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole
  ENABLED - sipTransportProtocol TCP
2 <!--NeedCopy-->

```

- Set SIP ALG = ENABLED, while creating the LSN group.

**Example:**

```
1 add lsn group g1 -clientname c1 -sipalg ENABLED
2 <!--NeedCopy-->
```

- Bind the SIP ALG profile to the LSN group.

**Sample SIP ALG Configuration:**

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, SIP ALG specific setting, and configure SIP ALG:

```
1 add lsn pool p1
2
3 Done
4
5 bind lsn pool p1 10.102.185.190
6
7 Done
8
9 add lsn client c1
10
11 Done
12
13 bind lsn client c1 -network 192.170.1.0 -netmask 255.255.255.0
14
15 Done
16
17 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
18
19 Done
20
21 add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
22
23 Done
24
25 bind lsn appsprofile app_tcp 1-65535
26
27 Done
28
29 bind lsn appsprofile app_udp 1-65535
30
31 Done
```

```
32
33 add lsn sipalgprofile sipalgprofile_tcp -sipdstportrange 5060 -
    openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -
    sipTransportProtocol TCP
34
35 Done
36
37 add lsn sipalgprofile sipalgprofile_udp -sipdstportrange 5060 -
    openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -
    sipTransportProtocol UDP
38
39 Done
40
41 add lsn group g1 -clientname c1 -sipalg ENABLED
42
43 Done
44
45 bind lsn group g1 -poolname p1
46
47 Done
48
49 bind lsn group g1 -appsprofilename app_tcp
50
51 Done
52
53 bind lsn group g1 -appsprofilename app_udp
54
55 Done
56
57 bind lsn group g1 -sipalgprofilename sipalgprofile_tcp
58
59 Done
60
61 bind lsn group g1 -sipalgprofilename sipalgprofile_udp
62
63 Done
64 <!--NeedCopy-->
```

## Application Layer Gateway for RTSP Protocol

September 21, 2020

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. Citrix ADC functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to Citrix ADC owned public IP address called an LSN pool IP address.
- Inbound response—LSN pool IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

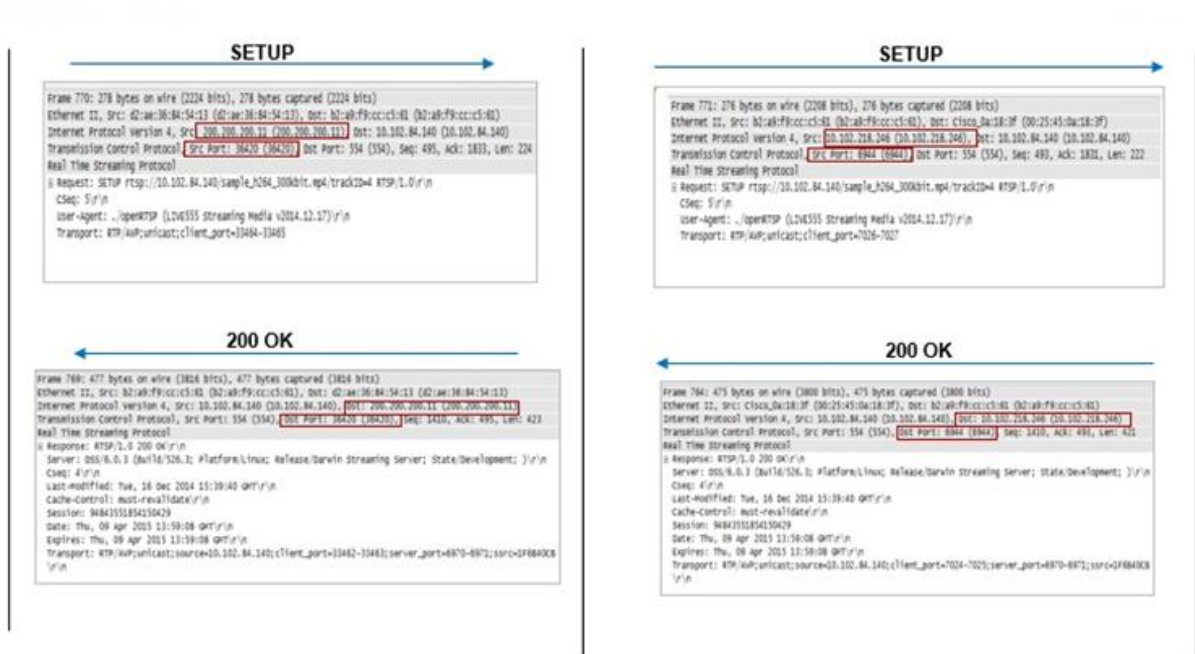

### **Limitations of RTSP ALG**

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- TD/admin partitioning/cluster deployments
- RSTP Authentication
- HTTP tunneling

### **RTSP and LSN scenario**

The following figure shows an RTSP SETUP request flow. Typically, a SETUP request specifies how a single media stream must be transported. The request contains the media stream URL and a transport specifier. This specifier typically includes one local port for receiving RTP data (audio or video), and another for receiving RTCP data (meta information). The server reply usually confirms the chosen parameters and fills in the missing parts, such as the server's chosen ports. Each media stream must be configured by using the SETUP command before an aggregate play request can be sent.

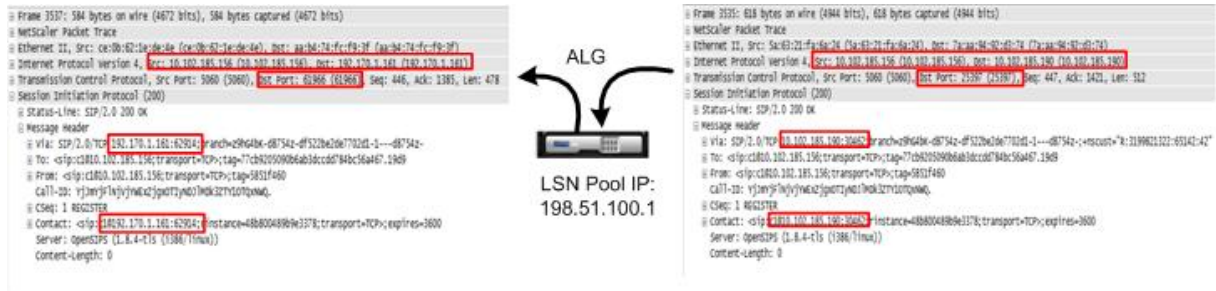

In a typical RTSP communication, the media client in the public network sends a SETUP request to the media server in the private network. RSTP ALG intercepts the request and, in the media stream, replaces the public IP address and port number with the LSN pool IP address and LSN port number. The following figure shows the translation performed by a Citrix ADC appliance in the media stream for an outbound request:

The media server in the private network uses the LSN pool IP address and LSN port number to send a 200 OK response to the media client in the public network. The Citrix ADC RTSP ALG intercepts the response and replaces the LSN pool IP address and LSN port number with the public IP address and port number of the media client. The following figure shows the translation performed by a Citrix ADC

appliance in the media stream for an inbound response:

## Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuration Steps for LSN](#). While configuring LSN, make sure that you:

- Set the **NAT Type** as DETERMINISTIC or DYNAMIC while adding the LSN pool.
- Set the following parameters while adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

### Sample RTSP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and RTSP ALG settings:

```

1 enable ns feature WL SP LB CS LSN
2
3 Done
4
5 add lsn pool pool1 -nattype DETERMINISTIC
6
7 Done
8
9 bind lsn pool pool1 10.102.218.246
10
11 Done
12
13 add lsn client client1
14
15 Done
16
17 bind lsn client client1 -network 200.200.200.11 -netmask 255.255.255.0
18

```

```
19 Done
20
21 add lsn appsprofile app1 TCP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
22
23 Done
24
25 add lsn appsprofile app2 UDP -ippooling PAIRED -mapping ENDPOINT-
    INDEPENDENT -filtering ENDPOINT-INDEPENDENT
26
27 Done
28
29 bind lsn appsprofile app1 1-65535
30
31 Done
32
33 bind lsn appsprofile app2 1-65535
34
35 Done
36
37 add lsn rtspalgprofile rtspalgprofiledefault -rtspIdleTimeout 1000 -
    rtspportrange 554
38
39 Done
40
41 add lsn group group1 -clientname client1 -nattype DETERMINISTIC -
    portblocksize 512 -rtspalg ENABLED
42
43 Done
44
45 bind lsn group group1 -poolname pool1
46
47 Done
48
49 bind lsn group group1 -appsprofilename app1
50
51 Done
52
53 bind lsn group group1 -appsprofilename app2
54
55 Done
56
57 bind lsn group group1 -rtspalgprofilename rtspalgprofiledefault
58
59 Done
```

## Application Layer Gateway for IPSec Protocol

September 21, 2020

If communication between two network devices (for example, client and server) uses the IPSec protocol, IKE traffic (which is over UDP) uses port fields, but Encapsulating Security Payload (ESP) traffic does not. If a NAT device on the path assigns the same NAT IP address (but different ports) to two or more clients at the same destination, the NAT device is unable to distinguish and properly route the return ESP traffic does not contain port information. Therefore, IPSec ESP traffic fails at the NAT device.

NAT-Traversal (NAT-T) capable IPSec endpoints detect the presence of an intermediate NAT device during IKE phase 1 and switch to UDP port 4500 for all subsequent IKE and ESP traffic (encapsulating ESP in UDP). Without NAT-T support on the peer IPSec endpoints, IPSec protected ESP traffic is transmitted without any UDP encapsulation. Therefore, IPSec ESP traffic fails at the NAT device.

The Citrix ADC appliance supports IPSec application layer gateway (ALG) functionality for large scale NAT configurations. The IPSec ALG processes IPSec ESP traffic and maintains session information so that the traffic does not fail when the IPSec endpoints do not support NAT-T (UDP encapsulation of ESP traffic).

### How IPSec ALG Works

An IPSec ALG monitors IKE traffic between a client and the server, and permits only one IKE phase 2 message exchange between the client and the server at any given time.

Once the two-way ESP packets are received for a particular flow, the IPSec ALG creates a NAT session for this particular flow so that subsequent ESP traffic can flow smoothly. The ESP traffic is identified by Security Parameters Indexes (SPIs), which are unique for a flow and for each direction. An IPSec ALG uses ESP SPIs in place of source and destination ports for performing large scale NAT.

If a gate receives no traffic, it times out. After both gates time out, another IKE phase 2 exchange is permitted.

### IPSec ALG Timeouts

IPsec ALG on a Citrix ADC appliance has three timeout parameters:

- **ESP Gate Timeout.** Maximum time that the Citrix ADC appliance blocks an IPsec ALG gate for a particular client on a specific NAT IP address for a given server if no two-way ESP traffic is exchanged between the client and the server.
- **IKE Session Timeout.** Maximum time that the Citrix ADC appliance keeps the IKE session information before removing it if there is no IKE traffic for that session.
- **ESP Session Timeout.** Maximum time that Citrix ADC appliance keeps the ESP session information before removing it if there is no ESP traffic for that session.

## Points to Consider before Configuring IPsec ALG

Before you start configuring IPsec ALG, consider the following points:

- You must understand the different components of IPsec protocol.
- IPsec ALG is not supported for DS-Lite and Large scale NAT64 configurations.
- IPsec ALG is not supported for hairpin LSN flow.
- IPsec ALG does not work with RNAT configurations.
- IPsec ALG is not supported in Citrix ADC clusters.

## Configuration Steps

Configuring IPsec ALG for large scale NAT44 on a Citrix ADC appliance consists of the following tasks:

- **Create an LSN application profile and bind it to the LSN configuration.** Set the following parameters while configuring an application profile:
  - Protocol=UDP
  - IP Pooling = PAIRED
  - Port=500

Bind the application profile to the LSN group of an LSN configuration. For instructions on creating an LSN configuration, see [Configuration Steps for LSN](#).

- **Create an IPsec ALG profile.** An IPsec profile includes various IPsec timeouts, such as IKE session timeout, ESP session timeout, and ESP gate timeout. You bind an IPsec ALG profile to an LSN group. An IPsec ALG profile has the following default settings:
  - IKE session timeout = 60 minutes
  - ESP session timeout = 60 minutes
  - ESP gate timeout = 30 seconds
- **Bind the IPsec ALG profile to the LSN configuration.** IPsec ALG is enabled for an LSN configuration when you bind an IPsec ALG profile to the LSN configuration. Bind the IPsec ALG profile to the LSN configuration by setting the IPsec ALG profile parameter to the name of the created profile in the LSN group. An IPsec ALG profile can be bound to multiple LSN groups, but an LSN group can have only one IPsec ALG profile.

**To create an LSN application profile by using the command line interface**

At the command prompt, type:

```
1 add lsn appsprofile <appsprofilename> UDP -ippooling PAIRED
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

**To bind destination port to the LSN application profile by using the command line interface**

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

**To bind an LSN application profile to an LSN group by using the command line interface**

At the command prompt, type:

```
1 bind lsn group <groupname> -appsprofilename <string>
2
3 show lsn group
4 <!--NeedCopy-->
```

**To create an IPSec ALG profile by using the CLI**

At the command prompt, type:

```
1 add ipsecalg profile <name> [-ikeSessionTimeout <positive_integer>] [-
  espSessionTimeout <positive_integer>] [-espGateTimeout <
  positive_integer>] [-connfailover ( ENABLED | DISABLED)
2
3 show ipsecalg profile <name>
4 <!--NeedCopy-->
```

**To bind an IPSec ALG profile to an LSN configuration by using the CLI**

At the command prompt, type:

```
1 bind lsn group <groupname> -poolname <string> - ipsecAlgProfile <string>
  >
2
3 show lsn group <name>
4 <!--NeedCopy-->
```

### To create an LSN application profile and bind it to an LSN configuration by using the GUI

Navigate to **System > Large Scale NAT > Profiles**, click **Application** tab, add an LSN application profile and bind it to an LSN group.

### To create an IPsec ALG profile by using the GUI\*\*

Navigate to **System > Large Scale NAT > Profiles**, click **IPSEC ALG** tab, and then add an IPsec ALG profile.

### To bind an IPsec ALG profile to an LSN configuration by using the GUI\*\*

1. Navigate to **System > Large Scale NAT > LSN Group**, open the LSN group.
2. In **Advanced Settings**, click **+ IPSEC ALG Profile** to bind the created IPsec ALG profile to the LSN group.

### Sample Configuration

In the following sample large scale NAT44 configuration, IPsec ALG is enabled for subscribers in the 192.0.2.0/24 network. IPsec ALG profile IPSECALGPROFILE-1 with various IPsec timeout settings is created and is bound to LSN group LSN Group -1.

#### Sample configuration:

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
```

```
13 bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.9
14
15 Done
16
17 add lsn appspfile LSN-APPSPROFILE-1 UDP -ippooling PAIRED
18
19 Done
20
21 bind lsn appspfile LSN-APPSPROFILE-1 500
22
23 Done
24
25 add ipsecalg profile IPSECALGPROFILE-1 -ikeSessionTimeout 45 -
    espSessionTimeout 40 - espGateTimeout 20 -connfailover ENABLED
26
27 Done
28
29 bind lsn group LSN-GROUP-1 -appspfilename LSN-APPSPROFILE-1
30
31 Done
32
33 bind lsn group LSN-GROUP-1 -poolname LSN-POOL-1
34
35 Done
36
37 bind lsn group LSN-GROUP-1 - ipsecAlgProfile IPSECALGPROFILE-1
38
39 Done
40 <!--NeedCopy-->
```

## Logging and Monitoring LSN

September 21, 2020

You can log LSN information to diagnose, troubleshoot problems, and to meet legal requirements. You can monitor the performance of the LSN feature by using LSN statistical counters and displaying current LSN sessions.

### Logging LSN

Logging LSN information is one of the important functions required by the ISPs to meet legal requirements and for identifying the source of traffic at any given time.

A Citrix ADC appliance logs LSN mapping entries and the LSN sessions created or deleted for each LSN group. You can control logging of LSN information for an LSN group by using the logging and session logging parameters of the LSN group. These are group level parameters and are disabled by default. The Citrix ADC appliance logs LSN sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

Logging	Session Logging	Logging Behavior
Enabled	Enabled	Logs LSN mapping entries as well as LSN sessions.
Enabled	Disabled	Logs LSN mapping entries but not LSN sessions.
Disabled	Enabled	Logs neither mapping entries nor LSN sessions.

A log message for an LSN mapping entry consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (MAPPING)
- Whether the LSN mapping entry was created or deleted
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for an LSN session consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (SESSION)
- Whether the LSN session is created or removed

- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the Citrix ADC appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG action entities.

For logging LSN information, Citrix recommends:

- Logging the LSN information on external log servers instead of on the Citrix ADC appliance. Logging on external servers facilitates optimal performance when the appliance creates large amounts of LSN log entries (in order of millions).
- Using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.

**Note:**

- The SYSLOG generated on Citrix ADC appliance are dynamically sent to the external log servers.
- When using SYSLOG over TCP, if the TCP connection is down or the SYSLOG server is busy, then the Citrix ADC appliances stores the logs in buffer and send the data once the connection is active.

For more information about configuring logging, see [Audit Logging](#).

Configuring LSN logging consists of the following tasks:

- **Configuring the Citrix ADC appliance for logging.** This task involves creating and setting various entities and parameters of the Citrix ADC appliance:
  - **Create a SYSLOG or NSLOG audit logging configuration.** Creating an audit logging configuration involves the following tasks:
    - \* Create a NSLOG or SYSLOG audit action and enable the LSN parameter. Audit actions specify the IP addresses of log servers.
    - \* Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy. Audit actions specify the IP addresses of log servers. Optionally, you can set the transport method for log messages that are sent to the external log servers. By default UDP is selected, you can set the transport method as TCP for a reliable transport mechanism. Bind the audit policy to system global.
    - \* Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy.

- \* Bind the audit policy to system global.

**Note:** For an existing audit logging configuration, just enable the LSN parameter for logging LSN information in the server specified by the audit action.

- **Enable logging and session logging parameters.** Enable logging and session logging parameters either as you add LSN groups or after you have created the groups. The Citrix ADC appliance generates log messages related to these LSN groups and sends them to the server of those audit actions that have the LSN parameter enabled.
- **Configuring log servers.** This task involves installing SYSLOG or NSLOG packages on the desired servers. This task also involves specifying the NSIP address of the Citrix ADC appliance in the configuration file of SYSLOG or NSLOG. Specifying the NSIP address enables the server to identify the log information sent by the Citrix ADC appliance for storing them in a log file.

For more information about configuring logging, see [Audit Logging](#).

## SYSLOG Configuration Using the Command Line Interface

### To create a SYSLOG server action for LSN logging by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel
  <logLevel>... [-transport (TCP)] [-lsn ( ENABLED | DISABLED )]
2 <!--NeedCopy-->
```

### To create a SYSLOG server policy for LSN logging by using the command line interface

At the command prompt, type:

```
1 add audit syslogPolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

### To bind a SYSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
1 bind system global [<policyName> [-priority <positive_integer>]]
2 <!--NeedCopy-->
```

## SYSLOG Configuration Using the Configuration Utility

### To configure a SYSLOG server action for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Syslog** and, on the Servers tab, add a new auditing server or edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.
3. (Optional) To enable SYSLOG over TCP, select the **TCP Logging** option.

#### **To configure a SYSLOG server policy for LSN logging by using the configuration utility**

Navigate to **Systems > Auditing > Syslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

#### **To bind a SYSLOG server policy to system global for LSN logging by using the configuration utility**

1. Navigate to **Systems > Auditing > Syslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

### **NSLOG Configuration Using the Command Line Interface**

#### **To create a NSLOG server action for LSN logging by using the command line interface**

At the command prompt, type:

```
1 add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel
  <logLevel> ... [-lsn ( ENABLED | DISABLED )]
2 <!--NeedCopy-->
```

#### **To create a NSLOG server policy for LSN logging by using the command line interface**

At the command prompt, type:

```
1 add audit nslogPolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

#### **To bind a NSLOG server policy to system global for LSN logging by using the command line interface**

At the command prompt, type:

```
1 bind system global [<policyName>]
2 <!--NeedCopy-->
```

## NSLOG Configuration Using the Configuration Utility

### To configure a NSLOG server action for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Nslog** and, on the **Servers** tab, add a new auditing server or, edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.

### To configure a NSLOG server policy for LSN logging by using the configuration utility

Navigate to **Systems > Auditing > Nslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

### To bind a NSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to **Systems > Auditing > Nslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

### Example

The following configuration specifies two SYSLOG and two NSLOG servers for storing log entries including LSN logs. LSN Logging is configured for LSN groups LSN-GROUP-2 and LSN-GROUP-3.

The Citrix ADC appliance generates log messages related to LSN mappings and LSN sessions of these LSN groups, and sends them to the specified log servers.

```
1 add audit syslogAction SYS-ACTION-1 198.51.101.10 -logLevel ALL -lsn
   ENABLED
2 Done
3 add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1

## Minimal Logging

Deterministic LSN configurations and Dynamic LSN configurations with port block significantly reduces the LSN log volume. For these two types of configuration, the Citrix ADC appliance allocates a NAT IP address and a block of ports to a subscriber. The Citrix ADC appliance generates a log message for a port block at the time of allocation to a subscriber. The Citrix ADC appliance also generates a log message when a NAT IP address and port block is freed. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the Citrix ADC appliance does not log any LSN session created or deleted. The appliance also neither logs any mapping entry created for a session nor when the mapping entry gets removed.

The minimal logging feature for deterministic LSN configurations and dynamic LSN configurations with port block is enabled by default and there is no provision to disable it. In other words, the Citrix ADC appliance automatically do minimal logging for deterministic LSN configurations and dynamic

LSN configurations with port block. There is no option available for disabling this feature. The appliance sends the log messages to all the configured log servers.

A log message for each port block consists of the following information:

- NSIP address of the Citrix ADC appliance
- Time stamp
- Entry type as DETERMINISTIC or PORTBLOCK
- Whether a port block is allocated or is freed
- Subscriber's IP address and the assigned NAT IP address and port block
- Protocol name

### Minimal Logging for Deterministic LSN Configuration

Consider an example of a simple deterministic LSN configuration for four subscribers having the IP address 192.0.17.1, 192.0.17.2, 192.0.17.3, and 192.0.17.4.

In this LSN configuration, the port block size is set to 32768 and LSN NAT IP address pool has IP addresses in the range 203.0.113.19-203.0.113.23.

```
1 add lsn client LSN-CLIENT-7
2 Done
3 bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask
   255.255.255.253
4 Done
5 add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
6 Done
7 bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
8 Done
9 add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype
   DETERMINISTIC -portblocksize 32768
10 Done
11 bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
12 Done
13 <!--NeedCopy-->
```

The Citrix ADC appliance sequentially preallocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-33791) on the beginning NAT IP address (203.0.113.19) to the beginning subscriber IP address (192.0.17.1). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The appliance logs the NAT IP address and the block of ports allocated for each subscriber.

The Citrix ADC appliance does not log any LSN session created or deleted for these subscribers. The appliance generates the following log messages for the LSN configuration.

```

1 1) 03/23/2015:00:30:56 GMT Informational 0-PPE-0 : default LSN

```

```

1 ### Minimal Logging for Dynamic LSN Configuration with Port Block
2
3 Consider an example of a simple dynamic LSN configuration with port
   block for any subscriber in the network 192.0.2.0/24. In this LSN
   configuration, the port block size is set to 1024 and LSN NAT IP
   address pool has IP addresses in the range 203.0.113.3-203.0.113.4.

```

```
set lsn parameter -memLimit 4000
```

```
Done
```

```
add lsn client LSN-CLIENT-1
```

```
Done
```

```
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
```

```
Done
```

```
add lsn pool LSN-POOL-1
```

Done

```
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
```

Done

```
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
```

Done

```
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
```

Done

1 The Citrix ADC appliance allocates a random NAT IP address and a block of ports, from the LSN NAT IP pool and on the basis of the set port block size, **for** a subscriber when it initiates a session **for** the first time. The Citrix ADC logs the NAT IP address and block of ports allocated to **this** subscriber. The appliance does not log any LSN session created or deleted **for this** subscriber. If all the ports are allocated (**for** different subscriber' s sessions) from the subscriber' s allocated port block, the appliance allocates a **new** random NAT IP address and port block **for** the subscriber **for** additional sessions. The Citrix ADC logs every NAT IP address and port block allocated to a subscriber.

2

3 The appliance generates the following log message when the subscriber, having the IP address 192.0.2.1, initiates a session. The log message shows that the appliance has allocated NAT IP address 203.0.113.3 and port block 1024-2047 to the subscriber.

```
03/23/2015:00:07:12 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106725793 0 : Port-block ALLOC Client 12.0.2.72, NatInfo 203.0.113.3:1024 to 2047, Proto:TCP
```

1 Once there are no more sessions left that is using the allocated NAT IP address and one of the ports in the allocated port block, the allocated NAT IP address and block of ports is freed from the subscriber. The Citrix ADC logs that the NAT IP address and the block of ports is freed from the subscriber. The appliance generates the following log messages **for** the subscriber, having the IP address 192.0.2.1 , when no more sessions are left that is using the allocated NAT IP address ( 203.0.113.3 ) and a port from the allocated port block ( 1024-2047 ). The log message shows that the NAT IP address and port block are freed from the subscriber.

```
03/23/2015:00:11:09 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106814342 0 : Port-block FREE Client 12.0.3.122, NatInfo 203.0.113.3: 1024 to 2047, Proto:TC
```

```
1 ## Load Balancing SYSLOG Servers
```

```
2
```

3 The Citrix ADC appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult **for** system administrators. To address **this** issue, the Citrix ADC appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers **for** better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

4

5 **###** Load balancing of SYSLOG servers using the command line **interface**

6

7 Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
add service (|) <serviceType (SYSLOGTCP | SYSLOGUDP)>
```

1 Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

```
add lb vserver <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod ]
```

1 Bind the service to the load balancing virtual server.

Bind lb vserver

1 Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogaction [-lbVserverName ] [-logLevel ]
```

1 Add a SYSLOG policy by specifying the rule and action.

add syslogpolicy

1 Bind the SYSLOG policy to the system global **for** the policy to take effect.

bind system global

1 **###** Load balancing of SYSLOG servers using the configuration utility

2

3 1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

4

5 Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

```
6
7 1. Add a load balancing virtual server, specify the service type as
  SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.
8
9   Navigate to Traffic Management > Virtual Servers, click Add and
  select SYLOGTCP or SYSLOGUDPas protocol.
10
11 1. Bing the service to the load balancing virtual server to the
  service.
12
13   Bing the service to the load balancing virtual server.
14
15   Navigate to Traffic Management > Virtual Servers, select a virtual
  server and then selectAUDITLOGHASH in the Load Balancing Method.
16
17 1. Add a SYSLOG action and specify the load balancing server name that
  has SYSLOGTCP or SYSLOGUDP as service type.
18
19   Navigate to System > Auditing, click Servers and add a server by
  selecting LB Vserver option inServers.
20
21 1. Add a SYSLOG policy by specifying the rule and action.
22
23   Navigate to System > Syslog, click Policies and add a SYSLOG policy
  .
24
25 1. Bind the SYSLOG policy to the system global for the policy to take
  effect.
26
27   Navigate to System > Syslog, select a SYSLOG policy and
  click Action, and then click Global Bindings and bind the policy
  to system global.
28
29 **Example:**
30
31 The following configuration specifies load balance of SYSLOG messages
  among the external log servers using the AUDITLOGHASH as load
  balancing method. The Citrix ADC appliance generates SYSLOG events
  and messages that are load balanced amongst the services, service1,
  service2, and service 3.
```

```
add service service1 192.0.2.10 SYSLOGUDP 514
```

```
Done
```

```
add service service2 192.0.2.11 SYSLOGUDP 514
```

Done

```
add service service3 192.0.2.11 SYSLOGUDP 514
```

Done

```
add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
```

Done

```
bind lb vserver lbvserver1 service1
```

Done

```
bind lb vserver lbvserver1 service2
```

Done

```
bind lb vserver lbvserver1 service3
```

Done

```
add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
```

Done

```
add syslogpolicy syspol1 ns_true sysaction1
```

Done

```
bind system global syspol1
```

Done

```
1  ## Logging HTTP Header Information
2
3  The Citrix ADC appliance can now log request header information of an
4     HTTP connection that is using the LSN functionality of the Citrix
5     ADC. The following header information of an HTTP request packet can
6     be logged:
7
8     - URL that the HTTP request is destined to.
9     - HTTP Method specified in the HTTP request.
10    - HTTP version used in the HTTP request.
11    - IP address of the subscriber that sent the HTTP request.
12
13    The HTTP header logs can be used by ISPs to see the trends related to
14    the HTTP protocol among a set a subscribers. For example, an ISP can
15    use this feature to find out the most popular websites among a set
16    of subscribers.
17
18    An HTTP header log profile is a collection of HTTP header attributes (
19    for example, URL and HTTP method) that can be enabled or disabled
20    for logging. The HTTP header log profile is then bound to an LSN
21    group. The Citrix ADC appliance then logs HTTP header attributes,
22    which are enabled in the bound HTTP header log profile for logging,
```

of any HTTP requests related to the LSN group. The appliance then sends the log messages to the configured log servers.

13

14 An HTTP header log profile can be bound to multiple LSN groups but an LSN group can have only one HTTP header log profile.

15

16 **###** To create an HTTP header log profile by using the the command line **interface**

17

18 At the command prompt, type:

```
add lsn httphdrlogprofile [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
```

```
show lsn httphdrlogprofile
```

1 **###** To bind an HTTP header log profile to an LSN group by using the the command line **interface**

2

3 At the command prompt, type:

```
bind lsn group -httphdrlogprofilename
```

```
show lsn group
```

1 **###** Example

2

3 In the following example of an LSN configuration, HTTP header log profile HTTP-Header-LOG-1 is bound to LSN group LSN-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled **for** logging so that all these attributes are logged **for** any HTTP requests from subscribers (in the network 192.0.2.0/24) related to the LSN group.

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
```

```
Done
```

```
set lsn parameter -memLimit 4000
```

```
Done
```

```
add lsn client LSN-CLIENT-1
```

```
Done
```

```
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
```

```
Done
```

```
add lsn pool LSN-POOL-1
```

Done

```
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
```

Done

```
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
```

Done

```
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
```

Done

```
bind lsn group LSN-GROUP-1 -httphdrlogfilename HTTP-HEADER-LOG-1
```

Done

- 1 The Citrix ADC generates the following HTTP header log message when one of the subscriber belonging to the LSN configuration example sends an HTTP request.
- 2
- 3 The log message tells us that a client having the IP address 192.0.2.33 sends an HTTP request to URL example.com using HTTP method GET and HTTP version 1.1.

03/19/2015:16:24:04 GMT Informational 0-PPE-1 : default LSN Message 59 0 : "LSN Client IP:TD 10.102.37.118:0 URL: example.com Host: 192.0.2.33 Version: HTTP1.1 Method: GET"

- 1 ## Logging MSISDN Information
- 2
- 3 A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber's operator.
- 4
- 5 You can configure a Citrix ADC appliance to include MSISDNs in LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs helps the administrator in faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.
- 6
- 7 The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.3:45195.
- 8

```

15
16 ### Perform the following tasks for including MSISDN information in LSN
    logs
17
18 - **Create an LSN log profile**. An LSN log profile includes the log
    subscriber ID parameter, which specifies whether to or not to
    include the MSISDN information in the LSN logs of an LSN
    configuration. Enable the log subscriber ID parameter when creating
    the LSN log profile.
19 - **Bind the LSN log profile to an LSN group of an LSN configuration
    **. Bind the created LSN log profile to an LSN group of an LSN
    configuration by setting the log profile name parameter to the
    created LSN log profile name. For instructions on configuring Large
    Scale NAT, see [Configuration Steps for LSN](/en-us/citrix-adc/12-1/
    citrix-adc-support-for-telecom-service-providers/lsn-introduction/
    configuration-steps-lsn.html).
20
21 ##### To create an LSN log profile by using the CLI
22
23 At the command prompt, type:
```

```
add lsn logprofile <logprofilename -logSubscriberID ( ENABLED | DISABLED )
```

show lsn logprofile

```
1 ##### To bind an LSN log profile to an LSN group of an LSN configuration
   by using the CLI
2
3 At the command prompt, type:
```

bind lsn group -logProfileName

show lsn group

```
1 **Sample Configuration:**
2
3 In this example of LSN configuration, the LSN log profile has the log
   subscriber ID parameter enabled. The profile is bound to LSN group
   LSN-GROUP-9. MSISDN information is included in the LSN session and
   LSN mapping logs for connections from mobile subscribers (in the
   network 192.0.2.0/24).
```

add lsn logprofile LOG-PROFILE-MSISDN-9 -logSubscriberID ENABLED

Done

add lsn client LSN-CLIENT-9

Done

bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0

Done

add lsn pool LSN-POOL-9

Done

bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4

Done

add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9

Done

bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9

Done

bind lsn group LSN-GROUP-9 -logprofilename LOG-PROFILE-MSISDN-9

Done

```
1 ## Displaying Current LSN Sessions
2
3 You can display the current LSN sessions for detecting any unwanted or
   inefficient LSN sessions on the Citrix ADC appliance. You can
```

```

    display all or some LSN sessions on the basis of selection
    parameters.
4
5 Note: When more than a million LSN sessions exist on the Citrix ADC
    appliance, Citrix recommends displaying selected LSN sessions
    instead of all by using the selection parameters.
6
7 ### Configuration Using the Command Line Interface
8
9 ##### To display all LSN sessions by using the command line interface
10
11 At the command prompt, type:

```

#### show lsn session

```

1 ##### To display selective LSN sessions by using the command line
    interface
2
3 At the command prompt, type:

```

#### show lsn session [-clientname ] [-network [-netmask ] [-td ]] [-natIP [-natPort ]]

```

1 ##### Example
2
3 To display all LSN sessions existing on a Citrix ADC
4
5 ![lsn-session](/en-us/citrix-adc/media/show-lsn-session1.png)
6
7 To display all LSN sessions related to an LSN client entity LSN-CLIENT
    -2
8
9 ![lsn-session2](/en-us/citrix-adc/media/lsn-session-2.png)
10 Done
11
12 To display all LSN sessions that uses 203.0.113.5 as the NAT IP address
13
14 ![lsn-session3](/en-us/citrix-adc/media/lsn-session-3.png)
15
16 ### Configuration Using the Configuration Utility
17
18 ##### To display all or selected LSN sessions by using the configuration
    utility
19
20 1. Navigate to System > Large Scale NAT > Sessions, and click the
    NAT44 tab.

```

```
21 1. For displaying LSN sessions on the basis of selection parameters,  
    click Search.  
22  
23 ### Parameter Descriptions (of commands listed in the CLI procedure)  
24  
25 -  
26     show lsn session  
27  
28     -  
29         clientname  
30  
31         Name of the LSN Client entity. Maximum Length: 127  
32  
33     -  
34         network  
35  
36         IP address or network address of subscriber(s).  
37  
38     -  
39         netmask  
40  
41         Subnet mask for the IP address specified by the network  
42             parameter.  
43  
44         Default value: 255.255.255.255  
45  
46     -  
47         td  
48  
49         Traffic domain ID of the LSN client entity.  
50  
51         Default value: 0  
52  
53         Minimum value: 0  
54  
55         Maximum value: 4094  
56     -  
57         natIP  
58  
59         Mapped NAT IP address used in LSN sessions.  
60  
61 ## Displaying LSN Statistics  
62  
63 You can display statistics related to the LSN feature for evaluating
```

the performance of the LSN feature or to troubleshoot problems. You can display a summary of statistics of the LSN feature or of a particular LSN group. The statistical counters reflect events since the Citrix ADC appliance was last restarted. All these counters are reset to 0 when the Citrix ADC appliance is restarted.

64

65 ### To display all LSN statistics by using the command line **interface**

66

67 At the command prompt, type:

### stat lsn

```
1 ### To display statistics for a specified LSN group by using the  
   command line interface
```

2

3 At the command prompt, type:

### stat lsn group []

```
1 ##### Example
```

```
stat lsn
```

#### Large Scale NAT statistics

Rate(/s) Total

LSN TCP Received Packets 0 40

LSN TCP Received Bytes 0 3026

LSN TCP Transmitted Packets 0 40

LSN TCP Transmitted Bytes 0 3026

LSN TCP Dropped Packets 0 0

LSN TCP Current Sessions 0 0

LSN UDP Received Packets 0 0

LSN UDP Received Bytes 0 0

LSN UDP Transmitted Packets 0 0

LSN UDP Transmitted Bytes 0 0

LSN UDP Dropped Packets 0 0

LSN UDP Current Sessions 0 0

LSN ICMP Received Packets 0 982

LSN ICMP Received Bytes 0 96236

LSN ICMP Transmitted Packets 0 0

LSN ICMP Transmitted Bytes 0 0

```
1  ### Parameter Descriptions (of commands listed in the CLI procedure)
2
3  -
4      stat lsn group
5
6      -
7          groupname
8
9          Name of the LSN Group. Maximum Length: 127
10
11     -
12         detail
13
14         Specifies detailed output (including more statistics). The
15             output can be quite voluminous. Without this argument, the
16             output will show only a summary.
17
18     -
19         fullValues
```

```
19         Specifies that numbers and strings should be displayed in their
           full form. Without this option, long strings are shortened
           and large numbers are abbreviated.
20
21     -
22     ntimes
23
24         The number of times, in intervals of seven seconds, the
           statistics should be displayed.
25
26         Default value: 1
27
28     -
29     logFile
30
31         The name of the log file to be used as input.
32
33     -
34     clearstats
35
36         Clear the statistics / counters
37
38         Possible values: basic, full
39
40 ## Compact Logging
41
42 Logging LSN information is one of the important functions needed by
           ISPs to meet legal requirements and be able to identify the source
           of traffic at any given time. This eventually results in a huge
           volume of log data, requiring the ISPs to make large investments to
           maintain the logging infrastructure.
43
44 Compact logging is a technique for reducing the log size by using a
           notational change involving short codes for event and protocol names
           . For example, C for client, SC for session created, and T for TCP.
           Compact logging results in an average of 40 percent reduction in
           log size.
45
46 The following examples of NAT44 mapping creation log entries show the
           advantage of compact logging.
47
48 |-|-|
49
50 |Default logging format|02/02/2016:01:13:01 GMT Informational 0-PPE-2 :
           default LSN LSN_ADDRPORT_MAPPING 85 0 : A&PDM CREATED ClientIP:Port
```

```

      :TD1.1.1.1:6500:0,NatIP:NatPort8.8.8.8:47902, DestinationIP:Port:TD2
      .2.2.2:80:0, Protocol: TCP|
51 |Compact logging format|02/02/2016:01:14:57 GMT Info 0-PE2:default LSN
      87 0:A&PDMC|C-1.1.1.1:6500:0|N-8.8.8.9:51066|D-2.2.2.2:80:0|T|
52
53 ## Configuration Steps
54
55 Perform the following tasks for logging LSN information in compact
      format:
56
57 - **Create an LSN log profile.** An LSN log profile includes the Log
      Compact parameter, which specifies whether to or not to log
      information in compact format for an LSN configuration.
58 - **Bind the LSN log profile to an LSN group of an LSN configuration
      .** Bind the created LSN log profile to an LSN group of an LSN
      configuration by setting the Log Profile Name parameter to the
      created LSN log profile name. All sessions and mappings for this LSN
      group are logged in compact format.
59
60 ### To create an LSN log profile by using the CLI
61
62 At the command prompt, type:

```

```
add lsn logprofile -logCompact (ENABLED|DISABLED)
```

```
show lsn logprofile
```

```

1 ### To bind an LSN log profile to an LSN group of an LSN configuration
      by using the CLI
2
3 At the command prompt, type:

```

```
bind lsn group -logProfileName
```

```
show lsn group
```

```
1 **Sample configuration:**
```

```
add lsn logprofile LOG-PROFILE-COMPACT-9 -logCompact ENABLED
```

```
Done
```

```
add lsn client LSN-CLIENT-9
```

```
Done
```

```
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
```

```
Done
```

```
add lsn pool LSN-POOL-9
```

Done

```
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
```

Done

```
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
```

Done

```
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
```

Done

```
bind lsn group LSN-GROUP-9 -logProfileName LOG-PROFILE-COMPACT-9
```

Done

```
1  ## IPFIX Logging
2
3  The Citrix ADC appliance supports sending information about LSN events
   in Internet Protocol Flow Information Export (IPFIX) format to the
   configured set of IPFIX collector(s). The appliance uses the
   existing AppFlow feature to send LSN events in IPFIX format to the
   IPFIX collectors.
4
5  IPFIX based logging is available for the following large scale NAT44
   related events:
6
7  - Creation or deletion of an LSN session.
8  - Creation or deletion of an LSN mapping entry.
9  - Allocation or de-allocation of port blocks in the context of
   deterministic NAT.
10 - Allocation or de-allocation of port blocks in the context of dynamic
   NAT.
11 - Whenever subscriber session quota is exceeded.
12
13 ### Points to Consider before you Configure IPFIX logging
14
15 Before you start configuring IPsec ALG, consider the following points:
16
17 - You must configure the AppFlow feature and IPFIX collector(s) on the
   Citrix ADC appliance. For instructions, see Configuring the AppFlow
   feature topic.
18
19 ### Configuration Steps
20
21 Perform the following tasks for logging LSN information in IPFIX format
   :
22
23 - **Enable LSN logging in the AppFlow configuration**. Enable the LSN
   logging parameter as part of AppFlow configuration.
```

```

24 - **Create an LSN log profile**. An LSN log profile includes the IPFIX
      parameter that enables or disables the log information in IPFIX
      format.
25 - **Bind the LSN log profile to an LSN group of an LSN configuration
      **. Bind the LSN log profile to one or multiple LSN group(s). Events
      related to the bound LSN group will be logged in IPFIX format.
26
27 ##### To enable LSN logging in the AppFlow configuration by using the
      CLI
28
29 At the command prompt, type:

```

```
set appflow param -lsnLogging ( ENABLED | DISABLED )
```

```
show appflow param
```

```

1 ##### To create an LSN log profile by using the CLI at the command prompt
2
3 At the command prompt, type:

```

```
set lsn logprofile -logipfix ( ENABLED | DISABLED )
```

```
show lsn logprofile
```

```

1 ##### To bind the LSN log profile to an LSN group of an LSN
      configuration by using the CLI
2
3 At the command prompt, type:

```

```
bind lsn group -logProfileName
```

```
show lsn group
```

```
““
```

### To create an LSN log profile by using the GUI

Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

### To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

## STUN Timeout

September 21, 2020

STUN (Session Traversal Utilities for NAT) enables an end host operating behind a NAT device to discover its NAT IP address and NAT port allocated by the NAT device. Interactive communication applications (for example real-time voice, video, and messaging) running on these hosts use the STUN protocol for discovering NAT IP address and port information. This information is used by these applications to connect to their peer applications in the Internet. STUN protocol includes servers, known as STUN servers, residing in the Internet. Using the STUN protocol, an application of an end host sends a request to a known STUN server, which in turn then embeds the NAT IP address and port in the payload of its response packet.

In an LSN deployment of a Citrix ADC appliance for an ISP, interactive communication applications (for example real-time voice, video, and messaging) running on a subscribers can use the STUN protocol to discover whether it is behind a NAT (Citrix ADC appliance) device or not. These applications send a request to a known STUN server. On receiving the request, the Citrix ADC allocates a NAT IP address and a port for this request, creates an LSN session and an LSN mapping entry, translates the packet with the allocated NAT IP address and port, and then forwards the packet to the STUN server. The STUN server embeds the allocated NAT IP address and port in the payload of its response packet. When the subscriber finally receives the packet, from the payload of the packet it learns that it is behind a NAT device, and the NAT IP address and port allocated for the session.

The application then notifies the peer applications that it is reachable at the NAT IP address and the port of the LSN mapping entry created for the STUN session. It notifies by embedding the NAT IP address and port in the payload of the packets sent to the peer applications. For making the application reachable at the same LSN mapping entry for any external application, full Cone NAT (endpoint Independent mapping and Endpoint Independent filtering) is enabled for the LSN configuration on the Citrix ADC appliance.

The Citrix ADC detects an LSN session of type STUN if the request packets are destined to TCP or UDP port 3478, and then marks the created mapping entry of type STUN. The Citrix ADC applies a timeout called, STUN timeout, to the created STUN LSN mapping entry. A STUN timeout is the maximum time that the Citrix ADC maintains an idle STUN LSN mapping entry since it was last used by any LSN session. If the STUN LSN mapping session is unused for a time that exceeds the STUN timeout, the Citrix ADC removes the mapping entry.

For an application on a subscriber that use STUN LSN mapping entry to stay available to other peer applications on the Internet, the application periodically sends keep-alive messages to the Citrix ADC appliance so that the STUN LSN mapping entry does not timeout. A higher frequency of keep-alive messages can have an affect on the performance a subscriber, especially, if the subscriber is a mobile device. A higher value of STUN timeout reduces the frequency of keep-alive messages from a

subscriber.

ALGs on the Citrix ADC appliance do not apply to an LSN session that use a STUN LSN mapping entry because NAT IP address and NAT port are communicated in payload of the packets related to the session.

For subscribers' applications that use STUN protocol, the LSN configuration must have the following settings:

- STUN timeout. In an LSN configuration, the LSN group includes the STUN timeout setting.
- Endpoint-independent mapping and endpoint-independent filtering for STUN protocol ports.

For instructions on creating an LSN configuration, see [Configuration Steps for LSN](#).

**Example:**

The following sample LSN configuration applies to applications that use STUN protocol over TCP or UDP. STUN timeout is set to 10 mins. Endpoint-independent mapping and endpoint-independent filtering is set for the STUN TCP port (3748) and the STUN UDP port (3748).

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -stuntimeout 10
18
19 Done
20
21 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
22
23 Done
24
25 add lsn appspfile LSNAPPSPROFILE-TCP-STUN-1 TCP -mapping ENDPOINT-
    INDEPENDENT - filtering ENDPOINT-INDEPENDENT
26
```

```
27 Done
28
29 bind lsn appprofile LSNAPPSPROFILE-TCP-STUN-1 3748
30
31 Done
32
33 bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-TCP-
    STUN-1
34
35 Done
36
37 add lsn appprofile LSNAPPSPROFILE-UDP-STUN-1 UDP -mapping ENDPOINT-
    INDEPENDENT - filtering ENDPOINT-INDEPENDENT
38
39 Done
40
41 bind lsn appprofile LSNAPPSPROFILE-UDP-STUN-1 3748
42
43 Done
44
45 bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-UDP-
    STUN-1
46
47 Done
48 <!--NeedCopy-->
```

## TCP SYN Idle Timeout

September 21, 2020

SYN idle timeout is the timeout for establishing TCP connections that use LSN on the Citrix ADC appliance. If a TCP session is not established within the configured timeout period, the Citrix ADC removes the session. SYN idle timeout is useful in providing protection against SYN flood attacks. In an LSN configuration, the LSN group entity includes the SYN idle timeout setting.

### Example:

In the following sample LSN configuration, SYN idle timeout is set to 30 secs for TCP connections related to subscribers from the 192.0.2.0/24 network.

```
1 add lsn client LSN-CLIENT-1
2
3 Done
```

```
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -synidletimeout 30
18
19 Done
20
21 bind lsn group LSN-GROUP-1 -poolname pool1LSN-POOL-1
22
23 Done
24 <!--NeedCopy-->
```

## Overriding LSN configuration with Load Balancing Configuration

September 21, 2020

An LSN configuration takes precedence over any load balancing configuration by default. For overriding the large scale networking (LSN) configuration with the load balancing configuration for traffic matching both configurations, create a net profile with Override LSN parameter enabled and bind this profile to the virtual server of the load balancing configuration. USNIP or USIP settings of the load balancing configuration are applied to the traffic, instead of applying the LSN IP address of the LSN configuration.

This option is useful in an LSN deployment that includes Citrix ADC appliances and value added services, such as firewall and optimization devices. In this type of deployment, the ingress traffic on the Citrix ADC appliance is required to pass through these value-added services before an LSN configuration on the appliance is applied to the traffic. For the Citrix ADC appliance to send the ingress traffic to a value added service, a load balancing configuration is created and override LSN is enabled on the appliance. The load balancing configuration includes value added services, represented as load balancing services, bound to a virtual server of type ANY. The virtual server is configured with listen policies for identifying the traffic to be sent to the value added service.

## To enable override lsn in a net profile by using the CLI

### To enable override lsn while adding a net profile, at the command prompt, type

```
1 add netProfile <name> -overrideLsn ( ENABLED | DISABLED )
2
3 show netprofile <name>
4 <!--NeedCopy-->
```

### To enable override lsn while adding a net profile, at the command prompt, type

```
1 set netProfile <name> -overrideLsn ( ENABLED | DISABLED )
2
3 show netprofile <name>
4 <!--NeedCopy-->
```

## To enable override lsn in a net profile by using GUI

1. Navigate to **System > Network > Net Profiles**.
2. Set the **Override LSN** parameter while adding or modifying net profiles.

In the following sample configuration, net profile NETPROFILE-OVERRIDE LSN-1 has override LSN option enabled and is bound to load balancing virtual server LBVS-1.

### Sample configuration:

```
1 add netprofile NETPROFILE-OVERRIDE LSN-1 -overrideLsn ENABLED
2
3 Done
4
5 set lb vserver LBVS-1 -netprofile NETPROFILE-OVERRIDE LSN-1
6
7 Done
8 <!--NeedCopy-->
```

## Clearing LSN Sessions

September 21, 2020

You can remove any unwanted or inefficient LSN sessions from the Citrix ADC appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these

sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected LSN sessions from the Citrix ADC appliance.

### To clear all LSN sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session
2
3 show lsn session
4 <!--NeedCopy-->
```

### To clear selective LSN sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session [-clientname <string>] [-network <ip_addr> [-netmask
    <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <
    port>]]
2
3 show lsn session
4 <!--NeedCopy-->
```

### Example

Clear all LSN sessions existing on a Citrix ADC

```
1 flush lsn session
2
3 Done
4 <!--NeedCopy-->
```

Clear all LSN sessions related to LSN client entity LSN-CLIENT-1

```
1 flush lsn session -clientname LSN-CLIENT-1
2
3 Done
4 <!--NeedCopy-->
```

Clear all LSN sessions related to a subscriber network (192.0.2.0) of LSN client entity LSN-CLIENT-2 belonging to traffic domain 100

```
1 flush lsn session -clientname LSN-CLIENT-2 - network 192.0.2.0 -  
   netmask 255.255.255.0 - td 100  
2  
3 Done  
4 <!--NeedCopy-->
```

### To clear all LSN sessions by using the configuration utility

Navigate to System > Large Scale NAT > Sessions, and click Flush Sessions.

### Parameter Descriptions (of commands listed in the CLI procedure)

- flush lsn session
  - clientname  
Name of the LSN Client entity. Maximum Length: 127
  - network  
IP address or network address of subscriber(s).
  - netmask  
Subnet mask for the IP address specified by the network parameter.  
Default value: 255.255.255.255
  - td  
Traffic domain ID of the LSN client entity.  
Default value: 0  
Minimum value: 0  
Maximum value: 4094
  - natIP  
Mapped NAT IP address used in LSN sessions.
  - natPort  
Mapped NAT port used in the LSN sessions.

## Load Balancing SYSLOG Servers

September 21, 2020

The Citrix ADC appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the Citrix ADC appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
1 add service <name>(<IP> | <serverName>) <serviceType (SYSLOGTCP |
  SYSLOGUDP)> <port>
2 <!--NeedCopy-->
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

```
1 add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod
  <AUDITLOGHASH>]
2 <!--NeedCopy-->
```

Bind the service to the load balancing virtual server.

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
1 add syslogaction <name> <serverIP> [-lbVserverName <string>] [-
  logLevel <logLevel>]
2 <!--NeedCopy-->
```

Add a SYSLOG policy by specifying the rule and action.

```
1 add syslogpolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
1 bind system global <policyName>
2 <!--NeedCopy-->
```

### Load balancing of SYSLOG servers using the configuration utility

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUD-Pas protocol.

3. Bind the service to the load balancing virtual server to the service.

Bind the service to the load balancing virtual server.

Navigate to Traffic Management > Virtual Servers, select a virtual server and then selectAUDIT-LOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYS-LOGUDP as service type.

Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option inServers.

5. Add a SYSLOG policy by specifying the rule and action.

Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bind-ings and bind the policy to system global.

### Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The Citrix ADC appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
1 add service service1 192.0.2.10 SYSLOGUDP 514
2
```

```
3 add service service2 192.0.2.11 SYSLOGUDP 514
4
5 add service service3 192.0.2.11 SYSLOGUDP 514
6
7 add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
8
9 bind lb vserver lbvserver1 service1
10
11 bind lb vserver lbvserver1 service2
12
13 bind lb vserver lbvserver1 service3
14
15 add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
16
17 add syslogpolicy syspol1 ns_true sysaction1
18
19 bind system global syspol1
20 <!--NeedCopy-->
```

**Limitations:**

The Citrix ADC appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

**Port Control Protocol**

September 21, 2020

Citrix ADC appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A Citrix ADC appliance implements the PCP server component and is compliant with RFC 6887.

## Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled
- Create a PCP server and bind a PCP profile to it. Create a PCP server on the Citrix ADC appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

### Note

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

## To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]
2
3 show pcp profile <name>
4 <!--NeedCopy-->
```

**To create a PCP server by using the CLI**

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
  string>]
2
3 show pcp server <name>
4 <!--NeedCopy-->
```

**Sample Configuration for NAT44**

In the following sample configuration, PCP server PCP-SERVER-9, with default PCP settings, is bound to LSN group LSN-GROUP-9. PCP-SERVER-9 serves PCP requests from subscribers in network 192.0.2.0/24.

**Sample configuration:**

```
1 add pcp server PCP-SERVER-9 192.0.3.9
2
3 Done
4
5 add lsn client LSN-CLIENT-9
6
7 Done
8
9 bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
10
11 Done
12
13 add lsn pool LSN-POOL-9
14
15 Done
16
17 bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
18
19 Done
20
21 add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
22
23 Done
24
25 bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
26
27 Done
```

```
28
29 bind lsn group LSN-GROUP-9 -pcpServer PCP-SERVER-9
30
31 Done
32 <!--NeedCopy-->
```

## LSN44 in a cluster setup

September 21, 2020

Large scale NAT44 configurations are supported on a Citrix ADC cluster setup.

ACitrix ADC cluster is a group of Citrix ADC appliances that are configured and managed as a single system. ACitrix ADC cluster provides scalability and availability. Each Citrix ADC appliance in a cluster setup acts as an independent LSN entity and is managed as a single system.

The LSN configuration in a cluster setup is same as in a standalone appliance except a specific pool of LSN IP addresses are owned by only one node at a time. In other words, an LSN IP pool entity is configured as a spotted entity in a particular node. All the nodes of a cluster setup can have a specific LSN IP pool entity. To make sure that the packets related to an LSN session are received on the same cluster node that performed the NAT operation, policy based backplane (PBS) steering is configured. PBS steers the received related packets of an LSN session to the same cluster node.

### Sample configuration:

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 -ownerNode 1 203.0.113.3
14
15 Done
16
17 bind lsn pool LSN-POOL-1 -ownerNode 2 203.0.113.3
18
```

```
19 Done
20
21 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
22
23 Done
24
25 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
26
27 Done
28
29 add ns acl b1 ALLOW -srcIP = 192.0.2.0-192.0.2.255 -type DFD -dfdhash
    SIP
30
31
32 Done
33
34 apply ns acls -type DFD
35
36 Done
37 <!--NeedCopy-->
```

## Dual-Stack Lite

September 21, 2020

Because of the shortage of IPv4 addresses, and the advantages of IPv6 over IPv4, many ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses only IPv4, and many subscribers do not support IPv6.

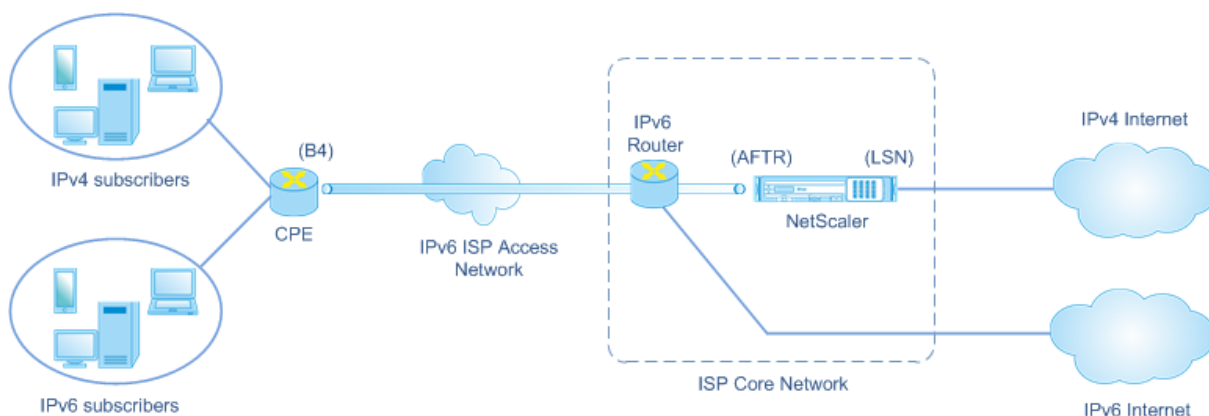

Dual Stack Lite (DS-Lite) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the Internet. DS-Lite uses IPv4-in-IPv6 tunneling to send a subscriber's IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber's IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN related processing. The response packets traverse through the same path to the subscriber.

The Citrix ADC appliance implements the AFTR component of a DS-Lite deployment and is compliant with RFC 6333.

### Architecture

The Dual-Stack Lite architecture for an ISP consists of the following components:

- **Basic Bridging Broadband (B4).** Basic Bridging broadband, or B4, is a device or component that resides in the subscriber premises. Typically, B4 is a component in the CPE devices in the subscriber premises. IPv4 subscribers are connected to the IPv6-only ISP access network through the CPE device containing the B4 component. The main function of the B4 is to initiate an IPv6 tunnel between B4 and an address family transition router (AFTR) in order to send or receive subscriber IPv4 request or response packets over the tunnel. B4 includes an IPv6 address known as the B4 tunnel endpoint address. B4 uses this address to source IPv6 packets to AFTR and receive packets from AFTR.
- **Address family transition router (AFTR).** AFTR is a device or component residing in the ISP's core network. AFTR terminates the IPv6 tunnel from the B4 device. In other words, the IPv6 tunnel is formed between B4 in the subscriber premise and AFTR in ISP core network. AFTR decapsulates IPv6 packets received from B4 to recover the subscribers' original IPv4 packets. AFTR sends the IPv4 packets to the LSN device or component. LSN routes the IPv4 packets to their destination after performing NAT address and port translation (NAT 44) and other LSN related processing. AFTR includes an IPv6 address known as the AFTR tunnel endpoint address. AFTR uses this address to source IPv6 packets to B4 and receive IPv6 packets from B4. The Citrix ADC appliance implements the AFTR component.
- **Softwire.** The IPv6 tunnel created between B4 and AFTR is called a softwire.

The DS-Lite architecture of an ISP using a Citrix ADC appliance consists of subscribers in private address spaces accessing the Internet through a Citrix ADC appliance deployed in ISP's core network. IPv4 subscribers are connected to a CPE device that includes the DS-Lite B4 functionality. The CPE device is connected to the ISP core network through ISP's IPv6-only access network. The Citrix ADC appliance contains the DS-Lite AFTR and LSN functionality.

IPv4 subscribers connected to the CPE device are assigned private IPv4 addresses either manually or through DHCP server running on the CPE device. On the CPE device, the AFTR tunnel endpoint address is specified manually or through DHCPv6. Configuration of CPE devices is vendor specific and therefore outside the scope of this documentation.

Upon receiving a request packet that is from an IPv4 subscriber and destined to a location on the Internet, the B4 component of the CPE device encapsulates the IPv4 packet in an IPv6 packet and sends

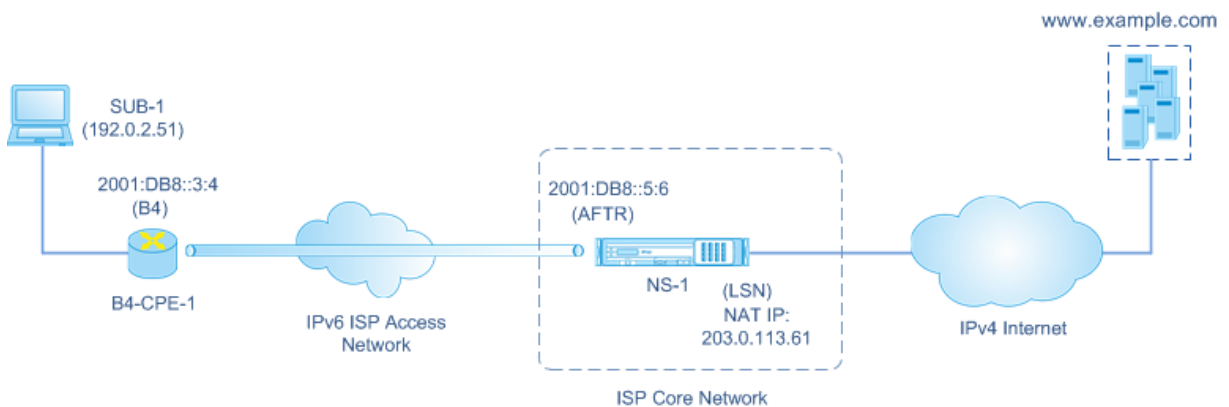

it to the Citrix ADC appliance in the ISP core network. The Citrix ADC appliance's AFTR functionality decapsulates the IPv6 packet to recover the subscriber's original IPv4 packet. The LSN functionality of the Citrix ADC appliance translates the source IP address and port of the IPv4 packet to a NAT IP address and NAT port selected from the configured NAT pool, and then sends the packet to its destination on the Internet.

The appliance maintains a record of all active sessions that use the AFTR and LSN functionalities. These sessions are called DS-Lite sessions. The Citrix ADC appliance also maintains the mappings between B4 IPv6 address, subscriber IPv4 address and port, and NAT IPv4 address and port, for each DS-Lite session. These mappings are called DS-Lite LSN mappings. From DS-Lite session entries and DS-Lite LSN mapping entries, the Citrix ADC appliance recognizes a response packet (received from the Internet) as belonging to a particular DS-Lite session.

When the Citrix ADC appliance receives a response packet belonging to a particular DS-Lite session, the appliance's LSN functionality translates the destination IP address and port of the response packet from NAT IP address and port to the subscriber IP address and port, the AFTR functionality encapsulates the resulting packet in an IPv6 packet and sends it to the CPE device. The B4 functionality of the CPE device decapsulates the IPv6 packet to recover the IPv4 response packet, and then sends the IPv4 packet to the subscriber.

### Example

Consider an example of a DS-Lite deployment consisting of Citrix ADC NS-1 in an ISP's core network, CPE device B4-CPE-1 in a subscriber premise, and a single IPv4 subscriber SUB-1. B4-CPE-1 supports the B4 functionality of DS-Lite feature.

The following table lists the settings used in this example.

Entity	Name	Details
IPv4 address of subscriber SUB-1		192.0.2.51
IPv6 address of software endpoint on the B4 device (B4-CPE-1)		2001:DB8::3:4
IPv6 address of the software endpoint on the AFTR device (NS-1)		2001:DB8::5:6

### Settings on Citrix ADC appliance NS-1:

Entity	Name	Details
LSN client	LSN-DSLITE-CLIENT-1	Network6 (Identifying traffic from B4 devices) = 2001:DB8::3:0/100
LSN pool	LSN-DSLITE-POOL-1	LSN IPs (NAT IP) = 203.0.113.61 - 203.0.113.70
IPv6 Profile	LSN-DSLITE-PROFILE-1	Type = DS-LITE; IPv6 address (AFTR IPv6 address) = One of the Citrix ADC owned IPv6 address of type SNIP6 = 2001:DB8::5:6
LSN group	LSN-DSLITE-GROUP-1	LSN client = LSN-DSLITE-CLIENT-1; LSN pool = LSN-DSLITE-POOL-1; IPv6 profile = LSN-DSLITE-PROFILE-1

Following is the traffic flow in this example:

1. IPv4 subscriber SUB-1 sends a request to (<http://www.example.com/>). The IPv4 packet has:
  - Source IP address = 192.0.2.51
  - Source port = 2552
  - Destination IP address = 198.51.100.250

- Destination port = 80
2. Upon receiving the IPv4 request packet, B4-CPE-1 encapsulates it in the payload of an IPv6 packet and then sends the IPv6 packet to NS-1. The IPv6 packet has:
    - Source IP address = 2001:DB8::3:4
    - Destination IP address = 2001:DB8::5:6
  3. When NS-1 receives the IPv6 packet, the AFTR module decapsulates the packet by removing the IPv6 headers. The resulting packet is SUB-1's original IPv4 request packet.
  4. The LSN module of NS-1 translates the source IP address and port of the packet to a NAT IP address and NAT port selected from the configured NAT pool. The translated IPv4 packet has:
    - Source IP address = 203.0.113.61
    - Source port = 3002
    - Destination IP address = 198.51.100.250
    - Destination port = 80
  5. The LSN module also creates an LSN mapping and session entry for this DS Lite session. The mapping includes the following information:
    - Source IP address of the IPv6 packet (B4-CPE-1's IPv6 address) = 2001:DB8::3:4
    - Source IP address of the IPv4 packet (SUB-1's IPv4 address) = 192.0.2.51
    - Source port of the IPv4 packet = 2552
    - NAT IP address = 203.0.113.61
    - NAT port = 3002
  6. NS-1 sends the resulting IPv4 packet to its destination on the Internet.
  7. The server for www.example.com processes the request packet and sends a response packet. The IPv4 response packet has:
    - Source IP address = 198.51.100.250
    - Source port = 80
    - Destination IP address = 203.0.113.61
    - Destination port = 3002
  8. Upon receiving the IPv4 packet, NS-1 examines the LSN mapping and session entries and finds that the IPv4 response packet belongs to a DS Lite session. The LSN module of NS-1 translates the destination IP address and port. The IPv4 packet now has:
    - Source IP address = 198.51.100.250
    - Source port = 80
    - Destination IP address = 192.0.2.51
    - Destination port = 2552

9. The AFTR module of NS-1 encapsulates the IPv4 packet in an IPv6 packet and then sends the IPv6 packet to B4-CPE-1. The IPv6 packet has:

- Source IP address = 2001:DB8::5:6
- Destination IP address = 2001:DB8::3:4

10. Upon receiving the packet, B4-CPE-1 decapsulates the IPv6 packet by removing the IPv6 headers, and then sends the resulting IPv4 packet to CL-1.

## Points to Consider before Configuring DS-Lite

September 21, 2020

Consider the following points before configuring DS-Lite on a Citrix ADC appliance:

1. You must understand the different components of DS-Lite, described in RFC 6333.
2. A DS-lite configuration on a Citrix ADC appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address AFTR component on a Citrix ADC appliance. For more information on Citrix ADC LSN feature, see [Large Scale NAT](#).
3. For a DS-Lite configuration, the Citrix ADC appliance supports LSN for IPv4 packets that belong to one of the following protocols only. The Citrix ADC appliance drops IPv4 packets belonging to other protocols:
  - TCP
  - UDP
  - ICMP
4. The Citrix ADC appliance supports the following ALGs DS-Lite:
  - ICMP
  - FTP
  - TFTP
  - Session Initiation Protocol (SIP)
  - Real Time Streaming Protocol (RTSP)

## Configuring DS-Lite

September 21, 2020

A DS-lite configuration on a Citrix ADC appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. For more information on the Citrix ADC LSN feature, see [Large Scale NAT](#). A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address (of type SNIP6) of the DS-Lite AFTR component on a Citrix ADC appliance.

Configuring DS-Lite on a Citrix ADC appliance consists of the following tasks:

Set the global LSN parameters\*\*. Global parameters include the amount of Citrix ADC memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

- **Create an LSN client entity for identifying traffic from B4 CPE devices.** The LSN client entity refers to a set of DS-Lite B4 devices. The client entity includes IPv6 addresses or IPv6 network address or ACL6 rules for identifying the traffic from these B4 devices. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.
- **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the Citrix ADC appliance to perform LSN. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.
- **Create an LSN IP6 profile.** An LSN IP6 profile defines the IPv6 address of the DS-Lite AFTR component on the Citrix ADC appliance. The IPv6 address must be one of the Citrix ADC owned IPv6 address of type SNIP6.
- **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
- **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound

profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

- **Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

## Configuration by Using the Command Line

### To create an LSN client by using the command line interface:

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
4 <!--NeedCopy-->
```

### To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface:

At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
  string>)
2
3 show lsn client
4 <!--NeedCopy-->
```

### To create an LSN pool by using the command line interface:

At the command prompt, type:

```

1 add lsn pool <poolname> [-nattype ( DYNAMIC )] [-portblockallocation (
  ENABLED | DISABLED )] [-portrealloctimeout <secs>] [-
  maxPortReallocTmq <positive_integer>]
2
3 show lsn pool
4 <!--NeedCopy-->

```

### To bind an IP address range to an LSN pool by using the command line interface:

At the command prompt, type:

```

1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
4 <!--NeedCopy-->

```

**Note:** For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

### To configure an LSN IPv6 profile by using the command line interface:

At the command prompt, type:

```

1 add lsn ip6profile <name> - type DS-Lite - network6 < ipv6_addr|*s >
2
3 show lsn ip6profile
4 <!--NeedCopy-->

```

### To create an LSN transport profile by using the command line interface:

At the command prompt, type:

```

1 add lsn transportprofile <transportprofilename> <transportprotocol> [-
  sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
  positive_integer>] [-sessionquota <positive_integer>] [-
  portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
  ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
2
3 show lsn transportprofile
4 <!--NeedCopy-->

```

### To create an LSN application profile by using the command line interface:

At the command prompt, type:

```

1 add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
  PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
  tcproxy ( ENABLED | DISABLED )] [-td <positive_integer>]

```

```

2
3 show lsn appsprofile
4 <!--NeedCopy-->

```

**To bind an application protocol port range to an LSN application profile by using the command line interface:**

At the command prompt, type:

```

1 bind lsn appsprofile <appsprofilename> <lsnport>
2
3 show lsn appsprofile
4 <!--NeedCopy-->

```

**To create an LSN group by using the command line interface:**

At the command prompt, type:

```

1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC )]
    [-portblocksize <positive_integer>] [-logging (ENABLED | DISABLED )]
    [-sessionLogging ( ENABLED | DISABLED )][--sessionSync ( ENABLED |
    DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED |
    DISABLED )] [-pptp ( ENABLED |DISABLED )] [-sipalg ( ENABLED |
    DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2
3 show lsn group
4 <!--NeedCopy-->

```

**To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface:**

At the command prompt, type:

```

1 bind lsn group <groupname> (-poolname <string> | -transportprofilename
    <string> | -httphdrlogprofilename <string> | -appsprofilename <
    string> | -sipalgprofilename <string> | rtspalgprofilename <string>)
2
3 show lsn group
4 <!--NeedCopy-->

```

## Configuration by Using the Configuration Utility

**To configure an LSN client and bind an IPv6 network address or an ACL6 rule by using the configuration utility:**

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv6 network address or an ACL6 rule to the client.

**To configure an LSN pool and bind NAT IP addresses by using the configuration utility:**

Navigate to **System > Large Scale NAT > Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

**To configure an LSN IPv6 profile by using the configuration utility:**

Navigate to **System > Large Scale NAT > Profiles**, click the **IPv6** tab, and assign an IPv6 address for DS-Lite AFTR.

**To configure an LSN transport profile by using the configuration utility:**

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport**, and then add a transport profile.

**To configure an LSN application profile by using the configuration utility:**

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application**, and then add an application profile.

**To configure an LSN group and bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles by using the configuration utility:**

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles to the group.

```
1 > add lsn client LSN-DSLITE-CLIENT-1
2 Done
3 > bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
4 Done
5 > add lsn pool LSN-DSLITE-POOL-1
6 Done
7 > bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
8 Done
9 > add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
10 Done
11 > add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1

```

## Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The Citrix ADC appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a Citrix ADC appliance whose NSIP address is 10.102.37.115.

LSN Log Entry Type	Sample Log Entry
DS-Lite session creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:38 GMT 0-PPE-1 : default LSN LSN_SESSION 37647607 0 : SESSION CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol:TCP
DS-Lite session deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:22 GMT 0-PPE-1 : default LSN LSN_SESSION 37647617 0 : SESSION DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol: TCP
DS-Lite LSN mapping creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:39 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647610 0 : EIM CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP
DS-Lite LSN mapping deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:25 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647618 0 : EIM DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP

## Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the Citrix ADC appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

### Configuration by Using the Command Line Interface

#### To display all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```

1 show lsn session - nattytype DS-Lite
2 <!--NeedCopy-->

```

### To display selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```

1 show lsn session - nattytype DS-Lite [-clientname <string>] [-network <
  ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
  ip_addr> [-natPort <port>]]
2 <!--NeedCopy-->

```

### Example:

The following sample output displays all DS-Lite sessions existing on a Citrix ADC appliance:

```

1 show lsn session - nattytype DS-Lite
2   B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP
   NatPort Proto Dir
3
4 1.  2001:DB8:::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61
   3002 TCP OUT
5
6 2.  2001:DB8:::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61
   52862 TCP OUT
7
8 3.  2001:DB8:::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61
   48116 ICMP OUT
9
10 4.  2001: DB8:::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69
   48305 TCP OUT
11
12 Done
13 <!--NeedCopy-->

```

### Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. **Navigate to System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

## Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the Citrix ADC appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the Citrix ADC appliance.

### To clear all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
flush lsn session -nattype DS-Lite
show lsn session -nattype DS-Lite
```

### To clear selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
1 flush lsn session -nattype DS-Lite [-clientname <string>] [-network <
   ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
   ip_addr> [-natPort <port>]]
2
3 show lsn session -nattype DS-Lite
4 <!--NeedCopy-->
```

### To clear all or selected DS-Lite sessions by using the configuration utility:

1. Navigate to **System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. Click **Flush Sessions**.

## Configuring DS-Lite Static Maps

September 21, 2020

The Citrix ADC appliance supports manual creation of DS-Lite LSN mappings, which contain the mapping between the following information:

- Subscriber's IP address and port, and IPv6 address of B4 device or component
- NAT IP address and port

Static DS-Lite LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP address and port map to the subscriber IP address and port through the specified B4 device (for example, web servers located in the internal network).

Note: This feature is supported in release 11.0 build 64.x and later.

## To create a DS-Lite static LSN mapping by using the command line

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td
   <positive_integer>] [-network6 <B4_ADDR>] [<natIP> [<natPort>]] [-
   destIP<ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
4 <!--NeedCopy-->
```

### Parameter Descriptions

#### add lsn static

- name

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “ds-lite lsn static1” or ‘ds-lite lsn static1’). This is a mandatory argument. Maximum Length: 127

- transportprotocol

Protocol for the DS-Lite LSN mapping entry.

- subscrIP

IPv4 address of a subscriber for the DS-Lite LSN mapping entry.

- subscrPort

Port of the subscriber for the DS-Lite LSN mapping entry.

- Network6

IPv6 address of the B4 device or component.

- td

ID of the traffic domain to which the B4 device belongs. The IPv6 address of the B4 device is specified in the network6 paramter. If you do not specify an ID, the B4 device is assumed to be a part of the default traffic domain.

- natIP

IPv4 address, already existing on the Citrix ADC appliance as type LSN, to be used as NAT IP address for this mapping entry.

- natPort

NAT port for this DS-Lite LSN mapping entry.

- destIP

Destination IP address for the DS-Lite LSN mapping entry.

- dsttd

ID of the traffic domain through which the destination IP address for this DS-Lite LSN mapping entry is reachable from the Citrix ADC appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0.

### **To create a DS-Lite static LSN mapping by using the configuration utility**

Navigate to System > Large Scale NAT > Static, and add a new DS-Lite static LSN mapping.

## **Configuring Deterministic NAT Allocation for DS-Lite**

September 21, 2020

Deterministic NAT allocation for DS-Lite LSN deployments is a type of NAT resource allocation in which the Citrix ADC appliance pre-allocates, from the LSN NAT IP pool and on the basis of the specified port block size, an LSN NAT IP address and a block of ports to each subscriber (subscriber behind B4 device).

**Note:** This feature is supported in release 11.0 build 64.x and later.

The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The Citrix ADC appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified by just its mapped NAT IP address and port block. For this reason, the Citrix ADC appliance does not log the creation or deletion of an LSN session.

A DS-Lite subscriber can have only one deterministic port block. If the entire block of ports is being used, the Citrix ADC appliance drops any new connection from the subscriber.

### Example: Deterministic DS-Lite

In this example, a deterministic DS-Lite configuration includes four subscribers with IP addresses 192.0.17.5, 192.0.17.6, 192.0.17.7, and 192.0.17.8. These ipv4 subscribers are behind a B4 device having the IPv6 address 2001:DB8::3:4. In this configuration, the port block size is set to 20480 and LSN NAT IP address pool has IP addresses in the range 203.0.113.41-203.0.113.42.

The Citrix ADC appliance sequentially pre-allocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-21503) on the beginning NAT IP address (203.0.113.41) to the beginning subscriber IP address (192.0.17.5). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The Citrix ADC logs the NAT IP address and the block of ports allocated for each subscriber.

The Citrix ADC appliance does not log any LSN session created or deleted for these subscribers.

The following table lists the NAT IP address and blocks of ports allocated to each subscriber in this example:

Subscriber IP address	Allocated NAT IP address	Allocated Block of Ports	IPv6 address of B4
192.0.17.5	203.0.113.41	1024 - 21503	2001:DB8::3:4
192.0.17.6	203.0.113.41	21504 - 41983	2001:DB8::3:4
192.0.17.7	203.0.113.41	41984 - 62463	2001:DB8::3:4
192.0.17.8	203.0.113.42	1024 - 21503	2001:DB8::3:4

### Configuration Steps

You need to configure deterministic NAT as part of the DS-Lite configuration. For instructions on configuring DS-Lite, see [Configuring DS-Lite](#).

While configuring DS-Lite, make sure that you:

- Set the NAT Type parameter to Deterministic when adding the LSN pool and the LSN group.
- Set the desired port block size parameter when adding the LSN group, unless you can accept the default value.

### Points to Consider before Configuring Deterministic DS-Lite

Consider the following points before configuring deterministic DS-Lite:

- The complete IP address of each subscriber must be specified in a separate add lsn client command, by setting the Network and Netmask parameters. (Set Netmask to 255.255.255.255.) Also the IPv4 address of the B4 device specified in Network6 parameter must be complete (/128 prefix). In other words, Network and Network6 parameter do not accept addresses other than /32 bit mask and /128 prefix, respectively.
- The Citrix ADC appliance drops connections from subscribers that are not specified in any deterministic DS-Lite configuration but are behind B4 devices specified in a deterministic DS-lite configuration.
- The Citrix ADC appliance recognizes subscribers having the same IPv4 address as different subscribers if they are behind different B4 devices. A combination of subscriber IPv4 address and B4 device defines a unique subscriber in the LSN client entity of a DS-Lite configuration.

### Sample Deterministic DS-Lite Configuration:

The following configuration uses the settings listed in section Example: Deterministic DS-Lite.

```
1 add lsn client LSN-DSLITE-CLIENT-10
2
3 Done
4 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.5 -netmask
   255.255.255.255 -network6 2001:DB8::3:4/128
5
6 Done
7 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.6 -netmask 255
   .255.255.255 -network6 2001:DB8::3:4/128
8
9 Done
10 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.7 -netmask 255
   .255.255.255 -network6 2001:DB8::3:4/128
11
12 Done
13 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.8 -netmask 255
   .255.255.255 -network6 2001:DB8::3:4/128
14
15 Done
16 add lsn pool LSN-DSLITE-POOL-10 -nattype DETERMINISTIC
17
18 Done
19 bind lsn pool LSN-DSLITE-POOL-10 203.0.113.41-203.0.113.42
20
21 Done
```

```
22 add lsn ip6profile LSN-DSLITE-PROFILE-10 -type DS-Lite -network6 2001:
    DB8::5:6
23
24 Done
25 add lsn group LSN-DSLITE-GROUP-10 -clientname LSN-DSLITE-CLIENT-10 -
    nattytype DETERMINISTIC -portblocksize 20480 -ip6profile LSN-DSLITE-
    PROFILE-10
26
27 Done
28 bind lsn group LSN-DSLITE-GROUP-10 -poolname LSN-DSLITE-POOL-10
29
30 Done
31 <!--NeedCopy-->
```

## Configuring Application Layer Gateways for DS-Lite

September 21, 2020

For some application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway (ALG) for a protocol parses the packet payload and does necessary changes to ensure that the protocol continues to work over DS-Lite.

The Citrix ADC appliance supports ALG for the following protocols for DS-Lite:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

## Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for a DS-Lite configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for a DS-Lite configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping,

endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

## Application Layer Gateway for SIP Protocol

September 21, 2020

Using DS-Lite with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for DS-Lite is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

### Limitations of SIP ALG

SIP ALG for DS-Lite has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Admin partitions
  - Citrix ADC clusters
  - Multipart body
  - Line folding

### Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuring DS-Lite](#). While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - o IP Pooling = PAIRED
  - o Address and Port Mapping = ENDPOINT-INDEPENDENT
  - o Filtering = ENDPOINT-INDEPENDENT

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group
- Enable SIP ALG in the LSN group

### To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string>[-sipalg ( ENABLED |
   DISABLED )]
2
3 show lsn group<groupname>
4 <!--NeedCopy-->
```

### To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn sipalgprofile<sipalgprofilename>[-dataSessionIdleTimeout<
   positive_integer>][-sipSessionTimeout<positive_integer>][-
   registrationTimeout<positive_integer>][-sipsrcportrange<port[-port
   ]>][-sipdstportrange<port[-port]>][-openRegisterPinhole ( ENABLED |
   DISABLED )][-openContactPinhole ( ENABLED | DISABLED )][-
   openViaPinhole ( ENABLED | DISABLED )][-openRecordRoutePinhole (
   ENABLED | DISABLED )][-sipTransportProtocol ( TCP | UDP )[-
   openRoutePinhole ( ENABLED | DISABLED )][-rport ( ENABLED | DISABLED
   )]
2
3 show lsn sipalgprofile<sipalgprofilename>
4 <!--NeedCopy-->
```

### Sample Configuration

The following sample DS-Lite configuration, SIP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::3:0/96.

```
1 add lsn client LSN-DSLITE-CLIENT-1
2 Done
3 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/96
4 Done
5 add lsn pool LSN-DSLITE-POOL-1
6 Done
7 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
```

```
8 Done
9 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
  DB8::5:6
10 Done
11 add lsn appsprofile LSN-DSLITE-APPS-PROFILE-1 TCP -ippooling PAIRED -
  mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn sipalprofile SIPALGPROFILE-1 -sipdstportrange 5060 -
  sipTransportProtocol TCP
14 Done
15 add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
  portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1 -sipalg ENABLED
16 Done
17 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
18 Done
19 bind lsn group LSN-DSLITE-GROUP-1 -appsprofile LSN-DSLITE-APPS-
  PROFILE-1
20 Done
21 bind lsn group LSN-DSLITE-GROUP-1 -sipalprofile SIPALGPROFILE-1
22 Done
23 <!--NeedCopy-->
```

## Application Layer Gateway for RTSP Protocol

September 21, 2020

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. Citrix ADC functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to Citrix ADC owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.

- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

### Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- Citrix ADC clusters
- RTSP Authentication
- HTTP tunneling

### Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuring DS-Lite](#). While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

#### To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED |  
    DISABLED )]  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

#### To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <  
    positive_integer>] -rtspportrange <port[-port]> [-  
    rtspTransportProtocol (TCP|UDP)]
```

```
2
3 show lsn rtspalgprofile <rtspalgprofilename>
4 <!--NeedCopy-->
```

### Sample RTSP ALG Configuration

The following sample DS-Lite configuration, RTSP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::4:0/96.

#### Sample RTSP ALG Configuration:

```
1 add lsn client LSN-DSLITE-CLIENT-5
2 Done
3 bind lsn client LSN-DSLITE-CLIENT-5 -network6 2001:DB8::4:0/96
4 Done
5 add lsn pool LSN-DSLITE-POOL-5
6 Done
7 bind lsn pool LSN-DSLITE-POOL-5 203.0.113.61 - 203.0.113.70
8 Done
9 add lsn ip6profile LSN-DSLITE-PROFILE-5 -type DS-Lite -network6 2001:
  DB8::5:6
10 Done
11 add lsn appsprofile LSN-DSLITE-APPS-PROFILE-5 TCP -ippooling PAIRED -
  mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn rtspalgprofile RTSPALGPROFILE-5 -rtspIdleTimeout 1000 -
  rtspportrange 554
14 Done
15 add lsn group LSN-DSLITE-GROUP-5 -clientname LSN-DSLITE-CLIENT-5 -
  portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-5 -rtspalg ENABLED
16 Done
17 bind lsn group LSN-DSLITE-GROUP-5 -poolname LSN-DSLITE-POOL-5
18 Done
19 bind lsn group LSN-DSLITE-GROUP-5 -appsprofilename LSN-DSLITE-APPS-
  PROFILE-5
20 Done
21 bind lsn group LSN-DSLITE-GROUP-5 -rtspalgprofilename RTSPALGPROFILE-5
22 Done
23 <!--NeedCopy-->
```

## Logging and Monitoring DS-Lite

September 21, 2020

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The Citrix ADC appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a Citrix ADC appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The

Citrix ADC appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a Citrix ADC appliance whose NSIP address is 10.102.37.115.

---

LSN Log Entry Type	Sample Log Entry
--------------------	------------------

DS-Lite session creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:38 GMT 0-PPE-1 : default LSN LSN_SESSION 37647607 0 : SESSION CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol:TCP
DS-Lite session deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:22 GMT 0-PPE-1 : default LSN LSN_SESSION 37647617 0 : SESSION DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 203.0.113.61:3002, Destination IP:Port:TD 198.51.100.250:80:0, Protocol: TCP
DS-Lite LSN mapping creation	Local4.Informational 10.102.37.115 08/14/2015:13:35:39 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647610 0 : EIM CREATED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP
DS-Lite LSN mapping deletion	Local4.Informational 10.102.37.115 08/14/2015:13:38:25 GMT 0-PPE-1 : default LSN LSN_EIM_MAPPING 37647618 0 : EIM DELETED 2001:DB8::3:4 Client IP:Port:TD 192.0.2.51:2552:0, NatIP:NatPort 198.51.100.250:80, Protocol: TCP

## Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the Citrix ADC appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

### To display all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session - nattype DS-Lite
2 <!--NeedCopy-->
```

## To display selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session -nattype DS-Lite [-clientname <string>] [-network <
  ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
  ip_addr> [-natPort <port>]]
2 <!--NeedCopy-->
```

The following sample output displays all DS-Lite sessions existing on a Citrix ADC appliance:

```
show lsn session -nattype DS-Lite
```

```
1   B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP
   NatPort Proto Dir
2
3 1. 2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61
   3002 TCP OUT
4
5 2. 2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61
   52862 TCP OUT
6
7 3. 2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61
   48116 ICMP OUT
8
9 4. 2001: DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69
   48305 TCP OUT
10 Done
11 <!--NeedCopy-->
```

## Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. **Navigate to System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

## Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the Citrix ADC appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the Citrix ADC appliance.

### To clear all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - nattytype DS-Lite
2
3 show lsn session - nattytype DS-Lite
4 <!--NeedCopy-->
```

### To clear selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - nattytype DS-Lite [-clientname <string>] [-network <
    ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <
    ip_addr> [-natPort <port>]]
2
3 show lsn session - nattytype DS-Lite
4 <!--NeedCopy-->
```

### To clear all or selected DS-Lite sessions by using the configuration utility

1. Navigate to **System > Large Scale NAT > Sessions**, and click the **DS-Lite** tab.
2. Click **Flush Sessions**.

### Logging HTTP Header Information

The Citrix ADC appliance can log request header information of an HTTP connection that is using the DS-Lite functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv4 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

### Configuration Steps

Perform the following tasks for configuring the Citrix ADC appliance to log HTTP header information:

- **Create an HTTP header log profile.** An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- **Bind the HTTP header to an LSN group of a DS-Lite LSN configuration.** Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The Citrix ADC appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

### To create an HTTP header log profile by using the command line interface

At the command prompt, type:

```
1 add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED |  
    DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (   
    ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]  
2  
3 show lsn httphdrlogprofile  
4 <!--NeedCopy-->
```

### To bind an HTTP header log profile to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> -httphdrlogprofilename <string>  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

### Sample Configuration

In the following DS-Lite LSN configuration, HTTP header log profile HTTP-Header-LOG-1 is bound to LSN group LSN-DSLITE-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging, so that all these attributes are logged for any HTTP requests from B4 devices (in the network 2001:DB8:5001::/96).

#### Sample Configuration:

```
1 add lsn httphdrlogprofile HTTP-HEADER-LOG-1  
2  
3 Done  
4  
5 add lsn client LSN-DSLITE-CLIENT-1
```

```
6
7 Done
8
9 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
10
11 Done
12
13 add lsn pool LSN-DSLITE-POOL-1
14
15 Done
16
17 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
18
19 Done
20
21 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
    DB8::5:6
22
23 Done
24
25 add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -
    portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1
26
27 Done
28
29 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
30
31 Done
32
33 bind lsn group LSN-DSLITE-GROUP-1 -httpdrlogprofilename HTTP-HEADER-
    LOG-1
34
35 Done
36 <!--NeedCopy-->
```

## IPFIX Logging

The Citrix ADC appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following DS\_Lite related events:

- Creation or deletion of an LSN session.

- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

### Points to Consider before you Configure IPFIX logging

Before you start configuring IPsec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the Citrix ADC appliance. For instructions, see [Configuring the AppFlow feature](#).

### Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

### To enable LSN logging in the AppFlow configuration by using the CLI

At the command prompt, type:

```
1 set appflow param -lsnLogging (ENABLED | DISABLED )
2
3 show appflow param
4 <!--NeedCopy-->
```

### To create an LSN log profile by using the CLIAt the command prompt, type

At the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

**To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

**To create an LSN log profile by using the GUI**

Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

**To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI**

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

## Port Control Protocol for DS-Lite

September 21, 2020

Citrix ADC appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A Citrix ADC appliance implements the PCP server component and is compliant with RFC 6887.

## Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled
- Create a PCP server and bind a PCP profile to it. Create a PCP server on the Citrix ADC appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group. Note: A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

### To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]
2
3 show pcp profile <name>
4 <!--NeedCopy-->
```

### To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
  string>]
2
3 show pcp server <name>
4 <!--NeedCopy-->
```

### Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3:0/100.

#### Sample configuration:

```
1 add pcp profile PCP-DSLITE-PROFILE-1 -minMapLife 300
2 Done
3 add pcp server PCP-DSLITE-SERVER-1 192.0.3.10 -pcpProfile PCP-DSLITE-
  PROFILE-1
4 Done
5 add lsn client LSN-DSLITE-CLIENT-1
6 Done
7 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
8 Done
9 add lsn pool LSN-DSLITE-POOL-1
10 Done
11 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:
  DB8::5:6
14 Done
15 add lsn group LSN-DSLITE-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -
  ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-DSLITE-GROUP-1 -poolname PCP-NAT64-SERVER-1
20 Done
21 <!--NeedCopy-->
```

## Large Scale NAT64

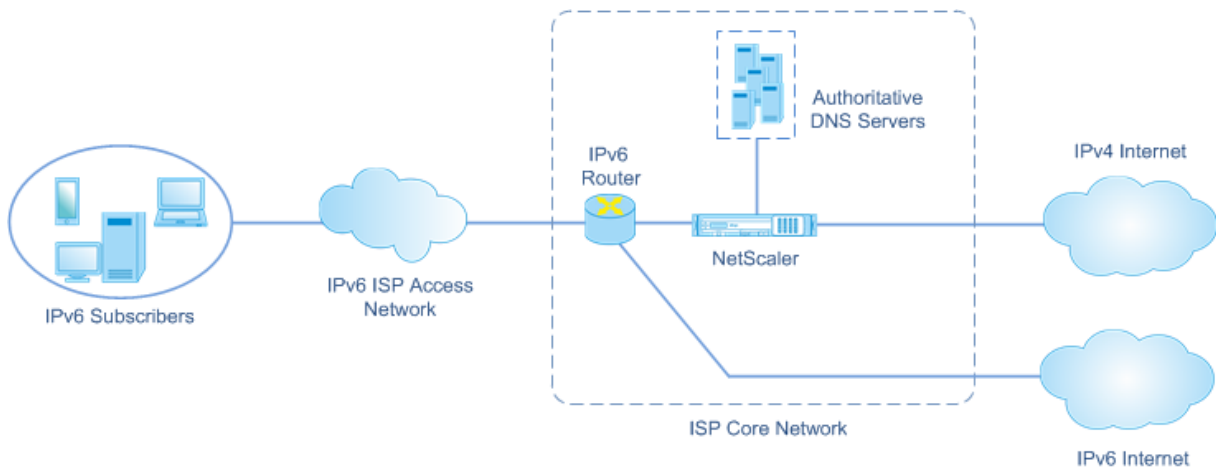

September 21, 2020

Because of the imminent exhaustion of IPv4 addresses, ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses IPv4. Large scale NAT64 is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv6-only subscribers to the IPv4 Internet. DNS64 is a solution for enabling discovery of IPv4-only domains by IPv6-only clients. DNS64 is used with large scale NAT64 to enable seamless communication between IPv6-only clients and IPv4-only servers.

A Citrix ADC appliance implements large scale NAT64 and DNS64 and is compliant with RFCs 6145, 6146, 6147, 6052, 3022, 2373, 2765, and 2464.

### Architecture

The NAT64 architecture of an ISP using a Citrix ADC appliance consists of IPv6 subscribers accessing the IPv4 Internet through a Citrix ADC appliance deployed in the ISP's core network. IPv6 subscribers are connected to the ISP core network through the ISP's IPv6-only access network.

The large scale NAT64 functionality of a Citrix ADC appliance enables communication between IPv6 clients and IPv4 servers through IPv6-to-IPv4 packet translation, and vice versa, while maintaining session information on the Citrix ADC appliance. Citrix ADC DNS64 functionality represents IPv4-only domains to IPv6-subscribers by synthesizing DNS AAAA records for IPv4-only domains and sending them to the subscribers.

Large scale NAT64 has two main components: NAT64 prefix and NAT IPv4 pool. DNS64 has one main component, DNS64 prefix, which has the same value as NAT64 prefix.

Upon receiving an AAAA request from an IPv6-only subscriber for a domain name that is hosted on an IPv4-only web server on the Internet, the Citrix ADC DNS64 functionality synthesizes an AAAA record

for the domain name and sends it to the subscriber. The AAAA record is synthesized by concatenating the DNS64 prefix (which is set to the NAT64 prefix) and the actual IPv4 address of the domain name.

The subscriber now has an IPv6 destination address that corresponds to the desired domain name. The subscriber sends the request to the synthesized IPv6 address. Upon receiving the IPv6 request, the large scale Citrix ADC NAT64 functionality translates the IPv6 request packet to an IPv4 request packet. Large scale NAT64 sets the IPv4 request's destination address to the IPv4 address, which is extracted from the IPv6 request's destination address by stripping the NAT64 prefix from the IPv6 address. The destination port is retained from the IPv6 request. Large Scale NAT64 also sets the source IP address:source port of the IPv4 packet to the NAT IP address:NAT port selected from the configured NAT pool.

The appliance maintains a record of all active sessions that use the large scale NAT64 functionality. These sessions are called large scale NAT64 sessions. The appliance also maintains the mappings between subscriber IPv6 address and port, and NAT IPv4 address and port, for each large scale NAT64 session. These mappings are called large scale NAT64 mappings. From large scale NAT64 session entries and large scale NAT64 mapping entries, the Citrix ADC appliance recognizes a response packet (received from the Internet) as belonging to a particular NAT64 session.

When the appliance receives an IPv4 response packet belonging to a particular NAT64 session, it uses the information stored in the NAT64 session to translate the IPv4 packet into an IPv6 packet, and then sends the IPv6 response packet to the subscriber.

### **Example: Traffic Flow of NAT64 and DNS64 Deployment**

Consider an example of a large scale NAT64 and DNS64 deployment consisting of Citrix ADC appliance NS-1 and two local DNS servers, DNS-1 and DNS-2, in an ISP's core network, and IPv6 subscriber SUB-1. SUB-1 is connected to NS-1 through the ISP's IPv6 access network. NS-1 includes large scale NAT64 and DNS64 configurations for enabling the communication between IPv6 subscriber SUB-1 and IPv4 hosts (internal and external).

Large scale NAT64 configuration includes a NAT64 prefix (2001:DB8:300::/96) and NAT IPv4 pool for translation of IPv6 requests to IPv4 requests and IPv4 responses to IPv6 responses.

DNS64 configuration includes a DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) and a DNS64 prefix (2001:DB8:300::/96). LBVS-DNS64-1 represents local DNS server DNS-1 and DNS-2 to ISP's subscribers. The DNS64 prefix, which has the same value as the NAT64 prefix, is used for synthesizing DNS AAAA records from DNS A records received from DNS servers DNS-1 and DNS-2. NS-1 responds with a synthesized AAAA record to SUB-1 for a DNS request to resolve an IPv4 host.

### DNS64 Traffic Flow

Traffic flows between IPv6 subscriber SUB-1 and site `www.example.com`, which resides on an IPv4-only web server on the Internet, as follows:

1. IPv6 subscriber SUB-1 sends a DNS AAAA request for `www.example.com` to its designated DNS server (2001:DB8:9999::99).
2. DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) on Citrix ADC appliance NS1 receives the AAAA request. LBVS-DNS64-1's load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
3. DNS-1 returns an empty record or an error message, because there is no AAAA record available for `www.example.com`.
4. Because the DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS1 sends a DNS A request to DNS-1 for the IPv4 address of `www.example.com`.
5. DNS-1 responds with the A record of 192.0.2.60 for `www.example.com`.
6. DNS64 module on NS1 synthesizes an AAAA record for `www.example.com` by concatenating the DNS64 Prefix (2001:DB8:300::/96) associated with LBVS-DNS64-1, and IPv4 address (192.0.2.60) for `www.example.com` = 2001:DB8:300::192.0.2.60
7. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

### NAT64 Traffic Flow

1. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 `www.example.com`. The IPv6 packet has:

- Source IP address = 2001:DB8:5001:30
- Source port = 2552

- Destination IP address = 2001:DB8:300::192.0.2.60
- Destination port = 80

2. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 [www.example.com](http://www.example.com). The IPv6 packet has:

- Source IP address = 2001:DB8:5001:30
- Source port = 2552
- Destination IP address = 2001:DB8:300::192.0.2.60
- Destination port = 80

3. When NS-1 receives the IPv6 packet, the large scale NAT64 module creates a translated IPv4 request packet with:

- Source IP address = One of the IPv4 addresses available in the configured NAT pool (203.0.113.61)
- Source port = One of ports available with the allocated NAT IPv4 address (3002)
- Destination IP address = IPv4 address extracted from the IPv6 request's destination address by stripping the NAT64 prefix (2001:DB8:300::/96) from the IPv6 address (192.0.2.60)
- Destination port = IPv6 request's destination port (80)

4. The large scale NAT64 module also creates mapping and session entries for this large scale NAT64 flow. The session and mapping entries include the following information:

- Source IP address of the IPv6 packet = 2001:DB8:5001:30
- Source port of the IPv6 packet = 2552
- NAT IP address = 203.0.113.61
- NAT port = 3002
- NS-1 sends the resulting IPv4 packet to its destination on the Internet.

5. Upon receiving the request packet, the server for [www.example.com](http://www.example.com) processes the packet and sends a response packet to NS-1. The IPv4 response packet has:

- Source IP address = 192.0.2.60
- Source port = 80
- Destination IP address = 203.0.113.61
- Destination port = 3002

6. Upon receiving the IPv4 response packet, NS-1 examines the large scale NAT64 mapping and session entries and finds that the IPv4 response packet belongs to a large scale NAT64 session. The large scale NAT64 module creates a translated IPv6 response packet:

- Source IP address = 2001:DB8:300::192.0.2.60
- Source port = 80
- Destination IP address = 2001:DB8:5001:30
- Destination port = 2552

7. NS-1 sends the translated IPv6 response to client SUB-1.

## Large Scale NAT64 features Supported on Citrix ADC appliances

Large scale NAT64 on a Citrix ADC appliance supports the standard LSN feature set. For more information on these LSN features, see [LSN Architecture](#).

Following are some of the large scale NAT64 features supported on Citrix ADC appliances:

- ALGs. Support of application Layer Gateway (ALG) for SIP, RTSP, FTP, ICMP, and TFTP protocols.
- Deterministic/Fixed NAT. Support for pre-allocation of blocks of ports to subscribers to minimize logging.
- Mapping. Support of Endpoint-independent mapping (EIM), Address-dependent mapping (ADM), and Address-Port dependent mapping (APDM).
- Filtering. Support of Endpoint-Independent Filtering (EIF), Address-Dependent Filtering (ADF), and Address-Port-Dependent Filtering (APDF).
- Quotas. Configurable limits on number of ports, sessions per subscriber, and sessions per LSN group.
- Static Mapping. Support for manually defining a large scale NAT64 mapping.
- Hairpin Flow. Support for communication between subscribers or internal hosts using NAT IP addresses.
- 464XLAT connections. Support for communication between IPv4-only applications on IPv6 subscriber hosts and IPv4 hosts on the Internet through IPv6 network.
- Variable length NAT64 and DNS64 prefixes. The Citrix ADC appliance supports defining NAT64 and DNS64 prefixes of lengths of 32, 40, 48, 56, 64, and 96.
- Multiple NAT64 and DNS64 prefix. The Citrix ADC appliance supports multiple NAT64 and DNS64 prefixes.
- LSN Clients. Support for specifying or identifying subscribers for large scale NAT64 by using IPv6 prefixes and extended ACL6 rules.
- Logging. Support for logging NAT64 sessions for law enforcement. In addition, the following are also supported for logging.
  - **Reliable SYSLOG.** Support for sending SYSLOG messages over TCP to external log servers for a more reliable transport mechanism.
  - **Load balancing of log servers.** Support for load balancing of external log servers for preventing storage of redundant log messages.
  - **Minimal Logging.** Deterministic LSN configurations or Dynamic LSN configurations with port block significantly reduce the large scale NAT64 log volume.
  - **Logging MSISDN information.** Support for including subscribers' MSISDN information in large scale NAT64 logs to identify and track subscriber activity over the Internet.

## Points to Consider for Configuring Large Scale NAT64

September 21, 2020

Before you start configuring large scale NAT64 and DNS64, consider these points:

1. Make sure you understand the different components of large scale NAT64, described in RFCs.
2. The Citrix ADC appliance supports only the following ALGs for large Scale NAT64:
  - FTP
  - TFTP
  - ICMP
  - SIP
  - RTSP
3. In a high availability setup of two Citrix ADC appliances, large NAT64 session synchronization (connection mirroring) is not supported.

## Configuring DNS64

September 21, 2020

Creating the required entities for stateful NAT64 configuration on the Citrix ADC appliance involves the following procedures:

- Add DNS services. DNS services are logical representations of DNS servers for which the Citrix ADC appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see “[Load Balancing](#)”.
- Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy. A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude-rule and mapped-rule settings.
- Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it. The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see “[Load Balancing](#)”.

### Note

The command line interface has separate commands for these two tasks, but the GUI combines them in a single dialog box.

- Enable caching of DNS records. Enable the global parameter for the Citrix ADC appliance to cache DNS records, which are obtained through DNS proxy operations. For more information on enabling caching of DNS records, see “[Enabling Caching of DNS Records](#)”.

### To create a service of type DNS by using the command line interface

At the command prompt, type:

```
1 add service <name> <IP> <serviceType> <port> ...
2 <!--NeedCopy-->
```

### To create a DNS64 action by using the command line interface

At the command prompt, type:

```
1 add dns action64 <actionName> -Prefix <ipv6_addr|*> [-mappedRule <
  expression>] [-excludeRule <expression>]
2 <!--NeedCopy-->
```

### To create a DNS64 policy by using the command line interface

At the command prompt, type:

```
1 add dns policy64 <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

### To create a DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
1 add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED
  ) [-bypassAAAA ( YES | NO)] ...
2 <!--NeedCopy-->
```

### To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
1 bind lb vserver <name> <serviceName> ...
2
```

```
3 bind lb vserver <name> -policyName <string> -priority <positive_integer>
  > ...
4 <!--NeedCopy-->
```

**Sample configuration:**

```
1 add service SVC-DNS-1 203.0.113.50 DNS 53
2 Done
3 add service SVC-DNS-2 203.0.113.60 DNS 53
4 Done
5 add dns Action64 DNS64-Action-1 -Prefix 2001:DB8:300::/96
6 Done
7 add dns Policy64 DNS64-Policy-1 -rule "CLIENT.IPv6.SRC.IN_SUBNET(2001:
  DB8:5001::/64)" -action DNS64-Action-1
8 Done
9 add lb vserver LBVS-DNS64-1 DNS 2001:DB8:9999::99 53 -dns64 ENABLED
10 Done
11 bind lb vserver LBVS-DNS64-1 SVC-DNS-1
12 Done
13 bind lb vserver LBVS-DNS64-1 SVC-DNS-2
14 Done
15 bind lb vserver LBVS-DNS64-1 -policyname DNS64-Policy-1 -priority 2
16 Done
17 <!--NeedCopy-->
```

## Configuring Large Scaler NAT64

September 21, 2020

A large scale NAT64 configuration on a Citrix ADC appliance uses the LSN commands sets. In a large scale NAT64 configuration, the LSN client entity specifies the IPv6 address or IPv6 network address, or ACL6 rules, for identifying IPv6 subscribers. A NAT64 configuration also includes an IPv6 profile, which specifies a NAT64 prefix.

Configuring NAT64 on a Citrix ADC appliance consists of the following tasks:

- Set the global LSN parameters. Global parameters include the amount of Citrix ADC memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
- Create an LSN client entity for identifying traffic from IPv6 subscribers. The LSN client entity refers to a set of IPv6 subscribers. The client entity includes IPv6 addresses or IPv6 network prefixes, or ACL6 rules, for identifying the traffic from these subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an

LSN client entity and binding a subscriber to the LSN client entity. The GUI combines these two operations on a single screen.

- Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the Citrix ADC appliance to perform large scale NAT64. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The GUI combines these two operations on a single screen.
- Create an LSN IP6 profile. An LSN IP6 profile defines the NAT64 prefix for a large scale NAT64 configuration.
- (Optional) Create an LSN Transport Profile for a specified protocol. An LSN transport profile defines various timeouts and limits, such as maximum large scale NAT64 sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
- (Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it. An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The GUI combines these two operations on a single screen.
- Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group. An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN

group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The GUI combines these two operations in a single screen.

## Configuration Using the Command Line

You can create different configurations using the command line interface. Follow the steps given below.

### To create an LSN client by using the command line interface

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
4 <!--NeedCopy-->
```

### To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface

At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
  string>)
2
3 show lsn client
4 <!--NeedCopy-->
```

### To create an LAN pool by using the command line interface

At the command prompt, type:

```
1 add lsn pool <poolname>
2
3 show lsn pool <poolname>
4 <!--NeedCopy-->
```

### To bind NAT IP addresses to an LSN pool by using the command line interface

At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
4 <!--NeedCopy-->
```

**Note**

For removing NAT IP (LSN IP addresses) addresses from an LSN pool, use the unbind lsn pool command.

**To configure an LSN IPv6 profile by using the command line interface**

At the command prompt, type:

```
1 add lsn ip6profile <name> - type NAT64 -natprefix <ipv6_addr|*>
2
3 show lsn ip6profile
4 <!--NeedCopy-->
```

**To create an LSN transport profile by using the command line interface**

At the command prompt, type:

```
1 add lsn transportprofile <transportprofilename> <transportprotocol> [-
  sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <
  positive_integer>] [-sessionquota <positive_integer>] [-
  portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange (
  ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
2
3 show lsn transportprofile
4 <!--NeedCopy-->
```

**To create an LSN application profile by using the command line interface**

At the command prompt, type:

```
1 add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (
  PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-
  tcpproxy ( ENABLED | DISABLED )]
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

### To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>
2
3 show lsn appsprofile
4 <!--NeedCopy-->
```

### To create an LSN group by using the command line interface

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC |
  DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging(
  ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-
  sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer
  >] [-ftp ( ENABLED | DISABLED )] [-sipalg ( ENABLED | DISABLED )] [-
  rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2
3 show lsn group
4 <!--NeedCopy-->
```

### To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> (-poolname <string> | -transportprofilename
  <string> | -httphdrlogprofilename <string> | -appsprofilename <
  string> | -sipalgprofilename <string> | rtspalgprofilename <string>)
2
3 show lsn group
4 <!--NeedCopy-->
```

### Sample Large Scale NAT64 Configurations

Here are some sample configurations of large scale NAT64:

#### Simple large scale NAT64 configuration with default settings:

```
1 add lsn client LSN-NAT64-CLIENT-1
```

```
2
3 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
4
5 add lsn pool LSN-NAT64-POOL-1
6
7 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
8
9 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
   :300::/96
10
11 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
   ip6profile LSN-NAT64-PROFILE-1
12
13 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
14
15 <!--NeedCopy-->
```

**Simple large scale NAT64 configuration with an extended ACL6 rule for identifying subscribers:**

```
1 add ns acl6 LSN-NAT64-ACL-2 ALLOW - srcIPv6 = 2001:DB8:5002::20 - 2001:
   DB8:5002::200
2
3 apply acl6s
4
5 add lsn client LSN-NAT64-CLIENT-2
6
7 bind lsn client LSN-NAT64-CLIENT-2 - acl6name LSN-NAT64-ACL-2
8
9 add lsn pool LSN-NAT64-POOL-2
10
11 bind lsn pool LSN-NAT64-POOL-2 203.0.113.5-203.0.113.10
12
13 add lsn ip6profile LSN-NAT64-PROFILE-2 -type NAT64 -natprefix 2001:DB8
   :302::/96
14
15 add lsn group LSN-NAT64-GROUP-2 -clientname LSN-NAT64-CLIENT-2 -
   ip6profile LSN-NAT64-PROFILE-2
16
17 bind lsn group LSN-NAT64-GROUP-2 -poolname LSN-NAT64-POOL-2
18
19 <!--NeedCopy-->
```

**Large scale NAT64 configuration with deterministic NAT resource allocation:**

```
1 add lsn client LSN-NAT64-CLIENT-7
```

```
2
3 bind lsn client LSN-NAT64-CLIENT-7 -network6 2001:DB8:1002::7/128
4
5 add lsn pool LSN-NAT64-POOL-7 -nattype DETERMINISTIC
6
7 bind lsn pool LSN-NAT64-POOL-7 203.0.113.24-203.0.113.27
8
9 add lsn ip6profile LSN-NAT64-PROFILE-7 -type NAT64 -natprefix 2001:DB8
   :307::/96
10
11 add lsn group LSN-NAT64-GROUP-7 -clientname LSN-NAT64-CLIENT-7 -
   ip6profile LSN-NAT64-PROFILE-7 -nattype DETERMINISTIC -portblocksize
   256
12
13 bind lsn group LSN-NAT64-GROUP-7 -poolname LSN-POOL-7
14
15 <!--NeedCopy-->
```

## Configuring Application Layer Gateways for Large Scale NAT64

September 21, 2020

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet payload. Application Layer Gateway for a protocol parses the packet's payload and does necessary changes to ensure that the protocol continues to work over large scale NAT64.

The Citrix ADC appliance supports ALG for the following protocols for large scale NAT64:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

## Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 21, 2020

You can enable or disable ALG for the FTP protocol for an large scale NAT64 configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an large scale NAT64 configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

## Application Layer Gateway for SIP Protocol

September 21, 2020

Using Large Scale NAT64 with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for large scale NAT64 is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

### Limitations of SIP ALG

SIP ALG for large scale NAT64 has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Traffic Domains
  - Admin partitions
  - Citrix ADC clusters
  - Multipart body
  - Line folding

### Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Large Scale NAT64. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:

- IP Pooling = PAIRED
- Address and Port Mapping = ENDPOINT-INDEPENDENT
- Filtering = ENDPOINT-INDEPENDENT
- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group.
- Enable SIP ALG in the LSN group.

### To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-sipalg ( ENABLED |
   DISABLED )]
2
3 show lsn group <groupname>
4 <!--NeedCopy-->
```

### To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn sipalgprofile <sipalgprofilename>[-dataSessionIdleTimeout <
   positive_integer>][-sipSessionTimeout <positive_integer>] [-
   registrationTimeout <positive_integer>] [-sipsrcportrange <port[-
   port]>] [-sipdstportrange <port[-port]>] [-openRegisterPinhole (
   ENABLED | DISABLED )] [-openContactPinhole ( ENABLED | DISABLED )]
   [-openViaPinhole ( ENABLED | DISABLED )] [-openRecordRoutePinhole (
   ENABLED | DISABLED )]-sipTransportProtocol ( TCP | UDP ) [-
   openRoutePinhole ( ENABLED | DISABLED )] [-rport ( ENABLED |
   DISABLED )]
2
3 show lsn sipalgprofile <sipalgprofilename>
4 <!--NeedCopy-->
```

### Sample Configuration

The following sample large scale NAT64 configuration, SIP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1003::/96.

```
1 add lsn client LSN-NAT64-CLIENT-9
2
3 Done
```

```
4 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
5
6 Done
7 add lsn pool LSN-NAT64-POOL-9
8
9 Done
10 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
11
12 Done
13 add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8
    :309::/96
14
15 Done
16 add lsn appprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -
    mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
17
18 Done
19 add lsn sipalgprofile SIPALGPROFILE-9 -sipdstportrange 5060 -
    sipTransportProtocol TCP
20
21 Done
22 add lsn group LSN-NAT64-GROUP-9 -clientnameLSN-NAT64-CLIENT-9 -
    ip6profile LSN-NAT64-PROFILE-7 -sipalg ENABLED
23
24 Done
25 bind lsn group LSN-NAT64-GROUP-9 -poolnameLSN-NAT64-POOL-9
26 Done
27 bind lsn group LSN-NAT64-GROUP-9 -appprofilename LSN-NAT64-APPS-
    PROFILE-9
28 Done
29 bind lsn group LSN-NAT64-GROUP-9 -sipalgprofilename SIPALGPROFILE-9
30 Done
31 <!--NeedCopy-->
```

## Application Layer Gateway for RTSP Protocol

September 21, 2020

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. Citrix ADC functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to Citrix ADC owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

### **Limitations of RTSP ALG**

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- Citrix ADC clusters
- RTSP Authentication
- HTTP tunneling

### **Configuring RTSP ALG**

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuring Large Scale NAT64](#). While configuring, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

### **To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED |  
    DISABLED )]
```

```
2
3 show lsn group <groupname>
4 <!--NeedCopy-->
```

### To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <
  positive_integer>] -rtspportrange <port[-port]> [-
  rtspTransportProtocol (TCP|UDP)]
2
3 show lsn rtspalgprofile <rtspalgprofilename>
4 <!--NeedCopy-->
```

### Sample RTSP ALG Configuration

The following sample large scale NAT64 configuration, RTSP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1002::/96.

```
1 add lsn client LSN-NAT64-CLIENT-9
2 Done
3 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
4 Done
5 add lsn pool LSN-NAT64-POOL-9
6 Done
7 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
8 Done
9 add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8
  :309::/96
10 Done
11 add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -
  mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn rtspalgprofile RTSPALGPROFILE-9 -rtspIdleTimeout 1000 -
  rtspportrange 554
14 Done
15 add lsn group LSN-NAT64-GROUP-9 -clientname LSN-NAT64-CLIENT-9 -
  ip6profile LSN-NAT64-PROFILE-7 -rtspalg ENABLED
16 Done
17 bind lsn group LSN-NAT64-GROUP-9 -poolname LSN-NAT64-POOL-9
18 Done
```

```
19 bind lsn group LSN-NAT64-GROUP-9 -appsprofile LSN-NAT64-APPS-  
    PROFILE-9  
20 Done  
21 bind lsn group LSN-NAT64-GROUP-9 -rtspalgprofile RTSPALGPROFILE-9  
22 Done  
23 <!--NeedCopy-->
```

## Configuring Static Large Scale NAT64 Maps

September 21, 2020

The Citrix ADC appliance supports manual creation of NAT64 mappings, which contain the mapping between the following information:

- Subscriber's IP address and port
- NAT IP address and port

Static Large Scale NAT64 mappings are useful in cases where you want to ensure that the IPv4 connections initiated to a NAT IP address:port are IPv6 translated and mapped to the subscriber IP address:port (for example, web servers located in the internal network).

### To create a Large Scale NAT64 mapping by using the command line

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [  
    natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd <positive_integer>]]  
2  
3 show lsn static  
4 <!--NeedCopy-->
```

### Wildcard Port Static Large Scale NAT64 Maps

A static large scale NAT64 mapping entry is usually a one-to-one mapping between a subscriber IPv6 address:port and a NAT IPv4 address:port. A one-to-one static large scale NAT64 mapping entry exposes only one port of the subscriber IP address to the Internet.

Some situations might require exposing all ports (64K - limited to the maximum number of ports of a NAT IPv4 address) of a subscriber IP address to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64 thousand one-to-one static mapping entries, one mapping entry for each port. Creating those entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the Citrix ADC appliance.

A simpler method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (\*), and the protocol parameter set to ALL, to expose all the ports of a subscriber IP address for all protocols to the Internet.

For a subscriber's inbound or outbound connections matching a wildcard static mapping entry, the subscriber's port does not change after the NAT operation. When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the Citrix ADC appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber's port by connecting to the NAT port that has the same number as the subscriber's port.

To configure the Citrix ADC appliance to provide access to all ports of a subscriber IPv6 address, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = \*
- NAT port = \*

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <
    positive_integer>] [-destIP <ip_addr>
2
3 show lsn static
4 <!--NeedCopy-->
```

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 2001:DB8:5001::3 are made accessible through NAT IP 203.0.113.33.

```
1 add lsn static NAT64-WILDCARD-STATIC-1 ALL 2001:DB8:5001::3 *
    203.0.113.33 *
2 Done
3 <!--NeedCopy-->
```

## Logging and Monitoring Large Scale NAT64

September 21, 2020

You can log large scale NAT64 information to diagnose and troubleshoot problems, and to meet legal requirements. You can monitor the performance of the large scale NAT64 deployment by using statistical counters and displaying the related current sessions.

### Logging Large Scale NAT64

Logging large scale NAT64 information is required for ISPs to meet legal requirements and identify the source of traffic at any given time.

A log message for a large scale NAT64 mapping entry consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.
- Entry type (MAPPING).
- Whether the mapping entry was created or deleted.
- Subscriber's IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for endpoint-independent mapping.
  - Only the destination IP address is logged for address-dependent mapping. The port is not logged.
  - Destination IP address and port are logged for address-port-dependent mapping.

A log message for a large scale NAT64 session consists of the following information:

- Citrix ADC owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the session is created or removed
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table displays sample large scale NAT64 log entries of each type stored on the configured log servers. The log entries show that a subscriber whose IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

Log Entry Type	Sample Log Entry
Session Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_SESSION 5532 0 : SESSION CREATED Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_ADDR_MAPPING 5533 0 : ADM CREATED Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:TD 23.0.0.1:80, Protocol: TCP
Session Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION DELETED Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM DELETED Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

### Configuration Steps

You can configure logging of large scale NAT64 information for a large scale NAT64 configuration by setting the LSN groups's logging and session logging parameters. These are group level parameters and are disabled by default. The Citrix ADC appliance logs large scale NAT64 sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and

session logging parameters.

Logging	Session Logging	Logging Behavior
Enabled	Enabled	Logs LSN mapping entries as well as LSN sessions
Enabled	Disabled	Logs LSN mapping entries but not LSN sessions
Disabled	Enabled	Logs neither mapping entries nor LSN sessions

### To log large scale NAT64 information by using the CLI

To set the logging and session logging parameters while adding an LSN group, at the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-logging (ENABLED|
   DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
2
3 show lsn group
4 <!--NeedCopy-->
```

To set the logging and session logging parameters for an existing LSN group, at the command prompt, type:

```
1 set lsn group <groupname> [-logging (ENABLED|DISABLED)] [-
   sessionLogging (ENABLED|DISABLED)]
2
3 show lsn group
4 <!--NeedCopy-->
```

### Sample Configuration

In this example of large scale NAT64 configuration, logging and session logging parameters are enabled for LSN group LSN-NAT64-GROUP-1.

The Citrix ADC appliance logs large scale NAT64 session and mapping information for connections from subscribers (in the network 2001:DB8:5001::/96).

#### Sample configuration:

```
1 add lsn client LSN-NAT64-CLIENT-1 Done
```

```
2 Done
3 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
4 Done
5 add lsn pool LSN-NAT64-POOL-1
6 Done
7 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
8 Done
9 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
  :300::/96
10 Done
11 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
  ip6profile LSN-NAT64-PROFILE-1 -logging ENABLED -sessionLogging
  ENABLED
12 Done
13 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
14 Done
15 <!--NeedCopy-->
```

### **Logging MSISDN Information for Large Scale NAT64**

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber's operator.

You can configure a Citrix ADC appliance to include MSISDNs in large scale NAT64 LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs facilitates faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 and IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

Log Entry Type	Sample Log Entry
Session Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_SESSION 5532 0 : SESSION CREATED <b>E164:5556543210</b> Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Creation	04/07/2016:14:07:57 GMT Informational 0-PPE-10 : default LSN LSN_ADDR_MAPPING 5533 0 : ADM CREATED <b>E164:5556543210</b> Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:TD 23.0.0.1:80, Protocol: TCP
Session Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION DELETED <b>E164:5556543210</b> Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP
Mapping Deletion	04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPING 25013 0 : ADM DELETED <b>E164:5556543210</b> Client IP-Port:TD <b>2001:db8:5001::9-34937:0</b> , NatIP:NatPort 203.0.113.63:45195, Destination IP:Port:TD 23.0.0.1:0:80, Protocol: TCP

## Configuration Steps

Perform the following tasks for including MSISDN information in LSN logs:

- **Create an LSN log profile.** An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration.
- Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. MSISDN information is included in all LSN logs related to mobile subscribers of this LSN group.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1 add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED |
   DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

**To bind an LSN log profile to an LSN group of an NAT64 LSN configuration by using the CLI**

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

**Sample Configuration**

In this example of NAT64 LSN configuration, the LSN log profile LOG-PROFILE-MSISDN-1 has the log subscriber ID parameter enabled. LOG-PROFILE-MSISDN-1 is bound to LSN group LSN-NAT64-GROUP-1. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in network 2001:DB8:5001::/96).

```
1 add lsn logprofile LOG-PROFILE-MSISDN-1 -logSubscriberID ENABLED
2 Done
3 add lsn client LSN-NAT64-CLIENT-1
4 Done
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6 Done
7 add lsn pool LSN-NAT64-POOL-1
8 Done
9 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10 Done
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
   :300::/96
12 Done
13 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
   ip6profile LSN-NAT64-PROFILE-1
14 Done
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
```

```
17 bind lsn group LSN-NAT64-GROUP-1 -logfilename LOG-PROFILE-MSISDN-1
18 Done
19 <!--NeedCopy-->
```

## Compact Logging for Large Scale NAT

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

### Configuration Steps

Perform the following tasks for logging LSN information in compact format:

1. Create an LSN log profile. An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
2. Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

### To create an LSN log profile by using the CLI

At the command prompt, type:

```
1 add lsn logprofile <logfilename> -logCompact (ENABLED|DISABLED)
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogfilename>
2
3 show lsn group
4 <!--NeedCopy-->
```

**Sample Configuration for NAT64:**

```
1 add lsn logfile LOG-PROFILE-COMPACT-1 -logCompact ENABLED
2 Done
3 add lsn client LSN-NAT64-CLIENT-1
4 Done
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6 Done
7 add lsn pool LSN-NAT64-POOL-1
8 Done
9 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10 Done
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
12 Done
13 add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -
    ip6profile LSN-NAT64-PROFILE-1
14 Done
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -logProfileName LOG-PROFILE-COMPACT-1
18 Done
19 <!--NeedCopy-->
```

**Logging HTTP Header Information**

The Citrix ADC appliance can log request header information of an HTTP connection that is using the Citrix ADC large scale NAT64 functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv6 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

**Configuration Steps**

Perform the following tasks for configuring the Citrix ADC appliance to log HTTP header information:

- Create an HTTP header log profile. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- Bind the HTTP header to an LSN group of a large scale NAT64 configuration. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The Citrix ADC appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

### To create an HTTP header log profile by using the the command line interface

At the command prompt, type:

```
1 add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED |  
    DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion (   
    ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]  
2  
3 show lsn httphdrlogprofile  
4 <!--NeedCopy-->
```

### To bind an HTTP header log profile to an LSN group by using the the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> -httphdrlogprofilename <string>  
2  
3 show lsn group <groupname>  
4 <!--NeedCopy-->
```

### Sample Configuration

```
1 add lsn httphdrlogprofile HTTP-HEADER-LOG-1  
2 Done  
3 add lsn client LSN-NAT64-CLIENT-1 Done  
4 Done  
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96  
6 Done  
7 add lsn pool LSN-NAT64-POOL-1  
8 Done  
9 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70  
10 Done
```

```
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
12 Done
13 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
    ip6profile LSN-NAT64-PROFILE-1
14 Done
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG
    -1
18 Done
19 <!--NeedCopy-->
```

## Displaying Current Large Scale NAT64 Sessions

You can display the current large scale NAT64 sessions in order to detect any unwanted or inefficient sessions on the Citrix ADC appliance. You can display all or some large scale NAT64 sessions on the basis of selection parameters.

### Note

When more than a million large scale NAT64 sessions exist on the Citrix ADC appliance, Citrix recommends using the selection parameters to display selected large scale NAT64 sessions instead of displaying all of them.

### To display all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session - nattytype NAT64
2 <!--NeedCopy-->
```

### To display selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session - nattytype NAT64 [-network6 <ipv6_addr|*>] [-clientname
    <string>] [-natIP <ip_addr> [-natPort <port>]]
2 <!--NeedCopy-->
```

## Displaying Large Scale NAT64 Statistics

You can display statistics related to large scale NAT64 module, and evaluate its performance or troubleshoot problems. You can display a summary of statistics of all large scale NAT64 configurations or of a particular large scale NAT64 configuration. The statistical counters reflect events since the Citrix ADC appliance was last restarted. All these counters are reset to 0 when the Citrix ADC appliance is restarted.

### To display total statistics of large scale NAT64 by using the command line interface

At the command prompt, type:

```
1 stat lsn nat64
2 <!--NeedCopy-->
```

### To display statistics for a specified large scale NAT64 configuration by using the command line interface

At the command prompt, type:

```
1 stat lsn group <groupname>
2 <!--NeedCopy-->
```

## Clearing Large Scale NAT64 Sessions

You can remove any unwanted or inefficient large scale NAT64 sessions from the Citrix ADC appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected large scale NAT64 sessions from the Citrix ADC appliance.

### To clear all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - nattype NAT64
2
3 show lsn session - nattype NAT64
4 <!--NeedCopy-->
```

**To clear selective large scale NAT64 sessions by using the command line interface**

At the command prompt, type:

```
1 flush lsn session -nattype NAT64 [-network6 <ipv6_addr|*>] [-
  clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
2
3 show lsn session -nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname
  <string>] [-natIP <ip_addr> [-natPort <port>]]
4 <!--NeedCopy-->
```

**Sample configuration:**

Clear all large scale NAT64 sessions existing on a Citrix ADC appliance

```
1 flush lsn session -nattype NAT64
2 Done
3 <!--NeedCopy-->
```

Clear all large scale NAT64 sessions related to client entity LSN-NAT64-CLIENT-1

```
1 flush lsn session -nattype NAT64 -clientname LSN-NAT64-CLIENT-1
2 Done
3 <!--NeedCopy-->
```

Clear all large scale NAT64 sessions related to a subscriber network (2001:DB8:5001::/96) of LSN client entity LSN-NAT64-CLIENT-2

```
1 flush lsn session -nattype NAT64 -network6 2001:DB8:5001::/96 -
  clientname LSN-NAT64-CLIENT-2
2 Done
3 <!--NeedCopy-->
```

**IPFIX Logging**

The Citrix ADC appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following NAT64 related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

## Points to Consider before you Configure IPFIX logging

Before you start configuring IPsec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the Citrix ADC appliance. For instructions, see [Configuring the AppFlow feature](#).

## Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

### To enable LSN logging in the AppFlow configuration by using the CLI

At the command prompt, type:

```
1 set appflow param -lsnLogging ( ENABLED | DISABLED )
2
3 show appflow param
4 <!--NeedCopy-->
```

### To create an LSN log profile by using the CLI

At the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2
3 show lsn logprofile
4 <!--NeedCopy-->
```

### To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
```

```
3 show lsn group
4 <!--NeedCopy-->
```

### To create an LSN log profile by using the GUI

Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

### To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

## Port Control Protocol for Large Scale NAT64

September 21, 2020

Citrix ADC appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP's subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP's access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A Citrix ADC appliance implements the PCP server component and is compliant with RFC 6887.

### Configuration Steps

Perform the following tasks for configuring PCP:

- **(Optional) Create a PCP profile.** A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP

server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:

- Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled
- **Create a PCP server and bind a PCP profile to it.** Create a PCP server on the Citrix ADC appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) or (SNIP6) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
  - **Bind the PCP server to an LSN group of an LSN configuration.** Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

#### Note

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

### To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer (
    ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
    announceMultiCount <positive_integer>][-thirdParty ( ENABLED |
    DISABLED )]
2
3 show pcp profile <name>
4 <!--NeedCopy-->
```

### To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <
    string>]
```

```
2
3 show pcp server <name>
4 <!--NeedCopy-->
```

### Sample Configuration for NAT64

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-PROFILE-1, is bound to LSN group LSN-NAT64-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv6 subscribers in network 2001:DB8:5001::/96.

#### Sample configuration:

```
1 add pcp profile PCP-PROFILE-1 -minMapLife 400
2 Done
3 add pcp server PCP-SERVER-1 2001:DB8:6001::90 -pcpProfile PCP-PROFILE
  -1
4 Done
5 add lsn client LSN-NAT64-CLIENT-1
6 Done
7 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
8 Done
9 add lsn pool LSN-NAT64-POOL-1
10 Done
11 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
  :300::/96
14 Done
15 add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -
  ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-NAT64-GROUP-1 -pcpServer PCP-NAT64-SERVER-1
20 Done
21 <!--NeedCopy-->
```

## LSN64 in a cluster setup

September 21, 2020

large scale NAT64 configurations are supported on a Citrix ADC cluster setup.

ACitrix ADC cluster is a group of Citrix ADC appliances that are configured and managed as a single system. ACitrix ADC cluster provides scalability and availability. Each Citrix ADC appliance in a cluster setup acts as an independent LSN entity and is managed as a single system.

The LSN configuration in a cluster setup is same as in a standalone appliance except for a specific pool of LSN IP addresses are owned by only one node at a time. In other words, an LSN IP pool entity is configured as a spotted entity in a particular node. All the nodes of a cluster setup can have a specific LSN IP pool entity. To make sure that the packets related to an LSN session are received on the same cluster node that performed the NAT operation, policy based backplane (PBS) steering is configured. PBS steers the received related packets of an LSN session to the same cluster node.

**Sample configuration:**

```
1 add lsn client LSN-NAT64-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6
7 Done
8
9 add lsn pool LSN-NAT64-POOL-1
10
11 Done
12
13 bind lsn pool LSN-NAT64-POOL-1 -ownerNode 1 203.0.113.61 -
    203.0.113.70
14
15 Done
16
17 bind lsn pool LSN-NAT64-POOL-1 -ownerNode 2 203.0.113.101 -
    203.0.113.110
18
19 Done
20
21 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8
    :300::/96
22
23 Done
24
25 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
    ip6profile LSN-NAT64-PROFILE-1
26
27 Done
28
```

```
29 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
30
31 Done
32
33 add ns acl6 NAT64-DFD ALLOW -srcIPv6 = 2001:DB8:5001:: -type DFD -
    dfdhash SIP -dfdprefix 64
34
35 Done
36
37 apply ns acls6 -type DFD
38
39 Done
40 <!--NeedCopy-->
```

## Mapping Address and Port using Translation

September 21, 2020

Mapping Address and Port using Translation (MAP-T) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the IPv4 internet. MAP-T is built on stateless IPv4 and IPv6 address translation technologies. MAP-T is a mechanism that performs double translation (IPv4 to IPv6 and vice versa) on customer edge (CE) devices and border routers (in ISP core network).

In a MAP-T deployment, the CE device implements a combination of stateful NAPT44 translation and stateless NAT46 translation. The CE device obtains NAT-IP and the port-block to be used for translation through DHCPv6 or any other method.

When an IPv4 packet from a subscriber device arrives at the CE device, the CE device performs NAPT44 and stores the NAPT44 binding information. After NAT44 translation, the packet is subjected to NAT46 translation and then forwarded to the border router (BR) device located in the ISP's core network. The BR device receives the IPv6 packets from the CE device, extracts and validates the NAT-IP and port-block embedded in the IPv6 header, and forwards the IPv4 packet to the IPv4 Internet. When the BR receives the IPv4 packet from the Internet, it translates the IPv4 packet to an IPv6 packet and send the IPv6 packet to the CE device.

MAP-T is stateless on a BR device, so it does not require the BR device to perform NAT on the traffic. Instead, NAT functionality is delegated to the CE devices. This delegation and stateless functionality in BR devices allows the BR deployment to scale in proportion to the volume of traffic.

The Citrix ADC appliance implements the BR functionality of a MAP-T solution as described by RFC 7599.

## Configuring MAP-T

Configuring MAP-T on a Citrix ADC appliance consists of the following tasks:

- Add a default mapping rule
- Add a basic mapping rule
- Bind an IPv4 NAT address range of CE devices to a basic mapping rule
- Add a map domain and bind a basic mapping rule and default mapping rule to the domain

### To add a default mapping rule by using the CLI

At the command prompt, type:

```
1 add MapDmr <name> -BRIPv6Prefix ( <ipv6_addr> | <*> )
2
3 show MapDmr <name>
4 <!--NeedCopy-->
```

### To add a basic mapping rule by using the CLI

At the command prompt, type:

```
1 add MapBmr <name> -RuleIPv6Prefix <ipv6_addr> | <*> [-psidoffset <
  positive_integer>] [-EAbitLength <positive_integer>] [-psidlength <
  positive_integer>]
2
3 show MapBmr <name>
4 <!--NeedCopy-->
```

### To bind IPv4 NAT address range of CE devices to a basic mapping rule by using the CLI

At the command prompt, type:

```
1 bind MapBmr <name> (-network <ip_addr> [-netmask <netmask>])
2
3 show MapBmr <name>
4 <!--NeedCopy-->
```

### To add a map domain by using the CLI

At the command prompt, type:

```
1 add MapDomain <name> -MapDmrName <string>
2
3 show MapDomain <name>
4 <!--NeedCopy-->
```

### To bind a basic mapping rule to a map domain by using the CLI

At the command prompt, type:

```
1 bind MapDomain <name> -MapBmrName <string>
2
3 show MapDomain <name>
4 <!--NeedCopy-->
```

### Sample configuration

```
1 add mapdmr DMR-1 -BRIPv6Prefix 2002:db8::/64
2
3 Done
4
5 add mapbmr BMR-1 -ruleIPv6Prefix 2002:db8:89ab::/48 -eAbitLength 16 -
  psidlength 8 -psidoffset 6
6
7 Done
8
9 bind mapbmr BMR-1 -network 192.0.1.0 -netmask 255.255.255.0
10
11 Done
12
13 add MapDomain MAP-DOMAIN-1 -mapdmrname DMR-1
14
15 Done
16
17 bind MapDomain MAP-DOMAIN-1 -mapbmrname BMR-1
18 Done
19 <!--NeedCopy-->
```

## Telco subscriber management

September 21, 2020

The number of subscribers in a telco network is increasing at an unprecedented rate, and managing them is becoming a challenge for service providers. Newer, faster, and smarter devices are placing high demand on the network and the subscriber management systems. It is no longer feasible to provide each subscriber the same standard of service, and the need for traffic processing on a per-subscriber basis is imperative.

The Citrix ADC appliance provides the intelligence to profile subscribers based on their information stored in the Policy and Charging Rules Function (PCRF). When a mobile subscriber connects to the Internet, the packet gateway associates an IP address with the subscriber and forwards the data packet to the appliance. The appliance receives the subscriber information dynamically, or you can configure static subscribers. This information enables the appliance to apply its rich traffic management capabilities, such as content switching, integrated caching, rewrite, and responder, on a per-subscriber basis to manage the traffic.

Before you configure the Citrix ADC appliance to manage subscribers, you must allocate memory to the module that stores subscriber sessions. For dynamic subscribers, you must configure an interface through which the appliance receives session information. Static subscribers must be assigned IDs, and you can associate them with policies.

You can also do the following:

- Subscriber policy enforcement and management.
- Configure the appliance to uniquely identify a subscriber by using only the IPv6 prefix instead of the complete IPv6 address.
- Use policies to optimize TCP traffic for both dynamic and static subscribers. These policies associate different TCP profiles with different types of users.
- Manage idle sessions on a Citrix ADC appliance.
- Enable logging to a log server.
- Remove LSN sessions for deleted subscriber sessions.

### **Allocating memory for the subscriber session store module**

Each subscriber session entry consumes 1 KB of memory. Storing 500,000 subscriber sessions at any point in time requires 500 MB of memory. This value must be added to the minimum memory requirement, which is shown as part of the output of the “show extendedmemoryparam” command. In the following example, the output is for a Citrix ADC VPX instance with 3 packet engines and 8 GB memory.

To store 500,000 subscriber sessions on this appliance, the configured memory must be 2058+500 MB (500,000 x 1 KB = 500 MB.)

#### **Note**

The configured memory must be in multiples of 2 MB and must not exceed the maximum memory usage limit. The appliance must be restarted for the changes to take effect.

### Example

```
1 show extendedmemoryparam
2     Extended Memory Global Configuration. This memory is utilized by
3     LSN and Subscriber Session Store Modules:
4     Active Memory Usage: 0 MBytes
5     Configured Memory Limit: 0 MBytes
6     Minimum Memory Required: 2058 MBytes
7     Maximum Memory Usage Limit: 2606 MBytes
8 Done
9 set extendedmemoryparam -memLimit 2558
10 Done
11 show extendedmemoryparam
12     Extended Memory Global Configuration. This memory is
13     utilized by LSN and Subscriber Session Store Modules:
14     Active Memory Usage: 2558 MBytes
15     Configured Memory Limit: 2558 MBytes
16     Minimum Memory Required: 2058 MBytes
17     Maximum Memory Usage Limit: 2606 MBytes
18 Done
19 <!--NeedCopy-->
```

### Configure an interface for dynamic subscribers

The Citrix ADC appliance dynamically receives the subscriber information through any of the following types of interface:

- Gx Interface
- RADIUS Interface
- RADIUS and Gx Interface

#### Note

- Starting with NetScaler release 12.0 build 57.19, Gx interface is supported for a cluster deployment. For more information see Gx interface in a cluster topology.
- In an HA setup, the subscriber sessions are continually synchronized on the secondary node. In the event of a failover, the subscriber information is still available on the secondary node.

## Gx interface

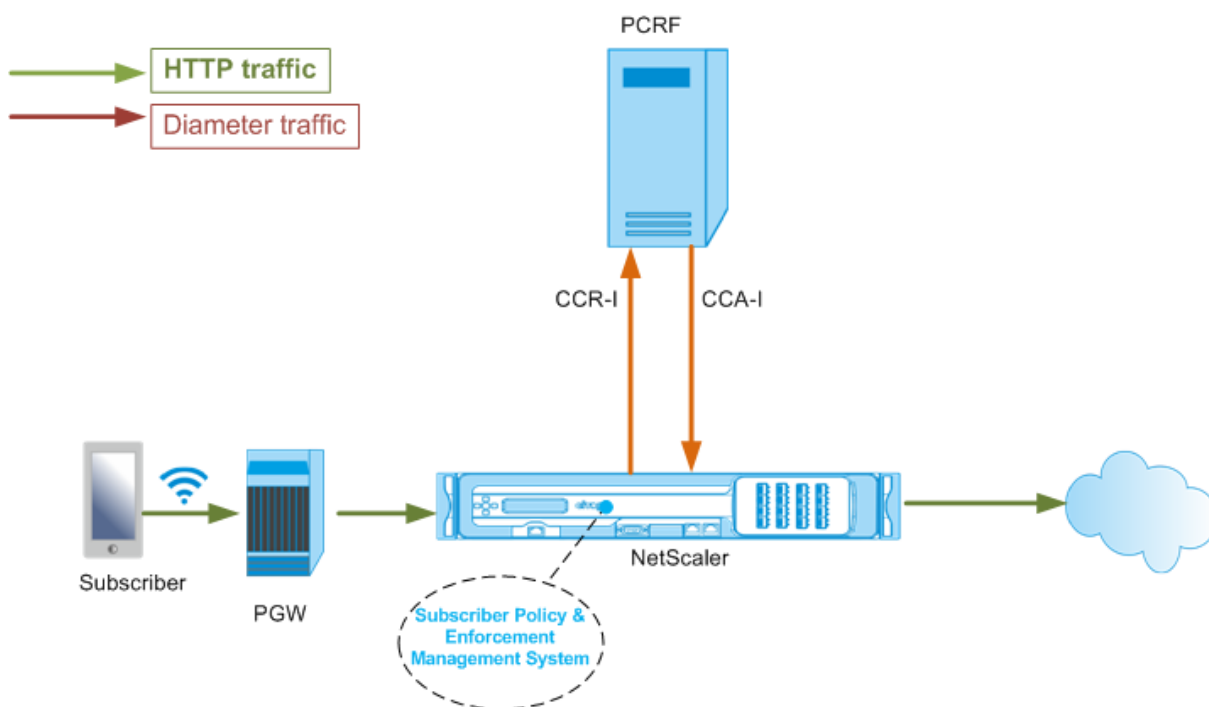

A Gx interface (as specified in 3GPP 29.212) is a standard interface based on the Diameter protocol that allows exchange of policy control and charging rules between a PCRF and a Policy and Charging Enforcement Function (PCEF) entity in a Telco network.

When an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the PCRF as a Diameter message. When the data packet arrives at the appliance from packet gateway (PGW), the appliance uses the subscriber IP address to query the PCRF to get the subscriber information. This is also known as secondary PCEF functionality.

The Policy and Charging Control (PCC) rules received by the appliance over the Gx interface are stored on the appliance during the subscriber session, that is, until the PCRF sends a Re-Auth-Request (RAR) message with a Session-Release-Cause AVP or the subscriber session is terminated from the CLI or the configuration utility. If there are any updates to an existing subscriber, the PCRF sends the updates in an RAR message. A subscriber session is initiated when a subscriber logs on to the network, and terminated when the subscriber logs off.

**Note:** If the PCRF server is down, the Citrix ADC appliance creates negative sessions for the pending or incoming Gx subscriber requests. When the PCRF server is back up again, the Citrix ADC appliance prevents a storm of requests by waiting for the negative sessions to expire before performing the specific subscriber requests.

The following illustration shows the high-level traffic flow. It assumes that the data plane traffic is HTTP. The appliance sends a Credit Control Request (CCR) over a Gx interface to the PCRF server and, in the credit control answer (CCA), receives the PCC rules and, optionally, other information, such as the Radio Access Technology (RAT) type, that applies to the particular subscriber. PCC rules include one or more policy (rule) names and other parameters. The appliance uses this information to retrieve the predefined rules stored on the appliance, and to direct the flow of traffic. It also stores this information in the subscriber policy and enforcement management system during the subscriber session. After a subscriber session is terminated, the appliance discards all the information about the subscriber.

The following example shows the commands for configuring a Gx interface. The commands are in boldface.

### To set up a Gx interface, perform the following tasks

Add a DIAMETER service for each Gx interface. For example:

```

1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2
3 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
4 <!--NeedCopy-->

```

Add a non-addressable DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server. For more than one service, specify a persistenceType and the persistAVPno so that specific sessions are handled by the same PCRF server. For example:

```

1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
2
3 bind lb vserver vdiam pcrf-svc1
4
5 bind lb vserver vdiam pcrf-svc2
6 <!--NeedCopy-->

```

Configure Citrix ADC diameter identity and realm. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client. For example:

```
1 set ns diameter - identity netscaler.com - realm com
2 <!--NeedCopy-->
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server. Specify the PCRF realm to use as Destination-Realm AVP in diameters messages sent by the Gx client. For example:

```
1 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
2 <!--NeedCopy-->
```

Set the subscriber interface type to GxOnly. For example:

```
1 set subscriber param -interfaceType GxOnly
2 <!--NeedCopy-->
```

**To see the Gx interface configuration and status, type:**

```
1 show subscriber gxinterface
2 <!--NeedCopy-->
```

### Example

```
1 show subscriber gxinterface
2     Gx Interface parameters:
3         PCRF Vserver: vdiam (DOWN)
4         Gx Client Identity...: netscaler1.com
5         Gx Client Realm .....: com
6         PCRF Realm: epc.mnc030.mcc234.3gppnetwork.org
7         Hold Packets On Subscriber Absence: YES
8         CCR Request Timeout: 4 Seconds
9         CCR Request Retry Attempts: 1
10        Gx HealthCheck enabled: NO
11        Gx HealthCheck TTL : 30 Seconds
12        CER Request Timeout: 10 Seconds
13        RevalidationTimeout: 30 Seconds
14        NegativeTTL: 60 Seconds
15        NegativeTTL Limited Success: NO
16        Purge SDB on Gx Failure: YES
17        ServicePath AVP code: 262099     ServicePath AVP VendorID: 3845
18        PCRF Connection State: PCRF is not ready
19    Done
20
21 <!--NeedCopy-->
```

## ARGUMENTS

### **vServer**

Name of the load balancing or content switching virtual server to which the Gx connections are established. The service type of the virtual server must be DIAMETER or SSL\_DIAMETER. This parameter is mutually exclusive with the service parameter. Therefore, you cannot set both service and the virtual server in the Gx interface.

### **Service**

Name of DIAMETER or SSL\_DIAMETER service corresponding to PCRF to which the Gx connection is established. This parameter is mutually exclusive with the vsServer parameter. Therefore, you cannot set both service and the virtual server in the Gx Interface.

### **pcrfRealm**

The realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by Citrix ADC Gx client (as a Diameter node).

### **holdOnSubscriberAbsence**

Set to Yes to hold packets until the subscriber session information is fetched from the PCRF server. If set to No, the default subscriber profile is applied until the subscriber session information is fetched from the PCRF server. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes.

### **requestTimeout**

Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for the number of times specified in the requestRetryAttempts parameter. If request is not complete even after retransmitting, then the default subscriber profile is applied to this subscriber. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes. Zero disables the timeout. Default value: 10

### **requestRetryAttempts**

Specify the number of times a request must be retransmitted if the request does not complete within the value specified in the requestTimeout parameter. Default value: 3.

### **healthCheck**

Set to Yes to enable inline health check of Gx peer. When enabled, Citrix ADC sends DWR packets to the PCRF server. When the Gx session is idle, the healthCheck timer expires and DWR packets are initiated to check if the PCRF server is active. Default value: No.

**Note:** This parameter is supported in Citrix ADC 12.1 build 51.xx and later.

### **healthCheckTTL**

Time in seconds defined for watchdog supervision. After the health check TTL time expires, DWR is sent to check the status of the PCRF server. Any CCR, CCA, RAR, or RAA message resets the timer.

Minimum value: 6 seconds. Default value: 30 seconds.

**Note:** This parameter is supported in Citrix ADC 12.1 build 51.xx and later.

### **cerRequestTimeout**

Time in seconds defined for retransmission of the capabilities exchange request. Citrix ADC initiates a new CER message if it does not receive a CEA from the PCRF within this configured time.

If no response is received from the PCRF server, the appliance tries to send the CER message 5 times. If there is no response even after 5 CER messages, the appliance closes the TCP connection and reports a failure. If the timeout value is set to 0, the application health check feature is disabled.

Minimum value: 0 seconds. Default value: 0 seconds.

**Note:** This parameter is supported in Citrix ADC 12.1 build 51.xx and later.

### **revalidationTimeout**

Time, in seconds, after which the Gx CCR-U request is sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout.

### **negativeTTL**

Time, in seconds, after which the Gx CCR-I request is resent for sessions that have not been resolved by PCRF because the server is down or there is no response or a failed response is received. Instead of polling the PCRF server constantly, a negative-TTL makes the appliance hold on to an unresolved session. For negative sessions, the appliance inherits the attributes from the default subscriber profile, if one is configured and from the RADIUS accounting message, if one is received. Zero value disables the negative sessions. The appliance does not install negative sessions even if a subscriber session could not be fetched. Default value: 600

### **negativeTTLimitedSuccess**

Set to Yes to create negative session for partial success response code (2002). If set to No, regular session is created. Default value: No.

This parameter is supported in Citrix ADC 12.1 build 49.xx and later.

### **purgeSDBonGxFailure**

Set to Yes to flush subscriber database when the Gx interface fails. Gx interface failure includes both DWR monitoring (if enabled) and network healthCheck (if enabled). When set to Yes, all subscriber sessions are cleared.

Default value: No.

**Note:** This parameter is supported in Citrix ADC 12.1 build 51.xx and later.

### **servicePathAVP**

The AVP code in which PCRF sends the service path applicable to a subscriber.

### **servicePathVendorid**

The vendor id of the AVP in which PCRF sends the service path applicable to a subscriber.

## **To configure Gx interface by using the GUI**

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **GxOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

## **Detect transport failures over established Gx connections**

**Note:** This feature is supported in Citrix ADC 12.1 build 51.xx and later.

A Citrix ADC appliance can be configured to detect transport failures over established Gx connections by using device watchdog request (DWR) and device watchdog answer (DWA) messages.

After a Gx session is established, a predefined timer is triggered to detect if a session is idle. A DWR message is sent after the idle time timer expires. The idle time timer is reset each time the Citrix ADC appliance receives a message over an established Gx session. The peer's availability is confirmed based on the DWA message after a DWR message is sent.

- If the DWA is received, a peer's availability is confirmed and the watchdog timer is reset.

- If the DWA is not received and the watchdog timer expires twice consecutively, the session is considered as down and peer unavailable. The appliance closes the session and tries to establish a new session with the Gx peer.

When the watchdog timer expires twice without a response, the Citrix ADC appliance considers the Gx connection as faulty and initiates a connection closure. Once the connection is closed, no other watchdog request is sent towards the Gx peer. Citrix ADC appliance uses the next available Gx session for any PCRF requests.

### To detect transport failures over established Gx connections by using the CLI

At the command prompt, type:

```
1 set subscriber gxInterface [-vServer <string>] [-service <string>] [-healthCheck ( YES | NO )] [-healthCheckTTL<positive_integer>][-cerRequestTimeout <positive_integer>] [-purgeSDBonGxFailure ( YES | NO )]
2 <!--NeedCopy-->
```

#### Example:

```
1 set subscriber gxInterface set subscriber gxInterface -vServer vdiam -healthCheck YES -healthCheckTTL 31 -cerRequestTimeout 15
   purgeSDBonGxFailure YES
2 <!--NeedCopy-->
```

### To detect transport failures over established Gx connections by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In **Interface Type**, select **GxOnly**.
4. Specify the values for all required parameters.
5. Select **Health Check** and specify values for **Health Check TTL** and **CER Request Timeout**.
6. Click **OK**.

### Gx interface in a cluster topology

The Citrix ADC appliance supports Gx interface in a cluster topology.

The Citrix ADC nodes in the cluster communicate with an external PCRf server through the Gx interface. When a node receives client traffic, the appliance performs the following:

- Sends a CCR-I request to the PCRf server to fetch subscriber information.
- The PCRf server responds with a CCR-A.
- The Citrix ADC node then stores the received subscriber information in its subscriber store and applies the rules to the client traffic.

Each node maintains an independent subscriber store and subscriber sessions are not synchronized to other nodes.

As per the Diameter Base Protocol RFC 6733, each peer must be configured with a unique diameter identity to communicate with other peers over the diameter protocol. Hence, in a cluster deployment, configuration of diameter identity is spotted. The diameter parameters (identity, realm, server close propagation) for each node can be configured individually by using the GUI or the CLI.

When a node is added to a cluster, it assumes the default diameter parameters (identity=netScaler.com, realm=com, serverClosePropogation=NO). After the nodes are added, the diameter parameters for each node must be configured.

### To configure the diameter parameters by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Change Diameter Parameters**.
3. In the Diameter Parameters page, select the Citrix ADC node for which you want to configure the diameter parameters and then click **Configure**.
4. In the Configure Diameter Parameters page, configure the diameter Identity, diameter Realm, and server Close Propagation for the selected node.
5. Click **OK**.

### To configure the diameter parameters by using the CLI

At the command prompt, type:

```
1 set ns diameter [-identity <string>] [-ownerNode <positive_integer>]
2 <!--NeedCopy-->
```

## ARGUMENTS

### Identity

Diameter Identity is used to identify a Diameter node uniquely. Before setting up diameter configuration, the Citrix ADC appliance (as a Diameter node) must be assigned a unique diameter identity.

For example, set ns diameter -identity netScaler.com -ownerNode 1. So, whenever Citrix ADC system needs to use identity in diameter messages, it uses 'netScaler.com' as Origin-Host AVP as defined in RFC3588.

Maximum Length: 255

### OwnerNode

OwnerNode represents the ID of the cluster node for which the diameter ID is set. OwnerNode can be configured only through CLIP.

Minimum value: 0

Maximum value: 31

**Example:**

```
set ns diameter -identity netscaler1.com -ownerNode 1
```

**Note:**

The OwnerNode option is also added to the show ns diameter command.

**Example:**

```
1 show diameter -ownerNode <0-31>
2 <!--NeedCopy-->
```

When the show ns diameter command is executed, it displays the diameter parameters for a given node.

**To configure a Gx interface for cluster deployment**

To set up a Gx interface, perform the following tasks:

Add a DIAMETER service for each Gx interface.

**Example:**

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
3 <!--NeedCopy-->
```

Add a DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server.

**Example:**

```
1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
2
3 bind lb vserver vdiam pcrf-svc1
4
5 bind lb vserver vdiam pcrf-svc2
6 <!--NeedCopy-->
```

Configure Citrix ADC diameter identity and realm on all the cluster nodes. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client.

**Example:**

```
1 set ns diameter -identity node0.netscaler.com -realm netscaler.com -
  ownerNode 0
```

```
2
3 set ns diameter -identity node1.netscaler.com -realm netscaler.com -
  ownerNode 1
4 <!--NeedCopy-->
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server and set the PCRF realm as well.

**Example:**

```
1 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
2
3 Set the subscriber interface type to GxOnly.
4 <!--NeedCopy-->
```

**Example:**

```
1 set subscriber param -interfaceType GxOnly
2 <!--NeedCopy-->
```

**To see the Gx interface configuration and status, type:**

```
1 show subscriber gxinterface
2 <!--NeedCopy-->
```

**RADIUS interface**

With a RADIUS interface, the packet gateway forwards the subscriber information in a RADIUS Accounting Start message to the appliance through the RADIUS interface when an IP-CAN session is established. A service of type RADIUSListener processes RADIUS Accounting messages. Add a shared secret for the RADIUS client. If a shared secret is not configured, the RADIUS message is silently dropped. The following example shows the commands for configuring a RADIUS interface. The commands are in boldface.

To set up a RADIUS interface, perform the following tasks:

Create a RADIUS listener service at the SNIP address where the RADIUS messages are received. For example:

```
1 add service srad1 192.0.0.206 RADIUSLISTENER 1813
2 <!--NeedCopy-->
```

Configure the subscriber RADIUS interface to use this service. For example:

```
1 set subscriber radiusInterface -listeningService srad1
2 <!--NeedCopy-->
```

Set the subscriber interface type to RadiusOnly. For example:

```
1 set subscriber param -interfaceType RadiusOnly
2 <!--NeedCopy-->
```

Add a RADIUS client specifying a subnet and shared secret. For example:

```
1 add radius client 192.0.2.0/24 -radkey client123
2 <!--NeedCopy-->
```

A subnet of 0.0.0.0/0 implies that it is the default shared secret for all clients. To see the RADIUS interface configuration and status, type:

```
1 show subscriber radiusInterface
2 <!--NeedCopy-->
```

RADIUS Interface parameters:

Radius Listener Service: srad1(UP)

Done

**Example:**

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2
3 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
4 <!--NeedCopy-->
```

## ARGUMENTS

### ListeningService

Name of the RADIUS listening service that processes the RADIUS accounting requests.

### svrState

The state of the RADIUS listening service.

The following illustration shows the high-level traffic flow.

### To configure RadiusOnly interface by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **RadiusOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

### RADIUS and Gx interface

With a RADIUS and Gx interface, when an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the appliance through the RADIUS interface. The appliance uses this subscriber ID to query the PCRF on the Gx interface to get the subscriber information. This is known as primary PCEF functionality. The following example shows the commands for configuring a RADIUS and Gx interface.

```

1 set subscriber param -interfaceType RadiusandGx
2 add service pcrf-svc 203.0.113.1 DIAMETER 3868
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
4 bind lb vserver vdiam pcrf-svc
5 set subscriber gxInterface -vServer vdiam -pcrfRealm testrealm1.net -
  holdOnSubscriberAbsence YES -revalidationTimeout 60 -negativeTTL 120

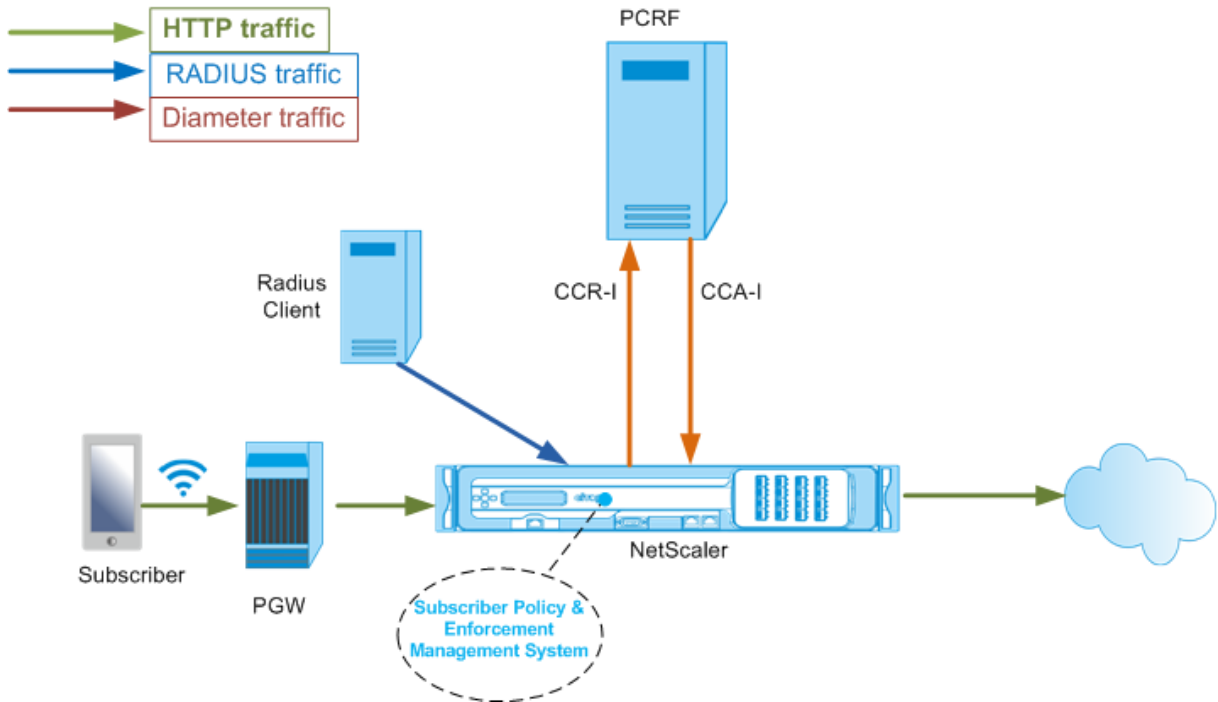

```

```

6 add service srad1 192.0.0.206 RADIUSLISTENER 1813 set subscriber
  radiusInterface -listeningService srad1
7 <!--NeedCopy-->

```

The following illustration shows the high-level traffic flow.

### To configure RadiusAndGx interface by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **RadiusAndGx**.
4. Specify the values for the all required parameters.
5. Click **OK**.

### Configure static subscribers

You can configure the subscribers manually on the Citrix ADC appliance by using the command line or the configuration utility. You create static subscribers by assigning a unique subscriber ID and optionally associating a policy with each subscriber. The following examples show the commands for configuring a static subscriber.

In the following examples, **subscriptionIdvalue** specifies the international telephone number, and **subscriptionIdType** (E164 in this example) specifies the general format for international telephone numbers.

```
1 add subscriber profile 203.0.113.6 -subscriberRules policy1 policy2
  -subscriptionIdType E164 -subscriptionIdvalue 98767543211
2 add subscriber profile 2002::a66:e8d3/64 -subscriberRules policy1
  policy3 -subscriptionIdtype E164 -subscriptionIdvalue
  98767543212
3 add subscriber profile 203.0.24.2 10 -subscriberRules policy2
  policy3 -subscriptionIdtype E164 -subscriptionIdvalue
  98767543213
4
5 <!--NeedCopy-->
```

To view the configured subscriber profiles, type:

```
show subscriber profile
```

```
1 > show subscriber profile
2
3 1) Subscriber IP: 203.0.24.2 VLAN:10
4 Profile Attributes:
5 Active Rules: policy2, policy3
6 Subscriber Id Type: E164
7 Subscriber Id Value: 98767543213
8 2) Subscriber IP: 2002::/64
9 Profile Attributes:
10 Active Rules: policy1, policy3
11 Subscriber Id Type: E164
12 Subscriber Id Value: 98767543212
13 3) Subscriber IP: 203.0.113.6
14 Profile Attributes:
15 Active Rules: policy1, policy2
16 Subscriber Id Type: E164
17 Subscriber Id Value: 98767543211
18
19 Done
20
21 <!--NeedCopy-->
```

### Default subscriber profile

A default subscriber profile is used if the subscriber IP address is not found in the subscriber session store on the appliance. In the following example, a default subscriber profile is added with the subscriber rule policy1.

```
1 > add subscriber profile * -subscriberRules policy1
2
3 <!--NeedCopy-->
```

## View and clear subscriber sessions

Use the following command to display all the static and dynamic subscriber sessions.

```
show subscriber sessions
```

```
1 > show subscriber sessions
2 1) Subscriber IP: 2002::/64
3 Session Attributes:
4 Active Rules: policy1, policy3
5 Subscriber Id Type: E164
6 Subscriber Id Value: 98767543212
7 2) Subscriber IP: *
8 Session Attributes:
9 Active Rules: policy1
10 3) Subscriber IP: 203.0.24.2 VLAN:10
11 Session Attributes:
12 Active Rules: policy2, policy3
13 Subscriber Id Type: E164
14 Subscriber Id Value: 98767543213
15 4) Subscriber IP: 203.0.113.6
16 Session Attributes:
17 Active Rules: policy1, policy2
18 Subscriber Id Type: E164
19 Subscriber Id Value: 98767543211
20 5) Subscriber IP: 192.168.0.11
21 Session Attributes:
22 Idle TTL remaining: 361 Seconds
23 Active Rules: policy1
24 Subscriber Id Type: E164
25 Subscriber Id Value: 1234567811
26 Service Path: policy1
27 AVP(44): 34 44 32 42 42 38 41 43 2D 30 30 30 30 30 30
31 31 31
28 AVP(257): 00 01 C0 A8 0A 02
29 PCRF-Host: host.pcrf.com
30 AVP(280): 74 65 73 74 2E 63 6F 6D
31
32 Done
33
```

```
34 <!--NeedCopy-->
```

Use the following command to clear a single session or the complete session store. If you do not specify an IP address, the complete subscriber session store is cleared.

```
1 clear subscriber sessions <ip>
2 <!--NeedCopy-->
```

## Subscriber policy enforcement & management system

The Citrix ADC appliance uses the subscriber's IP address as the key to the subscriber policy enforcement and management system.

You can add subscriber expressions to read the subscriber information available in the Subscriber Policy Enforcement & Management System. These expressions can be used with policy rules and actions that are configured for Citrix ADC features, such as integrated caching, rewrite, responder, and content switching.

The following commands are an example of adding a subscriber-based responder action and policy. The policy evaluates to true if the subscriber rule value is "pol1."

```
1 add responder action error_msg respondwith '"HTTP/1.1 403 OKrnrn" +
    " You are not authorized to access Internet"'
2 add responder policy no_internet_access "SUBSCRIBER.RULE_ACTIVE("
    pol1)" error_msg
3
4 <!--NeedCopy-->
```

The following example shows the commands to add a subscriber-based rewrite action and policy. The action inserts an HTTP header "X-Nokia-MSISDN" by using the value of AVP(45) in the subscriber session.

```
1 > add rewrite action AddHDR-act insert_http_header X-Nokia-MSISDN "
    SUBSCRIBER.AVP(45).VALUE"
2 > add rewrite policy AddHDR-pol "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.
    URL).EQUALS_ANY("patset-test)" AddHDR-act
3
4 <!--NeedCopy-->
```

In the following example, two policies are configured on the appliance. When the appliance checks the subscriber information and the subscriber rule is `cache_enable`, it performs caching. If the subscriber rule is `cache_disable`, the appliance does not perform caching.

---

```
1 > add cache policy nocachepol -rule "SUBSCRIBER.RULE_ACTIVE("
    cache_disable")" - action NOCACHE
2 > add cache policy cachepol -rule "SUBSCRIBER.RULE_ACTIVE("
    cache_enable")" - action CACHE -storeInGroup cgl
3
4 <!--NeedCopy-->
```

For a complete list of expressions starting with “SUBSCRIBER.” see the Policy Configuration Guide.

### Important

Citrix ADC software release 12.1 supports IPANDVLAN key lookup method when the subscriber interface is set to GxOnly. For details, see IP address and VLAN ID key lookup method.

## IPv6 prefix based subscriber sessions

A telco user is identified by the IPv6 prefix rather than the complete IPv6 address. The Citrix ADC appliance now uses the prefix instead of the complete IPv6 address (/128) to identify a subscriber in the database (subscriber store). For communicating with the PCRF server (for example, in a CCR-I message), the appliance now uses the framed-IPv6-Prefix AVP instead of the complete IPv6 address. The default prefix length is /64, but you can configure the appliance to use a different value.

### To configure the IPv6 prefix by using the command line

```
set subscriber param [-ipv6PrefixLookupList ...]
```

The first example command below sets a single prefix and the second example command sets multiple prefixes.

```
1 set subscriber param -ipv6PrefixLookupList 64
2 set subscriber param -ipv6PrefixLookupList 64 72 96
3
4 <!--NeedCopy-->
```

### To configure the IPv6 prefix by using the configuration utility

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and in **IPv6 Prefix Lookup List**, specify one or more prefixes.

## IP address and VLAN ID key lookup method

The Citrix ADC appliance uses the subscriber's IP address as the key lookup method to the subscriber policy enforcement and management system. This method is not effective if the IP addresses are overlapping. In such cases, you can use the VLAN ID as an additional subscriber lookup type. IPANDVLAN key lookup method is supported only when the subscriber interface is set to GxOnly. When IPANDVLAN is configured as the lookup method, the Citrix ADC appliance performs the following:

- Includes the originating VLAN ID in the Gx query for IPv4 subscribers.
- Includes the Gx VLAN AVP in all Gx responses. However, if there is a VLAN ID mismatch, the appliance ignores the responses.

For example, if the appliance sends a CCR-I with GxSessionId-a:IPv4-b:VLAN-c and the response contains GxSessionId-a:IPv4-b:VLAN-d, the response is dropped and a default subscriber entry is created.

### Note

- Interface type RadiusAndGx and RadiusOnly cannot be configured together with key type IPANDVLAN.
- If the traffic is from an IPv6 address, the Citrix ADC appliance uses the IP lookup method.

## To configure IP or IPANDVLAN as the key lookup method by using the CLI

At the command prompt, type:

```
1 set subscriber param [-keytype ( IP | IPANDVLAN )] [-interfaceType <
  interfaceType>]
2 <!--NeedCopy-->
```

### Example:

```
1 set subscriber param -keytype IPANDVLAN -interfaceType GxOnly
2
3 set subscriber param -keytype IP -interfaceType GxOnly
4 <!--NeedCopy-->
```

### Note

Changing the keytype parameter from IP to IPANDVLAN and conversely clears all subscriber data.

## VLAN parameter

The VLAN parameter is also added for the following commands.

```
1 add subscriber profile <ip>@ [-vlan]
2
```

```
3 set subscriber profile <ip>@ [-vlan] [-subscriptionIdType <
  subscriptionIdType>]
4
5 show subscriber profile [<ip>@] [-vlan]
6
7 rm subscriber profile <ip>@ [-vlan <positive_integer>]
8 <!--NeedCopy-->
```

## Arguments

### ip

Represents the subscriber IP address. This is a mandatory argument and cannot be changed after the subscriber profile is added.

### vlan

Represents the VLAN number on which the subscriber is located. The VLAN number cannot be changed after the subscriber profile is added.

Minimum value: 1

Maximum value: 4096

```
1 add subscriber profile 192.0.2.23 10
2
3 set subscriber profile 192.0.2.23 10 -subscriptionIdtype E164
4
5 show subscriber profile 192.0.2.23 10
6
7 rm subscriber profile 192.0.2.23 10
8
9 <!--NeedCopy-->
```

## To configure IP or IPANDVLAN as the key lookup method by using the GUI

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In **Key Type**, select **IP** or **IPANDVLAN** as per your requirement.
4. Complete the configuration and click **OK**.

## Idle session management of subscriber sessions in a Telco network

Subscriber session cleanup on a Citrix ADC appliance is based on control plane events, such as a RADIUS Accounting Stop message, a Diameter RAR (session release) message, or a “clear subscriber session” command. In some deployments, the messages from a RADIUS client or a PCRF server might not reach the appliance. Also, during heavy traffic, the messages might be lost. A subscriber session that is idle for a long time continues to consume memory and IP resources on the Citrix ADC appliance. The idle session management feature provides configurable timers to identify idle sessions, and cleans up these sessions based on the specified action.

A session is considered idle if no traffic from this subscriber is received on the data plane or the control plane. You can specify an update, terminate (inform PCRF and then delete the session), or delete (without informing PCRF) action. The action is taken only after the session is idle for the time specified in the idle timeout parameter.

### To configure the idle session timeout and the associated action by using the command line

```
1 set subscriber param [-idleTTL <positive_integer>] [-idleAction <
   idleAction>]
2 <!--NeedCopy-->
```

#### Examples:

```
1 set subscriber param -idleTTL 3600 -idleAction ccrTerminate
2
3 set subscriber param -idleTTL 3600 -idleAction ccrUpdate
4
5 set subscriber param -idleTTL 3600 -idleAction delete
6 <!--NeedCopy-->
```

To disable the idle session timeout, set the idle timeout to zero.

```
set subscriber param -idleTTL 0
```

### To configure the idle session timeout and the associated action by using the configuration utility

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and specify an **Idle Time** and **Idle Action**.

## Subscriber session event logging

If you enable subscriber logging, you can track the RADIUS and Gx control plane messages specific to a subscriber, and use the historical data to analyze subscriber activities. Some of the key attributes are MSISDN and time stamp. The following attributes are also logged:

- Session Event (Install, Update, Delete, Error)
- Gx Message Type (CCR-I, CCR-U, CCR-T, RAR)
- Radius Message Type (Start, Stop)
- Subscriber IP
- SubscriberID Type (MSISDN(E164), IMSI)
- SubscriberID value

By using these logs, you can track users by IP address and, if available, MSISDN.

You can enable subscriber session logging to a local or remote syslog or nslog server. The following example shows how to enable subscriber logging to a remote syslog server.

```
1 > add syslogAction sysact1 192.0.2.0 -loglevel EMERGENCY ALERT
   CRITICAL ERROR WARNING NOTICE INFORMATIONAL -subscriberlog
   enabled
2
3 <!--NeedCopy-->
```

From these logs, you can learn about any activity related to a user, such as the time when a session was updated, deleted, or created (installed). Additionally, error messages are also logged.

### Examples:

1. The following log entries are examples of RADIUS and Gx session creation, session update, and session deletion.

```
09/30/2015:16:29:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT
147 0 : Session Install, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164
- 30000000001

09/30/2015:16:30:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT
148 0 : Session Update, GX MsgType: CCR-U, IP: 100.10.1.1, ID: E164 - 30000000001

09/30/2015:17:27:56 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT
185 0 : Session Delete, GX MsgType: CCR-T, RADIUS MsgType: Stop, IP: 100.10.1.1, ID: E164
- 30000000001
```

2. The following log entries are examples of failure messages, such as when a subscriber is not found on the PCRF server and when the appliance cannot connect to the PCRF server.

```
09/30/2015:16:44:15 GMT Error 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 169 0  
: Failure Reason: PCRF failure response, GX MsgType: CCR-I, IP: 100.10.1.1
```

```
Sep 30 13:03:01 09/30/2015:16:49:08 GMT 0-PPE-0 : default SUBSCRIBER SES-  
SION_FAILURE 176 0 : Failure Reason: Unable to connect to PCRF, GX MsgType: CCR-I, RA-  
DIUS MsgType: Start, IP: 100.10.1.1, ID: E164 - 30000000001#000#000#000#000#000#000#000#000#000#000#000#000#000#000
```

## Subscriber aware LSN session termination

In earlier releases, if a subscriber session is deleted when a RADIUS Accounting STOP or a PCRF-RAR message is received, or as a result of any other event, such as TTL expiry or flush, the corresponding LSN sessions of the subscriber are removed only after the configured LSN timeout period. LSN sessions that are kept open until this timeout expires continue to consume resources on the appliance.

From release 11.1, a new parameter (`subscrSessionRemoval`) is added. If this parameter is enabled, and the subscriber information is deleted from the subscriber database, LSN sessions corresponding to that subscriber are also removed. If this parameter is disabled, the subscriber sessions are timed out as specified by the LSN timeout settings.

### To configure subscriber aware LSN session termination by using the CLI

At the command prompt, type:

---

```
set lsn parameter -subscrSessionRemoval ( DISABLED )  
ENABLED
```

---

```
1   > set lsn parameter -subscrSessionRemoval ENABLED  
2   Done  
3   > sh lsn parameter  
4          LSN Global Configuration:  
5  
6          Active Memory Usage: 0 MBytes  
7          Configured Memory Limit: 0 MBytes  
8          Maximum Memory Usage Limit: 912 MBytes  
9          Session synchronization: ENABLED  
10         Subscriber aware session removal: ENABLED  
11  
12 <!--NeedCopy-->
```

**To configure subscriber aware LSN session termination by using the GUI**

1. Navigate to **System > Large Scale NAT**.
2. In **Getting started**, click **Set LSN Parameter**.
3. Set the **Subscriber Aware Session Removal parameter**.

**Troubleshooting**

If your deployment is not working as expected, use the following commands to troubleshoot:

- show subscriber gxinterface  
This command's output can include the following error messages (shown here with suggested responses):
  - Gx Interface Not Configured-Use set subscriber param command to configure the correct interface type.
  - PCRF not configured-Configure a Diameter vServer or Service on GxInterface-Use the set subscriber gx interface command to assign a Diameter virtual server or service to this interface.
  - PCRF is not ready-Check corresponding vserver/service for more details-Use the show LB vserver or show service command to check the state of the service.
  - Citrix ADC is waiting for CEA from PCRF-Capability negotiation between the PCRF and Citrix ADC might be failing. This could be an intermittent state. If it persists, check the DIAMETER settings on your PCRF server.
  - Memory is not configured to store subscriber sessions. Please use 'set extendedmemoryparam -memlimit <>'-Use the set extendedmemoryparam command to configure extended memory.
- show subscriber radiusinterface  
If "Not Configured" is the output of this command, use the set subscriber radiusinterface command to specify a RADIUSListener service.

If subscriber logging is enabled, you can get more detailed information from the log files.

**Subscriber aware traffic steering**

September 21, 2020

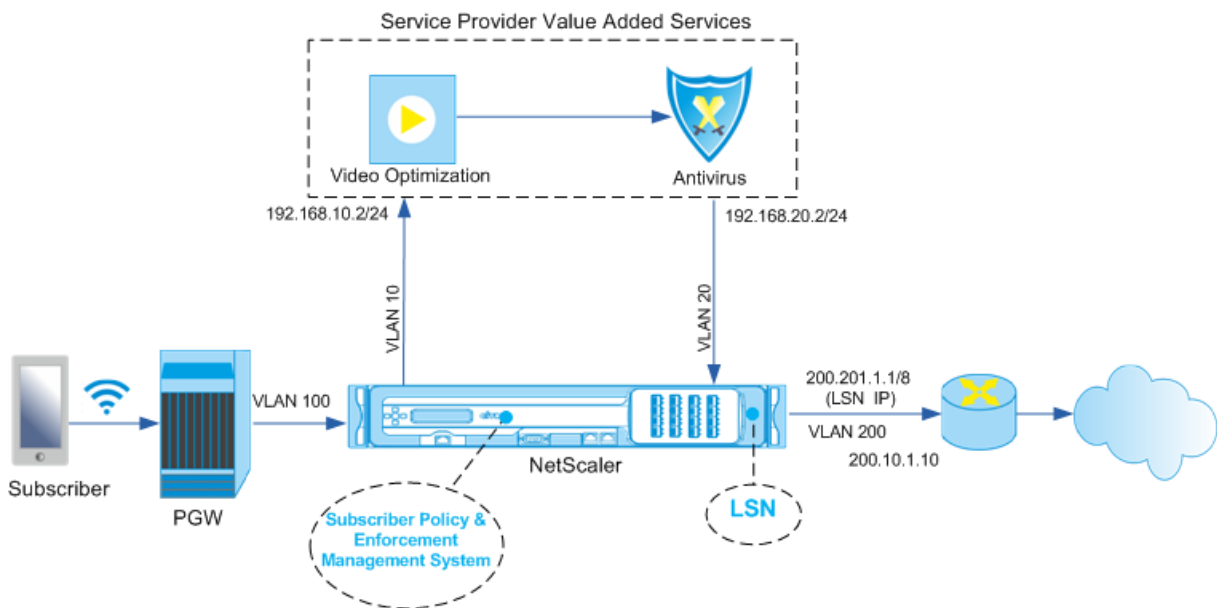

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the Citrix ADC appliance. The appliance communicates with the PCRF server over the Gx

interface to get the policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Drop the packet.
- Perform only Large Scale NAT (LSN), if LSN is configured on the appliance.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the Citrix ADC appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

### To configure traffic steering for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

#### Example:

```

1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2
3 add ns ip 192.168.20.1 255.255.255.0 -type snip
4
5 add ns ip 100.100.100.1 255.0.0.0 -type snip
6
7 add ns ip 200.200.200.1 255.0.0.0 -type snip
8
9 add ns ip 100.1.1.1 255.0.0.0 -type snip
10
11 add ns ip 200.201.1.1 255.0.0.0 -type snip

```

```
12 <!--NeedCopy-->
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

**Example:**

```
1 add vlan 10
2
3 add vlan 20
4
5 add vlan 100
6
7 add vlan 200
8
9 bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
10
11 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
12
13 bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
14
15 bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.1.1.1 255.0.0.0
16 <!--NeedCopy-->
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

**Example:**

```
1 set ns param -servicePathIngressVLAN 100
2
3 set subscriber gxinterface -servicepathAVP 1001 1005 -
  servicepathVendorid 10415
4
5 set subscriber param -interfaceType RadiusAndGx
6 <!--NeedCopy-->
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

**Example:**

```
1 add service sd1 10.102.232.200 DIAMETER 3868
2
```

```

3  add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
    persistAVPno 263
4
5  bind lb vserver vdiam sd1
6
7  set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
8
9  set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
    holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
10
11 add service srad1 10.102.232.236 RADIUSListener 1813
12
13 set subscriber radiusInterface -listeningService srad1
14 <!--NeedCopy-->

```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (\*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must already be configured as part of the global configuration. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

**Example:**

```

1  add ns servicefunction SF1 -ingressVLAN 20
2
3  add ns servicepath pol1
4
5  bind ns servicepath pol1 -servicefunction SF1 -index 255
6
7  add subscriber profile * -subscriberrules default_path
8  <!--NeedCopy-->

```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

```

1  add lsn pool pool1
2

```

```
3 bind lsn pool pool1 200.201.1.1
4
5 add lsn client client1
6
7 bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
8
9 add lsn group group1 -clientname client1
10
11 bind lsn group group1 -poolname pool1
12 <!--NeedCopy-->
```

The appliance performs LSN by default. To override LSN, you must create a net profile with the `overrideLsn` parameter enabled, and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

**Example:**

```
1 add netprofile np1
2
3 set netprofile np1 -overrideLsn ENABLED
4
5 set lb vserver vs1 -netprofile np1
6 <!--NeedCopy-->
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

```
1 add service vas1 192.168.10.2 ANY 80 -usip YES
2
3 add service sint 200.10.1.10 ANY 80 -usip YES
4
5 add lb vserver vs1 ANY -m MAC -l2Conn ON
6
7 add lb vserver vint ANY -m MAC -l2Conn ON
8
9 bind lb vserver vs1 vas1
10
11 bind lb vserver vint sint
12 <!--NeedCopy-->
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**

```
1 add cs vserver cs1 ANY * 80 -l2Conn ON
2
3 add cs action csact1 -targetLBVserver vs1
4
5 add cs action csactint -targetLBVserver vint
6
7 add cs policy cspol1 -rule SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") &&
   SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1
8
9 bind cs vserver cs1 -policyName cspol1 -priority 110
10
11 bind cs vserver cs1 -lbvserver vint
12 <!--NeedCopy-->
```

### To configure traffic steering on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
  - Interface Type: Specify **RadiusAndGx**.
  - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
  - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

## To configure service chaining on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
  - Interface Type: Specify **RadiusAndGx**.
  - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
  - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

## Subscriber aware service chaining

September 21, 2020

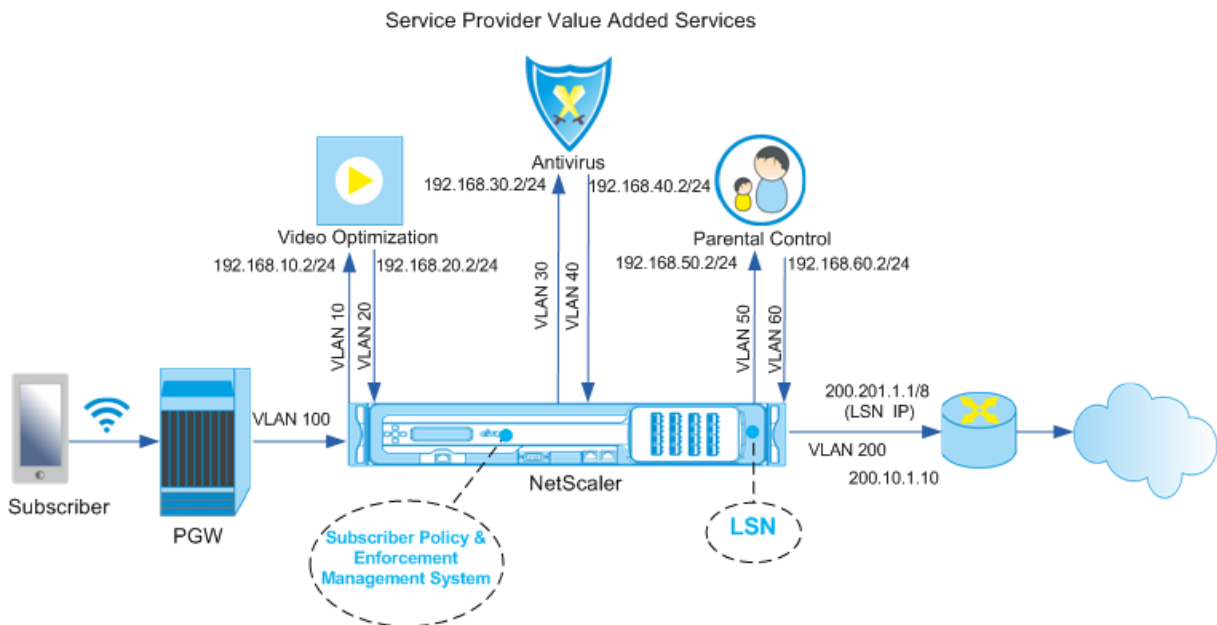

With the huge increase in the data traffic passing through telco networks, it is no longer feasible for service providers to steer all the traffic through all the value added services (VAS). A service provider should be able to optimize usage of VAS and intelligently steer traffic to improve the user experience. For example, video optimization is not required for traffic that does not include a video. Moreover, if a subscriber is connected to a 4G network, content can be streamed in high definition (HD), and video optimization might not be needed. However, video optimization improves the experience for a user in a 3G network. Similarly, caching provides a faster and better user experience and can be enabled depending on the subscriber plan. Another example of VAS is parental control. If parents provide a

mobile handset to a minor child, they would like some kind of control over the websites that their child visits.

To do the above and more, service providers must be able to provide value-added services on a per-subscriber basis. In other words, entities in the service provider network must be capable of extracting the subscriber information and intelligently steering the packet on the basis of this information.

Service chaining determines the set of services through which the traffic from a subscriber must pass before going to the Internet. Instead of sending all the traffic to all the services, the Citrix ADC intelligently routes all requests from a subscriber to a specific set of services on the basis of the policy defined for that subscriber.

The following figure shows the entities involved in service chaining. The values shown are configured in the procedure that follows the figure. A content switching virtual server on the Citrix ADC appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

### To configure service chaining for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

#### Example:

```

1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2
3 add ns ip 192.168.20.1 255.255.255.0 -type snip
4
5 add ns ip 192.168.30.1 255.255.255.0 -type snip

```

```
6
7 add ns ip 192.168.40.1 255.255.255.0 -type snip
8
9 add ns ip 192.168.50.1 255.255.255.0 -type snip
10
11 add ns ip 192.168.60.1 255.255.255.0 -type snip
12
13 add ns ip 100.1.1.1 255.0.0.0 -type snip
14
15 add ns ip 200.201.1.1 255.0.0.0 -type snip
16 <!--NeedCopy-->
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses. Add an ingress and an egress VLAN for each VAS.

**Example:**

```
1 add vlan 10
2
3 add vlan 20
4
5 add vlan 30
6
7 add vlan 40
8
9 add vlan 50
10
11 add vlan 60
12
13 add vlan 100
14
15 add vlan 200
16
17 bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
18
19 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
20
21 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.30.1 255.255.255.0
22
23 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.40.1 255.255.255.0
24
25 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.50.1 255.255.255.0
26
27 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.60.1 255.255.255.0
28
```

```
29 bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
30
31 bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.201.1.1 255.0.0.0
32 <!--NeedCopy-->
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

**Example:**

```
1 set ns param -servicePathIngressVLAN 100
2
3 set subscriber gxinterface -servicepathAVP 1001 1005 -
  servicepathVendorid 10415
4
5 set subscriber param -interfaceType RadiusAndGx
6 <!--NeedCopy-->
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

**Example:**

```
1 add service sd1 10.102.232.200 DIAMETER 3868
2
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263
4
5 bind lb vserver vdiam sd1
6
7 set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
8
9 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
  holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
10
11 add service srad1 10.102.232.236 RADIUSListener 1813
12
13 set subscriber radiusInterface -listeningService srad1
14 <!--NeedCopy-->
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS.

The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (\*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must be configured as part of the global configuration earlier. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

**Example:**

```
1 add ns servicefunction SF1 -ingressVLAN 20
2
3 add ns servicefunction SF2 -ingressVLAN 40
4
5 add ns servicefunction SF3 -ingressVLAN 60
6
7 add ns servicepath pol1
8
9 bind ns servicepath pol1 -servicefunction SF1 -index 255
10
11 bind ns servicepath pol1 -servicefunction SF2 -index 254
12
13 bind ns servicepath pol1 -servicefunction SF3 -index 253
14
15 add ns servicepath pol2
16
17 bind ns servicepath pol2 -servicefunction SF2 -index 255
18
19 add ns servicepath pol3
20
21 bind ns servicepath pol3 -servicefunction SF1 -index 255
22
23 add subscriber profile * -subscriberrules default_path
24 <!--NeedCopy-->
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

**Example:**

```
1 add lsn pool pool1
2
```

```
3 bind lsn pool pool1 200.201.1.1
4
5 add lsn client client1
6
7 bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
8
9 add lsn group group1 -clientname client1
10
11 bind lsn group group1 -poolname pool1
12 <!--NeedCopy-->
```

The appliance performs LSN by default. To override LSN, you must create a net profile with `overrideLsn` parameter enabled and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

**Example:**

```
1 add netprofile np1
2
3 set netprofile np1 -overrideLsn ENABLED
4
5 set lb vserver vs1 -netprofile np1
6 <!--NeedCopy-->
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

**Example:**

```
1 add service vas1 192.168.10.2 ANY 80 -usip YES
2
3 add service vas2 192.168.30.2 ANY 80 -usip YES
4
5 add service vas3 192.168.50.2 ANY 80 -usip YES
6
7 add service sint 200.10.1.10 ANY 80 -usip YES
8
9 add lb vserver vs1 ANY -m MAC -l2Conn ON
10
11 add lb vserver vs2 ANY -m MAC -l2Conn ON
12
13 add lb vserver vs3 ANY -m MAC -l2Conn ON
14
15 add lb vserver vint ANY -m MAC -l2Conn ON
16
17 bind lb vserver vs1 vas1
```

```
18
19 bind lb vserver vs2 vas2
20
21 bind lb vserver vs3 vas3
22
23 bind lb vserver vint sint
24 <!--NeedCopy-->
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**

```
1 add cs vserver cs1 ANY * 80 -l2Conn ON
2
3 add cs action csact1 -targetLBVserver vs1
4
5 add cs action csact2 -targetLBVserver vs2
6
7 add cs action csact3 -targetLBVserver vs3
8
9 add cs action csactint -targetLBVserver vint
10
11 add cs policy cspol1 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") &&
    SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1
12
13 add cs policy cspol2 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF2") &&
    SYS.VSERVER("vs2").STATE.EQ(UP)" -action csact2
14
15 add cs policy cspol3 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF3") &&
    SYS.VSERVER("vs3").STATE.EQ(UP)" -action csact3
16
17 bind cs vserver cs1 -policyName cspol1 -priority 110
18
19 bind cs vserver cs1 -policyName cspol2 -priority 120
20
21 bind cs vserver cs1 -policyName cspol3 -priority 130
22
23 bind cs vserver cs1 -lbvserver vint
24 <!--NeedCopy-->
```

## To configure service chaining on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
  - Interface Type: Specify **RadiusAndGx**.
  - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
  - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.
8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

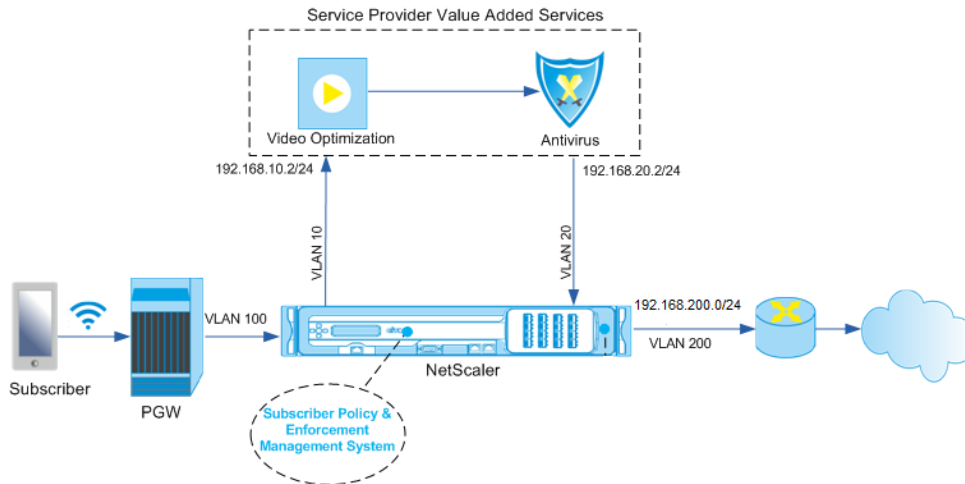

## Subscriber aware traffic steering with TCP optimization

September 21, 2020

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the Citrix ADC appliance. The appliance communicates with the PCRF server over the Gx interface to get the subscriber policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Perform only TCP optimization.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the Citrix ADC appliance directs requests to the value added services or skips them and performs TCP optimization, depending on the defined rule, and then sends the packet out to the Internet.

### Note

Support for the configuration shown below was introduced in release 11.1 build 50.10.

### To configure traffic steering for the above deployment by using the CLI:

1. Add the appliance's subnet IP (SNIP) addresses.

```

1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2
3 add ns ip 192.168.20.1 255.255.255.0 -type snip
4
5 add ns ip 192.168.100.1 255.255.255.0 -type snip
6
7 add ns ip 192.168.200.1 255.255.255.0 -type snip
8
9 add ns ip 10.102.232.236 255.255.255.0 -type snip
10 <!--NeedCopy-->
```

2. Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

```

1 add vlan 10
2
3 add vlan 20
4
```

```
5 add vlan 100
6
7 add vlan 200
8
9 add vlan 102
10
11 bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
12
13 bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
14
15 bind vlan 100 -ifnum 1/2 -tagged -IPAddress 192.168.100.1 255.255.255.0
16
17 bind vlan 200 -ifnum 1/2 -tagged -IPAddress 192.168.200.1 255.255.255.0
18
19 bind vlan 102 -ifnum 1/1 -tagged -IPAddress 10.102.232.236
    255.255.255.0
20 <!--NeedCopy-->
```

3. Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Specify the PCRF realm and values for the subscriber Gx interface parameters. Also specify the service path AVP that indicates where the appliance can find the service path name within the subscriber session. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface, and specify the interface type as “RadiusAndGx”.

```
1 add service sd1 10.102.232.200 DIAMETER 3868
2
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
    persistAVPno 263
4
5 bind lb vserver vdiam sd1
6
7 set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
8
9 set extendedmemoryparam -memLimit 2558
10
11 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net
12
13 set subscriber gxinterface -servicepathAVP 1001 1005 -
    servicepathVendorid 10415
14
15 add service srad1 10.102.232.236 RADIUSListener 1813
16
17 set subscriber radiusInterface -listeningService srad1
18
```

```
19 set subscriber param -interfaceType RadiusAndGx
20 <!--NeedCopy-->
```

4. Specify a default subscriber profile (\*) to be applied if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include the service path AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

```
1 add subscriber profile * -subscriberrules default_path
2 <!--NeedCopy-->
```

5. Create TCP profiles for the VAS and TCP optimization path, respectively. Traffic steered to VAS will not undergo any TCP optimization before or after leaving the VAS. Therefore, the TCP mode of the VAS profile should be set to TRANSPARENT while the TCP mode of the TCPOpt profile should be set to ENDPOINT.

```
add ns tcpProfile VAS -tcpMode TRANSPARENT
```

```
add ns tcpProfile TCPOpt -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd
16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -
KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn EN-
ABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
```

6. Configure load balancing for the VAS servers. Create a non-addressable virtual server of type TCP. Create TCP services with the IP addresses of the VAS servers, and bind the services to the virtual server. The virtual server and services will use the transparent TCP profile created for the VAS path:

```
1 add service vas1 192.168.10.2 TCP * -usip YES -useproxyport NO -TCPB NO
   -tcpProfileName VAS
2
3 add service vas2 192.168.10.3 TCP * -usip YES -useproxyport NO -TCPB NO
   -tcpProfileName VAS
4
5 add lb vserver vs1 TCP -m MAC -l2Conn ON - tcpProfileName VAS
6
7 bind lb vserver vs1 vas1
8
9 bind lb vserver vs1 vas2
10 <!--NeedCopy-->
```

7. Add a load balancing virtual server to capture VAS egress traffic. This vserver will monitor the VAS egress VLAN and will use the transparent TCP profile:

```

1 add lb vserver vsint TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(20)" -
  Listenpriority 30 -l2Conn ON -tcpProfileName VAS
2 <!--NeedCopy-->

```

8. Add a TCP optimization virtual server that listens for any traffic in the wireless-side VLAN and uses the endpoint TCP profile created for the TCP optimization path:

```

1 add lb vserver vs-TcpOpt TCP * * -Listenpolicy "client.vlan.id.eq(100)"
  - Listenpriority 20 -l2Conn ON -tcpProfileName TCP0pt
2 <!--NeedCopy-->

```

9. Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The CS virtual server receives the traffic and redirects it to the appropriate load balancing virtual server according to defined CS policies. Create a CS TCP virtual server that listens for any traffic in the wireless-side VLAN with highest priority and uses the endpoint TCP profile. Create a CS policy that evaluates to TRUE when “vas” is the subscriber rule, and specify a CS action that steers traffic to VAS. Make the TCP optimization virtual server the default LB vserver. Any subscriber traffic with a rule other than “vas” will go through the default LB vserver.

```

1 add cs vserver cs1 TCP * * -Listenpolicy "client.vlan.id.eq(100)" -
  Listenpriority 10 -l2Conn ON -tcpProfileName TCP0pt
2
3 add cs action csact1 -targetLBVserver vs1
4
5 add cs policy cspol1 -rule SUBSCRIBER.RULE_ACTIVE("\vas\") && SYS.
  VSERVER("\vs1\").STATE.EQ(UP)" -action csact1
6
7 bind cs vserver cs1 -policyName cspol1
8
9 bind cs vserver cs1 -lbvserver vs-TcpOpt
10 <!--NeedCopy-->

```

10. Add static or policy based routes to the internet. Dynamic routing is also supported in this configuration. The following example uses policy based routes:

```

1 add ns pbr pbr-vlan100-to-vlan200 ALLOW -nextHop 192.168.200.10 -vlan
  100 -priority 10
2
3 add ns pbr pbr-vlan20-to-vlan200 ALLOW -nextHop 192.168.200.10 -vlan 20
  -priority 11
4
5 apply ns pbrs
6 <!--NeedCopy-->

```

**Note**

The CS policies can contain IP addresses and port numbers in addition to the subscriber expressions—for example, SUBSCRIBER.RULE\_ACTIVE(\”vas\&& &&(CLIENT.TCP.DSTPORT.EQ(80)

CLIENT.TCP.DSTPORT.EQ(443).

They can also contain HTTP based expressions—for example,

HTTP.REQ.HOSTNAME.DOMAIN.EQ(\”somedo

In this case, replace TCP entities (vserver, service, etc.) with HTTP. The TCP profile configuration remains the same.

- 
- Add IPv6 configuration (addresses, routes, PBRs) to support IPv6 subscribers. Happy Eye-balls client applications will work smoothly for both VAS and TCP optimization paths.
- Add VLANs, IP addresses, PBRs and LB virtual servers in front of VAS (vs1, vs2, etc.) to support multiple subscriber flows. Modify the listen policies of CS vserver “cs1” and LB vserver “vsint” to include the additional VLANs.

**Policy based TCP profile selection**

September 21, 2020

You can configure the Citrix ADC appliance to perform TCP optimization based on subscriber attributes. For example, the appliance can select different TCP profiles at run time, based on the network to which the user equipment (UE) is connected. As a result, you can improve a mobile user’s experience by setting some parameters in the TCP profiles and then using policies to select the appropriate profile.

Create separate TCP profiles for subscribers connecting through a 4G network and for users connecting through any other network. Define a policy rule that is selected on the basis of a subscriber parameter, such as RAT-type. In the following examples, if RAT-Type is EUTRAN, a TCP profile that supports a faster connection is selected (Example 1). For all other RAT-Type values, a different TCP profile is selected (Example 2).

**Note**

The RAT-Type AVP (AVP code 1032) is of type Enumerated and is used to identify the radio access technology that is serving the UE.

The value "1004" indicates that the RAT is EUTRAN. (RFC 29.212).

#### Example1:

```

1 add ns tcpProfile tcp2 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd
  16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 1000000 -flavor BIC
  - dynamicReceiveBuffering DISABLED -sendBuffsize 1000000 -dsack
  DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 500 -maxburst 15
2
3 add appqoe action appact2 -priority HIGH -tcpprofile tcp2
4
5 add appqoe policy apppol2 -rule "SUBSCRIBER.AVP(1032).VALUE.
  GET_UNSIGNED32(0, BIG_ENDIAN).EQ(1004)" -action appact2
6
7 bind cs vserver <name> -policyname apppol2 -priority 20 -type request
8 <!--NeedCopy-->

```

#### Example2:

```

1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd
  16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 150000 -flavor BIC
  - dynamicReceiveBuffering DISABLED -sendBuffsize 150000 -dsack
  DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 200 -maxburst 15
2
3 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
4
5 add appqoe policy apppol1 -rule "SUBSCRIBER.AVP(1032).VALUE.
  GET_UNSIGNED32(0, BIG_ENDIAN).NE(1004)" -action appact1
6
7 bind cs vserver <name> -policyname apppol1 -priority 10 -type request
8 <!--NeedCopy-->

```

## Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

September 21, 2020

With the increase in control-plane traffic, the servers can become a bottleneck because the traffic is not optimally distributed among the servers. Therefore, messages must be load balanced. The Citrix ADC appliance supports Diameter, SIP, and SMPP load balancing.

## SIP

Citrix ADC enables you to load balance SIP messages over UDP or over TCP (including TLS) to a group of proxy servers. Citrix ADC also provides Call-ID based persistence and Call-ID hash load balancing method using which you direct packets for a particular SIP session to the same load balanced SIP server.

The Citrix ADC default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for SIP protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

For more information, see [Load Balancing a Group of SIP Servers](#).

## SMPP

Millions of short messages are exchanged daily between individuals and value-added service providers, such as banks, advertisers, and directory services, by using the short message peer to peer (SMPP) protocol. Often, message delivery is delayed because servers are overloaded and traffic is not optimally distributed among the servers.

The Citrix ADC appliance provides optimal distribution of messages across your servers, preventing poor performance and outages. The Citrix ADC appliance:

- Load balances messages originating from the server and from the client
- Monitors the health of the message centers
- Provides content switching support for the message centers
- Handles concatenated messages

**Limitation:** Message IDs, from the message center, longer than 59 bytes are not supported. If the message ID length returned by the message center is more than 59 bytes, ancillary operations fail and the Citrix ADC appliance responds with an error message.

For more information, see [SMPP Load Balancing](#)

## Diameter

Diameter is a base protocol with more than 50 protocols (also called applications) built over it. Therefore, the diameter traffic generated in a Telco network is high. To optimally maintain this diameter traffic, the Citrix ADC appliance performs load balancing, content switching, and acts as a relay agent. Additionally, the appliance offers rewrite and responder functionality. The appliance supports rate limiting of Diameter messages.

For more information, see [Configuring Diameter Load Balancing](#).

## **Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers**

September 21, 2020

Telecom service providers can configure the Citrix ADC appliance to function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the Citrix ADC appliance. This enables the Citrix ADC appliance to provide quick responses for repeated translations and hence enhances the customer experience and also saves the bandwidth. The caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the Citrix ADC appliance returns the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the Citrix ADC appliance. The Citrix ADC appliance then returns the address to the client.

For requests for a domain that has been cached earlier, the Citrix ADC appliance serves the Address record of the domain from the cache without querying the configured DNS server and hence saves the bandwidth.

From 11.0 release onwards, Citrix ADC also logs the DNS requests that it receives and also the responses that it sends to the client. Telecom service providers can use this log to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
- Troubleshooting

For more information, see

[Domain Name System](#).

## **Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider**

September 21, 2020

Scalability, high availability and performance are critical to service provider deployments. While many service providers deploy their infrastructure at a single location or multiple location, these deployments are subject to a number of inherent limitations, such as:

- If the site loses connectivity to all or part of the public Internet, it will be inaccessible to users and customers, which can have significant impact on the business.

- Users accessing the site from geographically distant locations may experience large and highly variable delays, which are exacerbated by the large number of round trips that HTTP requires to transfer content.

Citrix ADC appliance's Global Server Load Balancing (GSLB) overcomes these problems by distributing traffic among sites deployed in multiple geographic locations. By serving content from many different points in the Internet, GSLB alleviates the impact of network bandwidth bottlenecks and provides robustness in case of network failures at a particular site. Users can be automatically directed to the nearest or least loaded site at the time of the request, minimizing the likelihood of long download delays and/or service disruptions.

You can use Citrix ADC appliance's global server load balancing for:

- Disaster recovery or high availability by configuring an Active-standby data center setup that consists of an active and a standby data center. When a failover occurs as a result of a disaster event, the standby data center becomes operational.
- High availability and speed by configuring an active-active data center setup that consists of multiple active data centers. Client requests are load balanced across active data centers.
- Directing client requests to the data center that is closest in geographical distance or network distance by configuring a proximity setup.
- Full-DNS resolutions, GSLB processes DNS queries of the A, AAAA and CNAME types, and the DNS function option can process DNS queries of all other types, such as MX and PTR. Also, if the recursive resolution is enabled, the appliance will forward DNS queries for domain names that are not configured on the Citrix ADC appliance.

For more information, see [Global Server Load Balancing](#).

## **Bandwidth Utilization Using Cache Redirection Functionality**

September 21, 2020

The volume of web traffic on the Internet is enormous and a large percentage of that traffic is redundant. Multiple clients ask web servers for the same content repeatedly leading to inefficient use of bandwidth. To relieve the origin web server of processing each request, Internet Service Providers (ISPs) can use the cache redirection feature of Citrix ADC appliance and serve the content from a cache server instead of from the origin server. The Citrix ADC appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers. Cache redirection feature of Citrix ADC is policy-based, and by default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

For more information, see [Cache Redirection](#).

## Citrix ADC TCP Optimization

September 21, 2020

The Citrix ADC appliance provides advanced TCP tuning and optimization techniques and capabilities that are well suited to modern 3.5 and 4G networks, improving user experience and perceived download speeds significantly.

This section focuses on detailed instructions relevant to:

- Choosing and inserting an appropriate Citrix ADC T1000 Series model in a mobile network for TCP optimization
- Full configuration instructions related to not only TCP optimization but also for appropriate Layer-2 and Layer-3 configuration of the T1 device

The section includes the following topics:

- [Getting Started](#)
- [Management Network](#)
- [Licensing](#)
- [High Availability](#)
- [Gi-LAN Integration](#)
- [TCP Optimization Configuration](#)
- [Optimizing TCP Performance Using TCP NILE](#)
- [Analytics and Reporting](#)
- [Real-time Statistics](#)
- [SNMP](#)
- [Technical Recipes](#)
- [Troubleshooting Guidelines](#)
- [Frequently Asked Questions](#)

## Getting Started

October 14, 2020

### Hardware

Citrix provides a wide breath of Citrix ADC models that might be loosely based on two factors:

- Capacity, currently ranging from hundreds of Mbps for the low-end VPX appliance to 160Gbps for the high-end 25000 MPX series appliance
- Telco grade, with the availability of the T1000 series for Telco datacenters.

Your Citrix Sales or Support representative can help you select the appropriate hardware for your demo, trial, or production needs.

The remainder of this section uses a Citrix ADC T1200 as a reference hardware. Note that putting aside superficial differences related to number and notation of available interfaces (see \* in note) or well-documented limitations of Citrix ADC VPX (see \* in note) the instructions should apply mostly verbatim regardless of the Citrix ADC model selected.

#### Note

\* For instance a the T1010 model only has 12x1GbE typically marked as 1/1-1/12 rather than the 10/x notation used in this document.

\*\* A Citrix ADC VPX instance typically doesn't support LACP aggregation; it might also not support VLAN tagging.

## Initial Setup

### Through Serial Console

After a serial cable is connected, you can log on to the Citrix ADC appliance with the following credentials:

- Username: `nsroot`
- Password: `nsroot`

Once logged in, configure the basic details of the Citrix ADC appliance as shown in the screen capture below.

#### Example:

```
1 set ns config - IPAddress <ip_addr> -netmask <netmask>
2
3 saveconfig
4
5 reboot -warm
6 <!--NeedCopy-->
```

After you restart the appliance, you might use SSH for further configuration of the T1100 nodes.

## Through LOM

Lights out Management (LOM) port on the front panel of the Citrix ADC appliance allows operator to remotely monitor and manage the appliance independently of the operating system. Operator can change the IP address, power cycle, and perform a code dump by connecting to the Citrix ADC appliance through the LOM port.

Default IP Address of LOM port is 192.168.1.3

### Figure. Intial Configuration of LOM Module

Set a static IP on your laptop and plug it directly into the LOM interface with a crossover cable or into a switch in the same broadcast domain as the LOM interface.

For initial configuration, type the port's default address: <http://192.168.1.3> in a web browser and change the LOM port's default IP address.

Refer to Configuration Guides for further details.

## Software

The Citrix ADC TCP optimization for mobile networks is constantly evolving. The capabilities and tunings outlined in this document require a Citrix ADC Telco build. Here is an example showing the Citrix ADC Telco build.

### Example:

```
1 show ver
2
3 NetScaler NS11.0: Build 64.957.nc, Date: Aug 26 2016, 02:00:23
4 <!--NeedCopy-->
```

If the T1000 has not shipped with the appropriate build revision, contact the Citrix ADC Customer Support.

### Important

Both the appliances should have the same software image.

## SSH Client

A Citrix ADC appliance can be configured by using either the CLI or the HTML5 GUI. However, this section provides only CLI-based instructions.

While the CLI is accessible through the Citrix ADC serial console, an SSH client is normally recommended to allow for remote Citrix ADC configuration.

## Management Network

September 21, 2020

### Connectivity

Most Citrix ADC devices offer redundant 1GbE OAM ports, notated as 0/1 and 0/2. To provide for redundancy in case of a switch failure, you should connect the relevant ports to different upstream switches.

A high-level overview of the recommended connectivity is outlined in the following diagram:

After the Citrix ADC appliance is connected to the management network, subsequent configuration steps can be performed remotely using SSH or web connectivity to the CLI and GUI respectively.

### Routing

The `add route` command may be used to configure any routes appropriate to the management network. The relevant gateway should be reachable on the NSIP subnet, as shown below.

#### Example:

```
1 add route <network> <netmask> <gateway>
2 <!--NeedCopy-->
```

## Licensing

March 16, 2021

A valid license file should be installed on the Citrix ADC appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

### Example:

```
1 shell ls /nsconfig/license/  
2  
3 CNS_V3000_SERVER_PLT_Retail.lic ssl  
4 <!--NeedCopy-->
```

Do a warm restart to apply the new license, as shown in the screen capture below.

### Example:

```
1 reboot -warm  
2  
3 Are you sure you want to restart NetScaler (Y/N)? [N]:y  
4  
5 Done  
6 <!--NeedCopy-->
```

After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a 3Gbps Platinum license has been successfully installed.

### Example:

```
1 > show license  
2  
3 License status:  
4  
5 Web Logging: YES  
6  
7 ...  
8  
9 Model Number ID: 3000  
10  
11 License Type: Platinum License  
12
```

```
13     Done
14 <!--NeedCopy-->
```

## High Availability

September 21, 2020

High availability (HA) refers to an active-standby operational mode of a Citrix ADC device pair. Each device has its own dedicated management IP address. All other IP addresses are owned by the active device in the pair.

### Connectivity

While there are multiple connectivity options for a Citrix ADC HA pair, the most recommended one is depicted in the following diagram:

In the above diagram, the N+1 red links between each T1000 and the respective switch imply N+1 redundancy - as explained in [Connectivity](#). For instance, considering a 45 Gbps Gi-LAN N=5 is an appropriate value, with 6x10GbE LACP channels between each switch and the respective T1000 as well as between the two switches.

An extra pair of links is recommended between the Citrix ADC pair, to provide for HA communication isolation from the OAM network.

## Gi-LAN Integration

September 21, 2020

Typically, a Citrix ADC appliance is inserted as a separate L3 inline node in the Gi-LAN, similarly to an L3 router.

Figure: A simple depiction of a Gi-LAN

## Connectivity

A physical Citrix ADC connectivity to upstream switches is recommended to provide for sufficient redundancy. For example, assuming that a Citrix ADC appliance is inserted in a Gi-LAN that is handling a total (uplink+downlink) of 24Gbps, connectivity with 4x10GbE or more interfaces is recommended. This effectively provides for N+1 redundancy in case of a link failure.

The relevant ports on the upstream switch should be configured for LACP port aggregation. The relevant configuration on Citrix ADC is outlined below:

### Connectivity Configuration:

```

1 set interface 10/1 - tagall ON - lacpMode ACTIVE - lacpKey 1
2
3 set interface 10/2 - tagall ON - lacpMode ACTIVE - lacpKey 1
4
5 set interface 10/3 - tagall ON - lacpMode ACTIVE - lacpKey 1
6
7 set interface 10/4 - tagall ON - lacpMode ACTIVE - lacpKey 1
8 <!--NeedCopy-->

```

You can verify the appropriate functionality of LACP using the “show interface” command:

### show interface:

```
sh interface LA/1
```

```

1      1)      Interface LA/1 (802.3ad Link Aggregate) #39
2
3              flags=0x4100c020 <ENABLED, UP, AGGREGATE, UP, HAMON, 802.1
4              q>
5              MTU=1500, native vlan=1, MAC=02:e0:ed:33:88:b0, uptime 340
6              h11m56s
7              Requested: media NONE, speed AUTO, duplex NONE, fctl NONE,
8

```

```
9          throughput 0
10
11          Actual: throughput 4000
12
13          LLDP Mode: NONE,
14
15          RX: Pkts(918446) Bytes(110087414) Errs(0) Drops(795989)
16          Stalls(0)
17
18          TX: Pkts(124113) Bytes(15255532) Errs(0) Drops(0) Stalls
19          (0)
20
21          NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)
22          Muted(0)
23
24          Bandwidth thresholds are not set.
25
26 <!--NeedCopy-->
```

Disable the remaining unused interfaces and turn off the monitor.

```
set interface 10/5 -haMonitor OFF
```

**Command:**

```
1 set interface 10/24 - haMonitor OFF
2
3 disable interface 10/5
4
5 disable interface 10/24
6 <!--NeedCopy-->
```

Configuration of physical interfaces is not shared across the two Citrix ADC units. Hence, the above commands must be run across both Citrix ADC nodes in case of an HA pair deployment.

## HA Configuration

All other configuration parameters are shared between the Citrix ADC nodes of an HA pair. Hence, HA sync should be enabled prior to any other configuration commands being run. Basic HA configuration involves the following steps:

1. Using the exact same Citrix ADC hardware, software, and license: HA pairs are not supported between different models (i.e. a T1100 and an MPX21550) or same models with different firmware levels. Refer to the appropriate instructions on upgrading an existing HA pair - [Upgrading to Release 11.1](#).
2. Establishing the HA pair.

**Example:**

```
1 netcaler-1> add HA node 1 <netcaler-2-NSIP>
2
3 netcaler-2> add HA node 1 <netcaler-1-NSIP>
4 <!--NeedCopy-->
```

3. Verify the HA pair establishment running the following command in either node; both nodes should be visible, one of them as Primary (active), the other as a Secondary (standby).

**Example:**

“show HA node

```
1 4\. Enable failsafe mode and maxFlips. This ensures that in case of a
   route monitor failure on both nodes at least one node remains active
   without active/standby status constantly switching.
2
3 **Example:**
```

set HA node -failsafe ON

set HA node -maxFlips 3 -maxFlipTime 1200

```
1 5\. Finally, enable HA sync to occur over the dedicated intra-Citrix
   ADC ports rather than the OAM network.
2
3 **Example:**
```

add vlan 4080 -aliasName syncVlan

set HA node -syncvlan 4080

```
1 > **Note**
2 >
3 > The VLAN 4080 in the commands in the above example shouldn' t be
   taken literally. Any unused VLAN-ID might be reserved.
4
5 ## VLAN Configuration
6
7 After the physical interfaces have been appropriately configured, you
   might configure the appropriate Gi-LAN VLANs. For instance, consider
   a rather simple Gi-LAN environment with an ingress/egress VLAN pair
   with 100/101 VLAN-identifier respectively.
8
9 The following commands configure the relevant VLANs on top of the LACP
   channel created in the prior step.
```

```
add vlan 100
add vlan 101
bind vlan 100 -ifnum LA/1 -tagged
bind vlan 101 -ifnum LA/1 -tagged
```

```
1 ## IPv4 Configuration
2
3 Typically, a Citrix ADC appliance requires one SNIP per VLAN. The
  example below assumes that the networks outlined in the Gi-LAN
  integration diagram, given in the beginning of this page, have a /24
  subnet mask:
```

```
add ns ip 192.168.1.254 255.255.255.0 -vserver DISABLED -mgmtAccess DISABLED
add ns ip 192.168.2.254 255.255.255.0 -vserver DISABLED -mgmtAccess DISABLED
```

```
1 After the SNIPs have been configured they should be associated with the
  appropriate VLAN:
```

```
bind vlan 100 -IPAddress 192.168.1.254 255.255.255.0
bind vlan 101 -IPAddress 192.168.2.254 255.255.255.0
```

```
1 ## IPv4 Static Routing
2
3 The example outlined in the [Management Network](/en-us/citrix-adc
  /12-1/citrix-adc-support-for-telecom-service-providers/
  NS_TCP_optimization/NS_TCP_opt_mgmt_network.html) section calls for
  only a couple of static routing rules:
4
5 - A 10.0.0.0/8 static route to the clients through the ingress router
6 - A default route to the internet through the egress router
7
8 **Example:**
```

```
add route 0.0.0.0 0.0.0.0 192.168.2.1
add route 10.0.0.0 255.0.0.0 192.168.1.1
```

```
1 ## IPv4 Policy-Based (VLAN - VLAN) routing
2
3 A Citrix ADC appliance allows for policy-based routing instead of
  static routing, with routing decisions usually keyed against the
  incoming interface and/or VLAN rather than destination IP. Policy-
  based routing is either a convenient alternative, in case the client
  source IP address range is subject to periodic changes, or a
  mandatory consideration, in case a packet' s destination IP address
```

```
is not sufficient by itself to reach a routing decision (i.e. in
case of overlapping client IP addresses across multiple VLANs).
```

4

5 **\*\*Example:\*\***

```
add ns pbr fromWirelessToInternet ALLOW -nextHop 192.168.2.1 -vlan 100 -priority 10
```

Done

```
add ns pbr fromInternetToWireless ALLOW -nextHop 192.168.1.1 -vlan 200 -priority 20
```

Done

```
apply ns pbrs
```

1 **## IPv6 Configuration**

2

```
3 The following commands assign IPv6 SNIP per vlan. The example below
  assumes that the networks outlined in the Figure: A simple depiction
  of a Gi-LAN in this page have a /64 subnet mask:
```

4

5 **\*\*Command:\*\***

```
add ns ip6 fd00:192:168:1::254/64 -vServer DISABLED -mgmtAccess DISABLED
```

```
add ns ip6 fd00:192:168:2::254/64 -vServer DISABLED -mgmtAccess DISABLED
```

```
bind vlan 100 -IPAddress fd00:192:168:1::254/64
```

```
bind vlan 200 -IPAddress fd00:192:168:2::254/64
```

1 **## IPv6 Routing**

2

```
3 After IPv6 addressing is complete, IPv6 static routing might be
  configured:
```

4

```
5 - A fd00:10::/64 static route to the clients via the ingress router
```

```
6 - A default route to the internet via the egress router
```

7

8 **\*\*Example:\*\***

```
add route6 fd00:10::/64 fd00:192:168:1::1
```

```
add route6 ::/0 fd00:192:168:2::1
```

1 Or using policy-based routing:

2

3 **\*\*Example:\*\***

```
add ns pbr6 fromWirelessToInternetv6 ALLOW -vlan 100 -priority 10 -nextHop fd00:192:168:2::1
```

```
add ns pbr6 fromInternetToWirelessv6 ALLOW -vlan 200 -priority 20 -nextHop fd00:192:168:1::1
```

```
apply ns pbr6
```

```
1  ## LACP Redundancy and Failover
2
3  In case of an HA configuration, it' s recommended to leverage the
   throughput option to configure a low threshold for the LACP channel.
   For instance, consider a 25Gbps Gi-LAN and a 4x10GbE channel
   between each Citrix ADC appliance in the HA pair and the upstream
   switch to provide N+1 link redundancy:
4
5  **Example:**
```

```
set interface LA/1 -haMonitor ON -throughput 29000
```

```
1  In case of a double-link failure between the primary appliance and the
   upstream switch the maximum Gi-LAN throughput that can be supported
   would fall to 20Gbps. A 29Gbps low threshold per the example above
   would result in a redundancy switchover event to the secondary
   appliance (which has not suffered similar link failures) so that Gi-
   LAN traffic is not affected.
2
3  ## Route Monitors
4
5  In addition to LACP redundancy, route monitor checks might be
   configured and associated with the HA pair configuration. Route
   monitor checks can be useful to detect failures between the Citrix
   ADC appliance and the next-hop routers, especially if said routers
   are not directly connected but through an upstream switch.
6
7  A typical HA route monitor configuration per the sample Gi-LAN in
   section 2.5.1 is outlined below:
```

```
add route 192.168.1.0 255.255.255.0 192.168.1.1 -msr ENABLED -monitor arp
```

```
add route 192.168.2.0 255.255.255.0 192.168.2.1 -msr ENABLED -monitor arp
```

```
bind HA node -routeMonitor 192.168.1.0 255.255.255.0
```

```
bind HA node -routeMonitor 192.168.2.0 255.255.255.0
```

```
““
```

## TCP optimization configuration

October 14, 2020

Before configuring TCP optimization, apply the following basic configuration settings on the Citrix ADC appliance:

**Initial configuration:**

```
1 enable ns feature LB IPv6PT
2 enable ns mode FR L3 USIP MBF Edge USNIP PMTUD
3 disable ns feature SP
4 disable ns mode TCPB
5 set lb parameter -preferDirectRoute NO
6 set lb parameter -vServerSpecificMac ENABLED
7 set l4param -l2ConnMethod Vlan
8 set rsskeytype -rsstype SYMMETRIC
9 set ns param -useproxyport DISABLED
10 <!--NeedCopy-->
```

**Note**

Restart the Citrix ADC appliance if you change the rsskeytype system parameter.

**TCP termination**

For Citrix ADC T1 to apply TCP optimization it needs to first terminate incoming TCP traffic. Towards this end, a wildcard TCP vserver should be created and configured to intercept ingress traffic and then forward it to the Internet router.

**Static or dynamic routing environment**

For environments with static or dynamic routing in place, vserver can rely on routing table info to forward packets towards internet router. Default route must point to the internet router and also routing entries for client subnets towards wireless router should be in place:

**Example:**

```
1 add lb vserver vsrv-wireless TCP * * -persistenceType NONE -
  Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER(\"vsrv-wireless
  \").STATE.EQ(UP)" -m IP -cltTimeout 9000
2 add route 0.0.0.0 0.0.0.0 192.168.2.1
3 add route 10.0.0.0 255.0.0.0 192.168.1.1
4 <!--NeedCopy-->
```

## VLAN-to-VLAN (PBR) environment

There are customer environments where subscriber traffic is segmented to multiple flows and needs to be forwarded to different routers based on incoming traffic parameters. Policy Based Routing (PBR) can be used to route packets based on incoming packet parameters, such as VLAN, MAC address, Interface, source IP, source port, destination IP address, and destination port.

### Example:

```

1 add lb vserver vsrv-wireless TCP * * -m IP -l2Conn ON -listenpolicy "
  CLIENT.VLAN.ID.EQ(100) || CLIENT.VLAN.ID.EQ(101) || CLIENT.VLAN.ID.
  EQ(102)"
2
3 add ns pbr pbr-vlan100-to-vlan200 ALLOW -vlan 100 -nexthop 172.16.200.1
4
5 add ns pbr pbr-vlan101-to-vlan201 ALLOW -vlan 101 -nexthop 172.16.201.1
6
7 add ns pbr pbr-vlan102-to-vlan202 ALLOW -vlan 102 -nexthop 172.16.202.1
8 <!--NeedCopy-->

```

Using Policy Based Routing to route TCP optimized traffic is a new feature added in release 11.1 50.10. For previous releases, having multiple “mode MAC” vserver entities per VLAN is an alternative solution for multi-VLAN environments. Each vserver has a bound service representing the internet router for the particular flow.

### Example:

```

1 add server internet_router_1 172.16.200.1
2
3 add server internet_router_2 172.16.201.1
4
5 add server internet_router_3 172.16.202.1
6
7 add service svc-internet-1 internet_router_1 TCP * -usip YES -
  useproxyport NO

```

```
8
9 add service svc-internet-2 internet_router_2 TCP * -usip YES -
  useproxyport NO
10
11 add service svc-internet-3 internet_router_3 TCP * -usip YES -
  useproxyport NO
12
13 bind service svc-internet-1 -monitorName arp
14
15 bind service svc-internet-2 -monitorName arp
16
17 bind service svc-internet-3 -monitorName arp
18
19 add lb vserver vsrv-wireless-1 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ
  (100) && SYS.VSERVER(\"vsrv-wireless-1\").STATE.EQ(UP)" -m MAC -
  l2Conn ON
20
21 add lb vserver vsrv-wireless-2 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ
  (101) && SYS.VSERVER(\"vsrv-wireless-2\").STATE.EQ(UP)" -m MAC -
  l2Conn ON
22
23 add lb vserver vsrv-wireless-3 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ
  (102) && SYS.VSERVER(\"vsrv-wireless-3\").STATE.EQ(UP)" -m MAC -
  l2Conn ON
24
25 bind lb vserver vsrv-wireless-1 svc-internet-1
26
27 bind lb vserver vsrv-wireless-2 svc-internet-2
28
29 bind lb vserver vsrv-wireless-3 svc-internet-3
30 <!--NeedCopy-->
```

**Note:**

The vserver mode is MAC in contrast to previous examples where it is mode IP. This is required to retain the destination IP information when we have service(s) bound to vserver. Also, the additional PBR configuration need to route non-optimized traffic.

**TCP optimization**

Out-of-the-box Citrix ADC TCP termination is configured for TCP pass-through functionality. TCP pass-through essentially means that Citrix ADC T1 may transparently intercept a client-server TCP stream but does not retain separate client/server buffers or otherwise apply any optimization techniques.

To enable TCP optimization a TCP profile, named as nstcpprofile, is used to specify TCP configurations

that is used if no TCP configurations are provided at the service or virtual server level and it should be modified as follows:

**Command:**

```
1 add ns tcpProfile nstcpprofile -WS ENABLED -SACK ENABLED -WSVal 8 -mss
  1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA
  ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -
  spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -
  fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
2 <!--NeedCopy-->
```

**Note:**

If there is not any profile explicitly created and bound to vserver and service, the profile nstcp\_default\_profile is bound by default.

In case of multiple TCP profiles requirement, extra TCP profiles can be created and associated with the appropriate virtual server

```
1 add ns tcpProfile custom_profile -WS ENABLED -SACK ENABLED -WSVal 8 -
  mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA
  ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -
  spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -
  fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
2
3 set lb vserver vsrv-wireless -tcpProfileName custom_profile
4 <!--NeedCopy-->
```

**Note:**

For deployments with vserver -m MAC and service, same profile should be associated with service.

```
1 set service svc-internet -tcpProfileName custom_profile
2 <!--NeedCopy-->
```

### TCP optimization capabilities

Most of the relevant TCP optimization capabilities of a Citrix ADC appliance are exposed through a corresponding TCP profile. Typical CLI parameters that should be considered when creating a TCP profile are the following:

1. **Window Scaling (WS):** TCP Window scaling allows increasing the TCP receive window size beyond 65535 bytes. It helps improving TCP performance overall and specially in high bandwidth and long delay networks. It helps with reducing latency and improving response time over TCP.
2. **Selective acknowledgment (SACK):** TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgement the receiver can inform the sender about all the segments which are received successfully, enabling sender to only retransmit the segments which were lost. This technique helps T1 improve overall throughput and reduce the connection latency.
3. **Window Scaling Factor (WSVal):** Factor used to calculate the new window size. It must be configured with a high value in order to allow the advertised window by NS to be at least equal to the buffer size.
4. **Maximum Segment Size (MSS):** MSS of a single TCP segment. This value depends on the MTU setting on intermediate routers and end clients. A value of 1460 corresponds to an MTU of 1500.
5. **maxBurst:** Maximum number of TCP segments allowed in a burst.
6. **Initial Congestion Window size(initialCwnd):** TCP initial congestion window size determines the number of bytes which can be outstanding in beginning of the transaction. It enables T1 to send those many bytes without bothering for congestion on the wire.
7. **Maximum OOO packet queue size(oooQSize):** TCP maintains Out Of Order queue to keep the OOO packets in the TCP communication. This setting impacts system memory if the queue size is long as the packets need to be kept in runtime memory. Thus this needs to be kept at optimized level based on the kind of network and application characteristics.
8. **Minimum RTO(minRTO):** The TCP retransmission timeout is calculated on each received ACK based on internal implementation logic. The default retransmission timeout happens at 1 second to start with and this can be tweaked with this setting. For second retransmission of these packets RTO will be calculated by  $N*2$  and then  $N*4 \dots N*8 \dots$  goes on till last retransmission attempt.
9. **bufferSize / sendBuffsize:** these refer to the maximum amount of data that the T1 may receive from the server and buffer internally without sending to the client. They should be set to a value larger (at least double) than the Bandwidth Delay Product of the underlying transmission channel.
10. **flavor:** this refers to the TCP congestion control algorithm. Valid values are Default, BIC, CUBIC, Westwood and Nile.
11. **Dynamic receive buffering:** allows the receive buffer to be adjusted dynamically based on memory and network conditions. It will fill up the buffer as much as it's required to keep the client's download pipe full instead of filling up, by reading ahead from server, a fixed size buffer, as latter is specified in TCP profile and typically based on criteria such as  $2*BDP$ , for a connection. Citrix ADC T1 monitors the network conditions to the client and estimates how much it should read ahead from the server.
12. **Keep-Alive (KA):** Send periodic TCP keep-alive (KA) probes to check if peer is still up.

13. **rstWindowAttenuate**: Defending TCP against spoofing attacks. It will reply with corrective ACK when a sequence number is invalid.
14. **rstMaxAck**: Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number.
15. **spoofSynDrop**: Drop of invalid SYN packets to protect against spoofing.
16. **Explicit Congestion Notification (ecn)**: It sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption.
17. **Forward RTO-Recovery**: In case of spurious retransmissions, the congestion control configurations are reverted to their original state.
18. **TCP maximum congestion window (maxcwnd)**: TCP maximum congestion window size that is user configurable.
19. **Forward acknowledgment (FACK)**: To avoid TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either T1 or a client) control the amount of data injected into the network during retransmission timeouts.
20. **tcpmode**: TCP optimization modes for specific profile. There are two TCP optimization modes - Transparent and Endpoint.  
Endpoint. In this mode, the appliance manages the client and server connections separately.  
Transparent. In the transparent mode the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance.

## Silently Dropping Idle Connections

In a Telco network, almost 50 percent of a Citrix ADC appliance's TCP connections become idle, and the appliance sends RST packets to close them. The packets sent over radio channels activate those channels unnecessarily, causing a flood of messages that in turn cause the appliance to generate a flood of service-reject messages. The default TCP profile now includes DropHalfClosedConnOnTimeout and DropEstConnOnTimeout parameters, which by default are disabled. If you enable both of them, neither a half closed connection nor an established connection causes a RST packet to be sent to the client when the connection times out. The appliance just drops the connection.

```
1 set ns tcpProfile nstcpprofile -DropHalfClosedConnOnTimeout ENABLED
2 set ns tcpProfile nstcpprofile -DropEstConnOnTimeout ENABLED
3 <!--NeedCopy-->
```

## Analytics and Reporting

September 21, 2020

The TCP Speed Reporting is a Citrix ADC feature which extracts TCP connection statistics, as a measure of TCP download and upload performance, and is utilized in [TCP Insight](#) reports of the Citrix Application Delivery Management (ADM). To achieve this, Citrix ADC monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count and duration) for the identified maximum burst. TCP Speed Reporting feature is enabled by default, support both TCP and HTTP vServers and depends on the Appflow/ULFD reporting infrastructure.

## Real-time Statistics

September 21, 2020

The stat command might be used to verify that TCP optimization is properly applied:

### Command:

```

1 > stat lb vserver vsrv-wireless
2 Virtual Server Summary
3
4   actSvcs
5   vsrv...eless          *    0    TCP    UP    100
6   1
7   inactSvcs
8   vsrv...eless          0
9 Virtual Server Statistics
10
11   Total
12   Rate (/s)
13   Vserver hits          0
14   10
15   Requests              0
16   Responses             0
17   Request bytes         0
18   1580
19   Response bytes       0
20   532594360

```

The Total counters should constantly increase for an operational system. In addition, the Rate coun-

ters should be non-zero.

**Note**

The preceding output is from an operational yet idle lab system, explaining the zero rate.

## SNMP

September 21, 2020

SNMP agent can be queried for system specific information from a remote device (SNMP Manager). Based on the query, the agent searches for the equal object identifier (OID) in the management information base (MIB) for the data requested and sends the information to the SNMP Manager. The following are the most useful SNMP OIDs for Telco deployments:

### Memory

- **resMemUsage (1.3.6.1.4.1.5951.4.1.1.41.2)**

Percentage of memory utilization on Citrix ADC.

### Packet Engine CPU

- **resCpuUsage (1.3.6.1.4.1.5951.4.1.1.41.1)**

CPU utilization percentage.

- **nsCPUTable (1.3.6.1.4.1.5951.4.1.1.41.6)**

This table contains information about each CPU in Citrix ADC.

Indexed on: nsCPUname

- **nsCPUname (1.3.6.1.4.1.5951.4.1.1.41.6.1.1)**

The name of the CPU.

- **nsCPUusage (1.3.6.1.4.1.5951.4.1.1.41.6.1.2)**

CPU utilization percentage.

### Throughput

- **allNicTotRxMbits (1.3.6.1.4.1.5951.4.1.1.71.1)**

Number of megabits received by the Citrix ADC appliance.

- **allNicTotTxMbits (1.3.6.1.4.1.5951.4.1.1.71.2)**

Number of megabits transmitted by the Citrix ADC appliance.

- **ipTotRxPkts (1.3.6.1.4.1.5951.4.1.1.43.25)**

IP packets received.

- **ipTotRxMbits (1.3.6.1.4.1.5951.4.1.1.43.27)**

Megabits of IP data received.

- **ipTotTxPkts (1.3.6.1.4.1.5951.4.1.1.43.28)**

IP packets transmitted.

- **ipTotTxMbits (1.3.6.1.4.1.5951.4.1.1.43.30)**

Megabits of IP data transmitted.

## Connections

### Active connections:

- **tcpActiveServerConn (1.3.6.1.4.1.5951.4.1.1.46.8)**

Connections to a server currently responding to requests.

### Total connections:

- **tcpCurServerConn (1.3.6.1.4.1.5951.4.1.1.46.1)**

Server connections, including connections in the Opening, Established, and Closing state.

- **tcpCurClientConn (1.3.6.1.4.1.5951.4.1.1.46.2)**

Client connections, including connections in the Opening, Established, and Closing state.

**Note:** Because of SYN-Cookie, this doesn't include Client in Opening state

- **tcpTotZombieClntConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.26)**

Client connections that are flushed because the client has been idle for some time.

- **tcpTotZombieSvrConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.27)**

Server connections that are flushed because there have been no client requests in the queue for some time.

## Errors

- **tcpErrSynGiveUp (1.3.6.1.4.1.5951.4.1.1.46.37)**

Attempts to establish a connection on the Citrix ADC that timed out.

- **tcpErrRetransmitGiveUp (1.3.6.1.4.1.5951.4.1.1.46.60)**

Number of times Citrix ADC terminates a connection after retransmitting the packet seven times on that connection. Retransmission happens when receiving end doesn't acknowledge the packet.

- **ifInDiscards (1.3.6.1.2.1.2.2.1.13)**

The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

- **ifOutDiscards (1.3.6.1.2.1.2.2.1.19)**

The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

- **ifErrTxOverflow (1.3.6.1.4.1.5951.4.1.1.54.1.36)**

Number of packets that have passed through the overflow queues, during transmission on the specified interface, since the Citrix ADC appliance was started or the interface statistics were cleared. This gets incremented only on congested ports.

## Optimized/Bypass connections

- **tcpOptimizationEnabled (1.3.6.1.4.1.5951.4.1.1.46.131)**

Total number of connections enabled with TCP optimization.

- **tcpOptimizationBypassed (1.3.6.1.4.1.5951.4.1.1.46.132)**

Total number of connections bypassed TCP Optimization.

## Technical Recipes

September 21, 2020

The Citrix ADC T1 models provide advanced features and a powerful policy configuration language that allow for evaluation of complex decision in runtime.

While it is not possible to evaluate all capabilities that are potentially unlocked by the T1000 features and policy configuration guide, technical recipes consider implementation of various requirements brought in by Telco operators. Feel free to re-use the “recipes” as is or adapt to your environment.

## Per-user Connection Limit

The Citrix ADC T1 model can be configured to limit the number of connections per unique subscriber IP. With the below configuration, N concurrent TCP connections per IP (CLIENT.IP.SRC) is allowed. For every attempt for connection beyond the configured threshold, T1 sends an RST. For maximum 2 concurrent connections per user:

### Command:

```
1 add stream selector streamSel_usrlimit CLIENT.IP.SRC
2 add ns limitIdentifier limitId_usrlimit -threshold 2 -mode CONNECTION -
  selectorName streamSel_usrlimit
3 add responder policy respPol_usrlimit "SYS.CHECK_LIMIT(\"
  limitId_usrlimit\")" RESET
4 bind lb vserver vsrv-wireless -policyName respPol_usrlimit -priority 1
  -gotoPriorityExpression END
5 <!--NeedCopy-->
```

## Smooth Insertion/Deletion of Vserver

Many operators concern about TCP connections disruption when the Citrix ADC T1 model is activated inline for TCP optimization or when it is disabled for maintenance purposes. To avoid breaking existing connections when vserver is introduced, the following configuration needs to be applied before configuring or activating vserver for TCP optimization:

### Command:

```
1 add ns acl acl-ingress ALLOW -vlan 100
2 add forwardingSession fwd-ingress -aclname acl-ingress
3 apply ns acls
4 <!--NeedCopy-->
```

Forwarding sessions are effective on top of routing (either static or dynamic or PBR) and create session entries for traffic that is routed (L3 mode). Any existing connection is handled by forwarding session due to corresponding sessions, and upon vserver introduction it starts capturing only new TCP connections.

ACLs can be configured to capture only specific ports like vserver, in order to avoid creating sessions for unnecessary traffic, which is memory consuming. Another option is to remove specific configuration after vserver activation.

For maintenance purposes, vserver should be disabled and its state appears as OUT OF SERVICE. When this happens, the vserver terminates all connections immediately by default. To make vserver to still serve the existing connections and not accept new, the following configuration should be applied:

**Command:**

```

1 set lb vserver vsrv-wireless -downStateFlush DISABLED
2 <!--NeedCopy-->

```

New connections go through the routing table, and corresponding session entries are created due to forwarding sessions.

**Policy-Based TCP Profiling**

Policy-based TCP Profile selection allows operators to configure TCP profile dynamically for clients coming from different traffic domains (i.e. 3G or 4G). Some of the QoS metrics are different for these traffic domains, and in order to achieve better performance, you need to change some of the TCP parameter dynamically. Consider a case where clients coming from 3G and 4G hit same vserver and use same TCP profile, which have negative impact on some client's performance. AppQoE functionality can classify these clients and dynamically change TCP profile on vserver.

**Example:**

```

1 enable feature AppQoE
2
3 add ns tcpProfile nstcpprofile1 -WS ENABLED -SACK ENABLED -WSVal 8 -mss
  1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  slowStartIncr 1 -bufferSize 4000000 -flavor BIC -KA ENABLED -
  sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spooofSynDrop
  ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -tcpmode
  ENDPOINT
4
5 add ns tcpProfile nstcpprofile2 -WS ENABLED -SACK ENABLED -WSVal 8 -mss
  1460 -maxBurst 15 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -
  slowStartIncr 1 -bufferSize 128000 -flavor BIC -KA ENABLED -
  sendBuffsize 6000000 -rstWindowAttenuate ENABLED -spooofSynDrop
  ENABLED -frto ENABLED -maxcwnd 64000 -fack ENABLED -tcpmode ENDPOINT
6
7 add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
8
9 add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
10
11 add appqoe policy appqoe_4G -rule "CLIENT.VLAN.ID.EQ(100)" -action
  action_1
12
13 add appqoe policy appqoe_3G -rule "CLIENT.VLAN.ID.EQ(200)" -action
  action_2
14

```

```
15 bind lb vserver vsrv-wireless -policyName appqoe_4G -priority 100
16
17 bind lb vserver vsrv-wireless -policyName appqoe_3G -priority 110
18 <!--NeedCopy-->
```

The Citrix ADC T1 model is capable to receive the subscriber information dynamically through Gx or Radius or Radius and Gx interface and apply different TCP profile on a per-subscriber basis.

**Command:**

```
1 add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
2
3 add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
4
5 add appqoe policy appqoe_4G -rule "SUBSCRIBER.RULE_ACTIVE(\"3G\")" -
  action action_1
6
7 add appqoe policy appqoe_3G -rule "SUBSCRIBER.RULE_ACTIVE(\"4G\")" -
  action action_2
8 <!--NeedCopy-->
```

For integration of the Citrix ADC T1 model with operator control-plane network, see [Telco Subscriber Management](#).

## Scalability

September 21, 2020

Because TCP optimization is resource intensive, a single Citrix ADC appliance, even a high end –appliance, might not be able to sustain high Gi-LAN throughputs. To expand the capacity of your network, you can deploy Citrix ADC appliances in an N+1 cluster formation. In a cluster deployment, the Citrix ADC appliances work together as a single system image. The client traffic is distributed across the cluster nodes with the help of external switch device.

### Topology

Figure 1 is an example of a cluster consisting of four T1300-40G nodes.

The setup shown in Figure 1 has the following properties:

1. All cluster nodes belong to the same network (also known as an L2 cluster).
2. Data plane and backplane traffic are handled by different switches.
3. Assuming Gi-LAN throughput is 200 Gbps and that a T1300-40G appliance can sustain 80Gbps of throughput, we need three T1300-40G appliances. To provide redundancy in case of single cluster node failure, we deploy four appliances in total.
4. Each node will receive up to 67Gbps of traffic (50Gbps in normal operating conditions and 67Gbps in case of single cluster node failure), so it needs 2x40Gbps connections to the upstream switch. To provide redundancy in case of switch failure, we deploy a couple of upstream switches and double the number of connections.
5. Cluster Link Aggregation (CLAG) is used to distribute traffic across cluster nodes. A single CLAG handles both client and server traffic. Link Redundancy is enabled on the CLAG, so only one

“subchannel” is selected at any given time and handles the traffic. If some link fails or throughput falls below specified threshold, the other subchannel is selected.

6. The upstream switch performs symmetric port-channel load balancing (for example, source-dest-ip-only algorithm of Cisco IOS 7.0(8) N1(1)) so that forward and reverse traffic flows are handled by the same cluster node. This property is desirable because it eliminates packet re-ordering, which would degrade TCP performance.
7. Fifty percent of data traffic is expected to be steered to backplane, which means each node will steer up to 34Gbps to other cluster nodes (25Gbps in normal operating conditions and 34Gbps in case of single cluster node failure). Thus, each node needs at least 4x10G connections to the backplane switch. To provide redundancy in case of switch failure, we deploy a couple of backplane switches and double the number of connections. Link redundancy is not currently supported for backplane, so Cisco VPC or equivalent technology is desired to achieve switch-level redundancy.
8. MTU size of steered packets is 1578 bytes, so backplane switches must support an MTU more than 1500 bytes.

**Note:** The design depicted in Figure 1 is also applicable to T1120 and T1310 appliances. For T1310 we would use 40GbE interfaces for the backplane connections, since it lacks 10GbE ports.

**Note:** While this document uses Cisco VPC as an example, if working with non-Cisco switches alternate equivalent solutions could be used, such as Juniper’s MLAG.

**Note:** While other topologies such as ECMP instead of CLAG are possible, they are not currently supported for this particular use case.

## Configuring TCP Optimization in a Citrix ADC T1000 Cluster

After physical installation, physical connectivity, software installation, and licensing are completed, you can proceed with the actual cluster configuration. The configurations described below apply to the cluster depicted in Figure 1.

Note: For more information about cluster configuration, see “[Setting up a Citrix ADC cluster.](#)”

Assume that the four T1300 nodes in Figure 1 have the following NSIP addresses:

### Four T1300 nodes with NSIP address:

- |   |             |              |
|---|-------------|--------------|
| 1 | T1300-40-1: | 10.102.29.60 |
| 2 | T1300-40-2: | 10.102.29.70 |
| 3 | T1300-40-3: | 10.102.29.80 |
| 4 | T1300-40-4: | 10.102.29.90 |

The cluster will be managed through the cluster IP (CLIP) address, which is assumed to be 10.78.16.61.

## Setting Up the Cluster

To begin configuring the cluster shown in Figure 1, log on to the first appliance that you want to add to the cluster (for example, T1300-40-1) and do the following.

1. At the command prompt, enter the following commands:

**Command:**

```
1 > add cluster instance 1
2 > add cluster node 0 10.102.29.60 -state ACTIVE
3 > add ns ip 10.102.29.61 255.255.255.255 -type clip
4 > enable cluster instance 1
5 > save ns config
6 > reboot - warm
```

2. After the appliance restarts, connect to the Cluster IP (CLIP) address and add the rest of the nodes to the cluster:

**Command:**

```
1 > add cluster node 1 10.102.29.70 -state ACTIVE
2 > add cluster node 2 10.102.29.80 -state ACTIVE
3 > add cluster node 3 10.102.29.90 - state ACTIVE
4 > save ns config
```

3. Connect to the NSIP address of each of the newly added nodes and join the cluster:

**Command:**

```
1 > join cluster -clip 10.102.29.61 -password nsroot
2 > save ns config
3 > reboot - warm
```

4. After the nodes restart, proceed with backplane configuration. On the cluster IP address, enter the following commands to create an LACP channel for the backplane link of each cluster node:

**Command:**

```
1 > set interface 0/10/[1-8] - lacpkey 1 - lacpmode ACTIVE
2 > set interface 1/10/[1-8] - lacpkey 2 - lacpmode ACTIVE
3 > set interface 2/10/[1-8] - lacpkey 3 - lacpmode ACTIVE
4 > set interface 3/10/[1-8] - lacpkey 4 - lacpmode ACTIVE
```

5. Similarly, configure dynamic LA and VPC on the backplane switches. Make sure the MTU of the backplane switch interfaces is at least 1578 bytes.

6. Verify the channels are operational:

**Command:**

```
1 > show channel 0/LA/1
2 > show channel 1/LA/2
3 > show channel 2/LA/3
4 > show channel 3/LA/4
```

7. Configure the cluster node backplane interfaces.

**Command:**

```
1 > set cluster node 0 -backplane 0/LA/1
2 > set cluster node 1 -backplane 1/LA/2
3 > set cluster node 2 -backplane 2/LA/3
4 > set cluster node 3 -backplane 3/LA/4
```

8. Check the cluster status and verify that the cluster is operational:

```
1 > show cluster instance
2 > show cluster node
```

For more information on cluster setup, see [“Setting up a Citrix ADC cluster”](#)

**Distributing Traffic Across Cluster Nodes**

After you have formed the Citrix ADC cluster, deploy Cluster Link Aggregation (CLAG) to distribute traffic across cluster nodes. A single CLAG link will handle both client and server traffic.

On the cluster IP address, execute the following commands to create the Cluster Link Aggregation (CLAG) group shown in Figure 1:

**Command:**

```
1 > set interface 0/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
2 > set interface 1/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
3 > set interface 2/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
4 > set interface 3/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
```

Configure dynamic link aggregation on the external switches.

Then, enable Link Redundancy as follows:

**Code:**

```
1 > set channel CLA/1 -linkRedundancy ON -lrMinThroughput 240000
```

Finally, check the channel status by entering:

**Command:**

```
1 > show channel CLA/1
```

The channel should be UP and the actual throughput should be 320000.

For more information about cluster link aggregation, see the following topics:

- [Dynamic Cluster Link Aggregation](#)
- [Link Redundancy in a Cluster with LACP](#).

Because we will be using MAC-based forwarding (MBF), configure a linkset and bind it to the CLAG group as follows:

**Command:**

```
1 > add linkset LS/1
2 > bind linkset LS/1 -ifnum CLA/1
```

More information about linksets, see the following topics:

- [Configuring Linksets](#)
- [Using Cluster LA Channel with Linksets](#)

## Configuring VLAN and IP Addresses

We will be using striped IP configuration, which means that IP addresses are active on all nodes (default setting). See “[Striped, Partially Striped, and Spotted Configurations](#)” for more information about this topic.

1. Add the ingress and egress SNIPs:

**Command:**

```
1 > add ns ip 172.16.30.254 255.255.255.0 - type SNIP
2 > add ns ip 172.16.31.254 255.255.255.0 - type SNIP
3 > add ns ip6 fd00:172:16:30::254/112 - type SNIP
4 > add ns ip6 fd00:172:16:31::254/112 - type SNIP
```

2. Add the corresponding ingress and egress VLANs:

**Command:**

```
1 > add vlan 30 -aliasName wireless
2 > add vlan 31 -aliasName internet
```

### 3. Bind VLANs with IPs and linkset:

**Command:**

```
1 > bind vlan 31 -ifnum LS/1 -tagged
2 > bind vlan 30 -ifnum LS/1 -tagged
3 > bind vlan 30 -IPAddress 172.16.30.254 255.255.255.0
4 > bind vlan 31 -IPAddress 172.16.31.254 255.255.255.0
5 > bind vlan 30 -IPAddress fd00:172:16:30::254/112
6 > bind vlan 31 -IPAddress fd00:172:16:31::254/112
```

More ingress and egress VLANs can be added if needed.

## Configuring TCP Optimization

At this point, we have applied all cluster specific commands. To complete the configuration, follow the steps described in “[TCP optimization configuration]/en-us/citrix-adc/12-1/citrix-adc-support-for-telecom-service-providers/NS\_TCP\_optimization/NS\_TCP\_opt\_config.html”.

## Configuring Dynamic Routing

A Citrix ADC cluster can be integrated into the dynamic routing environment of the customer’s network. Following is an example of dynamic routing configuration using BGP routing protocol (OSPF is also supported).

### 1. From the CLIP address, enable BGP and dynamic routing on ingress and egress IP addresses:

**Command:**

```
1 > enable ns feature bgp
2 > set ns ip 172.16.30.254 - dynamicRouting ENABLED
3 > set ns ip 172.16.31.254 - dynamicRouting ENABLED
```

### 2. Open vtysh and configure BGP for the egress side:

**Code:**

```
1 > shell
2 root@ns# vtysh
3 ns# configure terminal
4 ns(config)# router bgp 65531
5 ns(config-router)# network 10.0.0.0/24
6 ns(config-router)# neighbor 172.16.31.100 remote-as 65530
7 ns(config-router)# neighbor 172.16.31.100 update-source 172.16.31.254
8 ns(config-router)# exit
9 ns(config)# ns route-install propagate
```

```
10 ns(config)# ns route-install default
11 ns(config)# ns route-install bgp
12 ns(config)# exit
```

3. Configure the egress-side BGP peer to advertise the default route to the Citrix ADC cluster. For example:

**Command:**

```
1 router bgp 65530
2  bgp router-id 172.16.31.100
3  network 0.0.0.0/0
4  neighbor 172.16.31.254 remote-as 65531
```

4. Follow similar steps to configure the ingress side.

5. From vtysh verify that configuration is propagated to all cluster nodes, by entering:

**Command:**

```
1 ns# show running-config
```

6. Finally, log on to NSIP address of each cluster node and verify routes advertised from BGP peer:

**Command:**

```
1 > show route | grep BGP
```

## Optimizing TCP Performance using TCP Nile

September 21, 2020

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

### Congestion Control Strategies

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

## NILE Algorithm

Citrix Systems has developed a new congestion-control algorithm, NILE, a TCP optimization algorithm designed for high-speed networks such as LTE, LTE advanced and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions and carrier aggregation.

The NILE algorithm:

- Bases queue-latency estimates on round-trip time measurements.
- Uses a congestion-window-increase function that is inversely proportional to the measured queue latency. This method results in approaching the network congestion point more slowly than does the standard TCP method, and reduces the packet losses during congestion.
- Can distinguish between random loss and congestion based loss on the network by using the estimated queue latency.

The telecom service providers can use the NILE algorithm in their TCP infrastructure to:

- Optimize mobile and long-distance networks— The NILE algorithm achieves higher throughput compared to standard TCP. This feature is especially important for mobile and long-distance networks.
- Decrease application perceived latency and enhance subscriber experience— The Nile algorithm uses packet loss information to determine whether the transmission-window size should be increased or decreased, and uses queuing delay information to determine the size of the increment or decrement. This dynamic setting of transmission-window size decreases the application latency on the network.

### To configure NILE support using the command line interface

At the command prompt, type the following:

```
1 set ns tcpProfile <name> [-flavor NILE]
2 <!--NeedCopy-->
```

### Configuring NILE support using the configuration utility

1. Navigate to **System > Profiles > TCP Profiles** and click **TCP profiles**.
2. From the **TCP Flavor** drop-down list, select **NILE**.

#### Example:

```
1 set ns tcpProfile tcpprofile1 -flavor NILE
2 <!--NeedCopy-->
```

## Proportional Rate Recovery (PRR) Algorithm

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

## TCP Fast Open (TFO)

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a Citrix ADC appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the Citrix ADC appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

### How TFO works

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the Citrix ADC appliance can include data in the SYN-ACK segment even though it has not received the final ACK segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the Citrix ADC appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client's IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The Citrix ADC appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

**Note:** If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the Citrix ADC appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

**Note:** If the server acknowledges the event with only a SYN segment, the Citrix ADC appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

### Configuring TCP Fast Open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

#### To enable or disable TFO by using the command line

At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

**Note:** The default value is DISABLED.

```
1 add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
2 set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3 unset tcpprofile <TCP Profile Name> - tcpFastOpen
4 <!--NeedCopy-->
```

#### Examples:

```
add tcpprofile Profile1 - tcpFastOpen
Set tcpprofile Profile1 - tcpFastOpen Enabled
unset tcpprofile Profile1 - tcpFastOpen
```

### To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1 set tcpparam - tcpfastOpenCookieTimeout <Timeout Value>
2 <!--NeedCopy-->
```

#### Example:

```
1 set tcpprofile - tcpfastOpenCookieTimeout 30secs
2 <!--NeedCopy-->
```

### To configure the TCP Fast Open by using the GUI

1. Navigate to **Configuration > System > Profiles >** and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **TCP Fast Open** checkbox.
3. Click **OK** and then **Done**.

### To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to **Configuration > System > Settings > Change TCP Parameters** and then **Configure TCP Parameters** page to set the TCP Fast Open Cookie timeout value.

## TCP Hystart

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

### Configuring TCP Hystart

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

### To configure Hystart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

```
1 add tcpprofile <profileName> -hystart ENABLED
2 set tcpprofile <profileName> -hystart ENABLED
3 unset tcpprofile <profileName> -hystart
4 <!--NeedCopy-->
```

**Examples:**

```
1 add tcpprofile Profile1 - tcpFastOpen
2 Set tcpprofile Profile1 - tcpFastOpen Enabled
3 unset tcpprofile Profile1 - tcpFastOpen
4 <!--NeedCopy-->
```

**To configure Hystart support by using the GUI**

1. Navigate to **Configuration > System > Profiles >** and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

**Optimization Techniques**

TCP uses the following optimization techniques and methods for optimized flow controls.

**Policy based TCP Profile Selection**

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server's traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

**Configuring Policy Based TCP Profile Selection**

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.

- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your Citrix ADC appliance can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

### Configuring using the command line interface

To enable AppQoE by using the command line interface:

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

```
1 enable ns feature appqoe
2
3 show ns feature
4 <!--NeedCopy-->
```

### To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with `tcpprofiletobind` option.

#### Binding a TCP Profile:

```
1 add appqoe action <name> [-priority <priority>] [-respondWith ( ACS |
  NS ) [<CustomFile>] [-altContentSvcName <string>] [-altContentPath <
  string>] [-maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth
  <positive_integer>] [-priqDepth <positive_integer>] [-
  dosTrigExpression <expression>] [-dosAction ( SimpleResponse |
  HICResponse )] [-tcpprofiletobind <string>]
2
3 show appqoe action
4 <!--NeedCopy-->
```

### To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
1 add appqoe policy <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

## To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
1 bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <
  priority>
2 bind lb vserver <name> - policyName <appqoe_policy_name> -priority <
  priority>
3 bind cr vserver <name> -policyName <appqoe_policy_name> -priority <
  priority>
4 <!--NeedCopy-->
```

### Example:

```
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle
  ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500 -
  slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -
  sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spooofSynDrop
  ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack ENABLED
  -tcpmode ENDPOINT
2
3 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
4
5 add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -
  action appact1
6
7 bind lb vserver lb2 -policyName apppol1 -priority 1 -
  gotoPriorityExpression END -type REQUEST
8
9 bind cs vserver cs1 -policyName apppol1 -priority 1 -
  gotoPriorityExpression END -type REQUEST
10 <!--NeedCopy-->
```

## Configuring Policy based TCP Profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

**To configure AppQoE policy by using the GUI**

1. Navigate to **App-Expert > AppQoE > Actions**.
2. In the details pane, do one of the following:
3. To create a new action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.
5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
  - a) Name—name
  - b) Action type—respondWith
  - c) Priority—priority
  - d) Policy Queue Depth—polqDepth
  - e) Queue Depth—priqDepth
  - f) DOS Action—dosAction
6. Click **Create**.

**To bind AppQoE policy by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:
  - a) Select a policy type as AppQoE from the drop-down list.
  - b) Select a traffic type from the drop-down list.
4. In the **Policy Binding** section, do the following:
  - a) Click **New** to create a new AppQoE policy.
  - b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

**SACK Block Generation**

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send

the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

**Note:** A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

### **Client Reneging**

A Citrix ADC appliance can handle client reneging during SACK based recovery.

### **Memory checks for marking end\_point on PCB is not considering total available memory**

In a Citrix ADC appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

### **Unnecessary retransmissions due to missing SACK blocks**

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.

### **SNMP for number of connections bypassed optimization because of overload**

The following SNMP ids have been added to a Citrix ADC appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.13 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

### **Dynamic Receive Buffer**

To maximize TCP performance, a Citrix ADC appliance can now dynamically adjust the TCP receive buffer size.

## **Troubleshooting Guidelines**

September 21, 2020

## Technical Support

All troubleshooting and escalation queries require a recent Citrix ADC techsupport bundle, which captures current configuration, firmware version installed, log files, outstanding cores, and others.

### Example:

```
1 show techsupport
2
3 showtechsupport data collector tool - $Revision: #5 $!
4 ...
5 All the data will be collected under
6     /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53
7 ...
8 Archiving all the data into "/var/tmp/support/collector_P_192
9     .168.121.117_18Jun2015_09_53.tar.gz" ....
10 Created a symbolic link for the archive with /var/tmp/support/support.
11     tgz
12 /var/tmp/support/support.tgz ---- points to ---> /var/tmp/support/
13     collector_P_192.168.121.117_18Jun2015_09_53.tar.gz
14
15 After a techsupport bundle has been generated, it might be copied using
16     SCP.
17 <!--NeedCopy-->
```

## Traces

Citrix ADC TCP optimization issues normally require Citrix ADC traces to troubleshoot properly. Note that one should try to capture traces under similar conditions, i.e. on the same cell, during the same time of day, using the same user equipment and application, and others.

The start nstrace and stop nstrace commands might be used to capture traces:

- It's strongly recommended that the appropriate filter is used to avoid capturing extraneous, unnecessary packets on the trace. For instance use start nstrace -filter 'IP == 10.20.30.40' to only capture packets being sent to or received from IP address 10.20.30.40, which is the user equipment IP address.
- Do not use the -tcpdump option, since it strips the nstrace headers which are required for debugging.

## Trace Analysis

After a Citrix ADC trace has been captured, it might be viewed with Wireshark 1.12 or later. Verify that the captured traces include the appropriate Citrix ADC Packet Trace headers, as shown in the screen

capture below:

```

0.0000000 192.168.134.3 192.168.216.72 TCP 118 80->8080 [SPK, ACK] Seq=4351 Win=65535 Len=0 MSS=1460 RST=1460 RSP=216 SACK_PERM=1
0.0000049 192.168.216.72 192.168.134.3 TCP 108 8080->80 [ACK] Seq=3 Ack=3 Win=29312 Len=0

### Connection Table

When the issue is related to TCP optimization and it can be reproduced or it's on-going, it is best to get also the connection table when the issue occurs from the primary T1 node.

To get the table you shall need to switch to the BSD shell and run the following command:

```

1 shell
2 ...
3
4 nscli -U 127.0.0.1:nsroot:nsroot show connectiontable -detail full link
  > /var/tmp/contable.log
5 <!--NeedCopy-->

```

#### Note

The command might be executed for a longer time and management CPU might be stressed at that time (depends on the number of connection table entries), but it's not service affecting.

## Frequently Asked Questions

September 21, 2020

### Timeouts

#### Important

Before using *any nsapimgr* knob, consult with Citrix Customer Support.

The following is a list of different idle connection timeouts that can be set on Citrix ADC T1 virtual servers and services. Idle timeout set for client or server connections at the vserver or service level are applicable only for the connections in TCP ESTABLISHED state and are idle.

- Load Balancing virtual server `cltTimeout` parameter specifies the time in seconds that a connection from a client to a Load Balancing virtual server must be idle, before the appliance closes the connection.
- Service `svrTimeout` parameter specifies the time in seconds that a connection from the appliance to a service or server must be idle, before the appliance closes the connection.
- Service `cltTimeout` parameter specifies the time in seconds that a connection from a client to a service must be idle, before the appliance closes the connection.

When a service is bound to a Load Balancing virtual server, then the `cltTimeout` for the Load Balancing virtual server takes precedence, and the service `cltTimeout` for service is ignored.

In case of there is not service bound to Load Balancing virtual server, global idle timeout, namely `tcpServer`, is used for server side connections. It can be configured as follows:

#### Command:

```
1 set ns timeout - tcpServer 9000
2 <!--NeedCopy-->
```

Connections in other state have different timeout values:

- Half open connections idle timeout: 120 seconds (hardcoded value)
- `TIME_WAIT` connections idle timeout: 40 seconds (hardcoded value)
- Half close connections idle timeout. By default it is 10s and can be configured between 1s and 600s using the snippet

#### Command:

```
1 set ns timeout - halfclose 10
2 <!--NeedCopy-->
```

When half-close timeout is triggered, connection is moved to zombie state. When zombie timeout expires, zombie cleanup kicks in and T1 sends RST on both client and server side for given connection by default.

- **Zombie timeout:** Interval at which the zombie cleanup process must run to clean up inactive TCP connections. Default timeout value is 120s and can be configured between 1s and 600s.

**Command:**

```
1 set ns timeout - zombie 120
2 <!--NeedCopy-->
```

### Maximum Segment Size Table

A Citrix ADC T1 appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted. Specific function is enabled by default without option to disable.

However, there is caveat as standard SYN cookies limit connections to the use of only eight Maximum Segment Size (MSS) values. If connection MSS does not match with any predefined value, it will pick up the next available lower value towards both client and server side.

The predefined TCP Maximum Segment Size (MSS) values are the following and can be configured through a new nsapimgr knob.

---

1460	1440	1330	1220	956	536	384	128
------	------	------	------	-----	-----	-----	-----

---

The new MSS table:

- Need not contain Jumbo-Frame support. Even though by default 8 values are reserved in the MSS table for jumbo frames, the table settings can be modified to include standard Ethernet-sized frames only.
- Should have 16 values
- Should have values in descending order
- Should include 128 as the last value

If the new MSS table is valid, the table is stored and the old values are switched out at the SYN-cookie

rotation time. Otherwise the new table returns an error. Changes are applied to new connections while existing connections preserve the old MSS table until the connections expire or are terminated.

To display the current MSS table in a Citrix ADC appliance, type the following command.

**Command:**

```
1 >shell
2
3 #nsapimgr -d mss_table
```

**Example:**

```
1 #nsapimgr -d mss_table
2
3 MSS table
4
5 {
6   9176,9156,8192,7168,6144,4196,3072,2048,1460,1440,1330,1212,956,536,384,128
7     }
8
9 Done.
```

To change the mss table, type the following command:

**Command:**

```
1 >shell
2
3 #nsapimgr -s mss_table=<16 comma seperated values>
```

**Example:**

```
1 #nsapimgr -ys mss_table
   =9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
2
3 # nsapimgr -d mss_table
4
5 MSS table
6
7 {
8   9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
9     }
10
```

```
11 Done.
```

An example using standard Ethernet-sized values is depicted below:

**Example:**

```
1 #nsapimgr -ys mss_table
   =1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128
2
3 # nsapimgr -d mss_table
4
5 MSS table
6
7 {
8   1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128
9   }
10
11 Done.
```

To make this change permanent even after the Citrix ADC appliance restarts, include the command “#nsapimgr -ys mss\_table=<16 comma separated values>” in the “/nsconfig/rc.netscaler” file. If the “rc.netscaler” file doesn’t exist, create it under the “/nsconfig” folder, and then append the command.

**Memory Overload Protection**

A Citrix ADC Packet Processing Engine (PPE) starts bypassing connections from TCP optimization if the memory in use by that one PPE is more than a specified high watermark value. If a PPE memory utilization goes above ~2.6GB, then it starts bypassing *any new* connections from optimization. The existing connections (ones admitted for optimization previously) continues getting optimization. This watermark value has been purposefully selected and is not recommended for tuning.

**Note**

If you believe that there is a good reason to change that watermark value, contact Customer Support.

**Support for Happy Eyeballs Clients**

If the Citrix ADC appliance receives a SYN for a destination for which the state is unknown, the appliance first checks the reachability of the server and then acknowledges the client. This probing mechanism enables clients with dual IP stacks to discover the reachability of dual-stack internet servers. If the client discovers that both IPv6 and IPv4 access are available, it establishes a connection to the

server that responds more quickly, and resets the other. For the connection for the Citrix ADC appliance receives a reset, it will reset the corresponding server side connection.

**Note:** This feature has no user configurable TCP settings to be disabled/enabled on the Citrix ADC appliance.

For more information on Happy Eyeballs support, see RFC 6555.

## Citrix ADC Video Optimization

September 21, 2020

The Citrix ADC appliance provides optimization techniques and capabilities to optimization ABR video traffic for video traffic over mobile networks. This improves user experience and reduces the overall network bandwidth consumption.

The section includes the following topics:

- [Getting Started](#)
- [Licensing](#)
- [Configuring Video Optimization over TCP](#)
- [Configuring Video Optimization over UDP](#)

## Getting Started

October 14, 2020

Media files have been driving an increasing amount of traffic over mobile networks, and migration to faster networking technologies has dramatically increased the volume of encrypted video traffic. The traditional media delivery technology (Progressive Download) is failing to deliver acceptable quality of experience (QoE) at a high transmission rate. This has led to the introduction of the Adaptive Bit Rate (ABR) protocol. It can adapt the streaming bit rate to the available network bandwidth and restrict streaming quality to match the capability of the handset receiving the video. However, the ABR protocol does not work as well in mobile networks as it does over the internet. Mobile operators must, therefore, optimize ABR traffic.

A Citrix ADC appliance has unique capabilities to detect incoming video traffic and selectively optimize ABR videos.

## How Citrix ADC Video Optimization Works

A Citrix ADC appliance can identify and optimize encrypted ABR traffic (including Facebook video traffic) over TCP, and YouTube ABR traffic over QUIC. The appliance has the following capabilities:

1. Detect Progressive Download (PD) videos over HTTP.
2. Detect and optimize ABR videos over HTTP.
3. Detect and optimize ABR videos over HTTPS.
4. Detect and optimize YouTube ABR videos over QUIC.

Also, the appliance uses the following support domains for detecting video traffic over TCP and QUIC protocols.

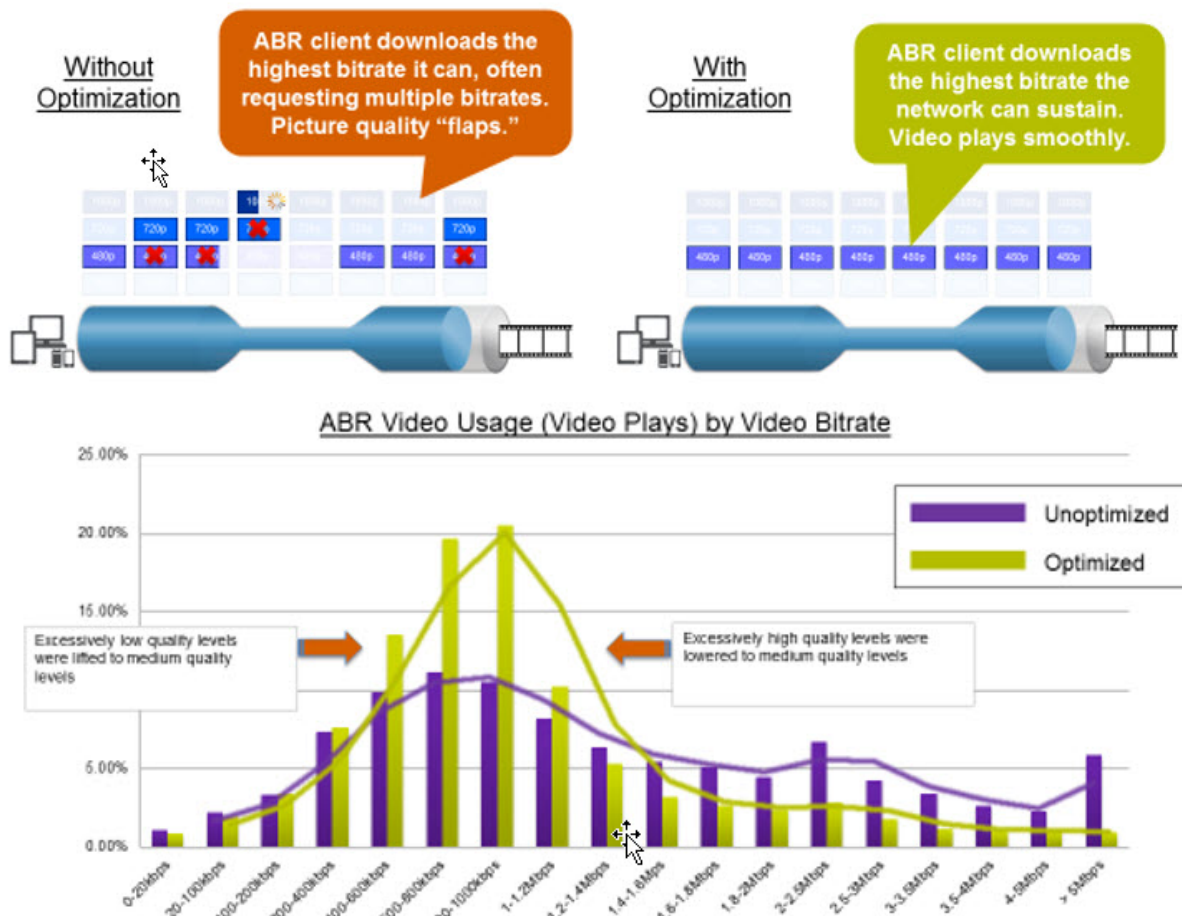

- Unencrypted ABR videos over TCP. Appliance detects all standard compliant video streaming web sites. The appliance detects ABR sessions by inspecting the response video payload header, URL, and HTTP headers.
- Encrypted ABR video over TCP. Appliance detects ABR sessions using a generic and heuristic algorithm based on domain, SSL header and traffic patterns. Using this, the appliance has a built-in support to detect top video web sites, with 95 percent accuracy and we continue to add support for new video types. Citrix ADC also has a program to provide additional verification for top encrypted ABR sites for a region or country to ensure network coverage.
- Encrypted ABR videos over QUIC. The appliance detects ABR sessions for QUIC based video provider, such as YouTube. The detection algorithm is on the basis of a heuristic leveraging the QUIC headers and domain. Citrix ADC will continue to add support for newer video sites using QUIC.

## Benefits

Optimizing the ABR video traffic can provide the following benefits:

- Manage the network during congestion in peak hours.
- Improve video play consistency and reduce video stalling.
- Enable new video service offerings (for example, Binge-on video services).
- Enable customers to select the best sustainable video quality.
- Provide a consistent user experience for the subscriber.

### Video Optimization over TCP

Citrix ADC optimization of ABR traffic over TCP works as follows:

1. HTTP or HTTPS traffic that the appliance receives over TCP is sent to the corresponding load balancing virtual server.
2. The built-in detection policies bound to the virtual server combined with other proprietary detection algorithms evaluate the traffic.
3. The policies use a set of built-in video detection signatures to detect the video type. The policy that matches traffic applies an action that categorizes the video type as one of the following:
  - a) Clear-text PD
  - b) Clear-text ABR
  - c) Encrypted ABR
  - d) Other
4. The optimization policies bound to the same virtual server evaluate the traffic and determine the optimization bit rate to apply to the traffic.
5. The optimization bit rate is applied if the traffic is either clear-text ABR or encrypted ABR.

A mobile service provider can improve the quality of experience (QoE) by setting the download speed for 2G, 3G, and 4G mobile traffic. This reduces the video start times or buffering events. Optimization can also reduce the amount of network bandwidth consumed by video sessions.

The optimization techniques include dynamic burst control and random sampling.

### **Dynamic Burst Control**

Citrix ADC ABR optimization adapts dynamically to changing network conditions. It allows an initial burst rate of 1.3 times the configured pacing rate for 15 seconds. The initial burst rate applies to the beginning of every optimized ABR video session, even when multiple sessions use the same TCP connection or group of TCP connections.

The appliance also supports recovery bursts in the event that the bit rate supported by the network drops below the configured pacing rate. For example, if the effective bit rate drops at the 7th second and recovers at 15th second of the initial burst, the appliance recovers the loss during the next burst cycle. By doing so, the appliance dynamically optimizes the network bandwidth for all subscribers so that the quality of video remains consistent per pixel.

Note: When a recovery burst happens during an initial burst, the pacing bit rate must not exceed the maximum recovery-burst and initial-burst rates (you must not add the Recovery Burst factor on top of the Initial Burst factor). Otherwise, it might be so fast that the media player shifts to a higher quality mode. However, if necessary, you can extend the duration of the Initial Burst to compensate the unused bandwidth.

### **Random Sampling**

To estimate the savings from video optimization, the Citrix ADC appliance implements random sampling. With this technique, the appliance randomly selects a configurable percentage of the detected video traffic (the random sampling parameter is an integer number ranging from 0 to 100, so less than 1 percent is not possible). These randomly selected and non-optimized transactions (and sessions) become a reference group, and they are identified in the transaction logs (along with other characteristics, such as byte size and timer fields. The characteristics of the optimized sessions are also logged, and the reporting engine compares statistics of the optimized and reference groups to estimate the savings from optimization (including the savings from ABR Optimization).

### **Video Optimization over UDP**

Google has introduced a new transport protocol called QUIC. Google's QUIC protocol is very similar to TCP+TLS+HTTP/2 and is implemented on top of UDP. Citrix ADC can detect YouTube ABR videos streamed over the QUIC protocol, and apply ABR video optimization in a similar way as ABR over TCP.

## Licensing

March 16, 2021

The Video Optimization feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other Citrix ADC platforms, the feature works with the purchase of a CNS Platinum license. Before you configure the video optimization feature, your appliance must have a suitable license.

License support for Telco platforms:

- **CBM\_TXXX\_SERVER\_Retail.lic**
- **CBM\_TPRE\_SERVER\_Retail.lic**
- **CNS\_WEBF\_SSERVER\_Retail.lic**

Where XXX is the throughput, for example, Citrix ADC T1000.

License support for other Citrix ADC platforms:

- **CNS\_XXX\_SERVER\_PLT\_Retail.lic**

Where XXX is the throughput.

To upload a premium license file, follow the steps given below:

1. A valid license file should be installed on the Citrix ADC appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

```
1 > shell ls /nsconfig/license/  
2 CNS_V3000_SERVER_PLT_Retail.lic ssl
```

2. Do a warm restart to apply for the new license, as shown in the screen capture below.

```
1 > reboot -warm  
2 Are you sure you want to restart NetScaler (Y/N)? [N]:y  
3 Done
```

3. After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a premium license with premium edition has been successfully installed.

```
1 > show license  
2  
3 License status:
```

```
4
5                               Video Optimization: YES
6
7                               ...
8
9                               Model Number ID: 110050
10
11                              License Type: Platinum License
```

## Configuring Video Optimization over TCP

February 25, 2021

To optimize video traffic over TCP, begin by enabling the video optimization feature. The appliance then activates the built-in detection policies to detect the incoming video traffic and identify the type of video. User configurable optimization policies for each video type specify the optimization bit rate needed for optimizing the traffic.

### Configuring Video Optimization over TCP by using the CLI

To configure video optimization on a Citrix ADC appliance, you perform the following tasks:

1. Enable the video optimization feature.
2. Add virtual servers for HTTP and HTTPS traffic.
3. Bind all the built-in detection policies to a load balancing virtual server for HTTP traffic.
4. Bind all the built-in detection policies to an SSL-bridge load balancing virtual server for HTTPS traffic.
5. Add the desired optimization policies for HTTP and HTTPS traffic.
6. Bind optimization policies to a load balancing virtual server for HTTP Traffic.
7. Bind optimization policies to an SSL-bridge load balancing virtual server for HTTPS traffic.

### Enabling Video Optimization

If you want the Citrix ADC appliance to detect, optimize, and report video traffic, you must enable the Video Optimization feature and set optimization to ON. After enabling the feature you can use built-in detection policies to identify the incoming video traffic, and you can configure optimization policies to optimize encrypted ABR traffic. To optimize ABR video traffic, you must configure the download bit rate (also called the *pacing rate*).

You must also enable the load balancing feature, and if you want to use video optimization for HTTPS traffic you must enable the SSL feature.

### To enable the video optimization feature

At the command prompt, type the following command:

```
1 enable ns feature VideoOptimization
2 <!--NeedCopy-->
```

#### Note

If you want to monitor the video optimization performance and video insight reports you must enable the AppFlow feature and then access the Video Analytics feature on Citrix Application Delivery Management (ADM). For more information, see [Video Insight](#) documentation.

### Creating Virtual Servers for HTTP and HTTPS Video Traffic

A Citrix ADC appliance uses different virtual servers for detecting and optimizing the different types of incoming video traffic. The appliance supports the following types of virtual servers for TCP traffic.

- **HTTP Load Balancing virtual server.** For detecting HTTP video traffic, the appliance uses an HTTP load balancing virtual server. It manages HTTP video requests that the appliance receives from clients.
- **SSL-Bridge Load Balancing virtual server.** To detect encrypted video traffic, you must configure an SSL bridge virtual server on the appliance.

### To add an HTTP Load Balancing virtual server for detecting HTTP video traffic

At the command prompt, type the following:

```
1 add lb vserver <name> HTTP * 80 -persistenceType NONE
2 <!--NeedCopy-->
```

#### Example:

```
1 add lb vserver ProxyVserver-HTTP HTTP * 80 -persistenceType NONE -
  cltTimeout 120
2 <!--NeedCopy-->
```

### To add an SSL Bridge virtual server for detecting HTTPS video traffic

At the command prompt, type the following:

```
1 add lb vserver <name> SSL_BRIDGE * 443 -persistenceType NONE
2 <!--NeedCopy-->
```

**Example:**

```

1 add lb vserver ProxyVserver-SSL SSL_BRIDGE * 443 -persistenceType NONE
   -cltTimeout 180
2 <!--NeedCopy-->

```

**Binding Built-In Detection Policies to an HTTP Load Balancing Virtual Server**

To detect video traffic over an HTTP connection, you must bind all the built-in detection policies to a load balancing virtual server. You must bind the policies to either request-time or response-time processing, depending on the policy type.

**Note:**

The `ns_videoopt_http_body_detection` video optimization policy does not support the `CONNECT` HTTP request method.

**To bind detection policies for different video types to an HTTP load balancing virtual server**

At the command prompt, type the appropriate command for each type. The available commands are:

```

1 bind lb vserver <name> -policyName ns_videoopt_http_abr_netflix -
   priority <integer> -type (REQUEST | RESPONSE)
2
3 bind lb vserver <name> -policyName ns_videoopt_http_abr_netflix2 -
   priority <integer> -type (REQUEST | RESPONSE)
4
5 bind lb vserver <name> -policyName ns_videoopt_http_abr_youtube -
   priority <integer> -type (REQUEST | RESPONSE)
6
7 bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube -
   priority <integer> -type (REQUEST | RESPONSE)
8
9 bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube2 -
   priority <integer> -type (REQUEST | RESPONSE)
10
11 bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube3 -
   priority <integer> -type (REQUEST | RESPONSE)
12
13 bind lb vserver <name> -policyName ns_videoopt_http_abr_generic -
   priority <integer> -type (REQUEST | RESPONSE)
14 <!--NeedCopy-->

```

**Example:**

```

1 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_abr_netflix -priority 400 type RESPONSE
2
3 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_abr_netflix2 -priority 500 -type RESPONSE
4
5 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_abr_youtube -priority 600 -type RESPONSE
6
7 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_pd_youtube -priority 800 -type RESPONSE
8
9 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_pd_youtube2 -priority 900 -type RESPONSE
10
11 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_pd_youtube3 -priority 1000 -type REQUEST
12
13 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_abr_generic -priority 1100 -type RESPONSE
14 <!--NeedCopy-->

```

### Binding the HTTP Body Content Detection Policy to Load Balancing Virtual Server

To detect video traffic over HTTP, you must bind the body content detection policy to the load balancing virtual server. You can use the following command:

```

1 bind lb vserver <name> -policyName ns_videoopt_http_body_detection -
   priority <integer> -type (REQUEST | RESPONSE)
2 <!--NeedCopy-->

```

#### Example:

```

1 bind lb vserver ProxyVserver-HTTP -policyName
   ns_videoopt_http_body_detection -priority 1500 -type REQUEST
2 <!--NeedCopy-->

```

### Binding Built-In Detection Policies to an SSL-Bridge Load Balancing Virtual Server

To detect video traffic over an HTTPS connection, you must bind built-in detection policies to an SSL Bridge load balancing virtual server.

### To bind a detection policy to an SSL bridge load balancing virtual server

At the command prompt, type the appropriate command for each type. The available commands are:

```

1 bind lb vserver <name> -policyName ns_videopt_https_abr_netflix -
  priority <positive_integer> -type (REQUEST | RESPONSE)
2
3 bind lb vserver <name> -policyName ns_videopt_https_abr_youtube -
  priority <positive_integer> -type (REQUEST | RESPONSE)
4
5 bind lb vserver <name> -policyName ns_videopt_https_abr_generic -
  priority <positive_integer> -type (REQUEST | RESPONSE)
6 <!--NeedCopy-->

```

#### Example:

```

1 bind lb vserver ProxyVserver-SSL -policyName
  ns_videopt_https_abr_netflix -priority 120 -type REQUEST
2
3 bind lb vserver ProxyVserver-SSL -policyName
  ns_videopt_https_abr_youtube -priority 140 -type REQUEST
4
5 bind lb vserver ProxyVserver-SSL -policyName
  ns_videopt_https_abr_generic -priority 150 -type REQUEST
6 <!--NeedCopy-->

```

### Adding Optimization Policies for Pacing ABR traffic

To optimize ABR traffic, you have to configure optimization policies and the associated actions. You then bind the policies to the same load balancing virtual servers to which you bound the detection policies. For each policy, create the action first, so that you can include it when you create the policy.

#### To add an optimization action

At the command prompt, type:

```

1 add videooptimization pacingaction <action Name> -rate <integer> [-
  comment <string>]
2 <!--NeedCopy-->

```

Where the **rate** parameter specifies the rate in Kbps at which to send the traffic (the pacing rate).

#### Example:

```
1 add videooptimization pacingaction MyOptAct2000 -rate 2000
2 <!--NeedCopy-->
```

### To add an optimization policy

At the command prompt, type:

```
1 add videooptimization pacingpolicy <name> -rule <expression> -action <
  string>
2 <!--NeedCopy-->
```

#### Example:

```
1 add videooptimization pacingpolicy myOptPolicy2000 -rule TRUE -action
  MyOptAct2000
2 <!--NeedCopy-->
```

## Binding Optimization Policies to an HTTP Load Balancing Virtual Server

To optimize ABR video traffic over an HTTP connection, you must bind the optimization policies to a load balancing virtual server to which the detection policies are bound.

### To bind an optimization policy to a Load Balancing virtual server

At the command prompt, type the following command:

```
1 bind lb vserver <name> -policyName <policy_name> -priority <
  positive_integer> -type (REQUEST | RESPONSE)
2 <!--NeedCopy-->
```

#### Example:

```
1 bind lb vserver ProxyVserver-HTTP -policyName myOptPolicy2000 -priority
  3400 -type REQUEST
2 <!--NeedCopy-->
```

## Binding Optimization Policies to SSL-bridge Virtual Servers

To optimize ABR video traffic over an HTTPS connection, you must bind the optimization policies to the SSL Bridge virtual server to which the built-in detection policies are bound.

### To bind an optimization policy to SSL Bridge virtual server for pacing encrypted traffic

At the command prompt, type the following command:

```
1 bind lb vserver <name> -policyName <policy_name> -priority <
   positive_integer> -type (REQUEST | RESPONSE)
2 <!--NeedCopy-->
```

#### Example:

```
1 bind lb vserver ProxyVserver-SSL -policyName myOptPolicy2000 -priority
   3400 -type REQUEST
2 <!--NeedCopy-->
```

### Setting video optimization pacing parameters

The CLI enables you to set the video optimization pacing parameters, such as random sampling percentage.

#### To set the random sampling percentage

At the command prompt, type the following command:

```
1 set videooptimization parameter - RandomSamplingPercentage <realNumber>
2 <!--NeedCopy-->
```

Where, realNumber is a value from 0.0 to 100.0.

#### Example:

```
1 set videooptimization parameter -RandomSamplingPercentage 50
2 <!--NeedCopy-->
```

### Configuring Video Optimization over TCP by using the GUI

The GUI enables you to:

- Enable video optimization feature.
- Create HTTP load balancing virtual server.
- Create SSL-bridge load balancing virtual server.
- Bind built-in detection policies to HTTP load balancing virtual server.
- Bind built-in detection policies to SSL-bridge load balancing virtual server.
- Create an optimization policy.

- Create an optimization action.
- Configuring optimization pacing parameter.
- Bind an optimization policy to load balancing virtual server for HTTP traffic.
- Bind an optimization policy to SSL-bridge load balancing virtual server for HTTPS traffic.

#### To enable video optimization feature

1. In the navigation pane, expand **System**, and then click **Settings**.
2. On the **Settings** page, click the **Configure Advanced Features** link.
3. On the **Configure Advanced Features** page, select the **Video Optimization** check box.
4. Click **OK**, and then click **Close**.

#### To create load balancing virtual server for HTTP traffic

1. Sign in to the Citrix ADC appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the Load Balancing Virtual Server screen, set the following parameters:
  - a) **Name**. Name of the load balancing virtual server.
  - b) **Protocol**. Select protocol type as HTTP
  - c) **IP Address Type**. IP address type: IPv4 or IPv6.
  - d) **IP Address**. IPv4 or IPv6 address assigned to the virtual server.
  - e) **Port**. Port number of the virtual server.
4. Click **OK** to continue with configuration of other, optional, parameters. For more information, see [Creating a Virtual Server](#).
5. Click **Create** and **Close**.

#### To create load balancing virtual server for HTTPS traffic

1. Sign in to the Citrix ADC appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
  - a) **Name**. Name of the load balancing virtual server.
  - b) **Protocol**. Select protocol type as SSL-bridge.
  - c) **IP Address Type**. IP address type: IPv4 or IPv6.
  - d) **IP Address**. IPv4 or IPv6 address assigned to the virtual server.
  - e) **Port**. Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see [Creating a Virtual Server](#).

5. Click **Create** and then **Close**.

#### To bind a built-in detection policy to a load balancing virtual server

1. Sign in to the Citrix ADC appliance and navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the load balancing virtual server and click **Edit**.
  - a) In the **Advanced Setting** section, click **Policies**.
  - b) In the **Policies** section, click the **+** icon to access the **Policies** slider.
  - c) In the **Policies** section, set the following parameters.
  - d) Choose Policy. Select a video optimization detection policy from the drop-down list.
  - e) Choose Type. Select the policy type as Request.
  - f) Click **Continue**.
3. Select the video detection policy from the list and click **Close**.

#### To bind a built-in detection policy to a SSL-bridge load balancing virtual server

1. Log on to the Citrix ADC appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
  - a) Choose Policy. Select video optimization detection policy from the drop-down list.
  - b) Choose Type. Select the policy type as Request.
6. Click **Continue**.
7. Select the video detection policy from the list and click **Close**.

#### To create a video optimization action

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Actions**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Action** page, set the following parameters.
  - a) **Name**. Name of the optimization action.
  - b) **ABR Optimization Rate (Kbps)**. Pacing rate at which to send the ABR video traffic. The default rate for ABR optimization is 1000 Kbps. The minimum value is 1, and the maximum value is 2147483647.
  - c) **Comment**. A short description of the action.
4. Click **Create** and **Close**.

### To create a video optimization policy

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Policy** page, set the following parameters.
  - a) **Name**. Name of the optimization policy
  - b) **Expression**. Custom regex expressions that implement the policy.
  - c) **Action**. Optimization action associated with the policy to handle the incoming video traffic.
  - d) **UNDEF Action**. Undefined event if the incoming request does not match the optimization policy.
  - e) **Comment**. A short description of the policy.
  - f) **Log Action**. Select the audit log action that creates the desired log messages.
4. Click **Create**, and then click **Close**.

### To set video optimization pacing parameters

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. In the **Video Optimization** page, click **Change Video Optimization Settings** link.
3. In the **Video Optimization Settings** page, set the following parameter.
  - a) **Random Sampling Percentage (%)**. Percentage of packets selected for random sampling.
4. Click **OK** and **Close**.

### To bind a video optimization policy to an HTTP load balancing virtual server

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.
3. Set the following parameters.
  - a) **Bind Point**. The point at which to apply the optimization policy during request or response processing.
  - b) **Connection Type**. Connection type as Request or Response.
  - c) **Virtual Server**. The load balancing virtual server to which to bind the policy.
  - d) Click **Continue**.
4. In the **Bind Point** section, do one of the following:
  - a) Select a policy from the list.
  - b) Click **Add Binding** to access the **Policies Binding** slider.

- i. Select an existing policy or add a new policy.
  - ii. Enter binding details and click **Bind**.
5. Click **Close**.

### To bind a video optimization policy to an SSL-bridge load balancing virtual server

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.
3. On the **Video Optimization Policy Manager** page, set the following parameters.
  - a) Bind Point. The point at which to apply the optimization policy during request/response processing.
  - b) Connection Type. Connection type as Request or Response.
  - c) Virtual Server. The SSL-bridge load balancing virtual server to which to bind the policy.
4. Click **Continue**.
5. In the **Bind Point** section, do one of the following:
  - a) Select a policy binding from the list.
  - b) Click **Add Binding** to access the **Policies Binding** slider.
    - i. Select an existing policy or add a policy.
    - ii. Enter binding details and click **Bind**.
6. Click **Close**.

## Configuring Video Optimization over UDP

September 21, 2020

To optimize QUIC ABR video traffic over UDP, begin by enabling the video optimization feature. After you complete the configuration, the appliance detects QUIC based ABR video traffic and applies the optimization bit rate that is configured on the appliance.

### Configuring video optimization for QUIC by using the CLI

To configure video optimization for QUIC video traffic over UDP, you must perform the following tasks:

1. Enable Video Optimization.
2. Create a QUIC service.
3. Create a QUIC load balancing virtual server.
4. Bind QUIC web service to the loading balancing virtual server.
5. Create video optimization policy for pacing QUIC based UDP traffic.
6. Bind optimization policy to a QUIC based load balancing virtual server.

### Enabling video optimization for QUIC traffic

If you want the Citrix ADC appliance to detect, optimize, and report video traffic, you must enable the Video Optimization feature and set optimization ON.

#### Note

If you want to use video optimization for QUIC traffic, you must enable the load balancing and AppFlow features.

### To enable the video optimization

At the command prompt, type the following command:

```
1 enable ns feature VideoOptimization
2 <!--NeedCopy-->
```

### Creating a service for QUIC traffic

A Citrix ADC appliance uses a QUIC service for the load balancing virtual server to connect to the egress router in the static routing mode.

#### Note

Currently, dynamic routing is not supported.

### To create a load balancing web service for QUIC video traffic

At the command prompt, type:

```
1 add service <name> <router-IP> <serviceType> <port> -usip yes -
  useproxyport [yes | no]
2 <!--NeedCopy-->
```

#### Example:

```
1 add service svc-quic 10.102.29.200 QUIC 443 - usip yes - useproxyport
  no
2
3 where IP address is the internet router address.
4 <!--NeedCopy-->
```

## Creating a load balancing virtual server for QUIC traffic

A Citrix ADC appliance uses a load balancing virtual server for detecting and optimizing QUIC video traffic over UDP.

### To create a load balancing virtual server for QUIC video traffic

At the command prompt, type:

```
1 add lb vserver <name> <serviceType> <ip> <port> -m MAC
2 <!--NeedCopy-->
```

#### Example:

```
1 add lb vserver vs-quic QUIC * 443 -persistenceType NONE -m MAC -
  cltTimeout 120
2 <!--NeedCopy-->
```

## Binding a QUIC web service to the load balancing virtual server

After you have created the web services and load balancing virtual server for QUIC traffic, you must bind the services to the virtual server.

### To bind a web service to load balancing virtual server for QUIC video traffic

At the command prompt, type:

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

#### Example:

```
1 bind lb vserver vs-quic svc-quic
2 <!--NeedCopy-->
```

## Creating Video Optimization Policy for QUIC based UDP traffic

To optimize QUIC based UDP traffic, you have to configure optimization pacing policies and its actions. You must then, bind the policies to QUIC based load balancing virtual servers. For each policy, create an action first so that you can associate it to the policy.

**To add an optimization action**

At the command prompt, type:

```
1 add videooptimization pacingaction <action Name> -rate <integer> [-  
  comment <string>]  
2 <!--NeedCopy-->
```

Where, the **rate** parameter specifies the rate in Kbps at which to send the traffic (the pacing rate).

**Example:**

```
1 set videooptimization parameter -QUICPacingRate 1000  
2 <!--NeedCopy-->
```

where 1000 represents the desired pacing rate in Kbits/sec.

**To add an optimization policy**

At the command prompt, type:

```
1 add videooptimization pacingpolicy <name> -rule <expression> -action <  
  string>  
2 <!--NeedCopy-->
```

**Example:**

```
1 add videooptimization pacingpolicy myOptPolicy2000 -rule TRUE -action  
  MyOptAct2000  
2 <!--NeedCopy-->
```

**Binding Optimization Policies to a QUIC Load Balancing Virtual Server**

To optimize QUIC video traffic over a UDP connection, you must bind the optimization policies to a QUIC load balancing virtual server.

**To bind an optimization policy to a QUIC Load Balancing virtual server**

At the command prompt, type the following command:

```
1 bind lb vserver <name> -policyName <policy_name> -priority <  
  positive_integer> -type (REQUEST)  
2 <!--NeedCopy-->
```

**Note**

The pacing policies must be bound to a QUIC load balancing virtual server only at request time.

**Example:**

```
1 bind lb vserver vs-quic -policyName myOptPolicy2000 -priority 3400 -  
   type REQUEST  
2 <!--NeedCopy-->
```

**Configuring video optimization for QUIC by using the GUI**

To configure the feature on the appliance through the GUI, you must perform the following tasks:

1. Enable video optimization
2. Configure a QUIC servers
3. Configure QUIC service
4. Configure a QUIC load balancing virtual server
5. Bind the QUIC web service to the load balancing virtual server
6. Create optimization policy.
7. Create optimization action.
8. Configuring optimization pacing parameter.
9. Bind optimization policy to load balancing virtual server for QUIC traffic.

**To enable video optimization**

1. Log on to the Citrix ADC appliance and navigate to **System > Settings**.
2. On the details page, select **Configure Advanced Features** link.
3. On the **Configure Advanced Features** page, select the **Video Optimization** check box.

**To create a QUIC servers**

1. Log on to the Citrix ADC appliance and navigate to the **Traffic Management > Load Balancing > Servers** screen.
2. In the details pane, click **Add**.
3. On the **Create Server** page, set the following parameters:
  - a) Name. Name of the QUIC server.
  - b) IP address. IP address of the QUIC server
  - c) Traffic Domain. Domain name of the server.
  - d) Enabling after creating. Initial state of the server.
  - e) Comments. Brief information about the server.
4. Click **Create**.

### To create a QUIC service

1. Log on to the Citrix ADC appliance and navigate to the **Traffic Management > Load Balancing > Services** screen.
2. In the details pane, click **Add**.
3. On the **Load Balancing Service** page, set the following parameters:
  - a) **Service Name**. Name of the QUIC service.
  - b) **IP address**. IP address assigned to the QUIC service.
  - c) **Protocol**. Select protocol as QUIC.
  - d) **Port**. Port number of the web service.
4. Click **OK** to continue. You can then configure other, optional, parameters. For more, see [Configuring Services](#).
5. Once you configure the optional parameters, click **OK** and **Close**.

### To create a load balancing virtual server

1. Log on to the Citrix ADC appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page, set the following parameters:
  - a) **Name**. Name of the load balancing virtual server.
  - b) **Protocol**. The protocol used by the service to send QUIC requests.
  - c) **IP Address Type**. IP address type: IPv4 or IPv6.
  - d) **IP Address**. IP 4 or IP6 IP address assigned to the virtual server.
  - e) **Port**. Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see [Creating a Virtual Server](#).

### To bind a load balancing virtual server to a QUIC service

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select a virtual server.
2. Click **Services and Service Groups** to access the **Load Balancing Virtual Server Service Binding** screen.
3. Select a QUIC based web service and click **Bind**.
4. Click **Done**.

### To bind a load balancing virtual server to a QUIC service

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select a virtual server.

2. Click **Services and Service Groups** to access the **Load Balancing Virtual Server Service Binding** screen.
3. Select a QUIC based web service and click **Bind**.
4. Click **Done**.

#### **To create a video optimization action for QUIC traffic**

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Actions**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Action** page, set the following parameters.
  - a) **Name**. Name of the optimization action.
  - b) **ABR Optimization Rate (Kbps)**. Pacing rate at which to send the ABR video traffic. The default rate for ABR optimization is 1000 Kbps. The minimum value is 1, and the maximum value is 2147483647.
  - c) **Comment**. A short description of the action.
4. Click **Create** and **Close**.

#### **To create a video optimization policy for QUIC traffic**

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Policy** page, set the following parameters.
  - a) **Name**. Name of the optimization policy
  - b) **Expression**. Custom regex expressions that implement the policy.
  - c) **Action**. Optimization action associated with the policy to handle the incoming video traffic.
  - d) **UNDEF Action**. Undefined event if the incoming request does not match the optimization policy.
  - e) **Comment**. A short description of the policy.
  - f) **Log Action**. Select the audit log action that creates the desired log messages.
4. Click **Create**, and then click **Close**.

#### **To bind a video optimization policy to an QUIC load balancing virtual server**

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization**.
2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.
3. On the **Video Optimization Policy Manager** page, set the following parameters.

- a) Bind Point. The point at which to apply the optimization policy during request processing. **Note:** The pacing policies must be bound to a QUIC load balancing virtual server only at request time.
  - b) Connection Type. Connection type as Request or Response.
  - c) Virtual Server. The load balancing virtual server to which to bind the policy.
4. Click **Continue**.
  5. In the **Bind Point** section, do one of the following:
    - a) Select a policy from the list.
    - b) Click **Add Binding** to access the **Policies Binding** slider.
      - i. Select an existing policy or add a new policy.
      - ii. Enter binding details and click **Bind**.
  6. Click **Close**.

## Citrix ADC URL Filtering

September 21, 2020

URL Filtering provides policy-based control of websites by using the information contained in URLs. This feature helps network administrators monitor and control user access to malicious websites on mobile networks.

As an administrator, you can configure a URL filtering policy by using either the URL Categorization feature or the URL List feature.

**URL List.** Controls access to blacklisted websites and web pages by blocking access to URLs that are in a URL set imported into the appliance.

**URL Categorization.** Controls access to websites and web pages by filtering traffic on the basis of a predefined list of categories.

## URL List

June 14, 2021

The URL List feature enables you to control access to customized URL lists (up to one million entries). The feature filters websites by applying a URL filtering policy bound to a virtual server.

As an administrator, you must import the URL List into the Citrix ADC appliance. This imported list is internally stored as a Policy data set called a *URL Set*. The appliance then applies a unique fast URL matching algorithm to the incoming URL requests. If the incoming URL request matches an entry in the set, the appliance applies the associated policy action to control access.

## URL List Types

Each entry in a URL set can include a URL and, optionally, its metadata (URL category, category groups, or any other related data). For URLs with a metadata, the appliance uses a policy expression that evaluates the metadata. For more information, see [URL Sets](#).

A Citrix ADC appliance supports custom URL list.

**Custom URL List.** You can create a customized URL set of up to 1,000,000 URL entries and import it as a text file into your appliance. The list can contain URLs with or without metadata (which could be like a URL category). The Citrix ADC platform automatically detects whether metadata is present. It also supports storing the imported lists securely. For more information, see [URL Set](#).

You can host the URL list and configure the Citrix ADC appliance to periodically update the list without requiring manual intervention. Once the URL list is updated, the appliance can automatically detect the metadata and the categories by using policy expressions to evaluate each incoming URL and then apply actions such as allow, block, redirect, or notify the user.

## URL List Policy Expressions

The following table describes the basic expressions you can use to evaluate incoming traffic. After you import an URL List to the appliance, it is called a *URL Set*.

Expression	Operation
<code>&lt;URL expression&gt;.URLSET_MATCHES_ANY (&lt;URLSET&gt;)</code>	Evaluates to TRUE if the URL exactly matches any entry in the URL set.
<code>&lt;URL expression&gt;. GET_URLSET_METADATA(&lt;URLSET&gt;)</code>	The <code>GET_URLSET_METADATA()</code> expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there is no match.
<code>&lt;URL expression&gt;.GET_ URLSET_METADATA(&lt;URLSET&gt;).EQ(&lt; METADATA&gt;)</code>	Evaluates to TRUE if the matched metadata is equal to <code>&lt;METADATA&gt;</code> .
<code>&lt;URL expression&gt;.GET_URLSET_METADATA (&lt;URLSET&gt;).TYPECAST_LIST_T( ' , ' ).GET (0).EQ(&lt;CATEGORY&gt;)</code>	Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata, but match only the <code>1&lt;sup&gt;st&lt;/sup&gt;</code> field.

Expression	Operation
HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)	Joins the host and URL parameters, which can then be used as a <URL expression> for matching.

## URL List Policy Actions

The most common enforcement action for URLs that match a URL list is to restrict access. Create a URL list policy with a desired URL list matching expression and enforcement action. The policy group usage depends upon the incoming traffic type (HTTP or HTTPS) and the virtual server configured on the appliance. You can use a Responder policy for HTTP traffic or a Video Optimization policy for HTTPS traffic. Specify actions to apply to the URLs that match the expressions in the policies. The following table lists the available actions.

Action Type	Policy	Description
ALLOW	Responder	Allow the request to access the target URL.
REDIRECT	Responder	Redirect the request to the URL specified as the target.
DENY	Responder	Deny the request.
RESET	Responder, VideoOptimization	Reset the connection.
DROP	Responder, VideoOptimization	Drop the connection.

## Prerequisites

To configure URL List feature, make sure you have configured the following server.

### DNS Server for DNS Requests

You must configure a DNS server if you import a URL Set from a hostname URL.

At the command prompt, type:

```
1 add dns nameServer ((<IP> [-local]) | <dnsVserverName>) [-state (
    ENABLED | DISABLED )] [-type <type>] [-dnsProfileName <string>]
```

```
2 <!--NeedCopy-->
```

**Example:**

```
1 add dns nameServer 10.140.50.5
2 <!--NeedCopy-->
```

## Configuring a URL List

To configure a URL List, do the following:

- Import a custom URL list
- Configure a URL list for HTTP traffic.
  - Add a URL List action.
  - Add a URL List policy.
  - Add an HTTP load balancing virtual server for HTTP traffic.
  - Bind the URL List policy to the HTTP load Balancing virtual server for HTTP traffic.
- Configure a URL list for HTTPS traffic.
  - Add a video optimization detection policy.
  - Add an SSL-bridge load balancing virtual server for HTTPS traffic.
  - Bind the video optimization detection policy to the SSL-bridge load balancing virtual server for HTTPS traffic

## Importing a custom URL list

To import a URL set, see See [URL Set](#) topic.

## Configuring a URL List for HTTP traffic

The Citrix ADC appliance supports HTTP and HTTPS traffic. To configure a load balancing virtual server for HTTP traffic and bind URL list policies to the server, do the following:

- Add URL List actions.
- Add URL List policies.
- Add an HTTP load balancing virtual server for HTTP traffic
- Bind the URL List policies to the HTTP load balancing virtual server for HTTP traffic

### To add a URL list action

At the command prompt, type the following:

```
1 add responder action <name> <type> (<target> | <htmlpage>) [-comment <
  string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <
  string>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add responder action act_url respondwith '"HTTP/1.1 451 Unavailable For
  Legal ReasonsrnrnURL is NOT authorized"'
2 <!--NeedCopy-->
```

**To add a URL list policy**

At the command prompt, type the following:

```
1 add responder policy <name> <rule> <action> [<undefAction>] [-comment <
  string>] [-logAction <string>] [-appflowAction <string>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add responder policy pol_http 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).
  URLSET_MATCHES_ANY("set")' act_url
2 <!--NeedCopy-->
```

**To add a HTTP load balancing virtual server for HTTP traffic**

At the command prompt, type the following:

```
1 add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltT
  imeout <secs>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add lb vserver vsrv-HTTP HTTP * 80 -persistenceType NONE -
  cltTimeout 120
2 <!--NeedCopy-->
```

**To bind URL list policy to HTTP load balancing virtual server**

At the command prompt, type the following:

```
1 bind lb vserver <vServerName> -policyName <string> [-priority <
  positive_integer>]
2 <!--NeedCopy-->
```

**Example:**

```
1 bind lb vserver vsrv-HTTP -policyName pol_http -priority 10 -
  type REQUEST
2 <!--NeedCopy-->
```

**Configuring URL List for HTTPS traffic**

The Citrix ADC appliance supports HTTP and HTTPS traffic. To configure a SSL-bridge load balancing virtual server for HTTPS traffic and bind URL list policies to the server, do the following:

- Add URL List actions.
- Add URL List policies.
- Add a SSL-bridge load balancing virtual server for HTTP traffic
- Bind the URL List policies to the SSL-bridge load balancing virtual server for HTTP traffic

**To add a URL List policy for HTTPS traffic**

At the command prompt, type:

```
1 add videooptimization detectionpolicy <name> -rule <expression> -action
  <string> [-undefAction <string>] [-comment <string>] [-logAction <
  string>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add videooptimization detectionpolicy pol_https -rule CLIENT.SSL.
  DETECTED_DOMAIN.URLSET_MATCHES_ANY("set") -action RESET
2 <!--NeedCopy-->
```

**To add a SSL-bridge load balancing virtual server**

At the command prompt type:

```
1 add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltT
  imeout <secs>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add lb vsrv vsvr-HTTPS SSL_BRIDGE * 443 -persistenceType NONE -
  cltTimeout 180
2 <!--NeedCopy-->
```

**To bind URL List policy with SSL-bridge load balancing by using the CLI**

At the command prompt type:

```
1 bind lb vsrv <vServerName> -policyName <string> [-priority <
  positive_integer>]
2 <!--NeedCopy-->
```

**Example:**

```
1 bind lb vsrv vsvr-HTTPS -policyName pol_https -priority 20 -type
  REQUEST
2 <!--NeedCopy-->
```

**Configuring a URL List by using the GUI**

The GUI enables you to:

- Import a URL list.
- Add a URL list.
- Configure URL list actions.
- Configure URL list policies for HTTP traffic.
- Add an HTTP load balancing virtual server for HTTP traffic.
- Add an SSL-bridge load balancing virtual server for HTTPS traffic.
- Bind URL list policies to the HTTP load balancing virtual server.
- Bind a URL list policies to the SSL-bridge load balancing virtual server.

**To import a URL list**

1. In the navigation pane, expand **AppExpert > URL Sets**.
2. In the details pane, click **Import**.
3. On the **Configure URL Set** page, set the following parameters.
  - a) **Name**. Name of the URL set.
  - b) **URL**. Web address of the location at which to access the URL Set.
  - c) **Overwrite**. Overwrite a previously imported URL set.
  - d) **Delimiter**. Character sequence that delimits a CSV file record.

- e) **Row Separator.** Row separator used in the CSV file. A single character value is permitted for example “/n”.
  - f) **Interval.** Interval in seconds, rounded off to the nearest 15 minutes, at which the URL set is updated.
  - g) **Private Set.** Option to prevent exporting the URL set
  - h) **Canary URL.** Internal URL for testing whether the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters
4. Click **Create**, and then **Close**.

### To add a URL list

1. In the navigation pane, expand **AppExpert > URL Sets**.
2. In the details pane, click **Add**.
3. On the **Create URL Set** page, set the following parameters.
  - a) **Name.** The name of the URL set that was given when it was imported.
  - b) **Comments.** A short description about the URL set.
4. Click **Create**.

### To configure a URL list action

1. Log on to the Citrix ADC appliance and navigate to **Configuration** tab page.
2. In the menu pane, navigate to **AppExpert > Responder > Actions**.
3. In the details pane, click **Add**.
4. On the **Create Responder Action** page, set the following parameters.
  - a) **Name.** Name of the URL List policy action.
  - b) **Type.** Select an action type.
  - c) **Expression.** Use the expression editor to create the policy expression.
  - d) **Comments.** A short description about the policy action.
5. Click **Create** and **Close**.

### To configure a URL list policy

1. In the navigation pane, expand **AppExpert > Responder > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Responder Policy** page, set the following parameters.
  - a) **Name.** Name of the URL List policy action.
  - b) **Action.** Select the URL List action that you prefer to associate with the policy.
  - c) **Log Action.** Select the log action.
  - d) **AppFlow.** Select an AppFlow action.
  - e) **Expression.** Use the expression editor to create the policy expression.

- f) **Comments.** A short description about the policy.
4. Click **Create** and **Close**.

#### To add an HTTP load balancing virtual server

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
  - a) **Name.** Name of the load balancing virtual server.
  - b) **Protocol.** Choose protocol type as HTTP.
  - c) **IP Address Type.** IP addressable type.
  - d) **IP Address.** IP 4 or IP6 IP address assigned to the virtual server.
  - e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see *Creating a Virtual Server*.

#### To bind a URL List policy to the HTTP load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
  - a) Choose Policy. Select a URL categorization policy from the drop-down list.
  - b) Choose Type. Select the policy type as Request.
6. Click **Continue**.
7. In the Policies page, select the URL List policy from the list and click **Select**.
8. In the **Policies** slider, click **Bind** and **Close**.

#### To add URL List policy for HTTPS traffic

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization > Detection**.
2. On the **Detection** page, click the **Video Optimization Detection Policies** link.
3. On the **Video Optimization Detection Policies** page, click **Add**.
4. On the **Create Video Optimization Detection Policy** page, set the following parameters.
  - a) **Name.** Name of the optimization policy
  - b) **Expression.** Configure policy using custom expressions.
  - c) **Action.** Optimization action associated with the policy to handle the incoming video traffic.

- d) **UNDEF Action.** Undefined event if the incoming request does not match the optimization policy.
  - e) **Comment.** A short description of the policy.
  - f) **Log Action.** Select an audit log action that specifies the action to be performed for the log messages.
5. Click **Create** and **Close**.

### To add a SSL-bridge load balancing virtual server for HTTPS traffic

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
  - a) **Name.** Name of the load balancing virtual server.
  - b) **Protocol.** Select protocol type as SSL-bridge.
  - c) **IP Address Type.** IP address type: IPv4 or IPv6.
  - d) **IP Address.** IPv4 or IPv6vIP address assigned to the virtual server.
  - e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see “Creating a Virtual Server” topic.

### To bind a URL List Policy to the SSL-bridge load balancing virtual server

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. Set the following parameters.
  - a) **Choose Policy.** Select video detection policy from the drop-down list.
  - b) **Choose Type.** Select the policy type as Request.
6. Click **Continue**.
7. Select the video detection policy from the list and click **Close**.

### Configuring Audit Log Messaging

Audit logging enables you to review a condition or a situation in any phase of URL List process. When a Citrix ADC appliance receives an incoming URL, if the responder policy has an URL Set advanced policy expression, the audit log feature collects URL Set information in the URL and stores the details as a log message for any target allowed by audit logging.

The log message contains the following information:

1. Timestamp.
2. Log message type.
3. The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency).
4. Log message information, such as URL set name, policy action, URL.

To configure audit logging for URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see [Audit Logging](#).

### URL List Semantics

The following table lists the URL Match patterns and describes how the URLs within a URL list are matched against the incoming-request URLs. For example, the pattern `www.example.com/bar` matches only with one page at `www.example.com/bar`. To match all the pages whose URL starts with `www.example.com/bar`, you would add an asterisk (\*) to the end of the URL.

Semantics	URL Pattern	Matched	Unmatched
Subdomain matching	<code>domain.com</code>	<code>domain.com</code> ; <code>www.domain.com</code> ; <code>sub.one.domain.com</code>	<code>yourdomain.com</code> ; <code>wwwdomain.com</code>
URL matching, exact path	<code>domain.com/example/bar/index.html</code>	<code>domain.com/example/bar/index.html</code> ; <code>www.domain.com/example/bar/index.html</code> ; <code>s.domain.com/example/bar/index.html</code>	<code>domain.com/example/bar/index.html</code> ; <code>wwwdomain.com/example/bar/index.html</code> ; <code>do-main.com/example/bar/index.html</code>
URL matching, exact path	<code>domain.com/example/ </code>	<code>domain.com/example/ </code>	<code>wwwdomain.com/example/ </code> ; <code>do-main.com/example/ </code>
URL matching, subpath matching	<code>domain.com/example/bar/ </code>	<code>domain.com/example/bar/ </code> ; <code>wwwdomain.com/example/bar/ </code> ; <code>do-main.com/example/bar/index.html</code> ; <code>www.domain.com/example/bar/index.html</code> ; <code>do-main.com/example/bar/index.html/one.jpg</code>	<code>wwwdomain.com/example/bar/index.html</code> ; <code>do-main.com/example/bar/index.html</code> ; <code>do-main.com/example/bar/index.html/one.jpg</code>

## URL Categorization

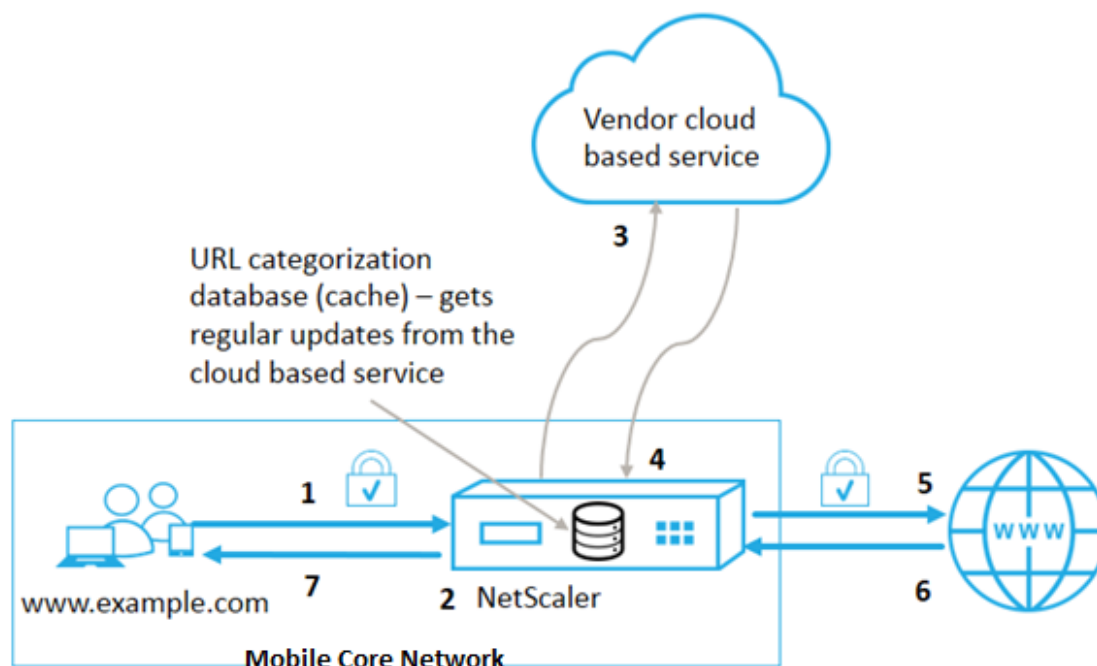

September 21, 2020

URL Categorization restricts user access to specific websites and website categories. As a subscription service offered by Citrix ADC T1000, the feature enables customers to filter web traffic by using a commercial categorization database. The database has billions of URLs classified into categories, such as social networking, gambling, adult content, new media, and shopping. In addition to categorization, each URL has a reputation score kept up to date based on the site's historical risk profile. To filter your traffic, you can configure advanced policies based on categories, category groups (such as Terrorism, Illegal drugs), or site-reputation scores.

For example, you might block access to dangerous sites, such as sites infected with malware, or selectively restrict access to adult content or entertainment streaming media.

### How URL Categorization Works

The following figure shows how the Citrix ADC URL Filtering service is integrated with a commercial URL Categorization database and cloud services for frequent updates.

The components interact as follows:

1. Client sends internet bound URL request.

2. A Citrix ADC policy attempts to evaluate the request in terms of categorization details (such as category, category group, and site-reputation score) retrieved from the URL categorization database. If the database returns the category details, the process jumps to step 5.
3. If the database does not return categorization details, the request is sent to a cloud-based lookup service maintained by a URL categorization vendor. However, the appliance does not wait for a response. Instead, it marks the URL as Uncategorized and jumps to step 5. However, it continues to monitor the cloud query feedback and uses it to update the cache so that future requests can benefit from the cloud lookup.
4. The Citrix ADC appliance receives the URL category details (category, category group, and reputation score) from the cloud-based service and stores it in the cloud cache.
5. If the policy allows the URL, the request is sent to the origin server. Otherwise, the appliance drops or redirects the request, or responds with a custom HTML page.
6. The origin server responds with the requested data to the Citrix ADC appliance.
7. The appliance sends the response to the client.

You can use the URL filtering feature to detect sites that violate safe internet usage mandates issued by the government and implement policies to block these sites. Sites that host adult content, streaming media, or social networking identified as unsafe for children or banned as illegal.

## Prerequisites

The feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other Citrix ADC platforms, the feature works with the purchase of a CNS Premium license.

**Note:** In addition to a Basic CBM license and a CBM Premium license, the appliance must have a URL Threat Intelligence license with a subscription service for 1 year or 3 years. Before enabling and configuring the feature, you must install the following licenses:

License support for Telco platforms:

- **CBM\_TXXX\_SERVER\_Retail.lic**
- **CBM\_TPRE\_SERVER\_Retail.lic**
- **CNS\_WEBF\_SSERVER\_Retail.lic**

Where XXX is the throughput, for example, Citrix ADC T1000.

License support for other Citrix ADC platforms:

- **CNS\_XXX\_SERVER\_PLT\_Retail.lic**

Where XXX is the throughput.

## URL Categorization Policy Expressions

The following table lists the different URL categorization policy expressions for identifying incoming URLs and applies a configured action.

Expression	Operation
<code>&lt;text&gt;. URL_CATEGORIZE (&lt;min_reputation&gt;, &lt;max_reputation&gt;)</code>	Returns a URL_CATEGORY object. Reputation score is a number from 1 to 4. To get objects will all reputation scores use 0.0 as <code>&lt;min_reputation&gt;</code> and <code>.</code> If is greater than 0, the returned object does not contain a category with reputation lower than <code>.</code> If is greater than 0, the returned object will not contain a category with reputation higher than <code>.</code> If the category fails to resolve in a timely manner, the undef value is returned.
<code>&lt;url_category&gt;. CATEGORY</code>	Returns the category string for this object. If the URL does not have a category, or if the URL is malformed, the returned value is "Uncategorized".
<code>&lt;url_category&gt;. GROUP</code>	Returns a string identifying the object's category group. This is a higher level grouping of categories, which is useful in operations that require less detailed information about the URL category. If the URL does not have a category, or if the URL is malformed, the returned value is "Uncategorized".
<code>&lt;url_category&gt;. REPUTATION</code>	Returns the reputation score as a number from 1 to 4, where 4 indicates the riskiest reputation. If the category is "Uncategorized," the reputation value is 2.

## Sample Policy Expressions

Policy	Policy Expressions
Policy to select requests for URLs that are in the Search Engine category	add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.EQ("Search Engine")
Policy to select requests for URLs that are in the Adult category group	add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.GROUP.EQ("Adult")'
Policy to select requests for Search Engine URLs with a reputation score equal to 4.	add responder policy p2 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.EQ("Search Engine")'
Policy to select requests for Search Engine and Shopping URLs	add policy patset good_categories; bind policy good_categories "Search Engine"; bind policy good_categories "Shopping"; add responder policy p3 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORY.EQUALS_ANY("good_categories")
Policy to select requests for Search Engine URLs with a reputation score equal to 4.	add responder policy p5 'CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(4,0).CATEGORY.EQ("Search Engine")

## URL Categorization Policy Actions

A URL filtering policy evaluates the traffic to identify requests belonging to a particular category. The following table lists the actions that you can assign to a URL filtering policy.

Policy Action	Policy Group	Description
ALLOW	Responder	Allow incoming request to access the target URL
REDIRECT	Responder	Redirect incoming request to the URL specified as the target.
DENY	Responder	Deny incoming request.
RESET	Responder, VideoOptimization	Reset connection.
DROP	Responder, VideoOptimization	Drop connection.

**Note**

For encrypted traffic, the VideoOptimization policy includes actions that implement the URL Filtering actions.

**Configuring URL Categorization**

To configure URL categorization, begin by enabling the URL Filtering feature. You must then configure the cache memory limits, categorization policy, and virtual servers for HTTP and HTTPS traffic. Configuring URL Categorization by using the CLI.

To use the CLI configure URL categorization on a Citrix ADC appliance, do the following:

- Set up URL Categorization.
  - Enable the URL Filtering feature.
  - Configure shared memory to limit cache memory.
  - Configure URL categorization parameters.
- Configure URL categorization for HTTP traffic.
  - Add URL categorization actions.
  - Add URL categorization policies.
  - Add a load balancing virtual server for HTTP traffic.
  - Bind URL categorization policies to the load balancing virtual server.
- Configure URL categorization for HTTPS traffic.
  - Add URL categorization policies.
  - Add a SSL-Bridge load balancing virtual server.
  - Bind URL categorization policies to the load balancing virtual server.

**Setting up URL Categorization**

To set up the feature, you must enable the URL Categorization feature, configure the filtering parameters and set the shared memory limit.

**To enable URL Filtering feature**

At the command prompt, type:

```
enable ns feature URLFiltering VideoOptimization Responder IC SSL AppFlow
```

**To configure shared memory limit**

At the command prompt, type:

```
1 set cache parameter [-memLimit <megaBytes>]
2 <!--NeedCopy-->
```

Where memLimit is the memory limit for caching.

**Example:**

```
set cache parameter -memLimit 10
```

**To configure URL categorization parameters**

At the command prompt, type:

```
1 set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer>]
   [-TimeOfDayToUpdateDB <HH:MM>]
2 <!--NeedCopy-->
```

**\*Example:**

```
set urlfiltering parameter -HoursBetweenDBUpdates 3 -TimeOfDayToUpdateDB
03:00
```

**Configuring URL categorization for HTTP traffic**

To configure the URL categorization feature for HTTP traffic, you must configure a loading balancing virtual server, add URL categorization policies and bind the policies to the virtual server. By doing so, the virtual server receives the HTTP traffic and based on policy evaluation, the system assigns a filtering action.

**To add URL categorization action for HTTP traffic**

At the command prompt, type:

```
add responder action <name> <type> (<target> | <htmlpage>)[-comment <string>]
> [-responseStatusCode <positive_integer>] [-reasonPhrase <string>]
```

**Example:**

```
add responder action act_url_categorize respondwith "\"HTTP/1.1 200 OK\r\n\r\n\" +
HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY
+ \"\n\""
```

**To add URL categorization policy for HTTP traffic**

At the command prompt, type:

```
add responder policy <name> <rule> <action> [<undefAction>] [-comment <string>] [-logAction <string>] [-appflowAction <string>]
```

**Example:**

```
add responder policy pol_url_categorize_http "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ(\"Adult\") || HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ(\"Gambling\")"RESET
```

**To add an HTTP load balancing virtual server**

If a virtual server for HTTP traffic is not already configured, at the command prompt, type:

```
add lb vserver <name> [-td <positive_integer>] <serviceType> [-clt Timeout <secs>]
```

**Example:**

```
add lb vserver vsrv-HTTP HTTP * 80 -persistenceType NONE -cltTimeout 120
```

**To bind URL categorization policy with load balancing virtual server**

At the command prompt, type:

```
bind lb vserver <name> -policyName <string> [-priority <positive_integer>]
```

**Example:**

```
bind lb vserver vsrv-HTTP -policyName pol_url_categorize_http -priority 10 -gotoPriorityExpression END -type REQUEST
```

**Configuring URL categorization for HTTPS traffic**

To configure the URL categorization feature for HTTPS traffic, you must configure a SSL-bridge load balancing virtual server, add URL categorization policies and bind the policies to the SSL-bridge virtual server. By doing so, the server receives the HTTPS traffic and based on policy evaluation, the system assigns a filtering action.

**To add URL categorization policy for HTTPS traffic**

At the command prompt, type:

```
add videooptimization detectionpolicy <name> -rule <expression> -action <string> [-undefAction <string>] [-comment <string>] [-logAction <string>]
```

**Example:**

```
add videooptimization detectionpolicy pol_url_categorize_https_block_adult -rule "CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(0,0).CATEGORY.EQ("Adult")' -action RESET
```

**To add SSL-Bridge load balancing virtual server**

At the command prompt, type:

```
add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltT imeout <secs>]
```

**Example:**

```
add lb vserver vsrv-HTTPS SSL_BRIDGE * 443 -persistenceType NONE -cltTimeout 180
```

**To bind categorization policy with SSL-Bridge virtual server**

At the command prompt, type:

```
bind lb vserver <name> -policyName <string> [-priority <positive_integer>]
```

**Example:**

```
bind lb vserver vsrv-HTTPS -policyName pol_url_categorize_https_block_adult -priority 20 -type REQUEST
```

**Configuring URL Categorization by using the GUI**

The GUI enables you to:

- Enable the URL Categorization feature.
- Add URL Categorization actions for HTTP traffic.
- Add URL Categorization policies for HTTP traffic.
- Add URL Categorization policies for HTTPS traffic.
- Add a load balancing virtual server for HTTP traffic.
- Add an SSL bridge load balancing virtual server for HTTPS traffic.
- Bind URL Categorization policies to the load balancing virtual server.
- Bind URL Categorization policies to the SSL-Bridge load balancing virtual server.
- Configure shared memory limit.
- Configure URL categorization parameters.

### To enable URL categorization

1. In the navigation pane, expand **System** and then click **Settings**.
2. On the **Settings** page, click **Configure Advanced Features** link.
3. On the **Configure Advanced Features** page, select **URL Filtering** check box.
4. Click **OK** and **Close**.

### To add a URL categorization action

1. In the navigation pane, expand **AppExpert > Responder > Action**.
2. In the details pane, click **Add**.
3. On the **Create Responder Action** page, set the following parameters.
  - a) **Name**. Name of the URL categorization policy action.
  - b) **Type**. Select an action type.
  - c) **Expression**. Use the expression editor to create the policy expression.
  - d) **Comments**. A short description of the policy action.
4. Click **Create** and **Close**.

### To add a URL categorization policy for HTTP traffic

1. In the navigation pane, expand **AppExpert > Responder > Policies**.
2. On the details pane, click **Add**.
3. On the **Create Responder Policy** page, set the following parameters.
  - a) **Name**. Name of the URL categorization policy action.
  - b) **Action**. Select the URL Categorization action that you prefer to associate with the policy.
  - c) **Log Action**. Select the log action.
  - d) **AppFlow**. Select an AppFlow action.
  - e) **Expression**. Use the expression editor to create the policy expression.
  - f) **Comments**. A short description about the policy action.
4. Click **Create** and **Close**.

### To add a categorization policy for HTTPS traffic

1. Log on to the Citrix ADC appliance and navigate to **Configuration > Optimization > Video Optimization > Detection**.
2. On the **Detection** page, click the **Video Optimization Detection Policies** link.
3. On the Video Optimization Detection Policies page, click **Add**.
4. On the **Create Video Optimization Detection Policy** page, set the following parameters.
  - a) **Name**. Name of the optimization policy
  - b) **Expression**. Configure policy using custom expressions.

- c) **Action.** Optimization action associated with the policy to handle the incoming video traffic.
  - d) **UNDEF Action.** Undefined event if the incoming request does not match the optimization policy.
  - e) **Comment.** A short description about the policy.
  - f) **Log Action.** Select an audit log action that specifies the action to be performed for the log messages.
5. Click **Create** and **Close**.

### To add a load balancing virtual server for HTTP traffic

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page set the following parameters:
  - a) **Name.** Name of the load balancing virtual server.
  - b) **Protocol.** Choose protocol type as HTTP.
  - c) **IP Address Type.** IPv4 or IPv6.
  - d) **IP Address.** IPv4 or IPv6, VIP address assigned to the virtual server.
  - e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters.
5. Click **Create** and **Close**.

### To add an SSL-bridge load balancing virtual server

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. On the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page, set the following parameters:
  - a) **Name.** Name of the load balancing virtual server.
  - b) **Protocol.** Select protocol type as SSL-bridge.
  - c) **IP Address Type.** IP addressable type.
  - d) **IP Address.** IP 4 or IP6 IP address assigned to the virtual server.
  - e) **Port.** Port number of the virtual server.
4. Choose **OK** to continue configuration other optional parameters.
5. Click **Create** and then **Close**.

### To bind a URL categorization policy to the HTTP load balancing virtual server

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** page.
2. On the details pane, select the load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.

4. In the **Policies** section, click the **+** icon to access the **Policies** slider.
5. Set the following parameters.
  - a) **Choose Policy**. Select URL categorization policy from the drop-down list.
  - b) **Choose Type**. Select the policy type as Request.
6. Click **Continue**.
7. Select the URL categorization policy from the list and click **Close**.

#### **To bind a categorization policy to the SSL-bridge load balancing virtual server**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click **+** icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
  - a) **Choose Policy**. Select video detection policy from the drop-down list.
  - b) **Choose Type**. Select the policy type as Request.
6. Click **Continue**.
7. Select the video detection policy from the list and click **Close**.

#### **To configure the shared memory limit**

1. Sign on to the appliance and navigate to **Optimization > Integrated Caching**.
2. In the details pane, click **Change cache settings** link.
3. On the **Cache Global Settings** page, set the following parameters.
  - a) **Memory Usage Limit (MB)**.
  - b) **Active memory Usage Limit**.
  - c) **Via Header**.
  - d) **Maximum Post Body Length to be Cached**
  - e) **Global Undefined-Result Action**
  - f) **Enable HA Object Persist**
  - g) **Verify Cached Object Persist**
  - h) **Prefetches**
4. Click **OK** and **Close**.

#### **To configure URL categorization parameters**

1. Sign to the appliance and navigate to **Security**.
2. On the details pane, click **Change URL filtering settings** link.
3. In the **Configuring URL Filtering Params** page, set the following parameters.

- a) Hours Between DB Updates. URL Filtering hours between database updates. Minimum value: 0 and Maximum value: 720.
  - b) Time of Day to Update DB. URL Filtering time of day to update the database.
4. Click **OK** and **Close**.

## Configuring Audit Log Messaging

When a Citrix ADC appliance receives an incoming URL, if the responder policy has a URL Filtering expression, the audit log feature collects categorization information and displays it as log messages to any target audit log server that is configured. The below info is logged.

- Source IP address (the IP address of the client that made the request).
- Destination IP address (the IP address of the requested server).
- Requested URL containing the schema, the host, and the domain name (<http://www.example.com>).
- URL category that the URL filtering framework returns.
- URL category group that the URL filtering framework returned.
- URL reputation number that the URL filtering framework returned.
- Audit log action taken by URL Categorization policy.

To configure audit logging for URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see [Audit Logging](#) topic.

## Storing Failure Errors Using SYSLOG Messaging

At any stage of the URL Filtering process, if there is a system-level failure, the Citrix ADC appliance uses the audit log mechanism to store logs in the ns.log file. The errors are stored as text messages in SYSLOG format so that, an administrator can view it later in a chronological order of event occurrence. These logs are also sent to an external SYSLOG server for archival. For more information, see [article CTX229399](#).

For example, if a failure occurs when you initialize the URL Filtering SDK, the error message is stored in the following messaging format.

```
Oct 3 15:43:40 <local0.err> ns URLFiltering[1349]: Error initializing NetStar SDK (SDK error=-1). (status=1).
```

The Citrix ADC appliance stores the error messages under four different failure categories:

- Download failure. If an error occurs when you try to download the categorization database.

- Integration failure. If an error occurs when you integrate an update into the existing categorization database.
- Initialization failure. If an error occurs when you initialize the URL Categorization feature, set categorization parameters, or end a categorization service.
- Retrieval failure. If an error occurs when the appliance retrieves the categorization details of the request.

## URL Reputation Score

The URL Categorization feature provides policy-based control to restrict blacklisted URLs. You can control access to websites based on URL category, reputation score, or URL category and reputation score. If a network administrator monitors a user accessing highly risky websites, he or she can use a responder policy bound to the URL reputation score to block such risky websites.

Upon receiving an incoming URL request, the appliance retrieves the category and reputation score from the URL categorization database. Based on the reputation score returned by the database, the appliance assigns a reputation rating for websites. The value can range from 1 to 4, where 4 is the riskiest type of websites, as shown in the following table.

---

URL Reputation Rating	Reputation Comment
1	Clean site.
2	Unknown site.
3	Potentially dangerous or affiliated to dangerous site.
4	Malicious site.

---

## Authentication, authorization, and auditing Application Traffic

September 21, 2020

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The authentication, authorization, and auditing feature allows a site administrator to manage access controls with the Citrix ADC appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The authentication, authorization, and auditing feature supports authentication, authorization, and auditing for all application traffic. To use authentication, authorization, and auditing, you must con-

figure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the Citrix ADC appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring authentication, authorization, and auditing, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the Citrix ADC appliance.

## How authentication, authorization, and auditing works

September 21, 2020

Authentication, authorization, and auditing provides security for a distributed internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of authentication, authorization, and auditing. Authentication enables the Citrix ADC to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it allows each user to access. Auditing enables the ADC to keep a record of each user's activity on a protected server.

To understand how authentication, authorization, and auditing works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP. For more information, see [Determining Attributes in Your LDAP Directory](#).
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.

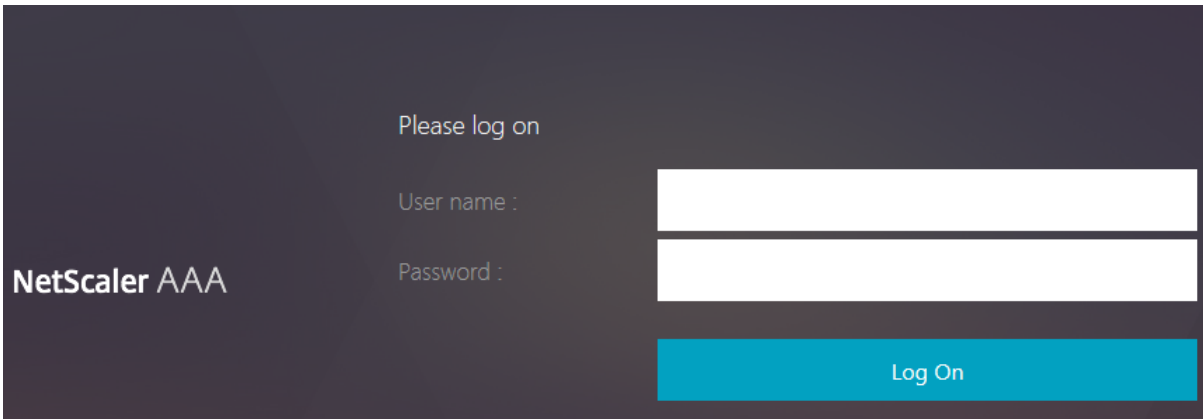

- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

**The following section discusses about the two authentication mechanism:**

- Forms based AAA-TM.
- 401 Authentication enabled AAA-TM.

### Forms based AAA-TM

With Forms based authentication, a logon form is presented to the end-user. This type of authentication form supports both multifactor (nFactor) authentication and Classic authentication.

Ensure the following for the Forms based authentication to work:

- The load balancing virtual server must have authentication turned **ON**.
- 'authenticationHost' parameter must be specified to which the user must be redirected for authentication. The command for configuring the same is as follows:

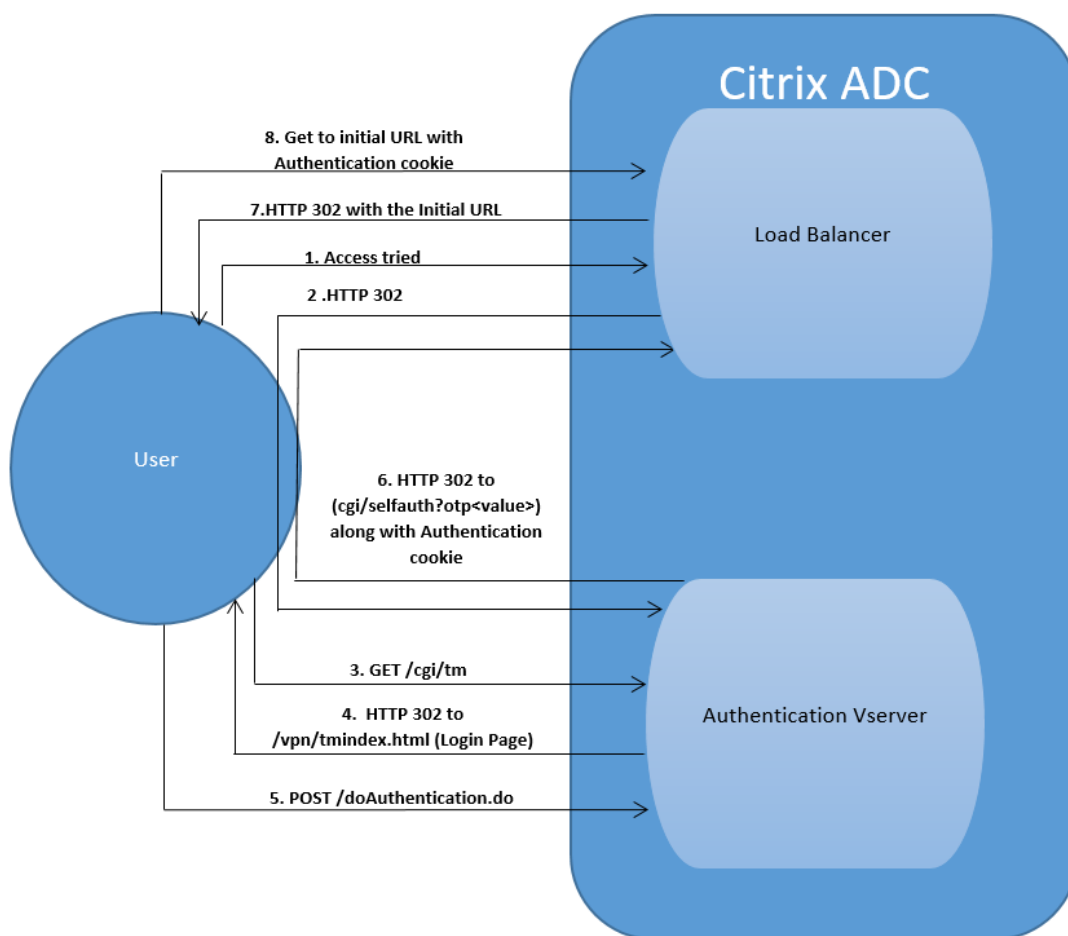

```
1 set lb vs lb1 -authentication on - authenticationhost aaavs-ip/  
   fqn
```

- Form based authentication works with browser that supports HTML

The following steps walk through how the Forms based authentication works:

1. The client (browser) sends a GET request for a URL on the TM (load balancing/CS) virtual server.
2. The TM virtual server determines that the client has not been authenticated, and sends an HTTP 302 response to the client. The response contains a hidden script that causes the client to issue a GET request for /cgi/tm to the authentication virtual server.
3. The client sends GET /cgi/tm containing the target URL to the authentication virtual server.

4. The authentication virtual server sends out a redirect to the login page.
5. The user sends out its credentials to the authentication virtual server with a POST /doAuthentication.do.  
Authentication is done by the authentication virtual server.
6. If the credentials are correct, the authentication virtual server sends an HTTP 302 response to the cgi/selfauth url on the load balancing server with a one time token (OTP).
7. The load balancing server sends HTTP 302 to the client.
8. The client sends a GET request for their initial URL target URL along with a 32 byte cookie.

#### 401 Authentication Enabled AAA-TM

With 401 based Authentication, the Citrix ADC appliance present a pop-up dialog box as follows to the end user.

Form based AAA-TM works on the redirect messages. However, some applications do not support redirects. In such applications, 401 authentication enabled AAA-TM is used.

Ensure the following for 401 Authentication Enabled AAA-TM to work:

- 'authnVsName' parameter value for the load balancing virtual server must be the name of the authentication virtual server to be used to authenticate users.
- 'authn401' parameter must be enabled. The command for configuring the same is as follows:

```
1 set lb vs lb1 - authn401 on - authnvsName <aaavs-name>
```

The following steps walk through how the 401 Authentication works:

1. User tries to access a particular URL using the load balancing virtual server.
2. The load balancing virtual server sends a 401 HTTP response back to the user indicating that authentication is required for the access.
3. The user sends its credentials to the load balancing virtual server in the authorization header.
4. The load balancing virtual server authenticates the user and then connects the user to the back end servers.

### Configuring the No\_Auth policy to bypass certain traffic

You can now configure No\_Auth policy to bypass certain traffic from authentication when 401-based authentication is enabled on traffic management virtual server. For such traffic, you must bind a “no-authentication” policy.

#### To configure the No\_Auth policy to bypass certain traffic by using the CLI

At the command prompt, type:

```
1 add authentication policy <name> -rule <expression> -action <string>
```

#### Example:

```
1 add authentication policy ldap -rule ldapAct1 -action
```

### Enabling authentication, authorization, and auditing

September 21, 2020

To use the authentication, authorization, and auditing - Application Traffic feature, you must enable it. You can configure authentication, authorization, and auditing entities—such as the authentication and traffic management virtual servers—before you enable the authentication, authorization, and auditing feature, but the entities will not function until the feature is enabled.

### To enable authentication, authorization, and auditing by using the command line interface

At the command prompt, type the following commands to enable authentication, authorization, and auditing and verify the configuration:

- `enable ns feature AAA`
- `show ns feature`

#### Example

- `enable feature AAA<!--NeedCopy-->`
- Done
- `show ns feature<!--NeedCopy-->`

1	Feature	Acronym	Status
2	-----	-----	-----
3	1) Web Logging	WL	OFF
4	2) Surge Protection	SP	ON
5	.		
6	.		
7	.		
8	15) AAA	AAA	ON
9	.		
10	.		
11	.		
12	23) HTML Injection	HTMLInjection	ON
13	24) NetScaler Push	push	OFF Done

### To enable authentication, authorization, and auditing by using the configuration utility

1. Navigate to **System > Settings**.
2. In the details pane, under **Modes and Features**, click **Change Basic Features**.
3. In the **Configure Basic Features** dialog box, select the **Authentication, Authorization and Auditing** check box.
4. Click **OK**.

## Authentication virtual server

December 16, 2020

The traffic management virtual server (load balancing or content switching) redirects all authentication requests to the authentication virtual server. This virtual server processes the associated authentication policies and accordingly provides access to the application.

**Note:** You cannot bind traffic management policies to authentication, authorization, and auditing virtual servers.

### Set up authentication virtual server

The steps involved in setting up an authentication virtual server are;

1. Enable the authentication, authorization, and auditing feature.

```
1 enable ns feature AAA
2 <!--NeedCopy-->
```

2. Configure an authentication virtual server. It must be of type SSL and make sure to bind the SSL certificate-key pair to the virtual server.

```
1 add authentication vserver <name> SSL <ipaddress> <port>
2
3 bind ssl certkey <auth-vserver-name> <certkey>
4 <!--NeedCopy-->
```

3. Specify the FQDN of the domain for the authentication virtual server.

```
1 set authentication vserver <name> -authenticationDomain <FQDN>
2 <!--NeedCopy-->
```

4. Associate the authentication virtual server to the relevant traffic management virtual server.

#### Points to Note:

- The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly. On the traffic management virtual server:
  - Enable authentication.
  - Specify the FQDN of the authentication virtual server as the authentication host of the traffic management virtual server.
  - [Optional] Specify the authentication domain on the traffic management virtual server.

- If you do not configure the authentication domain, the appliance assigns an FQDN that consists of the FQDN of the authentication virtual server without the host name portion. For example, if the domain name of the authentication virtual server is **tm.xyz.bar.com**, the appliance assigns **xyz.bar.com** as the authentication domain.

\* For load balancing:

```
1 set lb vserver <name> -authentication ON -
   authenticationhost <FQDN> [-authenticationdomain <
   authdomain>]
2 <!--NeedCopy-->
```

\* For content switching:

```
1 set cs vserver <name> <protocol> <IPAddress> <port>
2 <!--NeedCopy-->
```

- If you have to set a domain wide cookie for an authentication domain, you must enable authentication profile on a load balancing virtual server.

5. Verify that both the virtual servers are UP and configure correctly.

```
1 show authentication vserver <name>
2 <!--NeedCopy-->
```

### To set up an authentication virtual server by using the GUI

1. Enable the authentication, authorization, and auditing feature.

Navigate to **System > Settings**, click **Configure Basic features**, and enable **Authentication, Authorization and Auditing**.

2. Configure the authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and configure as required.

3. Configure the traffic management virtual server for authentication.

- **For load balancing:**

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and configure the virtual server as required.

- **For content switching:**

Navigate to **Traffic Management > Content Switching > Virtual Servers**, and configure the virtual server as required.

4. • Verify the authentication setup.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and check the details of the relevant authentication virtual server.

### Configure the authentication virtual server

To configure authentication, authorization, and auditing, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections.

For additional information about configuring SSL and creating a certificate-key pair, see [SSL certificates](#).

### Configure an authentication virtual server by using the CLI

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the same order:

```
1 dd authentication vserver <name> ssl <ipaddress>
2
3 show authentication vserver <name>
4
5 bind ssl certkey <certkeyName>
6
7 show authentication vserver <name>
8
9 set authentication vserver <name>
10
11 show authentication vserver <name>
12 <!--NeedCopy-->
```

### Example:

```
1 add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443 Done
2
3 show authentication vserver Auth-Vserver-2 Auth-Vserver-2
  (10.102.29.77:443) - SSL Type: CONTENT State: DOWN[Certkey not bound
  ] Client Idle Timeout: 180 sec Down state flush: DISABLED Disable
  Primary Vserver On Down : DISABLED Authentication : ON Current AAA
  Users: 0 Done
4
5 bind ssl certkey Auth-Vserver-2 Auth-Cert-1 Done
6
7 show authentication vserver Auth-Vserver-2 Auth-Vserver-2
  (10.102.29.77:443) - SSL Type: CONTENT State: UP Client Idle Timeout
```

```

      : 180 sec Down state flush: DISABLED Disable Primary Vserver On Down
      : DISABLED Authentication : ON Current AAA Users: 0 Done
8
9 show authentication vserver Auth-Vserver-2 Auth-Vserver-2
  (10.102.29.77:443) - SSL Type: CONTENT State: DOWN[Certkey not bound
  ] Client Idle Timeout: 180 sec Down state flush: DISABLED Disable
  Primary Vserver On Down : DISABLED Authentication : ON Current AAA
  Users: 0 Done
10 <!--NeedCopy-->

```

**Note**

The Authentication Domain parameter is deprecated. Use Authentication Profile for setting domain wide cookies.

**Configure an authentication virtual server by using the GUI**

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. In the details pane, do one of the following:
  - To create a new authentication virtual server, click **Add**.
  - To modify an existing authentication virtual server, select the virtual server, and then click **Edit**. The Configuration dialog opens with the Basic Settings area expanded.
3. Specify values for the parameters as follows (asterisk indicates a required parameter):
  - Name\*—name (Cannot be changed for a previously created virtual server)
  - IP Address Type\*—IP address type of the authentication virtual server
  - IP Address\*—IP address of the authentication virtual server
  - Port\*—TCP port on which the virtual server accepts connections.
  - Failed login timeout—failedLoginTimeout (Seconds allowed before login fails, and user must start login process again.)
  - Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

**Note:**

The authentication virtual server uses only the SSL protocol and port 443, so those options are grayed out. Any options that are not mentioned can be ignored.

4. Click **Continue** to display the Certificates area.
5. In the **Certificates** area, configure any SSL certificates you want to use with this virtual server.
  - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click

**Save.**

- To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for the CA certificate.
6. Click **Continue** to display the **Advanced Authentication Policies** area.
  7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the **Authentication Policy** dialog box, choose the policy that you want to bind to the server, set the priority, and then click **OK**.
  8. Click **Continue** to display the **Basic Authentication Policies** area.
  9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the **Policies** dialog box, and follow the prompts to configure the policy and bind it to this virtual server.
  10. Click **Continue** to display the 401-Based Virtual Servers area.
  11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
    - To bind a load balancing virtual server, click the arrow to the right of load balancing virtual server to display the Load Balancing Virtual Servers dialog box, and follow the prompts.
    - To bind a content switching virtual server, click the arrow to the right of content switching virtual server to display the Content Switching Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.
  12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.
  13. Review your settings, and when you are finished, click **Done**. The dialog box closes. If you created a new authentication virtual server, it now appears in the **Configuration** window list.

**Traffic management virtual server**

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual server with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix Traffic Management Guide* at [Traffic Management](#).

**Note:**

The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for authentication, authorization, and auditing by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server currently. If you do not configure this option, the Citrix ADC appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the host name portion. For example, if the domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com. as the authentication domain.

### To configure a traffic management virtual server by using the CLI

At the command prompt, type one of the following sets of commands:

```
1 set lb vserver <name> - authentication ON -authenticationhost <FQDN> [-
  authenticationdomain <authdomain>]
2 show lb vserver <name>
3 set cs vserver <name> - authentication ON -authenticationhost <FQDN> [-
  authenticationdomain <authdomain>]
4 show cs vserver <name>
5 <!--NeedCopy-->
```

### Example:

```
1 set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki
  .index.com Done
2
3 show lb vserver vs-cont-sw vs-cont-sw (0.0.0.0:0) - TCP Type: ADDRESS
  State: DOWN Last state change was at Wed Aug 19 10:03:15 2009 (+410
  ms) Time since last state change: 5 days, 20:00:40.290 Effective
  State: DOWN Client Idle Timeout: 9000 sec Down state flush: ENABLED
  Disable Primary Vserver On Down : DISABLED No. of Bound Services : 0
  (Total) 0 (Active) Configured Method: LEASTCONNECTION Mode: IP
  Persistence: NONE Connection Failover: DISABLED Authentication: ON
  Host: mywiki.index.com
4 Done
5 <!--NeedCopy-->
```

### To configure a traffic management virtual server by using the GUI

1. In the navigation pane, do one of the following.
  - Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
  - Navigate to **Traffic Management > Content Switching > Virtual Servers**

- In the details pane, select the virtual server on which you want to enable authentication, and then click **Edit**.
- In the Domain text box, type the authentication domain.
- In the **Advanced** menu on the right, select **Authentication**.
- Choose either **Form Based Authentication** or **401 Based Authentication**, and fill in the Authentication information.
  - For Form Based Authentication, enter the Authentication FQDN (the fully qualified domain name of the authentication server), the Authentication virtual server (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
  - For 401 Based Authentication, enter the Authentication virtual server and the Authentication Profile only.
- Click **OK**. A message appears in the status bar, stating that the virtual server has been configured successfully.

### **Simplified login protocol support for authentication, authorization, and auditing**

The login protocol between authentication, authorization, and auditing traffic management virtual servers and authentication, authorization, and auditing virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. Using this feature, the replay of requests is prevented.

### **Configure DNS**

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to the configure DNS address records, see [Domain Name System](#).

### **Verify authentication virtual server**

After you configure authentication and traffic management virtual servers and before you create user accounts, you must verify that both virtual servers are configured correctly and are in the UP state.

### **Configure a noAuth authentication by using the CLI**

At the command prompt, type the following command:

```
1 show authentication vserver <name>
2 <!--NeedCopy-->
```

**Example:**

```
1 show authentication vserver Auth-Vserver-2
2 Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
3 State: UP
4 Client Idle Timeout: 180 sec
5 Down state flush: DISABLED
6 Disable Primary Vserver On Down : DISABLED
7 Authentication : ON
8 Current AAA Users: 0
9 Authentication Domain: myCompany.employee.com
10 Done
11 <!--NeedCopy-->
```

**Configure a noAuth authentication by using the GUI**

1. Navigate to **Security > Citrix ADC AAA - Application Traffic > Virtual Servers**.  
Note: From Citrix Gateway, navigate to **Citrix Gateway > Virtual Servers**.
2. Review the information in the **AAA Virtual Servers** pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

**Configuring the authentication virtual server**

September 21, 2020

To configure authentication, authorization, and auditing, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections.

For additional information about configuring SSL and creating a certificate-key pair, see [SSL certificates](#).

**To configure an authentication virtual server by using the command line interface**

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- `add authentication vserver <name> ssl <ipaddress><!--NeedCopy-->`
- `show authentication vserver <name><!--NeedCopy-->`
- `bind ssl certkey <certkeyName><!--NeedCopy-->`
- `show authentication vserver <name><!--NeedCopy-->`
- `set authentication vserver <name><!--NeedCopy-->`
- `show authentication vserver <name><!--NeedCopy-->`

### Example

- `add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443 Done<!--NeedCopy-->`
- `show authentication vserver Auth-Vserver-2 Auth-Vserver-2 (10.102.29.77:443)`  
 - SSL Type: CONTENT State: DOWN[Certkey not bound] Client Idle Timeout: 180 sec Down state flush: DISABLED Disable Primary Vserver On Down : DISABLED Authentication : ON Current AAA Users: 0 Done<!--NeedCopy-->
- `bind ssl certkey Auth-Vserver-2 Auth-Cert-1 Done<!--NeedCopy-->`
- `show authentication vserver Auth-Vserver-2 Auth-Vserver-2 (10.102.29.77:443)`  
 - SSL Type: CONTENT State: UP Client Idle Timeout: 180 sec Down state flush: DISABLED Disable Primary Vserver On Down : DISABLED Authentication : ON Current AAA Users: 0 Done<!--NeedCopy-->
- `show authentication vserver Auth-Vserver-2 Auth-Vserver-2 (10.102.29.77:443)`  
 - SSL Type: CONTENT State: DOWN[Certkey not bound] Client Idle Timeout: 180 sec Down state flush: DISABLED Disable Primary Vserver On Down : DISABLED Authentication : ON Current AAA Users: 0 Done<!--NeedCopy-->

### Note

The Authentication Domain parameter is deprecated. Use Authentication Profile for setting domain wide cookies.

## To configure an authentication virtual server by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. In the details pane, do one of the following:
  - To create a new authentication virtual server, click **Add**.
  - To modify an existing authentication virtual server, select the virtual server, and then click **Edit**. The Configuration dialog opens with the Basic Settings area expanded.
3. Specify values for the parameters as follows (asterisk indicates a required parameter):

- Name\*—name (Cannot be changed for a previously created virtual server)
- IP Address Type\*
- IP Address\*—IP address of the authentication virtual server
- Port\*—TCP port on which the virtual server accepts connections.
- Failed login timeout—failedLoginTimeout (Seconds allowed before login fails and user must start login process again.)
- Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

**Note**

The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out. Any options that are not mentioned are not relevant and should be ignored.

4. Click **Continue** to display the Certificates area.
5. In the **Certificates** area, configure any SSL certificates you want to use with this virtual server.
  - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click **Save**.
  - To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for CA certificate.
6. Click **Continue** to display the **Advanced Authentication Policies** area.
7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the **Authentication Policy** dialog box, choose the policy that you want to bind to the server, set the priority, and then click **OK**.
8. Click **Continue** to display the **Basic Authentication Policies** area.
9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the **Policies** dialog box, and follow the prompts to configure the policy and bind it to this virtual server.
10. Click **Continue** to display the 401-Based Virtual Servers area.
11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
  - To bind a load balancing virtual server, click the arrow to the right of LB virtual server to display the LB Virtual Servers dialog box, and follow the prompts.
  - To bind a content switching virtual server, click the arrow to the right of CS virtual server to display the CS Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.

12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.
13. Review your settings, and when you are finished, click **Done**. The dialog box closes. If you created a new authentication virtual server, it now appears in the **Configuration** window list.

## Configuring a noAuth authentication

Citrix ADC appliance now supports noAuth authentication capability that enables the customer to configure a defaultAuthenticationGroup parameter in noAuthAction command, when a user performs this policy. The administrator can check for the presence of this group in user's group to determine user's navigation through noAuth policy.

### To configure a noAuth authentication by using the command line interface

```
1 add authentication noAuthAction <name> [-defaultAuthenticationGroup <string>]
```

#### Example

```
1 add authentication noAuthAction noauthact - defaultAuthenticationGroup mynoauthgroup
```

## Configuring a traffic management virtual server

September 21, 2020

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual sever with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix Traffic Management Guide* at [Traffic Management](#).

#### Note

The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for authentication, authorization, and auditing by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management

virtual server at this time. If you do not configure this option, the Citrix ADC appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com. as the authentication domain.

### **To configure a TM virtual server for authentication, authorization, and auditing by using the command line interface**

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- `set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]<!--NeedCopy-->`
- `show lb vserver <name><!--NeedCopy-->`
- `set cs vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]<!--NeedCopy-->`
- `show cs vserver <name><!--NeedCopy-->`

#### **Example**

- `set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com Done<!--NeedCopy-->`
- `show lb vserver vs-cont-sw vs-cont-sw (0.0.0.0:0)- TCP Type: ADDRESS State: DOWN Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms )Time since last state change: 5 days, 20:00:40.290 Effective State: DOWN Client Idle Timeout: 9000 sec Down state flush: ENABLED Disable Primary Vserver On Down : DISABLED No. of Bound Services : 0 (Total)0 (Active)Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Connection Failover: DISABLED Authentication: ON Host: mywiki.index.com Done<!--NeedCopy-->`

### **To configure a TM virtual server for authentication, authorization, and auditing by using the configuration utility**

1. In the navigation pane, do one of the following.
  - Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
  - Navigate to **Traffic Management > Content Switching > Virtual Servers**
  - In the details pane, select the virtual server on which you want to enable authentication, and then click **Edit**.
  - In the Domain text box, type the authentication domain.

- In the **Advanced** menu on the right, select **Authentication**.
- Choose either **Form Based Authentication** or **401 Based Authentication**, and fill in the Authentication information.
  - For Form Based Authentication, enter the Authentication FQDN (the fully-qualified domain name of the authentication server), the Authentication VServer (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
  - For 401 Based Authentication, enter the Authentication VServer and the Authentication Profile only.
- Click **OK**. A message appears in the status bar, stating that the vserver has been configured successfully.

### **Simplified login protocol support for authentication, authorization, and auditing**

The login protocol between authentication, authorization, and auditing traffic management virtual servers and authentication, authorization, and auditing virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. By leveraging this feature, the replay of requests is prevented.

## **Configuring DNS**

September 21, 2020

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to configure DNS address records, see [Domain Name System](#).

### **Verifying your setup for authentication, authorization, and auditing**

September 21, 2020

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

#### **To verify authentication virtual server setup by using the command line interface**

At the command prompt, type the following command:

“show authentication vserver

```
1      `` `show authentication vserver Auth-Vserver-2
2      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
3      State: UP
4      Client Idle Timeout: 180 sec
5      Down state flush: DISABLED
6      Disable Primary Vserver On Down : DISABLED
7      Authentication : ON
8      Current AAA Users: 0
9      Authentication Domain: myCompany.employee.com
10     Done<!--NeedCopy-->
```

### **To verify your authentication, authorization, and auditing virtual server setup by using the configuration utility**

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

## **Creating an authentication profile**

October 13, 2020

An authentication profile contains authentication settings to be bound to a server. It is used for the following purpose:

- An authentication profile specifies the authentication virtual server, the authentication host, the authentication domain, and an authentication level.
- You can create one or more authentication profiles to specify different authentication settings and bind these authentication profiles to relevant traffic management servers based on your requirements.
- When you want the same authentication settings to be used by multiple traffic management virtual servers, these servers can be bound to the same authentication profile.

### **To configure an authentication profile by using the CLI**

- Create the authentication profile and set the required parameters.

For example, to create a profile with an authentication virtual server named “authVS”.

```
ns-cli-prompt> add authentication authnProfile authProfile1 -authnVsName authVS -  
authenticationHost authnVS.example.com -authenticationDomain example.com -authenticationLevel
```

**Note:**

The authentication weight or level will depend on the virtual server to which the traffic is bound. A session that is created by authenticating against a traffic management virtual server at a given level cannot be used to access a traffic management virtual server at a higher level.

- Bind the authentication profile to the relevant traffic management virtual servers.

For example, to bind authProfile1 to a load balancing virtual server named “vserver1”.

```
ns-cli-prompt> set lb vserver vserver1 -authnProfile authProfile1
```

## To configure an authentication profile by using the GUI

In the **Configuration** tab, navigate to **Security > AAA - Application Traffic > Authentication Profile**, and configure the authentication profile as required.

## Configuring users and groups

September 21, 2020

After configuring the authentication, authorization, and auditing basic setup, you create users and groups. You first create a user account for each person who will authenticate via the Citrix ADC appliance. If you are using local authentication controlled by the Citrix ADC appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the Citrix ADC appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the Citrix ADC. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the Citrix ADC appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

## To create a local Authentication, authorization, and auditing user account by using the command line interface

At the command prompt, type the following commands to create a local Authentication, authorization, and auditing user account and verify the configuration:

- `add aaa user <username> [-password <password>]<!--NeedCopy-->`
- `show aaa user<!--NeedCopy-->`

### Example

```
1 > add aaa user user-2 -password emptybag
2 Done
3 > show aaa user
4 1) UserName: user-1
5 2) UserName: user-2
6 Done
7 <!--NeedCopy-->
```

## To change the password for an existing authentication, authorization, and auditing local user account by using the command line interface

At the command prompt, type the following command and, when prompted, type the new password:

```
1 set aaa user <username>
2 <!--NeedCopy-->
```

### Example

```
1 > set aaa user user-2
2 Enter password:
3 Done
4 <!--NeedCopy-->
```

## To configure authentication, authorization, and auditing local users by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Users**
2. In the details pane, do one of the following:
  - To create a new user account, click **Add**.
  - To modify an existing user account, select the user account, and then click **Open**.
3. In the **Create AAA User** dialog box, in the **User Name** text box, type a name for the user.

4. If creating a locally authenticated user account, clear the **External Authentication** check box and provide a local password that the user will use to log on
5. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the user has been configured successfully.

### To create authentication, authorization, and auditing local groups and add users to them by using the command line interface

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- `add aaa group <groupname><!--NeedCopy-->`
- `“show aaa group`

```
1  **Example**
```

```
add aaa group group-2
Done
show aaa group
1) GroupName: group-1
2) GroupName: group-2
Done
““
```

- `“bind aaa group -username`

```
1  **Example**
```

```
bind aaa group group-2 -username user-2
Done
show aaa group group-2
GroupName: group-2
UserName: user-2
Done
““
```

### To remove users from an authentication, authorization, and auditing group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

- ““unbind aaa group -username

```
1  **Example**
```

```
unbind aaa group group-hr -username user-hr-1
Done
““
```

### To remove an authentication, authorization, and auditing group by using the command line interface

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

- `rm aaa group <groupname><!--NeedCopy-->`
- ““show aaa group

```
1  **Example**
```

```
rm aaa group group-hr
Done
show aaa group
1) GroupName: group-1
2) GroupName: group-finance
Done
““
```

### To configure authentication, authorization, and auditing local groups and add users to them by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Groups**
2. In the details pane, do one of the following:
  - To create a new group, click **Add**.
  - To modify an existing group, select the group, and then click **Edit**.
3. If you are creating a new group, in the **Create AAA Group** dialog box, in the **Group Name** text box, type a name for the group.
4. In the **Advanced** area to the right, click **AAA Users**.
  - To add a user to the group, select the user, and then click **Add**.
  - To remove a user from the group, select the user, and then click **Remove**.

- To create a new user account and add it to the group, click the **Plus** icon, and then follow the instructions in “To configure authentication, authorization, and auditing local users by using the configuration utility.”
5. Click **Create** or **OK**. The group that you created appears in the **AAA Groups** page.

## Configuring authentication, authorization, and auditing policies

September 21, 2020

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail authentication, authorization, and auditing will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the Citrix ADC operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The authentication, authorization, and auditing feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the Citrix ADC appliance, see the *Citrix Traffic Management Guide* at [Traffic Management](#).

## Authentication policies

September 21, 2020

### Note

Citrix ADC appliance encodes only UTF-8 characters for authentication, and it is not compatible with servers that use ISO-8859-1 characters.

The Citrix ADC can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

- **LOCAL**

Authenticates to the Citrix ADC appliance by using a password, without reference to an external authentication server. User data is stored locally on the Citrix ADC appliance.

- **RADIUS**

Authenticate to an external RADIUS server.

- **LDAP**

Authenticates to an external LDAP authentication server.

- **TACACS**

Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

After a user authenticates to a TACACS server, the Citrix ADC connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents any delay while the ADC waits for the first TACACS server to time out. It happens before resending the authorization request to the second TACACS server.

### Note

When authenticating through a TACACS server, authentication, authorization, and auditing traffic management logs only successfully run TACACS commands. It prevents the logs from showing TACACS commands that are entered by users who were not authorized to run them.

Starting from NetScaler 12.0 Build 57.x, the Terminal Access Controller Access-Control System (TACACS) is not blocking the authentication, authorization, and auditing daemon while sending the TACACS request. The allow LDAP, and RADIUS authentication to proceed with the request. The TACACS authentication request resumes once the TACACS server acknowledges the TACACS request.

- **CERT**

Authenticates to the Citrix ADC appliance by using a client certificate, without reference to an external authentication server.

- **NEGOTIATE**

Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, Citrix ADC uses NTLM authentication.

- **SAML**

Authenticates to a server that supports the Security Assertion Markup Language (SAML).

- **SAML IDP**

Configures the Citrix ADC to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).

- **WEB**

Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful.

An authentication policy comprises of an expression and an action. Authentication policies use Citrix ADC expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies. It is intended to handle authentication for any user accounts that do not meet the more specific criteria.

## To add an authentication action by using the command line interface

If you do not use LOCAL authentication, you need to add an explicit authentication action. At the command prompt, type the following command:

```
“add authentication tacacsAction -serverip [-serverPort ][-authTimeout ][ ... ]
```

```
1 Example
```

```
add authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -  
authtimeout 15 -tacacsSecret “minotaur” -authorization OFF -accounting ON -auditFailedCmds  
OFF -defaultAuthenticationGroup “users”  
Done
```

```

1  ## To configure an authentication action by using the command line
   interface
2
3  To configure an existing authentication action, at the command prompt,
   type the following command:
4
5  ``set authentication tacacsAction <name> -serverip <IP> [-serverPort <
   port>][-authTimeout <positive_integer>][ ... ]<!--NeedCopy-->

```

### Example

```

1  > set authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -
   serverport 1812 -authtimeout 15 -tacacsSecret "
   minotaur" -authorization OFF -accounting ON -auditFailedCmds OFF -
   defaultAuthenticationGroup "users"
2  Done
3  <!--NeedCopy-->

```

### To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction
```

```
1 Example
```

```
rm authentication tacacsaction Authn-Act-1
Done
```

```

1  ## To configure an authentication server by using the configuration
   utility
2
3  > **Note**
4  >
5  > In the configuration utility, the term server is used instead of
   action, but refers to the same task.
6
7  1. Navigate to **Security > AAA - Application Traffic > Policies >
   Authentication**.
8  1. In the details pane, on the **Servers** tab, do one of the
   following:
9     - To create a new authentication server, click **Add**.
10    - To modify an existing authentication server, select the server,
   and then click **Open**.

```

```

11 1. In the **Create Authentication Server** or **Configure
    Authentication Server** dialog box, type or select the values for
    the parameters.
12 - Name\*-radiusActionName (Cannot be changed for a previously
    configured action)
13 - Authentication Type\*-authtype (Set to RADIUS, cannot be
    changed)
14 - IP Address\*-serverip </IP>
15 - IPV6\*-Select the check box if the server IP is an IPv6 IP. (No
    command line equivalent.)
16 - Port\*-serverPort
17 - Time-out (seconds)\*-authTimeout
18 1. Click **Create** or **OK**, and then click **Close**. The policy
    that you created appears in the **Authentication Policies** and **
    Servers** page.
19
20 ## To create and bind an authentication policy by using the command
    line interface
21
22 At the command prompt, type the following commands in the order shown
    to create and bind an authentication policy and verify the
    configuration:
23
24 - ``add authentication negotiatePolicy <name> <rule> <reqAction><!--
    NeedCopy-->

```

- show authentication localPolicy <name><!--NeedCopy-->
- bind authentication vserver <name> -policy <policyname> [-priority <priority>][-secondary]]<!--NeedCopy-->
- show authentication vserver <name><!--NeedCopy-->

### Example

```

1 > add authentication localPolicy Authn-Pol-1 ns_true Done
2 > show authentication localPolicy
3 1) Name: Authn-Pol-1 Rule: ns_true Request action
   : LOCAL Done
4 > bind authentication vserver Auth-Vserver-2 -policy Authn-Pol-1
5 Done
6 > show authentication vserver Auth-Vserver-2 Auth-Vserver-2
   (10.102.29.77:443) - SSL Type: CONTENT State: UP Client Idle
   Timeout: 180 sec Down state flush: DISABLED Disable
   Primary Vserver On Down : DISABLED Authentication : ON
   Current AAA Users: 0 Authentication Domain:
   myCompany.employee.com

```

```
7 1) Primary authentication policy name: Authn-Pol-1 Priority: 0
8 Done
9
10 <!--NeedCopy-->
```

### To modify an existing authentication policy by using the command line interface

At the command prompt, type the following commands to modify an existing authentication policy:

```
“set authentication localPolicy [-reqlaction ]
```

```
1 Example
```

```
set authentication localPolicy Authn-Pol-1 'ns_true' Done
“
```

### To remove an authentication policy by using the command line interface

At the command prompt, type the following command to remove an authentication policy:

```
“rm authentication localPolicy
```

```
1 Example
```

```
rm authentication localPolicy Authn-Pol-1
Done
“
```

### To configure and bind authentication policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication**, and then select the type of policy that you want to create.
2. In the details pane, on the **Policies** tab, do one of the following:
  - To create a new policy, click **Add**.
  - To modify an existing policy, select the action, and then click **Edit**.
3. In the Create Authentication Policy or Configure Authentication Policy dialog, type or select the values for the parameters.
  - **Name** — policy name (Cannot be changed for a previously configured action)
  - **Authentication Type** — authtype
  - **Server** — authVsName

- **Expression** — rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click **Create** or **OK**. The policy that you created appears in the Policies page.
  5. Click the **Servers** tab, and in the details pane do one of the following:
    - To use an existing server, select it, and then click.
    - To create a server, click Add, and follow the instructions.
  6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.
  7. Click **Insert Policy**.
  8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
  9. In the **Priority** column to the left, modify the default priority to ensure that the policy is evaluated in the proper order.
  10. Click **OK**. A message appears in the status bar, stating that the policy has been configured successfully.

## LDAP authentication policies

September 21, 2020

As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the Citrix ADC to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex authentication, authorization, and auditing configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the **serverName** parameter instead of the **serverIP** parameter, and substitute the server's FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to

authenticate users, consider that configuring authentication, authorization, and auditing to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. You must also make sure that the AD server accepts the same binddn credentials that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the Citrix ADC receives an LDAP\_REFERRAL response to a request, authentication, authorization, and auditing follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, authentication, authorization, and auditing looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the binddn credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections (for plain text LDAP)
- 636 for secure LDAP connections (for SSL LDAP)
- 3268 for Microsoft unsecure LDAP connections (for plain text Global Catalog Server)
- 3269 for Microsoft secure LDAP connections (for SSL Global Catalog Server)

The following table contains examples of user attribute fields for LDAP servers:

LDAP server	User attribute	Case sensitive
Microsoft Active Directory Server	sAMAccountName	No
Novell eDirectory	ou	Yes
IBM Directory Server	uid	Yes
Lotus Domino	CN	Yes
Sun ONE directory (formerly iPlanet)	uid or cn	Yes

This table contains examples of the base DN:

LDAP server	Base DN
Microsoft Active Directory Server	DC=citrix,DC=local
Novell eDirectory	ou=users,ou=dev
IBM Directory Server	cn=users
Lotus Domino	OU=City,O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	ou=People,dc=citrix,dc=com

The following table contains examples of bind DN:

LDAP server	Bind DN
Microsoft Active Directory Server	CN=Administrator, CN=Users, DC=citrix, DC=local
Novell eDirectory	cn=admin, o=citrix
IBM Directory Server	LDAP_dn
Lotus Domino	CN=Notes Administrator, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	uid=admin,ou=Administrators, ou=TopologyManagement,o=NetscapeRoot

For more information about setting up authentication policies in general, see [Authentication Policies](#). For more information about Citrix ADC expressions, which are used in the policy rule, see [Policies and Expressions](#).

### To create LDAP authentication server by using the command line interface

At the command prompt, type the following commands:

```

1 add authentication ldapAction <name> {
2   -serverIP }
3   <ip_addr|ipv6_addr> | {
4   -serverName <string> }
5 }
```

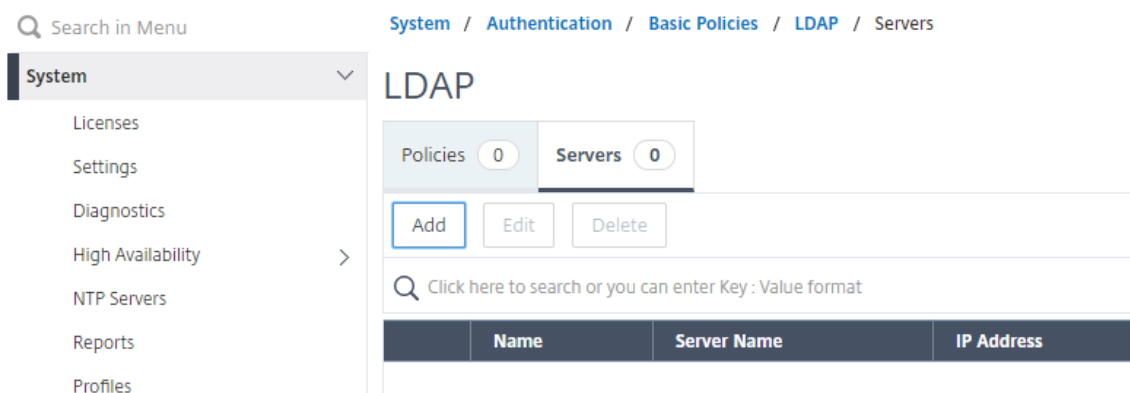

#### Example

```

1 add authentication ldapAction ldap_server -serverip 1.1.1.1 -serverName
  ldap_test
```

## To create LDAP authentication server by using the configuration utility

1. Navigate to **System > Authentication > Basic Policies > LDAP > Servers > Add**.

2. On the **Create Authentication LDAP Server** page, configure the parameters for the LDAP server.
3. Click **Create**.

## To enable authentication policy by using the command line interface

```
1 add authentication ldappolicy <name> <rule> [<reqAction>]
```

Example:

```
1 add authentication ldappolicy ldap-service-policy ns_true ldap_Server
```

## To create LDAP authentication policy by using the configuration utility

1. Navigate to **System > Authentication > Basic Policies > LDAP > Policies > Add**
2. On the **Create Authentication LDAP Policy** page, configure the parameters for LDAP policy.

← Create Authentication LDAP Policy

Name\*

Server\*

Expression\* Expression Editor

&&ns\_ext\_cgjREQ.HTTPURL

3. Click **Create**.

**Note**

You have an option to configure LDAP servers/policies through **Security** tab. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Basic Policies > LDAP > Servers / Policies**.

**To enable LDAP referral support by using the command line interface**

At the command prompt, type the following commands:

- `set authentication ldapAction <name> -followReferrals ON<!--NeedCopy-->`
- `set authentication ldapAction <name> -maxLDAPReferrals <integer><!--NeedCopy-->`

**Example**

```
1 > set authentication ldapAction ldapAction-1 -followReferrals ON
2 > set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2
```

**Key-based authentication support for LDAP users**

With key-based authentication, you can now fetch the list of public keys that are stored on the user object in LDAP server through SSH. The Citrix ADC appliance during role-based authentication (RBA) process must extract public SSH keys from the LDAP server. The retrieved public key, which is compatible with SSH, must allow you to log in through RBA method.

A new attribute “sshPublicKey” is introduced in the “add authentication ldapAction” and “set authentication ldapAction” commands. By using this attribute, you can obtain the following benefits:

- Can store the retrieved public key, and the LDAP action uses this attribute to retrieve SSH key information from LDAP server.
- Can extract attribute names of up to 24 KB.

**Note**

The external authentication server, such as LDAP is used only to retrieve SSH key information. It is not used for authentication purpose.

Following is an example of the flow of events through SSH:

- SSH daemon sends an AAA\_AUTHENTICATE request with password field empty to authentication, authorization, and auditing daemon port.
- If LDAP is configured to store the SSH public key, authentication, authorization, and auditing responds with “sshPublicKey” attribute along with other attributes.
- SSH daemon verifies these keys with the client keys.

- SSH daemon passes user name in the request payload, and authentication, authorization, and auditing returns the keys specific to this user along with generic keys.

**To configure the sshPublicKey attribute, at the command prompt type the following commands:**

- With add operation, you can add “sshPublicKey” attribute while configuring ldapAction command.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr
|*> | { -serverName <string> } } [-serverPort <port>] ... [-Attribute1 <
string>] ... [-Attribute16 <string>][-sshPublicKey <string>][-authentication
off]<!--NeedCopy-->
```

- With set operation, you can configure “sshPublicKey” attribute to an already added ldapAction command.

```
set authentication ldapAction <name> [-sshPublicKey <string>][-authentication
off]<!--NeedCopy-->
```

### Name-value attribute support for LDAP authentication

You can now configure the attributes of LDAP authentication with a unique name along with values. The names are configured in the LDAP action parameter and the values are obtained by querying for the name. By leveraging this feature, a Citrix ADC appliance administrator can now achieve the following benefits:

- Minimizes the effort for administrators by remembering the attribute by name (not just by value)
- Enhances the search to query the attribute value associated with a name
- Provides an option to extract multiple attributes

**To configure this feature at the Citrix ADC appliance command prompt, type:**

“add authentication ldapAction [-Attribute1 ]

```
1 Example
2
3 ```add authentication ldapAction ldapAct1 attribute1 mail<!--NeedCopy
-->
```

### Support for validating end-to-end LDAP authentication

The Citrix ADC appliance can now validate end-to-end LDAP authentication through GUI. To validate this feature, a new “test” button is introduced in GUI. A Citrix ADC appliance administrator can leverage this feature to achieve the following benefits:

- Consolidates the complete flow (packet engine – AAA daemon – external server) to provide better analysis
- Reduces time on validating and troubleshooting issues related to individual scenarios

You have two options to configure and view the test results of LDAP end-to-end authentication by using the GUI.

### From system option

1. Navigate to **System > Authentication > Basic Policies > LDAP**, click **Servers** tab.
2. Select the available **LDAP action** from the list.
3. On the **Configure Authentication LDAP Server** page, you have two options under **Connections Settings** section.
4. To check the LDAP server connection, click **Test LDAP Reachability** tab. You can view a pop-up message of successful connection to LDAP server with TCP port details and authenticity of valid credentials.
5. To view the end-to-end LDAP authentication, click **Test End User Connection** link.
6. On the **Test End User Connection** page, click **Test**.
  - On the authentication page, enter the valid credentials to log in. The success screen is displayed.

- If the authentication fails, the error screen is displayed.

### From Authentication option

1. Navigate to **Authentication > Dashboard**, select the available LDAP action from the list.
2. On the **Configure Authentication LDAP Server** page, you have two options under **Connections Settings** section.
3. To check the LDAP server connection, click **Test LDAP Reachability** tab. You can view a pop-up message of successful connection to LDAP server with TCP port details and authenticity of valid credentials.
4. To view the end-to-end LDAP authentication status, click **Test End User Connection** link.
5. On the **Test End User Connection** page, click **Test**.
  - On the authentication page, enter the valid credentials to log in. The success screen is displayed.

- If the authentication fails, the error screen is displayed.

### 14-day password expiry notification for LDAP authentication

The Citrix ADC appliance now supports 14-day password expiry notification for LDAP based authentication. By using this feature, administrators have an option to notify the end users about the password expiry threshold time in days. The 14-day password expiry notification is a precursor to self-service password reset (SSPR).

#### Note

The maximum value or threshold time in days for password expiry notification is 255 days.

### Advantages of password expiry notification

- Permit users to reset their passwords on their own and provide administrators a flexible way to notify end user about their password expiry in days.
- Eliminates end user dependence to track their password expiration days.
- Sends notifications to the VPN portal page to the users (based on the number of days) to change their password before expiry.

#### Note

This feature is applicable only for LDAP based authentication schemes, not for RADIUS or TACACS.

### Understanding the 14-day password notification

The Citrix ADC appliance fetches two attributes (Max-Pwd-Age and Pwd-Last-Set) from LDAP authentication server.

- **Max-Pwd-Age.** This attribute denotes the maximum amount of time, in 100-nanosecond intervals, until the password is valid. The value is stored as a large integer that represents the number of 100-nanosecond intervals from the time the password was set before the password expires.
- **Pwd-Last-Set.** This attribute determines the date and time at which the password for an account was last changed.

By fetching the two attributes from the LDAP authentication server, Citrix ADC appliance determines the time left for the password to expire for a particular user. This information is collected when any user credentials are validated on the authentication server and a notification is sent back to the user.

A new parameter “pwdExpiryNotification” is introduced in “set aaa parameter” command. By using this parameter, an administrator can keep track the number of days left for password expiry. The Citrix ADC appliance can now start notifying the end user about their password expiry.

#### Note

Currently, this feature works only for authentication servers having Microsoft AD servers with LDAP implementation. Support for OpenLDAP based servers is targeted later.

Following is an example of the flow of events for setting a 14-day password expiry notification:

1. An administrator, by using Citrix ADC appliance, sets a time (14-days) for password expiration.
2. The user sends an HTTP or HTTPS request to access a resource on the back-end server.

3. Before providing access, the Citrix ADC appliance validates the user credentials with what is configured on the LDAP authentication server.
4. Along with this query to the authentication server, the Citrix ADC appliance carries the request to fetch the details of two attributes (Max-Pwd-Age and Pwd-Last-Set).
5. Based on the time left for the password to expire, an expiry notification is displayed.
6. The user then takes appropriate action to update the password.

### To configure 14-day expiry notification by using the command line interface

#### Note

14-day expiry notification can be configured for CVPN and Full VPN use cases and not for ICA proxy.

At the command prompt, type the following commands:

- `set aaa parameter -pwdExpiryNotificationDays <positive_integer><!--NeedCopy-->`
- `show aaa parameter<!--NeedCopy-->`

#### Example

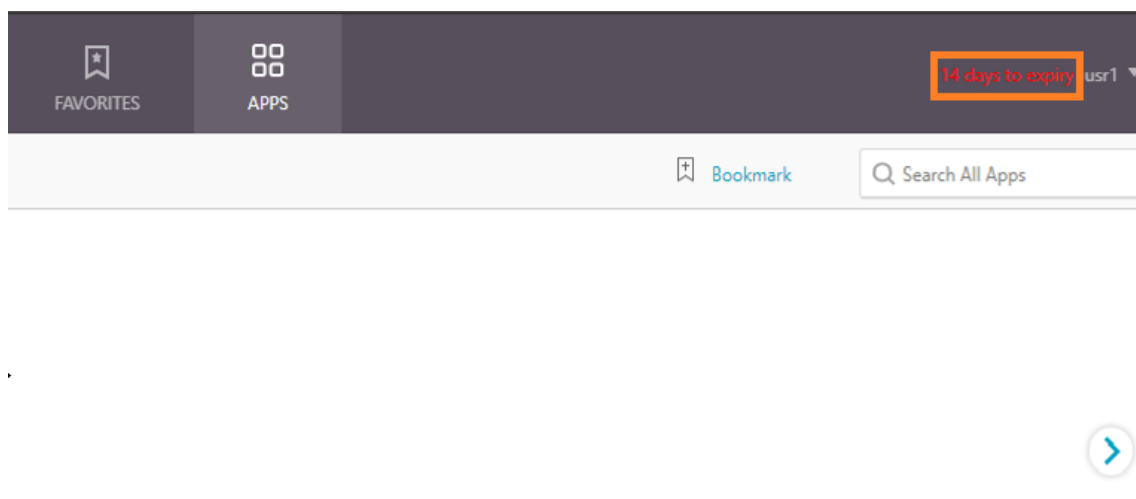

```

1 > set aaa parameter -pwdExpiryNotificationDays 14
2 Done
3 > show aaa parameter                               Configured AAA parameters
4 EnableStaticPageCaching: YES
5 EnableEnhancedAuthFeedback: NO
6 DefaultAuthType: LOCAL MaxAAAUsers:              Unlimited
7 AAAD nat ip: None
8 EnableSessionStickiness : NO
9 aaaSessionLogLevel : INFORMATIONAL                AAAD Log Level :
   INFORMATIONAL                                   Dynamic address: OFF
10 GUI mode: ON
11 Max Saml Deflate Size: 1024                       Password Expiry Notification Days
   : 14

```

### To configure 14-day expiry notification by using GUI

1. Navigate to **Security > AAA - Application Traffic > Authentication Settings**.
2. Click **Change authentication AAA settings**.
3. On the **Configure AAA Parameter** page, specify the days in the **Password Expiry Notification(days)** field.

4. Click **OK**.

The notification appears on the top right corner of VPN portal page, as shown below.

## ← Configure AAA Parameter

Maximum Number of Users	<input type="text" value="4294967295"/> ?
Max Login Attempts	<input type="text"/>
NAT IP Address	<input type="text" value="0 . 0 . 0 . 0"/>
Failed Login Timeout	<input type="text"/>
Default Authentication Type*	<input type="text" value="LOCAL"/> ▼
AAA Session Log Levels	<input type="text" value="INFORMATIONAL"/> ▼
AAAD Log Level	<input type="text" value="INFORMATIONAL"/> ▼
<input checked="" type="checkbox"/> Enable Static Caching	
<input type="checkbox"/> Enable Enhanced Authentication Feedback	
<input type="checkbox"/> Enable Session Stickiness	
Maximum Deflate Size	<input type="text" value="1024"/>
Persistent Login Attempts	<input type="text" value="DISABLED"/>
Password Expiry Notification(days)	<input type="text" value="14"/> ?

## Negotiate authentication policies

September 21, 2020

As with other types of authentication policies, a Negotiate authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

In addition to standard authentication functions, the Negotiate Action command can now extract user information from a keytab file instead of requiring you to enter that information manually. If a keytab has more than one SPN, authentication, authorization, and auditing selects the correct SPN. You can

configure this feature at the command line, or by using the configuration utility.

**Note**

These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

**To configure authentication, authorization, and auditing to extract user information from a keytab file by using the command line interface**

At the command prompt, type the appropriate command:

- `add authentication negotiateAction <name> [-keytab <string>]<!--NeedCopy -->`
- `set authentication negotiateAction <name> [-keytab <string>]<!--NeedCopy -->`

**Example**

```
1 > set authentication negotiateAction negotiateAction-1 -keytab keytab-1
2 <!--NeedCopy-->
```

**To configure authentication, authorization, and auditing to extract user information from a keytab file by using the configuration utility****Note**

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > Negotiate**.
2. In the details pane, on the **Servers** tab, do one of the following:
  - If you want to create a new **Negotiate** action, click **Add**.
  - If you want to modify an existing **Negotiate** action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new **Negotiate** action, in the **Name** text box, type a name for your new action. The name can be from one to 127 characters in length and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (\_) characters. If you are modifying an existing Negotiate action, skip this step. The name is read-only; you cannot change it.
4. Under **Negotiate**, if the Use Keytab file check box is not already checked, check it.
5. In the Keytab file path text box, type the full path and filename of the keytab file that you want to use.
6. In the Default authentication group text box, type the authentication group that you want to set as default for this user.

7. Click **Create** or **OK** to save your changes.

## RADIUS authentication policies

October 5, 2020

As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy comprises of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described in the following section.

Normally you configure the Citrix ADC to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex authentication, authorization, and auditing configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the **serverName** parameter for the **serverIP** parameter.

Before you decide whether to configure the Citrix ADC to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configuring authentication, authorization, and auditing to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

### Note

These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.

For more information about setting up authentication policies in general, see [Authentication Policies](#). For more information about Citrix ADC appliance expressions, which are used in the policy rule, see [Policies and Expressions](#).

### To add an authentication action for a RADIUS server by using the command line interface

If you authenticate to a RADIUS server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
“add authentication radiusAction [-serverip | -serverName ][-serverPort ] [-authTimeout ] {-radKey }
[-radNASip ( ENABLED | DISABLED )][-radNASid ][-radVendorID ][-radAttributeType ][-radGroupsPrefix
] [-radGroupSeparator ][-passEncoding ][-ipVendorID ] [-ipAttributeType ][-accounting ( ON | OFF )][-
pwdVendorID [-pwdAttributeType ]] [-defaultAuthenticationGroup ] [-callingstationid ( ENABLED | DIS-
ABLED )]
```

```
1 The following example adds a RADIUS authentication action named Authn-Act-1, with the server IP 10.218.24.65, the server port 1812, the authentication timeout 15 minutes, the radius key WareTheLorax, NAS IP disabled, and NAS ID NAS1.
```

```
add authentication radiusaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -
authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
Done
```

```
1 The following example adds the same RADIUS authentication action, but
using the server FQDN rad01.example.com instead of the IP.
```

```
add authentication radiusaction Authn-Act-1 -serverName rad01.example.com -serverport 1812
-authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
Done
```

```
1 RADIUS authentication might fail if both authentication and accounting
actions are configured on the same server port in “radiusAction”
command.
2
3 To overcome the preceding conditions, Citrix recommends you to use
different commands for RADIUS authentication and accounting.
4
5 - For RADIUS authentication, configure the authservRetry parameter
with default value 3.
6
7 - ``set authentication radiusAction Authn-Act-1 -serverip
10.218.24.65 -serverport 1812 -authservRetry 3<!--NeedCopy-->
```

- For RADIUS accounting, configure the **authservRetry** parameter with the value 1.

```
- set authentication radiusAction Authn-Act-1 -serverip 10.218.24.65
-serverport 1813 -authservRetry 1<!--NeedCopy-->
```

### To configure an authentication action for an external RADIUS server by using the command line

To configure an existing RADIUS action, at the command prompt, type the following command:

```
“set authentication radiusAction [-serverip | -serverName] ][-serverPort ] [-authTimeout ] {-radKey }
[-radNASip ( ENABLED | DISABLED )][-radNASid ] [-radVendorID ][-radAttributeType ][-radGroupsPrefix
] [-radGroupSeparator ] [-passEncoding ] [-ipVendorID ] [-ipAttributeType ] [-accounting ( ON | OFF )][
-pwdVendorID [-pwdAttributeType ] ] [-defaultAuthenticationGroup ] [-callingstationid ( ENABLED | DIS
ABLED )]
```

```
1 ## To remove an authentication action for an external RADIUS server by
   using the command line interface
2
3 To remove an existing RADIUS action, at the command prompt, type the
   following command:
4
5 ``rm authentication radiusAction <name><!--NeedCopy-->
```

### Example

```
1 > rm authentication radiusaction Authn-Act-1
2 Done
3
4 <!--NeedCopy-->
```

## To configure a RADIUS server by using the configuration utility

### Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Radius**
2. In the details pane, on the **Servers** tab, do one of the following:
  - To create a new RADIUS server, click **Add**.
  - To modify an existing RADIUS server, select the server, and then click **Edit**.
3. In the **Create Authentication RADIUS Server** or **Configure Authentication RADIUS Server** dialog, type or select the values for the parameters. To fill out parameters that appear beneath Send Calling Station ID, expand Details.
  - Name\*—radiusActionName (Cannot be changed for a previously configured action)
  - Authentication Type\*—authType (Set to RADIUS, cannot be changed)
  - Server Name / IP Address\*—Choose either Server Name or Server IP
    - Server Name\*—serverName <FQDN>
    - IP Address\*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
  - Port\*—serverPort
  - Time-out (seconds)\*—authTimeout
  - Secret Key\*—radKey (RADIUS shared secret.)

- Confirm Secret Key\*—Type the RADIUS shared secret a second time. (No command line equivalent.)
  - Send Calling Station ID—callingstationid
  - Group Vendor Identifier—radVendorID
  - Group Attribute Type—radAttributeType
  - IP Address Vendor Identifier—ipVendorID
  - pwdVendorID—pwdVendorID
  - Password Encoding—passEncoding
  - Default Authentication Group—defaultAuthenticationGroup
  - NAS ID—radNASid
  - Enable NAS IP address extraction—radNASip
  - Group Prefix—radGroupsPrefix
  - Group Separator—radGroupSeparator
  - IP Address Attribute Type—ipAttributeType
  - Password Attribute Type—pwdAttributeType
  - Accounting—accounting
4. Click **Create** or **OK**. The policy that you created appears in the Servers page.

### Support to pass through RADIUS attribute 66 (Tunnel-Client-Endpoint)

The Citrix ADC appliance now allows the pass-through of RADIUS attribute 66 (Tunnel-Client-Endpoint) during RADIUS authentication. It helps the second-factor authentication to receive the clients IP address from entrusting to make risk-based authentication decisions.

A new attribute “tunnelEndpointClientIP” is introduced in both “add authentication radiusAction” and “set radiusParams” command.

#### To use this feature, at the Citrix ADC appliance command prompt, type:

- `add authentication radiusAction <name> { -serverIP <ip_addr|ipv6_addr |*> | { -serverName <string> } } [-serverPort <port>] ... [-tunnelEndpointClientIP (ENABLED|DISABLED)]<!--NeedCopy-->`
- `set radiusParams { -serverIP <ip_addr|ipv6_addr|*> |{ -serverName < string> } } [-serverPort<port>] ... [-tunnelEndpointClientIP(ENABLED| DISABLED)]<!--NeedCopy-->`

#### Example

- `add authentication radiusAction radius -serverIP 1.217.22.20 -serverName FQDN -serverPort 1812 -tunnelEndpointClientIp ENABLED<!--NeedCopy-->`
- `set radiusParams -serverIp 1.217.22.20 -serverName FQDN1 -serverPort 1812 -tunnelEndpointClientIP ENABLED<!--NeedCopy-->`

## Support for validating end-to-end RADIUS authentication

The Citrix ADC appliance can now validate end-to-end RADIUS authentication through GUI. To validate this feature, a new “test” button is introduced in GUI. A Citrix ADC appliance administrator can use this feature to achieve the following benefits:

- Consolidates the complete flow (packet engine – AAA daemon – external server) to provide better analysis
- Reduces time on validating and troubleshooting issues related to individual scenarios

You have two options to configure and view the test results of RADIUS end-to-end authentication by using the GUI.

### From system option

1. Navigate to **System > Authentication > Basic Policies > RADIUS**, click **Servers** tab.
2. Select the available **RADIUS action** from the list.
3. On the **Configure Authentication RADIUS Server** page, you have two options under **Connections Settings** section.
4. To check the RADIUS server connection, click **Test RADIUS Reachability** tab.
5. To view the end-to-end RADIUS authentication, click **Test End User Connection** link.

### From Authentication option

1. Navigate to **Authentication > Dashboard**, select the available RADIUS action from the list.
2. On the **Configure Authentication RADIUS Server** page, you have two options under **Connections Settings** section.
3. To check the RADIUS server connection, click **Test RADIUS Reachability** tab.
4. To view the end-to-end RADIUS authentication status, click **Test End User Connection** link.

## SAML authentication policies

September 21, 2020

For information on Citrix ADC appliance as a SAML SP and IdP, see [SAML Authentication](#).

## Web authentication policies

September 21, 2020

Authentication, authorization, and auditing is now able to authenticate a user to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful. As with other types of authentication policies, a Web authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

To set up web-based authentication with a specific web server, first you create a web authentication action. Since authentication to web servers does not use a rigid format, you must specify exactly which information the web server requires and in which format when creating the action. To do this, you create an expression in Citrix ADC appliance default syntax that contains the following items:

- **Server IP**—The IP address of the authentication Web server.
- **Server Port**—The port of the authentication Web server.
- **Authentication Rule**—An expression in Citrix ADC appliance default syntax that contains the user’s credentials in the format that the Web server expects.
- **Scheme**—HTTP (for unencrypted web authentication) or HTTPS (for encrypted web authentication).
- **Success Rule**—An expression in Citrix ADC appliance default syntax that matches the web server response string that signifies that the user authenticated successfully.

For all other parameters, follow the normal rules for the add authentication action command.

Next you create a policy associated with that action. The policy is similar to an LDAP policy, and like LDAP policies uses Citrix ADC appliance syntax.

#### Note

These instructions assume that you are already familiar with the authentication requirements of the web server(s) to which you want to authenticate, and have already configured the web authentication server.

### To configure a Web authentication action by using the command line interface

To create a web authentication action at the command line, at the command line type the following command:

```
“add authentication webAuthAction -serverIP <ip_addr|ipv6_addr|*> -serverPort <port|*> [-fullReqExpr ] -scheme ( http | https ) -successRule [-defaultAuthenticationGroup ][-Attribute1 ][-Attribute2 ] [-Attribute3 ][-Attribute4 ] [-Attribute5 ][-Attribute6 ] [-Attribute7 ][-Attribute8 ] [-Attribute9 ][-Attribute10 ] [-Attribute11 ][-Attribute12 ] [-Attribute13 ][-Attribute14 ] [-Attribute15 ][-Attribute16 ]
```

1 Example

```
add authentication webAuthAction webauth1 -serverIP 10.214.56.31 -serverPort 80 -
```

““

## To configure a Web authentication action by using the configuration utility

### Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > LDAP**.
2. In the details pane, on the **Servers** tab, do one of the following:
  - If you want to create a new web authentication action, click **Add**.
  - If you want to modify an existing web authentication action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new web authentication action, in the **Create Authentication Web** server dialog box, **Name** text box, type a name for the new web authentication action. The name can be from one to 127 characters in length, and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (\_) characters. If you are modifying an existing web authentication action, skip this step. The name is read-only; you cannot change it.
4. In the **Web Server IP Address** text box, type the IPv4 or IPv6 IP address of the authentication web server. If the address is an IPv6 IP address, select the IPv6 check box first.
5. In the Port text box, type the port number on which the web server accepts connections.
6. Select **HTTP** or **HTTPS** in the **Protocol** drop-down list.
7. In the HTTP Request Expression text area, type a PCRE-format regular expression that creates the web server request that contains the user's credentials in the exact format expected by the authentication web server.
8. In the Expression to validate the Authentication text area, type a Citrix ADC appliance default syntax expression that describes the information in the web server response that indicates that user authentication was successful.
9. Fill out the remaining fields as described in the general authentication action documentation.
10. Click **OK**.

## Configuring advanced authentication policies

September 21, 2020

If you know exactly how you want an authentication policy to be configured, you can use the advanced authentication policy dialog to create the policy quickly.

## To configure an advanced authentication policy by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies**, and then select Policy.
2. In the details pane do one of the following:
  - To create a new policy, click **Add**.
  - To modify an existing policy, select the policy, and then click **Edit**.
3. In the **Create Authentication Policy** or **Configure Authentication Policy** dialog box, type or select values for the parameters.
  - Name\*—The policy name. Cannot be changed for a previously configured policy.
  - Action Type\*—The policy type: Cert, Negotiate, LDAP, RADIUS, SAML, SAMLIDP, TACACS, or WEBAUTH.
  - Action\*—The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create a new action of the proper type.
  - Log Action—The audit action to associate with the policy. You can choose an existing audit action, or click the plus and create a new action.
  - Expression\*—The rule that selects connections to which you want to apply the action that you specified. The rule can be simple (“true” selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
  - Comment—You can type a comment that describes the type of traffic that this authentication policy will apply to. Optional.
4. Click **Create** or **OK**, and then click **Close**. If you created a policy, that policy appears in the Authentication Policies and Servers page.

## Enable SSO for Basic, Digest, and NTLM authentication

December 23, 2020

From Citrix ADC feature release 12.1 build 60.16 and above, the following SSO types are disabled globally.

- Basic authentication
- Digest Access authentication
- NTLM without Negotiate NTLM2 Key or Negotiate Sign

Single Sign-On (SSO) configuration in Citrix ADC and Citrix Gateway can be enabled at global level and also per traffic level. By default the SSO configuration is **OFF** and an administrator can enable the

SSO per traffic or globally. From a security point of view, Citrix recommends administrators to turn SSO globally **OFF** and enable per traffic basis. This enhancement is to make SSO configuration more secure by disabling certain type of SSO methods globally.

StoreFront SSO configuration is impacted (disabled) only for 13.0 build 64.35. The configuration will not be impacted in the future 13.0 builds.

### Non-impacted SSO types

The following SSO types are not impacted with this enhancement.

- Kerberos authentication
- SAML authentication
- Form based authentication
- OAuth bearer authentication
- NTLM with Negotiate NTLM2 Key or Negotiate Sign

### Impacted SSO configurations

Following are the impacted (disabled) SSO configurations.

#### Global configurations

```
1 set tmsessionparam -SSO ON
2 set vpnparameter -SSO ON
3 add tmsessionaction tm_act -SSO ON
4 add vpn sessionaction tm_act -SSO ON
```

You can enable/disable SSO as a whole and cannot modify individual SSO types.

### Security measures to be applied

As part of the security measures, security sensitive SSO types are disabled in the global configuration but are allowed only through a Traffic action configuration.

So, if a back-end server expects Basic, Digest, or NTLM without Negotiate NTLM2 Key or Negotiate Sign, the administrator can allow SSO only through the following configuration.

#### Traffic Action

```
1 add vpn trafficaction tf_act http -SSO ON
2 add tm trafficaction tf_act -SSO ON
```

## Traffic Policy

```
1 add tm trafficpolicy <name> <rule> tf_act
2 add vpn trafficpolicy <name> <rule> tf-act
```

Administrator must have an appropriate rule configured for traffic policy to make sure SSO is enabled for only trusted back-end server.

## AAA-TM

### Scenarios based on global configuration:

```
1 set tmsessionparam -SSO ON
```

Workaround:

```
1 add tm trafficaction tf_act -SSO ON
2 add tm trafficpolicy tf_pol true tf_act
```

### Bind the following traffic policy to all LB virtual server where SSO is expected:

```
1 bind lb vserver <LB VS Name> -policy tf_pol -priority 65345
```

### Scenarios based on session Policy configuration:

```
1 add tmsessionaction tm_act -SSO ON
2 add tmsession policy <name> <rule> tm_act
3 add tm trafficaction tf_act -SSO ON
4 add tm trafficpolicy tf_pol <same rule as session Policy> tf_act
```

### Points of note:

- Citrix ADC AAA user/group for the preceding session policy must be replaced by traffic policy.
- Bind the following policy to the load balancing virtual servers for the preceding session policy, `bind lb vserver [LB VS Name] -policy tf_pol -priority 65345`
- If a traffic policy with other priority is configured, the preceding command does not serve good.

### The following section deals with scenarios based on conflict with multiple traffic policies associated with a traffic:

For a particular TM traffic, only one TM traffic policy is applied. Because of global setting of SSO feature changes, applying an additional TM traffic policy with low priority might not be applicable in case a TM traffic policy with high priority (that does not have required SSO configuration) is already applied. The following section describes method to ensure that such cases are handled.

**Consider that the following three traffic policies with higher priority are applied to load balancing (LB) virtual server:**

```

1 add tm trafficaction tf_act1 <Addition config>
2 add tm trafficaction tf_act2 <Addition config>
3 add tm trafficaction tf_act3 <Addition config>
4
5 add tm trafficpolicy tf_pol1 <rule1> tf_act1
6 add tm trafficpolicy tf_pol2 <rule2> tf_act2
7 add tm trafficpolicy tf_pol3 <rule3> tf_act3
8
9 bind lb vserver <LB VS Name> -policy tf_pol1 -priority 100
10 bind lb vserver <LB VS Name> -policy tf_pol2 -priority 200
11 bind lb vserver <LB VS Name> -policy tf_pol3 -priority 300

```

**Error prone method - To resolve the Global SSO configuration, you add the following configuration:**

```

1 add tm trafficaction tf_act_default -SSO ON
2 add tm trafficpolicy tf_pol_default true tf_act_default
3
4 bind lb vserver <LB VS Name> -policy tf_pol_default -priority 65345

```

**Note:** The preceding modification can break SSO for traffic which hits <tf\_pol1/tf\_pol2/tf\_pol3> as for these traffic, traffic policy is not be applied.

**Correct method - To mitigate this, the SSO property must be applied individually for each of the corresponding traffic actions:**

For example, in the preceding scenario, for SSO to happen for the traffic hitting tf\_pol1/tf\_pol3, the following configuration must be applied along with .

```

1 add tm trafficaction tf_act1 <Addition config> -SSO ON
2 add tm trafficaction tf_act3 <Addition config> -SSO ON

```

## Citrix Gateway cases

**Scenarios based on global configuration:**

```

1 set vpnparameter -SSO ON

```

Workaround:

```

1 add vpn trafficaction vpn_tf_act http -SSO ON
2 add vpn trafficpolicy vpn_tf_pol true vpn_tf_act

```

Bind the following traffic policy to all VPN virtual server where SSO is expected:

```
1 bind vpn vserver vpn_vs -policy vpn_tf_pol -priority 65345
```

#### Scenarios based on session Policy configuration:

```
1 add vpn sessionaction vpn_sess_act -SSO ON
2 add vpnsession policy <name> <rule> vpn_sess_act
```

#### Points to note:

- Citrix ADC AAA user/group for the preceding session policy must be replaced by traffic policy.
- Bind the following policy to the LB virtual servers for the preceding session policy, `bind lb virtual server [LB VS Name] -policy tf_pol -priority 65345`.
- If a traffic policy with other priority is configured, the preceding command does not serve good. The following section deals with scenarios based on conflict with multiple traffic policies associated with traffic.

#### Functional scenarios based on conflict with multiple traffic policies associated with a traffic:

For a particular Citrix Gateway traffic, only one VPN traffic policy is applied. Because of global setting of SSO feature changes, applying an additional VPN traffic policy with low priority might not be applicable if there are other VPN traffic policies with high priority that does not have a required SSO configuration.

#### The following section describes method to ensure such cases are handled:

Consider there are three traffic policies with higher priority applied to a VPN virtual server:

```
1 add vpn trafficaction tf_act1 <Addition config>
2 add vpn trafficaction tf_act2 <Addition config>
3 add vpn trafficaction tf_act3 <Addition config>
4
5 add vpn trafficpolicy tf_pol1 <rule1> tf_act1
6 add vpn trafficpolicy tf_pol2 <rule2> tf_act2
7 add vpn trafficpolicy tf_pol3 <rule3> tf_act3
8
9 bind vpn vserver <VPN VS Name> -policy tf_pol1 -priority 100
10 bind vpn vserver <VPN VS Name> -policy tf_pol2 -priority 200
11 bind vpn vserver <VPN VS Name> -policy tf_pol3 -priority 300
```

**Error prone method:** To resolve the Global SSO configuration, you add the following configuration:

```
1 add vpn trafficaction tf_act_default -SSO ON
2 add vpn trafficpolicy tf_pol_default true tf_act_default
3
```

```
4 bind vpn vserver <VPN VS Name> -policy tf_pol_default -priority 65345
```

**Note:** The preceding modification can break SSO for the traffic that hits <tf\_pol1/tf\_pol2/tf\_pol3> as for these traffic, traffic policy is not applied.

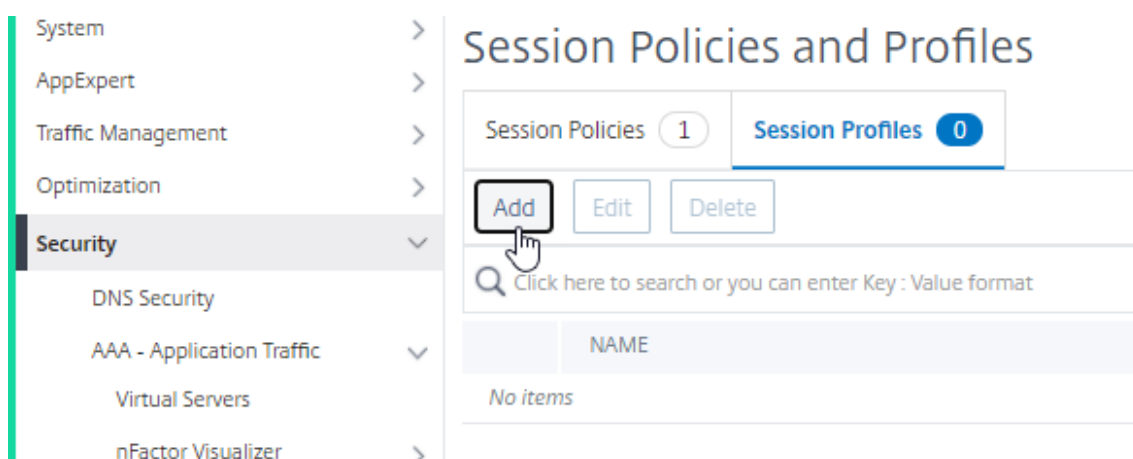

**Correct method:** To mitigate this, the SSO property must be applied individually for each of the corresponding traffic actions.

For example in the preceding scenario, for SSO to happen for traffic hitting tf\_pol1/tf\_pol3, the following configuration must be applied along with .

```
1 add vpn trafficaction tf_act1 [Additional config] -SSO ON
2
3 add vpn trafficaction tf_act3 [Additional config] -SSO ON
```

## Configure SSO using GUI

1. Navigate to **Security > AAA – Application Traffic > Policies > Session**, Select **Session Profiles** tab, and click **Add**.

2. Enter a name for the session profile, click **Override Global** check box next to **Single Sign-on to Web Applications** field, and click **Create**.

## ← Create Session Profile

## Self-service password reset

December 16, 2020

Self-service password reset is a web-based password management solution. It is available in both authentication, authorization, and auditing feature of Citrix ADC appliance and Citrix Gateway. It eliminates the user's dependency on administrator's assistance for changing password.

The self-service password reset provides end user the ability to securely reset or create a password in the following scenarios:

- User has forgotten the password.
- User is unable to logon.

Until now, if an end user forgets an AD password, the end user had to contact the AD administrator to reset the password. With self-service password reset functionality, an end user can reset the password without an administrator's intervention.

The following are some of the benefits of using self-service password reset:

- Increased productivity through automatic password change mechanism, which eliminates the lead-time for users to wait for password resets.
- With automatic password change mechanism, admins can concentrate on other critical tasks.

The following figure illustrates self-service password reset flow to reset the password.

To use the self-service password reset, a user must be registered either with the Citrix authentication, authorization, and auditing or with Citrix Gateway virtual server.

Self-service password reset provides the following capabilities:

- **New user self-registration.** You can self-register as a new user.
- **Configure knowledge-based questions.** As an administrator, you can configure a set of questions for users.
- **Alternate email ID registration.** You must provide an alternate email ID while registration. The OTP is sent to the alternate email ID because the user has forgotten the primary email ID password.

**Note:** Starting from version 12.1 build 51.xx, alternate email ID registration can be done as standalone. A new Loginschema, **AltEmailRegister.xml** is introduced to do only alternate email ID registration. Previously, alternate email ID registration could be done only while doing the KBA registration.

- **Reset forgotten password.** User can reset the password by answering the knowledge-based questions. As an administrator, you can configure and store the questions.

The self-service password reset provides the following two new authentication mechanisms:

- **Knowledge based question and answer.** You must register to Citrix authentication, authorization, and auditing or to a Citrix Gateway before selecting the knowledge-based question and answer schema.
- **Email OTP authentication.** An OTP is sent to the alternate email ID, which user has registered during self-service password reset registration.

### Note

These authentication mechanisms can be used for the self-service password reset use cases, and for any authentication purposes similar to any of the existing authentication mechanisms.

## Prerequisites

Before you configure the self-service password reset, review the following prerequisites:

- Citrix ADC feature release 12.1, build 50.28.
- Supported version is 2016, 2012, and 2008 AD domain function level.
- The ldapBind username bound to the Citrix ADC needs to have write access to the users AD path.

### Note

Self-service password reset is supported in nFactor authentication flow only. For more information, see [nFactor Authentication through Citrix ADC](#).

## Limitations

Following are some of the limitations of self-service password reset:

- Self-service password reset is available only if authentication back-end is LDAP.
- User cannot see the already registered alternate email ID.
- Knowledge-based question and answer, and email OTP authentication and registration cannot be the first factor in the authentication flow.
- For Native Plug-in and Receiver, registration is supported only through browser.
- The minimum certificate size used for self-service password reset is 1024 bytes, and must follow x.509 standard.

## Active directory setting

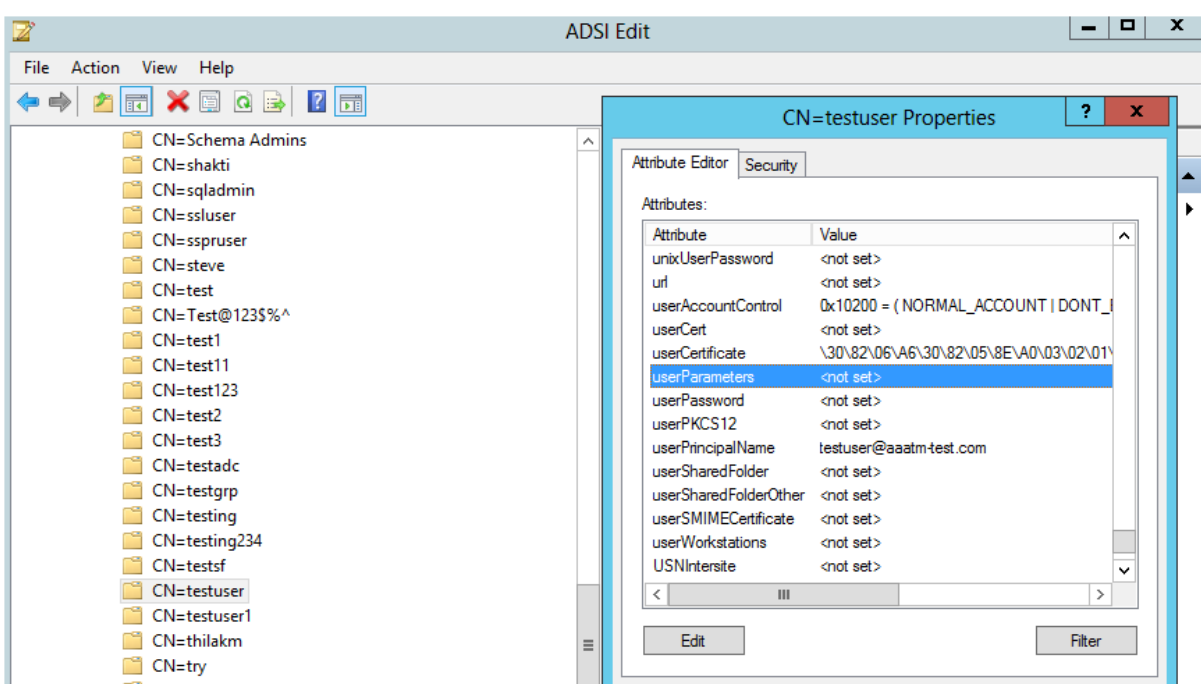

The Citrix ADC knowledge-based question and answer, and email OTP uses AD attribute to store users data. You must configure an AD attribute to store the questions and answers along with the alternate email ID. The Citrix ADC appliance stores it in the configured KB attribute in the AD user object. When configuring an AD attribute, consider the following:

- The attribute length must be at least 128 characters.
- The AD attribute must support 32k value of maximum length.
- Attribute type must be a 'DirectoryString'.
- A single AD attribute can be used for knowledge-based question and answer and alternate email ID.

- A single AD Attribute cannot be used for Native OTP and knowledge-based question and answer or alternative email ID registration.
- Citrix ADC LDAP administrator must have write access to the selected AD attribute.

You can also use an existing AD attribute. However, make sure that the attribute you plan to use is not used for other cases. For example, `userParameters` is an existing attribute within the AD user that you could use. To verify this attribute, perform the following steps:

1. Navigate to **ADSI > select user**.
2. Right-click and scroll down to attribute list.
3. On the **CN=testuser Properties** window pane, you can see the **userParameters** attribute is not set.

## Self-service password reset registration

To implement self-service password reset solution on a Citrix ADC appliance, you have to perform the following:

- Self-service password reset (knowledge-based question and answer/email ID) registration.
- User Logon Page (for password reset, which includes knowledge-based question and answer and email OTP validation and final password reset factor).

A set of predefined questions catalog is provided as a JSON file. As an administrator, you can select the questions and create self-service password reset registration login schema through Citrix ADC GUI. You can choose any of the following options:

- Select a maximum of four system-defined questions.

- Provide an option for users to customize two questions and answers.

### To view the default knowledge-based questions JSON file from CLI

```
root@ns# cd /nsconfig/loginschema/LoginSchema/  
root@ns# cat KBQuestions.json  
[  
  {"question":"What is the last name of the teacher who gave you your first failing  
grade?"},  
  {"question":"What is the name of your favourite childhood friend?"},  
  {"question":"Where were you when you first heard about 9/11?"},  
  {"question":"What is the name of a college you applied to but didn't attend?"},  
  {"question":"What was the last name of your third grade teacher?"},  
  {"question":"What was the name of your first stuffed animal?"},  
  {"question":"What is the name of the teacher who gave you your first A?"},  
  {"question":"What is the name of the city where you got lost?"},  
  {"question":"In what city or town did your mother and father meet?"},  
  {"question":"What was your most hated food as a child?"},  
  {"question":"What was your most favourite food as a child?"},  
  {"question":"What is your favourite website?"},  
  {"question":"What is your most disliked website?"},  
  {"question":"What is your dream job?"},  
  {"question":"Why did the chicken cross the road?"},  
  {"question":"Name your first boss."},  
  {"question":"What is the name of your favorite school teacher?"},  
  {"question":"What is the name of your favorite actor or actress?"},  
  {"question":"What is the title of your favorite movie?"},  
  {"question":"In what city or town did you spend most of your youth?"}  
]
```

#### Note

- Citrix Gateway includes the set of system-defined questions by default. Administrator can edit the “KBQuestions.json” file to include their choice of questions.
- System-defined questions are displayed only in English and language localisation support is not available for these questions.

### To complete knowledge-based question and answer registration Login Schema using GUI

1. Navigate to **Security > AAA – Application Traffic > Login Schema**.

2. On the **Login Schema** page, click **Profiles**.
3. Click **Add KBA Registration Login Schema**.
4. On the **Create Authentication Login Schema** page, specify a name in **Schema Name** field.

**Question2:**  
Choose a question from the available list and move it to the configured list.

Choose Questions

<p><b>Available (18)</b> <span style="float: right;">Select All</span></p> <ul style="list-style-type: none"> <li>What is your most disliked website?</li> <li>What is your dream job?</li> <li>Why did the chicken cross the road?</li> <li>Name your first boss.</li> <li>What is the name of your favorite school?</li> </ul>	<p>▶</p> <p>◀</p>	<p><b>Configured (2)</b> <span style="float: right;">Remove All</span></p> <ul style="list-style-type: none"> <li>Where were you when you first heard about...</li> <li>What was the last name of your third grade...</li> </ul>	<p>Question Field</p> <input type="text"/> <p>Answer Field</p> <input type="text"/>
--	-------------------	--	--

---

**Question3:**  
Choose a question from the available list and move it to the configured list.

Choose Questions

<p><b>Available (18)</b> <span style="float: right;">Select All</span></p> <ul style="list-style-type: none"> <li>What is your dream job?</li> <li>Why did the chicken cross the road?</li> <li>What is the name of your favorite actor?</li> <li>What is the title of your favorite movie?</li> <li>In what city or town did you spend most...</li> </ul>	<p>▶</p> <p>◀</p>	<p><b>Configured (2)</b> <span style="float: right;">Remove All</span></p> <ul style="list-style-type: none"> <li>Name your first boss.</li> <li>What is the name of your favorite school tea...</li> </ul>	<p>Question Field</p> <input type="text"/> <p>Answer Field</p> <input type="text"/>
--	-------------------	---	--

---

**Question4:**  
Choose a question from the available list and move it to the configured list.

Choose Questions

<p><b>Available (18)</b> <span style="float: right;">Select All</span></p> <ul style="list-style-type: none"> <li>What was your most favourite food as a...</li> <li>What is your favourite website?</li> <li>What is your most disliked website?</li> <li>Why did the chicken cross the road?</li> <li>What is the name of your favorite school?</li> </ul>	<p>▶</p> <p>◀</p>	<p><b>Configured (2)</b> <span style="float: right;">Remove All</span></p> <ul style="list-style-type: none"> <li>What is the name of the city where you got...</li> <li>Name your first boss.</li> </ul>	<p>Question Field</p> <input type="text"/> <p>Answer Field</p> <input type="text"/>
--	-------------------	---	--

5. Select the questions of your choice and move it to the **Configured** list.
6. In the **User Defined Questions** section, you can provide questions and answers in the Q1 and A1 fields.

**Specify User Defined Questions**

You have an option to define, a maximum of two question used to authenticate the user.

<p><b>Question1:</b></p> <p>Question Field</p> <input type="text" value="Q1"/> <p>Answer Field</p> <input type="text" value="A1"/>	<p><b>Question2:</b></p> <p>Question Field</p> <input type="text"/> <p>Answer Field</p> <input type="text"/>
---	---

▲ User Defined Questions

7. In the **Email Registration** section, check the **Register Alternate Email** option. You can register the **Alternate Email ID** from user registration logon page to receive the OTP.

Provide an additional email ID to receive notifications.

Register Alternate Email

---

▲ Email Registration

---

**Create**    Close

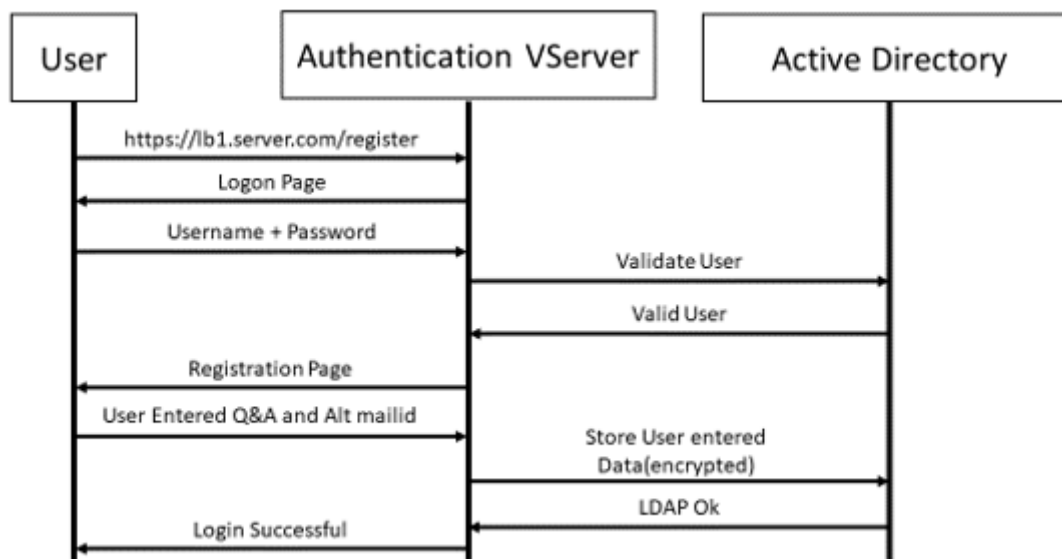

8. Click **Create**. The login schema once generated displays all the configured questions to the end user during registration process.

### Create user registration and management workflow using CLI

The following are required before you begin the configuration:

- IP address assigned to the authentication virtual server
- FQDN corresponding to the assigned IP address
- Server certificate for authentication virtual server

To setup device registration and management page, you require an authentication virtual server. The following figure illustrates the user registration.

### To create authentication virtual server

1. Configure an authentication virtual server. It must be of type SSL and make sure to bind authentication virtual server with portal theme.

```

1 > add authentication vserver <vServerName> SSL <ipaddress> <port>
2 > bind authentication vserver <vServerName> [-portaltheme<string>]

```

## 2. Bind SSL virtual server certificate-key pair.

```

1 > bind ssl vserver <vServerName> certkeyName <string>

```

### Example:

```

1 > add authentication vserver authvs SSL 1.2.3.4 443
2 > bind authentication vserver authvs -portaltheme RFWebUI
3 > bind ssl vserver authvs -certkeyname c1

```

## To create LDAP logon action

```

1 > add authentication ldapAction <name> {
2 -serverIP <ipaddr|ipv6_addr> [-serverPort <port>] [-ldapBase <BASE> ]
  [-ldapBindDn <AD USER>] [-ldapBindDnPassword <PASSWORD>] [-
  ldapLoginName <USER FORMAT>]

```

### Note

You can configure any authentication policy as the first factor.

### Example:

```

1 > add authentication ldapAction ldap_logon_action -serverIP 1.2.3.4
  -serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -
  ldapBindDn administrator@ctxnsdev.com -ldapBindDnPassword
  PASSWORD -ldapLoginName samAccountName -serverport 636 -sectype
  SSL -KBAttribute userParameters

```

## To create authentication policy for LDAP logon

```

1 > add authentication policy <name> <rule> [<reqAction>]

```

### Example:

```

1 > add authentication policy ldap_logon -rule true -action
  ldap_logon_action

```

## To create knowledge-based question and answer registration action

Two new parameters are introduced in ldapaction. “KBAttribute” for KBA Authentication (Registration and validation) and “alternateEmailAttr” for registration of user’s alternate email ID.

```
1 > add authentication ldapAction <name> {
2 -serverIP <ipaddr|ipv6_addr|> [-serverPort <port>] [-ldapBase <BASE>
  ] [-ldapBindDn <AD USER>] [-ldapBindDnPassword <PASSWORD>] [-
  ldapLoginName <USER FORMAT>] [-KBAttribute <LDAP ATTRIBUTE>] [-
  alternateEmailAttr <LDAP ATTRIBUTE>]
```

### Example:

```
1 > add authentication ldapAction ldap1 -serverIP 1.2.3.4 -sectype
  ssl -serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -
  ldapBindDn administrator@ctxnsdev.com -ldapBindDnPassword
  PASSWORD -ldapLoginName samAccountName -KBAttribute
  userParameters -alternateEmailAttr userParameters
```

## Display user registration and management screen

The “KBRegistrationSchema.xml” login schema is used to display the user registration page to the end user. Use the following CLI to display the login schema.

```
1 > add authentication loginSchema <name> -authenticationSchema <string>
```

### Example:

```
1 > add authentication loginSchema kba_register -authenticationSchema /
  nsconfig/loginschema/LoginSchema/KBRegistrationSchema.xml
```

Citrix recommends two ways of displaying the user registration and management screen: URL or LDAP Attribute.

### Using URL

If the URL path contains ‘/register’ (for example, <https://lb1.server.com/register>) then the user registration page is displayed using URL.

## To create and bind registration policy

```
1 > add authentication policylabel user_registration -loginSchema
  kba_register
```

```
2 > add authentication policy ldap1 -rule true -action ldap1
3 > bind authentication policylabel user_registration -policy ldap1 -
    priority 1
```

### To bind authentication policy to authentication, authorization, and auditing virtual server when the URL contains '/register'

```
1 > add authentication policy ldap_logon -rule "http.req.cookie.value(\
    NSC_TASS\").contains(\"register\")" -action ldap_logon
2 > bind authentication vserver authvs -policy ldap_logon -nextfactor
    user_registration -priority 1
```

### To bind certificate to VPN global

```
1 bind vpn global -userDataEncryptionKey c1
```

#### Note

You must bind the certificate to encrypt the user data (KB Q&A and registered alternate email ID) stored in AD attribute.

### Using attribute

You can bind authentication policy to the authentication, authorization, and auditing virtual server to check if the user is already registered or not. In this flow, any of the preceding policies before knowledge-based question and answer registration factor needs to be LDAP with KBAattribute configured. This is to check if the AD user is registered or not using an AD attribute.

#### Important

The rule "AAA.USER.ATTRIBUTE("kba\_registered").EQ("0")" enforces new users to register for knowledge-based questions and answer and alternate email.

### To create authentication policy to check if the user is not already registered

```
1 > add authentication policy switch_to_kba_register -rule "AAA.USER.
    ATTRIBUTE(\"kba_registered\").EQ(\"0\")" -action NO_AUTHN
2 > add authentication policy first_time_login_forced_kba_registration -
    rule true -action ldap1
```

### To create registration policy label and bind to the LDAP registration policy

```
1 > add authentication policylabel auth_or_switch_register -loginSchema
  LSCHEMA_INT
2 > add authentication policylabel kba_registration -loginSchema
  kba_register
3
4 > bind authentication policylabel auth_or_switch_register -policy
  switch_to_kba_register -priority 1 -nextFactor kba_registration
5 > bind authentication policylabel kba_registration -policy
  first_time_login_forced_kba_registration -priority 1
```

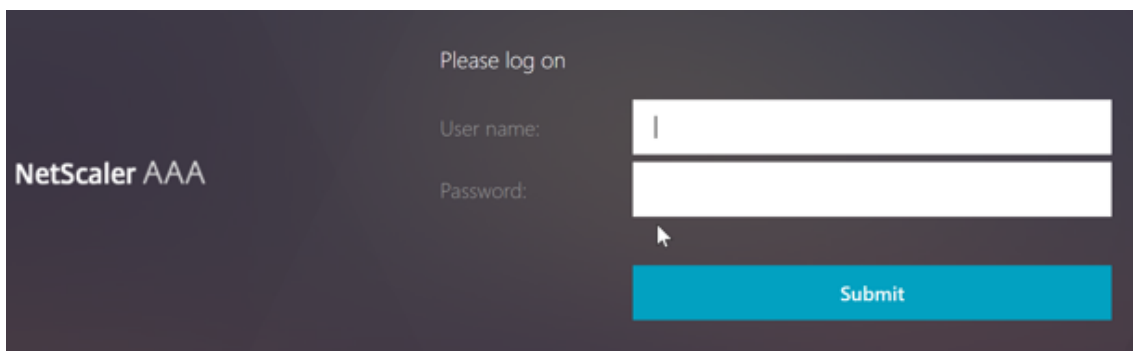

### To bind authentication policy to authentication, authorization, and auditing virtual server

```
1 bind authentication vserver authvs -policy ldap_logon -nextfactor
  auth_or_switch_register -priority 2
```

### User registration and management validation

Once you have configured all the steps mentioned in the previous sections, you should see the UI screenshots shown below.

1. Enter the lb vserver URL; for example, <https://lb1.server.com>. The logon screen is displayed.

2. Enter the user name and password. Click **Submit**. The **User Registration** screen is displayed.

NetScaler AAA

KBA Registration

Question: What is the name of your favourite childhood frie ▾

Answer:

Question: Where were you when you first heard about 9/11 ▾

Answer:

Question: Name your first boss. ▾

Answer:

Question: What is the name of the city where you got lost? ▾

Answer:

Q1:

A1:

Alternate Email Id:

Submit

3. Select the preferred question from the dropdown list and enter the **Answer**.
4. Click **Submit**. The user registration successful screen is displayed.

### Configure user logon page

In this example, administrator assumes that the first factor is LDAP logon (for which the end user has forgotten the password). The user then follows the knowledge-based question and answer registration and email ID OTP validation, and finally resets the password using self-service password reset.

You can use any of the authentication mechanisms for self-service password reset. Citrix recommends having either a knowledge-based question and answer, and email OTP or both to achieve strong privacy, and to avoid any illegitimate user password resets.

The following are required before you start configuring the user logon page:

- IP for load balancer virtual server
- Corresponding FQDN for the load balancer virtual server
- Server certificate for the load balancer

### Create load balancer virtual server by using CLI

To access the internal website, you have to create an LB virtual server to front the back-end service and delegate the authentication logic to authentication virtual server.

```
1 > add lb vserver lb1 SSL 1.2.3.162 443 -persistenceType NONE -
    cltTimeout 180 -AuthenticationHost otpauth.server.com -
    Authentication ON -authnVsName authvs
2
3 > bind ssl vserver lb1 -certkeyname c1
```

To represent the backend service in load balancing:

```
1 > add service iis_backendsso_server_com 1.2.3.4 HTTP 80
2
3 > bind lb vserver lb1 iis_backendsso_server_com
```

### Create LDAP action with authentication disabled as first policy

```
1 > add authentication ldapAction ldap3 -serverIP 1.2.3.4 -serverPort 636
    -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
    administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
    ldapLoginName samAccountName -authentication disabled
2
3 > add authentication policy ldap3 -rule aaa.LOGIN.VALUE("passwdreset").
    EQ("1") -action ldap3
```

### Create knowledge-based question and answer validation action

For knowledge-based question and answer validation in self-service password reset flow, you need to configure LDAP server with authentication disabled.

```
1 > add authentication ldapAction <LDAP ACTION NAME> -serverIP <SERVER IP>
    > -serverPort <SERVER PORT> -ldapBase <BASE> -ldapBindDn <AD USER> -
    ldapBindDnPassword <PASSWORD> -ldapLoginName <USER FORMAT> -
    KBAAttribute <LDAP ATTRIBUTE> - alternateEmailAttr <LDAP ATTRIBUTE>
    -authentication DISABLED
```

### Example:

```
1 > add authentication ldapAction ldap2 -serverIP 1.2.3.4 -serverPort 636
    -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
    administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
    ldapLoginName samAccountName -KBAAttribute userParameters -
    alternateEmailAttr userParameters -authentication disabled
```

## To create authentication policy for knowledge-based question and answer validation using CLI

```
1 add authentication policy kba_validation -rule true -action ldap2
```

### Create email validation action

LDAP must be a prior factor to email validation factor because you need the user's email ID or alternate email ID as part of self-service password reset registration.

## To configure email action using CLI

```
1 add authentication emailAction emailact -userName sender@example.com -
  password <Password> -serverURL "smtps://smtp.example.com:25" -
  content "OTP is $code"
```

### Example:

```
1 add authentication emailAction email -userName testmail@gmail.com -
  password 298
  a34b1a1b7626cd5902bbb416d04076e5ac4f357532e949db94c0534832670 -
  encrypted -encryptmethod ENCMTD_3 -serverURL "smtps
  ://10.19.164.57:25" -content "OTP is $code" -emailAddress "aaa.user.
  attribute(\"alternate_mail\")"
```

#### Note

The "emailAddress" parameter in the configuration is a PI expression. Hence, this is configured to take either the default user email ID from the session or the already registered alternative email ID.

## To configure email ID using GUI

1. Navigate to **Security > AAA – Application Traffic > policies > Authentication > Advanced Policies > Actions > Authentication Email Action**. Click **Add**.
2. On the **Create Authentication Email Action** page, fill the details, and click **Create**.

The screenshot shows the Citrix ADC VPX (8000) Configuration page. The navigation menu includes Dashboard, Configuration (selected), Reporting, Documentation, and Downloads. The main heading is 'Create Authentication Email Action'. The form contains the following fields:

- Name\*: email
- Username\*: testmail@gmail.com
- Password\*: [masked]
- Server URL\*: \*smtps://10.19.164.57:25\*
- Content: \*OTP is 5code\*
- Default Authentication Group: [empty]
- Code Expiry Timeout: [empty]
- Type: [empty]
- Email Address: %a.user.attribute(\*alternate\_mail\*)

At the bottom of the form are two buttons: 'Create' and 'Close'.

### To create authentication policy for email validation by using CLI

```
1 add authentication policy email_validation -rule true -action email
```

### To create authentication policy for password reset factor

```
1 add authentication policy ldap_pwd -rule true -action ldap_logon_action
```

### Presenting UI through Login Schema

There are three LoginSchema's for self-service password reset to reset the password. Use the following CLI commands to view the three Login Schema:

```
1 root@ns# cd /nsconfig/loginschema/LoginSchema/  
2 root@ns# ls -ltr | grep -i password  
3 -r--r--r-- 1 nobody wheel 2088 Nov 13 08:38  
   SingleAuthPasswordResetRem.xml  
4 -r--r--r-- 1 nobody wheel 1541 Nov 13 08:38  
   OnlyUsernamePasswordReset.xml  
5 -r--r--r-- 1 nobody wheel 1391 Nov 13 08:38 OnlyPassword.xml
```

### To create single authentication password reset by using CLI

```
1 > add authentication loginSchema lschema_password_reset -  
   authenticationSchema "/nsconfig/loginschema/LoginSchema/  
   SingleAuthPasswordResetRem.xml"  
2  
3 > add authentication loginSchemaPolicy lpol_password_reset -rule true -  
   action lschema_password_reset
```

### Create knowledge-based question and answer and email OTP validation factor through policy label

If the first factor is LDAP login, you can create a knowledge-based question and answer and email OTP policy labels for the next factor using the following commands.

```
1 > add authentication loginSchema lschema_noschema -authenticationSchema  
   noschema  
2  
3 > add authentication policylabel kba_validation -loginSchema  
   lschema_noschema  
4  
5 > add authentication policylabel email_validation -loginSchema  
   lschema_noschema
```

### Create password reset factor through policy label

You can create password reset factor through policy label by using the following commands.

```
1 > add authentication loginSchema lschema_noschema -authenticationSchema  
   noschema  
2  
3 > add authentication policylabel password_reset -loginSchema  
   lschema_noschema
```

```
4
5 > bind authentication policylabel password_reset -policyName ldap_pwd -
    priority 10 -gotoPriorityExpression NEXT
```

Bind the knowledge-based question and answer and email policy to the previous created policies using the following commands.

```
1 > bind authentication policylabel email_validation -policyName
    email_validation -nextfactor password_reset -priority 10 -
    gotoPriorityExpression NEXT
2
3 > bind authentication policylabel kba_validation -policyName
    kba_validation -nextfactor email_validation -priority 10 -
    gotoPriorityExpression NEXT
```

### **Bind the flow**

You must have the LDAP logon flow created under authentication policy for LDAP Logon. In this flow, user clicks on forgot password link presented on first LDAP logon page, then KBA validation followed by OTP validation and finally password reset page.

```
1 bind authentication vserver authvs -policy ldap3 -nextfactor
    kba_validation -priority 10 -gotoPriorityExpression NEXT
```

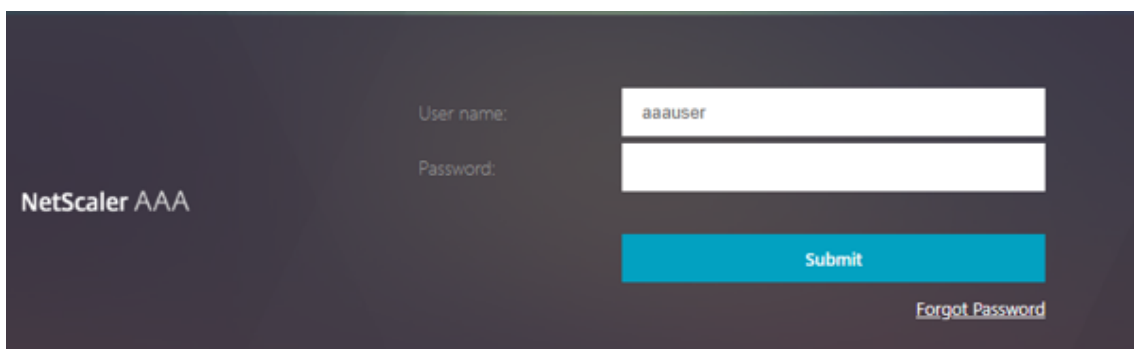

### **To bind all the UI flow**

```
1 bind authentication vserver authvs -policy lpol_password_reset -
    priority 20 -gotoPriorityExpression END
```

### **User logon workflow to reset password**

Following is a user logon workflow if the user needs to reset password:

1. Enter the lb vserver URL; for example, <https://lb1.server.com>. The logon screen is displayed.

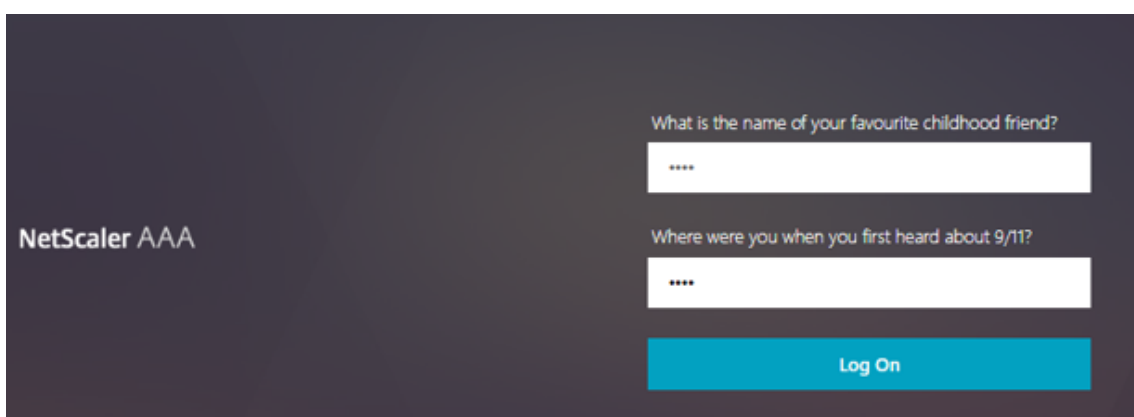

NetScaler AAA

User name:

Password:

[Forgot Password](#)

2. Click **Forgot Password**. A validation screen displays two questions out of maximum of six questions and answers registered against an AD user.

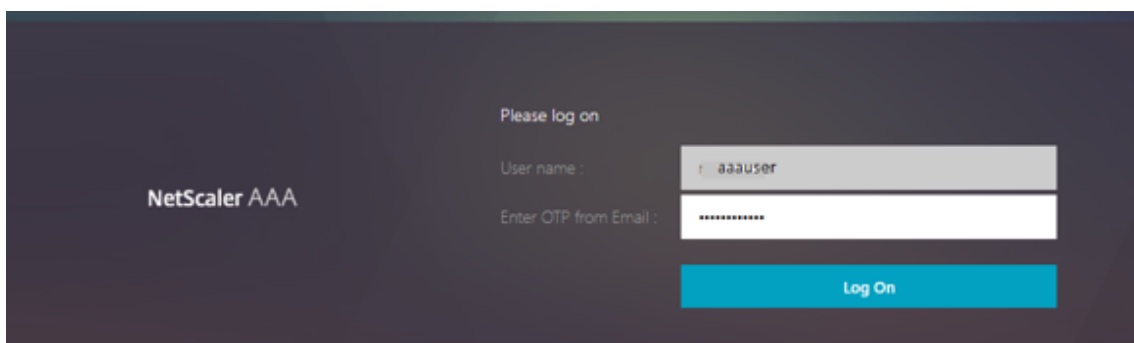

NetScaler AAA

What is the name of your favourite childhood friend?

Where were you when you first heard about 9/11?

3. Answer the questions, and click **Log on**. An email OTP Validation screen where you must enter the OTP received on the registered alternate email ID, is displayed.

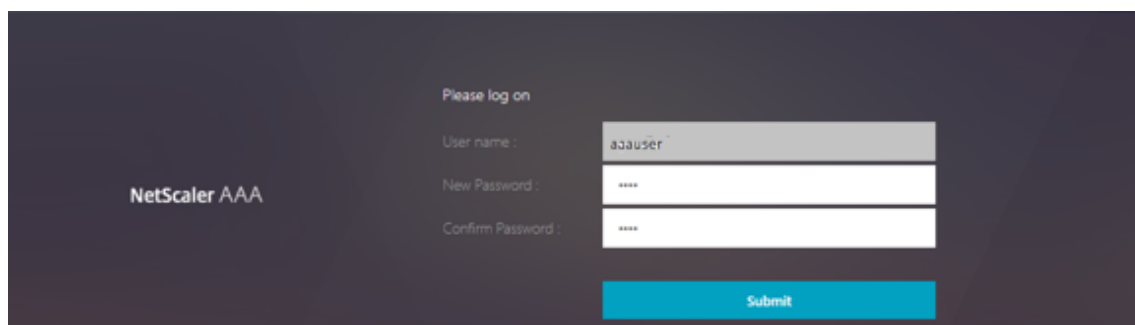

NetScaler AAA

Please log on

User name :

Enter OTP from Email :

4. Enter the email OTP. Once the email OTP validation is successful, the password reset page is displayed.

A screenshot of the NetScaler AAA login interface. The background is dark blue. On the left, the text "NetScaler AAA" is displayed. On the right, there is a "Please log on" section with three input fields: "User name:" containing "aaauser", "New Password:" containing four asterisks, and "Confirm Password:" containing four asterisks. Below these fields is a blue "Submit" button.

5. Enter a new password and confirm the new password. Click **Submit**. After the password reset is successful, the password reset successful screen is displayed.

You can now logon using the reset password.

## Troubleshooting

Citrix provides an option to troubleshoot some of the basic issues that you might face while using self-service password reset. The following section helps you troubleshoot some of the issues that might occur in specific areas.

### NS Log

Before analyzing the log, it is recommended to set the log level to debug using the following command:

```
1 > set syslogparams -loglevel DEBUG
```

### Registration

The following message indicates a successful user registration.

```
1 "ns_aaa_insert_hash_keyValue_entry key:kba_registered value:1"
```

```
2 Nov 14 23:35:51 <local0.debug> 10.102.229.76 11/14/2018:18:05:51 GMT
  0-PPE-1 : default SSLVPN Message 1588 0 : "
  ns_aaa_insert_hash_keyValue_entry key:alternate_mail value:
  eyJ2ZXJzaW9uIjoiaMSIsICJraWQiOiIxbk1oWjN0T2NjLVVvZUx6NDRwZFhxdS01dTAA9IiwgImtleS
  ==.oKmv0ala0J3a9z7BcGCSEgNPMw=="
```

### Knowledge-based question and answer validation

The following message indicates successful knowledge-based question and answer validation.

```
1 "NFactor: Successfully completed KBA Validation, nextfactor is email"
```

### Email ID validation

The following message indicates successful password reset.

```
1 "NFactor: Successfully completed email auth, nextfactor is pwd_reset"
```

## Configuration support for SameSite cookie attribute

September 21, 2020

The SameSite attribute indicates the browser whether the cookie can be used for cross-site context or only for same-site context. Also, if an application intends to be accessed in cross-site context then it can do so only via HTTPS connection. For details, see RFC6265.

Until Feb 2020, the SameSite attribute was not explicitly set in Citrix ADC. The browser took the default value (None). The non-setting of SameSite attribute did not impact the Citrix Gateway and Citrix ADC AAA deployments.

With certain browsers upgrade, such as Google Chrome 80, there is a change in the default cross-domain behavior of cookies. The SameSite attribute can be set to one of the following values. Default value for Google Chrome is set to Lax. For certain version of other browsers, the default value for SameSite attribute might still be set to None.

- **None:** Indicates the browser to use cookie in cross-site context only on secure connections.
- **Lax:** Indicates the browser to use cookie for requests on the same-site context. In cross-site context, only safe HTTP methods like GET request can use the cookie.
- **Strict:** Use the cookie only in the same site context.

If there is no SameSite attribute in the cookie, the Google Chrome assumes the functionality of SameSite = Lax.

As a result, for deployments within an iframe with cross-site context that require cookies to be inserted by the browser, Google Chrome does not share cross site cookies. As a result, the iframe within the website might not load.

## Configure SameSite cookie attribute

A new cookie attribute named SameSite is added to the VPN and Citrix ADC AAA virtual servers. This attribute can be set at the global level and at the virtual server level.

To configure SameSite attribute, you must perform the following:

1. Set the SameSite attribute for the virtual server
2. Bind cookies to the patset (if the browser drops cross-site cookies)

## Setting the SameSite attribute by using the CLI

To set the SameSite attribute at the virtual server level, use the following commands.

```
1 set vpn vserver VP1 -SameSite [ STRICT | LAX | None ]
2 set aaa vserver VP1 -SameSite [ STRICT | LAX | None ]
3 <!--NeedCopy-->
```

To set the SameSite attribute at the global level, use the following commands.

```
1 set vpn param VP1 -SameSite [ STRICT | LAX | None ]
2 set aaa param VP1 -SameSite [ STRICT | LAX | None ]
3 <!--NeedCopy-->
```

**Note:** The virtual server level setting takes preference over the global level setting. Citrix recommends setting the SameSite cookie attribute at the virtual server level.

## Binding cookies to the patset by using the CLI

If the browser drops cross-site cookies, you can bind that cookie string to the existing ns\_cookies\_SameSite patset so that the SameSite attribute is added to the cookie.

### Example:

```
1 bind patset ns_cookies_SameSite "NSC_TASS"
2 bind patset ns_cookies_SameSite "NSC_TMAS"
3 <!--NeedCopy-->
```

## Setting the SameSite attribute by using the GUI

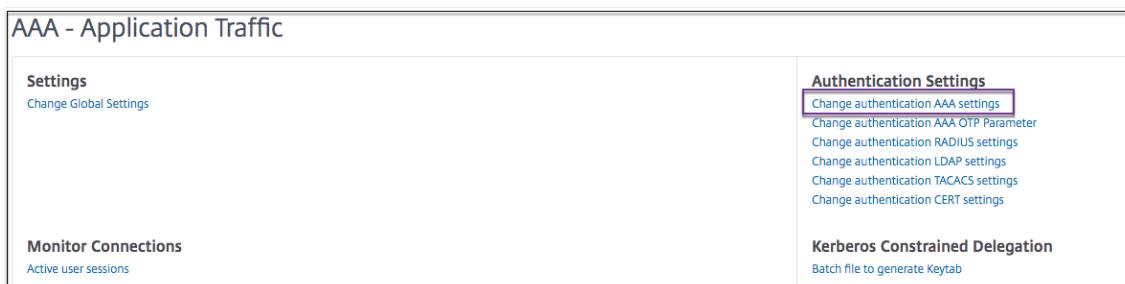

### To set the SameSite attribute at the virtual server level:

1. Navigate to **Security > AAA – Application Traffic > Virtual Servers.**
2. Select a virtual server and click **Edit.**
3. Click the edit icon in the **Basic Settings** section and click **More.**
4. In **SameSite**, select the option as required.

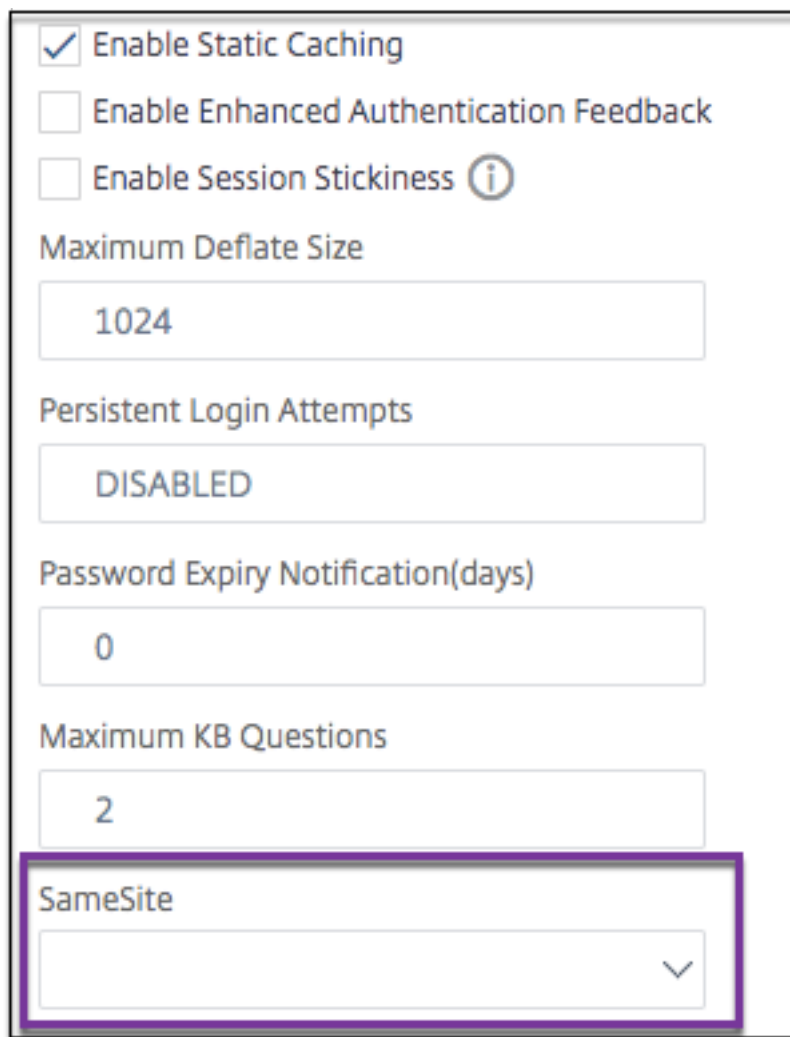

The screenshot displays the configuration interface for a virtual server. At the top, there are four checked checkboxes: Authentication, State, AppFlow Logging, and Range. Below these is a text input field containing the number '1'. A section titled 'CA for Device Certificate' contains a list box labeled 'Configured (0)' with a 'Remove All' button and an 'Add' button. The list box is empty and contains the text 'No items'. Below this is a dropdown menu labeled 'SameSite', which is highlighted with a purple border. At the bottom of the configuration area is a 'Comments' text area and a 'Less' button.

### To set the SameSite attribute at the global level:

1. Navigate to **Security > AAA – Application Traffic > Change Authentication Settings.**

2. In the **Configure AAA Parameter** page, click the **SameSite** list, and select the option as required.

## Native OTP support for authentication

November 2, 2020

Citrix ADC supports one-time passwords (OTPs) without having to use a third-party server. One-time password is a highly secure option for authenticating to secure servers as the number or passcode generated is random. Previously, specialized firms, such as RSA with specific devices that generate random numbers offered the OTPs. This system must be in constant communication with the client to generate a number expected by the server.

In addition to reducing capital and operating expenses, this feature enhances the administrator's control by keeping the entire configuration on the Citrix ADC appliance.

**Note:** Because third-party servers are no longer needed, the Citrix ADC administrator has to configure an interface to manage and validate user devices.

User must be registered with a Citrix ADC virtual server to use the OTP solution. Registration is required only once per unique device, and can be restricted to certain environments. Configuring and validation of a registered user is similar to configuring an extra authentication policy.

### **Advantages of having Native OTP support**

- Reduces operating cost by eliminating the need to have an extra infrastructure on an authenticating server in addition to the Active Directory.
- Consolidates configuration only to Citrix ADC appliance thus offering great control to administrators.
- Eliminates the client's dependence on an extra authentication server for generating a number expected by clients.

### **Native OTP workflow**

The native OTP solution is a two-fold process and the workflow is classified as the following:

- Device registration
- End user login

**Important:** You can skip the registration process if you are using third-party solutions or managing other devices apart from the Citrix ADC appliance. The final string that you add must be in the Citrix ADC specified format.

The following figure depicts the device registration flow to register a new device to receive OTP.

**Note:** The device registration can be done using any number of factors. The single factor (as specified in the previous figure) is used as an example to explain the device registration process.

The following figure depicts the verification of OTP through the registered device.

## Prerequisites

To use the native OTP feature, make sure the following prerequisites are met.

- Citrix ADC feature release version is 12.0 build 51.24 and later.
- Advanced or Premium edition license is installed on Citrix Gateway.
- Citrix ADC is configured with management IP and the management console is accessible both using a browser and command line.
- Citrix ADC is configured with authentication, authorization, and auditing virtual server to authenticate users.
- Citrix ADC appliance is configured with Unified Gateway and the authentication, authorization, and auditing profile is assigned to the Gateway virtual server.
- Native OTP solution is restricted to nFactor authentication flow. Advanced policies are required to configure the solution. For more details, see article [CTX222713](#).

Also ensure the following for Active Directory:

- A minimum attribute length of 256 characters.
- Attribute type must be 'DirectoryString' such as UserParameters. These attributes can hold string values.
- Attribute string type must be Unicode, if device name is in non-English characters.
- Citrix ADC LDAP administrator must have write access to the selected AD attribute.
- Citrix ADC appliance and client machine must be synced to a common Network Time Server.

## Configure Native OTP using the GUI

The native OTP registration is not just a single factor authentication. The following sections help you to configure the single and second factor authentication.

### Create Login Schema for first factor

1. Navigate to **Security AAA > Application Traffic > Login Schema**.
2. Go to **Profiles** and click **Add**.
3. On the **Create Authentication Login Schema** page, enter *lschema\_single\_auth\_manage\_otp* under the **Name** field and click **Edit** next to **noschema**.
4. Click the **LoginSchema** folder.
5. Scroll down to select **SingleAuth.xml** and click **Select**.
6. Click **Create**.
7. Click **Policies** and Click **Add**.

8. On the **Create Authentication Login Schema Policy** screen, enter the following values.

**Name:** lpol\_single\_auth\_manage\_otp\_by\_url

**Profile:** select lpol\_single\_auth\_manage\_otp\_by\_url from the list.

**Rule:** HTTP.REQ.COOKIE.VALUE("NSC\_TASS").EQ("manageotp")

### **Configure authentication, authorization, and auditing virtual server**

1. Navigate to **Security > AAA – Application Traffic > Authentication Virtual Servers**. Click to edit the existing virtual server.
2. Click the + icon next to **Login Schemas** under **Advanced Settings** in the right pane.
3. Select **No Login Schema**.
4. Click the arrow and select the **lpol\_single\_auth\_manage\_otp\_by\_url** Policy.
5. Select the **lpol\_single\_auth\_manage\_otp\_by\_url** policy and Click **Select**.
6. Click **Bind**.
7. Scroll up and select **1 Authentication Policy** under **Advanced Authentication Policy**.
8. Right-click the **nFactor Policy** and select **Edit Binding**.
9. Click the + icon present under **Select Next Factor**, create a Next Factor, and click **Bind**.
10. On the **Create Authentication PolicyLabel** screen, enter the following, and click **Continue**:  
**Name:** manage\_otp\_flow\_label  
**Login Schema:** Lschema\_Int
11. On the **Authentication PolicyLabel** screen, click the + icon to create a Policy.
12. On the **Create Authentication Policy** screen, enter the following:  
**Name:** auth\_pol\_ldap\_otp\_action
13. Select the Action type using the **Action Type** list.
14. In the **Action** field, click the + icon to create an Action.
15. In the **Create Authentication LDAP server** page, select **Server IP** radio button, deselect the check box next to **Authentication**, enter the following values, and select **Test Connection**.  
**Name:** ldap\_otp\_action  
**IP Address:** 192.168.10.11  
**Base DN:** DC=training, DC=lab  
**Administrator:** Administrator@training.lab  
**Password:** xxxxxx

16. Scroll down to the **Other Settings** section. Use the drop-down menu to select the following options.  
**Server Logon Name Attribute** as **New** and type **userprincipalname**.
17. Use the drop-down menu to select **SSO Name Attribute** as **New** and type **userprincipalname**.
18. Enter “UserParameters” in the **OTP Secret** field and click **More**.
19. Enter the following Attributes.  
**Attribute 1** = mail  
**Attribute 2** = objectGUID  
**Attribute 3** = immutableID
20. Click **OK**.
21. On the **Create Authentication Policy** page, set the Expression to **true** and click **Create**.
22. On the **Create Authentication Policylabel** page, click **Bind**, and click **Done**.
23. On the **Policy Binding** page, click **Bind**.
24. On the **Authentication policy** page, click **Close** and click **Done**.

**Note**

The authentication virtual server must be bound to the RFWebUI portal theme. Bind a server certificate to the server. The server IP ‘1.2.3.5’ must have a corresponding FQDN that is, otpauth.server.com, for later use.

**Create login schema for second factor OTP**

1. Navigate to **Security > AAA-Application Traffic > Virtual Servers**. Select the virtual server to be edited.
2. Scroll down and select **1 Login Schema**.
3. Click **Add Binding**.
4. Under the **Policy Binding** section, click the **+** icon to add a policy.
5. On the **Create Authentication Login Schema Policy** page, enter Name as OTP, and click the **+** icon to create a profile.
6. On the **Create Authentication Login Schema** page, enter Name as OTP, and click the icon next to **noschema**.
7. Click the **LoginSchema** folder, select **DualAuthManageOTP.xml**, and then click **Select**.
8. Click **Create**.
9. In the **Rule** section, enter **True**. Click **Create**.
10. Click **Bind**.
11. Notice the two factors of authentication. Click **Close** and click **Done**.

## Configure content switching policy for manage OTP

The following configurations are required if you are using Unified Gateway.

1. Navigate to **Traffic Management > Content Switching > Policies**. Select the content switching policy, right click, and select **Edit**.
2. Edit the expression to evaluate the following OR statement and click **OK**:

is_vpn_url	HTTP.REQ.URL.CONTAINS("manageotp")
------------	------------------------------------

## Configure Native OTP using the CLI

You must have the following information to configure the OTP device management page:

- IP assigned to authentication virtual server
- FQDN corresponding to the assigned IP
- Server certificate for authentication virtual server

**Note:** Native OTP is a web-based solution only.

## To configure the OTP device registration and management page

Create authentication virtual server

```
1 > add authentication vserver authvs SSL 1.2.3.5 443
2 > bind authentication vserver authvs -portaltheme RFWebUI
3 > bind ssl vserver authvs -certkeyname otpauthcert
```

**Note:** The authentication virtual server must be bound to the RFWebUI portal theme. Bind a server certificate to the server. The server IP '1.2.3.5' must have a corresponding FQDN that is, otpauth.server.com, for later use.

## To create LDAP logon action

```
1 add authentication ldapAction <LDAP ACTION NAME> -serverIP <SERVER IP>
  - serverPort <SERVER PORT> -ldapBase <BASE> -ldapBindDn <AD USER> -
  ldapBindDnPassword <PASSWO> -ldapLoginName <USER FORMAT>
```

## Example:

```
1 add authentication ldapAction ldap_logon_action -serverIP 1.2.3.4 -
  serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
  administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
  ldapLoginName userprincipalname
```

### To add authentication policy for LDAP Logon

```
1 add authentication Policy auth_pol_ldap_logon -rule true -action
  ldap_logon_action
```

### To present UI via LoginSchema

Show user name field and password field to users upon logon

```
1 add authentication loginSchema lschema_single_auth_manage_otp -
  authenticationSchema "/nsconfig/loginschema/LoginSchema/
  SingleAuthManageOTP.xml"
```

### Display device registration and management page

Citrix recommends two ways of displaying the device registration and management screen: URL or host name.

- **Using URL**

When the URL contains '/manageotp'

```
- add authentication loginSchemaPolicy lpol_single_auth_manage_otp_by_url
  -rule "http.req.cookie.value("NSC_TASS").contains("manageotp")"-
  action lschema_single_auth_manage_otp
- bind authentication vserver authvs -policy lpol_single_auth_manage_otp_by_url
  -priority 10 -gotoPriorityExpression END
```

- **Using hostname**

When the host name is 'alt.server.com'

```
- add authentication loginSchemaPolicy lpol_single_auth_manage_otp_by_host
  -rule "http.req.header("host").eq("alt.server.com")"-action
  lschema_single_auth_manage_otp
- bind authentication vserver authvs -policy lpol_single_auth_manage_otp_by_hos
  -priority 20 -gotoPriorityExpression END
```

### To configure the user login page using the CLI

You must have the following information to configure the User Logon page:

- IP for a load balancing virtual server
- Corresponding FQDN for the load balancing virtual server
- Server certificate for the load balancing virtual server

```
bind ssl vserver lbvs_https -certkeyname lbvs_server_cert
```

Back-end service in load balancing is represented as follows:

```
1 add service iis_backendsso_server_com 1.2.3.210 HTTP 80
2 bind lb vserver lbvs_https iis_backendsso_server_com
```

### To create OTP passcode validation action

```
1 add authentication ldapAction <LDAP ACTION NAME> -serverIP <SERVER IP>
  -serverPort <SERVER PORT> -ldapBase <BASE> -ldapBindDn <AD USER> -
  ldapBindDnPassword <PASSWORD> -ldapLoginName <USER FORMAT> -
  authentication DISABLED -OTPSecret <LDAP ATTRIBUTE>`
```

#### Example:

```
1 add authentication ldapAction ldap_otp_action -serverIP 1.2.3.4 -
  serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
  administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
  ldapLoginName userprincipalname -authentication DISABLED -OTPSecret
  userParameters
```

**Important:** The difference between the LDAP logon and OTP action is the need to disable the authentication and introduce a new parameter `OTPSecret`. Do not use the AD attribute value.

### To add authentication policy for OTP passcode validation

```
1 add authentication Policy auth_pol_otp_validation -rule true -action
  ldap_otp_action
```

### To present the two-factor authentication through LoginSchema

Add the UI for two factor authentication.

```
1 add authentication loginSchema lscheme_dual_factor -
  authenticationSchema "/nsconfig/loginschema/LoginSchema/DualAuth.xml
  "
2 add authentication loginSchemaPolicy lpol_dual_factor -rule true -
  action lscheme_dual_factor
```

### To create passcode validation factor via the policy label

Create a manage OTP flow policy label for the next factor (first factor is LDAP logon)

```
1 add authentication loginSchema lschema_noschema -authenticationSchema
  noschema
2 add authentication policylabel manage_otp_flow_label -loginSchema
  lschema_noschema
```

### To bind the OTP policy to the policy label

```
1 bind authentication policylabel manage_otp_flow_label -policyName
  auth_pol_otp_validation -priority 10 -gotoPriorityExpression NEXT
```

### To bind the UI flow

Bind the LDAP logon followed by the OTP validation with the authentication virtual server.

```
1 bind authentication vserver authvs -policy auth_pol_ldap_logon -
  priority 10 -nextFactor manage_otp_flow_label -
  gotoPriorityExpression NEXT
2 bind authentication vserver authvs -policy lpol_dual_factor -priority
  30 -gotoPriorityExpression END
```

## Register your device with Citrix ADC

1. Navigate to your Citrix ADC FQDN (first public facing IP), with a /manageotp suffix. For example, <https://otpauth.server.com/manageotp> Login with user credentials.
2. Click the + icon to add a device.
3. Enter a device name and press **Go**. A barcode appears on the screen.
4. Click **Begin Setup** and then click **Scan Barcode**.
5. Hover the device camera over the QR code. You can optionally enter the 16 digit code.

**Note:** The displayed QR code is valid for 3 minutes.

6. Upon successful scan, you are presented with a 6 digit time sensitive code that can be used to log in.
7. To test, click **Done** on the QR screen, then click the green check mark on the right.
8. Select your device from the drop-down menu and enter the code from Google Authenticator (must be blue, not red) and click **Go**.
9. Make sure to log out using the drop-down menu at the top right corner of the page.

### **Log in to Citrix ADC using the OTP**

1. Navigate to your first public facing URL and enter your OTP from Google Authenticator to log on.
2. Authenticate to the Citrix ADC splash page.

### **Store OTP secret data in an encrypted format**

September 21, 2020

Starting from Citrix ADC release 12.1 build 54.13, the OTP secret data can be stored in an encrypted format instead of plain text.

Previously, the Citrix ADC appliance stored OTP secret as a plain text in AD. Storing OTP secret in plain text poses a security threat as a malicious attacker or an admin might exploit the data by viewing the shared secret of other users.

The encryption parameter enables encryption of OTP secret in AD. When you register a new device with Citrix ADC version 12.1 build 54.13, and enable the encryption parameter, the OTP secret is stored in an encrypted format, by default. However, if the encryption parameter is disabled, the OTP secret is stored in plain text format.

For devices registered prior to 12.1 build 54.13, you must perform the following as a best practice:

1. Upgrade the 12.1 Citrix ADC appliance to 12.1 build 54.13.
2. Enable the encryption parameter on the appliance.
3. Use the OTP secret migration tool to migrate OTP secret data from plain text format to encrypted format.

For details about the OTP secret migration tool, see [OTP encryption tool](#).

**Important**

Citrix recommends you as an admin to ensure the following criteria is met:

- A new certificate must be configured to encrypt OTP secrets if you are not using KBA as part of self-service password reset feature.

- To bind the certificate to VPN global, you can use the following command:

```
bind vpn global -userDataEncryptionKey c1
```

- If you are already using a certificate to encrypt KBA, you can use the same certificate to encrypt OTP secrets.

**To enable OTP encryption data by using the CLI**

At the command prompt, type:

```
set aaa otpparameter [-encryption ( ON | OFF )]
```

Example

```
set aaa otpparameter -encryption ON
```

**To configure the OTP encryption by using the GUI**

1. Navigate to **Security > AAA – Application Traffic** and click **Change authentication AAA OTP Parameter** under **Authentication Settings** section.
2. On the **Configure AAA OTP Parameter** page, select **OTP Secret encryption**.
3. Click OK.

**Configuring the number of end-user devices for receiving OTP notifications**

Administrators can now configure the number of devices that an end user can register to receive OTP notification or authentication.

**To configure the number of devices in OTP by using the CLI**

At the command prompt, type:

```
set aaa otpparameter [-maxOTPDevices <positive_integer>]
```

Example

```
set aaa otpparameter -maxOTPDevices 4
```

### To configure the number of devices by using the GUI

1. Navigate to **Security > AAA – Application Traffic**, click **Change authentication AAA OTP Parameter** under **Authentication Settings** section.
2. On the **Configure AAA OTP Parameter** page, enter the value for **Max OTP device Configured**.
3. Click **OK**.

The screenshot displays the Citrix ADC GUI interface for configuring the AAA OTP parameter. The top navigation bar shows 'Citrix ADC VPX (8000)' and several menu items: 'Dashboard', 'Configuration', 'Reporting', 'Documentation', and 'Downloads'. The 'Configuration' tab is selected. Below the navigation bar, the page title is 'Configure AAA OTP Parameter'. The main configuration area includes a checkbox for 'OTP Secret encryption' which is checked. Underneath, there is a text input field labeled 'Max OTP device Configured' containing the number '4'. At the bottom of the configuration area, there are two buttons: 'OK' and 'Close'.

## OTP encryption tool

September 21, 2020

Starting from Citrix ADC release 12.1 build 54.13, the OTP secret data is stored in an encrypted format instead of plain text for enhanced security. Storing of OTP secret in encrypted format is automatic and does not require manual intervention.

Previously, the Citrix ADC appliance stored OTP secret as a plain text in the active directory. Storing OTP secret in a plain text format posed a security threat as a malicious attacker or an admin could exploit the data by viewing the shared secret of other users.

The OTP encryption tool provides the following advantages:

- Does not result in any data loss even if you have old devices that are using old format (plain text).
- The backward compatibility support with old Citrix Gateway versions, helps to integrate and work with the existing devices, along with the new device.
- The OTP encryption tool helps admins migrate all the OTP secret data of all users at once.

## Uses of OTP encryption tool

The OTP encryption tool can be used for the following:

- **Encryption.** Store the OTP secret in encrypted format. The tool extracts the OTP data of the devices registered with Citrix ADC, and then converts the OTP data in plain text format to encrypted format.
- **Decryption.** Revert the OTP secret to the plain text format.
- **Update certificates.** Admins can update the certificate to a new certificate at any time. Admins can use the tool to enter the new certificate and update all the entries with the new certificate data. The certificate path must either be a absolute path or relative path.

### Important

- You must enable the encryption parameter in the Citrix ADC appliance to use the OTP encryption tool.
- For devices registered with Citrix ADC prior to build 54.13, you must perform the following:
  - Upgrade the 12.1 Citrix ADC appliance to 12.1 build 54.13.
  - Enable the encryption parameter on the appliance.
  - Use the OTP Secret migration tool to migrate OTP secret data from plain text format to encrypted format.

## OTP secret data in plain text format

Example:

```
##@devicename=<16 or more bytes>&tag=<64bytes>&
```

As you can see, the starting pattern for old format is always “#@” and ending pattern is always “&”. All the data between “devicename=” and end pattern, constitutes user OTP data.

## OTP secret data in encrypted format

The new encrypted format of OTP data is of the following format:

Example:

```
1      {
2
3      "otpdata" : {
4
5      "devices" : {
6
7          "device1" : "value1" ,
8          "device2" : "value2" , ...
```

```

9             }
10
11         }
12
13     }
14
15 <!--NeedCopy-->

```

Where, value1 is base64 encoded value of kid + IV +cipher data

Cipher data is structured as following:

```

1     {
2
3     secret:<16-byte secret>,
4     tag : <64-byte tag value>
5     alg: <algorithm used> (not mandatory, default is sha1, specify
        the algorithm only if it is not default)
6     }
7
8 <!--NeedCopy-->

```

- In “devices”, you have value against each name. The value is base64encode(kid).base64encode(IV).base64en
- In standard AES algorithms, IV is always sent as first 16 or 32 bytes of cipher data. You can follow the same model.
- IV will differ for each device though key remains the same.

## OTP encryption tool setup

The OTP encryption tool is located in the directory `\var\netscaler\otptool`. You must download the code from the Citrix ADC source and run the tool with the required AD credentials.

- Prerequisites for using the OTP encryption tool:
  - Install python 3.5 or higher version in the environment where this tool is run.
  - Install pip3 or later versions.
- Execute the following commands:
  - **pip install requirements.txt**. Automatically installs the requirements
  - **python main.py**. Invokes the OTP encryption tool. You must provide the required arguments as per your need for the migration of OTP secret data.
- The tool can be located at `\var\netscaler\otptool` from shell prompt.
- Run the tool with the required AD credentials.

## OTP encryption tool interface

The following figure displays a sample OTP encryption tool interface. The interface contains all the arguments that must be defined for encryption/decryption/certificate upgrade. Also, a brief description of each argument is captured.

## OPERATION argument

You must define the OPERATION argument to use the OTP encryption tool for encryption, decryption, or certificate upgrade.

The following table summarizes some of the scenarios in which you can use the OTP encryption tool and the corresponding OPERATION argument values.

Scenario	Operation argument value and other arguments
Convert plaintext OTP secret to encrypted format in the same attribute	Enter the OPERATION argument value as 0 and provide the same value for source and target attribute. <b>Example:</b> <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute unixhomedirectory -operation 0</code>
Convert plaintext OTP secret to encrypted format in a different attribute	Enter the OPERATION argument value as 0 and provide the corresponding values for source and target attribute. <b>Example:</b> <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 0</code>

Scenario	Operation argument value and other arguments
Convert the encrypted entries back to plaintext	Enter the OPERATION argument value as 1 and provide the corresponding values for source and target attribute. <b>Example:</b> <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 1</code>
Convert the encrypted entries from a KBA attribute to plaintext	Enter the OPERATION argument value as 1 and it is mandatory to provide a different target attribute. <b>Example:</b> <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 1</code>
Update the certificate to a new certificate	Enter the OPERATION argument value as 2 and provide all the previous certificate and the new certificate details in the corresponding arguments. <b>Example:</b> <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 2 -cert_path aaatm_wild_all.cert -new_cert_path aaatm_wild_all_new.cert</code>

### Enabling encryption option in the Citrix ADC appliance

To encrypt the plain text format, you must enable the encryption option in the Citrix ADC appliance.

To enable OTP encryption data by using the CLI, at the command prompt, type:

```
set aaa otpparameter [-encryption ( ON | OFF )]
```

Example:

```
set aaa otpparameter -encryption ON
```

## OTP encryption tool use cases

The OTP encryption tool can be used for the following use cases.

### Register new devices with Citrix ADC appliance version 12.1 build 54.13

When you register your new device with Citrix ADC appliance version 12.1 build 54.13, and if the encryption option is enabled, then the OTP data is saved in an encrypted format. You can avoid manual intervention.

If the encryption option is not enabled, the OTP data is stored in the plain text format.

### Migrate OTP data for the devices registered previous to 12.1 build 54.13

You must perform the following to encrypt the OTP secret data for the devices that are registered with Citrix ADC appliance prior to 12.1 build 54.13.

- Use the conversion tool to migrate OTP data from plain text format to encrypted format.
- Enable the “Encryption” parameter on Citrix ADC appliance.
  - To enable encryption option by using the CLI:
    - \* `set aaa otpparameter -encryption ON`
  - To enable encryption options by using the GUI:
    - \* Navigate to **Security > AAA – Application Traffic** and click **Change authentication AAA OTP Parameter** under **Authentication Settings** section.
    - \* On the **Configure AAA OTP Parameter** page, select **OTP Secret encryption**, and click **OK**.
  - Log in with the valid AD credentials.
  - If it is required, register additional devices (optional).

### Migrate encrypted data from old certificate to new certificate

If admins want to update the certificate to a new certificate, the tool provides an option to update the new certificate data entries.

To update the certificate to a new certificate by using the CLI

At the command prompt, type:

Example:

```
python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local  
-search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -  
target_attribute userparameters -operation 2 -cert_path aaatm_wild_all.cert  
-new_cert_path aaatm_wild_all_new.cert
```

#### Note

- The certificates must contain both private and public keys.
- Currently, the functionality is provided only for OTP.

### Re-encrypt or migrate to new certificate for devices registered after the appliance is upgraded to 12.1 build 54.13 with encryption

Admin can use the tool on the devices that are already encrypted with a certificate, and can update that certificate with a new certificate.

### Convert encrypted data back to plain text format

Admin can decrypt the OTP secret and revert them to the original plain text format. The OTP encryption tool scans through all the users for OTP secret in encrypted format and converts them to decrypted format.

To update the certificate to a new certificate by using the CLI

At the command prompt, type:

Example:

```
python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local  
-search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -  
target_attribute userparameters -operation 1
```

### Troubleshooting

The tool generates the following log files.

- **app.log.** Logs all the major steps of execution and information about errors, warnings, and failures.
- **unmodified\_users.txt.** Contains a list of User DNs that was not upgraded from plain text to encrypted format. These logs are generated to an error in format or might be due to some other reason.

## Push notification for OTP

May 6, 2021

Citrix Gateway supports push notifications for OTP. Users do not have to manually enter the OTP received on their registered devices to log in to Citrix Gateway. Admins can configure Citrix Gateway such that login notifications are sent to users' registered devices using push notification services. When users receive the notification, they have to simply tap Allow on the notification to log in to Citrix Gateway. When gateway receives acknowledgment from the user, it identifies source of the request, and sends response to that browser connection.

If the notification response is not received within the timeout period (30 seconds), users are redirected to the Citrix Gateway login page. The users can then enter the OTP manually or click **Resend Notification** to receive the notification again on the registered device.

Admins can make push notification authentication as the default authentication by using the login schemas created for push notification.

### **Important:**

Push notification feature is available with a Citrix ADC Premium edition license.

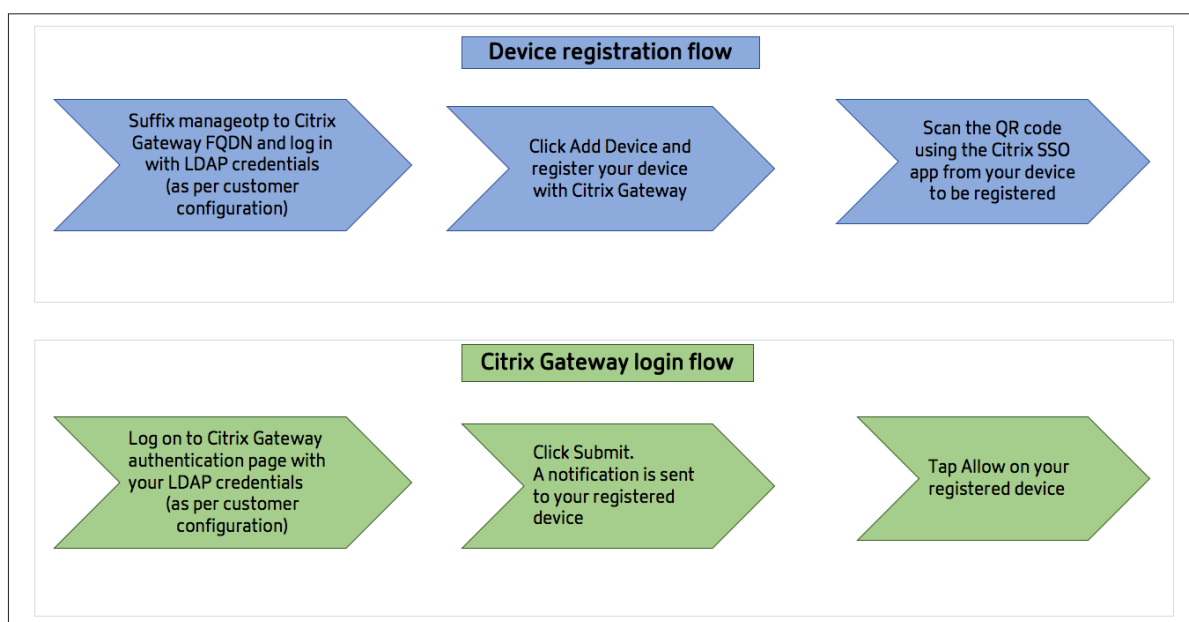

### **Advantages of push notifications**

- Push notifications provide a more secure multifactor authentication mechanism. Authentication to Citrix Gateway is not successful until the user approves the login attempt.
- Push notification is easy to administer and use. Users have to download and install the Citrix SSO mobile app that does not require any administrator assistance.
- Users do not have to copy or remember the code. They have to simply tap on the device to get authenticated.
- Users can register multiple devices.

### **How push notifications work**

The push notification workflow can be classified into two categories:

- Device registration
- End user login

## Prerequisites for using push notification

- Complete the Citrix Cloud onboarding process.
  1. Create a Citrix Cloud company account or join an existing one. For detailed processes and instructions on how to proceed, see [Signing Up for Citrix Cloud](#).
  2. Log in to <https://citrix.cloud.com>, and select the customer.
  3. From Menu, select **Identity and Access Management** and then navigate to **API Access** tab to create a client for the account.
  4. Copy the ID, secret, and customer ID. The ID and secret are required to configure push service in Citrix ADC as “ClientID” and “ClientSecret” respectively.

### Important:

- Same API credentials can be used on multiple data centers.
- On premises Citrix ADC appliances must be able to resolve server addresses [mfa.cloud.com](https://mfa.cloud.com) and [trust.citrixworkspacesapi.net](https://trust.citrixworkspacesapi.net) and are accessible from the appliance. This is to ensure that there are no firewalls or IP address blocks for these servers over port 443.
- Download the Citrix SSO mobile app from App Store and Play Store for iOS devices and Android devices respectively. Push notification is supported on iOS from build 1.1.13 on Android from 2.3.5.
- Ensure the following for the Active Directory.
  - Minimum attribute length must be at least 256 characters.

- Attribute type must be 'DirectoryString' such as UserParameters. These attributes can hold string values.
- Attribute string type must be Unicode, if device name is in non-English characters.
- Citrix ADC LDAP administrator must have write access to the selected AD attribute.
- Citrix ADC and the client machine must be synchronized to a common Network Time Server.

## Push notification configuration

The following are the high-level steps that must be completed to use the push notification functionality.

- The Citrix Gateway administrator must configure the interface to manage and validate users.
  1. Configure a push service.
  2. Configure Citrix Gateway for OTP management and end user login.

Users must register their devices with gateway for logging in to Citrix Gateway.
  3. Register your device with Citrix Gateway.
  4. Log in to Citrix Gateway.

### Create a push service

1. Navigate to **Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Actions > Push Service** and click **Add**.
2. In **Name**, enter the name of the push service.
3. In **Client ID**, enter the unique identity of the relying party for communicating with Citrix Push server in cloud.
4. In **Client Secret**, enter the unique secret of the relying party for communicating with Citrix Push server in cloud.
5. In **Customer ID**, enter the customer ID or name of the account in cloud that is used to create Client ID and Client Secret pair.

#### Important

The TLS 1.2 version is required for push service. For more information, see [TLS 1.2 configuration details](#).

### Configure Citrix Gateway for OTP management and end user login

Complete the following steps for OTP management and end user login.

- Create login schema for OTP management
- Configure authentication, authorization, and auditing virtual server
- Configure VPN or load balancing virtual servers
- Configure policy label
- Create login schema for end user login

For details on configuration, see [Native OTP support](#).

**Important:** For push notification, admins must explicitly configure the following:

- Create a push service.
- While creating login schema for OTP management, select the SingleAuthManageOTP.xml login schema or equivalent as per the need.
- While creating login schema for end user login, select the DualAuthOrPush.xml login schema or equivalent as per the need.

### Register your device with Citrix Gateway

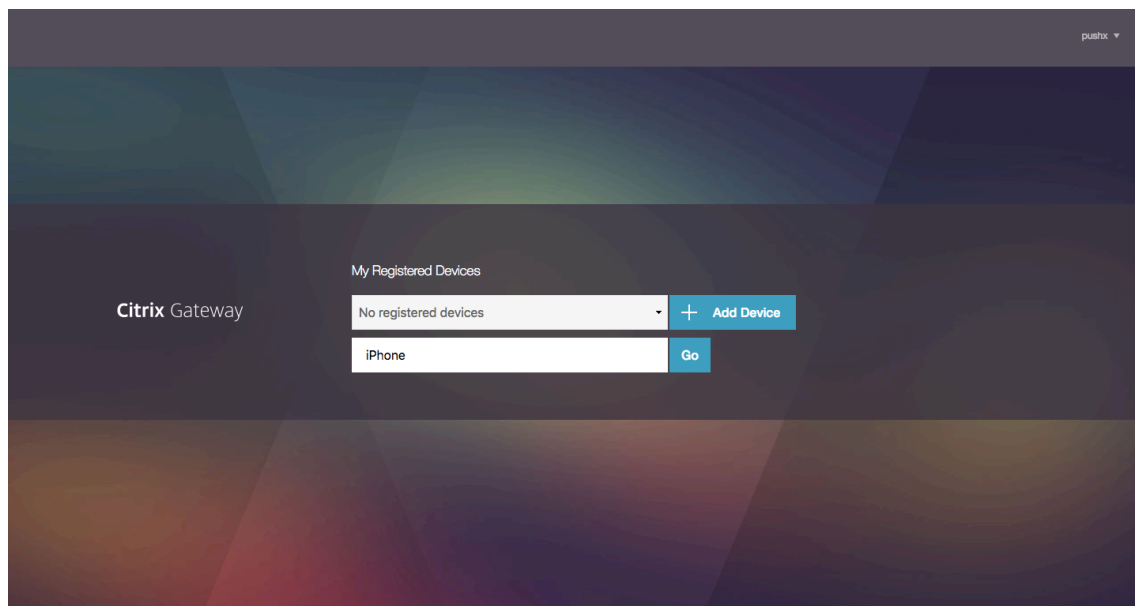

Users must register their devices with Citrix Gateway to use the push notification functionality.

1. In your web browser, browse to your Citrix Gateway FQDN, and suffix **/manageotp** to the FQDN.

This loads the authentication page.

Example: <https://gateway.company.com/manageotp>

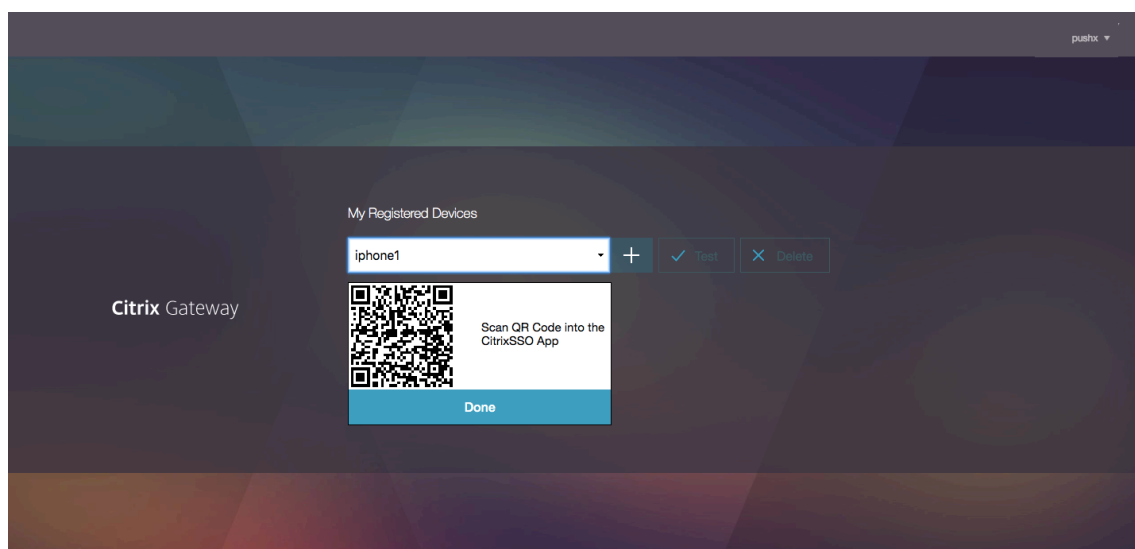

2. Log in using your LDAP credentials or appropriate two-factor authentication mechanisms, as required.

3. Click **Add Device**.

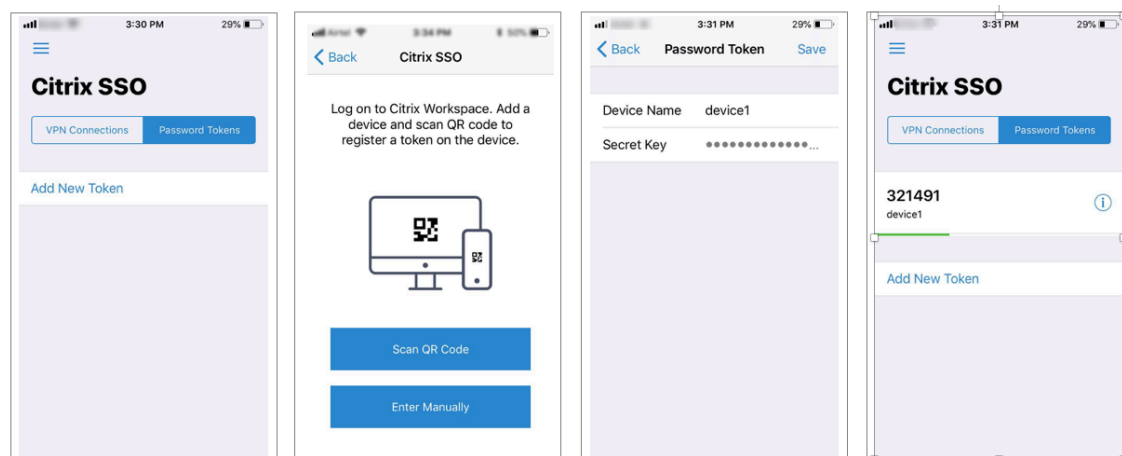

4. Enter a name for your device, then click **Go**.

A QR code is displayed on the Citrix Gateway browser page.

5. Scan this QR code using the Citrix SSO app from the device to be registered.

Citrix SSO validates the QR code and then registers with gateway for push notifications. If there are no errors in the registration process, the token is successfully added to the password tokens page.

6. If there are no additional devices to add/manage log out using the list at the top right corner of the page.

### Test one-time password authentication

1. To test the OTP, click your device from the list and then click **Test**.
2. Enter the OTP that you have received on your device and click **Go**.

The OTP verification successful message appears.

3. Log out using the list at the top right corner of the page.

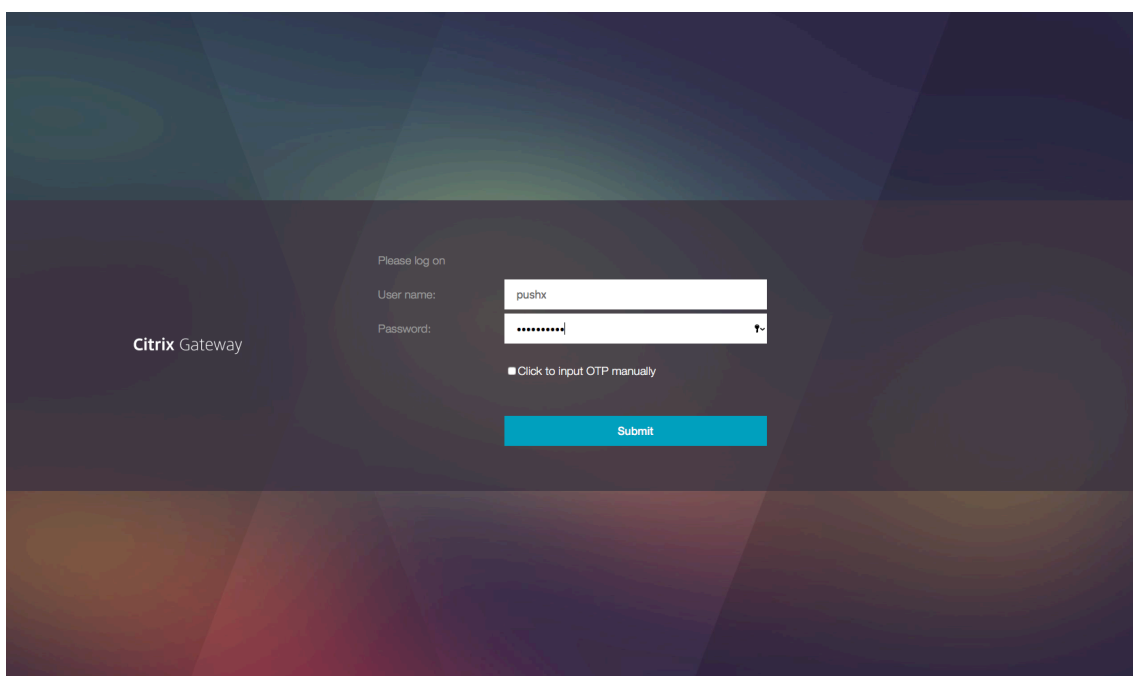

**Note:** You can use the OTP management portal anytime to test authentication, remove registered devices, or register more devices.

### Log in to Citrix Gateway

After registering their devices with Citrix Gateway, users can use the push notification functionality for authentication.

1. Navigate to your Citrix Gateway authentication page (for example: <https://gateway.company.com>)

You are prompted to enter only your LDAP credentials depending on the login schema configuration.

2. Enter your LDAP user name and password, then select **Submit**.

A notification is sent to your registered device.

**Note:** If you want to enter the OTP manually, you must select **Click** to input OTP manually and enter the OTP in the **TOTP** field.

3. Open the Citrix SSO app on your registered device and tap **Allow**.

**Note:**

- In case of an iOS device, you are prompted for Touch-ID/Face-ID/Passcode as an extra factor of authentication.
- The authentication server waits for push server notification response until the configured timeout period expires. After the timeout, Citrix Gateway displays the login page. The users can then enter the OTP manually or click **Resend Notification** to receive the notification again on the registered device. Based on your selected option, gateway validates the OTP that you have entered or resends the notification on your registered device.

- No notification is sent to your registered device regarding login failure.

**Failure conditions**

- The device registration might fail in the following cases.
  - Server certificate might not be trusted by end-user device.
  - Citrix Gateway used to register for OTP is not reachable by client.
- The notifications might fail in the following cases.
  - User device is not connected to the internet
  - Notifications on the user device are blocked
  - User does not approve the notification on the device

In these cases, the authentication server waits until the configured timeout period expires. After the timeout, the Citrix Gateway displays a login page with the options to manually enter the OTP or to resend the notification again on your registered device. Based on the selected option, further validation occurs.

## Failure logs

The following are the expected logs when the OTP push service is not reachable.

- Push notification failure when user device is not connected to the internet - Push: Failed to prepare Push Request to “client name” for Push service.
- Device registration failure log - Push: No devices are registered to send Push Request to cloud for “client name”.
- In case user does not accept the push - Push: Response is not seen from client, for “user name”, checking retry options.

## Citrix SSO app behavior on iOS – points to note

### Notification shortcuts

Citrix SSO iOS app includes support for actionable notifications to enhance user experience. Once a notification is received on an iOS device, and if the device is locked or the Citrix SSO app is not in foreground, users can use the shortcuts built into the notification to either approve or deny login request.

To access notification shortcuts, users need to either force touch (3D touch) or long press the notification depending on the device’s hardware. Selecting the Allow shortcut action sends a login request to Citrix ADC. Depending on how the authentication policy is configured on the authentication, authorization, and auditing virtual server;

- The login request might be sent in the background without any need to launch the app into foreground or unlock the device.
- The app might prompt for Touch-ID/Face-ID/Passcode as an extra factor in which case the app is launched into foreground.

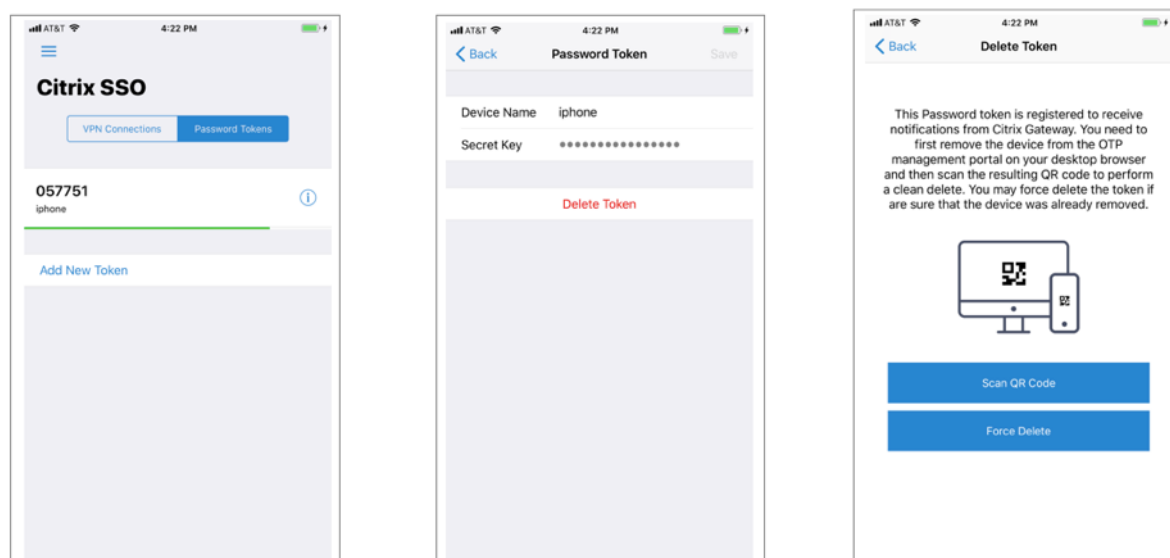

### Deleting password tokens from Citrix SSO

1. To delete a password token registered for push in the Citrix SSO app, users must perform the following steps:
2. Unregister (remove) the iOS/Android device on gateway. QR code for removing registration from device appears.
3. Open the Citrix SSO app and tap the info button of the password token to be deleted.
4. Tap **Delete Token** and scan the QR code.

#### Note:

- If the QR code is valid, the token is successfully removed from the Citrix SSO app.
- Users can tap Force Delete to delete a password token without having to scan the QR code if the device is already removed from gateway. Force deleting might result in the device continuing to receive notifications if the device has not been removed from Citrix Gateway.

## Authorizing user access to application resources

September 21, 2020

You can control the resources that an authenticated user can access within an application.

To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

- **Rule.** The resource to which access must be authorized. This can be specified by using basic or advanced expressions.
- **Action.** Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is **DENIED** to all users. However, you can change this default authorization action to **ALLOW** access to all users (by setting the session parameters in session profile or by setting the global session parameters).

### Warning

For optimum security, Citrix recommends that you do not to change the default authorization action from DENY to ALLOW. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

## To configure authorization by using the CLI

1. Configure the authorization policy.

```
ns-cli-prompt> add authorization policy <name> <rule> <action>
```

2. Associate the policy with the appropriate user or group.

- Bind the policy to a specific user.

```
ns-cli-prompt> bind aaa user <username> -policy <policyname>
```

- Bind the policy to a specific group.

```
ns-cli-prompt> bind aaa group <groupName> -policy <policyname>
```

## To configure authorization by using the GUI (Configuration tab)

1. Create the authorization policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authorization**, click **Add** and then define the policy as required.

2. Associate the policy with the appropriate user or group.

Navigate to **Security > AAA - Application Traffic > Users** or **Groups**, and edit the relevant user or group to associate it with the authorization policy.

## Sample authorization configurations

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes (“”).

- ```
add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")"
ALLOW<!--NeedCopy-->
```
- ```
bind aaa user user1 -policy authzpol1<!--NeedCopy-->
```
- ```
add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ(\"png\")"
DENY<!--NeedCopy-->
```
- ```
bind aaa group group1 -policy authzpol2<!--NeedCopy-->
```

## Auditing authenticated sessions

September 21, 2020

You can configure the Citrix ADC appliance to keep a log of all the events that are triggered in an authenticated session. Using this information, you can audit state and status information, to see the history for users in chronological order.

To do this, define an audit policy that specifies the following:

- **Log type.** The logs can be stored remotely (syslog) or locally on the Citrix ADC appliance (nslog).
- **Rule.** The conditions on which the logs are stored.
- **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, authentication, authorization, and auditing virtual server, and global system level. The policies configured at the user-level have the highest priority.

#### Note

This topic details steps for using syslog. Make necessary changes to use nslog.

### To configure syslog auditing by using the CLI

1. Configure the audit server with the relevant log settings.

```
ns-cli-prompt> add audit syslogAction <name> <serverIP> ...
```

2. Configure the audit policy by associating the audit server.

```
ns-cli-prompt> add audit syslogPolicy <name> <rule> <action>
```

3. Associate the audit policy with one of the following entities:

- Bind the policy to a specific user.

```
ns-cli-prompt> bind aaa user <userName> -policy <policyname> ...
```

- Bind the policy to a specific group.

```
ns-cli-prompt> bind aaa group <groupName> -policy <policyname> ...
```

- Bind the policy to a authentication, authorization, and auditing virtual server.

```
ns-cli-prompt> bind authentication vserver <name> -policy <policyname> ...
```

- Bind the policy globally to the Citrix ADC appliance.

```
ns-cli-prompt> bind tm global -policyName <policyname> ...
```

### To configure syslog auditing by using the GUI (Configuration tab)

1. Configure the audit server and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog**, and configure the server and the policy in the relevant tabs.

2. Associate the policy with one of the following:

- Bind the policy to a specific user.

Navigate to **Security > AAA - Application Traffic > Users**, and associate the authorization policy with the relevant user.

- Bind the policy to a specific group.  
Navigate to **Security > AAA - Application Traffic > Groups**, and associate the authorization policy with the relevant group.
- Bind the policy to a authentication, authorization, and auditing virtual server.  
Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the authorization policy with the relevant virtual server.
- Bind the policy globally to the Citrix ADC appliance.  
Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog or Nslog**, select the authorization policy, and click **Action > Global Bindings** to bind the policy globally.

## Session settings

September 21, 2020

After you configure your authentication, authorization, and auditing profiles, you configure session settings to customize your user sessions. The session settings are:

- **The session timeout.**  
Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.
- **The default authorization setting.**  
Determines whether the Citrix ADC appliance will by default allow or deny access to content for which there is no specific authorization policy.
- **The single sign-on setting.**  
Determines whether the Citrix ADC appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.
- **The credential index setting.**  
Determines whether the Citrix ADC appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you

want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

## Session profiles

September 21, 2020

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

### Note

The terms “session profile” and “session action” mean the same thing.

### To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

- `add tm sessionAction <name> [-sesTimeout <mins>] [-defaultAuthorizationAction ( ALLOW | DENY )][-SSO ( ON | OFF )][-ssoCredential ( PRIMARY | SECONDARY )] [-ssoDomain <string>][-httpOnlyCookie ( YES | NO )] [-persistentCookie ( ENABLED | DISABLED )] [-persistentCookieValidity <minutes>]<!--NeedCopy-->`
- `show tm sessionAction <name><!--NeedCopy-->`

### Example

```
1 > add tm sessionAction session-profile -sesTimeout 30 -
   defaultAuthorization ALLOW
2 Done
3 > show tm sessionAction session-profile
4 1)      Name: session-profile
5         Authorization action : ALLOW
6         Session timeout: 30 minutes
7 Done
8 <!--NeedCopy-->
```

## To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- `set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction ( ALLOW | DENY )][-SSO ( ON | OFF )][-ssoCredential ( PRIMARY | SECONDARY )] [-ssoDomain <string>][-httpOnlyCookie ( YES | NO )] [-persistentCookie ( ENABLED | DISABLED )] [-persistentCookieValidity <minutes>]<!--NeedCopy-->`
- `show tm sessionAction<!--NeedCopy-->`

### Example

```

1 > set tm sessionAction session-profile -sessTimeout 30 -
   defaultAuthorization ALLOW
2 Done
3 > show tm sessionAction session-profile
4 1)      Name: session-profile
5         Authorization action : ALLOW
6         Session timeout: 30 minutes
7 Done
8 <!--NeedCopy-->
```

## To remove a session profile by using the command line interface

At the command prompt, type the following command to remove a session profile:

```
rm tm sessionAction <name><!--NeedCopy-->
```

## To configure session profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Session**.
3. In the details pane, click the **Profiles** tab.
4. On the **Profiles** tab, do one of the following:
  - To create a new session profile, click **Add**.
  - To modify an existing session profile, select the profile, and then click **Edit**.
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.
  - Name\*—actionname (Cannot be changed for a previously configured session action.)
  - Session Time-out—sesstimeout
  - Single Signon to Web Applications—sso

- Default Authorization Action—defaultAuthorizationAction
  - Credential Index—ssocredential
  - Single Sign-on Domain—ssoDomain
  - HTTPOnly Cookie—httpOnlyCookie
  - Enable Persistent Cookie—persistentCookie
  - Persistent Cookie Validity—persistentCookieValidity
6. Click **Create** or **OK**. The session profile that you created appears in the Session Policies and Profiles pane.

## Session policies

September 21, 2020

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

### To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

```
1 - add tm sessionPolicy <name> <rule> <action>
2 - show tm sessionPolicy <name>
3 <!--NeedCopy-->
```

#### Example

```
1 > add tm sessionPolicy session-pol "URL == /*.png" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1)      Name: session-pol      Rule: URL == '/*.*.png'
5        Action: session-profile
6 Done
7 <!--NeedCopy-->
```

### To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

```

1 - set tm sessionPolicy <name> [-rule <expression>] [-action <action>]
2 - show tm sessionPolicy <name>
3 <!--NeedCopy-->

```

### Example

```

1 > set tm sessionPolicy session-pol "URL == /*.png" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol Rule: URL == '/*.png'
5 Action: session-profile
6 Done
7 <!--NeedCopy-->

```

## To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

“bind tm global -policyName [-priority ]

```
1 Example
```

```
bind tm global -policyName session-pol
Done
```

```
show tm sessionPolicy session-pol
1) Name: session-pol Rule: URL == '/*.png'
Action: session-profile
Policy is bound to following entities
1) TM GLOBAL PRIORITY : 0
Done
```

```

1 ## To bind a session policy to an authentication virtual server by
   using the command line interface
2
3 At the command prompt, type the following command to bind a session
   policy to an authentication virtual and verify the configuration:
4
5 ``bind authentication vserver <name> -policy <polycname> [-priority <
   priority>]<!--NeedCopy-->

```

### Example

```
1 > bind authentication vserver auth-vserver-1 -policyName Session-Pol-1
   -priority 1000
2 Done
3 <!--NeedCopy-->
```

### To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

“unbind authentication vserver -policy

```
1 Example
```

```
unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
Done
```

```
1 ## To unbind a globally bound session policy by using the command line
   interface
2
3 At the command prompt, type the following commands to unbind a globally
   -bound session policy:
4
5 ``unbind tm global -policyName <polycyname><!--NeedCopy-->
```

#### Example

```
1 > unbind tm global -policyName Session-Pol-1
2 Done
3 <!--NeedCopy-->
```

### To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

“rm tm sessionPolicy

```
1 Example
```

rm tm sessionPolicy Session-Pol-1

Done

““

## To configure and bind session policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Session**.
3. In the details pane, on the **Policies** tab, do one of the following:
  - To create a new session policy, click **Add**.
  - To modify an existing session policy, select the policy, and then click **Edit**.
4. In the **Create Session Policy** or **Configure Session Policy** dialog, type or select values for the parameters.
  - Name\*—policyname (Cannot be changed for a previously configured session policy.)
  - Request Profile\*—actionname
  - Expression\*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking **Add** to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.
6. To globally bind a session policy, in the details pane, select **Global Bindings** from the **Action** drop-down list, and fill in the dialog.
  - Select the name of the session policy you want to globally bind.
  - Click **OK**.
7. To bind a session policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the policies list.
  - In the details pane, select the virtual server, and then click **Edit**.
  - In the **Advanced Selections** to the right of the detail area, click **Policies**.
  - Select a policy, or click the **plus** icon to add a policy.
  - In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
  - Click **OK**.

A message appears in the status bar, stating that the policy has been configured successfully.

## Global session settings

September 21, 2020

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

### To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

```
“set tm sessionParameter [-sessTimeout ][-defaultAuthorizationAction ( ALLOW | DENY )][-SSO ( ON | OFF )][-ssoCredential ( PRIMARY | SECONDARY )][-ssoDomain ][-httpOnlyCookie ( YES | NO )][-persistentCookie ( ENABLED | DISABLED )] [-persistentCookieValidity ]
```

#### 1 Example

```
set tm sessionParameter -sessTimeout 30
Done
set tm sessionParameter -defaultAuthorizationAction DENY
Done
set tm sessionParameter -SSO ON
Done
set tm sessionParameter -ssoCredential PRIMARY
Done
```

““

### To configure the session settings by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**
2. In the details pane, under **Settings**, click Change global settings.
3. In the **Global Session Settings** dialog, type or select values for the parameters.
  - Session Time-out—sessTimeout
  - Default Authorization Action—defaultAuthorizationAction
  - Single Sign-on to Web Applications—sso
  - Credential Index—ssoCredential
  - Single Sign-on Domain—ssoDomain
  - HTTPOnly Cookie—httpOnlyCookie

- Enable Persistent Cookie—persistentCookie
  - Persistent Cookie Validity (minutes)—persistentCookieValidity
  - Home Page—homepage
4. Click **OK**.

## Traffic Settings

September 21, 2020

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put your company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one Citrix ADC appliance or virtual appliance instance to authenticate to another Citrix ADC appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

## Traffic profiles

September 21, 2020

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

### Note

In this feature, the terms “profile” and “action” mean the same thing.

### To create a traffic profile by using the command line interface

At the command prompt, type:

```
“add tm trafficAction [-appTimeout ][-SSO ( ON | OFF ) [-formSSOAction ]][-persistentCookie ( EN-  
ABLED | DISABLED )][-InitiateLogout ( ON | OFF )]
```

```
1 ### Example
```

```
add tm trafficAction Traffic-Prof-1 -appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1
```

```
1 ## To modify a session profile by using the command line interface
2
3 At the command prompt, type:
4
5 ``set tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF )
  [-formSSOAction <string>]] [-persistentCookie ( ENABLED | DISABLED )
  ] [-InitiateLogout ( ON | OFF )]<!--NeedCopy-->
```

### Example

```
1 set tm trafficAction Traffic-Prof-1 - appTimeout 10 -SSO ON -
  formSSOAction SSO-Prof-1
2 <!--NeedCopy-->
```

### To remove a session profile by using the command line interface

At the command prompt, type:

```
“rm tm trafficAction
```

```
1 ### Example
```

```
rm tm trafficAction Traffic-Prof-1
```

```
1 ## To configure traffic profiles by using the configuration utility
2
3 1. Navigate to **Security > AAA - Application Traffic > Traffic.**
4 1. Navigate to **Security > AAA - Application Traffic > Policies >
  Traffic.**
5 1. In the details pane, click the Profiles tab.
6 1. On the Profiles tab, do one of the following:
7 - To create a new traffic profile, click **Add.**
8 - To modify an existing traffic profile, select the profile, and
  then click **Edit.**
9 1. In the **Create Traffic Profile** or **Configure Traffic Profile**
  dialog box, specify values for the parameters.
10 - Name\*-name (Cannot be changed for a previously configured
  session action.)
11 - AppTimeout - appTimeout
```

```

12     - Single Sign-On – SSO
13     - Form SSO Action – formSSOAction
14     - SAML SSO Action – samlSSOAction
15     - Enable Persistent Cookie – persistentCookie
16     - Initiate Logout – InitiateLogout
17 1. Click **Create** or **OK**. The traffic profile that you created
    appears in the Traffic Policies, Profiles, and either the Form SSO
    Profiles or SAML SSO Profiles pane, as appropriate.
18
19 ## Support for AAA.USER and AAA.LOGIN expressions
20
21 The AAA.USER expression is now implemented to replace the existing HTTP
    .REQ.USER expressions. The AAA.USER expression is applicable to
    handle non-HTTP traffic, such as Secure Web Gateway (SWG) and role-
    based access (RBA) mechanism. The AAA.USER expressions are
    equivalent to HTTP.REQ.USER expressions.
22
23 You can use the expression at a variety of actions or profiles
    configuration.
24
25 At the command prompt, type:
26
27 ``add tm trafficAction <name> [SSO (ON|OFF) [-userExpression <string
    >]<!--NeedCopy-->

```

### Example

```

1 add tm trafficAction tm_act -SSO ON -userExpression "AAA.USER.NAME"
2
3 Done
4
5     add tm trafficPolicy tm_pol true tm_act
6
7 Done
8
9     bind lb vserver lb1 -policyName tm_pol -priority 2
10 <!--NeedCopy-->

```

### Note

If you use HTTP.REQ.USER expression, a warning message “HTTP.REQ.USER has been deprecated. Use AAA.USER instead” appears on the command prompt.

- **AAA.LOGIN Expression.** The LOGIN expression represents pre-login, also known as the login

request. The login request can be from Citrix Gateway, SAML IdP, or from OAuth authentication. The Citrix ADC will abstract the required attributes from policy configuration. The AAA.LOGIN expression contains the attributes, which can be fetched based on the following:

- **AAA.LOGIN.USERNAME.** The username (if found) is fetched from the current login request. The same expression applied to a non-login request (determined by a authentication, authorization, and auditing) results in an empty string.
- **AAA.LOGIN.PASSWORD.** The user password (if found) is fetched from the current login request. The expression results in an empty string if the password is not found.
- **AAA.LOGIN.PASSWORD2.** The second password (if found) is fetched from the login request.
- **AAA.LOGIN.DOMAIN.** The domain information is fetched from the login request.
- **AAA.USER.ATTRIBUTE.** The AAA.USER.ATTRIBUTE expressions have now an integer associated with it. The attributes can be grouped and name the string with an appropriate name. The authentication, authorization, and auditing module looks up user sessions attribute and AAA.USER.ATTRIBUTE("string") would query the hash table for that particular attribute. For example, if Attributes("samaccountname") is set, AAA.USER.ATTRIBUTE("samaccountname") would query the hash map and would fetch the value corresponding to "samaccountname."

## Traffic policies

September 21, 2020

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

### To create a traffic policy by using the command line interface

At the command prompt, type:

“add tm trafficPolicy

```
1 ### Example
```

add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true)" Traffic-Prof-1

```
1 ## To modify a traffic policy by using the command line interface
2
3 At the command prompt, type:
4
5 ``set tm trafficPolicy <name> <rule> <action><!--NeedCopy-->
```

**Example**

```
1 set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS(  
    "login=true)" Traffic-Prof-1  
2 <!--NeedCopy-->
```

**To globally bind a traffic policy by using the command line interface**

At the command prompt, type:

“bind tm global -policyName [-priority ]

```
1 ### Example  
2  
3 ``bind tm global -policyName Traffic-Pol-1<!--NeedCopy-->
```

**To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface**

At the command prompt, type one of the following commands:

- `bind lb vserver <name> -policy <policyName> [-priority <priority>]<!--NeedCopy-->`
- `bind cs vserver <name> -policy <policyName> [-priority <priority>]<!--NeedCopy-->`

**Example**

```
1 bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -  
    priority 1000  
2 <!--NeedCopy-->
```

**To unbind a globally bound traffic policy by using the command line interface**

At the command prompt, type:

“unbind tm global -policyName

```
1 ### Example
```

unbind tm global -policyName Traffic-Pol-1

```

1  ## To unbind a traffic policy from a load balancing or content
   switching virtual server by using the command line interface
2
3  At the command prompt, type one of the following commands:
4
5  -  ``unbind lb vserver <name> -policy <polycyname><!--NeedCopy-->

```

- `unbind cs vserver <name> -policy <polycyname><!--NeedCopy-->`

### Example

```

1  unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
2
3  <!--NeedCopy-->

```

### To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

```
“rm tm trafficPolicy
```

```
1  ### Example
```

```
rm tm trafficPolicy Traffic-Pol-1
```

```
““
```

### To configure and bind traffic policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
3. In the details pane, do one of the following:
  - To create a new session policy, click **Add**.
  - To modify an existing session policy, select the policy, and then click **Edit**.
4. In the **Create Traffic Policy** or **Configure Traffic Policy** dialog, specify values for the parameters.
  - Name\*—policyName (Cannot be changed for a previously configured session policy.)
  - Profile\*—actionName
  - Expression—rule (You enter expressions by first choosing the type of expression in the left-most drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

- Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.

## Form SSO profiles

September 21, 2020

To enable and configure forms-based SSO, you first create an SSO profile.

### Note

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.

### To create a form SSO profile by using the command line interface

At the command prompt, type:

- `add tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>][-nvtype ( STATIC | DYNAMIC )][ -submitMethod ( GET | POST )]<!--NeedCopy-->`
- `show tm formSSOAction [<name>]<!--NeedCopy-->`

### Example

```
1 add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -nameValuePair "loginID passwd" -responsesize "9096"
4 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
5 -nvtype STATIC -submitMethod GET
6 - sessTimeout 10 -defaultAuthorizationAction ALLOW
7 <!--NeedCopy-->
```

### To modify a form SSO by using the command line interface

At the command prompt, type:

```
“set tm formSSOAction -actionURL -userField -passwdField -ssoSuccessRule [-nameValuePair ]
[-responsesize ][-nvtype ( STATIC | DYNAMIC )][ -submitMethod ( GET | POST )]
```

```
1 ### Example
```

```
set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"  
-userField "loginID" -passwdField "passwd"  
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"  
-nameValuePair "loginID passwd" -responsesize "9096"  
-nvtype STATIC -submitMethod GET  
-sessTimeout 10 -defaultAuthorizationAction ALLOW
```

```
1 ## To remove a form SSO profile by using the command line interface  
2  
3 At the command prompt, type:  
4  
5 ``rm tm formSSOAction <name><!--NeedCopy-->
```

### Example

```
1 rm tm sessionAction SSO-Prof-1  
2 <!--NeedCopy-->
```

### To configure form SSO profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
2. In the details pane, click the **Form SSO Profiles** tab.
3. On the Form SSO Profiles tab, do one of the following:
  - To create a new form SSO profile, click **Add**.
  - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the **Create Form SSO Profile** or **Configure Form SSO Profile** dialog, specify values for the parameters:
  - Name\*—name (Cannot be changed for a previously configured session action.)
  - Action URL\*—actionURL
  - User Name Field\*—userField
  - Password Field\*—passField
  - Expression\*—ssoSuccessRule
  - Name Value Pair—nameValuePair
  - Response Size—responsesize
  - Extraction—nvtype
  - Submit Method—submitMethod</span>
5. Click **Create** or **OK**, and then click **Close**. The form SSO profile that you created appears in the **Traffic Policies, Profiles**, and **Form SSO Profiles** pane.

## SAML SSO profiles

September 21, 2020

To enable and configure SAML-based SSO, you first create a SAML SSO profile.

### To create a SAML SSO profile by using the command line interface

At the command prompt, type:

```
“add tm samlSSOProfile -samlSigningCertName -assertionConsumerServiceURL -relaystateRule
-sendPassword (ON | OFF) [-samlIssuerName ]
```

```
1 ### Example
```

```
add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName “Example, Inc.” -assertionConsumerServiceURL
“https://service.example.com” -relaystateRule “true” -sendPassword “ON” -samlIssuerName “Exam-
ple, Inc.”
```

```
1 ## To modify a SAML SSO by using the command line interface
2
3 At the command prompt, type:
4
5 ``set tm samlSSOProfile <name> -samlSigningCertName <string> -
  assertionConsumerServiceURL <URL> -relaystateRule <expression> -
  sendPassword (ON | OFF) [-samlIssuerName <string>]<!--NeedCopy-->
```

### Example

```
1 set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example,
  Inc." -assertionConsumerServiceURL "https://service.example.com" -
  relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example,
  Inc."
2 <!--NeedCopy-->
```

### To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

```
“rm tm samlSSOProfile
```

```
1 ### Example
```

```
rm tm sessionAction saml-SSO-Prof-1
```

““

### To configure a SAML SSO profile by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
2. In the details pane, click the **SAML SSO Profiles** tab.
3. On the **SAML SSO Profiles** tab, do one of the following:
  - To create a new SAML SSO profile, click **Add**.
  - To modify an existing SAML SSO profile, select the profile, and then click **OpenEdit**.
4. In the **Create SAML SSO Profiles** or the **Configure SAML SSO Profiles** dialog box, set the following parameters:
  - Name\*
  - Signing Certificate Name\*
  - ACS URL\*
  - Relay State Rule\*
  - Send Password
  - Issuer Name
5. Click **Create** or **OK**, and then click **Close**. The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

## Session timeout for OWA 2010

September 21, 2020

You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

### To force OWA 2010 to timeout after a specified period by using the command line interface

At the command prompt, type the following commands:

- `add tm trafficAction <actname> [-forcedTimeout <forcedTimeout> -forcedTimeoutVal <mins>]<!--NeedCopy-->`

For <actname>, substitute a name for your traffic policy. For <mins>, substitute the number of minutes after which to initiate a forced timeout. For <forcedTimeout>, substitute one of the following values:

- **START**—Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect.
  - **STOP**—Stops a running timer. If no running timer is found, has no effect.
  - **RESET**—Restarts a running timer. If no running timer is found, starts a timer just as if the START option had been used.
- `add tm trafficPolicy <polname> <rule> <actname><!--NeedCopy-->`  
For <polname>, substitute a name for your traffic policy. For <rule>, substitute a rule in Citrix ADC default syntax.
  - `bind lb vserver <vservername> -policyName <name> -priority <number><!--NeedCopy-->`  
For <vservername>, substitute the name of the authentication, authorization, and auditing traffic management virtual server. For <priority>, substitute an integer that designates the policy's priority.

### Example

```
1 add tm trafficAction act-owa2010timeout -forcedTimeout RESET -
   forcedTimeoutVal 10
2 add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
3 bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
4 <!--NeedCopy-->
```

## Authenticating with client certificates

September 21, 2020

Web sites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure authentication, authorization, and auditing to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the Citrix ADC must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from

the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.

The following procedures assume that you have already created a functioning authentication, authorization, and auditing configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the `/nsconfig/ssl` directory.

### To configure the authentication, authorization, and auditing client certificate parameters by using the command line interface

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

- `add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod><!--NeedCopy-->`
- `bind ssl certKey <certkeyName> -vServer <certkeyName> -CA -crlCheck Mandatory<!--NeedCopy-->`
- `show ssl certKey [<certkeyName>]<!--NeedCopy-->`
- `set aaa parameter -defaultAuthType CERT<!--NeedCopy-->`
- `show aaa parameter<!--NeedCopy-->`
- `set aaa certParams -userNameField "Subject:CN"<!--NeedCopy-->`
- `show aaa certParams<!--NeedCopy-->`

### To configure the authentication, authorization, and auditing client certificate parameters by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click **Edit**.
3. On the **Configuration** page, under **Certificates**, click the right arrow (>) to open the CA Cert Key installation dialog.
4. In the **CA Cert Key** dialog box, click **Insert**.
5. In the **CA Cert Key - SSL Certificates** dialog box, click **Install**.
6. In the **Install Certificate** dialog box, set the following parameters, whose names correspond to the CLI parameter names as shown:

- Certificate-Key Pair Name\*—certkeyName
  - Certificate File Name—certFile
  - Key File Name—keyFile
  - Certificate Format—inform
  - Password—password
  - Certificate Bundle—bundle
  - Notify When Expires—expiryMonitor
  - Notification Period—notificationPeriod
7. Click **Install**, and then click **Close**.
  8. In the **CA Cert Key** dialog box, in the **Certificate** list, select the root certificate.
  9. Click **Save**.
  10. Click **Back** to return to the main configuration screen.
  11. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > CERT**.
  12. In the details pane, select the policy you want to configure to handle client certificate authentication, and then click **Edit**.
  13. In the **Configure Authentication CERT Policy** dialog, Server drop-down list, select the virtual server you just configured to handle client certificate authentication.
  14. Click **OK**. A message appears in the status bar, stating that the configuration completed successfully.

### Support to notify number of unsuccessful login attempts

The Citrix ADC appliance can now log the number of unsuccessful login attempts made from the last successful log on. The feature works only if the persistentLoginAttempts option is enabled on the appliance. By default, the option is disabled on the Citrix ADC appliance.

A Citrix ADC administrator can use this information to verify if any unauthorized attempts have occurred on a secured external user account.

#### To use this feature, at the Citrix ADC command prompt, type:

```
“set aaa parameter [-maxloginAttempts [-failedLoginTimeout ]] -persistentLoginAttempts (ENABLED | DISABLED)
```

```
1  **Example:**
2
3  ``set aaa parameter -maxLoginAttempts 4 -failedLoginTimeout 3 -
   persistentLoginAttempts ENABLED<!--NeedCopy-->
```

## Client certificate pass-through

September 21, 2020

The Citrix ADC can now be configured to pass client certificates through to protected applications that require client certificates for user authentication. The ADC first authenticates the user, then inserts the client certificate into the request and sends it to the application. This feature is configured by adding appropriate SSL policies.

The exact behavior of this feature when a user presents a client certificate depends upon the configuration of the VPN virtual server.

- If the VPN virtual server is configured to accept client certificates but not require them, the ADC inserts the certificate into the request and then forwards the request to the protected application.
- If the VPN virtual server has client certificate authentication disabled, the ADC renegotiates the authentication protocol and reauthenticates the user before it inserts the client certificate in the header and forwards the request to the protected application.
- If the VPN virtual server is configured to require client certificate authentication, the ADC uses the client certificate to authenticate the user, then inserts the certificate in the header and forwards the request to the protected application.

In all of these cases, you configure client certificate pass-through as follows.

### To create and configure client certificate pass-through by using the command line interface

At the command prompt, type the following commands:

- `add vpn vserver <name> SSL <IP> 443<!--NeedCopy-->`

For *name*, substitute a name for the virtual server. The name must contain from one to 127 ASCII characters, beginning with a letter or underscore (`_`), and containing only letters, numbers, and the underscore, hash (`#`), period (`.`), space, colon (`:`), at (`@`), equals (`=`), and hyphen (`-`) characters. For *<IP>*, substitute the IP address assigned to the virtual server.“

- `set ssl vserver <name> -clientAuth ENABLED -clientCert <clientcert>`  
For *<name>*, substitute the name of the virtual server that you just created. For *<clientCert>*, substitute one of the following values:
  - `disabled`—disables client certificate authentication on the VPN virtual server.
  - `mandatory`—configures the VPN virtual server to require client certificates to authenticate.
  - `optional`—configures the VPN virtual server to allow client certificate authentication, but not to require it.

- `bind vpn vserver \<name\> -policy local`  
For <name>, substitute the name of the VPN virtual server that you created.
- `bind vpn vserver \<name> -policy cert`  
For <name>, substitute the name of the VPN virtual server that you created.
- `bind ssl vserver \<name> -certkeyName \<certkeyname>`  
For <name>, substitute the name of the virtual server that you created. For <certkeyName>, substitute the client certificate key.
- `bind ssl vserver \<name> -certkeyName \<cacertkeyname> -CA -ocspCheck Optional`  
For <name>, substitute the name of the virtual server that you created. For <cacertkeyName>, substitute the CA certificate key.
- `add ssl action \<actname\> -clientCert ENABLED -certHeader CLIENT-CERT`  
For <actname>, substitute a name for the SSL action.
- `add ssl policy \<polname\> -rule true -action \<actname\>`  
For <polname>, substitute a name for your new SSL policy. For <actname>, substitute the name of the SSL action that you just created.
- `bind ssl vserver \<name\> -policyName \<polname\> -priority 10`  
For <name>, substitute the name of the VPN virtual server.

### Example

- `add vpn vserver vs-certpassthru SSL 10.121.250.75 443`
  - `set ssl vserver vs-certpassthru -clientAuth ENABLED -clientCert optional`
  
  - `bind vpn vserver vs-certpassthru -policy local`
  - `bind vpn vserver vs-certpassthru -policy cert`
  - `bind ssl vserver vs-certpassthru -certkeyName mycertKey`
  - `bind ssl vserver vs-certpassthru -certkeyName mycertKey -CA -ocspCheck Optional`
  - `add ssl action act-certpassthru -clientCert ENABLED -certHeader CLIENT-CERT`
  - `add ssl policy pol-certpassthru -rule true -action act-certpassthru`
  - `bind ssl vserver vs-certpassthru -policyName pol-certpassthru -priority 10`
- ““

## Configuring authentication, authorization, and auditing with commonly used protocols

September 21, 2020

Configuring the Citrix ADC appliance for authentication, authorization, and auditing needs a specific setup on the Citrix ADC appliance and clients' browsers. The configuration varies with the protocol used for authentication, authorization, and auditing.

For more information about configuring the Citrix ADC appliance for Kerberos authentication, see [Handling Authentication, Authorization and Auditing with Kerberos/NTLM](#).

## Handling authentication, authorization and auditing with Kerberos/NTLM

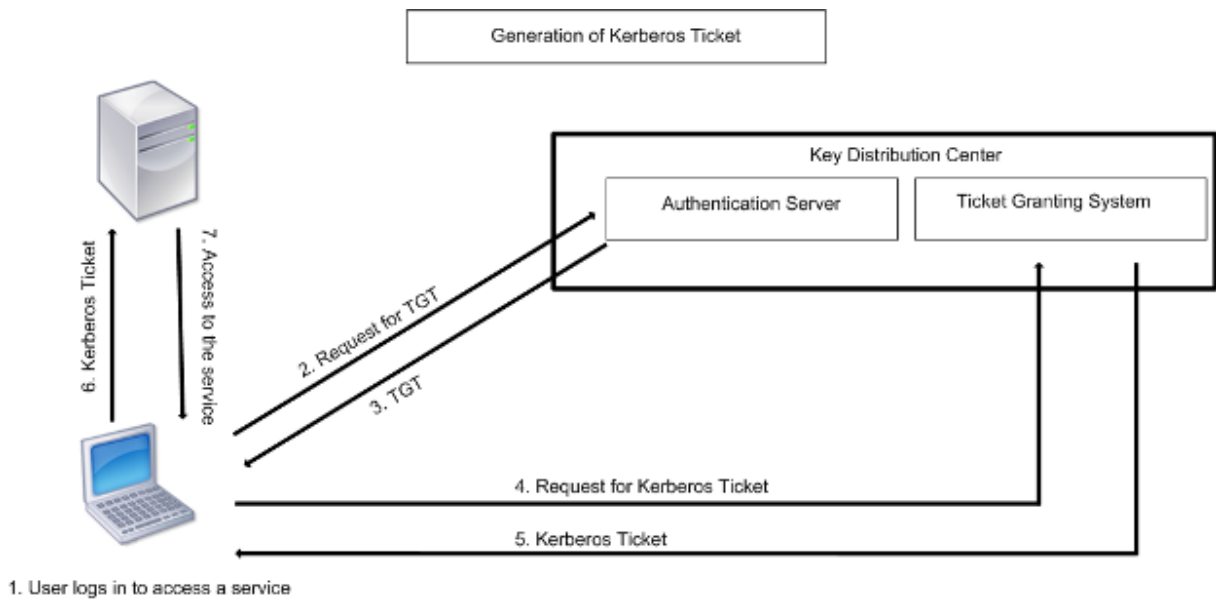

September 21, 2020

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other's authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. **Functioning of Kerberos**

**Kerberos authentication has the following advantages:**

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the Citrix ADC appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

**Kerberos authentication may have the following disadvantages:**

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user's password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the Citrix ADC appliance and on each client.

## **Optimizing Kerberos authentication on authentication, authorization, and auditing**

The Citrix ADC appliance now optimizes and improves the system performance while Kerberos authentication. The authentication, authorization, and auditing daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

## **How Citrix ADC implements Kerberos for client authentication**

September 21, 2020

### **Important**

Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for authentication, authorization, and auditing traffic management virtual servers.

Citrix ADC handles the components involved in Kerberos authentication in the following way:

### **Key Distribution Center (KDC)**

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

### **Note**

All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

### **Authentication service and protocol negotiation**

A Citrix ADC appliance supports Kerberos authentication on the authentication, authorization, and auditing traffic management authentication virtual servers. If the Kerberos authentication fails, the Citrix ADC uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for authentication, authorization, and auditing. If you create an authentication policy with NEGOTIATE as the authentication type, the Citrix ADC attempts to use the Kerberos protocol for authentication, authorization, and auditing and if the client's browser fails to receive a Kerberos ticket, the Citrix ADC uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.

- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the Citrix ADC does not use the data that is present locally on the Citrix ADC appliance.

### **Authorization**

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

### **Auditing**

The Citrix ADC appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

### **Supported Environment**

Kerberos authentication does not need any specific environment on the Citrix ADC. The client (browser) must provide support for Kerberos authentication.

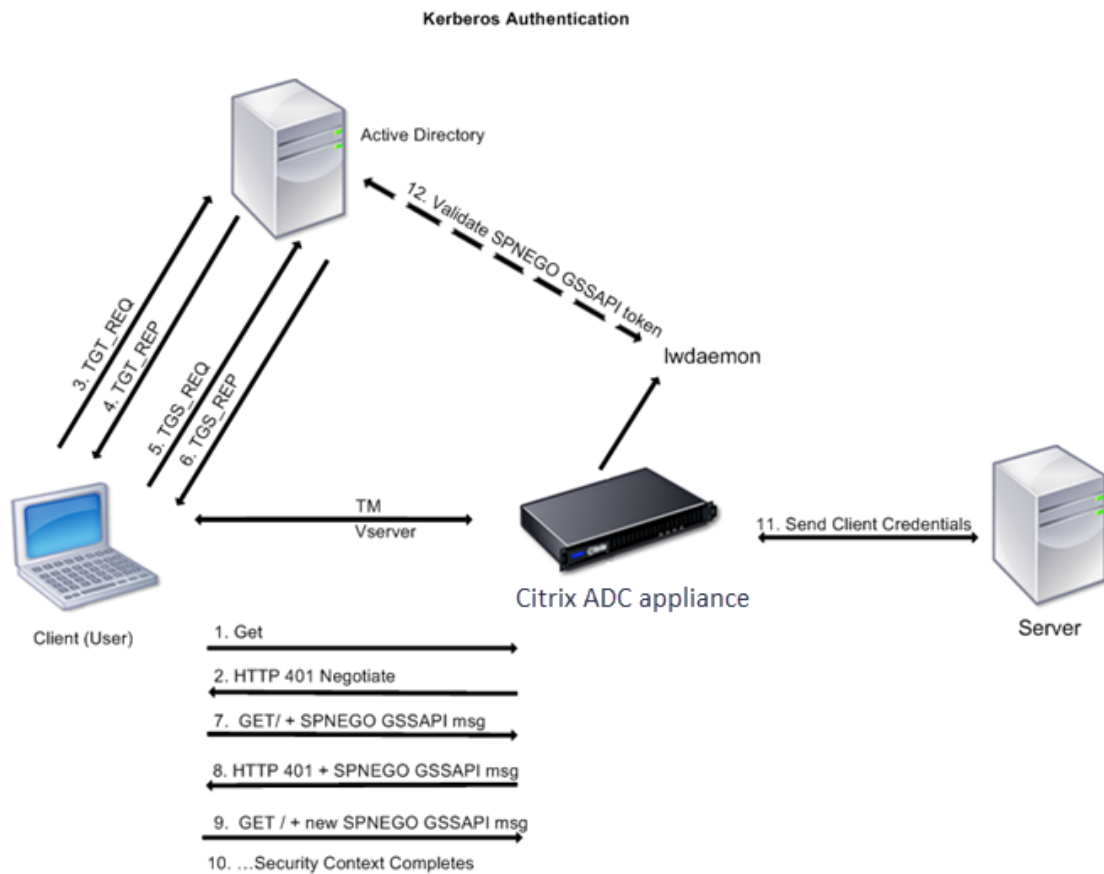

### **High Availability**

In a high availability setup, only the active Citrix ADC joins the domain. In case of a failover, the Citrix ADC lwagent daemon joins the secondary Citrix ADC appliance to the domain. No specific configuration is required for this functionality.

### **Kerberos authentication process**

The following figure shows a typical process for Kerberos authentication in the Citrix ADC environment.

Figure 1. Kerberos Authentication Process on Citrix ADC

The Kerberos authentication occurs in the following stages:

**Client authenticates itself to the KDC**

1. The Citrix ADC appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the Citrix ADC appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
  - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
  - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

**Note**

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

### **Client requests a service.**

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the Citrix ADC. The SPNEGO token has the necessary GSSAPI data.
2. The Citrix ADC appliance establishes a security context between the client and the Citrix ADC. If the Citrix ADC cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the Citrix ADC acts as an HTTP proxy between the client and the physical server.

### **Citrix ADC appliance completes the authentication.**

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

## **Configuring kerberos authentication on the Citrix ADC appliance**

September 21, 2020

This topic provides the detailed steps to configure Kerberos authentication on the Citrix ADC appliance by using the CLI and the GUI.

### **Configuring Kerberos authentication on the CLI**

1. Enable the authentication, authorization, and auditing feature to ensure the authentication of traffic on the appliance.

```
ns-cli-prompt> enable ns feature AAA
```

2. Add the keytab file to the Citrix ADC appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the Citrix ADC appliance.

First generate the keytab file on the Active Directory server and then transfer it to the Citrix ADC appliance.

- Log on to the Active Directory server and add a user for Kerberos authentication. For example, to add a user named “Kerb-SVC-Account”:

**net user Kerb-SVC-Account freebsd!@#456 /add****Note**

In the **User Properties** section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

- Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

```
ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM /pass freebsd!@#456 /mapuser newacp\dummy /ptype KRB5_NT_PRINCIPAL
```

**Note**

You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

- Transfer the keytab file to the Citrix ADC appliance by using the unix **ftp** command or any other file transfer utility of your choice.
3. The Citrix ADC appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the Citrix ADC with a DNS server.

```
ns-cli-prompt> add dns nameserver <ip-address>
```

**Note**

Alternatively, you can add static host entries or use any other means so that the Citrix ADC appliance can resolve the FQDN name of the domain controller to an IP address.

4. Configure the authentication action and then associate it to an authentication policy.

- Configure the negotiate action.

```
ns-cli-prompt> add authentication negotiateAction <name> -domain <domainName> -domainUser <domainUsername> -domainUserPasswd <domainUserPassword> -keytab <string>
```

- Configure the negotiate policy and associate the negotiate action to this policy.

```
ns-cli-prompt> add authentication negotiatePolicy <name> <rule> <reqAction>
```

5. Create an authentication virtual server and associate the negotiate policy with it.

- Create an authentication virtual server.

```
ns-cli-prompt> add authentication vserver <name> SSL <ipAuthVserver> 443 -authenticationDomain <domainName>
```

- Bind the negotiate policy to the authentication virtual server.

```
ns-cli-prompt> bind authentication vserver <name> -policy <negotiatePolicyName>
```

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

```
ns-cli-prompt> set lb vserver <name> -authn401 ON -authnVsName <string>
```

#### Note

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:

- Access the traffic management virtual server, using the FQDN. For example, [Sample](#)
- View the details of the session on the CLI.

```
ns-cli-prompt> show aaa session
```

## Configuring Kerberos authentication on the GUI

1. Enable the authentication, authorization, and auditing feature.

Navigate to **System > Settings**, click **Configure Basic Features** and enable the authentication, authorization, and auditing feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.

3. Add a DNS server.

Navigate to **Traffic Management > DNS > Name Servers**, and specify the IP address for the DNS server.

4. Configure the **Negotiate** action and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with **Negotiate** as the action type. Click **ADD** to create a new authentication negotiate server or click **Edit** to configure the existing details.

5. Bind the negotiate policy to the authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the **Negotiate** policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and specify the relevant authentication settings.

**Note**

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

## Configuring kerberos authentication on a client

September 21, 2020

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

### To configure Internet Explorer for Kerberos authentication

1. In the **Tools** menu select **Internet Options**.
2. On the **Security** tab, click **Local Intranet**, and then click **Sites**.
3. In the **Local Intranet** dialog box, make sure that the Automatically detect intranet network option is selected, and then click **Advanced**.
4. In the **Local Intranet** dialog box, add the web sites of the domains of the traffic management virtual server on the Citrix ADC appliance. The specified sites become local intranet sites.
5. Click **Close** or **OK** to close the dialog boxes.

### To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.

Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

## Offloading Kerberos authentication from physical servers

March 16, 2021

The Citrix ADC appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the Citrix ADC authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the Citrix ADC and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current Citrix ADC appliance release, Kerberos authentication is available only for authentication, authorization, and auditing traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the Citrix Gateway Advanced Edition appliance or for Citrix ADC appliance management.

Kerberos authentication requires configuration on the Citrix ADC appliance and on client browsers.

### **To configure Kerberos authentication on the Citrix ADC appliance**

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
  - Make sure that you do not select the Change password at next logon option.
  - Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
  - `ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerbtabsfile.txt`

#### **Note**

Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbtabsfile.txt file.

3. Upload the kerbtabsfile.txt file to the /etc directory of the Citrix ADC appliance by using a Secure Copy (SCP) client.
4. Run the following command to add a DNS server to the Citrix ADC appliance.
  - `add dns nameserver 1.2.3.4`

The Citrix ADC appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.

5. Switch to the command line interface of Citrix ADC.
6. Run the following command to create a Kerberos authentication server:
  - `add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser kerbuser -domainUserPasswd Citrix1 -keytab /var/mykcd.keytab`

**Note**

If keytab is not available, you can specify the parameters: domain, domainUser, and -domainUserPasswd.

7. Run the following command to create a negotiation policy:

- `add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer<!--NeedCopy-->`

8. Run the following command to create an authentication virtual server.

- `add authentication vsriver Kerb-Auth SSL 192.168.17.201 443 - AuthenticationDomain crete.lab.net<!--NeedCopy-->`

9. Run the following command to bind the Kerberos policy to the authentication virtual server:

- `bind authentication vsriver Kerb-Auth -policy Kerberos-Policy - priority 100<!--NeedCopy-->`

10. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI Citrix ADC appliance. Run the following command to use the ServerTestCert sample certificate.

- `bind ssl vsriver Kerb-Auth -certkeyName ServerTestCert<!--NeedCopy -->`

11. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.

Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

12. Run the following command to configure an authentication virtual server:

- `set lb vsriver <name>-authn401 ON -authnVsName Kerb-Auth<!--NeedCopy -->`

13. Enter the host name [Example](#) in the address bar of the Web browser.

The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

**Note**

Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

14. Configure Kerberos on the Web browser of the client computer.

- For configuring on Internet Explorer, see [Configuring Internet Explorer for Kerberos authentication](#).

- For configuring on Mozilla Firefox, see [Configuring Internet Explorer for Kerberos authentication](#).

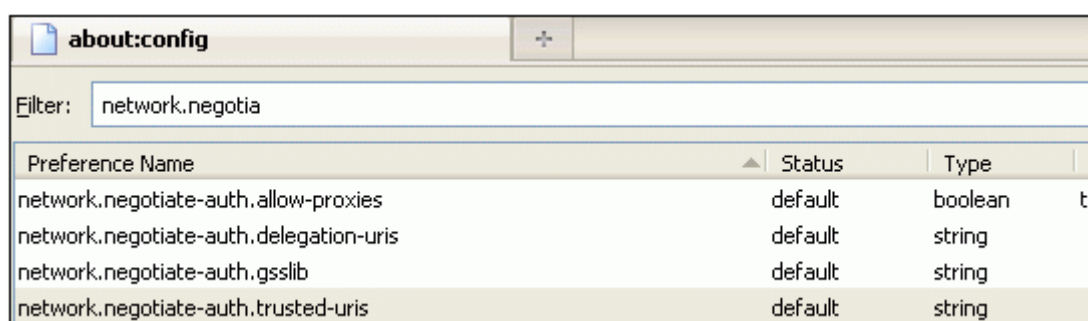

15. Verify whether you can access the backend physical server without authentication.

### To configure Internet Explorer for Kerberos authentication

1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.
6. Specify the URL, [Example](#) and click **Add**.
7. Restart **Internet Explorer**.

### To configure Mozilla Firefox for Kerberos authentication

1. Enter `about:config` in the address bar of the browser.
2. Click the warning disclaimer.
3. Type **Network.Negotiate-auth.trusted-uris** in the **Filter** box.
4. Double click **Network.Negotiate-auth.trusted-uris**. A sample screen is shown below.

5. In the Enter String Value dialog box, specify `www.crete.lab.net`.
6. Restart Firefox.

## Citrix ADC kerberos single sign-on

September 21, 2020

Citrix ADC appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The Citrix ADC Kerberos SSO implementation requires the user's password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user's password is not required for Kerberos SSO, although if Kerberos SSO fails and the Citrix ADC appliance has the user's password, it uses the password to attempt NTLM SSO.

If the user's password is available, the KCD account is configured with a realm, and no delegated user information is present, the Citrix AD Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The Citrix ADC Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user's behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

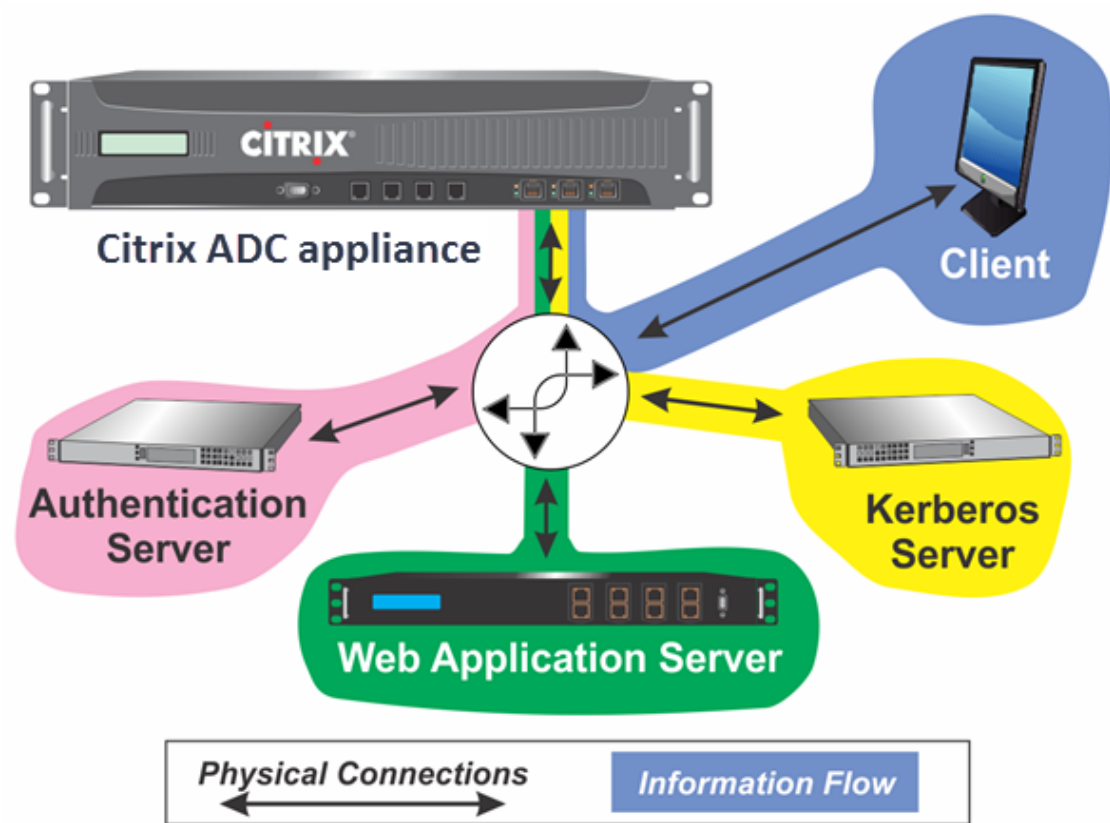

## **An overview of Citrix ADC kerberos SSO**

September 21, 2020

To use the Citrix ADC Kerberos SSO feature, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user's browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user's browser with a service ticket that provides proof. The browser resends the user's request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

Authentication, authorization, and auditing traffic management implements this process as shown in the following diagram. The diagram illustrates the flow of information through the Citrix ADC appliance and authentication, authorization, and auditing traffic management, on a secure network with LDAP authentication and Kerberos authorization. Authentication, authorization, and auditing traffic management environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos

The authentication, authorization, and auditing traffic management with authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the Citrix ADC appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management virtual server.
3. The traffic management virtual server sends the client's request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.
6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user's initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

## Integration of Citrix ADC Kerberos SSO with authentication methods

All authentication, authorization, and auditing traffic management authentication mechanisms support Citrix ADC Kerberos SSO. Authentication, authorization, and auditing traffic management supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the Citrix ADC appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the Citrix ADC appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

Table 1. Supported Authentication Methods

	Basic/Digest/NTLM	Kerberos Constrained Delegation	User Impersonation
CAC (Smart Card): at SSL/TLS Layer		X	X
Forms-Based (LDAP/RADIUS/TACACS)	X	X	X
HTTP Basic (LDAP/RADIUS/TACACS)	X	X	X
Kerberos		X	
NTLM v1/v2		X	X
SAML		X	
SAML Two-Factor	X	X	X
Certificate Two-Factor	X	X	X

## Setting up Citrix ADC SSO

September 21, 2020

You can configure Citrix ADC SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore usually preferable when your configuration allows it. To configure Citrix ADC SSO by impersonation, you must have the user's user name and password.

To configure Citrix ADC SSO by delegation, you must have the delegated user's credentials in one of the following formats: the user's user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

## Prerequisites

September 21, 2020

Before you configure Citrix ADC SSO, you need to have your Citrix ADC appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must configure either load balancing or content switching, and then authentication, authorization, and auditing, for these web application servers. You should also verify routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the Citrix ADC command line. For further assistance, see [Setting up an Authentication Virtual Server](#).

### To create a server and service by using the command line

For Citrix ADC SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the Citrix ADC appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the Citrix ADC server entity by specifying the FQDN of the web application server.
- Configure the Citrix ADC server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

```
1 - add server name <serverFQDN>
2
```

```
3 - add service name serverName serviceType port
4 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **serverName**. A name for the Citrix ADC appliance to use to refer to this server.
- **serverFQDN**. The FQDN of the server. If the server has no domain assigned to it, use the server's IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName**. A name for the Citrix ADC appliance to use to refer to this service.
- **type**. The protocol used by the service, either HTTP or MSSQLSVC.
- **port**. The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

### Example

The following examples add server and service entries on the Citrix ADC appliance for the web application server was1.example.com. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, was1.example.com, you would type the following commands:

```
1 add server was1 was1.example.com
2 add service was1service was1 HTTP 80
3 <!--NeedCopy-->
```

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

```
1 add server WAS1 10.237.64.87
2 add service was1service WAS1 HTTP 8
3 <!--NeedCopy-->
```

### To create a traffic management virtual server by using the command line

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

```
“add lb vserver
```

```
1 For the variables, substitute the following values:
2
3 - **vserverName**—A name for the Citrix ADC appliance to use to refer
   to this virtual server.
4 - **type**—The protocol used by the service, either HTTP or MSSQLSVC.
5 - **IP**—The IP address assigned to the virtual server. This would
   normally be an IANA-reserved, non-public IP address on your LAN.
6 - **port**—The port on which the service listens. HTTP services
   normally listen on port 80. Secure HTTPS services normally listen on
   port 443.
7
8 ## Example
9
10 To add a load balancing virtual server called tmvserver1 to a
    configuration that manages HTTP traffic on port 80, assigning it a
    LAN IP address of 10.217.28.20 and then binding the load balancing
    virtual server to the wasservice1 service, you would type the
    following commands:
```

```
add lb vserver tmvserver1 HTTP 10.217.28.20 80
bind lb vserver tmvserv1 wasservice1
```

```
1 ## To create an authentication virtual server by using the command line
2
3 The authentication virtual server manages authentication traffic
   between the client and the authentication (LDAP) server. To create
   an authentication virtual server, at the command prompt type the
   following commands:
```

- add authentication vserver SSL 443
- set authentication vserver -authenticationdomain

```
1 For the variables, substitute the following values:
2
3 - **authvserverName** —A name for the Citrix ADC appliance to use to
   refer to this authentication virtual server. Must begin with a
   letter, number, or the underscore character (\_), and must contain
   only letters, numbers, and the hyphen (-), period (.) pound (\#),
   space ( ), at (@), equals (=), colon (:), and underscore characters.
   Can be changed after the authentication virtual server is added by
   using the rename authentication vserver command.
4 - **IP**—The IP address assigned to the authentication virtual server
   . As with the traffic management virtual server, this address would
   normally be an IANA-reserved, non-public IP on your LAN.
```

```

5 - **domain** –The domain assigned to the virtual server. This would
    usually be the domain of your network. It is customary, though not
    required, to enter the domain in all capitals when configuring the
    authentication virtual server.
6
7 ## Example
8
9 To add an authentication virtual server called authverver1 to your
    configuration and assign it the LAN IP 10.217.28.21 and the domain
    EXAMPLE.COM, you would type the following commands:

```

```
add authentication vserver authvserver1 SSL 10.217.28.21 443
```

```
set authentication vserver authvserver1 -authenticationdomain EXAMPLE.COM
```

```

1 ## To configure a traffic management virtual server to use an
    authentication profile
2
3 The authentication virtual server can be configured to handle
    authentication for a single domain or for multiple domains. If it is
    configured to support authentication for multiple domains, you must
    also specify the domain for Citrix ADC SSO by creating an
    authentication profile, and then configuring the traffic management
    virtual server to use that authentication profile.
4
5 > **Note**
6 >
7 > The traffic management virtual server can be either a load balancing
    (lb) or content switching (cs) virtual server. The following
    instructions assume that you are using a load balancing virtual
    server. To configure a content switching virtual server, simply
    substitute
8 set cs vserver for set lb vserver. The procedure is otherwise the same.
9
10 To create the authentication profile, and then configure the
    authentication profile on a traffic management virtual server, type
    the following commands:

```

- add authentication authnProfile{-authvserverName}{-authenticationHost}{-authenticationDomain  
}
- set lb vserver <vserverName> -authnProfile

```

1 For the variables, substitute the following values:
2
3 - **authnprofileName** –A name for the authentication profile. Must
    begin with a letter, number, or the underscore character (\_), and

```

```

    must consist of from one to thirty-one alphanumeric or hyphen (-),
    period (.) pound (\#), space ( ), at (@), equals (=), colon (:), and
    underscore characters.
4 - **authvsName**—The name of the authentication virtual server
    that this profile uses for authentication.
5 - **authenticationHost**—Host name of the authentication virtual
    server.
6 - **authenticationDomain**—Domain for which Citrix ADC SSO handles
    authentication. Required if the authentication virtual server
    performs authentication for more than one domain, so that the
    correct domain is included when the Citrix ADC appliance sets the
    traffic management virtual server cookie.
7
8 ## Example
9
10 To create an authentication profile named authnProfile1 for
    authentication of the example.com domain, and to configure the load
    balancing virtual server vserver1 to use the authentication profile
    authnProfile1, you would type the following commands:

```

```

add authentication authnProfile authnProfile1 -authnvsName authvsesrver1
-authenticationHost authvsesrver1 -authenticationDomain example.com
set lb vserver vserver1 -authnProfile authnProfile1

```

““

## Configuring SSO

September 21, 2020

Configuring Citrix ADC SSO to authenticate by impersonation is simpler than configuring than SSO to authenticate by delegation, and is therefore usually preferable when your configuration allows it. You just create a KCD account. You can use the user’s password.

If you do not have the user’s password, you can configure Citrix ADC SSO to authenticate by delegation. Although somewhat more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user’s credentials might not be available to the Citrix ADC appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

## Enabling integrated authentication on the web application server

September 21, 2020

To set up Citrix ADC Kerberos SSO on each web application server that Kerberos SSO will manage, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

### To configure Microsoft IIS to use integrated authentication

1. Log on to the IIS server and open **Internet Information Services Manager**.
2. Select the web site for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings for the Default Web Site. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.
3. Open the **Properties** dialog box for the default web site or for the individual service, and click the **Directory Security** tab.
4. Beside **Authentication** and **Access Control**, select **Edit**.
5. Disable anonymous access.
6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication should automatically set protocol negotiation for the web server to Negotiate, NTLM, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to Negotiate, NTLM.

## Setting up SSO by impersonation

September 21, 2020

You can configure the KCD account for Citrix ADC SSO by impersonation. In this configuration, the Citrix ADC appliance obtains the user's username and password when the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user's name is in UPN format, the appliance obtains the user's realm from UPN.

Otherwise, it obtains the user's name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user's realm if the user's realm cannot be obtained from authentication with the Citrix ADC appliance or from the session profile.

### **To create the KCD account for SSO by impersonation with a password**

At the command prompt, type the following command:

```
“add aaa kcdaccount -realmStr
```

```
1 For the variables, substitute the following values:
2
3 - **accountname**. The KCD account name.
4 - **realm**. The domain assigned to Citrix ADC SSO.
5
6 ### Example
7
8 To add a KCD account named kcdaccount1, and use the keytab named
   kcdvserver.keytab, you would type the following command:
```

```
add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab
```

```
““
```

For information on configuring Kerberos impersonation through Citrix ADC GUI, see [Citrix Support](#).

## **Configuring SSO by delegation**

September 21, 2020

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certificates on the Citrix ADC appliance and add them to the Citrix ADC configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service tickets for your protected applications.
- Configure the Active Directory server.

### **Note**

For more information on creating KCD account and configuring on the NetScaler appliance, refer to the following topics:

- [Handling authentication, authorization and auditing with Kerberos/NTLM](#)
- [How Citrix ADC implements Kerberos for client authentication](#)
- [Configuring kerberos authentication on the Citrix ADC appliance](#)

## Installing the client CA certificate on the Citrix ADC appliance

If you are configuring Citrix ADC SSO with a client certificate, you must copy the matching CA certificate for the client certificate domain (the client CA certificate) to the Citrix ADC appliance, and then install the CA certificate. To copy the client CA certificate, use the file transfer program of your choice to transfer the certificate and private-key file to the Citrix ADC appliance, and store the files in /nsconfig/ssl.

### To install the client CA certificate on the Citrix ADC appliance

At the command prompt, type the following command:

```
“add ssl certKey -cert [(-key [-password]) | -fipsKey ][-inform ( DER | PEM )][-expiryMonitor ( ENABLED | DISABLED | UNSET ) [-notificationPeriod ]] [-bundle ( YES | NO )]
```

- ```
1 For the variables, substitute the following values:
2
3 - certkeyName. A name for the client CA certificate. Must begin
  with an ASCII alphanumeric or underscore (\_) character, and must
  consist of from one to thirty-one characters. Allowed characters
  include the ASCII alphanumerics, underscore, hash (\#), period(.),
  space, colon (:), at (@), equals (=), and hyphen (-) characters.
  Cannot be changed after the certificate-key pair is created. If the
  name includes one or more spaces, enclose the name in double or
  single quotation marks (for example, "my cert" or 'my cert').
4 - cert. Full path name and file name of the X509 certificate file
  used to form the certificate-key pair. The certificate file must be
  stored on the Citrix ADC appliance, in the /nsconfig/ssl/ directory.
5 - key. Full path name and file name of the file that contains the
  private key to the X509 certificate file. The key file must be
  stored on the Citrix ADC appliance in the /nsconfig/ssl/ directory.
6 - password. If a private key is specified, the passphrase used to
  encrypt the private key. Use this option to load encrypted private
  keys in PEM format.
7 - fipsKey. Name of the FIPS key that was created inside the
  Hardware Security Module (HSM) of a FIPS appliance, or a key that
  was imported into the HSM.
8   > Note
9   >
```

```

10 > You can specify either a key or a fipsKey, but not both.
11 - **inform**. Format of the certificate and private-key files, either
    PEM or DER.
12 - **passplain**. Pass phrase used to encrypt the private key. Required
    when adding an encrypted private-key in PEM format.
13 - **expiryMonitor**. Configure the Citrix ADC appliance to issue an
    alert when the certificate is about to expire. Possible values:
    ENABLED, DISABLED, UNSET.
14 - **notificationPeriod**. If expiryMonitor is ENABLED, number of days
    before the certificate expires to issue an alert.
15 - **bundle**. Parse the certificate chain as a single file after
    linking the server certificate to its issuer's certificate within
    the file. Possible values: YES, NO.
16
17 #### Example
18
19 The following example adds the specified delegated user certificate
    customer-cert.pem to the Citrix ADC configuration along with the key
    customer-key.pem, and sets the password, certificate format,
    expiration monitor, and notification period.
20
21 To add the delegated user certificate, you would type the following
    commands:

```

```

“add ssl certKey customer -cert “/nsconfig/ssl/customer-cert.pem”
-key “/nsconfig/ssl/customer-key.pem” -password “dontUseDefaultPWs!”
-inform PEM -expiryMonitor ENABLED [-notificationPeriod 14]

```

```

1 ## Creating the KCD account
2
3 If you are configuring Citrix ADC SSO by delegation, you can configure
    the KCD account to use the user's log-on name and password, to use
    the user's log-on name and keytab, or to use the user's client
    certificate. If you configure SSO with user name and password, the
    Citrix ADC appliance uses the delegated user account to obtain a
    Ticket Granting Ticket (TGT), and then uses the TGT to obtain
    service tickets for the specific services that each user requests.
    If you configure SSO with keytab file, the Citrix ADC appliance uses
    the delegated user account and keytab information. If you configure
    SSO with a delegated user certificate, the Citrix ADC appliance
    uses the delegated user certificate.
4
5 ### To create the KCD account for SSO by delegation with a password
6
7 At the command prompt, type the following commands:

```

```

8
9 <!--NeedCopy-->
10 ```add aaa kcdaccount <accountname> -delegatedUser root -kcdPassword <
    password> -realmStr <realm>```
11
12 For the variables, substitute the following values:
13
14 - **accountname**. A name for the KCD account.
15 - **password**. A password for the KCD account.
16 - **realm**. The realm of the KCD account, usually the domain for
    which SSO is active.</span>
17
18 ##### Example (UPN Format)
19
20 To add a KCD account named kcdaccount1 to the Citrix ADC appliance
    configuration with a password of password1 and a realm of EXAMPLE.
    COM, specifying the delegated user account in UPN format (as root),
    you would type the following commands:
21
22 <!--NeedCopy-->

```

```
add aaa kcdaccount kcdaccount1 -delegatedUser root
-kcdPassword password1 -realmStr EXAMPLE.COM
```

```

1 ##### Example (SPN Format)
2
3 To add a KCD account named kcdaccount1 to the Citrix ADC appliance
    configuration with a password of password1 and a realm of EXAMPLE.
    COM, specifying the delegated user account in SPN format, you would
    type the following commands:
4
5 <!--NeedCopy-->

```

```
add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM
-delegatedUser "host/kcdvserver.example.com" -kcdPassword password1
```

```

1 ### Creating the KCD account for SSO by delegation with a keytab
2
3 If you plan to use a keytab file for authentication, first create the
    keytab. You can create the keytab file manually by logging onto the
    AD server and using the ktpass utility, or you can use the Citrix
    ADC configuration utility to create a batch script, and then run
    that script on the AD server to generate the keytab file. Next, use
    FTP or another file transfer program to transfer the keytab file to
    the Citrix ADC appliance and place it in the /nsconfig/krb directory

```

```
4      . Finally, configure the KCD account for Citrix ADC SSO by
5      delegation and provide the path and file name of the keytab file to
6      the Citrix ADC appliance.
7
8      ##### To create the keytab file manually
9
10     Log on to the AD server command line and, at the command prompt, type
11     the following command:
12
13     <!--NeedCopy-->
14     ```ktpass princ <SPN> ptype KRB5_NT_PRINCIPAL mapuser <DOMAIN><username>
15     > pass <password> -out <File_Path>```
16
17     For the variables, substitute the following values:
18
19     - **SPN**. The service principal name for the KCD service account.
20     - **DOMAIN**. The domain of the Active Directory server.
21     - **username**. The KSA account username.
22     - **password**. The KSA account password.
23     - **path**. The full path name of the directory in which to store the
24     keytab file after it is generated.
25
26     ##### To use the Citrix ADC configuration utility to create a script to
27     generate the keytab file
28
29     1. Navigate to **Security > AAA - Application Traffic.**
30     1. In the data pane, under **Kerberos Constrained Delegation**, click
31     **Batch** file to generate Keytab.
32     1. In the **Generate KCD (Kerberos Constrained Delegation) Keytab
33     Script** dialog box, set the following parameters:
34         - **Domain User Name**. The KSA account username.
35         - **Domain Password**. The KSA account password.
36         - **Service Principal**. The service principal name for the KSA.
37         - **Output File Name**. The full path and file name to which to
38         save the keytab file on the AD server.
39     1. Clear the **Create Domain User Account** check box.
40     1. Click **Generate Script**.
41     1. Log on to the Active Directory server and open a command line
42     window.
43     1. Copy the script from the **Generated Script** window and paste it
44     directly into the Active Directory server command-line window. The
45     keytab is generated and stored in the directory under the file name
46     that you specified as **Output File Name**.
47     1. Use the file transfer utility of your choice to copy the keytab
48     file from the Active Directory server to the Citrix ADC appliance
```

```

    and place it in the /nsconfig/krb directory.
34
35 ##### To create the KCD account
36
37 At the command prompt, type the following command:
38
39 <!--NeedCopy-->
40 ```add aaa kcdaccount <accountname> - keytab <keytab>```
41
42 ##### Example
43
44 To add a KCD account named kcdccount1, and use the keytab named
    kcdvserver.keytab, you would type the following commands:
45
46 <!--NeedCopy-->

```

add aaa kcdaccount kcdaccount1 -keytab kcdvserver.keytab

```

1  ### To create the KCD account for SSO by delegation with a delegated
    user cert
2
3  At the command prompt, type the following command:
4
5  <!--NeedCopy-->
6  ```add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <
    user_nameSPN> -usercert <cert> -cacert <cacert>```
7
8  For the variables, substitute the following values:
9
10 - **accountname**. A name for the KCD account.
11 - **realmStr**. The realm for the KCD account, usually the domain for
    which SSO is configured.
12 - **delegatedUser**. The delegated user name, in SPN format.
13 - **usercert**. The full path and name of the delegated user
    certificate file on the Citrix ADC appliance. The delegated user
    certificate must contain both the client certificate and the private
    key, and must be in PEM format. If you use smart card
    authentication, you might need to create a smart card certificate
    template to allow certificates to be imported with the private key.
14 - **cacert**. The full path to and name of the CA certificate file on
    the Citrix ADC appliance.
15
16 ##### Example
17
18 To add a KCD account named kcdccount1, and use the keytab named

```

```
kcdvserver.keytab, you would type the following command:
```

```
19
20 <!--NeedCopy-->
```

```
add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM
-delegatedUser "host/kcdvserver.example.com" -usercert /certs/usercert
-cacert /cacerts/cacert
```

```
1 ## Setting up Active Directory for Citrix ADC SSO
2
3 When you configure SSO by delegation, in addition to creating the
  KCDAccount on the Citrix ADC appliance, you must also create a
  matching Kerberos Service Account (KSA) on your LDAP active
  directory server, and configure the server for SSO. To create the
  KSA, use the account creation process on the active directory server
  . To configure SSO on the active directory server, open the
  properties window for the KSA. In the Delegation tab, enable the
  following options: Trust this user for delegation to specified
  services only and Use any Authentication protocol. (The Kerberos
  only option does not work, because it does not enable protocol
  transition or constrained delegation.) Finally, add the services
  that Citrix ADC SSO will manage.
4
5 > **Note**
6 >
7 > If the Delegation tab is not visible in the KSA account properties
  dialog box, before you can configure the KSA as described, you must
  use the Microsoft
8 setspn command-line tool to configure the active directory server so
  that the tab is visible.
9
10 ### To configure delegation for the Kerberos service account
11
12 1. In the LDAP account configuration dialog box for the Kerberos
  service account that you created, click the **Delegation** tab.
13 1. Choose "Trust this user for delegation to the specified services
  only".
14 1. Under "Trust this user for delegation to the specified services
  only," choose "Use any authentication protocol".
15 1. Under "Services to which this account can present delegated
  credentials," click **Add.**
16 1. In the **Add Services** dialog box, click **Users** or **Computers
  **, choose the server that hosts the resources to be assigned to the
  service account, and then click **OK.**
17 > **Note**
```

```
18 >
19 > - Constrained delegation does not support services hosted in
    domains other than the domain assigned to the account, even
    though Kerberos might have a trust relationship with other
    domains.
20 > - Use the following command to create the setspn if a new user
    is created in active directory: setspn -A host/kcdvserver.
    example.com example\kcdtest
21 1. Back in the Add Services dialog box, in the Available
    Services list, choose the services assigned to the service account
    . Citrix ADC SSO supports the HTTP and MSSQLSVC services.
22 1. Click OK.  
--NeedCopy-->
```

## Generating the KCD keytab script

September 21, 2020

The KCD Keytab Script dialog box generates the keytab script, which in turn generates the keytab file necessary to configure KCD on the Citrix ADC.

### To generate the KCD keytab script by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**.
2. In the details pane, under **Kerberos Constrained Delegation**, click Batch file to generate keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) **Keytab Script** dialog box, fill out the fields as described below.
  - **Domain User Name:** The name of the domain user.
  - **Domain Password:** The password for the domain user.
  - **Service Principal:** The service principal.
  - **Output File Name:** A filename for the KCD script file.
  - **Create Domain User Account:** Select this check box to create the specified domain user account.
4. Click **Generate Script** to generate the script. The script is generated, and appears in the **Generated Script** text box below the **Generate Script** button.
5. Copy the script, and save it as a file on your AD domain controller. You must now run this script on the domain controller to generate the keytab file, and then copy the keytab file to the /nsconfig/krb/ directory on the Citrix ADC appliance.
6. Click **OK**.

## SAML authentication

October 12, 2020

Security Assertion Markup Language (SAML) is an XML-based authentication mechanism that provides single sign-on capability and is defined by the OASIS Security Services Technical Committee.

### Note

Starting from NetScaler 12.0 Build 51.x, Citrix ADC appliance used as a SAML Service Provider (SP) with Multi-Factor (nFactor) authentication now prepopulates the user-name field on the login page. The appliance sends a NameID attribute as part of a SAML authorization request, retrieves the NameID attribute value from the Citrix ADC SAML Identity Provider (IdP), and prepopulates the user-name field.

### Why use SAML authentication

Consider a scenario in which a service provider (LargeProvider) hosts a number of applications for a customer (BigCompany). BigCompany has users that must seamlessly access these applications. In a traditional setup, LargeProvider would need to maintain a database of users of BigCompany. This raises some concerns for each of the following stakeholders:

- LargeProvider must ensure security of user data.
- BigCompany must validate the users and keep the user data up-to-date, not just in its own database, but also in the user database maintained by LargeProvider. For example, a user removed from the BigCompany database must also be removed from the LargeProvider database.
- A user has to log on individually to each of the hosted applications.

The SAML authentication mechanism provides an alternative approach. The following deployment diagram shows how SAML works.

The concerns raised by traditional authentication mechanisms are resolved as follows:

- LargeProvider does not have to maintain a database for BigCompany users. Freed from identity management, LargeProvider can concentrate on providing better services.
- BigCompany does not bear the burden of making sure the LargeProvider user database is kept in sync with its own user database.

- A user can log on once, to one application hosted on LargeProvider, and be automatically logged on to the other applications that are hosted there.

The Citrix ADC appliance can be deployed as a SAML Service Provider (SP) and a SAML Identity Provider (IdP). Read through the relevant topics to understand the configurations that must be performed on the Citrix ADC appliance.

A Citrix ADC appliance configured as a SAML service provider can now enforce an audience restriction check. The audience restriction condition evaluates to “Valid” only if the SAML replying party is a member of at least one of the specified audiences.

You can configure a Citrix ADC appliance to parse attributes in SAML assertions as group attributes. Parsing them as group attributes enables the appliance to bind policies to the groups.

#### Note

A Citrix ADC MPX FIPS appliance used as a SAML service provider now supports encrypted assertions. Also, a Citrix ADC MPX FIPS appliance functioning as a SAML service provider or a SAML identity provider can now be configured to use the SHA2 algorithms on FIPS hardware.

#### Configuring FIPS offload support using the command line interface:

1. Add SSL FIPS

```
add ssl fipsKey fips-key
```

2. Create a CSR and use it at CA server to generate a certificate. You can then copy the certificate in **/nsconfig/ssl**. Let's assume that the file is *fips3cert.cer*.

```
add ssl certKey fips-cert -cert fips3cert.cer -fipsKey fips-key<!--
NeedCopy-->
```

3. Specify this certificate in the SAML action for SAML SP module

```
set samlAction <name> -samlSigningCertName fips-cert<!--NeedCopy-->
```

4. Use the certificate in samlIdpProfile for SAML IDP module

```
set samlidpprofile fipstest -samlIdpCertName fips-cert<!--NeedCopy-->
```

The following table lists some articles that are specific to deployments where the Citrix ADC appliance is used as a SAML SP or a SAML IdP.

| SAML SP    | SAML IdP                | Information Link               |
|------------|-------------------------|--------------------------------|
| Citrix ADC | Citrix AppController Z3 | <a href="#">Citrix Support</a> |
| Citrix ADC | CloudGateway            | <a href="#">Citrix Support</a> |
| Citrix ADC | Microsoft AD FS 3.0     | <a href="#">Citrix Support</a> |
| Citrix ADC | Shibboleth              | <a href="#">Citrix Support</a> |

| SAML SP    | SAML IdP                                           | Information Link               |
|------------|----------------------------------------------------|--------------------------------|
| Citrix ADC | Shibboleth (With SAML single logout configuration) | <a href="#">Citrix Support</a> |
| Siteminder | Citrix ADC                                         | <a href="#">Citrix Support</a> |
| ShareFile  | Citrix ADC                                         | <a href="#">Citrix Support</a> |

Some information on other specific deployments:

- [NetScaler as SAML SP on FIPS Device](#)
- [Configuring Office365 for Single Sign-on with NetScaler as SAML IdP](#)

### WebView credential type support for authentication mechanisms

The authentication of a Citrix ADC appliance can now support AUTHv3 protocol. The WebView credential type in AUTHv3 protocol support all type of authentication mechanisms (including SAML and OAuth). The WebView credential type is a part of AUTHv3, which is implemented by Citrix Receiver and browser in web applications.

The following example explains the flow of WebView events through Citrix Gateway and Citrix Receiver:

1. The Citrix Receiver negotiates to Citrix Gateway for AUTHv3 protocol support.
2. Citrix ADC appliance responds positively and suggests a specific start URL.
3. Citrix Receiver then connects to the specific endpoint (URL).
4. The Citrix Gateway sends a response to the client to start the WebView.
5. Citrix Receiver starts WebView and sends initial request to Citrix ADC appliance.
6. Citrix ADC appliance redirects URI to browser login endpoint.
7. Once authentication is complete, Citrix ADC appliance sends completion response to WebView.
8. The WebView now exits and gives control back to Citrix Receiver to continue AUTHv3 protocol for session establishment.

### Metadata reading and generation support for SAML SP and IdP configuration

Citrix ADC appliance now supports metadata files as means of configuration entities for both SAML Service Provider (SP) and Identity Provider (IdP). The metadata file is a structured XML file that describes the configuration of an entity. The metadata files for SP and IdP are separate. Based on deployment, and at times, one SP or IdP entity can have multiple metadata files.

As an administrator, you can export and import (SAML SP and IdP) metadata files on Citrix ADC.

The functionality of metadata export and import for SAML SP and IdP are explained in the following sections.

### Metadata export for SAML SP

Consider an example where Citrix ADC is configured as SAML SP and an SAML IdP would like to import metadata that contains Citrix ADC SP configuration. Assume that Citrix ADC appliance is already configured with a “samlAction” attribute that specifies SAML SP configuration. To export metadata from users or administrator, query Citrix Gateway or authentication virtual server as shown below:

```
1 https://vserver.company.com/metadata/samlsp/<action-name>
```

### Metadata import for SAML SP

Currently, SAML Action configuration on Citrix ADC appliance takes various parameters. Administrator manually specifies these. However, administrators are often unaware of nomenclature if it comes to interop with different SAML systems. If metadata of IdP is available, then bulk of the configuration in the ‘samlAction’ entity can be avoided. In fact, the entire IdP specific configuration might be omitted if IdP metadata file is given. The ‘samlAction’ entity now takes an additional parameter to read configuration from metadata file.

When you import a metadata in a Citrix ADC appliance, the metadata does not contain any signature algorithms to be used, it contains the endpoint details. A metadata can be signed with certain algorithms which can be used to verify the metadata itself. The algorithms are not stored in the ‘samlAction’ entity.

Therefore, what you specify in the ‘samlAction’ entity are the ones used when sending the data out. An incoming data can contain a different algorithm for a Citrix ADC appliance to process.

#### To fetch the metadata files by using command line interface.

```
1 set samlAction <name> [-metadataUrl <url> [-metadataRefreshInterval <int>] https://idp.citrix.com/samlidp/metadata.xml
```

#### Note

The metadataRefreshInterval parameter is the interval in minutes for fetching metadata information from the specified metadata URL. Default value 36000.

### Metadata import for SAML IdP

The “samlIdPProfile” parameter takes a new argument to read the entire configuration that is specific to SP. SAML IdP configuration can be simplified by replacing SP specific properties with an SP metadata file. This file is queried through HTTP.

#### To read from metadata file using command line interface:

```
1 set samlIdPProfile <name> [-metadataUrl <url>] [-  
  metadataRefreshInterval <int>]
```

## Name-value attribute support for SAML authentication

You can now configure SAML authentication attributes with a unique name along with values. The names are configured in the SAML action parameter and the values are obtained by querying for the names. By specifying the name attribute value, admins can easily search for the attribute value associated with the attribute name. Also, admins no longer have to remember the attribute by its value alone.

### Important

- In `samlAction` command, you can configure a maximum of 64 attributes separated by comma with total size less than 2048 bytes.
- Citrix recommends that you use the attributes list. Use of “attribute 1 to attribute 16” will cause session failure if the extracted attribute size is large.

## To configure the name-value attributes by using the CLI

At the command prompt, type:

```
1 add authentication samlAction <name> [-Attributes <string>]
```

### Example:

```
1 add authentication samlAction samlAct1 -attributes "mail,sn,  
  userprincipalName"
```

## Citrix ADC as a SAML SP

June 9, 2021

The SAML Service Provider (SP) is a SAML entity that is deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC\_TMAA or NSC\_TMAS cookie), the SP redirects the request to the SAML Identity Provider (IdP).

The SP also validates SAML assertions that are received from the IdP.

When the Citrix ADC appliance is configured as an SP, all user requests are received by a traffic management virtual server (load balancing or content switching) that is associated with the relevant SAML action.

The Citrix ADC appliance also supports POST and Redirect bindings during logout.

**Note**

A Citrix ADC appliance can be used as a SAML SP in a deployment where the SAML IdP is configured either on the appliance or on any external SAML IdP.

When used as a SAML SP, a Citrix ADC appliance:

- Can extract the user information (attributes) from the SAML token. This information can then be used in the policies that are configured on the Citrix ADC appliance. For example, if you want to extract the GroupMember and emailaddress attributes, in the SAMLAction, specify the **Attribute2** parameter as GroupMember and the **Attribute3** parameter as emailaddress.

**Note**

Default attributes such as username, password, and logout URL must not be extracted in attributes 1 to 16, because they are implicitly parsed and stored in the session.

- Can extract attribute names of upto 127 bytes from an incoming SAML assertion. The previous limit was 63 bytes. Support introduced in NetScaler 11.0 Build 64.x.
- Supports post, redirect, and artifact bindings. Support for redirect and artifact bindings is introduced in NetScaler 11.0 Build 55.x.

**Note**

Redirect binding should not be used for large amount of data, when the assertion after inflate or decoding is greater than 10K.

- Can decrypt assertions. Support introduced in NetScaler 11.0 Build 55.x.
- Can extract multi-valued attributes from a SAML assertion. These attributes are sent as nested XML tags such as:

```
<AttributeValue> <AttributeValue>Value1</AttributeValue>  
<AttributeValue>Value2</AttributeValue>  
</AttributeValue>
```

When presented with above XML, the Citrix ADC appliance can extract both Value1 and Value2 as values of a given attribute, as opposed to the old firmware that extracts only Value1.

**Note**

Support introduced in NetScaler 11.0 Build 64.x.

- Can specify the validity of a SAML assertion.

If the system time on Citrix ADC SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

**Note**

Support introduced in NetScaler 11.0 Build 64.x.

- Can send additional attribute called ‘ForceAuth’ in the authentication request to external IDP (Identity Provider). By default, the ForceAuthn is set to ‘False’. It can be set to ‘True’ to suggest IDP to force authentication despite existing authentication context. Additionally, Citrix ADC SP does authentication request in query parameter when configured with artifact binding.

## To configure the Citrix ADC appliance as a SAML SP by using the command line interface

1. Configure a SAML SP action.

**Example**

The following command adds a SAML action that redirects unauthenticated user requests.

```
add authentication samlAction SamlSPAct1 -samlIdPCertName nssp -samlRedirectUrl
  https://auth1.example.com -relaysStateRule "AAA.LOGIN.RELAYSTATE.EQ(\
  https://lb.example1.com/\")"
```

**Points to note**

- Certificate provided for `-samlIdPCertName` in the `samlAction` command must match the corresponding certificate from IdP for the signature verification to succeed.
- Citrix recommends to have a full domain name with trailing ‘/’ in the expression.
- Administrators must configure an expression for **relaysStateRule** in the `samlAction` command. The expression must contain the list of published domains that the user connects to before being redirected to the authentication virtual server. For example, the expression must contain the domains of the front-end virtual server (VPN, LB, or CS) that use this SAML action for authentication.

For more details on the command, see <https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlAction> and <https://support.citrix.com/article/CTX316577>.

2. Configure the SAML policy.

**Example**

The following command defines a SAML policy that applies the above defined SAML action to all traffic.

```
add authentication samlPolicy SamlSPPol1 ns_true SamlSPAct1<!--NeedCopy-->
```

3. Bind the SAML policy to the authentication virtual server.

**Example**

The following command binds the SAML policy to a authentication virtual server named “av\_saml”.

```
bind authentication vserver av_saml -policy SamlSPPol1<!--NeedCopy-->
```

4. Bind the authentication virtual server to the appropriate traffic management virtual server.

**Example**

The following command adds a load balancing virtual server named “lb1\_ssl” and associates the authentication virtual server named “av\_saml” to the load balancing virtual server.

```
add lb vserver lb1_ssl SSL 10.217.28.224 443 -persistenceType NONE -  
cltTimeout 180 -AuthenticationHost auth1.example.com -Authentication ON  
-authnVsName av_saml<!--NeedCopy-->
```

**To configure a Citrix ADC appliance as a SAML SP by using the graphical user interface**

1. Configure the SAML action and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, create a policy with SAML as the action type, and associate the required SAML action with the policy.

2. Associate the SAML policy with an authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML policy with the authentication virtual server.

3. Associate the authentication server with the appropriate traffic management virtual server.

Navigate to **Traffic Management > Load Balancing (or Content Switching) > Virtual Servers**, select the virtual server, and associate the authentication virtual server with it.

**Citrix ADC as a SAML IdP**

June 9, 2021

The SAML IdP (Identity Provider) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter their credentials. The IdP authenticates these credentials with the user directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP.

The SP validates the token, and the user is then granted access to the requested protected application.

When the Citrix ADC appliance is configured as an IdP, all requests are received by an authentication virtual server that is associated with the relevant SAML IdP profile.

**Note**

A Citrix ADC appliance can be used as a IdP in a deployment where the SAML SP is configured either on the appliance or on any external SAML SP.

When used as a SAML IdP, a Citrix ADC appliance:

- Supports all authentication methods that it supports for traditional logons.
- Digitally signs assertions. Support for the SHA256 algorithm is introduced in NetScaler 11.0 Build 55.x.
- Supports single-factor and two-factor authentication. SAML must not be configured as the secondary authentication mechanism.
- Can encrypt assertions by using the public key of the SAML SP. This is recommended when the assertion includes sensitive information. Support introduced in NetScaler 11.0 Build 55.x.
- Can be configured to accept only digitally signed requests from the SAML SP. Support introduced in NetScaler 11.0 Build 55.x.
- Can log on to the SAML IdP by using the following 401-based authentication mechanisms: Negotiate, NTLM, and Certificate. Support introduced in NetScaler 11.0 Build 55.x.
- Can be configured to send 16 attributes in addition to the NameId attribute. The attributes must be extracted from the appropriate authentication server. For each of them, you can specify the name, the expression, the format, and a friendly name in the SAML IdP profile. Support introduced in NetScaler 11.0 Build 55.x.
- If the Citrix ADC appliance is configured as a SAML IdP for multiple SAML SP, a user can gain access to applications on the different SPs without explicitly authenticating every time. The Citrix ADC appliance creates a session cookie for the first authentication, and every subsequent request uses this cookie for authentication. Support introduced in NetScaler 11.0 Build 55.x.
- Can send multi-valued attributes in a SAML assertion. Support introduced in NetScaler 11.0 Build 64.x.
- Supports post and redirect bindings. Support for redirect bindings is introduced in NetScaler 11.0 Build 64.x.

- Can specify the validity of a SAML assertion.

If the system time on Citrix ADC SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

**Note**

Support introduced in NetScaler 11.0 Build 64.x.

- Can be configured to serve assertions only to SAML SPs that are pre-configured on or trusted by the IdP. For this configuration, the SAML IdP must have the service provider ID (or issuer name) of the relevant SAML SPs. Support introduced in NetScaler 11.0 Build 64.x.

**Note**

Before proceeding, make sure that you have an authentication virtual server that is linked to an LDAP authentication server.

## To configure a Citrix ADC appliance as a SAML IdP by using the command line interface

1. Configure a SAML IdP profile.

**Example**

Adding Citrix ADC appliance as an IdP with SiteMinder as the SP.

```
add authentication samlIdPProfile samlIDPProf1 -samlSPCertName siteminder
-cert -encryptAssertion ON -samlIdPCertName ns-cert -assertionConsumerServiceURL
http://sm-proxy.nsi-test.com:8080/affwebservices/public/saml2assertionconsumer
-rejectUnsignedRequests ON -signatureAlg RSA-SHA256 -digestMethod
SHA256 -acsUrlRule AAA.LOGIN.SAML_REQ_ACS_URL.REGEX_MATCH(re##^https://
example2\.com/cgi/samlauth$##)
```

**Points to note**

- In SAML IdP profile, configure **acsURLRule** that takes an expression of the list of applicable service provider URLs for this IdP. This expression depends on the SP being used. If Citrix ADC is configured as SP, ACS URL will be `https://<SP-domain_name>/cgi/samlauth`. Citrix recommends having a full URL in the expression for matching.
- You must specify the starting of the domain with “^” sign (example: ^https) along with the dollar sign “\$” at the end of the string (example: samlauth\$).

For more details on the command, see <https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlAction> and <https://support.citrix.com/article/CTX316577>.

2. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

```
add authentication samlIdPPolicy samlIDPPol1 -rule true -action samlIDPProf1
```

3. Bind the policy to the authentication virtual server.

```
bind authentication vserver saml-auth-vserver -policy samlIDPPol1 -  
priority 100
```

## To configure a Citrix ADC appliance as a SAML IdP by using the graphical user interface

1. Configure the SAML IdP profile and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > SAML IDP**, and create a policy with SAML IdP as the action type, and associate the required SAML IdP profile with the policy.

2. Associate the SAML IdP policy with an authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML IdP policy with the authentication virtual server.

## Configuring SAML single sign-on

September 21, 2020

To provide single sign-on capabilities across applications that are hosted on the service provider, you can configure SAML single sign-on on the SAML SP.

### Configuring SAML single sign-on by using the command line interface

1. Configure the SAML SSO profile.

#### Example

In the following command, [Example](#) is the load balancing virtual server that has a web link from the SharePoint portal. Nssp.example.com is the Traffic Management virtual server that is load balancing the SharePoint server.

```
add tm samlSSOProfile tm-saml-ss0 -samlSigningCertName nssp -assertionConsumerServiceURL "https://nssp2.example.com/cgi/samlauth"-relaystateRule "\\\"https://nssp2.example.com/samlss0.html\\\"" -sendPassword ON -samlIssuerName nssp.example.com<!--NeedCopy-->
```

2. Associate the SAML SSO profile with the traffic action.

#### Example

The following command enables SSO and binds the SAML SSO profile created above to a traffic action.

```
add tm trafficAction html\\_act -SSO ON -samlSSOProfile tm-saml-ss0<!--NeedCopy-->
```

3. Configure the traffic policy that specifies when the action must be executed.

#### Example

The following command associates the traffic action with a traffic policy.

```
add tm trafficPolicy html_pol "HTTP.REQ.URL.CONTAINS(\\\"abc.html\\\")" html_act<!--NeedCopy-->
```

4. Bind the traffic policy created above to a traffic management virtual server (load balancing or content switching). Alternatively, the traffic policy can be associated globally.

#### Note

This traffic management virtual server must be associated with the relevant authentication virtual server that is associated with the SAML action.

```
bind lb vserver lb1_ssl -policyName html_pol -priority 100 -gotoPriorityExpression END -type REQUEST<!--NeedCopy-->
```

## Configuring SAML single sign-on by using the graphical user interface

1. Define the SAML SSO profile, the traffic profile, and the traffic policy.

Navigate to **Security > AAA - Application Traffic > Policies > Traffic**, select the appropriate tab, and configure the settings.

2. Bind the traffic policy to a traffic management virtual server or globally to the Citrix ADC appliance.

## OAuth Authentication

September 21, 2020

The authentication, authorization, and auditing traffic management feature supports OAuth and OIDC authentication. It authorizes and authenticates users to services that are hosted on applications such as Google, Facebook, and Twitter.

### **Points to note**

- Citrix ADC Advanced Edition and higher is required for the solution to work.
- A Citrix ADC appliance must be on version 12.1 or later for the appliance to work as OAuth IdP using OpenID-Connect (OIDC) protocol.
- OAuth on a Citrix ADC appliance is qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

A Citrix ADC appliance can be configured to behave as a Service Provider (SP) or an Identity Provider (IdP), using SAML and OIDC protocols. Previously, a Citrix ADC appliance configured as IdP supported only SAML protocol, starting Citrix ADC 12.1 version, Citrix ADC supports OIDC protocol as well.

OpenID Connect is an extension to OAuth authorization/delegation. A Citrix ADC appliance supports OAuth and OpenID Connect protocols in the same class of other authentication mechanisms. OpenID Connect is an add-on to OAuth as it provides a way for getting user information from authorization server as opposed to OAuth that gets only a token which cannot be gleaned for user information.

The authentication mechanism facilitates the inline verification of OpenID tokens. A Citrix ADC appliance can be configured to obtain certificates and verify signatures on the token.

A major advantage of using the OAuth and OpenID-Connect mechanisms is that the user information is not sent to the hosted applications. Therefore, the risk of identity theft is considerably reduced.

The Citrix ADC appliance configured for authentication, authorization, and auditing now accepts incoming tokens that are signed using HMAC HS256 algorithm. In addition, the public keys of the SAML Identity Provider (IdP) are read from a file, instead of learning from a URL endpoint.

In the Citrix ADC implementation, the application is accessed by the authentication, authorization, and auditing traffic management virtual server. So, to configure OAuth, you must configure an OAuth policy which must then be associated with an authentication, authorization, and auditing traffic management virtual server.

## **Citrix ADC as an OAuth SP**

September 21, 2020

The authentication, authorization, and auditing traffic management feature supports OAuth authentication for authenticating users to applications that are hosted on applications such as Google, Facebook, and Twitter.

## Points to note

- Citrix ADC Advanced Edition and higher is required for the solution to work.
- OAuth on Citrix ADC appliance is qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

## To configure OAuth by using the configuration utility

1. Configure the OAuth action and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with OAuth as the action type, and associate the required OAuth action with the policy.

2. Associate the OAuth policy with an authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the OAuth policy with the authentication virtual server.

**Note:** Attributes (1 to 16) can be extracted in the OAuth response. Currently these attributes are not evaluated. They are added for the future reference.

## To configure OAuth by using the command line interface:\*\*

1. Define an OAuth action.

```
1  add authentication OAuthAction <name> -authorizationEndpoint <URL>
   -tokenEndpoint <URL> [-idtokenDecryptEndpoint <URL>] -clientID
   <string> -clientSecret <string> [-defaultAuthenticationGroup <
   string>][-tenantID <string>][-GraphEndpoint <string>][-
   refreshInterval <positive_integer>] [-CertEndpoint <string>][-
   audience <string>][-usernameField <string>][-skewTime <mins>][-
   issuer <string>][-Attribute1 <string>][-Attribute2 <string>][-
   Attribute3 <string>]...
2  <!--NeedCopy-->
```

2. Associate the action with an advanced authentication policy.

```
1  add authentication Policy** <name> -rule <expression> -action <
   string>
2  <!--NeedCopy-->
```

**Example:** `add authentication oauthAction a -authorizationEndpoint https://example.com/ -tokenEndpoint https://example.com/ -clientId sadf -clientsecret df`

For more information on authentication OAuthAction parameters, see [authentication OAuthAction](#).

**Note:** When a certEndpoint is specified, the Citrix ADC appliance polls that endpoint at the configured frequency to learn the keys.

To configure a Citrix ADC to read the local file and parse keys from that file, a new configuration option is introduced as follows:

```
1 set authentication OAuthAction <> ---CertFilePath--- <path to local file  
   with jwks>  
2 <!--NeedCopy-->
```

### Name-value attribute support for OAuth authentication

You can now configure OAuth authentication attributes with a unique name along with the values. The names are configured in the OAuth action parameter either as “Attributes” and the values are obtained by querying for the names. The extracted attributes are stored in authentication, authorization, and auditing session. Admins can query these attributes either using `http.req.user.attribute("attribute name")` or `http.req.user.attribute(1)`, based on the chosen method of specifying attribute names.

By specifying the name of the attribute, admins can easily search for the attribute value associated with that attribute name. Also, admins no longer have to remember the “attribute1 to attribute16” by its number alone.

**Important:** In a OAuth command, you can configure a maximum of 64 attributes separated by comma with a total size less than 1024 bytes.

**Note:** The session failure can be avoided if the total value size of “attribute 1 to attribute 16” and the values of attributes specified in “Attributes” are not more than 10 KB.

### To configure the name-value attributes by using the CLI

At the command prompt, type:

- `add authentication OAuthAction <name> [-Attributes <string>]`
- `set authentication OAuthAction <name> [-Attributes <string>]`

Examples:

- `add authentication OAuthAction a1 -attributes "email,company"-attribute1 email`
- `set authentication OAuthAction oAuthAct1 -attributes "mail,sn,userprincipalName"`

## Citrix ADC as an OAuth IdP

September 21, 2020

A Citrix ADC appliance can now be configured as an identity provider by using the OpenID-Connect (OIDC) protocol. OIDC protocol strengthens the identity providing capabilities of the Citrix ADC appliance. You can now access the enterprise wide hosted application with a single sign-on as OIDC offers more security by not transferring the user password but using tokens with specific lifetime. OpenID also is designed to integrate with non-browser clients such as apps and services. Therefore, the OIDC protocol is widely adopted by many implementations.

**Note:** Citrix ADC must be on version 12.1 or later for the appliance to work as an OAuth IdP using the OIDC protocol.

### Advantages of having Citrix ADC as an OAuth IdP

- Eliminates the overhead of maintaining multiple authentication passwords as the user has a single identity across an organization.
- Provides a robust security for your password as the password is shared only with your identity provider and not with any application you access.
- Provided vast interoperability with various systems making it easier for the hosted applications to accept OpenID.

**Note:** Citrix ADC Advanced Edition and higher is required for the solution to work.

### To configure the Citrix ADC appliance as an OAuth IdP using the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > OAuth IdP**.
2. Click **Profile** and click **Add**.

On the **Create Authentication OAuth IDP Profile** screen, set values for the following parameters and click **Create**.

- **Name** – Name of the authentication profile. Must begin with a letter, number, or the underscore character ( ), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created.
- **Client ID** – Unique string that identifies SP. Authorization server infers client configuration using this ID. Maximum Length: 127.

- **Client Secret** – Secret string established by user and authorization server. Maximum Length: 239.
  - **Redirect URL** – Endpoint on SP to which code/token has to be posted.
  - **Issuer Name** – Identity of the server whose tokens are to be accepted. Maximum Length: 127.
  - **Audience** – Target recipient for the token being sent by IdP. This might be checked by the recipient.
  - **Skew Time** – This option specifies the allowed clock skew in number of minutes that Citrix ADC allows on an incoming token. For example, if skewTime is 10, then the token would be valid from (current time - 10) min to (current time + 10) min, that is 20 min in all. Default value: 5.
  - **Default Authentication Group** – A group added to the session for this profile to simplify policy evaluation and help in customizing policies. This is the default group that is chosen when the authentication succeeds in addition to the extracted groups. Maximum Length: 63.
3. Click **Policies** and click **Add**.
  4. On the **Create Authentication OAuth IDP Policy** screen, set values for the following parameters and click **Create**.
    - **Name** – The name of the authentication policy.
    - **Action** – Name of profile created above.
    - **Log Action** – Name of message log action to use when a request matches this policy. Not a mandatory field.
    - **Undefined-Result Action** – Action to perform if the result of policy evaluation is undefined(UNDEF). Not a mandatory field.
    - **Expression** – Default syntax expression that the policy uses to respond to specific request. For example, true.
    - **Comments** – Any comments about the policy.

### **Binding the OAuthIDP policy and LDAP policy to the authentication virtual server**

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Actions > LDAP**.
2. On **LDAP Actions** screen, click **Add**.
3. On the **Create Authentication LDAP Server** screen, set the values for the following parameters, and click **Create**.
  - **Name** – The name of the ldap action

- **ServerName/ServerIP** – Provide FQDN or IP of the LDAP server
  - Choose appropriate values **for Security Type, Port, Server Type, Time-Out**
  - Make sure **Authentication** is checked
  - **Base DN** – Base from which to start LDAP search. For example, dc=aaa,dc=local.
  - **Administrator Bind DN:** Username of the bind to LDAP server. For example, admin@aaa.local.
  - **Administrator Password/Confirm Password: Password to bind LDAP**
  - Click **Test Connection** to test your settings.
  - **Server Logon Name Attribute:** Choose “sAMAccountName”
  - Other fields are not mandatory and hence can be configured as required.
4. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Policy.**
  5. On the **Authentication Policies** screen, click **Add.**
  6. On the **Create Authentication Policy** page, set the values for the following parameters, and click **Create.**
    - **Name** – Name of the LDAP Authentication Policy.
    - **Action Type** – Choose **LDAP.**
    - **Action** – Choose the LDAP action.
    - **Expression** – Default syntax expression that the policy uses to respond to specific request. For example, true\*\*.

### To configure the Citrix ADC appliance as an IdP using the OIDC protocol with the command line

At the command prompt, type the following commands:

- `add authentication OAuthIDPProfile <name> [-clientID <string>][-clientSecret <string>][-redirectURL <URL>][-issuer <string>][-audience <string>][-skewTime <mins>] [-defaultAuthenticationGroup <string>]<!--NeedCopy-->`
- `add authentication OAuthIdPPolicy <name> -rule <expression> [-action <string> [-undefAction <string>] [-comment <string>][-logAction <string>]<!--NeedCopy-->`
- `add authentication ldapAction aaa-ldap-act -serverIP 10.0.0.10 -ldapBase "dc=aaa,dc=local"<!--NeedCopy-->`
- `ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password> -ldapLoginName sAMAccountName<!--NeedCopy-->`
- `add authentication policy aaa-ldap-adv-pol -rule true -action aaa-ldap-act<!--NeedCopy-->`

- `bind authentication vserver auth_vs -policy <ldap_policy_name> -priority 100 -gotoPriorityExpression NEXT<!--NeedCopy-->`
- `bind authentication vserver auth_vs -policy <OAuthIDPPolicyName> -priority 5 -gotoPriorityExpression END<!--NeedCopy-->`
- `bind vpn global -certkey <><!--NeedCopy-->`

**Note**

You can bind more than one key. Public parts of certificates bound are sent in response to `jwtks \\_uri query (https://gw/oauth/idp/certs)`.

## Encrypted tokens support on OIDC protocol

Citrix ADC appliance with the OIDC mechanism now supports the sending of encrypted tokens along with signed tokens. The Citrix ADC appliance uses JSON web encryption specifications to compute the encrypted tokens and supports only compact serialization of encrypted tokens. To encrypt an OpenID token, a Citrix ADC appliance needs the public key of the relying party (RP). The public key is obtained dynamically by polling the relying party's well-known configuration endpoint.

A new "relyingPartyMetadataURL" option is introduced in the "authentication OAuthIDPProfile." profile.

### To configure the relying party's endpoint by using CLI

At the command prompt, type:

```
set authentication OAuthIDPProfile <name> [-relyingPartyMetadataURL <URL>] [-refreshInterval <mins>] [-status < >]<!--NeedCopy-->
```

- **relyingPartyMetadataURL** - Endpoint at which Citrix ADC IdP can get details about the relying party being configured. Metadata response must include endpoints for `jwtks_uri` for RP public keys.
- **refreshInterval** - Defines the rate at which this endpoint must be polled to update the certificates in minutes.
- **status** - Reflects the status of the polling operation. The status is complete once the Citrix ADC appliance successfully obtains the public keys.

**Example**

```
1 set authentication OAuthIDPProfile sample_profile -
   relyingPartyMetadataURL https://rp.customer.com/metadata -
   refreshInterval 50 -status < >
```

After the endpoint is configured, a Citrix ADC appliance first polls the relying party's well-known endpoint to read configuration. Currently, the Citrix ADC appliance processes only the 'jwks\_uri' endpoint.

- If the 'jwks\_uri' is absent in the response, the status of the profile is not complete.
- If the 'jwks\_uri' is present in the response, Citrix ADC polls that endpoint also to read the public keys of the relying party.

**Note:** Only RSAES-OAEP and AES GCM encryption type algorithms are supported for token encryption.

### Custom attributes support on OpenID Connect

OpenID relying parties may require more than a user name or a user principal name (UPN) in the token to create the user profile or make authorization decisions. Most commonly, the user groups are required to apply authorization policies for the user. Sometimes, more details, such as the first or the last name is required for provisioning a user account.

Citrix ADC appliance configured as an IdP can be used to send extra attributes in the `OIDCid_token` using expressions. Advanced policy expressions are used to send the custom attributes as per the requirement. The Citrix IdP evaluates the expressions corresponding to the attributes and then computes the final token.

Citrix ADC appliance automatically JSONify the output data. For example, numbers (such as SSN) or boolean values (true or false) are not surrounded by quotes. Multi-valued attributes, such as groups are placed within an array marker ("[" and "]"). The complex type attributes are not automatically computed, and you can configure the PI expression of those complex values as per your requirement.

### To configure the relying party's endpoint by using CLI

At the command prompt, type:

```
1 set oauthidprofile <name> -attributes <AAA-custom-attribute-pattern>
```

The `<AAA-custom-attribute-pattern>` can be described as:

```
1 Attribute1=PI-Expression@@@attribute2=PI-Expression@@@
```

'attribute1';attribute2' are literal strings that represent the name of the attribute to be inserted in the `id_token`.

**Note:** You can configure up to 2,000 bytes of attributes.

**Example:** `set oauthidpprofile sample_1 -attributes q{ myname=http.req.user.name@@@ssn="123456789"@@@jit="false"@@@groups=http.req.user.groups }`

- Preceding PI expression is an advanced policy expression that represents the value to be used against the attribute. The PI expression can be used to send a string literal, such as “hardcoded string”. The string literal is surrounded by double quotes around single quotes or double quotes around a start and pattern (as stated earlier, the start pattern is “q{“). If the value of the attribute is not a string literal, the expression is evaluated at runtime and its value is sent in token. If the value at runtime is empty, the corresponding attribute is not added to the ID token.
- As defined in the example, “false” is a literal string for the attribute “jit”. Also, “ssn” has hard-coded value for reference. Groups and “myname” are PI expressions that yield strings.

## Support for active-active GSLB deployments on Citrix Gateway

Citrix Gateway configured as an Identity Provider (IdP) using the OIDC protocol can support active-active GSLB deployments. The active-active GSLB deployment on Citrix Gateway IdP provides the capability to load balance an incoming user login request across multiple geographic locations.

### Important

Citrix recommends you to bind CA certificates to the SSL service and enable certificate validation on the SSL service for enhanced security.

For more information on configuring GSLB setup, see [Example of a GSLB setup and configuration](#).

## API authentication with the Citrix ADC appliance

May 6, 2021

There is a paradigm shift in the way modern applications interact with their clients. Traditionally, browser clients were used to access services. Applications usually set session cookies to track user context. Modern and distributed applications make it hard to maintain user sessions across microservices. Due to this, most of the application accesses have become API based.

Clients that communicate with these distributed services have also evolved. Most clients obtain tokens from a trusted entity called Authorization Server to prove user identity and access. These clients then present the token to the application with each access request. Therefore, traditional proxy devices like Citrix ADC need to evolve to support these clients. A Citrix ADC appliance provides a way for administrators to handle such traffic. Citrix ADC can be deployed as an API Gateway to front-end all the traffic that destined to the published services. An API Gateway can be deployed for traditional (Hybrid Multi Cloud or HMC) or Cloud native environments. The API Gateway terminates all the inbound traffic to offer several services such as authentication, authorization, rate limiting, routing, caching, SSL offload, application firewall, and so on. Therefore, it becomes a critical component in the infrastructure.

## Token types

Tokens exchanged during the API access mostly conform to the OAuth/OpenID Connect (OIDC) protocol. Access tokens that are used only for 'delegated access' conform to the OAuth protocol, whereas ID Tokens that comply with OIDC carry user information as well.

Access tokens are normally an opaque or random blob of data. However, they can sometimes be signed tokens conforming to JWT (Json Web Token) standards. ID Tokens are always signed JWTs.

## API Access with OAuth

OAuth authentication type on a Citrix ADC appliance can be used to handle both OAuth and OIDC protocols. OIDC is an extension to the OAuth protocol.

OAuthAction on a Citrix ADC appliance can be used to handle interactive clients such as browsers and native clients such as client apps. Interactive clients are redirected to Identity Provider for login using the OIDC protocol. Native clients can obtain tokens out of band and can present those tokens at a Citrix ADC appliance for access.

### Note:

The access token obtained from endpoints can be cached for subsequent requests, thereby enhancing the API performance.

**To configure token caching support by using the command line interface, type the following command at the command prompt:**

```
1 set aaaparameter - apITokenCache <ENABLED>
2
3 <!--NeedCopy-->
```

The following sections describe the API access method performed by native clients.

## Virtual server for API Access

To deploy a Citrix ADC appliance for an API access, a Traffic Management (TM) virtual server is deployed with 401 Authentication. It is associated with an authentication (authentication, authorization, and auditing) virtual server to hold the authentication and session policies. Following configuration snippet creates one such virtual server.

```
1 Add lb vsrver lb-api-access SSL <IP> 443 -authn401 On -AuthnVsName
   auth-api-access
2
3 Bind ssl vsrver lb-api-access -certkeyName <ssl-cert-entity>
4
5 Add authentication vsrver auth-api-access SSL
```

```
6 <!--NeedCopy-->
```

**Note:**

You would need to bind a service to the TM vserver, and an authentication policy (with OAuthAction described as follows) to the authentication virtual server to complete the configuration.

After creating the virtual server, one needs to add an OAuthAction along with corresponding policy. There are several other options within an OAuth action depending on the token type, and other security mechanisms.

### OAuth Configuration for ID Tokens

ID Tokens are always signed JWTs. That is, they carry header, payload and signature. Since these are self-contained tokens, a Citrix ADC appliance can validate these tokens locally. To validate these tokens, the appliance would need to know the public key of the corresponding private key used to sign these tokens.

Following is an example of OAuthAction with certain mandatory arguments along with “certEndpoint”.

```
1 Add authentication OAuthAction oauth-api-access -clientid <your-client-id> -clientsecret <your-client-secret> -authorizationEndpoint <URL to which users would be redirected for login> -tokenEndpoint <endpoint at which tokens could be obtained> -certEndpoint <uri at which public keys of IdP are published>
2 <!--NeedCopy-->
```

Where,

- **Client ID** – Unique string that identifies SP. Authorization server infers client configuration using this ID. Maximum Length: 127.
- **Client Secret** – Secret string established by user and authorization server. Maximum Length: 239.
- **authorizationEndpoint** - URL at which users would normally log in (when using interactive clients).
- **tokenEndpoint** - URL on Authorization Server at which tokens/code are obtained/exchanged
- **certEndpoint** - URL at which Authorization Server publishes public keys used to sign the tokens. Authorization Server can publish more than one key and choose one of them to sign tokens.

**Note:** Client ID/Client Secret/authorizationEndpoint/TokenEndpoint are optional parameters for API Access. However, it is a good practice to provide values for these parameters as the action entity can be reused for different purposes.

In the preceding configuration 'certEndpointpoint' is essential for ID Token validation. This endpoint contains public keys of the certificate used to sign the tokens. These public keys must correspond to JWKs (Json Web Keys) specification.

Once the certEndpoint is configured at the Citrix ADC appliance, it polls the endpoint periodically (with the default interval of 1 day that can be customizable in the configuration) to keep the public keys up to date. After the public keys are available, ADC can perform local validation of the incoming ID Tokens.

### OAuth Configuration for opaque access tokens

Opaque tokens cannot be verified locally on the Citrix ADC appliance. These need to be validated on the Authorization server. A Citrix ADC appliance uses 'introspection protocol' mentioned in OAuth specifications in order to verify these tokens. A new option, introspectURL, is provided in OAuth configuration for verifying opaque tokens.

```
1 set oauthAction oauth-api-access -introspectURL <uri of the
   Authorization Server for introspection>
2
3 <!--NeedCopy-->
```

The format of the introspection API conforms to the specification at <https://tools.ietf.org/html/rfc7662##section-2.1> as follows:

```
1 POST /introspect HTTP/1.1
2 Host: server.example.com
3 Accept: application/json
4 Content-Type: application/x-www-form-urlencoded
5 Authorization: Basic czZCaGRSa3F0MzpnWDFmQmF0M2JW
6 token=mF_9.B5f-4.1JqM&token_type_hint=access_token
7
8 <!--NeedCopy-->
```

### Binding policy to Authentication vserver

Once OAuthAction is created, corresponding policy needs to be created for invoking it.

```
1 add authentication policy oauth-api-access -rule <> -action <oauth-api-
   access><!--NeedCopy-->
```

```
bind authentication vservers auth-api-access -policy oauth-api-access -pri 100
```

```
1 ## Additional security settings on a Citrix ADC appliance
2
3 Token validation includes token lifetime checks. Tokens outside of
  acceptable time are rejected. Following are the additional settings
  for extra security. Some of these are recommended to be configured
  always.
4
5 **Audience**: OAuth Action can be configured with an intended recipient
  of the token. All tokens are matched against this configured URL. A
  Citrix ADC appliance has an additional capability where the
  audience field actually points to a pattern set on the appliance.
  Using this pattern set, an administrator can configure more than one
  url for the audience.
6
7 <!--NeedCopy-->
```

```
add policy patset oauth_audiences
```

```
bind patset oauth_audiences https://app1.company.com
```

```
bind patset oauth_audiences https://app2.company.com
```

```
bind patset oauth_audiences https://app1.company.com/path1
```

```
set oAuthAccess oauth-api-access -audience oauth_audiences
```

```
1 In the preceding example, more than one audience is specified in a
  pattern set. Therefore, an incoming token is allowed only if it
  contains any of the configured URLs in the pattern set.
2
3 **Issuer**: Identity of the server whose tokens are to be accepted.
  Maximum Length: 127. It is a good practice to configure the issuer
  of the tokens in OAuth action. This ensures that tokens issued by
  wrong Authorization Server are not allowed.
4
5 **SkewTime**: Specifies the allowed clock skew in number of minutes
  that a Citrix ADC appliance allows on an incoming token. For example
  , if skewTime is 10, then the token would be valid from (current
  time - 10) min to (current time + 10) min, that is 20 min in all.
  Default value: 5
6
7 **AllowedAlgorithms**: This option allows administrator to restrict
  certain algorithms in the incoming tokens. By default, all the
  supported methods are allowed. However, these can be controlled
  using this option.
```

```
8
9 The following configuration ensures only tokens that use RS256 and
  RS512 are allowed:
10
11 <!--NeedCopy-->
```

```
set oAuthAction oauth-api-access -allowedAlgorithms RS256 RS512
```

```
1 After above configuration, only tokens that use RS256 and RS512 are
  allowed.
2
3 ## Bypassing certain traffic from authentication
4
5 In many instances, there are some discovery APIs that are publicly
  accessible to the clients. These APIs typically reveal configuration
  and capabilities of the service itself. AN administrator can
  configure the Citrix ADC appliance to bypass authentication from
  these metadata URLs using 'No Authentication' policy described as
  follows:
6
7 <!--NeedCopy-->
```

```
add authentication policy auth-bypass-policy -rule <> -action NO_AUTHN
```

```
bind authentication vserver auth-api-access -policy auth-bypass-policy -pri 110
```

```
1 NO_AUTHN is an implicit action that results in authentication to be
  completed when the rule matches. There are other uses of NO_AUTHN
  action beyond the scope of API access.
2 <!--NeedCopy-->
```

## Multi-Factor (nFactor) authentication

September 21, 2020

### Important

- Citrix ADC Advanced Edition or Citrix ADC Premium Edition is required for nFactor authentication feature to work.
- Supported from NetScaler 11.0 Build 62.x onwards.
- Starting from NetScaler 12.0 Build 51.x, Citrix ADC appliance used as a SAML Service Provider (SP) with Multi-Factor (nFactor) authentication now prepopulates the user-name

field on the login page. The appliance sends a NameID attribute as part of a SAML authorization request, retrieves the NameID attribute value from the Citrix ADC SAML Identity Provider (IdP), and prepopulates the user-name field.

Multifactor authentication enhances the security of an application by requiring users to provide multiple proofs of identify to gain access. The Citrix ADC appliance provides an extensible and flexible approach to configuring multifactor authentication. This approach is called *nFactor authentication*.

### **How nFactor authentication works**

Each authentication factor performs the following tasks:

- Collects credentials from the user. Citrix ADC supported authentication mechanisms include LDAP, RADIUS, SAML assertion, Client Certificate, OAuth OpenID Connect, Kerberos, and so on.
- Evaluates the supplied credentials to decide whether the authentication succeeded, failed or the actions like Group extraction, Attribute extraction is to be performed.
- Based on the evaluation results, access is either granted, denied, or a next factor is selected.
- Repeat these steps, until there are no more next factors to evaluate.

With nFactor authentication you can:

- Configure any number of authentication factors.
- Base the selection of the next factor on the result of executing the previous factor.
- Customize the login interface. For example, you can customize the label names, error messages, and help text.
- Extract user group information without doing authentication.
- Configure pass-through for an authentication factor. This means that no explicit login interaction is required for that factor.
- Configure the order in which different types of authentication are applied. Any of the authentication mechanisms that are supported on the Citrix ADC appliance can be configured as any factor of the nFactor authentication setup. These factors are executed in the order in which they are configured.
- Configure the Citrix ADC to proceed to an authentication factor that must be executed when authentication fails. To do so, you configure another authentication policy with the exact same condition, but with the next highest priority and with the action set to “NO\_AUTH”. You must configure the next factor, which must specify the alternative authentication mechanism to apply.

### **Encryption of Citrix Gateway login information for nFactor authentication**

Starting from Citrix ADC release 12.1 build 56.22, Citrix Gateway with nFactor authentication can encrypt the login request fields submitted by a client (browser or SSO apps) during authentication pro-

cess. The encrypted login request fields provide an extra layer of security to protect the user's sensitive data from being disclosed.

### Compatible browsers

The following table lists the browsers along with version details that support login encryption.

| Browsers          | Version        |
|-------------------|----------------|
| Chrome            | 78 and above   |
| Firefox           | 69 and above   |
| Internet Explorer | 11             |
| Edge              | 42 and above   |
| Safari            | 11.0 and above |
| Opera             | 66             |

### Compatible clients

The following section lists the clients along with version details that support encryption of Citrix Gateway login information.

- Citrix Workspace app in Mac supports encryption only when OS version is 10.14.x and above.
- Citrix SSO app in Mac supports encryption only when OS version is 10.14.x and above.
- Windows SSO app does not have restrictions on the compatibility.
- Password encryption in Citrix Workspace app for Windows clients is supported only in Internet Explorer 11 version.

### To enable the login encryption by using the CLI

At the command prompt, type:

```
1 set aaa parameter [-loginEncryption (ENABLED | DISABLED)]
```

#### Note

The loginEncryption parameter is DISABLED by default. You must ENABLE it.

## To enable the login encryption by using the GUI

1. Navigate to **Security > AAA – Application Traffic**, click **Change authentication AAA settings** under **Authentication Settings** section.
2. On the **Configure AAA Parameter** page, scroll down to the **Login Encryption** option, and enable it.

## How to configure nFactor authentication

September 21, 2020

The primary entity used for nFactor authentication is called a *login schema*.

A login schema specifies an authentication schema XML file that defines the manner in which the login form will be rendered. Considering the interaction that the user must have when logging in to the application, you can create a single file for multiple factors or different files for different factors. [View sample XML file.](#)

- **Single file for multiple factors.** User will be provided a single form in which to provide credentials for multiple authentication factors.
- **Different files for different factors.** User will be provided a different form for each authentication factor.

Next, you must associate the XML file(s) with login schema(s). You can also specify expressions to extract the user name and the password from the login form.

### Tip

You can configure an authentication factor to be pass-through. This means that the user is not required to provide credentials explicitly and there is no login form for that factor. The credentials are either taken from the previous factor or the user name and/or password are dynamically extracted by using the username/password expressions that are configured for that login schema. You must set the login schema to “NOSHEMA”, instead of an XML file.

Now that the login schemas are configured, you must specify the manner in which they must be invoked. A login schema can be invoked by using either a login schema policy or an authentication policy label. The decision depends on the following:

- **Login schema policy.**
  - Specifies the condition on which the login form must be presented to the user.
  - Must be bound to an authentication virtual server.
  - In an authentication virtual server that has multiple login schema policies, the policy with the highest priority that evaluates to true is executed. That is, the login form associated

with that policy is presented to the user.

- The login schema policy is only used to present the first login form.

- **Authentication policy label.**

- Specifies a collection of authentication policies for a particular factor. Each policy label corresponds to a single factor.
- Specifies the login form that must be presented to the user.
- Must be bound as the next factor of an authentication policy or of another authentication policy label.
- Typically, a policy label includes authentication policies for a specific authentication mechanism. However, you can also have a policy label that has authentication policies for different authentication mechanisms.

To summarize, the configurations you must perform to set up nFactor authentication are as follows:

1. Create the authentication schema XML files.
2. Associate each XML file with a login schema.
3. Associate each login schema with a login schema policy or authentication policy label.
4. Bind login schema policy to an authentication virtual server.
5. Bind authentication policy label, as next factor, to an authentication policy.

## How nFactor authentication works

September 21, 2020

Imagine a user requesting access to an application that requires user credentials. As is the case in Citrix ADC deployments, the request arrives at the Citrix ADC appliance through a traffic management virtual server (in this case, a load balancing virtual server). Since the user must provide authentication credentials, the load balancing virtual server redirects the request to the authentication virtual server, which does the following:

1. Checks to determine whether any login schema policies are associated with the authentication virtual server.
  - If yes, the user is presented the login form associated with the login schema policy with the highest priority that evaluates to true.
  - If no, the default login form is presented to the user.

**Note**

The default login schema files are available in the `/nsconfig/loginschema/LoginSchema/` directory of the Citrix ADC appliance. Citrix recommends that you copy these files to the `/nsconfig/loginschema/` directory before using them, so that changes made to the files are

preserved post reboot.

2. The authentication policies that are associated with the authentication virtual server are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.
3. The policy label that is associated as the next factor is invoked.
4. The authentication policies that are associated with the authentication policy label are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.
5. The policy label that is associated as the next factor is invoked.
6. Steps 4 and 5 are performed repetitively till all the configured next factors are executed.

## Configuring nFactor authentication

September 21, 2020

The following diagram illustrates the high-level steps involved in nfactor configuration.

To understand the step-wise configurations for nFactor authentication, let us consider a 2-factor authentication deployment where the 1st factor is LDAP authentication and the 2nd factor is RADIUS authentication.

This sample deployment requires the user to login to both factors using a single login form. Therefore, we define a single login form that accepts two passwords. The first password is used for LDAP authentication and the other for RADIUS authentication. [View XML file.](#)

Here are the configurations that are performed.

1. Configure the load balancing virtual server for authentication

```
add lb vsrver lbvs55 HTTP 1.217.193.55 80 -AuthenticationHost auth56.aaatm.com -  
Authentication ON'
```

2. Configure the authentication virtual server.

```
add authentication vsrver auth56 SSL 1.217.193.56 443 -AuthenticationDomain aaatm.com
```

3. Configure the login schema for the login form and bind it to a login schema policy.

```
add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -  
userCredentialIndex 1 -passwordCredentialIndex 2
```

```
add authentication loginSchemaPolicy login1 -rule true -action login1
```

4. Configure a login schema for the pass-through and bind it to a policy label

```
add authentication loginSchema login2 -authenticationSchema noschema
```

```
add authentication policylabel label1 -loginSchema login2
```

5. Configure the LDAP and RADIUS policies.

```
add authentication ldapAction ldapAct1 -serverIP 1.217.28.180 -ldapBase "dc=aaatm,  
dc=com" -ldapBindDn administrator@aaatm.com -ldapBindDnPassword 71ca2b11ad800ce2787fb7deb5484  
-encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName  
memberOf -subAttributeName CN
```

```
add authentication Policy ldap -rule true -action ldapAct1
```

```
add authentication radiusAction radius -serverIP 1.217.22.20 -radKey a740d6a0aeb3288fa0a6fbe932d329a  
-encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType  
11 -ipAttributeType 8
```

```
add authentication Policy radius -rule true -action radius
```

6. Bind the login schema policy to the authentication virtual server

```
bind authentication vsrver auth56 -policy login1 -priority 1 -gotoPriorityExpression END
```

7. Bind the LDAP policy (first factor) to the authentication virtual server.

```
bind authentication vsrver auth56 -policy ldap -priority 1 -nextFactor label1 -gotoPriorityExpression  
next
```

8. Bind the RADIUS policy (second factor) to the authentication policy label.

```
bind authentication policylabel label1 -policyName radius -priority 2 -gotoPriorityExpression  
end
```

## reCaptcha configuration for nFactor authentication

September 21, 2020

Starting from Citrix ADC release 12.1 build 50.x, Citrix Gateway supports a new first class action 'captchaAction' that simplifies reCaptcha configuration. As reCaptcha is a first class action, it can be a factor of its own. You can inject reCaptcha anywhere in the nFactor flow.

Previously, you had to write custom WebAuth policies with changes to RfWeb UI as well. With the introduction of captchaAction, you do not have to modify the JavaScript.

### Important

If reCaptcha is used along with username or password fields in the schema, submit button is disabled until reCaptcha is met.

## reCaptcha configuration

reCaptcha configuration involves two parts.

1. Configuration on Google for registering reCaptcha.
2. Configuration on Citrix ADC appliance to use reCaptcha as part of login flow.

### reCaptcha configuration on Google

Register a domain for reCaptcha at <https://www.google.com/recaptcha/admin#l1ist>.

1. When you navigate to this page, the following screen appears.

←
**Register a new site**

**Label** ⓘ

e.g. example.com 0 / 50

---

**reCAPTCHA type** ⓘ

reCAPTCHA v3 Verify requests with a score

reCAPTCHA v2 Verify requests with a challenge

**Domains** ⓘ

+ Add a domain, e.g. example.com

**Accept the reCAPTCHA Terms of Service**

By accessing or using the reCAPTCHA APIs, you agree to the Google APIs [Terms of Use](#), Google [Terms of Use](#), and to the Additional Terms below. Please read and understand all applicable terms and policies before accessing the APIs.

reCAPTCHA Terms of Service ▾

**Send alerts to owners** ⓘ

CANCEL
SUBMIT

**Note**

Use reCAPTCHA v2 only. Invisible reCAPTCHA is still in Beta.

- After a domain is registered, the “SiteKey” and “SecretKey” are displayed.

ⓘ Adding reCAPTCHA to your site

▾ Keys

**Site key**

Use this in the HTML code your site serves to users.

6Ld1\_.....\_B

**Secret key**

Use this for communication between your site and Google. Be sure to keep it a secret.

6I7T.....\_FFC

▾ Step 1: client-side integration

**Note**

The “SiteKey” and “SecretKey” are grayed out for security reasons. “SecretKey” must be

kept safe.

## reCaptcha configuration on Citrix ADC appliance

reCaptcha configuration on Citrix ADC appliance can be divided into three parts:

- Display reCaptcha screen
- Post the reCaptcha response to Google server
- LDAP configuration is second factor for user logon (optional)

### Display reCaptcha screen

The login form customization is done through the SingleAuthCaptcha.xml loginschema. This customization is specified at authentication virtual server and is sent to UI for rendering the login form. The built-in loginschema, SingleAuthCaptcha.xml, is at /nsconfig/loginSchema/LoginSchema directory on the Citrix ADC appliance.

#### Important

- Based on your use case and different schemas, you can modify the existing schema. For instance if you need only reCaptcha factor (without username or password) or dual authentication with reCaptcha.
- If any custom modifications are performed or the file is renamed, Citrix recommends copying all loginSchemas from /nsconfig/loginschema/LoginSchema directory to parent directory, /nsconfig/loginschema.

### To configure display of reCaptcha using CLI

- `add authentication loginSchema singleauthcaptcha -authenticationSchema /nsconfig/loginschema/SingleAuthCaptcha.xml`
- `add authentication loginSchemaPolicy singleauthcaptcha -rule true -action singleauthcaptcha`
- `add authentication vserver auth SSL <IP> <Port>`
- `add ssl certkey vserver-cert -cert <path-to-cert-file> -key <path-to-key-file>`
- `bind ssl vserver auth -certkey vserver-cert`
- `bind authentication vserver auth -policy singleauthcaptcha -priority 5 -gotoPriorityExpression END`

### Post the reCaptcha response to Google server

After you have configured the reCaptcha that must be displayed to the users, admins post add the configuration to the Google server to verify the reCaptcha response from browser.

**To verify reCaptcha response from the browser**

- `add authentication captchaAction myrecaptcha -sitekey <sitekey-copied-from-google> -secretkey <secretkey-from-google>`
- `add authentication policy myrecaptcha -rule true -action myrecaptcha`
- `bind authentication vserver auth -policy myrecaptcha -priority 1`

The following commands are required to configure if AD authentication is desired. Else, you can ignore this step.

- `add authentication ldapAction ldap-new -serverIP x.x.x.x -serverPort 636 -ldapBase "cn=users,dc=aaatm,dc=com"-ldapBindDn adminuser@aaatm.com -ldapBindDnPassword <password> -encrypted -encryptmethod ENCMTD_3 -ldapLoginName sAMAccountName -groupAttrName memberof -subAttributeName CN -secType SSL -passwdChange ENABLED -defaultAuthenticationGroup ldapGroup`
- `add authenticationpolicy ldap-new -rule true -action ldap-new`

**LDAP configuration is second factor for user logon (optional)**

The LDAP authentication happens after reCaptcha, you add it to the second factor.

- `add authentication policylabel second-factor`
- `bind authentication policylabel second-factor -policy ldap-new -priority 10`
- `bind authentication vserver auth -policy myrecaptcha -priority 1 -nextFactor second-factor`

Administrator needs to add appropriate virtual servers depending on whether load balancing virtual server or Citrix Gateway appliance is used for access. Administrator must configure the following command if load balancing virtual server is required:

- `add lb vserver lbtest HTTP <IP> <Port> -authentication ON -authenticationHost nssp.aaatm.com`

**nssp.aaatm.com** – Resolves to authentication virtual server.

**User validation of reCaptcha**

Once you have configured all the steps mentioned in the previous sections, you must see the UI screenshots shown below.

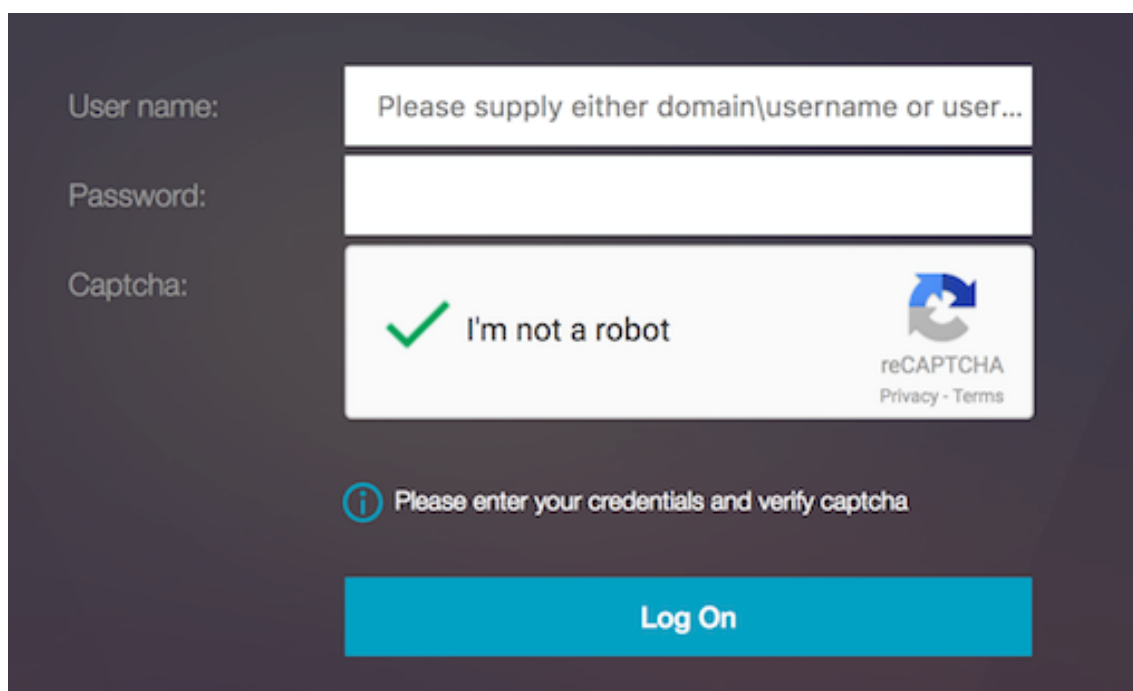

1. Once the authentication virtual server loads the login page, the logon screen is displayed. **Log On** is disabled until reCaptcha is complete.

The image shows a login interface on a dark background. On the left, there are three labels: "User name:", "Password:", and "Captcha:". To the right of "User name:" is a text input field containing the placeholder text "Please supply either domain\username or user@". To the right of "Password:" is a password input field. To the right of "Captcha:" is a reCAPTCHA widget. The widget includes a checkbox, the text "I'm not a robot", and the reCAPTCHA logo with the text "reCAPTCHA Privacy - Terms". Below the input fields is a blue information icon followed by the text "Please enter your credentials and verify captcha". At the bottom center is a large, dark blue button with the text "Log On" in white.

2. Select I'm not a robot option. The reCaptcha widget is displayed.

3. You are navigated through series of reCaptcha images, before the completion page is displayed.
4. Enter the AD credentials, select the **I'm not a robot** check box and click **Log On**. If authentication succeeds, you are redirected to the desired resource.

The screenshot shows a login interface with a dark background. On the left, there are labels for 'User name:', 'Password:', and 'Captcha:'. The 'User name:' field contains the placeholder text 'Please supply either domain\username or user...'. The 'Password:' field is empty. The 'Captcha:' field contains a reCAPTCHA challenge with a green checkmark, the text 'I'm not a robot', and the reCAPTCHA logo with 'reCAPTCHA Privacy - Terms' below it. Below the captcha field, there is an information icon and the text 'Please enter your credentials and verify captcha'. At the bottom, there is a large blue button labeled 'Log On'.

#### Notes

- If reCaptcha is used with AD authentication, Submit button for credentials is disabled until reCaptcha is complete.
- The reCaptcha happens in a factor of its own. Therefore, any subsequent validations like AD must happen in the 'nextfactor' of reCaptcha.

## Configuring the OpenID Connect protocol

September 21, 2020

A Citrix ADC appliance can now be configured as an identity provider by using OpenID Connect protocol. OpenID connect protocol strengthens identity providing capabilities of the Citrix ADC appliance. You can now access enterprise wide hosted application with a single sign-on as OpenID connect offers more security by not transferring user password but works with tokens with specific lifetime. OpenID also is designed to integrate with non-browser clients such as apps and services. Therefore, OpenID Connect is widely adopted by many implementations.

### Advantages of having the OpenID Connect support

- OpenID eliminates overhead of maintaining multiple authentication passwords as the user has a single identity across organization.

- OpenID provides a robust security for your password as the password is shared only with your identity provider and not with any application you access.
- OpenID has vast interoperability with various systems making it easier for the hosted applications to accept OpenID.
- OpenID is a simple protocol that enables native clients to easily integrate with servers.

### To configure Citrix ADC appliance as an IdP using the OpenID Connect protocol with the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > OAuth IdP**.

2. Click **Profile** and click **Add**.

On the **Create Authentication OAuth IDP Profile** screen, set values for the following parameters and click **Create**.

- **Name** – Name of the authentication profile.
- **Client ID** – Unique string that identifies SP.
- **Client Secret** – Unique secret that identifies SP.
- **Redirect URL** – Endpoint on SP to which code/token has to be posted.
- **Issuer Name** – String that identifies IdP.
- **Audience** – Target recipient for the token being sent by IdP. This might be checked by the recipient.
- **Skew Time** – The time for which the token remains valid.
- **Default Authentication Group** – A group added to the session for this profile to simplify policy evaluation and help in customizing policies.

3. Click **Policies** and click **Add**.

4. On the **Create Authentication OAuth IDP Policy** screen, set values for the following parameters and click **Create**.

- **Name** – The name of the authentication policy.
- **Action** – Name of profile created above.
- **Log Action** – Name of message log action to use when a request matches this policy. Not a mandatory field.
- **Undefined-Result Action** – Action to perform if the result of policy evaluation is undefined(UNDEF). Not a mandatory field.
- **Expression** – Default syntax expression that the policy uses to respond to specific request. For example, true.
- **Comments** – Any comments about the policy.

**Binding the OAuthIDP policy and LDAP policy to the authentication virtual server**

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Actions > LDAP**.
2. On **LDAP Actions** screen, click **Add**.
3. On **Create Authentication LDAP Server** screen, set the values for the following parameters, and click **Create**.
  - **Name** – The name of the ldap action
  - **ServerName/ServerIP** – Provide FQDN or IP of the LDAP server
  - Choose appropriate values **for Security Type, Port, Server Type, Time-Out**
  - Make sure **Authentication** is checked
  - **Base DN** – Base from which to start LDAP search. For example, dc=aaa,dc=local.
  - **Administrator Bind DN:** Username of the bind to LDAP server. For example, admin@aaa.local.
  - **Administrator Password/Confirm Password: Password to bind LDAP**
  - Click **Test Connection** to test your settings.
  - **Server Logon Name Attribute:** Choose “sAMAccountName”
  - Other fields are not mandatory and hence can be configured as required.
4. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Policy**.
5. On **Authentication Policies** screen, click **Add**.
6. On **Create Authentication Policy** page, set the values for the following parameters, and click **Create**.
  - **Name** – Name of the LDAP Authentication Policy.
  - **Action Type** – Choose **LDAP**.
  - **Action** – Choose the LDAP action.
  - **Expression** – Default syntax expression that the policy uses to respond to specific request. For example, true\*\*.

**To configure the Citrix ADC appliance as an IdP using the OpenID Connect protocol with the command line**

At the command prompt, type the following commands:

- `add authentication OAuthIDPProfile <name> [-clientID <string>][-clientSecret <string>][-redirectURL <URL>][-issuer <string>][-audience <string>][-skewTime <mins>] [-defaultAuthenticationGroup <string>]<!--NeedCopy-->`

- `add authentication OAuthIdPPolicy <name> -rule <expression> [-action <string> [-undefAction <string>] [-comment <string>] [-logAction <string>] <!--NeedCopy-->`
- `add authentication ldapAction aaa-ldap-act -serverIP 10.0.0.10 -ldapBase "dc=aaa,dc=local" <!--NeedCopy-->`
- `ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password> -ldapLoginName <!--NeedCopy-->`

#### sAMAccountName

- `add authentication policy aaa-ldap-adv-pol -rule true -action aaa-ldap-act <!--NeedCopy-->`
- `bind authentication vserver auth_vs -policy <ldap_policy_name> -priority 100 -gotoPriorityExpression NEXT <!--NeedCopy-->`
- `bind authentication vserver auth_vs -policy <OAuthIDPPolicyName> -priority 5 -gotoPriorityExpression END <!--NeedCopy-->`
- `bind vpn global -certkey <> <!--NeedCopy-->`

#### Note

You can bind more than one key. Public parts of certificates bound are sent in response to `jwks_uri` query (<https://gw/oauth/idp/certs>).

## Encrypted tokens support on OpenID Connect

Citrix ADC appliance with OpenID Connect mechanism now supports sending of encrypted tokens along with signed tokens. The Citrix ADC appliance uses JSON web encryption specifications to compute the encrypted tokens and supports only compact serialization of encrypted tokens. To encrypt OpenID token, Citrix ADC appliance needs public key of the relying party (RP). The public key is obtained dynamically by polling the relying party's well-known configuration endpoint.

A new “`relyingPartyMetadataURL`” option is introduced in “`authentication OAuthIDPPProfile`.”

### To configure relying party's endpoint by using CLI

At the command prompt, type:

```
1 set authentication OAuthIDPPProfile <name> [-relyingPartyMetadataURL <URL>] [-refreshInterval <mins>] [-status < >] - **
   relyingPartyMetadataURL** - This is the endpoint at which Citrix ADC
   IdP can get details about relying party being configured. Metadata
   response must include endpoints for jwks_uri for RP public keys.
```

- **refreshInterval** - Defines the rate at which this endpoint must be polled to update the certificates in minutes.
- **status** - Reflects the status of the polling operation. The status is complete once Citrix ADC successfully obtains the public keys.

**Example**

```
1 set authentication OAuthIDPProfile sample_profile -  
   relyingPartyMetadataURL https://rp.customer.com/metadata -  
   refreshInterval 50 -status < >
```

After endpoint is configured, Citrix ADC appliance first polls relying party's well-known endpoint to read configuration. Currently, the Citrix ADC appliance processes only the 'jwks\_uri' endpoint.

- If the 'jwks\_uri' is absent in the response, the status of the profile is not complete.
- If the 'jwks\_uri' is present in the response, Citrix ADC polls that endpoint also to read the public keys of the relying party.

**Note:**

Only RSAES-OAEP and AES GCM encryption type algorithms are supported for token encryption.

**Custom attributes support on OpenID Connect**

OpenID relying parties may require more than username or user principal name (UPN) in the token to create user profile or make authorization decisions. Most commonly, the user groups are required to apply authorization policies for the user. Sometimes, more details, such as the first or the last name is required for provisioning user account.

Citrix ADC appliance configured as an IdP can be used to send extra attributes in the OpenID Connect id\_token using expressions. Advanced policy expressions are used to send the custom attributes as per the requirement. The Citrix IdP evaluates the expressions corresponding to the attributes and then computes the final token.

Citrix ADC appliance automatically JSONify the output data. For example, numbers (such as SSN) or boolean values (true or false) are not surrounded by quotes. Multi-valued attributes, such as groups are placed within array marker (“[“ and “]”). The complex type attributes are not automatically computed, and you can configure the PI expression of those complex values as per your requirement.

**To configure relying party's endpoint by using CLI**

At the command prompt, type:

```
1 set oauthidpprofile <name> -attributes <AAA-custom-attribute-pattern>
```

The <AAA-custom-attribute-pattern> can be described as:

```
1 Attribute1=PI-Expression@@@attribute2=PI-Expression@@@
```

'attribute1';attribute2' are literal strings that represent the name of the attribute to be inserted in the id\_token.

**Note:**

You can configure up to 2,000 bytes of attributes.

**Example:**

```
1 set oauthidpprofile sample_1 -attributes q{
2  myname=http.req.user.name@@@ssn="123456789"@@@jit="false"@@@groups=
   http.req.user.groups }
```

- Above PI expression is an advanced policy expression that represents the value to be used against the attribute. The PI expression can be used to send a string literal, such as “hard-coded string”. The string literal is surrounded by double quotes around single quotes or double quotes around a start and pattern (as stated above, start pattern is “q{“). If the value of the attribute is not a string literal, the expression is evaluated at runtime and its value is sent in token. If the value at runtime is empty, corresponding attribute is not added to the ID token.
- As defined in the example, 'false' is a literal string for the attribute “jit”. Also, “ssn” has hard-coded value for reference. Groups and myname are PI expressions that yield strings.

## Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud

November 2, 2020

**Note:** Citrix Gateway authentication is supported on Citrix ADC 12.1 54.13 Advanced edition and later.

Citrix Cloud supports using an on-premises Citrix Gateway as an identity provider to authenticate subscribers signing in to their workspaces.

By using Citrix Gateway authentication, you can:

- Continue authenticating users through your existing Citrix Gateway so they can access the resources in your on-premises Virtual Apps and Desktops deployment through Citrix Workspace.
- Use the Citrix Gateway authentication, authorization, and auditing (Citrix ADC AAA) functions with Citrix Workspace.

- Use features such as pass-through authentication, smart cards, secure tokens, conditional access policies, federation, and many others while providing your users access to the resources they need through Citrix Workspace.

## Prerequisites

- Cloud Connectors - You need at least two servers on which to install the Citrix Cloud Connector software.
- Active Directory - Perform the necessary checks.
- Citrix Gateway requirements
  - Use advanced policies on the on-premises gateway due to deprecation of classic policies.
  - When configuring the Gateway for authenticating subscribers to Citrix Workspace, the gateway acts as an OpenID Connect provider. Messages between Citrix Cloud and Gateway conform to the OIDC protocol, which involves digitally signing tokens. Therefore, you must configure a certificate for signing these tokens.
  - Clock synchronization - The gateway must be synchronized to NTP time.

For details, see [Prerequisites](#).

## Create an OAuth IdP policy on the on-premises Citrix Gateway

### Important:

You must have generated the client ID, secret, and redirect URL in **Citrix Cloud > Identity and Access Management > Authentication** tab. For details, see [Connect an on-premises Citrix Gateway to Citrix Cloud](#).

### Creating an OAuth IdP authentication policy involves the following tasks:

1. Create an OAuth IdP profile.
2. Add an OAuth IdP policy.
3. Bind the OAuth IdP policy to an authentication virtual server.
4. Bind the certificate globally.

## Creating an OAuth IdP profile by using the CLI

At the command prompt, type;

At the command prompt, type;

```

1 add authentication OAuthIDPProfile <name> [-clientID <string>] [-
  clientSecret ] [-redirectURL <URL>] [-issuer <string>] [-
  sendPassword ( ON | OFF )]
2
3 add authentication OAuthIdPPolicy <name> -rule <expression> -action <
  string>
4
5 bind authentication vserver <name> [-policy <string> [-priority <
  positive_integer>] [-gotoPriorityExpression <expression>]] [-
  portaltheme <string>]
6 <!--NeedCopy-->

```

**Example:**

```

1 add authentication OAuthIDPProfile oauthidp_staging -clientID <client>
  -clientSecret <Secret from client> -redirectURL <url from client> -
  issuer <https://GatewayFQDN.com>
2 -sendPassword ON
3
4 add authentication OAuthIdPPolicy oauthidp_staging -rule true -action
  oauthidp_staging
5
6 bind authentication vserver auth -policy oauthidp_staging -priority 10
  -gotoPriorityExpression next
7
8 bind vpn global -certkeyName MyCertKeyName
9
10 <!--NeedCopy-->

```

**Creating an OAuth IdP profile by using the GUI**

1. Navigate to **Security > AAA – Application Traffic > Policies > Authentication > Advanced Policies > OAuth IDP**.
2. In the **OAuth IDP** page, select the **Profiles** tab and click **Add**.
3. Configure the OAuth IdP profile.

**Note:**

- Copy and paste the client ID, secret, and Redirect URL values from **Citrix Cloud > Identity and Access Management > Authentication** tab to establish the connection to Citrix Cloud.

- Enter the Gateway URL correctly in the **Issuer Name** Example: <https://GatewayFQDN.com>
- Also copy and paste the client ID in the **Audience** field as well.
- **Send Password**: Enable this option for single sign-on support. This option is disabled by default.

4. Click **Create**.
5. In the **OAuth IDP** page, select **Policies** and click **Add**.
6. Configure the OAuth IdP policy.
7. Bind the OAuth IdP policy to the authentication, authorization, and auditing authentication virtual server.
  - a) Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
  - b) Select the virtual server to which you want to bind the policy, and then click **Edit**.
  - c) In **Advanced Authentication Policies**, click > next to **No OAuth IDP Policy**.
  - d) In the **Authentication OAuth IDP Policy** page, click **Add Binding**.
  - e) In **Select Policy**, select the OAuth IdP policy.
  - f) Click **Bind**.

**Note:**

When **sendPassword** is set to ON (OFF by default), user credentials are encrypted and passed through a secure channel to Citrix Cloud. Passing user credentials through a secure channel allows you to enable SSO to Citrix Virtual Apps and Desktops upon launch.

## Troubleshoot authentication issues in Citrix ADC and Citrix Gateway with aad.debug module

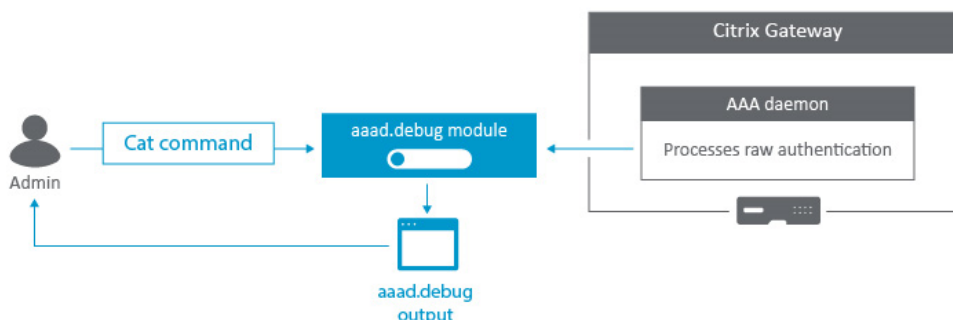

September 21, 2020

This section describes how to troubleshoot authentication issues in Citrix ADC and Citrix Gateway with aad.debug module.

### Background

Authentication in Citrix Gateway is handled by the Authentication, authorization, and auditing (AAA) daemon. The raw authentication events that AAA daemon processes can be monitored by viewing the output of the **aad.debug** module and serves as a valuable troubleshooting tool. The aad.debug is a pipe as opposed to a flat file and does not display the results or log them. Therefore, the cat command

can be used to view the output of `aaad.debug`. The process of using `nsaaad.debug` to troubleshoot an authentication problem is typically referred to as “debugging aaad”.

This process is useful for troubleshooting authentication issues such as:

- General authentication errors
- Username/password failures
- Authentication policy configuration errors
- Group extraction discrepancies

**Note:** This process applies to Citrix Gateway and Citrix ADC appliance.

## Troubleshooting authentication issues

To troubleshoot authentication with `aaad.debug` module, complete the following procedure:

1. Connect to the Citrix Gateway command line interface with a Secure Shell (SSH) client such as PuTTY.
2. Run the following command to switch to the shell prompt:  
`shell`
3. Run the following command to change to the `/tmp` directory:  
`cd /tmp`
4. Run the following command to start the debugging process:  
`cat aaad.debug`
5. Perform the authentication process that requires troubleshooting, such as a user logon attempt.
6. Monitor the output of the `cat aaad.debug` command to interpret and troubleshoot the authentication process.
7. Stop the debugging process by pressing `Ctrl+Z`.
8. Run the following command to record the output of `aaad.debug` to a file:  
`cat aaad.debug | tee /var/tmp/debug_logname,`  
where `/var/tmp` is the required directory path and is the required log name.

The following section provides examples of how `aaad.debug` module can be used to troubleshoot and interpret an authentication error.

### Incorrect password

In the following example, the user enters an incorrect Lightweight Directory Access Protocol (LDAP) password.

```
1 process_radius Got RADIUS event
2 process_radius Received BAD_ACCESS_REJECT for: <username>
3 process_radius Sending reject.
4 send_reject_with_code Rejecting with error code 4001
5 <!--NeedCopy-->
```

### Invalid username

In the following example, the user enters an incorrect LDAP username.

```
1 /home/build/rs_121/usr.src/netscaler/aaad/ldap_drv.c[450]:
   receive_ldap_user_search_event 1-140: Admin authentication(Bind)
   succeeded, now attempting to search the user testusernew
2
3 /home/build/rs_121/usr.src/netscaler/aaad/ldap_drv.c[453]:
   receive_ldap_user_search_event 1-140: Number of entires in LDAP
   server response = 0
4
5 /home/build/rs_121/usr.src/netscaler/aaad/ldap_drv.c[459]:
   receive_ldap_user_search_event 1-140: ldap_first_entry returned null
   , user testusernew not found
6
7 /home/build/rs_121/usr.src/netscaler/aaad/naaad.c[4781]:
   send_reject_with_code 1-140: Not trying cascade again 4009
8
9 /home/build/rs_121/usr.src/netscaler/aaad/naaad.c[4783]:
   send_reject_with_code 1-140: sending reject to kernel for :
   testusernew
10
11 /home/build/rs_121/usr.src/netscaler/aaad/naaad.c[4801]:
   send_reject_with_code 1-140: Rejecting with error code 4009
12 <!--NeedCopy-->
```

## Determining group extraction results

In the following example, the group extraction results can be determined. Many issues with AAA group access involve the user not picking up the correct session policies for their assigned group in a Citrix Gateway appliance. Some common reasons for this include an incorrect spelling of AD or the Radius group name in the appliance and users not being a member of the security group in AD or the Radius server.

```

1 /usr/home/build/rs_80_48/usr.src/usr.bin/nsaaad/../../../../netscaler/aaad/
  ldap_drv.c[40]:
2 start_ldap_auth attempting to auth scottli @ 10.12.33.216
3
4 /usr/home/build/rs_80_48/usr.src/usr.bin/nsaaad/../../../../netscaler/aaad/
  ldap_drv.c[291]:
5
6 /usr/home/build/rs_80_48/usr.src/usr.bin/nsaaad/../../../../netscaler/aaad/
  ldap_drv.c[551]: recieve_ldap_user_search_event built group string
  for scottli of:Domain Admins
7 <!--NeedCopy-->

```

## aaad.debug module error codes

The following table lists the various **aaad.debug** module error codes, cause for the error, and the resolution.

| aaad.debug module |                                              |                                                                                                                    |                                       |
|-------------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| error codes       | Error message                                | Cause of error                                                                                                     | Resolution                            |
| 4001              | Incorrect credentials/- Password. Try again. | Incorrect credentials are supplied                                                                                 | Enter the correct credentials         |
| 4002              | Not Permitted                                | This is a catch all error. Occurs when ldapbind operation fails for reasons other than incorrect user credentials. | Make sure bind operation is permitted |

---

| aaad.debug module |                                                                  |                                                                                      |                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| error codes       | Error message                                                    | Cause of error                                                                       | Resolution                                                                                                                                                                                                                                                                                                                   |
| 4003              | Cannot connect to server. Try connecting again in a few minutes. | Server times out                                                                     | Increase the LDAP/Radius server timeout value on Citrix ADC (Authentication > LDAP/Radius > Server > Timeout value). Default timeout value is 3 secs.                                                                                                                                                                        |
| 4004              | System Error                                                     | Citrix ADC/Citrix Gateway internal error or a runtime error in the appliance library | Check for the cause of the system error and resolve the same                                                                                                                                                                                                                                                                 |
| 4005              | Socket Error                                                     | Socket error while talking to the authentication server                              | Make sure that LDAP/RADIUS server or any other authentication servers can listen on the ports mentioned in the authentication action configured on Citrix ADC. For example, a common error scenario can be that an ldaprofile on Citrix ADC is configured to use port 636 /SSL, however the same port is not open on the AD. |
| 4006              | Incorrect username                                               | Bad (format) username passed to nsaaad, like empty username                          | Enter the correct username                                                                                                                                                                                                                                                                                                   |

## Admin Partitioning

September 21, 2020

A Citrix ADC appliance can be partitioned into logical entities called admin partitions, where each partition can be configured and used as a separate Citrix ADC appliance. The following figure shows the partitions of a Citrix ADC being used by different customers and departments:

A partitioned Citrix ADC appliance has a single default partition and one or more admin partitions. The following table provides further details on the two partition types:

**Note:** In a partitioned appliance, the mode BridgeBPDUs can be enabled only in the default partition and not in the administrative partitions.

Default Partition

Admin Partitions

**Availability:**

The Citrix ADC appliance ships with a single partition, which is called a default partition. The default partition is retained even after the Citrix ADC appliance is partitioned.

Must be explicitly created as described in [Configure admin partitions](#).

**Number of Partitions:**

One

A Citrix ADC appliance can have one or more (maximum of 512) admin partitions.

**User Access and Roles:**

The default partition can be accessed and configured by all Citrix ADC users who are not associated with a *partition-specific* command policy. As always, the operations that a user can perform are restricted by the associated command policy.

Can be created only by Citrix ADC superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition.

Note: Partition users do not have shell access.

### **File Structure:**

All files in a default partition are stored in the default Citrix ADC file structure.

For example, the Citrix ADC configuration file is stored in the `/nsconfig` directory and Citrix ADC logs are stored in the `/var/log/` directory.

All files in an admin partition are stored in directory paths that have the name of the admin partition.

For example, the Citrix ADC configuration file (`ns.conf`) is stored in the `*/nsconfig/partitions/<partitionName>` directory. Other partition-specific files are stored in the `*/var/partitions/<partitionName>` directories.

Some other paths in an admin partition:

- Downloaded files: `*/var/partitions/<partitionName>/download/*`
- Log files: `*/var/partitions/<partitionName>/log/*`

**Note:** Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the `*/var/log/*` directory.

- SSL CRL certificate related files: `*/var/partitions/<partitionName>/netscaler/ssl*`

### **Resources Available:**

All Citrix ADC resources.

Citrix ADC resources that are explicitly assigned to the admin partition.

## **User access and roles**

In authenticating and authorizing a partitioned Citrix ADC appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users to that partition without affecting other partitions. These are partition users and they are authorized to access only that partition using SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA) by authorizing users to access different applications.

Administrators and user roles can be described as follows:

**Root Administrator.** Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition using a NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.

**Partition Administrator.** Accesses the specified partition through a NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

**System User.** Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

**Partition User.** Accesses a partition through a SNIP address. This user account is created by the partition administrator and the user has access to resources, only within the partition.

### Points to remember

Following are some points to remember when providing role-based access in a partition.

1. Citrix ADC users accessing the GUI through NSIP address will use default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through partition SNIP address will use partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot login using NSIP address.
4. Citrix ADC user bound to a partition cannot login using partition SNIP address.
5. External users accessing a partition through external server configuration as LDAP, Radius, or TACACS added in the partition. The user must access using SNIP address to directly log onto the partition.

### Use case for managing role Based access in an partitioned setup

Consider a scenario where an enterprise organization, [www.example.com](http://www.example.com) has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

John: Root Administrator

George: Partition Administrator

Adam: System User

Jane: Partition User

John, is the root administrator of a partitioned Citrix ADC appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the appliance. He provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role based access to few applications running

on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with partition-admin command policy in P2 partition. Adam being another network engineer prefers to access an application running on P2. John creates a system user account for Adam and associates his user account to P2 partition. Once his account is created, Adam can log into the appliance to access the Citrix ADC Management interface through NSIP address and can switch to partition P2 based on user/group binding.

Suppose, Jane who is another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane's user account created within the partition is now directly associated with P2. Now Jane can access the Citrix ADC Management interface through SNIP address and cannot switch to any other partition.

**Note**

If Jane's user account is created by a partition administrator in partition P2, she can access the Citrix ADC Management interface only through SNIP address (created within the partition) and not permitted to access the interface through NSIP address. Similarly, if Adam's user account is created by a root administrator in the default partition and is bound to P2 partition, he can access the Citrix ADC Management interface only through NSIP address or SNIP address created in the default partition (with management access enabled) and not permitted to access the partition interface through SNIP address created in the administrative partition.

**Configure roles and responsibilities for partition administrators**

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users – A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing system user as partition administrator for a specific partition – Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. This is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations performed by a partition administrator in an administrative partition.

Configuring SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy -The partition administrator creates partition users and defines the scope of user access. This is done by binding the user

account to partition command policies.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. This is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.

1. Creating an Administrative Partition – Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.
2. Switching user access from default partition to partition P2 – If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition (for example, partition P2) based on user binding.
3. Adding SNIP address to the Partition user account with Management access enabled-Once you have switched your access to an administration partition, you must create a SNIP address and provide management access to the address.
4. Creating and Binding a Partition System User with Partition Command Policy-If you are a partition administrator, you can create partition users and define the scope of user access. This is done by binding the user account to partition command policies.
5. Creating and Binding Partition user group with Partition Command Policy-If you are a partition administrator, you can create partition user groups and define the scope of user access control. This is done by bind the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

### **Benefits of using admin partitions**

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned Citrix ADC appliance, authorized users of other application could intentionally or unintentionally change configurations that are required for your application. This could lead to undesirable behavior. This possibility is reduced in a partitioned Citrix ADC appliance.
- Isolates traffic between different applications by the use of dedicated VLANs for each partition.
- Accelerates and allows to scale application deployments.
- Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

### **User case 1: How Admin partition is used in an enterprise network**

Let us consider a scenario faced by a company named **Foo.com**.

- **Foo.com** has a single Citrix ADC.
- There are five departments and each department has one application that requires to be deployed with the Citrix ADC.
- Each application must be managed independently by a different set of users or administrators.
- Other users must be restricted from accessing the configurations.
- The application or back-end must be able to share resources like IP addresses.
- The global IT department must be able to control Citrix ADC-level settings which must be common to all partitions.
- Applications must be independent of one another. An error in configuration of one application must not affect the other.

A non-partitioned Citrix ADC would not be able to satisfy these requirements. However, you can achieve all these requirements by partitioning a Citrix ADC.

Simply create a partition for each of the applications, assign the required users to the partitions, specify a VLAN for each partition, and define global settings on the default partition.

### **Use case 2: How an admin partition is used by a service provider**

Let us consider a scenario faced by a service provider named **BigProvider**:

- BigProvider has 5 customers: 3 small enterprises and 2 large enterprises.
- **SmallBiz**, **SmallerBiz**, and **StartupBiz** need only the most basic Citrix ADC functionality.
- **BigBiz** and **LargeBiz** are larger enterprises and have applications that attract a lot of traffic. They would like to use some of the more complex Citrix ADC functionality.

In a non-partitioned approach, the Citrix ADC administrator would typically use a Citrix ADC SDX appliance and provision a Citrix ADC instance for each customer.

This solution suits **BigBiz** and **LargeBiz** because their applications need the undiminished power of the entire non-partitioned Citrix ADC appliance. However, this solution might not be as cost effective for servicing **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

Therefore, **BigProvider** decides on the following solution:

- Using a Citrix ADC SDX appliance to bring up dedicated Citrix ADC instances for **BigBiz** and **LargeBiz**.
- Using a single Citrix ADC which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The Citrix ADC administrator (superuser) creates an admin partition for each of these customers, specifies the users for the partitions, specifies the Citrix ADC resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

## Supported Citrix ADC configurations

September 7, 2021

Citrix ADC configurations can be categorized into the following three types of configurations. It depends on the Citrix configuration and the partition in which the configuration is performed.

### Note

- Admin partitions cannot be set up on a Citrix ADC cluster. It means that a Citrix ADC cluster cannot be partitioned.
- Admin partitions cannot be set up on a Citrix ADC MPX-FIPS appliance.
- [Case 3](#) lists the Citrix ADC features that are not supported in admin partitions.
- Load balancing templates are not supported in admin partitions.

### Case 1 (global configurations)

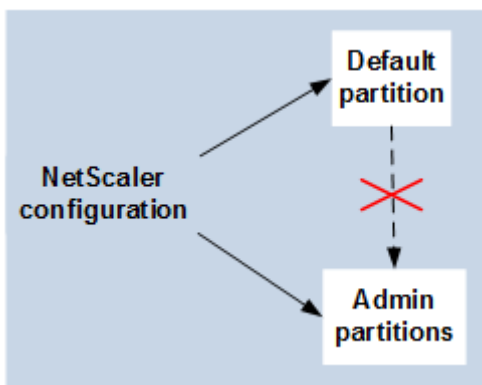

Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.
- Updates to global parameters for syslog, NSLOG, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

## Case 2 (partition-specific configurations)

Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.

- Getting traffic level statistics for a partition.
- Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
- Clearing Citrix ADC configurations.
- Feature-specific parameters for the following features: AppFlow, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
- Feature-specific configurations such as virtual servers, services, monitors.

## Case 3

Configurations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.

### Note

Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

| Feature Component | Citrix ADC Feature           | NetScaler 11.1                              | NetScaler 12.0 | Citrix ADC 12.1 | Citrix ADC 13.0 |
|-------------------|------------------------------|---------------------------------------------|----------------|-----------------|-----------------|

| Optimization      | Front-end-optimization | No             | Yes            | Yes             | Yes             |
| AppQoE            | AppQoE                 | Yes            | Yes            | Yes             | Yes             |
| BOT               | BOT Management         | NA             | NA             | NA              | NO              |

The preceding table lists some of the features as **Restricted Features** in the admin partition setup. The following section provides the reason why some of the features are mentioned as **Restricted Features**.

- **VRRP.** The VRRP is Restricted Feature in the admin partition because of the following:
  - VRID addition or deletion can be done only from the default partition context. However, once a VRID is created, it can be used within non-default partitions.
  - VRRP functionality is supported only over the dedicated VLANs.
  - VRRP functionality is not supported on shared VLANs, used by the admin partition. It is blocked internally. No error message is shown during configuration. The protocol is blocked on a shared VLAN (tagged or untagged) bound to a default or any administrative partition.

#### Important

To support active-active deployment using VRRP, main and backup VIP must use the same VRID. Different VRIDs cannot be used.

- **Networking.** Some of the networking configurations (L2 Param and L3 Param) are not supported or valid in the partition context. If you come across any such configurations, the following error message is displayed. “ERROR: This configuration option is not supported on the non-default partition.”

## Configure admin partitions

February 5, 2021

#### Important

- Only superusers are authorized to create and configure admin partitions.
- Unless specified otherwise, configurations to set up an admin partition must be done from

the default partition.

By partitioning a Citrix ADC appliance, you are in-effect creating multiple instances of a single Citrix ADC appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned Citrix ADC has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned Citrix ADC is the same as accessing a non-partitioned Citrix ADC: through the NSIP address or any other management IP address. As a user, after you provide your valid logon credentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, configurations that you perform are saved to that partition and are specific to that partition.

#### Note

- Citrix ADC superusers and other non-partition users are taken to the default partition.
- Users of all the 512 partitions can log in simultaneously.

#### Tip

To access a partitioned Citrix ADC appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the Citrix ADC.

```
add ssl certKey ns-server-certificate -cert ns-server.cert -key ns-server.key
```

2. Bind it to a service named `nshttps-<SNIP>-3009`, where `<SNIP>` must be replaced with the SNIP address, in this case `100.10.10.1`.

- `bind ssl service nshttps-100.10.10.1-3009 -certkeyName ns-server-certificate`

#### Partition resource limiting

In a partitioned Citrix ADC appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. This is done by

specifying Zero as the partition resource value, where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when you migrate a traffic domain deployment to an administrative partition or if you do not know about resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. Partition memory. This is the maximum allocated memory for a partition. You must make sure to specify the values when creating a partition.

**Note**

From NetScaler 12.0 onwards, when you create a partition, you can set the memory limit to Zero. If a partition is already created with a specific memory limit, you can reduce the limit to any value or set the limit as Zero.

Parameter: maxMemLimit

Maximum memory is allocated in megabytes in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

Default value: 10

2. Partition bandwidth. Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance's licensed throughput. Otherwise, you are not limiting the bandwidth that can be used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.

**Note**

From NetScaler 12.0 onwards, when you can create a partition, you can set the partition bandwidth limit to Zero. If a partition is already created with a specific bandwidth, you can reduce the bandwidth or set the limit as Zero.

Parameter: maxBandwidth

Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

Default value: 10240

Maximum Value: 4294967295

3. Partition connection. Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only

on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

**Note**

From NetScaler 12.0 onwards, you can create a partition with number of open connections set to Zero. If you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections.

Default value: 1024

Minimum value: 0

Maximum Value: 4294967295

## Configure an admin partition

To configure an admin partition, complete the following tasks.

### Access an admin partition

#### To access in an admin partition by using the command line interface

1. Log on to the Citrix ADC appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.
3. If yes, skip to the next step.
4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
  - `show system user <username>`
  - `switch ns partition <partitionName>`
5. Now, you can perform the required configurations just as a non-partitioned Citrix ADC.

#### To access an admin partition by using the configuration utility

1. Log on to the Citrix ADC appliance.
2. Check if you are in the correct partition. The top bar of the graphical user interface displays the name of the currently selected partition.

- If yes, skip to the next step.
  - If no, navigate to **Configuration > System > Administrative Partitions > Partitions**, right-click the partition to which you want to switch, and select **Switch**.
3. Now, you can perform the required configurations just as a non-partitioned Citrix ADC.

### Add an admin partition

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.

#### To create an administrative partition by using the command line interface

At the command prompt, type:

```
1 add partition <partitionname>
```

#### Switch user access from default partition to an admin partition

Now switch user access from default partition to partition Par1.

#### To switch a user account from default partition to an admin partition by using the command line interface:

At the command prompt, type:

```
1 Switch ns partition <pname>
```

#### Adding SNIP address to a partition user account with management access enabled

In the partition, create SNIP address with management access enabled.

#### To add SNIP address to the partition user account with management access enabled by using the command line interface:

At the command prompt, type:

```
> add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

#### Create and Bind a partition user with partition command policy

In partition, create a partition system user and bind the user with partition-admin command policies.

#### To create and bind a partition system user with partition command policy by using the command line interface:

At the command prompt, type:

```
> add system user <username> <password>
Done
```

### **Creating and binding partition user group with partition command policy**

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

**To create and bind a partition user group with partition command policy by using the command line interface:**

```
1 > add system group <groupName>
2 > bind system group <groupname> (-userName | -policyName <cmdpolicy> <
    priority> | -partitionName)
```

### **Configuring external server authentication for external users**

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through SNIP address.

**To configure external server authentication for external users by using the command line interface:**

At the command prompt, type:

```
1 add authentication tacacsaction <name> -serverip <IP> -tacacsSecret <
    secret key> -authorization ON -accounting ON
2 add authentication policy <pollicname> -rule true -action <name>
3 bind system global <pollicname> -priority <value>1
```

### **Configure a Partition System User Accounts in a Partition by using the GUI**

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.

#### **To create a partition user account in a partition by using the GUI**

Navigate to **System > User Administration**, click **Users** to add a partition system user and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

### To create a partition user group account in a partition by using the GUI

Navigate to **System > User Administration**, click **Groups** to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

### To configure External server authentication for external users by using the GUI

Navigate to **System > Authentication > Basic Actions** and click **TACACS** to configure TACACS server for authenticating external users accessing the partition.

### Sample Configuration

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```

1 > add partition Par1
2 > switch ns partition Par1
3 > add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled
4 > add system user John Password
5 > bind system user Jane partition-read-only -priority 1
6 > add system group Retail
7 > bind system group Retail -policyname partition-network 1 (where 1 is
   the priority number)
8 > bind system group Retail -username Jane
9 > add authentication tacacssaction tacuser -serverip 10.102.29.200 -
   tacacsSecret Password -authorization ON -accounting ON
10 > add authentication policy polname -rule true -action tacacsAction
11 > bind system global polname -priority 1

```

### Command Policies for a Partition Users and Partition User Groups in Administrative Partition

| Commands to authorize an user account inside administrative partition | Command policies available inside an administrative partition (built-in policies) | User account access type              |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------|---------------------------------------|
| add system user                                                       | Partition-admin                                                                   | SNIP (with management access enabled) |
| add system group                                                      | Partition-network                                                                 | SNIP (with management access enabled) |

| Commands to authorize an user account inside administrative partition       | Command policies available inside an administrative partition (built-in policies) | User account access type              |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------|---------------------------------------|
| add authentication<br><action, policy>, bind system global<br><policy name> | Partition-read-only                                                               | SNIP (with management access enabled) |
| remove system user                                                          | Partition-admin                                                                   | SNIP(with management access enabled)  |
| remove system group                                                         | Partition-admin                                                                   | SNIP (with management access enabled) |
| bind system cmdpolicy to system user; bind system cmdpolicy to system group | Partition-admin                                                                   | SNIP (with management access enabled) |

### Configure an LACP ethernet channel on the default admin partition

With Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a Citrix ADC appliance:

1. Active. A port in active mode sends LACPDUs. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.
2. Passive. A port in passive mode sends LACPDUs only when it receives LACPDUs. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.
3. Disable. Link aggregation is not formed.

#### Note

By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:

- LACP Mode. Active, passive or disable.
- LACP timeout. The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.

- Port Key. To distinguish between the different channel. When key is 1, LA/1 is created. When key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- Port Priority. Minimum value: 1. Maximum value: 65535. Default: 32768.
- System Priority. Uses this priority along with system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.
- Interface. Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

### Configure and verify LACP

#### To configure and verify LACP on a Citrix ADC appliance by using the command line

1. Enable LACP on each interface.

At the command prompt, type:

```
set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1<!--NeedCopy  
-->
```

When you enable LACP on an interface, the channels are dynamically created. Additionally, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.

#### Note

When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel was created dynamically by LACP, you cannot perform add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.

At the command prompt, type:

```
set lacp -sysPriority <Positive_Integer><!--NeedCopy-->
```

3. Verify that LACP is working as expected.

“show interface

```
1 `` `show channel<!--NeedCopy-->
```

```
show LACP<!--NeedCopy-->
```

**Note**

In some versions of Cisco IOS, running the switchport trunk native vlan command causes the Cisco switch to tag LACP PDUs. This causes the LACP channel between the Cisco switch and the Citrix ADC appliance to fail. However, this issue does not affect the static link aggregation channels configured in the above procedure.

## VLAN configuration for admin partitions

March 16, 2021

VLANs can be bound to a partition as a “Dedicated” VLAN or a “Shared” VLAN. Based on your deployment, you can bind a VLAN to a partition to isolate its network traffic from other partitions.

**Dedicated VLAN** – A VLAN bound only to one partition with “Sharing” option disabled and must be a tagged VLAN. For example, in a client-server deployment, for security reasons a system administrator creates a dedicated VLAN for each partition on the server side.

**Shared VLAN** – A VLAN bound (shared across) to multiple partitions with “Sharing” option enabled. For example, in a client-server deployment, if the system administrator does not have control over the client side network, a VLAN is created and shared across multiple partitions.

Shared VLAN can be used across multiple partitions. It is created in the default partition and you can bind a shared VLAN to multiple partitions. By default, a shared VLAN is bound to the default partition implicitly and hence it cannot be bound explicitly.

**Note**

- A Citrix ADC appliance deployed on any hypervisor (ESX, KVM, Xen, and Hyper-V) platform must comply with both the following conditions in a partition setup and traffic domain:
  - Enable the promiscuous mode, MAC changes, MAC spoofing, or forged transmit for shared VLANs with partition.
  - Enable the VLAN with port group properties of the virtual switch, if the traffic is through a dedicated VLAN.
- In a partitioned (multitenant) Citrix ADC appliance, a system administrator can isolate the traffic flowing to a particular partition or partitions by binding one or more VLANs to each partition. A VLAN can be dedicated to one partition or Shared across multiple partitions.

## Dedicated VLANs

To isolate the traffic flowing into a partition, create a VLAN and associate it with the partition. The VLAN is then visible only to the associated partition, and the traffic flowing through the VLAN is classified and processed only in the associated partition.

To implement a dedicated VLAN for a particular partition, do the following.

1. Add a VLAN (100).
2. Bind a network interface to VLAN as a tagged network interface.
3. Create a partition (P1).
4. Bind partition (P1) to the dedicated VLAN (100).

### To add a VLAN by using the command line interface

At the command prompt, type:

```
add vlan <id>  
add vlan 100
```

### To bind a VLAN by using the command line interface

At the command prompt, type:

```
bind vlan <id> -ifnum <interface> -tagged  
bind vlan 100 -ifnum 1/8 -tagged
```

### To create a partition by using the command line interface

At the command prompt, type:

```
add ns partition <partition name> [-maxBandwidth <positive_integer>] [-maxConn <positive_integer>] [-maxMemLimit <positive_integer>]
```

```
add ns partition P1 -maxBandwidth 200 -maxconn 50 -maxmemlimit 90
```

### To bind a partition to a VLAN by using the Citrix ADC CLI

At the command prompt, type:

```
bind partition <partition-id> -vlan <id>
```

```
bind partition P1 -vlan 100
```

### To configure a dedicated VLAN by using the Citrix ADC GUI

1. Navigate to **Configuration > System > Network > VLANs\*** and click **Add** to create a VLAN.
2. On the **Create VLAN** page, set the following parameters:
  - VLAN ID
  - Alias Name
  - Maximum Transmission Unit
  - Dynamic Routing
  - IPv6 Dynamic Routing
  - Partitions Sharing
3. In the **Interface Bindings** section, select one or more interfaces and bind it to the VLAN.
4. In the **IP Bindings** section, select one or more IP addresses and bind to the VLAN.
5. Click **OK** and **Done**.

### Shared VLAN

In a shared VLAN configuration, each partition has a MAC address, and traffic received on the shared VLAN is classified by MAC address. Only a Layer3 VLAN is recommended because it can restrict the sub-net traffic. A partition MAC address is applicable and important only for a shared VLAN deployment.

The following diagram shows how a VLAN (VLAN 10) is shared across two partitions.

To deploy a shared VLAN configuration, do the following:

1. Create a VLAN with the sharing option 'enabled', or enable the sharing option on an existing VLAN. By default, the option is 'disabled'.
2. Bind partition interface to shared VLAN.
3. Create the partitions, each with its own PartitionMAC address.
4. Bind the partitions to the shared VLAN.

### To configure a shared VLAN by using the command line interface

At the command prompt, type one of the following commands to add a new VLAN or set the sharing parameter of an existing VLAN:

```

1   add vlan <id> [-sharing (ENABLED | DISABLED)]
2
3   set vlan <id> [-sharing (ENABLED | DISABLED)]
4
5   add vlan 100 - sharing ENABLED
6
7   set vlan 100 - sharing ENABLED
8 <!--NeedCopy-->
```

### To bind a partition to a Shared VLAN by using the command line interface

At the command prompt, type:

```

1   bind partition <partition-id> -vlan <id>
2
3   bind partition P1 - vlan 100
```

```
4
5     Add ns partition P1 - maxBandwidth 200 - maxconn 50 - maxmemlimit
      90 -partitionMAC<mac_addr>
6
7 Done
8 <!--NeedCopy-->
```

### To configure a Partition MAC Address

At the command prompt, type:

```
1     set ns partition <partition name> [-partitionMAC<mac_addr>]
2
3     set ns partition P1 - partitionMAC 22:33:44:55:66:77
4
5 <!--NeedCopy-->
```

### To bind partitions to a shared VLAN by using the command line interface

At the command prompt, type:

```
1     bind partition <partition-id> -vlan <id>
2
3     bind partition <partition-id> -vlan <id>
4
5     bind partition P1 - vlan 100
6
7     bind partition P2 - vlan 100
8
9     bind partition P3 - vlan 100
10
11    bind partition P4 - vlan 100
12 <!--NeedCopy-->
```

### To configure Shared VLAN by using the Citrix ADC GUI

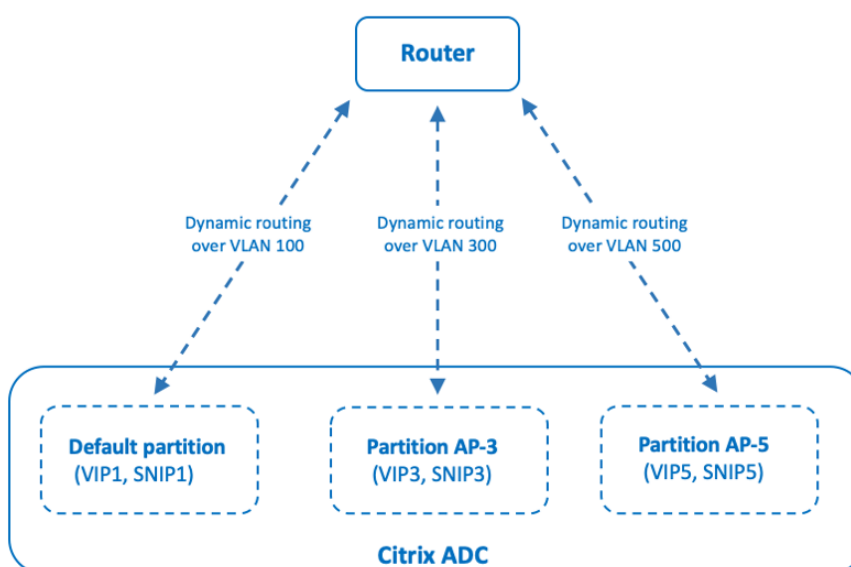

1. Navigate to **Configuration > System > Network > VLANs** and then select a **VLAN** profile and click **Edit** to set the partition sharing parameter.
2. On the **Create VLAN** page, select the **Partitions Sharing** check box.
3. Click **OK** and then **Done**.

## Dynamic routing over a shared VLAN across admin partitions

Admin partitions in a Citrix ADC appliance provide a way to host multiple tenants.

Starting from Citrix ADC version 12.1 build 51.16, a shared VLAN in a partitioned appliance supports dynamic routing protocol. Routing can be configured in dedicated or shared VLANs associated with admin partitions.

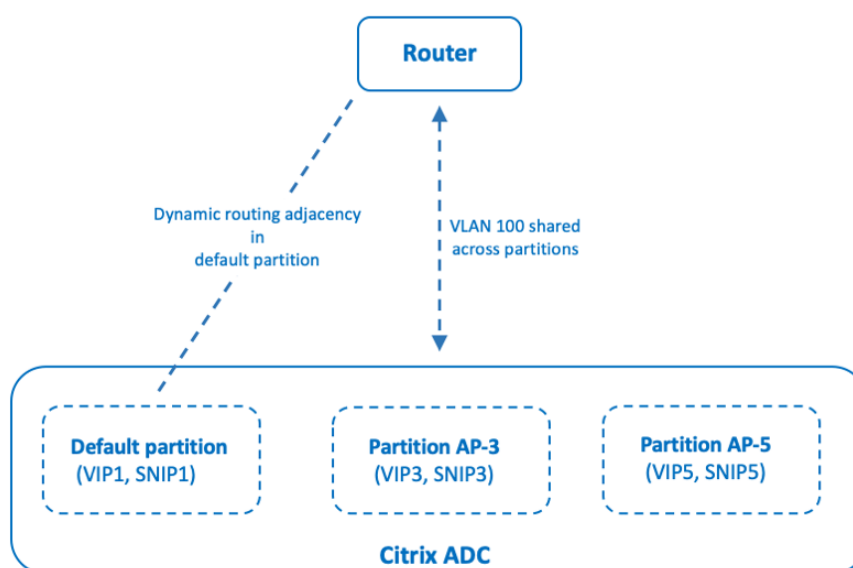

**Dedicated VLAN of an admin partition.** In a dedicated VLAN, the data path for the tenant is identified using one or more VLANs. This results in strict configuration and data-path isolation for the tenant. For advertising the health of a VIP address, dynamic routing is enabled in each partition and the routing adjacency is established per partition.

*Dynamic routing over a dedicated VLAN per partition*

**A shared VLAN across admin partitions.** In a shared VLAN, VIP addresses configured in non-default partition can be advertised through a single adjacency or peering formed in the default partition. A SNIP address in the non-default partition is used as the next-hop for all the VIP addresses (configured with **advertiseOnDefaultPartition** option) in that non-default partition. The configured SNIP address is marked as a next-hop IP address in the routing advertisements.

Consider an example setup of admin partitions in a Citrix ADC appliance, VLAN 100 is shared across default partition, and non-default partitions: AP-3 and AP-5. SNIP addresses SNIP1 is added in default partition, SNIP3 is added in AP-3, and SNIP5 is added in AP-5. SNIP1, SNIP3, and SNIP5 are reachable over vlan-100. VIP addresses VIP1 is added in default partition, VIP3 is added in AP-3, and VIP5 is added in AP-5. VIP3 and VIP5 are advertised through the single adjacency or peering formed in the default partition.

*Dynamic routing over a shared VLAN across partitions*

## Before you begin

Before configuring dynamic routing over a shared VLAN in a non-default admin partition, make sure that:

- **Dynamic routing is configured on the shared VLAN in the default partition.** Configuring dynamic routing on the shared VLAN in the default partition consists of the following steps:
  1. Enable dynamic routing on the shared VLAN.
  2. Add a SNIP IP address with dynamic routing enabled. This SNIP IP address is used for dynamic routing with the upstream.
  3. Bind the SNIP IP subnet to the shared VLAN.
- **One or more dynamic routing protocol is configured on the default partition.** For more information, see [configure dynamic routing protocols](#).

## Configuration steps

Configuring dynamic routing over a shared VLAN in a non-default admin partition consists of the following steps:

1. **Add a SNIP IP address in the non-default partition.** This SNIP IP address must be in the same subnet of the SNIP IP address that is being used for dynamic routing in the default partition.
2. **Set or enable the following parameters for advertising a VIP address, in a non-default partition, using dynamic routing.**

- Host route gateway (hostRtGw). Set this parameter to the SNIP address added in the above step.
- Advertise on default partition (advertiseOnDefaultPartition). Enable this parameter.

### Sample configuration

Consider an example of an admin partition setup in a Citrix ADC appliance. A non-default admin partition AP-3 is configured on this appliance. A shared VLAN VLAN100 is bound to AP-3. The following sample configuration configures dynamic routing, through VLAN100, in AP-3.

| Steps                                                                                                                                                                             | Sample configuration                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>On default admin partition</b>                                                                                                                                                 | -                                                                                                                                 |
| Enable dynamic routing on shared VLAN 100.                                                                                                                                        | <code>set vlan 100 -dynamicRouting enabled</code>                                                                                 |
| Add SNIP IP address 192.0.2.10 with dynamic routing enabled. This SNIP IP address is used for dynamic routing with the upstream.                                                  | <code>add ns ip 192.0.2.10 255.255.255.0 -type SNIP -dynamicRouting enabled</code>                                                |
| Bind subnet of 192.0.2.10 to shared VLAN 100.                                                                                                                                     | <code>bind vlan 100 -IPAddress 192.0.2.10 255.255.255.0</code>                                                                    |
| <b>On non-default admin partition AP-3</b>                                                                                                                                        | -                                                                                                                                 |
| Add SNIP IP address 192.0.2.30. This SNIP IP address is in the same subnet as the SNIP IP address 192.0.2.10 on the default partition.                                            | <code>add ns ip 192.0.2.30 255.255.255.0 -type SNIP</code>                                                                        |
| For advertising VIP address 203.0.113.300 using dynamic routing, enable <code>advertiseOnDefaultPartition</code> parameter and set <code>hostRtGw</code> parameter to 192.0.2.30. | <code>set ns ip 203.0.113.300 255.255.255.255 -hostRoute enabled -advertiseOnDefaultPartition enabled -hostRtGw 192.0.2.30</code> |

### Shared VLAN with admin partition on Citrix ADC SDX appliance

On SDX appliance, you must generate and configure the PMAC address by using the Management Service user interface, before using the admin partitions with shared VLANs. Management Service enables you to generate partition MAC addresses by:

- Using a base MAC address
- Specifying custom MAC addresses
- Randomly generating MAC addresses

#### Note

- The randomly generating MAC addresses are used for other deployments other than high availability.
- After generating the partition MAC addresses, you must restart the Citrix ADC instance before configuring the admin partitions. For more information on generating partition MAC addresses from SDX appliance, see [Generating Partition MAC Addresses to Configure Admin Partition on a Citrix ADC instance in the SDX Appliance](#).

## VXLAN support for admin partitions

September 21, 2020

In a partitioned Citrix ADC appliance, similar to configuring a VLAN, you can configure a VXLAN in the default partition. After configuring a VXLAN, you can bind it to an administrative partition or if a VXLAN is extending a VLAN that is bound to a partition, the appliance binds the VXLAN to the partition under the same broadcasting domain. This is applicable in unbinding a VLAN that unbinds a VXLAN from the partition.

For more information about how VXLAN works in a Citrix ADC appliance, see [VXLAN](#).

Also, for more information on how VLAN works in a partitioned Citrix ADC appliance, see [Admin Partitioning](#).

### Points to remember before configuring a VXLAN

Remember the following points before you configure a VXLAN in a partitioned Citrix ADC appliance:

- When you extend a VLAN over VXLAN, make sure VLAN is bound to the partition.
- Only a partition administrator must configure the IP and dynamic routing for the VXAN in the administrative partition.

A shared VXLAN is not supported in a partitioned appliance and so a VXLAN cannot be tagged to a shared VLAN or you cannot make a VLAN a shared one when it is tagged to a VXLAN.

### Supportable VXLAN configurations

Following are the supportable VXLAN configurations.

**Case 1: Extending VLAN over a VXLAN in the same broadcast domain\*\***

Follow the steps given below to extend a VLAN over a VXLAN and vice versa within the same broadcast domain:

1. Add a VLAN in the default partition

At the command prompt, type:

```
Add vlan <id>
```

1. Extend VLAN over a VXLAN within the same broadcast domain.

At the command prompt, type:

```
Add vxlan <vxlan id> -vlan <id>
```

1. Configure a peer vtep to carry all BUM (broadcast unknown multicast) traffic.

**Note**

The vtep address can be a multicast address.

At the command prompt, type:

```
add bridgetable -mac <mac_addr> -vxlan <positive_integer> -vtep <ip_addr>
[-vni <positive_integer>][-deviceVlan <positive_integer>]
```

1. Bind IP addresses to VXLAN.

At the command prompt, type:

```
Bind vxlan <id> [-srcIP <ip_addr>][-IPAddress <ip_addr|ipv6_addr|*> [<
netmask>]]
```

1. Bind VLAN to an administrative partition.

At the command prompt, type:

```
1 Bind partition <partition-id> -vxlan <id>
2
3 Add vlan 3000
4 Add vxlan 3000 -vlan 10
5 Add bridgetable -mac 00:00:00:00:00:00 -vxlan 3000 -vtep
   10.102.58.8 -vni 11
6 Bind vxlan 3000 -srcIP 10.102.101.15
7 Bind partition p1 -vlan 10
8 <!--NeedCopy-->
```

## SNMP support for admin partitions

September 21, 2020

A partitioned Citrix ADC appliance uses SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

### SNMP traps for admin partition rate limiting

On a partitioned Citrix ADC appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:

- **partitionCONNThresholdReached.** The number of active connections for a partition exceeds its high threshold percentage.
- **partitionCONNThresholdNormal.** The number of active connections is less than or equal to the normal threshold percentage.
- **partitionBWThresholdReached.** The partition's bandwidth usage reaches its high threshold percentage.
- **partitionMEMThresholdReached.** The current memory usage of the partition exceeds its high threshold percentage.
- **partitionMEMThresholdNormal.** The current memory usage of the partition becomes less than or equal to the normal threshold percentage.
- **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.
- **partitionCONNLimitExceeded.** The number of active connections for a partition exceeds its configured limit and new connections are being dropped.
- **partitionCONNLimitNormal.** The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.
- **partitionBWLimitExceeded.** The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are as follows are:

- High threshold = 80% (applicable for all partition rate limit traps)
- Low threshold = 60 % (applicable for all partition rate limit traps)
- Memory limit = 95% (applicable only for partition memory traps)

## Configuring PARTITION-RATE-LIMIT alarm

To configure PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages.

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

### To enable PARTITION-RATE-LIMIT alarm by using the Citrix ADC CLI

At the command prompt, type the following commands:

```
1 enable snmp alarm PARTITION-RATE-LIMIT
2
3 show snmp alarm PARTITION-RATE-LIMIT
```

### To configure PARTITION-RATE-LIMIT Alarm by using the Citrix ADC CLI

At the command prompt, type the following command

```
1 set snmp alarm PARTITION-RATE-LIMIT [-state ( ENABLED | DISABLED )]
   [-severity <severity>] [-logging ( ENABLED | DISABLED )]
2 <!--NeedCopy-->
```

### To configure SNMP trap destination by using the Citrix ADC CLI

At the command prompt, type the following command:

```
1 add snmp trap <trapClass> <trapDestination> [-version <version>] [-
   td <positive_integer>] [-destPort <port>] [-communityName <
   string>] [-srcIP <ip_addr|ipv6_addr>] [-severity <severity>] [-
   allPartitions ( ENABLED | DISABLED )]
2 <!--NeedCopy-->
```

### To configure PARTITION-Rate-Limit alarm by using the Citrix ADC GUI

Navigate to **System > SNMP > Alarms**, select **PARTITION-RATE-LIMIT** alarm and configure the alarm parameters.

### To configure SNMP trap destination by using the Citrix ADC GUI

Navigate to **System > SNMP > Trap**, specify the IP address of the destination device.

## SNMP monitoring for partition resource utilization

Using SNMP, you can monitor a partition's resource (such as bandwidth, connection, and memory) utilization details at real time on a Citrix ADC appliance. This is done by sending a SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

### Note

In order to monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the *partitionTable* is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

Consider a scenario where a Citrix ADC administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (*partitionCurrentBandwidth*) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of *partitionTable* and its description:

| SNMP Parameter                     | SNMP OID                      | Description                                            |
|------------------------------------|-------------------------------|--------------------------------------------------------|
| <i>partitionName</i>               | 1.3.6.1.4.1.5951.4.1.1.88.1.1 | Partition name                                         |
| <i>partitionCurrentBandwidth</i>   | 1.3.6.1.4.1.5951.4.1.1.88.1.2 | Current bandwidth usage of the partition.              |
| <i>partitionCurrentConnections</i> | 1.3.6.1.4.1.5951.4.1.1.88.1.3 | Current number of active connections of the partition. |
| <i>partitionMemoryUsagePcnt</i>    | 1.3.6.1.4.1.5951.4.1.1.88.1.4 | Current Memory usage (in percentage) of the partition. |

## Audit log support for admin partitions

September 21, 2020

On a partitioned Citrix ADC appliance, for enhanced data security, you can configure audit logging in an administrative partition by using advanced policies. For example, you might want to view logs (states and status information) of a specific partition that has multiple users accessing different sets of features on the basis of their levels of authorization in the partition.

**Points to remember**

1. The audit logs generated from the partition will be stored as a single log file (/var/log/ns.log).
2. You must configure the audit log server's (syslog or nslog) subnet address as the source IP address in the partition for sending the audit-log messages.
3. The default partition uses the NSIP as the source IP address for the audit log messages by default.
4. You can display the audit-log message by using the "show audit messages" command.

For information on audit-log configuration, see [Configuring the NetScaler Appliance for Audit Logging](#).

**Configuring audit logging in partitioned Citrix ADC appliance**

Complete the following tasks to configure audit logging in an administrative partition.

1. Configure partition subnet IP address. An IPv4 SNIP address of an administrative partition.
2. Configure audit-log (syslog and nslog) action. An Audit action is a collection of information that specifies the messages to be logged and how to log the messages on the external log server.
3. Configure audit-log (syslog and nslog) policies. Audit-log policies define log messages for the source partition to the syslog or nslog server.
4. Bind audit-log policy to sysGlobal and nsGlobal entity. You must bind an audit-log policy to a system global entity.
5. Review audit-log statistics. Display the audit-log statistics and evaluate the configuration.

To configure the partition's subnet IP address by using the command line interface

At the command prompt, type:

```
1 add ns ip <ip address> <subnet mask>
```

To configure a syslog action by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> <serverIP> [-serverPort <port>] -  
  logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY )] [-  
  transport ( TCP | UDP )]
```

To configure an nslog action by using the command line interface

At the command prompt, type:

```
1 add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel  
  <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY )]
```

To configure syslog audit-log policies by using the command line interface

At the command prompt, type:

```
1 add audit syslogpolicy syslog-pol1 true audit-action1
```

To configure nslog audit-log policies by using the command line interface.

At the command prompt, type:

```
1 add audit nslogpolicy nslog-pol1 true audit-action1
```

To bind audit-log policy to syslogGlobal entity by using the command line interface.

```
1 bind audit syslogglobal -policyName <name> -priority <priority_integer>
   -globalBindType SYSTEM_GLOBAL
```

To bind audit-log policy to nslogGlobal entity by using the command line interface.

At the command prompt, type:

```
1 bind audit nslogglobal -policyName <name> -priority <priority_integer>
   -globalBindType SYSTEM_GLOBAL
```

To display audit-log statistics by using the command line interface.

At the command prompt, type:

```
1 stat audit -detail
```

### Example

```
1 add ns ip 10.102.1.1 255.255.255.0
2 add audit syslogAction syslog_action1 10.102.1.2 - logLevel
   INFORMATIONAL - dateFormat MMDDYYYY - transport UDP
3 add audit syslogpolicy syslog-pol1 true syslog_action1
4 bind audit syslogglobal - policyName syslog-pol1 - priority 1 -
   globalBindType SYSTEM_GLOBAL
```

## Configuring audit-log by using the Citrix ADC GUI

### Storing logs

When SYSLOG or NSLOG server collects log information from all partitions, it is stored as log messages in ns.log file. The log messages contain the following information:

- Partition Name.

- The IP address.
- A time stamp.
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information.

## Display configured PMAC addresses for shared VLAN configuration

September 21, 2020

To use a partition setup with shared VLAN configuration, you need a virtual MAC address called as partition MAC (PMAC) address. The partition uses the PMAC address for its communication on the shared VLAN. A unique PMAC address is configured for each partition and it is used across all shared VLANs bound to that partition. In the case of a non-SDX platform (VPX or MPX) platform, the PMAC address can be either user specified or internally generated by a Citrix ADC appliance. If the PMAC address is not specified for a partition, it is internally generated when the partition is bound to the first shared VLAN. While in the case of an SDX platform, the PMAC addresses always need to be configured from the SVM tool first and then assigned to a partition.

To display a list of configured PMACs, you can use the **Show ns PartitionMAC** command. The command enables you to verify the configured PMACs either through the Citrix ADC CLI or GUI. The command displays all the PMAC addresses and the corresponding partitions (if assigned). In the case of a non-SDX platform, the command displays all the PMAC addresses and their corresponding partitions because the PMAC address is assigned to a partition only on need basis (when a partition bound a shared VLAN). However in the case of a SDX platform, you might have some unassigned PMACs in the list.

For information on how to generate PMAC for SDX platform, see [Generating Partition MAC Addresses](#) topic.

### Displaying PMACs by using the Citrix ADC CLI

At the command prompt, type the following command:

```
show ns partitionMAC
```

```
1 Partition MAC Partition Name
2
3 1) f2:0c:64:da:f6:d7
4
5 2) b4:0c:43:da:f6:d2
```

```
6  
7 3) a6:e7:b2:6c:48:e0  
8  
9 Done
```

## Displaying PMAC Addresses by using the Citrix ADC GUI

1. Sign in to the Citrix ADC appliance and navigate to the **Configuration > System > Partition MAC**.
2. The Partition MAC page displays a list of PMACs and its partitions.

## AppExpert

September 21, 2020

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the Citrix ADC appliance.

### Note

For information about policy extensions, see [Policy Extensions](#).

- **Action Analytics**: Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.
- **AppExpert Applications and Templates**: Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Citrix Gateway applications, and entity templates.
- **AppQoE**: Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the Citrix ADC appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.
- **Entity Template**: Describes how to use entity templates to set up and configure individual Citrix ADC entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.
- **HTTP Callouts**: An HTTP request that the Citrix ADC appliance generates and sends to an external application when certain criteria are met during policy evaluation.
- **Pattern Sets**: Allow string matching during the evaluation of a default syntax policy.
- **Policies and Expressions**: Rules that determine the operations that the Citrix ADC appliance must perform.

- **Rate Limiting:** Defines the maximum load for a given network entity or virtual entity on the Citrix ADC appliance.
- **Responder:** Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.
- **Rewrite:** Rewrites information in the requests or responses handled by the Citrix ADC appliance.
- **String Maps:** Perform pattern matching in all Citrix ADC features that use the default policy syntax.

## Action analytics

September 21, 2020

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the Citrix ADC appliance, this functionality is provided by the action analytics feature. The feature operates on a single Citrix ADC appliance and collects run-time statistics on the basis of criteria that you define. When used with Citrix ADC policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the configuration utility.

## Configure a selector

September 21, 2020

A selector is a filter for identifying requests. It consists of up to five individual default syntax expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound default syntax expression and is considered to be in an AND relationship with the other expressions. Following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR("<string>").BEFORE_STR("<string>")`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the Citrix ADC considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the Citrix ADC, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named `myLimitSelector1`, invoke it from `myLimitID1`, and invoke the identifier from a DNS policy named `dnsRateLimit1`. If you change the expression in `myLimitSelector1`, you might receive an error when binding `dnsRateLimit1` to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The Citrix ADC appliance provides [built-in selectors](#) for some of the most common use cases. Refer to the pdf.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add HTTP.REQ.HEADER("") to the selector that you intend to use.

#### **To configure a selector by using the command line interface:**

At the command prompt, type the following commands to configure a selector and verify the configuration:

- `add stream selector <name> <rule> ...`
- `show stream selector`

#### **Example**

```
1 > add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
2 Done
3 > show stream selector myselector
4     Name: myselector
5     Expressions:
6         1) HTTP.REQ.URL
7         2) CLIENT.IP.SRC
8 Done
9 >
10 <!--NeedCopy-->
```

#### **To modify or remove a selector by using the command line interface:**

- To modify a selector, type the `set stream selector` command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the `rm stream selector` command and the name of the selector.

#### **To configure a selector by using the GUI:**

1. Navigate to **AppExpert > Action Analytics > Selectors**.
2. In the details pane, do one of the following:
  - To create a selector, click **Add**.
  - To modify a selector, select the selector, and then click **Edit**.
3. In the **Create Selector** or **Configure Selector** page, set the following parameters:
  - Name
  - Expressions
    - To add the expression to the selector configuration, click

Add. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click

**Delete.**

Note: In the

Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The Expressions text box displays both the first and second keywords for the expression prefix, for example,

HTTP.REQ. Continue adding expression components until the complete expression is formed.

4. Click **Add**.
5. Continue adding up to five non-compound expressions.
6. Click **OK** and then **Close**.

## Configure a stream identifier

September 21, 2020

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The Citrix ADC appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the

REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built in identifier Top\_URL is associated with the built-in selector Top\_URL). Following are the built-in identifiers:

- Top\_URL
- Top\_CLIENTS
- Top\_URL\_CLIENTS\_LBVSERVER
- Top\_URL\_CLIENTS\_CSVSERVER
- Top\_MSSQL\_QUERY\_DB\_LBVSERVER
- Top\_MYSQL\_QUERY\_DB\_LBVSERVER

For more information about the built-in selectors, see [Configuring a Selector](#).

Note: The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier's configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- `add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]`
- `show stream identifier <name>`

## Example

```
1 > add stream identifier myidentifier Top_URL -interval 10 -sampleCount
   100
2 Done
3 <!--NeedCopy-->
```

To configure a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. In the details pane, do one of the following:
  - To create a stream identifier, click **Add**.
  - To modify a stream identifier, select the identifier, and then click **Edit**.
3. In the Configure Stream Identifier page, set the following parameters:
  - Name
  - Selector
  - Interval
  - Sample Count
  - Sort
4. Click **OK**, and then click **Close**.

## View statistics

September 21, 2020

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the configuration utility.

The following table describes the collected statistics:

| Statistics         | Column name in the output of the stat stream identifier <code>&lt;identifier name&gt;</code> command | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of requests | Req                                                                                                  | The number of requests for which records were created in the last <code>&lt;interval&gt;</code> number of minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Bandwidth consumed | BandW                                                                                                | The total bandwidth consumed by the requests that were received in the last <code>&lt;interval&gt;</code> number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. Consequently, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB, one instance of the request might be shown as having consumed 2 KB and two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB. |
| Response time      | RspTime                                                                                              | The average response time for all the requests received in the last <code>&lt;interval&gt;</code> number of minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                        | Column name in the output of the stat stream identifier<br><identifier name> |                                                                     |
|------------------------|------------------------------------------------------------------------------|---------------------------------------------------------------------|
| tistics                | command                                                                      | Description                                                         |
| Concurrent connections | Conn                                                                         | The total number of concurrent connections that are currently open. |

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <sortBy> [<sortOrder>]]
```

## Examples

Example 1 sorts the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the Req column, and in the ascending order

### Example 1

```
1 > stat stream identifier myidentifier -sortBy BandW Descending -
  fullValues
2 Stream Session statistics
3           Req           BandW
4 User1           508       125924
5 User2           5020      12692
6 User3           2025       4316
7
8           RspTime        Conn
9 User1           5694         0
10 User2           109         0
11 User3            3         0
12 Done
13 <!--NeedCopy-->
```

### Example 2

```
1 > stat stream identifier myidentifier -sortBy Req Ascending -
  fullValues
2 Stream Session statistics
```

|    |                 |         |        |
|----|-----------------|---------|--------|
| 3  |                 | Req     | BandW  |
| 4  | User1           | 508     | 125924 |
| 5  | User3           | 2025    | 4316   |
| 6  | User2           | 5020    | 12692  |
| 7  |                 |         |        |
| 8  |                 | RspTime | Conn   |
| 9  | User1           | 5694    | 0      |
| 10 | User3           | 3       | 0      |
| 11 | User2           | 109     | 0      |
| 12 | Done            |         |        |

To view the statistical data collected for a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output on the basis of the values collected for various selector expressions.

## Grouping records on attribute values

September 21, 2020

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the configuration utility, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions `HTTP.REQ.URL`, `CLIENT.IP.SRC`, and `HTTP.REQ.LB_VSERVER.NAME`, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for `CLIENT.IP.SRC`, the output is based on the patterns `?`. The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns `* <IP address> ?` and `? <IP address> *` where `<IP address>` is the IP address you selected. In the resulting output, if you click a URL, the pattern used is `<URL> <IP address> ?`.

## To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [<pattern> ...]
```

The following examples use a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER("UserHeader"), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.

### Example 1

In the following command, the pattern used is ? ?. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header /mysite/mypage1.html?Ed displays statistics for requests made by user Ed for the URL /mysite/mypage1.html.

#### Note:

You must ensure to type the following command with “\?” instead of “?”. For example, If selector uses an expression - client.ip.src and client.tcp.srcport. The Stat command to group the output on the values collected for the selector is ‘stat stream identifier myidentifier \? \? -fullValues’ as given below.

```

1 > stat stream identifier myidentifier ? ? -fullValues
2 Stream Session statistics
3
4                               Req                               BandW
5 /mysite/mypage2.html?Grace           1                               2553
6 /mysite/mypage1.html?Grace           2                               4
7 /mysite/mypage1.html?Ed              8                               16
8 /mysite/mypage2.html?Joe             1                               2554
9 /mysite/mypage1.html?Joe             5                               10
10 /mysite/?Joe                         1                               4
11
12                               RspTime                          Conn
13 /mysite/mypage2.html?Grace           0                               0
14 /mysite/mypage1.html?Grace           0                               0
15 /mysite/mypage1.html?Ed              0                               0
16 /mysite/mypage2.html?Joe             0                               0
17 /mysite/mypage1.html?Joe             0                               0
18 /mysite/?Joe                         6                               0
19 Done

```

```
19 <!--NeedCopy-->
```

### Example 2

In the following command, the pattern used is \* ?. The appliance groups the output on the values accumulated for the second expression HTTP.REQ.HEADER("UserHeader"). The rows display statistics for all requests made by users Grace, Ed, and Joe.

**Note:**

Ensure to type the following command with "\?" instead of "?".

```
1 > stat stream identifier myidentifier * ?
2 Stream Session statistics
3           Req      BandW  RspTime      Conn
4 Grace           3      2557         0         0
5 Ed              8        16         0         0
6 Joe             7      2568         6         0
7 Done
8 <!--NeedCopy-->
```

### Example 3

In the following command, the pattern used is ? \*, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

**Note:**

Ensure to type the following command with "\?" instead of "?".

```
1 > stat stream identifier myidentifier ? * -fullValues
2 Stream Session statistics
3           Req           BandW
4 /mysite/mypage2.html      2      5107
5 /mysite/mypage1.html     15        30
6 /mysite/                   1         4
7
8           RspTime      Conn
9 /mysite/mypage2.html      0         0
10 /mysite/mypage1.html      0         0
11 /mysite/                   6         0
12 Done
13 <!--NeedCopy-->
```

### Example 4

In the following command, the pattern used is \* \*. The appliance displays one set of collective statistics for all the requests received, with no row title.

```
1 > stat stream identifier myidentifier * *
2 Stream Session statistics
3           Req      BandW  RspTime      Conn
4           18      5141     6          0
5 Done
6 <!--NeedCopy-->
```

### Example 5

In the following command, the pattern is `/mysite/mypage1.html *`. The appliance displays one set of collective statistics for all the requests received for the URL `/mysite/mypage1.html`, with no row title.

```
1 > stat stream identifier myidentifier /mysite/mypage1.html *
2 Stream Session statistics
3           Req      BandW  RspTime      Conn
4           15      30     0          0
5 Done
6 <!--NeedCopy-->
```

## Clearing a stream session

September 21, 2020

You can flush all the records that have been accumulated for a stream identifier.

### To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

- clear stream session
- stat stream identifier

### Example

This example uses the `stat stream identifier` command first, so that a comparison can be made with the `stat stream identifier` command that is used for verifying the result of the `clear stream session` command.

```
1 >stat stream identifier myidentifier
2 Stream Session statistics
```

```

3           Req      BandW  RspTime    Conn
4  /aed....html      2         0         0         0
5  /                636       303        12         0
6  Done
7  >clear stream session myidentifier
8  Done
9  >stat stream identifier myidentifier
10 Done
11 <!--NeedCopy-->

```

## To clear a stream session by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to clear, and then click **Clear Sessions**.

## Configure policy for optimizing traffic

September 21, 2020

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do so by configuring a default syntax policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of default syntax expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression `COLLECT_STATS` is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- **\*\*IS\_TOP().\*\*** Finds if a given object is in the top of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are considered to be similar in nature. The sort function must be turned on to avoid an undef condition.
- **\*\*IS\_TOP\_FREQUENTS().\*\*** Finds if a given object is in the top of the elements that are in the top elements. For example, is the element among the top 50% of all the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undef condition.

It is your policy configuration that determines whether the Citrix ADC appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can con-

figure a policy with the rule `ANALYTICS.STREAM().COLLECT_STATS` and the action `NOOP`. The `NOOP` policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the `gotoPriorityExpression` parameter of the `NOOP` policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM()` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy `responder_stat_collection` enables the appliance to collect statistics based on the identifier, `myidentifier`. The policy `responder_notify` evaluates the data that is collected.

### Example

```
1 > add responder action send_notification respondwith '"You are in the
   Top 10 list for bandwidth consumption"'
2 Done
3 > add responder policy responder_stat_collection' ANALYTICS.STREAM("
   myidentifier").COLLECT_STATS' NOOP
4 Done
5 > add responder policy responder_notify 'ANALYTICS.STREAM("myidentifier
   ").BANDWIDTH.IS_TOP(10)' send_notification
6 Done
7 > bind responder global responder_stat_collection 10 NEXT
8 Done
9 > bind responder global responder_notify 20 END
10 Done
11 <!--NeedCopy-->
```

## How to limit bandwidth consumption per user or client device

April 27, 2021

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client's bandwidth consumption by using temporary service denial techniques such as responding to a client re-

quest with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client's or user's bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server `mysitevip`, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to `mysitevip`.

```
1 > add lb vserver mysitevip HTTP 192.0.2.17 80
2 Done
3 > add service service[1-10] 192.0.2.[240-249] HTTP 80
4 service "service1" added
5 service "service2" added
6 service "service3" added
7 .
8 .
9 .
10 service "service10" added
11 Done
12 > bind lb vserver vserver1 service[1-10]
13 service "service1" bound
14 service "service2" bound
15 service "service3" bound
16 .
17 .
18 .
19 service "service10" bound
20 Done
21 <!--NeedCopy-->
```

2. **Configure the stream selector.** Configure one of the following stream selectors:

- To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.

```
1 > add stream selector myselector CLIENT.IP.SRC
2 Done
3 <!--NeedCopy-->
```

- To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.

```
1 > add stream selector myselector HTTP.REQ.HEADER( "UserHeader
   ")
2 Done
3 <!--NeedCopy-->
```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

```
1 > add stream identifier myidentifier myselector -interval 60 -
   sampleCount 1 -sort BANDWIDTH
2 Done
3 <!--NeedCopy-->
```

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action `crossed_limits`.

```
1 > import responder htmlpage http://192.0.2.20:80/stdpages/wait.
   html crossed-limits.html
2 This operation may take some time, Please wait...
3
4 Done
5 > add responder action crossed_limits respondwithhtmlpage crossed-
   limits.html
6 Done
7 <!--NeedCopy-->
```

5. **Configure the responder policies.** Configure responder policy `myrespol1` with the rule `ANALYTICS.STREAM("myidentifier").COLLECT_STATS` and the action `NOOP`. Then, configure policy `myrespol2` for determining whether a client or user has crossed the 100 MB limit. The policy `myrespol2` is configured with the responder action `crossed_limits`.

```
1 > add responder policy myrespol1 'ANALYTICS.STREAM("myidentifier")
   .COLLECT_STATS' NOOP
```

```
2 Done
3 > add responder policy myrespol2 'ANALYTICS.STREAM("myidentifier")
    .BANDWIDTH.GT(104857600)' crossed_limits
4 Done
5 <!--NeedCopy-->
```

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

```
1 > bind lb vserver mysitevip -policyName myrespol1 -priority 1 -
    gotoPriorityExpression NEXT
2 Done
3 > bind lb vserver mysitevip -policyName myrespol2 -priority 2 -
    gotoPriorityExpression END
4 Done
5 <!--NeedCopy-->
```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

```
1 > stat stream identifier myidentifier -sortBy BandW - fullValues
2 Stream Session statistics
3
4           Req           BandW
5 192.0.2.30      5000      3761
6 192.0.2.31       29      2602
7 192.0.2.32       25       51
8
9           RspTime       Conn
10 192.0.2.30         2         0
11 192.0.2.31         0         0
12 192.0.2.32         0         0
13 Done
14 >
15 <!--NeedCopy-->
```

## AppExpert applications and templates

March 5, 2021

An AppExpert application is a collection of configuration that you set up on the Citrix ADC appliance. Managing AppExpert applications is simplified by a GUI (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Also, it consolidates deployment steps in one view, so you can quickly configure target IP addresses for clients and specify host servers.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the Citrix ADC appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If necessary, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (authentication, authorization, and auditing) policies for the application.

### **AppExpert application terminology**

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

**Public endpoint.** The IP address and port combination at which the Citrix ADC appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

**Application unit.** An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The Citrix ADC services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units. Thereby ensuring all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

**Service.** The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format `\<IP address\>:\<Port\>`

. A web application that serves many requests is hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the Citrix ADC appliance. Services are deployment-specific and are therefore not included in templates. You must configure services after you import a template.

**Application unit rule.** Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:

```
HTTP.REQ.URL.SUFFIX.EQ("bmp") || HTTP.REQ.URL.SUFFIX.EQ("gif") || HTTP.REQ.  
URL.SUFFIX.EQ("png") || HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about default syntax expressions and classic policy expressions, see [Policies and Expressions](#).

**Traffic Subset.** A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

## How appExpert application works

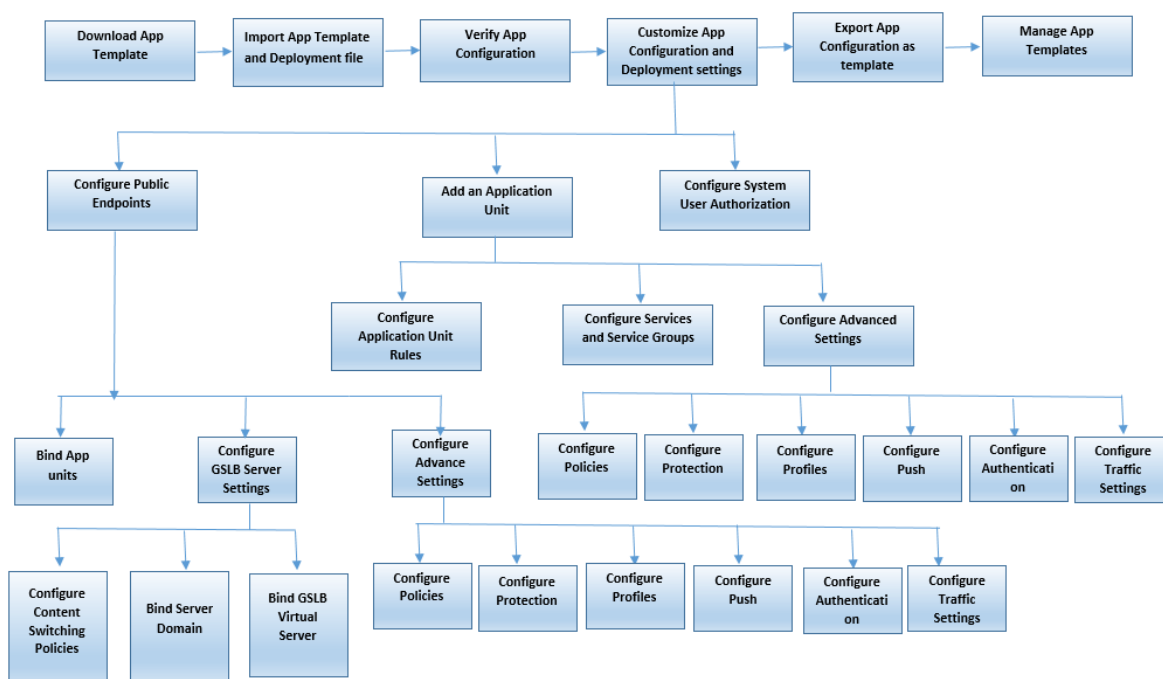

September 21, 2020

When the endpoint receives a client request, the Citrix ADC appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other Citrix ADC appliances that require a similar AppExpert application configuration

## Get started with appExpert

July 22, 2021

To get started with an AppExpert application, you must first obtain an application template and import the template to a Citrix ADC appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

The process of setting up an application can be done in two ways:

- Using a prebuilt application template

- Creating a custom application without using a template.

If you prefer to set up the application by using a prebuilt application template, do the following:

1. Download an application template.
2. Import template files to Citrix ADC appliance.
3. Verify application setup.
4. Configure application and deployment settings.
5. Export the configuration to new template files (optional).
6. Import the template files to other Citrix ADC appliances that require a similar AppExpert application configuration.

Citrix ADC's video tutorials enable you to understand Citrix ADC features in easy and simple way. Watch [https://www.youtube.com/watch?v=aqayflvCR\\_0](https://www.youtube.com/watch?v=aqayflvCR_0) video to learn how to set up an application using AppExpert Application template.

## Downloading an application template

April 29, 2021

AppExpert application setup begins with downloading an application template from the Citrix community website at <http://community.citrix.com> to your local computer or Citrix ADC appliance. The application templates are designed to be imported and exported, so that you can easily share application-specific configurations within an organization or across organizations. An application template includes the following set of entities:

1. Application components (for example, web pages, files, archives, and web services)
2. Traffic management entities (for example, virtual server IP addresses and associated load-balancing algorithms, and SSL offload settings) for the application components.
3. Citrix ADC policies used for optimizing the application traffic.

**Note:** Application templates are available in different versions for configuring different types of Citrix ADC appliances.

## Importing an application template

May 6, 2021

For Citrix ADC software version 9.3 or later, each AppExpert template has two XML files: a Template file and a Deployment file. You must import both files from your local computer to a Citrix ADC appliance. You can either import the template files from your computer to the AppExpert application templates

directory in Citrix ADC appliance or upload files to a Citrix ADC appliance and then import them from the appliance.

**Note:** When you import a template from an appliance, you have to provide the variable value available in the template. By default, the pre-configured value is display <https://docs.citrix.com/en-us/citrix-adc/12-1/appexpert/appexpert-application-templates/creating-managing-templates/citrix-adc-application-template-deployment-files.html>

After you import the template files, the application-configuration and deployment information populates the target application automatically. The appliance imports all the configuration from the template files through the NITRO API. If you do not import the deployment file, the system generates an application populated with content switching virtual server configuration. For more information about the format of application templates and deployment files, see [Understanding Citrix ADC Application Templates and Deployment Files](#).

When you import a template, if you do not include a deployment file, you have to configure the public endpoints in the application that the system automatically generates from the template. One endpoint for HTTP and another endpoint for HTTPS. When configuring a public endpoint of type HTTPS, make sure you enable the SSL feature, bind the server certificate, and include the server-certificate and certificate-key files.

For more information about configuring endpoints after you import a template, see [Configuring Public Endpoints](#).

To import AppExpert application template files to a Citrix ADC appliance by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click **Import Template**.
3. On the **Import** page, set the following parameters:
  - a) Application Name (mandatory)
  - b) Template File (mandatory)
  - c) Use deployment file
4. Click **Continue** to auto populate application-configuration and deployment information into an application.

Citrix ADC's video tutorials enable you to understand Citrix ADC features in an easy and simply way. Watch <https://www.youtube.com/watch?v=AR9TwSD9uJM> video to learn how to import an application template.

## Verifying and testing application configuration

September 21, 2020

The GUI includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the Citrix ADC appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

| Icon                                                                                | Entity           | Indicates that                                                                                                                                                             |
|-------------------------------------------------------------------------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Application      | At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.                                                     |
|    | Application unit | The application unit is up. The application unit is up when at least one service or service group is up.                                                                   |
|    | Application      | The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.                   |
|  | Application      | All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application. |
|  | Application unit | All the services configured for the application unit are down.                                                                                                             |

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have configured the public endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the services are configured correctly. However, note that a green indicator does not mean that the state of all associated entities is UP. It only means that the application has sufficient resources (endpoints and services) to serve client requests. To verify that the state of all associated entities is UP, check the health of all the entities on the statistics page for the application.

## Customizing the configuration

September 21, 2020

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. [Configuring Public Endpoints](#)
2. [Configuring Application Units](#)
3. [Specifying the Order of Evaluation](#)
4. [Viewing Application Configuration using Visualizer](#)

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular Citrix ADC feature, such as Rewrite or application firewall, you can configure your own policies.

## Configure public endpoints

September 21, 2020

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Edit**.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
  - a) Public endpoint type. Select the radio button to define the endpoint type.
  - b) Name. Name of the public endpoint.
  - c) IP address. IP address of the public endpoint.
  - d) Port. Port number of the public endpoint.
  - e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click **Continue**.
6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then **Done**.
9. Click **Close**.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see [Content Switching](#).

## Configure services and service groups for an application unit

September 21, 2020

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application and then click **Edit**.
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
  - a) In the Service Binding slider, set the following parameters.
    - i. Service. Select a load balancing service from the list or create a new service.
    - ii. Weight. Provide a weight value for the service.
  - b) Click **Bind** and then **Done**.
  - c) In the ServiceGroup Binding slider, set the following parameters:

- i. Service Group Name. Select a load balancing service group or create a new service group.
  - ii. Click **Bind** and then **Done**.
- d) Click **Done**.
5. Click **Continue** to set other configurations.

## Create application units

July 2, 2021

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **+** icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
  - a) To specify that you want to configure a expression in the Rule box, click Syntax.
  - b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
  - c) In the Rule box, configure the expression.
5. Click **OK**.

## Configuring application unit rules

September 21, 2020

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the Configure Application Unit dialog box, do the following:
  - a) To specify the format of the new expression, do one of the following:
    - To specify that you want to configure a classic expression in the Rule box, click **Classic Syntax**.
    - To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
  - b) In the Rule box, configure the expression.
4. Click **OK**.

## Configuring policies for application units

September 21, 2020

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.

For information about configuring policies and expressions in both formats, see [Policies and Expressions](#).

## Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - Click Switch to Default Syntax if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.  
**Important:** This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
  - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time. You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
  - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.  
For information about modifying a compression policy, see [Compression](#).
  - To unbind a policy, click the name of the policy, and then click Unbind Policy.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click Regenerate Priorities.
  - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the Create Compression Policy dialog box, configure the policy, and then click **Create**.  
For information about modifying a compression policy, see [Compression](#).
  - If you are configuring a default syntax expression, do the following:
    - In the Goto Expression column, select a Goto expression.
    - In the Invoke column, specify the policy bank that you want to invoke if the current

policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

## Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the Configure Cache Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.  
You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
  - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.  
For information about modifying a Caching policy, see [Integrated Caching](#).
  - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click **Regenerate Priorities**.
  - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.  
For information about modifying a Caching policy, see [Integrated Caching](#).
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

## Configuring rewrite policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.  
You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
  - To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click **OK**.  
For information about modifying a Rewrite policy, see [Rewrite](#).
  - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click **Regenerate Priorities**.
  - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.  
For information about modifying a Rewrite policy, see [Rewrite](#).
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

## Configuring responder policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Responder Policy dialog box, modify the policy, and then click **OK**.

For information about modifying a Responder policy, see [Responder](#).

- To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click **Regenerate Priorities**.
- To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.

For information about modifying a Responder policy, see [Responder](#).

- In the Goto Expression column, select a Goto expression.
- In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

## Configuring Application Firewall Policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Application Firewall** column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.  
Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click **Insert Policy**, the list that appears in the **Policy Name** column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
  - To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.  
For information about modifying a application firewall policy, see [Policies](#).

- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click New Policy. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a application firewall policy, see [Policies](#).

4. Click **Apply Changes**, and then click **Close**.

## Configuring Application Units

September 21, 2020

To configure an application unit by using the GUI:

1. Navigate to **AppExpert > Applications > Application Unit** section and then click the plus icon to add a new application unit for a traffic subset.
2. In the **Application Unit** slider, set the following parameters:
  - Name
  - Expression

You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example, type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression\* text box now displays the components that you have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.

3. Click **Continue** to bind services and service groups.
4. Click the **Service** section to select or add a virtual service and bind it to the application unit.
5. Click **Continue** and click the **Service Group** section to select or add a virtual service group and bind it to the application unit.

6. Click **Bind** and **Continue** to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.
7. Click the **plus** icon in each section to set the configuration parameters.
8. Click **OK** and then **Done**.

To edit an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, select an entity, click the edit icon and modify the application unit settings.

**Note:** You cannot modify the name and rule expression for an existing application unit.

Citrix ADC's video tutorials enable you to understand Citrix ADC features in an easy and simple way. Watch [https://www.youtube.com/watch?v=bJ5\\_i8fV2hc](https://www.youtube.com/watch?v=bJ5_i8fV2hc) video to learn how configure an application unit.

## Configuring Public Endpoints for an application

September 21, 2020

To configure public endpoints for an application by using the GUI:

1. Navigate to **AppExpert > Applications**, select an application entity, and then click **Edit**.
2. In the **Public Endpoint** section, click **+** to configure a new public endpoint.
3. In the **Public Endpoint** slider, do one of the following:
  - a) Click **New** to create a new endpoint.
  - b) Click **Existing Public Endpoint** to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
  - a) Name
  - b) IP address
  - c) Protocol
  - d) Port
5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application, and click **Edit**. In the **Public Endpoint** section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to **AppExpert > Applications > Public Endpoint**, click the pen icon to view the delete icon next to the entity.

Citrix ADC's video tutorials enable you to understand Citrix ADC features in an easy and simply way. Watch <https://www.youtube.com/watch?v=z4v-edQiVpw> video to learn how to configure a public endpoint.

## Specifying the order of evaluation of application units

September 21, 2020

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

## Configuring persistency groups for application units

September 21, 2020

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert > Applications**.

2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
  - To add a persistency group, click **Add**.
  - To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
  - **Group Name**—Name of the persistency group. For the Citrix ADC appliance to recognize the persistency group as part of the application's configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
  - **Persistence**—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
  - **Timeout**—Time period for which a persistence session is in effect.
  - **Backup Persistence**—Type of backup persistence for the group.
  - **Backup Timeout**—Time period, in minutes, for which backup persistence is in effect.
  - **Application Units**—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click **Add**. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.
5. Click **OK**.

## Viewing AppExpert applications and configuring entities by using the application visualizer

September 21, 2020

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to **AppExpert > Applications**, select an application entity, and click **Visualizer**.

## Configuring user authentication, authorization, and auditing

September 21, 2020

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to **AppExpert > Applications**, select an application entity, and then click **Edit**.
2. In the **Advanced Settings** section, click **Authorization**, and configure authorized users and user groups.
3. Click the **AAA** user section to bind authorized users to the application.
4. In the **AAA User** slider, set the parameters .
5. Click **Continue**, and then click **Authorization Policies** in the **Advanced Settings** section.
6. In the **Authorization Policy** slider, bind an authorization policy to the application.
7. Click **Continue**, and then click the **Authorization Group** section in the **Advanced Settings** section.
8. In the **AAA Group Binding** slider, bind an authorization user group to the application.
9. Click **Continue**, and then click **Policies** in the **Advanced Settings** section.
10. In the **Policies** slider, bind an **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert > Applications > Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.

To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

## Monitoring a Citrix ADC application

September 21, 2020

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

## View application statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

## Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:
  - To view the statistics, click **Show Stats**.  
The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
  - To refresh the statistical information, click **Refresh Stats**.

## Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see [Verifying and Testing the Configuration](#).

## Deleting an application

September 21, 2020

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity

## Configure application authentication, authorization, and auditing

July 22, 2021

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, do one of the following:
  - a) Click Add to add an authentication for a new application.
  - b) Click Edit to modify an existing application.
3. In the **Applications** page, select an Application Unit.
4. In the **Application Unit** slider page, click Authentication from the **Advanced Settings** section.
5. In the **Authentication** section, select the authentication type as follows:
  - a) Form based authentication
  - b) 401 based authentication
  - c) None
6. Click **OK** and then click **Done**.

### Configure application authorization

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the **Applications** page, and then click Authorization. from the **Advanced Settings** section.
4. Do one of the following:
  - If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
  - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.  
The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
5. Click **Done** and then click **Close**.

## Configure application auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application's public endpoints.

To configure auditing policies for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to configure auditing policies.
3. In the Application Unit slider page, click + icon in the **Policies** section to configure the auditing policies.
4. In the **Policies** slider page, select policy type as Syslog auditing or Nslog auditing and click **Continue**.
5. In the Policy binding section, set the following parameters.
  - a) Select a policy for binding. If you do not have a policy for binding, click + to create a new policy.
  - b) To create a new auditing policy, under Policy Name, click **New Policy**, and then, in the **Policy** page do the following:
    - i. In the Name box, type a name for the policy.
    - ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
    - iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
    - iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify. In the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see [Auditing Authenticated Sessions](#).
    - v. If you want to configure a new audit server, click New, and then, in the Create Auditing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.
    - vi. Click **Create**.
  - c) To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.
  - d) To regenerate priorities, click **Regenerate Priorities**.
  - e) To unbind a policy, click the policy, and then click **Unbind Policy**.
  - f) To modify a policy, click the policy, and then click **Modify Policy**.
6. Click **Apply Changes**, and then click **Close**.

## Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
3. To disable AAA for the application, click **Turn Off AAA**.
4. To enable AAA for the application, click **Turn On AAA**.

## Setting up a custom Citrix ADC application

July 22, 2021

If an AppExpert application template is not available for the Web application that you want to manage through the Citrix ADC appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

### Creating an application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click Applications, and then click **Add**.
3. In the **Create Application** dialog box, in Name, enter a name for the application, and then click **OK**.

## Creating application units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. Click **Create**.

## Configuring public endpoints for an AppExpert application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the Citrix ADC appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application, do one of the following:
  - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
  - If you want to specify all the public endpoints, click **Activate All**.
  - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
  - If you want to create a new public endpoint, click **Add**. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click **OK**.

In the **Create public endpoint** dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, provide additional settings, and then click **OK**.

For more information about the parameters in the **Create public endpoint** and **Configure Public Endpoint** dialog boxes, see [Content Switching](#).

- If you want to modify a public endpoint, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, modify settings for the endpoint, and then click **OK**.

For more information about the parameters in the Configure Public Endpoint dialog box, see [Content Switching](#).

4. Click **Close**.

## Configuring public endpoints for an application unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see [Configuring Endpoints for an Application Unit](#).

To configure endpoints for an application unit by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
  - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
  - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

## Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
  - To configure services, click the **Services** tab.
  - To configure service groups, click the **Service Groups** tab.
4. On the **Service** or **Service Groups** tab, do one of the following:
  - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
  - If you want to specify all the services or service groups, click **Activate All**.

- If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
- If you want to modify a service, click the service, and then click **Open**. Then, in the **Configure Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the **Create Service**, **Configure Service**, and **Create Service Group** dialog boxes, see [Load Balancing](#).

### Configuring services and service groups for an application unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
  - To configure services, click the **Services** tab.
  - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
  - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the **Weight** column, specify the weight that you want to assign to each configured service.
  - To specify all services or service groups, click **Activate All**.
5. On the **Method** and **Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

### Configuring policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see [Configuring Policies for Application Units](#).

## Creating and managing template files

July 22, 2021

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the configuration and then share the template with other administrators. Or, you can create a template and then import the template to other Citrix ADC appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances.

AppExpert application template files can be exported either to the template directory on the Citrix ADC appliance or to a folder on your local computer. You can then upload and download the templates to and from the Citrix ADC appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

AppExpert application template files can be exported either to the template directory on the Citrix ADC appliance or to a folder on your local computer. You can then upload and download the templates to and from the Citrix ADC appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

## Exporting an AppExpert Application to a Template File

September 21, 2020

When you export an AppExpert application, all application-configuration information is exported to a template file, and all deployment-specific information is exported to a deployment file. The string `_deployment` is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the Citrix ADC appliance, the template file is stored in the `/nsconfig/nstemplates/applications` directory and the deployment file is stored in the `/nsconfig/nstemplates/applications/deployment_files/` directory. If you have configured a Citrix Gateway application, you can choose to include the Citrix Gateway policies in the template.

To export an AppExpert application to a template file by using the GUI:

1. Navigate to **AppExpert > Application**, select an application entity, and then click **Edit**.
2. On the **Applications** page, click the **Export as a Template** link to export the application configuration and deployment settings as a template.
3. In the **Export Application** slider, set the following parameters:
  - a) Template Filename
  - b) Deployment Filename

4. Click **Continue** and **Done**.
5. Navigate to **AppExpert > Application** and click **Manage Templates** to show the exported configuration as files on the **Template File** and **Deployment File** tabs.

## Exporting a Content Switching Virtual Server Configuration to a Template File

September 21, 2020

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string “\_deployment” is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the Citrix ADC appliance, the template file is stored in the `/nsconfig/nstemplates/applications` directory on the Citrix ADC appliance and the deployment file is stored in the `/nsconfig/nstemplates/applications/deployment_files/` directory.

For more information about the format of application templates and deployment files, see [Understanding Citrix ADC Application Templates and Deployment Files](#). The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.

However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file. In this scenario, you must export the associated AppExpert application to a template.

For more information about exporting an AppExpert application to a template file, see [Exporting an AppExpert Application to a Template File](#).

To export a content switching configuration to an application template file from the Content Switching Visualizer by using the GUI:

1. Navigate to **Traffic Management > Content Switching > Virtual Servers**.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click **Visualizer**.
3. In the Content Switching Visualizer, click the icon for the content switching vserver, click **Related Tasks**, and then click **Create Template**.
4. In the **Export...as Template** dialog box, enter a name for the template file, and then do one of the following:

- To export the template file to the appliance, make sure that Browse (Appliance) is displayed.
  - To export the template file to your computer, click the Browse (Appliance) drop-down menu, click Local, browse to the location to which you want to save the file, and then click Save.
5. Provide the following information:
    - **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
    - **Summary Description**—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
    - **Author**—The name of the author of the template.
    - **Major**—The major version number of the template.
    - **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format Major.Minor.
  6. Click OK.

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Create AppExpert Template.
3. Perform steps 4 through 6 described in **To export a content switching configuration to an application template file from the Content Switching Visualizer** procedure.

## Creating Variables in Application Templates

September 21, 2020

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```
1 HTTP.REQ.HEADER("Host").CONTAINS("server1")
2 <!--NeedCopy-->
```

If you want the server name to be configurable at import time, you can specify the string “server1” as a variable. When importing the template, you can specify a new value for the variable on the Variables tab.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

In the export application template wizard, you can define variables in certain fields (fields with an adjacent  button) for the following entities:

- Cache policies
- Rewrite policies
- Rewrite actions
- Responder policies
- Responder actions

To configure a variable in a policy expression or action by using the GUI:

1. Navigate to **AppExpert > Variables**.
2. In the **Variables** page, click **Add**.
3. In the **Create Variables** page, set the following parameters.

Name. Name of the variable.

Scope. Select the scope as Global or transaction.

Type. Select the variable type as text, ulong, map.

Expires in. Enter the expiry date.

If Full\*. Action to perform if an assignment to a map exceeds its configured max-entries:

lru - (default) reuse the least recently used entry in the map.

undef - force the assignment to return an undefined (Undef) result to the policy executing the assignment.

Possible values: undef, lru

Default value: lru.

if no value. Value expiration in seconds. If the value is not referenced within the expiration period it will be deleted. 0 (the default) means no expiration. Minimum value: 0, Maximum value: 31622400

Init Value. Initialization value for this variable, to which a singleton variable or map entry will be set if it is referenced before an assignment action has assigned it a value. If the singleton variable or map entry already has been assigned a value, setting this parameter will have no effect on that variable value. Default: 0 for ulong, NULL for text Maximum Length: 127

Comments. A brief description about the variable.

4. Click **Close**.

## Uploading and Downloading Template Files

September 21, 2020

Template files can be uploaded from your local computer to the Citrix ADC appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is `/nsconfig/nstemplates/applications/`.

To upload an AppExpert application template from your local computer to the Citrix ADC appliance:

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click Application Templates, and then click Upload.
4. In the Upload Application Template dialog box, browse to the directory in which the template file is stored, click the template file, and then click Select.

The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the Citrix ADC appliance to your local computer:

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click the AppExpert application template that you want to download, and click Download.
4. In the Download Application Template dialog box, browse to the location to which you want to save the file, and then click Save.

## Understanding Citrix ADC Application Templates and Deployment Files

September 21, 2020

When you export a Citrix ADC application, the following two files are automatically created:

- **Citrix ADC application template file.** Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file.** Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In a template file or deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the `<appendpoint>` and `</appendpoint>` tags, and all the endpoint elements are encapsulated within the `<appendpoint_list>` and `</appendpoint_list>` tags.

**Note:** After you export a Citrix ADC application, you can add elements, remove elements, and modify existing elements before importing the application to a Citrix ADC appliance.

### Example of a Citrix ADC Application Template

Following is an example of a template file that was created from a Citrix ADC application called **SharePoint\_Team\_Site**:

```
1 <?xml version="1.0" encoding="UTF-8" ?>
2 <template>
3 <template_info>
4   <application_name>SharePoint_Team_Site</application_name>
5   <templateversion_major>1</templateversion_major>
6   <templateversion_minor>1</templateversion_minor>
7   <author>Ed</author>
8   <introduction>An application for managing a SharePoint team site
9     with images, reports, and, XML content.</introduction>
10  <summary>This template includes variables</summary>
11  <version_major>9</version_major>
12  <version_minor>3</version_minor>
13  <build_number>38</build_number>
14 </template_info>
15 <apptemplate>
16   <rewrite>
17     <rewriteaction_list>
18       <rewriteaction>
19         <name>Rw_name</name>
```

```
19         <type>replace</type>
20         <target>HTTP.REQ.BODY(10000).AFTER_REGEX(re/number/).
           BEFORE_REGEX(re/address/)</target>
21         <stringbuilderexpr>"NA"</stringbuilderexpr>
22         <allow_unsafe_pi1>N0</allow_unsafe_pi1>
23     </rewriteaction>
24     <rewriteaction>
25         .
26         .
27         .
28     </rewriteaction>
29     .
30     .
31     .
32 </rewriteaction_list>
33 <rewritepolicy_list>
34     <rewritepolicy>
35         <name>Rw_number_NA</name>
36         <rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
37         <action>Rw_name</action>
38     </rewritepolicy>
39     <rewritepolicy>
40         .
41         .
42         .
43     </rewritepolicy>
44     .
45     .
46     .
47 </rewritepolicy_list>
48 </rewrite>
49 <appunit_list>
50     <appunit>
51         <name>SharePoint_Team_Sitedefault</name>
52         <rule />
53         <expressiontype>PE</expressiontype>
54         <servicetype>HTTP</servicetype>
55         <ipv46>0.0.0.0</ipv46>
56         <ipmask>*</ipmask>
57         <port>0</port>
58         <range>1</range>
59         <persistencetype>NONE</persistencetype>
60         <timeout>2</timeout>
61         <persistencebackup>NONE</persistencebackup>
62         <backuppersistencetimeout>2</backuppersistencetimeout>
```

```
63     <lbmethod>LEASTCONNECTION</lbmethod>
64     <persistmask>255.255.255.255</persistmask>
65     <v6persistmasklen>128</v6persistmasklen>
66     <pq>OFF</pq>
67     <sc>OFF</sc>
68     <m>IP</m>
69     <datalength>0</datalength>
70     <dataoffset>0</dataoffset>
71     <sessionless>DISABLED</sessionless>
72     <state>ENABLED</state>
73     <connfailover>DISABLED</connfailover>
74     <clttimeout>180</clttimeout>
75     <somethod>NONE</somethod>
76     <so Persistence>DISABLED</so Persistence>
77     <redirectportrewrite>DISABLED</redirectportrewrite>
78     <downstateflush>DISABLED</downstateflush>
79     <gt2gb>DISABLED</gt2gb>
80     <ipmapping>0.0.0.0</ipmapping>
81     <disableprimaryondown>DISABLED</disableprimaryondown>
82     <insertvserveripport>OFF</insertvserveripport>
83     <authentication>OFF</authentication>
84     <authn401>OFF</authn401>
85     <push>DISABLED</push>
86     <pushlabel>none</pushlabel>
87     <l2conn>OFF</l2conn>
88 </appunit>
89 <appunit>
90     .
91     .
92     .
93 </appunit>
94 .
95 .
96 .
97 </appunit_list>
98 </apptemplate>
99 <parameters>
100     <property_list>
101         <property>
102             <variable_definition_list>
103                 <variable_definition>
104                     <name>body_size</name>
105                     <defaultvalue>10000</defaultvalue>
106                     <description>Evaluation Scope</description>
107                     <startindex>14</startindex>
```

```

108         <length>5</length>
109     </variable_definition>
110     .
111     .
112     .
113 </variable_definition_list>
114 <object_type>rewriteaction</object_type>
115 <object_name>Rw_name</object_name>
116 <name>target</name>
117 </property>
118     .
119     .
120     .
121 </property_list>
122 </parameters>
123 </template>
124 <!--NeedCopy-->

```

### Example of a Deployment File

Following is the deployment file associated with the **SharePoint\_Team\_Site** application in the preceding example:

```

1 <?xml version="1.0" encoding="UTF8" ?>
2 <template_deployment>
3     <template_info>
4         <application_name>SharePoint_Team_Site</application_name>
5         <templateversion_major>1</templateversion_major>
6         <templateversion_minor>1</templateversion_minor>
7         <author>Ed</author>
8         <introduction>An application for managing a SharePoint team site
9             with images, reports, and, XML content.</introduction>
10        <summary>This template includes variables</summary>
11        <version_major>9</version_major>
12        <version_minor>3</version_minor>
13        <build_number>38</build_number>
14    </template_info>
15    <appendpoint_list>
16        <appendpoint>
17            <ipv46>10.111.111.1</ipv46>
18            <port>80</port>
19            <servicetype>HTTP</servicetype>
20        </appendpoint>
21    </appendpoint_list>

```

```
21 <service_list>
22   <service>
23     <ip>10.102.29.5</ip>
24     <port>80</port>
25     <servicetype>HTTP</servicetype>
26   </service>
27   <service>
28     .
29     .
30     .
31   </service>
32   .
33   .
34   .
35 </service_list>
36 <variable_list>
37   <variable>
38     <name>body_size</name>
39     <description>Evaluation Scope</description>
40     <value>10000</value>
41   </variable>
42   <variable>
43     .
44     .
45     .
46   </variable>
47   .
48   .
49   .
50 </variable_list>
51 </template_deployment>
52 <!--NeedCopy-->
```

## Deleting a Template File

September 21, 2020

If you no longer need an application template and its configuration, you can delete it. When you delete a template, the template XML file that is stored in the application template directory gets deleted. When you delete a template file, you are prompted to confirm the deletion. Click **Yes** to confirm and delete the selected file from the directory.

To delete a template file from the application template directory by using the GUI:

1. Navigate to **AppExpert > Applications** and then click **Manage Template**. Select a file from **Template Files** tab page or **Deployment Files** tab page and click **Delete**.

## Citrix gateway applications

September 21, 2020

When you configure an AppExpert application to manage a web application through the Citrix® Citrix ADC® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure Citrix Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure Citrix Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the Citrix Gateway home page.

You can configure the entities in the Citrix Gateway Applications feature only by using the GUI.

### How an Citrix Gateway application works

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application's configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The Citrix ADC appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application's public endpoint is first evaluated against the Citrix Gateway policies and then evaluated against the policies configured for AppExpert application's application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure Citrix Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the Citrix Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

### **How a Citrix ADC configuration for a file share works**

On the Citrix ADC appliance, you can configure Authorization policies for a file share that is hosted on your organization's network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The Citrix ADC configuration for a file share cannot be saved in AppExpert application templates.

### **How a Citrix ADC configuration for an intranet subnet works**

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the Citrix ADC appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet's IP address and netmask, respectively.

The Citrix ADC configuration for an intranet subnet cannot be saved in AppExpert application templates.

### **How other resources category works**

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the Citrix ADC appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The Citrix ADC appliance applies the configured Citrix Gateway policies to any requests that match the configured rule.

The Citrix ADC configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

## Entity naming conventions

The Citrix Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (\_). The name that you provide for the entity is appended to this string. If the name of a subnet is “subnet1,” the name of the profile begins with “subnet1\_.” When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

## Adding intranet subnets

September 21, 2020

You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
  - To add an intranet subnet, click **Intranet Subnets**, and then click **Add**.
  - To modify an intranet subnet, click an intranet subnet, and then click **Open**.
3. In the **Create Intranet Subnet** or **Configure Intranet Subnet** dialog box, do the following:
  - a) In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
  - b) In the IP Address box, type the IP address of the intranet subnet.
  - c) In the Netmask box, type the netmask that will be used for the intranet subnet.
  - d) Click **Create** or **OK**, and then click **Close**.

## Adding other resources

September 21, 2020

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see the .

To configure a resource in other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, do one of the following:
  - To add a resource, click **Other Resources**, and then click **Add**.
  - To modify a resource, click a resource, and then click **Open**.
3. In the **Create Resource** or **Configure Resource** dialog box, do the following:
  - a) In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
  - b) In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.  
Alternatively, click **Configure**, and then create the rule in the **Create Expression** dialog box.
  - c) Click **Create** or **OK**, and then click **Close**.

## Configuring authorization policies

September 21, 2020

You can configure Citrix Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:
  - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the <application name> tree. Then, right-click the user or group and click **Allow**.
  - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the <application name> tree, right-click Users or Groups, and then click **Add**. In the Create **AAA Group** or **Create AAA User** dialog box, fill in the values, click **Create**, and then click **Close**.  
The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click **Close**.

## Configuring traffic policies

September 21, 2020

The traffic policies that you configure for the resources in the Citrix Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application timeout, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:
  - To specify an existing traffic policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
  - To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (\_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.  
For more information about configuring a traffic policy or profile, see [Citrix Gateway](#).
  - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click **Modify Profile**.
  - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
  - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
  - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

## Configuring clientless access policies

September 21, 2020

Clientless access, when configured for a resource on the Citrix ADC appliance, allows end-users to access the resource without using the Citrix Gateway client software. Users can use web browsers

to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the Citrix Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the **Configure Clientless Access Policies** dialog box, do the following:
  - To specify an existing clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
  - To configure a new clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**. In the **Create Clientless Access Policy** dialog box, in the Name box, after the underscore (\_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click **Modify** to modify the profile.  
For more information about configuring a clientless access policy or profile, see [Citrix Gateway](#).
  - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
  - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
  - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

## Configuring TCP compression policies

March 16, 2021

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see [Citrix Gateway](#).

To configure a TCP compression policy for a resource in the Citrix Gateway Applications node

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applica-**

**tions.**

2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the **Configure TCP Compression Policies** dialog box, do the following:
  - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
  - To create a new TCP compression policy, click **Insert Policy**, and then, in the Policy Name column, click **New Policy**. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore (“\_”), type a name for the policy. Then, in Action, either select an existing action or click **New** and configure a new action. You can also click **View** to view the configured compression type.  
For more information about configuring a TCP compression policy or action, see Citrix Gateway , Advanced Edition at [Citrix Gateway](#).
  - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**.
  - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
  - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
  - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

## Configure bookmarks

October 23, 2020

You can configure bookmarks for internal applications or resources that are available for an entitled user. You can then bind the bookmark to a user, user group or virtual server globally and enable it for the user in the Access Interface. The bookmark links that you create appear on the websites panes under enterprise websites.

For more information, see [Creating and Applying Web Links](#) topic.

## AppQoE

March 23, 2021

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the Citrix ADC appliance into a single integrated feature that takes advantage of a new queuing

mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle the queuing of all requests to a website or application as one group before load balancing, instead of as separate streams after load balancing.

The features that are integrated into AppQoE are HTTP Denial-of-Service Protection (HDOSP), and Priority Queuing (PQ). Collectively these services provide protection against a number of problems:

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected website or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections til the server can accept them. The Priority Queuing feature ensures that whoever most needs access to a resource is provided access without having to wait behind other lower-priority requests. The AppQoE feature displays an alternate web page that notifies users that the resource that they requested is not available.
- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection, and Priority Queuing features help manage DOS attacks in addition to other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your websites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the Citrix ADC operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the Citrix ADC appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has a number of advantages, some of which are listed below:

- Absolute priority of connections as configured in the priority queuing feature can be maintained.
- Connections are not flushed if a service transitions state, as they are in a service-level queue.
- During periods of high load, such as a denial-of-service attack, and HTTP DoS come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

## Enabling AppQoE

September 21, 2020

To configure AppQoE, you must first enable the feature.

### To enable AppQoE by using the command line

At the command prompt, type the following commands:

- enable ns feature appqoe
- show ns feature

#### Example:

```
1 > enable ns feature appqoe
2 Done
3 > show ns feature
4
5         Feature                               Acronym           Status
6         -----                               -
```

|        |                  |        |    |
|--------|------------------|--------|----|
| 7 1)   | Web Logging      | WL     | ON |
| 8 2)   | Surge Protection | SP     | ON |
| 9 3)   | Load Balancing   | LB     | ON |
| 10 ... |                  |        |    |
| 11 1)  | AppQoE           | AppQoE | ON |

```
12 Done
13 <!--NeedCopy-->
```

### To enable AppQoE by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

## AppQOE actions

September 21, 2020

After enabling the AppQoE feature, you must configure one or more actions for handling request.

**Important:** No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

## To configure an AppQoE action by using the command line

At the command prompt, type the following commands:

- `add appqoe action <name> [-priority <priority>] [-respondWith (ACS|NS)[<customfile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction ( **SimpleResponse** | **HICResponse** )]`
- `show appqoe action`

### Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```

1 > add appqoe action appqoe-act-basic-prhigh -priority HIGH
2   Done
3
4 > add appqoe action appqoe-act-basic-prmedium -priority MEDIUM -
   polqDepth 10
5   Done
6
7 > add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth
   1000
8   Done
9
10 > show appqoe action
11 1)      Name: appqoe-act-basic-prhigh
12        ActionType: PRIORITY_QUEUING
13        Priority: HIGH
14        PolicyQdepth: 0
15        Qdepth: 0
16
17 2)      Name: appqoe-act-basic-prmedium
18        ActionType: PRIORITY_QUEUING
19        Priority: MEDIUM
20        PolicyQdepth: 10
21        Qdepth: 0
22
23 3)      Name: appqoe-act-basic-prlow
24        ActionType: PRIORITY_QUEUING

```

```
25      Priority: LOW
26      PolicyQdepth: 1000
27      Qdepth: 0
28 Done
29 <!--NeedCopy-->
```

## To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- `set appqoe action <name> [-priority <priority>] [-altContentSvcName <string>] [-altContentPath <string>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-maxConn <positive_integer>] [-delay <usecs>] [-dosTrigExpression <expression>] [-dosAction ( SimpleResponse | HICResponse )]`
- `show appqoe action`

## To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- `rm appqoe action <name>`
- `show appqoe action`

## Parameters for configuring an AppQoE action

- name

A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) symbols.

- priority

The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:

1. **HIGH.** Fulfills the request as soon as resources are available.
2. **MEDIUM.** Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
3. **LOW.** Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
4. **LOWEST.** Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the Citrix ADC appliance assigns the request to the LOWEST priority queue by default.

- **respondWith**

Configures the Citrix ADC to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:

- **ACS:** Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
- **NS:** Serves a built-in response from the Citrix ADC. Threshold: maxConn (maximum connections) or delay.
- **NO ACTION:** Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.

- **altContentSvcName**

If

-responseWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

- **altContentPath**

|                        |                                                         |
|------------------------|---------------------------------------------------------|
| If -responseWith ( ACS | NS ) is specified, the path to the alternative content. |
|------------------------|---------------------------------------------------------|

- **olqDepth**

Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

- **priqDepth**

Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294

- **maxConn**

The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294

- **delay**

The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the Citrix ADC appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999

- dosTrigExpression

Adds an optional second-level check to trigger DoS actions.

- dosAction

Action to take when the appliance determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client's response and verify that the client seems to be genuine. When sending a challenge, a Citrix ADC appliance generates two cookies:

Header cookie (\_DOSQ). Contains client-specific information, so that the Citrix ADC appliance can verify the response.

Body cookie (\_DOSH). Information used to validate the client machine. The client's browser (or the user, in the case of HIC) computes a value for this cookie. The Citrix ADC appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the \_DOSH value is based on the DoS Action configuration.

1. SimpleResponse: In this case, a Citrix ADC appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.
2. HICResponse: in this case, a Citrix ADC appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

Limitations:

1. This is not a trivial CAPTCHA implementation, which is why that term not used.
2. The validation number is based on a Citrix ADC-generated number that does not change for 120s. This number should be dynamic or client specific.

### **To configure an AppQoE action by using the configuration utility**

1. Navigate to **App-Expert > AppQoE > Actions**.

2. In the details pane, do one of the following:
  - To create a new action, click **Add**.
  - To modify an existing action, select the action, and then click **Edit**.
3. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
  - Name—name
  - Action type—respondWith
  - Priority—priority
  - Policy Queue Depth—polqDepth
  - Queue Depth—priqDepth
  - DOS Action—dosAction
4. Click **Create** or **OK**.

## AppQoE parameters

September 21, 2020

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

### To configure the AppQoE parameter settings by using the command line

At the command prompt, type the following commands:

- `set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]`
- `show appqoe parameter`

### Parameters for configuring the AppQoE parameters

- sessionLife

Number of seconds to wait after displaying alternate content before the appliance displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- avgwaitingclient

The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

- MaxAltRespBandWidth

The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the appliance quits sending the alternate content til bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

- dosAtckThrsh

The denial-of-service attack threshold. The number of connections that must be waiting in queues before the appliance responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

## To configure the AppQoE parameter settings by using the GUI

1. Navigate to **AppExpert > AppQoE**.
2. In the details pane, click **Configure AppQoE Parameters**.
3. In the **Configure AppQoE params** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Parameters” as follows (asterisk indicates a required parameter):
  - Session Life (secs)
  - sessionLife
  - Average waiting client—avgwaitingclient
  - Alternate Response Bandwidth Limit(Mbps) —MaxAltRespBandWidth
  - DOS Attack Threshold —dosAttackThresh
4. Click **OK**.

## AppQoE policies

September 21, 2020

To implement AppQoE, you must configure at least one policy to tell your Citrix ADC how to distinguish the connections to be queued in a specific queue.

## To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

```
add appqoe policy <name> -rule <expression> -action <string>
```

**Example:**

The following example selects requests with a User-Agent header that contains “Android”, and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
1 > add appqoe action appqoe-act-primd -priority MEDIUM
2 Done
3 > add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER("User-Agent
   ").CONTAINS("Android")" -action appqoe-act-primd
4 Done
5 > sh appqoe policy appqoe-pol-primd
6     Name: appqoe-pol-primd
7     Rule: HTTP.REQ.HEADER("User-Agent").CONTAINS("Android")
8     Action: appqoe-act-primd
9     Hits: 0
10
11 Done
12 <!--NeedCopy-->
```

**Parameters for configuring an AppQoE policy**

- name. A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore ( ) symbols. You should chose a name that helps identify the type of action.
- rule. A Citrix ADC expression that tells the appliance which connections it should handle.
- action. The AppQoE action to perform when a connection matches the policy.

**To configure an AppQoE policy by using the configuration utility**

1. Navigate to **App-Expert > AppQoE > Policies**.
2. In the details pane, do one of the following:
  - To create a new policy, click **Add**.
  - To modify an existing policy, select the policy, and then click **Edit**.
3. If you are creating a new policy, in the **Create AppQoE Policy** dialog, in the Name text box, type a name for your new policy.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore ( ) symbols. You should chose a name that helps identify the purpose and effect of this policy.

If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the **Action** drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the **Add AppQoE Action** dialog and add a new action.
5. In the **Rule** text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
  - a) In the **Create Expression** dialog box, click **Add**.
  - b) In the Add Expression dialog box, select a common expression from the Frequently Used Expressions drop-down list, or use the Construct Expression drop-down lists to create the expression that defines which traffic to filter.

If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:

- HTTP: All traffic to port 80 and port 443.
- SYS:
- CLIENT:
- SERVER:
- ANALYTICS:
- TEXT:

The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices; the lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.

- c) When you have created the expression that you want, click **OK**. The expression is added in the Expression text box.
6. Click **Create**. The expression appears in the **Rule** text box.

## Entity template for load balancing virtual server

September 21, 2020

An entity template is a collection of information for creating a load balancing virtual server template on a Citrix ADC appliance. It provides a specification and a set of defaults to be configured for a load balancing virtual server. By using a template that defines a set of defaults, you can quickly configure

multiple virtual servers that require a similar configuration while eliminating several configuration steps.

You can create an entity template by exporting the load balancing virtual server details to a template file. This can be done only through the Citrix ADC GUI. You use the Citrix ADC GUI to export, import, and manage entity templates. You can share entity templates with other administrators and manage templates saved locally on your appliance or machine. You can also import entity templates from the appliance or your local computer.

Before creating a template, you should be familiar with the configuration of the load balancing virtual server.

### **Load balancing virtual server template**

Load balancing entity templates are created in the same way that Citrix ADC application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:

- Load balancing virtual server template file. Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- Deployment file. Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, `lbMethod`, is encapsulated within the `<lbmethod>` and `</lbmethod>` tags.

#### **Note:**

After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a Citrix ADC appliance.

### **How a load balancing virtual server template works**

When you create a template for a load balancing virtual server, you specify default values for the server. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the template to a Citrix ADC appliance, the GUI guides the user through the various pages that you configured for the template. The GUI displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions, the appliance creates the entity with the configured values.

You can create or modify an entity template for a load balancing virtual server from Traffic Management node.

To export virtual server details to a template, you must specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

For example, when you are creating a load balancing virtual server template, you can specify the policies that you want to bind to the virtual server that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another Citrix ADC appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exists on the target appliance, they are bound to the entity that is created from the template.

When you export a template for the load balancing virtual server, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

### **Configure variables in load balancing virtual server template**

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the accept-language header in an HTTP request.

```
HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")
```

If you want the value of the header to be configurable at import time, you can specify the string en-us as a variable.

After you create a variable, you can do the following:

- Assign more strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable

### To configure variables in a load balancing virtual server template

Complete the following procedure to configure variables for a load balancing virtual server template by using the Citrix ADC GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click **Add**.
3. In the **Create Load balancing Virtual Server** page, set the virtual server parameters. For more information on configuring a load balancing virtual server, see [How load balancing works](https://en-us/citrix-adc/current-release/load-balancing/load-balancing-how-it-works.html)[(/en-us/citrix-adc/current-release/load-balancing/load-balancing-how-it-works.html)]
4. Once you have the set the parameters for the load balancing virtual server, click **Done**.

| Services and Service Groups                           |   |
|-------------------------------------------------------|---|
| No Load Balancing Virtual Server Service Binding      | > |
| No Load Balancing Virtual Server ServiceGroup Binding | > |

5. Click **Export as Template** link at the top to export the server details as a template file.
6. In the **Create Load Balancing Template** page, enter the template settings.
7. Click **Done**.

The screenshot shows a web interface for managing load balancing templates. At the top, there is a header 'Load Balancing Template'. Below it, a section titled 'Exported Load Balancing Template' contains a 'Template Filename' field with the value 'testing'. A blue 'Done' button is located at the bottom of this section.

### Modify a load balancing virtual server template

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The Citrix ADC appliance does not provide you with the option of modifying a load balancing virtual server template.

To modify a load balancing virtual server by using Citrix ADC GUI

1. Navigate to **Traffic Management > Load balancing > Virtual Servers**.
2. In the **Load Balancing Virtual Server** page, modify the entity parameters.
3. Click Done.
4. Click **Export as a Template** link.
5. The modified changes are now available in the load balancing virtual server template file.
6. In the **Exported Load Balancing Template** page, click **Done**.

### Manage load balancing virtual server templates

You can organize load balancing virtual server template files and deployment files by using the Citrix ADC GUI.

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the **Virtual Servers** page, select **Manage Template action**.
3. In the **Load Balancing Templates** page, click **Template File** tab.
4. In the **Template Files** tab page, you can upload or download a template from and to the appliance template folder.

**Example of load balancing virtual server template and deployment template**

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip”:

```

1 COPY
2
3 <?xml version="1.0" encoding="UTF-8" ?>
4 <template>
5   <template_info>
6     <entity_name>Lbvip</entity_name>
7     <version_major>10</version_major>
8     <version_minor>0</version_minor>
9     <build_number>40.406</build_number>
10  </template_info>
11  <entitytemplate>
12    <lbvserver_list>
13      <lbvserver>
14        <name>Lbvip</name>
15        <servicetype>HTTP</servicetype>
16        <ipv46>0.0.0.0</ipv46>
17        <ipmask>*</ipmask>
18        <port>0</port>
19        <range>1</range>
20        <persistencetype>NONE</persistencetype>
21        <timeout>2</timeout>
22        <persistencebackup>NONE</persistencebackup>
23        <backuppersistencetimeout>2</backuppersistencetimeout>
24        <lbmethod>LEASTCONNECTION</lbmethod>

```

```
25     <persistmask>255.255.255.255</persistmask>
26     <v6persistmasklen>128</v6persistmasklen>
27     <pq>OFF</pq>
28     <sc>OFF</sc>
29     <m>IP</m>
30     <datalength>0</datalength>
31     <dataoffset>0</dataoffset>
32     <sessionless>DISABLED</sessionless>
33     <state>ENABLED</state>
34     <connfailover>DISABLED</connfailover>
35     <clttimeout>180</clttimeout>
36     <somethod>NONE</somethod>
37     <sopersistence>DISABLED</sopersistence>

## HTTP callouts

September 21, 2020

For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP or HTTPS request that the Citrix ADC appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by default syntax policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the *HTTP callout agent*, must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the Citrix ADC appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the Citrix ADC appliance. Finally, to invoke the callout, you include the callout in a default syntax policy in the appropriate Citrix ADC feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

## How an HTTP callout works

October 14, 2020

When the Citrix ADC appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, `SYS.HTTP_CALLOUT(<name>)`, it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the

HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.

The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the Citrix ADC appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client's IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client's IP address is listed, and sends a response that the Citrix ADC appliance evaluates. If the response indicates that the client's IP address is not blacklisted, the appliance forwards the request to the configured service. If the client's IP address is blacklisted, the appliance resets the client connection

Figure 1. HTTP Callout Entity Model

- 1: Client request
- 2: HTTP callout request to check whether the client is blacklisted
- 3: Response from HTTP callout agent
- 4: Request forwarded to service if 3 indicates a safe IP address
- 5: Connection RESET if 3 indicates a bad IP address

## Notes on the format of HTTP requests and responses

September 21, 2020

The Citrix ADC appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the

format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request
- Format of an HTTP Response

### Format of an HTTP Request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either `<CR><LF>` or `\r\n`.

The first line of a request (the *message line*) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
1 GET /mysite/mydirectory/index.html HTTP/1.1\r\n
2 <!--NeedCopy-->
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a blank line (an extra `<CR><LF>` or `\r\n`).

Following is an example of a request:

```
1 Get /mysite/index.html HTTP/1.1\r\n
2 Host: 10.101.101.10\r\n
3 Accept: */*\r\n
4 \r\n
5 <!--NeedCopy-->
```

### Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

```
1 HTTP/1.1 200 OK\r\n
2 Content-Length: 55\r\n
3 Content-Type: text/html\r\n
4 Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT\r\n
5 Accept-Ranges: bytes\r\n
6 ETag: "04f97692cbd1:377" \r\n
```

```

7 Date: Thu, 19 Jun 2008 19:29:07 GMT\r\n
8 \r\n
9 <55-character response>
10 <!--NeedCopy-->

```

## Configuring an HTTP callout

August 13, 2021

When configuring an HTTP callout, you specify the type of request (HTTP or HTTPS), destination, and format of the request. The expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent. Or engage a load balancing, content switching, or cache redirection virtual server, to manage the HTTP callout requests.

In the first case, the HTTP callout requests are sent directly to the HTTP callout agent. In the second case, the HTTP callout requests are sent to the virtual IP address (VIP) of the specified virtual server. The virtual server processes the request in the same way as it processes a client request. For example, if you expect many callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as an advanced policy expression (an expression-based HTTP callout).

The following table describes the elements in an HTTP callout policy:

For more information, see [policy-httpCallout](#)

| Parameter                                                                                  | Description                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                                                       | Name of the callout, 127 character maximum                                                                                                                                                                                                                                    |
| IP address and port ( <i>ip-address / port</i> ) or Virtual server name ( <i>vserver</i> ) | IPv4 or IPv6 address of the server to which the callout is sent, or a wildcard, and the port on the server to which the callout is sent, or a wildcard. Or, the name of a load balancing, content switching, or cache redirection virtual server with a service type of HTTP. |

| Parameter                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP Method (httpMethod)                                     | HTTP Method (httpMethod). Method used in the HTTP request that this callout sends. Valid values: GET or POST. Default: GET.                                                                                                                                                                                                                                                                                                        |
| Host expression (hostExpr)                                   | Host expression (hostExpr). Advanced text expression to configure the Host header. Maximum length: 255. The expression can be a literal value or it can be an advanced expression that derives the value. Examples: "10.101.10.11" , "http.req.header("Host")"                                                                                                                                                                     |
| URL stem expression (urlStemExpr)                            | URL stem expression (urlStemExpr) An advanced string expression for generating the URL stem. Maximum length: 8191. The expression can be a literal string or an expression that derives the value. Examples: ""/mysite/index.html"" "http.req.url"                                                                                                                                                                                 |
| HTTP Headers (headers)                                       | HTTP Headers (headers). Advanced text expression to insert HTTP headers and their values in the HTTP callout request. Specify a value for every header. You specify the header name as a string and the header value as an advanced expression. Specify the headers separated by space. Such as -headers cip(client.ip.src) hdr(http.req.header("HDR")). The number of headers can be 8                                            |
| Expression-based request to send to the server (fullReqExpr) | Exact HTTP request that the Citrix ADC is to send as an advanced expression to 8191 characters. If you specify this parameter, you must omit the httpMethod, hostExpr, urlStemExpr, headers, and parameters arguments. The request expression is constrained by the feature where the callout is used. For example, an HTTP.RES expression cannot be used in a request-time policy bank or in a TCP content switching policy bank. |

| Parameter                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expression-based request to send to the server (bodyExpr) | An advanced string expression for generating the body of the request. The expression can contain a literal string or an expression that derives the value (for example, client.ip.src). Mutually exclusive with -fullReqExpr.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Parameters                                                | Advanced expression to insert query parameters in the HTTP request that the callout sends. Specify a value for every parameter that you configure. If the callout request uses the GET method, these parameters are inserted in the URL. If the callout request uses the POST method, these parameters are inserted in the POST body. You configure the query parameter name as a string and the value as an advanced expression. The parameter values are URL encoded. Specify the parameters separated by space like: -parameters name1("name1") name2(http.req.header("hdr")). The maximum 8 parameters can be configured. |
| Return type (returnType)                                  | Type of data that the target application returns in the response to the callout. Valid values:<br>TEXT: Treat the returned value as a text string.<br>NUM: Treat the returned value as a number.<br>BOOL: Treat the returned value as a Boolean value. Note: You cannot change the return type after it is set.                                                                                                                                                                                                                                                                                                               |

| Parameter                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expression to extract data from the response (resultExpr) | Advanced expression that extracts HTTP.RES objects from the response to the HTTP callout. The maximum length is 8191. The operations in this expression must match the return type. For example, if you configure a return type of text, the result expression must be a text-based expression. If the return type is num, the result expression (resultExpr) must return a numeric value similar to the following: "http.res.body(10000).length" Note: Sometimes, if you set a return type of TEXT and the result sent from the server exceeds 16 KB, the result expression can return NULL. For example, when the result is a concatenated string that exceeds 16 KB. |
| Scheme                                                    | The type of scheme for the callout server. Example: HTTP, https                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| cacheForSecs                                              | Duration, in seconds, for which the callout response is cached. The cached responses are stored in an integrated caching content group named "calloutContentGroup". If no duration is configured, the callout responses are not cached unless a normal caching configuration is used to cache them. This parameter takes precedence over any normal caching configuration that would otherwise apply to these responses.                                                                                                                                                                                                                                                |

**Note:** The appliance does not check for the validity of the request. You must make sure that the request is a valid request and doesn't contain any confidential information. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain Citrix ADC features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see [Avoiding HTTP Callout Recursion](#).

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response type can be a Boolean value, a number, or text. Based on this return type only, you can use the further expression methods on the callout response. If the return type is a number, then you can use the number based expression on the callout response. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use `HTTP.RES.BODY(<unit>)` to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the `add` command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout's parameters by using the `set` command. The `set` command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. So, the command-line instructions that follow include a `set` command for configuring an attribute-based callout and a `set` command for configuring an expression-based callout. In the configuration utility, all of these configuration tasks are performed in a single dialog box.

Note: Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change `HTTP.REQ.HEADER("myval")` to `CLIENT.IP.SRC`. You can modify the operators and arguments that are passed to the expression. For example, you can change `HTTP.REQ.HEADER("myVal1")` to `HTTP.REQ.HEADER("myVal2")`, or `HTTP.REQ.HEADER("myVal")` to `HTTP.REQ.HEADER("myVal").AFTER_STR(<string>)`. If the `set` command fails, create an HTTP callout.

HTTP callout configuration involves configuring advanced policy expressions. For more information about configuring advanced policy expressions, see [Configuring advanced policy expression: getting started](#) topic.

## To configure an HTTP callout by using the command line interface

At the command prompt, do the following:

Create an HTTP callout.

```
1 add policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port<
  port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (
  GET | POST )] [-hostExpr <expression>] [-urlStemExpr <expression>]
  [-headers <name(value)> ...] [-parameters <name(value)> ...] [-
  bodyExpr <expression>] [-fullReqExpr <expression>] [-scheme ( http |
  https )] [-resultExpr <expression>] [-cacheForSecs <secs>] [-
  comment <string>]
```

```

2
3 <!--NeedCopy-->

```

**Example:**

```

1 add policy httpCallout mycallout -vserver lbv1 -returnType num -
  httpMethod GET -hostExpr 'http.req.header("Host")'-urlStemExpr "http
  .req.url" -parameters Name("My Name") -headers Name("MyHeader")-
  resultExpr "http.res.body(10000).length"
2
3 <!--NeedCopy-->

```

Modify the HTTP callout configuration.

```

1 set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-port
  <port|*>] [-vServer <string>] [-returnType <returnType>] [-
  httpMethod ( GET | POST )] [-hostExpr <string>] [-urlStemExpr <
  string>] [-headers <name(value)> ...] [-parameters <name(value)>
  ...] [-resultExpr <string>]
2
3 <!--NeedCopy-->

```

**Example:**

```

1 > set policy httpCallout mycallout -vserver lbv1 -returnType num -
  httpMethod GET -hostExpr 'http.req.header("Host")'-urlStemExpr "http
  .req.url" -parameters Name("My Name") -headers Name("MyHeader") -
  resultExpr "http.res.body(10000).length"
2 <!--NeedCopy-->

```

Configure HTTP callout using fullReqExpr parameter.

```

1 set policy httpCallout <name> [-vServer <string>] [-returnType <
  returnType>] [-fullReqExpr <string>] [-resultExpr <string>]
2 <!--NeedCopy-->

```

**Example:**

```

1 > set policy httpCallout mycallout1 -vserver lbv1 -returnType num
  fullReqExpr q{
2 "GET " + http.req.url + "HTTP/" + http.req.version.major + "." + http.
  req.version.minor.sub(1) + "r\nHost:10.101.10.10\r\nAccept: */*\r\n
  \r\n" }
3
4

```

```
5 <!--NeedCopy-->
```

Verify the configurations of the HTTP callout.

```
1 show policy httpCallout `<name>`
2
3 sh policy httpCallout mycallout1
4 > Name: mycallout1
5 >Vserver: lbv1 (UP)
6 Effective Vserver state: UP
7 Return type: TEXT
8 Scheme: HTTP
9 Full REQ expr: "GET " + http.req.url + "HTTP/" + http.req.version.major
  + "." + http.req.version.minor.sub(1)+ "r\nHost:10.101.10.10\r\
  nAccept: */*\r\n\r\n"
10 Result expr: http.res.body(100)
11 Hits: 0
12 Undef Hits: 0
13 Done
14 >
15
16 <!--NeedCopy-->
```

### To configure an HTTP callout by using the configuration utility

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, click **Add**.
3. In the **Create HTTP Callout** dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
4. Click **Create** and then click **Close**.

## Verifying the configuration

September 21, 2020

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the Citrix ADC appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

| Icon                                                                                | Indicates that                                                                                                                                                                                |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.             |
|    | The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE. |
|  | The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.           |

Table 1. Icons That Indicate the States of Entities Bound to an HTTP Callout

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the Citrix ADC appliance sends to the client.

Note: An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion,

see

[Avoiding HTTP Callout Recursion.](#)

## To view the hits counter for an HTTP callout

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the **Details** area.

## Invoking an HTTP Callout

September 21, 2020

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a default syntax policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use default syntax expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the `CONTAINS(<string>)` operator to check whether the specified portion of the response contains a particular string, as in the following example:

```
1 SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
2 <!--NeedCopy-->
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as `GT(int)`. If the response contains a Boolean value, you can use a Boolean operator.

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a default syntax expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see

[Avoiding HTTP Callout Recursion.](#)

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the Citrix ADC appliance is parsing the callout before sending the callout to the callout server, a second set of policies

can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called myCallout1, and then configure a responder policy, Pol1, to invoke myCallout1. Then, you could configure a second HTTP callout, myCallout2, and a responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called "Request1." Pol1 is configured to avoid HTTP callout recursion by using the default syntax expression,

```
1 HTTP.REQ.HEADER("Request1").EQ("Callout Request").NOT.
2 <!--NeedCopy-->
```

Pol2 uses the same default syntax expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the Citrix ADC appliance is parsing it. Note that myCallout2 identifies its own unique header called "Request2," and Pol2 includes a default syntax expression to prevent myCallout2 from invoking itself recursively.

#### Example:

```
1 > add policy httpCallout myCallout1
2
3 Done
4
5 > set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -
  returnType TEXT -hostExpr
6 "10.102.3.95" -urlStemExpr "\/cgi-bin/check_clnt_from_database.pl\"
  " -headers Request1
7 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.
  RES.BODY(100)"
8
9 Done
10
11 > add responder policy Pol1 "HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout
  Request\").NOT &&
12 SYS.HTTP_CALLOUT(myCallout1).CONTAINS(\"IP Matched\")" RESET
13
14 Done
15
16 > bind responder global Pol1 100 END -type OVERRIDE
17
18 Done
19
20 > add policy httpCallout myCallout2
21
```

```
22 Done
23
24 > set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80 -
    returnType TEXT -hostExpr
25 "\"10.102.3.96\"" -urlStemExpr "\/cgi-bin/
    check_clnt_location_from_database.pl\"" -headers Request2
26 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.
    RES.BODY(200)"
27
28 Done
29
30 > add responder policy Pol2 "HTTP.REQ.HEADER(\"Request2\").EQ(\"Callout
    Request\").NOT &&
31 HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\") && SYS.
    HTTP_CALLOUT(myCallout2).CONTAINS
32 (\"APAC\")" RESET
33
34 Done
35
36 > bind responder global Pol2 110 END -type OVERRIDE
37
38 Done
39 <!--NeedCopy-->
```

## Avoiding HTTP callout recursion

September 21, 2020

Even though the Citrix ADC appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful Citrix ADC features (such as integrated caching) to work on the callout request. However, during this parsing, the HTTP callout request can select the same policy and therefore invoke itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF) condition. However, the recursive invocation results in the policy and HTTP callout select counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another default syntax expression in the policy rule. The expression must precede the

`SYS.HTTP_CALLOUT(<name>)` expression so that it is evaluated before the callout expression is evaluated. For example:

```
1 <Expression that prevents callout recursion> OR SYS.HTTP_CALLOUT(<name
  >)
2 <!--NeedCopy-->
```

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the select counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP callout called “myCallout.” The callout generates an HTTP request that checks whether a client’s IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called “Request,” which is set to the value “Callout Request.” A globally bound responder policy, “Pol1,” invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is `HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT`.

**Example:**

```
1 > add policy httpCallout myCallout
2 Done
3
4 > set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -
  returnType TEXT -hostExpr "\"10.102.3.95\"" -urlStemExpr "\/cgi-bin
  /check_clnt_from_database.pl\"" -headers Request("Callout Request")
  -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"
5 Done
6
7 > add responder policy Pol1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout
  Request\").NOT && SYS.HTTP_CALLOUT(myCallout).CONTAINS(\"IP Matched
  \")" RESET
8 Done
9
10 > bind responder global Pol1 100 END -type OVERRIDE
11 Done
12 <!--NeedCopy-->
```

**Note:**

You can also configure an expression to check whether the request URL includes the stem expression configured for the HTTP callout. To implement the solution, ensure the HTTP callout agent can respond only to HTTP callouts and not to other requests directed through the appliance. If

the HTTP callout agent is an application or Web server that serves other client requests, such an expression prevents the appliance from processing those client requests. Instead, use a unique custom header as described earlier..

## Caching HTTP callout responses

September 21, 2020

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named callout-ContentGroup for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

### To set the cache duration by using the command line interface

At the command prompt, type:

```
set policy httpCallout <name> -cacheForSecs <secs>
```

#### Example:

```
1 > set httpcallout httpcallout1 -cacheForSecs 120
2 <!--NeedCopy-->
```

### To set the cache duration by using the configuration utility

1. Navigate to **AppExpert > \*\*HTTP Callouts**.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click **Open**.
3. In the **Configure HTTP Callout** dialog box, specify the **Cache Expiration Time**.
4. Verify that you have entered the correct time duration, and then click **OK**.

## Use Case: Filtering clients by using an IP blacklist

September 21, 2020

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for you organization, or a combination of both.

The Citrix ADC appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the Citrix ADC appliance.
2. Create an HTTP callout on the Citrix ADC appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

## Enabling responder

You must enable responder before you can use it.

### To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the configuration utility, expand AppExpert, and right-click **Responder**, and then click **Enable Responder** feature.

## Creating an HTTP callout on the Citrix ADC appliance

Create an HTTP callout, HTTP\_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#) pdf.

## Configuring a responder policy and binding it globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the Policies sub-node and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

### To create a responder policy and bind it globally by using

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Policy Manager**.

3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, under **Policy Name**, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
  - a) In **Name**, type **PolicyResponder1**.
  - b) In **Action**, select **RESET**.
  - c) In **Undefined-Result Action**, select **Global undefined-result** action.
  - d) In **Expression**, type the following default syntax expression:

```

1  "HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT && SYS.
    HTTP_CALLOUT(HTTP_Callout).CONTAINS("IP Matched)"
2  <!--NeedCopy-->

```

- e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

### Creating an HTTP callout agent on the remote server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the Citrix ADC appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MySQL database.

The following CGI script checks for a given IP address on the callout server.

```

1  #!/usr/bin/perl -w
2  print "Content-type: text/html\n\n";
3      use DBI();
4      use CGI qw(:standard);
5  #Take the Client IP address from the request query
6      my $ip_to_check = param('cip');
7  # Where a MYSQL database is running
8      my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
9  # Database username to connect with
10     my $db_user_name = 'dbuser' ;
11  # Database password to connect with
12     my $db_password = 'dbpassword';
13     my ($id, $password);
14  # Connecting to the database
15     my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
16     my $sth = $dbh->prepare(qq{
17     select * from bad_clnt  }
18 );

```

```
19     $sth->execute();
20     while (my ($ip_in_database) = $sth->fetchrow_array()) {
21
22         chomp($ip_in_database);
23     # Check for IP match
24     if ($ip_in_database eq $ip_to_check) {
25
26         print "\n IP Matched\n";
27
28                                     $sth->finish();
29                                     exit;
30     }
31 }
32
33 print "\n IP Failed\n";
34 $sth->finish();
35 exit;
36 <!--NeedCopy-->
```

## Use Case: ESI support for fetching and updating content dynamically

September 21, 2020

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the Citrix ADC appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the Citrix ADC appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

### Enabling rewrite

Rewrite must be enabled before it is used on the Citrix ADC appliance. The following procedure describes the steps to enable the rewrite feature.

### To enable rewrite by using the GUI

1. Make sure that you have installed the rewrite license.
2. In the configuration utility, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

### Creating an HTTP Callout on the Citrix ADC Appliance

For more information about creating an HTTP callout, see

[Configuring an HTTP Callout](#).

For more information about the parameter values, see [Parameters and Values for HTTP-Callout-2](#) pdf.

### Configuring the Rewrite Action

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

| Parameter                                  | Value                                                                       |
|--------------------------------------------|-----------------------------------------------------------------------------|
| Name                                       | Action-Rewrite-1                                                            |
| Type                                       | Replace                                                                     |
| Expression to choose target text reference | "HTTP.RES.BODY(500).AFTER_STR (\<br><example>").BEFORE_STR (\</example>\")" |
| String expression for replacement text     | "SYS.HTTP_CALLOUT(HTTP-Callout-2)"                                          |

Table 2. Parameters and Values for Action-Rewrite-1

### To configure the rewrite action by using the configuration utility

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, in Name, type **Action-Rewrite-1**.
4. In Type, select **REPLACE**.
5. In **Expression** to choose target text reference, type the following default syntax expression:

```

1  "HTTP.RES.BODY(500).AFTER_STR("<example>").BEFORE_STR("<example>")
   "
2  <!--NeedCopy-->

```

6. In the String expression for replacement text, type the following string expression:

```
1 "SYS.HTTP_CALLOUT(HTTP-Callout-2)"
2 <!--NeedCopy-->
```

7. Click **Create**, and then click **Close**.

## Creating the Rewrite Policy and Binding it Globally

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table. You can create a rewrite policy in the Policies subnode and then bind it globally by using the Rewrite Policy Manager. Alternatively, you can use the Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

| Parameter               | Value                                                 |
|-------------------------|-------------------------------------------------------|
| Name                    | Policy-Rewrite-1                                      |
| Action                  | Action_Rewrite-1                                      |
| Undefined Result Action | -Global undefined-result action-                      |
| Expression              | "HTTP.REQ.HEADER("Name").CONTAINS<br>("Callout").NOT" |

Table 3. Parameters and Values for Policy-Rewrite-1

### To configure a rewrite policy and bind it globally by using the configuration utility

1. Navigate to **AppExpert > Rewrite**.
2. In the details pane, under **Policy Manager**, click **Rewrite Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Rewrite Policy** dialog box, do the following:
  - a) In Name, type Policy-Rewrite-1.
  - b) In Action, select Action-Rewrite-1.
  - c) In Undefined-Result Action, select Global undefined-result action.
  - d) In Expression, type the following default syntax expression:

```
1 "HTTP.REQ.HEADER("Name").CONTAINS("Callout").NOT"
2 <!--NeedCopy-->
```

- e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

## Use Case: Access control and authentication

September 21, 2020

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the Citrix ADC appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the Citrix ADC appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

### Enabling Responder

The responder feature must be enabled before it is used on the Citrix ADC appliance.

#### To enable responder by using the configuration utility

1. Make sure that the responder license is installed.
2. In the configuration utility, expand AppExpert, and right-click Responder, and then click **Enable Responder feature**.

### Creating an HTTP callout on the Citrix ADC appliance

Create an HTTP callout, HTTP-Callout-3, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

Table 1. Parameters and Values for HTTP-Callout-3

Parameter

Value

Name

HTTP-Callout-3

**Server to receive callout request:**

IP Address

10.103.9.95

Port

80

**Request to send to the server:**

Method

GET

Host Expression

10.102.3.95

URL Stem Expression

“/cgi-bin/authenticate.pl”

**Headers:**

Name

Request

Value-expression

Callout Request

**Parameters:**

Name

Username

Value-expression

HTTP.REQ.HEADER(“Username”).VALUE(0)

Name

Password

Value-expression

HTTP.REQ.HEADER(“Password”).VALUE(0)

**Server Response:**

Return Type

TEXT

Expression to extract data from the response

HTTP.RES.BODY(100)

## Creating a Responder Policy to Analyze the Response

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

| Parameter               | Value                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Name                    | Policy-Responder-3                                                                                                                 |
| Action                  | RESET                                                                                                                              |
| Undefined-Result-Action | -Global undefined-result action-                                                                                                   |
| Expression              | “HTTP.REQ.HEADER(\“Request\”).EQ(\“Callout Request\”).NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\“Authentication Failed\”)” |

Table 2. Parameters and Values for Policy-Responder-3

### To create a responder policy and bind it globally by using the configuration utility

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder Policy Manager**.
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
  - a) In Name, type Policy-Responder-3.
  - b) In Action, select **RESET**.
  - c) In Undefined-Result Action , select Global undefined-result action.

d) In the Expression text box, type:

```
1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT &&  
   SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\"Authentication  
   Failed\")"  
2 <!--NeedCopy-->
```

e) Click **Create**, and then click **Close**.

6. Click **Apply Changes**, and then click **Close**.

## Creating an HTTP Callout Agent on the Remote Server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the Citrix ADC appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

### To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the Citrix ADC appliance.

## Use Case: OWA-based spam filtering

September 21, 2020

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the Citrix ADC appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message

is legitimate or spam. In case of spam email, for security reasons, the Citrix ADC appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the Citrix ADC appliance.
2. Create an HTTP callout on the Citrix ADC appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

## Enabling responder

The responder feature must be enabled before it can be used on the Citrix ADC appliance.

### To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the configuration utility, expand AppExpert, and right-click **Responder**, and then click **Enable Responder** feature.

## Creating an HTTP callout on the Citrix ADC appliance

Create an HTTP callout, HTTP-Callout-4, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

For more information, see [Parameters and Values for HTTP-Callout-4](#) pdf.

## Creating a responder action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

| Parameter | Value              |
|-----------|--------------------|
| Name      | Action-Responder-4 |
| Type      | Respond with       |

| Parameter | Value                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Target    | """HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\r\n""" |

Table 2. Parameters and Values for Action-Responder-4

### To create a responder action by using the configuration utility

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, in Name, type **Action-Responder-4**.
4. In Type, click **Respond with**.
5. In Target, type:

```

1  "\"HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By:
   ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\n
   nCache-Control: no-cache\r\n\r\n\""
2  <!--NeedCopy-->

```

6. Click **Create**, and then click **Close**.

### Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word “

*subject*,” invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

| Parameter | Value              |
|-----------|--------------------|
| Name      | Policy-Responder-4 |
| Action    | Action-Responder-4 |

| Parameter               | Value                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------|
| Undefined-Result-Action | -Global undefined-result action-                                                                   |
| Expression              | "HTTP.REQ.BODY(1000).CONTAINS("urn:schemas:httpmail:subject") && SYS.HTTP_CALLOUT(HTTP-Callout-4)" |

### To create a responder policy by using the configuration utility

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder policy** manager.
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
  - a) In Name, type **Policy-Responder-4**.
  - b) In Action, click **Action-Responder-4**.
  - c) In Undefined-Result Action, click **Global undefined-result** action.
  - d) In the **Expression** text box, type:

```

1  "HTTP.REQ.BODY(1000).CONTAINS(\"urn:schemas:httpmail:subject
   \") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"
2  <!--NeedCopy-->

```

- e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

### Creating an HTTP callout agent on the remote server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the Citrix ADC appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

### To identify spam email by using pseudo-code

1. Accept the email subjecta provided by the Citrix ADC appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.

3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the Citrix ADC appliance.

## Use Case: Dynamiccontent switching

September 21, 2020

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

```
1 > add cs vserver cs_vserver1 HTTP 10.102.29.196 80
2 <!--NeedCopy-->
```

2. Create an HTTP callout.

```
1 > add policy httpCallout http_callout1
2 <!--NeedCopy-->
```

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header "X-CLIENT-IP".

```
1 > set policy httpCallout http_callout1 -IPAddress 10.217.14.23 -
  port 80 -returnType TEXT -hostExpr "'www.get-lbvip.com'" -
  urlStemExpr "\"/index.html\"" -headers X-CLIENT-IP(CLIENT.IP.
  SRC) -resultExpr "HTTP.RES.BODY(1000).AFTER_STR(\"<lbvip>\").
  BEFORE_STR("<lbvip")"
2 <!--NeedCopy-->
```

4. Configure the content switching action to retrieve the callout response.

```
1 > add cs action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(
  http_callout1)'
2 <!--NeedCopy-->
```

Note: You must bind a load balancing virtual server to the content switching virtual server to account for:

- The non-availability of the load balancing virtual server that the callout resolves to.
- A UNDEF condition that results from the execution of the callout.

```
1 > bind cs vserver cs_vserver1 -lbvserver default_lbvip
2 <!--NeedCopy-->
```

## 2. Configure the content switching policy.

```
1 ```
2 > add cs policy cs_policy1 -rule true -action cs_action1
3 <!--NeedCopy--> ```
```

## 3. Binding the content switching policy to the content switching virtual server.

```
1 ```
2 > bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10
3 <!--NeedCopy--> ```
```

## Pattern sets and data sets

September 21, 2020

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: `imagetypes {svg, bmp, png, gif, tiff, jpg}`.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

In many cases, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

**Note:**

Pattern sets and data sets can be used only in default syntax policies.

To use pattern sets or data sets, first create the pattern set or data set and bind patterns to it. Then, when you configure a policy for comparing a string in a packet, use an appropriate operator and pass the name of the pattern set or data set as an argument.

## How string matching works with pattern sets and data sets

October 14, 2020

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

**Note:** This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

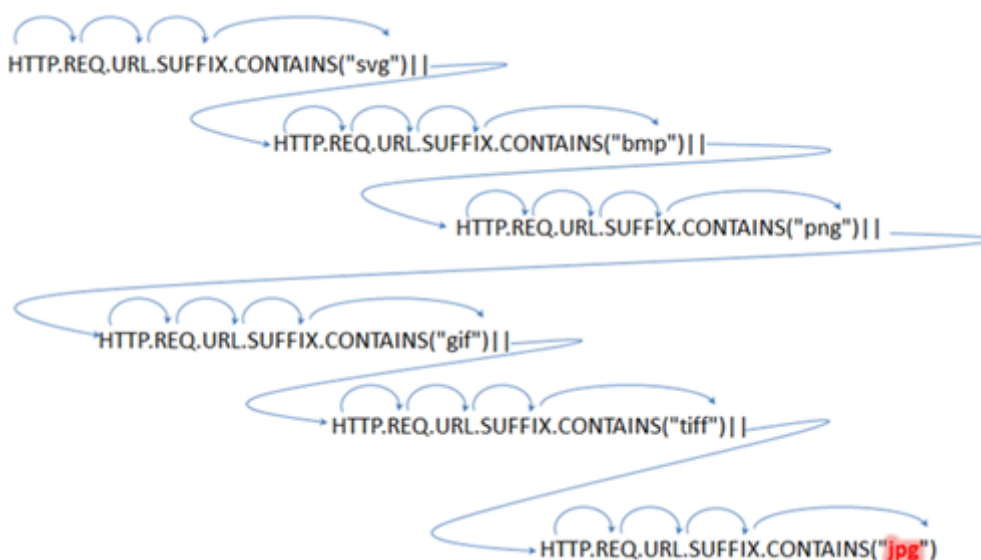

You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```

1 HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("
  bmp") || HTTP.REQ.URL.SUFFIX.CONTAINS("png") ||
2 HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("
  tiff") || HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
3 <!--NeedCopy-->

```

If the URL has a suffix of “jpg,” with the above compound expression, the Citrix ADC appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.

During policy evaluation as shown above, the operator (`CONTAINS_ANY`) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the `Sample_Patset` expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

## Configuring a Pattern Set

April 28, 2021

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

### Points to remember about index values:

- You cannot bind the same index value to more than one pattern.

- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value is 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

### To configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.

```
add policy patset <name>
```

**Example:**

```
1 > add policy patset samplepatset
2 <!--NeedCopy-->
```

2. Bind patterns to the pattern set.

```
bind policy patset <name> <string> [-index <positive_integer>]
```

**Example:**

```
1 > bind policy patset samplepatset product1 -index 1
2 <!--NeedCopy-->
```

**Note:** Repeat this step for all the patterns you want to bind to the pattern set.

3. Verify the configuration.

```
show policy patset <name>
```

### To configure a pattern set by using the configuration utility

1. Navigate to **AppExpert > Pattern Sets**.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.

3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:
  - Treat back slash as escape character—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
  - Index—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
6. Repeat steps 4 and 5 to add more patterns, and then click **Create**.

## Configuring a data set

April 5, 2021

To configure a data set, you must specify the strings that are to serve as patterns, and assign a type (number, IPv4 address, or IPv6 address) to each pattern. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7 layer protocol. It works only on text/string. There are different types of dataset such as num, ulong, ipv4, and ipv6. To use a dataset on IP, we have to convert the input into text/string.

### Note:

Data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

The rules applied for index values of data sets are the same as those applied for pattern sets. For information about index values, see [Configuring a Pattern Set](#).

### To configure a data set by using the command line interface

At the command prompt, do the following:

1. Create a data set.

```
add policy dataset <name> <type>
```

### Example:

```
1 > add policy dataset sampledataset ipv4
2 <!--NeedCopy-->
```

1. Bind patterns to the data set.

```
bind policy dataset <name> <value> [-index <positive_integer>]
```

**Example:**

```
1 > bind policy dataset sampledataset 10.102.29.1 -index 1
2 <!--NeedCopy-->
```

**Note:**

Repeat this step for all the patterns you want to bind to the data set.

1. add policy expression sampleexpression client.ip.src.typecast\_text\_t.equals\_any("sampledataset")
2. Verify the configuration.

```
show policy dataset <name>
```

**To configure a data set by using the configuration utility**

Navigate to **AppExpert > Data Sets**, click **Add** and specify the relevant details.

**Using pattern sets and data sets**

September 21, 2020

Default syntax policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```
1 <text>.<operator>("<name>")
2 <!--NeedCopy-->
```

where,

- <text> is the expression that identifies a string in a packet. Example: HTTP.REQ.HEADER("Host").
- <operator> is one of the operators described in the [Pattern Set Types table](#) pdf.

For sample usage, see [Sample Usage](#).

**Sample usage**

September 21, 2020

To understand the usage of pattern sets in expressions, consider the example of a pattern set named “imagetypes.”

| Patterns | Index value |
|----------|-------------|
| svg      | 1           |
| bmp      | 2           |
| png      | 3           |
| gif      | 4           |
| tiff     | 5           |
| jpg      | 6           |

Table 1. Pattern set “imagetypes”

**Example 1:** Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_ANY(“imagetypes”)`
- **Sample URL.** <http://www.example.com/homepageicon.jpg>
- **Result.** TRUE

**Example 2:** Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set, and return the index of that pattern.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”)`
- **Sample URL.** <http://www.example.com/mylogo.png>
- **Result.** 4 (The index value of the pattern “gif”.)

**Example 3:** Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS_ANY(“imagetypes”).LE(4)`
- **Sample URL.** <http://www.example.com/mylogo.png>
- **Result.** TRUE (The index value of gif file types is 4.)

**Example 4:** Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).LE(3)`
- `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).GE(4)`

## Variables

September 21, 2020

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the Citrix ADC Appliance for internal computation and policy processing.

The Citrix ADC appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: ulong and text (max-size). The ulong type is an unsigned 64-bit integer, the text type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.
- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

map (key\_type, value\_type, max-values).

where,

- *key\_type* is the data type of the key. It is of type text (max-size).

```
1 *value_type* is the data type of the values of the map. It can  
be of type ulong or text (max-size).
```

```
1 *max-values* is the maximum number of entries that the map can  
contain. It is of type ulong.
```

Values for these variables are set using assignments which must be invoked on policy actions.

- **Note:** Variables are not yet supported in a high-availability setup or in a cluster.

### Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.

- **Global Scope Variable** - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a Citrix ADC appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.

- **Transaction Scope Variable** - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the Citrix ADC appliance. When the transaction processing is complete, the transaction variable value is deleted.

**Note:** Transaction scope variables are available in Citrix ADC release 10.5.e or later.

## Configuring and Using Variables

September 21, 2020

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

Note: Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

### To configure variables by using the command line interface

1. Create a variable.

```
1 add ns variable <name> -type <string> [-scope global] [-ifFull ( undef
  | lru )] [-ifValueTooBig ( undef | truncate )] [-ifNoValue ( undef |
  init )] [-init <string>] [-expires <positive_integer>] [-comment <
  string>]
2 <!--NeedCopy-->
```

**Note:** Refer to the man page “man add ns variable” for description of the command parameters.

Example 1: Create a ulong variable named “my\_counter” and initialize it to 1.

```
1 add ns variable my_counter - type ulong -init 1
2 <!--NeedCopy-->
```

Example 2: Create a map named “user\_privilege\_map”. The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.

```
1 add ns variable user_privilege_map -type map(text(15),text(10),10000)
2 <!--NeedCopy-->
```

**Note:** If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```
1 add ns assignment <name> -variable <expression> [-set <expression> | -
  add <expression> | -sub <expression> | -append <expression> | -clear
  ] [-comment <string>]
2 <!--NeedCopy-->
```

Note: A variable is referenced by using the variable selector (\$). Therefore,

**\$variable1** is used to refer to text or ulong variables. Similarly,

**\$variable2[key-expression]** is used to refer to map variables.

Example 1: Define an assignment named “inc\_my\_counter” that automatically adds 1 to the “my\_counter” variable.

```
1 add ns assignment inc_my_counter -variable $my_counter -add 1
2 <!--NeedCopy-->
```

Example 2: Define an assignment named “set\_user\_privilege” that adds to the “user\_privilege\_map” variable an entry for the client’s IP address with the value returned by the “get\_user\_privilege” HTTP callout.

```
1 add ns assignment set_user_privilege -variable $user_privilege_map[
  client.ip.src.typecast_text_t] -set sys.http.callout(
  get_user_privilege)
2 <!--NeedCopy-->
```

**Note:** If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user\_privilege\_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

There are two functions that can operate on map variables.

- **\$name.valueExists(key-expression)**. Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.

- **\$name.valueCount.** Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.

**Example:** Invoke the assignment named “set\_user\_privilege” with a compression policy.

```
1 add cmp policy set_user_privilege_pol -rule $user_privilege_map.
  valueExists(client.ip.src.typecast_text_t).not -resAction
  set_user_privilege
2 <!--NeedCopy-->
```

### Use Case to Insert HTTP header in the Response Side

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```
1 add ns variable http_req_data -type text(100) -scope transaction
2 <!--NeedCopy-->
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```
1 add ns assignment set_http_req_data -variable $http_req_data -set http.
  req.body(100)
2 <!--NeedCopy-->
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```
1 add rewrite action act_ins_header insert_http_header user_name
  $http_req_data.after_str("user_name").before_str("password")
2 <!--NeedCopy-->
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we'll take assignment action and store the data into the ns variable (http\_req\_data)

```
1 add rewrite policy pol_set_variable true set_http_req_data
2
3 bind rewrite global pol_set_variable 10 -type req_DEFAULT
4 <!--NeedCopy-->
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```
1 add rewrite policy pol_ins_header true act_ins_header
2
```

```

3 bind rewrite global pol_ins_header 10 -type res_DEFAULT
4 <!--NeedCopy-->

```

## To configure variables by using the configuration utility

1. Navigate to AppExpert > NS Variables, to create a variable.
2. Navigate to AppExpert > NS Assignments, to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

## Use Case: Caching User Privileges

September 21, 2020

In this use case, user privileges (“GOLD”, “SILVER”, and so on) must be retrieved from an external web service.

### To achieve this use case, perform the following operations

Create an HTTP callout to fetch the user privileges from the external web service.

```

1 add policy httpcallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port <
  port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (
  GET | POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers
  <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <
  string>][-fullReqExpr <string>] [-scheme ( http | https )] [-
  resultExpr <string>] [-cacheForSecs <secs>] [-comment <string>]
2
3 add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -
  port 80 -returnType text -httpMethod GET -hostExpr "/"
  get_user_privilege" -resultExpr 'http.res.body(5)'
4 <!--NeedCopy-->

```

Store the privileges in a variable.

```

1 add ns variable <name> -type <string> [-scope ( global | transaction )
  ][-ifFull ( undef | lru )] [-ifValueTooBig ( undef | truncate )][-
  ifNoValue ( undef | init )] [-init <string>] [-expires <
  positive_integer>] [-comment <string>]
2

```

```

3 add ns variable user_privilege_map -type map(text(15),text(10),10000) -
  expires 1200
4
5 add ns assignment set_user_privilege -variable $user_privilege_map[
  client.ip.src] -set sys.http_callout(get_user_privilege)
6 <!--NeedCopy-->

```

Create a policy to check if there is already a cached entry for the client's IP address; if not, it calls the HTTP callout to set a map entry for the client.

```

1 add cmp policy <name> -rule <expression> -resAction <string>
2
3 add cmp policy set_user_privilege_pol -rule $user_privilege_map.
  valueExists(client.ip.src).not -resAction set_user_privilege>
4 <!--NeedCopy-->

```

Create a policy that compresses if the cached privilege entry for the client is "GOLD".

```

1 add cmp policy <name> -rule <expression> -resAction <string>
2
3 add cmp policy compress_if_gold_privilege_pol -rule '
  $user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
4 <!--NeedCopy-->

```

Bind the compression policies globally.

```

1 bind cmp global <policyName> [-priority <positive_integer>] [-state (
  ENABLED | DISABLED )] [-gotoPriorityExpression <expression>] [-type
  <type>] [-invoke (<labelType> <labelName> ) ]
2
3 bind cmp global set_user_privilege_pol -priority 10 NEXT
4
5 bind cmp global compress_if_gold_privilege_pol -priority 20 END
6 <!--NeedCopy-->

```

## Use Case: Limiting the Number of Sessions
