In this use case, the requirement is to limit the number of active backend sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the backend sets a sessionid cookie with a unique 10 character value.

**To achieve this use case, perform the following operations:**

1. Create a map variable that can store each active session. The key of the map is the sessionid. The expiry time for the variable is set to 600 seconds (10 minutes).

```
1 > add ns variable session_map -type map(text(10),ulong,100) -
    expires 600
2 <!--NeedCopy-->
```

2. Create the following assignments for the map variable:

- Create an entry for the sessionid and set that value to 1 (this value is not actually used).

```
1 > add ns assignment add_session -variable '$session_map[http.
    req.cookie.value("sessionid")] -set 1
2 <!--NeedCopy-->
```

- Deallocate the entry for a session ID, which implicitly decrements the value count for session\_map.

```
1 > add ns assignment delete_session -variable '$session_map[
    http.req.cookie.value("sessionid")] -clear
2 <!--NeedCopy-->
```

3. Create responder policies for the following:

- To check if a map entry exists for that sessionid in the HTTP request. The add\_session assignment is executed if the map entry does not exist.

```
1 > add responder policy add_session_pol 'http.req.url.contains
    ("twbkwbis.P_SabanciLogin") || $session_map.valueExists(
    http.req.cookie.value("netsuis"))' add_session
2 <!--NeedCopy-->
```

**Note:** The

valueExists() function in the

add\_session\_pol policy counts as a reference to the session's map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session's entry will be deallocated.

- To check when the session is logged out. The delete\_session assignment is executed.

```
1 add responder policy delete_session_pol "http.req.url.
    contains(\"Logout\")" delete_session
```

```
2 <!--NeedCopy-->
```

- To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, in order to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.</span>

```
1 add responder action redirect_too_busy redirect "/too_busy.html"
2 add responder policy check_login_pol "http.req.url.contains
  (\\"twbkwbis.P_SabanciLogin\\") && $session_map.valueCount >
  100" redirect_too_busy
3 <!--NeedCopy-->
```

#### 4. Bind the responder policies globally.</span>

```
1 bind responder global add_session_pol 30 next
2 bind responder global delete_session_pol 10
3 bind responder global check_login_pol 20
4 <!--NeedCopy-->
```

## Policies and expressions

July 2, 2021

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the Citrix® Citrix ADC® appliance.

To know about all the advanced policy expressions supported on the Citrix ADC appliance, see [Policy Expressions](#)

|                                          |                                                                                                                          |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|

Configuring  
Advanced  
Policies

Describes the structure of advanced policies and how to configure them individually and as policy banks.

Configuring  
Advanced  
Expressions:  
Getting  
Started

Describes expression syntax and semantics, and briefly introduces how to configure expressions and policies.

Advanced  
Expressions:  
Evaluating  
Text

Describes expressions that you configure when you want to operate on text (for example, the body of an HTTP POST request or the contents of a user certificate).

Advanced Expressions: Working with Dates, Times, and Numbers

Describes expressions that you configure when you want to operate on any type of numeric data (for example, the length of a URL, a client's IP address, or the date and time that an HTTP request was sent).

Advanced Expressions: Parsing HTTP, TCP, and UDP Data

Describes expressions for parsing IP and IPv6 addresses, MAC addresses, and data that is specific to HTTP and TCP traffic.

|                                                                         |                                                                                                                                                                                     |                                                              |                                                                                                                                             |                            |                                                                                                     |

## Introduction to policies and expressions

September 21, 2020

For many Citrix ADC features, policies control how a feature evaluates data, which ultimately determines what the feature does with the data. A policy uses a logical expression, also called a rule, to evaluate requests, responses, or other data, and applies one or more actions determined by the outcome of the evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some Citrix ADC features use default syntax policies, which provide greater capabilities than do the older, classic, policies. If you migrated to a newer release of the Citrix ADC software and have configured classic policies for features that now use default syntax policies, you might have to manually

migrate policies to the default syntax.

This document contains the following details:

- [Classic and Default Syntax Policies](#)
- [Classic and Default Syntax Expressions](#)
- [Converting Classic Expressions to the Newer Default Expression Syntax](#)
- [Before You Proceed](#)

## Classic and advanced policies

September 21, 2020

### Warning

Classic policy expressions are deprecated from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see [Advanced Policies](#)

Classic policies evaluate basic characteristics of traffic and other data. For example, classic policies can identify whether an HTTP request or response contains a particular type of header or URL.

Advanced policies can perform the same type of evaluations as classic policies. In addition, default syntax policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

In addition to assigning a policy an action or profile, you bind the policy to a particular point in the processing associated with the Citrix ADC features. The bind point is one factor that determines when the policy will be evaluated.

### Benefits of using advanced policies

Default syntax policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various Citrix ADC features. With default syntax policies, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the default syntax policy infrastructure supports at the default, override, and virtual server levels.
- Use goto expressions to transfer control to other policies and bind points, as determined by the result of expression evaluation.

- Use special tools such as pattern sets, policy labels, rate limit identifiers, and HTTP callouts, which enable you to configure policies effectively for complex use cases.

Additionally, the configuration utility extends robust graphical user interface support for default syntax policies and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The configuration utility also includes a policy evaluation feature for default syntax policies. You can use this feature to evaluate a default syntax policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

### **Basic components of an advanced policy**

Following are a few characteristics of an Advanced policy:

- Name. Each policy has a unique name.
- Rule. The rule is a logical expression that enables the Citrix ADC feature to evaluate a piece of traffic or another object.  
For example, a rule can enable the Citrix ADC to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”

Advanced policies can use all of the expressions that are available in a classic policy, with the exception of classic expressions for the SSL VPN client. In addition, Advanced policies enable you to configure more complex expressions.

- Bindings. To ensure that the Citrix ADC can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

You can bind a policy globally or to a virtual server. For more information, see “[About policy bindings.](#)”

- An associated action. An action is a separate entity from a policy. Policy evaluation ultimately results in the Citrix ADC performing an action. For example, a policy in the integrated cache can identify HTTP requests for .png or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

For some features, you configure actions as part of a more complex set of instructions known as a profile.

### **How different Citrix ADC features use policies**

The Citrix ADC supports a variety of features that rely on policies for operation. The following table summarizes how the Citrix ADC features use policies.

| <b>Feature Name</b> | <b>Policy Type</b>   | <b>How You Use Policies in the Feature</b>                                                                                                                                                                                                             |
|---------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System              | Classic              | For the Authentication function, policies contain authentication schemes for different authentication methods. For example, you can configure LDAP and certificate-based authentication schemes. You also configure policies in the Auditing function. |
| DNS                 | Advanced             | To determine how to perform DNS resolution for requests.                                                                                                                                                                                               |
| SSL                 | Classic and Advanced | To determine when to apply an encryption function and add certificate information to clear text. To provide end-to-end security, after a message is decrypted, the SSL feature re-encrypts clear text and uses SSL to communicate with Web servers.    |
| Compression         | Classic and Advanced | To determine what type of traffic is compressed.                                                                                                                                                                                                       |
| Integrated Caching  | Advanced             | To determine whether HTTP responses are cacheable.                                                                                                                                                                                                     |
| Responder           | Advanced             | To configure the behavior of the Responder function.                                                                                                                                                                                                   |
| Protection Features | Classic              | To configure the behavior of the Filter, SureConnect, and Priority Queuing functions.                                                                                                                                                                  |

| <b>Feature Name</b>      | <b>Policy Type</b>                                                                                                                                      | <b>How You Use Policies in the Feature</b>                                                                                                                                                                                                                                                      |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content Switching        | Classic and Advanced                                                                                                                                    | To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.                                     |
| AAA - Traffic Management | Classic. Exceptions: Traffic policies support only default syntax policies and authorization policies support both classic and default syntax policies. | To check for client-side security before users log in and establish a session. Traffic policies, which determine whether single sign-on (SSO) is required, use only the default syntax. Authorization policies authorize users and groups that access intranet resources through the appliance. |
| Cache Redirection        | Classic                                                                                                                                                 | To determine whether responses are served from a cache or from an origin server.                                                                                                                                                                                                                |

---

| <b>Feature Name</b>                        | <b>Policy Type</b>   | <b>How You Use Policies in the Feature</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rewrite                                    | Advanced             | To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be transformed. |
| Application Firewall                       | Classic and Advanced | To identify characteristics of traffic and data that should or should not be admitted through the firewall.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Citrix Gateway, Clientless Access function | Advanced             | To define rewrite rules for general Web access using the Citrix Gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Citrix Gateway                             | Classic              | To determine how the Citrix Gateway performs authentication, authorization, auditing, and other functions.                                                                                                                                                                                                                                                                                                                                                                                                                          |

---

## About actions and profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

**Note:** Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

### About actions

Actions are steps that the Citrix ADC takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the Citrix ADC can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some Citrix ADC features actions are predefined, and in others they are configurable. In some cases, (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

### About profiles

Some Citrix ADC features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

### Use of actions and profiles in particular features

The following table summarizes the use of actions and profiles in different Citrix ADC features. The table is not exhaustive. For more information about specific uses of actions and profiles for a feature, see the documentation for the feature.

| <b>Feature</b>           | <b>Use of an Action</b>                                                                                                                                                                                                                                                                                  | <b>Use of a Profile</b>                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Application firewall     | Synonymous with a profile                                                                                                                                                                                                                                                                                | All application firewall features use profiles to define complex behaviors, including pattern-based learning. You add these profiles to policies.            |
| Citrix Gateway           | The following features of the Citrix Gateway use actions: Pre-Authentication. Uses Allow and Deny actions. You add these actions to a profile., Authorization. Uses Allow and Deny actions. You add these actions to a policy. TCP Compression. Uses various actions. You add these actions to a policy. | The following features use a profile: Pre-Authentication, Session, Traffic, and Clientless Access. After configuring the profiles, you add them to policies. |
| Rewrite                  | You configure URL rewrite actions and add them to a policy.                                                                                                                                                                                                                                              | Not used.                                                                                                                                                    |
| Integrated Caching       | You configure caching and invalidation actions within a policy                                                                                                                                                                                                                                           | Not used.                                                                                                                                                    |
| AAA - Traffic Management | You select an authentication type, set an authorization action of ALLOW or DENY, or set auditing to SYSLOG or NSLOG.                                                                                                                                                                                     | You can configure session profiles with a default timeout and authorization action.                                                                          |
| Protection Features      | You configure actions within policies for the following functions: Filter, Compression, Responder, and SureConnect.                                                                                                                                                                                      | Not used.                                                                                                                                                    |
| SSL                      | You configure actions within SSL policies                                                                                                                                                                                                                                                                | Not used.                                                                                                                                                    |

| Feature           | Use of an Action                                                                                                                     | Use of a Profile |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------|
| System            | The action is implied. For the Authentication function, it is either Allow or Deny. For Auditing, it is Auditing On or Auditing Off. | Not used.        |
| DNS               | The action is implied. It is either Drop Packets or the location of a DNS server.                                                    | Not used.        |
| SSL Offload       | The action is implied. It is based on a policy that you associate with an SSL virtual server or a service.                           | Not used.        |
| Compression       | Determine the type of compression to apply to the data                                                                               | Not used.        |
| Content Switching | The action is implied. If a request matches the policy, the request is directed to the virtual server associated with the policy.    | Not used.        |
| Cache Redirection | The action is implied. If a request matches the policy, the request is directed to the origin server.                                | Not used.        |

### About policy bindings

A policy is associated with, or bound to, an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of different types of bind points for a policy:

- Request time global. A policy can be available to all components in a feature at request time.
- Response time global. A policy can be available to all components in a feature at response time.
- Request time, virtual server-specific. A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection

virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.

- Response time, virtual server-specific. A policy can also be bound to response-time processing for a particular virtual server.
- User-defined policy label. For default syntax policies, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.
- Other bind points. The availability of additional bind points depends on type of policy (classic or default syntax), and specifics of the relevant Citrix ADC feature. For example, classic policies that you configure for the foCitrix Gateway have user and group bind points.

For additional information about default syntax policy bindings, see [“Bind policies that use the default syntax”](#) and [Configure a policy bank for a virtual server](#). For additional information about classic policy bindings, see [“Configure a classic policy.”](#)

### **About evaluation order of policies**

For classic policies, policy groups and policies within a group are evaluated in a particular order, depending on the following:

- The bind point for the policy, for example, whether the policy is bound to request-time processing for a virtual server or global response-time processing. For example, at request time, the Citrix ADC evaluates all request-time classic policies before evaluating any virtual server-specific policies.
- The priority level for the policy. For each point in the evaluation process, a priority level that is assigned to a policy determines the order of evaluation relative to other policies that share the same bind point. For example, when the Citrix ADC evaluates a bank of request-time, virtual server-specific policies, it starts with the policy that is assigned to the lowest priority value. In classic policies, priority levels must be unique across all bind points.

For Advanced policies, as with classic policies, the Citrix ADC selects a grouping, or bank, of policies at a particular point in overall processing. Following is the order of evaluation of the basic groupings, or banks, of Advanced policies:

1. Request-time global override
2. Request-time, virtual server-specific (one bind point per virtual server)
3. Request-time global default
4. Response-time global override
5. Response-time virtual server-specific
6. Response-time global default

However, within any of the preceding banks of policies, the order of evaluation is more flexible than in classic policies. Within a policy bank, you can point to the next policy to be evaluated regardless of

the priority level, and you can invoke policy banks that belong to other bind points and user-defined policy banks.

### **Order of evaluation based on traffic flow**

As traffic flows through the Citrix ADC and is processed by various features, each feature performs policy evaluation. Whenever a policy matches the traffic, the Citrix ADC stores the action and continues processing until the data is about to leave the Citrix ADC. At that point, the Citrix ADC typically applies all matching actions. Integrated Caching, which only applies a final Cache or NoCache action, is an exception.

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other Citrix ADC features do not process the response or the request that initiated it.
- If the Content Filtering feature prevents a response from being served, no subsequent features evaluate the response.

If the application firewall rejects an incoming request, no other features can process it.

## **Classic and advanced policy expressions**

September 21, 2020

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy's functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the Citrix ADC to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

### **About classic expressions**

Classic expressions enable you to evaluate basic characteristics of data. They have a structured syntax that performs string matching and other operations.

Following are a few simple examples of classic expressions:

- An HTTP response contains a particular type of Cache Control header.

`res.http.header Cache-Control` contains `public`

- An HTTP response contains image data.

`res.http.header Content-Type` contains `image/`

- An SSL request contains a certificate.

`req.ssl.client.cert` exists

## About advanced policy expressions

Any feature that uses default syntax policies also uses Advanced expressions. For information about which features use Advanced policies, see the table [Citrix ADC Feature, Policy Type, and Policy Usage](#).

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced expressions in the following situations:

- Integrated Caching:

You use Advanced policy expressions to configure a selector for a content group in the integrated cache.

- Load Balancing:

You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.

- Rewrite:

You use Advanced policy expressions to configure rewrite actions.

- Rate-based policies:

You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:

- An HTTP request URL contains no more than 500 characters.

```
http.req.url.length \<= 500
```

- An HTTP request contains a cookie that has fewer than 500 characters.

```
http.req.cookie.length \< 500
```

- An HTTP request URL contains a particular text string.

```
http.req.url.contains(".html")
```

## Converting policy expressions using the NSPEPI tool

September 17, 2021

**Note:**

You can download the NSPEPI and preconfig check tool from the public GitHub. For more information, see [Github NEPEPI](#) page and [GitHub preconfig](#) page for detailed instructions to download the tools. We recommend customers to use tools available in GitHub for the most complete and up-to-date version.

Classic policy-based features and functionalities are deprecated from NetScaler 12.0 build 56.20 onwards. As an alternative, Citrix recommends you to use the Advanced policy infrastructure. As part of this effort, when you upgrade to Citrix ADC 12.1 build 56.20 or later, you must replace the Classic policy-based features and functionalities to its corresponding non-deprecated features and functionalities. Also, you must convert Classic policies and expressions to Advanced policies and expressions. Also, all new Citrix ADC features support only Advanced policy infrastructure.

The `nspepi` tool can perform the following:

1. Convert Classic policy expressions to Advanced policy expressions.
2. Convert certain Classic policies and their entity bindings to Advanced policies and bindings.
3. Convert a few more deprecated features to their corresponding non-deprecated features.
4. Convert classic filter commands to advanced filter commands.

**Note:**

After the `nspepi` tool successfully converts the `ns.conf` config file, the tool displays the converted file as a new file with a prefix, “new\_”. If the converted config file has errors or warnings, you must manually fix them as part of the conversion process. Once converted, you must test the file in the test environment and then use it to replace the actual `ns.conf` config file. After testing, you must reboot the appliance for the newly converted or fixed `ns.conf` config file.

Features that only support Classic policies or expressions are deprecated and they can be replaced by the corresponding non-deprecated features.

**Note:**

Information pertaining to the older version of the `nspepi` tool is available in a PDF format. For more information, see [Classic policy conversion using nspepi tool prior to 12.1-51.16](#) PDF.

### Conversion warnings and error files

Before you use the tool for your conversion, there are few warnings to keep in mind:

1. All warnings and errors are output to the console. There is a warning file created where the configuration files are stored.
2. The warnings and error file has the same name as the input file but with a prefix “warn\_” added to the file name. During expression conversion (when using -e), the warnings show up in the current directory with a name “warn\_expr”.

**Note:**

This file is in a standard log file format, with date/time stamp and log level. Previous instances of the file are kept with suffixes like “.1”, “.2”, and so forth as the tool is run multiple times. At most 10 instances will be kept.

**Converted file format**

When converting a configuration file (using “-f”), the converted file is put into the same directory as where the input configuration file exists with the same name but a prefix “new\_”.

**Commands or features handled by the nspepi conversion tool**

Following are the commands handled during the auto conversion process.

- The following Classic policies and their expressions are converted to Advanced policies and expressions. The conversion includes entity bindings and global bindings.
1. add appfw policy
  2. add cmp policy
  3. add cr policy
  4. add cs policy
  5. add tm sessionPolicy
  6. add filter action
  7. add filter policy
  8. filter policy binding to load balancing, content switching, cache redirection, and global.

**Note:**

However, for “add tm sessionPolicy”, you cannot bind to global override in Advanced policies.

- The rule parameter configured in “add lb virtual server” is converted from Classic expression to Advanced expression.
- The SPDY parameter configured in the “add ns httpProfile” or the “set ns httpProfile” command is changed to “-http2 ENABLED”.
- Named expressions (“add policy expression” commands). Each Classic named policy expression is converted to its corresponding Advanced named expression with “nspepi\_adv\_” set as the prefix. In addition, usage of named expressions for the converted Classic expressions is

changed to the corresponding Advanced named expressions. In addition, every named expression has two named expressions, where one is Classic and the other one is Advanced (as shown below).

- Tunnel TrafficPolicy conversion is supported.
- Handling builtin-in classic policy bindings in CMP, CR, and Tunnel.
- Patclass feature is converted to Pat set feature.
- “-pattern” parameter in the “add rewrite action” command is converted to use “-search” parameter.
- SYS.EVAL\_CLASSIC\_EXPR is converted to the equivalent non-deprecated advanced expression. These expressions can be seen in any command where advanced expressions are allowed.
- Q and S prefixes of advanced expressions are converted to equivalent non-deprecated advanced expressions. These expressions can be seen in any command where advanced expressions are allowed.

**For example:**

```
1 add policy expression classic_expr ns_true
2 Converts to:
3 add policy expression classic_expr ns_true
4 add policy expression nspepi_adv_classic_expr TRUE
5 <!--NeedCopy-->
```

- The policyType parameter configured in the “set cmp parameter” command is removed. By default, the policy type is “Advanced”.

### Convert classic filter commands to advanced filter commands

The `nspepi` tool can convert commands based on classic filter actions such as add, bind and so forth to advanced filter commands.

However, the `nepepi` tool does not support the following filter commands.

1. add filter action <action Name> FORWARD <service name>
2. add filter action <action name> ADD prebody
3. add filter action <action name> ADD postbody

**Note:**

1. If there are existing rewrite or responder features in ns.conf and their policies are bound globally with the `GOTO` expression as `END` or `USER_INVOCATION_RESULT` and the bind type is `REQ_X` or `RES_X` then the tool converts bind filter commands partially and comments out. Warning is displayed to put manual effort.
2. If there are existing rewrite or responder features and their policies are bound to virtual

servers(for example, load balancing, content switching or cache redirect) of type HTTPS with GOTO - END or USER\_INVOCATION\_RESULT, the tool converts bind filter commands partially and then comments out. Warning is displayed to put manual effort.

### Example

Following is a sample input:

```
1 add lb vserver v1 http 1.1.1.1 80 -persistenceType NONE -cltTimeout
  9000
2 add cs vserver csv1 HTTP 1.1.1.2 80 -cltTimeout 180 -persistenceType
  NONE
3 add cr vserver crv1 HTTP 1.1.1.3 80 -cacheType FORWARD
4 add service svc1 1.1.1.4 http 80
5 add filter action fact_add add 'header:value'
6 add filter action fact_variable add 'H1:%%HTTP.TRANSID%%'
7 add filter action fact_prebody add prebody
8 add filter action fact_error_act1 ERRORCODE 200 "<HTML>Good URL</HTML>"
9 add filter action fact_forward_act1 FORWARD svc1
10 add filter policy fpol_add_res -rule ns_true -resAction fact_add
11 add filter policy fpol_error_res -rule ns_true -resAction
  fact_error_act1
12 add filter policy fpol_error_req -rule ns_true -reqAction
  fact_error_act1
13 add filter policy fpol_add_req -rule ns_true -reqAction fact_add
14 add filter policy fpol_variable_req -rule ns_true -reqAction
  fact_variable
15 add filter policy fpol_variable_res -rule ns_true -resAction
  fact_variable
16 add filter policy fpol_prebody_req -rule ns_true -reqAction
  fact_prebody
17 add filter policy fpol_prebody_res -rule ns_true -resAction
  fact_prebody
18 add filter policy fpol_forward_req -rule ns_true -reqAction
  fact_forward_act1
19 bind lb vserver v1 -policyName fpol_add_res
20 bind lb vserver v1 -policyName fpol_add_req
21 bind lb vserver v1 -policyName fpol_error_res
22 bind lb vserver v1 -policyName fpol_error_req
23 bind lb vserver v1 -policyName fpol_variable_res
24 bind lb vserver v1 -policyName fpol_variable_req
25 bind lb vserver v1 -policyName fpol_forward_req
26 bind cs vserver csv1 -policyName fpol_add_req
27 bind cs vserver csv1 -policyName fpol_add_res
```

```
28 bind cs vserver csv1 -policyName fpol_error_res
29 bind cs vserver csv1 -policyName fpol_error_req
30 bind cr vserver crv1 -policyName fpol_add_req
31 bind cr vserver crv1 -policyName fpol_add_res
32 bind cr vserver crv1 -policyName fpol_error_res
33 bind cr vserver crv1 -policyName fpol_error_req
34 bind cr vserver crv1 -policyName fpol_forward_req
35 bind filter global fpol_add_req
36 bind filter global fpol_add_res
37 bind filter global fpol_error_req
38 bind filter global fpol_error_res
39 bind filter global fpol_variable_req
40 bind filter global fpol_variable_res
41 bind filter global fpol_variable_res -state DISABLED
42 bind filter global fpol_prebody_req
43 bind filter global fpol_forward_req
44 After conversion, warning/error messages will be displayed for manual
    effort.
45 Warning files:
46 cat warn_<input file name>:
47 2019-11-07 17:13:34,724: ERROR - Conversion of [add filter action
    fact_prebody add prebody] not supported in this tool.

### Convert classic filter commands to advanced feature commands if existing rewrite or responder policy bindings have goto expression END or USE\_INNVOCATION

In this conversion, if a rewrite policy bound to one or more virtual servers and if the server has END or USE\_INVOCATION\_RESULT, the tool comments out the commands.

#### Example

Following is a sample input command:

```
1 COPY
2 add filter policy fpol1 -rule ns_true -resAction reset
```

```
3 add filter policy fpol2 -rule ns_true -reqAction reset
4 add rewrite policy pol1 true NOREWRITE
5 add rewrite policylabel pl http_res
6 bind rewrite policylabel pl pol1 1
7 bind rewrite global NOPOLICY 1 USE_INVOCATION_RESULT -type RES_DEFAULT
  -invoke policylabel pl
8 add responder policy pol2 true NOOP
9 add responder policylabel pl -policylabeltype HTTP
10 bind responder policylabel pl pol2 1
11 bind responder global NOPOLICY 1 USE_INVOCATION_RESULT -type
  REQ_DEFAULT -invoke policylabel pl
12 bind lb vserver v1_tcp -policyName pol1 -priority 100 -
  gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
13 bind cs vserver csv1_tcp -policyName pol1 -priority 100 -
  gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
14 bind lb vserver v1_tcp -policyName pol2 -priority 100 -
  gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
15 bind cs vserver csv1_tcp -policyName pol2 -priority 100 -
  gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
16 bind cr vserver crv1_tcp -policyName pol2 -priority 100 -
  gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
17 bind lb vserver v1_http -policyName fpol1
18 bind cs vserver csv1_http -policyName fpol1
19 bind lb vserver v2_http -policyName fpol2
20 bind cs vserver csv2_http -policyName fpol2
21 bind cr vserver crv2_http -policyName fpol2
22 bind filter global fpol1 -priority 100
23 bind filter global fpol2 -priority 100
24 <!--NeedCopy-->
```

Following is a sample output command:

```

## Commands or features not handled by the nspepi conversion tool

Following are some commands that are not handled as part of the auto conversion process.

- Some bindings cannot be converted if there are certain interleaving of priorities between global and non-global bind points, between users and groups, and also among bindings to different entities. These have the affected configuration commented out and an error produced. Such configurations must be converted manually.
- Both Classic and Advanced policies can be bound to cmp global. There are many cases where the functionality changes once Classic policies are converted to Advanced policies. We have converted commands that can be solved by commenting out some policies. Still there are some commands that cannot be converted. In such cases an error will be produced and conversion has to be done manually.
- Not all uses of Classic built-in named expressions are converted to equivalent Advanced named expressions.
- Client security expressions are not handled.
- The “-precedence” option for content switching and cache redirection virtual servers is not handled.
- Sure Connect (SC)
- Priority Queuing (PQ)
- HTTP Denial of Service (HDOS)
- HTML Injection

- Authentication
- Authorization
- VPN
- Syslog
- Nslog
- File based Classic expressions are not handled.

**Note:**

For some features like Patclass/filter, the command syntax is changed. If there are cmd policies, then cmd policies might need to be changed depending on customer requirement.

**Known Issues**

The following errors can be produced by the `nspepi` tool:

- If there is an issue when converting an expression.
- If a named policy expression uses the `-clientSecurityMessage` parameter because this parameter is not supported in the Advanced policy expression.

**Note:**

All classic policy bindings with `-state` option disabled are commented out. The `-state` option is not available for Advanced policy bindings.

**Running the nspepi tool**

The following is a command line example for running the `nspepi` tool. This tool is run from the command line of the shell (you need to type the “shell” command to the NetScaler”CLI” to get to that). Either “-f” or “-e” must be specified to perform a conversion. Use of “-d” is intended for Citrix personnel to analyze for support purposes.

```
1 usage: nspepi [-h] (-e <classic policy expression> | -f <path to ns
   config file>)[-d] [-v] [-V]
2
3 Convert classic policy expressions to advanced policy expressions and
   deprecated commands to non-deprecated
4 commands.
5
6 optional arguments:
7 -h, --help show this help message and exit
8 -e <classic policy expression>, --expression <classic policy expression
   >
9 convert classic policy expression to advanced policy
10 expression (maximum length of 8191 allowed)
```

```

11 -f <path to ns config file>, --infile <path to ns config file>
12 convert netscaler config file
13 -d, --debug log debug output
14 -v, --verbose show verbose output
15 -V, --version show program's version number and exit
16 <!--NeedCopy-->

```

**Usage Examples:**

1. nspepi -e "req.tcp.destport == 80"
2. nspepi -f ns.conf

Following are few examples of running the nspepi tool by using the CLI

**Example output for -e parameter:**

```

1 root@ns# nspepi -e "req.http.header foo == \"bar\""
2 "HTTP.REQ.HEADER(\"foo\").EQ(\"bar\")"
3 <!--NeedCopy-->

```

**Example output for -f parameter:**

```

1 root@ns# cat sample.conf
2 add c**Input**r vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout
   180 -originUSIP OFF
3 add cr policy cr_pol1 -rule ns_true
4 bind cr vserver cr_vs -policyName cr_pol1
5 <!--NeedCopy-->

```

**Running nspepi with -f parameter:**

```

1 nspepi -f sample.conf
2 <!--NeedCopy-->

```

Converted config is available in a new file `new_sample.conf`.

Check the `warn_sample.conf` file for any warnings or errors that might have been generated.

Example output of -f parameter along with -v parameter

```

1 nspepi -f sample.conf -v
2 INFO - add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180
   -originUSIP OFF
3 INFO - add cr policy cr_pol1 -rule TRUE -action ORIGIN
4 INFO - bind cr vserver cr_vs -policyName cr_pol1 -priority 100 -
   gotoPriorityExpression END -type REQUEST
5 <!--NeedCopy-->

```

Converted config is available in a new file `new_sample.conf`.

Check the `warn_sample.conf` file for any warnings or errors that might have been generated.

**Converted Config file:**

```
1 root@ns# cat new_sample.conf
2 add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180 -
  originUSIP OFF
3 add cr policy cr_pol1 -rule TRUE -action ORIGIN
4 set cmp parameter -policyType ADVANCED
5 bind cr vserver cr_vs -policyName cr_pol1 -priority 100 -
  gotoPriorityExpression END -type REQUEST
6
7 <!--NeedCopy-->
```

**Example output of a sample configuration with no errors or warnings:**

```
1 nspepi -f sample_2.conf
2 <!--NeedCopy-->
```

Converted config is available in a new file `new_sample_2.conf`.

Check the `warn_sample_2.conf` file for any warnings or errors that might have been generated.

**Example output of a sample configuration with warnings:**

```
1 root@ns# cat sample_2.conf
2 add policy expression security_expr "req.tcp.destport == 80" -
  clientSecurityMessage "Not allowed"
3 set cmp parameter -policyType CLASSIC
4 add cmp policy cmp_pol1 -rule ns_true -resAction COMPRESS
5 add cmp policy cmp_pol2 -rule ns_true -resAction COMPRESS
6 add cmp policy cmp_pol3 -rule TRUE -resAction COMPRESS
7 bind cmp global cmp_pol1
8 bind cmp global cmp_pol2 -state DISABLED
9 bind cmp global cmp_pol3 -priority 1 -gotoPriorityExpression END -type
  RES_DEFAULT
10 bind lb vserver lb_vs -policyName cmp_pol2
11 root@ns#
12 <!--NeedCopy-->
```

**Example of running nspepi with -f parameter:**

```
1 root@ns# nspepi -f sample_2.conf
2 ERROR - Error in converting expression security_expr : conversion of
  clientSecurityMessage based expression is not supported.
```

```
3 WARNING - Following bind command is commented out because state is
  disabled. Advanced expressions only have a fixed ordering of the
  types of bindings without interleaving, except that global bindings
  are allowed before all other bindings and after all bindings. If you
  have global bindings in the middle of non-global bindings or any
  other interleaving then you will need to reorder all your bindings
  for that feature and direction. Refer to nspepi documentation. If
  command is required please take a backup because comments will not
  be saved in ns.conf after triggering 'save ns config': bind cmp
  global cmp_pol2 -state DISABLED
4 Warning - Bindings of advanced CMP policies to cmp global are commented
  out, because initial global cmp parameter is classic but advanced
  policies are bound. Now global cmp parameter policy type is set to
  advanced. If commands are required please take a backup because
  comments will not be saved in ns.conf after triggering 'save ns
  config'. Advanced expressions only have a fixed ordering of the
  types of bindings without interleaving, except that global bindings
  are allowed before all other bindings and after all bindings. If you
  have global bindings in the middle of non-global bindings or any
  other interleaving then you will need to reorder all your bindings
  for that feature and direction. Refer to nspepi documentation.

## Binding Priorities

Advanced policies do not allow arbitrary interleaving by priority between global and non-global and between different binding types. If you rely on such interleaving of Classic policy priorities, you need to adjust the priorities to conform to the Advanced policy rules and to get the behavior you desire.

Priorities in Advanced policies are local to a bind point. A bind point is a unique combination of protocol, feature, direction, and entity (entities are specific virtual servers, users, groups, services, and either global override or global default). Policy priorities are not followed across bind points.

For a given protocol, feature, and direction the order of evaluation of Advanced policies is given below:

- Global override.
- (Current) authentication, authorization, and auditing user.

- Authentication, authorization, and auditing groups (that the user is a member of) in order of weight - ordering is undefined if two or more groups have the same weight.
- LB virtual server that either the request was received on or that Content Switching selected.
- Content switching virtual server, cache redirection virtual server that the request was received on.
- Service selected by load balancing.
- Global default.

For authorization policy evaluation, the order is:

- Systems override.
- Load balancing virtual server that either the request was received on or that CS selected.
- Content switching virtual server that the request was received on.
- System default.

Within each bind point, the policies are evaluated in order of priority from lowest numbered to highest numbered. Policies are only evaluated for the protocol used and the direction that the message was received from.

### **Classic policy bindings that require manual reprioritization**

Here are some types of Classic policy bindings that require manual reprioritization to accomplish your needs. All these are for a given feature and the direction.

- Classic priorities that increase in priority number opposite to the direction of the above entity type lists. For example a content switching virtual server binding lower than a load balancing virtual server binding.
- Classic priorities that interleave authentication, authorization, and auditing groups. One part of one group is before some other group and yet another part is after part of that other group.
- Classic priorities that increase in number other than the order of weights of authentication, authorization, and auditing groups.
- Classic global priorities that are less than some non-global priority and the same global priorities are greater than some other non-global priority (in other words, any segment of priorities that are a non-global, followed by one or more globals, followed by a non-global).

### **Classic Policy Deprecation FAQs**

August 18, 2021

- **What are the classic policies deprecated from Citrix ADC 12.0 release onwards?**

All the features and functionalities mentioned in the [Deprecated policies](#) table are deprecated from Citrix ADC release 12.0 build 56.20. Citrix recommends you to see the following tables (in PDF format) for deprecated feature and policy details.

- [Table 1](#) for deprecated policies and its alternative.
- [Table 2](#) for deprecated Citrix ADC functionalities and its alternative with configuration details.

- **How can I convert Classic policy based feature and functionalities to Advanced policy?**

You can use the Citrix ADC proprietary nspepi tool to convert commands, expressions, and configurations. nspepi tool helps to convert all the Classic expressions in the Citrix ADC configuration to the Advanced policy. For more information about the nspepi tool, see [Converting policy expressions using NSPEPI tool](#)

- **From which release onwards are Classic policy based features and functionalities deprecated?**

Citrix ADC 12.0 build 56.20 onwards.

- **What steps should I take when I upgrade my appliance to builds that does not support the features listed in the table?**

Citrix recommends you to replace Classic policy-based features with its alternative feature and functionality (as mentioned in Table 1) before you upgrade your appliance to releases later than Citrix ADC 13.0. Citrix does not support Classic policy and its usage in releases later than Citrix ADC 13.0.

- **How long will the deprecated features be supported on Citrix ADC appliance??**

Citrix supports the policy based features and functionalities as per current software support guidelines. For more details refer to [Citrix ADC Product Matrix](#)

- **Do I have to reboot my appliance after converting the configuration file ?**

Yes, you have to reboot the Citrix ADC instance after successful conversion of the `ns.config` file.

## Before you proceed

September 21, 2020

Before configuring expressions and policies, be sure you understand the relevant Citrix ADC feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.

- Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

**Note:** The Citrix ADC supports either classic or Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some Citrix ADC features have migrated from using classic policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

## Configure advanced policy infrastructure

September 21, 2020

You can create advanced policies for various Citrix ADC features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the Citrix Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a *policy bank*. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure *policy labels*. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

## Rules for names in identifiers used in policies

September 21, 2020

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (\_). The remaining characters can be ASCII alphanumeric characters or underscores (\_).

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntax indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET
  - TEXT
  - URL
  - MYSQL
  - MSSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORE-CASE, YEAR, or LATIN2\_CZECH\_CS (a MySQL character set).

**Note:** The Citrix ADC appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with TRUE, True, or true.

## Create or modify a policy

September 21, 2020

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of

overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

### Create a policy by using the CLI

At the command prompt, type the following commands to create a policy and verify the configuration:

```
1 - add responder|dns|cs|rewrite|cache policy <policyName> -rule <
  expression> [<feature-specific information>]
2
3 - show rewrite policy <name>
4 <!--NeedCopy-->
```

#### Example 1:

```
1 add rewrite policy "pol_remove-ae" true "act_remove-ae"
2 Done
3 > show rewrite policy pol_remove-ae
4     Name: pol_remove-ae
5     Rule: true
6     RewriteAction: act_remove-ae
7     UndefAction: Use Global
8     Hits: 0
9     Undef Hits: 0
10    Bound to: GLOBAL RES_OVERRIDE
11    Priority: 90
12    GotoPriorityExpression: END
13 Done
14 <!--NeedCopy-->
```

#### Example 2:

```
1 add cache policy BranchReportsCachePolicy -rule q{
2   http.req.url.query.value("actionoverride").contains("branchReport s")
3   }
4   -action cache
```

```
4 Done
5 show cache policy BranchReportsCachePolicy
6     Name: BranchReportsCachePolicy
7     Rule: http.req.url.query.value("actionoverride").contains("
8         branchReports")
9     CacheAction: CACHE
10    Stored in group: DEFAULT
11    UndefAction: Use Global
12    Hits: 0
13    Undef Hits: 0
14 Done
15 <!--NeedCopy-->
```

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the `q` delimiter. For more information, see [Configure advanced policy expressions: Get started](#).

## Create or modify a policy by using the GUI

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click **Policies**. For example, you can select **Content Switching, Integrated Caching, DNS, Rewrite, or Responder**.
2. In the details pane, click **Add**, or select an existing policy and click **Open**. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in “Parameters for creating or modifying a policy.”)
4. Click **Create**, and then click **Close**.
5. Click **Save**. A policy is added.

Note: After you create a policy, you can view the policy’s details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

## Policy configuration examples

September 21, 2020

These examples show how policies and their associated actions are entered at the command line interface. In the configuration utility, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```
1 add cache policy BranchReportsCachePolicy -rule q{
2 http.req.url.query.value("actionoverride").contains("branchReports") }
3 -action cache
4 <!--NeedCopy-->
```

Following is an example of a rewrite policy and action:

```
1 add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "
   valueForMyHeader"
2 add rewrite policy myPolicy1 "http.req.url.contains(\"myURLstring\")"
   myAction1
3 <!--NeedCopy-->
```

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see [Configure advanced policy expressions: Get started](#).

## Bind policies using advanced policy

August 25, 2021

After defining a policy, the policy can be invoked by binding the policy to a bind point and specifying a priority level. You can bind the policy to only one bind point. A bind point can be global (applying to all configured virtual servers) or bind point can be a specific virtual server (either a load balancing or a content switching virtual server).

The order in which policies are evaluated determines the order in which they are applied. ADC features typically evaluate various policy banks in a particular order. Sometimes, however, other features can affect the order of evaluation. Within a policy bank, the order of evaluation depends on parameter values configured in the policies. Most features apply all the actions associated with a policy if the evaluated result matches with the data being processed.

**Note:**

Integrated caching feature is an exception.

### Feature-specific differences in policy bindings

You can bind policies to a built-in, global bind points (or banks), specific virtual servers, or policy labels.

However, the Citrix ADC features differ in the type of bindings that are available. The following table summarizes policy bindings in Citrix ADC features that use policies.

| Feature Name                                                                        | Virtual Servers Configured in the Feature | Policies Configured in the Feature | Bind Points Configured for the Policies                                                                         | Use of Policies in the Feature                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------|-------------------------------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS                                                                                 | none                                      | DNS policies                       | Global                                                                                                          | To determine how to perform DNS resolution for requests.                                                                                                                                                                                                    |
| Content Switching (Note: This feature can support Advanced policies, but not both.) | Content Switching (CS)                    | Content Switching policies         | Content switching or cache redirection virtual server; Policy label                                             | To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server. |
| Integrated Caching                                                                  | none                                      | Caching policies                   | Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server | To determine whether HTTP responses can be stored in, and served from, the Citrix ADC appliance's integrated cache.                                                                                                                                         |

| Feature Name | Virtual Servers Configured in the Feature | Policies Configured in the Feature | Bind Points Configured for the Policies                                                                         | Use of Policies in the Feature                                                                                                                                                                                                                                                                                     |
|--------------|-------------------------------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Responder    | none                                      | Responder policies                 | Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server | To configure the behavior of the Responder function.                                                                                                                                                                                                                                                               |
| Rewrite      | none                                      | Rewrite policies                   | Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server | To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a selected server based on the address of the incoming request, or to mask server information in a response for security purposes. |

| Feature Name                                   | Virtual Servers Configured in the Feature | Policies Configured in the Feature | Bind Points Configured for the Policies       | Use of Policies in the Feature                                                                                                                                                          |
|------------------------------------------------|-------------------------------------------|------------------------------------|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URL Transform function in the Rewrite feature  | none                                      | Transformation policies            | Global override, Global default, Policy label | To identify URLs in HTTP transactions and text files for evaluating whether a URL should be altered.                                                                                    |
| Citrix Gateway (clientless VPN functions only) | VPN server                                | Clientless Access policies         | VPN Global, VPN server                        | To determine how the Citrix Gateway performs authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the Citrix Gateway. |

### Bind points and order of evaluation

For a policy to take effect, you must ensure that the policy is invoked at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the Citrix ADC evaluates, listed in the typical order of evaluation within a policy bank

1. **Request-time override.** When a request flows through a feature, the Citrix ADC first evaluates request-time override policies for the feature.
2. **Request-time Load Balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies have been evaluated, the Citrix ADC processes request-time policies for load balancing virtual servers.

3. **Request-time Content Switching virtual server.** If policy evaluation cannot be completed after all the request-time policies for load balancing virtual servers have been evaluated, the Citrix ADC processes request-time policies for content switching virtual servers.
4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the Citrix ADC processes request-time Advanced policies.
5. **Response-time override.** At response time, the Citrix ADC starts with policies that are bound to the response-time override bind point.
6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the Citrix ADC process the response-time policies for load balancing virtual servers.
7. **Response-time Content Switching virtual server.** If policy evaluation cannot be completed after all policies have been evaluated for load balancing virtual servers, the Citrix ADC process the response-time policies for content switching virtual servers.
8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the Citrix ADC processes response-time Advanced policies.

### Policy evaluation across features

In addition to evaluate policies within a feature, if you bind policies to a content switching virtual server, it is important that these policies are evaluated before other policies. Binding a policy to a content switching virtual server produces a different result in Citrix ADC versions 9.0.x and later than in 8.x versions. In Citrix ADC 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing virtual server is selected.
- If all content switching policies evaluate to FALSE, the default load balancing virtual server under the content switching VIP is selected.

After a target load balancing virtual server is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.
2. Policies that are bound to the default load balancing virtual server.
3. Policies that are bound to the target content switching virtual server.
4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing virtual server is not directly reachable from the outside; for example, the virtual server IP address can be 0.0.0.0.

- To prevent exposing internal data on the load balancing default virtual server, configure a policy to respond with a “503 Service Unavailable” status and bind it to the default load balancing virtual server.

### **Entries in a policy bank**

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke external policy banks.

Policy bank is the group of policies which are bound at a particular bind point and which can be evaluated for some traffic. If some policies are bound to LB vserver of an HTTP protocol type, then LB vserver is a policy bank. And the policies bound to this policy bank can be evaluated for the HTTP traffic. If some rewrite policies are bound to rewrite global at DNS\_REQ\_OVERRIDE bindpoint, then DNS\_REQ\_OVERRIDE bindpoint will be a policy bank where some policies are bound.

Since, in policy label we can bind number of policies, so policy label is also a policy bank.

The policy banks are differentiated based on the protocols, conditions, and priorities. Suppose, you have 2 LB virtual server. One is of type HTTP and another is of type DNS. And, different policies are bound to these virtual servers. So, both virtual servers are the policy banks, but policies bound to one of the policy bank are evaluated for HTTP traffic. The policies bound to another policy bank are evaluated for DNS traffic. For each policy evaluation, a rule is evaluated. For NOPOLICY also, a rule true is evaluated.

If a user wants to invoke a policy label for all the traffic, then the user can use NOPOLICY as its rule true.

The following table summarizes each entry in a policy bank.

| Policy Name                           | Priority    | Goto Expression                                                                                                                                                                                           | Invocation Type                                                                                                                            | Policy Bank to Be Invoked                                                                                                                                                         |
|---------------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The policy name, or a “dummy” policy. | An integer. | Optional. If not configured, ADC takes the default gotoPriorityExpression value. It identifies the next policy to be evaluated if the current policy is evaluated to true, or ends any further evaluation | Optional. Indicates that an external policy bank is invoked. The field restricts the choices to a global policy label or a virtual server. | Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The Citrix ADC returns to the current bank after processing the external bank. |

If the policy evaluates to TRUE, the Citrix ADC stores the action that is associated with the policy. Add evaluate next policy based on the `gotoPriorityExpression` field value. If the policy evaluates to FALSE, the Citrix ADC evaluates the next policy. If the policy is neither TRUE nor FALSE, the Citrix ADC uses the associated Undef (undefined) action.

Invocation type designates a policy bank type. The value can be one of the following:

- Request Vserver: Invokes request-time policies that are associated with a virtual server.
  - Response Vserver: Invokes response-time policies that are associated with a virtual server.
  - Policy label: Invokes another policy bank, as identified by the policy label for the bank.
- GotoPriorityExpression field values:
- Goto NEXT - Go to the policy with the next higher priority
  - Goto END - End evaluation
  - Goto # - An expression that produces the priority number of the next policy to be evaluated. The Goto can only proceed forward in a policy bank.
  - Goto USE\_INVOCATION\_RESULT – Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT.

If you omit the Goto expression, it is the same as specifying END.

Example of a Policy bank that uses Goto expression:

| Policy Name         | Priority | Goto                        | Invocation     | Policy Bank to be Invoked |
|---------------------|----------|-----------------------------|----------------|---------------------------|
| ClientCertificatePc | 100      | 300                         | None           | None                      |
| SubnetPolicy        | 200      | Next                        | None           | None                      |
| NOPOLICY            | 300      | USE<br>INVOCATION<br>RESULT | Request Server | My_Request_VServer        |
| NOPOLICY            | 350      | USE<br>INVOCATION<br>RESULT | Policy Label   | My_Policy_Label           |
| WorkingHoursPoli    | 400      | END                         | None           | None                      |

### Evaluation order within a policy bank

Within a policy bank, the evaluation order depends on the following parameters:

- **A priority.**

The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

- **A Goto expression.**

If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement point backwards in the bank.

- **Invocation of other policy banks.**

Any entry can invoke an external policy bank. The Citrix ADC provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

- **NEXT.**

This keyword selects the policy with the next higher priority level in the current policy bank. The Policies are evaluated in priority order from lower numbered priority to higher numbered priority.

- **An integer.**

If you supply an integer, it must match the priority level of another policy in the current policy bank.

- **END.**

This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

- **Blank.**

If the Goto expression is empty, it is the same as specifying END.

- **A numeric expression.**

This is an advanced policy expression that resolves to a priority number for another policy in the current bank.

- **USE\_INVOCATION\_RESULT.**

This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the Citrix ADC to perform one of the following actions:

- If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
- If the final Goto expression in the invoked policy bank is anything other than END, the Citrix ADC performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

| Policy Name | Priority | Goto | Invocation | Policy Bank | to | Be | In- | vokec |
|-------------|----------|------|------------|-------------|----|----|-----|-------|
|             |          |      |            |             |    |    |     |       |

Table 3. Example of a Policy Bank That Uses Gotos and External Bank Invocations

### How policy evaluation ends

Evaluation of a policy bank ends when the Citrix ADC appliance executes one of the following steps:

- If a policy evaluation is “TRUE,” it invokes an external policy bank and its Goto statement value is “USE\_INVOCATION\_RESULT,” and if another policy in the external policy bank also evaluates

“TRUE” and Goto statement value is “END,” then after returning from the external policy bank, no further policy will be evaluated.

- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE\_INVOCATION\_RESULT or END. Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the Citrix ADC next evaluates request-time policy banks for the virtual servers.
- The Citrix ADC has walked through all the policy banks in this feature, but has not encountered an END.

If this is the last entry to be evaluated in this policy bank, the Citrix ADC proceeds to the next feature.

### How features use actions after policy evaluation

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the Citrix ADC stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the Citrix ADC. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the “highest priority” policy bank (for example, request-time override policies are applied before virtual server-specific policies).

## Bind a policy globally

September 21, 2020

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

### Bind an integrated caching policy globally by using the CLI

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
1 - bind cache global <policy> -priority <positiveInteger> [-type
    REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cache global
4 <!--NeedCopy-->
```

#### Example:

```
1 > bind cache global _nonPostReq -priority 100 -type req_default
2     Done
3 > show cache global
4     1)      Global bindpoint: REQ_DEFAULT
5           Number of bound policies: 2
6
7     2)      Global bindpoint: RES_DEFAULT
8           Number of bound policies: 1
9 Done
10 <!--NeedCopy-->
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ\_DEFAULT or RES\_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

### Bind a rewrite policy globally by using the CLI

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```
1 - bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE |
    REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show rewrite global
4 <!--NeedCopy-->
```

### Example:

```
1 bind rewrite global pol_remove-pdf 100
2 Done
3 > show rewrite global
4     1)      Global bindpoint: REQ_DEFAULT
5           Number of bound policies: 1
6
7     2)      Global bindpoint: REQ_OVERRIDE
8           Number of bound policies: 1
9
10 Done
11 <!--NeedCopy-->
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ\_DEFAULT or RES\_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

## Bind a compression policy globally by using the CLI

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```
1 - bind cmp global <policyName> -priority <positiveInteger> [-type
    REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cmp global
4 <!--NeedCopy-->
```

### Example:

```
1 > bind cmp global cmp_pol_1 -priority 100
2 Done
3 > show cmp policy cmp_pol_1
4     Name: cmp_pol_1
5     Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")
6     Response Action: COMPRESS
7     Hits: 0
8
9     Policy is bound to following entities
10    1) GLOBAL REQ_DEFAULT
11    Priority: 100
12    GotoPriorityExpression: END
13 Done
14 <!--NeedCopy-->
```

## Bind a responder policy globally by using the CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

```
1 - bind responder global <policyName> <priority> [-type OVERRIDE |
    DEFAULT ]
2
3 - show responder global
4 <!--NeedCopy-->
```

### Example:

```
1 bind responder global pol404Error1 200
2 Done
3 > show responder global
4    1) Global bindpoint: REQ_DEFAULT
```

```
5          Number of bound policies: 1
6
7 Done
8 <!--NeedCopy-->
```

### Bind a DNS policy globally by using the CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

```
1 - bind dns global <policyName> <priority>
2
3 - show dns global
4 <!--NeedCopy-->
```

#### Example:

```
1 > bind dns global pol_ddos_drop1 150
2 Done
3 > show dns global
4     Policy name : pol_ddos_drop
5         Priority : 100
6         Goto expression : END
7     Policy name : pol_ddos_drop1
8         Priority : 150
9 Done
10 <!--NeedCopy-->
```

### Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.

5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

### Bind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

### Bind a policy to a virtual server

September 21, 2020

A globally bound policy applies to all load balancing and content switching virtual servers.

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

### Bind a policy to a load balancing or content switching virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

```
1 - bind lb|cs vserver <virtualServerName> -policyName <policyName> -  
   priority <positiveInteger> -type REQUEST|RESPONSE  
2  
3 - show lb vserver <name>  
4 <!--NeedCopy-->
```

#### Example:

```
1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50  
2 Done  
3 > show lb vserver lbvip  
4         lbvip (8.7.6.6:80) - HTTP           Type: ADDRESS  
5         State: DOWN  
6         Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)  
7         Time since last state change: 28 days, 01:57:26.350  
8         Effective State: DOWN
```

```

 9      Client Idle Timeout: 180 sec
10      Down state flush: ENABLED
11      Disable Primary Vserver On Down : DISABLED
12      Port Rewrite : DISABLED
13      No. of Bound Services : 0 (Total)          0 (Active)
14      Configured Method: LEASTCONNECTION
15      Mode: IP
16      Persistence: NONE
17      Vserver IP and Port insertion: OFF
18      Push: DISABLED  Push VServer:
19      Push Multi Clients: NO
20      Push Label Rule: none
21
22      1)      Policy : ns_cmp_msapp Priority:50
23      2)      Policy : cf-pol Priority:1          Inherited
24 Done
25 <!--NeedCopy-->

```

### Bind a policy to an SSL offload virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

```
bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger>
>
```

### Bind a policy to a virtual server by using the GUI

1. In the navigation pane, expand Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA- Application Traffic, or Citrix Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.
3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the default syntax to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

## Display policy bindings

September 21, 2020

You can display policy bindings to verify that they are correct.

### Display policy bindings by using the CLI

At the command prompt, type the following commands to display policy bindings and verify the configuration:

```
show rewrite policy <name>
```

#### Example:

```
1 > show rewrite policy pol_remove-pdf
2     Name: pol_remove-pdf
3     Rule: http.req.url.contains(".pdf")
4     RewriteAction: act_remove-ae
5     UndefAction: Use Global
6     Hits: 0
7     Undef Hits: 0
8     Bound to: GLOBAL REQ_DEFAULT
9     Priority: 100
10    GotoPriorityExpression: END
11 Done
12 >
13 <!--NeedCopy-->
```

### Display global policy bindings for integrated caching, rewrite, or responder by using the GUI

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.
2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

### Display global policy bindings for DNS or clientless access in the Citrix Gateway by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.

## Display global policy bindings for content switching by using the GUI

1. Navigate to **Traffic Management** >> **Content Switching** >> **Policies**.
2. In detailed pane, select **Policy**.
3. In the details pane, click **Show Bindings**.

## Unbind a policy

September 21, 2020

If you want to reassign a policy or delete it, you must first remove its binding.

## Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
1 - unbind cache|rewrite|cmp global <policyName> [-type req_override|
    req_default|res_override|res_default] [-priority <positiveInteger>]
2
3 - show cache|rewrite|cmp global
4 <!--NeedCopy-->
```

### Example:

```
1 > unbind cache global_nonPostReq
2 Done
3 > show cache global
4     1)      Global bindpoint: REQ_DEFAULT
5           Number of bound policies: 1
6
7     2)      Global bindpoint: RES_DEFAULT
8           Number of bound policies: 1
9
10 Done
11 <!--NeedCopy-->
```

The priority is required only for the “dummy” policy named NOPOLICY.

## Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

```
1 - unbind responder global <policyName> [-type override|default] [-  
    priority <positiveInteger>]  
2  
3 - show responder global  
4 <!--NeedCopy-->
```

### Example:

```
1 > unbind responder global pol404Error  
2 Done  
3 > show responder global  
4     1)      Global bindpoint: REQ_DEFAULT  
5           Number of bound policies: 1  
6 Done  
7 <!--NeedCopy-->
```

The priority is required only for the “dummy” policy named NOPOLICY.

## Unbind a DNS policy globally by using the CLI

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

```
1 - unbind responder global <policyName>  
2  
3 - unbind responder global  
4 <!--NeedCopy-->
```

### Example:

```
1 unbind dns global dfgdfg  
2 Done  
3 show dns global  
4     Policy name : dfgdfggfhg  
5           Priority : 100  
6           Goto expression : END  
7 Done  
8 <!--NeedCopy-->
```

## Unbind an advanced policy from a virtual server by using the CLI

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

```
1 - unbind cs vserver <name> -policyName <policyName> [-priority <
    positiveInteger>] [-type REQUEST|RESPONSE]
2
3 - show lb vserver <name>
4 <!--NeedCopy-->
```

### Example:

```
1 unbind cs vserver vs-cont-switch -policyName pol1
2 Done
3 > show cs vserver vs-cont-switch
4         vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT
5         State: UP
6         Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)
7         Time since last state change: 0 days, 02:47:55.750
8         Client Idle Timeout: 180 sec
9         Down state flush: ENABLED
10        Disable Primary Vserver On Down : DISABLED
11        Port Rewrite : DISABLED
12        State Update: DISABLED
13        Default:          Content Precedence: RULE
14        Vserver IP and Port insertion: OFF
15        Case Sensitivity: ON
16        Push: DISABLED  Push VServer:
17        Push Label Rule: none
18 Done
19 <!--NeedCopy-->
```

The priority is required only for the “dummy” policy named NOPOLICY.

## Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the **Policy Manager** dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.

5. Click **Apply Changes**.
6. Click **Close**. A message in the status bar indicates that the policy is unbound successfully.

### **Unbind a DNS policy globally by using the GUI**

1. Navigate to **Traffic Management > DNS > Policies**.
2. In the details pane, click **Global Bindings**.
3. In the **Global Bindings** dialog box, select policy and click **unbind policy**.
4. Click **OK**. A message in the status bar indicates that the policy is unbound successfully.

### **Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI**

1. Navigate to **Traffic Management**, and expand Load Balancing or Content Switching, and then click **Virtual Servers**.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the **Policies** tab, in the **Active** column, clear the check box next to the policy that you want to unbind.
4. Click **OK**. A message in the status bar indicates that the policy is unbound successfully.

## **Create policy labels**

September 21, 2020

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The Citrix ADC also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

### Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
1 - add cache policylabel <labelName> -evaluates req|res
2
3 - show cache policylabel<labelName>
4 <!--NeedCopy-->
```

#### Example:

```
1 > add cache policylabel lbl-cache-pol -evaluates req
2 Done
3
4 > show cache policylabel lbl-cache-pol
5     Label Name: lbl-cache-pol
6     Evaluates: REQ
7     Number of bound policies: 0
8     Number of times invoked: 0
9 Done
10 <!--NeedCopy-->
```

### Create a content switching policy label by using the CLI

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

```
1 - add cs policylabel <labelName> http|tcp|rtsp|ssl
2
3 - show cs policylabel <labelName>
4 <!--NeedCopy-->
```

#### Example:

```
1 > add cs policylabel lbl-cs-pol http
2 Done
3 > show cs policylabel lbl-cs-pol
4     Label Name: lbl-cs-pol
5     Label Type: HTTP
6     Number of bound policies: 0
```

```
7          Number of times invoked: 0
8 Done
9 <!--NeedCopy-->
```

### Create a rewrite policy label by using the CLI

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

```
1 - add rewrite policylabel <labelName> http_req|http_res|url|text|
   clientless_vpn_req|clientless_vpn_res
2
3 - show rewrite policylabel <labelName>
4 <!--NeedCopy-->
```

#### Example:

```
1 > add rewrite policylabel lbl-rewrt-pol http_req
2 Done
3
4 > show rewrite policylabel lbl-rewrt-pol
5          Label Name: lbl-rewrt-pol
6          Transform Name: http_req
7          Number of bound policies: 0
8          Number of times invoked: 0
9 Done
10 <!--NeedCopy-->
```

### Create a responder policy label by using the CLI

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```
1 - add responder policylabel <labelName>
2
3 - show responder policylabel <labelName>
4 <!--NeedCopy-->
```

#### Example:

```
1 > add responder policylabel lbl-respndr-pol
2 Done
3
```

```
4 > show responder policylabel lbl-respndr-pol
5         Label Name: lbl-respndr-pol
6         Number of bound policies: 0
7         Number of times invoked: 0
8 Done
9 <!--NeedCopy-->
```

**Note:** Invoke this policy label from a policy bank. For more information, see the “Binding a Policy to a Policy Label” section.

### Create a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click **Policy Labels**. The choices are Integrated Caching, Rewrite, Content Switching, or Responder.
2. In the details pane, click **Add**.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for Integrated Caching, in the Evaluates drop-down menu, you would select REQ if you want this policy label to contain request-time policies, or select RES if you want this policy label to contain response-time policies. For Rewrite, you would select a Transform name.
5. Click **Create**.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the “Binding a Policy to a Policy Label” section. A message in the status bar indicates that the policy label is created successfully.

### Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name.** The name of a policy, or, to invoke another policy bank without evaluating a policy, the “dummy” policy name NOPOLICY.

You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

- **Priority.** An integer. This setting can work with the Goto expression.
- **Goto Expression.** Determines the next policy to evaluate in this bank. You can provide one of the following values:

- **NEXT.** Go to the policy with the next higher priority.
- **END.** Stop evaluation.
- **USE\_INVOCATION\_RESULT.** Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
- **Positive number:** The priority number of the next policy to be evaluated.
- **Numeric expression.** An expression that produces the priority number of the next policy to be evaluated.

The Goto can only proceed forward in a policy bank.

If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type.** Designates a policy bank type. The value can be one of the following:
  - **Request Vserver.** Invokes request-time policies that are associated with a virtual server.
  - **Response Vserver.** Invokes response-time policies that are associated with a virtual server.
  - **Policy label.** Invokes another policy bank, as identified by the policy label for the bank.
- **Invocation Name.** The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

## Configure a policy label or virtual server policy bank

September 21, 2020

After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

### Configure a policy label

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to

invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the Citrix ADC command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in [Bind policies using advanced policy](#).
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

### Configure a policy label by using the CLI

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```

1 - bind cache|rewrite|responder policylabel <policylabelName> -
  policyName <policyName> -priority <priority> [-
  gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver
  |resvserver|policylabel <policyLabelName>|<vserverName>]
2
3 - show cache|rewrite|responder policylabel <policylabelName>
4 <!--NeedCopy-->
```

### Example:

```

1 bind cache policylabel _reqBuiltinDefaults -policyName _nonGetReq -
  priority 100
2 Done
3 show cache policylabel _reqBuiltinDefaults
4     Label Name: _reqBuiltinDefaults
5     Evaluates: REQ
6     Number of bound policies: 3
7     Number of times invoked: 0
8     1) Policy Name: _nonGetReq
9        Priority: 100
10     GotoPriorityExpression: END
11     2) Policy Name: _advancedConditionalReq
12        Priority: 200
13     GotoPriorityExpression: END
14
15     3) Policy Name: _personalizedReq
16        Priority: 300
```

```

17          GotoPriorityExpression: END
18 Done
19 <!--NeedCopy-->

```

### Invoke a policy label from a rewrite policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```

1 - bind rewrite global <policyName> <priority> <gotoPriorityExpression>
   -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke
   reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>
2
3 - show rewrite global
4 <!--NeedCopy-->

```

#### Example:

```

1 > bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke
   policylabel lbl-rewrt-pol
2 Done
3 > show rewrite global
4     1)      Global bindpoint: REQ_DEFAULT
5           Number of bound policies: 1
6
7     2)      Global bindpoint: REQ_OVERRIDE
8           Number of bound policies: 1
9 Done
10 <!--NeedCopy-->

```

### Invoke a policy label from an Integrated Caching policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

```

1 - bind cache global NOPOLICY -priority <priority> -
   gotoPriorityExpression <gotopriorityExpression> -type REQ_OVERRIDE|
   REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|
   policylabel <policyLabelName>|<vserverName>
2
3 - show cache global
4 <!--NeedCopy-->

```

**Example:**

```

1 bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -
  type REQ_DEFAULT -invoke policylabel lbl-cache-pol
2 Done
3 > show cache global
4     1)      Global bindpoint: REQ_DEFAULT
5           Number of bound policies: 2
6
7     2)      Global bindpoint: RES_DEFAULT
8           Number of bound policies: 1
9
10 Done
11 <!--NeedCopy-->

```

**Invoke a policy label from a Responder policy bank by using the CLI**

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

```

1 - bind responder global NOPOLICY <priority> <gotopriorityExpression> -
  type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>
  >|<vserverName>
2
3 - show responder global
4 <!--NeedCopy-->

```

**Example:**

```

1 > bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke
  policylabel lbl-respndr-pol
2 Done
3 > show responder global
4     1)      Global bindpoint: REQ_DEFAULT
5           Number of bound policies: 2
6
7 Done
8 <!--NeedCopy-->

```

**Configure a policy label by using the GUI**

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.

2. In the details pane, double-click the label that you want to configure.
3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see [Create or modify a policy](#). Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.
4. For each entry in this policy label, configure the following:
  - **Policy Name:**

This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.
  - **Priority:**

A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.
  - **Expression:**

The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see [Configure advanced policy expressions: Get started](#).
  - **Action:**

The action to be taken if this policy evaluates to TRUE.
  - **Goto Expression:**

Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in [Bind policies using advanced policy](#).
  - **Invoke:**

Optional. Invokes another policy bank.
5. Click **OK**. A message in the status bar indicates that the policy label is configured successfully.

## Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

### Add policies to a virtual server policy bank by using the CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

```

1 - bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <
    policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression
    <expression>] [-type REQUEST|RESPONSE]
2
3 - show lb|cs vserver <virtualServerName>
4 <!--NeedCopy-->

```

### Example:

```

1 add lb vserver vs-cont-sw TCP
2 Done
3 show lb vserver vs-cont-sw
4         vs-cont-sw (0.0.0.0:0) - TCP      Type: ADDRESS
5         State: DOWN
6         Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)
7         Time since last state change: 0 days, 00:02:14.420
8         Effective State: DOWN
9         Client Idle Timeout: 9000 sec
10        Down state flush: ENABLED
11        Disable Primary Vserver On Down : DISABLED
12        No. of Bound Services : 0 (Total)      0 (Active)
13        Configured Method: LEASTCONNECTION
14        Mode: IP
15        Persistence: NONE
16        Connection Failover: DISABLED
17 Done
18 <!--NeedCopy-->

```

### Invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:

```

1 - bind lb|cs vserver <virtualServerName> -policyName NOPOLICY_REWRITE|
    NOPOLICY_CACHE|NOPOLICY_RESPONDER -priority <integer> -type REQUEST|
    RESPONSE -gotoPriorityExpression <gotopriorityExpression> -invoke
    reqVserver|resVserver|policyLabel <vserverName>|<labelName>
2
3 - show lb vserver
4 <!--NeedCopy-->

```

**Example:**

```
1 > bind lb vserver vs-cont-sw -policyname NOPOLICY-REWRITE -priority 200
   -type REQUEST -gotoPriorityExpression NEXT -invoke policyLabel lbl-
   rewrt-pol
2 Done
3 <!--NeedCopy-->
```

**Configure a virtual server policy bank by using the GUI**

1. In the left navigation pane, expand **Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA - Application Traffic**, or **Citrix Gateway**, as appropriate, and then click **Virtual Servers**.
2. In the details pane, select the virtual server that you want to configure, and then click **Open**.
3. In the **Configure Virtual Server** dialog box click the **Policies** tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server's bank of policies, click **Insert Policy**. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY "dummy" policy.
5. To configure an existing entry in this policy bank, enter the following:
  - **Priority:**  
A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.
  - **Expression:**  
The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see [Configuring Advanced Policy Expressions: Getting Started](#).
  - **Action:**  
The action to be taken if this policy evaluates to TRUE.
  - **Goto Expression:**  
Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section "Entries in a Policy Bank" in [Bind policies using advanced policy](#).
  - **Invoke:**  
Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.
6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

## Invoke or remove a policy label or virtual server policy bank

September 21, 2020

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server's policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY “dummy” entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

### Invoke a rewrite or integrated caching policy label by using the CLI

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

```

1 - bind cache global <policy> -priority <positive_integer> [-
    gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|
    RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel
    <label_name>
2
3 - bind rewrite global<policy> -priority <positive_integer> [-
    gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|
    RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel
    <label_name>
4
5 - show cache global|show rewrite global
6 <!--NeedCopy-->

```

### Example:

```

1 > bind cache global _nonPostReq2 -priority 100 -type req_override -
    invoke
2     policylabel lbl-cache-pol
3 Done
4 > show cache global
5     1)      Global bindpoint: REQ_DEFAULT
6           Number of bound policies: 2
7
8     2)      Global bindpoint: RES_DEFAULT

```

```

 9          Number of bound policies: 1
10
11      3)      Global bindpoint: REQ_OVERRIDE
12          Number of bound policies: 1
13
14 Done
15 <!--NeedCopy-->

```

### Invoke a responder policy label by using the CLI

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```

1 - bind responder global <policy_Name> <priority_as_positive_integer>
   [<gotoPriorityExpression>] -type REQ_OVERRIDE|REQ_DEFAULT|OVERRIDE|
   DEFAULT -invoke vserver|policylabel <label_name>
2
3 - show responder global
4 <!--NeedCopy-->

```

#### Example:

```

1 > bind responder global pol404Error1 300 -invoke policylabel lbl-
   respndr-pol
2 Done
3 > show responder global
4      1)      Global bindpoint: REQ_DEFAULT
5          Number of bound policies: 2
6
7 Done
8 <!--NeedCopy-->

```

### Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```

1 - bind lb vserver <vserver_name> -policyName <policy_Name> -priority <
   positive_integer> [-gotoPriorityExpression <expression>] -type
   REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel <
   policy_Label_Name>
2
3 - bind lb vserver <vserver_name>

```

```
4 <!--NeedCopy-->
```

**Example:**

```
1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
2 Done
3
4 > show lb vserver lbvip
5         lbvip (8.7.6.6:80) - HTTP           Type: ADDRESS
6         State: DOWN
7         Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
8         Time since last state change: 28 days, 06:37:49.250
9         Effective State: DOWN
10        Client Idle Timeout: 180 sec
11        Down state flush: ENABLED
12        Disable Primary Vserver On Down : DISABLED
13        Port Rewrite : DISABLED
14        No. of Bound Services : 0 (Total)      0 (Active)
15        Configured Method: LEASTCONNECTION
16        Mode: IP
17        Persistence: NONE
18        Vserver IP and Port insertion: OFF
19        Push: DISABLED  Push VServer:
20        Push Multi Clients: NO
21        Push Label Rule: none
22
23        1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority:
24              100   Hits: 0
25
26        2)      Policy : pol-ssl Priority:0
27        3)      Policy : ns_cmp_msapp Priority:100
28        4)      Policy : cf-pol Priority:1      Inherited
29 Done
30 <!--NeedCopy-->
```

**Remove a rewrite or integrated caching policy label by using the CLI**

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

```
1 - unbind rewrite global <policyName> -priority <positiveInteger> -type
   REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT
2
```

```

3 - unbind cache global <policyName> -priority <positiveInteger> -type
   REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT
4
5 - show rewrite global|show cache global
6 <!--NeedCopy-->

```

**Example:**

```

1 > unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE
2 > show rewrite global
3 Done
4     1)      Global bindpoint: REQ_DEFAULT
5             Number of bound policies: 1
6
7 Done
8 <!--NeedCopy-->

```

**Remove a responder policy label by using the CLI**

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

```

1 - unbind responder global <policyName> -priority <positiveInteger> -
   type OVERRIDE|DEFAULT
2
3 - show responder global
4 <!--NeedCopy-->

```

**Example:**

```

1 > unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT
2 Done
3 > show responder global
4     1)      Global bindpoint: REQ_DEFAULT
5             Number of bound policies: 1
6
7 Done
8 <!--NeedCopy-->

```

**Remove a virtual server policy label by using the CLI**

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

```
1 - unbind lb vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
  NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <
  positiveInteger>
2
3 - unbind cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
  NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <
  positiveInteger>
4
5 - show lb vserver|show cs vserver
6 <!--NeedCopy-->
```

**Example:**

```
1 > unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200
2 Done
3 > show lb vserver lbvip
4         lbvip (8.7.6.6:80) - HTTP          Type: ADDRESS
5         State: DOWN
6         Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)
7         Time since last state change: 28 days, 06:47:54.600
8         Effective State: DOWN
9         Client Idle Timeout: 180 sec
10        Down state flush: ENABLED
11        Disable Primary Vserver On Down : DISABLED
12        Port Rewrite : DISABLED
13        No. of Bound Services : 0 (Total)      0 (Active)
14        Configured Method: LEASTCONNECTION
15        Mode: IP
16        Persistence: NONE
17        Vserver IP and Port insertion: OFF
18        Push: DISABLED  Push VServer:
19        Push Multi Clients: NO
20        Push Label Rule: none
21
22        1)      CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority:
           100   Hits: 0
23
24        1)      Policy : pol-ssl Priority:0
25        2)      Policy : cf-pol Priority:1      Inherited
26 Done
27 <!--NeedCopy-->
```

## Invoke a policy label or virtual server policy bank by using the GUI

1. Bind a policy, as described in [Bind a policy globally](#), [Bind a policy to a virtual server](#), or [Bind a policy to a policy label](#). Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the policy label or virtual server policy bank is invoked successfully.

## Remove a policy label invocation by using the GUI

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

## Configure and bind policies with the policy manager

July 2, 2021

### Warning:

Classic policy expressions are no longer supported from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see [Advanced Policies](#).

Some applications provide a specialized Policy Manager in the Citrix ADC configuration utility to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.

- To remove a policy, tab to the row that contains the policy and press Delete.

**Note:** Note that when you delete the policy, the Citrix ADC searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.

### **Configure policy bindings by using the policy manager**

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.
2. In the details pane, click **Policy Manager**.
3. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy click the Switch to Advanced Policy button.
4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.
5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:
  - **New policy:** Create the policy as described in “[Create or modify a policy](#),” and then configure the priority level, GoTo expression, and policy invocation as described in the table, “[Format of each entry in a policy bank](#).”
  - **Existing policy, NOPOLICY, or NOPOLICY<feature name>:** Configure the priority level, GoTo expression, and policy invocation as described in the table, “[Format of each entry in a policy bank](#).” The **NOPOLICY** or **NOPOLICY<feature name>** options are available only for policies that use Advanced Policies.
6. Repeat the preceding steps to add entries to this policy bank.
7. To modify the priority level for an entry, you can do any of the following:
  - Double-click the Priority field for an entry and edit the value.
  - Click and drag a policy to another row in the table.
  - Click Regenerate Priorities.

In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.

8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:
  - To change the policy, select another policy name or select New Policy and follow the steps in [Create or modify a policy](#).
  - To change the Goto Expression, select Next, End, USE\_INVOCATION\_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.
  - To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in [Bind a policy to a policy label](#).
9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.
10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

### **Remove unused policies by using the policy manager**

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click <Feature Name> policy manager.
3. In the **Feature Name > Policy Manager** dialog box, click **Cleanup Configuration**.
4. In the **Cleanup Configuration** dialog box, select the items that you want to delete, and then click **Remove**.
5. In the Remove dialog box, click **Yes**.
6. Click **Close**. A message in the status bar indicates that the policy is removed successfully.

## **Configuring advanced policy expression: getting started**

July 2, 2021

Advanced policies evaluate data on the basis of information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the Citrix ADC system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some Citrix ADC features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into

an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.

Advanced policy expression can also contain expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the Citrix ADC uses to evaluate a packet in the traffic flowing through it, to extract data from the Citrix ADC system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the Citrix ADC receives. With this knowledge, you can configure policies that match the actual data and enable the Citrix ADC to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

## Basic elements of an advanced policy expression

September 21, 2020

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```
<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]
```

where

- <prefix>

is an anchor point for starting an expression.

The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

```
http.req.header("Content-Type")
```

Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- <operation>

identifies an evaluation that is to be performed on the data identified by the prefix.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html")
```

In this expression, the following is the operator component:

```
eq("text/html")
```

This operator causes the Citrix ADC to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string "text/html." For more information, see "Operations."

- **<compound-operator>**

is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html") && http.req.url.contains(".html")
```

## Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- Citrix ADC system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- **CLIENT:**
  - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
    - The prefix `client.ip.dst` designates the destination IP address in the request or response.
    - The prefix `client.ip.src` designates the source IP address.
- **HTTP:**
  - Identifies an element in an HTTP request or a response, as in the following examples:
    - The prefix `http.req.body(integer)` designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
    - The prefix `http.req.header("header_name")` designates an HTTP header, as specified in `header_name`.

- The prefix `http.req.url` designates an HTTP URL in URL-encoded format.

- **SERVER:**

Identifies an element in the server that is either processing a request or sending a response.

- **SYS:**

Identifies a characteristic of the Citrix ADC that is processing the traffic.

**Note:** Note that DNS policies support only SYS, CLIENT, and SERVER objects.

In addition, in the Citrix Gateway, the Clientless VPN function can use the following types of prefixes:

- **TEXT:**

Identifies any text element in a request or a response.

- **TARGET:**

Identifies the target of a connection.

- **URL:**

Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the Citrix ADC feature. The following table describes the expression prefixes that are of interest on a per-feature basis

| Feature                          | Types of Expression Prefix Used in the Feature |
|----------------------------------|------------------------------------------------|
| DNS                              | SYS, CLIENT, SERVER                            |
| Responder in Protection Features | HTTP, SYS, CLIENT                              |
| Content Switching                | HTTP, SYS, CLIENT                              |

| Feature                           | Types of Expression Prefix Used in the Feature    |
|-----------------------------------|---------------------------------------------------|
| Rewrite                           | HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN |
| Integrated Caching                | HTTP, SYS, CLIENT, SERVER                         |
| Citrix Gateway, Clientless Access | HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN |

Table 1. Permitted Types of Expression Prefixes in Various Citrix ADC Features

**Note:** For details on the permitted expression prefixes in a feature, see the documentation for that feature.

### Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- **true.** An Advanced policy expression can consist simply of the value true. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- **false.** An Advanced policy expression can consist simply of the value false. This type of expression always returns a value of FALSE.
- **A prefix for a compound expression.** For example, the prefix HTTP.REQ.HOSTNAME is a complete expression that returns a host name and HTTP.REQ.URL is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

### Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

```
http.req.url
```

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.

- Evaluate the length of the URL.
- Search for a string in the URL that indicates a time stamp and convert it to GMT.

The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string "www.mycompany.com" as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

### Basic operations on expression prefixes

The following table describes a few of the basic operations that can be performed on expression prefixes.

| Operation          | Determines Whether or Not                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------|
| CONTAINS(<string>) | The object matches <string>. Following is an example: <code>http.req.header("Cache-Control").contains("no-cache")</code>  |
| EXISTS             | A particular item is present in an object. Following is an example: <code>http.res.header("MyHdr").exists</code>          |
| EQ(<text>)         | A particular non-numeric value is present in an object. Following is an example: <code>http.req.method.eq(post)</code>    |
| EQ(<integer>)      | A particular numeric value is present in an object. Following is an example: <code>client.ip.dst.eq(10.100.10.100)</code> |
| LT(<integer>)      | An object's value is less than a particular value. Following is an example: <code>http.req.content_length.lt(5000)</code> |
| GT(<integer>)      | An object's value is greater than a particular value. Following is an example: <code>http.req.content_length.gt(5)</code> |

The following table summarizes a few of the available types of operations.

| Operation Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Text operations    | Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string "XYZ" from "XYZSomeText". Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: Transform a string into an integer value, create a list from the query strings in a URL, and transform a string into a time value. |
| Numeric operations | Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Compound advanced policy expressions

July 22, 2021

You can configure an Advanced policy expression that contains Boolean or arithmetic operators and multiple atomic operations. The following compound expression contains a boolean AND:

```
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```
http.req.url.length + http.req.cookie.length \<= 500
```

A compound expression can contain any number of logical and arithmetic operators. The following expression evaluates the length of an HTTP request on the basis of its URL and cookie, evaluates text in the header, and performs a Boolean AND on these two results:

```
http.req.url.length + http.req.cookie.length \<= 500 && http.req.header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.

## Booleans in compound expressions

You configure compound expressions with the following operators:

- `&&`.

This operator is a logical AND. For the expression to evaluate to TRUE, all components that are joined by the And must evaluate to TRUE. Following is an example:

```
http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists
```

- This operator is a logical OR. If any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE.

- `!`.

Performs a logical NOT on the expression.

In some cases, the Citrix ADC configuration utility offers AND, NOT, and OR operators in the Add Expression dialog box. However, these are of limited use. Citrix recommends that you use the operators `&&`,

, and `!` to configure compound expressions that use Boolean logic.

## Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

```
http.req.url.contains("myCompany.com") || (http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists)
```

The following is another example:

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists || http.req.header("Content-Length").exists)
```

## Compound operations for strings

The following table describes operators that you can use to configure compound operations on string data.

| Operations that produce a string value | Description                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>str + str</code>                 | Concatenates the value of the expression on the left of the operator with the value on the right. Following is an example: <code>http.req.hostname + http.req.url.protocol</code>                                     |
| <code>str + num</code>                 | Concatenates the value of the expression on the left of the operator with a numeric value on the right. Following is an example: <code>http.req.hostname + http.req.url.content_length</code>                         |
| <code>num + str</code>                 | Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Following is an example: <code>http.req.url.content_length + http.req.url.hostname</code>         |
| <code>str + ip</code>                  | Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Following is an example: <code>http.req.hostname + 10.00.000.00</code>                        |
| <code>ip + str</code>                  | Concatenates the IP address value of the expression on the left of the operator with a string value on the right. Following is an example: <code>client.ip.dst + http.req.url.hostname</code>                         |
| <code>str1 ALT str2</code>             | Uses string2 if the evaluation of string1 results in an undef exception or the result is a null string; otherwise uses string1 and never evaluates string2. Example: <code>http.req.hostname alt client.ip.src</code> |

| Operations on strings that produce a result of TRUE or FALSE | Description                                                                                                                                                                 |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>str == str</code>                                      | Evaluates whether the strings on either side of the operator are the same. Following is an example: <code>http.req.header("myheader") == http.res.header("myheader")</code> |
| <code>str &lt;= str</code>                                   | Evaluates whether the string on the left side of the operator is the same as the string on the right, or precedes it alphabetically.                                        |
| <code>str &gt;= str</code>                                   | Evaluates whether the string on the left side of the operator is the same as the string on the right, or follows it alphabetically.                                         |
| <code>str &lt; str</code>                                    | Evaluates whether the string on the left side of the operator precedes the string on the right alphabetically.                                                              |
| <code>str &gt; str</code>                                    | Evaluates whether the string on the left side of the operator follows the string on the right alphabetically.                                                               |
| <code>str != str</code>                                      | Evaluates whether the strings on either side of the operator are different.                                                                                                 |

---

---

| Logical operations on strings     | Description                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>bool &amp;&amp; bool</code> | This operator is a logical AND. When evaluating the components of the compound expression, all components that are joined by the AND must evaluate to TRUE. Following is an example: <code>http.req.method.ec &amp;&amp; http.req.url.query.contains("my_pagelabel")</code> |
| <code>bool    bool</code>         | This operator is a logical OR. When evaluating the components of the compound expression, if any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE. Following is an example: <code>http.req.url.contains(".js")</code>  |
| <code>bool</code>                 | Performs a logical NOT on the expression.                                                                                                                                                                                                                                   |

---

## Compound operations for numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

```
http.req.header.length + http.req.url.length
```

The following table describes operators that you can use to configure compound expressions for numeric data.

| Arithmetic operations on numbers |                                                                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                  | Description                                                                                                                                                                                  |
| num + num                        | Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example: <code>http.req.content_length + http.req.url.length</code> |
| num - num                        | Subtract the value of the expression on the right of the operator from the value of the expression on the left.                                                                              |
| num x num                        | Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example: <code>client.interface.rxtraffic * 9</code>         |
| num / num                        | Divide the value of the expression on the left of the operator by the value of the expression on the right.                                                                                  |

---

**Arithmetic operations**

on numbers

Description

**num % num**

Calculate the modulo, or the numeric remainder on a division of the value of the expression on the left of the operator by the value of the expression on the right. For example, the values “15 mod 4” equals 3, and “12 mod 4” equals 0.

**~number**

Returns a number after applying a bitwise logical negation of the number. The following example assumes that numeric.expression returns 12 (binary 1100): ~numeric.expression. The result of applying the ~ operator is -11 (a binary 1110011, 32 bits total with all ones to the left). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

## Arithmetic operations

on numbers

Description

`number ^ number`

Compares two bit patterns of equal length and performs an XOR operation on each pair of corresponding bits in each number argument, returning 1 if the bits are different, and 0 if they are the same. Returns a number after applying a bitwise XOR to the integer argument and the current number value. If the values in the bitwise comparison are the same, the returned value is a 0. The following example assumes that `numeric.expression1` returns 12 (binary 1100) and `numeric.expression2` returns 10 (binary 1010): `numeric.expression1 ^ numeric.expression2` The result of applying the ^ operator to the entire expression is 6 (binary 0110). Note that all returned values of less than 32 bits before applying

the operator implicitly have zeros to the left to make them 32 bits wide.

---

**Arithmetic operations**

on numbers

Description

number | number

Returns a number after applying a bitwise OR to the number values. If either value in the bitwise comparison is a 1, the returned value is a 1. The following example assumes that `numeric.expression1` returns 12 (binary 1100) and `numeric.expression2` returns 10 (binary 1010): `numeric.expression1`

`numeric.expression2`The operator to the entire result of applying the expression is 14 (binary 1110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

---

**Arithmetic operations**

on numbers

Description

**number & number**

Compares two bit patterns of equal length and performs a bitwise AND operation on each pair of corresponding bits, returning 1 if both of the bits contains a value of 1, and 0 if either bits are 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1 & numeric.expression2 The whole expression evaluates to 8 (binary 1000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

---

**Arithmetic operations**

on numbers

Description

---

num « num

Returns a number after a bitwise left shift of the number value by the right-side number argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: numeric.expression1 « numeric.expression2 The result of applying the LSHIFT operator is 96 (a binary 1100000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.

 Numeric operators that produce a result of TRUE or FALSE

Description

num == num

Determine if the value of the expression on the left of the operator is equal to the value of the expression on the right.

| Numeric operators that produce a result of TRUE or FALSE | Description                                                                                                                                |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| num != num                                               | Determine if the value of the expression on the left of the operator is not equal to the value of the expression on the right.             |
| num > num                                                | Determine if the value of the expression on the left of the operator is greater than the value of the expression on the right.             |
| num < num                                                | Determine if the value of the expression on the left of the operator is less than the value of the expression on the right.                |
| num >= num                                               | Determine if the value of the expression on the left of the operator is greater than or equal to the value of the expression on the right. |
| num <= num                                               | Determine if the value of the expression on the left of the operator is less than or equal to the value of the expression on the right.    |

### Functions for data types in the policy infrastructure

The Citrix ADC policy infrastructure supports the following numeric data types:

- Integer (32 bits)
- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Therefore, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string ul to the number. Literal constants of type double contain a period (.), an exponent, or both.

### Arithmetic Operators, Logical Operators, and Type Promotion

In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, \*, and /

---

%, ~, ^, &,

, <<, and >> (do not apply to double)

---

- 
- ==, !=, >, <, >=, and <=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double, type promotion is performed so that the operation can be performed on operands of the same type. A type of lower precedence is automatically promoted to the type of the operand with the highest precedence involved in the operation. The order of precedence (higher to lower) is as follows:

- Double
- Unsigned long
- Integer

Therefore, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is performed even in simple expressions in which the type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. To illustrate such an example, in the operation `HTTP.REQ.CONTENT_LENGTH.DIV(3ul)`, the integer returned by the prefix `HTTP.REQ.CONTENT_LENGTH` is automatically converted to unsigned long (the type of the data passed as the argument to the `DIV()` function), and an unsigned long division is performed. Similarly, the argument can be promoted in an expression. For example, `HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5)` promotes the integer 5 to type double and performs double-precision division.

For information about expressions for casting data of one type to data of another type, see [Typecasting data](#).

## Specify the character set in expressions

September 21, 2020

The policy infrastructure on the Citrix® Citrix ADC® appliance supports the ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. However, you must specify the character set in every simple expression that is meant for UTF-8 traffic. To specify the

UTF-8 character set in a simple expression, you must include the SET\_CHAR\_SET(<charset>) function, with <charset> specified as UTF\_8, as shown in the following examples:

```

1 HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8).CONTAINS("ß")
2
3 HTTP.RES.BODY(100).SET_CHAR_SET(UTF_8).BEFORE_STR("Bücher").AFTER_STR("
  Wörterbuch")
4 <!--NeedCopy-->

```

In an expression, the SET\_CHAR\_SET() function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression HTTP.REQ.BODY(1000).AFTER\_REGEX(re/following example/).BEFORE\_REGEX(re/In the preceding example/).CONTAINS\_ANY("Greek\_alphabet"), if the strings stored in the pattern set "Greek\_alphabet" are in UTF-8, you must include the SET\_CHAR\_SET(UTF\_8) function immediately before the CONTAINS\_ANY("<string>") function, as follows:

```

HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In
the preceding example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("Greek_alphabet")

```

The SET\_CHAR\_SET() function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another SET\_CHAR\_SET() function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the SET\_CHAR\_SET(UTF\_8) function immediately after functions that identify text (for example, the HEADER("<name>") or BODY(<int>) functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the AFTER\_REGEX() and BEFORE\_REGEX() functions are changed to UTF-8 strings, you can include the SET\_CHAR\_SET(UTF\_8) function immediately after the BODY(1000) function, as follows:

```

HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEX(re/Bücher/).BEFORE_REGEX
(re/Wörterbuch/).CONTAINS_ANY("Greek_alphabet")

```

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

### Compound expressions with different character sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:

```
HTTP.REQ.HEADER("MyHeader")== HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)
```

However, when processing the compound expression, just before evaluating the “is equal to” Boolean operator, the Citrix ADC appliance promotes the character set of the value returned by HTTP.REQ.HEADER(“MyHeader”) to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the Citrix ADC appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by HTTP.REQ.BODY(10) to UTF-8.

```
HTTP.REQ.BODY(10)+ HTTP.REQ.HEADER("MyHeader").SET_CHAR_SET(UTF_8)
```

Consequently, the compound expression returns data in the UTF-8 character set.

### **Specify the character set based on the character set of traffic**

You can set the character set to UTF-8 on the basis of traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of “charset” in the request’s Content-Type header for “UTF-8” before checking whether the first 1000 bytes in the request contain the UTF-8 string Bücher:

```
HTTP.REQ.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).TYPECAST_NVLIST_T  
( '=', ' ; ', ' ' ).VALUE("charset").EQ("UTF-8")&& HTTP.REQ.BODY(1000).SET_CHAR_SET  
(UTF_8).CONTAINS("Bücher")
```

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

### **Character and string literals in expressions**

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (‘’) and quotation marks (“”), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

#### **Note:**

The string literals in advanced policy expressions are now as long as the policy expression. The expression is allowed to be 1499 or 8191 bytes long.

## Values in hexadecimal and octal formats

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regardless of whether the value is entered manually or pasted from the clipboard. For example, “\xce\x20” is an invalid UTF-8 character because “c8” cannot be followed by “20” (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is “\xce\xa9,” since the hexadecimal characters are separated by a white-space character.

## Functions that return UTF-8 strings

Only the

<text>.XPATH and

<text>.XPATH\_JSON functions always return UTF-8 strings. The following MySQL routines determine at runtime which character set to return, depending on the data in the protocol:

- MYSQL\_CLIENT\_T.USER
- MYSQL\_CLIENT\_T.DATABASE
- MYSQL\_REQ\_QUERY\_T.COMMAND
- MYSQL\_REQ\_QUERY\_T.TEXT
- MYSQL\_REQ\_QUERY\_T.TEXT(<unsigned int>)
- MYSQL\_RES\_ERROR\_T.SQLSTATE
- MYSQL\_RES\_ERROR\_T.MESSAGE
- MYSQL\_RES\_FIELD\_T.CATALOG
- MYSQL\_RES\_FIELD\_T.DB
- MYSQL\_RES\_FIELD\_T.TABLE
- MYSQL\_RES\_FIELD\_T.ORIGINAL\_TABLE
- MYSQL\_RES\_FIELD\_T.NAME
- MYSQL\_RES\_FIELD\_T.ORIGINAL\_NAME
- MYSQL\_RES\_OK\_T.MESSAGE
- MYSQL\_RES\_ROW\_T.TEXT\_ELEM(<unsigned int>)

## Terminal connection settings for UTF-8

When you set up a connection to the Citrix ADC appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

## Classic expressions in advanced policy expressions

September 21, 2020

**Warning**

Classic policy expressions are no longer supported from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see [Configure advanced policy expressions: Get started](#).

Classic expressions describe basic characteristics of traffic. In some cases, you may want to use a classic expression in an Advanced policy expression are no longer supported from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies topic. You can do so with the Advanced policy expression configuration tool. This can be helpful when manually migrating the older classic expressions to the Advanced policy.

Note that when you upgrade the Citrix ADC to version 9.0 or higher, Integrated Caching policies are automatically upgraded to Advanced policies, and the expressions in these policies are upgraded to the Advanced policies.

The following is the syntax for all Advanced policy expressions that use a classic expression:

```
SYS.EVAL_CLASSIC_EXPR("expression")
```

**Note**

The syntax and the metadata for the SYS.EVAL\_CLASSIC\_EXPR expression is getting deprecated. You can manually convert or use nspepi tool to convert the Classic expression to advanced expression.

Following are examples of the SYS.EVAL\_CLASSIC\_EXPR("expression") expression:

```
1 sys.eval_classic_expr("req.ssl.client.cipher.bits > 1000")
2 sys.eval_classic_expr("url contains abc")
3 sys.eval_classic_expr("req.ip.sourceip == 10.102.1.61 -netmask
   255.255.255.255")
4 sys.eval_classic_expr("time >= *:30:00GMT")
5 sys.eval_classic_expr("e1 || e2")
6 sys.eval_classic_expr("req.http.urlllen > 50")
7 sys.eval_classic_expr("dayofweek == wedGMT")
8 <!--NeedCopy-->
```

## Configure advanced policy expressions in a policy

September 21, 2020

You can configure an Advanced policy expression of up to 1,499 characters in a policy. The user interface for Advanced policy expressions depends to some extent on the feature for which you are con-

figuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (“ . . ” or ‘ . . ’). Within an expression, you escape additional quotation marks by using a back-slash (). For example, the following are standard methods for escaping quotation marks in an expression:

```
"\"abc\""
```

```
'\"abc\"'
```

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression `http.req.url.contains("\?")` requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression `'http.req.url.contains("\\http")'`), the escape characters are echoed on the command line.

To make an entry more readable, you can escape the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: /{<

```
~$^+=&%@'?
```

You enter only the special character at the end of the expression, as follows:

```
1 q@http.req.url.contains("sometext") && http.req.cookie.exists@
2
3 q~http.req.url.contains("sometext") && http.req.cookie.exists~
4 <!--NeedCopy-->
```

Note that an expression that uses the { delimiter is closed with }.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other advanced policy expression features are available. To use arithmetic operators, write your expressions in free-form format.

## Configure an Advanced policy syntax rule by using the CLI

**Note:**

Default syntax policy is now renamed as Advanced policy.

At the command prompt, type the following commands to configure a default syntax rule and verify the configuration:

1. `add cache|dns|rewrite|cs policy policyName **rule** expression featureSpecificPa  
**action**`
2. `show cache|dns|rewrite|cs policy policyName`

Following is an example of configuring a caching policy:

**Example:**

```

1 > add cache policy pol-cache -rule http.req.content_length.le(5) -
  action INVALID
2 Done
3
4 > show cache policy pol-cache
5 Name: pol-cache
6 Rule: http.req.content_length.le(5)
7 CacheAction: INVALID
8 Invalidate groups: DEFAULT
9 UndefAction: Use Global
10 Hits: 0
11 Undef Hits: 0
12
13 Done
14 <!--NeedCopy-->

```

**Configure a default syntax policy expression by using the GUI**

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click **Policies**.
2. Click Add.
3. For most features, click in the **Expression** field. For content switching, click **Configure**.
4. Click the **Prefix** icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.
5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.

6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

```
HTTP.REQ.BODY(1000).BETWEEN("this","that")
```

To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars,

7. `HTTP.REQ.URL.EQ("www.mycompany.com") || HTTP.REQ.BODY(1000).BETWEEN("this", "that")`
8. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.
9. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The **Add Expression** dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click **OK**.
10. When finished, click **Create**. A message in the status bar indicates that the policy expression is configured successfully.

### Test a default syntax expression by using the GUI

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.
2. Select a policy and click **Open**.
3. To test the expression, click the Evaluate icon (the check mark).
4. In the expression evaluator dialog box, select the Flow Type that matches the expression.

5. In the **HTTP Request Data** or **HTTP Response Data** field, paste the HTTP request or response that you want to parse with the expression, and click **Evaluate**. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.
6. Click **Close** to close this dialog box.

## Configure named advanced policy expressions

September 21, 2020

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

- ThisExpression:

```
http.req.body(100).contains("this")
```

- ThatExpression:

```
http.req.body(100).contains("that")
```

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

---

|                |                |
|----------------|----------------|
| ThisExpression | ThatExpression |
|----------------|----------------|

---

You can use the name of an advanced policy expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

### Example 1: Simple Named Expression as a Prefix

The following simple named expression, which identifies a text string, can be used as a prefix to the AFTER\_STR("<string>") function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is top1KB, you can use top1KB.AFTER\_STR("username") instead of HTTP.REQ.BODY(1000).AFTER\_STR("username").

## Example 2: Compound named expression as a prefix

You can create a compound named expression called `basic_header_value` to concatenate the user name in a request, a colon (:), and the user's password, as follows:

```
add policy expression basic_header_value "HTTP.REQ.USER.NAME + \":\" + HTTP.REQ.USER.PASSWD"
```

You can then use the name of the expression in a rewrite action, as shown in the following example:

```
add rewrite action insert_b64encoded_authorization insert_http_header
authorization '"Basic " + basic_header_value.b64encode'-bypassSafetyCheck
YES
```

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite

## Configure a named default syntax expression by using the CLI

At the command prompt, type the following commands to configure a named expression and verify the configuration:

```
1 - add policy expression <name>\<value>
2
3 - show policy expression <name>
4 <!--NeedCopy-->
```

### Example:

```
1 > add policy expression myExp "http.req.body(100).contains(\"the other
   \")"
2 Done
3
4 > show policy expression myExp
5     1)      Name: myExp  Expr: "http.req.body(100).contains("the other"
   )"  Hits: 0  Type : ADVANCED
6 Done
7 <!--NeedCopy-->
```

The expression can be up to 1,499 characters.

## Configure a named expression by using the GUI

1. In the navigation pane, expand **AppExpert**, and then click **Expressions**.
2. Click **Advanced Expressions**.
3. Click **Add**.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in [Configure advanced policy expression](#). A message in the status bar indicates that the policy expression is configured successfully.

## Configure advanced policy expressions outside the context of a policy

September 21, 2020

A number of functions, including the following, can require an advanced policy expression that is not part of a policy:

- **Integrated Caching selectors:**  
You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.
- **Load Balancing:**  
You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.
- **Rewrite actions:**  
Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.
- **Rate-based policies:**  
You use advanced policy expressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

## Configure an advanced policy expression outside a policy by using the CLI (cache selector example)

At the command prompt, type the following commands to configure an advanced policy expression outside a policy and verify the configuration:

```

1 - add cache selector \<selectorName\> \<rule\>
2 - show cache selector \<selectorName\>
3 <!--NeedCopy-->

```

**Example:**

```

1 > add cache selector mainpageSelector "http.req.cookie.value(\"ABC_def
   \")"
2   "http.req.url.query.value(\"_ghi\")"selector "mainpageSelector"
   added
3 Done
4 > show cache selector mainpageSelector
5     Name: mainpageSelector
6     Expressions:
7         1) http.req.cookie.value("ABC_def")
8         2) http.req.url.query.value("_ghi")
9 Done
10 <!--NeedCopy-->

```

Following is an equivalent command that uses the more readable q delimiter, as described in [Configure advanced policy expressions in a policy](#):

```

1 > add cache selector mainpageSelector2 q~http.req.cookie.value("ABC_def
   ")~
2   q~http.req.url.query.value("_ghi")~selector "mainpageSelector2"
   added
3 Done
4 > show cache selector mainpageSelector2
5     Name: mainpageSelector2
6     Expressions:
7         1) http.req.cookie.value("ABC_def")
8         2) http.req.url.query.value("_ghi")
9 Done
10 <!--NeedCopy-->

```

**Advanced policy expressions: evaluating text**

September 21, 2020

You can configure a policy with an advanced policy expression that evaluates text in a request or response. Advanced policy text expressions can range from simple expressions that perform string

matching in HTTP headers to complex expressions that encode and decode text. You can configure text expressions to be case sensitive or case insensitive and to use or ignore spaces. You can also configure complex text expressions by combining text expressions with Boolean operators.

You can use expression prefixes and operators for evaluating HTTP requests, HTTP responses, and VPN and Clientless VPN data. However, text expression prefixes are not restricted to evaluating these elements of your traffic.

## About text expressions

September 21, 2020

You can configure various expressions for working with text that flows through the Citrix ADC appliance. Following are some examples of how you can parse text by using a default syntax expression:

- Determine that a particular HTTP header exists.  
For example, you may want to identify HTTP requests that contains a particular Accept-Language header for the purpose of directing the request to a particular server.
- Determine that a particular HTTP URL contains a particular string.  
For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.
- Identify a POST request that is directed to a particular application.  
For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

Note that there are specialized tools for viewing the data stream for HTTP requests and responses. You can use the tools to view the data stream.

### About operations on text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:

```
http.req.header("myHeader").contains("some-text")
```

Following expressions are examples of matching a file type in a request:

```
http.req.url.suffix.contains("jpeg")
```

```
http.req.url.suffix.eq("jpeg")
```

In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

**Note:**

Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- [Pattern sets and data sets.](#)
- [Regular expressions.](#)
- [Typecasting data.](#)

## Compounding and precedence in text expressions

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

```
http.req.hostname + http.req.url
```

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

```
http.req.method.eq(post)&& http.req.body(1024).startswith("destination=")
```

**Note:**

For more information on operators for compounding, see [Compound default syntax expressions.](#)

## Categories of text expressions

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.  
For more information, see [Expression prefixes for text in HTTP requests and responses.](#)
- Information regarding a VPN or a clientless VPN.  
For more information, see [Expression prefixes for VPNs and clientless VPNs.](#)

- TCP payload information.

For more information about TCP payload expressions, see [Default syntax expressions: Parsing HTTP, TCP, and UDP data](#).

- Text in a Secure Sockets Layer (SSL) certificate.

For information about text expressions for SSL and SSL certificate data, see [Default syntax expressions: Parsing SSL certificates](#) and [Expressions for SSL certificate dates](#).

**Note:**

Parsing a document body, such as the body of a POST request, can affect performance. You may want to test the performance impact of policies that evaluate a document body.

### Guidelines for text expressions

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```
HTTP.REQ.HEADER("Example").TYPECAST_LIST_T(',').GET(1)
```

(For more information on typecasting, see [Typecasting data](#). The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```
HTTP.REQ.HEADER("Example").AFTER_STR(",").BEFORE_STR(",")
```

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```
HTTP.REQ.HEADER("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```
HTTP.REQ.HEADER("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see [Regular expressions](#).

## Expression prefixes for text in HTTP requests and responses

September 21, 2020

An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

Refer to the [Expression Prefix](#) table for information on how to configure and extract text from different parts of an HTTP request or response.

## Expression prefixes for VPNs and clientless VPNs

September 21, 2020

The Advanced policy engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see [Expressions for extracting segments of URLs](#)

For information about VPN expression prefixes, see [VPN expression table](#).

## Basic operations on text

September 21, 2020

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

### String comparison functions

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

---

| Function                                             | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.CONTAINS(&lt;string&gt;)</code>   | Returns a Boolean TRUE value if the target contains <code>&lt;string&gt;</code> . Example:<br><code>http.req.url.contains(".jpeg")</code>                                                                                                                                                                                                                                                       |
| <code>&lt;text&gt;.EQ(&lt;string&gt;)</code>         | Returns a Boolean TRUE value if the target is an exact match with <code>'</code> . For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc":<br><code>'http.req.url.hostname.eq("myhostabc")'</code>                                                                                                                                              |
| <code>&lt;text&gt;.STARTSWITH(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the target begins with <code>&lt;string&gt;</code> . For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc":<br><code>http.req.url.hostname.startswith("myhost")</code>                                                                                                                                         |
| <code>&lt;text&gt;.ENDSWITH(&lt;string&gt;)</code>   | Returns a Boolean TRUE value if the target ends with <code>&lt;string&gt;</code> . For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc":<br><code>http.req.url.hostname.endswith("abc")</code>                                                                                                                                                |
| <code>&lt;text&gt;.NE(&lt;string&gt;)</code>         | Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets. |

| Function                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.GT(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets.             |
| <code>&lt;text&gt;.GE(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets. |
| <code>&lt;text&gt;.LT(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets.              |
| <code>&lt;text&gt;.LE(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets.  |

## Calculate the length of a string

The `<text>.LENGTH` operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

```
<text>.LENGTH
```

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:

```
HTTP.REQ.URL.LENGTH < 500
```

After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see [Default Syntax Expressions: Working with Dates, Times, and Numbers](#).

## Consider, ignore, and change text case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

| Function                                             | Description                                                                                                                                                                    |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.SET_TEXT_MODE (IGNORECASE)</code> | NOIGNORECASE) This function turns case sensitivity on or off for all text operations.                                                                                          |
| <code>&lt;text&gt;.TO_LOWER</code>                   | Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string "ABCd:" is converted to "abcd:". |
| <code>&lt;text&gt;.TO_UPPER</code>                   | Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string "abcD:" is converted to "ABCD:".                                           |

## Strip specific characters from a string

You can use the `STRIP_CHARS(<string>)` function to remove specific characters from the text that is returned by a default syntax expression prefix (the input string). All instances of the characters that

you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression `CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS("._")`, the `STRIP_CHARS(<string>)` function strips all periods (.), hyphens (-), and underscores (\_) from the domain name returned by the prefix `CLIENT.UDP.DNS.DOMAIN`. If the domain name that is returned is "a.dom\_ai\_n-name", the function returns the string "adomainname".

In the following example, the resulting string is compared with a pattern set called "listofdomains":

```
CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS("._").CONTAINS_ANY("listofdomains")
```

**Note:** You cannot perform a rewrite on the string that is returned by the `STRIP_CHARS(<string>)` function.

The following functions strip matching characters from the beginning and end of a given string input.

| Function                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.STRIP_START_CHARS(s)</code> | Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is <code>TestLang</code> and <code>:/en_us:is its value,HTTP.RES.HEADER("TestLang").STRIP_START_CHARS(":"</code> the specified characters from the beginning of the value of the header until the first non-matching character <code>e</code> is found and returns <code>sen_us: as a string.</code> |
| <code>&lt;text&gt;.STRIP_END_CHARS(s)</code>   | Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is <code>TestLang</code> and <code>:/en_us:is its value,HTTP.RES.HEADER("TestLang").STRIP_START_CHARS(":"</code> the specified characters from the end of the value of the header until the first non-matching character <code>s</code> is found and returns <code>:/_en_us as a string.</code>               |

## Append a string to another string

You can use the APPEND() function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argument can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the + operator.

## Complex operations on text

September 21, 2020

In addition to performing simple string matching, you can configure expressions that examine more complex aspects of text, including examining the length of a string and looking within a text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

## Operations on the length of a string

The following operations extract strings on the basis of a character count.

| Character Count Operation                                            | Description                                                                                                                                                                                                |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.TRUNCATE(&lt;count&gt;)</code>                    | Returns a string after truncating the end of the target by the number of characters in <code>&lt;count&gt;</code> . If the entire string is shorter than <code>&lt;count&gt;</code> , nothing is returned. |
| <code>&lt;text&gt;.TRUNCATE(&lt;character&gt;, &lt;count&gt;)</code> | Returns a string after truncating the text after <code>&lt;character&gt;</code> by the number of characters specified in <code>&lt;count&gt;</code> .                                                      |
| <code>&lt;text&gt;.PREFIX(&lt;character&gt;, &lt;count&gt;)</code>   | Selects the longest prefix in the target that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code> .                                                                       |

| Character Count Operation                                                 | Description                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.SUFFIX(&lt;character&gt;, &lt;count&gt;)</code>        | Selects the longest suffix in the target that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code> . For example, consider the following response body: JLEwx. The following expression returns a value of "JLEwx": <code>http.res.body(100).suffix('L',1)</code> The following expression returns "LLEwx": <code>http.res.body(100).suffix('L',2)</code> |
| <code>&lt;text&gt;.SUBSTR(&lt;starting_offset&gt;, &lt;length&gt;)</code> | Select a string with <code>&lt;length&gt;</code> number of characters from the target object. Begin extracting the string after the <code>&lt;starting_offset&gt;</code> . If the number of characters after the offset are fewer than the value of the <code>&lt;length&gt;</code> argument, select all the remaining characters.                                                        |
| <code>&lt;text&gt;.SKIP(&lt;character&gt;, &lt;count&gt;)</code>          | Select a string from the target after skipping over the longest prefix that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code> .                                                                                                                                                                                                                        |

## Operations on a portion of a string

Refer to the [String operations table](#) to know how to extract a subset of a larger string by using one of the operations.

## Operations for comparing the alphanumeric order of two strings

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries.

This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between "abc" and "abd" is -1 (based on the third pair-wise character comparison).
- The difference between "@" and "abc" is -33.
- The difference between "1" and "abc" is -47.

Following is the syntax for the COMPARE operation.

```
<text>.COMPARE(<string>)
```

### **Extract an integer from a string of bytes that represent text**

Refer to the [Integer extraction table](#) to know how to treat a string of bytes that represent text as a sequence of bytes, extract 8, 16, or 32 bits from the sequence, and then convert the extracted bits to an integer.

### **Convert text to a hash value**

You can convert a text string to a hash value by using the HASH function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

```
<text>.HASH
```

This function ignores case and white spaces. For example, after the operation, the two strings Ab c and a bc would produce the same hash value.

### **Encode and decode text by applying the Base64 encoding algorithm**

The following two functions encode and decode a text string by applying the Base64 encoding algorithm

| Function       | Description                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| text.B64ENCODE | Encodes the text string (designated by text) by applying the Base64 encoding algorithm.                                                                               |
| text.B64DECODE | Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an UNDEF if text is not in B64-encoded format. |

### **Refine the search in a rewrite action by using the EXTEND function**

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND(m,n), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:

- The search is performed by using patterns or patterns sets (not regular expressions)
- The rewrite action evaluates only the bodies of HTTP packets.

Additionally, the EXTEND function can be used only with the following types of rewrite actions:

- replace\_all
- insert\_after\_all
- delete\_all
- insert\_before\_all

For example, you might want to delete all instances of “<http://exampleurl.com/>” and “<http://exampleurl.au/>” in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string exampleurl, extend the scope of the search on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

```
add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)'  
-pattern exampleurl -refineSearch 'extend(20,50).regex_select(re##http://exampleurl  
. (com|au)##)'
```

## Convert text to hexadecimal format

The following function converts text to hexadecimal format and extracts the resulting string:

```
<text>.BLOB_TO_HEX(<string>)
```

For example, this function converts the byte string “abc” to “61:62:63”.

## Encrypt and decrypt text

In default syntax expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given Citrix ADC appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same Citrix ADC appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is

set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

**Note:** You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see [Encrypt and decrypt XML payloads](#).

### Configure encryption

During startup, the appliance runs the `set ns encryptionParams` command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the Citrix ADC configuration file. Consequently, the AES256 encryption method is enabled for the ENCRYPT and DECRYPT functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

You can run the `set ns encryptionParams` command manually, or use the configuration utility, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the method parameter, as shown in “**Example 1: Changing the Encryption Method.**” If you want the appliance to generate a new key value for the current encryption method, set the method parameter to the current encryption method and the `keyValue` parameter to an empty string (“”), as shown in “**Example 2: Generating a New Key Value for the Current Encryption Method.**” After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

### Configure encryption by using the GUI

1. Navigate to **System > Settings**.
2. In the **Settings** area, click **Change Encryption** parameters.
3. In the **Change Encryption Parameters** dialog box, do one of the following:
  - To change the encryption method, in the Method list, select the encryption method that you want.
  - To generate a new key value for the current encryption method, click Generate a new key for the selected method.
4. Click **OK**.

### Use the ENCRYPT and DECRYPT functions

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRYPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
1 add rewrite action my-cookie-encrypt-action replace "HTTP.RES.  
   SET_COOKIE.COOKIE("MyCookie").VALUE(0)" "HTTP.RES.SET_COOKIE.COOKIE(  
   "MyCookie").VALUE(0).ENCRYPT" -bypassSafetyCheck YES  
2  
3 add rewrite action my-cookie-decrypt-action replace "HTTP.REQ.COOKIE.  
   VALUE("MyCookie)" "HTTP.REQ.COOKIE.VALUE("MyCookie").DECRYPT" -  
   bypassSafetyCheck YES  
4 <!--NeedCopy-->
```

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

### Configure encryption key for third-party encryption

In default syntax expressions, you can use ENCRYPT and DECRYPT functions for encrypting and decrypting text in a request or response. The data encrypted by the ENCRYPT function on an appliance (standalone, high availability or cluster) is intended to be decrypted by the DECRYPT function by the same appliance. The appliance supports RC4, DES, Triple-DES, AES92, and AES256 encryption methods and each of these methods use a secret key for both encryption and decryption of data. You can use any of these methods to encrypt and decrypt data in two ways - self-encryption and third-party encryption.

The self-encryption feature in an appliance (standalone, high availability or cluster) encrypts and then decrypts data by evaluating the header value. One example to understand this is the HTTP Cookie encryption. The expression evaluates the header, encrypts the HTTP cookie value in the Set-Cookie header in the outgoing response and then decrypts the cookie value when it is returned in the cookie header of a subsequent incoming request from the client. The key value is not user configurable, instead when an encryption method is configured in the set ns encryptionParams command, the appliance automatically generates a random key value for the configured method. By default, the command uses the AES256 encryption method, which is the highly secured method and Citrix recommends this method.

The third-party encryption feature encrypts or decrypts data with a third-party application. For example, a client may encrypt data in a request and the appliance decrypts the data before sending it to the back-end server or vice versa. To perform this, the appliance and the third party application must share a secret key. On the appliance, you can directly configure the secret key using an encryption

key object and key value is automatically generated by the appliance for a stronger encryption. The same key is manually configured on the third-party appliance so that both appliance and third-party application can use the same key for encrypting and decryption data.

Note: Using third-party encryption, you can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see “Encrypting and Decrypting XML Payloads.”

## **Cipher methods**

A cipher method provides two functions: an encryption function that transforms a plaintext byte sequence into a ciphertext byte sequence, and a decryption function that transforms the ciphertext back to the plaintext. Cipher methods use byte sequences called keys to perform encryption and decryption. Cipher methods that use the same key for encryption and decryption are called symmetric. Cipher methods that use different keys for encryption and decryption are asymmetric. The most notable examples of asymmetric ciphers are in public key cryptography, which uses a public key available to anyone for encryption and a private key known only to the decryptor.

A good cipher method makes it infeasible to decrypt (“crack”) ciphertext if you don’t possess the key. “Infeasible” really means that cracking the ciphertext would take more time and computing resources than it is worth. As computers become more powerful and cheaper, ciphers that were formerly infeasible to crack become more feasible. Also, over time, flaws are found in cipher methods (or their implementations), making cracking easier. Newer cipher methods are therefore preferred over older ones. In general, longer length keys provide better security than shorter keys, at the cost of longer encryption and decryption times.

A cipher method can use stream ciphers or block ciphers. RC4 is the mostly secured stream ciphers and it is used only for legacy application. Block ciphers can include padding.

## **Stream ciphers**

A stream cipher method operates on individual bytes. Only one stream cipher is available on Citrix ADC appliances: RC4, which uses a 128 bit (16 byte) key length. For a given key, RC4 generates a pseudo-random sequence of bytes, call a keystream, which is X-ORed with the plaintext to produce the ciphertext. RC4 is no longer considered secure and should be used only if required by legacy applications.

## **Block ciphers**

A block cipher method operates on a fixed block of bytes. A Citrix ADC appliance provides two block ciphers: Data Encryption Standard (DES) and the Advanced Encryption Standard (AES). DES uses a block size of 8 bytes and (on a Citrix ADC appliance) two choices for key length: 64 bits (8 bytes), of

which 56 bits are data and 8 bits are parity, and Triple-DES, a 192 bit (24 byte) key length. AES has a block size of 16 bytes and (on Citrix ADC) three choices for key length: 128 bits (16 bytes), 192 bits (24 bytes) and 256 bits (32 bytes).

## Padding

If the plaintext for a block cipher is not an integral number of blocks, padding with additional bytes might be required. For example, suppose the plaintext is “xyzyz” (hex 78797a7a79). For an 8-byte Triple-DES block, this value would have to be padded to create 8 bytes. The padding scheme must allow the decryption function to determine the length of the original plaintext after decryption. Following are some padding schemes currently in use (n is the number of bytes added):

- PKCS7: Adds n bytes of value n each. For example, 78797a7a79030303. This is the padding scheme used by OpenSSL and ENCRYPT() policy function. The PKCS5 padding scheme is the same as PKCS7.
- ANSI X.923: Adds n-1 zero bytes and a final byte of value n. For example, 78797a7a79000003.
- ISO 10126: Adds n-1 random bytes and a final byte of value n. For example, 78797a7a79xxxx03, where xx can be any byte value. The DECRYPT() policy function accepts this padding scheme, which also allows it to accept the PKCS7 and ANSI X.923 schemes.
- ISO/IEC 7816-4: Adds a 0x80 byte and n-1 zero bytes. For example, 78797a7a79800000. This is also call OneAndZeros padding.
- Zero: Adds n zero bytes. Example: 78797a7a79000000. This can only be used with plaintext that does not include NUL bytes.

If padding is used and the plaintext is an integral number of blocks, an additional block is typically added so that the decryption function can unambiguously determine the original plaintext length. For PCKS7 and 8 byte block, this would be 0808080808080808.

## Modes of operation

There are a number of different modes of operation for block ciphers, which specify how multiple blocks of plaintext are encrypted. Some modes use an initialization vector (IV), a block of data apart from the plaintext that is used to start the encryption process. It is a good practice to use a different IV for each encryption, so that the same plaintext produces different ciphertext. The IV does not need to be secret, and so is usually prepended to the ciphertext. Modes include:

- Electronic Codebook (ECB): Each block of plaintext is encrypted independently. An IV is not used. Padding is required if the plaintext is not a multiple of the cipher block size. The same plaintext and key always produces the same ciphertext. Because of this, ECB is considered less secure than other modes and should only be used for legacy applications.
- Cipher Block Chaining (CBC): Each block of plaintext is XORed with the previous ciphertext block, or the IV for the first block, before being encrypted. Padding is required if the plain-

text is not a multiple of the cipher block size. This is the mode used with the Citrix ADC encryptionParams method.

- Cipher Feedback (CFB): The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block. The feedback can be 1 bit, 8 bits, or 128 bits. Since the plaintext is XORed with the cipher text, padding is not required.
- Output Feedback (OFB): A keystream is generated by applying the cipher successively to the IV and XORing the keystream blocks with the plaintext. Padding is not required.

### Configure encryption keys for third-party encryption

Following are the configuration tasks performed in configuring encryption key.

1. Adding an encryption key. Configures an encryption key for a specified cipher method with a specified key value.
2. Modifying an encryption key. You can edit parameters for a configured encryption key.
3. Unsetting an encryption key. Sets parameters for a configured encryption key to their default values. An encryptionKey value with the name must exist. Sets padding to DEFAULT (determined by the method), Deletes an existing IV, which causes ENCRYPT() to generate a random IV. Deletes an existing comment. The method and key value cannot be reset.
4. Removing an encryption key. Deletes a configured encryption key. The key cannot have any references.
5. Show an encryption key. Displays parameters for the configured encryption key or all configured keys. If the name is omitted, the key value is not displayed.

### Add an encryption key by using the CLI

At the command prompt, type:

```
add ns encryptionKey <name> -method <method> [-keyValue <hexstring>][-padding (OFF | ON)] [-iv <hexstring>] [-comment <string>]
```

Where,

```
1 <method> = ( NONE | RC4 | DES3 | AES128 | AES192 | AES256 | DES | DES-
  CBC | DES-CFB | DES-OFB | DES-ECB | DES3-CBC | DES3-CFB | DES3-OFB |
  DES3-ECB | AES128-CBC | AES128-CFB | AES128-OFB | AES128-ECB |
  AES192-CBC | AES192-CFB | AES192-OFB | AES192-ECB | AES256-CBC |
  AES256-CFB | AES256-OFB | AES256-ECB ) <hexstring> = hex-encoded
  byte sequence
2 <!--NeedCopy-->
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

### Modify an encryption key by using the CLI

At the command prompt, type:

```
set ns encryptionKey <name> [-method <method>] [-keyValue <hexstring>][-padding ( OFF | ON )] [-iv <string>] [-comment <string>]
```

### Unset an encryption key by using the CLI

At the command prompt, type:

```
unset ns encryptionKey <name> [-padding] [-iv] [-comment]
```

### Remove an encryption key by using the CLI

At the command prompt, type:

```
rm ns encryptionKey <name>
```

### Show an encryption key by using the CLI

At the command prompt, type:

#### Example:

```
1 show ns encryptionKey [<name>]
2
3 add ns encryptionKey my_key -method aes256 -keyValue 26
   ea5537b7e0746089476e5658f9327c0b10c3b4778c673a5b38cee182874711 - iv
   c2bf0b2e15c15004d6b14bc7e5e365
4   set ns encryptionKey my_key -keyValue
   b8742b163abcf62d639837bbee3cef9fb5842d82d00dfe6548831d2bd1d93476
5   unset ns encryptionKey my_key -iv
6   rm ns encryptionKey my_key
7   show ns encryptionKey my_key
8   Name: my_key
9   Method: AES256
10  Padding: DEFAULT
11  Key Value: (not disclosed)
12 <!--NeedCopy-->
```

### Add an encryption key by using the GUI

Navigate to **System > Encryption Keys** and click **Add** to create an encryption key.

### Modify an encryption key by using the GUI

Navigate to **System > Encryption Keys** and click **Edit** to modify parameters for a configured encryption key.

### Remove an encryption key by using the GUI

Navigate to **System > Encryption keys** and click **Delete**.

### ENCRYPT and DECRYPT functions for third-party encryption

Following is the ENCRYPT function used for third-part encryption.

```
ENCRYPT (encryptionKey, out_encoding)
```

Where,

Input data for the appliance is the text to be encrypted

**encryptionKey:** An optional string parameter that specifies the configured encryption key object to provide the encryption method, secret key value and other encryption parameters. If omitted, the method uses the automatically generated key value associated with the set ns encryptionParamS command.

**out\_encoding:** This value specifies how the output is encoded. If omitted, BASE64 encoding is used.

#### Input:

```

1  BASE64:      original PEM base64-encoding: 6 bits (0..63) encoded as one
      ASCII character:
2              0..23 = 'A'..'Z', 24..51 = 'a'..'z', 52..61 = '0'..'9
      ', 62 = '+', 63 = '/', '=' = pad byte.
3  BASE64URL:  URL and Filename safe base64-encoding: same as BASE64
      except 62 = '-', 63 = '_'
4  HEX_UPPER:  Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F'
      '.'
5  HEX_LOWER:  Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'a'..'f'
      '.'
6  HEX_COLONS: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F'
      '; ':' between each hex byte. Matches BLOB_TO_HEX() output
      format
7  HEX:        For input, accepts HEX_UPPER, HEX_LOWER, and
      HEX_COLONS format. For output, produces HEX_LOWER format

```

---

```
8 <!--NeedCopy-->
```

Output: The output is a text encrypted using the specified method and key and encoded using a specified output encoding. It inserts a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

Following is the DECRYPT function used for third-part decryption.

```
DECRYPT(encryptionKey, in_encoding)
```

Where,

Input data is an encrypted text using the specified method and key encoded using the specified input encoding. This text is expected to include a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

encryptionKey—An optional string parameter that specifies the configured encryptionKey object to provide the encryption method, secret key and other encryption parameters. If omitted, the method and automatically generated key associated with the encryptionParams setting will be used

in\_encoding—An optional enumeration parameter that specifies how the input is expected to be encoded. The values are the same as the out\_encoding of ENCRYPT. If omitted, BASE64 encoding will be expected.

The output data is an unencoded decrypted text.

### Variants and optional parameters

Following are the variants of these functions with the optional parameters:

| Variant                              | Description                                                           |
|--------------------------------------|-----------------------------------------------------------------------|
| ENCRYPT                              | Use encryptionParams command and BASE64 output encoding parameter.    |
| ENCRYPT(out_encoding)                | Use encryptionParams and specified output encoding parameter.         |
| ENCRYPT(encryptionKey)               | Use the specified encryptionKey and BASE64 output encoding parameter. |
| ENCRYPT(encryptionKey, out_encoding) | Use the specified encryptionKey and output encoding parameter.        |
| DECRYPT                              | Use encryptionParams command and BASE64 input encoding parameter.     |

| Variant                              | Description                                                              |
|--------------------------------------|--------------------------------------------------------------------------|
| DECRYPT(out_encoding)                | Use encryptionParams command and the specified input encoding parameter. |
| DECRYPT(encryptionKey)               | Use the specified encryptionKey and BASE64 input encoding parameter.     |
| DECRYPT(encryptionKey, out_encoding) | Use the specified encryptionKey and input encoding parameter.            |

### Configure HMAC keys

Citrix ADC appliances support a Hashed Message Authentication Code (HMAC) function that calculates a digest method or hash of input text by using a secret key shared between a message sender and message receiver. The digest method (derived from an RFC 2104 technique) authenticates the sender and verifies that the message content has not been altered. For example, when a client sends a message with the shared HMAC key to a Citrix ADC appliance, advanced (PI) policy expressions use the HMAC function to compute the hash-based code on the selected text. Then, when the receiver receives the message with the secret key, it recomputes the HMAC by comparing it with the original HMAC to determine whether the message has been altered. The HMAC function is supported by standalone appliances and by appliances in a high availability configuration or in a cluster. Using it is similar to configuring an encryption key.

The `add ns hmackey` and `set ns hmackey` commands include a parameter that specifies the digest method and the shared secret key to use for the HMAC computation.

To configure a HMAC key, you must perform the following:

1. Adding an HMAC key. Configures an HMAC key with a specified key value.
2. Modifying an HMAC key. Modifies parameters for a configured HMAC key. The digest method can be changed without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest.
3. Unsetting an HMAC key. Sets parameters for a configured HMAC key to their default values. An `hmackey` object with the name must exist. The only parameter that can be unset is the comment, which is deleted.
4. Removing an HMAC key. Deletes a configured key. The key cannot have any references.
5. Show an HMAC key. Displays parameters for the configured HMAC key or all configured keys. If the name is omitted, the key value is not displayed.

### Add an HMAC key by using the CLI

At the command prompt, type:

```
add ns hmacKey <name> -digest <digest> -keyValue <hexstring> [-comment <string>]
```

Where,

```
<digest> = (MD2 | MD4 | MD5 | SHA1 | SHA224 | SHA256 | SHA384 | SHA512)
```

This command configures a key for the HMAC () function with the specified digest and key value and also validates the following:

- Name syntax is correct and does not duplicate the name of an existing key.
- Key value is valid hex. As specified by RFC 2104, the key can any length. On a Citrix ADC appliance, the key value can range from 0 to 255 bytes (0 to 510 hex characters). If the key is shorter than the digest block size, a warning is issued and the key is padded with zeroes. If the key is longer than the block size, it is run through the digest to produce an effective key that is the same length as the block.

**Example:**

```
add ns hmacKey my_hmac_key -digest sha1 -keyValue 0c753c6c5ef859189cacdf95b506d02c179
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

**Modify an HMAC key by using the CLI**

This command modifies the parameters configured for a HMAC key. You can change the digest without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest. At the command prompt, type:

```
set ns hmacKey <name> [-digest <digest>] [-keyValue <hexvalue>] [-comment <string>]
```

**Unset an HMAC key by using the CLI**

This command sets parameters configured for a HMAC key with their default values. An hmacKey object with the name must exist. The only parameter that you can unset is the comment option, which is deleted. At the command prompt, type:

```
unset ns hmacKey <name> -comment
```

### Remove an HMAC key by using the CLI

This command deletes the configured hmac key. The key cannot have references. At the command prompt, type:

```
rm ns hmacKey <name>
```

### Show an HMAC key by using the CLI

At the command prompt, type:

```
1 show ns encryptionKey [<name>]
2
3 add ns hmacKey my_hmac_key -digest sha1 -keyValue 0
   c753c6c5ef859189cacdf95b506d02c1797407d
4 set ns hmacKey my_hmac_key -keyValue
   f348c594341a840a1f641a1cf24aa24c15eb1317
5 rm ns hmacKey my_hmac_key
6 show ns hmacKey my_hmac_key
7     Name: my_hmac_key
8     Digest: SHA1
9     Key Value: (not disclosed)
10 <!--NeedCopy-->
```

## Advanced policy expressions: working with dates, times, and numbers

September 21, 2020

Most numeric data that the Citrix ADC appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure advanced policy expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are `SYS.TIME.DAY`, `HTTP.REQ.CONTENT_LENGTH`, and `HTTP.RES.BODY.LENGTH`. Numeric operators can work with any prefix expression that returns data in numeric format. The `GT(<int>)` operator, for example, can be used with any prefix expression, such as `HTTP.REQ.CONTENT_LENGTH`, that returns an integer. Numeric expression prefixes and operators are also covered in [Compound Operations for Numbers](#) and [Advanced Policy Expressions: Parsing HTTP, TCP, and UDP Data](#).

## Format of dates and times in an expression

September 21, 2020

When configuring an advanced policy expression in a policy that works with dates and times (for example, the Citrix ADC system time or a date in an SSL certificate), you specify a time format as follows:

```
GMT|LOCAL [<yyyy>] [<month>] [<d>] [<h>] [<m>] [<s>]
```

Where:

- <yyyy> is a four-digit year after GMT or LOCAL.
- <month> is a three-character abbreviation for the month, for example, Jan, Dec.
- <d> is a day of the week or an integer for the date.

You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

- Sun\_1 is the first Sunday of the month.
  - Sun\_3 is the third Sunday of the month.
  - Wed\_3 is the third Wednesday of the month.
  - 30 is an example of an exact date in a month.
- <h> is the hour, for example, 10h.
  - <s> is the number of seconds, for example, 30s.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT.

```
http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)
```

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

```
sys.time.ge(GMT 2008 Mar)
```

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

```
1  **Note:**
2
3  In an expression that requires two time values, both must use GMT or
   both must use LOCAL. You cannot mix the two in an expression.
4
5  Unlike when you use the SYS.TIME prefix in an advanced policy
   expression, if you specify SYS.TIME in a rewrite action, the Citrix
   ADC returns a string in conventional date format (for example, Sun,
```

```
06 Nov 1994 08:49:37 GMT). For example, the following rewrite action
replaces the http.res.date header with the Citrix ADC system time
in a conventional date format:
```

6

```
7 add rewrite action sync_date replace http.res.date sys.time
```

## Expressions for the Citrix ADC system time

September 21, 2020

The SYS.TIME expression prefix extracts the Citrix ADC system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the Citrix ADC system time.

The following table describes the expressions that you can create by using the SYS.TIME prefix.

- **SYS.TIME.BETWEEN(<time1>, <time2>):**

Returns a Boolean TRUE if the returned value is later than <time1> and earlier than <time2>.

You format the <time1>, <time2> arguments as follows:

- They must both be GMT or both LOCAL.
- <time2> must be later than <time1>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

- sys.time.between(GMT 2004, GMT 2006)
- sys.time.between(GMT 2004 Jan, GMT 2006 Nov)
- sys.time.between(GMT 2004 Jan, GMT 2006)
- sys.time.between(GMT 2005 May Sun\_1, GMT 2005 May Sun\_3)
- sys.time.between(GMT 2005 May 1, GMT May 2005 1)
- sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)

- **SYS.TIME.DAY:**

Returns the current day of the month as a number from 1 through 31.

- **SYS.TIME.EQ(<time>):**

Returns a Boolean TRUE if the current time is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.eq(GMT 2005) (TRUE in this example.)

- sys.time.eq(GMT 2005 Dec) (FALSE in this example.)
- sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.)
- sys.time.eq(GMT 10h) (TRUE in this example.)
- sys.time.eq(GMT 10h 30s) (TRUE in this example.)
- sys.time.eq(GMT May 10h) (TRUE in this example.)
- sys.time.eq(GMT Sun) (TRUE in this example.)
- sys.time.eq(GMT May Sun\_1) (TRUE in this example.)

- **SYS.TIME.NE(<time>):**

Returns a Boolean TRUE if the current time is not equal to the <time> argument.

- **SYS.TIME.GE(<time>):**

Returns a Boolean TRUE if the current time is later than or equal to <time>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.ge(GMT 2004) (TRUE in this example.)
- sys.time.ge(GMT 2005 Jan) (TRUE in this example.)
- sys.time.ge(LOCAL 2005 May) (TRUE or FALSE in this example, depending on the current time zone.)
- sys.time.ge(GMT 8h) (TRUE in this example.)
- sys.time.ge(GMT 30m) (FALSE in this example.)
- sys.time.ge(GMT May 10h) (TRUE in this example.)
- sys.time.ge(GMT May 10h 0m) (TRUE in this example.)
- sys.time.ge(GMT Sun) (TRUE in this example.)
- sys.time.ge(GMT May Sun\_1) (TRUE in this example.)

- **SYS.TIME.GT(<time>):**

Returns a Boolean TRUE if the time value is later than the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.gt(GMT 2004) (TRUE in this example.)
- sys.time.gt(GMT 2005 Jan) (TRUE in this example.)
- sys.time.gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone. )
- sys.time.gt(GMT 8h) (TRUE in this example.)
- sys.time.gt(GMT 30m) (FALSE in this example.)
- sys.time.gt(GMT May 10h) (FALSE in this example.)
- sys.time.gt(GMT May 10h 0m) (TRUE in this example.)
- sys.time.gt(GMT Sun) (FALSE in this example.)

- `sys.time.gt(GMT May Sun_1)` (FALSE in this example.)

- **SYS.TIME.HOURS:**

Returns the current hour as an integer from 0 to 23.

- **SYS.TIME.LE(<time>):**

Returns a Boolean TRUE if the current time value precedes or is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.le(GMT 2006)` (TRUE in this example.)
- `sys.time.le(GMT 2005 Dec)` (TRUE in this example.)
- `sys.time.le(LOCAL 2005 May)` (TRUE or FALSE depending on the current timezone. )
- `sys.time.le(GMT 8h)` (FALSE in this example.)
- `sys.time.le(GMT 30m)` (TRUE in this example.)
- `sys.time.le(GMT May 10h)` (TRUE in this example.)
- `sys.time.le(GMT Jun 11h)` (TRUE in this example.)
- `sys.time.le(GMT Wed)` (TRUE in this example.)
- `sys.time.le(GMT May Sun_1)` (TRUE in this example.)

- **SYS.TIME.LT(<time>):**

Returns a Boolean TRUE if the current time value precedes the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.lt(GMT 2006)` (TRUE in this example.)
- `sys.time.lt.time.lt(GMT 2005 Dec)` (TRUE in this example.)
- `sys.time.lt(LOCAL 2005 May)` (TRUE or FALSE depending on the current time zone.)
- `sys.time.lt(GMT 8h)` (FALSE in this example.)
- `sys.time.lt(GMT 30m)` (TRUE in this example.)
- `sys.time.lt(GMT May 10h)` (FALSE in this example.)
- `sys.time.lt(GMT Jun 11h)` (TRUE in this example.)
- `sys.time.lt(GMT Wed)` (TRUE in this example.)
- `sys.time.lt(GMT May Sun_1)` (FALSE in this example.)

- **SYS.TIME.MINUTES:**

Returns the current minute as an integer from 0 to 59.

- **SYS.TIME.MONTH:**

Extracts the current month and returns an integer from 1 (January) to 12 (December).

- **SYS.TIME.RELATIVE\_BOOT:**

Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer.

If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **SYS.TIME.RELATIVE\_NOW:**

Calculates the number of seconds between the current Citrix ADC system time and the specified time, and returns an integer showing the difference.

If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **SYS.TIME.SECONDS:**

Extracts the seconds from the current Citrix ADC system time, and returns that value as an integer from 0 to 59.

- **SYS.TIME.WEEKDAY:**

Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).

- **SYS.TIME.WITHIN (<time1>, <time2>):**

If you omit an element of time in <time1>, for example, the day or hour, it is assumed to have the lowest value in its range. If you omit an element in <time2>, it is assumed to have the highest value of its range.

The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both <time1> and <time2>.

For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.within(GMT 2004, GMT 2006)` (TRUE in this example.)
- `sys.time.within(GMT 2004 Jan, GMT 2006 Mar)` (FALSE, May is not in the range of January to March.)
- `sys.time.within(GMT Feb, GMT)` (TRUE, May is in the range of February to December.)
- `sys.time.within(GMT Sun_1, GMT Sun_3)` (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- `sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h)` (TRUE in this example.)
- `sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1)` (TRUE or FALSE, depending on the Citrix ADC system time zone.)

- **SYS.TIME.YEAR:**

Extracts the year from the current system time and returns that value as a four-digit integer.

## Expressions for SSL certificate dates

September 21, 2020

You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

```
CLIENT.SSL.CLIENT_CERT
```

The following example expression matches a particular time for expiration with the information in the certificate:

```
client.ssl.client_cert.valid_not_after.eq(GMT 2009)
```

The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace *certificate* in the expression in the first column with the prefix expression, "CLIENT.SSL.CLIENT\_CERT".

- **<certificate>.VALID\_NOT\_AFTER:**

Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate>.VALID\_NOT\_AFTER.BETWEEN(<time1>, <time2>):**

Returns a Boolean TRUE value if the certificate validity is between the <time1> and <time2> arguments. Both <time1> and <time2> must be fully specified. Following are examples:

GMT 1995 Jan is fully specified.

GMT Jan is not fully specified

GMT 1995 20 is not fully specified.

GMT Jan Mon\_2 is not fully specified.

The <time1> and <time2> arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses).

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun\_1, GMT 2005 May Sun\_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the Citrix ADC system time zone.)

- **<certificate>.VALID\_NOT\_AFTER.DAY:**

Extracts the last day of the month that the certificate is valid, and returns a number from 1 through 31, as appropriate for the date.

- **<certificate>.VALID\_NOT\_AFTER.EQ(<time>):**

Returns a Boolean TRUE if the time is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results for this example are in parentheses):

- . . .eq(GMT 2005) (TRUE)
- . . .eq(GMT 2005 Dec) (FALSE)
- . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone)
- . . .eq(GMT 10h) (TRUE)
- . . .eq(GMT 10h 30s) (TRUE)
- . . .eq(GMT May 10h) (TRUE)
- . . .eq(GMT Sun) (TRUE)
- . . .eq(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_AFTER.GE(<time>):**

Returns a Boolean TRUE if the time value is greater than or equal to the argument <time>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .ge(GMT 2004) (TRUE)
- . . .ge(GMT 2005 Jan) (TRUE)
- . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .ge(GMT 8h) (TRUE)
- . . .ge(GMT 30m) (FALSE)
- . . .ge(GMT May 10h) (TRUE)
- . . .ge(GMT May 10h 0m) (TRUE)
- . . .ge(GMT Sun) (TRUE)
- . . .ge(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_AFTER.GT(<time>):**

Returns a Boolean TRUE if the time value is greater than the argument <time>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .gt(GMT 2004) (TRUE)

- . . .gt(GMT 2005 Jan) (TRUE)
- . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .gt(GMT 8h) (TRUE)
- . . .gt(GMT 30m) (FALSE)
- . . .gt(GMT May 10h) (FALSE)
- . . .gt(GMT Sun) (FALSE)
- . . .gt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_AFTER.HOURS:**

Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **<certificate>.VALID\_NOT\_AFTER.LE(<time>):**

Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .le(GMT 2006) (TRUE)
- . . .le(GMT 2005 Dec) (TRUE)
- . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .le(GMT 8h) (FALSE)
- . . .le(GMT 30m) (TRUE)
- . . .le(GMT May 10h) (TRUE)
- . . .le(GMT Jun 11h) (TRUE)
- . . .le(GMT Wed) (TRUE)
- . . .le(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_AFTER.LT(<time>):**

Returns a Boolean TRUE if the time precedes the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

- . . .lt(GMT 2006) (TRUE)
- . . .lt(GMT 2005 Dec) (TRUE)
- . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .lt(GMT 8h) (FALSE)
- . . .lt(GMT 30m) (TRUE)
- . . .lt(GMT May 10h) (FALSE)
- . . .lt(GMT Jun 11h) (TRUE)
- . . .lt(GMT Wed) (TRUE)

- . . .lt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_AFTER.MINUTES:**

Extracts the last minute that the certificate is valid and returns that value as an integer from 0 to 59.

- **<certificate>.VALID\_NOT\_AFTER.MONTH:**

Extracts the last month that the certificate is valid and returns that value as an integer from 1 (January) to 12 (December).

- **<certificate>.VALID\_NOT\_AFTER.RELATIVE\_BOOT:**

Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **<certificate>.VALID\_NOT\_AFTER.RELATIVE\_NOW;**

Calculates the number of seconds between the current system time and the specified time and returns an integer. If the time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **<certificate>.VALID\_NOT\_AFTER.SECONDS:**

Extracts the last second that the certificate is valid and returns that value as an integer from 0 to 59.

- **<certificate>.VALID\_NOT\_AFTER.WEEKDAY:**

Extracts the last weekday that the certificate is valid. Returns a number between 0 (Sunday) and 6 (Saturday) to give the weekday in the time value.

- **<certificate>.VALID\_NOT\_AFTER.WITHIN(<time1>, <time2>):**

Returns a Boolean TRUE if the time lies within all the ranges defined by the elements in <time1> and <time2>.

If you omit an element of time from <time1>, it is assumed to have the lowest value in its range. If you omit an element from <time2>, it is assumed to have the highest value of its range. If you specify a year in <time1>, you must specify it in <time2>.

The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For the result to be TRUE, each element in the time must exist in the corresponding range that you specify in <time1>, <time2>.

For example, if time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

- . . .within(GMT 2004, GMT 2006) (TRUE)

- . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- . . .within(GMT Feb, GMT) (TRUE, May is in the range for February to December)
- . . .within(GMT Sun\_1, GMT Sun\_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the Citrix ADC system time zone)

- **<certificate>.VALID\_NOT\_AFTER.YEAR:**

Extracts the last year that the certificate is valid and returns a four-digit integer.

- **<certificate>.VALID\_NOT\_BEFORE:**

Returns the date that the client certificate becomes valid.

The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate>.VALID\_NOT\_BEFORE.BETWEEN(<time1>, <time2>):**

Returns a Boolean TRUE if the time value is between the two time arguments. Both <time1> and <time2> arguments must be fully specified.

Following are examples:

GMT 1995 Jan is fully specified.

GMT Jan is not fully specified.

GMT 1995 20 is not fully specified.

GMT Jan Mon\_2 is not fully specified.

The time arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun\_1, GMT 2005 May Sun\_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the Citrix ADC system time zone.)

- **<certificate>.VALID\_NOT\_BEFORE.DAY:**

Extracts the last day of the month that the certificate is valid and returns that value as a number from 1 through 31 representing that day.

- **<certificate>.VALID\_NOT\_BEFORE.EQ(<time>):**

Returns a Boolean TRUE if the time is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .eq(GMT 2005) (TRUE)
- . . .eq(GMT 2005 Dec) (FALSE)
- . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .eq(GMT 10h) (TRUE)
- . . .eq(GMT 10h 30s) (TRUE)
- . . .eq(GMT May 10h) (TRUE)
- . . .eq(GMT Sun) (TRUE)
- . . .eq(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_BEFORE.GE(<time>):**

Returns a Boolean TRUE if the time is greater than (after) or equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- . . .ge(GMT 2004) (TRUE)
- . . .ge(GMT 2005 Jan) (TRUE)
- . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .ge(GMT 8h) (TRUE)
- . . .ge(GMT 30m) (FALSE)
- . . .ge(GMT May 10h) (TRUE)
- . . .ge(GMT May 10h 0m) (TRUE)
- . . .ge(GMT Sun) (TRUE)
- . . .ge(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_BEFORE.GT(<time>):**

Returns a Boolean TRUE if the time occurs after the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- . . .gt(GMT 2004) (TRUE)
- . . .gt(GMT 2005 Jan) (TRUE)
- . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)

- . . .gt(GMT 8h) (TRUE)
- . . .gt(GMT 30m) (FALSE)
- . . .gt(GMT May 10h) (FALSE)
- . . .gt(GMT May 10h 0m) (TRUE)
- . . .gt(GMT Sun) (FALSE)
- . . .gt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_BEFORE.HOURS:**

Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **\*\*<certificate>.VALID\_NOT\_BEFORE.LE(<time>)**

Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .le(GMT 2006) (TRUE)
- . . .le(GMT 2005 Dec) (TRUE)
- . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .le(GMT 8h) (FALSE)
- . . .le(GMT 30m) (TRUE)
- . . .le(GMT May 10h) (TRUE)
- . . .le(GMT Jun 11h) (TRUE)
- . . .le(GMT Wed) (TRUE)
- . . .le(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_BEFORE.LT(<time>):**

Returns a Boolean TRUE if the time precedes the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .lt(GMT 2006) (TRUE)
- . . .lt(GMT 2005 Dec) (TRUE)
- . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .lt(GMT 8h) (FALSE)
- . . .lt(GMT 30m) (TRUE)
- . . .lt(GMT May 10h) (FALSE)
- . . .lt(GMT Jun 11h) (TRUE)
- . . .lt(GMT Wed) (TRUE)

- . . .lt(GMT May Sun\_1) (FALSE)

• **<certificate>.VALID\_NOT\_BEFORE.MINUTES:**

Extracts the last minute that the certificate is valid. Returns the current minute as an integer from 0 to 59.

• **<certificate>.VALID\_NOT\_BEFORE.MONTH:**

Extracts the last month that the certificate is valid. Returns the current month as an integer from 1 (January) to 12 (December).

• **<certificate>.VALID\_NOT\_BEFORE.RELATIVE\_BOOT:**

Calculates the number of seconds to the closest previous or scheduled Citrix ADC reboot and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

• **<certificate>.VALID\_NOT\_BEFORE.RELATIVE\_NOW:**

Returns the number of seconds between the current Citrix ADC system time and the specified time as an integer. If the designated time is in the past, the integer is negative. If it is in the future, the integer is positive.

• **<certificate>.VALID\_NOT\_BEFORE.SECONDS:**

Extracts the last second that the certificate is valid. Returns the current second as an integer from 0 to 59.

• **<certificate>.VALID\_NOT\_BEFORE.WEEKDAY:**

Extracts the last weekday that the certificate is valid. Returns the weekday as a number between 0 (Sunday) and 6 (Saturday).

• **<certificate>.VALID\_NOT\_BEFORE.WITHIN(<time1>, <time2>):**

Returns a Boolean TRUE if each element of time exists within the range defined in the <time1>, <time2> arguments.

If you omit an element of time from <time1>, it is assumed to have the lowest value in its range. If you omit an element of time from <time2>, it is assumed to have the highest value in its range. If you specify a year in <time1>, it must be specified in <time2>. The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59.

For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

- . . .within(GMT 2004, GMT 2006) (TRUE)
- . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- . . .within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)

- . . .within(GMT Sun\_1, GMT Sun\_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the Citrix ADC system time zone)

- **<certificate>.VALID\_NOT\_BEFORE.YEAR:**

Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.

## Expressions for HTTP request and response dates

September 21, 2020

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- As a number. The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1, 1970.

For example, the expression `http.req.date.mod(86400)` returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see [Expression prefixes for numeric data other than date and time](#).

- As an HTTP header. Date headers can be evaluated using the same operations as other HTTP headers.

For more information, see [Default syntax expressions: Parsing HTTP, TCP, and UDP data](#).

- As text. Date headers can be evaluated using the same operations as other strings.

For more information, see [Advanced Policy Expressions: Evaluating Text](#).

| Prefix        | Description                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.DATE | Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT, RFC850. Sunday, 06-Jan-80 09:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980. |

| Prefix        | Description                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.RES.DATE | Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980. |

## Generate the day of the week, as a string, in short and long formats

September 21, 2020

The functions, WEEKDAY\_STRING\_SHORT and WEEKDAY\_STRING, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

| Function                      | Description                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <prefix>.WEEKDAY_STRING_SHORT | Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6. |

---

| Function                | Description                                                                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <prefix>.WEEKDAY_STRING | Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6. |

---

## Expression prefixes for numeric data other than date and time

September 21, 2020

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:

- The length of HTTP requests, the number of HTTP headers in a request, and so on.

For more information, see [Expressions for numeric HTTP payload data other than dates](#).

- IP and MAC addresses.

For more information, see [Expressions for IP addresses and IP subnets](#).

- Client and server data in regard to interface IDs and transaction throughput rate.

For more information, see [Expressions for numeric client and server data](#).

- Numeric data in client certificates other than dates.

For information on these prefixes, including the number of days until certificate expiration and the encryption key size, see [Prefixes for numeric data in SSL certificates](#).

## Converting numbers to text

September 21, 2020

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see [Rewrite](#).

All the functions return a value of type text. The endianness that some of the functions accept as a parameter is either LITTLE\_ENDIAN or BIG\_ENDIAN.

| Function                                 | Description                                                                                                                                                                                                                                     |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <number>.SIGNED8_STRING                  | Produces an 8-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING                                                   |
| <number>.UNSIGNED8_STRING                | Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING                                             |
| <number>.SIGNED16_STRING(<endianness>)   | Produces a 16-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)                 |
| <number>.UNSIGNED16_STRING(<endianness>) | Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)             |
| <number>.SIGNED32_STRING(<endianness>)   | Produces a 32-bit signed binary string representing the number. Example: HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_ENDIAN)                                                                   |
| <unsigned_long_number>.UNSIGNED8_STRING  | Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIGNED8_STRING                  |
| <unsigned_long_number>.UNSIGNED16_STRING | Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIGNED16_STRING |

| Function                                                   | Description                                                                                                                                                                                                                                          |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <unsigned_long_number>.UNSIGNED32_STRING( <b>Radixes</b> ) | Represents a 32-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).AFTER_STR("delim2").GET_UNSIGNED_STRING(BIG_ENDIAN).ADD(2).UNSIGNED32_STRING(BIG_ENDIAN) |

## Virtual server based expressions

September 21, 2020

The

SYS.VSERVER("<vserver-name>") expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.  
**Usage:** SYS.VSERVER("vserver").THROUGHPUT
- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.  
**Usage:** SYS.VSERVER("vserver").CONNECTIONS
- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or OUT\_OF\_SERVICE. One of these values can therefore be passed as an argument to the EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.  
**Usage:** SYS.VSERVER("vserver").STATE
- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.  
**Usage:** SYS.VSERVER("vserver").HEALTH
- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.  
**Usage:** SYS.VSERVER("vserver").RESPTIME

- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

**Usage:** SYS.VSERVER("vserver").SURGECOUNT

#### Example 1:

The following rewrite policy aborts rewrite processing if the number of connections at the load balancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol sys.vserver("LBvserver").connections.gt  
(10000)norewrite
```

#### Example 2:

The following rewrite action inserts a custom header, TP, whose value is the throughput at the virtual server LBvserver:

```
add rewrite action tp_header insert_http_header TP SYS.VSERVER("LBvserver")  
.THROUGHPUT
```

#### Example 3:

The following audit log message action writes the average TTFB of the services bound to a virtual server, to the newslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS  
Response Time to Servers:\" + sys.vserver(\"ssl\b\").resptime + \" millisec  
\"\"-logtoNewslog YES -bypassSafetyCheck YES
```

## Advanced policy expressions: Parsing HTTP, TCP, and UDP data

September 21, 2020

You can configure Advanced policy expressions to evaluate and process the payload in HTTP requests and responses. The payload associated with an HTTP connection includes the various HTTP headers (both standard and custom headers), the body, and other connection information such as the URL. Additionally, you can evaluate and process the payload in a TCP or UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML “safe” coding for subsequent evaluation. You can also use XPATH and JSON prefixes to evaluate data in XML and JSON files, respectively.

For more information about authentication expressions such as AAA.USER, AAA.LOGIN, see [AAA login](#) and for AAA.AUTHENTICATION expression, see [AAA user authentication](#) topics.

You can also use text-based and numeric Advanced policy expressions to evaluate HTTP request and response data. For more information, see [Advanced policy expressions: Evaluating text](#). and [Default Syntax Expressions: Working with Dates, Times, and Numbers](#).

## About evaluating HTTP and TCP payload

September 21, 2020

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure a default syntax expression to evaluate HTTP payload, you use a default syntax expression prefix and, if necessary, an operator.

For example, you use the following expression, which includes the `http.req.header("<header_name>")` prefix and the `exists` operator, if you want to determine whether an HTTP connection includes a custom header named "myHeader":

```
http.req.header("myHeader").exists
```

You can also combine multiple Advanced policy expressions with Boolean and arithmetic operators. For example, the following compound expression could be useful with various Citrix ADC features, such as Integrated Caching, Rewrite, and Responder. This expression first uses the `&&` Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of "text/html." If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a "Transfer-Encoding" or "Content-Length" header.

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists) || (http.req.header("Content-Length").exists)
```

The payload of a TCP or UDP packet is the data portion of the packet. You can configure Advanced policy expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- `HTTP.REQ.BODY(integer)`. Returns the body of an HTTP request as a multiline text object, up to the character position designated in the integer argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.

- `HTTP.RES.BODY(integer)`. Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the integer argument. If there are fewer characters in the body than is specified in integer, the entire body is returned.
- `CLIENT.TCP.PAYLOAD(integer)`. Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string “https”, and this string occurs after the string “start string” and before the string “end string”:

```
http.res.body(1024).after_str("start_string").before_str("end_string").contains("https")
```

**Note:** You can apply any text operation to the payload body. For information on operations that you can apply to text, see

[Advanced policy expressions: Evaluating text.](#)

## Expressions for identifying the protocol in an incoming IP packet

September 21, 2020

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

| Expression                        | Description                                              |
|-----------------------------------|----------------------------------------------------------|
| <code>CLIENT.IP.PROTOCOL</code>   | Identifies the protocol in IPv4 packets sent by clients. |
| <code>CLIENT.IPV6.PROTOCOL</code> | Identifies the protocol in IPv6 packets sent by clients. |
| <code>SERVER.IP.PROTOCOL</code>   | Identifies the protocol in IPv4 packets sent by servers. |
| <code>SERVER.IPV6.PROTOCOL</code> | Identifies the protocol in IPv6 packets sent by servers. |

### Arguments to the PROTOCOL function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use `CLIENT.IP.PROTOCOL.EQ(6)`, where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead

of `CLIENT.IP.PROTOCOL.EQ(6)`, you can use `CLIENT.IP.PROTOCOL.EQ(TCP)`. The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the `PROTOCOL` function.

| Protocol                                                                              | Enumeration value |
|---------------------------------------------------------------------------------------|-------------------|
| Transmission Control Protocol (TCP)                                                   | TCP               |
| User Datagram Protocol (UDP)                                                          | UDP               |
| Internet Control Message Protocol (ICMP)                                              | ICMP              |
| IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6 | AH                |
| Encapsulating Security Payload (ESP) protocol                                         | ESP               |
| General Routing Encapsulation (GRE)                                                   | GRE               |
| IP-within-IP Encapsulation Protocol                                                   | IPIP              |
| Internet Control Message Protocol for IPv6 (ICMPv6)                                   | ICMPv6            |
| Fragment Header for IPv6                                                              | FRAGMENT          |

### Use case scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various Citrix ADC features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as `EQ()` and `NE()`, to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy `CLIENT.IP.PROTOCOL.EQ(TCP)` so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.
- For content switching virtual servers of type ANY, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.
- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use `CLIENT.IP.PROTOCOL` to configure persistence on the basis of the protocols

in incoming IPv4 packets.

## Expressions for HTTP and cache-control headers

September 21, 2020

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

### Note

If an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER\_STR operation, when applied to a header, overrides text-based AFTER\_STR operations for all instances of the current header type.

## Prefixes for HTTP headers

The following table describes expression prefixes that extract HTTP headers.

---

| HTTP Header Prefix   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.HEADER("")  | Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters. Note that this prefix returns the value from the Host header by default. To use this value as a hostname you need to typecast it as follows: <code>http.req.header("more information on typecasting, see [Typecasting data]/(en-us/citrix-adc/12-1/appexpert/policies-and-expressions/ns-typecasting-data-wrapper-con.html)</code> . |
| HTTP.REQ.FULL_HEADER | Returns the contents of the complete set of HTTP header fields including the request line (for example, "GET /brochures/index.html HTTP/1.1") and the terminating <code>\r\n\r\n</code> sequence.                                                                                                                                                                                                                                                    |

---

| HTTP Header Prefix   | Description                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.DATE        | Returns the contents of the HTTP Date header. The following date formats are recognized: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, ASCII TIME. Sun Jan 6 08:49:37 1980. To evaluate a Date header as a date object, see <a href="#">Default Syntax Expressions: Working with Dates, Times, and Numbers</a> . |
| HTTP.REQ.COOKIE      | (Name/Value List)<br>Returns the contents of the HTTP Cookie header.                                                                                                                                                                                                                                                                            |
| HTTP.REQ.TXID        | Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.                                                                                                                                                                                                            |
| HTTP.RES.HEADER(" ") | Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters.                                                                                                                                                                                                                                 |

---

| HTTP Header Prefix                          | Description                                                                                                                                                                                                                               |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.RES.FULL_HEADE                         | Returns the contents of the complete set of HTTP header fields including the status line (for example, "HTTP/1.1 200 OK") and the terminating \r\n\r\n sequence.                                                                          |
| HTTP.RES.SET_COOKIE or HTTP.RES.SET_COOKIE2 | Returns the Set-Cookie header object in a response.                                                                                                                                                                                       |
| HTTP.RES.SET_COOKIE                         | Returns the cookie of the specified name if it is present. If it is not present, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the specified cookie was not found in these headers. |

---

| HTTP Header Prefix                 | Description                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.RES.SET_COOKIE(<name>).DOMAIN | Returns the DOMAIN of HTTP.RES.SET_COOKIE2(<name>).DOMAIN the first Domain field in the cookie. For example, if the cookie is Set-Cookie :<br>Customer = "ABC";<br>DOMAIN=".abc.com";<br>DOMAIN=xyz.com,<br>the following expression returns<br>.abc.com: http.res.set_cookie.cookie("customer").domain. A string of zero length is returned if the Domain field or its value is absent. |
| HTTP.RES.SET_COOKIE                | Returns a Boolean TRUE if a Cookie with the name specified in the <name> argument exists in the Set-Cookie header. This prefix returns UNDEF if more than 15 Set-Cookie headers are present and the named cookie is not in the first 15 headers.                                                                                                                                         |

---

| HTTP Header Prefix                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.RES.SET_COOKIE.COOKIE(<name>).EXPIRES or HTTP.RES.SET_COOKIE2.COOKIE(<name>).EXPIRES | <p>COOKIE(&lt;name&gt;).EXPIRES field of the cookie.</p> <p>This is a date string that can be evaluated as a number, as a time object, or as text.</p> <p>If multiple Expires fields are present, the first one is returned.</p> <p>If the Expires field is absent, a text object of length zero is returned. To evaluate the returned value as a time object, see <a href="#">Default Syntax Expressions: Working with Dates, Times, and Numbers</a>.</p> |
| HTTP.RES.SET_COOKIE                                                                       | PATH.GET(n)                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| HTTP Header Prefix                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| o<br>HTTP.RES.SET_COOKIE2.COOKIE(<name>).PATH | <p>Returns the value of Path field of the cookie as a slash- ("/") separated list. Multiple instances of a slash are treated as single slash. If multiple Path fields are present, the value of the first instance is returned. For example, the following is a cookie with two path fields: Set-Cookie : Customer = "ABC"; PATH="/a//b/c"; PATH= "/x/y/z". The following expression returns /a//b/c from this cookie: <code>http.res.set_cookie.cookie("Customer").path</code>. The following expression returns <code>b</code>: <code>http.res.set_cookie.cookie("Customer").path.get(2)</code>. Quotes are stripped from the returned value. A string of zero length is returned if the Path field or its value is absent.</p> |

| HTTP Header Prefix  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.RES.SET_COOKIE | <p data-bbox="552 349 1433 1335">Ignores the empty elements in the list. For example, in the list a=10,b=11, ,c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123,,24, ,15 the following expression returns a value of 4: http.req.header("Cust_Header", ,15) the following expression returns a value of 5: http.req.header("Cust_Header", ,15)</p> |

HTTP.RES.SET\_COOKIE

A string of zero length is returned if the Port field or its value is absent.                                                                                                                                                                                                                                                                                                                                                    |

| HTTP Header Prefix | Description                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.RES.TXID      | Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address. |

### Operations for HTTP headers

The following table describes operations that you can specify with the prefixes for HTTP headers.

| HTTP Header Operation                                | Description                                                                                                                                                                                                 |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http header .EXISTS                                  | Returns a Boolean TRUE if an instance of the specified header type exists. Following is an example: <code>http.req.header("Cache-Control").exists</code>                                                    |
| http header.CONTAINS" http header.CONTAINS(<string>) | Returns a Boolean TRUE if the <string> argument appears in any instance of the header value. Note: This operation overrides any text-based Contains operations on all instances of the current header type. |
| http header .COUNT                                   | Returns the number of headers in a request or response, to a maximum of 15 headers of the same type. The result is undefined if there are more than 15 instances of the header.                             |
| http header.AFTER_STR(<string>)                      | Extracts the text that follows the first occurrence of the <string> argument. The headers are evaluated from the last instance to the first.                                                                |
| http header.BEFORE_STR(<string>)                     | Extracts the text that appears prior to the first occurrence of the input <string> argument. The headers are evaluated from the last instance to the first.                                                 |

| HTTP Header Operation                   | Description                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| http header.INSTANCE(<instance number>) | An HTTP header can occur multiple times in a request or a response. This operation returns the header that occurs <instance number> of places before the final instance. For example, instance(0) selects the last instance of the current type, instance(1) selects the next-to-last instance, and so on. This prefix cannot be used in bidirectional policies. |
| http header.SUBSTR(<string>)            | Extracts the text that matches the <string> argument. The headers are evaluated from the last instance to the first.                                                                                                                                                                                                                                             |
| http header.VALUE(<instance number>)    | An HTTP header can occur multiple times in a request or a response. VALUE(0) selects the value in the last instance, VALUE(1) selects the value in the next-to-last instance, and so on. The <instance number> argument cannot exceed 14.                                                                                                                        |

### Prefixes for cache-control headers

The following prefixes apply specifically to Cache-Control headers.

| HTTP Header Prefix     | Description                                         |
|------------------------|-----------------------------------------------------|
| HTTP.REQ.CACHE_CONTROL | Returns a Cache-Control header in an HTTP request.  |
| HTTP.RES.CACHE_CONTROL | Returns a Cache-Control header in an HTTP response. |

### Operations for cache-control headers

You can apply any of the operations for HTTP headers to Cache-Control headers. For more information, see [Operations for HTTP headers](#).

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.

| HTTP Header Operation                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache-Control header.NAME(<integer>) | Returns as a text value the name of the Cache-Control header that corresponds to the nth component in a name-value list, as specified by <integer>. The index of the name-value component is 0-based. If the <integer> that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: <code>http.req.cache_control.name(3).contains("some_text")</code> |
| Cache-Control header.IS_INVALID      | Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example: <code>http.req.cache_control.is_invalid</code>                                                                                                                                                                                                                                                                                    |
| Cache-Control header.IS_PRIVATE      | Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: <code>http.req.cache_control.is_private</code>                                                                                                                                                                                                                                                                                                        |
| Cache-Control header.IS_PUBLIC       | Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: <code>http.req.cache_control.is_public</code>                                                                                                                                                                                                                                                                                                         |
| Cache-Control header.IS_NO_STORE     | Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: <code>http.req.cache_control.is_no_store</code>                                                                                                                                                                                                                                                                                                      |
| Cache-Control header.IS_NO_CACHE     | Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: <code>http.req.cache_control.is_no_cache</code>                                                                                                                                                                                                                                                                                                      |
| Cache-Control header.IS_MAX_AGE      | Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: <code>http.req.cache_control.is_max_age</code>                                                                                                                                                                                                                                                                                                        |
| Cache-Control header.IS_MIN_FRESH    | Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: <code>http.req.cache_control.is_min_fresh</code>                                                                                                                                                                                                                                                                                                    |
| Cache-Control header.IS_MAX_STALE    | Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: <code>http.req.cache_control.is_max_stale</code>                                                                                                                                                                                                                                                                                                    |

| HTTP Header Operation                    | Description                                                                                                                                                                               |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache-Control header.IS_MUST_REVALIDATE  | Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example: <code>http.req.cache_control.is_must_revalidate</code>                         |
| Cache-Control header.IS_NO_TRANSFORM     | Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example: <code>http.req.cache_control.is_no_transform</code>                               |
| Cache-Control header.IS_ONLY_IF_CACHED   | Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example: <code>http.req.cache_control.is_only_if_cached</code>                           |
| Cache-Control header.IS_PROXY_REVALIDATE | Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate. Following is an example: <code>http.req.cache_control.is_proxy_revalidate</code>                       |
| Cache-Control header.IS_S_MAXAGE         | Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: <code>http.req.cache_control.is_s_maxage</code>                                       |
| Cache-Control header.IS_UNKNOWN          | Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: <code>http.req.cache_control.is_unknown</code>                                         |
| Cache-Control header.MAX_AGE             | Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example: <code>http.req.cache_control.max_age.le(3)</code>     |
| Cache-Control header.MAX_STALE           | Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example: <code>http.req.cache_control.max_stale.le(3)</code> |
| Cache-Control header.MIN_FRESH           | Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example: <code>http.req.cache_control.min_fresh.le(3)</code> |

| HTTP Header Operation         | Description                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache-Control header.S_MAXAGE | Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned. Following is an example: <code>http.req.cache_control.s_maxage.eq(2)</code> |

## Expressions for extracting segments of URLs

September 21, 2020

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg") || http.req.url.suffix.eq("gif")
```

Most expressions for URLs operate on text and are described in [Expression Prefixes for Text in HTTP Requests and Responses](#). This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- HTTP.REQ.URL.PATH
- VPN.BASEURL.PATH
- VPN.CLIENTLESS\_BASEURL.PATH

The following table describes prefixes for HTTP URLs.

| URL Prefix                 | Description                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.URL.PATH.GET(<n>) | Returns a slash- ("/") separated list from the URL path. For example, consider the following URL: <code>&lt;http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1&gt;</code> . The following expression returns dir1 from this URL: <code>&lt;http.req.url.path.get(1)&gt;</code> . The following expression returns dir2: <code>http.req.url.path.get(2)</code> |

| URL Prefix                         | Description                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.URL.PATH.GET_REVERSE(<n>) | Returns a slash- ("/") separated list from the URL path, starting from the end of the path. For example, consider the following URL: <http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1>. The following expression returns index.html from this URL: <http.req.url.path.get_reverse(0)>. The following expression returns dir3: http.req.url.path.get_reverse(1) |

## Expressions for HTTP status codes and numeric HTTP payload data other than dates

September 21, 2020

The following table describes prefixes for numeric values in HTTP data other than dates.

| Prefix                  | Description                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.CONTENT_LENGTH | Returns the length of an HTTP request as a number. Following is an example: http.req.content_length < 500                                                                                                                                                                                                                                                    |
| HTTP.RES.CONTENT_LENGTH | Returns the length of the HTTP response as a number. Following is an example: http.res.content_length <= 1000                                                                                                                                                                                                                                                |
| HTTP.RES.STATUS         | Returns the response status code                                                                                                                                                                                                                                                                                                                             |
| HTTP.RES.IS_REDIRECT    | Returns a Boolean TRUE if the response code is associated with a redirect. Following are the redirect response codes: 300 (Multiple Choices), 301 (Moved Permanently), 302 (Found), 303 (See Other), 305 (Use Proxy), and 307 (Temporary Redirect). Note: Status code 304 is not considered a redirect HTTP response status code. Status code 306 is unused. |

## SIP expressions

September 21, 2020

The Citrix ADC Advanced policy expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a sip\_udp policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
1 INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0
2 Record-Route: <sip:200.200.100.22;lr=on>
3 Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport
   =5060;
4   received=10.102.84.18
5 Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
6   received=10.102.84.160
7 From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53
   cc0185
8 To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
9 Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
10 Max-Forwards: 69CSeq: 101 INVITE
11 User-Agent: Cisco-CP7940G/8.0
12 Contact: <sip:12@10.102.84.180:5060;transport=udp>
13 Expires: 180
14 Accept: application/sdp
15 Allow: ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE
16 Supported: replaces,join,norefersub
17 Content-Length: 277
18 Content-Type: application/sdp
19 Content-Disposition: session;handling=optiona
20 <!--NeedCopy-->
```

## SIP reference tables

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from SIP.REQ to SIP.RES, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

### SIP request expressions

| Expression           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.METHOD       | Operates on the method of the SIP request. The supported SIP request methods are ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIBE, and UPDATE. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE<br>sip:16@10.102.84.181:5060;transport=udp<br>SIP/2.0, this expression returns INVITE. |
| SIP.REQ.URL          | Operates on the SIP request URL. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE<br>sip:16@10.102.84.181:5060;transport=udp<br>SIP/2.0, this expression returns sip:16@10.102.84.181:5060;transport=udp.                                                                                                                                  |
| SIP.REQ.URL.PROTOCOL | Returns the URL protocol. For example, for a SIP URL<br>of sip:16@www.sip.com:5060;transport=udp, this expression returns sip.                                                                                                                                                                                                                                                                                                                                     |

---

| Expression                  | Description                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.URL.HOSTNAME        | Returns the hostname portion of the SIP URL. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns www.sip.com:5060.                                                                                                                                                |
| SIP.REQ.URL.HOSTNAME.PORT   | Returns the port portion of the SIP URL hostname. If no port is specified, this expression returns the default SIP port, 5060. For example, for a SIP hostname of www.sip.com:5060, this expression returns 5060.                                                                                          |
| SIP.REQ.URL.HOSTNAME.DOMAIN | Returns the domain name portion of the SIP URL hostname. If the host is an IP address, then this expression returns an incorrect result. For example, for a SIP hostname of www.sip.com:5060, this expression returns sip.com. For a SIP hostname of 192.168.43.15:5060, this expression returns an error. |
| SIP.REQ.URL.HOSTNAME.SERVER | Returns the server portion of the host. For example, for a SIP hostname of www.sip.com:5060, this expression returns www.                                                                                                                                                                                  |
| SIP.REQ.URL.USERNAME        | Returns the username that precedes the @ character. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns 16.                                                                                                                                                       |
| SIP.REQ.VERSION             | Returns the SIP version number in the request. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns SIP/2.0.                                                                                                                                  |
| SIP.REQ.VERSION.MAJOR       | Returns the major version number (the number to the left of the period). For example, for a SIP version number of SIP/2.0, this expression returns 2.                                                                                                                                                      |

---

| Expression              | Description                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.VERSION.MINOR   | Returns the minor version number (the number to the right of the period). For example, for a SIP version number of SIP/2.0, this expression returns 0.                                                                                                                              |
| SIP.REQ.CONTENT_LENGTH  | Returns the contents of the Content-Length header. This expression is a derivative of thesip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Content-Length header of Content-Length: 277, this expression returns 277.    |
| SIP.REQ.TO              | Returns the contents of the To header. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185.                                    |
| SIP.REQ.TO.ADDRESS      | Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:16@sip_example.com. |
| SIP.REQ.TO.DISPLAY_NAME | Returns the display name portion of the To header. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 16.                                                                                         |
| SIP.REQ.TO.TAG          | Returns the "tag" value from the "tag" name value pair in the TO header. For example, for a SIP To header of To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.                                    |

---

| Expression                 | Description                                                                                                                                                                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.FROM               | Returns the contents of the From header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com.                                                                               |
| SIP.REQ.FROM.ADDRESS       | Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com. |
| SIP.REQ.FROM.DISPLAY_NAME  | Returns the display name portion of the To header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 12.                                                                                         |
| SIP.REQ.FROM.TAG           | Returns the "tag" value from the "tag" name/value pair in the TO header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.                                    |
| SIP.REQ.VIA                | Returns the complete Via header. If there are multiple Via headers in the request, returns the last Via header. For example, for the two Via headers in the sample SIP header, this expression returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re         |
| SIP.REQ.VIA.SENTBY_ADDRESS | Returns the address that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.180.                                                                                              |

---

| Expression              | Description                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.VIA.SENTBY_PORT | Returns the port that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 5060.                                                                                                                                                                         |
| SIP.REQ.VIA.RPORT       | Returns the value from the rport name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 5060.                                                                                                                                                               |
| SIP.REQ.VIA.BRANCH      | Returns the value from the branch name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns z9hG4bK03e76d0b.                                                                                                                                                   |
| SIP.REQ.VIA.RECEIVED    | Returns the value from the received name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.160.                                                                                                                                                   |
| SIP.REQ.CALLID          | Returns the contents of the Callid header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Callid header of Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180, this expression returns 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180. |
| SIP.REQ.CSEQ            | Returns the CSEQ number from the CSEQ, as an integer. For example, for a SIP CSEQ header of CSeq: 101 INVITE, this expression returns 101.                                                                                                                                                                                                             |

| Expression                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER(<header_name>)            | Returns the specified SIP header. For , substitute the name of the header that you want. For example, to return the SIP From header, you would type SIP.REQ.HEADER("From").                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SIP.REQ.HEADER(<header_name>).INSTANCE() | Returns the specified instance of the specified SIP header. Multiple instances of the same SIP header can occur. Where you want a specific instance of such a SIP header (for example, a specific Via header), you can specify that header by typing a number as the . Header instances are matched from last (0) to first. In other words, SIP.REQ.HEADER("Via").INSTANCE(0) returns the last instance of the Via header, while SIP.REQ.HEADER("Via").INSTANCE(1) returns the last instance but one of the Via header, and so on. For example, if used on the example SIP header, SIP.REQ.HEADER("Via").INSTANCE(1) returnsVia: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060. |
| SIP.REQ.HEADER(<header_name>).VALUE()    | Returns the contents of the specified instance of the specified SIP header. The usage is nearly the same as the previous expression. For example, if used on the SIP header example in the preceding table entry, SIP.REQ.HEADER("Via").VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.                                                                                                                                                                                                                                                                                                                                                                         |
| SIP.REQ.HEADER(<header_name>).COUNT      | Returns the number of instances of a particular header as an integer. For example, if used on the SIP header example above, SIP.REQ.HEADER("Via").COUNT returns 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Expression                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER(<header_name>).EXISTS             | Returns a boolean value of true or false, depending upon whether the specified header exists or not. For example, if used on the SIP header example above, SIP.REQ.HEADER("Expires").EXISTS returns true, while SIP.REQ.HEADER("Caller-ID").EXISTS returns false.                                                                                                                                                                                                                                                                                                                                        |
| SIP.REQ.HEADER(<header_name>).LIST               | Returns the comma-separated parameter list in the specified header. For example, if used on the SIP header example above, SIP.REQ.HEADER("Allow").LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,U You can append the string .GET() to select a specific list item. For example, to get the first item (ACK) from the above list, you would type SIP.REQ.HEADER("Allow").LIST.GET(0). To extract the second item (BYE), you would type SIP.REQ.HEADER("Allow").LIST.GET(1). Note: If the specified header contains a list of name/value pairs, the entire name/value pair is returned. |
| SIP.REQ.HEADER(<header_name>).TYPECAST_SI        | Typecasts to . Any text can be typecasted to this sip_header_t class, after which all header-based operations can be used. After you perform this operation, you can apply all operations that can be used with . For example, the expres- sion SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T ty casts all instances of the Content-Length header. After you perform this operation, you can apply all header operations to all instances of the specified header.                                                                                                                                        |
| SIP.REQ.HEADER(<header_name>).CONTAINS(<string>) | Returns boolean true if the specified text string is present in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                                                                                                                                                                                                                                                                        |

| Expression                                     | Description                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER(<header_name>).EQUALS_ANY       | Returns boolean true if any pattern associated with <patset> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                 |
| SIP.REQ.HEADER(<header_name>).CONTAINS_ANY     | Returns boolean true if any pattern associated with <patset> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                 |
| SIP.REQ.HEADER(<header_name>).CONTAINS_INDEX   | Returns the index of the matching pattern associated with <patset> if that pattern matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                           |
| SIP.REQ.HEADER(<header_name>).EQUALS_INDEX     | Returns the index of the matching pattern associated with <patset> if that pattern matches any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                          |
| SIP.REQ.HEADER(<header_name>).SUBSTR(<string>) | If the specified string is present in any instance of the specified header, this expression returns that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;return=5060, SIP.REQ.HEADER("Via").SUBSTR("rport=5060") turns "rport=5060". SIP.REQ.HEADER("Via").SUBSTR("return=5060") turns an empty string. |

---

| Expression                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER(<header_name>).AFTER_STR(<string>) | If the specified string is present in any instance of the specified header, this expression returns the string immediately after that string. For example, for the SIP header <code>Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re</code> , the expression <code>SIP.REQ.HEADER("Via").AFTER_STR("rport=")</code> returns 5060.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SIP.REQ.HEADER(<header_name>).REGEX_MATCH         | Returns boolean true if the specified regular expression (regex) matches any instance of the specified header. You must specify the regular expression in the following format: <code>re&lt;delimiter&gt;regular expression&lt;same delimiter&gt;</code> . The regular expression cannot be larger than 1499 characters in length. It must conform to the PCRE regular expression library. See <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for documentation on PCRE regular expression syntax. The <code>pcrepattern</code> man page also has useful information on specifying patterns by using PCRE regular expressions. The regular expression syntax supported in this expression has some differences from PCRE. Back references are not allowed. You should avoid recursive regular expressions; although some work, many do not. The dot (.) metacharacter matches newlines. Unicode is not supported. <code>SET_TEXT_MODE(IGNORECASE)</code> overrides the (?i) internal option specified in the regular expression. |

| Expression                                          | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER(<header_name>).REGEX_SELECT(<regex>) | If the specified regex matches any text in any instance of the specified header, this expression returns the text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160 the expression SIP.REQ.HEADER("Via").REGEX_SELECT("received=[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}") returns received=10.102.84.160.          |
| SIP.REQ.HEADER(<header_name>).AFTER_REGEX(<regex>)  | If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately after that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160 the expression SIP.REQ.HEADER("Via").AFTER_REGEX("received=") returns 10.102.84.160.                                 |
| SIP.REQ.HEADER(<header_name>).BEFORE_REGEX(<regex>) | If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately before that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160 the expression SIP.REQ.HEADER("Via").BEFORE_REGEX("[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}") returns received=. |
| SIP.REQ.FULL_HEADER                                 | Returns the entire SIP header, including the terminating CR/LF.                                                                                                                                                                                                                                                                                                                                    |
| SIP.REQ.IS_VALID                                    | Returns boolean true if the request format is valid.                                                                                                                                                                                                                                                                                                                                               |
| SIP.REQ.BODY(<length>)                              | Returns the request body, up to the specified length. If the specified length is greater than the length of the request body, this expression returns the entire request body.                                                                                                                                                                                                                     |

| Expression         | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| SIP.REQ.LB_VSERVER | Returns the name of the load balancing virtual server (LB vserver) that is serving the current request.    |
| SIP.REQ.CS_VSERVER | Returns the name of the content switching virtual server (CS vserver) that is serving the current request. |

### SIP response expressions

| Expression          | Description                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.RES.STATUS      | Returns the SIP response status code. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns 100.       |
| SIP.RES.STATUS_MSG  | Returns the SIP response status message. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns Trying. |
| SIP.RES.IS_REDIRECT | Returns boolean true if the response code is a redirect.                                                                                       |
| SIP.RES.METHOD      | Returns the response method extracted from the request method string in the CSeq header.                                                       |

## Operations for HTTP, HTML, and XML encoding and “safe” characters

September 21, 2020

The following operations work with the encoding of HTML data in a request or response and XML data in a POST body.

- **<text>.HTML\_XML\_SAFE:**

Transforms special characters into XML safe format, as in the following examples:

A left-pointing angle bracket (<) is converted to <

A right-pointing angle bracket (>) is converted to >

An ampersand (&) is converted to &

This operation safeguards against cross-site scripting attacks. Maximum length of the transformed text is 2048 bytes. This is a read-only operation.

After applying the transformation, additional operators that you specify in the expression are applied to the selected text. Following is an example:

```
http.req.url.query.html_xml_safe.contains("myQueryString")
```

- **<text>.HTTP\_HEADER\_SAFE:**

Converts all new line ('\n') characters in the input text to '%0A' to enable the input to be used safely in HTTP headers.

This operation safeguards against response-splitting attacks.

The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

- **<text>.HTTP\_URL\_SAFE:**

Converts unsafe URL characters to '%xx' values, where "xx" is a hex-based representation of the input character. For example, the ampersand (&) is represented as %26 in URL-safe encoding. The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

Following are URL safe characters. All others are unsafe:

- Alpha-numeric characters: a-z, A-Z, 0-9
- Asterix: "\*"
- Ampersand: "&"
- At-sign: "@"
- Colon: ":"
- Comma: ","
- Dollar: "\$"
- Dot: "."
- Equals: "="
- Exclamation mark: "!"
- Hyphen: "-"
- Open and close parentheses: "(", ")"
- Percent: "%"
- Plus: "+"
- Semicolon: ";"
- Single quote: "'"
- Slash: "/"
- Question mark: "?"
- Tilde: "~"
- Underscore: "\_"

- **<text>.MARK\_SAFE:**

Marks the text as safe without applying any type of data transformation.

- **`<text>.SET_TEXT_MODE(URL ENCODED|NO URL ENCODED)`**

Transforms all %HH encoding in the byte stream. This operation works with characters (not bytes). By default, a single byte represents a character in ASCII encoding. However, if you specify URL ENCODED mode, three bytes can represent a character.

In the following example, a PREFIX(3) operation selects the first 3 characters in a target.

```
http.req.url.hostname.prefix(3)
```

In the following example, the Citrix ADC can select up to 9 bytes from the target:

```
http.req.url.hostname.set_text_mode(urlencoded).prefix(3)
```

- **`<text>.SET_TEXT_MODE(PLUS_AS_SPACE|NO_PLUS_AS_SPACE):`**

Specifies how to treat the plus character (+). The PLUS\_AS\_SPACE option replaces a plus character with white space. For example, the text “hello+world” becomes “hello world.” The NO\_PLUS\_AS\_SPACE option leaves plus characters as they are.

- **`<text>.SET_TEXT_MODE(BACKSLASH_ENCODED|NO_BACKSLASH_ENCODED):`**

Specifies whether or not backslash decoding is performed on the text object represented by `<text>`.

If BACKSLASH\_ENCODED is specified, the SET\_TEXT\_MODE operator performs the following operations on the text object:

- All occurrences of “\XXX” will be replaced with the character “Y” (where XXX represents a number in the octal system and Y represents the ASCII equivalent of XXX). The valid range of octal values for this type of encoding is 0 to 377. For example, the encoded text “http\72//” and http\072//” will both be decoded to <http://>, where the colon (:) is the ASCII equivalent of the octal value “72”.
- All occurrences of “\xHH” will be replaced with the character “Y” (HH represents a number in the hexadecimal system and Y denotes the ASCII equivalent of HH. For example, the encoded text “http\x3a//” will be decoded to <http://>, where the colon (:) is the ASCII equivalent of the hexadecimal value “3a”.
- All occurrences of “\uWWXX” will be replaced with the character sequence “YZ” (Where WW and XX represent two distinct hexadecimal values and Y and Z represent their ASCII equivalents of WW and XX respectively. For example, the encoded text “http%u3a2f//” and “http%u003a//” will both be decoded to <http://>, where “3a” and “2f” are two hexadecimal values and the colon (:) and forward slash (“/”) represent their ASCII equivalents respectively.
- All occurrences of “\b”, “\n”, “\t”, “\f”, and “\r” are replaced with the corresponding ASCII characters.

If NO\_BACKSLASH\_ENCODED is specified, backslash decoding is not performed on the text object.

- **<text>.SET\_TEXT\_MODE(BAD\_ENCODE\_RAISE\_UNDEF|NO\_BAD\_ENCODE\_RAISE\_UNDEF):**  
Performs the associated undefined action if either the URLENCODED or the BACKSLASH\_ENCODED mode is set and bad encoding corresponding to the specified encoding mode is encountered in the text object represented by <text>.

If NO\_BAD\_ENCODE\_RAISE\_UNDEF is specified, the associated undefined action will not be performed when bad encoding is encountered in the text object represented by <text>.

## Expressions for TCP, UDP, and VLAN data

September 21, 2020

TCP and UDP data take the form of a string or a number. For expression prefixes that return string values for TCP and UDP data, you can apply any text-based operations. For more information, see [Advanced policy expressions: Evaluating text](#).

For expression prefixes that return numeric value, such as a source port, you can apply an arithmetic operation. For more information, see [Basic operations on expression prefixes](#) and [Compound operations for numbers](#).

The following table describes prefixes that extract TCP and UDP data.

| GET Operation                 | Description                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.TCP.PAYLOAD(<integer>) | Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the <integer> argument. You can apply any text-based operation to this prefix.                                                                                                                     |
| CLIENT.TCP.SRCPORT            | Returns the ID of the current packet's source port as a number.                                                                                                                                                                                                                                                                          |
| CLIENT.TCP.DSTPORT            | Returns the ID of the current packet's destination port as a number.                                                                                                                                                                                                                                                                     |
| CLIENT.TCP.OPTIONS            | Returns the TCP options set by the client. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the server, see the SERVER.TCP.OPTIONS prefix. |

| GET Operation                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.TCP.OPTIONS.COUNT               | Returns the number of TCP options that the client has set.                                                                                                                                                                                                                                                                                                                                                                                             |
| CLIENT.TCP.OPTIONS.TYPE(<type>)        | Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value                                                                                                                                                                                                                                   |
| CLIENT.TCP.OPTIONS.TYPE_NAME(<m>)      | Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). Parameters: m - TCP option enumeration constant |
| CLIENT.TCP.REPEATER_OPTION.EXISTS      | Returns a Boolean TRUE if Repeater TCP options exist.                                                                                                                                                                                                                                                                                                                                                                                                  |
| CLIENT.TCP.REPEATER_OPTION.IP          | Returns the branch repeater's IPv4 address from the Repeater TCP options.                                                                                                                                                                                                                                                                                                                                                                              |
| CLIENT.TCP.REPEATER_OPTION.MAC         | Returns the branch repeater's MAC address from the Repeater TCP options.                                                                                                                                                                                                                                                                                                                                                                               |
| CLIENT.UDP.DNS.DOMAIN                  | Returns the DNS domain name.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CLIENT.UDP.DNS.DOMAIN.EQ("<hostname>") | Returns a Boolean TRUE if the domain name matches the <hostname> argument. The comparison is case insensitive. Following is an example: client.udp.dns.domain.eq("www.mycompany.com")                                                                                                                                                                                                                                                                  |
| CLIENT.UDP.DNS.IS_AAAAREC              | Returns a Boolean TRUE if the record type is AAAA. These types of records indicate an IPv6 address in forward lookups.                                                                                                                                                                                                                                                                                                                                 |
| CLIENT.UDP.DNS.IS_ANYREC               | Returns a Boolean TRUE if it is of any record type.                                                                                                                                                                                                                                                                                                                                                                                                    |

| GET Operation                       | Description                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.UDP.DNS.IS_AREC              | Returns a Boolean TRUE if the record is type A. Type A records provide the host address.                                                                                                                                                     |
| CLIENT.UDP.DNS.IS_CNAMEREC          | Returns a Boolean TRUE if the record is of type CNAME. In systems that use multiple names to identify a resource, there is one canonical name and a number of aliases. The CNAME provides the canonical name.                                |
| CLIENT.UDP.DNS.IS_MXREC             | Returns a Boolean TRUE if the record is of type MX (mail exchanger). This DNS record describes a priority and a host name. The MX records for the same domain name specify the email servers in the domain and the priority for each server. |
| CLIENT.UDP.DNS.IS_NSREC             | Returns a Boolean TRUE if the record is of type NS. This is a name server record that includes a host name with an associated A record. This enables locating the domain name that is associated with the NS record.                         |
| CLIENT.UDP.DNS.IS_PTRREC            | Returns a Boolean TRUE if the record is of type PTR. This is a domain name pointer and is often used to associate a domain name with an IPv4 address.                                                                                        |
| CLIENT.UDP.DNS.IS_SOAREC            | Returns a Boolean TRUE if the record is of type SOA. This is a start of authority record.                                                                                                                                                    |
| CLIENT.UDP.DNS.IS_SRVREC            | Returns a Boolean TRUE if the record is of type SRV. This is a more general version of the MX record.                                                                                                                                        |
| CLIENT.UDP.DSTPORT                  | Returns the numeric ID of the current packet's UDP destination port.                                                                                                                                                                         |
| CLIENT.UDP.SRCPORT                  | Returns the numeric ID of the current packet's UDP source port.                                                                                                                                                                              |
| CLIENT.UDP.RADIUS                   | Returns RADIUS data for the current packet.                                                                                                                                                                                                  |
| CLIENT.UDP.RADIUS.ATTR_TYPE(<type>) | Returns the value for the attribute type specified as the argument.                                                                                                                                                                          |
| CLIENT.UDP.RADIUS.USERNAME          | Returns the RADIUS user name.                                                                                                                                                                                                                |

---

| GET Operation                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.TCP.MSS                    | Returns the maximum segment size (MSS) for the current connection as a number.                                                                                                                                                                                                                                                                                                                                                                         |
| CLIENT.VLAN.ID                    | Returns the numeric ID of the VLAN through which the current packet entered the Citrix ADC.                                                                                                                                                                                                                                                                                                                                                            |
| SERVER.TCP.DSTPORT                | Returns the numeric ID of the current packet's destination port.                                                                                                                                                                                                                                                                                                                                                                                       |
| SERVER.TCP.SRCPORT                | Returns the numeric ID of the current packet's source port.                                                                                                                                                                                                                                                                                                                                                                                            |
| SERVER.TCP.OPTIONS                | Returns the TCP options set by the server. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(<type>), and TYPE_NAME(<m>) operators can be used with this prefix. For the TCP options set by the client, see the CLIENT.TCP.OPTIONS prefix.                                                                                                               |
| SERVER.TCP.OPTIONS.COUNT          | Returns the number of TCP options that the server has set.                                                                                                                                                                                                                                                                                                                                                                                             |
| SERVER.TCP.OPTIONS.TYPE(<type>)   | Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value                                                                                                                                                                                                                                   |
| SERVER.TCP.OPTIONS.TYPE_NAME(<m>) | Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(<type>). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(<type>). Parameters: m - TCP option enumeration constant |

| GET Operation  | Description                                                                                 |
|----------------|---------------------------------------------------------------------------------------------|
| SERVER.VLAN    | Operates on the VLAN through which the current packet entered the Citrix ADC.               |
| SERVER.VLAN.ID | Returns the numeric ID of the VLAN through which the current packet entered the Citrix ADC. |

## Expressions for evaluating a DNS message and identifying its carrier protocol

September 21, 2020

You can evaluate DNS requests and responses by using expressions that begin with DNS.REQ and DNS.RES, respectively. You can also identify the transport layer protocol that is being used to send the DNS messages.

The following functions return the contents of a DNS query.

| Function                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.REQ.QUESTION.DOMAIN | Return the domain name (the value of the QNAME field) in the question section of the DNS query. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.                                                                                                                                                                                                                                              |
| DNS.REQ.QUESTION.TYPE   | Return the query type (the value of the QTYPE field) in the DNS query. The field indicates the type of resource record (for example, A, NS, or CNAME) for which the name server is being queried. The returned value can be compared to one of the following values by using the EQ() and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. Note: You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.REQ.QUESTION.TYPE.EQ(MX) |

The following functions return the contents of a DNS response.

| Function                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.RES.HEADER.RCODE    | Return the response code (the value of the RCODE field) in the header section of the DNS response. You can use only the EQ() and NE() functions with the RCODE function. Following are the possible values: NOERROR, FORMERR, SERVFAIL, NXDOMAIN, NOTIMP, and REFUSED.                                                                                                                                                                                                                  |
| DNS.RES.QUESTION.DOMAIN | Return the domain name (the value of the QNAME field) in the question section of the DNS response. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.                                                                                                                                                                                                                                                        |
| DNS.RES.QUESTION.TYPE   | Return the query type (the value of the QTYPE field) in the question section of the DNS response. The field indicates the type of resource record (for example, A, NS, or CNAME) that is contained in the response. The returned value can be compared to one of the following values by using the EQ() and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.RES.QUESTION.TYPE.EQ(SOA) |

The following functions return the transport layer protocol name.

| Function          | Description                                                                                                                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.REQ.TRANSPORT | Return the name of the transport layer protocol that was used to send the DNS query. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.REQ.TRANSPORT.EQ(TCP) |

| Function          | Description                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.RES.TRANSPORT | Return the name of the transport layer protocol that was used for the DNS response. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.RES.TRANSPORT.EQ(TCP) |

## XPath and HTML, XML, or JSON expressions

September 21, 2020

The Advanced policy infrastructure supports expressions for evaluating and retrieving data from HTML, XML, and JavaScript Object Notation (JSON) files. This enables you to find specific nodes in an HTML, XML, or JSON document, determine if a node exists in the file, locate nodes in XML contexts (for example, nodes that have specific parents or a specific attribute with a given value), and return the contents of such nodes. Additionally, you can use XPath expressions in rewrite expressions.

The Advanced policy expression implementation for XPath comprises an Advanced policy expression prefix (such as “HTTP.REQ.BODY”) that designates HTML or XML text, and the XPATH operator that takes the XPath expression as its argument.

HTML files are a largely free-form collection of tags and text elements. You can use the XPATH\_HTML operator, which takes an XPath expression as its argument, to process HTML files. JSON files are either a collection of name/value pairs or an ordered list of values. You can use the XPATH\_JSON operator, which takes an XPath expression as its argument, to process JSON files.

- **<text>.XPATH(xpathex) :**

Operate on an XML file and return a Boolean value.

For example, the following expression returns a Boolean TRUE if a node called “creator” exists under the node “Book” within the first 1000 bytes of the XML file.

```
HTTP.REQ.BODY(1000).XPATH(xpath%boolean(//Book/creator)%)
```

Parameters:

xpathex - XPath Boolean expression

- **<text>.XPATH(xpathex) :**

Operate on an XML file and return a value of data type “double.”

For example, the following expression converts the string “36” (a price value) to a value of data type “double” if the string is in the first 1000 bytes of the XML file:

```
HTTP.REQ.BODY(1000).XPATH(xp%number(/Book/price)%)
```

Parameters:

xpathex - XPath numeric expression

- **<text>.XPATH(xpathex) :**

Operate on an XML file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

For example, the following expression selects all the nodes that are enclosed by “/Book/creator” (a node-set) in the first 1000 bytes of the body:

```
HTTP.REQ.BODY(1000).XPATH(xp%/Book/creator%)
```

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_HTML(xpathex)**

Operate on an HTML file and return a text value.

For example, the following expression operates on an HTML file and returns the text enclosed in <title><\title> tags if the title HTML element is found in the first 1000 bytes:

```
HTTP.REQ.BODY(1000).XPATH_HTML(xp%/html/head/title%)
```

Parameters:

xpathex - XPath text expression

- **<text\>.XPATH\_HTML\_WITH\_MARKUP(xpathex)**

Operate on an HTML file and return a string that contains the entire selected portion of the document, including markup such as including the enclosing element tags.

The following expression operates on the HTML file and selects all content within the <title\> tag, including markup.

```
HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP( xp%/html/head/title%)
```

**Example:**

```

1    <Book>
2    <creator>
3        <Person>
4            <name>Milton</name>
5        </Person>
6    </creator>
```

```

7     <title>Paradise Lost</title>
8     </Book>
9 <!--NeedCopy-->

```

The portion of the HTML body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

- **<text\>.XPATH\_JSON(xpathex)**

Operate on a JSON file and return a Boolean value.

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": '<name>' } }, "title": '<title>' }
```

The following expression operates on the JSON file and returns a Boolean TRUE if the JSON file contains a node named “creator,” whose parent node is “Book,” in the first 1000 bytes:

```
HTTP.REQ.BODY(1000).XPATH_JSON(xp%boolean(/Book/creator)%)
```

Parameters:

xpathex - XPath Boolean expression

- **<text\>.XPATH\_JSON(xpathex)**

Operate on a JSON file and return a value of data type “double.”

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": '<name>' } } , "title": '<title>', "price": "36" } }
```

The following expression operates on the JSON file and converts the string “36” to a value of data type “double” if the string is present in the first 1000 bytes of the JSON file.

```
HTTP.REQ.BODY(1000).XPATH_JSON(xp%number(/Book/price)%)
```

Parameters:

xpathex - XPath numeric expression

- **<text\>.XPATH\_JSON(xpathex)**

Operate on a JSON file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": '<name>' } } , "title": '<title>' }
```

The following expression selects all the nodes that are enclosed by “/Book” (a node-set) in the first 1000 bytes of the body of the JSON file and returns the corresponding string value, which is “<name><title>”:

```
HTTP.REQ.BODY(1000).XPATH_JSON(xp%/Book%)
```

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_JSON\_WITH\_MARKUP(xpathex)**

Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

For example, consider the following JSON file:

```
{“Book”:{“creator”:{“person”:{“name”:'<name>' }}, “title”:'<title>' } }
```

The following expression operates on the JSON file and selects all the nodes that are enclosed by “/Book/creator” in the first 1000 bytes of the body, which is “creator:{ person:{ name:'<name>' } }.”

```
HTTP.REQ.BODY(1000).XPATH_JSON_WITH_MARKUP(xp%/Book/creator%)
```

The portion of the JSON body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_WITH\_MARKUP(xpathex):**

Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

For example, the following expression operates on an XML file and selects all the nodes enclosed by “/Book/creator” in the first 1000 bytes of the body.

```
HTTP.REQ.BODY(1000).XPATH_WITH_MARKUP(xp%/Book/creator%)
```

The portion of the JSON body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

## Encrypt and decrypt XML payloads

October 14, 2020

You can use the XML\_ENCRYPT() and XML\_DECRYPT() functions in Advanced policy expressions to encrypt and decrypt, respectively, XML data. These functions conform to the W3C XML Encryption standard defined at "[http://www.w3.org/TR/2001/PR-xmlsig-core-20010820/.](http://www.w3.org/TR/2001/PR-xmlsig-core-20010820/)" XML\_ENCRYPT() and XML\_DECRYPT() support a subset of the XML Encryption specification. In the subset, data encryption uses a bulk cipher method (RC4, DES3, AES128, AES192, or AES256), and an RSA public key is used to encrypt the bulk cipher key.

**Note:** If you want to encrypt and decrypt text in a payload, you must use the ENCRYPT and DECRYPT functions. For more information about these functions, see [Encrypt and decrypt text](#).

The XML\_ENCRYPT() and XML\_DECRYPT() functions are not dependent on the encryption/decryption service that is used by the ENCRYPT and DECRYPT commands for text. The cipher method is specified explicitly as an argument to the XML\_ENCRYPT() function. The XML\_DECRYPT() function obtains the information about the specified cipher method from the <xenc:EncryptedData> element. Following are synopses of the XML encryption and decryption functions:

- **XML\_ENCRYPT(<certKeyName>, <method> [, <flags>]).** Returns an <xenc:EncryptedData> element that contains the encrypted input text and the encryption key, which is itself encrypted by using RSA.
- **XML\_DECRYPT(<certKeyName>).** Returns the decrypted text from the input <xenc:EncryptedData> element, which includes the cipher method and the RSA-encrypted key.

**Note:** The <xenc:EncryptedData> element is defined in the W3C XML Encryption specification.

Following are descriptions of the arguments:

- **certKeyName:** Selects an X.509 certificate with an RSA public key for XML\_ENCRYPT() or an RSA private key for XML\_DECRYPT(). The certificate key must have been previously created by an `add ssl certKey` command.
- **method:** Specifies which cipher method to use for encrypting the XML data. Possible values: RC4, DES3, AES128, AES192, AES256.
- **flags:** A bitmask specifying the following optional key information (<ds:KeyInfo>) to be included in the <xenc:EncryptedData> element that is generated by XML\_ENCRYPT():
  - **1** - Include a KeyName element with the certKeyName. The element is <ds:KeyName>.

- **2** - Include a KeyValue element with the RSA public key from the certificate. The element is <ds:KeyValue>.
- **4** - Include an X509IssuerSerial element with the certificate serial number and issuer DN. The element is <ds:X509IssuerSerial>.
- **8** - Include an X509SubjectName element with the certificate subject DN. The element is <ds:X509SubjectName>.
- **16** - Include an X509Certificate element with the entire certificate. The element is <ds:X509Certificate>.

### Use the XML\_ENCRYPT() and XML\_DECRYPT() functions in expressions

The XML encryption feature uses SSL certificate-key pairs to provide X.509 certificates (with RSA public keys) for key encryption and RSA private keys for key decryption. Therefore, before you use the XML\_ENCRYPT() function in an expression, you must create an SSL certificate-key pair. The following command creates an SSL certificate-key pair, `my-certkey`, with the X.509 certificate, `my-cert.pem`, and the private key file, `my-key.pem`.

```
add ssl certKey my-certkey -cert my-cert.pem -key my-key.pem -passcrypt
kxPeMRyNitY=
```

The following CLI commands create rewrite actions and policies for encrypting and decrypting XML content.

```
1 add rewrite action my-xml-encrypt-action replace "HTTP.RES.BODY(10000).
  XPATH_WITH_MARKUP(xp%/)" "HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp
  %/).XML_ENCRYPT("my-certkey", AES256, 31)" -bypassSafetyCheck YES
2
3 add rewrite action my-xml-decrypt-action replace "HTTP.REQ.BODY(10000).
  XPATH_WITH_MARKUP(xp%/xenc:EncryptedData%)" "HTTP.REQ.BODY(10000).
  XPATH_WITH_MARKUP(xp%/xenc:EncryptedData%).XML_DECRYPT("my-certkey"
  )" -bypassSafetyCheck YES
4
5 add rewrite policy my-xml-encrypt-policy "HTTP.REQ.URL.CONTAINS("xml-
  encrypt")" my-xml-encrypt-action
6
7 add rewrite policy my-xml-decrypt-policy "HTTP.REQ.BODY(10000).XPATH(xp
  %boolean(//xenc:EncryptedData%)" my-xml-decrypt-action
8
9 bind rewrite global my-xml-encrypt-policy 30
10
11 bind rewrite global my-xml-decrypt-policy 30
12 <!--NeedCopy-->
```

In the preceding example, the rewrite action `my-xml-encrypt-action` encrypts the entire XML document (`XPATH_WITH_MARKUP(xp%/%)`) in the request by using the AES-256 bulk encryption method and the RSA public key from `my-certkey` to encrypt the bulk encryption key. The action replaces the document with an `<xenc:EncryptedData>` element containing the encrypted data and an encrypted key. The flags represented by 31 include all the optional `<ds:KeyInfo>` elements.

The action `my-xml-decrypt-action` decrypts the first `<xenc:EncryptedData>` element in the response (`XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)`). This requires the prior addition of the `xenc` XML namespace by use of the following CLI command:

```
add ns xmlnamespace xenc http://www.w3.org/2001/04/xm1enc##
```

The `my-xml-decrypt-action` action uses the RSA private key in `my-certkey` to decrypt the encrypted key and then uses the bulk encryption method specified in the element to decrypt the encrypted contents. Finally, the action replaces the encrypted data element with the decrypted content.

The rewrite policy `my-xml-encrypt-policy` applies `my-xml-encrypt-action` to requests for URLs containing `xml-encrypt`. The action encrypts the entire response from a service configured on the Citrix ADC appliance.

The rewrite policy `my-xml-decrypt-policy` applies `my-xml-decrypt-action` to requests that contain an `<xenc:EncryptedData>` element (`((XPATH(xp%//xenc:EncryptedData%)` returns a non-empty string). The action decrypts the encrypted data in requests that are bound for a service configured on the Citrix ADC appliance.

## Advanced policy expressions: parsing SSL

September 21, 2020

There are advanced policy expressions to parse SSL certificates and SSL client hello messages.

### Parse SSL certificates

You can use advanced policy expressions to evaluate X.509 Secure Sockets Layer (SSL) client certificates. A client certificate is an electronic document that can be used to authenticate a user's identity. A client certificate contains (at a minimum) version information, a serial number, a signature algorithm ID, an issuer name, a validity period, a subject (user) name, a public key, and signatures.

You can examine both SSL connections and data in client certificates. For example, you may want to send SSL requests that use low-strength ciphers to a particular load balancing virtual server farm. The following command is an example of a Content Switching policy that parses the cipher strength in a request and matches cipher strengths that are less than or equal to 40:

```
1 add cs policy p1 -rule "client.ssl.cipher_bits.le(40)"
2 <!--NeedCopy-->
```

As another example, you can configure a policy that determines whether a request contains a client certificate:

```
1 add cs policy p2 -rule "client.ssl.client_cert exists"
2 <!--NeedCopy-->
```

Or, you can configure a policy that examines particular information in a client certificate. For example, the following policy verifies that the certificate has one or more days before expiration:

```
1 add cs policy p2 -rule "client.ssl.client_cert exists && client.ssl.
  client_cert.days_to_expire.ge(1)"
2 <!--NeedCopy-->
```

#### Note

For information on parsing dates and times in a certificate, see [Format of Dates and Times in an Expression](#) and [Expressions for SSL Certificate Dates](#).

## Prefixes for text-based SSL and certificate data

The following table describes expression prefixes that identify text-based items in SSL transactions and client certificates.

Table 1. Prefixes That Return Text or Boolean Values for SSL and Client Certificate Data

| Prefix                        | Description                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_CERT        | Returns the SSL client certificate in the current SSL transaction.                                                            |
| CLIENT.SSL.CLIENT_CERT.TO_PEM | Returns the SSL client certificate in binary format.                                                                          |
| CLIENT.SSL.CIPHER_EXPORTABLE  | Returns a Boolean TRUE if the SSL cryptographic SSL cryptographic cipher is exportable.                                       |
| CLIENT.SSL.CIPHER_NAME        | Returns the name of the SSL Cipher if invoked from an SSL connection, and a NULL string if invoked from a non-SSL connection. |

| Prefix            | Description                                                    |
|-------------------|----------------------------------------------------------------|
| CLIENT.SSL.IS_SSL | Returns a Boolean TRUE if the current connection is SSL-based. |

### Prefixes for numeric data in SSL certificates

The following table describes prefixes that evaluate numeric data other than dates in SSL certificates. These prefixes can be used with the operations that are described in [Basic Operations on Expression Prefixes](#) and [Compound Operations for Numbers](#).

Table 2. Prefixes That Evaluate Numeric Data Other Than Dates in SSL Certificates

| Prefix                                | Description                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_CERT.DAYS_TO_EXPIRE | Returns the number of days that the certificate is valid, or returns -1 for expired certificates.                                                                                                                                                                                                                            |
| CLIENT.SSL.CLIENT_CERT.PK_SIZE        | Returns the size of the public key used in the certificate.                                                                                                                                                                                                                                                                  |
| CLIENT.SSL.CLIENT_CERT.VERSION        | Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).                                                                                                                                                                                                                         |
| CLIENT.SSL.CIPHER_BITS                | Returns the number of bits in the cryptographic key. Returns 0 if the connection is not SSL-based.                                                                                                                                                                                                                           |
| CLIENT.SSL.VERSION                    | Returns a number that represents the SSL protocol version, as follows: 0. The transaction is not SSL-based.; 0x002. The transaction is SSLv2.; 0x300. The transaction is SSLv3.; 0x301. The transaction is TLSv1.; 0x302. The transaction is TLS 1.1.; 0x303. The transaction is TLS 1.2; 0x304. The transaction is TLS 1.3. |

#### Note

For expressions related to expiration dates in a certificate, see [Expressions for SSL Certificate Dates](#).

## Expressions for SSL certificates

You can parse SSL certificates by configuring expressions that use the following prefix:

CLIENT.SSL.CLIENT\_CERT

This section discusses the expressions that you can configure for certificates, with the exception of expressions that examine certificate expiration. Time-based operations are described in [Advanced Policy Expressions: Working with Dates, Times, and Numbers](#).

The following table describes operations that you can specify for the CLIENT.SSL.CLIENT\_CERT prefix.

Table 3. Operations That Can Be Specified with the CLIENT.SSL.CLIENT\_CERT Prefix

| SSL Certificate Operation               | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;certificate&gt;.EXISTS</code> | Returns a Boolean TRUE if the client has an SSL certificate.                                                                                                                                                                                                                                                                                                                                       |
| <code>&lt;certificate&gt;.ISSUER</code> | Returns the Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign (“=”) is the delimiter for the name and the value, and the slash (“/”) is the delimiter that separates the name-value pairs. Following is an example of the returned DN:<br><code>/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com</code> |

| SSL Certificate Operation                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>&lt;certificate&gt;.ISSUER.<br/>IGNORE_EMPTY_ELEMENTS</pre> | <p>Returns the Issuer and ignores the empty elements in a name-value list. For example, consider the following: Cert-Issuer:<br/>/c=in/st=kar//l=bangalore<br/>//o=mycompany/ou=sales/<br/>/emailAddress=myuserid@mycompany.com.</p> <p>The following Rewrite action returns a count of 6 based on the preceding Issuer definition:</p> <pre>sh rewrite action insert_ssl_header<br/>Name: insert_sslOperation:<br/>insert_http_header Target:Cert-<br/>Issuer<br/>Value:CLIENT.SSL.CLIENT_CERT.ISSUER<br/>.COUNT. However, if you change the value to<br/>the following, the returned count is 9:<br/>CLIENT.SSL.CLIENT_CERT.ISSUER.<br/>IGNORE_EMPTY_ELEMENTS.COUNT</pre> |

### Parse SSL client hello

You can parse the SSL client hello by configuring expressions that use the following prefix:

| Prefix                                      | Description                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_HELLO.CIPHERS.HAS_HEXCODE | Matches the hex code provided in the expression with the hex codes of cipher suites received in the client hello message.   |
| CLIENT.SSL.CLIENT_HELLO.CLIENT_VERSION      | Version received in the client hello message header.                                                                        |
| CLIENT.SSL.CLIENT_HELLO.IS_RENEGOTIATE      | Returns true if a client or server initiate session renegotiation.                                                          |
| CLIENT.SSL.CLIENT_HELLO.IS_REUSE            | Returns true if the appliance reuses the SSL session based on the non-zero session-ID received in the client-hello message. |

| Prefix                                    | Description                                                                                                                                         |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_HELLO.IS_SCSV           | Returns true if Signaling Cipher Suite Value (SCSV) capability is advertised in the client hello message. The hex code for fallback SCSV is 0x5600. |
| CLIENT.SSL.CLIENT_HELLO.IS_SESSION_TICKET | Returns true if session ticket extension with non-zero length is advertised in the client-hello message.                                            |
| CLIENT.SSL.CLIENT_HELLO.LENGTH            | Length received in the client hello message header.                                                                                                 |
| CLIENT.SSL.CLIENT_HELLO.SNI               |                                                                                                                                                     |

These expressions can be used at CLIENTHELLO\_REQ bind point. For more information, see [SSL policy binding](#).

## Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs

September 21, 2020

You can use Advanced policy expression prefixes that return IPv4 and IPv6 addresses, MAC addresses, IP subnets, useful client and server data such as the throughput rates at the interface ports (Rx, Tx, and RxCtx), and the IDs of the VLANs through which packets are received. You can then use various operators to evaluate the data that is returned by these expression prefixes.

### Expressions for IP addresses and IP subnets

You can use Advanced policy expressions to evaluate addresses and subnets that are in Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) format. Expression prefixes for IPv6 addresses and subnets include IPv6 in the prefix. Expression prefixes for IPv4 addresses and subnets include IP in the prefix. Following is an example of an expression that identifies whether a request has originated from a particular IPv4 subnet.

```
1 client.ip.src.in_subnet(147.1.0.0/16)
2 <!--NeedCopy-->
```

Following are two examples of Rewrite policies that examine the subnet from which the packet is received and perform a rewrite action on the Host header. With these two policies configured, the rewrite action that is performed depends on the subnet in the request. These two policies evaluate IP addresses that are in the IPv4 address format.

```

1 - add rewrite action URL1-rewrite-action replace "http.req.header(\
  Host\)" "\"www.mycompany1.com\""
2 - add rewrite policy URL1-rewrite-policy "http.req.header(\\"Host\").
  contains(\\"www.test1.com\") && client.ip.src.in_subnet(147.1.0.0/16)
  " URL1-rewrite-action
3 - add rewrite action URL2-rewrite-action replace "http.req.header(\
  Host\)" "\"www.mycompany2.com\""
4 - add rewrite policy URL2-rewrite-policy "http.req.header(\\"Host\").
  contains(\\"www.test2.com\") && client.ip.src.in_subnet
  (10.202.0.0/16)" URL2-rewrite-action
5 <!--NeedCopy-->

```

#### Note

The preceding examples are commands that you type at the Citrix ADC command-line interface (CLI) and, therefore, each quotation mark must be preceded by a backslash (\). For more information, see “

[Configuring advanced policy expressions in a policy.](#)”

### Prefixes for IPV4 addresses and IP subnets

The following table describes prefixes that return IPv4 addresses and subnets, and segments of IPv4 addresses. You can use numeric operators and operators that are specific to IPv4 addresses with these prefixes. For more information about numeric operations, see “[Basic Operations on Expression Prefixes](#)” and “[Compound Operations for Numbers](#).”

Table 1. Prefixes That Evaluate IP and MAC Addresses

| Prefix        | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| CLIENT.IP.SRC | Returns the source IP of the current packet as an IP address or as a number.      |
| CLIENT.IP.DST | Returns the destination IP of the current packet as an IP address or as a number. |
| SERVER.IP.SRC | Returns the source IP of the current packet as an IP address or as a number.      |

| Prefix        | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| SERVER.IP.DST | Returns the destination IP of the current packet as an IP address or as a number. |

### Operations for IPV4 Addresses

The following table describes the operators that can be used with prefixes that return an IPv4 address.

| Prefix                                                    | Description                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip address&gt;.EQ(&lt;address&gt;)</code>       | Returns a Boolean TRUE if the IP address value is same as the <code>&lt;address&gt;</code> argument. The following example checks whether the client's destination IP address is equal to 10.100.10.100:<br><code>client.ip.dst.eq(10.100.10.100)</code>                              |
| <code>&lt;ip address&gt;.GET1. . .GET4</code>             | Returns a portion of an IP address as a numeric value. For example, if the IP address value is 10.100.200.1, the following is returned:<br><code>client.ip.src.get1</code> Returns 10;<br><code>client.ip.src.get2</code> returns 100;<br><code>client.ip.src.get3</code> returns 200 |
| <code>&lt;ip address&gt;.IN_SUBNET(&lt;subnet&gt;)</code> | Returns a Boolean TRUE if the <code>&lt;subnet&gt;</code> argument matches the subnet of the IP address value. For example, the following determines whether the client's destination IP address subnet is 10.100.10.100/18:<br><code>client.ip.dst.eq(10.100.10.100/18)</code>       |
| <code>&lt;ip address&gt;.SUBNET(&lt;n&gt;)</code>         | Returns the IP address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 32. For example: <code>CLIENT.IP.SRC.SUBNET(24)</code> returns 192.168.1.0 <b>if</b> the IP address represented by the prefix is 192.168.1.[0-255].    |

| Prefix                                                             | Description                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip address&gt;.IS_IPV6</code>                            | Returns a Boolean TRUE if this is an Internet Protocol version 6 (IPv6) host for the client or server. Following is an example:<br><code>client.ip.src.is_ipv6</code>                                                                                                                                                                                                  |
| <code>&lt;ip address&gt;.MATCHES(&lt;hostname&gt;)</code>          | Returns a Boolean TRUE if the IP address for the host specified in <code>&lt;hostname&gt;</code> matches the current IP address. The <code>&lt;hostname&gt;</code> cannot exceed 255 characters.                                                                                                                                                                       |
| <code>&lt;ip address&gt;.MATCHES_LOCATION(&lt;location&gt;)</code> | Returns a Boolean TRUE if the location of the IP address matches the <code>&lt;location&gt;</code> argument. The Location string can take the following form: <code>qual1.qual2.qual3.qual4.qual5.qual6</code> , <b>for</b> example: <code>NorthAmerica.CA.*</code> . Following is an example: <code>client.ip.src.matches_location \"Europe.GB.17.London.*.*\"</code> |

### About IPv6 expressions

The IPv6 address format allows more flexibility than the older IPv4 format. IPv6 addresses are in the hexadecimal format (RFC 2373). In the following examples, Example 1 is an IPv6 address, Example 2 is a URL that includes the IPv6 address, and Example 3 includes the IPv6 address and a port number.

#### Example 1:

```
1 9901:0ab1:22a2:88a3:3333:4a4b:5555:6666
2 <!--NeedCopy-->
```

#### Example 2:

```
1 http://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]/
2 <!--NeedCopy-->
```

#### Example 3:

```
1 https://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]:8080/
2 <!--NeedCopy-->
```

In Example 3, the brackets separate the IP address from the port number (8080).

Note that you can only use the '+' operator to combine IPv6 expressions with other expressions. The output is a concatenation of the string values that are returned from the individual expressions. You cannot use any other arithmetic operator with an IPv6 expression. The following syntax is an example:

```
1 client.ipv6.src + server.ip.dst
2 <!--NeedCopy-->
```

For example, if the client source IPv6 address is `ABCD:1234::ABCD`, and the server destination IPv4 address is `10.100.10.100`, the preceding expression returns `"ABCD:1234::ABCD10.100.10.100"`.

Note that when the Citrix ADC appliance receives an IPv6 packet, it assigns a temporary IPv4 address from an unused IPv4 address range and changes the source address of the packet to this temporary address. At response time, the outgoing packet's source address is replaced with the original IPv6 address.

#### Note

You can combine an IPv6 expression with any other expression except an expression that produces a Boolean result.

### Expression prefixes for IPv6 addresses

The IPv6 addresses that are returned by the expression prefixes in the following table can be treated as text data. For example, the prefix `client.ipv6.dst` returns the destination IPv6 address as a string that can be evaluated as text.

The following table describes expression prefixes that return an IPv6 address.

Table 3. IPv6 Expression Prefixes That Return Text

| Prefix          | Description                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.IPV6     | Operates on the IPv6 address in with the current packet.                                                                                                                                   |
| CLIENT.IPV6.DST | Returns the IPv6 address in the destination field of the IP header.                                                                                                                        |
| CLIENT.IPV6.SRC | Returns the IPv6 address in the source field of the IP header. Following are examples: <code>client.ipv6.src.in_subnet(2007::2008/64)</code><br><code>client.ipv6.src.get1.le(2008)</code> |
| SERVER.IPV6     | Operates on the IPv6 address in with the current packet.                                                                                                                                   |

| Prefix          | Description                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVER.IPV6.DST | Returns the IPv6 address in the destination field of the IP header.                                                                                                                        |
| SERVER.IPV6.SRC | Returns the IPv6 address in the source field of the IP header. Following are examples: <code>server.ipv6.src.in_subnet(2007::2008/64)</code><br><code>server.ipv6.src.get1.le(2008)</code> |

### Operations for IPv6 prefixes

The following table describes the operators that can be used with prefixes that return an IPv6 address:

Table 4. Operations That Evaluate IPv6 Addresses

| IPv6 Operation                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6&gt;.EQ(&lt;IPv6_address&gt;)</code> | Returns a Boolean TRUE if the IP address value is same as the <code>&lt;IPv6_address&gt;</code> argument. Following is an example:<br><code>client.ipv6.dst.eq(ABCD:1234::ABCD)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>&lt;ipv6&gt;.GET1. . .GET8</code>            | Returns a segment of an IPv6 address as a number. The following example expressions retrieve segments from the ipv6 address 1000:1001:CD10:0000:0000:89AB:4567:CDEF:<br><code>client.ipv6.dst.get5</code> extracts 0000, which is the fifth set of bits in the address.<br><code>client.ipv6.dst.get6</code> extracts 89AB.<br><code>client.ipv6.dst.get7</code> extracts 4567.<br>You can perform numeric operations on these segments. Note that you cannot perform numeric operations when you retrieve an entire IPv6 address. This is because expressions that return an entire IPv6 address, such as CLIENT.IPV6.SRC, return the address in text format. |

| IPv6 Operation                                      | Description                                                                                                                                                                                                                      |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6&gt;.IN_SUBNET(&lt;subnet&gt;)</code> | Returns a Boolean TRUE if the IPv6 address value is in the subnet specified by the <code>&lt;subnet&gt;</code> argument. Following is an example:<br><code>client.ipv6.dst.eq(1000:1001:CD10:0000:0000:89AB:4567:CDEF/60)</code> |
| <code>&lt;ipv6&gt;.IS_IPV4</code>                   | Returns a Boolean TRUE if this is an IPv4 client, and returns a Boolean FALSE if it is not.                                                                                                                                      |
| <code>&lt;ipv6&gt;.SUBNET(&lt;n&gt;)</code>         | Returns the IPv6 address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 128. For example:<br><code>CLIENT.IPV6.SRC.SUBNET(24)</code>                                    |

## Expressions for MAC addresses

A MAC address consists of colon-delimited hexadecimal values in the format `##:##:##:##:##:##`, where each “#” represents either a number from 0 through 9 or a letter from A through F. Default syntax expression prefixes and operators are available for evaluating source and destination MAC addresses.

### Prefixes for MAC addresses

The following table describes prefixes that return MAC addresses.

Table 5. Prefixes That Evaluate MAC Addresses

| Prefix                           | Description                                                              |
|----------------------------------|--------------------------------------------------------------------------|
| <code>client.ether.dstmac</code> | Returns the MAC address in the destination field of the Ethernet header. |
| <code>client.ether.srcmac</code> | Returns the MAC address in the source field of the Ethernet header.      |

### Operations for MAC addresses

The following table describes the operators that can be used with prefixes that return a MAC address.

Table 6. Operations on MAC Addresses

| Prefix                                               | Description                                                                                                                                                                                                                         |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;mac address&gt;.EQ(&lt;address&gt;)</code> | Returns a Boolean TRUE if the MAC address value is same as the <code>&lt;address&gt;</code> argument.                                                                                                                               |
| <code>&lt;mac address&gt;.GET1. . .GET4</code>       | Returns a numeric value extracted from the segment of the MAC address that is specified in the GET operation. For example, if the MAC address is 12:34:56:78:9a:bc, the following returns 34: <code>client.ether.dstmac.get2</code> |

### Expressions for numeric client and server data

The following table describes prefixes for working with numeric client and server data, including throughput, port numbers, and VLAN IDs.

Table 7. Prefixes That Evaluate Numeric Client and Server Data

| Prefix                                      | Description                                                                                                                        |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>client.interface.rxthroughput</code>  | Returns an integer representing the raw received traffic throughput in kilobytes per second (KBps) for the previous seven seconds. |
| <code>client.interface.txthroughput</code>  | Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.                     |
| <code>client.interface.rxtthroughput</code> | Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.        |
| <code>server.interface.rxthroughput</code>  | Returns an integer representing the raw received traffic throughput in KBps for the previous seven seconds.                        |
| <code>server.interface.txthroughput</code>  | Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.                     |
| <code>server.interface.rxtthroughput</code> | Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.        |

| Prefix         | Description                                                                                |
|----------------|--------------------------------------------------------------------------------------------|
| server.vlan.id | Returns a numeric ID of the VLAN through which the current packet entered the Citrix ADC.  |
| client.vlan.id | Returns a numeric ID for the VLAN through which the current packet entered the Citrix ADC. |

---

## Advanced policy expressions: stream analytics functions

September 21, 2020

Stream Analytics expressions begin with the ANALYTICS.STREAM(<identifier\_name>) prefix. The following list describes the functions that can be used with this prefix.

- **COLLECT\_STATS**

Collect statistical data from the requests that are evaluated against the policy and create a record for each request.

- **REQUESTS**

Return the number of requests that exist for the specified record grouping. The value returned is of type unsigned long.

- **BANDWIDTH**

Return the bandwidth statistic for the specified record grouping. The value returned is of type unsigned long.

- **RESPTIME**

Return the response time statistic for the specified record grouping. The value returned is of type unsigned long.

- **CONNECTIONS**

Return the number of concurrent connections that exist for the specified record grouping. The value returned is of type unsigned long.

- **IS\_TOP(n)**

Return a Boolean

TRUE if the statistical value for the specified record grouping is one among the top

n groups. Otherwise, return a Boolean  
FALSE.

- **CHECK\_LIMIT**

Return a Boolean  
TRUE if the statistic for the specified record grouping has hit the preconfigured limit. Otherwise,  
return a Boolean  
FALSE.

## Advanced policy expressions: DataStream

September 21, 2020

The policy infrastructure on the Citrix ADC appliance includes expressions that you can use to evaluate and process database server traffic when the appliance is deployed between a farm of application servers and their associated database servers.

This topic includes the following sections:

- Expressions for the MySQL Protocol
- Expressions for Evaluating Microsoft SQL Server Connections

### Expressions for the MySQL protocol

The following expressions evaluate traffic associated with MySQL database servers. You can use the request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors.

- **MYSQL.CLIENT.** Operates on the client properties of a MySQL connection.
- **MYSQL.CLIENT.CAPABILITIES.** Returns the set of flags that the client has set in the capabilities field of the handshake initialization packet during authentication. Examples of the flags that are set are `CLIENT_FOUND_ROWS`, `CLIENT_COMPRESS`, and `CLIENT_SSL`.
- **MYSQL.CLIENT.CHAR\_SET.** Returns the enumeration constant assigned to the character set that the client uses. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the character set enumeration constants:
  - `LATIN2_CZECH_CS`
  - `DEC8_SWEDISH_CI`

- CP850\_GENERAL\_CI
- GREEK\_GENERAL\_CI
- LATIN1\_GERMAN1\_CI
- HP8\_ENGLISH\_CI
- KOI8R\_GENERAL\_CI
- LATIN1\_SWEDISH\_CI
- LATIN2\_GENERAL\_CI
- SWE7\_SWEDISH\_CI
- ASCII\_GENERAL\_CI
- CP1251\_BULGARIAN\_CI
- LATIN1\_DANISH\_CI
- HEBREW\_GENERAL\_CI
- LATIN7\_ESTONIAN\_CS
- LATIN2\_HUNGARIAN\_CI
- KOI8U\_GENERAL\_CI
- CP1251\_UKRAINIAN\_CI
- CP1250\_GENERAL\_CI
- LATIN2\_CROATIAN\_CI
- CP1257\_LITHUANIAN\_CI
- LATIN5\_TURKISH\_CI
- LATIN1\_GERMAN2\_CI
- ARMSCII8\_GENERAL\_CI
- UTF8\_GENERAL\_CI
- CP1250\_CZECH\_CS
- CP866\_GENERAL\_CI
- KEYBCS2\_GENERAL\_CI
- MACCE\_GENERAL\_CI
- MACROMAN\_GENERAL\_CI
- CP852\_GENERAL\_CI
- LATIN7\_GENERAL\_CI
- LATIN7\_GENERAL\_CS
- MACCE\_BIN
- CP1250\_CROATIAN\_CI
- LATIN1\_BIN
- LATIN1\_GENERAL\_CI
- LATIN1\_GENERAL\_CS
- CP1251\_BIN
- CP1251\_GENERAL\_CI
- CP1251\_GENERAL\_CS

- MACROMAN\_BIN
- CP1256\_GENERAL\_CI
- CP1257\_BIN
- CP1257\_GENERAL\_CI
- ARMSCII8\_BIN
- ASCII\_BIN
- CP1250\_BIN
- CP1256\_BIN
- CP866\_BIN
- DEC8\_BIN
- GREEK\_BIN
- HEBREW\_BIN
- HP8\_BIN
- KEYBCS2\_BIN
- KOI8R\_BIN
- KOI8U\_BIN
- LATIN2\_BIN
- LATIN5\_BIN
- LATIN7\_BIN
- CP850\_BIN
- CP852\_BIN
- SWE7\_BIN
- UTF8\_BIN
- GEOSTD8\_GENERAL\_CI
- GEOSTD8\_BIN
- LATIN1\_SPANISH\_CI
- UTF8\_UNICODE\_CI
- UTF8\_ICELANDIC\_CI
- UTF8\_LATVIAN\_CI
- UTF8\_ROMANIAN\_CI
- UTF8\_SLOVENIAN\_CI
- UTF8\_POLISH\_CI
- UTF8\_ESTONIAN\_CI
- UTF8\_SPANISH\_CI
- UTF8\_SWEDISH\_CI
- UTF8\_TURKISH\_CI
- UTF8\_CZECH\_CI
- UTF8\_DANISH\_CI
- UTF8\_LITHUANIAN\_CI

- UTF8\_SLOVAK\_CI
  - UTF8\_SPANISH2\_CI
  - UTF8\_ROMAN\_CI
  - UTF8\_PERSIAN\_CI
  - UTF8\_ESPERANTO\_CI
  - UTF8\_HUNGARIAN\_CI
  - INVAL\_CHARSET
- **MYSQL.CLIENT.DATABASE.** Returns the name of the database specified in the authentication packet that the client sends to the database server. This is the databasename attribute.
  - **MYSQL.CLIENT.USER.** Returns the user name (in the authentication packet) with which the client is attempting to connect to the database. This is the user attribute.
  - **MYSQL.REQ.** Operates on a MySQL request.
  - **MYSQL.REQ.COMMAND.** Identifies the enumeration constant assigned to the type of command in the request. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the enumeration constant values:
    - SLEEP
    - QUIT
    - INIT\_DB
    - QUERY
    - FIELD\_LIST
    - CREATE\_DB
    - DROP\_DB
    - REFRESH
    - SHUTDOWN
    - STATISTICS
    - PROCESS\_INFO
    - CONNECT
    - PROCESS\_KILL
    - DEBUG
    - PING
    - TIME
    - DELAYED\_INSERT
    - CHANGE\_USER
    - BINLOG\_DUMP
    - TABLE\_DUMP
    - CONNECT\_OUT
    - REGISTER\_SLAVE

- STMT\_PREPARE
- STMT\_EXECUTE
- STMT\_SEND\_LONG\_DATA
- STMT\_CLOSE
- STMT\_RESET
- SET\_OPTION
- STMT\_FETCH

- **MYSQL.REQ.QUERY.** Identifies the query in the MySQL request.
- **MYSQL.REQ.QUERY.COMMAND.** Returns the first keyword in the MySQL query.
- **MYSQL.REQ.QUERY.SIZE.** Returns the size of the request query in integer format. The SIZE method is similar to the CONTENT\_LENGTH method that returns the length of an HTTP request or response.
- **MYSQL.REQ.QUERY.TEXT.** Returns a string covering the entire query.
- **MYSQL.REQ.QUERY.TEXT(<n>).** Returns the first n bytes of the MySQL query as a string. This is similar to HTTP.BODY(<n>).

**Parameters:**

n - Number of bytes to be returned

- **MYSQL.RES.** Operates on a MySQL response.
- **MYSQL.RES.ATLEAST\_ROWS\_COUNT(<i>).** Checks whether the response has at least i number of rows and returns a Boolean TRUE or FALSE to indicate the result.

**Parameters:**

i - Number of rows

- **MYSQL.RES.ERROR.** Identifies the MySQL error object. The error object includes the error number and the error message.
- **MYSQL.RES.ERROR.MESSAGE.** Returns the error message that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.NUM.** Returns the error number that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.SQLSTATE.** Returns the value of the SQLSTATE field in the server's error response. The MySQL server translates error number values to SQLSTATE values.
- **MYSQL.RES.FIELD(<i>).** Identifies the packet that corresponds to the <sup>i</sup> individual field in the server's response. Each field packet describes the properties of the associated column. The packet count (i) begins at 0.

**Parameters:**

i - Packet number

- **MYSQL.RES.FIELD(<i>).CATALOG.** Returns the catalog property of the field packet.
- **MYSQL.RES.FIELD(<i>).CHAR\_SET.** Returns the character set of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.
- **MYSQL.RES.FIELD(<i>).DATATYPE.** Returns an enumeration constant that represents the data type of the column. This is the type (also called `enum_field_type`) attribute of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. The possible values for the various data types are:
  - DECIMAL
  - TINY
  - SHORT
  - LONG
  - FLOAT
  - DOUBLE
  - NULL
  - TIMESTAMP
  - LONGLONG
  - INT24
  - DATE
  - TIME
  - DATETIME
  - YEAR
  - NEWDATE
  - VARCHAR (new in MySQL 5.0)
  - BIT (new in MySQL 5.0)
  - NEWDECIMAL (new in MySQL 5.0)
  - ENUM
  - SET
  - TINY\_BLOB
  - MEDIUM\_BLOB
  - LONG\_BLOB
  - BLOB
  - VAR\_STRING
  - STRING
  - GEOMETRY
- **MYSQL.RES.FIELD(<i>).DB.** Returns the database identifier (db) attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).DECIMALS.** Returns the number of positions after the decimal point if

the type is DECIMAL or NUMERIC. This is the decimals attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).FLAGS.** Returns the flags property of the field packet. Following are the possible hexadecimal flag values:
  - 0001: NOT\_NULL\_FLAG
  - 0002: PRI\_KEY\_FLAG
  - 0004: UNIQUE\_KEY\_FLAG
  - 0008: MULTIPLE\_KEY\_FLAG
  - 0010: BLOB\_FLAG
  - 0020: UNSIGNED\_FLAG
  - 0040: ZEROFILL\_FLAG
  - 0080: BINARY\_FLAG
  - 0100: ENUM\_FLAG
  - 0200: AUTO\_INCREMENT\_FLAG
  - 0400: TIMESTAMP\_FLAG
  - 0800: SET\_FLAG
- **MYSQL.RES.FIELD(<i>).LENGTH.** Returns the length of the column. This is the value of the length attribute of the field packet. The value that is returned might be larger than the actual value. For example, an instance of a VARCHAR(2) column might return a value of 2 even when it contains only one character.
- **MYSQL.RES.FIELD(<i>).NAME.** Returns the column identifier (the name after the AS clause, if any). This is the name attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL\_NAME.** Returns the original column identifier (before the AS clause, if any). This is the org\_name attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).ORIGINAL\_TABLE.** Returns the original table identifier of the column (before the AS clause, if any). This is the org\_table attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).TABLE.** Returns the table identifier of the column (after the AS clause, if any). This is the table attribute of the field packet.
- **MYSQL.RES.FIELDS\_COUNT.** Returns the number of field packets in the response (the field\_count attribute of the OK packet).
- **MYSQL.RES.OK.** Identifies the OK packet sent by the database server.
- **MYSQL.RES.OK.AFFECTED\_ROWS.** Returns the number of rows affected by an INSERT, UPDATE, or DELETE query. This is the value of the affected\_rows attribute of the OK packet.
- **MYSQL.RES.OK.INSERT\_ID.** Identifies the unique\_id attribute of the OK packet. If an auto-increment identity is not generated by the current MySQL statement or query, the value of unique\_id, and hence the value returned by the expression, is 0.

- **MYSQL.RES.OK.MESSAGE.** Returns the message property of the OK packet.
- **MYSQL.RES.OK.STATUS.** Identifies the bit string in the server\_status attribute of the OK packet. Clients can use the server status to check whether the current command is a part of a running transaction. The bits in the server\_status bit string correspond to the following fields (in the given order):
  - IN TRANSACTION
  - AUTO\_COMMIT
  - MORE RESULTS
  - MULTI QUERY
  - BAD INDEX USED
  - NO INDEX USED
  - CURSOR EXISTS
  - LAST ROW SEEN
  - DATABASE DROPPED
  - NO BACKSLASH ESCAPES
- **MYSQL.RES.OK.WARNING\_COUNT.** Returns the warning\_count attribute of the OK packet.
- **MYSQL.RES.ROW(<i>).** Identifies the packet that corresponds to the *i* individual row in the database server's response.

**Parameters:**

*i* - Row number

- **MYSQL.RES.ROW(<i>).DOUBLE\_ELEM(<j>).** Checks whether the *j* column of the *i* row of the table is NULL. Following C conventions, both indexes *i* and *j* start from 0. Therefore, row *i* and column *j* are actually the (*i*+1) row and the (*j*+1) column, respectively.

**Parameters:**

*i* - Row number

*j* - Column number

- **MYSQL.RES.ROW(<i>).IS\_NULL\_ELEM(j).** Checks whether the *j* column of the *i* row of the table is NULL. Following C conventions, both indexes *i* and *j* start from 0. Therefore, row *i* and column *j* are actually the (*i*+1) row and the (*j*+1) column, respectively.

**Parameters:**

*i* - Row number

*j* - Column number

- **MYSQL.RES.ROW(<i>).NUM\_ELEM(<j>)**. Returns an integer value from the  $j^{\text{th}}$  column of the  $i^{\text{th}}$  row of the table. Following C conventions, both indexes  $i$  and  $j$  start from 0. Therefore, row  $i$  and column  $j$  are actually the  $(i+1)^{\text{th}}$  row and the  $(j+1)^{\text{th}}$  column, respectively.

**Parameters:**

$i$  - Row number

$j$  - Column number

- **MYSQL.RES.ROW(<i>).TEXT\_ELEM(j)**. Returns a string from the  $j^{\text{th}}$  column of the  $i^{\text{th}}$  row of the table. Following C conventions, both indexes  $i$  and  $j$  start from 0. Therefore, row  $i$  and column  $j$  are actually the  $(i+1)^{\text{th}}$  row and the  $(j+1)^{\text{th}}$  column, respectively.

**Parameters:**

$i$  - Row number

$j$  - Column number

- **MYSQL.RES.TYPE**. Returns an enumeration constant for the response type. Its values can be ERROR, OK, and RESULT\_SET. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

## Expressions for evaluating Microsoft SQL server connections

The following expressions evaluate traffic associated with Microsoft SQL Server database servers. You can use the request-based expressions (expressions that begin with MSSQL.CLIENT and MSSQL.REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MSSQL.RES) to evaluate server responses to user-configured health monitors.

| Expression                | Description                                                                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.CLIENT.CAPABILITIES | Returns the OptionFlags1, OptionFlags2, OptionFlags3, and TypeFlags fields of the LOGIN7 authentication packet, in that order, as a 4-byte integer. Each field is 1 byte long and specifies a set of client capabilities. |
| MSSQL.CLIENT.DATABASE     | Returns the name of the client database. The value returned is of type text.                                                                                                                                              |

---

| Expression                | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.CLIENT.USER         | Returns the user name with which the client authenticated. The value returned is of type text.                                                                                                                                                                                                                                                                                                           |
| MSSQL.REQ.COMMAND         | Returns an enumeration constant that identifies the type of command in the request sent to a Microsoft SQL Server database server. The value returned is of type text. Examples of the values of the enumeration constant are QUERY, RESPONSE, RPC, and ATTENTION. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression. |
| MSSQL.REQ.QUERY.COMMAND   | Returns the first keyword in the SQL query. The value returned is of type text.                                                                                                                                                                                                                                                                                                                          |
| MSSQL.REQ.QUERY.SIZE      | Returns the size of the SQL query in the request. The value returned is a number.                                                                                                                                                                                                                                                                                                                        |
| MSSQL.REQ.QUERY.TEXT      | Returns the entire SQL query as a string. The value returned is of type text.                                                                                                                                                                                                                                                                                                                            |
| MSSQL.REQ.QUERY.TEXT(<n>) | Returns the first n bytes of the SQL query. The value returned is of type text. Parameters: n - Number of bytes                                                                                                                                                                                                                                                                                          |
| MSSQL.REQ.RPC.NAME        | Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.                                                                                                                                                                                                                                                                       |
| MSSQL.REQ.RPC.IS_PROCID   | Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a procedure ID or an RPC name. A return value of TRUE indicates that the request contains a procedure ID and a return value of FALSE indicates that the request contains an RPC name.                                                                                                                    |
| MSSQL.REQ.RPC.PROCID      | Returns the procedure ID of the remote procedure call (RPC) request as an integer.                                                                                                                                                                                                                                                                                                                       |
| MSSQL.REQ.RPC.BODY        |                                                                                                                                                                                                                                                                                                                                                                                                          |

| Expression                                                                       | Description                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note: Not available for releases before 10.1.<br>MSSQL.REQ.RPC.BODY(n)           | Returns the body of the SQL request as a string in the form of parameters represented as “a=b” clauses separated by commas, where “a” is the RPC parameter name and “b” is its value.                                                                                                                                                     |
| Note: Not available for releases before 10.1.<br>MSSQL.RES.ATLEAST_ROWS_COUNT(i) | Returns part of the body of the SQL request as a string in the form of parameters represented as “a=b” clauses separated by commas, where “a” is the RPC parameter name and “b” is its value. Parameters are returned from only the first “n” bytes of the request, skipping the SQL header. Only complete name-value pairs are returned. |
| MSSQL.RES.DONE.ROWCOUNT                                                          | Checks whether the response has at least i number of rows. The value returned is a Boolean TRUE or FALSE value. Parameters: i - Number of rows                                                                                                                                                                                            |
| MSSQL.RES.DONE.STATUS                                                            | Returns a count of the number of rows affected by an INSERT, UPDATE, or DELETE query. The value returned is of type unsigned long.                                                                                                                                                                                                        |
| MSSQL.RES.ERROR.MESSAGE                                                          | Returns the status field from the DONE token sent by a Microsoft SQL Server database server. The value returned is a number.                                                                                                                                                                                                              |
| MSSQL.RES.ERROR.NUM                                                              | Returns the error message from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the MsgText field in the ERROR token. The value returned is of type text.                                                                                                                                             |
|                                                                                  | Returns the error number from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the Number field in the ERROR token. The value returned is a number.                                                                                                                                                   |

| Expression                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.RES.ERROR.STATE               | Returns the error state from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the State field in the ERROR token. The value returned is a number.                                                                                                                                                                                                                                            |
| MSSQL.RES.FIELD(<i>).DATATYPE       | Returns the data type of the ith field in the server response.<br>The EQ(<m>) and NE(<m>) functions, which return Boolean values to indicate the result of a comparison, are used with this prefix. For example, the following expression returns a Boolean TRUE if the DATATYPE function returns a value of datetime for the third field in the response: MSSQL.RES.FIELD(<2>).DATATYPE.EQ(datetime) Parameters: i - Row number |
| MSSQL.RES.FIELD(<i>).LENGTH         | Returns the maximum possible length of the ith field in the server response. The value returned is a number. Parameters: i - Row number                                                                                                                                                                                                                                                                                          |
| MSSQL.RES.FIELD(<i>).NAME           | Returns the name of the ith field in the server response. The value returned is of type text. Parameters: i - Row number                                                                                                                                                                                                                                                                                                         |
| MSSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>) | Returns a value of type double from the jth column of the ith row of the table. If the value is not a double value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number                                                           |

| Expression                         | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.RES.ROW(<i>).NUM_ELEM(j)     | Returns an integer value from the jth column of ith row of the table. If the value is not an integer value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number |
| MSSQL.RES.ROW(<i>).IS_NULL_ELEM(j) | Checks whether the jth column of the ith row of the table is NULL and returns a Boolean TRUE or FALSE to indicate the result. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number             |
| MSSQL.RES.ROW(<i>).TEXT_ELEM(j)    | Returns a text string from the jth column of ith row of the table. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number                                                                        |
| MSSQL.RES.TYPE                     | Returns an enumeration constant that identifies the response type. Following are the possible return values: ERROR, OK, and RESULT_SET.<br>The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.                                                                               |

## Typecasting data

September 21, 2020

You can extract data of one type (for example, text or an integer) from requests and responses and transform it to data of another type. For example, you can extract a string and transform the string to time format. You can also extract a string from an HTTP request body and treat it like an HTTP header or extract a value from one type of request header and insert it in a response header of a different type.

After typecasting the data, you can apply any operation that is appropriate for the new data type. For example, if you typecast text to an HTTP header, you can apply any operation that is applicable to HTTP headers to the returned value.

For more information about typecasting data, see the [Typecasting Operations](#) pdf.

## Regular Expressions

September 21, 2020

When you want to perform string matching operations that are more complex than the operations that you perform with the CONTAINS( "<string>" ) or EQ( "<string>" ) operators, you use regular expressions. The policy infrastructure on the Citrix® Citrix ADC® appliance includes operators to which you can pass regular expressions as arguments for text matching. The names of the operators that work with regular expressions include the string REGEX. The regular expressions that you pass as arguments must conform to the regular expression syntax that is described in "<http://www.pcre.org/pcre.txt>." You can learn more about regular expressions at "<http://www.regular-expressions.info/quickstart.html>" and at "<http://www.silverstones.com/thebat/Regex.html>."

The target text for an operator that works with regular expressions can be either text or the value of an HTTP header. Following is the format of a default syntax expression that uses a regular expression operator to operate on text:

```
<text>.<regex_operator>(re<delimiter><regex_pattern><delimiter>)
```

The string <text> represents the default syntax expression prefix that identifies a text string in a packet (for example, HTTP.REQ.URL). The string <regex\_operator> represents the regular expression operator. The regular expression always begins with the string re. A pair of matching delimiters, represented by <delimiter>, enclose the string <regex\_pattern>, which represents the regular expression.

The following example expression checks whether the URL in an HTTP packet contains the string `*.jpeg` (where `*` is a wildcard) and returns a Boolean TRUE or FALSE to indicate the result. The regular expression is enclosed within a pair of slash marks (`/`), which act as delimiters.

```
http.req.url.regex_match(re/.<asterisk>\.jpeg/)
```

Regular expression operators can be combined to define or refine the scope of a search. For example, `<text>.AFTER_REGEX(reregex_pattern1).BEFORE_REGEX(reregex_pattern2)` specifies that the target for string matching is the text between the patterns `regex_pattern1` and `regex_pattern2`. You can use a text operator on the scope that is defined by the regular expression operators. For example, you can use the `CONTAINS(“<string>”)` operator to check whether the defined scope contains the string `abc`:

```
<text>.AFTER_REGEX(re/regex_pattern1).BEFORE_REGEX(re/regex_pattern2/).  
CONTAINS(“abc”)
```

**Note**

The process of evaluating a regular expression inherently takes more time than that for an operator such as `CONTAINS(“<string>”)` or `EQ(“<string>”)`, which work with simple string arguments. You should use regular expressions only if your requirement is beyond the scope of other operators.

## Basic characteristics of regular expressions

September 21, 2020

Following are notable characteristics of regular expressions as defined on the Citrix ADC appliance:

- A regular expression always begins with the string “re” followed by a pair of delimiting characters (called delimiters) that enclose the regular expression that you want to use.

For example, `re##\<regex_pattern\>##` uses the number sign (`#`) as a delimiter.

- A regular expression cannot exceed 1499 characters.
- Digit matching can be done by using the string `\d` (a backslash followed by `d`).
- White space can be represented by using `\s` (a backslash followed by `s`).
- A regular expression can contain white spaces.

Following are the differences between the Citrix ADC syntax and the PCRE syntax:

- The Citrix ADC does not allow back references in regular expressions.
- You should not use recursive regular expressions.
- The dot meta-character also matches the newline character.

- Unicode is not supported.
- The operation SET\_TEXT\_MODE(IGNORECASE) overrides the (?i) internal option in the regular expression.

## Operations for regular expressions

September 21, 2020

The following table describes the operators that work with regular expressions. The operation performed by a regular expression operator in a given default syntax expression depends on whether the expression prefix identifies text or HTTP headers. Operations that evaluate headers override any text-based operations for all instances of the specified header type. When you use an operator, replace `<text>` with the default syntax expression prefix that you want to configure for identifying text.

| Regular Expression Operation                                       | Description                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.BEFORE_REGEX(&lt;regular expression&gt;)</code> | Selects the text that precedes the string that matches the <code>&lt;regular expression&gt;</code> argument. If the regular expression does not match any data in the target, the expression returns a text object of length 0. The following expression selects the string “text” from “text/plain”. <code>http.res.header(“content-type”).before_regex(re/#/#)</code> |
| <code>&lt;text&gt;.AFTER_REGEX(&lt;regular expression&gt;)</code>  | Selects the text that follows the string that matches the <code>&lt;regular expression&gt;</code> argument. If the regular expression does not match any text in the target, the expression returns a text object of length 0. The following expression extracts “Example” from “myExample”: <code>http.req.header(“etag”).after_regex(re/my//)</code>                  |
| <code>&lt;text&gt;.REGEX_SELECT(&lt;regular expression&gt;)</code> | Selects a string that matches the <code>&lt;regular expression&gt;</code> argument. If the regular expression does not match the target, a text object of length 0 is returned. The following example extracts the string “NS-CACHE-9.0: 90” from a Via header: <code>http.req.header(“via”).regex_select(re!NS-CACHE-\d.\d:\s*\d{1,3}!)</code>                         |

---

| Regular Expression Operation                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.REGEX_MATCH(&lt;regular expression&gt;)</code> | <p>Returns TRUE if the target matches a <code>&lt;regular expression&gt;</code> argument of up to 1499 characters. The regular expression must be of the following format: <code>re&lt;delimiter&gt;regular expression&lt; delimiter&gt;</code> Both delimiters must be the same. Additionally, the regular expression must conform to the Perl-compatible (PCRE) regular expression library syntax. For more information, go to <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a>. In particular, see the <code>pcrepattern</code> man page. However, note the following: Back-references are not allowed. Recursive regular expressions are not recommended. The dot metacharacter also matches the newline character. The Unicode character set is not supported. <code>SET_TEXT_MODE(IGNORECASE)</code> overrides the <code>(?i)</code> internal option specified in the regular expression. The following are examples: <code>http.req.hostname.regex_match(re/[[:alpha:]]+(abc){ 2,3 } )</code> and <code>http.req.url.set_text_mode(urlencoded).regex_match(re##(a*b+c*)##)</code> The following example matches <code>ab</code> and <code>aB</code>: <code>http.req.url.regex_match(re/a(?i)b)</code> The following example matches <code>ab</code>, <code>aB</code>, <code>Ab</code> and <code>AB</code>: <code>http.req.url.set_text_mode(ignorecase).regex_match(re/ab)</code> The following example performs a case-insensitive, multiline match in which the dot meta-character also matches a newline character: <code>http.req.body.regex_match(re(?ixm)(^ab (.*)cd\$))</code></p> |

---

## Configuring classic policies and expressions

September 21, 2020

Some Citrix ADC features use classic policies and classic expressions. As with default syntax policies, classic policies can be either global or specific to a virtual server. However, to a certain extent, the configuration method and bind points for classic policies are different from those of default syntax policies. As with default syntax expressions, you can configure named expressions and use a named expression in multiple classic policies.

The following table summarizes Citrix ADC features that can be configured by using classic policies.

Click [Policy types and bind points](#) PDF to view the table.

### Configure a classic policy

September 21, 2020

You can configure classic policies and classic expressions by using either the configuration utility or the command-line interface. A policy rule cannot exceed 1,499 characters. When configuring the policy rule, you can use named classic expressions. For more information about named expressions, see [Create named classic expressions](#). After configuring the policy, you bind it either globally or to a virtual server.

Note that there are small variations in the policy configuration methods for various Citrix ADC features.

Note: You can embed a classic expression in a default syntax expression by using the syntax `SYS.EVAL_CLASSIC_EXPR(classic_expression)`, specifying the `classic_expression` as the argument.

### Create a classic policy by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add cmp policy <name> -rule <expression> -action <action>
2
3 - show cmp policy [<policyName>]
4 <!--NeedCopy-->
```

## Example

The following commands first create a compression action and then create a compression policy that applies the action:

```
1 > add cmp action cmp-act-compress compress
2 Done
3 > show cmp action cmp-act-compress
4 1)      Name: cmp-act-compress  Compression Type: compress
5 Done
6 > add cmp pol cmp-pol-compress -rule ExpCheckIp -resAction cmp-act-
      compress
7 Done
8 > show cmp pol cmp-pol-compress
9 1)      Name: cmp-pol-compress  Rule: ExpCheckIp
10        Response action: cmp-act-compress      Hits: 0
11 Done
12 >
13 <!--NeedCopy-->
```

## Create a policy with classic expressions by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy and, depending on the feature, do the following:
  - For Content Switching, Cache Redirection, and the application firewall, click Policies.
  - For SSL, click Policies, and then in the details pane, click the Policies tab.
  - For System Authentication, click Authentication, and then in the details pane, click the Policies tab.
  - For Filter, SureConnect, and Priority Queuing, expand Protection Features, select the desired function, and then in the details pane, click the Policies tab.
  - For the Citrix Gateway, expand Citrix Gateway, expand Policies, select the desired function, and then in the details pane, click the Policies tab.
2. For most features, click the Add button.
3. In the Create <feature name> Policy dialog box, in the Name\* text box, enter a name for the policy.

**Note:** You must begin a policy name with a letter or underscore. A policy name can consist of 1 to 31 characters, including letters, numbers, hyphen (-), period (.), pound sign (#), space ( ), and underscore (\_).
4. For most features, you associate an action or a profile. For example, you may be required to select an action, or, in the case of an Citrix Gateway or application firewall policy, you select a

profile to associate with the policy. A profile is a set of configuration options that operate as a set of actions that are applied when the data being analyzed matches the policy rule.

5. Create an expression that describes the type of data that you want this policy to match.

Depending on the type of policy you want to create, you can choose a predefined expression, or you can create a new expression.

Named expressions are predefined expressions that you can reference by name in a policy rule.

6. Click Create to create your new policy.
7. Click Close to return to the Policies screen for the type of policy you were creating.

## Configure a classic expression

September 21, 2020

Classic expressions consist of the following expression elements, listed in hierarchical order:

- **Flow Type.** Specifies whether the connection is incoming or outgoing. The flow type is REQ for incoming connections and RES for outgoing connections.
- **Protocol.** Specifies the protocol, the choices for which are HTTP, SSL, TCP, and IP.
- **Qualifier.** The protocol attribute, which depends on the selected protocol.
- **Operator.** The type of test you want to perform on the connection data. Your choice of operator depends upon the connection information you are testing. If the connection information you are testing is text, you use text operators. If it is a number, you use standard numeric operators.
- **Value.** The string or number against which the connection data element—defined by the flow type, protocol, and qualifier—is tested. The value can be either a literal or an expression. The literal or expression must match the data type of the connection data element.

In a policy, classic expressions can be combined to create more complex expressions using Boolean and comparative operators.

Expression elements are parsed from left to right. The leftmost element is either REQ or RES and designates a request or a response, respectively. Successive terms define a specific connection type and a specific attribute for that connection type. Each term is separated from any preceding or following term by a period. Arguments appear in parentheses and follow the expression element to which they are passed.

The following classic expression fragment returns the client source IP for an incoming connection.

```
REQ.IP.SOURCEIP
```

The example identifies an IP address in a request. The expression element SOURCEIP designates the source IP address. This expression fragment may not be useful by itself. You can use an additional

expression element, an operator, to determine whether the returned value meets specific criteria. The following expression tests whether the client IP is in the subnet 200.0.0.0/8 and returns a Boolean TRUE or FALSE:

```
REQ.IP.SOURCEIP == 200.0.0.0 -netmask 255.0.0.0
```

### Create a classic policy expression by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - set appfw policy \<name\> -rule \<expression\> -action \<action\>
2
3 - show appfw policy \<name\>
4 <!--NeedCopy-->
```

### Example

```
1 > set appfw policy GenericApplicationSSL_ 'HTTP.REQ.METHOD.EQ("get")'
   APPFW_DROP
2 Done
3 > show appfw policy GenericApplicationSSL_
4     Name: GenericApplicationSSL_    Rule: HTTP.REQ.METHOD.EQ("get")
5     Profile: APPFW_DROP      Hits: 0
6     Undef Hits: 0
7     Policy is bound to following entities
8     1) REQ VSERVER app_u_GenericApplicationSSLPortalPages
        PRIORITY : 100
9 Done
10 <!--NeedCopy-->
```

### Add an expression for a classic policy by using the GUI

This procedure documents the Add Expression dialog box. Depending on the feature for which you are configuring a policy, the route by which you arrive at this dialog box may be different.

1. Perform steps 1-4 in [“To create a policy with classic expressions by using the configuration utility.”](#)
2. In the Add Expression dialog box, in Expression Type, click the type of expression you want to create.
3. Under Flow Type, click the down arrow and choose a flow type.

The flow type is typically REQ or RES. The REQ option specifies that the policy applies to all incoming connections or requests. The RES option applies the policy to all outgoing connections or responses.

For Application Firewall policies, you should leave the expression type set to General Expression, and the flow type set to REQ. The Application Firewall treats each request and response as a single paired entity, so all Application Firewall policies begin with REQ.

4. Under Protocol, click the down arrow and choose the protocol you want for your policy expression. Your choices are:
  - HTTP. Evaluates HTTP requests that are sent to a Web server. For classic expressions, HTTP includes HTTPS requests.
  - SSL. Evaluates SSL data associated with the current connection.
  - TCP. Evaluates the TCP data associated with the current connection.
  - IP. Evaluates the IP addresses associated with the current connection.

5. Under Qualifier, click the down arrow and choose a qualifier for your policy.

The qualifier defines the type of data to be evaluated. The list of qualifiers that appears depends on which protocol you selected in step 4.

The following choices appear for the HTTP protocol:

- METHOD. Filters HTTP requests that use a particular HTTP method.
  - URL. Filters HTTP requests for a specific Web page.
  - URLQUERY. Filters HTTP requests that contain a particular query string.
  - VERSION. Filters HTTP requests on the basis of the specified HTTP protocol version.
  - HEADER. Filters on the basis of a particular HTTP header.
  - URLLEN. Filters on the basis of the length of the URL.
  - URLQUERY. Filters on the basis of the query portion of the URL.
  - URLQUERYLEN. Filters on the basis of the length of the query portion of the URL only.
6. Under Operator, click the down arrow and choose the operator for your policy expression. Some common operators are:

| Operator | Description                                                                     |
|----------|---------------------------------------------------------------------------------|
| ==       | Matches the specified value exactly or is exactly equal to the specified value. |
| !=       | Does not match the specified value.                                             |
| >        | Is greater than the specified value.                                            |
| <        | Is less than the specified value.                                               |
| >=       | Is greater than or equal to the specified value.                                |

| Operator           | Description                                                       |
|--------------------|-------------------------------------------------------------------|
| <=                 | Is less than or equal to the specified value.                     |
| <b>CONTAINS</b>    | Contains the specified value.                                     |
| <b>CONTENTS</b>    | Returns the contents of the designated header, URL, or URL query. |
| <b>EXISTS</b>      | The specified header or query exists.                             |
| <b>NOTCONTAINS</b> | Does not contain the specified value.                             |
| <b>NOTEXISTS</b>   | The specified header or query does not exist.                     |

7. If a Value text box appears, type a string or numeric value, as appropriate. For example, chose REQ as the Flow Type, HTTP as the Protocol, and HEADER as the qualifier, and then type the value of the header string in the Value field and the header type for which you want to match the string in the Header Name text box.
8. Click OK.
9. To create a compound expression, click Add. Note that the type of compounding that is done depends on the following choices in the Create Policy dialog box:
  - **Match Any Expression.** The expressions are in a logical OR relationship.
  - **Match All Expressions.** The expressions are in a logical AND relationship.
  - **Tabular Expressions.** Click the AND, OR, and parentheses buttons to control evaluation.
  - **Advanced Free-Form.** Enter the expressions components directly into the Expression field, and click the AND, OR, and parentheses buttons to control evaluation.

## Bind a classic policy

September 21, 2020

Depending on the policy type, you can bind a classic policy either globally or to a virtual server. Policy bind points are described in the table, “Policy Type and Bind Points for Policies in Features That Use Classic Policies.”

**Note:** You can bind a classic policy to multiple bind points.

### Bind a classic policy globally by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1 - bind cmp global <policyName> [-priority <positive_integer>]
2
3 - show cmp global
4 <!--NeedCopy-->

```

**Example**

```

1 > bind cmp global cmp-pol-compress -priority 2
2 Done
3 > show cmp global
4 1) Policy Name: cmp-pol-compress Priority: 2
5 2) Policy Name: ns_nocmp_xml_ie Priority: 8700
6 3) Policy Name: ns_nocmp_mozilla_47 Priority: 8800
7 4) Policy Name: ns_cmp_mscss Priority: 8900
8 5) Policy Name: ns_cmp_msapp Priority: 9000
9 6) Policy Name: ns_cmp_content_type Priority: 10000
10 Done
11 >
12 <!--NeedCopy-->

```

**Bind a classic policy to a virtual server by using the CLI**

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1 - bind lb vserver <name> [<targetVserver>] [-policyName <string> [-
priority <positive_integer>]
2
3 - show lb vserver<name>
4 <!--NeedCopy-->

```

**Example**

```

1 > bind lb vserver lbtemp -policyName cmp-pol-compress -priority 1
2 Done
3 > show lb vserver lbtemp
4 lbtemp (10.102.29.101:80) - HTTP Type: ADDRESS
5 State: UP
6 Last state change was at Tue Oct 27 06:40:38 2009 (+557 ms)
7 Time since last state change: 0 days, 02:00:40.330
8 Effective State: UP

```

```
9      Client Idle Timeout: 180 sec
10     Down state flush: ENABLED
11     Disable Primary Vserver On Down : DISABLED
12     Port Rewrite : DISABLED
13     No. of Bound Services : 1 (Total)          1 (Active)
14     Configured Method: LEASTCONNECTION
15     Current Method: Round Robin, Reason: Bound service's state
      changed to UP
16     Group: vserver-grp
17     Mode: IP
18     Persistence: COOKIEINSERT (version 0) Persistence Backup:
      SOURCEIP Persistence Mask: 255.255.255.255
19     Persistence Timeout: 2 min Backup Persistence Timeout: 2
      min
20     Vserver IP and Port insertion: OFF
21     Push: DISABLED Push VServer:
22     Push Multi Clients: NO
23     Push Label Rule: none
24 1) http-one (10.102.29.252: 80) - HTTP State: UP Weight: 1
25     Persistence Cookie Value : NSC_wtfswfs-hsq=
      ffffffff096e03ed45525d5f4f58455e445a4a423660
26 1) Policy : cmp-pol-compress Priority:1
27 Done
28 >
29 <!--NeedCopy-->
```

## Bind a classic policy globally by using the GUI

Note: This procedure documents the Global Bindings dialog box. Depending on the feature for which you want to globally bind a policy, the route by which you arrive at this dialog box may be different.

1. In the navigation pane, expand the feature for which you want to globally bind a classic policy, and then locate the policy that you want to bind globally.

Note: You cannot globally bind policies for Content Switching, Cache Redirection, SureConnect, Priority Queuing, or Citrix Gateway Authorization.

2. In the details pane, click Global Bindings.
3. In the Bind/Unbind <feature name> Policy(s) to Global dialog box, click Insert Policy.
4. In the Policy Name column, click the name of an existing policy that you want to globally bind, or click New Policy to open the Create <feature name> Policy dialog box.

5. After you have selected the policy or created a new policy, in the Priority column, type the priority value.

The lower the number, the sooner this policy is applied relative to other policies. For example, a policy assigned a priority of 10 is applied before a policy with a priority of 100. You can use the same priority for different policies. All features that use classic policies implement only the first policy that a connection matches, so policy priority is important for getting the results you intend.

As a best practice, leave room to add policies by setting priorities with intervals of 50 (or 100) between each policy.

6. Click OK.

### **Bind a classic policy to a virtual server by using the GUI**

1. In the navigation pane, expand the feature that contains the virtual server to which you want to bind a classic policy (for example, if you want to bind a classic policy to a content switching virtual server, expand Traffic Management > Content Switching), and then click Virtual Servers.
2. In the details pane, select the virtual server, and then click Open.
3. In the Configure <Feature> Virtual Server dialog box, on the Policies tab, click the feature icon for the type policy that you want, and then click Insert Policy.
4. In the Policy Name column, click the name of an existing policy that you want to bind to a virtual server, or click A to open the Create <feature name> Policy dialog box.
5. After you have selected the policy or created a new policy, in the Priority column, set the priority.  
If you are binding a policy to a content switching virtual server, in the Target column, select a load balancing virtual server to which traffic that matches the policy should be sent.
6. Click OK.

### **View classic policies**

September 21, 2020

You can view classic policies by using either the configuration utility or the command line. You can view details such as the policy's name, expression, and bindings.

## View a classic policy and its binding information by using the CLI

At the command prompt, type the following commands to view a classic policy and its binding information:

```
show <featureName> policy [policyName]
```

### Example

```
1 > show appfw policy GenericApplicationSSL_  
2     Name: GenericApplicationSSL_    Rule: ns_only_get_adv  
3     Profile: GenericApplicationSSL_Prof1    Hits: 0  
4     Undef Hits: 0  
5     Policy is bound to following entities  
6     1) REQ VSERVER app_u_GenericApplicationSSLPortalPages  
        PRIORITY : 100  
7 Done  
8 <!--NeedCopy-->
```

**Note:** If you omit the policy name, all policies are listed without the binding details.

## View classic policies and policy bindings by using the GUI

1. In the navigation pane, expand the feature whose policies you want to view, (for example, if you want to view application firewall policies, expand Application Firewall), and then click Policies.
2. In the details pane, do one or more of the following:
  - To view details for a specific policy, click the policy. Details appear in the Details area of the configuration pane.
  - To view bindings for a specific policy, click the policy, and then click Show Bindings.
  - To view global bindings, click the policy, and then click Global Bindings. Note that you cannot bind a Content Switching, Cache Redirection, SureConnect, Priority Queuing, or Citrix Gateway Authorization policy globally.

## Create named classic expressions

September 21, 2020

A named classic expression is a classic expression that can be referenced through an assigned name. Often, you need to configure classic expressions that are large or complex and form a part of a larger compound expression. You might also configure classic expressions that you need to use frequently

and in multiple compound expressions or classic policies. In these scenarios, you can create the classic expression you want, save it with a name of your choice, and then reference the expression from compound expressions or policies through its name. This saves configuration time and improves the readability of complex compound expressions. Additionally, any modifications to a named classic expression need to be made only once.

Some named expressions are built-in, and a subset of these are read-only. Built-in named expressions are divided into four categories: General, Anti-Virus, Personal Firewall, and Internet Security. General named expressions have a wide variety of uses. For example, from the General category, you can use the expressions `ns_true` and `ns_false` to specify a value of TRUE or FALSE, respectively, to be returned for all traffic. You can also identify data of a particular type (for example, HTM, DOC, or GIF files), determine whether caching headers are present, or determine whether the round trip time for packets between a client and the Citrix ADC is high (over 80 milliseconds).

Anti-Virus, Personal Firewall, and Internet Security named expressions test clients for the presence of a particular program and version and are used primarily in Citrix Gateway policies.

**Note:** You cannot modify or delete built-in named expressions.

### Create a named classic expression by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add expression <name> <value> [-comment <string>] [-
    clientSecurityMessage <string>]
2 - show expression [<name> | -type CLASSIC
3 <!--NeedCopy-->
```

### Example

```
1 > add expression classic_ne "REQ.HTTP.URL CONTAINS www.example1.com" -
    comment "Checking the URL for www.example1.com"
2 Done
3 > show expression classic_ne
4 1)      Name: classic_ne  Expr: REQ.HTTP.URL CONTAINS www.example1.com
        Hits: 0 Type : CLASSIC
        Comment: "Checking the URL for www.example1.com"
5
6 Done
7 >
8 <!--NeedCopy-->
```

## Create a named classic expression by using the GUI

1. In the navigation pane, expand AppExpert, expand Expressions, and then click Classic Expressions.

2. In the details pane, click Add.

Note: Some of the built-in expressions in the Expressions list are read-only.

3. In the Create Policy Expression dialog box, specify values for the following parameters:

- Expression Name\*—name
- Client Security Message—clientSecurityMessage
- Comments—comment

\*A required parameter

4. To create the expression, do one of the following:

- You can choose inputs to this expression from the Named Expressions drop-down list.
- You can create a new expression, as described in [Add an expression for a classic policy by using the GUI](#).

5. When you are done, click Close. Verify that your new expression was created by scrolling to the bottom of the Classic Expressions list to view it.

## Expressions reference-advanced policy expressions

September 16, 2021

### Warning:

Q and S prefixes are deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the HTTP.REQ and HTTP.RES functionality. However, Q and S prefixes are removed and no longer available on the Citrix ADC appliance release 13.1 onwards. For more information, see [Advanced policy expression](#) topic.

The following table is a listing of default syntax expression prefixes, with cross-references to descriptions of these prefixes and the operators that you can specify for them. Note that some prefixes can work with multiple types of operators. For example, a cookie can be parsed by using operators for text or operators for HTTP headers. For more information, see [Expression Prefixes for text in HTTP requests and responses](#) topic.

You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

**Note:** The Description column in the following table contains cross-references to additional information about prefix usage and applicable operators for the prefix.

For more information, refer [Expression](#) PDF to view the table.

## Expressions reference-classic expressions

July 2, 2021

### Warning

Classic policy expressions are no longer supported from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see [Advanced Policies](#)

The subtopics listed in the table of contents on the left side of your screen contain tables listing the Citrix ADC expressions.

In the table of operators, the result type of each operator is shown at the beginning of the description. In the other tables, the level of each expression is shown at the beginning of the description. For named expressions, each expression is shown as a whole.

## Operators

| Expression Element | Definition                                                                                                                                                                                                                             |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ==                 | Boolean. Returns TRUE if the current expression equals the argument. For text operations, the items being compared must exactly match one another. For numeric operations, the items must evaluate to the same number.                 |
| !=                 | Boolean. Returns TRUE if the current expression does not equal the argument. For text operations, the items being compared must not exactly match one another. For numeric operations, the items must not evaluate to the same number. |
| CONTAINS           | Boolean. Returns TRUE if the current expression contains the string that is designated in the argument.                                                                                                                                |

| Expression Element | Definition                                                                                                           |
|--------------------|----------------------------------------------------------------------------------------------------------------------|
| NOTCONTAINS        | Boolean. Returns TRUE if the current expression does not contain the string that is designated in the argument.      |
| CONTENTS           | Text. Returns the contents of the current expression.                                                                |
| EXISTS             | Boolean. Returns TRUE if the item designated by the current expression exists.                                       |
| NOTEXISTS          | Boolean.<br>Returns TRUE if the item designated by the current expression does not exist.                            |
| >                  | Boolean. Returns TRUE if the current expression evaluates to a number that is greater than the argument.             |
| <                  | Boolean. Returns TRUE if the current expression evaluates to a number that is less than the argument.                |
| >=                 | Boolean. Returns TRUE if the current expression evaluates to a number that is greater than or equal to the argument. |
| <=                 | Boolean. Returns TRUE if the current expression evaluates to a number that is less than or equal to the argument.    |

## General expressions

| Expression Element | Definition                                            |
|--------------------|-------------------------------------------------------|
| REQ                | Flow Type. Operates on incoming (or request) packets. |
| REQ.HTTP           | Protocol. Operates on HTTP requests.                  |
| REQ.HTTP.METHOD    | Qualifier. Designates the HTTP method.                |
| REQ.HTTP.URL       | Qualifier. Designates the URL.                        |
| REQ.HTTP.URLTOKENS | Qualifier. Designates the URL token.                  |
| REQ.HTTP.VERSION   | Qualifier. Designates the HTTP version.               |

| Expression Element               | Definition                                                                       |
|----------------------------------|----------------------------------------------------------------------------------|
| REQ.HTTP.HEADER                  | Qualifier. Designates the HTTP header.                                           |
| REQ.HTTP.URLLEN                  | Qualifier. Designates the number of characters in the URL.                       |
| REQ.HTTP.URLQUERY                | Qualifier. Designates the query portion of the URL.                              |
| REQ.HTTP.URLQUERYLEN             | Qualifier. Designates the length of the query portion of the URL.                |
| REQ.SSL                          | Protocol. Operates on SSL requests.                                              |
| REQ.SSL.CLIENT.CERT              | Qualifier. Designates the entire client certificate.                             |
| REQ.SSL.CLIENT.CERT.SUBJECT      | Qualifier. Designates the client certificate subject.                            |
| REQ.SSL.CLIENT.CERT.ISSUER       | Qualifier. Designates the issuer of the client certificate.                      |
| REQ.SSL.CLIENT.CERT.SIGALGO      | Qualifier. Designates the validation algorithm used by the client certificate.   |
| REQ.SSL.CLIENT.CERT.VERSION      | Qualifier. Designates the client certificate version.                            |
| REQ.SSL.CLIENT.CERT.VALIDFROM    | Qualifier. Designates the date before which the client certificate is not valid. |
| REQ.SSL.CLIENT.CERT.VALIDTO      | Qualifier. Designates the date after which the client certificate is not valid.  |
| REQ.SSL.CLIENT.CERT.SERIALNUMBER | Qualifier. Designates the serial number of the client certificate.               |
| REQ.SSL.CLIENT.CIPHER.TYPE       | Qualifier. Designates the encryption protocol used by the client.                |
| REQ.SSL.CLIENT.CIPHER.BITS       | Qualifier. Designates the number of bits used by the client's SSL key.           |
| REQ.SSL.CLIENT.SSL.VERSION       | Qualifier. Designates the SSL version that the client is using.                  |
| REQ.TCP                          | Protocol. Operates on incoming TCP packets.                                      |
| REQ.TCP.SOURCEPORT               | Qualifier. Designates the source port of the incoming packet.                    |

| Expression Element  | Definition                                                                                                                                                                                               |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REQ.TCP.DESTPORT    | Qualifier. Designates the destination port of the incoming packet.                                                                                                                                       |
| REQ.IP              | Protocol. Operates on incoming IP packets.                                                                                                                                                               |
| REQ.IP.SOURCEIP     | Qualifier. Designates the source IP of the incoming packet.                                                                                                                                              |
| REQ.IP.DESTIP       | Qualifier. Designates the destination IP of the incoming packet.                                                                                                                                         |
| RES                 | Flow Type. Operates on outgoing (or response) packets.                                                                                                                                                   |
| RES.HTTP            | Protocol. Operates on HTTP responses.                                                                                                                                                                    |
| RES.HTTP.VERSION    | Qualifier. Designates the HTTP version.                                                                                                                                                                  |
| RES.HTTP.HEADER     | Qualifier. Designates the HTTP header.                                                                                                                                                                   |
| RES.HTTP.STATUSCODE | Qualifier. Designates the status code of the HTTP response.                                                                                                                                              |
| RES.TCP             | Protocol. Operates on incoming TCP packets.                                                                                                                                                              |
| RES.TCP.SOURCEPORT  | Qualifier. Designates the source port of the outgoing packet.                                                                                                                                            |
| RES.TCP.DESTPORT    | Qualifier. Designates the destination port of the outgoing packet.                                                                                                                                       |
| RES.IP              | Protocol. Operates on outgoing IP packets.                                                                                                                                                               |
| RES.IP.SOURCEIP     | Qualifier. Designates the source IP of the outgoing packet. This can be in IPv4 or IPv6 format. For example: add expr exp3 "sourceip == 10.102.32.123 -netmask 255.255.255.0 && destip == 2001::23/120". |
| RES.IP.DESTIP       | Qualifier. Designates the destination IP of the outgoing packet.                                                                                                                                         |

### Client security expressions

The expressions to configure client settings on the Access Gateway with the following software:

- Antivirus
- Personal firewall
- Antispam

- Internet Security

For example usage, see <http://support.citrix.com/article/CTX112599>.

| Actual Expression                                  | Definition                                                                                     |
|----------------------------------------------------|------------------------------------------------------------------------------------------------|
| CLIENT.APPLICATION.AV(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated anti-virus program and version.            |
| CLIENT.APPLICATION.AV(<NAME>.VERSION != <VERSION>) | Checks whether the client is not running the designated anti-virus program and version.        |
| CLIENT.APPLICATION.PF(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated personal firewall program and version.     |
| CLIENT.APPLICATION.PF(<NAME>.VERSION != <VERSION>) | Checks whether the client is not running the designated personal firewall program and version. |
| CLIENT.APPLICATION.IS(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated internet security program and version.     |
| CLIENT.APPLICATION.IS(<NAME>.VERSION != <VERSION>) | Checks whether the client is not running the designated internet security program and version. |
| CLIENT.APPLICATION.AS(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated anti-spam program and version.             |
| CLIENT.APPLICATION.AS(<NAME>.VERSION != <VERSION>) | Checks whether the client is not running the designated anti-spam program and version.         |

## Network-based expressions

| Expression       | Definition                                                            |
|------------------|-----------------------------------------------------------------------|
| REQ              | Flow Type. Operates on incoming, or request, packets.                 |
| REQ.VLANID       | Qualifier. Operates on the virtual LAN (VLAN) ID.                     |
| REQ.INTERFACE.ID | Qualifier. Operates on the ID of the designated Citrix ADC interface. |

| Expression                   | Definition                                                                                                        |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| REQ.INTERFACE.RXTHROUGHPUT   | Qualifier. Operates on the raw received packet throughput of the designated Citrix ADC interface.                 |
| REQ.INTERFACE.TXTHROUGHPUT   | Qualifier. Operates on the raw transmitted packet throughput of the designated Citrix ADC interface.              |
| REQ.INTERFACE.RXTXTHROUGHPUT | Qualifier. Operates on the raw received and transmitted packet throughput of the designated Citrix ADC interface. |
| REQ.ETHER.SOURCEMAC          | Qualifier. Operates on the source MAC address.                                                                    |
| REQ.ETHER.DESTMAC            | Qualifier. Operates on the destination MAC address.                                                               |
| RES                          | Flow Type. Operates on outgoing (or response) packets.                                                            |
| RES.VLANID                   | Qualifier. Operates on the virtual LAN (VLAN) ID.                                                                 |
| RES.INTERFACE.ID             | Qualifier. Operates on the ID of the designated Citrix ADC interface.                                             |
| RES.INTERFACE.RXTHROUGHPUT   | Qualifier. Operates on the raw received packet throughput of the designated Citrix ADC interface.                 |
| RES.INTERFACE.TXTHROUGHPUT   | Qualifier. Operates on the raw transmitted packet throughput of the designated Citrix ADC interface.              |
| RES.INTERFACE.RXTXTHROUGHPUT | Qualifier. Operates on the raw received and transmitted packet throughput of the designated Citrix ADC interface. |
| RES.ETHER.SOURCEMAC          | Qualifier. Operates on the source MAC address.                                                                    |
| RES.ETHER.DESTMAC            | Qualifier. Operates on the destination MAC address.                                                               |

### Date/time expressions

| Expression | Definition                                            |
|------------|-------------------------------------------------------|
| TIME       | Qualifier. Operates on the date and time of day, GMT. |
| DATE       | Qualifier. Operates on the date, GMT.                 |
| DAYOFWEEK  | Operates on the specified day in the week, GMT.       |

### File system expressions

You can specify file system expressions in authorization policies for users and groups who access file sharing through the Citrix Gateway file transfer utility (the VPN portal). These expressions work with the Citrix Gateway file transfer authorization feature to control user access to file servers, folders, and files. For example, you can use these expressions in authorization policies to control access based on file type and size.

For more information, refer to the [File Name Expression](#) pdf.

**Note:** File system expressions do not support regular expressions.

### Built-in named expressions (General)

| Expression              | Definition                                                                                                    |
|-------------------------|---------------------------------------------------------------------------------------------------------------|
| ns_all_apps_ncomp       | Tests for connections with destination ports between 0 and 65535. In other words, tests for all applications. |
| ns_cachecontrol_nocache | Tests for connections with an HTTP Cache-Control header that contains the value “no-cache”.                   |
| ns_cachecontrol_nostore | Tests for connections with an HTTP Cache-Control header that contains the value “no-store”.                   |
| ns_cmpclient            | Tests the client to determine if it accepts compressed content.                                               |
| ns_content_type         | Tests for connections with an HTTP Content-Type header that contains “text”.                                  |
| ns_css                  | Tests for connections with an HTTP Content-Type header that contains “text/css”.                              |

| Expression      | Definition                                                                                                                                     |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| ns_ext_asp      | Tests for HTTP connections to any URL that contains the string .asp—in other words, any connection to an active server page (ASP).             |
| ns_ext_cfm      | Tests for HTTP connections to any URL that contains the string .cfm                                                                            |
| ns_ext_cgi      | Tests for HTTP connections to any URL that contains the string .cgi—in other words, any connection to a common gateway interface (CGI) script. |
| ns_ext_ex       | Tests for HTTP connections to any URL that contains the string .ex                                                                             |
| ns_ext_exe      | Tests for HTTP connections to any URL that contains the string .exe—in other words, any connection to an executable file.                      |
| ns_ext_htx      | Tests for HTTP connections to any URL that contains the string .htx                                                                            |
| ns_ext_not_gif  | Tests for HTTP connections to any URL that does not contain the string .png—in other words, any connection to a URL that is not a GIF image.   |
| ns_ext_not_jpeg | Tests for HTTP connections to any URL that does not contain the string .jpeg—in other words, any connection to a URL that is not a JPEG image. |
| ns_ext_shtml    | Tests for HTTP connections to any URL that contains the string .shtml—in other words, any connection to a server-parsed HTML page.             |
| ns_false        | Always returns a value of FALSE.                                                                                                               |

---

| Expression       | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ns_farclient     | Client is in a different geographical region from the Citrix ADC, as determined by the geographical region in the client's IP address. The following regions are predefined: 192.0.0.0 – 193.255.255.255: Multi-regional, 194.0.0.0 – 195.255.255.255: European Union, 196.0.0.0 – 197.255.255.255: Other1, 198.0.0.0 – , 199.255.255.255: North America, 200.0.0.0 – 201.255.255.255: Central and South America, 202.0.0.0 – 203.255.255.255: Pacific Rim, 204.0.0.0 – 205.255.255.255: Other2, and 206.0.0.0 – 207.255.255.255: Other3 |
| ns_header_cookie | Tests for HTTP connections that contain a Cookie header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ns_header_pragma | Tests for HTTP connections that contain a Pragma: no-cache header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ns_mozilla_47    | Tests for HTTP connections whose User-Agent header contains the string Mozilla/4.7—in other words, any connection from a client using the Mozilla 4.7 Web browser.                                                                                                                                                                                                                                                                                                                                                                       |
| ns_msexcel       | Tests for HTTP connections whose Content-Type header contains the string application/vnd.msexcel—in other words, any connection transmitting a Microsoft Excel spreadsheet.                                                                                                                                                                                                                                                                                                                                                              |
| ns_msie          | Tests for HTTP connections whose User-Agent header contains the string MSIE—in other words, any connection from a client using any version of the Internet Explorer Web browser.                                                                                                                                                                                                                                                                                                                                                         |
| ns_msppt         | Tests for HTTP connections whose Content-Type header contains the string application/vnd.ms-powerpoint—in other words, any connection transmitting a Microsoft PowerPoint file.                                                                                                                                                                                                                                                                                                                                                          |

| Expression         | Definition                                                                                                                                                         |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ns_msword          | Tests for HTTP connections whose Content-Type header contains the string application/vnd.msword—in other words, any connection transmitting a Microsoft Word file. |
| ns_non_get         | Tests for HTTP connections that use any HTTP method except for GET.                                                                                                |
| ns_slowclient      | Returns TRUE if the average round trip time between the client and the Citrix ADC is more than 80 milliseconds.                                                    |
| ns_true            | Returns TRUE for all traffic.                                                                                                                                      |
| ns_url_path_bin    | Tests the URL path to see if it points to the /bin/ directory.                                                                                                     |
| ns_url_path_cgibin | Tests the URL path to see if it points to the CGI-BIN directory.                                                                                                   |
| ns_url_path_exec   | Tests the URL path to see if it points to the /exec/directory.                                                                                                     |
| ns_url_tokens      | Tests for the presence of URL tokens.                                                                                                                              |
| ns_xmldata         | Tests for the presence of XML data.                                                                                                                                |

### Built-in named expressions (Anti-Virus)

| Expression                                           | Definition                                                                                       |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| McAfee Virus Scan 11                                 | Tests to determine whether the client is running the latest version of McAfee VirusScan.         |
| McAfee Antivirus                                     | Tests to determine whether the client is running any version of McAfee Antivirus.                |
| Symantec AntiVirus 10 (with Updated Definition File) | Tests to determine whether the client is running the most current version of Symantec AntiVirus. |
| Symantec AntiVirus 6.0                               | Tests to determine whether the client is running Symantec AntiVirus 6.0.                         |
| Symantec AntiVirus 7.5                               | Tests to determine whether the client is running Symantec AntiVirus 7.5.                         |

| Expression                 | Definition                                                                                     |
|----------------------------|------------------------------------------------------------------------------------------------|
| TrendMicro OfficeScan 7.3  | Tests to determine whether the client is running Trend Microsystems' OfficeScan, version 7.3.  |
| TrendMicro AntiVirus 11.25 | Tests to determine whether the client is running Trend Microsystems' AntiVirus, version 11.25. |
| Sophos Antivirus 4         | Tests to determine whether the client is running Sophos Antivirus, version 4.                  |
| Sophos Antivirus 5         | Tests to determine whether the client is running Sophos Antivirus, version 5.                  |
| Sophos Antivirus 6         | Tests to determine whether the client is running Sophos Antivirus, version 6.                  |

### Built-in named expressions (Personal Firewall)

| Expression                      | Definition                                                                                     |
|---------------------------------|------------------------------------------------------------------------------------------------|
| TrendMicro OfficeScan 7.3       | Tests to determine whether the client is running Trend Microsystems' OfficeScan, version 7.3.  |
| Sygate Personal Firewall 5.6    | Tests to determine whether the client is running the Sygate Personal Firewall, version 5.6.    |
| ZoneAlarm Personal Firewall 6.5 | Tests to determine whether the client is running the ZoneAlarm Personal Firewall, version 6.5. |

### Built-in named expressions (Client Security)

| Expression               | Definition                                                                                |
|--------------------------|-------------------------------------------------------------------------------------------|
| Norton Internet Security | Tests to determine whether the client is running any version of Norton Internet Security. |

## Summary examples of default syntax expressions and policies

September 21, 2020

The following table provides examples of default syntax expressions that you can use as the basis for your own default syntax expressions.

Table 1. Examples of Default Syntax Expressions

| Expression Type                                                                            | Sample Expressions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Look at the method used in the HTTP request.                                               | <code>http.req.method.eq(post)</code><br><code>http.req.method.eq(get)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check the Cache-Control or Pragma header value in an HTTP request (req) or response (res). | <code>http.req.header("Cache-Control").contains("no-store")</code><br><code>http.req.header("Cache-Control").contains("no-cache")</code><br><code>http.req.header("Pragma").contains("no-cache")</code><br><code>http.res.header("Cache-Control").contains("private")</code><br><code>http.res.header("Cache-Control").contains("public")</code><br><code>http.res.header("Cache-Control").contains("must-revalidate")</code><br><code>http.res.header("Cache-Control").contains("proxy-revalidate")</code><br><code>http.res.header("Cache-Control").contains("max-age")</code> |
| Check for the presence of a header in a request (req) or response (res).                   | <code>http.req.header("myHeader").exists</code><br><code>http.res.header("myHeader").exists</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Expression Type                                                                                 | Sample Expressions                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Look for a particular file type in an HTTP request based on the file extension.                 | <code>http.req.url.contains(".html")http.req.url.contains(".cgi")http.req.url.contains(".asp")http.req.url.contains(".exe")http.req.url.contains(".cfm")http.req.url.contains(".ex")http.req.url.contains(".shtml")http.req.url.contains(".htx")http.req.url.contains("/cgi-bin/")http.req.url.contains("/exec/")http.req.url.contains("/bin/)</code>                                                                       |
| Look for anything that is other than a particular file type in an HTTP request.                 | <code>http.req.url.contains(".png").not;http.req.url.contains(".jpeg").not</code>                                                                                                                                                                                                                                                                                                                                           |
| Check the type of file that is being sent in an HTTP response based on the Content-Type header. | <code>http.res.header("Content-Type").contains("text")http.res.header("Content-Type").contains("application/msword")http.res.header("Content-Type").contains("vnd.ms-excel")http.res.header("Content-Type").contains("application/vnd.ms-powerpoint"); http.res.header("Content-Type").contains("text/css"); http.res.header("Content-Type").contains("text/xml"); http.res.header("Content-Type").contains("image/)</code> |
| Check whether this response contains an expiration header.                                      | <code>'http.res.header("Expires").exists</code>                                                                                                                                                                                                                                                                                                                                                                             |
| Check for a Set-Cookie header in a response.                                                    | <code>http.res.header("Set-Cookie").exists</code>                                                                                                                                                                                                                                                                                                                                                                           |
| Check the agent that sent the response.                                                         | <code>http.res.header("User-Agent").contains("Mozilla/4.7")http.res.header("User-Agent").contains("MSIE")'</code>                                                                                                                                                                                                                                                                                                           |
| Check if the first 1024 bytes of the body of a request starts with the string "some text".      | <code>http.req.body(1024).contains("some text")</code>                                                                                                                                                                                                                                                                                                                                                                      |

The following table shows examples of policy configurations and bindings for commonly used functions.

Table 2. Examples of Default Syntax Expressions and Policies

| Purpose                                                                                                                            | Example                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use the rewrite feature to replace occurrences of <code>http://</code> with <code>https://</code> in the body of an HTTP response. | <pre>add rewrite action httpRewriteAction replace_all http. res.body(50000) "\"https://\""- pattern http://add rewrite policy demo_rep34312 "http.res.body(50000) .contains(\"http://\")" httpRewriteAction</pre>                                                                                                |
| Replace all occurrences of “abcd” with “1234” in the first 1000 bytes of the HTTP body.                                            | <pre>add rewrite action abcdTo1234Action replace_all "http.req.body(1000)" "1234"-pattern abcd add rewrite policy abcdTo1234Policy "http.req. body(1000).contains(\"abcd\")" abcdTo1234Action bind rewrite global abcdTo1234Policy 100 END - type REQ_OVERRIDE</pre>                                             |
| Downgrade the HTTP version to 1.0 to prevent the server from chunking HTTP responses.                                              | <pre>add rewrite action downgradeTo1.0 Action replace http.req.version. minor "\"0\""+add rewrite policy downgradeTo1.0Policy "http.req. version.minor.eq(1)"downgradeTo1.0 Action bind lb vserver myLBVserver -policyName downgradeTo1.0Policy - priority 100 - gotoPriorityExpression NEXT -type REQUEST</pre> |

| Purpose                                                                                                                                                                                                                 | Example                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remove references to the HTTP or HTTPS protocol in all responses, so that if the user's connection is HTTP, the link is opened by using HTTP, and if the user's connection is HTTPS, the link is opened by using HTTPS. | <pre>add rewrite action remove_http_https replace_all "http .res.body(1000000).set_text_mode( ignorecase)""\//\""-pattern "re~ https?:// HTTPS?://~"add rewrite policy remove_http_https <b>true</b> remove_http_https bind lb vserver test_vsvr -policyName remove_http_https -priority 20 - gotoPriorityExpression NEXT -type RESPONSE</pre> |
| Rewrite instances of http: to https: in all URLs.                                                                                                                                                                       | <pre>add responder action httpToHttpsAction redirect "\"https ://\" + http.req.hostname + http. req.url"-bypassSafetyCheck YES add responder policy httpToHttpsPolicy "!CLIENT.SSL.IS_SSL" httpToHttpsAction bind responder global httpToHttpsPolicy 1 END - type OVERRIDE</pre>                                                               |
| Modify a URL to redirect from URL A to URL B. In this example, "file5.html" is appended to the path.                                                                                                                    | <pre>add responder action appendFile5Action redirect "\"http ://\" + http.req.hostname + http. req.url + \"/file5.html\""- bypassSafetyCheck YES add responder policy appendFile5Policy "http.req .url.eq(\"/testsite\"")" appendFile5Action bind responder global appendFile5Policy 1 END - type OVERRIDE</pre>                               |

| Purpose                                                                                                                                                                           | Example                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Tutorial examples of default syntax policies for rewrite

September 21, 2020

With the rewrite feature, you can modify any part of an HTTP header, and, for responses, you can modify the HTTP body. You can use this feature to accomplish a number of useful tasks, such as removing unnecessary HTTP headers, masking internal URLs, redirecting Web pages, and redirecting queries or keywords.

In the following examples, you first create a rewrite action and a rewrite policy. Then you bind the policy globally.

This document includes the following details:

- Redirecting an External URL to an Internal URL
- Redirecting a Query
- Rewriting HTTP to HTTPS
- Removing Unwanted Headers
- Reducing Web Server Redirects
- Masking the Server Header
- Converting plain text to URL encoded string and vice-versa

For more information about the commands and syntax descriptions, see [Rewrite Command Reference](#) page.

### Redirecting an external URL to an internal URL

This example describes how to create a rewrite action and rewrite policy that redirects an external URL to an internal URL. You create an action, called `act_external_to_internal`, that performs the rewrite. Then you create a policy called `pol_external_to_internal`.

#### To redirect an external URL to an internal URL by using the command line interface

- To create the rewrite action, at the command prompt, type:

```
add rewrite action act_external_to_internal REPLACE "http.req.hostname.  
server""host_name_of_internal_Web_server"
```

- To create the rewrite policy, at the Citrix ADC command prompt, type:

```
add rewrite policy pol_external_to_internal "http.req.hostname.server.eq("  
host_name_of_external_Web_server")act_external_to_internal"
```

- Bind the policy globally.

### To redirect an external URL to an internal URL by using the configuration utility

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, enter the name `act_external_to_internal`.
4. To replace the HTTP server host name with the internal server name, choose **Replace** from the Type list box.
5. In the header name field, type **Host**.
6. In the string expression for replacement text field, type the internal host name of your Web server.
7. Click **Create** and then click **Close**.
8. In the navigation pane, click **Policies**.
9. In the details pane, click **Add**.
10. In the Name field, type `pol_external_to_internal`. This policy will detect connections to the Web server.
11. In the Action drop-down menu, choose the action `act_external_to_internal`.
12. In the Expression editor, construct the following expression:

```
1 HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")
2 <!--NeedCopy-->
```

1. Bind your new policy globally.

### Redirecting a query

This example describes how to create a rewrite action and rewrite policy that redirects a query to the proper URL. The example assumes that the request contains a Host header set to **www.example.com** and a GET method with the **string /query.cgi?server=5**. The redirect extracts the domain name from the host header and the number from the query string, and redirects the user's query to the server **Web5.example.com**, where the rest of the user's query is processed.

Note: Although the following commands appears on multiple lines, you should enter them on a single line without line breaks.

### To redirect a query to the appropriate URL using the command line

- To create a rewrite action named `act_redirect_query` that replaces the HTTP server host name with the internal server name, type:

```
add rewrite action act_redirect_query REPLACE q##http.req.header("Host").
before_str(".example.com") "'Web"+ http.req.url.query.value("server")##
```

- To create a rewrite policy named `pol_redirect_query`, type the following commands at the Citrix ADC command prompt. This policy detects connections, to the Web server, that contain a query string. Do not apply this policy to connections that do not contain a query string:

```
add rewrite policy pol_redirect_query q##http.req.header("Host").eq("www.  
example.com")&& http.req.url.contains("?") 'act_redirect_query##
```

- Bind your new policy globally.

Because this rewrite policy is highly specific and should be run before any other rewrite policies, it is advisable to assign it a high priority. If you assign it a priority of 1, it will be evaluated first.

## Rewriting HTTP to HTTPS

This example describes how to rewrite Web server responses to find all URLs that begin with the string “http” and replace that string with “https.” You can use this to avoid having to update Web pages after moving a server from HTTP to HTTPS.

### To redirect HTTP URLs to HTTPS by using the command line interface

- To create a rewrite action named `act_replace_http_with_https` that replaces all instances of the string “http” with the string “https,” enter the following command:

```
add rewrite action act_replace_http_with_https replace_all 'http.res.body  
(100)'"https"'-pattern http
```

- To create a rewrite policy named `pol_replace_http_with_https` that detects connections to the Web server, enter the following command:

```
add rewrite policy pol_replace_http_with_https TRUE act_replace_http_with_https  
NOREWRITE
```

- Bind your new policy globally.

To troubleshoot this rewrite operation, see [“Case Study: Rewrite Policy for Converting HTTP Links to HTTPS not Working.”](#)

## Removing Unwanted Headers

This example explains how to use a Rewrite policy to remove unwanted headers. Specifically, the example shows how to remove the following headers:

- **Accept Encoding header.** Removing the Accept Encoding header from HTTP responses prevents compression of the response.
- **Content Location header.** Removing the Content Location header from HTTP responses prevents your server from providing a hacker with information that might allow a security breach.

To delete headers from HTTP responses, you create a rewrite action and a rewrite policy, and you bind the policy globally.

### **To create the appropriate Rewrite action by using the command line interface**

At the command prompt, type one of the following commands to either remove the Accept Encoding header and prevent response compression or remove the Content Location header:

- `add rewrite action "act_remove-ae"delete_http_header "Accept-Encoding"`
- `add rewrite action "act_remove-cl"delete_http_header "Content-Location"`

### **To create the appropriate Rewrite policy by using the command line interface**

At the command prompt, type one of the following commands to remove either the Accept Encoding header or the Content Location header:

- `add rewrite policy "pol_remove-ae"true "act_remove-ae"`
- `add rewrite policy "pol_remove-cl"true "act_remove-cl"`

### **To bind the policy globally by using the command line interface**

At the command prompt, type one of the following commands, as appropriate, to globally bind the policy that you have created:

- `bind rewrite global pol_remove_ae 100`
- `bind rewrite global pol_remove_cl 200`

## **Reducing Web Server Redirects**

This example explains how to use a Rewrite policy to modify connections to your home page and other URLs that end with a forward slash (/) to the default index page for your server, preventing redirects and reducing load on your server.

### **To modify directory-level HTTP requests to include the default home page by using the command line**

- To create a Rewrite action named `action-default-homepage` that modifies URLs that end in a forward slash to include the default home page `index.html`, type:

```
add rewrite action "action-default-homepage"replace q\##http.req.url.path "/"  
/"/index.html"\##
```

- To create a Rewrite policy named `policy-default-homepage` that detects connections to your home page and applies your new action, type:

```
add rewrite policy "policy-default-homepage"q\##http.req.url.path.EQ("/")"
action-default-homepage"\##
```

- Globally bind your new policy to put it into effect.

## Masking the Server Header

This example explains how to use a Rewrite policy to mask the information in the Server header in HTTP responses from your Web server. That header contains information that hackers can use to compromise your Web site. While masking the header will not prevent a skilled hacker from finding out information about your server, it will make hacking your Web server more difficult and encourage hackers to choose less well protected targets.

### To mask the Server header in responses from the command line

1. To create a Rewrite action named act\_mask-server that replaces the contents of the Server header with an uninformative string, type:

```
add rewrite action "act_mask-server"replace "http.RES.HEADER(\\\"Server\\\")"
"\\\"Web Server 1.0\\\""
```

1. To create a Rewrite policy named pol\_mask-server that detects all connections, type:

```
add rewrite policy "pol_mask-server"true "act_mask-server"
```

1. Globally bind your new policy to put it into effect.

### How to convert plain text to URL encoded string and vice-versa

The following expressions convert plain text to URL encoded string and vice-versa:

1. URL\_RESERVED\_CHARS\_SAFE (string to URL ENCODED).

#### Example:

```
1 ("abc def&123").URL_RESERVED_CHARS_SAFE
2 Output will be
3 "abc%20def%26123" which is url encoded.
4 <!--NeedCopy-->
```

1. SET\_TEXT\_MODE(URL ENCODED).DECODE\_USING\_TEXT\_MODE. (URL ENCODED to string)

#### Example:

```
1 ("abc%20def%26123").SET_TEXT_MODE(URL ENCODED).
  DECODE_USING_TEXT_MODE
2 Output will be
```

```
3      "abc def&123"  
4 <!--NeedCopy-->
```

## Tutorial examples of classic policies

September 21, 2020

The following examples describe useful examples of classic policy configuration for certain Citrix ADC features, such as Citrix Gateway, application firewall, and SSL.

This document includes the following details:

- Citrix Gateway Policy to Check for a Valid Client Certificate
- Application Firewall Policy to Protect a Shopping Cart Application
- Application Firewall Policy to Protect Scripted Web Pages
- DNS Policy to Drop Packets from Specific IPs
- SSL Policy to Require Valid Client Certificates

### Citrix Gateway policy to check for a valid client certificate

The following policies enable the Citrix ADC to ensure that a client presents a valid certificate before establishing a connection to a company's SSL VPN.

#### To check for a valid client certificate by using the command line interface

- Add an action to perform client certificate authentication.  

```
add ssl action act1 -clientAuth DOCLIENTAUTH
```
- Create an SSL policy to evaluate the client requests.  

```
add ssl policy pol1 -rule "REQ.HTTP.METHOD == GET"-action act1
```
- Add a rewrite action to insert the certificate issuer details into the HTTP header of the requests being sent to web server.  

```
add rewrite action act2 insert_http_header "CertDN"CLIENT.SSL.CLIENT_CERT.SUBJECT
```
- Create a rewrite policy to insert the certificate issuer details, if the client certificate exists.  

```
add rewrite policy pol2 "CLIENT.SSL.CLIENT_CERT.EXISTS"act2
```

Bind these new policies to the Citrix ADC VIP to put them into effect.

## Application firewall policy to protect a shopping cart application

Shopping cart applications handle sensitive customer information, for example, credit card numbers and expiration dates, and they access back-end database servers. Many shopping cart applications also use legacy CGI scripts, which can contain security flaws that were unknown at the time they were written, but are now known to hackers and identity thieves.

A shopping cart application is particularly vulnerable to the following attacks:

- **Cookie tampering.** If a shopping cart application uses cookies, and does not perform the appropriate checks on the cookies that users return to the application, an attacker could modify a cookie and gain access to the shopping cart application under another user's credentials. Once logged on as that user, the attacker could obtain sensitive private information about the legitimate user or place orders using the legitimate user's account.
- **SQL injection.** A shopping cart application normally accesses a back-end database server. Unless the application performs the appropriate safety checks on the data users return in the form fields of its Web forms before it passes that information on to the SQL database, an attacker can use a Web form to inject unauthorized SQL commands into the database server. Attackers normally use this type of attack to obtain sensitive private information from the database or modify information in the database.

The following configuration will protect a shopping cart application against these and other attacks.

### To protect a shopping cart application by using the configuration utility

1. Navigate to **Security > Application Firewall > Profiles**, and then click **Add**.
2. In the **Create Application Firewall Profile** dialog box, in the Profile Name field, enter `shopping_cart`.
3. In the Profile Type drop-down list, select Web Application.
4. In the Configure Select Advanced defaults.
5. Click **Create** and then click **Close**.
6. In the details view, double-click the new profile.
7. In the Configure Web Application Profile dialog box, configure your new profile as described below:
  - Click the Checks tab, double-click the Start URL check, and in the Modify Start URL Check dialog box, click the General tab and disable blocking, and enable learning, logging, statistics, and URL closure. Click OK and then click Close.

Note that if you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

```
set appfw profile shopping_cart -startURLAction LEARN LOG STATS -
startURLClosure ON
```

- For the Cookie Consistency check and Form Field Consistency checks, disable blocking, and enable learning, logging, statistics, using a similar method to the Modify Start URL Check configuration.

If you are using the command line, you configure these settings by typing the following commands:

```
set appfw profile shopping_cart -cookieConsistencyAction LEARN LOG
STATS
```

```
set appfw profile shopping_cart -fieldConsistencyAction LEARN LOG
STATS
```

- For the SQL Injection check, disable blocking, and enable learning, logging, statistics, and transformation of special characters in the Modify SQL Injection Check dialog box, General tab, Check Actions section.

If you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

```
set appfw profile shopping_cart -SQLInjectionAction LEARN LOG STATS
-SQLInjectionTransformSpecialChars ON
```

- For the Credit Card check, disable blocking; enable logging, statistics, and masking of credit card numbers; and enable protection for those credit cards you accept as forms of payment.
  - If you are using the configuration utility, you configure blocking, logging, statistics, and masking (or x-out) in the Modify Credit Card Check dialog box, General tab, Check Actions section. You configure protection for specific credit cards in the Settings tab of the same dialog box.
  - If you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

```
set appfw profile shopping_cart -creditCardAction LOG STATS -
creditCardXOut ON -creditCard <name> [<name>...]
```

For <name> you substitute the name of the credit card you want to protect. For Visa, you substitute VISA. For Master Card, you substitute MasterCard. For American Express, you substitute Amex. For Discover, you substitute Discover. For Diners Club, you substitute DinersClub. For JCB, you substitute JCB.

8. Create a policy named shopping\_cart that detects connections to your shopping cart application and applies the shopping\_cart profile to those connections.

To detect connections to the shopping cart, you examine the URL of incoming connections. If you host your shopping cart application on a separate host (a wise measure for security and other reasons), you can simply look for the presence of that host in the URL. If you host your shopping cart in a directory on a host that handles other traffic, as well, you must determine that the connection is going to the appropriate directory and/or HTML page.

The process for detecting either of these is the same; you create a policy based on the following expression, and substitute the proper host or URL for `<string>`.

```
1 REQ.HTTP.HEADER URL CONTAINS <string>
2 <!--NeedCopy-->
```

- If you are using the configuration utility, you navigate to the application firewall Policies page, click the Add... button to add a new policy, and follow the policy creation process described in “To create a policy with classic expressions using the configuration utility” beginning on page 201 and following.
- If you are using the command line, you type the following command at the prompt and press Enter:

```
add appfw policy shopping_cart "REQ.HTTP.HEADER URL CONTAINS <
string>"shopping_cart
```

2. Globally bind your new policy to put it into effect.

Because you want to ensure that this policy will match all connections to the shopping cart, and not be preempted by another more general policy, you should assign a high priority to it. If you assign one (1) as the priority, no other policy can preempt this one.

## Application firewall policy to protect scripted web pages

Web pages with embedded scripts, especially legacy JavaScripts, often violate the “same origin rule,” which does not allow scripts to access or modify content on any server but the server where they are located. This security vulnerability is called cross-site scripting. The application firewall Cross-Site Scripting rule normally filters out requests that contain cross-site scripting.

Unfortunately, this can cause Web pages with older JavaScripts to stop functioning, even when your system administrator has checked those scripts and knows that they are safe. The example below explains how to configure the application firewall to allow cross-site scripting in Web pages from trusted sources without disabling this important filter for the rest of your Web sites.

### To protect Web pages with cross-site scripting by using the command line interface

- At the command line, to create an advanced profile, type:

```
add appfw profile pr_xssokay -defaults advanced
```

- To configure the profile, type:

```
set appfw profile pr_xssokay -startURLAction NONE -startURLClosure OFF  
-cookieConsistencyAction LEARN LOG STATS -fieldConsistencyAction LEARN  
LOG STATS -crossSiteScriptingAction LEARN LOG STATS$"
```

- Create a policy that detects connections to your scripted Web pages and applies the pr\_xssokay profile, type:

```
add appfw policy pol_xssokay "REQ.HTTP.HEADER URL CONTAINS ^\\.pl\\?$  
|| REQ.HTTP.HEADER URL CONTAINS ^\\.js$"pr_xssokay
```

- Globally bind the policy.

### To protect Web pages with cross-site scripting by using the configuration utility

1. Navigate to **Security > Application Firewall > Profiles**.
2. In the details view, click **Add**.
3. In the **Create Application Firewall Profile** dialog box, create a Web Application profile with advanced defaults and name it pr\_xssokay. Click **Create** and then click **Close**.
4. In the details view, click the profile, click Open, and in the Configure Web Application Profile dialog box, configure the pr\_xssokay profile as shown below.

Start URL Check: Clear all actions.

- Cookie Consistency Check: Disable blocking.
- Form Field Consistency Check: Disable blocking.
- Cross-Site Scripting Check: Disable blocking.

This should prevent blocking of legitimate requests involving Web pages with cross-site scripting that you know are nonetheless safe.

5. Click **Policies**, and then click **Add**.
6. In the **Create Application Firewall Policy** dialog box, create a policy that detects connections to your scripted Web pages and applies the pr\_xssokay profile:
  - Policy name: pol\_xssokay
  - Associated profile: pr\_xssokay

|                                                                  |                                          |
|------------------------------------------------------------------|------------------------------------------|
| Policy expression:<br>"REQ.HTTP.HEADER URL<br>CONTAINS ^\.pl\?\$ | REQ.HTTP.HEADER URL<br>CONTAINS ^\.js\$" |
|------------------------------------------------------------------|------------------------------------------|

7. Globally bind your new policy to put it into effect.

## DNS Policy to drop packets from specific IPs

The following example describes how to create a DNS action and DNS policy that detects connections from unwanted IPs or networks, such as those used in a DDOS attack, and drops all packets from those locations. The example shows networks within the IANA reserved IP block 192.168.0.0/16. A hostile network will normally be on publicly routable IPs.

### To drop packets from specific IPs by using the command line interface

- To create a DNS policy named `pol_ddos_drop` that detects connections from hostile networks and drops those packets, type:

```
add dns policy pol_ddos_drop 'client.ip.src.in_subnet(192.168.253.128/25)
|| client.ip.src.in_subnet(192.168.254.32/27) '-drop YES'
```

For the example networks in the 192.168.0.0/16 range, you substitute the IP and netmask in `###.###.###.###/##` format of each network you want to block. You can include as many networks as you want, separating each `CLIENT.IP.SRC.IN_SUBNET(###.###.###.###/##)` command with the OR operator.

- Globally bind your new policy to put it into effect.

## SSL policy to require valid client certificates

The following example shows an SSL policy that checks the user's client certificate validity before initiating an SSL connection with a client.

### To block connections from users with expired client certificates

- Log on to the command line interface.

If you are using the GUI, navigate to the SSL Policies page, then in the Data area, click the Actions tab.

- Create an SSL action named `act_current_client_cert` that requires that users have a current client certificate to establish an SSL connection with the Citrix ADC.

```
add ssl action act_current_client_cert-clientAuth DOCLIENTAUTH -clientCert
  ENABLED -certHeader "clientCertificateHeader"-clientCertNotBefore
  ENABLED -certNotBeforeHeader "Mon, 01 Jan 2007 00:00:00 GMT"
```

- Create an SSL policy named `pol_current_client_cert` that detects connections to the Web server that contain a query string.

```
add ssl policy pol_current_client_cert 'REQ.SSL.CLIENT.CERT.VALIDFROM
 \>= "Mon, 01 Jan 2007 00:00:00 GMT"'act_block_ssl
```

- Bind your new policy globally.

Because this SSL policy should apply to any user's SSL connection unless a more specific SSL policy applies, you may want to assign it a low priority. If you assign it a priority of one thousand (1000), that should ensure that other SSL policies are evaluated first, meaning that this policy will apply only to connections that do not match more specific policy criteria.

## Migration of Apache `mod_rewrite` rules to the default syntax

September 21, 2020

The Apache HTTP Server provides an engine known as `mod_rewrite` for rewriting HTTP request URLs. If you migrate the `mod_rewrite` rules from Apache to the Citrix ADC, you boost back-end server performance. In addition, because the Citrix ADC typically load balances multiple (sometimes thousands of) Web servers, after migrating the rules to the Citrix ADC you will have a single point of control for these rules.

Following are examples of `mod_rewrite` functions, and translations of these functions into Rewrite and Responder policies on the Citrix ADC.

### Converting URL variations into canonical URLs

On some Web servers you can have multiple URLs for a resource. Although the canonical URLs should be used and distributed, other URLs can exist as shortcuts or internal URLs. You can make sure that users see the canonical URL regardless of the URL used to make an initial request.

In the following examples, the URL `/~user` is converted to `/u/user`.

### Apache `mod_rewrite` solution for converting a URL

```
1 RewriteRule ^/~([^/]+)/?(.*) /u/$1/$2[R]
2 <!--NeedCopy-->
```

### Citrix ADC solution for converting a URL

```
1 add responder action act1 redirect '" /u/" + HTTP.REQ.URL.AFTER_STR("/~")'
  -bypassSafetyCheck yes
2 add responder policy pol1 'HTTP.REQ.URL.STARTSWITH("/~") && HTTP.REQ.
  URL.LENGTH.GT(2)' act1
3 bind responder global pol1 100
4 <!--NeedCopy-->
```

### Converting Host Name Variations to Canonical Host Names

You can enforce the use of a particular host name for reaching a site. For example, you can enforce the use of `www.example.com` instead of `example.com`.

### Apache `mod_rewrite` solution for enforcing a particular host name for sites running on a port other than 80

```
1 RewriteCond %{
2   HTTP_HOST }
3   !^www.example.com
4 RewriteCond %{
5   HTTP_HOST }
6   !^$
7 RewriteCond %{
8   SERVER_PORT }
9   !^80$
10 RewriteRule ^/(.*)          http://www.example.com:%{
11   SERVER_PORT }
12   /$1 [L,R]
13 <!--NeedCopy-->
```

### Apache `mod_rewrite` solution for enforcing a particular host name for sites running on port 80

```
1 RewriteCond %{
2   HTTP_HOST }
```

```

3     !^www.example.com
4 RewriteCond %{
5   HTTP_HOST }
6     !^$
7 RewriteRule ^/(.*)      http://www.example.com/$1 [L,R]
8 <!--NeedCopy-->

```

### Citrix ADC solution for enforcing a particular host name for sites running on a port other than 80

```

1 add responder action act1 redirect '"http://www.example.com:"+CLIENT.
   TCP.DSTPORT+HTTP.REQ.URL' -bypassSafetyCheck yes
2 add responder policy pol1 '!HTTP.REQ.HOSTNAME.CONTAINS("www.example.com
   ")&&!HTTP.REQ.HOSTNAME.EQ("")&&!HTTP.REQ.HOSTNAME.PORT.EQ(80)&&HTTP.
   REQ.HOSTNAME.CONTAINS("example.com")' act1
3 bind responder global pol1 100 END
4 <!--NeedCopy-->

```

### Citrix ADC solution for enforcing a particular host name for sites running on port 80

```

1 add responder action act1 redirect '"http://www.example.com"+HTTP.REQ.
   URL' -bypassSafetyCheck yes
2 add responder policy pol1 '!HTTP.REQ.HOSTNAME.CONTAINS("www.example.
   com")&&!HTTP.REQ.HOSTNAME.EQ("")&&HTTP.REQ.HOSTNAME.PORT.EQ(80)&&
   HTTP.REQ.HOSTNAME.CONTAINS("example.com")' act1
3 bind responder global pol1 100 END
4 <!--NeedCopy-->

```

### Moving a document root

Usually the document root of a Web server is based on the URL “/”. However, the document root can be any directory. You can redirect traffic to the document root if it changes from the top-level “/” directory to another directory.

In the following examples, you change the document root from / to /e/www. The first two examples simply replace one string with another. The third example is more universal because, along with replacing the root directory, it preserves the rest of the URL (the path and query string), for example, redirecting /example/file.html to /e/www/example/file.html.

### Apache mod\_rewrite solution for moving the document root

```
1 RewriteEngine on
2 RewriteRule ^/$ /e/www/ [R]
3 <!--NeedCopy-->
```

### Citrix ADC solution for moving the document root

```
1 add responder action act1 redirect '/e/www/' -bypassSafetyCheck yes
2 add responder policy pol1 'HTTP.REQ.URL.EQ("/")' act1
3 bind responder global pol1 100
4 <!--NeedCopy-->
```

### Citrix ADC solution for moving the document root and appending path information to the request

```
1 add responder action act1 redirect '/e/www'+HTTP.REQ.URL' -
  bypassSafetyCheck yes
2 add responder policy pol1 '!HTTP.REQ.URL.STARTSWITH("/e/www/")' act1
3 bind responder global pol1 100 END
4 <!--NeedCopy-->
```

### Moving home directories to a new web server

You may want to redirect requests that are sent to home directories on a Web server to a different Web server. For example, if a new Web server is replacing an old one over time, as you migrate home directories to the new location you need to redirect requests for the migrated home directories to the new Web server.

In the following examples, the host name for the new Web server is newserver.

### Apache mod\_rewrite solution for redirecting to another Web server

```
1 RewriteRule ^/(.+) http://newserver/$1 [R,L]
2 <!--NeedCopy-->
```

### Citrix ADC solution for redirecting to another Web server (method 1)

```
1 add responder action act1 redirect 'http://newserver'+HTTP.REQ.URL' -
  bypassSafetyCheck yes
```

```

2 add responder policy pol1 'HTTP.REQ.URL.REGEX_MATCH(re#^/(.+)#)' act1
3 bind responder global pol1 100 END
4 <!--NeedCopy-->

```

## Citrix ADC solution for redirecting to another Web server (method 2)

```

1 add responder action act1 redirect '"http://newserver"+HTTP.REQ.URL' -
  bypassSafetyCheck yes
2 add responder policy pol1 'HTTP.REQ.URL.LENGTH.GT(1)' act1
3 bind responder global pol1 100 END
4 <!--NeedCopy-->

```

## Working with structured home directories

Typically, a site with thousands of users has a structured home directory layout. For example, each home directory may reside under a subdirectory that is named using the first character of the user name. For example, the home directory for jsmith (/~jsmith/anypath) might be /home/j/smith/.www/anypath, and the home directory for rvalveti (/~rvalveti/anypath) might be /home/r/rvalveti/.www/anypath.

The following examples redirect requests to the home directory.

## Apache mod\_rewrite solution for structured home directories

```

1 RewriteRule ^/~(([a-z])[a-z0-9]+)(.*) /home/$2/$1/.www$3
2 <!--NeedCopy-->

```

## Citrix ADC solution for structured home directories

Citrix ADC solution for structured home directories

```

1 add rewrite action act1 replace 'HTTP.REQ.URL' '/home/'+ HTTP.REQ.URL
  .AFTER_STR("~").PREFIX(1)+"/"+ HTTP.REQ.URL.AFTER_STR("~").
  BEFORE_STR("/")+"/.www"+HTTP.REQ.URL.SKIP('\',1)' -
  bypassSafetyCheck yes
2 add rewrite policy pol1 'HTTP.REQ.URL.PATH.STARTSWITH("/~")' act1
3 bind rewrite global pol1 100
4
5 <!--NeedCopy-->

```

## Redirecting invalid URLs to other web servers

If a URL is not valid, it should be redirected to another Web server. For example, you should redirect to another Web server if a file that is named in a URL does not exist on the server that is named in the URL.

On Apache, you can perform this check using `mod_rewrite`. On the Citrix ADC, an HTTP callout can check for a file on a server by running a script on the server. In the following Citrix ADC examples, a script named `file_check.cgi` processes the URL and uses this information to check for the presence of the target file on the server. The script returns TRUE or FALSE, and the Citrix ADC uses the value that the script returns to validate the policy.

In addition to performing the redirection, the Citrix ADC can add custom headers or, as in the second Citrix ADC example, it can add text in the response body.

### Apache `mod_rewrite` solution for redirection if a URL is wrong

```
1 RewriteCond  /your/docroot/%{
2   REQUEST_FILENAME }
3   !-f
4 RewriteRule  ^(.+)      http://webserverB.com/$1 [R]
5
6 <!--NeedCopy-->
```

### Citrix ADC solution for redirection if a URL is wrong (method 1)

```
1 add HTTPCallout Call
2 set policy httpCallout Call -IPAddress 10.102.59.101 -port 80 -hostExpr
   "10.102.59.101" -returnType BOOL -ResultExpr 'HTTP.RES.BODY(100).
   CONTAINS("True")' -urlStemExpr '/cgi-bin/file_check.cgi' -
   parameters query=http.req.url.path -headers Name("ddd")
3 add responder action act1 redirect "'http://webserverB.com'+HTTP.REQ.
   URL' -bypassSafetyCheck yes
4 add responder policy pol1 '!HTTP.REQ.HEADER("Name").EXISTS && !SYS.
   HTTP_CALLOUT(call)' act1
5 bind responder global pol1 100
6
7 <!--NeedCopy-->
```

### Citrix ADC solution for redirection if a URL is wrong (method 2)

```
1 add HTTPCallout Call
```

```

2 set policy httpCallout Call -IPAddress 10.102.59.101 -port 80 -hostExpr
  "10.102.59.101" -returnType BOOL -ResultExpr 'HTTP.RES.BODY(100).
  CONTAINS("True")' -urlStemExpr '/cgi-bin/file_check.cgi' -
  parameters query=http.req.url.path -headers Name("ddd")
3 add responder action act1 respondwith "HTTP/1.1 302 Moved
  Temporarily\r\nLocation: http://webserverB.com"+HTTP.REQ.URL+"\r\n\r
  \nHTTPCallout Used" -bypassSafetyCheck yes
4 add responder policy pol1 '!HTTP.REQ.HEADER("Name").EXISTS && !SYS.
  HTTP_CALLOUT(call)' act1
5 bind responder global pol1 100
6
7 <!--NeedCopy-->

```

### Rewriting a URL based on time

You can rewrite a URL based on the time. The following examples change a request for example.html to example.day.html or example.night.html, depending on the time of day.

#### Apache mod\_rewrite solution for rewriting a URL based on the time

```

1 RewriteCond %{
2   TIME_HOUR }
3   %{
4   TIME_MIN }
5   >0700
6 RewriteCond %{
7   TIME_HOUR }
8   %{
9   TIME_MIN }
10  <1900
11 RewriteRule ^example\.html$ example.day.html [L]
12 RewriteRule ^example\.html$ example.night.html
13
14 <!--NeedCopy-->

```

#### Citrix ADC solution for rewriting a URL based on the time

```

1 add rewrite action act1 insert_before 'HTTP.REQ.URL.PATH.SUFFIX
  (\.\',0)' "day."
2 add rewrite action act2 insert_before 'HTTP.REQ.URL.PATH.SUFFIX
  (\.\',0)' "night."

```

```
3 add rewrite policy pol1 'SYS.TIME.WITHIN(LOCAL 07h 00m,LOCAL 18h 59m)'
  act1
4 add rewrite policy pol2 'true' act2
5 bind rewrite global pol1 101
6 bind rewrite global pol2 102
7
8 <!--NeedCopy-->
```

### Redirecting to a new file name (Invisible to the User)

If you rename a Web page, you can continue to support the old URL for backward compatibility while preventing users from recognizing that the page was renamed.

In the first two of the following examples, the base directory is `/~quux/`. The third example accommodates any base directory and the presence of query strings in the URL.

### Apache `mod_rewrite` solution for managing a file name change in a fixed location

```
1 RewriteEngine on
2 RewriteBase /~quux/
3 RewriteRule ^foo\.html$ bar.html
4
5 <!--NeedCopy-->
```

### Citrix ADC solution for managing a file name change in a fixed location

```
1 add rewrite action act1 replace 'HTTP.REQ.URL.AFTER_STR("/~quux").
  SUBSTR("foo.html")' '"bar.html"'
2 add rewrite policy pol1 'HTTP.REQ.URL.ENDSWITH("/~quux/foo.html")' act1
3 bind rewrite global pol1 100
4
5 <!--NeedCopy-->
```

### Citrix ADC solution for managing a file name change regardless of the base directory or query strings in the URL

```
1 add rewrite action act1 replace 'HTTP.REQ.URL.PATH.SUFFIX('\.\/\','0)' '"
  bar.html"'
2 Add rewrite policy pol1 'HTTP.REQ.URL.PATH.CONTAINS("foo.html")' act1
3 Bind rewrite global pol1 100
```

```
4
5 <!--NeedCopy-->
```

### Redirecting to new file name (user-visible URL)

If you rename a Web page, you may want to continue to support the old URL for backward compatibility and allow users to see that the page was renamed by changing the URL that is displayed in the browser.

In the first two of the following examples, redirection occurs when the base directory is /~quux/. The third example accommodates any base directory and the presence of query strings in the URL.

### Apache mod\_rewrite solution for changing the file name and the URL displayed in the browser

```
1 RewriteEngine on
2 RewriteBase    /~quux/
3 RewriteRule    ^old\.html$ new.html [R]
4
5 <!--NeedCopy-->
```

### Citrix ADC solution for changing the file name and the URL displayed in the browser

```
1 add responder action act1 redirect 'HTTP.REQ.URL.BEFORE_STR("foo.html")
  +"new.html"' -bypassSafetyCheck yes
2 add responder policy pol1 'HTTP.REQ.URL.ENDSWITH("/~quux/old.html")'
  act1
3 bind responder global pol1 100
4
5 <!--NeedCopy-->
```

### Citrix ADC solution for changing the file name and the URL displayed in the browser regardless of the base directory or query strings in the URL

```
1 add responder action act1 redirect 'HTTP.REQ.URL.PATH.BEFORE_STR("old.
  html")+ "new.html"+HTTP.REQ.URL.AFTER_STR("old.html")' -
  bypassSafetyCheck yes
2 add responder policy pol1 'HTTP.REQ.URL.PATH.CONTAINS("old.html")' act1
3 bind responder global pol1 100
4
```

```
5 <!--NeedCopy-->
```

## Accommodating browser dependent content

To accommodate browser-specific limitations—at least for important top-level pages—it is sometimes necessary to set restrictions on the browser type and version. For example, you might want to set a maximum version for the latest Netscape variants, a minimum version for Lynx browsers, and an average feature version for all others.

The following examples act on the HTTP header “User-Agent”, such that if this header begins with “Mozilla/3”, the page MyPage.html is rewritten to MyPage.NS.html. If the browser is “Lynx” or “Mozilla” version 1 or 2, the URL becomes MyPage.20.html. All other browsers receive page MyPage.32.html.

## Apache mod\_rewrite solution for browser-specific settings

```
1 RewriteCond %{
2   HTTP_USER_AGENT }
3   ^Mozilla/3.*
4 RewriteRule ^MyPage\.html$ MyPage.NS.html [L]
5 RewriteCond %{
6   HTTP_USER_AGENT }
7   ^Lynx/.* [OR]
8 RewriteCond %{
9   HTTP_USER_AGENT }
10  ^Mozilla/[12].*
11 RewriteRule ^MyPage\.html$ MyPage.20.html [L]
12 RewriteRule ^fMyPage\.html$ MyPage.32.html [L]
13 Citrix ADC solution for browser-specific settings
14 add patset pat1
15 bind patset pat1 Mozilla/1
16 bind Patset pat1 Mozilla/2
17 bind patset pat1 Lynx
18 bind Patset pat1 Mozilla/3
19 add rewrite action act1 insert_before 'HTTP.REQ.URL.SUFFIX' '"NS."'
20 add rewrite action act2 insert_before 'HTTP.REQ.URL.SUFFIX' '"20."'
21 add rewrite action act3 insert_before 'HTTP.REQ.URL.SUFFIX' '"32."'
22 add rewrite policy pol1 'HTTP.REQ.HEADER("User-Agent").STARTSWITH_INDEX
23   ("pat1").EQ(4)' act1
24 add rewrite policy pol2 'HTTP.REQ.HEADER("User-Agent").STARTSWITH_INDEX
25   ("pat1").BETWEEN(1,3)' act2
26 add rewrite policy pol3 '!HTTP.REQ.HEADER("User-Agent").STARTSWITH_ANY
27   ("pat1)'" act3
28 bind rewrite global pol1 101 END
```

```
26 bind rewrite global pol2 102 END
27 bind rewrite global pol3 103 END
28
29 <!--NeedCopy-->
```

## Blocking access by robots

You can block a robot from retrieving pages from a specific directory or a set of directories to ease up the traffic to and from these directories. You can restrict access based on the specific location or you can block requests based on information in User-Agent HTTP headers.

In the following examples, the Web location to be blocked is `/~quux/foo/arc/`, the IP addresses to be blocked are 123.45.67.8 and 123.45.67.9, and the robot's name is `NameOfBadRobot`.

## Apache `mod_rewrite` solution for blocking a path and a User-Agent header

```
1 RewriteCond %{
2   HTTP_USER_AGENT }
3   ^NameOfBadRobot.*
4 RewriteCond %{
5   REMOTE_ADDR }
6   ^123\.45\.67\.[8-9]$
7 RewriteRule ^/~quux/foo/arc/.+ - [F]
8
9 <!--NeedCopy-->
```

## Citrix ADC solution for blocking a path and a User-Agent header

```
1 add responder action act1 respondwith '"HTTP/1.1 403 Forbidden\r\n\r\n"
2 add responder policy pol1 'HTTP.REQ.HEADER("User-Agent").STARTSWITH("
3   NameOfBadRobot")&&CLIENT.IP.SRC.EQ(123.45.67.8)&&CLIENT.IP.SRC.EQ
4   (123.45.67.9) && HTTP.REQ.URL.STARTSWITH("/~quux/foo/arc")' act1
5 bind responder global pol1 100
6
7 <!--NeedCopy-->
```

## Blocking access to inline images

If you find people frequently going to your server to copy inline graphics for their own use (and generating unnecessary traffic), you may want to restrict the browser's ability to send an HTTP Referer

header.

In the following example, the graphics are located in [Example](#).

### Apache mod\_rewrite solution for blocking access to an inline image

```
1 RewriteCond %{
2   HTTP_REFERER }
3   !^$
4 RewriteCond %{
5   HTTP_REFERER }
6   !^http://www.quux-corp.de/~quux/.*$
7 RewriteRule .*\.png$ - [F]
8
9 <!--NeedCopy-->
```

### Citrix ADC solution for blocking access to an inline image

```
1 add patset pat1
2 bind patset pat1 .png
3 bind patset pat1 .jpeg
4 add responder action act1 respondwith 'HTTP/1.1 403 Forbidden\r\n\r\n'
5 add responder policy pol1 '!HTTP.REQ.HEADER("Referer").EQ("") && !HTTP.
6   REQ.HEADER("Referer").STARTSWITH("http://www.quux-corp.de/~quux/")&&
7   HTTP.REQ.URL.ENDSWITH_ANY("pat1")' act1
8 bind responder global pol1 100
9
10 <!--NeedCopy-->
```

### Creating extensionless links

To prevent users from knowing application or script details on the server side, you can hide file extensions from users. To do this, you may want to support extensionless links. You can achieve this behavior by using rewrite rules to add an extension to all requests, or to selectively add extensions to requests.

The first two of the following examples show adding an extension to all request URLs. In the last example, one of two file extensions is added. Note that in the last example, the mod\_rewrite module can easily find the file extension because this module resides on the Web server. In contrast, the Citrix ADC must invoke an HTTP callout to check the extension of the requested file on the Web server. Based on the callout response, the Citrix ADC adds the .html or .php extension to the request URL.

**Note**

In the second Citrix ADC example, an HTTP callout is used to query a script named `file_check.cgi` hosted on the server. This script checks whether the argument that is provided in the callout is a valid file name.

**Apache mod\_rewrite solution for adding a .php extension to all requests**

```
1 RewriteRule ^/?([a-z]+)$ $1.php [L]
2
3 <!--NeedCopy-->
```

**Citrix ADC policy for adding a .php extension to all requests**

```
1 add rewrite action act1 insert_after 'HTTP.REQ.URL' '".php"'
2 add rewrite policy pol1 'HTTP.REQ.URL.PATH.REGEX_MATCH(re#^/([a-z]+)$#)
   ' act1
3 bind rewrite global pol1 100
4 <!--NeedCopy-->
```

**Apache mod\_rewrite solution for adding either .html or .php extensions to requests**

```
1 RewriteCond %{
2   REQUEST_FILENAME }
3   .php -f
4 RewriteRule ^/?([a-zA-Z0-9]+)$ $1.php [L]
5 RewriteCond %{
6   REQUEST_FILENAME }
7   .html -f
8 RewriteRule ^/?([a-zA-Z0-9]+)$ $1.html [L]
9 <!--NeedCopy-->
```

**Citrix ADC policy for adding either .html or .php extensions to requests**

```
1 add HTTPCallout Call_html
2 add HTTPCallout Call_php
3 set policy httpCallout Call_html -IPAddress 10.102.59.101 -port 80 -
   hostExpr '"10.102.59.101"' -returnType BOOL -ResultExpr 'HTTP.RES.
   BODY(100).CONTAINS("True")' -urlStemExpr '/cgi-bin/file_check.cgi'
   ' -parameters query=http.req.url+".html"
```

```
4 set policy httpCallout Call_php -IPAddress 10.102.59.101 -port 80 -
  hostExpr '"10.102.59.101"' -returnType BOOL -ResultExpr 'HTTP.RES.
  BODY(100).CONTAINS("True")' -urlStemExpr '/cgi-bin/file_check.cgi'
  ' -parameters query=http.req.url+".php"
5 add patset pat1
6 bind patset pat1 .html
7 bind patset pat1 .php
8 bind patset pat1 .asp
9 bind patset pat1 .cgi
10 add rewrite action act1 insert_after 'HTTP.REQ.URL.PATH' '".html"'
11 add rewrite action act2 insert_after "HTTP.REQ.URL.PATH" '".php"'
12 add rewrite policy pol1 '!HTTP.REQ.URL.CONTAINS_ANY("pat1") && SYS.
  HTTP_CALLOUT(Call_html)' act1
13 add rewrite policy pol2 '!HTTP.REQ.URL.CONTAINS_ANY("pat1") && SYS.
  HTTP_CALLOUT(Call_php)' act2
14 bind rewrite global pol1 100 END
15 bind rewrite global pol2 101 END
16
17 <!--NeedCopy-->
```

## Redirecting a Working URI to a New Format

Suppose that you have a set of working URLs that resemble the following:

```
1 /index.php?id=nnnn
2
3 <!--NeedCopy-->
```

To change these URLs to /nnnn and make sure that search engines update their indexes to the new URI format, you need to do the following:

- Redirect the old URIs to the new ones so that search engines update their indexes.
- Rewrite the new URI back to the old one so that the index.php script runs correctly.

To accomplish this, you can insert marker code into the query string (making sure that the marker code is not seen by visitors), and then removing the marker code for the index.php script.

The following examples redirect from an old link to a new format only if a marker is not present in the query string. The link that uses the new format is re-written back to the old format, and a marker is added to the query string.

## Apache mod\_rewrite solution

```
1 RewriteCond %{
```

```

2  QUERY_STRING }
3  !marker
4  RewriteCond %{
5  QUERY_STRING }
6  id=([-a-zA-Z0-9_]+)
7  RewriteRule ^/?index\.php$ %1? [R,L]
8  RewriteRule ^/?([-a-zA-Z0-9_]+)$ index.php?marker&id=$1 [L]
9  Citrix ADC solution
10 add responder action act_redirect redirect 'HTTP.REQ.URL.PATH.
    BEFORE_STR("index.php")+HTTP.REQ.URL.QUERY.VALUE("id")' -
    bypassSafetyCheck yes
11 add responder policy pol_redirect '!HTTP.REQ.URL.QUERY.CONTAINS("marker
    ")&& HTTP.REQ.URL.QUERY.VALUE("id").REGEX_MATCH(re/[-a-zA-Z0-9_]+/+)
    && HTTP.REQ.URL.PATH.CONTAINS("index.php")' act_redirect
12 bind responder global pol_redirect 100 END
13 add rewrite action act1 replace 'HTTP.REQ.URL.PATH.SUFFIX('\',\',0)' '"
    index.phpmarker&id="+HTTP.REQ.URL.PATH.SUFFIX('\',\',0)' -
    bypassSafetyCheck yes
14 add rewrite policy pol1 '!HTTP.REQ.URL.QUERY.CONTAINS("marker")' act1
15 bind rewrite global pol1 100 END
16
17 <!--NeedCopy-->

```

## Ensuring That a Secure Server Is Used for Selected Pages

To make sure that only secure servers are used for selected Web pages, you can use the following Apache mod\_rewrite code or Citrix ADC Responder policies.

### Apache mod\_rewrite solution

```

1 RewriteCond %{
2 SERVER_PORT }
3 !^443$
4 RewriteRule ^/?(page1|page2|page3|page4|page5)$ https://www.example.
    com/%1 [R,L]
5
6 <!--NeedCopy-->

```

### Citrix ADC solution using regular expressions

```

1 add responder action res_redirect redirect '"https://www.example.com"+
    HTTP.REQ.URL' -bypassSafetyCheck yes

```

```
2 add responder policy pol_redirect '!CLIENT.TCP.DSTPORT.EQ(443)&&HTTP.
   REQ.URL.REGEX_MATCH(re/page[1-5]/)' res_redirect
3 bind responder global pol_redirect 100 END
4
5 <!--NeedCopy-->
```

## Citrix ADC solution using pattern sets

```
1 add patset pat1
2 bind patset pat1 page1
3 bind patset pat1 page2
4 bind patset pat1 page3
5 bind patset pat1 page4
6 bind patset pat1 page5
7 add responder action res_redirect redirect '"https://www.example.com"+
   HTTP.REQ.URL' -bypassSafetyCheck yes
8 add responder policy pol_redirect '!CLIENT.TCP.DSTPORT.EQ(443)&&HTTP.
   REQ.URL.CONTAINS_ANY("pat1")' res_redirect
9 bind responder global pol_redirect 100 END
10
11 <!--NeedCopy-->
```

## Rate limiting

September 21, 2020

The rate limiting feature enables you to define the maximum load for a given network entity or virtual entity on the Citrix ADC appliance. The feature enables you to configure the appliance to monitor the rate of traffic associated with the entity and take preventive action, in real time, based on the traffic rate. This feature is particularly useful when the network is under attack from a hostile client that is sending the appliance a flood of requests. You can mitigate the risks that affect the availability of resources to clients, and you can improve the reliability of the network and the resources that the appliance manages.

You can monitor and control the rate of traffic that is associated with virtual and user-defined entities, including virtual servers, URLs, domains, and combinations of URLs and domains. You can throttle the rate of traffic if it is too high, base information caching on the traffic rate, and redirect traffic to a given load balancing virtual server if the traffic rate exceeds a predefined limit. You can apply rate-based monitoring to HTTP, TCP, and DNS requests.

To monitor the rate of traffic for a given scenario, you configure a *rate limit identifier*. A rate limit identifier specifies numeric thresholds such as the maximum number of requests or connections (of a particular type) that are permitted in a specified time period called a *time slice*.

Optionally, you can configure filters, known as *stream selectors*, and associate them with rate limit identifiers when you configure the identifiers. After you configure the optional stream selector and the limit identifier, you must invoke the limit identifier from a default syntax policy. You can invoke identifiers from any feature in which the identifier may be useful, including rewrite, responder, DNS, and integrated caching.

You can globally enable and disable SNMP traps for rate limit identifiers. Each trap contains cumulative data for the rate limit identifier's configured data collection interval (time slice), unless you specified multiple traps to be generated per time slice. For more information about configuring SNMP traps and managers, see "[SNMP](#)."

## Configuring a stream selector

September 21, 2020

A traffic stream selector is an optional filter for identifying an entity for which you want to throttle access. The selector is applied to a request or a response and selects data points (keys ) that can be analyzed by a rate stream identifier. These data points can be based on almost any characteristic of the traffic, including IP addresses, subnets, domain names, TCP or UDP identifiers, and particular strings or extensions in URLs.

A stream selector consists of individual default syntax expressions called selectlets. Each selectlet is a non-compound default syntax expression. A traffic stream selector can contain up to five non-compound expressions called selectlets. Each selectlet is considered to be in an AND relationship with the other expressions. Following are some examples of selectlets:

```
1 http.req.url
2 http.res.body(1000>after_str("car_model").before_str("made_in"))
3 "client.ip.src.subnet(24)"
4 <!--NeedCopy-->
```

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the Citrix ADC considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the Citrix ADC, again, can count the same transaction more than once.

**Note:**

If you modify an expression in a stream selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a stream selector named `myStreamSelector1`, invoke it from `myLimitID1`, and invoke the identifier from a DNS policy named `dnsRateLimit1`. If you change the expression in `myStreamSelector1`, you might receive an error when binding `dnsRateLimit1` to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

**To configure a traffic stream selector by using the command line interface**

At the command prompt, type:

```
1 add stream selector <name> <rule> ...
2 <!--NeedCopy-->
```

**Example:**

```
1 add stream selector myStreamSel HTTP.REQ.URL CLIENT.IP.SRC
2 <!--NeedCopy-->
```

**To configure a stream selector by using the Citrix ADC GUI**

Navigate to **AppExpert > Rate Limiting > Selectors**, click **Add** and specify the relevant details.

**Configuring a traffic rate limit identifier**

September 21, 2020

A rate limit identifier checks if the amount of traffic exceeds a specified value, within a particular time interval. The identifier returns a “Boolean TRUE” if the amount of traffic exceeds a limit within a particular time interval. When you include a limit identifier in the compound default syntax expression in a policy rule, you must include a stream selector. If you do not specify, the limit identifier is applied to all requests or responses identified by the compound expression.

**Note:**

The maximum length for storing string results (for example, `HTTP.REQ.URL`) is 60 characters. If

the string (for example, URL) is 1000 characters long, out of which 50 characters are long enough to uniquely identify a string, you can use an expression to extract required 50 characters.

## To configure a traffic limit identifier from the command line interface

At the command prompt, type:

```
1 add ns limitIdentifier <limitIdentifier> -threshold <positive_integer>
  -timeSlice <positive_integer> -mode <mode> -limitType ( BURSTY |
  SMOOTH ) -selectorName <string> -maxBandwidth <positive_integer> -
  trapsInTimeSlice <positive_integer>
2 <!--NeedCopy-->
```

### Argument description

**limitIdentifier.** Name for a rate limit identifier. Must begin with an ASCII letter or underscore ( \_ ) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used. This is a mandatory argument. Maximum Length: 31

**threshold.** A maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST\_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Default value: 1 Minimum value: 1 Maximum Value: 4294967295

**timeSlice.** Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. This argument is needed only when the mode is set to REQUEST\_RATE. Default value: 1000 Minimum value: 10 Maximum Value: 4294967295

**mode.** Defines the type of traffic to be tracked.

**REQUEST\_RATE** - Tracks requests/timeslice.

**CONNECTION** - Tracks active transactions.

**limitType.** Smooth or bursty request type.

**selectorName.** Name of the rate limit selector. If this argument is NULL, rate limiting is applied on all traffic received by the virtual server or the Citrix ADC (depending on whether the limit identifier is bound to a virtual server or globally) without any **filtering**. **Maximum Length: 31**

**maxBandwidth.** Maximum bandwidth permitted, in kbps. Minimum value: 0 Maximum value: 4294967287

### Example:

Configuring traffic rate limit identifier in BURSTY mode:

```
1 add ns limitIdentifier 100_request_limit -threshold 100 -timeSlice 1000
   -mode REQUEST_RATE -limitType BURSTY -selectorName
   limit_100_requests_selector -trapsInTimeSlice 30
2 <!--NeedCopy-->
```

Configuring traffic rate limit identifier in SMOOTH mode:

```
1 add ns limitIdentifier limit_req -mode request_rate -limitType smooth -
   timeslice 1000 -Threshold 2000 -trapsInTimeSlice 200
2 <!--NeedCopy-->
```

### To configure a traffic limit identifier by using the configuration utility

Navigate to **AppExpert > Rate Limiting > Limit Identifiers**, click **Add** and specify the relevant details.

## Configuring and binding a traffic rate policy

September 21, 2020

You implement rate-based application behavior by configuring a policy in an appropriate Citrix ADC feature. The feature must support default syntax policies. The policy expression must contain the following expression prefix to enable the feature to analyze the traffic rate:

```
1 sys.check_limit(<limit_identifier>)
2 <!--NeedCopy-->
```

Where `limit_identifier` is the name of a limit identifier.

The policy expression must be a compound expression that contains at least two components:

- An expression that identifies traffic to which the rate limit identifier is applied. For example:

```
1 http.req.url.contains("my_aspx.aspx") .
2 <!--NeedCopy-->
```

- An expression that identifies a rate limit identifier, for example, `sys.check_limit("my_limit_identifier")`. This must be the last expression in the policy expression.

### To configure a rate-based policy by using the command line interface

At the command prompt, type the following command to configure a rate-based policy and verify the configuration:

```
1 add cache|dns|rewrite|responder policy <policy_name> -rule expression
  && sys.check_limit("<LimitIdentifierName>") [<feature-specific
  information>]
2 <!--NeedCopy-->
```

Following is a complete example of a rate-based policy rule. Note that this example assumes that you have configured the responder action, `send_direct_url`, that is associated with the policy. Note that the `sys.check_limit` parameter must be the last element of the policy expression:

```
1 add responder policy responder_threshold_policy "http.req.url.contains(
  "myindex.html") && sys.check_limit("my_limit_identifier)"
  send_direct_url
2 <!--NeedCopy-->
```

For information about binding a policy globally or to a virtual server, see [“Binding Default Syntax Policies.”](#)

### To configure a rate-based policy by using the Citrix ADC GUI

1. In the navigation pane, expand the feature in which you want to configure a policy (for example, Integrated Caching, Rewrite, or Responder), and then click Policies.
2. In the details pane, click Add. In Name, enter a unique name for the policy.
3. Under Expression, enter the policy rule, and make sure that you include the `sys.check_limit` parameter as the final component of the expression. For example:

```
1 http.req.url.contains("my_aspx.aspx") && sys.check_limit("
  my_limit_identifier")
2 <!--NeedCopy-->
```

4. Enter feature-specific information about the policy.  
For example, you may be required to associate the policy with an action or a profile. For more information, see the feature-specific documentation.
5. Click Create, and then click Close.
6. Click Save.

### Viewing the traffic rate

September 21, 2020

If traffic through one or more virtual servers matches a rate-based policy, you can view the rate of this traffic. The rate statistics are maintained in the limit identifier that you named in the rule for the rate-based policy. If more than one policy uses the same limit identifier, you can view the traffic rate as defined by hits to all of the policies that use the particular limit identifier.

### To view the traffic rate by using the command line interface

At the command prompt, type the following command to view the traffic rate:

```
1 show ns limitSessions <limitIdentifier>
2 <!--NeedCopy-->
```

#### Example:

```
1 sh limitSession myLimitSession
2 <!--NeedCopy-->
```

### To view the traffic rate by using the configuration utility

1. Navigate to **AppExpert > Rate Limiting > Limit Identifiers**.
2. Select a limit identifier whose traffic rate you want to view.
3. Click the **Show Sessions** button. If traffic through one or more virtual servers has matched a rate limiting policy that uses this limit identifier (and the hits are within the configured time slice for this identifier), the Session Details dialog box appears. Otherwise, you receive a “No session exists” message.

## Testing a rate-based policy

September 21, 2020

To test a rate-based policy, you can send traffic to any virtual server to which a rate-based policy is bound.

### Task overview: Testing a rate-based policy

1. Configure a stream selector (optional) and a rate limit identifier (required). For example:

```
1 add stream selector sel_subnet Q.URL "CLIENT.IP.SRC.SUBNET(24)"
2 add ns limitIdentifier k_subnet -Threshold 4 -timeSlice 3600 -mode
  REQUEST_RATE -limittype smooth -selectorName sel_subnet -
  trapsInTimeSlice 8
```

```
3 <!--NeedCopy-->
```

2. Configure the action that you want to associate with the policy that uses the rate limit identifier. For example:

```
1 add responder action resp_redirect redirect "\"http://
  response_site.com/\\""
2 <!--NeedCopy-->
```

3. Configure a policy that uses the `sys.check_limit` expression prefix to call the rate limit identifier. For example, the policy can apply a rate limit identifier to all requests arriving from a particular subnet, as follows:

```
1 add responder policy resp_subnet "SYS.CHECK_LIMIT(\"k_subnet\")"
  resp_redirect
2 <!--NeedCopy-->
```

4. Bind the policy globally or to a virtual server. For example:

```
1 bind responder global resp_subnet 6 END -type DEFAULT
2 <!--NeedCopy-->
```

5. In a browser address bar, send a test HTTP query to a virtual server. For example:

```
1 http://<IP of a vserver>/testsite/test.txt
2 <!--NeedCopy-->
```

6. At the Citrix ADC command prompt, type:

```
1 show ns limitSessions <limitIdentifier>
2 <!--NeedCopy-->
```

### Example

```
1 > sh limitsession k_subnet
2 1)      Time Remaining:      98 secs  Hits: 2
          Action Taken: 0
3      Total Hash:      1718618  Hash String: /test.txt
4      IPs gathered:
5          1) 10.217.253.0
6      Active Transactions: 0
7 Done
8 >
9 <!--NeedCopy-->
```

7. Repeat the query and check the limit identifier statistics again to verify that the statistics are being updated correctly.

## **Examples of rate-based policies**

September 21, 2020

The following table shows examples of rate-based policies.

Table 1. Examples of Rate-Based Policies

| Purpose                                                                                                                                    | Example                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of requests per second from a URL                                                                                         | <pre>add stream selector ipStreamSelector http.req.url "client.ip.src" add ns limitIdentifier ipLimitIdentifier -threshold 4 -timeSlice 1000 -mode request_rate -limitType smooth -selectorName ipStreamSelector  add responder action myWebSiteRedirectAction redirect "\http://www.mycompany.com/"  add responder policy ipLimitResponderPolicy "http.req.url.contains(\"myasp.asp\") &amp;&amp; sys.check_limit(\"ipLimitIdentifier\")" myWebSiteRedirectAction  bind responder global ipLimitResponderPolicy 100 END -type default</pre> |
| Cache a response if the request URL rate exceeds 5 per 20000 milliseconds                                                                  | <pre>add stream selector cacheStreamSelector http.req.url add ns limitIdentifier cacheRateLimitIdentifier -threshold 5 -timeSlice 2000 -selectorName cacheStreamSelector  add cache policy cacheRateLimitPolicy -rule "http.req.method.eq(get) &amp;&amp; sys.check_limit(\"cacheRateLimitIdentifier\")" -action cache  bind cache global cacheRateLimitPolicy -priority 10</pre>                                                                                                                                                            |
| Drop a connection on the basis of cookies received in requests from www.yourcompany.com if the requests exceed the rate limit              | <pre>add stream selector reqCookieStreamSelector "http.req.cookie .value(\"mycookie\")" "client.ip.src.subnet(24)"  add ns limitIdentifier myLimitIdentifier -Threshold 2 -timeSlice 3000 -selectorName reqCookieStreamSelector  add responder action sendRedirectUrl redirect '\http://www.mycompany.com\' + http.req.url' -bypassSafetyCheck YES  add responder policy rateLimitCookiePolicy "http.req.url.contains(\"www.yourcompany.com\") &amp;&amp; sys.check_limit(\"myLimitIdentifier\")" sendRedirectUrl</pre>                      |
| Drop a DNS packet if the requests from a particular client IP address and DNS domain exceed the rate limit                                 | <pre>add stream selector dropDNSStreamSelector client.udp.dns.domain client.ip.src add ns limitIdentifier dropDNSRateIdentifier -timeslice 20000 -mode request_rate -selectorName dropDNSStreamSelector -maxBandwidth 1 -trapsintimeslice 20  add dns policy dnsDropOnClientRatePolicy "sys.check_limit (\"dropDNSRateIdentifier\")" -drop yes</pre>                                                                                                                                                                                         |
| Limit the number of HTTP requests that arrive from the same host (with a subnet mask of 32) and that have the same destination IP address. | <pre>add stream selector ipv6_sel "CLIENT.IPv6.src.subnet(32)" CLIENT.IPv6.dst Q.URL add ns limitIdentifier ipv6_id -imeSlice 20000 -selectorName ipv6_sel add lb vserver ipv6_vip HTTP 3ffe::209 80 -persistenceType NONE -cltTimeout 180 add responder action redirect_page redirect "\http://redirectpage.com/" add responder policy ipv6_resp_pol "SYS.CHECK_LIMIT(\"ipv6_id\")" redirect_page bind responder global ipv6_resp_pol 5 END -type DEFAULT</pre>                                                                             |

## Sample Use Cases for rate-based policies

September 21, 2020

The following scenarios describe two uses of rate-based policies in global server load balancing (GSLB):

- The first scenario describes the use of a rate-based policy that sends traffic to a new data center if the rate of DNS requests exceed 1000 per second.
- In the second scenario, if more than five DNS requests arrive for a local DNS (LDNS) client within a particular period, the additional requests are dropped.

### Redirecting traffic on the basis of traffic rate

In this scenario, you configure a proximity-based load balancing method, and a rate-limiting policy that identifies DNS requests for a particular region. In the rate-limiting policy, you specify a threshold of 1000 DNS requests per second. A DNS policy applies the rate limiting policy to DNS requests for the region “Europe.GB.17.London.UK-East.ISP-UK.” In the DNS policy, DNS requests that exceed the rate limiting threshold, starting with request 1001 and continuing to the end of the one-second interval, are to be forwarded to the IP addresses that are associated with the region “North America.US.TX.Dallas.US-East.ISP-US.”

The following configuration demonstrates this scenario:

```
1 add stream selector DNSSelector1 client.udp.dns.domain
2
3 add ns limitIdentifier DNSLimitIdentifier1 -threshold 5 -timeSlice 1000
  -selectorName DNSSelector1
4
5 add dns policy DNSLimitPolicy1 "client.ip.src.matches_location(\"Europe
  .GB.17.London.*.*\") &&
6 sys.check_limit(\"DNSLimitIdentifier1\")" -preferredLocation "North
  America.US.TX.Dallas.*.*"
7
8 bind dns global DNSLimitPolicy1 5
9 <!--NeedCopy-->
```

### Dropping DNS requests on the basis of traffic rate

In the following example of global server load balancing, you configure a rate limiting policy that permits a maximum of five DNS requests in a particular interval, per domain, to be directed to an LDNS

client for resolution. Any requests that exceed this rate are dropped. This type of policy can help protect the Citrix ADC from resource exploitation. For example, in this scenario, if the time to live (TTL) for a connection is five seconds, this policy prevents the LDNS from requerying a domain. Instead, it uses data that is cached on the Citrix ADC.

```
1 add stream selector LDNSSelector1 client.udp.dns.domain client.ip.src
2
3 add ns limitIdentifier LDNSLimitIdentifier1 -threshold 5 -timeSlice
  1000 -selectorName LDNSSelector1
4
5 add dns policy LDNSPolicy1 "client.udp.dns.domain.contains(\".\") &&
  sys.check_limit(\"LDNSLimitIdentifier1\")" -drop YES
6
7 bind dns global LDNSPolicy1 6
8
9 show gslb vserver gvip

## Rate Limiting for traffic domains

September 21, 2020

You can configure rate limiting for traffic domains. The following expression in the Citrix ADC expressions language identifies traffic associated with traffic domains.

- `client.traffic_domain.id`

You can configure rate limiting for traffic associated with a particular traffic domain, a set of traffic domains, or all traffic domains.

For configuring rate limiting for traffic domains, you perform the following steps on a Citrix ADC appliance by using the configuration utility or the Citrix ADC command line:

1. Configure a stream selector that uses the `client.traffic_domain.id` expression for identifying the traffic, associated with traffic domains, to be rate limited.
2. Configure a rate limit identifier that specifies parameters such as maximum threshold for traffic to be rate limited. You also associate a stream selector to the rate limiter in this step.
3. Configure an action that you want to associate with the policy that uses the rate limit identifier.
4. Configure a policy that uses the `sys.check_limit` expression prefix to call the rate limit identifier, and associate the action with this policy.
5. Bind the policy globally.

Consider an example in which two traffic domains, with IDs 10 and 20, are configured on Citrix ADC NS1. On traffic domain 10, LB1-TD-1 is configured to load balance servers S1 and S2; LB2-TD1 is configured to load balance servers S3 and S4.

On traffic domain 20, LB1-TD-2 is configured to load balance servers S5 and S6; LB2-TD2 is configured to load balance servers S7 and S8.

The following table lists some examples of rate limiting policies for traffic domains in the example setup.

| Purpose                                                                                                                           | CLI command                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of requests to 10 per second for each of the traffic domains.                                                    | <pre>add stream selector tdratelimit-1 CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier limitidf-1 -threshold 10 -selectorName tdratelimit-1 -trapsInTimeSlice 0 add responder policy ratelimit-pol "sys.check_limit(\"limitidf-1\")" DROP bind responder global ratelimit-pol 1</pre>                                                                               |
| Limit the number of requests to 5 per client per second for each of the traffic domains.                                          | <pre>add stream selector tdandclientip CLIENT.IP.SRC,CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td_limitidf -threshold 5 -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy tdratelimit-pol "sys.check_limit(\"td_limitidf\")" DROP bind responder global tdratelimit-pol 2</pre>                                                            |
| Limit the number of requests sent for a particular traffic domain (for example traffic domain 10) to 30 requests every 3 seconds. | <pre>add stream selector tdratelimit CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td10_limitidf -threshold 30 -timeSlice 3000 -selectorName tdratelimit -trapsInTimeSlice 5 add responder policy td10ratelimit "client.traffic_domain.id==10 &amp;&amp; sys.check_limit(\"td10_limitidf\")" DROP bind responder global td10ratelimit 3</pre>                     |
| Limit the number of connections to 5 per client per second for a particular traffic domain (for example traffic domain 20).       | <pre>add stream selector tdandclientip CLIENT.IP.SRC CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td20_limitidf -threshold 5 -mode CONNECTION -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy td20_ratelimit "client.traffic_domain.id==20 &amp;&amp; sys.check_limit(\"td20_limitidf\")" DROP bind responder global td20_ratelimit 4</pre> |

## Configure rate limit at packet level

September 21, 2020

You can configure a stream selector and a responder policy to collect statistics at the packet level flowing through all the connections identified by the selector. If the number of packets per second exceed the configured threshold, the policy applies the configured action (RESET or DROP). You can configure these policies for all types of virtual servers. Packets of all sizes are considered.

### **To configure rate limiting at packet level, perform the following tasks**

1. Enable load balancing
2. Add stream selector
3. Add stream identifier
4. Add responder policy
5. Add load balancing virtual server
6. Bind responder policy

### **To enable load balancing feature**

At the command prompt, type:

```
1 enable ns feature lb
2 <!--NeedCopy-->
```

### **To add a stream selector**

At the command prompt, type:

```
1 add stream selector packetlimitselector client.ip.src client.tcp.
   srcport client.ip.dst client.tcp.dstport
2 <!--NeedCopy-->
```

### **To add a stream identifier**

At the command prompt, type:

```
1 add stream identifier packetlimitidentifier packetlimitselector -
   interval 1
2 <!--NeedCopy-->
```

### **To enable tracking of ACK only packets**

At the command prompt, type:

```
1 set stream identifier packetlimitidentifier - trackAckOnlyPackets
   ENABLED
2 <!--NeedCopy-->
```

### To add a responder policy

At the command prompt, type:

```
1 add responder policy packet_rate_sessionpolicy "ANALYTICS.STREAM(\"
   packetlimitidentifier\").COLLECT_STATS(\"PACKET_LIMIT\", <
   max_threshold_PPS>, ACTION, 0/1)" NOOP
2 <!--NeedCopy-->
```

Where,

- <max\_threshold\_PPS> is the maximum number of packets allowed through the connection per second.
- ACTION can be DROP or RESET.
- 0 or 1 represents the limit type; 0 represents the BURSTY limit type and 1 represents the SMOOTH limit type.

### Example:

```
1 add responder policy packet_rate_sessionpolicy "ANALYTICS.STREAM(\"
   packetlimitidentifier\").COLLECT_STATS(\"PACKET_LIMIT\", 40, RESET,
   0)" NOOP
2 <!--NeedCopy-->
```

### To add a load balancing virtual server

At the command prompt, type:

```
1 add lb vserver <name> <serviceType> <ip> <port>
2
3 add lb vserver Vserver-lb-1 HTTP 10.102.20.200 80
4 <!--NeedCopy-->
```

### To bind a responder policy

After the selector and the responder policy are configured, the policy can be bound globally or to the specific virtual server.

At the command prompt, type either of the following commands:

```
1 bind responder global <policyName> <priority> [<gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <labelName>)] ]
2 <!--NeedCopy-->
```

OR

```
1 bind lb vserver <name>@ (-policyName <string>@ [-priority <positive_integer>])
2 <!--NeedCopy-->
```

**Examples:**

```
1 bind responder global packet_rate_sessionpolicy 101 END -type REQ_DEFAULT
2
3 bind responder global packet_rate_sessionpolicy 102 END -type
4
5 bind lb vserver v1 -policyname packet_rate_sessionpolicy -priority 10
6 <!--NeedCopy-->
```

## Responder

September 21, 2020

**Warning**

Filter features using classic policies are deprecated and as an alternative, Citrix recommends you to use the rewrite and responder features with advanced policy infrastructure.

Today's complex Web configurations often require different responses for HTTP requests. When users request a webpage, you might provide a different page depending on user geographical location, browser specification, or languages the browser accepts and the order of preference. You might want to drop a connection if the request is coming from an IP range that has DDoS attacks or initiating hacking attempts.

Responder supports protocols such as TCP, DNS (UDP), and HTTP. With responder enabled on your appliance, server responses are based on who sends the request, where it comes from, and other criteria with security and system management implications. The feature is simple and quick to use. By avoiding the invocation of more complex features, it reduces CPU cycles and time spent in handling requests that do not require complex processing.

For handling sensitive data such as financial information, if you want to ensure that the client uses a secure connection to browse a site, you can redirect the request to a secure connection by using `https://` instead of `http://`.

To use the Responder feature, do the following;

- Enable the Responder feature on the Citrix ADC.
- Configure responder actions. The action can be to generate a custom response, redirect a request to a different webpage, or reset a connection.
- Configure responder policies. The policy determines the requests (traffic) on which an action has to be taken.
- Bind each policy to a bind point put it into effect. A bind point refers to an entity at which Citrix ADC examines the traffic to see if it matches a policy. For example, a bind point can be a load balancing virtual server.

You can specify a default action for requests that do not match any policy, and you can bypass the safety check for actions that would otherwise generate error messages.

The Rewrite feature of Citrix ADC helps in rewriting some information in the requests or responses handled by Citrix ADC. The following section shows some differences between the two features.

### **Comparison between Rewrite and Responder options**

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting an HTTP request to new websites or webpages
- Responding with some custom response
- Dropping or resetting a connection at request level

If there is a responder policy, the Citrix ADC examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

If there is a rewrite policy, the Citrix ADC examines the request and forwards it to the server.

In general, it is recommended to use responder feature, if you want the appliance to reset or drop a connection based on a request-based parameter. Use responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

## Enabling the Responder Feature

September 21, 2020

To use the Responder feature, you must first enable it.

To enable the responder feature by using the Citrix ADC command line:

At the command prompt, type the following commands to enable the responder feature and verify the configuration:

- enable ns feature <feature>
- show ns feature

### Example:

```

1 enable ns feature Responder
2 Done
3 > show ns feature
4
5         Feature                Acronym        Status
6         -----                -
7 1)    Web Logging              WL             ON
8 2)    Surge Protection         SP             ON
9 .
10 .
11 .
12 1)    Responder                RESPONDER     ON
13 2)    HTML Injection           HTMLInjection ON
14 3)    Citrix ADC Push          push          OFF
15 Done
16 >
17 <!--NeedCopy-->

```

To enable the responder feature by using the GUI:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change advanced features.
3. In the Configure Advanced Features dialog box, select the Responder check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click YES. A message appears in the status bar, stating that the feature has been enabled.

## Configuring a Responder Action

September 21, 2020

After enabling the responder feature, you must configure one or more actions for handling requests. The responder supports the following types of actions:

- **Respond with.** Sends the response defined by the Target expression without forwarding the request to a web server. (The Citrix ADC appliance substitutes for and acts as a web server.) Use this type of action to manually define a simple HTML-based response. Normally the text for a Respond with action consists of a web server error code and brief HTML page.
- **Respond with SQL OK.** Sends the designated SQL OK response defined by the Target expression. Use this type of action to send an SQL OK response to an SQL query.
- **Respond with SQL Error.** Sends the designated SQL Error response defined by the Target expression. Use this type of action to send an SQL Error response to an SQL query.
- **Respond with HTML page.** Sends the designated HTML page as the response. You can choose from a drop-down list of HTML pages that were previously uploaded, or upload a new HTML page. Use this type of action to send an imported HTML page as the response.
- **Redirect.** Redirects the request to a different webpage or web server. A Redirect action can redirect requests originally sent to a “dummy” website that exists in DNS, but for which there is no actual web server, to an actual website. It can also redirect search requests to an appropriate URL. Normally, the redirection target for a Redirect action consists of a complete URL.

To configure a responder action by using the Citrix ADC command line:

Displays the current settings for the specified responder action. If no action name is provided, display a list of all responder actions currently configured on the Citrix ADC appliance, with abbreviated settings.

At the command prompt, type the following commands to configure a responder action and verify the configuration:

- add responder action <name> <type> <target> [-bypassSafetyCheck (YES | NO) ]
- show responder action

### Parameters:

- **Name.** Name of the responder action. Maximum Length: 127
- **type.** Type of responder action. It can be: (respondwith).
- **target.** An expression specifying what to respond with
- **homepage.** Option specifying to respondwith htmlpage

- **bypassSafetyCheck.** The safety check to allow unsafe expressions. **Note:** This attribute is deprecated.
- **hits.** The number of times the action has been taken.
- **referenceCount.** The number of references to the action.
- **undefHits.** The number of times the action resulted in UNDEF.
- **comment.** Any type of information about this responder action.
- **builtin.** Flag to determine whether responder action is built in or not

**Example:**

```
1 To create a responder action that displays a "Not Found" error page
  for URLs that do not exist:
2
3 > add responder action act404Error respondWith "HTTP/1.1 404 Not Found
  \r\n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
  server."
4 Done
5
6 > show responder action
7
8 1) Name: act404Error
9 Operation: respondwith
10 Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does
  not exist on the web server."
11 BypassSafetyCheck : NO
12 Hits: 0
13 Undef Hits: 0
14 Action Reference Count: 0
15 Done
16
17 To create a responder action that displays a "Not Found" error page
  for URLs that do not exist:
18
19 add responder action act404Error respondWith "HTTP/1.1 404 Not Found\r
  \n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
  server."
20 Done
21 > show responder action
22
23 1) Name: act404Error
24 Operation: respondwith
25 Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does
  not exist on the web server."
```

```
26 BypassSafetyCheck : NO
27 Hits: 0
28 Undef Hits: 0
29 Action Reference Count: 0
30 Done
31 <!--NeedCopy-->
```

To modify an existing responder action by using the Citrix ADC command line:

At the command prompt, type the following command to modify an existing responder action and verify the configuration:

- `set responder action <name> -target <string> [-bypassSafetyCheck ( YES | NO )]`
- `show responder action`

**Example:**

```
1 set responder action act404Error -target '"HTTP/1.1 404 Not Found\r\n\r\n'+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web server."'
2 Done
3 > show responder action
4
5 1)      Name: act404Error
6         Operation: respondwith
7         Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE +
8             " does not exist on the web server."
9         BypassSafetyCheck : NO
10        Hits: 0
11        Undef Hits: 0
12        Action Reference Count: 0
13 Done
14 <!--NeedCopy-->
```

To remove a responder action by using the Citrix ADC command line:

At the command prompt, type the following command to remove a responder action and verify the configuration:

- `rm responder action <name>`
- `show responder action`

**Example:**

```
1 rm responder action act404Error
2 Done
```

```
3
4 > show responder action
5 Done
6 <!--NeedCopy-->
```

To configure a responder action by using the GUI:

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, do one of the following:
  - To create an action, click Add.
  - To modify an existing action, select the action, and then click Open.
3. Click Create or OK, depending on whether you are creating an action or modifying an existing action.
4. Click Close. A message appears in the status bar, stating that the feature has been enabled.
5. To delete a responder action, select the action, and then click Remove. A message appears in the status bar, stating that the feature has been disabled.

To add an expression by using the **Add Expression** dialog box

1. In the Create Responder Action or Configure Responder Action dialog box, click Add.
2. In the Add Expression dialog box, in the first list box choose the first term for your expression.
  - HTTP. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - SYS. One or more protected web sites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - CLIENT. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
  - ANALYTICS. The analytics data associated with the request. Choose this if you want to examine request metadata.
  - SIP. A SIP request. Choose this if you want to examine some aspect of a SIP request.

When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

## Configuring the Global HTTP Action

You can configure the global HTTP action to invoke a responder action when an HTTP request times out. To configure this feature, you must first create the responder action that you want to invoke. Then, you configure the global HTTP timeout action to respond to a timeout with that responder action.

To configure the global HTTP action by using the Citrix ADC command line:

At the command prompt, type the following command:

- `set ns httpProfile -reqTimeoutAction <responder action name>`
- `save ns config`

For `<responder action name>`, substitute the name of the responder action.

## Configure HTML page import

When a Citrix ADC appliance responds with a custom message, we can respond with an HTML file. You can import the file using the `import responder htmlpage` command and then use this file in `add responder action <act name> respondwithhtmlpage <file name>` command. You can also import the file through the Citrix ADC GUI. You can import a desired HTML page into the appliance folder and upload the page during responder run time.

To import HTML page by using the Citrix ADC GUI:

1. Navigate to **AppExpert > Responder > HTML Page Imports**.
2. In the **Responder HTML Imports** details pane, click **Add**.
3. In the **HTML Page Import Object** page, set the following parameters:
  - a) Name. Name of the HTML page.
  - b) Import From. Imported from file, text, or text.
  - c) URL. Select to enter the URL location of the HTML file.
  - d) File. Select the HTML file from the appliance directory.
  - e) Text. Select the HTML file as a text.
4. Click **Continue**.
5. Verify responder HTML page details.
6. Click **Done**.

## HTML Page Import Object

| View Responder Details                                                   |                           |
|--------------------------------------------------------------------------|---------------------------|
| Name<br>Test-HTML-page-import                                            | Import From<br><b>URL</b> |
| File Contents                                                            |                           |

| <input type="button" value="Click to select"/> >                         |                           |
| Comment                                                                  |                           |
| <input type="text" value="A brief description about the page import"/> ⓘ |                           |
| File Contents*                                                           |                           |

To edit an HTML page, you can select an HTML file and click **Edit & Update**.

## Configuring a Responder Policy

September 21, 2020

After you configure a responder action, you must next configure a responder policy to select the requests to which the Citrix ADC appliance should respond. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.

**Note:** For creating and managing responder policies, the GUI provides assistance that is not available at the Citrix ADC command prompt.

To configure a responder policy by using the Citrix ADC command line:

At the command prompt, type:

- `add responder policy <name> <expression> <action> [<undefaction>]-appFlowaction <actionName>`
- `show responder policy <name>`

### Example:

```

1 > add responder policy policyThree "CLIENT.IP.SRC.IN_SUBNET
    (222.222.0.0/16)" RESET
2 Done
3 > show responder policy policyThree
4
5     Name: policyThree
6     Rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)

```

```
7      Responder Action: RESET
8      UndefAction: Use Global
9      Hits: 0
10     Undef Hits: 0
11     Done
12 <!--NeedCopy-->
```

To modify an existing responder policy by using the Citrix ADC command line:

At the command prompt, type:

- `set responder policy <name> [-rule <expression>] [-action <string>] [-undefAction <string>]`
- `show responder policy <name>`

To remove a responder policy by using the Citrix ADC command line:

At the command prompt, type:

- `rm responder policy <name>`
- `show responder policy`

**Example:**

```
1 >rm responder policy pol404Error
2   Done
3
4 > show responder policy
5   Done
6 <!--NeedCopy-->
```

To configure a responder policy by using the GUI:

1. Navigate to AppExpert > Responder > Policies.
2. In the details pane, do one of the following:
  - To create a new policy, click Add.
  - To modify an existing policy, select the policy, and then click Open.
3. Click Create or OK, depending on whether you are creating a new policy or modifying an existing policy.
4. Click Close. A message appears in the status bar, stating that the feature has been configured.

## Binding a Responder Policy

September 21, 2020

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the Citrix ADC, or to a specific virtual server, so that the policy applies only to requests whose destination IP address is the VIP of that virtual server.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the Citrix ADC operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The responder feature implements only the first policy that a request matches, not any additional policies that it might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the Citrix ADC, see [Policies and Expressions](#).

**Note:** Responder policies cannot be bound to TCP-based virtual servers.

To globally bind a responder policy by using the Citrix ADC command line:

At the command prompt, type the following command to globally bind a responder policy and verify the configuration:

- `bind responder global <policyName> <priority> [<gotoPriorityExpression> [-type <type>] [-invoke (<labelType> <labelName>)]`
- `show responder global`

**Example:**

```
1 > bind responder global poliError 100
2 Done
3 > show responder global
4 1)      Global bindpoint: REQ_DEFAULT
5         Number of bound policies: 1
6
7 Done
8 <!--NeedCopy-->
```

To bind responder policy to a specific virtual server by using the Citrix ADC command line:

At the command prompt, type:

- `bind lb vserver <name> -policyname <policy_name> -priority <priority>`

- sh lb vserver <name>

**Example:**

```

1 > bind lb vserver vs-loadbal -policyName policyTwo -priority 100
2 Done
3 > show lb vserver
4 1) vs-loadbal (10.102.29.20:80) - HTTP Type: ADDRESS
5 State: OUT OF SERVICE
6 Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)
7 Time since last state change: 2 days, 00:58:03.260
8 Effective State: DOWN
9 Client Idle Timeout: 180 sec
10 Down state flush: ENABLED
11 Disable Primary Vserver On Down : DISABLED
12 Port Rewrite : DISABLED
13 No. of Bound Services : 0 (Total) 0 (Active)
14 Configured Method: LEASTCONNECTION
15 Mode: IP
16 Persistence: NONE
17 Vserver IP and Port insertion: OFF
18 Push: DISABLED Push VServer:
19 Push Multi Clients: NO
20 Push Label Rule: none
21 2) vs-cont-sw (0.0.0.0:0) - TCP Type: ADDRESS
22 State: DOWN
23 Last state change was at Wed Aug 19 10:03:46 2009 (+213 ms)
24 Time since last state change: 2 days, 00:00:04.260
25 Effective State: DOWN
26 Client Idle Timeout: 9000 sec
27 Down state flush: ENABLED
28 Disable Primary Vserver On Down : DISABLED
29 No. of Bound Services : 0 (Total) 0 (Active)
30 Configured Method: LEASTCONNECTION
31 Mode: IP
32 Persistence: NONE
33 Connection Failover: DISABLED
34 Done
35 <!--NeedCopy-->

```

To globally bind a responder policy by using the GUI:

1. Navigate to **AppExpert > Responder > Policies**.
2. On the **Responder Policies** page, select a responder policy, and then click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box Bind Points menu, select Default Global.

4. Click **Insert Policy** to insert a new row and display a drop-down list of all unbound responder policies.
5. Click one of the policies on the list. That policy is inserted into the list of globally bound responder policies.
6. Click **Apply Changes**.
7. Click **Close**. A message appears in the status bar, stating that the configuration has been successfully completed.

To bind a responder policy to a specific virtual server by using the GUI:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. On the **Load Balancing Virtual Servers** page, select the virtual server to which you want to bind the responder policy, and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, select the **Policies** tab, which displays a list of all policies configured on your Citrix ADC appliance.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click **OK**. A message appears in the status bar, stating that the configuration has been successfully completed.

## Setting default responder parameters for a responder policy

September 21, 2020

The Citrix ADC appliance generates an undefined event (UNDEF event) when a request does not match a responder policy. The appliance then performs the default action assigned to undefined events. By default, the action forwards the request to the next feature such as load balancing, content filtering and so forth. This default behavior ensures the requests do not require any specific responder action to be sent to your Web servers. Also, the clients receive access to the content that they have requested.

If one or more websites your Citrix ADC appliance protects receive a significant number of invalid or malicious requests, however, you might want to change the default action to either reset the client connection or drop the request. In this type of configuration, you would write one or more responder policies that would match any legitimate requests, and simply redirect those requests to their original destinations. Your Citrix ADC appliance would then block any other requests as specified by the default action you configured.

You can assign any one of the following actions to an undefined event:

- **NOOP**. The NOOP action aborts responder processing but does not alter the packet flow. So that the appliance continues to process requests that do not match any responder policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks

or redirects the request. This action is appropriate for normal requests to your Web servers and is the default setting.

- **RESET.** If the undefined action is set to RESET, the appliance resets the client connection, informing the client that it must re-establish its session with the Web server. The action is appropriate for repeat requests for webpages that do not exist, or for connections that might be attempts to hack or probe your protected websites.
- **DROP.** If the undefined action is set to DROP, the appliance silently drops the request without responding to the client in any way. This action is appropriate for requests that appear to be part of a DDoS attack or other sustained attack on your servers.

**Note:** UNDEF events are triggered only for client requests. No UNDEF events are triggered for responses.

To set the undefined action by using the Citrix ADC command line:

At the command prompt, type the following command to set the undefined action and verify the configuration:

- `set responder param -undefAction (RESET|DROP|NOOP)`
- `show responder param`

**Example:**

```
1 >set responder param -undefAction RESET
2   Done
3 > show responder param
4 Action Name: RESET
5   Done
6 >
7 <!--NeedCopy-->
```

### Set the undefined action by using the GUI

1. Navigate to **AppExpert > Responder**, and then under **Settings**, click the **Change Responder Settings** link.
2. In the **Set Responder Params** page, set the following parameters:
  - a) Global Undefined-Result Action. Undefined-result action is preferred in an unhandled processing exception in the responder policies and actions. Select **NOOP**, **RESET**, or **DROP**.
3. Click **OK**.

## Responder Action and Policy Examples

May 5, 2021

Responder actions and policies are powerful and complex, but you can get started with relatively simple applications.

### Example: Blocking Access from Specified IPs

The following procedures block access to your protected Web site(s) by clients originating from the CIDR 222.222.0.0/16. The responder sends an error message stating that the client is not authorized to access the URL requested.

To block access by using the Citrix ADC command line:

At the command prompt, type the following commands to block access:

- add responder action act\_unauthorized respond with “HTTP/1.1 403 Forbidden\r\n\r\n” + “Client: “ + CLIENT.IP.SRC + “ is not authorized to access URL:” + “HTTP.REQ.URL.HTTP\_URL\_SAFE”
- add responder policy pol\_un “CLIENT.IP.SRC.IN\_SUBNET (222.222.0.0/16)” act\_unauthorized
- bind responder global pol\_un 10

To block access by using the GUI:

1. In the navigation pane, expand **Responder**, and then click **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
  - a) In the **Name** text box, type act\_unauthorized.
  - b) Under **Type**, select Respond with.
  - c) In the **Target** text area, type the following string: “HTTP/1.1 200 OK\r\n\r\n” + “Client: “ + CLIENT.IP.SRC + “ is not authorized to access URL:” + HTTP.REQ.URL.HTTP\_URL\_SAFE
  - d) Click **Create**, and then click **Close**.  
The responder action you configured, named act\_unauthorized, now appears in the **Responder Actions** page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
  - a) In the **Name** text box, type pol\_unauthorized.
  - b) Under **Action**, select act\_unauthorized.
  - c) In the **Expression** window, type the following rule: CLIENT.IP.SRC.IN\_SUBNET(222.222.0.0/16)
  - d) Click **Create**, then click **Close**.  
The responder policy you configured, named pol\_unauthorized, now appears in the **Responder Policies** page.

7. Globally bind your new policy, pol\_unauthorized, as described in [Binding a Responder Policy](#).

### Example: Redirecting a client to a new URL

The following procedures redirect clients who access your protected Web site(s) from within the CIDR 222.222.0.0/16 to a specified URL.

To redirect clients by using the Citrix ADC command line:

At the command prompt, type the following commands to redirect clients and verify the configuration:

- add responder action act\_redirect redirect "<http://www.example.com/404.html>"
- show responder action act\_redirect
- add responder policy pol\_redirect "CLIENT.IP.SRC.IN\_SUBNET(222.222.0.0/16)" act\_redirect
- show responder policy pol\_redirect
- bind responder global pol\_redirect 10

### Example:

```
1 > add responder action act_redirect redirect ` " http ://www.example.com
  /404.html "`
2 Done
3
4 > add responder policy pol_redirect "CLIENT.IP.SRC.IN_SUBNET
  (222.222.0.0/16)" act_redirect
5 Done
6 <!--NeedCopy-->
```

To redirect clients by using the GUI:

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
  - a) In the **Name** text box, type act\_redirect.
  - b) Under **Type**, select **Redirect**.
  - c) In the **Target** text area, type the following string: `http://www.example.com/404.html`
  - d) Click **Create**, then click **Close**.  
The responder action you configured, named act\_redirect, now appears in the **Responder Actions** page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
  - a) In the **Name** text box, type pol\_redirect.
  - b) Under **Action**, select act\_redirect.

- c) In the **Expression** window, type the following rule: CLIENT.IP.SRC.IN\_SUBNET(222.222.0.0/16)
- d) Click **Create**, then click **Close**.

The responder policy you configured, named pol\_redirect, now appears in the **Responder Policies** page.

7. Globally bind your new policy, pol\_redirect, as described in [Binding a Responder Policy](#).

## Diameter Support for Responder

September 21, 2020

The Responder feature now supports the Diameter protocol. You can configure Responder to respond to Diameter requests as it does HTTP and TCP requests. For example, you could configure Responder to respond to requests from a specific Diameter origin with a redirect to a web page enhanced for mobile devices. A number of Citrix ADC expressions have been added that support examination of the Diameter header and the attribute-value pairs (AVPs). These expressions support lookup of specific AVPs by index, ID or name, examine the information in each AVP, and send an appropriate response.

To configure Responder to respond to a Diameter request:

At the command prompt, type the following commands:

- add responder action <actname> RESPONDWITH "DIAMETER.NEW\_REDIRECT("aaa://host.example.com")"

For <actname>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For aaa://host.example.com, substitute the URL of the diameter host to which you want to redirect connections.

- add responder policy <polname> "diameter.req.avp(264).value.eq("host1.example.net")" <actname>

For <polname>, substitute a name for your new policy. As with <actname>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For host1.example.net, substitute the name of the originating host of the requests that you want to redirect. For <actname>, substitute the name of the action that you just created.

- bind lb vserver <vservname> -policyName <polname> -priority <priority> -type REQUEST

For <vservname>, substitute the name of the load balancing virtual server to which you want to bind the policy. For <polname>, substitute the name of the policy you just created. For <priority>, substitute a priority for the policy.

### Example:

To create a Responder action and policy to respond to Diameter requests that originate from “host1.example.net” with a redirect to “host.example.com”, you could add the following action and policy, and bind the policy as shown.

```
1 > add responder action act_resp-dm-redirect RESPONDWITH "DIAMETER.  
    NEW_REDIRECT(\"aaa://host.example.com\")"  
2 Done  
3  
4 > add responder pol_resp-dm-redirect "diameter.req.avp(264).value.eq(\"  
    host1.example.net\")" act_resp-dm-redirect  
5 Done  
6  
7 > bind lb vserver vs1 -policyName pol_resp-dm-redirect -priority 10 -  
    type REQUEST  
8 Done  
9 <!--NeedCopy-->
```

## RADIUS Support for Responder

September 21, 2020

The Citrix ADC expressions language contains expressions that can extract information from and manipulate RADIUS requests. These expressions enable you to use the Responder feature to respond to RADIUS requests. Your responder policies and actions can use any expression that is appropriate or relevant to a RADIUS request. The available expressions enable you to identify the RADIUS message type, extract any attribute-value pair (AVP) from the connection, and send different responses on the basis of that information. You can also create policy labels that invoke all responder policies for RADIUS connections.

You can use RADIUS expressions to construct simple responses that do not require communication with the RADIUS server to which the request was sent. When a responder policy matches a connection, the Citrix ADC constructs and sends the appropriate RADIUS response without contacting the RADIUS authentication server. For example, if the source IP address of a RADIUS request is from a subnet that is specified in the responder policy, the Citrix ADC can reply to that request with an access-reject message, or can simply drop the request.

You can also create policy labels to route specific types of RADIUS requests through a series of policies that are appropriate to those requests.

**Note:** The current RADIUS expressions do not work with RADIUS IPv6 attributes.

The Citrix ADC documentation for expressions that support RADIUS assumes familiarity with the basic

structure and purpose of RADIUS communications. If you need more information about RADIUS, see your RADIUS server documentation or search online for an introduction to the RADIUS protocol.

## Configuring Responder Policies for RADIUS

The following procedure uses the Citrix ADC command line to configure a responder action and policy, and bind the policy to a RADIUS-specific global bind point.

To configure a Responder action and policy, and bind the policy:

At the command prompt, type the following commands:

- add responder action <actName> <actType>
- add responder policy <polName> <rule> <actName>
- bind responder policy <polName> <priority> <nextExpr> -type <bindPoint> where <bindPoint> represents one of the RADIUS-specific global bind points.

## RADIUS Expressions for Responder

In a responder configuration, you can use the following Citrix ADC expressions to refer to various portions of a RADIUS request.

### Identifying the Type of Connection:

- RADIUS.IS\_CLIENT  
Returns TRUE if the connection is a RADIUS client (request) message.
- RADIUS.IS\_SERVER  
Returns TRUE if the connection is a RADIUS server (response) message.

### Request Expressions:

- RADIUS.REQ.CODE  
Returns the number that corresponds to the RADIUS request type. A derivative of the num\_at class. For example, a RADIUS access request would return 1 (one). A RADIUS accounting request would return 4.
- RADIUS.REQ.LENGTH  
Returns the length of the RADIUS request, including the header. A derivative of the num\_at class.
- RADIUS.REQ.IDENTIFIER  
Returns the RADIUS request identifier, a number assigned to each request that allows the request to be matched to the corresponding response. A derivative of the num\_at class.

- **RADIUS.REQ.AVP(<AVP Code No>).VALUE**  
Returns the value of first occurrence of this AVP as a string of type `text_t`.
- **RADIUS.REQ.AVP(<AVP code no>).INSTANCE(instance number)**  
Returns the specified instance of the AVP as a string of type `RAMP_t`. A specific RADIUS AVP can occur multiple times in a RADIUS message. `INSTANCE (0)` returns the first instance, `INSTANCE (1)` returns second instance, and so on, up to sixteen instances.
- **RADIUS.REQ.AVP(<AVP code no>).VALUE(instance number)**  
Returns the value of specified instance of the AVP as a string of type `text_t`.
- **RADIUS.REQ.AVP(<AVP code no>).COUNT**  
Returns the number of instances of a specific AVP in a RADIUS connection, as an integer.
- **RADIUS.REQ.AVP(<AVP code no>).EXISTS**  
Returns `TRUE` if the specified type of AVP exists in the message, or `FALSE` if it does not.

**Response Expressions:**

RADIUS response expressions are identical to RADIUS request expressions, except that `RES` replaces `REQ`.

**Typecasts of AVP Values:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other Citrix ADC typecast expressions.

**Example:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other Citrix ADC typecast expressions.

```
1 RADIUS.REQ.AVP(8).VALUE(0).typecast_ip_address_at
2 <!--NeedCopy-->
```

**AVP Type Expressions:**

The Citrix ADC supports expressions to extract RADIUS AVP values by using the assigned integer codes described in RFC2865 and RFC2866. You can also use text aliases to accomplish the same task. Some examples follow.

- RADIUS.REQ.AVP (1).VALUE or RADIUS.REQ.USERNAME.value  
Extracts the RADIUS user-name value.
- RADIUS.REQ.AVP (4). VALUE or RADIUS.REQ. ACCT\_SESSION\_ID.value  
Extracts the Acct-Session-ID AVP (code 44) from the message.
- RADIUS.REQ.AVP (26). VALUE or RADIUS.REQ.VENDOR\_SPECIFIC.VALUE  
Extracts the vendor-specific value.

The values of most commonly-used RADIUS AVPs can be extracted in the same manner.

### **RADIUS Bind Points:**

Four global bind points are available for policies that contain RADIUS expressions.

- RADIUS\_REQ\_OVERRIDE  
Priority/override request policy queue.
- RADIUS\_REQ\_DEFAULT  
Standard request policy queue.
- RADIUS\_RES\_OVERRIDE  
Priority/override response policy queue.
- RADIUS\_RES\_DEFAULT  
Standard response policy queue.

### **RADIUS Responder-Specific Expressions:**

- RADIUS\_RESPONDWITH  
Respond with the specified RADIUS response. The response is created with Citrix ADC expressions, both RADIUS expressions and any others that are applicable.
- RADIUS.NEW\_ANSWER  
Sends a new RADIUS answer to the user.
- RADIUS.NEW\_ACCESSREJECT  
Rejects the RADIUS request.
- RADIUS.NEW\_AVP  
Adds the specified new AVP to the response.

### **Use Cases**

Following are use cases for RADIUS with responder.

## Blocking RADIUS Requests from a Specific Network

To configure the responder feature to block authentication requests from a specific network, begin by creating a responder action that rejects requests. Use the action in a policy that selects requests from the networks that you want to block. Bind the responder policy to a RADIUS-specific global bind point, specifying:

- The priority
- END as the nextExpr value, to ensure that policy evaluation stops when this policy is matched
- RADIUS\_REQ\_OVERRIDE as the queue to which you assign the policy, so that it is evaluated before policies assigned to the default queue

To configure Responder to block logons from a specific network\*\*

- add responder action <actName> <actType>
- add responder policy <polName> <rule> <actName>
- bind responder global <polName> <priority> <nextExpr> -type <bindPoint>

### Example:

```
1 > add responder action rspActRadiusReject respondwith radius.  
    new_accessreject  
2 Done  
3  
4 > add responder policy rspPolRadiusReject client.ip.src.in_subnet  
    (10.224.85.0/24) rspActRadiusReject  
5 Done  
6  
7 > bind responder global rspPolRadiusReject 1 END -type  
    RADIUS_REQ_OVERRIDE  
8 <!--NeedCopy-->
```

## DNS Support for the Responder Feature

September 21, 2020

You can configure the responder feature to respond to DNS requests as it does to HTTP and TCP requests. For example, you could configure it to send DNS responses over UDP and ensure that the DNS requests from the client are sent over TCP. A number of Citrix ADC expressions support examination of the DNS header in the request. These expressions examine specific header fields and send an appropriate response.

- **DNS Expressions.** In a responder configuration, you can use the following Citrix ADC expressions to refer to various portions of a DNS request:

| Expressions                      | Descriptions                                                  |
|----------------------------------|---------------------------------------------------------------|
| DNS.NEW_RESPONSE                 | Creates a new empty DNS response based on the request.        |
| DNS.NEW_RESPONSE <AA, TC, rcode> | Creates a new DNS response based on the specified parameters. |

- **DNS Bind Points.** The following global bind points are available for policies that contain DNS expressions.

| Bind Points      | Descriptions                            |
|------------------|-----------------------------------------|
| DNS_REQ_OVERRIDE | Priority/override request policy queue. |
| DNS_REQ_DEFAULT  | Standard request policy queue.          |

In addition to the default bind points, you can create policy labels of type DNS and bind DNS policies to them.

## Configuring Responder Policies for DNS

The following procedure uses the Citrix ADC command line to configure a responder action and policy and bind the policy to a responder-specific global bind point.

To configure Responder to respond to a DNS request:

At the command prompt, type the following commands:

1. add responder action <actName> <actType>

For <actname>, substitute a name for your new action. The name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For <actType>, substitute a responder action type, *respondWith*.

2. add responder policy <polName> <rule> <actName>

For <polname>, substitute a name for your new policy. For <actname>, the name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For <actname>, substitute the name of the action that you just created.

3. bind responder policy <polName> <priority> <nextExpr> -type <bindPoint>

For <bindPoint>, specify one of the responder-specific global bind points. For <polName>, substitute the name of the policy that you just created. For <priority>, specify the priority of the policy.

**Sample configuration - Enforce all DNS request over TCP:**

To enforce all the DNS requests over TCP, create a responder action that will set the TC bit and rcode as NOERROR.

```
1 > add responder action resp_act_set_tc_bit respondwith DNS.NEW_RESPONSE
   (true, true, NOERROR)
2 Done
3
4 > add responder policy enforce_tcp dns.REQ.TRANSPORT.EQ(udp)
   resp_act_set_tc_bit
5 Done
6
7 >bind lb vserver dns_udp - policyName enforce_tcp -type request -
   priority 100
8 Done
9 <!--NeedCopy-->
```

**How to redirect HTTP request to HTTPS using responder**

September 21, 2020

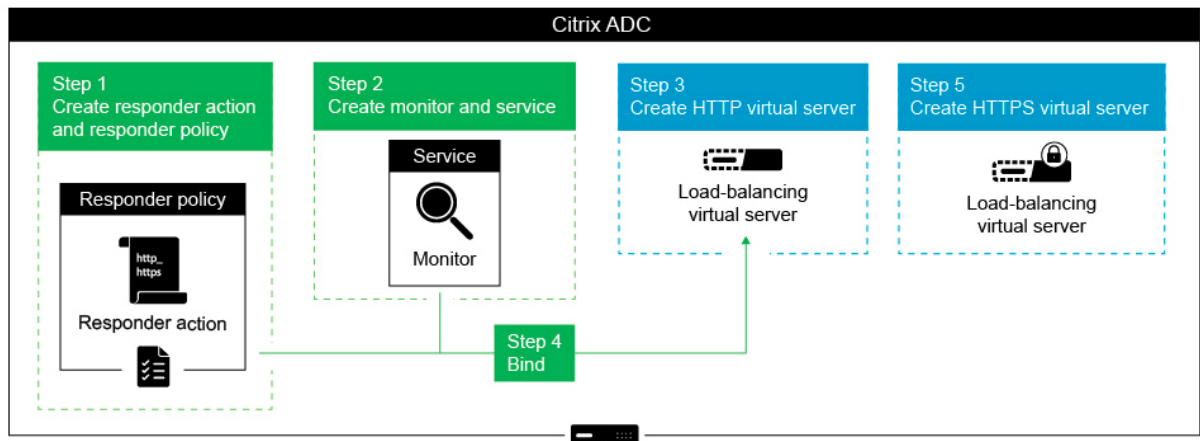

This article explains how to configure the responder feature with a load balancing virtual server IP addresses and redirect client requests from HTTP to HTTPS.

Consider a scenario, where a user might attempt to access a secure web site by sending an HTTP request. Instead of dropping the request, you might want to redirect the request to a secure web site. You can use the responder feature to redirect the request to the secure web site without changing the path and the URL query which the user attempts to access.

**How Citrix ADC responder redirects a request from HTTP to HTTPS**

The following illustration shows a step by step flow of how the appliance redirects a request.

**Note:** The navigation paths and screen shots are derived from NetScaler 11.0.

To configure the Responder feature along with the Load Balancing VIP addresses of a NetScaler appliance to redirect client requests from HTTP to HTTPS, complete the following procedure.

1. Enable the responder feature on the appliance. Navigate to **System > Settings > Configure Advanced Features > Responder**.

## ← Configure Advanced Features

2. Create a responder action and specify an appropriate name, such as, http\_to\_https\_actn, in the Name field.
3. To create a responder action, in the navigation pane, expand **AppExpert > Responder**, click **Actions** and then click **Add**.
4. Select Redirect as Type.

5. In the **Expression** field, type the following expression:  
`"https://" + HTTP.REQ.HOSTNAME.HTTP_URL_SAFE + HTTP.REQ.URL.PATH_AND_QUERY .HTTP_URL_SAFE.`
6. In NetScaler version 9.0 and 10.0 ensure that the **Bypass Safety Check** option is cleared.  
**Note:** This option is not present from NetScaler 11.0 onwards.
7. Create **Responder Policy** and specify an appropriate name, such as http\_to\_https\_pol, in the Name field.
8. To create a Responder Policy, in the navigation pane, expand **AppExpert > Responder**, click **Policies** and then click **Add**.
9. From the Action list, select the action name that you have created.
10. From the Undefined Action list, select RESET.
11. Type the **HTTP.REQ.IS\_VALID** expression in the **Expression** field as shown in the following screen shot.

← Create Responder Policy

 + ✎

Undefined-Result Action\*

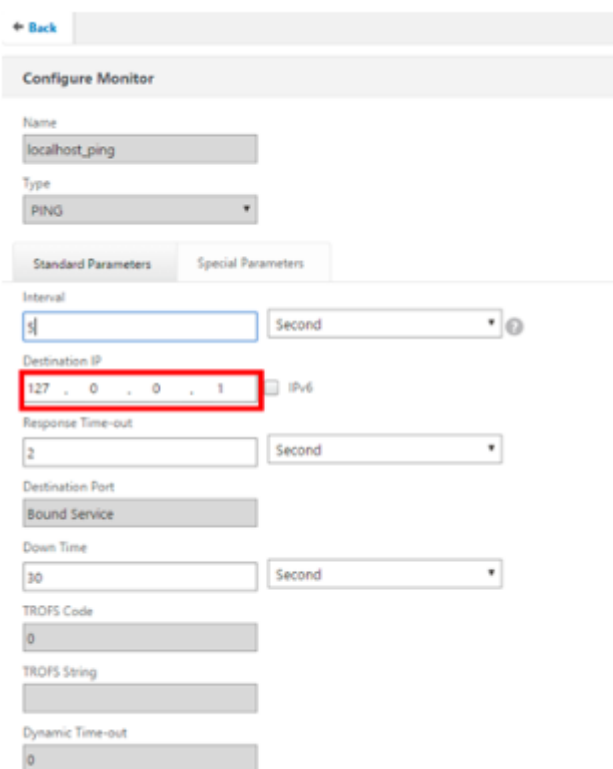

Expression\*  

Operators Saved Policy Expressions Frequently Used Expressions

Comments

1. Create a monitor for which the status is always marked as UP and specify an appropriate name, such as localhost\_ping, in the Name field.

2. To create a monitor, in the navigation pane expand **Load Balancing**, click **Monitors** and then click **Add**.
3. In the **Destination IP** field, specify the 127.0.0.1 IP address, as shown in the following screen shot.

The screenshot shows the 'Configure Monitor' configuration page. The 'Name' field is 'localhost\_ping' and the 'Type' is 'PING'. Under 'Standard Parameters', the 'Interval' is set to 5 seconds, 'Destination IP' is 127.0.0.1 (highlighted with a red box), 'Response Time-out' is 2 seconds, 'Destination Port' is 'Bound Service', 'Down Time' is 30 seconds, 'TROFS Code' is 0, 'TROFS String' is empty, and 'Dynamic Time-out' is 0. There is an 'IPv6' checkbox which is unchecked.

4. Create a service and specify an appropriate name, such as Always\_UP\_service, in the **Name** field.
5. To create a service, in the navigation pane, expand **Load Balancing**, click **Services** and then click **Add**.
6. Specify a non-existent IP address in the **Server** field.

← Back

▶ More

OK Cancel

7. Specify 80 in the **Port** field.
8. Add the created monitor from the **Available Monitors** list.
9. Create a Load Balancing Virtual Server and specify an appropriate name in the **Name** field.
10. To create a Load Balancing Virtual Server, in the navigation pane, expand **Load Balancing**, click **Services** and then click **Add**.
11. Specify the IP address of the web site in IP Address field.
12. Select HTTP from the Protocol list.
13. Type 80 in the Port field.
14. On NetScaler version 9.0 and 10.0, select the Active option for the service you have created in the Services tab as shown in the following screen shot. This option is deprecated in NetScaler version 11.0.

15. Click the **Policies** tab.
16. Bind the Responder policy you created to the HTTP Load Balancing VIP address of the web site.
17. Create a secure Load Balancing virtual server that has the IP address of the web site and port as 443.

To create a configuration similar to the preceding procedure from the command line interface of the appliance, run following commands:

```

1 enable ns feature responder
2 add responder action http_to_https_actn redirect "\"https://\" + http.
  req.hostname.HTTP_URL_SAFE + http.REQ.URL.PATH_AND_QUERY.
  HTTP_URL_SAFE"
3 add responder policy http_to_https_pol HTTP.REQ.IS_VALID
  http_to_https_actn RESET
4 add lb monitor localhost_ping PING -LRTM ENABLED -destIP 127.0.0.1
5 add service Always_UP_service 1.2.3.4 HTTP 80 -gslb NONE -maxClient 0 -
  maxReq 0 -cip ENABLED dummy -usip NO -sp OFF -cltTimeout 180 -
  svrTimeout 360 -CKA NO -TCPB NO -CMP YES
6 bind lb monitor localhost_ping Always_UP_service
7 add lb vserver http_site.com HTTP 10.217.96.238 80 -persistenceType
  COOKIEINSERT -timeout 0 -cltTimeout 180
8 bind lb vserver http_site.com Always_UP_service
9 bind lb vserver http_site.com -policyName http_to_https_pol -priority 1
  -gotoPriorityExpression END
10 <!--NeedCopy-->

```

**Notes:**

- The status of the port 80 Load Balancing Redirect virtual server must be UP for the redirect to work.
- Web browsers might not redirect correctly if the HTTPS virtual server is not active.
- This redirect setup allows for situations where multiple domains are bound to the same IP address.
- If the client sends an invalid HTTP request to the redirect virtual server, then the appliance sends a RESET message code.

## Troubleshooting

September 21, 2020

If the responder feature does not work as expected after you have configured it, you can use some common tools to access Citrix ADC resources and diagnose the problem.

### Resources for Troubleshooting

For best results, use the following resources to troubleshoot an integrated cache issue on a Citrix ADC appliance:

- The ns.conf file
- The relevant trace files from the client and the Citrix ADC appliance

In addition to the above resources, the following tools expedite troubleshooting:

- The iehttpheaders or a similar utility
- The Wireshark application customized for the Citrix ADC trace files

### Troubleshooting Responder Issues

- **Issue**

The Responder feature is configured, but the responder action is not working.

**Resolution**

- Verify that the feature is enabled.
- Check the hit counters of any of the policies to see if the counters are getting incremented.
- Verify that the policies and actions are configured correctly.
- Verify that the actions and policies are bound appropriately.

- Record the packet traces on the client and the Citrix ADC appliance, and analyze the them to get some pointer to the issue.
- Record the iehttpHeaters packet traces on the client and verify the HTTP requests and responses to get some pointer to the issue.

- **Issue**

You need to create a maintenance page.

**Resolution**

1. Configure the services and virtual Server.
2. Configure a backup virtual server with a service bound to it. This ensures that the status of the Web site is always displayed as UP.
3. Configure the primary virtual server to use the backup virtual server as a backup.
4. Create a responder action with an appropriate target. Following is an example for your reference:

```
add responder action sorry_page respondwith q{"HTTP/1.0 200 OK" +"\r\n\r\n" +
"<html><body>Sorry, this page is not available</body></html>" + "\r\n"}.
```

5. Create a responder policy and bind the action to it.
6. Bind the responder policy to the backup virtual Server.

## Rewrite

September 21, 2020

**Warning**

Filter features using classic policies are deprecated and as an alternative Citrix recommends you to use the rewrite and responder features with advanced policy infrastructure.

Rewrite refers to the rewriting of some information in the requests or responses handled by the Citrix ADC appliance. Rewriting can help in providing access to the requested content without exposing unnecessary details about the website's actual configuration. A few situations in which the rewrite feature is useful are described below:

- <To improve security, the Citrix ADC can rewrite all the [http://links](#) to [https://](#) in the response body.
- <In the SSL offload deployment, the insecure links in the response have to be converted into secure links. Using the rewrite option, you can rewrite all the [http://links](#) to [https://](#) for making sure that the outgoing responses from Citrix ADC to the client have the secured links.

- <If a website has to show an error page, you can show a custom error page instead of the default 404 Error page. For example, if you show the home page or site map of the website instead of an error page, the visitor remains on the site instead of moving away from the website.
- <If you want to launch a new website, but use the old URL, you can use the Rewrite option.
- <When a topic in a site has a complicated URL, you can rewrite it with a simple, easy-to-remember URL (also referred to as 'cool URL').
- <You can append the default page name to the URL of a website. For example, if the default page of a company's website is `http://www.abc.com/index.php`, when the user types 'abc.com' in the address bar of the browser, you can rewrite the URL to 'abc.com/index.php'.

When you enable the rewrite feature, Citrix ADC can modify the headers and body of HTTP requests and responses.

To rewrite HTTP requests and responses, you can use protocol-aware Citrix ADC policy expressions in the rewrite policies you configure. The virtual servers that manage the HTTP requests and responses must be of type

HTTP or

SSL. In HTTP traffic, you can take the following actions:

- <Modify the URL of a request
- <Add, modify, or delete headers
- <Add, replace, or delete any specific string within the body or headers.

To rewrite TCP payloads, consider the payload as a raw stream of bytes. Each of the virtual servers that managing the TCP connections must be of type TCP or SSL\_TCP. The term TCP rewrite is used to refer to the rewrite of TCP payloads that are not HTTP data. In TCP traffic, you can add, modify, or delete any part of the TCP payload.

For examples to use the rewrite feature, see [Rewrite Action and Policy Examples](#).

## **Comparison between Rewrite and Responder options**

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting an http request to new websites or webpages
- Responding with some custom response
- Dropping or resetting a connection at request level

If there is a responder policy, the Citrix ADC examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

If there is a rewrite policy, the Citrix ADC examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use a responder if you want the Citrix ADC to reset or drop a connection based on a client or request-based parameter. Use a responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

## How rewrite works

September 21, 2020

A rewrite policy consists of a rule and action. The rule determines the traffic on which rewrite is applied and the action determines the action to be taken by the Citrix ADC. You can define multiple rewrite policies. For each policy, specify the bind point and priority.

A bind point refers to a point in the traffic flow at which the Citrix ADC examines the traffic to verify whether any rewrite policy can be applied to it. You can bind a policy to a specific load balancing or content switching virtual server, or make the policy global if you want the policy to be applied to the entire traffic handled by the Citrix ADC. These policies are referred to as global policies.

In addition to the user-defined policies, the Citrix ADC has some default policies. You cannot modify or delete a default policy.

For evaluating the policies, Citrix ADC follows the order mentioned below:

- Global policies
- Policies bound to specific virtual servers
- Default policies

Note: Citrix ADC can apply a rewrite policy only when it is bound to a point.

Citrix ADC implements the rewrite feature in the following steps:

- The Citrix ADC appliance checks for global policies and then checks for policies at individual bind points.
- If multiple policies are bound to a bind point, the Citrix ADC evaluates the policies in the order of their priority. The policy with the highest priority is evaluated first. After evaluating each policy, if the policy is evaluated to TRUE (the traffic matches the rule), it adds the action associated with the policy to a list of actions to be performed. A match occurs when the characteristics specified in the policy rule match the characteristics of the request or response being evaluated.
- For any policy, in addition to the action, you can specify the policy that should be evaluated after the current policy is evaluated. This policy is referred to as the 'Go to Expression'. For any

policy, if a Go to Expression (gotoPriorityExpr) is specified, the Citrix ADC evaluates the Go to Expression policy; it ignores policy with the next highest priority.

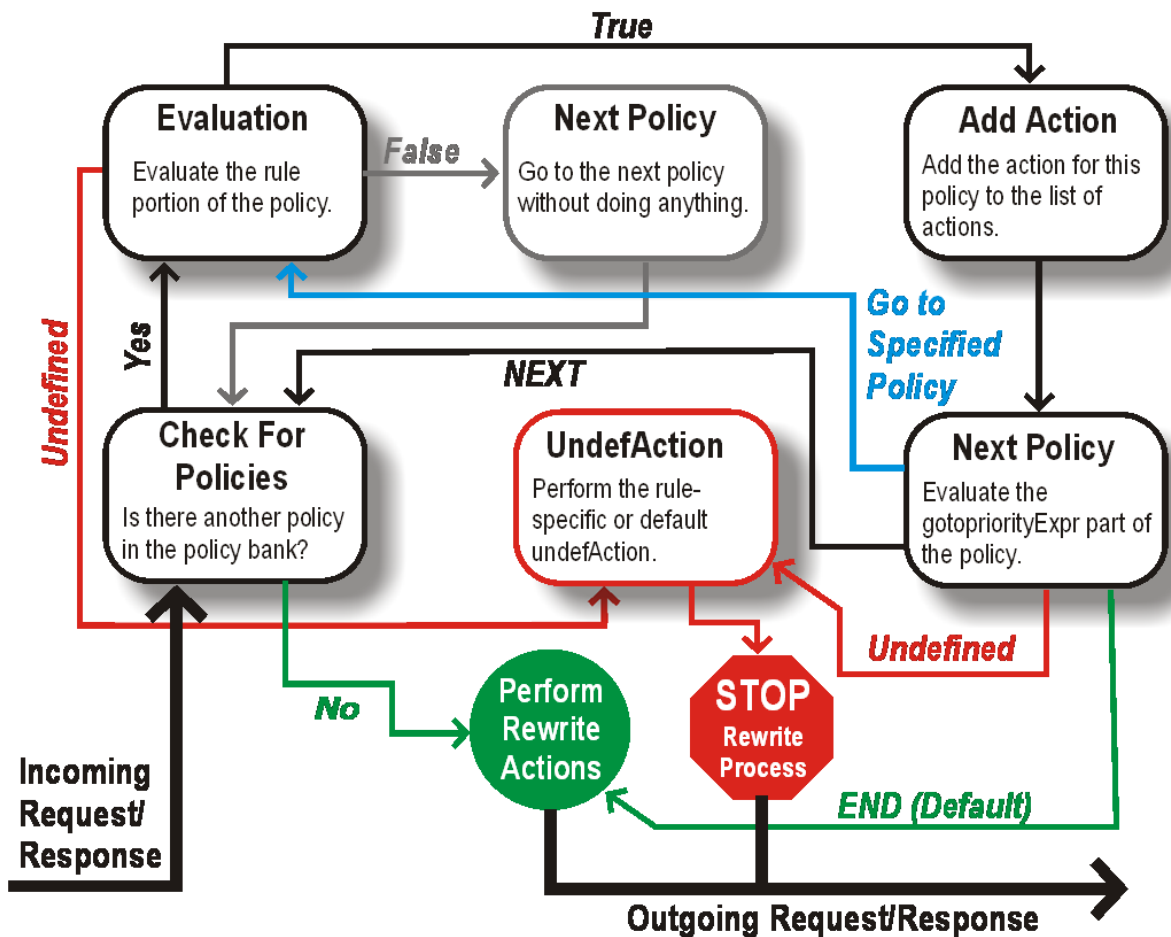

You can specify the priority of the policy to indicate the Go to Expression policy; you cannot use the name of the policy. If you want the Citrix ADC to stop evaluating other policies after evaluating a particular policy, you can set the Go to Expression to 'END'.

- After all the policies are evaluated or when a policy has the Go to Expression set as END, the Citrix ADC starts performing the actions according to the list of actions.

For more information about configuring rewrite policies, see “[Configuring a Rewrite Policy](#)” and about binding rewrite policies, see “[Binding a Rewrite Policy](#).”

The following figure illustrates how Citrix ADC processes a request or response when the rewrite feature is used.

Figure 1. The Rewrite Process

## Policy Evaluation

The policy with the highest priority is evaluated first. Citrix ADC does not stop the evaluation of rewrite policies when it finds a match; it evaluates all the rewrite policies configured on the Citrix ADC.

- If a policy evaluates to TRUE, the Citrix ADC follows the procedure below:
  - If the policy has the Go to Expression set to END, the Citrix ADC stops evaluating all the other policies and starts performing the rewrite.
  - The gotoPriorityExpression can be set to 'NEXT', 'END', some integer or 'INVOCATION\_LIST'. The value determines the policy with the next priority. The following table shows the action taken by Citrix ADC for each value of the expression.

| Value of the expression | Action                                                                  |
|-------------------------|-------------------------------------------------------------------------|
| NEXT                    | Policy with the next priority gets evaluated.                           |
| END                     | Evaluation of policies stops.                                           |
| <an integer>            | Policy with specified priority gets evaluated.                          |
| INVOCATION_LIST         | Goto NEXT or END is applied based on the result of the invocation list. |

- If a policy evaluates to FALSE, the Citrix ADC continues the evaluation in the order of priority.
- If a policy evaluates to UNDEFINED (cannot be evaluated on the received traffic due to an error), the Citrix ADC performs the action assigned to the UNDEFINED condition (referred to as undefAction) and stops further evaluation of policies.

The Citrix ADC starts the actual rewriting only after the evaluation is complete. It refers to the list of actions identified by policies that are evaluated to TRUE, and starts the rewriting. After implementing all the actions in the list, the Citrix ADC forwards the traffic as required.

### Note:

Ensure that the policies do not specify conflicting or overlapping actions on the same part of the HTTP header or body, or TCP payload. When such a conflict occurs, the Citrix ADC encounters an undefined situation and aborts the rewrite.

## Rewrite Actions

On the Citrix ADC appliance, specify the actions to be taken such as adding, replacing, or deleting text within the body, or adding, modifying or deleting headers, or any changes in the TCP payload as rewrite actions. For more information about rewrite actions, see [Configuring a Rewrite Action](#).

The following table describes the steps the Citrix ADC can take when a policy evaluates to TRUE.

| <b>Action</b> | <b>Result</b>                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------|
| Insert        | The rewrite action specified for the policy is carried out.                                                          |
| NOREWRITE     | The request or response is not rewritten. Citrix ADC forwards the traffic without rewriting any part of the message. |
| RESET         | The connection is aborted at the TCP level.                                                                          |
| DROP          | The message is dropped.                                                                                              |

**Note:**

For any policy, you can configure the undefaction (action to be taken when the policy evaluates to UNDEFINED) as NOREWRITE, RESET, or DROP.

To use the

Rewrite feature, take the following steps:

- Enable the feature on the Citrix ADC.
- Define rewrite actions.
- Define rewrite policies.
- Bind the policies to a bind point to bring a policy into effect.

## Enabling the rewrite feature

September 21, 2020

Enable the rewrite feature on the Citrix ADC appliance if you want to rewrite the HTTP or TCP requests or responses. If the feature is enabled, Citrix ADC takes rewrite action according to the specified policies. For more information, see

[How rewrite works.](#)

### To enable the rewrite feature by using the command line interface

At the command prompt, type the following commands to enable the rewrite feature and verify the configuration:

- enable ns feature REWRITE
- show ns feature

**Example:**

```

1 > enable ns feature REWRITE
2 Done
3 > show ns feature
4
5         Feature                Acronym        Status
6         -----                -
7 1)    Web Logging              WL             OFF
8 2)    Surge Protection         SP             ON
9 .
10 .
11 .
12 1)    Rewrite                  REWRITE       ON
13 .
14 .
15 1)    Citrix ADC Push          push           OFF
16 Done
17 <!--NeedCopy-->

```

### To enable the rewrite feature by using the configuration utility

1. <In the navigation pane, click System, and then click Settings.
2. <In the details pane, under Modes and Features, click Configure basic features.
3. <In the Configure Basic Features dialog box, select the Rewrite check box, and then click OK.
4. <In the Enable/Disable Feature(s) dialog box, click Yes. A message appears in the status bar, stating that the selected feature was enabled.

## Configuring a Rewrite Action

September 16, 2021

### Warning:

The Pattern function in a rewrite action is deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the “search rewrite action” parameter. However, “Pattern” function is removed and no longer available on the Citrix ADC appliance release 13.1 onwards.

A rewrite action indicates changes made to a request or response prior to sending it to a server or client.

Expressions define the following:

- Rewrite action type.
- Location of the rewrite action.
- Rewrite action configuration type.

For Example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

After enabling the rewrite feature, you need to configure one or more actions unless a built-in rewrite action is sufficient. All of the built-in actions have names beginning with the string `ns_cvpn`, followed by a string of letters and underscore characters. Built-in actions perform useful and complex tasks such as decoding parts of a clientless VPN request or response or modifying JavaScript or XML data. The built-in actions can be viewed, enabled, and disabled, but cannot be modified or deleted.

Note: Action types that can be used only for HTTP rewrite are identified in the **Rewrite Action Type** column.

For more information, see **Type parameter**.

### Create a rewrite action by using the command line interface

At the command prompt, type the following commands to create a rewrite action and verify the configuration:

- `add rewrite action <name> <type> <target> [<stringBuilderExpr>] [-search <expression>] [refineSearch <expression>] [-comment<string>]`
- `show rewrite action <name>`

For more information, see the [Rewrite Action Types and their Arguments](#) table.

The rewrite feature has the following built-in actions:

- NOREWRITE-Sends the request or response to the user without rewriting it.
- RESET - Resets the connection and notifies the user's browser, so that the user can resend the request.
- DROP - Drops the connection without sending a response to the user.

One of the following flow types is implicitly associated with every action:

- Request - Action applies to the request.
- Response - Action applies to the response.
- Neutral - Action applies to both requests and responses.

## Name

Name for the user-defined rewrite action. Must begin with a letter, number, or the underscore character (`_`), and must contain only letters, numbers, and the hyphen (`-`), period (`.`) hash (`#`), space (), at (`@`), equals (`=`), colon (`:`), and underscore characters. Can be changed after the rewrite policy is added.

## Type parameter

The **Type** parameter shows the type of user-defined rewrite action.

Following are the values of the *Type* parameter:

- **REPLACE** `<target>` `<string_builder_expr>`. Replaces the string with the string-builder expression.

## Example:

```
1 > add rewrite action replace_http_act replace http.res.body(100) "
    new_replaced_data"
2 Done
3 > sh rewrite action replace_http_act
4 Name: replace_http_act
5 Operation: replace
6 Target:http.res.body(100)
7 Value:"new_replaced_data"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

- **REPLACE\_ALL** `<target>` `<string_builder_expr1>` `-(pattern|search)<string_builder_expr2>`. In the request or response specified by `<target>`, replaces all occurrences of the string defined by `<string_builder_expr1>` with the string defined by `<string_builder_expr2>`. You can use a PCRE-format pattern or the search facility to find the strings to be replaced.

## Example:

```
1 > add policy patset pat_list_2
2 Done
3 > bind policy patset pat_list_2 "www.abc.com"
4 Done
5 > bind policy patset pat_list_2 "www.def.com"
6 Done
```

```

7 > add rewrite action refineSearch_act_31 replace_all "HTTP.RES.BODY
  (100000)" "\"https://\""-search "patset(\"pat_list_2\")" -
  refineSearch "EXTEND(7,0).REGEX_SELECT(re#http://#)"
8 Done
9
10 > sh rewrite action refineSearch_act_31
11 Name: refineSearch_act_31
12 Operation: replace_all
13 Target:HTTP.RES.BODY(100000)
14 Refine Search:EXTEND(7,0).REGEX_SELECT(re#http://#)
15 Value:"https://"
16 Search: patset("pat_list_2")
17 Hits: 0
18 Undef Hits: 0
19 Action Reference Count: 0
20 Done
21
22 <!--NeedCopy-->

```

- **REPLACE\_HTTP\_RES** <string\_builder\_expr>. Replaces the complete HTTP response with the string defined by the string-builder expression.

#### Example:

```

1 > add rewrite action replace_http_res_act replace_http_res '"HTTP/1.1
  200 OK\r\n\r\nSending from ADC"'
2 Done
3 > sh rewrite action replace_http_res_act
4 Name: replace_http_res_act
5 Operation: replace_http_res
6 Target:"HTTP/1.1 200 OK
7 Sending from ADC"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- **REPLACE\_SIP\_RES** <target>. Replaces the complete SIP response with the string specified by <target>.

#### Example:

```

1 > add rewrite action replace_sip_res_act replace_sip_res '"HTTP/1.1 200
  OK\r\n\r\nSending from ADC"'

```

```

2 Done
3 > sh rewrite action replace_sip_res_act
4 Name: replace_sip_res_act
5 Operation: replace_sip_res
6 Target:"HTTP/1.1 200 OK
7 Sending from ADC"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0

10 Undef Hits: 0
11 Action Reference Count: 0
12 Done
13
14 <!--NeedCopy-->

```

- `INSERT_BEFORE_ALL <target> <string_builder_expr1> -(pattern|search)<string_builder_expr2>`. In the request or response specified by `<target>`, locates all occurrences of the string specified in `<string_builder_expr1>` and inserts the string specified in `<string_builder_expr2>` before it. You can use a PCRE-format pattern or the search facility to find the strings.

**Example:**

```

1 > add policy patset pat
2 Done
3 > bind policy patset pat abcd
4 Done
5 > add rewrite action refineSearch_act_1 insert_before_all http.res.body
   (10) 'target.prefix(10) + "refineSearch_testing"' -search patset("
   pat") -refineSearch extend(10,10)
6 Done
7 > sh rewrite action refineSearch_act_1
8 Name: refineSearch_act_1
9 Operation: insert_before_all
10 Target:http.res.body(10)
11 Refine Search:extend(10,10)
12 Value:target.prefix(10) + "refineSearch_testing"
13 Search: patset("pat")
14 Hits: 0
15 Undef Hits: 0
16 Action Reference Count: 0
17 Done
18
19 <!--NeedCopy-->

```

- `INSERT_AFTER <string_builder_expr1> <string_builder_expr2>`. Finds the string specified in , and inserts the string specified in after it.

**\*\*Example\*\*:**

```

1 > add rewrite action insert_after_act insert_after http.req.body(100) '
   "add this string after 100 bytes"
2 Done
3 > sh rewrite action insert_after_act
4 Name: insert_after_act
5 Operation: insert_after
6 Target:http.req.body(100)
7 Value:"add this string after 100 bytes"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0

```

```

11 Done
12
13 <!--NeedCopy-->

```

- **INSERT\_AFTER\_ALL** <target> <string\_builder\_expr1> -(pattern|search)<string\_builder\_expr>. In the request or response specified by <target>, locates all occurrences of the string specified by <string\_builder\_expr1> and inserts the string specified by <string\_builder\_expr2> after it. You can use a PCRE-format pattern or the search facility to find the strings.

**Example:**

```

1 > add rewrite action refineSearch_act_2 insert_after_all http.res.body
  (100) "refineSearch_testing" -search text("abc") -refineSearch
  extend(0, 10)
2 Done
3 > sh rewrite action refineSearch_act_2
4 Name: refineSearch_act_2
5 Operation: insert_after_all
6 Target:http.res.body(100)
7 Refine Search:extend(0, 10)
8 Value:"refineSearch_testing"

8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **REPLACE\_DNS\_ANSWER\_SECTION** <target>. Replace the DNS answer section in the response. This is applicable for A and AAAA records only. Use `DNS.NEW_RRSET_A` and `NS.NEW_RRSET_AAAA` expressions to configure the new answer section.

**Example:**

```

1 > add rewrite action replace_dns_ans_act replace_dns_answer_section
  DNS.NEW_RRSET_A("1.1.1.1", 10)
2 Done
3 > sh rewrite action replace_dns_ans_act
4 Name: replace_dns_ans_act
5 Operation: replace_dns_answer_section
6 Target:DNS.NEW_RRSET_A("1.1.1.1", 10)
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **CLIENTLESS\_VPN\_DECODE**<target>. Decodes the pattern specified by a target In clientless VPN format.

**Example:**

```
1 > add rewrite action cvpn_decode_act_1 clientless_vpn_decode http.req.  
   body(100)  
2 Done  
3 > sh rewrite action cvpn_decode_act_1  
4 Name: cvpn_decode_act_1  
5 Operation: clientless_vpn_decode  
6 Target:http.req.body(100)  
7 Hits: 0  
8 Undef Hits: 0  
9 Action Reference Count: 0  
10 Done  
11  
12 <!--NeedCopy-->
```

- **CLIENTLESS\_VPN\_DECODE\_ALL<target>-search<expression>**. Decodes ALL the patterns specified by the search parameter in clientless VPN format.

**Example:**

```
1 > add rewrite action act1 clientless_vpn_decode_all http.req.body(100)  
   -search text("abcd")  
2 Done  
3 > sh rewrite action act1  
4 Name: act1  
5 Operation: clientless_vpn_decode_all  
6 Target:http.req.body(100)  
7 Search: text("abcd")  
8 Hits: 0  
9 Undef Hits: 0  
10 Action Reference Count: 0  
11 Done  
12  
13 <!--NeedCopy-->
```

- **CLIENTLESS\_VPN\_ENCODE<target>**. Encodes the pattern specified by the target in clientless VPN format.

**Example:**

```
1 > add rewrite action cvpn_encode_act_1 clientless_vpn_encode http.req.  
   body(100)  
2 Done  
3 > sh rewrite action cvpn_encode_act_1  
4 Name: cvpn_encode_act_1
```

```
5 Operation: clientless_vpn_encode
6 Target:http.req.body(100)
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->
```

- **CLIENTLESS\_VPN\_ENCODE\_ALL**<target>-search<expression>. Encodes ALL the patterns specified search parameter in clientless VPN format.

**Example:**

```
1 > add rewrite action act2 clientless_vpn_encode_all http.req.body(100)
   -search text("abcd")
2 Done
3 > sh rewrite action act2
4 Name: act1
5 Operation: clientless_vpn_encode_all
6 Target:http.req.body(100)
7 Search: text("abcd")
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

- **CORRUPT\_SIP\_HEADER**<target>. Replaces the header name of all occurrences of the SIP header specified by <target> with a corrupted name, so that it will not be recognized by the receiver.

**Example:**

```
1 > add rewrite action corrupt_sip_hdr_act corrupt_sip_header SIP_HDR
2 Done
3 > sh rewrite action corrupt_sip_hdr_act
4 Name: corrupt_sip_hdr_act
5 Operation: corrupt_sip_header
6 Target:SIP_HDR
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
```

```
12 <!--NeedCopy-->
```

- **INSERT\_SIP\_HEADER** <header\_string\_builder\_expr> <contents\_string\_builder\_expr>. Inserts the SIP header specified by <header\_string\_builder\_expr> and header contents specified by <contents\_string\_builder\_expr>.

**Example:**

```
1 > add rewrite action insert_sip_hdr_act insert_sip_header SIP_HDR "
  inserting_sip_header"
2 Done
3 >sh rewrite action insert_sip_hdr_act
4 Name: insert_sip_hdr_act
5 Operation: insert_sip_header
6 Target:SIP_HDR
7 Value:"inserting_sip_header"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

- **DELETE\_SIP\_HEADER**<target>. Deletes the SIP header specified by <target>

**Example:**

```
1 > add rewrite action delete_sip_hdr delete_sip_header SIP_HDR
2 Done
3 > sh rewrite action delete_sip_hdr
4 Name: delete_sip_hdr
5 Operation: delete_sip_header
6 Target:SIP_HDR
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->
```

**Target parameter**

The Target parameter is an expression that specifies which part of the request or response to rewrite.

## StringBuilderExpr

The `StringBuilderExpr` is an expression that specifies the content that is to be inserted into the request or response at the specified location. This expression replaces a specified string.

### Example 1. Inserting an HTTP Header With the Client IP:

```
1 > add rewrite action insertact INSERT_HTTP_HEADER "client-IP" CLIENT.IP
   .SRC
2 Done
3 > show rewrite action insertact
4 Name: insertact
5 Operation: insert_http_header
6 Target:Client-IP
7 Value:CLIENT.IP.SRC
8 BypassSafetyCheck : NO
9 Hits: 0
10 Undef Hits: 0
11 Action Reference Count: 0
12 Done
13
14 <!--NeedCopy-->
```

### Example 2. Replacing Strings in a TCP Payload (TCP Rewrite):

```
1 > add rewrite action client_tcp_payload_replace_all REPLACE_ALL
2 'client.tcp.payload(1000)' 'new-string' -search text("old-string")
3 Done
4 > show rewrite action client_tcp_payload_replace_all
5 Name: client_tcp_payload_replace_all
6 Operation: replace_all
7 Target:client.tcp.payload(1000)
8 Value:"new-string"
9 Search: text("old-string")
10 BypassSafetyCheck : NO
11 Hits: 0
12 Undef Hits: 0
13 Action Reference Count: 0
14 Done
15 >
16 <!--NeedCopy-->
```

The Search functionality is required to be used in the following Action types:

- INSERT\_BEFORE\_ALL
- INSERT\_AFTER\_ALL

- REPLACE\_ALL
- DELETE\_ALL
- CLIENTLESS\_VPN\_ENCODE\_ALL
- CLIENTLESS\_VPN\_DECODE\_ALL

The Search functionality cannot be used with the following Action types:

- INSERT\_HTTP\_HEADER
- INSERT\_BEFORE
- INSERT\_AFTER
- REPLACE
- DELETE
- DELETE\_HTTP\_HEADER
- CORRUPT\_HTTP\_HEADER
- REPLACE\_HTTP\_RES
- CLIENTLESS\_VPN\_ENCODE
- CLIENTLESS\_VPN\_DECODE
- INSERT\_SIP\_HEADER
- DELETE\_SIP\_HEADER
- CORRUPT\_SIP\_HEADER
- REPLACE\_DIAMETER\_HEADER\_FIELD
- REPLACE\_DNS\_ANSWER\_SECTION
- REPLACE\_DNS\_HEADER\_FIELD
- REPLACE\_SIP\_RES

The following Search types are supported:

- Text - a literal string  
Example: -search text ("hello")
- Regular Expression - pattern that is used to match multiple strings in the request or response  
Example: -search regex(re~^hello\*~)
- XPATH - An XPATH expression to search XML.  
Example: -search xpath(xp%/a/b%)
- JSON - An XPATH expression to search JSON.  
Example: -search xpath\_json(xp%/a/b%)
- HTML - An XPATH expression to search HTML  
Example: -search xpath\_html(xp%/html/body%)
- Patset - This searches all the patterns bound to the patset entity.  
Example: -search patset("patset1")
- Dataset - This searches all the patterns bound to the dataset entity.  
Example: -search dataset("dataset1")
- AVP - AVP number that is used to match multiple AVPs in a Diameter/Radius Message

Example: -search avp(999)

## Refine the search results

You can use the Refine Search functionality to specify the additional criteria to refine the search results. Refine Search functionality can only be used if Search functionality is used.

The Refine search parameter always starts with the “extend(m,n)” operation, where ‘m’ specifies a number of bytes to the left of the search result and ‘n’ specifies a number of bytes to the right of the search result to extend the selected area.

If the configured rewrite action is:

```

1 > add rewrite action test_refine_search replace_all http.res.body(10) '
   " testing_refine_search" ' -search text("abc") -refineSearch extend
   (1,1)
2 And the HTTP response body is abcxxx456.
3
4 <!--NeedCopy-->

```

Then, the search parameter finds the pattern “abc” and since the refineSearch parameter is also configured to check an extra one byte to the left and an extra one byte to the right of the matched pattern. The resultant replaced text is: abcx. So, the output of this action is testing\_refine\_searchxxx456.

### Example 1:Using the Refine search functionality in INSERT\_BEFORE\_ALL action type.

```

1 > add policy patset pat
2 Done
3 > bind policy patset pat abcd
4 Done
5 > add rewrite action refineSearch_act_1 insert_before_all http.res.body
   (10) 'target.prefix(10) + "refineSearch_testing" ' -search patset("
   pat") -refineSearch extend(10,10)
6 Done
7 > sh rewrite action refineSearch_act_1
8 Name: refineSearch_act_1
9 Operation: insert_before_all
10 Target:http.res.body(10)
11 Refine Search:extend(10,10)
12 Value:target.prefix(10) + "refineSearch_testing"
13 Search: patset("pat")
14 Hits: 0
15 Undef Hits: 0
16 Action Reference Count: 0
17 Done

```

```
18
19 <!--NeedCopy-->
```

**Example 2: Using the Refine search functionality in INSERT\_AFTER\_ALL action type.**

```
1 > add rewrite action refineSearch_act_2 insert_after_all http.res.body
  (100) "refineSearch_testing" -search text("abc") -refineSearch
  extend(0, 10)
2 Done
3 > sh rewrite action refineSearch_act_2
4 Name: refineSearch_act_2
5 Operation: insert_after_all
6 Target:http.res.body(100)
7 Refine Search:extend(0, 10)
8 Value:"refineSearch_testing"
9 Search: text("abc")
10 Hits: 0
11 Undef Hits: 0
12 Action Reference Count: 0
13 Done
14
15 <!--NeedCopy-->
```

**Example 3:Using the Refine search functionality in REPLACE\_ALL action type.**

```
1 > add policy patset pat_list_2
2 Done
3 > bind policy patset pat_list_2 "www.abc.com"
4 Done
5 > bind policy patset pat_list_2 "www.def.com"
6 Done
7 > add rewrite action refineSearch_act_31 replace_all "HTTP.RES.BODY
  (100000)" "\"https://\" -search "patset(\"pat_list_2\")" -
  refineSearch "EXTEND(7,0).REGEX_SELECT(re#http://#)"
8 Done
9 > sh rewrite action refineSearch_act_31
10 Name: refineSearch_act_31
11 Operation: replace_all
12 Target:HTTP.RES.BODY(100000)
13 Refine Search:EXTEND(7,0).REGEX_SELECT(re#http://#)
14 Value:"https://"
15 Search: patset("pat_list_2")
16 Hits: 0
17 Undef Hits: 0
18 Action Reference Count: 0
```

```

19 Done
20
21 <!--NeedCopy-->

```

**Example 4: Using the Refine search functionality in DELETE\_ALL action type.**

```

1 >add rewrite action refineSearch_act_4 delete_all "HTTP.RES.BODY(50000)
  " -search text("Windows Desktops") -refineSearch "EXTEND(40,40).
  REGEX_SELECT(re#\s*<AppData>.*\s*<\/AppData>#)"
2 > show REWRITE action refineSearch_act_4
3 Name: refineSearch_act_4
4 Operation: delete_all
5 Target:HTTP.RES.BODY(50000)
6 Refine Search:EXTEND(40,40).REGEX_SELECT(re#\s*<AppData>.*\s*<\/`
  AppData`>#)
7 Search: text("Windows Desktops")
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12 >
13 <!--NeedCopy-->

```

**Example 5: Using the Refine Search functionality in CLIENTLESS\_VPN\_ENCODE\_ALL action type.**

””

```

add rewrite action act2 clientless_vpn_encode_all http.req.body(100) -search text("abcd")
Done
sh rewrite action act2
Name: act1
Operation: clientless_vpn_encode_all
Target:http.req.body(100)
Search: text("abcd")
Hits: 0
Undef Hits: 0
Action Reference Count: 0
Done
””

```

**Example 6: Using the Refine Search functionality in CLIENTLESS\_VPN\_DECODE\_ALL action type.**

```

1 > add rewrite action act1 clientless_vpn_decode_all http.req.body(100)
  -search text("abcd")

```

```
2 Done
3 > sh rewrite action act1
4 Name: act1
5 Operation: clientless_vpn_decode_all
6 Target:http.req.body(100)
7 Search: text("abcd")

9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12 >
13 <!--NeedCopy-->
```

### Modify an existing rewrite action by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite action and verify the configuration:

- `set rewrite action <name> [-target<expression>] [-stringBuilderExpr<expression>] [-pattern<expression> | -search <expression>] [-refineSearch <expression>] [-comment<string>]`
- `show rewrite action <name>`

#### Example:

```
1 > set rewrite action insertact -target "Client-IP"
2 Done
3 > show rewrite action insertact
4
5 Name: insertact
6 Operation: insert_http_header Target:Client-IP
7 Value:CLIENT.IP.SRC
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

### Remove a rewrite action by using the command line interface

At the command prompt, type the following commands to remove a rewrite action:

```
rm rewrite action <name>
```

**Example:**

```

1 > rm rewrite action insertact
2 Done
3
4 <!--NeedCopy-->

```

**Configure a rewrite action by using the configuration utility**

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, do one of the following:
  - To create an action, click **Add**.
  - To modify an existing action, select the action, and then click **Edit**.
3. Click **Create** or **OK**. A message appears in the status bar, stating that the Action has been configured successfully.
4. Repeat steps 2 through 4 to create or modify as many rewrite actions as you want.
5. Click **Close**.

**Add an expression by using the Add Expression dialog box**

1. In the **Create Rewrite Action** or **Configure Rewrite Action** dialog box, under the text area for the type argument you want to enter, click **Add**.
2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
  - HTTP

The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.

- SYS

The protected Web sites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

- CLIENT

The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

For more information about the PI expressions language and creating expressions for responder policies, see [“Policies and Expressions.”](#)

If you want to test the effect of a rewrite action when used on sample HTTP data, you can use the Rewrite Expression Evaluator.

Note: The Rewrite Expression Evaluator is only available in the configuration utility. There is no Citrix ADC command line version.

### **Evaluate a rewrite action by using the Rewrite Action Evaluator dialog box**

1. In the **Rewrite Actions** details pane, select the rewrite action that you want to evaluate, and then click **Evaluate**.
2. In the **Rewrite Expression Evaluator** dialog box, specify values for the following parameters. (An asterisk indicates a required parameter.)
  - Rewrite Action\*—If the rewrite action you want to evaluate is not already selected, select it from the drop-down list. After you select a Rewrite action, the Details section displays the details of the selected Rewrite action.
  - New\*—Select New to open the Create Rewrite Action dialog box and create a rewrite action.
  - Modify\*—Select Modify to open the Configure Rewrite Action dialog box and modify the selected rewrite action.

- Flow Type\*—Specifies whether to test the selected rewrite action with HTTP Request data or HTTP Response data. The default is Request. If you want to test with Response data, select Response.
  - HTTP Request/Response Data\*—Provides a space for you to provide the HTTP data that the Rewrite Action Evaluator is used for testing. You can paste the data directly into the window, or click Sample to insert some sample HTTP headers.
  - Show end-of-line—Specifies whether to show UNIX-style end-of-line characters (\n) at the end of each line of sample HTTP data.
  - Sample—Inserts sample HTTP data into the HTTP Request/Response Data window. You can choose either GET or POST data.
  - Browse—Opens a local browse window so that you can choose a file containing sample HTTP data from a local or network location.
  - Clear—Clears the current sample HTTP data from the HTTP Request/Response Data window.
3. Click **Evaluate**. The Rewrite Action Evaluator evaluates the effect of the Rewrite action on the sample data that you chose, and displays the results as modified by the selected Rewrite action in the Results window. Additions and deletions are highlighted as indicated in the legend in the lower left-hand corner of the dialog box.
  4. Continue evaluating Rewrite actions until you have determined that all of your actions have the effect that you wanted.
    - You can modify the selected rewrite action and test the modified version by clicking **Modify** to open the **Configure Rewrite Action** dialog box, making and saving your changes, and then clicking **Evaluate** again.
    - You can evaluate a different rewrite action using the same request or response data by selecting it from the Rewrite Action drop-down list, and then clicking Evaluate again.
  5. Click **Close**, to close the **Rewrite Expression Evaluator** and return to the **Rewrite Actions** pane.

To delete a rewrite action, select the rewrite action you want to delete, then click **Remove** and, when prompted, confirm your choice by clicking **OK**.

**Rewrite Action Evaluator** ✕

**Details**

## Configuring a Rewrite Policy

September 21, 2020

After you create any needed rewrite action(s), you must create at least one rewrite policy to select the requests that you want the Citrix ADC appliance to rewrite.

A rewrite policy consists of a rule, which itself consists of one or more expressions, and an associated action that is performed if a request or response matches the rule. Policy rules for evaluating HTTP requests and responses can be based on almost any part of a request or response.

Even though you cannot use TCP rewrite actions to rewrite data other than the TCP payload, you can base the policy rules for TCP rewrite policies on the information in the transport layer and the layers below the transport layer.

If a configured rule matches a request or response, the corresponding policy is triggered and the action associated with it is carried out.

Note: You can use either the command line interface or the configuration utility to create and configure rewrite policies. Users who are not thoroughly familiar with the command line interface and the Citrix ADC Policy expression language will usually find using the configuration utility much easier.

### To add a new rewrite policy by using the command line interface

At the command prompt, type the following commands to add a new rewrite policy and verify the configuration:

- `<add rewrite policy <name> <expression> <action> [<undefaction>]`
- `<show rewrite policy <name>`

#### Example 1. Rewriting HTTP Content:

```
1 > add rewrite policy policyNew "HTTP.RES.IS_VALID" insertact NOREWRITE
2 Done
3 > show rewrite policy policyNew
4     Name: policyNew
5     Rule: HTTP.RES.IS_VALID
6     RewriteAction: insertact
7     UndefAction: NOREWRITE
8     Hits: 0
9     Undef Hits: 0
10
11 Done
12 <!--NeedCopy-->
```

#### Example 2. Rewriting a TCP Payload (TCP Rewrite):

```
1 > add rewrite policy client_tcp_payload_policy CLIENT.IP.SRC.EQ
   (172.168.12.232) client_tcp_payload_replace_all
2 Done
3 > show rewrite policy client_tcp_payload_policy
4     Name: client_tcp_payload_policy
5     Rule: CLIENT.IP.SRC.EQ(172.168.12.232)
6     RewriteAction: client_tcp_payload_replace_all
7     UndefAction: Use Global
8     LogAction: Use Global
9     Hits: 0
10    Undef Hits: 0
11
12 Done
13 >
14 <!--NeedCopy-->
```

## To modify an existing rewrite policy by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite policy and verify the configuration:

- `<set rewrite policy <name> -rule <expression> -action <action> [<undefaction>]`
- `<show rewrite policy <name>`

### Example:

```
1 > set rewrite policy policyNew -rule "HTTP.RES.IS_VALID" -action
    insertaction
2 Done
3
4 > show rewrite policy policyNew
5     Name: policyNew
6     Rule: HTTP.RES.IS_VALID
7     RewriteAction: insertaction
8     UndefAction: NOREWRITE
9     Hits: 0
10    Undef Hits: 0
11
12 Done
13 <!--NeedCopy-->
```

## To remove a rewrite policy by using the command line interface

At the command prompt, type the following command to remove a rewrite policy:

```
rm rewrite policy <name>
```

### Example:

```
1 > rm rewrite policy policyNew
2 Done
3 <!--NeedCopy-->
```

## To configure a rewrite policy by using the configuration utility

1. <Navigate to AppExpert > Rewrite > Policies.
2. <In the details pane, do one of the following:
  - <To create a new policy, click Add.
  - <To modify an existing policy, select the policy, and then click Open.
3. <Click Create or OK. A message appears in the status bar, stating that the Policy has been configured successfully.

4. <Repeat steps 2 through 4 to create or modify as many rewrite actions as you wish.
5. <Click Close. To delete a rewrite policy, select the rewrite policy you want to delete, then click Remove and, when prompted, confirm your choice by clicking OK.

## Binding a Rewrite Policy

September 21, 2020

After creating a rewrite policy, you must bind it to put it into effect. You can bind your policy to Global if you want to apply it to all traffic that passes through your Citrix ADC, or you can bind your policy to a specific virtual server or bind point to direct only that virtual server or bind point's incoming traffic to that policy. If an incoming request matches a rewrite policy, the action associated with that policy is carried out.

Rewrite policies for evaluating HTTP requests and responses can be bound to virtual servers of type HTTP or SSL, or they can be bound to the

REQ\_OVERRIDE,

REQ\_DEFAULT,

RES\_OVERRIDE, and

RES\_DEFAULT bind points. Rewrite policies for TCP rewrite can be bound only to virtual servers of type

TCP or

SSL\_TCP, or to the

OTHERTCP\_REQ\_OVERRIDE,

OTHERTCP\_REQ\_DEFAULT,

OTHERTCP\_RES\_OVERRIDE, and

OTHERTCP\_RES\_DEFAULT bind points.

Note: The term

OTHERTCP is used in the context of the Citrix ADC appliance to refer to all

TCP or

SSL\_TCP requests and responses that you want to treat as a raw stream of bytes regardless of the protocols that the TCP packets encapsulate.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the Citrix ADC operating system, policy priorities work in reverse order - the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is applied first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000.

Unlike most other features in the Citrix ADC operating system, the rewrite feature continues to evaluate and implement policies after a request matches a policy. However, the effect of a particular action policy on a request or response will often be different depending on whether it is performed before or after another action. Priority is important to get the results you intended.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind it. If you do this, you can add additional policies at any time without having to reassign the priority of an existing policy.

When binding a rewrite policy, you also have the option of assigning a goto expression (gotoPriorityExpression) to the policy. A goto expression can be any positive integer that matches the priority assigned to a different policy that has a higher priority than the policy that contains the goto expression. If you assign a goto expression to a policy, and a request or response matches the policy, the Citrix ADC will immediately go to the policy whose priority matches the goto expression. It will skip over any policies with priority numbers that are lower than that of the current policy, but higher than the priority number of the goto expression, and not evaluate those policies.

### To globally bind a rewrite policy by using the command line interface

At the command prompt, type the following commands to globally bind a rewrite policy and verify the configuration:

- `bind rewrite global <policyName> <priority> [<gotoPriorityExpression>] [-type <type>] [-invoke <labelType> <labelName>]`
- `show rewrite global`

#### Example:

```
1 >bind rewrite global policyNew 10
2   Done
3
4 > show rewrite global
5 1)      Global bindpoint: RES_DEFAULT
6         Number of bound policies: 1
7
8 2)      Global bindpoint: REQ_OVERRIDE
9         Number of bound policies: 1
10
11   Done
12 <!--NeedCopy-->
```

## To bind rewrite policy to a specific virtual server by using the command line interface

At the command prompt, type the following commands to bind rewrite policy to a specific virtual server and verify the configuration:

```
bind lb vserver      <serviceName>@ (-policyName      RESPONSE ) [-invoke
<name>@             <string>@ [-priority      (<labelType>
(<serviceName>@    <positive_integer>] [-  <labelName>)] )
[-weight           gotoPriorityExpression
<positive_integer>] <expression>] [-type (
                    REQUEST
```

- 
- show lb vserver <name>

### Example:

```
1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
2 Done
3 >
4 > show lb vserver lbvip
5     lbvip (8.7.6.6:80) - HTTP           Type: ADDRESS
6     State: DOWN
7     Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
8     Time since last state change: 28 days, 01:57:26.350
9     Effective State: DOWN
10    Client Idle Timeout: 180 sec
11    Down state flush: ENABLED
12    Disable Primary Vserver On Down : DISABLED
13    Port Rewrite : DISABLED
14    No. of Bound Services : 0 (Total)      0 (Active)
15    Configured Method: LEASTCONNECTION
16    Mode: IP
17    Persistence: NONE
18    Vserver IP and Port insertion: OFF
19    Push: DISABLED Push VServer:
20    Push Multi Clients: NO
21    Push Label Rule: none
22
23 1) Policy : ns_cmp_msapp Priority:50
24 2) Policy : cf-pol Priority:1      Inherited
25 Done
26 <!--NeedCopy-->
```

**To bind a rewrite policy to a bind point by using the configuration utility**

1. Navigate to AppExpert > Rewrite > Policies.
2. In the details pane, select the rewrite policy you want to globally bind, and then click Policy Manager.
3. In the Rewrite Policy Manager dialog box, in the Bind Points menu, do one of the following:
  - a) If you want to configure bindings for HTTP rewrite policies, click HTTP, and then click either Request or Response, depending on whether you want to configure request-based rewrite policies or response-based rewrite policies.
  - b) If you want to configure bindings for TCP rewrite policies, click TCP, and then click either Client or Server, depending on whether you want to configure client-side TCP rewrite policies or server-side TCP rewrite policies.
4. Click the bind point to which you want to bind the rewrite policy. The Rewrite Policy Manager dialog box displays all the rewrite policies that are bound to the selected bind point.
5. Click Insert Policy to insert a new row and display a drop-down list with all available, unbound rewrite policies.
6. Click the policy you want to bind to the bind point. The policy is inserted into the list of rewrite policies bound to the bind point.
7. In the Priority column, you can change the priority to any positive integer. For more information about this parameter, see priority in “Parameters for binding a rewrite policy.”
8. If you want to skip over policies and go directly to a specific policy in the event that the current policy is matched, change the value in the Goto Expression column to equal the priority of the next policy to be applied.. For more information about this parameter, see gotoPriorityExpression in “Parameters for binding a rewrite policy.”
9. To modify a policy, click the policy, and then click Modify Policy.
10. To unbind a policy, click the policy, and then click Unbind Policy.
11. To modify an action, in the Action column, click the action you want to modify, and then click Modify Action.
12. To modify an invoke label, in the Invoke column, click the invoke label you want to modify, and then click Modify Invoke Label.
13. To regenerate the priorities of all the policies that are bound to the bind point you are currently configuring, click Regenerate Priorities. The policies retain their existing priorities relative to the other policies, but the priorities are renumbered in multiples of ten.
14. Click Apply Changes.
15. Click Close. A message appears in the status bar, stating that the Policy has been configured successfully.

**To bind a rewrite policy to a specific virtual server by using the configuration utility**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.

2. In the details pane list of virtual servers, select the virtual server to which you want to bind the rewrite policy, and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab. All policies configured on your Citrix ADC appear on the list.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click OK. A message appears in the status bar, stating that the Policy has been configured successfully.

## Configuring Rewrite Policy Labels

September 21, 2020

If you want to build a more complex policy structure than is supported by single policies, you can create policy labels and then bind them as you would policies. A policy label is a user-defined point to which policies are bound. When a policy label is invoked, all the policies bound to it are evaluated in the order of the priority you configured. A policy label can include one or multiple policies, each of which can be assigned its own result. A match on one policy in the policy label can result in proceeding to the next policy, invoking a different policy label or appropriate resource, or an immediate end to policy evaluation and the return of control to the policy that invoked the policy label.

A rewrite policy label consists of a name, a transform name that describes the type of policy included in the policy label, and a list of policies bound to the policy label. Each policy that is bound to the policy label contains all of the elements described in [Configuring a Rewrite Policy](#).

Note: You can use either the command line interface or the configuration utility to create and configure rewrite policy labels. Users who are not thoroughly familiar with the command line interface and the Citrix ADC Policy Infrastructure (PI) language will usually find using the configuration utility much easier.

### To configure a rewrite policy label by using the command line interface

To add a new rewrite policy label, at the command prompt, type the following command:

```
add rewrite policylabel <labelName> <transform>
```

For example, to add a rewrite policy label named `polLabelHTTPResponses` to group all policies that work on HTTP responses, you would type the following:

```
add rewrite policylabel polLabelHTTPResponses http_res
```

To modify an existing rewrite policy label, at the Citrix ADC command prompt, type the following command:

```
set rewrite policy <name> <transform>
```

**Note:**

The set rewrite policy command takes the same options as the add rewrite policy command.

To remove a rewrite policy label, at the Citrix ADC command prompt, type the following command:

```
'rm rewrite policy
```

For example, to remove a rewrite policy label named polLabelHTTPResponses, you would type the following:

```
rm rewrite policy polLabelHTTPResponses
```

**To configure a rewrite policy label by using the configuration utility**

1. Navigate to **AppExpert > Rewrite > Policy Labels**.
2. In the details pane, do one of the following:
  - To create a new policy label, click **Add**.
  - To modify an existing policy label, select the policy, and then click Open.
3. Add or remove policies from the list that is bound to the policy label.
  - To add a policy to the list, click Insert Policy, and choose a policy from the drop-down list. You can create a new policy and add it to the list by choosing New Policy in the list, and following the instructions in “[Configuring a Rewrite Policy](#).”
  - To remove a policy from the list, select that policy, and then click Unbind Policy.
4. Modify the priority of each policy by editing the number in the Priority column.  
You can also automatically renumber policies by clicking Regenerate Priorities.
5. Click **Create** or **OK**, and then click **Close**.

To remove a policy label, select it, and then click **Remove**. To rename a policy label, select it and then click Rename. Edit the name of the policy, and then click **OK** to save your changes.

**Configuring the Default Rewrite Action**

September 21, 2020

An undefined event is triggered when the Citrix ADC cannot evaluate a policy, usually because it detects a logical or other error in the policy or an error condition on the Citrix ADC. When the rewrite policy evaluation results in an error, the specified undefined action is carried out. Undefined actions configured at the rewrite policy level are carried out before a globally configured undefined action.

The Citrix ADC supports following three types of undefined actions:

- undefAction NOREWRITE

Aborts rewrite processing, but does not alter the packet flow. This means that the Citrix ADC continues to process requests and responses that do not match any rewrite policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks or redirects the request. This action is appropriate for normal requests to your Web servers, and is the default setting.

- undefAction RESET

Resets the client connection. This means that the Citrix ADC tells the client that it must re-establish its session with the Web server. This action is appropriate for repeat requests for Web pages that do not exist, or for connections that might be attempts to hack or probe your protected Web site(s).

- undefAction DROP

Silently drops the request without responding to the client in any way. This means that the Citrix ADC simply discards the connection without responding to the client. This action is appropriate for requests that appear to be part of a DDoS attack or another sustained attack on your servers.

Note: Undefined events can be triggered for both request and response flow specific policies.

### To configure the default action by using the command line interface

At the command prompt, type the following commands to configure the default action and verify the configuration:

```
<set rewrite param          RESET          DROP )
-undefAction ( NOREWRITE
```

- 
- <show rewrite param

#### Example:

```
1 > set rewrite param -undefAction NOREWRITE
2 Done
3 > show rewrite param
4     Action Name: NOREWRITE
5 Done
6 <!--NeedCopy-->
```

## To configure the default action by using the configuration utility

1. Navigate to AppExpert > Rewrite.
2. In the details pane, under Rewrite Overview, click the Change Rewrite Settings link. The Set Rewrite Params dialog box appears.
3. Under Global Undefined-Result Action, select an option as follows:
  - NoRewrite—NOREWRITE
  - Reset—RESET
  - Drop—DROP
4. Click OK. The global undefined action is set to the value you chose.

## Bypassing the Safety Check

September 16, 2021

### Warning:

The Bypass Safety Check parameter is deprecated from NetScaler 12.0 build 56.20 onwards. However, Bypass Safety Check parameter is removed and no longer available on the Citrix ADC appliance release 13.1 onwards.

When you create a rewrite action, the Citrix ADC verifies that the expression you used to create the action is safe. Expressions created by the Citrix ADC from run-time data, such as URLs contained in HTTP requests, can cause unexpected errors. The Citrix ADC reports expressions that cause such errors as unsafe expressions.

In some cases, the expressions may be safe. For example, the Citrix ADC cannot validate an expression that contains a URL that does not resolve, even if the URL does not resolve because the Web server is temporarily unavailable. You can manually bypass the Safety Check to allow these expressions.

## To bypass the safety check by using the command line interface

At the command prompt, type the following commands to bypass the safety check and verify the configuration:

- `<set rewrite action <name> -bypassSafetyCheck YES`
- `<show rewrite action <name>`

### Example:

```
1 > set rewrite action insertact -bypassSafetyCheck YES
2 Done
3 > show rewrite action insertact
```

```
4
5     Name: insertact
6     Operation: insert_http_header    Target:Client-IP
7     Value:CLIENT.IP.SRC
8     BypassSafetyCheck : YES
9     Hits: 0
10    Undef Hits: 0
11    Action Reference Count: 2
12 Done
13 <!--NeedCopy-->
```

### To bypass safety check by using the configuration utility

1. Navigate to AppExpert > Rewrite > Actions.
2. In the details pane, select the rewrite action to be exempted from the safety check, and then click Open.
3. In the Configure Rewrite Action dialog box, select the Bypass Safety Check check box.
4. Click OK.

## Rewrite Action and Policy Examples

May 5, 2021

The examples in this section demonstrate how to configure rewrite to perform various useful tasks. The examples occur in the server room of Example Manufacturing Inc., a mid-sized manufacturing company that uses its Web site to manage a considerable portion of its sales, deliveries, and customer support.

Example Manufacturing has two domains: [example.com](#) for its Web site and email to customers, and [example.net](#) for its intranet. Customers use the Example Web site to place orders, request quotes, research products, and contact customer service and technical support.

As an important part of Example's revenue stream, the Web site must respond quickly and keep customer data confidential. Example therefore has several Web servers and uses Citrix ADC appliances to balance the Web site load and manage traffic to and from its Web servers.

The Example system administrators use the rewrite features to perform the following tasks:

#### **Example 1: Delete old X-Forwarded-For and Client-IP Headers**

Example Inc. removes old X-Forwarded-For and Client-IP HTTP headers from incoming requests.

#### **Example 2: Adding a Local Client-IP Header**

Example Inc. adds a new, local Client-IP header to incoming requests.

### **Example 3: Tagging Secure and Insecure Connections**

Example Inc. tags incoming requests with a header that indicates whether the connection is a secure connection.

### **Example 4: Mask the HTTP Server Type**

Example Inc. modifies the HTTP Server: header so that unauthorized users and malicious code cannot use that header to determine the HTTP server software it uses.

### **Example 5: Redirect an External URL to an Internal URL**

Example Inc. hides information about the actual names of its Web servers and the configuration of its server room from users, to make URLs on its Web site shorter and easier to remember and to improve security on its site.

### **Example 6: Migrating Apache Rewrite Module Rules**

Example Inc. moved its Apache rewrite rules to a Citrix ADC appliance, translating the Apache PERL-based script syntax to the Citrix ADC rewrite rule syntax.

### **Example 7: Marketing Keyword Redirection**

The marketing department at Example Inc. sets up simplified URLs for certain predefined keyword searches on the company's Web site.

### **Example 8: Redirect Queries to the Queried Server.**

Example Inc. redirects certain query requests to the appropriate server.

### **Example 9: Home Page Redirection**

Example Inc. recently acquired a smaller competitor, and it now redirects requests to the acquired company's home page to a page on its own Web site.

### **Example 10: Policy-based RSA Encryption**

Example Inc. encrypt HTTP predefined and user-defined header or body content by using PEM RSA public key.

Each of these tasks requires that the system administrators create rewrite actions and policies and bind them to a valid bind point on the Citrix ADC.

## **Example 1: Delete Old X-Forwarded-For and Client-IP Headers**

September 21, 2020

Example Inc. wants to remove old X-Forwarded-For and Client-IP HTTP headers from incoming requests, so that the only X-Forwarded-For headers that appear are the ones added by the local server. This configuration can be done through the Citrix ADC command line or the configuration utility. The Example Inc. system administrator is an old-school networking engineer and prefers to use a CLI where possible, but wants to be sure he understands the configuration utility interface so that he can show new system administrators on the team how to use it.

The examples below demonstrate how to perform each configuration with both the CLI and the configuration utility. The procedures are abbreviated on the assumption that users will already know the basics of creating rewrite actions, creating rewrite policies, and binding policies.

- For more detailed information about creating rewrite actions, see [Configuring a Rewrite Action](#).
- For more detailed information about creating rewrite policies, see [Configuring a Rewrite Policy](#).
- For more detailed information about binding rewrite policies, see [Binding a Rewrite Policy](#).

### To delete old X-Forwarded and Client-IP headers from a request by using the command line interface

At the command prompt, type the following commands in the order shown:

```

1 add rewrite action act_del_xfor delete_http_header x-forwarded-for
2 add rewrite action act_del_cip delete_http_header client-ip
3 add rewrite policy pol_check_xfor 'HTTP.REQ.HEADER("x-forwarded-for").
  EXISTS' act_del_xfor
4 add rewrite policy pol_check_cip 'HTTP.REQ.HEADER("client-ip").EXISTS'
  act_del_cip
5 bind rewrite global pol_check_xfor 100 200
6 bind rewrite global pol_check_cip 200 300
7 <!--NeedCopy-->

```

### To delete old X-Forwarded and Client-IP headers from a request by using the configuration utility

In the Create Rewrite Action dialog box, create two rewrite actions with the following descriptions.

| Name         | Type               | Argument(s)     |
|--------------|--------------------|-----------------|
| act_del_xfor | delete_http_header | x-forwarded-for |
| act_del_cip  | delete_http_header | client-ip       |

In the Create Rewrite Policy dialog box, create two rewrite policies with the following descriptions.

| Name           | Expression                                  | Action       |
|----------------|---------------------------------------------|--------------|
| pol_check_xfor | 'HTTP.REQ.HEADER("x-forwarded-for").EXISTS' | act_del_xfor |
| pol_check_cip  | 'HTTP.REQ.HEADER("client-ip").EXISTS'       | act_del_cip  |

Bind both policies to global, assigning the priorities and goto expression values shown below.

| Name           | Priority | Goto Expression |
|----------------|----------|-----------------|
| pol_check_xfor | 100      | 200             |
| pol_check_cip  | 200      | 300             |

All old X-Forwarded-For and Client-IP HTTP headers are now deleted from incoming requests.

## Example 2: Adding a Local Client-IP Header

June 9, 2021

Example Inc. wants to add a local Client-IP HTTP header to incoming requests. This example contains two slightly different versions of the same basic task.

### To add a local Client-IP header by using the command line interface

At the command prompt, type the following commands in the order shown:

```

1 add rewrite action act_ins_client insert_http_header NS-Client 'CLIENT.
  IP.SRC'
2 add rewrite policy pol_ins_client 'HTTP.REQ.HEADER("x-forwarded-for").
  EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS' act_ins_client
3 bind rewrite global pol_ins_client 300 END
4 <!--NeedCopy-->

```

### To add a local Client-IP header by using the configuration utility

In the Create Rewrite Action dialog box, create a rewrite action with the following description.

| Name           | Type               | Argument(s)               |
|----------------|--------------------|---------------------------|
| act_ins_client | insert_http_header | NS-Client 'CLIENT.IP.SRC' |

In the Create Rewrite Policy dialog box, create a rewrite policy with the following description.

| Name           | Expression                                     | Action                                         |
|----------------|------------------------------------------------|------------------------------------------------|
| pol_ins_client | 'HTTP.REQ.HEADEI<br>forwarded-<br>for").EXISTS | HTTP.REQ.HEADEF act_ins_client<br>ip").EXISTS' |

Bind policy to global, assigning the priorities and goto expression values shown below.

| Name           | Priority | Goto Expression |
|----------------|----------|-----------------|
| pol_ins_client | 100      | Next            |

### Example 3: Tagging Secure and Insecure Connections

September 21, 2020

Example Inc. wants to tag incoming requests with a header that indicates whether or not the connection is a secure connection. This helps the server keep track of secure connections after the Citrix ADC has decrypted the connections.

To implement this configuration, you would begin by creating rewrite actions with the values shown in the following tables. These actions label connections to port 80 as insecure connections, and connections to port 443 as secure connections.

| Action Name            | Type of Rewrite    |             |       |
|------------------------|--------------------|-------------|-------|
|                        | Action             | Header Name | Value |
| Action-Rewrite-SSL_YES | INSERT_HTTP_HEADER | SSL         | YES   |

| Action Name           | Type of Rewrite<br>Action | Header Name | Value |
|-----------------------|---------------------------|-------------|-------|
| Action-Rewrite-SSL_NO | INSERT_HTTP_HEADER        | SSL         | NO    |

You would then create a rewrite policy with the values shown in the following tables. These policies check incoming requests to determine which requests are directed to port 80 and which are directed to port 443. The policies then add the correct SSL header.

| Policy Name            | Action Name            | Undefined Action | Expression                 |
|------------------------|------------------------|------------------|----------------------------|
| Policy-Rewrite-SSL_YES | Action-Rewrite-SSL_YES | NOREWRITE        | CLIENT.TCP.DSTPORT.EQ(443) |
| Policy-Rewrite-SSL_NO  | Action-Rewrite-SSL_NO  | NOREWRITE        | CLIENT.TCP.DSTPORT.EQ(80)  |

Finally, you would bind the rewrite policies to Citrix ADC, assigning the first policy a priority of 200, and the second a priority of 300, and setting the goto expression of both policies to END.

Each incoming connection to port 80 now has an SSL:NO HTTP header added to it and each incoming connection to port 443 has an SSL:YES HTTP header added to it.

## Example 4: Mask the HTTP Server Type

September 21, 2020

Example Inc. wants to modify the HTTP Server: header so that unauthorized users and malicious code cannot use the header to identify the software that the HTTP server uses.

To modify the HTTP Server: header, you would create a rewrite action and a rewrite policy with the values in the following tables.

| Action Name                | Type of Rewrite<br>Action | Expression to choose<br>target reference | String expression for<br>replacement text |
|----------------------------|---------------------------|------------------------------------------|-------------------------------------------|
| Action-Rewrite-Server_Mask | REPLACE                   | HTTP.RES.HEADER("Sei                     | "Web Server 1.0"                          |

| Policy Name                | Action Name                | Undefined Action | Expression        |
|----------------------------|----------------------------|------------------|-------------------|
| Policy-Rewrite-Server_Mask | Action-Rewrite-Server_Mask | NOREWRITE        | HTTP.RES.IS_VALID |

**Example commands:**

```
> add rewrite action Action-Rewrite-Server_Mask REPLACE HTTP.RES.HEADER("Server") "\"Web Server 1.0\""
```

```
> add rewrite policy Policy-Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite-Server_Mask NOREWRITE
```

You would then globally bind the rewrite policy, assigning a priority of 100 and setting the Goto Priority Expression of the policy to END.

The HTTP Server: header is now modified to read “Web Server 1.0,” masking the actual HTTP server software used by the Example Inc. Web site.

**Example 5: Redirect an external URL to an internal URL**

September 21, 2020

Example Inc. wants to hide its actual server room configuration from users to improve security on its Web servers.

To do this, you would create a rewrite action with the values as shown in the following tables. For request headers, the action in the table modifies `www.example.com` to `web.hq.example.net`. For response headers, the action does the opposite, translating `web.hq.example.net` to `www.example.com`.

| Action Name                            | Type of Rewrite Action | Expression to choose target reference   | String expression for replacement text |
|----------------------------------------|------------------------|-----------------------------------------|----------------------------------------|
| Action-Rewrite-Request_Server_Replace  | REPLACE                | HTTP.REQ.HOSTNAME                       | “Web.hq.example.net”                   |
| Action-Rewrite-Response_Server_Replace | REPLACE                | HTTP.RES.HEADER(“Server”)w.example.com” | “www.example.com”                      |

The first policy checks incoming requests to see if they are valid, and if they are, it performs the Action-Rewrite-Request\_Server\_Replace action. The second policy checks responses to see if

they originate at the server `web.hq.example.net`. If they do, it performs the `Action-Rewrite-Response_Server_Replace` action.

Examples of rewrite action and policy for redirecting an external URL.

```
add rewrite action Action-Rewrite-Request_Server_Replace REPLACE HTTP.REQ.  
HOSTNAME.SERVER '"Web.hq.example.net"  
  
add rewrite action Action-Rewrite-Response_Server_Replace REPLACE HTTP.RES.  
HEADER("Server") '"www.example.com"  
  
add rewrite policy Policy-Rewrite-Request_Server_Replace HTTP.REQ.HOSTNAME.  
SERVER.EQ("www.example.com")Action-Rewrite-Request_Server_Replace NOREWRITE  
  
add rewrite policy Policy-Rewrite-Response_Server_Replace HTTP.REQ.HEADER("  
Server").EQ("Web.hq.example.net")Action-Rewrite-Response_Server_Replace
```

Finally, you would bind the rewrite policies, assigning each a priority of 500 because they are in different policy banks and therefore will not conflict. You should set the `goto` expression to `NEXT` for both bindings.

```
bind rewrite global Policy-Rewrite-Request_Server_Replace 500 END -type  
REQ_DEFAULT  
  
bind rewrite global Policy-Rewrite-Response_Server_Replace 500 END -type  
RES_DEFAULT
```

All instances of `www.example.com` in the request headers are now changed to `web.hq.example.net`, and all instances of `web.hq.example.net` in response headers are now changed to `www.example.com`.

## Example 6: Migrating Apache Rewrite Module Rules

September 21, 2020

Example Inc., is currently using the Apache rewrite module to process search requests sent to its Web servers and redirect those requests to the appropriate server on the basis of information in the request URL. Example Inc. wants to simplify its setup by migrating these rules onto the Citrix ADC platform.

Several Apache rewrite rules that Example currently uses are shown below. These rules redirect search requests to a special results page if they do not have a SiteID string or if they have a SiteID string equal to zero (0), or to the standard results page if these conditions do not apply.

The following are the current Apache rewrite rules:

- `RewriteCond %{REQUEST_FILENAME} ^/search$ [NC]`

- RewriteCond %{QUERY\_STRING} !SiteId= [OR]
- RewriteCond %{QUERY\_STRING} SiteId=0
- RewriteCond %{QUERY\_STRING} CallName=DisplayResults [NC]
- RewriteRule ^.\*\$ /results2.html [P,L]
- RewriteCond %{REQUEST\_FILENAME} ^/search\$ [NC]
- RewriteCond %{QUERY\_STRING} CallName=DisplayResults [NC]
- <RewriteRule ^.\*\$ /results.html [P,L]

To implement these Apache rewrite rules on the Citrix ADC, you would create rewrite actions with the values in the following tables.

| Action Name                           | Type of Rewrite Action | Expression to choose target reference | String expression for replacement text |
|---------------------------------------|------------------------|---------------------------------------|----------------------------------------|
| Action-Rewrite-Display_Results_NulSit | REPLACE                | HTTP.REQ.URL                          | "/results2.html"                       |
| Action-Rewrite-Display_Results        | REPLACE                | HTTP.REQ.URL                          | "/results2.html"                       |

You would then create rewrite policies with the values as shown in the tables below.

| Policy Name                    | Action Name                    | Undefined Action | Expression                                                       |
|--------------------------------|--------------------------------|------------------|------------------------------------------------------------------|
| Policy-Rewrite-Display_Re:     | Action-Rewrite-Display_Re:     | NOREWRITE        | HTTP.REQ.U && (!HTTP.REQ                                         |
| Policy-Rewrite-Display_Results | Action-Rewrite-Display_Results | NOREWRITE        | HTTP.REQ.URL.PATH.SET_HTTP_MODERATOR(QUERY_STRING)"/MaDef(IGNORE |

Finally, you would bind the rewrite policies, assigning the first a priority of 600 and the second a priority of 700, and then set the goto expression to NEXT for both bindings.

The Citrix ADC now handles these search requests exactly as the Web server did before the Apache rewrite module rules were migrated.

## Example 7: Marketing Keyword Redirection

September 21, 2020

The marketing department at Example Inc. wants to set up simplified URLs for certain predefined keyword searches on the company's Web site. For these keywords, it wants to redefine the URL as shown below.

- External URL:

<http://www.example.com/<marketingkeyword>>

- Internal URL:

<http://www.example.com/go/kwsearch.asp?keyword=<marketingkeyword>>

To set up redirection for marketing keywords, you would create a rewrite action with the values in the following table.

| Action Name               | Type of Rewrite Action | Expression to choose target location | String expression for replacement text |
|---------------------------|------------------------|--------------------------------------|----------------------------------------|
| Action-Rewrite-Modify_URL | INSERT_BEFORE          | HTTP.REQ.URL.PATH.GI                 | ""go/kwsearch.aspkeyword="l"           |

You would then create a rewrite policy with the values in the following table.

| Policy Name               | Action Name               | Undefined Action | Expression                     |
|---------------------------|---------------------------|------------------|--------------------------------|
| Policy-Rewrite-Modify_URL | Action-Rewrite-Modify_URL | NOREWRITE        | HTTP.REQ.HOSTNAME.SERVER.EQ("v |

Finally, you would bind the rewrite policy, assigning it a priority of 800. Unlike the previous rewrite policies, this policy should be the last to be applied to a request that matches its criteria. For this reason, Citrix ADC administrator sets its Goto Priority Expression to END.

Any request using a marketing keyword is redirected to the keyword search CGI page, whereupon a search is performed and all remaining policies are skipped.

## Example 8: Redirect Queries to the Queried Server

May 5, 2021

Example Inc. wants to redirect query requests to the appropriate server, as shown here.

- <Request: GET /query.cgi?server=5HOST: www.example.com
- <Redirect URL: <http://web-5.example.com/>

To implement this redirection, you would first create a rewrite action with the values in the following table.

| Action Name                       | Type of Rewrite | Expression to choose target reference | String expression for replacement text                       |
|-----------------------------------|-----------------|---------------------------------------|--------------------------------------------------------------|
| Action-Rewrite-Replace_Hostheader | REPLACE         | HTTP.REQ.HEADER("Host")               | "server-" + HTTP.REQ.URL.QUERY.VALUE("web") + ".example.com" |

You would then create a rewrite policy with the values in the following table.

| Policy Name                       | Action Name                       | Undefined Action | Expression                                    |
|-----------------------------------|-----------------------------------|------------------|-----------------------------------------------|
| Policy-Rewrite-Replace_Hostheader | Action-Rewrite-Replace_Hostheader | NOREWRITE        | HTTP.REQ.HEADER("Host").EQ("www.example.com") |

### Example commands:

```
> add rewrite action Action-Rewrite-Server_Mask REPLACE HTTP.RES.HEADER("Server") "\"Web Server 1.0\""
```

Done

```
> add rewrite policy Policy-Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite-Server_Mask NOREWRITE
```

Done

Finally, you would bind the rewrite policy, assigning it a priority of 900. Because this policy should be the last policy applied to a request that matches its criteria, you set the goto expression to END.

Incoming requests to any URL that begins with `http://www.example.com/query.cgi?server` are redirected to the server number in the query.

## Example 9: Home Page Redirection

September 21, 2020

New Company, Inc. recently acquired a smaller competitor, Purchased Company, and wants to redirect the home page for Purchased Company to a new page on its own Web site, as shown here.

- Old URL: <http://www.purchasedcompany.com/>\*
- New URL: <http://www.newcompany.com/products/page.htm>

To redirect requests to the Purchased Company home page, you would create rewrite actions with the values in the following table.

| Action Name                 | Type of Rewrite Action | Expression to choose target reference | String expression for replacement text |
|-----------------------------|------------------------|---------------------------------------|----------------------------------------|
| Action-Rewrite-Replace_URLr | REPLACE                | HTTP.REQ.URL.PATH_A                   | "/products/page.htm"                   |
| Action-Rewrite-Replace_Host | REPLACE                | HTTP.REQ.HOSTNAME                     | "www.newcompany.com"                   |

You would then create rewrite policies with the values in the following table.

| Policy Name                 | Action Name                 | Undefined Action | Expression                                               |
|-----------------------------|-----------------------------|------------------|----------------------------------------------------------|
| Policy-Rewrite-Replace-None | Action-Rewrite-Replace-None | NOREWRITE        | !HTTP.REQ.HOSTNAME.SERVER.EQ("www.purchasedcompany.com") |
| Policy-Rewrite-Replace-Host | Action-Rewrite-Replace_Host | NOREWRITE        | HTTP.REQ.HOSTNAME.SERVER.EQ("www.purchasedcompany.com")  |
| Policy-Rewrite-Replace-URL  | Action-Rewrite-Replace_URL  | NOREWRITE        | HTTP.REQ.IS_VALID                                        |

Finally, you would bind the rewrite policies globally, assigning the first a priority of 100, the second a priority of 200, and the third a priority of 300. These policies should be the last policies applied to a request that matches the criteria. For this reason, set the goto expression to END for the first and third policies, and to 300 for the second policy. This ensures that all remaining requests are processed correctly.

Requests to the acquired company's old Web site are now redirected to the correct page on the New Company home page.

## Example 10: Policy-based RSA Encryption

September 21, 2020

The RSA algorithm uses the PKEY\_ENCRYPT\_PEM() function to encrypt HTTP predefined and user-defined header or body content. The function accepts only RSA public keys (not private keys) and the encrypted data cannot be longer than the length of the public key. When the data being encrypted is shorter than the key length, the algorithm uses RSA\_PKCS1 padding method.

In a sample scenario, the function can be used with B64ENCODE() function in a rewrite action to replace an HTTP header value with a value encrypted by an RSA public key. The data being encrypted is then decrypted by the recipient using the RSA private key.

You can implement the feature by using a rewrite policy. To do this, you must complete the following tasks:

1. Add RSA public key as a policy expression.
2. Create rewrite action.
3. Create rewrite policy.
4. Bind rewrite policy as global.
5. Verify RSA encryption

### Policy-based RSA encryption by using Citrix ADC command interface

Complete the following tasks to configure policy-based RSA encryption by using the Citrix ADC command interface.

#### To add RSA public key as a policy expression by using the Citrix ADC command interface:

```
1 add policy expression pubkey '"-----BEGIN RSA PUBLIC KEY-----
MIGJAoGBAKl5vgQEj73Kxp+9
yn1v5gPR1pnc4oLM2a0kaWwB0sB6rzCIy6znwnvwCY1xRvQhRlJSAyJb1oL7wZFIJ2FOR8Cz
+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o79az597eNPAjsHZ/C2oL/+6qY5a/
f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=-----END RSA PUBLIC KEY-----"'
2 <!--NeedCopy-->
```

#### To add rewrite an action to encrypt an HTTP header request by using the Citrix ADC command interface:

```
1 add rewrite action encrypt_act insert_http_header encrypted_data
2
3 'HTTP.REQ.HEADER("data_to_encrypt").PKEY_ENCRYPT_PEM(pubkey).B64ENCODE'
```

#### To add rewrite policy by using the Citrix ADC command interface:

```
1 add rewrite policy encrypt_pol 'HTTP.REQ.HEADER("data_to_encrypt").
  EXISTS' encrypt_act
2 <!--NeedCopy-->
```

**To bind rewrite policy global by using the Citrix ADC command interface:**

```
1 bind rewrite global encrypt_pol 10 -type RES_DEFAULT
```

**To verify RSA encryption by using the Citrix ADC command interface:**

```
1 >curl -v -H "data_to_encrypt: Now is the time that tries men's souls"
  http://10.217.24.7/
2
3 * About to connect() to 10.217.24.7 port 80 (#0)

## Policy-based RSA encryption by using the GUI

The GUI enables you to complete the following tasks:

### To add RSA public key as a policy expression by using the GUI:

1. Sign into the Citrix ADC appliance and navigate to **Configurations > AppExpert > Advanced Expressions**.
2. In the details pane, click **Add** to define an RSA public key as an advanced policy expression.
3. In Create Expression page, set the following parameters:
  - a) Expression name. Name of the advanced expression.
  - b) Expression. Define RSA public key as an advanced expression using the Expression Editor.
  - c) Comments. A brief description of the expression.
4. Click **Create**.

### To add rewrite an action to encrypt an HTTP header request by using the GUI:

1. Sign into the Citrix ADC appliance and navigate to **Configurations > AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add** to add a rewrite action.
3. In the **Create Rewrite Action** screen, set the following parameters:
  - a) Name. Name of the rewrite action.
  - b) Type. Select action type as INSERT\_HTTP\_HEADER.
  - c) Use the action type to insert a header. Enter the name of the HTTP header that needs to be rewritten.
  - d) Expression. Name of the advanced policy expression associated to the action.
  - e) Comments. A brief description of the rewrite action.
4. Click **Create**.

### To add rewrite advanced policy by using the GUI:

1. Sign into the Citrix ADC appliance and navigate to **Configurations > AppExpert > Rewrite > Policies**.
2. In the **Rewrite Policies** page, click **Add** to add a rewrite policy.
3. In the **Create Rewrite Policy** page, set the following parameters:
  - a) Name. Name of the rewrite policy.
  - b) Action. Name of the rewrite action to perform if the request or response matches this rewrite policy.
  - c) Log Action. Name of message log action to use when a request matches this policy.
  - d) Undefined-Result Action. Action to perform if the result of policy evaluation is undefined.
  - e) Expression. Name of the advanced policy expression that triggers the action.
  - f) Comments. A brief description of the rewrite action.
4. Click **Create**.\*\*

### To bind rewrite policy global by using the GUI:

1. Sign into the Citrix ADC appliance and navigate to **Configurations > AppExpert > Rewrite > Policies**.
2. In the **Rewrite Policies** screen, select a rewrite policy that you want to bind and click **Policy Manager**.
3. In the Rewrite Policy Manager page, in the Bind Points section, set the following parameters:
  - a) Bind Point. Select the binding point as Default Global.
  - b) Protocol. Select the protocol type as HTTP.
  - c) Connection Type. Select the connection type as Request.
  - d) Click **Continue** to view the **Policy Binding** section.
  - e) In the **Policy Binding** section, select the rewrite policy and set the bind parameters.
4. Click **Bind**.

## Example 11: Policy-based RSA encryption with no padding operation

September 21, 2020

The PKEY\_ENCRYPT\_PEM\_NO\_PADDING() policy function uses the RSA algorithm with no padding operation before performing RSA encryption. The policy function works just like the PKEY\_ENCRYPT\_PEM() function, except it uses RSA\_NO\_PADDING method instead of RSA\_PKCS1\_PADDING. The pkey parameter is a text string with a PEM-encoded RSA public key. Similar to PKEY\_ENCRYPT\_PEM(), you can use a policy expression for the key.

You can implement the feature by using a rewrite policy. To do this, you must complete the following tasks:

1. Add RSA public key as a policy expression.
2. Create rewrite action.

### Policy-based RSA encryption by using Citrix ADC command interface

Complete the following tasks to configure policy-based RSA encryption by using the Citrix ADC command interface.

**To add RSA public key with no padding policy expression by using the Citrix ADC command interface:**

```
1 add expression rsa_pub_key_4096 '"-----BEGIN RSA PUBLIC KEY-----" + "
  MIICCAgEAwwBldKd48xrp0SRPMrg+eNA000DU6t5b/WYQLdElqNv7WpefBrA" +
  \"nwI2s619gEU1r4zoLqL7L5ALtt5Z+F0JBYf0zBz0ky0GtEJ5iX5GP4QxT65J3nHH"
  + "4MTF3acmjvXxclmaKXEFlaVIzW7FTTr3Luw/Cn0jflAB403Q6F9VBVvQm0VYWnqoI"
  + \"+0q1VIg6Q1pAcvdKBi0f85BBofE5EibZ/1Jt0CdbSv568l+8
  ve7BnSuncFHoRR30" + "/"
```

```

VfSsDuNWZf7n3RNMzxEuIA72UGPzNYFQzvcPOdzd0aN7jAXw0mgC/NSvKzGKHLo" +
\"mUYYBzLVQdDMZWnd6jSzsBRXSXsNEy/RuXwp1rA5epo7JdCoMkfeI4vUXm6MNR8"
+ "TQdFqIc1pdn0sbRf9ec62XbcfR7P8CDTsmLSaagx3rjenPdB+LTWKw2VUF+YONIG"
+ \"jM3fyFef9ovVhLhS5HvMqFGs8P75W+
d7B0IbIu3EngACiEJ0pYSsETD4WgPK6Iyv" + "
j6cxsLeYMtElTb0fBIIqysCHdmjF3M1lqdpq4dKs3+W798GJZYM5MxZKUzrBi0Xu" +
\"e7GtSh2aimsfQureUD+0z0RN2umeDsYcA1ghXMclDP+jLS1lnrv0Yvo+TKcm9b8G"
+ "uR/drbcrcCsGyWFW+bsAu3AWz9S6TePurP5unRmNNvXpH5DRgsYl3d50CAwEAAQ=="
+ \"-----END RSA PUBLIC KEY-----\"
2 <!--NeedCopy-->

```

**To add rewrite action for no padding policy expression by using the Citrix ADC command interface:**

```

add rewrite action rsa_encrypt_act insertHTTPHeader encrypted 'HTTP.REQ.
HEADER("plaintext").PKEY_ENCRYPT_PEM_NO_PADDING(rsa_pub_key_4096)

```

### Policy-based RSA encryption with no padding option by using the GUI

The GUI enables you to complete the following tasks:

**To add RSA public key for no padding operation as a policy expression by using the GUI:**

1. Sign into the Citrix ADC appliance and navigate to **Configurations > AppExpert > Advanced Expressions**.
2. In the details pane, click **Add** to define an RSA public key as an advanced policy expression.
3. In Create Expression page, set the following parameters:
  - a) Expression name. Name of the advanced expression.
  - b) Expression. Define RSA public key as an advanced expression using the Expression Editor.

**Note:** The maximum string length is of 255 characters in a policy expression. For any key longer than 1024-bits, you have to break the key into smaller chunks and concatenate the chunks together as “chunk1” + “chunk2” + ...
  - c) Comments. A brief description of the expression.
4. Click **Create**.

**To add rewrite an action by using the GUI:**

1. Sign into the Citrix ADC appliance and navigate to **Configurations > AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add** to add a rewrite action.
3. In the **Create Rewrite Action** screen, set the following parameters:
  - a) Name. Name of the rewrite action.
  - b) Type. Select action type as INSERT\_HTTP\_HEADER.

- c) Use the action type to insert a header. Enter the name of the HTTP header that needs to be rewritten.
  - d) Expression. Name of the advanced policy expression associated to the action.
  - e) Comments. A brief description of the rewrite action.
4. Click **Create**.

## URL Transformation

September 21, 2020

The URL transformation feature provides a method for modifying all URLs in designated requests from an external version seen by outside users to an internal URL seen only by your Web servers and IT staff. You can redirect user requests seamlessly, without exposing your network structure to users. You can also modify complex internal URLs that users may find difficult to remember into simpler, more easily remembered external URLs.

### Note

Before you can use the URL transformation feature, you must enable the Rewrite feature. To enable the Rewrite feature, see [Enabling the Rewrite Feature](#).

URL transform feature rewrites URLs in HTML response body and is not applied to JavaScript and other variables.

To begin configuring URL transformation, you create profiles, each describing a specific transformation. Within each profile, you create one or more actions that describe the transformation in detail. Next, you create policies, each of which identifies a type of HTTP request to transform, and you associate each policy with an appropriate profile. Finally, you globally bind each policy to put it into effect.

## Configuring URL Transformation Profiles

September 21, 2020

A profile describes a specific URL transformation as a series of actions. The profile functions primarily as a container for the actions, determining the order in which the actions are performed. Most transformations transform an external hostname and optional path into a different, internal hostname and path. Most useful transformations are simple and require only a single action, but you can use multiple actions to perform complex transformations.

You cannot create actions and then add them to a profile. You must create the profile first, and then add actions to it. In the CLI, creating an action and configuring the action are separate steps. Creating a profile and configuring the profile are separate steps in both the CLI and the configuration utility.

### To create a URL transformation profile by using the Citrix ADC command line

At the Citrix ADC command prompt, type the following commands, in the order shown, to create a URL transformation profile and verify the configuration. You can then repeat the second and third commands to configure additional actions:

```
add transform profile <profileName> -type URL [OFF] [-comment <comment>]
[-onlyTransformAbsURLinBody (ON
```

- 
- add transform action <name> <profileName> <priority>

```
set transform action <name> [-priority [DISABLED]] [-comment "<string>"]
<priority> [-reqUrlFrom <expression>]
[-reqUrlInto <expression>] [-resUrlFrom
<expression>] [-resUrlInto <expression>]
[-cookieDomainFrom <expression>]
[-cookieDomainInto <expression>] [-state
(ENABLED
```

- 
- show transform profile <name>

#### Example:

```
1 > add transform profile shoppingcart -type URL
2 Done
3 > add transform action actshopping shoppingcart 1000
4 Done
5 > set transform action actshopping -priority 1000 -reqUrlFrom 'shopping
   .example.com' -reqUrlInto 'www.example.net/shopping' -resUrlFrom '
   www.example.net/shopping' -resUrlInto 'shopping.example.com' -
   cookieDomainFrom 'example.com' -cookieDomainInto 'example.net' -
   state ENABLED -comment 'URL transformation for shopping cart.'
6 Done
7 > show transform profile shoppingcart
```

```

8      Name: shoppingcart
9          Type: URL          onlyTransformAbsURLinBody: OFF
10     Comment:
11     Actions:
12
13 1)          Priority 1000   Name: actshopping          ENABLED
14 Done
15 <!--NeedCopy-->

```

## To modify an existing URL transformation profile or action by using the Citrix ADC command line

At the Citrix ADC command prompt, type the following commands to modify an existing URL transformation profile or action and verify the configuration:

Note: Use a set transform profile or set transform action command, respectively. The set transform profile command takes the same arguments as does the add transform profile command, and set transform action is the same command that was used for initial configuration.

```

set transform action <name> [-priority          DISABLED)] [-comment "<string>"]
<priority>] [-reqUrlFrom <expression>]
[-reqUrlInto <expression>] [-resUrlFrom
<expression>] [-resUrlInto <expression>]
[-cookieDomainInto <expression>] [-state
(ENABLED

```

- 
- show transform profile <name>

### Example:

```

1 > set transform action actshopping -priority 1000 -reqUrlFrom '
    searching.example.net' -reqUrlInto 'www.example.net/searching' -
    resUrlFrom 'www.example.net/searching' -resUrlInto 'searching.
    example.com' -cookieDomainInto 'example.net' -state ENABLED -comment
    'URL transformation for searching cart.'
2 Done
3 > show transform profile shoppingcart
4     Name: shoppingcart
5         Type: URL          onlyTransformAbsURLinBody: OFF
6     Comment:
7     Actions:

```

```
8
9 1)          Priority 1000   Name: actshopping   ENABLED
10 Done
11 <!--NeedCopy-->
```

## To remove a URL transformation profile and actions by using the Citrix ADC command line

First remove all actions associated with that profile by typing the following command once for each action:

- `rm transform action <name>` After you have removed all actions associated with a profile, remove the profile as shown below.
- `rm transform profile <name>`

## To create a URL transformation profile by using the configuration utility

1. In the navigation pane, expand Rewrite, expand URL Transformation, and then click Profiles.
2. In the details pane, click Add.
3. In the Create URL Transformation Profile dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring URL transformation profiles” as follows (asterisk indicates a required parameter):
  - Name\*—name
  - Comment—comment
  - Only transform absolute URLs in response body—onlyTransformAbsURLinBody
4. Click Create, and then click Close. A message appears in the status bar, stating that the Profile has been configured successfully.

## To configure a URL transformation profile and actions by using the configuration utility

1. In the navigation pane, expand Rewrite, expand URL Transformation, and then click Profiles.
2. In the details pane, select the profile you want to configure, and then click Open.
3. In the Configure URL Transformation Profile dialog box, do one of the following.
  - To create a new action, click Add.
  - To modify an existing action, select the action, and then click Open.
4. Fill in the Create URL Transformation Action or Modify URL Transformation Action dialog box by typing or selecting values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring URL transformation profiles” as follows (asterisk indicates a required parameter):

- Action Name\*—name
  - Comments—comment
  - Priority\*—priority
  - Request URL from—reqUrlFrom
  - Request URL into—reqUrlInto
  - Response URL from—resUrlFrom
  - Response URL into—resUrlInto
  - Cookie Domain from—cookieDomainFrom
  - Cookie Domain into—cookieDomainInto
  - Enabled—state
5. Save your changes.
    - If you are creating a new action, click Create, and then Close.
    - If you are modifying an existing action, click OK.  
A message appears in the status bar, stating that the Profile has been configured successfully.
  6. Repeat step 3 through step 5 to create or modify any additional actions.
  7. To delete an action, select the action, and then click Remove. When prompted, click OK to confirm the deletion.
  8. Click OK to save your changes and close the Modify URL Transformation Profile dialog box.
  9. To delete a profile, in the details pane select the profile, and then click Remove. When prompted, click OK to confirm the deletion.

## Configuring URL Transformation Policies

September 21, 2020

After you create a URL transformation profile, you next create a URL transformation policy to select the requests and responses that the Citrix ADC should transform by using the profile. URL transformation considers each request and the response to it as a single unit, so URL transformation policies are evaluated only when a request is received. If a policy matches, the Citrix ADC transforms both the request and the response.

**Note:** The URL transformation and rewrite features cannot both operate on the same HTTP header during request processing. Because of this, if you want to apply a URL transformation to a request, you must make sure that none of the HTTP headers it will modify are manipulated by any rewrite action.

## To configure a URL transformation policy by using the Citrix ADC command line

You must create a new policy. On the command line, an existing policy can only be removed. At the Citrix ADC command prompt, type the following commands to configure a URL transformation policy and verify the configuration:

- `<add transform policy <name> <rule> <profileName>`
- `<show transform policy <name>`

### Example:

```
1 > add transform policy polsearch HTTP.REQ.URL.SUFFIX.EQ("Searching")
   prosearching
2 Done
3 > show transform policy polsearch
4 1) Name: polsearch
5 Rule: HTTP.REQ.URL.SUFFIX.EQ("Searching")
6 Profile: prosearching
7 Priority: 0
8 Hits: 0
9 Done
10 <!--NeedCopy-->
```

## To remove a URL transformation policy by using the Citrix ADC command line

At the Citrix ADC command prompt, type the following command to remove a URL transformation policy:

```
rm transform policy <name>
```

### Example:

```
1 > rm transform policy polsearch
2 Done
3 <!--NeedCopy-->
```

## To configure a URL transformation policy by using the configuration utility

1. In the navigation pane, expand Rewrite, expand URL Transformation, and then click Policies.
2. In the details pane, do one of the following:
  - To create a new policy, click Add.
  - To modify an existing policy, select the policy, and then click Open.

3. In the Create URL Transformation Policy or Configure URL Transformation Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring URL transformation policies” as follows (asterisk indicates a required parameter):

- Name\*—name (Cannot be changed for a previously configured policy.)
- Profile\*—profileName
- Expression—rule

If you want help with creating an expression for a new policy, you can either hold down the Control key and press the space bar while your cursor is in the Expression text box. To create the expression, you can type it directly as described below, or you can use the Add Expression dialog box.

a) Click Prefix, and choose the prefix for your expression.

Your choices are:

- HTTP—The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
- SYS—The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
- CLIENT—The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
- SERVER—The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
- URL—The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.
- TEXT—Any text string in the request. Choose this if you want to examine a text string in the request.
- TARGET—The target of the request. Choose this if you want to examine some aspect of the request target.

After you choose a prefix, the Citrix ADC displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom. The choices depend on which prefix you chose.

b) Select your next term.

If you chose HTTP as your prefix, your choices are REQ, which specifies HTTP requests, and RES, which specifies HTTP responses. If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you are certain which choice you want, double-click it to insert it into the Expression window.

- c) Type a period, and then continue selecting terms from the list boxes that appear to the right of the previous list box. You type the appropriate text strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.
4. Click Create or OK, depending on whether you are creating a new policy or modifying an existing policy.
5. Click Close. A message appears in the status bar, stating that the Policy has been configured successfully.

### **To add an expression by using the Add Expression dialog box**

1. In the Create Responder Action or Configure Responder Action dialog box, click Add.
2. In the Add Expression dialog box, in the first list box choose the first term for your expression.
  - HTTP  
The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - SYS  
The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - CLIENT  
The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
  - SERVER  
The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
  - URL  
The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.
  - TEXT  
Any text string in the request. Choose this if you want to examine a text string in the request.
  - TARGET

The target of the request. Choose this if you want to examine some aspect of the request target.

When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

3. <In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. <Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

## Globally Binding URL Transformation Policies

September 21, 2020

After you have configured your URL transformation policies, you bind them to Global or a bind point to put them into effect. After binding, any a request or response that matches a URL transformation policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the Citrix ADC OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the URL transformation feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you tell the Citrix ADC to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you tell the Citrix ADC to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you globally bind your policies.

Note: URL transformation policies cannot be bound to TCP-based virtual servers.

### To bind a URL transformation policy by using the Citrix ADC command line

At the Citrix ADC command prompt, type the following commands to globally bind a URL transformation policy and verify the configuration:

- `bind transform global <policyName> <priority>`

- `show transform global`

**Example:**

```
1 > bind transform global polisearching 100
2 Done
3 > show transform global
4 1)      Policy Name: polisearching
5        Priority: 100
6
7 Done
8 <!--NeedCopy-->
```

**To bind a URL transformation policy by using the configuration utility**

1. In the navigation pane, expand Rewrite, then expand URL Transformation, and then click Policies.
2. In the details pane, click Policy Manager.
3. In the Transform Policy Manager dialog box, choose the bind point to which you want to bind the policy. The choices are:
  - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance, and are applied before any other policies.
  - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
  - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
  - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance.
  - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
4. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound URL transformation policies.
5. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound URL transformation policies.
6. Make any additional adjustments to the binding.
  - <To modify the policy priority, click the field to enable it, and then type a new priority. You

can also select Regenerate Priorities to renumber the priorities evenly.

- To modify the policy expression, double click that field to open the Configure Transform Policy dialog box, where you can edit the policy expression.
  - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
  - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression.
7. Repeat steps 3 through 6 to add any additional URL transformation policies you want to globally bind.
  8. Click OK to save your changes. A message appears in the status bar, stating that the Policy has been configured successfully.

## Globally Binding URL Transformation Policies

September 21, 2020

After you have configured your URL transformation policies, you bind them to Global or a bind point to put them into effect. After binding, any a request or response that matches a URL transformation policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the Citrix ADC OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the URL transformation feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you tell the Citrix ADC to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you tell the Citrix ADC to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you globally bind your policies.

Note: URL transformation policies cannot be bound to TCP-based virtual servers.

### To bind a URL transformation policy by using the Citrix ADC command line

At the Citrix ADC command prompt, type the following commands to globally bind a URL transformation policy and verify the configuration:

- `bind transform global \<policyName\> \<priority\>`

- `show transform global`

**Example:**

```
1 > bind transform global polisearching 100
2 Done
3 > show transform global
4 1)      Policy Name: polisearching
5         Priority: 100
6
7 Done
8 <!--NeedCopy-->
```

**To bind a URL transformation policy by using the configuration utility**

1. In the navigation pane, expand Rewrite, then expand URL Transformation, and then click Policies.
2. In the details pane, click Policy Manager.
3. In the Transform Policy Manager dialog box, choose the bind point to which you want to bind the policy. The choices are:
  - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance, and are applied before any other policies.
  - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
  - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
  - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance.
  - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
4. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound URL transformation policies.
5. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound URL transformation policies.
6. Make any additional adjustments to the binding.
  - <To modify the policy priority, click the field to enable it, and then type a new priority. You

can also select Regenerate Priorities to renumber the priorities evenly.

- To modify the policy expression, double click that field to open the Configure Transform Policy dialog box, where you can edit the policy expression.
  - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
  - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression.
7. Repeat steps 3 through 6 to add any additional URL transformation policies you want to globally bind.
  8. Click OK to save your changes. A message appears in the status bar, stating that the Policy has been configured successfully.

## Diameter Support for Rewrite

May 5, 2021

The Rewrite feature now supports the Diameter protocol. You can configure Rewrite to modify Diameter requests and response as you would HTTP or TCP requests and responses, allowing you to use Rewrite to manage the flow of Diameter requests and make necessary modifications. For example, if the “Origin-Host” value in a Diameter request is inappropriate, you can use Rewrite to replace it with a value that is acceptable to the Diameter server.

### To configure Rewrite to modify a Diameter request

To configure the Rewrite feature to replace the Origin-Host in a diameter request with a different value, at the command prompt, type the following commands:

- `<add rewrite action \<actname\> replace “DIAMETER.REQ.AVP(264,\“CitrixADC.example.net\”)”`  
For <actname>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For Citrix ADC.example.net, substitute the Host-Origin that you want to use instead of the original Host-Name.
- `add rewrite policy <polname> “diameter.req.avp(264).value.eq(\“host.example.com\”)”`  
<actname>

For <polname>, substitute a name for your new policy. As with <actname>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For `host.example.com`, substitute the name of the Host-Origin that you want to change. For <actname>, substitute the name of the action that you just created.

- `bind lb vserver <vservname> -policyName <polname> -priority <priority> -type REQUEST`  
For <vservname>, substitute the name of the load balancing virtual server to which you want to bind the policy. For <polname>, substitute the name of the policy you just created. For <priority>, substitute a priority for the policy.

**Example:**

To create a rewrite action and policy to modify all Diameter Host-Origins of `host.example.com` to `Citrix ADC.example.net`, you could add the following action and policy, and bind the policy as shown.

```
1 > add rewrite action rw_act_replace_avp replace "diameter.req.avp(264)"
   "diameter.new.avp(264,\"Citrix ADC.example.net\")"
2 > add rewrite policy rw_diam_pol "diameter.req.avp(264).value.eq(\"
   client.realm2.net\")" rw_act_replace_avp
3 > bind lb vserver vs1 -policyName rw_diam_pol -priority 10 -type
   REQUEST
4
5 Done
6 <!--NeedCopy-->
```

## DNS Support for the Rewrite Feature

September 21, 2020

You can configure the rewrite feature to modify DNS requests and responses, as you would for HTTP or TCP requests and responses. You can use rewrite to manage the flow of DNS requests, and make necessary modifications in the header, or in the answer section. For example, if the DNS response does not have the AA bit set in the header flag, you can use rewrite to set the AA bit in the DNS response and send it to the client.

### DNS Expressions

In a rewrite configuration, you can use the following Citrix ADC expressions to refer to various portions of a DNS request or response:

See [Expressions and Descriptions](#)

### DNS Bind Points

The following global bind points are available for policies that contain DNS expressions.

| Bind Points      | Description                     |
|------------------|---------------------------------|
| DNS_REQ_OVERRIDE | Override request policy queue.  |
| DNS_REQ_DEFAULT  | Standard request policy queue.  |
| DNS_RES_OVERRIDE | Override response policy queue. |
| DNS_RES_DEFAULT  | Standard response policy queue. |

In addition to the default bind points, you can create policy labels of type DNS\_REQ or DNS\_RES and bind DNS policies to them.

### Rewrite Action Types for DNS

- **replace\_dns\_answer\_section**—This action replaces the DNS answers section with the defined expression in the DNS policy.
- **replace\_dns\_header\_field**—Checks the opcode type in the DNS request. Returns True or False, indicating whether the opcode type in the DNS request matches the specified opcode type. This action replaces the DNS header section with the defined expression in the DNS policy.

### Configuring Rewrite Policies for DNS

The following procedure uses the Citrix ADC command line to configure a rewrite action and policy and bind the policy to a rewrite-specific global bind point.

#### Configure Rewrite action and policy, and bind the policy for DNS

At the command prompt, type the following commands:

1. add rewrite action <actName> <actType>

For <actname>, substitute a name for your new action. The name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For <actType>, specify the rewrite action types provided for DNS expressions.

2. add rewrite policy <polName> <rule> <actName>

For <polname>, substitute a name for your new policy. For <actname>, the name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For <actname>, substitute the name of the action that you just created.

3. bind rewrite global <polName> <priority> < gotoPriorityExpression> -type <bindPoint>

For <polName>, substitute the name of the policy that you just created. For <priority>, specify the priority of the policy. For <bindPoint>, substitute one of the rewrite -specific global bind points.

**Example:**

**Set the AA bit of DNS request to load balance virtual server.**

The following commands configure the Citrix ADC appliance to act as an authoritative DNS server for all the queries that it serves.

```
1 add rewrite action set_aa replace_dns_header_field dns.req.header.flags
   .set(aa)
2 add rewrite policy pol !dns.req.header.flags.is_set(aa) set_aa
3 bind rewrite global pol 100 -type dns_res_override
4 <!--NeedCopy-->
```

**Modify the response answer and header section.**

If the server responds with an NX domain, you can set the rewrite action to replace the response with specified IP address. A NOPOLICY-REWRITE enables you to invoke an external bank without processing an expression (a rule). This entry is a dummy policy that does not contain a rule but directs the entry to a policy label or virtual server specific policy banks.

```
1 add rewrite action set_aa_res replace_dns_header_field "dns.res.header.
   flags.set(aa)"
2 add rewrite action modify_nxdomain_res replace_dns_answer_section "dns.
   new_rrset_a(\"10.102.218.160\",300)"
3 add rewrite policy set_res_aa true set_aa_res
4 add add rewrite policy modify_answer "dns.RES.HEADER.RCODE.EQ(nxdomain)
   && dns.RES.QUESTION.TYPE.EQ(A)"
5 modify_nxdomain_res
6 add rewrite policylabel MODIFY_NODATA dns_res
7 bind rewrite policylabel MODIFY_NODATA modify_answer 10 END
8 bind rewrite policylabel MODIFY_NODATA set_res_aa 11 END
9 bind lb vserver v1 -policyName NOPOLICY-REWRITE -priority 11 -
   gotoPriorityExpression END -type
10 RESPONSE -invoke policylabel MODIFY_NODATA
11 <!--NeedCopy-->
```

**Limitations:**

- Rewrite policies are evaluated only if the Citrix ADC appliance is configured as a DNS proxy server and there is a cache miss.
- If the Recursion Available (RA) flag in the header is set to YES, the RA flag will not be modified in the rewrites.

- If the RA flag in the header is set to YES, the CD flag in the header is modified regardless of any rewrite action.

## String maps

September 21, 2020

You can use string maps to perform pattern matching in all Citrix ADC features that use the default policy syntax. A string map is a Citrix ADC entity that consists of key-value pairs. The keys and values are strings in either ASCII or UTF-8 format. String comparison uses two new functions, `MAP_STRING()` and `IS_STRINGMAP_KEY()`.

A policy configuration that uses string maps performs better than one that does string matching through policy expressions, and you need fewer policies to perform string matching with a large number of key-value pairs. String maps are also intuitive, simple to configure, and result in a smaller configuration.

### How String Maps Work

String maps are similar in structure to pattern sets (a pattern set defines a mapping of index values to strings; a string map defines a mapping of strings to strings) and the configuration commands for string maps (commands such as `add`, `bind`, `unbind`, `remove`, and `show`) are syntactically similar to configuration commands for pattern sets. Also, as with index values in a pattern set, each key in a string map must be unique across the map. The following table illustrates a string map called `url_string_map`, which contains URLs as keys and values.

| Key                      | Value                                                 |
|--------------------------|-------------------------------------------------------|
| <code>/url_1.html</code> | <code>http://www.redirect_url_1.com/url_1.html</code> |
| <code>/url_2.html</code> | <code>http://www.redirect_url_2.com/url_2.html</code> |
| <code>/url_3.html</code> | <code>http://www.redirect_url_1.com/url_1.html</code> |

Table 1. String Map “url\_string\_map”

The following table describes the two functions that have been introduced to enable string matching with keys in a string map. String matching is always performed with the keys. Additionally, the follow-

ing functions perform a comparison between the keys in the string map and the complete string that is returned by the expression prefix. The examples in the descriptions refer to the preceding example.

For completed information about the two functions introduced for enabling string matching with keys in a string map, see [String Map Function](#) table pdf.

## Configuring a String Map

You first create a string map and then bind key-value pairs to it. You can create a string map from the command line interface (CLI) or the configuration utility.

To configure a string map by using the command line interface

At the command prompt, do the following:

1. Create a string map.

```
add policy stringmap <name> -comment <string>
```

2. Bind a key-value pair to the string map.

```
bind policy stringmap <name> <key> <value>
```

Example:

```
1 > bind policy stringmap url_string_map1 "/url_1.html" "http://www.  
    redirect_url_1.com/url_1.html"  
2 <!--NeedCopy-->
```

To configure a string map by using the configuration utility

Create a string map and bind the key-value pair to the created entity.

Navigate to **AppExpert > String Maps**, click **Add** and specify the relevant details.

## Example: responder policy with a redirect action

The following use case involves a responder policy with a redirect action. In the example below, the first four commands create the string map `url_string_map` and bind the three key-value pairs used in the earlier example. After creating the map and binding the key-value pairs, you create a responder action (`act_url_redirects`) that redirects the client to the corresponding URL in the string map or to `www.default.com`. You also configure a responder policy (`pol_url_redirects`) that checks whether requested URLs match any of the keys in `url_string_map` and then performs the configured action. Finally, you bind the responder policy to the content switching virtual server that receives the client requests that are to be evaluated.

```
add stringmap url_string_map
```

```
bind stringmap url_string_map /url_1.html http://www.redirect_url_1.com/
url_1.html

bind stringmap url_string_map /url_2.html http://www.redirect_url_2.com/
url_2.html

bind stringmap url_string_map /url_3.html http://www.redirect_url_1.com/
url_1.html

add responder action act_url_redirects redirect 'HTTP.REQ.URL.MAP_STRING("
url_string_map")ALT "www.default.com"'-bypassSafetyCheck yes

add responder policy pol_url_redirects TRUE act_url_redirects

bind cs vserver csw_redirect -policyname pol_url_redirects -priority 1 -
type request
```

## URL Sets

September 21, 2020

This feature enables you to blacklist one million URLs. The section includes the following topics:

- [Getting Started](#)
- [Using Advanced Policy Expressions for URL Evaluation](#)
- [Configuring a URL Set](#)
- [URL Pattern Semantics](#)
- [Blacklisted URL Categories](#)

## Getting Started

September 21, 2020

To prevent access to restricted websites, a Citrix ADC appliance uses a specialized URL matching algorithm. The algorithm uses a URL set that can contain a list of URLs up to 1 million (1,000,000) blacklisted entries. Each entry can include metadata that defines URL categories and category groups as indexed patterns. The appliance can also periodically download URLs of highly sensitive URL sets managed by internet enforcement agencies (with government websites) or internet organizations. Once the URL set is downloaded from a website and imported into the appliance, the appliance encrypts the URL sets (as required by these agencies) and they are kept confidential and the entries are not tampered.

The Citrix ADC appliance uses advanced policies to determine whether an incoming URL must be blocked, allowed, or redirected. These policies use advanced expressions to evaluate incoming URLs against blacklisted entries. An entry can include metadata. For entries that have no metadata, you might want to use an expression that evaluates the URL based on an exact string match. For other URLs, you might want to use an expression that evaluates the URL's metadata, in addition to an expression that checks for an exact string match.

### **Use Case for Safe Internet Access Policies for ISPs/Telcos**

A URL set enables an ISP (ISP) or a Telco customer to enforce government mandated safe internet access policies such as:

1. Block access to illegal internet sites (child abuse, drugs, and so on)
2. Safe browsing for children

A Citrix ADC appliance enables you to periodically download URL sets managed by internet enforcement agencies or independent internet organizations. The appliance periodically downloads the list and updates it securely. The list is stored as confidential URL sets so that it is not tampered or human readable. The periodically downloaded URL set functions as a blacklisted set for URL evaluation purposes.

If you have a private URL set and the contents of the list are kept confidential and the network administrator does not know about the blacklisted URLs present in the list. To make sure the policy is configured correctly and the correct list is referenced, you must configure the Canary URL and add it to the URL set. Using the Canary URL, the administrator can request through the appliance uses the private URL set to ensure it is looked up for every URL request.

### **Advanced Policy Expressions for URL Evaluation**

September 21, 2020

The following table describes the expressions you can use to evaluate incoming URLs with entries in an URL set.

**Note:** HTTP.REQ.URL is generalized to be used as <URL expression>

| Expression                                  | Operation                                                              |
|---------------------------------------------|------------------------------------------------------------------------|
| <URL <i>expression</i> >.URLSET_MATCHES_ANY | Evaluates to TRUE if the URL exactly matches any entry in the URL set. |

| Expression                                                                                                                         | Operation                                                                                                                                                                          |
|------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;URL expression&gt;<br/>.GET_URLSET_METADATA(&lt;URLSET&gt;)</code>                                                       | The GET_URLSET_METADATA() expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there was no match. |
| <code>&lt;URL expression&gt;.GET_URLSET_METADATA(&lt;URLSET&gt;).EQ(&lt;METADATA&gt;)</code>                                       | Evaluates to TRUE if the matched metadata is equal to <METADATA>.                                                                                                                  |
| <code>&lt;URL expression&gt;<br/>.GET_URLSET_METADATA(&lt;URLSET&gt;).<br/>TYPECAST_LIST_T(';').GET(0).EQ(&lt;CATEGORY&gt;)</code> | Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata, but match only the 1st field.   |
| <code>HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)</code>                                                                                | Joins the host and URL parameters, which can then be used as a <URL expression> for matching.                                                                                      |

## Configuring URL Set

August 31, 2021

You can perform the following tasks to configure a URL set and restrict URLs on a Citrix ADC platform:

1. Import a URL set (download and encrypt it). Importing a URL set in a Citrix ADC appliance allows you to download the URL file, adding the file to the appliance, and then encrypting the file. Until you add the URL set to the system, it is not visible to the user.

You can download a set in the following ways:

- Download a URL set once from a remote server and specify it as `http://myserver.com/file_with_urlset.csv`
- add a file under the `/var/tmp/` path inside ADC and use the command, as in the example:

```
1 > shell cat /var/tmp/test_urlset.csv
2 example.com
3 google.com
4 > import policy urlset top10
```

```
5 k -url local:test_urlset.csv -delimiter "," -rowSeparator "n" -interval
   10 -privateSet -canaryUrl http://www.in.gr
6 Done
7
8 <!--NeedCopy-->
```

The imported URL set is further categorized into different categories and category groups in the database. This is valid only if categories exist in the metadata of the URL set file.

**Note:** There can be a chance that you might have URL patterns without metadata.

Once you have imported the file, you can update, delete, or display file properties. After the file is pushed into the appliance, you can modify the entries by more adding rows.

The imported set is then stored in an encrypted file format on the Citrix ADC directory. The imported list contains millions of URL entries. To the following ‘The imported list can contain up to 1 million URL entries. Otherwise, the appliance returns an error message saying that the value exceeds the limit. If the imported URL set has blacklisted entries with metadata, the metadata it is detected by the appliance when it is imported.

Once you import a URL set and add it into the appliance, the URL set is available for advanced policies to identify the correct URL set during incoming URL evaluation. `HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY(<URL set name>)`

1. Updating a URL set on the Citrix ADC appliance. Once you have pushed the file into the appliance, at this interval you can manually update a URL file by using command line interface.
2. Exporting a URL set. If you prefer a backup of the URL set, you can export the list of URL patterns and save a copy of it to a destination URL. Before you export, check whether the URL set is marked as private. If is marked private, the URL set cannot be exported. Export functionality does not work with private set. So a new url set `myurl` would be imported without private set defined, and then it would be exported to another file in a local path, as below:

```
1 > shell touch /var/tmp/test_urlset_export.csv
2 Done
3 > shell cat /var/tmp/test_urlset_export.csv
4 Done
5 > shell cat /var/tmp/test_urlset.csv
6 example.com
7 google.com
8 Done
9 > export urlset myurl -url local:test_urlset_export.csv
10
11 > import urlset myurl -url local:test_urlset.csv
12 Done
13 (a non-private urlset is imported)
```

```
14
15 <!--NeedCopy-->
```

1. Removing a URL set. If you want to delete a URL set of blacklisted entries, you can use the remove command to delete the URL set from the Citrix ADC appliance.
2. Displaying a URL set. You can display the properties of a URL set by using the show command.

**Note:** URLs with query part are removed during import.

#### Example:

```
1 show urlset
2 Name: top100 PatternCount: 100 Delimiter: RowSeparator: Interval: 0
3 Done
4 <!--NeedCopy-->
```

### Import a URL set with meta by using the command line interface

At command prompt, type:

```
1 import urlset <name> [-overwrite] [-delimiter <character>] [-
   rowSeparator <character>] [-url <url> [-interval <seconds>] [-
   privateSet] [-canaryUrl <URL>]
2 <!--NeedCopy-->
```

Where,

delimiter is a CSV file record with default value set as 44.

rowSeparator is a CSV file row separator with default value set as 10.

Interval is the time interval in secs, rounded to the nearest 15 minutes at which the update of the url set occurs.

CanaryURL is a URL used for testing when the contents of the url set is kept confidential.

Example

```
import policy urlset -url local:test_urlset.csv -delimiter ","-rowSeparator
"n"-interval 10 -privateSet -canaryUrl http://www.in.gr
```

### Perform explicit subdomain match for an imported URL set

You can now perform an explicit subdomain match for an imported URL set. To do this, a new parameter, “subdomainExactMatch” is added to the “import policy URLset” command. When you enable the parameter, the URL Filtering algorithm performs an explicit subdomain match. For example, if the

incoming URL is “news.example.com” and if the entry in the URL set is “example.com,” the algorithm does not match the URLs.

At the command prompt, type:

```
import policy urlset <name> [-overwrite] [-delimiter <character>] [-rowSeparator
<character>] -url [-interval <secs>] [-privateSet] [-subdomainExactMatch]
[-canaryUrl <URL>]
```

**Example:**

```
import policy urlset forth_urlset -url local:test_urlset.csv -interval 3600
-subdomainExactMatch
```

**To show the URL set by using the command line interface**

At the command prompt, type:

```
show urlset <name>
```

**Example:**

At the command prompt, type:

```
1          URLset      Count
2          -----      -
3 1)      top1k        100
4 Done
5
6 > show urlset top1k
7          Count      Delimiter  Interval  RowSeparator
8          -----      -
9          100          ,          0          0x0a
10 Done
11 >
12
13 <!--NeedCopy-->
```

**To show the URL set imported by using the command line interface**

At the command prompt, type:

```
show urlset -imported
```

**Example:**

At the command prompt, type:

```
1      URLset
2      -----
3  1)    top1k
4  Done
5  <!--NeedCopy-->
```

### **To show URL set by using the command line interface**

At the command prompt, type:

```
show urlset <name>
```

### **To export a URL set by using the command line interface**

At the command prompt, type:

```
export urlset <name> <url>
```

### **To add a URL set by using the command line interface**

At the command prompt, type:

```
add urlset <urlset_name>
```

### **To update a URL set by using the command line interface**

At the command prompt, type:

```
update urlset <name>
```

### **To remove a URL set command by using the command line interface**

At the command prompt, type:

```
remove urlset <name>
```

#### **Example:**

Note:

Before you import or export a URLset, you must make sure the `test_urlset_export.csv` and `test_urlset.csv` files are created and available under the `/var/tmp` directory.

```
1  import policy urlset -url local:test_urlset.csv -delimiter "," -
    rowSeparator "n" -interval 10 -privateSet -overwrite -canaryUrl
    http://www.in.gr
2
3  add policy urlset top10k
4
5  update policy urlset top10k
6
7  sh policy urlset
8
9  sh policy urlset top10k
10
11 export policy urlset urlset1 -url local:test_urlset_export.csv
12
13 import policy urlset top10k -url local:test_urlset.csv -privateSet
14
15 add policy urlset top10k
16
17 update policy urlset top10k
18
19 show policy urlset top10k
20 <!--NeedCopy-->
```

### Display imported URL sets

You can now display imported URL sets in addition to added URL sets. To do this, a new parameter “imported” is added to the “show url set” command. If you enable this option, the appliance displays all imported URL sets and distinguishes the imported URL sets from the added URL sets.

At the command prompt, type:

```
show policy urlset [<name>] [-imported]
```

#### Example:

```
show policy urlset -imported
```

### To import a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, click **Import** to download the URL set.

### To add a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, click **Add** to create a URL set file for the downloaded URL set.

### To edit a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set and click **Edit** to modify.

### To Update a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set and click **Update URL Set** to update the URL set with the latest modifications made to the file.

### To Export a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set and click **Export URL Set** to export the URL patterns in a set to a destination URL and save it in that location.

## URL Pattern Semantics

May 5, 2021

The following table shows the URL patterns used for specifying the list of pages you to want to filter. For example, the same URL pattern, `http://www.example.com/bar`) matches a single page `http://www.example.com/bar`. To cover all the pages where the URL starts with `www.example.com/bar`, you must explicitly add a `*` at the end.

For more information, see [URL pattern metadata mapping](#) table.

## URL Categories

September 21, 2020

Following is a list of blacklisted categories.

| S.no | Blacklisted Categories |
|------|------------------------|
| 1    | Illegal Activities     |
| 2    | Illegal Drugs          |
| 3    | Medication             |
| 4    | Marijuana              |
| 5    | Terrorism/Extremists   |

---

| S.no | Blacklisted Categories |
|------|------------------------|
| 6    | Weapons                |
| 7    | Hate/Slander           |
| 8    | Violence/Suicide       |
| 9    | Advocacy in general    |
| 10   | Adult/Porn             |
| 11   | Nudity                 |
| 12   | Sexual Services        |
| 13   | Adult Search/Links     |
| 14   | Hacking/Cracking       |
| 15   | Malware                |
| 16   | Remote Proxies         |
| 17   | Search Engine Caches   |
| 18   | Translators            |
| 19   | Dating                 |
| 20   | Weddings/Matrimony     |
| 21   | Market Rates           |
| 22   | Online Trading         |
| 23   | Insurance              |
| 24   | Financial Products     |
| 25   | Gambling in general    |
| 26   | Lottery                |
| 27   | Online games           |
| 28   | Games                  |
| 29   | Auctions               |
| 30   | Shopping/Retail        |
| 31   | Real Estate            |
| 32   | IT Online Shopping     |
| 33   | Web based Chat         |
| 34   | Instant Messages       |

---

| S.no | Blacklisted Categories   |
|------|--------------------------|
| 35   | Web based Mail           |
| 36   | E-Mail Subscriptions     |
| 37   | Bulletin Boards          |
| 38   | IT Bulletin Boards       |
| 39   | Personal Web Pages/Blogs |
| 40   | Downloads                |
| 41   | Program Downloads        |
| 42   | Storage Services         |
| 43   | Streaming Media          |
| 44   | Employment               |
| 45   | Career Advancement       |
| 46   | Side Business            |
| 47   | Grotesque                |
| 48   | Special Events           |

## AppFlow

September 21, 2020

The Citrix ADC appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. It also collects webpage performance data and database information. AppFlow transmits the information by using the Internet Protocol Flow Information export (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information, webpage performance data, and database information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, SSL\_TCP flows, and HDX Insight flows. You can sample and filter the flow types that you want to monitor.

### Note

For more information on HDX Insight, see [HDX Insight](#).

AppFlow use actions and policies to send records for a selected flow to specific set of collectors. An AppFlow action specifies which set of collectors receive the AppFlow records. Policies, which are based on Advanced expressions can be configured to select flows for which flow records are sent to the collectors specified by the associated AppFlow action.

To limit the types of flows, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Note: This feature is supported only on Citrix ADC nCore builds.

## How AppFlow Works

In the most common deployment scenario, inbound traffic flows to a Virtual IP address (VIP) on the Citrix ADC appliance and is load balanced to a server. Outbound traffic flows from the server to a mapped or subnet IP address on the Citrix ADC and from the VIP to the client. A flow is a unidirectional collection of IP packets identified by the following five tuples: sourceIP, sourcePort, destIP, destPort, and protocol.

The following figure describes how the AppFlow feature works.

Figure 1. Citrix ADC Flow Sequence

As shown in the figure, the network flow identifiers for each leg of a transaction depend on the direction of the traffic.

The different flows that form a flow record are:

Flow1: Client-IP, Client-Port, VIP-IP, VIP-port, Protocol

Flow2: NS-SNIP, NS-port, Server-IP, Server-Port, Protocol

Flow3: Server-IP, Server-Port, NS-SNIP, NS-Port, Protocol

Flow4: VIP-IP, VIP-port, Client-IP, Client-Port, Protocol

To help the collector link all four flows in a transaction, AppFlow adds a custom transactionID element to each flow. For application-level content switching, such as HTTP, it is possible for a single client TCP connection to be load balanced to different back end TCP connections for each request. AppFlow provides a set of records for each transaction.

## Flow Records

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response status codes, server response time, and latency). Webpage performance data (such as page load time, page render time, and time spent on the page). And database information (such as database protocol, database response status, and database response size). IPFIX flow records are based on templates that need to be sent before sending flow records.

## Templates

AppFlow defines a set of templates, one for each type of flow. Each template contains a set of standard Information Elements (IEs) and Enterprise-specific Information Elements (EIEs). IPFIX templates define the order and sizes of the Information Elements (Internet Explorer) in the flow record. The templates are sent to the collectors at regular intervals, as described in RFC 5101.

A template can include the following EIEs:

- transactionID

An unsigned 32-bit number identifying an application-level transaction. For HTTP, it corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. In the most common case, there are four unidirectional flow records that correspond to this transaction. If the Citrix ADC generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for this transaction.

- connectionID

An unsigned 32-bit number identifying a layer-4 connection (TCP or UDP). The Citrix ADC flows are bidirectional, with two separate flow records for each direction of the flow. This information element can be used to link the two flows.

For the Citrix ADC, a connectionID is an identifier for the connection data structure to track the progress of a connection. In an HTTP transaction, for instance, a given connectionID might have multiple transactionID elements corresponding to multiple requests that were made on that connection.

- tcpRTT

The round trip time, in milliseconds, as measured on the TCP connection. It can be used as a metric to determine the client or server latency on the network.

- httpRequestMethod

An 8-bit number indicating the HTTP method used in the transaction. An options template with the number-to-method mapping is sent along with the template.

- `httpRequestSize`

An unsigned 32-bit number indicating the request payload size.

- `httpRequestURL`

The HTTP URL requested by the client.

- `httpUserAgent`

The source of incoming requests to the Web server.

- `httpResponseStatus`

An unsigned 32-bit number indicating the response status code.

- `httpResponseSize`

An unsigned 32-bit number indicating the response size.

- `httpResponseTimeToFirstByte`

An unsigned 32-bit number indicating the time taken to receive the first byte of the response.

- `httpResponseTimeToLastByte`

An unsigned 32-bit number indicating the time taken to receive the last byte of the response.

- `flowFlags`

An unsigned 64-bit flag used to indicate different flow conditions.

### **EIEs for webpage performance data**

- `clientInteractionStartTime`

Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and style sheets.

- `clientInteractionEndTime`

Time at which the browser received the last byte of response to load all the objects of the page such as images, scripts, and style sheets.

- `clientRenderStartTime`

Time at which the browser starts to render the page.

- `clientRenderEndTime`

Time at which a browser finished rendering the entire page, including the embedded objects.

### **EIEs for database information**

- **dbProtocolName**  
An unsigned 8-bit number indicating the database protocol. Valid values are 1 for MS SQL and 2 for MySQL.
- **dbReqType**  
An unsigned 8-bit number indicating the database request method used in the transaction. For MS SQL, valid values are 1 is for QUERY, 2 is for TRANSACTION, and 3 is for RPC. For valid values for MySQL, see the MySQL documentation.
- **dbReqString**  
Indicates the database request string without the header.
- **dbRespStatus**  
An unsigned 64-bit number indicating the status of the database response received from the web server.
- **dbRespLength**  
An unsigned 64-bit number indicating the response size.
- **dbRespStatString**  
The response status string received from the web server.

## **Configuring the AppFlow Feature**

September 21, 2020

You configure AppFlow in the same manner as most other policy-based features. First, you enable the AppFlow feature. Then you specify the collectors to which the flow records are sent. After that, you define actions, which are sets of configured collectors. Then you configure one or more policies and associate an action to each policy. The policy tells the Citrix ADC appliance to select requests the flow records of which are sent to the associated action. Finally, you bind each policy either globally or to specific virtual server to put it into effect.

You can further set AppFlow parameters to specify the template refresh interval and to enable the exporting of httpURL, httpCookie, and httpReferer information. On each collector, you must specify the Citrix ADC IP address as the address of the exporter.

#### **Note**

For information about configuring the Citrix ADC as an exporter on the collector, see the docu-

mentation for the specific collector.

The configuration utility provides tools that help users define the policies and actions that determine exactly how the Citrix ADC appliance export records for a particular flow to a set of collectors(action.) The command line interface provides a corresponding set of CLI-based commands for experienced users who prefer a command line.

## Enabling AppFlow

To be able to use the AppFlow feature, you must first enable it.

### Note

AppFlow can be enabled only on nCore Citrix ADC appliances.

### To enable the AppFlow feature by using the command line interface

At the command prompt, type one of the following commands:

```
1 enable ns feature AppFlow
2 <!--NeedCopy-->
```

### To enable the AppFlow feature by using the configuration utility

Navigate to **System > Settings**, click **Configure Advanced Features**, and select the **AppFlow** option.

## Specifying a Collector

A collector receives AppFlow records generated by the Citrix ADC appliance. To send the AppFlow records, you must specify at least one collector. By default, the collector listens to IPFIX messages on UDP port 4739. You can change the default port, when configuring the collector. Similarly, by default, NSIP is used as the source IP for AppFlow traffic. You can change this default source IP to a SNIP address when configuring a collector. You can also remove unused collectors.

### To specify a collector by using the command line interface

#### Important

Starting from Citrix ADC release 12.1-55.13, you can specify the type of collector that you want to use. A new parameter “Transport” is introduced in the “add appflow collector” command. By default, the collector listens to IPFIX messages. You can change the type of collector to either log

stream or ipfix or rest by using “Transport” parameter. For more information on configuration, see example.

At the command prompt, type the following commands to add a collector and verify the configuration:

```
1 - add appflow collector <name> -IPAddress <ipaddress> -port <
    port_number> -netprofile <netprofile_name> -Transport <Transport>
2
3 - show appflow collector <name>
4 <!--NeedCopy-->
```

### Example

```
1 add appflow collector col1 -IPAddress 10.102.29.251 -port 8000 -
    netprofile n2 -Transport ipfix
2 <!--NeedCopy-->
```

### To specify multiple collectors by using the command line interface

At the command prompt, type the following commands to add and send same data to multiple collectors:

```
1 add appflow collector <collector1> -IPAddress <IP>
2
3 add appflow collector <collector2> -IPAddress <IP>
4
5 add appflow action <action> -collectors <collector1> <collector2>
6
7 add appflow policy <policy> true <action>
8
9 bind lbserver <lbserver> -policy <policy> -priority <priority>
10 <!--NeedCopy-->
```

### To specify one or more collectors by using the configuration utility

Navigate to **System > AppFlow > Collectors**, and create the AppFlow collector.

### Configuring an AppFlow Action

An AppFlow action is a set collector, to which the flow records are sent if the associated AppFlow policy matches.

### To configure an AppFlow action by using the command line interface

At the command prompt, type the following commands to configure an AppFlow action and verify the configuration:

```
1 add appflow action <name> --collectors <string> ... [-
    clientSideMeasurements (Enabled|Disabled) ] [-comment <string>]
2
3 show appflow action
4 <!--NeedCopy-->
```

### Example

```
1 add appflow action apfl-act-collector-1-and-3 -collectors collector-1
    collector-3
2 <!--NeedCopy-->
```

### To configure an AppFlow action by using the configuration utility

Navigate to **System > AppFlow > Actions**, and create the AppFlow action.

### Configuring an AppFlow Policy

After you configure an AppFlow action, you must next configure an AppFlow policy. An AppFlow policy is based on a rule, which consists of one or more expressions.

#### Note

For creating and managing AppFlow policies, the configuration utility provides assistance that is not available at the command line interface.

### To configure an AppFlow policy by using the command line interface

At the command prompt, type the following command to add an AppFlow policy and verify the configuration:

```
1 add appflow policy <name> <rule> <action>
2
3 show appflow policy <name>
4 <!--NeedCopy-->
```

**Example**

```
1 add appflow policy apfl-pol-tcp-dsprt client.TCP.DSTPORT.EQ(22) apfl-act-collector-1-and-3
2 <!--NeedCopy-->
```

**To configure an AppFlow policy by using the configuration utility**

Navigate to **System > AppFlow > Policies**, and create the AppFlow policy.

**To add an expression by using the Add Expression dialog box**

1. In the Add Expression dialog box, in the first list box choose the first term for your expression.
  - HTTP  
The HTTP protocol. Choose the option if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - SSL  
The protected websites. Choose the option if you want to examine some aspect of the request that pertains to the recipient of the request.
  - CLIENT  
The computer that sent the request. Choose the option if you want to examine some aspect of the sender of the request.  
When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
2. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
3. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

**Binding an AppFlow Policy**

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the Citrix ADC, or to a specific virtual server, so that the policy applies only to the traffic related to that virtual server.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the Citrix ADC operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first. Later, the policy assigned with a priority of 100, and finally the policy assigned an order of 1000.

You can leave yourself plenty of a room to add other policies in any order, and still set them to evaluate in the order you want. You can set priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add more policies at any time without having to change the priority of an existing policy.

### To globally bind an AppFlow policy by using the command line interface

At the command prompt, type the following command to globally bind an AppFlow policy and verify the configuration:

```
1 bind appflow global <policyName> <priority> [<gotoPriorityExpression [-  
    type <type>] [-invoke (<labelType> <labelName>)]  
2  
3 show appflow global  
4 <!--NeedCopy-->
```

### Example

```
1 bind appflow global af_policy_lb1_10.102.71.190 1 NEXT -type  
    REQ_OVERRIDE -invoke vserver google  
2 <!--NeedCopy-->
```

### To bind an AppFlow policy to a specific virtual server by using the command line interface

At the command prompt, type the following command to bind an AppFlow policy to a specific virtual server and verify the configuration:

```
1 bind lb vserver <name> -policyname <policy_name> -priority <priority>  
2 <!--NeedCopy-->
```

### Example

```
1 bind lb vserver google -policyname af_policy_google_10.102.19.179 -
   priority 251
2 <!--NeedCopy-->
```

### To globally bind an AppFlow policy by using the configuration utility

Navigate to **System > AppFlow**, click **AppFlow policy Manager**, and select the relevant Bind Point (Default Global) and Connection Type, and then bind the AppFlow policy.

### To bind an AppFlow policy to a specific virtual server by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select the virtual server, and click **Policies**, and bind the AppFlow policy.

### Enabling AppFlow for Virtual Servers

If you want to monitor only the traffic through certain virtual servers, enable AppFlow specifically for those virtual servers. You can enable AppFlow for load balancing, content switching, cache redirection, SSL VPN, GSLB, and authentication virtual servers.

### To enable AppFlow for a virtual server by using the command line interface

At the command prompt, type:

```
1 set cs vserver <name> <protocol> <IPAddress> <port> -appflowLog ENABLED
2 <!--NeedCopy-->
```

### Example

```
1 set cs vserver Vserver-CS-1 HTTP 10.102.29.161 80 -appflowLog ENABLED
2 <!--NeedCopy-->
```

### To enable AppFlow for a virtual server by using the configuration utility

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select the virtual server, and enable AppFlow Logging option.

### Enabling AppFlow for a Service

You can enable AppFlow for services that are to be bound to the load balancing virtual servers.

### To enable AppFlow for a service by using the command line interface

At the command prompt, type:

```
1 set service <name> -appflowLog ENABLED
2 <!--NeedCopy-->
```

### Example

```
1 set service ser -appflowLog ENABLED
2 <!--NeedCopy-->
```

### To enable AppFlow for a service by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Services**, select the service, and enable AppFlow Logging option.

### Setting the AppFlow Parameters

You can set AppFlow parameters to customize the exporting of data to the collectors.

### To set the AppFlow Parameters by using the command line interface

#### Important

Starting from Citrix ADC release 12.1–55.13, you can use the NSIP to send Log stream records instead of the SNIP. A new parameter “logstreamOverNSIP” is introduced in the “set appflow param” command. By default, the “logstreamOverNSIP” parameter is DISABLED, you need to “ENABLE” it. For more information on configuration, see example.

At the command prompt, type the following commands to set the AppFlow parameters and verify the settings:

```
1 - set appflow param [-templateRefresh <secs>] [-appnameRefresh <secs>]
   [-flowRecordInterval <secs>] [-udpPmtu <positive_integer>] [-
   httpUrl ( **ENABLED** | **DISABLED** )] [-httpCookie ( **ENABLED** |
   **DISABLED** )] [-httpReferer ( **ENABLED** | **DISABLED** )] [-
   httpMethod ( **ENABLED** | **DISABLED** )] [-httpHost ( **ENABLED**
   | **DISABLED** )] [-httpUserAgent ( **ENABLED** | **DISABLED** )] [-
   httpXForwardedFor ( **ENABLED** | **DISABLED** )] [-clientTrafficOnly
   ( **YES** | **NO** )] [-logstreamOverNSIP ( **ENABLED** | **DISABLED
   ** )]
2
```

```
3 - show appflow Param
4 <!--NeedCopy-->
```

### Example

```
1 set appflow Param -templateRefresh 240 -udpPmtu 128 -httpUrl enabled -
  logstreamOverNSIP ENABLED
2 <!--NeedCopy-->
```

### To set the AppFlow parameters by using the configuration utility

Navigate to **System > AppFlow**, click **Change AppFlow Settings**, and specify relevant AppFlow parameters.

### Example: Configuring AppFlow for DataStream

The following example illustrates the procedure for configuring AppFlow for DataStream using the command line interface.

```
1 enable feature appflow
2
3 add db user sa password freebsd
4
5 add lbvserver lb0 MSSQL 10.102.147.97 1433 -appflowLog ENABLED
6
7 add service sv0 10.103.24.132 MSSQL 1433 -appflowLog ENABLED
8
9 bind lbvserver lb0 sv0
10
11 add appflow collector col0 -IPAddress 10.102.147.90
12
13 add appflow action act0 -collectors col0
14
15 add appflow policy pol0 "mssql.req.query.text.contains('select')" act0
16
17 bind lbvserver lb0 -policyName pol0 -priority 10
18 <!--NeedCopy-->
```

When the Citrix ADC appliance receives a database request, the appliance evaluates the request against a configured policy. If a match is found, the details are sent to the AppFlow collector configured in the policy.

## Exporting Performance Data of Web Pages to AppFlow Collector

September 21, 2020

The EdgeSight Monitoring application provides web page monitoring data with which you can monitor the performance of various Web applications served in a Citrix ADC environment. You can now export this data to AppFlow collectors to get an in-depth analysis of the web page applications. AppFlow, which is based on IPFIX standard, provides more specific information about web application performance than does EdgeSight monitoring alone.

You can configure both load balancing and content switching virtual servers to export EdgeSight Monitoring data to AppFlow collectors. Before configuring a virtual server for AppFlow export, associate an Appflow action with the EdgeSight Monitoring responder policy.

The following web page performance data is exported to AppFlow:

- **Page Load Time.** Elapsed time, in milliseconds, from when the browser starts to receive the first byte of a response until the user starts to interact with the page. At this stage, all the page content might not be loaded.
- **Page Render Time.** Elapsed time, in milliseconds, from when the browser receives the first byte of response until either all page content has been rendered or the page load action has timed out.
- **Time Spent on the Page.** Time spent by users on a page. Represents the period of time from one page request to the next one.

AppFlow transmits the performance data by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. The AppFlow templates use the following enterprise-specific Information Elements (IEs) to export the information:

- **Client Load End Time.** Time at which the browser received the last byte of a response to load all the objects of the page such as images, scripts, and stylesheets.
- **Client Load Start Time.** Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and stylesheets.
- **Client Render End Time.** Time at which browser finished rendering the entire page, including the embedded objects.
- **Client Render Start Time.** Time at which the browser started rendering the page.

### Prerequisites for Exporting Performance Data of Web Pages to AppFlow Collectors

Before associating the AppFlow action with the AppFlow policy, verify that the following prerequisites have been met:

- The AppFlow feature has been enabled and configured.

- The Responder feature has been enabled.
- The EdgeSight Monitoring feature has been enabled.
- EdgeSight Monitoring has been enabled on the load balancing or content switching virtual servers bound to the services of applications for which you want to collect the performance data.

### Associating an AppFlow Action with the EdgeSight Monitoring Responder Policy

To export the web page performance data to the AppFlow collector, you must associate an AppFlow action with the EdgeSight Monitoring responder policy. An AppFlow action specifies which set of collectors receive the traffic.

#### To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the command line interface

At the command prompt, type:

```
1 set responder policy <name> -appflowAction <action_Name>
2 <!--NeedCopy-->
```

#### Example

```
1 set responder policy pol -appflowAction actn
2 <!--NeedCopy-->
```

#### To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the configuration utility

1. Navigate to **AppExpert > Responder > Policies**.
2. In the details pane, select an EdgeSight Monitoring responder policy, and then click **Open**.
3. In the **Configure Responder Policy** dialog box, in the **AppFlow Action** drop-down list, select the AppFlow action associated with the collectors to which you want to send the web-page performance data.
4. Click **OK**.

### Configuring a Virtual Server to Export EdgeSight Statistics to Appflow Collectors

To export EdgeSight statistics information from a virtual server to the AppFlow collector, you must associate an AppFlow action with the virtual server.

**To associate an AppFlow action with a Load Balancing or Content Switching virtual server by using the configuration utility**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**. You can also navigate to **Traffic Management > Content Switching > Virtual Servers**.
2. In the details pane, select a virtual server, or multiple virtual servers, and then click **Enable EdgeSight Monitoring**.
3. In the Enable EdgeSight Monitoring dialog box, select the **Export EdgeSight statistics to Appflow** check box.
4. From the Appflow Action drop-down list, select the **AppFlow** action. The AppFlow action defines the list of AppFlow collectors to which it exports EdgeSight Monitoring statistics. If you have selected multiple load balancing virtual servers, the same AppFlow Action will be associated with the responder policies bound to them. You can later change the AppFlow Action configured for each of the selected Load Balancing virtual server individually, if required.
5. Click **OK**.

**Session Reliability on Citrix ADC High Availability Pair**

January 4, 2021

When a network disruption or a device failover occurs during an ICA session, session reconnection can use one of two mechanisms: Session Reliability or Auto Client Reconnect.

**Session Reliability.** The preferred mode, is a seamless experience for the user. The disruption is barely noticeable for brief network interruptions.

**Auto Client Reconnect.** The fallback option, involves restarting the client. This mechanism is disruptive for the user and is not always supported.

Receivers can now reconnect their ICA sessions seamlessly using the ICA Session Reliability feature, when HDX Insight is enabled.

This feature works both in standalone and in a Citrix ADC HA pair configuration, and even when a Citrix ADC failover happens.

**Note**

- Citrix ADC appliances must be running on software version 11.1 build 49.16 or later.
- Do not enable or disable Session Reliability mode when the Citrix ADC appliances have active connections.
- Enabling or disabling the feature when connections are still active causes HDX Insight to stop parsing those sessions after a failover occurs and result in loss of information about the sessions.

- Session Reliability on a high availability setup is disabled by default for Citrix ADC software version 11.1 49.16 or later. Session Reliability is supported on a high availability setup only if both the nodes of the setup run the same build (for example, release 11.1 build 53). In other words, session reliability is not supported on a high availability setup if both the nodes run different builds (for example, one node has release 11.1 build 53 whereas the other has release 11.1 build 56).
- When HDX Insight is enabled, basic encryption applications and desktops reconnect after high availability failover even if the `EnableSRonHAFailover` parameter is disabled.

#### To configure Session reliability from Citrix ADC CLI:

1. At the command line, use the default system administrator credentials to log on to the system.
2. To enable Session Reliability on HA failover, at the prompt, type: `set ica parameter EnableSRonHAFailover YES`
3. To disable Session Reliability on HA failover, at the prompt, type: `set ica parameter EnableSRonHAFailover NO`

#### To Enable Session reliability on HA failover from Citrix ADC GUI:

1. In a web browser, type the IP address of the primary Citrix ADC instance in the HA pair (for example, <http://192.168.100.1>).
2. In **User Name** and **Password**, enter the administrator credentials.
3. On the **Configuration** tab, navigate to **System > Settings**, and click **Change ICA Parameters**.
4. In the **Change ICA Parameters section**, select **Session Reliability on HA Failover**.
5. Click **OK**.

#### Limitations

- Enabling this feature results in increased bandwidth consumption which is due to ICA compression being turned off by the feature, and the extra traffic between the primary and secondary nodes to keep them in sync.
- This feature is supported in Active-Passive mode only. Active-Active mode is not currently supported.
- When HDX Insight is enabled, and Session Reliability on the HA knob is set to NO, only ACR reconnect mode is supported in the Citrix ADC high availability failover scenario. The HA knob does not disable Session Reliability if HDX Insight is disabled.

The **Session Reconnect Semantics** table is as follows:

#### Session Reconnect Semantics

| Status               | EnableSRonHAFailover Yes                   | EnableSRonHAFailover No (Default)                   |
|----------------------|--------------------------------------------|-----------------------------------------------------|
| HDX Insight enabled  | Session reconnect for ICA<br>Session works | Session reconnect for ICA<br>Sessions does not work |
| HDX Insight disabled | Session reconnect for ICA<br>Session works | Session reconnect for ICA<br>Sessions works         |

### Points to note

- Session Reliability for ICA sessions works out of the box with Citrix Gateway.
- Session Reliability for ICA sessions does not work ONLY when both the following conditions are met:
  - HDX Insight is enabled
  - EnableSRonHAFailover is set to NO
- Setting the `EnableSRonHAFailover` knob to either YES or NO does not make any difference, when HDX Insight is disabled.

## Citrix Web App Firewall

April 5, 2021

The following topics cover installation and configuration of the Citrix Web App Firewall feature.

|                             |                                                                                                                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction                | An overview of web security and how the Web App Firewall works.                                                                                                                                   |
| Configuration               | How to configure the Web App Firewall to protect a web site, a web service, or a Web 2.0 site.                                                                                                    |
| Signatures                  | A detailed description of the signatures feature and how to configure the signatures, add signatures from a supported vulnerability scanning tool, and define your own signatures, with examples. |
| Overview of Security Checks | A detailed description of all of the Web App Firewall security checks, with configuration information and examples.                                                                               |

---

|                               |                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Profiles                      | A description of how profiles are configured and used in the Web App Firewall.                                                                   |
| Policies                      | A description of how policies are used when configuring the Web App Firewall, with examples of useful policies.                                  |
| Imports                       | A description of how the Web App Firewall uses different types of imported files, and how to import and export files.                            |
| Global Configuration          | A description of Web App Firewall features that apply to all profiles, and how to configure them.                                                |
| Use Cases                     | Extended examples that demonstrate how to set up the Web App Firewall to best protect specific types of more complex web sites and web services. |
| Logs, Statistics, and Reports | How to access and use the Web App Firewall logs, the statistics, and the reports to assist in configuring the Web App Firewall.                  |

---

The Citrix Web App Firewall offers easy to configure options to meet a wide range of application security requirements. Web App Firewall profiles, which consist of sets of security checks, can be used to protect both the requests and the responses by providing deep packet-level inspections. Each profile includes an option to select basic protections or advanced protections. Some protections might require use of other files. For example, xml validation checks might require WSDL or schema files. The profiles can also use other files, such as signatures or error objects. These files can be added locally, or they can be imported ahead of time and saved on the appliance for future use.

Profiles work in conjunction with the Web App Firewall policies. Each policy identifies a type of traffic, and that traffic is inspected for the security check violations specified in the profile that is associated with the policy. The policies can have different bind points, which determine the scope of the policy. For example, a policy that is bound to a specific virtual server is invoked and evaluated for only the traffic flowing through that virtual server. The policies are evaluated in the order of their designated priorities, and the first one that matches the request or response is applied.

- Quick Deployment of Web App Firewall Protection

You can use the following procedure for quick deployment of Web App Firewall security:

1. Add an appfw profile and select the appropriate type (html, xml, JSON) for the security requirements of the application.
  2. Select the required level of security (basic or advanced).
  3. Add or import the required files, such as signatures or WSDL.
  4. Configure the profile to use the files, and make any other necessary changes to the default settings.
  5. Add an appfw policy for this profile.
  6. Bind the policy to the target bind point and specify the priority.
- Web App Firewall entities

**Profile**—An Web App Firewall profile specifies what to look for and what to do. It inspects both the request and the response to determine which potential security violations should be checked and what actions should be taken when processing a transaction. A profile can protect an HTML, XML or HTML and XML payload. Depending on the security requirements of the application, you can create either a basic or an advanced profile. A basic profile can protect against known attacks. If higher security is required, you can deploy an advanced profile to allow controlled access to the application resources, blocking zero day attacks. However, a basic profile can be modified to offer advanced protections, and vice versa. Multiple action choices (for example, block, log, learn, and transform) are available. Advanced security checks might use session cookies and hidden form tags for controlling and monitoring the client connections. Web App Firewall profiles can learn the triggered violations and suggest the relaxation rules.

**Basic Protections**—A basic profile includes a preconfigured set of Start URL and Deny URL relaxation rules. These relaxation rules determine which requests should be allowed and which should be denied. Incoming requests are matched against these lists and the configured actions are applied. This allows the user to be able to secure applications with minimal configuration for relaxation rules. The Start URL rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-site scripting can also be easily detected.

**Advanced Protections**—As the name indicates, advanced protections are used for applications that have higher security requirements. Relaxation rules are configured to allow access to only specific data and block the rest. This positive security model mitigates unknown attacks, which might not be detected by basic security checks. In addition to all the basic protections, an advanced profile keeps track of a user session by controlling the browsing, checking for cookies, specifying input requirements for various form fields, and protecting against tampering of forms or cross-site request forgery attacks. Learning, which observes the traffic and deploys the appropriate relaxations, is enabled by default for many security checks. Although easy to use, advanced protections require due consideration, because they offer tighter security but also require more processing and do not allow use of caching, which can affect performance.

**Import**—Import functionality is useful when Web App Firewall profiles need to use external files, that is, files hosted on an external or internal web server, or that have to be copied from a local machine. Importing a file and storing it on the appliance is very useful, especially in situations where you have to control access to external websites, or where compilation takes a long time, large files have to be synced across HA deployments, or you can reuse a file by copying it across multiple devices. For example:

- WSDLs hosted on external web servers can be imported locally before blocking access to external websites.
- Large signature files generated by an external scan tool such as Cenzic can be imported and precompiled, using schema on the Citrix appliance.
- A customized HTML or XML error page can be imported from an external web server or copied from a local file.

**Signatures**—Signatures are very powerful, because they use pattern matching to detect malicious attacks and can be configured to check both the request and the response of a transaction. They are a preferred option when a customizable security solution is needed. Multiple choices (for example, block, log, learn, and transform) are available for the action to take when a signature match is detected. The Web App Firewall has a built-in default signature object consisting of more than 1,300 signature rules, with an option to get the latest rules by using the auto-update feature. Rules created by other scan tools can also be imported. The signature object can be customized by adding new rules, which can work in conjunction with the other security checks specified in the Web App Firewall profile. A signature rule can have multiple patterns and can flag a violation only when all the patterns are matched, thereby avoiding false positives. Careful selection of a literal fastmatch pattern for a rule can significantly optimize processing time.

**Policies**—Web App Firewall Policies are used to filter and separate the traffic into different types. This provides the flexibility to implement different levels of security protections for the application data. Access to highly sensitive data can be directed to advanced security-check inspections, while less sensitive data is protected by basic-level security inspections. Policies can also be configured to bypass security-check inspection for harmless traffic. Higher security requires more processing, so careful design of the policies can provide desired security along with optimized performance. The priority of the policy determines the order in which it is evaluated, and its bind point determines the scope of its application.

## Highlights

1. Ability to secure a wide range of applications by protecting different types of data, implementing the right level of security for different resources, and still getting maximum performance.
2. Flexibility to add or modify a security configuration. You can tighten or relax security checks by enabling or disabling basic and advanced protections.

3. Option to convert an HTML profile to an XML or Web2.0 (HTML+XML) profile and vice-versa, providing the flexibility to add security for different types of payload.
4. Easily deployed actions to block attacks, monitor them in logs, collect statistics, or even transform some attack strings to render them harmless.
5. Ability to detect attacks by inspecting incoming requests, and to prevent leakage of sensitive data by inspecting the responses sent by the servers.
6. Capability to learn from the traffic pattern to get recommendations for easily editable relaxation rules that can be deployed to allow exceptions.
7. Hybrid security model that applies the power of customizable signatures to block attacks that match specified patterns, and provides the flexibility to use the positive-security-model checks for basic or advanced security protections.
8. Availability of comprehensive configuration reports, including information about PCI-DSS compliance.

## FAQs and Deployment Guide

October 23, 2020

### Q: Why is Citrix Web App Firewall the preferred choice for securing applications?

With the following features, the Citrix Web App Firewall offers a comprehensive security solution:

- **Hybrid security model:** Citrix ADC hybrid security model allows you to take advantage of both a positive security model and a negative security model to come up with a configuration ideally suited for your applications.
  - **Positive security model** protects against Buffer Overflow, CGI-BIN Parameter Manipulation, Form/Hidden Field Manipulation, Forceful Browsing, Cookie or Session Poisoning, Broken ACLs, Cross-Site Scripting (XSS), Command Injection, SQL Injection, Error Triggering Sensitive Information Leak, Insecure Use of Cryptography, Server Misconfiguration, Back Doors and Debug Options, Rate-Based Policy Enforcement, Well Known Platform Vulnerabilities, Zero-Day Exploits, Cross Site Request Forgery (CSRF), and leakage of Credit Card and other sensitive data.
  - **Negative security model** uses a rich set signatures to protect against L7 and HTTP application vulnerabilities. The Web App Firewall is integrated with several third party scanning tools, such as those offered by Cenzic, Qualys, Whitehat, and IBM. The built-in XSLT files allow easy importation of rules, which can be used in conjunction with the native-format Snort based rules. An auto-update feature gets the latest updates for new vulnerabilities.

The positive security model might be the preferred choice for protecting applications that have a high need for security, because it gives you the option to fully control who can access what data. You allow

only what you want and block the rest. This model includes a built-in security check configuration, which is deployable with few clicks. However, keep in mind that the tighter the security, the greater the processing overhead.

The negative security model might be preferable for customized applications. The signatures allow you to combine multiple conditions, and a match and the specified action are triggered only when all the conditions are satisfied. You block only what you don't want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. The option to add your own signature rules, based on the specific security needs of your applications, gives you the flexibility to design your own customized security solutions.

- **Request as well as response side detection and protection:** You can inspect the incoming requests to detect any suspicious behavior and take appropriate actions, and you can check the responses to detect and protect against leakage of sensitive data.
- **Rich set of built-in protections for HTML, XML and JSON payloads:** The Web App Firewall offers 19 different security checks. Six of them (such as Start URL and Deny URL) apply to both HTML and XML data. Five checks (such as Field Consistency and Field Format) are specific to HTML, and eight (such as XML Format and Web Service Interoperability) are specific to XML payloads. This feature includes a rich set of actions and options. For example, URL Closure enables you to control and optimize the navigation through your website, to safeguard against forceful browsing without having to configure relaxation rules to allow each and every legitimate URL. You have the option to remove or x-out the sensitive data, such as credit-card numbers, in the response. Be it SOAP Array attack protection, XML denial of Service (XDoS), WSDL scan prevention, Attachment check, or any number of other XML attacks, you have the comfort of knowing that you have an ironclad shield protecting your data when your applications are protected by the Web App Firewall. The signatures allow you to configure rules using XPATH-Expressions to detect violations in the body as well as the header of a JSON payload.
- **GWT:** Support for protecting Google Web Toolkit applications to safeguard against SQL, XSS and Form Field Consistency check violations.
- **Java-free, user friendly graphical user interface (GUI):** An intuitive GUI and preconfigured security checks make it easy to deploy security by clicking a few buttons. A wizard prompts and guides you to create the required elements, such as profiles, policies, signatures, and bindings. The HTML5 based GUI is free of any Java dependency. It's performance is significantly better than that of the older, Java based versions.
- **Easy to Use and automatable CLI:** Most of the configuration options that are available in GUI are also available in the command line interface (CLI). The CLI commands can be executed by a batch file and are easy to automate.
- **Support for REST API:** The Citrix ADC NITRO protocol supports a rich set of REST API's to automate Web App Firewall configuration and collect pertinent statistics for ongoing monitoring of

security violations.

- **Learning:** The Web App Firewall's ability to learn by monitoring traffic to fine tune security is very user friendly. The learning engine recommends rules, which makes it easy to deploy relaxations without proficiency in regular expressions.
- **RegEx editor support:** Regular expression offer an elegant solution to the dilemma of wanting to consolidate rules and yet optimize search. You can capitalize on the power of regular expressions to configure URLs, field names, signature patterns, and so on. The rich built-in GUI RegEx editor offers you a quick reference for the expressions and provides a convenient way to validate and test your RegEx for accuracy.
- **Customized error page:** Blocked requests can be redirected to an error URL. You also have the option to display a customized error object that uses supported variables and Citrix default syntax (advanced PI expressions) to embed troubleshooting information for the client.
- **PCI-DSS, stats, and other violation reports:** The rich set of reports makes it easy to meet the PCI-DSS compliance requirement, gather stats about traffic counters, and view violation reports for all profiles or just one profile.
- **Logging and click-to-rule from log:** Detailed logging is supported for native as well as CEF format. The Web App Firewall offers you the ability to filter targeted log messages in the syslog viewer. You can select a log message and deploy a corresponding relaxation rule by a simple click of a button. You have the flexibility to customize log messages and also have support for generating web logs. For additional details, see [Web App Firewall Logstopic](#).
- **Include violation logs in trace records:** The ability to include log messages in the trace records makes it very easy to debug unexpected behavior such as reset and block.
- **Cloning:** The useful Import/Export profile option allows you to clone the security configuration from one Citrix ADC appliance to others. Export learned data options make it easy to export the learned rules to an Excel file. You can then get them reviewed and approved by application owner before applying them.
- **An AppExpert template** (a set of configuration settings) can be designed to provide appropriate protection for your websites. You can simplify and expedite the process of deploying similar protection on other appliances by exporting these cookie-cutter templates to a template.

For additional details, see [AppExpert template topic](#).

- **Sessionless security checks:** Deploying sessionless security checks can help you reduce the memory footprint and expedite the processing.
- **Interoperability with other Citrix ADC features:** The Web App Firewall works seamlessly with other Citrix ADC features, such as rewrite, URL transformation, integrated caching, CVPN, and rate limiting.

- **Support of PI expressions in policies:** You can leverage the power of advanced PI expressions to design policies to implement different levels of security for different parts of your application.
- **Support for IPv6:** The Web App Firewall supports both IPv4 and IPv6 protocols.
- **Geolocation based security protection:** You have the flexibility of using Citrix default syntax (PI Expressions) for configuring location based policies, which can be used in conjunction with a built-in location database to customize firewall protection. You can identify the locations from which malicious requests originate, and enforce the desired level of security-check inspections for requests that originate from a specific geographical location.
- **Performance:** Request-side **streaming** significantly improves performance. As soon as a field is processed, the resulting data is forwarded to the back end while evaluation continues for the remaining fields. The improvement in processing time is especially significant when handling large posts.
- **Other security features:** The Web App Firewall has several other security knobs that can help ensure the security of your data. For example, the **Confidential Field** lets you block leakage of sensitive information in the log messages, and **Strip HTML Comment** allows you to remove the HTML comments from the response before forwarding it to the client. **Field Types** can be used to specify what inputs are allowed in the forms submitted to your application.

### **Q: What do I need to do to configure Web App Firewall?**

Do the following:

- Add an Web App Firewall profile and select the appropriate type (html, xml, web2.0) for the security requirements of the application.
- Select the required level of security (basic or advanced).
- Add or import the required files, such as signatures or WSDL.
- Configure the profile to use the files, and make any other necessary changes to the default settings.
- Add an Web App Firewall policy for this profile.
- Bind the policy to the target bind point and specify the priority.

### **Q: How do I know what profile type to choose?**

The Web App Firewall profile offers protection for both HTML and XML payloads. Depending on the need of your application, you can choose either a HTML profile or XML profile. If your application supports both HTML and XML data, you can choose a Web2.0 profile.

**Q: What is the difference between basic and advanced profiles? How do I decide which one I need?**

The decision to use a basic or an advanced profile depends on the security need of your application. A basic profile includes a preconfigured set of Start URL and Deny URL relaxation rules. These relaxation rules determine which requests are allowed and which are denied. Incoming requests are matched with the preconfigured rules, and the configured actions are applied. The user can secure applications with minimal configuration of relaxation rules. The Start URL rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-Site Scripting can also be easily detected.

As the name indicates, advanced protections are for applications that have higher security requirements. Relaxation rules are configured to allow access to only specific data and block the rest. This positive security model mitigates unknown attacks, which might not be detected by basic security checks. In addition to all the basic protections, an advanced profile keeps track of a user session by controlling the browsing, checking for cookies, specifying input requirements for various form fields, and protecting against tampering of forms or Cross-Site Request Forgery attacks. Learning, which observes the traffic and recommends the appropriate relaxations, is enabled by default for many security checks. Although easy to use, advanced protections require due consideration, because they offer tighter security but also require more processing. Some advanced security checks do not allow use of caching, which can affect performance.

Keep the following points in mind when deciding whether to use basic or advanced profiles:

- Basic and advanced profiles are just starting templates. You can always modify the basic profile to deploy advanced security features, and vice versa.
- Advanced security checks require more processing and can affect performance. Unless your application needs advanced security, you might want to start with a basic profile and tighten the security as required for your application.
- You do not want to enable all security checks unless your application needs it.

**Q: What is a policy? How do I select the bind point and set the priority?**

Web App Firewall policies can help you sort your traffic into logical groups for configuring different levels of security implementation. Carefully select the bind points for the policies to determine which traffic is matched against which policy. For example, if you want every incoming request to be checked for SQL/XSS attacks, you can create a generic policy and bind it globally. Or, if you want to apply more stringent security checks to the traffic of a virtual server hosting applications that contain sensitive data, you can bind a policy to that virtual server.

Careful assignment of priorities can enhance the traffic processing. You want to assign higher priorities to more specific policies and lower priorities to generic policies. Note that the higher the number,

the lower the priority. A policy with a priority of 10 is evaluated before a policy that has a priority of 15.

You can apply different levels of security for different kinds of contents, e.g. requests for static objects like images and text can be by-passed by using one policy and requests for other sensitive contents can be subjected to a much stringent check by using a second policy.

### **Q: How do I go about configuring the rules to secure my application?**

The Web App Firewall makes it very easy to design the right level of security for your web-site. You can have multiple Web App Firewall policies, bound to different Web App Firewall profiles, to implement different levels of security-check inspections for your applications. You can initially monitor the logs to observe what security threats are being detected and which violations are being triggered. You can either manually add the relaxation rules or take advantage of the Web App Firewall's recommended learned rules to deploy the required relaxations to avoid false positives.

The Citrix Web App Firewall offers **visualizer** support in GUI, which makes rule management very easy. You can easily view all the data on one screen, and take action on several rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate several rules. You can select a subset of the rules, basing your selection on the delimiter and Action URL. Visualizer support is available for viewing 1) learned rules and 2) relaxation rules.

1. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. You can also skip (ignore) rules.
2. The visualizer for deployed relaxations offers you the option to add a new rule or edit an existing one. You can also enable or disable a group of rules by selecting a node and clicking the **Enable** or **Disable** button in the relaxation visualizer.

### **Q: What are signatures? How do I know which signatures to use?**

A signature is an object that can have multiple rules. Each rule consists of one or more patterns that can be associated with a specified set of actions. The Web App Firewall has a built-in default signature object consisting of more than 1,300 signature rules, with an option to get the latest rules by using the **auto-update** feature to get protection against new vulnerabilities. Rules created by other scan tools can also be imported.

Signatures are very powerful because they use pattern matching to detect malicious attacks and can be configured to check both the request and the response of a transaction. They are a preferred option when a customizable security solution is needed. Multiple action choices (for example, block, log, learn, and transform) are available for when a signature match is detected. The default signatures cover rules to protect different types of applications, such as web-cgi, web-coldfusion, web-frontpage,

web-iis, web-php, web-client, web-activex, web-shell-shock, and web-struts. To match the needs of your application, you can select and deploy the rules belonging to a specific category.

Signature-usage tips:

- You can just make a copy of the default signature object and modify it to enable the rules you need and configure the actions you want.
- The signature object can be customized by adding new rules, which can work in conjunction with other signature rules.
- The signature rules can also be configured to work in conjunction with the security checks specified in the Web App Firewall profile. If a match indicating a violation is detected by a signature as well as a security check, the more restrictive action is the one that gets enforced.
- A signature rule can have multiple patterns and be configured to flag a violation only when all the patterns are matched, thereby avoiding false positives.
- Careful selection of a literal fast-match pattern for a rule can significantly optimize processing time.

### **Q: Does the Web App Firewall work with other Citrix ADC features?**

The Web App Firewall is fully integrated into the Citrix ADC appliance and works seamlessly with other features. You can configure maximum security for your application by using other Citrix ADC security features in conjunction with the Web App Firewall. For example, **AAA-TM** can be used to authenticate the user, check the user's authorization to access the content, and log the accesses, including invalid login attempts. **Rewrite** can be used to modify the URL or to add, modify or delete headers, and **Responder** can be used to deliver customized content to different users. You can define the maximum load for your website by using **Rate Limiting** to monitor the traffic and throttle the rate if it is too high. **HTTP Denial-of-Service (DoS)** protection can help distinguish between real HTTP clients and malicious DoS clients. You can narrow the scope of security-check inspection by binding the Web App Firewall policies to virtual servers, while still optimizing the user experience by using the **Load Balancing** feature to manage heavily used applications. Requests for static objects such as images or text can bypass security check inspection, taking advantage of **integrated caching** or **compression** to optimize the bandwidth usage for such content.

### **Q: How is the payload processed by the Web App Firewall and the other Citrix ADC features?**

A diagram showing details of the L7 packet flow in a Citrix ADC appliance is available in the [Processing Order of Features](#) section.

**Q: What is the recommended workflow for Web App Firewall deployment?**

Now that you know the advantages of using the state-of-the-art security protections of the Citrix Web App Firewall, you might want to collect additional information that can help you design the optimal solution for your security needs. Citrix recommends that you do the following:

- **Know your environment:** Knowing your environment will help you to identify the best security protection solution (signatures, security checks, or both) for your needs. Before you begin configuration, you should gather the following information.
  - **OS:** What kind of OS (MS Windows, Linux, BSD, Unix, others) do you have?
  - **Web Server:** What web server (IIS, Apache or Citrix ADC Enterprise Server) are you running?
  - **Application:** What type of applications are running on your application server (for example, ASP.NET, PHP, Cold Fusion, ActiveX, FrontPage, Struts, CGI, Apache Tomcat, Domino, and WebLogic)?
  - Do you have customized applications or off-the-shelf (for example, Oracle, SAP) applications? What version you are using?
  - **SSL:** Do you require SSL? If so, what key size (512, 1024, 2048, 4096) is used for signing certificates?
  - **Traffic Volume:** What is the average traffic rate through your applications? Do you have seasonal or time-specific spikes in the traffic?
  - **Server Farm:** How many servers do you have? Do you need to use load balancing?
  - **Database:** What type of database (MS-SQL, MySQL, Oracle, Postgres, SQLite, nosql, Sybase, Informix etc.) do you use?
  - **DB Connectivity:** What kind of data base connectivity do you have (DSN, per-file connection string, single file connection string) and what drivers are used?
- **Identify your security needs:** You might want to evaluate which applications or specific data need maximum security protection, which ones are less vulnerable, and the ones for which security inspection can safely be bypassed. This will help you in coming up with an optimal configuration, and in designing appropriate policies and bind points to segregate the traffic. For example, you might want to configure a policy to bypass security inspection of requests for static web content, such as images, MP3 files, and movies, and configure another policy to apply advanced security checks to requests for dynamic content. You can use multiple policies and profiles to protect different contents of the same application.
- **License requirement:** Citrix offers a unified solution to optimize the performance of your application by taking advantage of a rich set of features such as load balancing, content switching, caching, compression, responder, rewrite, and content filtering, to name a few. Identifying the features that you want can help you decide which license you need.
- **Install and baseline a Citrix ADC appliance:** Create a virtual server and run test traffic through it to get an idea of the rate and amount of traffic flowing through your system. This information will help you to identify your capacity requirement and select the right appliance (VPX, MPX, or SDX).

- **Deploy the Web App Firewall:** Use the Web App Firewall wizard to proceed with a simple security configuration. The wizard walks you through several screens and prompts you to add a profile, policy, signature, and security checks.
  - **Profile:** Select a meaningful name and the appropriate type (HTML, XML or WEB 2.0) for your profile. The policy and signatures will be auto-generated using the same name.
  - **Policy:** The auto-generated policy has the default Expression (true), which selects all traffic and is bound globally. This is a good starting point unless you have in mind a specific policy that you want to use.
  - **Protections:** The wizard helps you take advantage of the hybrid security model, in which you can use the default signatures offering a rich set of rules to protect different types of applications. **Simple** edit mode allows you to view the various categories (CGI, Cold Fusion, PHP, etc.). You can select one or more categories to identify a specific set of rules applicable to your application. Use the **Action** option to enable all the signature rules in the selected categories. Make sure that blocking is disabled, so that you can monitor the traffic before tightening the security. Click **Continue**. In the **Specify Deep protections** pane, you can make changes as needed to deploy the security check protections. In most cases, basic protections are sufficient for initial security configuration. Run the traffic for a while to collect a representative sample of the security-inspection data.
  - **Tightening the security:** After deploying Web App Firewall and observing the traffic for a while, you can start tightening the security of your applications by deploying relaxations and then enabling blocking. **Learning**, **Visualizer**, and **Click to deploy rules** are useful features that make it very easy to tweak your configuration to come up with just the right level of relaxation. At this point, you can also change the policy expression and/or configure additional policies and profiles to implement desired levels of security for different types of content.
  - **Debugging:** If you see unexpected behavior of your application, the Web App Firewall offers various options for easy debugging:
    - \* **Log.** If legitimate requests are getting blocked, your first step is to check the ns.log file to see if any unexpected security-check violation is being triggered.
    - \* **Disable feature.** If you do not see any violations but are still seeing unexpected behavior, such as an application resetting or sending partial responses, you can disable the Web App Firewall feature for debugging. If the issue persists, it rules out the Web App Firewall as a suspect.
    - \* **Trace records with log messages.** If the issue appears to be Web App Firewall related and needs closer inspection, you have the option to include security violation messages in an nstrace. You can use “Follow TCP stream” in the trace to view the details of the individual transaction, including headers, payload, and the corresponding log message, together on the same screen. Details of how to use this functionality are available at [Appendixes](#).

## Introduction

October 23, 2020

The Citrix Web App Firewall prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking those that exhibit such activity. Your site is protected not only from common types of attacks, but also from new, as yet unknown attacks. In addition to protecting web servers and web sites from unauthorized access and misuse by hackers and malicious programs, the Web App Firewall provides protection against security vulnerabilities in legacy CGI code or scripts, other web frameworks, web server software, and the underlying operating systems.

The Citrix Web App Firewall is available as a stand-alone appliance, or as a feature on a Citrix ADC virtual appliance (VPX). In the Web App Firewall documentation, the term Citrix ADC refers to the platform on which the Web App Firewall is running, regardless of whether that platform is a dedicated firewall appliance, a Citrix ADC on which other features have also been configured, or a Citrix ADC VPX.

To use the Web App Firewall, you must create at least one security configuration to block connections that violate the rules that you set for your protected web sites. The number of security configurations that you might want to create depends on the complexity of your web site. In some cases, a single configuration is sufficient. In other cases, particularly those that include interactive web sites, web sites that access database servers, online stores with shopping carts, you might need several different configurations to best protect sensitive data without wasting significant effort on content that is not vulnerable to certain types of attacks. You can often leave the defaults for the global settings, which affect all security configurations, unchanged. However, you can change the global settings if they conflict with other parts of your configuration or you prefer to customize them.

## Web application security

September 21, 2020

Web application security is network security for computers and programs that communicate by using the HTTP and HTTPS protocols. This is an extremely broad area in which security flaws and weaknesses abound. Operating systems on both servers and clients have security issues and are vulnerable to attack. Web server software and web site enabling technologies such as CGI, Java, JavaScript, PERL and PHP have underlying vulnerabilities. Browsers and other client applications that communicate with web-enabled applications also have vulnerabilities. Web sites that use any technology but

the simplest of HTML, including any site that allows interaction with visitors, often have vulnerabilities of their own.

In the past, a breach in security was often just an annoyance, but today that is seldom the case. For example, attacks in which a hacker gained access to a web server and made unauthorized modifications to (defaced) a web site used to be common. They were usually launched by hackers who had no motivation beyond demonstrating their skills to fellow hackers or embarrassing the targeted person or company. Most current security breaches, however, are motivated by a desire for money. The majority attempt to accomplish one or both of the following goals: to obtain sensitive and potentially valuable private information, or to obtain unauthorized access to and control of a web site or web server.

Certain forms of web attacks focus on obtaining private information. These attacks are often possible even against web sites that are secure enough to prevent an attacker from taking full control. The information that an attacker can obtain from a web site can include customer names, addresses, phone numbers, social security numbers, credit card numbers, medical records, and other private information. The attacker can then use this information or sell it to others. Much of the information obtained by such attacks is protected by law, and all of it by custom and expectation. A breach of this type can have extremely serious consequences for customers whose private information is compromised. At best, these customers will have to exercise vigilance to prevent others from abusing their credit cards, opening unauthorized credit accounts in their name, or appropriating their identities outright (identity theft). At worst, the customers may face ruined credit ratings or even be blamed for criminal activities in which they had no part.

Other web attacks are aimed at obtaining control of (or *compromising*) a web site or the server on which it operates, or both. A hacker who gains control of a web site or server can use it to host unauthorized content, act as a proxy for content hosted on another web server, provide SMTP services to send unsolicited bulk email, or provide DNS services to support such activities on other compromised web servers. Most web sites that are hosted on compromised web servers promote questionable or outright fraudulent businesses. For example, the majority of phishing web sites and child exploitation web sites are hosted on compromised web servers.

Protecting your web sites and web services against these attacks requires a multilayered defense capable of both blocking known attacks with identifiable characteristics and protecting against unknown attacks, which can often be detected because they look different from the normal traffic to your web sites and web services.

### **Known web attacks**

The first line of defense for your web sites is protection against the large number of attacks that are known to exist and have been observed and analyzed by web security experts. Common types of attacks against HTML-based web sites include:

- **Buffer overflow attacks.** Sending an extremely long URL, extremely long cookie, or other extremely long bit of information to a web server in hopes of causing it or the underlying operating system to hang, crash, or provide the attacker with access to the underlying operating system. A buffer overflow attack can be used to gain access to unauthorized information, to compromise a web server, or both.
- **Cookie security attacks.** Sending a modified cookie to a web server, usually in hopes of obtaining access to unauthorized content by using falsified credentials.
- **Forceful browsing.** Accessing URLs on a web site directly, without navigating to the URLs by means of hyperlinks on the home page or other common start URLs on the web site. Individual instances of forceful browsing may simply indicate a user who bookmarked a page on your web site, but repeated attempts to access nonexistent content, or content that users should never access directly, often represent an attack on web site security. Forceful browsing is normally used to gain access to unauthorized information, but can also be combined with a buffer overflow attack in an attempt to compromise your server.
- **Web form security attacks.** Sending inappropriate content to your web site in a web form. Inappropriate content can include modified hidden fields, HTML or code in a field intended for alphanumeric data only, an overly long string in a field that accepts only a short string, an alphanumeric string in a field that accepts only an integer, and a wide variety of other data that your web site does not expect to receive in that web form. A web form security attack can be used either to obtain unauthorized information from your web site or to compromise the web site outright, usually when combined with a buffer overflow attack.

Two specialized types of attacks on web form security deserve special mention:

- **SQL injection attacks.** Sending an active SQL command or commands in a web form or as part of a URL, with the goal of causing an SQL database to execute the command or commands. SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a URL or a script on a web page to violate the same-origin policy, which forbids any script from obtaining properties from or modifying any content on a different web site. Since scripts can obtain information and modify files on your web site, allowing a script access to content on a different web site can provide an attacker the means to obtain unauthorized information, to compromise a web server, or both.

Attacks against XML-based web services normally fall into at least one of the following two categories: attempts to send inappropriate content to a web service, or attempts to breach security on a web service. Common types of attacks against XML-based web services include:

- **Malicious code or objects.** XML requests that contain code or objects that can either directly obtain sensitive information or can give an attacker control of the web service or underlying server.
- **Badly-formed XML requests.** XML requests that do not conform to the W3C XML specification, and that can therefore breach security on an insecure web service

- **Denial of service (DoS) attacks.** XML requests that are sent repeatedly and in high volume, with the intent of overwhelming the targeted web service and denying legitimate users access to the web service.

In addition to standard XML-based attacks, XML web services and Web 2.0 sites are also vulnerable to SQL injection and cross-site scripting attacks, as described below:

- **SQL injection attacks.** Sending an active SQL command or commands in an XML-based request, with the goal of causing an SQL database to execute that command or commands. As with HTML SQL injection attacks, XML SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a script included in an XML based application to violate the same-origin policy, which does not allow any script to obtain properties from or modify any content on a different application. Since scripts can obtain information and modify files by using your XML application, allowing a script access to content belonging to a different application can give an attacker the means to obtain unauthorized information, to compromise the application, or both

Known web attacks can usually be stopped by filtering web site traffic for specific characteristics (signatures) that always appear for a specific attack and should never appear in legitimate traffic. This approach has the advantages of requiring relatively few resources and posing relatively little risk of false positives. It is therefore a valuable tool in fighting attacks on web sites and web services, and configuring basic signature protections that intercept most known web attacks is easy to do.

### Unknown web attacks

The greatest threat against web sites and applications does not come from known attacks, but from unknown attacks. Most unknown attacks fall into one of two categories: newly-launched attacks for which security firms have not yet developed an effective defense (zero-day attacks), and carefully-targeted attacks on a specific web site or web service rather than many web sites or web services (spear attacks). These attacks, like known attacks, are usually intended to obtain sensitive private information, compromise the web site or web service and allow it to be used for further attacks, or both of those goals.

Zero-day attacks are a major threat to all users. These attacks are usually of the same types as known attacks; zero-day attacks often involve injected SQL, a cross-site script, a cross-site request forgery, or another type of attack similar to known attacks. In most cases, they target vulnerabilities that the developers of the targeted software, web site, or web service either are unaware of or have just learned about. Security firms have therefore usually not developed defenses against these attacks, and even if they have, users have usually not obtained and installed the patches or performed the workarounds necessary to protect against these attacks. The time between discovery of a zero-day attack and availability of a defense (the vulnerability window) is shrinking, but perpetrators can still count on hours

or even days in which many web sites and web services lack any specific protection against the attack.

Spear attacks are a major threat, but to a more select group of users. A common type of spear attack, a spear phish, is usually targeted at customers of a specific bank or financial institution, or (less commonly) at employees of a specific company or organization. Unlike other phishes, which are often crudely written forgeries that a user with any familiarity with the actual communications of that bank or financial institution can recognize, spear phishes are letter perfect and extremely convincing. They can contain information specific to the individual that, at first look, no stranger should know or be able to obtain. The spear phisher is therefore able to convince his or her target to provide the requested information, which the phisher can then use to loot accounts, to process illegitimately obtained money from other sources, or to gain access to other, even more sensitive information.

Both of these types of attack have certain characteristics that can usually be detected, although not by using static patterns that look for specific characteristics, as do standard signatures. Detecting these types of attacks requires more sophisticated and more resource-intensive approaches, such as heuristic filtering and positive security model systems. Heuristic filtering looks, not for specific patterns, but for patterns of behaviors. Positive security model systems model the normal behavior of the web site or web service that they are protecting, and then block connections that do not fit within that model of normal use. URL based and web-form based security checks profile normal use of your web sites, and then control how users interact with your web sites, using both heuristics and positive security to block anomalous or unexpected traffic. Both heuristic and positive security, properly designed and deployed, can catch most attacks that signatures miss. However, they require considerably more resources than do signatures, and you must spend some time configuring them properly to avoid false positives. They are therefore usually used, not as the primary line of defense, but as backups to signatures or other less resource-intensive approaches.

By configuring these advanced protections in addition to signatures, you create a hybrid security model, which enables the Web App Firewall to provide comprehensive protection against both known and unknown attacks.

## **How Web App Firewall works**

September 21, 2020

When you install the Web App Firewall, you create an initial security configuration, which consists of a policy, a profile, and a signatures object. The policy is a rule that identifies the traffic to be filtered, and the profile identifies the patterns and types of behavior to allow or block when the traffic is filtered. The simplest patterns, which are called signatures, are not specified within the profile, but in a signatures object that is associated with the profile.

A signature is a string or pattern that matches a known type of attack. The Web App Firewall con-

tains over a thousand signatures in seven categories, each directed at attacks on specific types of web servers and web content. Citrix updates the list with new signatures as new threats are identified. During configuration, you specify the signature categories that are appropriate for the web servers and content that you need to protect. Signatures provide good basic protection with low processing overhead. If your applications have special vulnerabilities or you detect an attack against them for which no signature exists, you can add your own signatures.

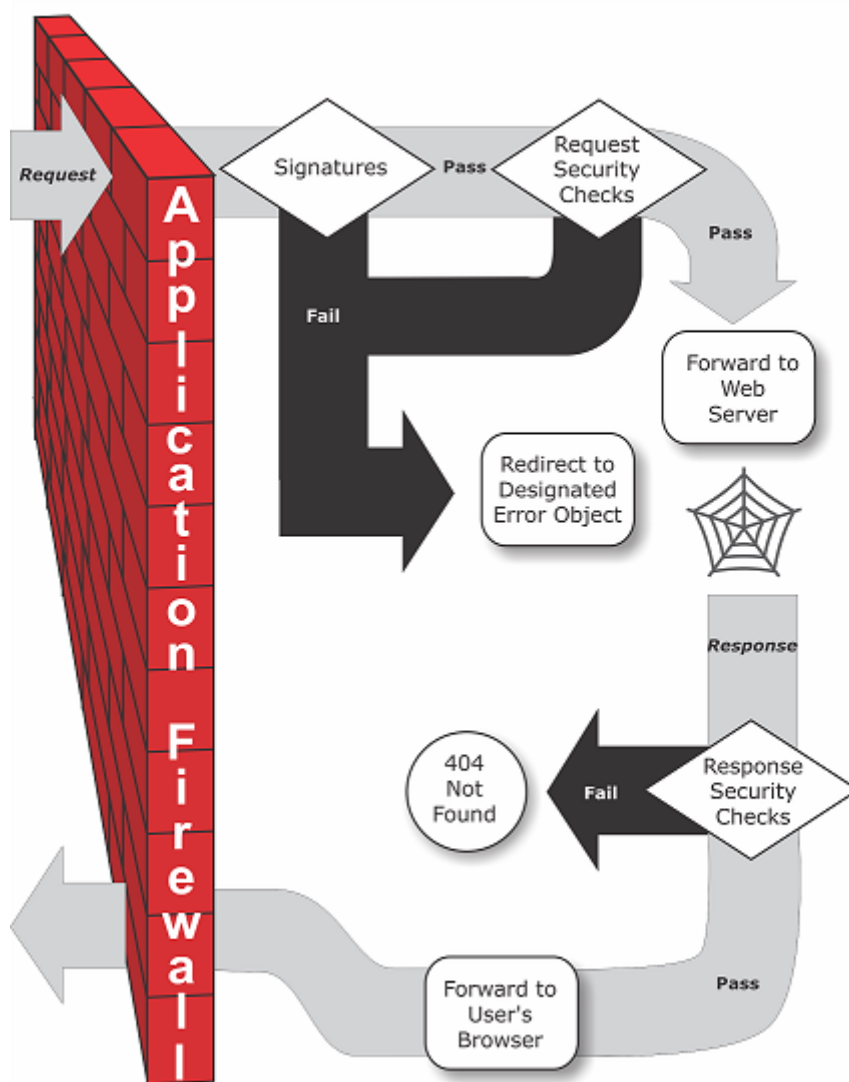

The more advanced protections are called security checks. A security check is a more rigorous, algorithmic inspection of a request for specific patterns or types of behavior that might indicate an attack or constitute a threat to your protected web sites and web services. It can, for example, identify a request that attempts to perform a certain type of operation that might breach security, or a response that includes sensitive private information such as a social security number or credit card number. During configuration, you specify the security checks that are appropriate for the web servers and content that you need to protect. The security checks are restrictive. Many of them can block legitimate requests and responses if you do not add the appropriate exceptions (relaxations) when configuring them. Identifying the needed exceptions is not difficult if you use the adaptive learning feature, which observes normal use of your web site and creates recommended exceptions.

The Web App Firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between your servers and your users, usually behind your company's router or firewall. It must be installed in a location where it can intercept traffic between the web servers that you want to protect and the hub or switch through which users access those web servers. You then configure the network to send requests to the Web App Firewall instead of directly to your web servers, and responses to the Web App Firewall instead of directly to your users. The Web App Firewall filters that traffic before forwarding it to its final destination, using both its internal rule set and your additions and modifications. It blocks or renders harmless any activity that it detects as harmful, and then forwards the remaining traffic to the web server. The following figure provides an overview of the filtering process.

**Note:**

The figure omits the application of a policy to incoming traffic. It illustrates a security configuration in which the policy is to process all requests. Also, in this configuration, a signatures object has been configured and associated with the profile, and security checks have been configured in the profile.

Figure 1. A Flowchart of Web App Firewall Filtering

As the figure shows, when a user requests a URL on a protected web site, the Web App Firewall first examines the request to ensure that it does not match a signature. If the request matches a signature, the Web App Firewall either displays the error object (a web page that is located on the Web App Firewall appliance and which you can configure by using the imports feature) or forwards the request to the designated error URL (the error page). Signatures do not require as many resources as do security checks, so detecting and stopping attacks that are detected by a signature before running any of the security checks reduces the load on the server.

If a request passes signature inspection, the Web App Firewall applies the request security checks that have been enabled. The request security checks verify that the request is appropriate for your web site or web service and does not contain material that might pose a threat. For example, security checks examine the request for signs indicating that it might be of an unexpected type, request unexpected content, or contain unexpected and possibly malicious web form data, SQL commands, or scripts. If the request fails a security check, the Web App Firewall either sanitizes the request and then sends it

back to the Citrix ADC appliance (or Citrix ADC virtual appliance), or displays the error object. If the request passes the security checks, it is sent back to the Citrix ADC appliance, which completes any other processing and forwards the request to the protected web server.

When the web site or web service sends a response to the user, the Web App Firewall applies the response security checks that have been enabled. The response security checks examine the response for leaks of sensitive private information, signs of web site defacement, or other content that should not be present. If the response fails a security check, the Web App Firewall either removes the content that should not be present or blocks the response. If the response passes the security checks, it is sent back to the Citrix ADC appliance, which forwards it to the user.

### **Web App Firewall features**

The basic Web App Firewall features are policies, profiles, and signatures, which provide a hybrid security model as described in [“Known Web Attacks,”](#) [“Unknown Web Attacks,”](#) and [“How the Web App Firewall Works.”](#) Of special note is the learning feature, which observes traffic to your protected applications and recommends appropriate configuration settings for certain security checks.

The imports feature manages files that you upload to the Web App Firewall. These files are then used by the Web App Firewall in various security checks, or when responding to a connection that matches a security check.

You can use the logs, statistics, and reports features to evaluate the performance of the Web App Firewall and identify possible needs for additional protections.

## **The Web App Firewall configuration interfaces**

September 21, 2020

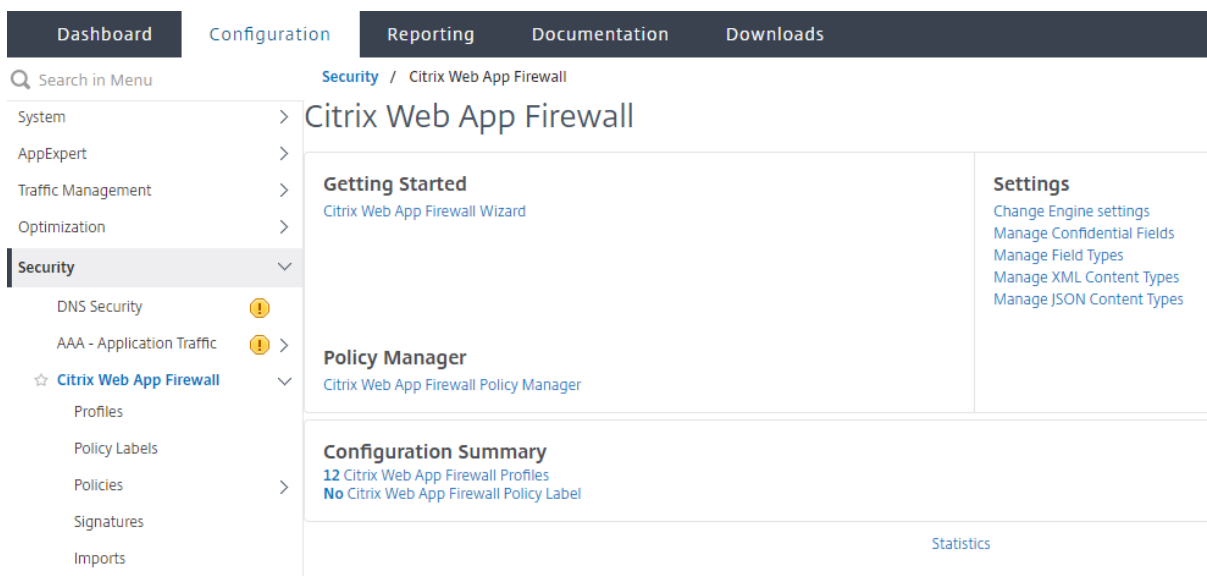

May 24, 2018

All hardware and virtual versions of the Citrix ADC application delivery controller (appliance) can be configured and managed from the Citrix ADC command line interface or the web-based GUI. All features of most Citrix ADC features can be configured using either of these tools. The Citrix Web App Firewall is an exception: not all Web App Firewall configuration tasks can be performed at the command line. Inexperienced users also find the GUI easier to use. In particular, the Web App Firewall wizard considerably reduces the complexity of configuring the Web App Firewall. Unlike most Citrix ADC wizards, the Web App Firewall wizard can serve as your primary interface to the Web App Firewall.

The command line interface is a modified UNIX shell based on the FreeBSD bash shell. To configure the Web App Firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. For instructions for using the command

line interface, see [Command Reference] (<https://developer-docs.citrix.com/projects/netscaler-command-reference/en/12.0/appfw/application-firewall-commands/>).

The GUI is a web-based GUI interface to the appliance. The Web App Firewall configuration section is found under Security > Web App Firewall. Figure 1 shows the navigation pane expanded to display the Web App Firewall screens, and in the detail pane the main Web App Firewall screen.

The GUI has two main areas on all screens. The panel on the left, called the navigation pane, contains a navigation tree, with which you navigate to the screens on which you configure the features that are installed on your appliance. The screens to which you navigate appear to the right of the navigation pane, in the details pane.

When you access the GUI, the details pane displays the System Overview screen. If, in the navigation pane, you click plus sign next to the Web App Firewall folder, the Web App Firewall node expands to include the main Web App Firewall elements that you can configure. If you click the first element, Profiles, the details pane displays the configured profiles, if any profiles have been configured. At the bottom of the details pane, you can click Add to configure a new profile. Other buttons at the bottom of the details pane are grayed out until you select an existing profile. Screens for the other elements work in the same way.

If, instead of expanding the Web App Firewall node, you click the node itself, the details pane displays different options, one of which is the Web App Firewall wizard, as shown in Figure 1. Citrix recommends that you use the wizard for initial configuration, and many users use it almost exclusively. It includes most of the functionality that is available elsewhere in the GUI.

For information and instructions on accessing the GUI, see “[Citrix ADC Getting Started Guide](#).”

## Configuring the Web App Firewall

September 21, 2020

You can configure the Citrix Web App Firewall (Web App Firewall) by using any of the following methods:

- **Web App Firewall Wizard.** A dialog box consisting of a series of screens that step you through the configuration process.
- **Citrix Web Interface AppExpert Template.** A AppExpert template (a set of configuration settings) that are designed to provide appropriate protection for web sites. This AppExpert template contains appropriate Web App Firewall configuration settings for protecting many web sites.
- **Citrix ADC GUI.** The web-based configuration interface.
- **Citrix ADC Command Line Interface.** The command line configuration interface.

Citrix recommends that you use the Web App Firewall Wizard. Most users will find it the easiest method to configure the Web App Firewall, and it is designed to prevent mistakes. If you have a new Citrix ADC or VPX that you will use primarily to protect web sites, you may find the Web Interface AppExpert template a better option because it provides a good default configuration, not just for the Web App Firewall, but for the entire appliance. Both the GUI and the command line interface are intended for experienced users, primarily to modify an existing configuration or use advanced options.

### The Web App Firewall Wizard

The Web App Firewall wizard is a dialog box that consists of several screens that prompt you to configure each part of a simple configuration. The Web App Firewall then creates the appropriate configuration elements from the information that you give it. This is the simplest and, for most purposes, the best way to configure the Web App Firewall.

To use the wizard, connect to the GUI with the browser of your choice. When the connection is established, verify that the Web App Firewall is enabled, and then run the Web App Firewall wizard, which prompts you for configuration information. You do not have to provide all of the requested information the first time you use the wizard. Instead, you can accept default settings, perform a few relatively straightforward configuration tasks to enable important features, and then allow the Web App Firewall to collect important information to help you complete the configuration.

For example, when the wizard prompts you to specify a rule for selecting the traffic to be processed, you can accept the default, which selects all traffic. When it presents you with a list of signatures, you can enable the appropriate categories of signatures and turn on the collection of statistics for those signatures. For this initial configuration, you can skip the advanced protections (security checks). The wizard automatically creates the appropriate policy, signatures object, and profile (collectively,

the security configuration), and binds the policy to global. The Web App Firewall then begins filtering connections to your protected websites, logging any connections that match one or more of the signatures that you enabled and collecting statistics about the connections that each signature matches. After the Web App Firewall processes some traffic, you can run the wizard again and examine the logs and statistics to see if any of the signatures that you have enabled are matching legitimate traffic. After determining which signatures are identifying the traffic that you want to block, you can enable blocking for those signatures. If your website or web service is not complex, does not use SQL, and does not have access to sensitive private information, this basic security configuration will probably provide adequate protection.

You may need additional protection if, for example, your website is dynamic. Content that uses scripts may need protection against cross-site scripting attacks. Web content that uses SQL—such as shopping carts, many blogs, and most content management systems—may need protection against SQL injection attacks. Websites and web services that collect sensitive private information such as social security numbers or credit card numbers may require protection against unintentional exposure of that information. Certain types of web-server or XML-server software may require protection from types of attacks tailored to that software. Another consideration is that specific elements of your websites or web services may require different protection than do other elements. Examining the Web App Firewall logs and statistics can help you identify the additional protections that you might need.

After deciding which advanced protections are needed for your websites and web services, you can run the wizard again to configure those protections. Certain security checks require that you enter exceptions (relaxations) to prevent the check from blocking legitimate traffic. You can do so manually, but it is usually easier to enable the adaptive learning feature and allow it to recommend the necessary relaxation. You can use the wizard as many times as necessary to enhance your basic security configuration and/or create additional security configurations.

The wizard automates some tasks that you would have to perform manually if you did not use the wizard. It automatically creates a policy, a signatures object, and a profile, and assigns them the name that you provided when you were prompted for the name of your configuration. The wizard also adds your advanced-protection settings to the profile, binds the signatures object to the profile, associates the profile with the policy, and puts the policy into effect by binding it to Global.

A few tasks cannot be performed in the wizard. You cannot use the wizard to bind a policy to a bind point other than Global. If you want the profile to apply to only a specific part of your configuration, you must manually configure the binding. You cannot configure the engine settings or certain other global configuration options in the wizard. While you can configure any of the advanced protection settings in the wizard, if you want to modify a specific setting in a single security check, it may be easier to do so on the manual configuration screens in the GUI.

For more information on using the Web App Firewall Wizard, see “[The Web App Firewall Wizard]/en-us/citrix-adc/12-1/application-firewall/configuring-application-firewall/using-wizard.html.”

## The Citrix Web Interface AppExpert Template

AppExpert Templates are a different and simpler approach to configuring and managing complex enterprise applications. The AppExpert display in the GUI consists of a table. Applications are listed in the left-most column, with the Citrix ADC features that are applicable to that application appearing each in its own column to the right. (In the AppExpert interface, those features that are associated with an application are called *application units*.) In the AppExpert interface, you configure the interesting traffic for each application, and turn on rules for compression, caching, rewrite, filtering, responder and the Web App Firewall, instead of having to configure each feature individually.

The Web Interface AppExpert Template contains rules for the following Web App Firewall signatures and security checks:

- “**Deny URL check.**” Detects connections to content that is known to pose a security risk, or to any other URLs that you designate.
- “**Buffer Overflow check.**” Detects attempts to cause a buffer overflow on a protected web server.
- “**Cookie Consistency check.**” Detects malicious modifications to cookies set by a protected web site.
- “**Form Field Consistency check.**” Detects modifications to the structure of a web form on a protected web site.
- “**CSRF Form Tagging check.**” Detects cross-site request forgery attacks.
- “**Field Formats check.**” Detects inappropriate information uploaded in web forms on a protected web site.
- “**HTML SQL Injection check.**” Detects attempts to inject unauthorized SQL code.
- “**HTML Cross-Site Scripting check.**” Detects cross-site scripting attacks.

For information on installing and using an AppExpert Template, see “[AppExpert Applications and Templates.](#)”

## The Citrix GUI

The GUI is a web-based interface that provides access to all configuration options for the Web App Firewall feature, including advanced configuration and management options that are not available from any other configuration tool or interface. Specifically, many advanced Signatures options can be configured only in the GUI. You can review recommendations generated by the learning feature only in the GUI. You can bind policies to a bind point other than Global only in the GUI.

For a description of the GUI, see “[The Web App Firewall Configuration Interfaces.](#)” For more information on using the GUI to configure the Web App Firewall, see “[Manual Configuration By Using the GUI.](#)”

For instructions on configuring the Web App Firewall by using the GUI, see “[Manual Configuration By Using the GUI.](#)” For information on the citrix-adc GUI, see “[The Web App Firewall Configuration Interfaces.](#)”

## The Citrix ADC command line interface

The Citrix ADC command line interface is a modified UNIX shell based on the FreeBSD bash shell. To configure the Web App Firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. You can configure most parameters and options for the Web App Firewall by using the NetScaler command line. Exceptions are the signatures feature, many of whose options can be configured only by using the GUI or the Web App Firewall wizard, and the learning feature, whose recommendations can only be reviewed in the GUI.

For instructions on configuring the Web App Firewall by using the Citrix ADC command line, see “[Manual Configuration By Using the Command Line Interface](#).”

## Enable Citrix Web App Firewall

September 21, 2020

Before you can create a security configuration, you must enable the Citrix Web App Firewall feature on the appliance.

### Points to remember

- If you are configuring a dedicated Citrix Web App Firewall appliance or upgrading an existing appliance, the feature is already enabled. You do not have to perform either of the procedures described here.
- If you have a new Citrix ADC or VPX, you must enable the Citrix Web App Firewall feature before you configure it.
- If you are upgrading a Citrix ADC or VPX from a previous version, you must first enable the Citrix Web App Firewall feature before you configure it.

#### Note:

If you are upgrading a Citrix ADC or VPX from a previous version, you might need to update the licenses on your appliance before you enable Citrix Web App Firewall. Check with your Citrix representative or reseller to obtain the correct license.

### Enable Citrix Web App Firewall by using the command interface

At the command prompt, type the following command:

```
enable ns feature AppFW
```

## Enable the Web App Firewall by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** page, select **Citrix Web App Firewall**.
4. Click **OK**.

### ← Configure Advanced Features

|                                                                |                                                             |

## The Web App Firewall wizard

October 23, 2020

Unlike most wizards, the Citrix Web App Firewall Wizard is designed not just to simplify the initial configuration process, but also to modify previously created configurations and to maintain your Web

App Firewall setup. A typical user runs the wizard multiple times, skipping some of the screens each time.

The Web App Firewall Wizard automatically creates profiles, policies, and signatures.

## Opening the wizard

To run the Web App Firewall Wizard, open the GUI and follow these steps:

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.

For more information about the GUI, see [“The Web App Firewall Configuration Interfaces.”](#)

## The Wizard screens

The Web App Firewall wizard displays the following screens on a tabular page:

**1. Specify Name:** on this screen, when creating a new security configuration, specify a meaningful name and the appropriate type (HTML, XML or WEB 2.0) for your profile. The default policy and signatures are auto-generated by using the same name.

### Profile Name

The name can begin with a letter, number, or the underscore symbol, and can consist of from 1 to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (\_) symbols. Choose a name that makes it easy for others to tell what content your new security configuration protects.

#### Note:

Because the wizard uses this name for both the policy and the profile, it is limited to 31 characters. Manually created policies can have names up to 127 characters in length.

When modifying an existing configuration, you select **Modify Existing Configuration** and then, in the Name drop-down list, select the name of the existing configuration that you want to modify.

#### Note:

Only policies that are bound to global or to a bind point appear in this list; you cannot modify an unbound policy by using the Application Firewall wizard. You must either manually bind it to Global or a bind point, or modify it manually. (For manual modification, in the GUI **Application Firewall > Policies > Firewall** pane, select the policy and click **Open**).

### Profile Type

You also select a profile type on this screen. The profile type determines the types of advanced protection (security checks) that can be configured. Because certain kinds of content are not vulnerable to certain types of security threats, restricting the list of available checks saves time during configuration. The types of Web App Firewall profiles are:

- Web Application (HTML). Any HTML-based Web site that does not use XML or Web 2.0 technologies.
- XML Application (XML, SOAP). Any XML-based Web service.
- Web 2.0 Application (HTML, XML, REST). Any Web 2.0 site that combines HTML and XML-based content, such as an ATOM-based site, a blog, an RSS feed, or a wiki.

**Note:** If you are unsure which type of content is used on your website, you can choose Web 2.0 Application to ensure that you protect all types of web application content.

**2. Specify Rule:** on this screen, you specify the policy rule (expression) that defines the traffic the current configuration examines. If you create an initial configuration to protect your websites and web services, you can accept the default value, **true**, which selects all web traffic .

If you want this security configuration to examine, not all HTTP traffic that is routed through the appliance, but specific traffic, you can write a policy rule specifying the traffic that you want it to examine. Rules are written in Citrix ADC expressions language, which is a fully functional object-oriented programming language.

**Note:** In addition to the default expressions syntax, for backward compatibility the Citrix ADC operating system supports the Citrix ADC classic expressions syntax on Citrix ADC Classic and nCore appliances and virtual appliances. Classic expressions are not supported on Citrix ADC Cluster appliances and virtual appliances. Current users who want to migrate their existing configurations to the Citrix ADC cluster must migrate any policies that contain classic expressions to the default expressions syntax.

- For a simple description of using the Citrix ADC expressions syntax to create Web App Firewall rules, and a list of useful rules, see [“Firewall Policies.”](#)
- For a detailed explanation of how to create policy rules in Citrix ADC expressions syntax, see [“Policies and Expressions.”](#)

**4. Select Signatures:** on this screen, you select the categories of signatures that you want to use to protect your web sites and web services.

This is not a mandatory step, and you can skip it if you want to and go to the **Specify Deep Protections** screen. If the Select Signatures screen is skipped, only a profile and associated policies are created, and the signatures are not created.

You can select **Create New Signature** or **Select Existing Signature**.

If you are creating a new security configuration, the signature categories that you select are enabled, and by default they are recorded in a new signatures object. The new signatures object is assigned the

same name that you entered on the Specify name screen as the name of the security configuration.

If you have previously configured signatures objects and want to use one of them as the signatures object associated with the security configuration that you are creating, click **Select Existing Signature** and select a signatures object from the Signatures list.

If you are modifying an existing security configuration, you can click Select Existing Signature and assign a different signatures object to the security configuration.

If you click Create New Signature, you can choose the edit mode as **Simple** or **Advanced**.

### 1. Specify Signature Protections (Simple mode)

The simple mode allows for easy configuration of the signature, with a preset list of protection definitions for common applications such as IIS (Internet Information Server), PHP and ActiveX. The default categories in Simple mode are:

- CGI. Protection against attacks on web sites that use CGI scripts in any language, including PERL scripts, Unix shell scripts, and Python scripts.
- Cold Fusion. Protection against attacks on web sites that use the Adobe Systems® ColdFusion® Web development platform.
- FrontPage. Protection against attacks on web sites that use the Microsoft® FrontPage® Web development platform.
- PHP. Protection against attacks on web sites that use the PHP open-source Web development scripting language.
- Client side. Protection against attacks on client-side tools used to access your protected web sites, such as Microsoft Internet Explorer, Mozilla Firefox, the Opera browser, and the Adobe Acrobat Reader.
- Microsoft IIS. Protection against attacks on Web sites that run the Microsoft Internet Information Server (IIS)
- Miscellaneous. Protection against attacks on other server-side tools, such as Web servers and database servers.

On this screen, you select the actions associated with the signature categories that you selected on the Select Signatures screen. The actions that you can configure are:

- Block
- Log
- Stats

By default the Log and Stats actions are enabled but not the Block action. To configure actions, click **Settings**. You can change the action settings of all the selected categories by using the **Action** drop-down menu.

## 1. Specify Signature Protections (Advanced mode)

The advanced mode allows for more granular control over the signature definitions and provides significantly more information. Use the advanced mode if you want complete control over signature definition.

The contents of this screen are the same as the contents of the Modify Signatures Object dialog box, as described in “[Configuring or Modifying a Signatures Object](#).” In this screen, you can configure actions either by clicking the **Actions** drop-down menu or the actions menu, which appears as a circle with three dots.

**7. Specify Deep Protections:** on this screen, you choose the advanced protections (also called security checks or simply checks) that you want to use to protect your web sites and web services. Which checks are available depends on the profile type that you chose on the Specify Name screen. All checks are available for Web 2.0 Application profiles.

For more information, see [Overview of Security Checks](#) and see “[Advanced Form Protections Checks](#).”

You configure the actions for the advanced protections that you have enabled. The actions that you can configure are:

- **Block:** blocks connections that match the signature. Disabled by default.
- **Log:** logs connections that match the signature for later analysis. Enabled by default.
- **Stats:** maintains statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.
- **Learn.** Observe traffic to this website or web service, and use connections that repeatedly violate this check to generate recommended exceptions to the check, or new rules for the check. Available only for some checks. For more information about the learning feature see “[Configuring and Using the Learning Feature](#),” and how learning works and how to configure exceptions (relaxations) or deploy learned rules for a check, see “[Manual Configuration By Using the GUI](#).”

To configure actions, select the protection by clicking the check box, and then click **Action Settings** to select the required actions. Select other parameters, if required, and then click **OK** to close the Action Settings window.

To view all logs for a specific check, select that check, and then click **Logs** to display the Syslog Viewer, as described in “[Web App Firewall Logs](#).” If a security check is blocking legitimate access to your protected web site or web service, you can create and implement a relaxation for that security check by selecting a log that shows the unwanted blocking, and then clicking **Deploy**.

After you completing specifying Action Settings, click **Finish** to complete the wizard.

Following are four procedures that show how to perform specific types of configuration by using the Web App Firewall wizard.

## Create a new configuration

Follow these steps to create a new firewall configuration and signature objects, by using the Application Firewall wizard.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall**. The wizard opens.

3. On the **Specify Name** screen, select **Create New Configuration**.
4. In the **Name** field, type a name, and then click **Next**.
5. In the **Specify Rule** screen, click **Next** again.
6. In the **Select Signatures** screen, select **Create New Signature** and **Simple** as the edit mode, and then click **Next**.
7. In the **Specify Signature Protections** screen, configure the required settings. For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see [Signatures](#).
8. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
9. When you complete, click **Finish** to close the Application Firewall wizard.

## Modify an existing configuration

Follow these steps to modify an existing configuration and existing signature categories.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.
3. On the **Specify Name** screen, select Modify Existing Configuration and, in the **Name** drop-down list, choose the security configuration that you created during new configuration, and then click **Next**.
4. In the **Specify Rule** screen, click Next to keep the default value “true.” If you want to modify the rule, follow the steps described in “[Configure a Custom Policy Expression](#).”
5. In the **Select Signatures** screen, click **Select Existing Signature**. From the **Existing Signature** drop-down menu, select the appropriate option, and then click **Next**. The advanced signature protection screen appears.  
**Note:** If you select an existing signature, the default edit mode for signature protected is advanced.
6. In the Specify Signature Protections screen, configure the required settings and click **Next**. For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see “[Signatures](#).”
7. In the **Specify Deep Protections** screen, configure the settings and click **Next**.
8. After you complete, click **Finish** to close the **Web App Firewall Wizard**.

## Create a new configuration without signatures

Follow these steps to use the Application Firewall Wizard to skip the Select Signatures screen and create a new configuration with just the profile and the associated policies but without any signatures.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.The wizard opens.
3. On the **Specify Name** screen, select **Create New Configuration**.
4. In the **Name** field, type a name, and then click **Next**.
5. In the **Specify Rule** screen, click **Next** again.
6. In the **Select Signatures** screen, click **Skip**.
7. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
8. When you complete, click **Finish** to close the Application Firewall Wizard.

## Configure a custom policy expression

Follow these steps to use the Application Firewall Wizard to create a specialized security configuration to protect only specific content. In this case, you create a new security configuration instead of modifying the initial configuration. This type of security configuration requires a custom rule, so that the policy applies the configuration to only the selected Web traffic.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Specify Name screen, type a name for your new security configuration in the Name text box, select the type of security configuration from the Type drop-down list, and then click **Next**.
4. On the **Specify Rule** screen, enter a rule that matches only that content that you want this web application to protect. Use the **Frequently Used Expressions** drop-down list and the **Expression Editor** to create a custom expression. When you complete, click **Next**.
5. In the **Select Signatures** screen, select the edit mode, and then click **Next**.
6. In the **Specify Signature Protections** screen, configure the required settings.
7. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
8. When you complete, click **Finish** to close the **Application Firewall Wizard**.

## Manual configuration

September 21, 2020

If you want to bind a profile to a bind point other than Global, you must manually configure the binding. Also, certain security checks require that you either manually enter the necessary exceptions or enable the learning feature to generate the exceptions that your Web sites and Web services need. Some of these tasks cannot be performed by using the Web App Firewall wizard.

If you are familiar with how the Web App Firewall works and prefer manual configuration, you can manually configure a signatures object and a profile, associate the signatures object with the profile, create a policy with a rule that matches the web traffic that you want to configure, and associate the policy with the profile. You then bind the policy to Global, or to a bind point, to put it into effect, and you have created a complete security configuration.

For manual configuration, you can use the GUI (a graphical interface) or the command line. Citrix recommends that you use the GUI. Not all configuration tasks can be performed at the command line. Certain tasks, such as enabling signatures and reviewing learned data, must be done in the GUI. Most other tasks are easier to perform in the GUI.

## Replicating configuration

When you use the GUI (GUI) or the command line interface (CLI) to manually configure the Web App Firewall, the configuration is saved in the `/nsconfig/ns.conf` file. You can use the commands in that file to replicate the configuration on another appliance. You can cut and paste the commands into the CLI one by one, or you can save multiple commands in a text file in the `/var/tmp` folder and run them as a batch file. Following is an example of running a batch file containing commands copied from the `/nsconfig/ns.conf` file of a different appliance:

```
> batch -f /var/tmp/appfw_add.txt
```

### Warning

Import commands are not saved in the `ns.conf` file. Before running commands from the `ns.conf` file to replicate the configuration on another appliance, you must import all the objects used in the configuration (for example, signatures, error page, WSDL, and Schema) to the appliance on which you will replicate the configuration. The `add` command to add an Web App Firewall profile saved in an `ns.conf` file might include the name of an imported object, but such a command might fail when executed on another appliance if the referenced object does not exist on that appliance.

## Manual configuration by using the Citrix ADC GUI

September 22, 2020

If you need to manually configure the Web App Firewall feature, Citrix recommends you to use the Citrix ADC GUI procedure.

### To create and configure signatures object

Before you can configure the signatures, you must create a signatures object from the appropriate default signatures object template. Assign the copy a new name, and then configure the copy. You cannot configure or modify the default signatures objects directly. The following procedure provides basic instructions for configuring a signatures object. For more detailed instructions, see [Manually Configuring the Signatures Feature](#).

1. Navigate to **Security > Citrix Web App firewall > Signatures**.
2. In the details pane, select the signatures object that you want to use as a template, and then click **Add**.

Your choices are:

- **Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
  - **XPath Injection.** Contains all of the items in the Default Signatures, and in addition, contains the XPath injection rules.
3. In the **Add Signatures Object** dialog box, type a name for your new signatures object, click **OK**, and then click **Close**. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (\_) symbols.
  4. Select the signatures object that you created, and then click **Open**.
  5. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.  
  
As you modify these options, the results that you specify are displayed in the Filtered Results window at the right. For more information about the categories of signatures, see [Signatures](#).
  6. In the **Filtered Results** area, configure the settings for a signature by selecting and clearing the appropriate checkboxes.
  7. When finished, finished, click **Close**.

### To create a Web App Firewall profile by using the GUI

Creating an Web App Firewall profile requires that you specify only a few configuration details.

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the details pane, click **Add**.
3. In the **Create Web App Firewall Profile** dialog box, type a name for your profile.  
  
The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (\_) symbols.
4. Choose the profile type from the drop-down list.
5. Click **Create**, and then click **Close**.

### To configure an Web App Firewall profile by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** dialog box, on the **Security Checks** tab, configure the security checks.

- To enable or disable an action for a check, in the list, select or clear the check box for that action.
- To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check.

You can also select a check and, at the bottom of the dialog box, click **Open** to display the **Configure Relaxation** dialog box or **Configure Rule** dialog box for that check. These dialog boxes also vary from check to check. Most of them include a **Checks** tab and a **General** tab. If the check supports relaxations or user-defined rules, the **Checks** tab includes an **Add** button, which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.) If relaxations have already been configured, you can select one and click **Open** to modify it.

- To review learned exceptions or rules for a check, select the check, and then click **Learned Violations**. In the **Manage Learned Rules** dialog box, select each learned exception or rule in turn.
  - To edit the exception or rule, and then add it to the list, click **Edit & Deploy**.
  - To accept the exception or rule without modification, click **Deploy**.
  - To remove the exception or rule from the list, click **Skip**.
- To refresh the list of exceptions or rules to be reviewed, click **Refresh**.
- To open the **Learning Visualizer** and use it to review learned rules, click **Visualizer**.
- To review the log entries for connections that matched a check, select the check, and then click **Logs**. You can use this information to determine which checks are matching attacks so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see [Logs, Statistics, and Reports](#).
- To completely disable a check, in the list, clear all of the check boxes to the right of that check.

#### 4. On the **Settings** tab, configure the profile settings.

- To associate the profile with the set of signatures that you previously created and configured, under **Common Settings**, choose that set of signatures in the **Signatures** drop-down list.

**Note:**

You may must use the scroll bar on the right of the dialog box to scroll down to display the **Common Settings** section.

- To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.

**Note:**

You must first upload the error object that you want to use in the Import pane.

- To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types.
5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile. For more information, see [Configure and Learning feature](#).
  6. Click **OK** to save your changes and return to the Profiles pane.

## Configuring a Web App Firewall rule or relaxation

You configure two different types of information in this dialog box, depending upon which security check you are configuring. Usually, you configure an exception (or relaxation) to the security check. If you are configuring the Deny URL check or the Field Formats check, you configure an addition (or rule). The process for either of these is the same.

### To configure a relaxation rule by using the Citrix ADC GUI

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** page, click **Relaxation Rule** from **Advanced Settings** section. The **Relaxation Rule** section contains the complete list of Web App Firewall relaxation rules.
4. Click a security rule that you want to configure, and then click **Edit**.
5. The URL Relaxation Rules page contains a list of actions and that you can configure for this rule and a list of existing relaxations or rules. The list might be empty if you have not either manually added any relaxations or approved any relaxations that were recommended by the learning engine. Beneath the list is a row of buttons that allow you to add, modify, delete, enable, or disable the relaxations on the list.
6. To add or modify a relaxation or a rule, do one of the following:
  - To add a new relaxation, click **Add**.
  - To modify an existing relaxation, select the relaxation that you want to modify, and then click **Open**.

The **Start URL Relaxation Rule** page is displayed. Except for the title, these dialog boxes are identical.

7. Fill in the dialog box as described below. The dialog boxes for each check are different. The list below covers all elements that might appear in any dialog box.
  - **Enabled check box** — Select to place this relaxation or rule in active use; clear to deactivate it.
  - **Attachment Content Type** — The Content-Type attribute of an XML attachment. In the text area, enter a regular expression that matches the Content-Type attribute of the XML attachments to allow.
  - **Action URL** — In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
  - **Cookie**—In the text area, enter a PCRE-format regular expression that defines the cookie.
  - **Field Name** — A web form field name element may be labeled Field Name, Form Field, or another similar name. In the text area, enter a PCRE-format regular expression that defines the name of the form field.
  - **From Origin URL** — In the text area, enter a PCRE-format regular expression that defines the URL that hosts the web form.
  - **From Action URL** — In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
  - **Name** — An XML element or attribute name. In the text area, enter a PCRE-format regular expression that defines the name of the element or attribute.
  - **URL** — A URL element may be labeled Action URL, Deny URL, Form Action URL, Form Origin URL, Start URL, or simply URL. In the text area, enter a PCRE-format regular expression that defines the URL.
  - **Format** — The format section contains multiple settings that include list boxes and text boxes. Any of the following can appear:
    - **Type** — Select a field type in the Type drop-down list. To add a new field type definition, click Manage—
    - **Minimum Length** — Type a positive integer that represents the minimum length in characters if you want to force users to fill in this field. Default: 0 (Allows field to be left blank.)
    - **Maximum length**—To limit the length of data in this field, type a positive integer that represents the maximum length in characters. Default: 65535
  - **Location** — Choose the element of the request that your relaxation applies to from the drop-down list. For HTML security checks, the choices are:

- FORMFIELD—Form fields in web forms.
- HEADER—Request headers.
- COOKIE—Set-Cookie headers.

For XML security checks, the choices are:

- ELEMENT—XML element.
- ATTRIBUTE—XML attribute.

- **Maximum Attachment Size** — The maximum size in bytes allowed for an XML attachment.
- **Comments** — In the text area, type a comment. Optional.

**Note:** For any element that requires a regular expression, you can type the regular expression, use the

Regex Tokens menu to insert regular expression elements and symbols directly into the text box, or click **Regex Editor** to open the **Add Regular Expression** dialog box, and use it to construct the expression.

8. To remove a relaxation or rule, select it, and then click **Delete**.
9. To enable a relaxation or rule, select it, and then click **Enable**.
10. To disable a relaxation or rule, select it, and then click **Disable**.
11. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click **Visualizer**, and use the display tools.

**Note:**

The **Visualizer** button does not appear on all check relaxation dialog boxes.

12. To review learned rules for this check, click Learning and perform the steps in [To configure and use the Learning feature](#)
13. Click **OK**.

### To configure the Learned Rules by using the Citrix ADC GUI

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. In the **Citrix Web App Firewall Profile** page, click **Learned Rules** from **Advanced Settings**. In the **Learned Rules** section you can see a list of security checks that are available in the current profile and that support the learning feature.
4. To configure the learning thresholds, select a security check, and click **Settings**.
5. In the **Dynamic Profiling and Learning Rules Settings** page, you can set the settings. For more information, see [Dynamic profile settings](#)

- **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1
  - **Percentage of times threshold.** Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0
6. To remove all learned data and reset the learning feature, so that it must start its observations again from the beginning, select **Remove All Learned Data** action.

**Note:**

This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.
  7. To restrict the learning engine to traffic from a specific set of IPs, click **Trusted Learning Clients**, and add the IP addresses that you want to use to the list.
    - a) To add an IP address or IP address range to the Trusted Learning Clients list, click **Add**.
    - b) In the **AppFirewall Profile to Trusted Client Binding** page, click **Add**.
    - c) Select the **Enabled** check box to enable the feature.
    - d) In Trusted Learning Client\*\* box, type the IP address or an IP address range in CIDR format.
    - e) In the **Comments** text area, type a comment that describes this IP address or range.
    - f) Click **Create** and **Close**.
  8. To modify an existing IP address or range, click the IP address or range, and then click **Edit**. Except for the name, the dialog box that appears is identical to the Add Trusted Learning Clients dialog box.
  9. To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click **Disable** or **Enable**, as appropriate.
  10. To remove an IP address or range completely, click the IP address or range, and then click **Delete**.
  11. Click **Close** to return to the **Citrix Web App Firewall Profile** page.

## To create a Citrix Web App Firewall policy by using the Citrix ADC GUI

1. Navigate to **Security > Citrix Web App firewall > Policies**.

2. In the **Policies** page, click **Citrix Web App Firewall Policy** link.
3. In the **Citrix Web App Firewall Policies** page, click **Add**.
4. In the **Create Citrix Web App Firewall Policy** page, set the following parameters.
  - a) Name. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (\_) symbols.
  - b) Profile. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a profile to associate with your policy by clicking New, and you can modify an existing profile by clicking **Modify**.
  - c) Expression. In the Expression text area, create a rule for your policy.
  - d) Log Action. Add a log action or you can modify an existing log action.
  - e) Comments. A brief description about the policy.
5. Click **Create** or **OK**, and then click **Close**.

#### ← Configure Citrix Web App Firewall Policy

The screenshot shows the configuration form for a Citrix Web App Firewall Policy. The fields are as follows:

- Name:** test
- Profile\*:** APPFW\_BYPASS (with Add and Edit buttons)
- Expression\*:** true (with Expression Editor link and Evaluate button)
- Log Action:** audit-log policy (with Add and Edit buttons)
- Comments:** a short description about the WAF policy (with a refresh icon and info icon)

At the bottom, there are **OK** and **Close** buttons.

### To create or configure a Web App Firewall rule (expression)

The policy rule, also called the *expression*, defines the web traffic that the Web App Firewall filters by using the profile associated with the policy. Like other Citrix ADC policy rules (or *expressions*), Web App Firewall rules use Citrix ADC expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the Web App Firewall wizard or the Citrix ADC GUI to create your policy rule:

- If you are configuring a policy in the Web App Firewall wizard, in the navigation pane, click **Citrix Web App Firewall Wizard**, then in the details pane click **Citrix Web App Firewall Wizard**, and then navigate to the **Specify Rule** tab page.
- In the **Specify Rule** page, choose the prefix for your expression from the drop-down list. Your choices are:
  - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - **SYS**. One or more protected Web sites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - **CLIENT**. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
  - **SERVER**. The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

After you choose a prefix, the Web App Firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.

2. Choose your next term.

If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The Web App Firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you have decided which term you want, double-click it to insert it into the Expression window.

3. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.
4. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished.

Following are some examples of expressions for specific purposes.

- **Specific web host**. To match traffic from a particular web host:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

For shopping.example.com, substitute the name of the web host that you want to match.

- **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

```
HTTP.REQ.URL.STARTSWITH("https://www.example.com/folder")
```

For www.example.com, substitute the name of the web host. For folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

- **Specific type of content: GIF images.** To match GIF format images:

```
HTTP.REQ.URL.ENDSWITH(".png")
```

To match other format images, substitute another string in place of .png.

- **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

```
HTTP.REQ.URL.STARTSWITH("https://www.example.com/CGI-BIN")
```

To match all JavaScripts with .js extensions:

```
HTTP.REQ.URL.ENDSWITH(".js")
```

For more information about creating policy expressions, see [Policies and Expressions](#).

#### Note:

If you use the command line to configure a policy, remember to escape any double quotation marks within Citrix ADC expressions. For example, the following expression is correct if entered in the GUI:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

If entered at the command line, however, you must type this instead:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

```
1 ![Policy expression configuration](/en-us/citrix-adc/media/waf-rule.png
  )
```

## To add a firewall rule (expression) by using the Add Expression dialog box

The **Add Expression** dialog box (also referred to as the Expression Editor) helps users who are not familiar with the Citrix ADC expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the Web App Firewall wizard or the Citrix ADC GUI:
  - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall Wizard**, and then navigate to the **Specify Rule** screen.

- If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a new policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, in the **Create Web App Firewall Profile** dialog box, or in the **Configure Web App Firewall Profile** dialog box, click **Add**.
  3. In the **Add Expression** dialog box, in the Construct Expression area, in the first list box, choose one of the following prefixes:
    - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.
    - **SYS**. One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
    - **CLIENT**. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
    - **SERVER**. The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
  4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the Web App Firewall treats requests and associated responses as a single unit and filters both, you do not need to specify responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the Preview Expression window displays your expression.
  5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The Preview Expression window updates to display the expression as you have specified it to that point.
  6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or more terms that you added after the term that you modified is cleared.
  7. When you have finished constructing your expression, click OK to close the Add Expression dialog box. Your expression is inserted into the Expression text area.

### **To bind a Web App Firewall policy by using the Citrix ADC GUI**

1. Do one of the following:
  - Navigate to **Security > Web App Firewall**, and in the details pane, click **application firewall policy manager**.
  - Navigate to **Security > Citrix Web App Firewall > Policies > Firewall**, and in the “Citrix Web App Firewall Policies” pane, click **Policy Manager**.

2. In the **Application Firewall Policy Manager** dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:
  - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance, and are applied before any other policies.
  - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
  - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
  - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance.
  - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
  - **None.** Do not bind the policy to any bind point.
3. Click **Continue**. A list of existing Web App Firewall policies appears.
4. Select the policy you want to bind by clicking it.
5. Make any additional adjustments to the binding.
  - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select **Regenerate Priorities** to renumber the priorities evenly.
  - To modify the policy expression, double-click that field to open the **Configure Web App Firewall Policy** dialog box, where you can edit the policy expression.
  - To set the Goto Expression, double-click field in the **Goto Expression** column heading to display the drop-down list, where you can choose an expression.
  - To set the Invoke option, double-click field in the Invoke column heading to display the drop-down list, where you can choose an expression.
6. Repeat steps 3 through 6 to add any additional Web App Firewall policies you want to globally bind.
7. Click **OK**. A message appears in the status bar, stating that the policy has been successfully bound.

## Manual configuration By using the command line interface

September 21, 2020

**Note:**

If you need to manually configure the Web App Firewall feature, Citrix recommends you to use the Citrix ADC GUI procedure.

You can configure many Web App Firewall features from the Citrix ADC command line. There are important exceptions, however. You cannot enable signatures from the command line. There are over 1,000 default signatures in seven categories. The task is too complex for the command line interface. You can configure the check actions and parameters for security checks from the command line, but cannot enter manual relaxations. While you can configure the adaptive learning feature and enable learning from the command line, you cannot review learned relaxations or learned rules and approve or skip them. The command line interface is intended for advanced users who are thoroughly familiar with the Citrix ADC appliance and the Web App Firewall feature.

To manually configure the Web App Firewall by using the Citrix ADC command line, use a telnet or secure shell client of your choice to log on to the Citrix ADC command line.

**To create a profile by using the command line interface**

At the command prompt, type the following commands:

- `add appfw profile <name> [-defaults ( basic | advanced )]`
- `set appfw profile <name> -type ( HTML | XML | HTML XML )`
- `save ns config`

**Example**

The following example adds a profile named pr-basic, with basic defaults, and assigns a profile type of HTML. This is the appropriate initial configuration for a profile to protect an HTML website.

```
1 add appfw profile pr-basic -defaults basic
2 set appfw profile pr-basic -type HTML
3 save ns config
4 <!--NeedCopy-->
```

**To configure a profile by using the command line interface**

At the command prompt, type the following commands:

- `set appfw profile <name> <arg1> [<arg2> ...]` where `<arg1>` represents a parameter and `<arg2>` represents either another parameter or the value to assign to the parameter represented by `<arg1>`. For descriptions of the parameters to use when configuring specific

security checks, see [Advanced Protections](#) and its subtopics. For descriptions of the other parameters, see “Parameters for Creating a Profile.”

- `save ns config`

### Example

The following example shows how to configure an HTML profile created with basic defaults to begin protecting a simple HTML-based website. This example turns on logging and maintenance of statistics for most security checks, but enables blocking only for those checks that have low false positive rates and require no special configuration. It also turns on transformation of unsafe HTML and unsafe SQL, which prevents attacks but does not block requests to your websites. With logging and statistics enabled, you can later review the logs to determine whether to enable blocking for a specific security check.

```
1 set appfw profile -startURLAction log stats
2 set appfw profile -denyURLAction block log stats
3 set appfw profile -cookieConsistencyAction log stats
4 set appfw profile -crossSiteScriptingAction log stats
5 set appfw profile -crossSiteScriptingTransformUnsafeHTML ON
6 set appfw profile -fieldConsistencyAction log stats
7 set appfw profile -SQLInjectionAction log stats
8 set appfw profile -SQLInjectionTransformSpecialChars ON
9 set appfw profile -SQLInjectionOnlyCheckFieldsWithSQLChars ON
10 set appfw profile -SQLInjectionParseComments checkall
11 set appfw profile -fieldFormatAction log stats
12 set appfw profile -bufferOverflowAction block log stats
13 set appfw profile -CSRFtagAction log stats
14 save ns config
15 <!--NeedCopy-->
```

### To create and configure a policy

At the command prompt, type the following commands:

- `add appfw policy <name> <rule> <profile>`
- `save ns config`

### Example

The following example adds a policy named `pl-blog`, with a rule that intercepts all traffic to or from the host `blog.example.com`, and associates that policy with the profile `pr-blog`. This is an appropriate policy to protect a blog hosted on a specific host name.

```
1 add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com
  ")" pr-blog
2 <!--NeedCopy-->
```

### To bind a Web App Firewall policy

At the command prompt, type the following commands:

- `bind appfw global <policyName> <priority>`
- `save ns config`

### Example

The following example binds the policy named pl-blog and assigns it a priority of 10.

```
1 bind appfw global pl-blog 10
2 save ns config
3 <!--NeedCopy-->
```

### To configure session limit per PE

At the command prompt, type the following commands:

- `set appfw settings <session limit>`

### Example

The following example configures the session limit per PE.

```
1 > set appfw settings -sessionLimit 500000`
2
3 Done
4
5 Default value:100000    Max value:500000 per PE
6 <!--NeedCopy-->
```

## Signatures

September 21, 2020

The Web App Firewall signatures function provides specific, configurable rules to simplify the task of protecting your web sites against known attacks. A signature represents a pattern that is a component of a known attack on an operating system, web server, website, XML-based web service, or other resource. A rich set of preconfigured Web App Firewall built-in or Native rules offers an easy to use security solution, leveraging the power of pattern matching to detect attacks and protect against application vulnerabilities.

You can create your own signatures or use the signatures in the built-in templates. The Web App Firewall has two built-in templates:

- **Default Signatures:** This template contains a preconfigured list of over 1,300 signatures, in addition to a complete list of SQL injection keywords, SQL special strings, SQL transform rules, and SQL wildchar characters. It also contains denied patterns for cross-site scripting, and allowed attributes and tags for cross-site scripting. This is a read-only template. You can view the contents, but you cannot add, edit, or delete anything in this template. To use it, you must make a copy. In your own copy, you can enable the signature rules that you want to apply to your traffic, and specify the actions to be taken when the signature rules match the traffic.

The Web App Firewall signatures are derived from the rules published by [Snort](#), which is an open source intrusion prevention system capable of performing real-time traffic analysis to detect a variety of attacks and probes.

- **\*Xpath Injection Patterns:** This template contains a preconfigured set of literal and PCRE keywords and special strings that are used to detect XPath (XML Path Language) injection attacks.

**Blank Signatures:** In addition to making a copy of the built-in \*Default Signatures template, you can use a blank signatures template to create a new signature object. The signature object that you create with the blank signatures option does not have any native signature rules, but, just like the \*Default template, it has all the SQL/XSS built-in entities.

**External-Format Signatures:** The Web App Firewall also supports the use of external format signatures. You can import the scan files of the third party scan tools by using the XSLT files that are supported by the Citrix Web App Firewall. A set of built-in XSLT files are available for the following scan tools to translate these external format files to the Native format:

- Cenzic
- Deep Security for Web Apps
- IBM AppScan Enterprise
- IBM AppScan Standard.
- Qualys
- Whitehat
- Hewlett Packard Enterprise WebInspect

## Protection options for your application

Tighter security increases processing overhead. Signatures provide the following deployment options to help you to optimize the protection of your applications:

- **Negative Security Model:** With the negative security model, you use a rich set of preconfigured signature rules to leverage the power of pattern matching to detect attacks and protect against application vulnerabilities. You block only what you don't want and allow the rest.[DR1] You can add your own signature rules, based on the specific security needs of your applications, to design your own customized security solutions.
- **Hybrid security Model:** In addition to using signatures, you can use positive security checks to create a configuration ideally suited for your applications. Use signatures to block what you don't want, and use positive security checks to enforce what is allowed.

To protect your application by using signatures, you must configure one or more profiles to use your signatures object. In a hybrid security configuration, the SQL injection and Cross-Site scripting patterns, and the SQL transformation rules, in your signatures object are used not only by the signature rules, but also by the positive security checks configured in the Web App Firewall profile that is using the signatures object.

The Web App Firewall examines the traffic to your protected web sites and web services to detect traffic that matches a signature. A match is triggered only when every pattern in the rule matches the traffic. When a match occurs, the specified actions for the rule are invoked. You can display an error page or error object when a request is blocked. Log messages can help you to identify attacks being launched against your application. If you enable statistics, the Web App Firewall maintains data about requests that match an Web App Firewall signature or security check.

If the traffic matches both a signature and a positive security check, the more restrictive of the two actions is enforced. For example, if a request matches a signature rule for which the block action is disabled, but the request also matches an SQL Injection positive security check for which the action is block, the request is blocked. In this case, the signature violation might be logged as `<not blocked >`, although the request is blocked by the SQL injection check.

**Customization:** If necessary, you can add your own rules to a signatures object. You can also customize the SQL/XSS patterns. The option to add your own signature rules, based on the specific security needs of your applications, gives you the flexibility to design your own customized security solutions. You block only what you don't want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. You can add, modify, or remove SQL injection and cross-site scripting patterns. Built-in RegEx and expression editors help you configure your patterns and verify their accuracy.

**Auto-update:** You can manually update the signature object to get the latest signature rules, or you can leverage the auto-update feature so that the Web App Firewall can automatically update the signatures from the cloud-based Web App Firewall updates service.

**Note:**

If new signature rules are added during auto-update, they are disabled by default. You should periodically review the updated signatures and enable the newly added rules that are pertinent for protecting your applications.

You must configure CORS to host signatures on IIS servers.

Signature auto update feature does not work on the local web server when you access the URL from the Citrix ADC GUI.

## Getting started

Using Citrix signatures to protect your application is quite easy and can be accomplished in a few simple steps:

1. Add a signature object.
  - You can use the Wizard that prompts you to create the entire Web App Firewall configuration, including adding the profile and policy, selecting and enabling signatures, and specifying actions for signatures and positive security checks. The signatures object is created automatically.
  - You can create a copy of the signatures object from the \*Default Signatures template, use a blank template to create a new signature with your own customized rules, or add an external format signature. Enable the rules and configure the actions that you want to apply.
2. Configure the target Web App Firewall profile to use this signatures object.
3. Send traffic to validate the functionality

## Highlights

- The `\*Default` signatures object is a template. It cannot be edited or deleted. To use it, you must create a copy. In your own copy, you can enable the rules and the desired action for each rule as required for your application. To protect the application, you must configure the target profile to use this signature.
- Processing signature patterns has overhead. Try to enable only those signatures that are applicable for protecting your application, rather than enabling all signature rules.
- Every pattern in the rule must match to trigger a signature match.
- You can add your own customized rules to inspect incoming requests to detect various types of attacks, such as SQL injection or cross-site scripting attacks. You can also add rules to inspect the responses to detect and block leakage of sensitive information such as credit card numbers.

- You can make a copy of an existing signatures object and tweak it, by adding or editing rules and SQL/XSS patterns, to protect another application.
- You can use auto-update to download the latest version of the Web App Firewall default rules without need for ongoing monitoring to check for the availability of the new update.
- A signature object can be used by more than one profile. Even after you have configured one or more profile(s) to use a signature object, you can still enable or disable signatures or change the action settings. You can manually create and modify your own custom signature rules. The changes will apply to all the profiles that are currently configured to use this signature object.
- You can configure signatures to detect violations in various types of payloads, such as HTML, XML, JSON, and GWT.
- You can export a configured signatures object and import it to another Citrix ADC appliance for easy replication of your customized signature rules.

Signatures are patterns that are associated with a known vulnerability. You can use signature protection to identify the traffic that attempts to exploit these vulnerabilities, and take specific actions.

Signatures are organized into categories. You can optimize the performance and reduce the processing overhead by enabling only the rules in the categories that are appropriate for protecting your application.

## Manually configuring the signatures feature

September 21, 2020

To use signatures to protect your web sites, you must review the rules, and enable and configure the ones that you want to apply. The rules are disabled by default. Citrix recommends that you enable all rules that are applicable to the type of content that your web site uses.

To manually configure the signatures feature, use a browser to connect to the GUI. Then, create a signatures object from a built-in template, an existing signatures object, or by importing a file. Next, configure the new signatures object as explained in [Configuring or Modifying a Signatures Object](#).

## Adding or removing a signatures object

September 22, 2020

You can add a new signatures object to the Web App Firewall by:

- Copying a built-in template.
- Copying an existing signatures object.

- Importing a signatures object from an external file.

You must use the GUI to copy a template or existing signatures object. You can use either the GUI or the command line to import a signatures object. You can also use either the GUI or the command line to remove a signatures object.

### To create a signatures object from a template

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to use as a template.

Your choices are:

- **Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
- **XPath Injection.** Contains the XPath injection patterns.
- **Any existing signatures object.**

#### Attention:

If you do not choose a signatures type to use as a template, the Web App Firewall will prompt you to create signatures from scratch.

3. Click **Add**.
4. In the Add Signatures Object dialog box, type a name for your new signatures object, and then click OK. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (\_) symbols.
5. Click **Close**.

### To create a signatures object by importing a file

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, click **Add**.
3. In the **Add Signatures Object** dialog box, select the format of the signatures you want to import.
  - To import a Citrix ADC format signatures file, select the **Native Format** tab.
  - To import an external signatures format file, select the **External Format** tab.
4. Choose the file that you want to use to create your new signatures object.
  - To import a native Citrix ADC format signatures file, in the Import section select either Import from Local File or Import from URL, then type or browse to the path or URL to the file.

- To import a Cenzic, IBM AppScan, Qualys, or Whitehat format file, in the XSLT section select Use Built-in XSLT File, Use Local File, or Reference from URL. Next, if you chose Use Built-in XSLT File, select the appropriate file format from the drop-down list. If you chose Use Local File or Reference from URL, then type or browse to the path or URL to the file.
5. Click **Add**, and then click **Close**.

## To create a signatures object by importing a file by using the command line

At the command prompt, type the following commands:

- `import appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge] [-sha1 <string>]`
- `save ns config`

### Example #1

The following example creates a new signatures object from a file named signatures.xml and assigns it the name MySignatures.

```
1 import appfw signatures signatures.xml MySignatures
2 save ns config
3 <!--NeedCopy-->
```

## To remove a signatures object by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to remove.
3. Click **Remove**.

## To remove a signatures object by using the command line

At the command prompt, type the following commands:

- `rm appfw signatures <name>`
- `save ns config`

## Configuring or modifying a signatures object

September 22, 2020

You configure a signatures object after creating it, or modify an existing signatures object, to enable or disable signature categories or specific signatures, and configure how the Web App Firewall responds when a signature matches a connection.

### To configure or modify a signatures object

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

As you modify these options, the results that you requested are displayed in the Filtered Results window at the right.

```

1 - To display only selected categories of signatures, check or clear
   the appropriate signature-category check boxes. The signature
   categories are:
2
3   | Name          | Type of Attack that this Signature Protects Against
4   | -----      |
   |
5   | cgi            | CGI scripts. Includes Perl and UNIX shell scripts.
6   | client         | Browsers and other clients.
7   | coldfusion    | Web sites that use the Adobe Systems ColdFusion
   application server.
8   | frontpage     | Web sites that use Microsoft' s FrontPage server.
9   | iis           | Web sites that use the Microsoft Internet
   Information Server (IIS).
10  | misc          | Miscellaneous attacks.
11  | php           | Web sites that use PHP
12  | web-activex   | Web sites that contain ActiveX controls.
13  | web-struts    | Web sites that contain Apache struts, which are
   java-ee based applets.
14 - To display only signatures that have specific check actions enabled,
   select the ON check box for each of those actions, clear the ON
   check boxes for the other actions, and clear all of the OFF check

```

boxes. To display only signatures that have a specific check action disabled, select their respective OFF check boxes and clear all of the ON check boxes. To display signatures regardless of whether they have a check action enabled or disabled, select or clear both the ON and the OFF check boxes **for** that action. The check actions are:

| 15 | Criterion | Description                                                                                                                                    |
|----|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 16 | -----     | -----                                                                                                                                          |
| 17 | Enabled   | The signature is enabled. The Web App Firewall checks only <b>for</b> signatures that are enabled when it processes traffic.                   |
| 18 | Block     | Connections that match <b>this</b> signature are blocked.                                                                                      |
| 19 | Log       | A log entry is produced <b>for</b> any connection that matches <b>this</b> signature.                                                          |
| 20 | Stats     | The Web App Firewall includes any connection that matches <b>this</b> signature in the statistics that it generates <b>for</b> that check.     |
| 21 | -         | To display only signatures that contain a specific string, type the string into the text box under the filter criteria, and then click Search. |
| 22 | -         | To reset all display filter criteria to the <b>default</b> settings and display all signatures, click Show All.                                |

1. For information about a specific signature, select the signature, and then click the blue double arrow in the More field. The Signature Rule Vulnerability Detail message box appears. It contains information about the purpose of the signature and provides links to external web-based information about the vulnerability or vulnerabilities that this signature addresses. To access an external link, click the blue double arrow to the left of the description of that link.
2. Configure the settings for a signature by selecting the appropriate check boxes.
3. If you want to add a local signature rule to the signatures object, or modify an existing local signature rule, see “[The Signatures Editor](#).”
4. If you have no need for SQL injection, cross-site scripting, or Xpath injection patterns, click OK, and then click Close. Otherwise, in the lower left-hand corner of the details pane, click Manage SQL/XSS Patterns.
5. In the Manage SQL/XSS Patterns dialog box, Filtered Results window, navigate to the pattern category and pattern that you want to configure. For information about the SQL injection pat-

terns, see “[HTML SQL Injection Check](#).” For information about the cross-site scripting patterns, see “[HTML Cross-Site Scripting Check](#).”

6. To add a new pattern:
  - a) Select the branch to which you want to add the new pattern.
  - b) Click the **Add** button directly below the lower section of the **Filtered Results** window.
  - c) In the Create Signature Item dialog box, fill in the Element text box with the pattern that you want to add. If you are adding a transformation pattern to the transform rules branch, under Elements, fill in the From text box with the pattern that you want to change and the To text box with the pattern to which you want to change the previous pattern.
  - d) Click **OK**.
7. To modify an existing pattern:
  - a) In the **Filtered Results** window, select the branch that contains the pattern that you want to modify.
  - b) In the detail window beneath the **Filtered Results** window, select the pattern that you want to modify.
  - c) Click **Modify**.
  - d) In the **Modify Signature Item** dialog box, **Element** text box, modify the pattern. If you are modifying a transformation pattern, you can modify either or both patterns under Elements, in the From and the To text boxes.
  - e) Click **OK**.
8. To remove a pattern, select the pattern that you want to remove, then click the **Remove** button below the details pane beneath the **Filtered Results** window. When prompted, confirm your choice by clicking **Close**.
9. To add the patterns category to the XSS branch:
  - a) Select the branch to which you want to add the patterns category.
  - b) Click the **Add** button directly below the **Filtered Results** window.

**Note:** Currently you can add only one category, named patterns, to the XSS branch, so after you click **Add**, you must accept the default choice, which is patterns.
3. Click **OK**.
10. To remove a branch, select that branch, and then click the Remove button directly below the **Filtered Results** window. When prompted, confirm your choice by clicking **OK**.

**Note:** If you remove a default branch, you remove all of the patterns in that branch. Doing so can disable the security checks that use that information.
11. When you are finished modifying the SQL injection, cross-site scripting, and XPath injection patterns, click **OK**, and then click **Close** to return to the **Modify Signatures Object** dialog box.

12. Click **OK** at any point to save your changes, and when you are finished configuring the signatures object, click **Close**.

## Protecting JSON applications using signatures

September 21, 2020

JavaScript Object Notation (JSON) is a text-based open standard derived from the JavaScript scripting language. JSON is preferred for human readable representation of simple data structures and associative arrays, called objects. It serves as an alternative to XML and is primarily used to transmit serialized data structures for communicating with web applications. The JSON files are typically saved with a .json extension.

The JSON payload is typically sent with the MIME type specified as **application/json**. The other “standard” content types for JSON are:

- **application/x-javascript**
- **text/javascript**
- **text/x-javascript**
- **text/x-json**

### Using the Citrix Web App Firewall signatures to protect JSON applications

To allow JSON requests, the appliance is preconfigured with the JSON content type as shown in the following show-command output:

```
1 > sh appfw jsonContentType
2 1)      JSONContenttypevalue:  "^application/json$" IsRegex:  REGEX
3 Done
4 <!--NeedCopy-->
```

The Citrix Web App Firewall processes the post body for the following content-types only:

- **application/x-www-form-urlencoded**
- **multipart/form-data**
- **text/x-gwt-rpc**

The requests that are received with other content-type headers including application/json (or any other allowed content type) are forwarded to the backend after header inspection. The post body in such requests is not inspected for security check violations even when the profile’s security checks such as SQL or XSS are enabled.

In order to protect JSON applications and detect violations, Web App Firewall signatures can be used. All requests that contain the allowed content-type header are processed by the Web App Firewall for signature match. You can add your own customized signature rules to process JSON payload to perform various security check inspections (for example, XSS, SQL, and Field Consistency), to detect violations in the headers as well as the post body, and take specified actions.

**Tip**

Unlike the other built-in defaults, the preconfigured JSON content type can be edited or removed by using the CLI or the GUI (GUI). If legitimate requests for JSON applications are getting blocked and triggering content-type violations, check to make sure that the content type value is configured accurately. For additional details regarding how Web App Firewall processes content-type header, see [Content type protection](#)

**To add or remove JSON content-type by using the command line interface**

At the command prompt, type one of the following commands:

```
add appfw jsonContentType ^application/json$ IsRegEx REGEX
rm appfw JSONContentType "^application/json$"
```

**To managing JSON content types by using the GUI**

Navigate to **Security > Web App Firewall** and, in the **Settings** section, select **Manage JSON Content Types**.

In the **Configure Web App Firewall JSON Content Type** panel, add, edit, or delete JSON content types to suit the needs of your applications.

**Configuring signature protection to detect attacks in JSON payload**

In addition to a valid JSON content type, you need to configure signatures to specify the pattern(s) that, when detected in a JSON request, indicate a security breach. The specified actions, such as block and log, are taken when an incoming request triggers a match for all the target patterns in the signature rule.

To add a customized signature rule, Citrix recommends that you use the GUI. Navigate to **System > Security > Web App Firewall > Signatures**. Double click the target signature object to access the **Edit Web App Firewall Signatures** panel. Click on the **Add** button to configure the actions, category, log string, rule patterns and so on. Although Web App Firewall inspects all allowed content-type payload for signature match, you can optimize the processing by specifying the JSON expression in the rule. When you **Add** a new rule pattern, select **Expression** in the drop-down options for **Match** and provide

the target match expression from your JSON payload to identify the specific requests that need to be inspected. An expression must begin with a **TEXT.** prefix. You can add other rule patterns to specify additional match patterns to identify the attack.

The following example shows a signature rule. If any cross-site script tag is detected in the POST body of the JSON payload that matches the specified XPATH\_JSON expression, a signature match is triggered.

### Example of a signature to detect XSS in JSON payload

```
1 <SignatureRule actions="log,stats" category="JSON" enabled="ON" id="
  1000001" severity="" source="" type="" version="1">
2
3 <PatternList>
4
5 <RequestPatterns>
6
7 <Pattern>
8
9 <Location area="HTTP_POST_BODY"/>
10
11 <Match type="Expression">TEXT.XPATH_JSON(xp%/glossary/title%).
  CONTAINS("example glossary")</Match>
12
13 </Pattern>
14
15 <Pattern>
16
17 <Location area="HTTP_METHOD"/>
18
19 <Match type="LITERAL">POST</Match>
20
21 </Pattern>
22
23 <Pattern>
24
25 <Location area="HTTP_POST_BODY"/>
26
27 <Match type="CrossSiteScripting"/>
28
29 </Pattern>
30
31 </RequestPatterns>
32
```

```

33 </PatternList>
34
35 <LogString>Cross-site scripting violation detected in json payload</
  LogString>
36
37 <Comment/>
38
39 </SignatureRule>
40 <!--NeedCopy-->

```

### Example of the payload

The following payload triggers the signature match, because it includes the cross-site scripting tag **<Gotcha!!>**.

```

1 {
2   "glossary": {
3     "title": "example glossary", "GlossDiv": {
4       "title": "S", "GlossList": {
5         "GlossEntry": {
6           "ID": "SGML", "SortAs": "SGML", "GlossTerm": "Standard Generalized
              Markup Language", "Acronym": "SGML", "Abbrev": "ISO 8879:1986", "
              GlossDef": {
7             "para": "A meta-markup language, used to create markup languages **<
              Gotcha!!>** such as DocBook.", "GlossSeeAlso": ["GML", "XML"] }
8           , "GlossSee": "markup" }
9         }
10      }
11    }
12  }
13
14 <!--NeedCopy-->

```

### Example of the log message

```

1 Aug 21 12:21:42 <local0.info> 10.217.31.239 08/21/2015:23:21:42 GMT ns
  0-PPE-1 : APPFW APPFW_SIGNATURE_MATCH 1471 0 : 10.217.253.62 990-
  PPE0 NtJnVMNnvPeQJnaUzXYW/GTvAQsA010 prof1 http://10.217.31.212/FFC/
  login_post.php Signature violation rule ID 1000001: cross-site
  scripting violation detected in json payload <not blocked>
2 <!--NeedCopy-->

```

**Note**

If you send the same payload after removing the cross-site script tag (<Gotcha!!>), the signature rule match is not triggered.

**Highlights**

- To protect JSON payload, use Web App Firewall signatures to detect XSS, SQL and other violations.
- Verify that the JSON content type is configured on the appliance as the allowed content type.
- Make sure that the content type in the payload matches the configured JSON content type.
- Make sure that all the patterns configured in the signature rule match for the signature violation to be triggered.
- When you add a signature rule, it MUST have at least one Rule pattern to match the Expression in the JSON payload. All the PI expressions in signature rules must start with the prefix TEXT. and must be Boolean.

**Protect application or JSON content-type with SQL and XSS encoded payload using policies and signatures**

Citrix Web App Firewall can protect application or JSON content type using policies and signatures.

**Inspect application or JSON content type for SQL injection using policies**

You must add the following policies and bind it to virtual server globally for supporting SQL injection.

```
add appfw policy sql_i_1 HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).
SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE.REGEX_MATCH(re##((\\A
|(?<=[^a-zA-Z0-9_])))(select|insert|delete|update|drop|create|alter|grant
|revoke|commit|rollback|shutdown|union|intersect|minus|case|decode|where
|group|begin|join|exists|distinct|add|modify|constraint|null|like|exec|
execute|char|or|and|sp_sdidebug)(( Z)|(=?[^a-zA-Z0-9_]))##)APPFW_BLOCK

add appfw policy sql_i_2 HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).
SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE.REGEX_MATCH(re##((\\A
|(?<=[^a-zA-Z0-9_]))(xp_availablemedia|xp_cmdshell|xp_deletemail|xp_dirtree

|xp_stopmail|xp_subdirs|xp_unc_to_drive)(( Z)|(?=[^a-zA-Z0-9_]))##)APPFW_BLOCK
```

```
add appfw policy sql_i_3 HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).
SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE.REGEX_MATCH(re##((\\A
|(?<=[^a-zA-Z0-9_]))(sysobjects|syscolumns|MSysACEs|MSysObjects|MSysQueries
|MSysRelationships)(( Z)|(?=[^a-zA-Z0-9_]))##)APPFW_BLOCK
```

```
add appfw policy sql_i_4 HTTP.REQ.BODY(10000).SET_TEXT_MODE(IGNORECASE).
SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE.REGEX_MATCH(re##((\\A
)|(?<=[^a-zA-Z0-9_]))(SYS\\.USER_OBJECTS|SYS\\.TAB|SYS\\.USER_TABLES|SYS\\.
USER_VIEWS|SYS\\.ALL_TABLES|SYS\\.USER_TAB_COLUMNS|SYS\\.USER_CONSTRAINTS|SYS
\\.USER_TRIGGERS|SYS\\.USER_CATALOG|SYS\\.ALL_CATALOG|SYS\\.ALL_CONSTRAINTS|SYS
\\.ALL_OBJECTS|SYS\\.ALL_TAB_COLUMNS|SYS\\.ALL_TAB_PRIVS|SYS\\.ALL_TRIGGERS|SYS
\\.ALL_USERS|SYS\\.ALL_VIEWS|SYS\\.USER_ROLE_PRIVS|SYS\\.USER_SYS_PRIVS|SYS\\.
USER_TAB_PRIVS)(( Z)|(?=[^a-zA-Z0-9_]))##)APPFW_BLOCK
```

### Inspect application or JSON content type using signatures

You can add the following signature rules to the signature object in the application firewall profile to support SQL injection for JSON content-type.

#### Note:

Post body signatures are cpu-intensive.

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <!-- Copyright 2013-2018 Citrix Systems, Inc. All rights reserved. -->
3 <SignaturesFile schema_version="6" version="0" minor_schema_version="0"
4 >
5   <Signatures>
6     <SignatureRule id="4000000" enabled="ON" actions="log,block"
7       category="sql" source="" severity="" type="" version="1"
8       sourceid="" harmscore="">
9       <PatternList>
10        <RequestPatterns>
11          <Pattern>
12            <Location area="HTTP_POST_BODY"/>
13            <Match type="Expression">TEXT.SET_TEXT_MODE(
14              IGNORECASE).SET_TEXT_MODE(URLENCODED).
15              DECODE_USING_TEXT_MODE.REGEX_MATCH(re#(((\\A

## Updating a signature object

September 21, 2020

You should update your signatures objects frequently to ensure that your Web App Firewall is providing protection against current threats. You must regularly update both the default Web App Firewall signatures and any signatures that you import from a supported vulnerability scanning tool.

Citrix regularly updates the default signatures for the Web App Firewall. You can update the default signatures manually or automatically. In either case, ask your Citrix representative or Citrix reseller for the URL to access the updates. You can enable automatic updates of the Citrix native format signatures in the “Engine Settings” and “Signature Auto Update Settings” dialog boxes.

Most makers of vulnerability scanning tools regularly update the tools. Most websites also change frequently. You should update your tool and rescan your web sites regularly, exporting the resulting signatures to a file and importing them into your Web App Firewall configuration.

**Tip**

When you update the Web App Firewall signatures from the Citrix ADC command line, you must first update the default signatures, and then issue more update commands to update each custom signatures file that is based on the default signatures. If you do not update the default signatures first, a version mismatch error prevents updating of the custom signatures files.

**Note**

The following applies to merging a third-party signature object with a user-defined signature object with Native rules and user-added rules:

When a version 0 signatures is merged with a new imported file, the resultant signatures remain as version 0.

This means all native (or built-in) rules in the imported file will be ignored after the merge. This is to ensure that the version 0 signatures are maintained as is after a merge.

To include the native rules in the imported file for merge, you should update the existing signatures from version 0 first before the merge. This means you need to abandon the version 0 nature of the existing signatures.

When there is a Citrix ADC release upgrade, the file “default\_signatures.xml” is added to the new build and the file “updated\_signature.xml” is removed from the older build. After the upgrade, if the signature auto update feature is enabled, the appliance updates the existing signature to the latest version of the build and generates the “updated\_signature.xml” file.

**To update the Web App Firewall signatures from the source by using the command line**

At the command prompt, type the following commands:

- `update appfw signatures <name> [-mergedefault]`
- `save ns config`

**Example**

The following example updates the signatures object named MySignatures from the default signatures object, merging new signatures in the default signatures object with the existing signatures. This command does not overwrite any user-created signatures or signatures imported from another source, such as an approved vulnerability scanning tool.

```
1 update appfw signatures MySignatures -mergedefault
2 save ns config
3 <!--NeedCopy-->
```

## Updating a signatures object from a Citrix format file

Citrix regularly updates the signatures for the Web App Firewall. You should regularly update the signatures on your Web App Firewall to ensure that your Web App Firewall is using the most current list. Ask your Citrix representative or Citrix reseller for the URL to access the updates.

### To update a signatures object from a Citrix format file by using the command line

At the command prompt, type the following commands:

- `update appfw signatures <name> [-mergeDefault]`
- `save ns config`

### To update a signatures object from a Citrix format file by using the GUI

1. Navigate to **Security > Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to update.
3. In the **Action** drop-down list, select **Merge**.
4. In the **Update Signatures Object** dialog box, choose one of the following options.
  - **Import from URL**—Choose this option if you download signature updates from a web URL.
  - **Import from Local File**—Choose this option if you import signature updates from a file on your local hard drive, network hard drive, or other storage device.
5. In the text area, type the URL, or type or browse to the local file.
6. Click **Update**. The update file is imported, and the Update Signatures dialog box changes to a format nearly identical to that of the **Modify Signatures Object** dialog box. The **Update Signatures Object** dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
7. Review and configure the new and modified signatures.
8. When you are finished, click **OK**, and then click **Close**.

## Updating a signatures object from a supported vulnerability scanning tool

**Note:** Before you update a signatures object from a file, you must create the file by exporting signatures from the vulnerability scanning tool.

### To import and update signatures from a vulnerability scanning tool

1. Navigate to **Security > Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to update, and then click **Merge**.
3. In the **Update Signatures Object** dialog box, on the **External Format** tab, Import section, choose one of the following options.

- **Import from URL**—Choose this option if you download signature updates from a Web URL.
  - **Import from Local File**—Choose this option if you import signature updates from a file on your local or a network hard drive or other storage device.
4. In the text area, type the URL, or browse or type the path to the local file.
  5. In the XSLT section, choose one of the following options.
    - **Use Built-in XSLT File**—Choose this option if you want to use a built-in XSLT file.
    - **Use Local XSLT File**—Choose this option to use an XSLT file on your local computer.
    - **Reference XSLT from URL**—Choose this option to import an XSLT file from a web URL.
  6. If you chose Use Built-in XSLT File, in the Built-In XSLT drop-down list select the file that you want to use from the following options:
    - **Cenzic.**
    - **Deep\_Security\_for\_Web\_Apps.**
    - **Hewlett\_Packard\_Enterprise\_WebInspect.**
    - **IBM-AppScan-Enterprise.**
    - **IBM-AppScan-Standard.**
    - **Qualys.**
    - **Whitehat.**
  7. Click **Update**. The update file is imported, and the Update Signatures dialog box changes to a format nearly identical to that of the Modify Signatures Object dialog box, which is described in “[Configuring or Modifying a Signatures Object](#).” The **Update Signatures Object** dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
  8. Review and configure the new and modified signatures.
  9. When you are finished, click **OK**, and then click **Close**.

## Exporting a signatures object to a file

September 22, 2020

You export a signatures object to a file so that you can import it to another Citrix ADC.

### To export a signatures object to a file

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to configure.
3. In the **Actions** drop-down list, select **Export**.
4. In the **Export Signatures Object** dialog box, **Local File** text box, type the path and name of the file to which you want to export the signatures object, or use the **Browse** dialog to designate a

path and name.

5. Click **OK**.

## The Signatures editor

September 22, 2020

You can use the signatures editor, which is available in the GUI, to add a new user-defined (local) signature rule to an existing signatures object, or to modify a previously configured local signature rule. Except that it is defined by the user (you), a local signature rule has the same attributes as a default signature rule from Citrix, and it functions in the same way. You enable or disable it, and configure the signature actions for it, just as you do for a default signature.

Add a local rule if you need to protect your web sites and services from a known attack that the existing signatures do not match. For example, you might discover a new type of attack and determine its characteristics by examining the logs on your web server, or you might obtain third-party information about a new type of attack.

At the heart of a signature rule are the rule *patterns*, which collectively describe the characteristics of the attack that the rule is designed to match. Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting patterns.

You might want to modify a signature rule by adding a new pattern or modifying an existing pattern to match an attack. For example, you might find out about changes to an attack, or you might determine a better pattern by examining the logs on your web server, or from third-party information.

### To add or modify a local signature rule by using the Signatures Editor

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to edit, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen beneath the **Filtered Results** window, do one of the following:
  - To add a new local signature rule, click **Add**.
  - To modify an existing local signature rule, select that rule, and then click **Open**.
4. In the **Add Local Signature Rule** or the **Modify Local Signature Rule** dialog box, configure the actions for a signature by selecting the appropriate check boxes.
  - **Enabled**. Enables the new signature rule. If you do not select this, this new signature rule is added to your configuration, but is inactive.
  - **Block**. Blocks connections that violate this signature rule.

- **Log.** Logs violations of this signature rule to the Citrix ADC log.
  - **Stat.** Includes violations of this signature rule in the statistics.
  - **Remove.** Strips information that matches the signature rule from the response. (Applies only to response rules.)
  - **X-Out.** Masks information that matches the signature rule with the letter X. (Applies only to response rules.)
  - **Allow Duplicates.** Allows duplicates of this signature rule in this signatures object.
5. Choose a category for the new signature rule from the **Category** drop-down list.

You can also create a new category by clicking the icon to the right of the list and using the Add Signature Rule Category dialog box to add a new category to the list, The rule you are modifying is automatically added to the new category. For instructions, see [“To add a signature rule category.”](#)
  6. In the **LogString** text box, type a brief description of the signature rule to be used in the logs.
  7. In the **Comment** text box, type a comment. (Optional)
  8. Click More..., and modify the advanced options.
    - a) To strip HTML comments before applying this signature rule, in the Strip Comments drop-down list choose All or Exclude Script Tag.
    - b) To set CSRF Referer Header checking, in the CSRF Referer Header checking radio button array, select either the If Present or Always radio button.
    - c) To manually modify the Rule ID assigned to this local signature rule, modify the number in the Rule ID text box. The ID must be a positive integer between 1000000 and 1999999 that has not already been assigned to a local signature rule.
    - d) To assign a version number to the new signature rule, modify the number in the Version Number text box.
    - e) To assign a Source ID, modify the string in the Source ID text box.
    - f) To specify the source, choose Local or Snort from the Source drop-down list, or click the Add icon to the right of the list and add a new source.
    - g) To assign a harm score to violations of this local signature rule, type a number between 1 and 10 in the Harm Score text box.
    - h) To assign a severity rating to this local signature rule, in the Severity drop-down list choose High, Medium, or Low, or click the Add icon to the right of the list and add a new severity rating.
    - i) To assign a violation type to this local signature rule, in the Type drop-down list choose Vulnerable or Warning, or click the Add icon to the right of the list and add a new violation type.
  9. In the **Patterns** list, add or edit a pattern.
    - To add a pattern, click **Add**. In the **Create New Signature Rule Pattern** dialog box, add

one or more patterns for your signature rule, and then click **OK**.

- To edit a pattern, select the pattern, and then click **Open**. In the **Edit Signature Rule Pattern** dialog box, modify the pattern, and then click **OK**.

For more information about adding or editing patterns, see “[Signature Rule Patterns](#).”

2. Click **OK**.

## To add a signature rule category

September 21, 2020

Putting signature rules into a category enables you to configure the actions for a group of signatures instead of for each individual signature. You might want to do so for the following reasons:

- **Ease of selection.** For example, assume that all of signature rules in a particular group protect against attacks on a specific type of web server software or technology. If your protected web sites use that software or technology, you want to enable them all. If they do not, you do not want to enable any of them.
- **Ease of initial configuration.** It is easiest to set defaults for a group of signatures as a category, instead of one-by-one. You can then make any changes to individual signatures as needed.
- **Ease of ongoing configuration.** It is easier to configure signatures if you can display only those that meet specific criteria, such as belonging to a specific category.

1. Navigate to **Security > Web App Firewall > Signatures**.
2. In the details pane, select that signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen, beneath the **Filtered Results** window, click **Add**.
4. In the **Add Local Signature Rule** dialog box, click the icon to the right of the Category drop-down list.
5. In the **Add Signature Rule Category** dialog box, **New Category** text box, type a name for your new signature category. The name can consist of from one to 64 characters.
6. Click **OK**.

## Signature rule patterns

June 9, 2021

You can add a new pattern to a signature rule or modify an existing pattern of a signature rule to specify a string or expression that characterizes an aspect of the attack that the signature matches. To

determine which patterns an attack exhibits, you can examine the logs on your web server, use a tool to observe connection data in real time, or obtain the string or expression from a third-party report about the attack.

**Caution:**

Any new pattern that you add to a signature rule is in an AND relationship with the existing patterns. Do not add a new pattern to an existing signature rule if you do not want a potential attack to have to match all of the patterns in order to match the signature.

Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting pattern. Before you attempt to add a pattern that is based on a regular expression, you should make sure that you understand PCRE-format regular expressions. PCRE expressions are complex and powerful; if you do not understand how they work, you can unintentionally create a pattern that matches something that you did not want (a *false positive*) or that fails to match something that you did want (a *false negative*).

If you are not already familiar with PCRE-format regular expressions, you can use the following resources to learn the basics, or for help with some specific issue:

- “Mastering Regular Expressions”, Third Edition. Copyright (c) 2006 by Jeffrey Friedl. O’Reilly Media, ISBN: 9780596528126.
- “Regular Expressions Cookbook”. Copyright (c) 2009 by Jan Goyvaerts and Steven Levithan. O’Reilly Media, ISBN: 9780596520687
- **PCRE Man page/Specification** (text/official): <http://www.pcre.org/pcre.txt>
- **PCRE Man Page/Specification**

<http://www.gammon.com.au/pcre/index.html>

- **Wikipedia PCRE entry:** <http://en.wikipedia.org/wiki/PCRE>
- **PCRE Mailing List**  
[Pcre-dev - PCRE Development](#)

If you need to encode non-ASCII characters in a PCRE-format regular expression, the Citrix ADC platform supports encoding of hexadecimal UTF-8 codes. For more information, see “[PCRE Character Encoding Format](#).”

**To configure a signature rule pattern**

1. Navigate to **Security > Citrix Web App Firewall > Signatures**.
2. In the details pane, select that signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen beneath the **Filtered Results** window, either click **Add** to create a signature rule, or select an existing signature rule

and click **Open**.

**Note:** You can modify only signature rules that you added. You cannot modify the default signature rules.

Depending on your action, either the Add Local Signature Rule or the Modify Local Signature Rule dialog box appears. Both dialog boxes have the same contents.

4. Under the **Patterns window** in the dialog box, either click **Add** to add a new pattern, or select an existing pattern from the list beneath the **Add** button and click **Open**. Depending on your action, either the **Create New Signature Rule Pattern** or the **Edit Signature Rule Pattern** dialog box appears. Both dialog boxes have the same contents.
5. In the **Pattern Type** drop-down list, choose the type of connection that the pattern is intended to match.
  - If the pattern is intended to match request elements or features, such as injected SQL code, attacks on web forms, cross-site scripts, or inappropriate URLs, choose **Request**.
  - If the pattern is intended to match response elements or features, such as credit card numbers or safe objects, choose **Response**.
6. In the Location area, define the elements to examine with this pattern.

The Location area describes what elements of the HTTP request or response to examine for this pattern. The choices that appear in the Location area depend upon the chosen pattern type. If you chose Request as the pattern type, items relevant to HTTP requests appear; if you chose Response, items relevant to HTTP responses appear.

In addition, as you choose a value from the Area drop-down list, the remaining parts of the Location area change interactively. Following are all configuration items that might appear in this section.

- Area

Drop-down list of elements that describe a particular portion of the HTTP connection. The choices are as follows:

- **HTTP\_ANY**. All parts of the HTTP connection.
- **HTTP\_COOKIE**. All cookies in the HTTP request headers after any cookie transformations are performed.  
Note: Does not search HTTP response "Set-Cookie:" headers.
- **HTTP\_FORM\_FIELD**. Form fields and their contents, after URL decoding, percent decoding, and removal of excess whitespace. You can use the <Location> tag to further restrict the list of form field names to be searched.
- **HTTP\_HEADER**. The value portions of the HTTP header after any cross-site scripting or URL decoding transformations.
- **HTTP\_METHOD**. The HTTP request method.

- **HTTP\_ORIGIN\_URL.** The origin URL of a web form.
  - **HTTP\_POST\_BODY.** The HTTP post body and the web form data that it contains.
  - **HTTP\_RAW\_COOKIE.** All HTTP request cookie, including the “Cookie:” name portion.  
Note: Does not search HTTP response “Set-Cookie:” headers.
  - **HTTP\_RAW\_HEADER.** The entire HTTP header, with individual headers separated by linefeed characters (\n) or carriage return/line-feed strings (\r\n).
  - **HTTP\_RAW\_RESP\_HEADER.** The entire response header, including the name and value parts of the response header after URL transformation has been done, and the complete response status. As with HTTP\_RAW\_HEADER, individual headers are separated by linefeed characters (\n) or carriage return/line-feed strings (\r\n).
  - **HTTP\_RAW\_SET\_COOKIE.** The entire Set-Cookie header after any URL transformations have been performed  
Note: URL transformation can change both the domain and path parts of the Set-Cookie header.
  - **HTTP\_RAW\_URL.** The entire request URL before any URL transformations are performed, including any query or fragment parts.
  - **HTTP\_RESP\_HEADER.** The value part of the complete response headers after any URL transformations have been performed.
  - **HTTP\_RESP\_BODY.** The HTTP response body
  - **HTTP\_SET\_COOKIE.** All “Set-Cookie” headers in the HTTP response headers.
  - **HTTP\_STATUS\_CODE.** The HTTP status code.
  - **HTTP\_STATUS\_MESSAGE.** The HTTP status message.
  - **HTTP\_URL.** The value portion of the URL in the HTTP headers, excluding any query or fragment parts, after conversion to the UTF-\* character set, URL decoding, stripping of whitespace, and conversion of relative URLs to absolute. Does not include HTML entity decoding.
- URL

Examines any URLs found in the elements specified by the Area setting. Select one of the following settings.

- **Any.** Checks all URLs.
- **Literal.** Checks URLs that contain a literal string. After you select Literal, a text box is displayed. Type the literal string that you want in the text box.
- **PCRE.** Checks URLs that match a PCRE-format regular expression. After you select this choice, the regular expression window is displayed. Type the regular expression in the window. You can use the **Regex Tokens** to insert common regular expression elements at the cursor, or you can click Regex Editor to display the Regular Expression Editor dialog box, which provides more assistance in constructing the regular expression that you want.
- **Expression.** Checks URLs that match a Citrix ADC default expression.

- Field Name

Examines any form field names found in the elements specified by the Area selection.

- **Any.** Checks all URLs.
- **Literal.** Checks URLs that contain a literal string. After you select Literal, a text box is displayed. Type the literal string that you want in the text box.
- **PCRE.** Checks URLs that match a PCRE-format regular expression. After you select this choice, the regular expression window is displayed. Type the regular expression in the window. You can use the **Regex Tokens** to insert common regular expression elements at the cursor, or you can click Regex Editor to display the Regular Expression Editor dialog box, which provides more assistance in constructing the regular expression that you want.
- **Expression.** Checks URLs that match a Citrix ADC default expression.

7. In the Pattern area, define the pattern. A pattern is a literal string or PCRE-format regular expression that defines the pattern that you want to match. The Pattern area contains the following elements:

- Match

A drop-down list of search methods that you can use for the signature. This list differs depending on whether the pattern type is Request or Response.

### **Request Match Types**

**PCRE.** A PCRE-format regular expression.

**NOTE:** When you choose PCRE, the regular expression tools beneath the Pattern window are enabled. These tools are not useful for most other types of patterns.

- **Injection.** Directs the Web App Firewall to look for injected SQL in the specified location. The Pattern window disappears, because the Web App Firewall already has the patterns for SQL injection.
- **CrossSiteScripting.** Directs the Web App Firewall to look for cross-site scripts in the specified location. The Pattern window disappears, because the Web App Firewall already has the patterns for cross-site scripts.
- **Expression.** An expression in the Citrix ADC default expressions language. This is the same expressions language that is used to create Web App Firewall policies and other policies on the Citrix ADC appliance. Although the Citrix ADC expressions language was originally developed for policy rules, it is a highly flexible general purpose language that can also be used to define a signature pattern.

When you choose Expression, the Citrix ADC Expression Editor appears beneath Pattern window. For more information about the Expression Editor and instructions on how to use it, see [“To add a firewall rule \(expression\) by using the Add Expression dialog box](#)

**Response Match Types:**

- **Literal.** A literal string
- **PCRE.** A PCRE-format regular expression.

**Note:**

When you choose PCRE, the regular expression tools beneath the Pattern window are enabled. These tools are not useful for most other types of patterns.

- **Credit Card.** A built-in pattern to match one of the six supported types of credit card number.

**Note:**

The Expression match type is not available for Response-side signatures.

- Pattern Window (unlabeled)

In this window, type the pattern that you want to match, and fill in any additional data.

- 1 - **Literal.** Type the string you want to search **for** in the text area.
- 2 - **CRE.** Type the regular expression in the text area. Use the Regex Editor **for** more assistance in constructing the regular expression that you want, or the Regex Tokens to insert common regular expression elements at the cursor. To enable UTF-8 characters, click UTF-8.
- 3 - **Expression.** Type the Citrix ADC advanced expression in the text area. Use Prefix to choose the first term in your expression, or Operator to insert common operators at the cursor. Click Add to open the Add Expression dialog box **for** more assistance in constructing the regular expression that you want. Click Evaluate to open the Advanced Expression Evaluator to help determine what effect your expression has.
- 4 - **Offset.** The number of characters to skip over before starting to match on **this** pattern. You use **this** field to start examining a string at some point other than the first character.
- 5 - **Depth.** How many characters from the starting point to examine **for** matches. You use **this** field to limit searches of a large string to a specific number of characters.
- 6 - **Min-Length.** The string to be searched must be at least the specified number of bytes in length. Shorter strings are not matched.
- 7 - **Max-Length.** The string to be searched must be no longer than the specified number of bytes in length. Longer strings are not matched.

8 - Search method. A check box labeled fastmatch. You can enable fastmatch only **for** a literal pattern, to improve performance.

1. Click **OK**.
2. Repeat the previous four steps to add or modify additional patterns.
3. When finished adding or modifying patterns, click **OK** to save your changes and return to the Signatures pane.

**Caution:**

Until you click **OK** in the **Add Local Signature Rule** or **Modify Local Signature Rule** dialog box, your changes are not saved. Do not close either of these dialog boxes without clicking **OK** unless you want to discard your changes.

## To Import and merge rules

September 21, 2020

When using the signature editor to perform an import and merge operation from the GUI, you can now see the new, updated, duplicate, and invalid rules.

The signature editor displays the following four new rows:

1. New Rules
2. Updated Rules
3. Duplicate Rules
4. Invalid Rules

The output of the New Rules Only and Updated Rules Only filters also appears in the Category filter pane of the Edit window in signature editor.

You will need to import the files from GUI to see the corresponding links for New, duplicate, invalid and updated rules.

**Procedure to import signature rules:**

1. In the Citrix ADC web GUI, go to **Configuration > Security > Application Firewall > Signatures**. In the Signatures window, click **Add**. Then select **File Format > Native, Import From > URL** and in the URL field, add the above link. If you are unable to access the URL, you can download the [XML data](#) in a text file format.
2. After you click **Open**, the signature file will open and you can see links for new rule and invalid rules.

3. If you import a 3<sup><sup>rd</sup></sup>
- party signature rule, you can see 90 new rules and 9 duplicate rules in the imported .xml file. If you are unable to access the URL, you can download the [XML data](#) in a text file format.

## Signature updates in high availability deployment and build upgrades

September 21, 2020

The signature update occurs on the primary node. While the signatures are updated on the primary node, in parallel the updated files are simultaneously synchronized with the secondary node.

The \*Default signature is always updated first and then the rest of the user-defined signatures are updated.

### Connecting to Amazon AWS

The default route NSIP is used to connect to the Amazon AWS. If there is a specific use case scenario where SNIP is used, and if there are multiple SNIPs, the first one to receive the ARP response from the hosting site will hold the route.

### Signature updates during version upgrades

In case of an upgrade, if the NS has an older base version for the signatures, \*Default signature is automatically updated if a newer signature version is available.

If the schema has changed, the schema version of all the signature objects gets updated when the version is upgraded.

However, for the base version of the user-defined signatures, the behavior is different in release 10.5 versus release 11.0.

In release 10.5, only the default signature was updated and the base version of the rest of the signatures remained unchanged after the build upgrade.

In release 11.0, this behavior has changed. When the appliance is upgraded to install a new build, not only the \*Default signature object but all the other user-defined signatures that currently exist in the appliance are also updated and will have the same version after the build upgrade.

In both 10.5 and 11.0 release builds, if auto-update is configured, the \*Default Signatures as well as all non-zero version signatures get auto-updated to the latest released signature version and will have the same base version.

## Overview of security checks

September 21, 2020

The Web App Firewall advanced protections (security checks) are a set of filters designed to catch complex or unknown attacks on your protected web sites and web services. The security checks use heuristics, positive security, and other techniques to detect attacks that may not be detected by signatures alone. You configure the security checks by creating and configuring a Web App Firewall profile, which is a collection of user-defined settings that tell the Web App Firewall which security checks to use and how to handle a request or response that fails a security check. A profile is associated with a signatures object and with a policy to create a security configuration.

The Web App Firewall provides twenty security checks, which differ widely in the types of attacks that they target and how complex they are to configure. The security checks are organized into the following categories:

- **Common security checks.** Checks that apply to any aspect of web security that either does not involve content or is equally applicable to all types of content.
- **HTML security checks.** Checks that examine HTML requests and responses. These checks apply to HTML-based web sites and to the HTML portions of Web 2.0 sites, which contain mixed HTML and XML content.
- **XML security checks.** Checks that examine XML requests and responses. These checks apply to XML-based web services and to the XML portions of Web 2.0 sites.

The security checks protect against a wide range of types of attack, including attacks on operation system and web server software vulnerabilities, SQL database vulnerabilities, errors in the design and coding of web sites and web services, and failures to secure sites that host or can access sensitive information.

All security checks have a set of configuration options, the check actions, which control how the Web App Firewall handles a connection that matches a check. Three check actions are available for all security checks. They are:

- **Block.** Block connections that match the signature. Disabled by default.
- **Log.** Log connections that match the signature, for later analysis. Enabled by default.
- **Stats.** Maintain statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.

A fourth check action, **Learn**, is available for more than half of the check actions. It observes traffic to a protected Web site or web service and uses connections that repeatedly violate the security check to generate recommended exceptions (relaxations) to the check, or new rules for the check. In addition to the check actions, certain security checks have parameters that control the rules that the check uses

to determine which connections violate that check, or that configure the Web App Firewall's response to connections that violate the check. These parameters are different for each check, and they are described in the documentation for each check.

To configure security checks, you can use the Web App Firewall wizard, as described in "[The Web App Firewall Wizard](#)," or you can configure the security checks manually, as described in [Manual Configuration By Using the GUI](#). Some tasks, such as manually entering relaxations or rules or reviewing learned data, can be done only by using the GUI, not the command line. Using the wizard is usually best configuration method, but in some cases manual configuration might be easier if you are thoroughly familiar with it and simply want to adjust the configuration for a single security check.

Regardless of which method you use to configure the security checks, each security check requires that certain tasks be performed. Many checks require that you specify exceptions (relaxations) to prevent blocking of legitimate traffic before you enable blocking for that security check. You can do this manually, by observing the log entries after a certain amount of traffic has been filtered and then creating the necessary exceptions. However, it is usually much easier to enable the learning feature and let it observe the traffic and recommend the necessary exceptions.

Web App Firewall uses packet engines (PE) during processing the transactions. Each packet engine has a limit of 100K sessions which is sufficient for most deployment scenarios. However, when Web App Firewall is processing heavy traffic and the session timeout is configured at a higher value, the sessions might get accumulated. If the number of alive Web App Firewall sessions exceed the 100K per PE limit, the Web App Firewall security check violations might not be sent to the Security Insight appliance. Lowering the session timeout to a smaller value, or using sessionless mode for the security checks with sessionless URL closure or sessionless field consistency might help in preventing the sessions getting accumulated. If this is not a viable option in scenarios where transactions might require longer sessions, upgrading to a higher-end platform with more packet engine is recommended.

Support for cached AppFirewall is added, and the max session setting through the CLI per core is set to 50K sessions.

## Top level protections

September 21, 2020

Four of the Web App Firewall protections are especially effective against common types of Web attacks, and are therefore more commonly used than any of the others. They are:

- **HTML Cross-Site Scripting.** Examines requests and responses for scripts that attempt to access or modify content on a different Web site than the one on which the script is located. When this check finds such a script, it either renders the script harmless before forwarding the request or response to its destination, or it blocks the connection.

- **HTML SQL Injection.** Examines requests that contain form field data for attempts to inject SQL commands into an SQL database. When this check detects injected SQL code, it either blocks the request or renders the injected SQL code harmless before forwarding the request to the Web server.

**Note:** If both of the following conditions apply to your configuration, you should make certain that your Web App Firewall is correctly configured:

- If you enable the HTML Cross-Site Scripting check or the HTML SQL Injection check (or both), and
- Your protected Web sites accept file uploads or contain Web forms that can contain large POST body data.

For more information about configuring the Web App Firewall to handle this case, see [“Configuring the Application Firewall.”](#)

- **Buffer Overflow.** Examines requests to detect attempts to cause a buffer overflow on the Web server.
- **Cookie Consistency.** Examines cookies returned with user requests to verify that they match the cookies your Web server set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the Web server.

The Buffer Overflow check is simple; you can usually enable blocking for it immediately. The other three top-level checks are considerably more complex and require configuration before you can safely use them to block traffic. Citrix strongly recommends that, rather than attempting to configure these checks manually, you enable the learning feature and allow it to generate the necessary exceptions.

## HTML cross-site scripting check

October 27, 2020

The HTML Cross-Site Scripting (XSS) check examines both the headers and the POST bodies of user requests for possible cross-site scripting attacks. If it finds a cross-site script, it either modifies (*transforms*) the request to render the attack harmless, or blocks the request.

**Note:**

The HTML Cross-Site Scripting (XSS) check works only for content type, content length, etc. It does not work for cookie. Also ensure to have the ‘checkRequestHeaders’ option enabled in your Web Application Firewall profile.

To prevent misuse of the scripts on your protected web sites to breach security on your web sites, the HTML Cross-Site Scripting check blocks scripts that violate the *same origin rule*, which states that

scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of JavaScript-enhanced web content that violates the same origin rule. If you enable the HTML Cross-Site Scripting check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity.

The Web App Firewall offers various action options for implementing HTML Cross-Site Scripting protection. In addition to the **Block**, **Log**, **Stats** and **Learn** actions, you also have the option to **Transform cross-site scripts** to render an attack harmless by entity encoding the script tags in the submitted request. You can configure Check complete URL's for cross-site scripting parameter to specify if you want to inspect not just the query parameters but the entire URL to detect XSS attack. You can configure **InspectQueryContentTypes parameter** to inspect request query portion for XSS attack for the specific content-types.

You can deploy relaxations to avoid false positives. The Web App Firewall learning engine can provide recommendations for configuring relaxation rules.

Following options are available for configuring an optimized HTML Cross-Site Scripting protection for your application:

- **Block**—If you enable block, the block action is triggered if the XSS tags are detected in the request.
- **Log**—If you enable the log feature, the HTML Cross-Site Scripting check generates log messages indicating the actions that it takes. If block is disabled, a separate log message is generated for each header or form field in which the XSS violation was detected. However, only one message is generated when the request is blocked. Similarly, one log message per request is generated for the transform operation, even when XSS tags are transformed in multiple fields. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.
- **Stats**—If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.
- **Learn**—If you are not sure which relaxation rules might be ideally suited for your application, you can use the learn feature to generate HTML Cross-Site Scripting rule recommendations based on the learned data. The Web App Firewall learning engine monitors the traffic and provides learning recommendations based on the observed values. To get optimal benefit without compromising performance, you might want to enable the learn option for a short time to get

a representative sample of the rules, and then deploy the rules and disable learning.

- **Transform cross-site scripts**—If enabled, the Web App Firewall makes the following changes to requests that match the HTML Cross-Site Scripting check:
  - Left angle bracket (<) to HTML character entity equivalent (&lt;)
  - Right angle bracket (>) to HTML character entity equivalent (&gt;)

This ensures that browsers do not interpret unsafe html tags, such as `<script>`, and thereby execute malicious code. If you enable both request-header checking and transformation, any special characters found in request headers are also modified as described above. If scripts on your protected web site contain cross-site scripting features, but your web site does not rely upon those scripts to operate correctly, you can safely disable blocking and enable transformation. This configuration ensures that no legitimate web traffic is blocked, while stopping any potential cross-site scripting attacks.

- **Check complete URLs for cross-site scripting**—If checking of complete URLs is enabled, the Web App Firewall examines entire URLs for HTML cross-site scripting attacks instead of checking just the query portions of URLs.
- **InspectQueryContentTypes** — If Request query inspection is configured, the App Firewall examines the query of requests for cross-site scripting attacks for the specific content-types. If you use the GUI, you can configure this parameter in the Settings tab of the App Firewall profile.

### Important

As part of the streaming changes, the Web App Firewall processing of the Cross-site Scripting tags has changed. This change is applicable to 11.0 builds onwards. This change is also pertinent for the enhancement builds of 10.5.e that support request side streaming. In earlier releases, presence of either open bracket (<), or close bracket (>), or both open and close brackets (<>) was flagged as Cross-site Scripting Violation. The behavior has changed in the builds that include support for request side streaming. Only the close bracket character (>) is no longer considered as an attack. Requests are blocked even when an open bracket character (<) is present, and is considered as an attack. The Cross-site scripting attack gets flagged.

## XSS Fine grained Relaxations

The Web App Firewall gives you an option to exempt a specific form field, header, or Cookie from cross-site scripting inspection check. You can completely bypass the inspection for one or more of these fields by configuring relaxation rules.

The Web App Firewall allows you to implement tighter security by fine tuning the relaxation rules. An application might require the flexibility to allow specific patterns, but configuring a relaxation rule to bypass the security inspection might make the application vulnerable to attacks, because the target field is exempted from inspection for any cross-site scripting attack patterns. Cross-site scripting fine grained relaxation provides the option to allow specific attributes, tags, and patterns. The rest of the attributes, tags and patterns are blocked. For example, the Web App Firewall currently has a default

set of more than 125 denied patterns. Because hackers can use these patterns in Cross-site script attacks, the Web App Firewall flags them as potential threats. You can relax one or more pattern(s) that are considered safe for the specific location. The rest of the potentially dangerous XSS patterns are still checked for the target location and continue to trigger the security check violations. You now have much tighter control.

The commands used in relaxations have optional parameters for **Value Type** and **Value Expression**. The value type can be left blank or you have an option to select **Tag** or **Attribute** or **Pattern**. If you leave the value type blank, the configured field of the specified URL is exempted from the Cross-Site Scripting check inspection. If you select a value type, you must provide a value expression. You can specify whether the value expression is a regular expression or a literal string. When the input is matched against the allowed and denied list, only the specified expressions configured in the relaxation rules are exempted.

The Web App Firewall has the following XSS built-in lists:

1. **XSS Allowed Attributes:** There are 52 default allowed attributes, such as, **abbr, acceskey, align, alt, axis, bgcolor, border, cellpadding, cellspacing, char, charoff, charset** etc.
2. **XSS Allowed Tags:** There are 47 default allowed tags, such as, **address, basefont, bgsound, big, blockquote, bg, br, caption, center, cite, dd, del** etc.
3. **XSS Denied Patterns:** There are 129 default denied patterns, such as, **FSCCommand, javascript:, onAbort, onActivate** etc.

#### Warning

Web App Firewall action URL's are regular expressions. When configuring HTML cross-site scripting relaxation rules, you can specify **Name**, and **Value Expression** to be literal or RegEx. Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the rule that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.\* ) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML Cross-Site Scripting check would otherwise have blocked.

#### Points to Consider:

- Value expression is an optional argument. A field name might not have any value expression.
- A field name can be bound to multiple value expressions.
- Value expressions should be assigned a value type. The XSS value type can be: 1) Tag, 2) Attribute, or 3) Pattern.
- You can have multiple relaxation rules per field name/URL combination
- The form field names and the action URL's are not case sensitive.

## Using the Command Line to Configure the HTML Cross-Site Scripting check

To configure HTML Cross-Site Scripting check actions and other parameters by using the command line

If you use the command-line interface, you can enter the following commands to configure the HTML Cross-Site Scripting Check:

- `set appfw profile` “Parameter descriptions provided at bottom of the page.”
- `<name> -crossSiteScriptingAction (([block] [learn] [log] [stats])| [** none**])`
- `set appfw profile` “Parameter descriptions provided at bottom of the page.”
- `<name> **-crossSiteScriptingTransformUnsafeHTML** (ON | OFF)`
- `set appfw profile` Parameter descriptions provided at bottom of the page.
- `<name> -crossSiteScriptingCheckCompleteURLs (ON | OFF)`
- `set appfw profile` Parameter descriptions provided at bottom of the page.
- `<name> -checkRequestHeaders (ON | OFF)` Parameter descriptions provided at bottom of the page.
- `<name> -CheckRequestQueryNonHtml (ON | OFF)` Parameter descriptions provided at bottom of the page.

To configure a HTML Cross-Site Scripting check relaxation rule by using the command line

Use the bind or unbind command to add or delete binding, as follows:

- `bind appfw profile <name> -crossSiteScripting <String> [isRegex (REGEX | NOTREGEX)] <formActionURL> [-location <location>] [-valueType (Tag|Attribute|Pattern)][<valueExpression>] [-isValueRegex (REGEX | NOTREGEX)]]`
- `unbind appfw profile <name> -crossSiteScripting <String> <formActionURL> [-location <location>] [-valueType (Tag |Attribute|Pattern)][<valueExpression>]`

## Using the GUI to configure the HTML Cross-Site scripting check

In the GUI, you can configure the HTML Cross-Site Scripting check in the pane for the profile associated with your application.

To configure or modify the HTML Cross-Site Scripting check by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

a. If you just want to enable or disable **Block, Log, Stats**, and **Learn** actions for the HTML Cross-Site Scripting, you can select or clear check boxes in the table, click **OK**, and then click **Save and Close** to close the Security Check pane.

b. If you want to configure additional options for this security check, double click **HTML Cross-Site Scripting**, or select the row and click **Action Settings**, to display the following options:

**Transform cross-site scripts**—Transform unsafe script tags.

**Check complete URLs for Cross-site scripting**—Instead of checking just the query part of the URL, check the complete URL for cross-site script violations.

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

To enable or disable the **Check request Header** setting, in the **Advanced Settings** pane, click **Profile Settings**. In **Common Settings**, Select or clear the **Check Request Headers** check box. Click **OK**. You can either use the X icon at the top right hand side of the Profile Settings pane to close this section or, if you have finished configuring this profile, you can click **Done** to return to the **Application Firewall > Profile**.

To enable or disable the **InspectQueryContentTypes** setting, in the **Advanced Settings** pane, click **Profile Settings**. In **Common Settings**, Select or clear the **InspectQueryContentTypes** check box. Click **OK**. You can either use the X icon at the top right hand side of the **Profile Settings** pane to close this section or, if you have finished configuring this profile, you can click **Done** to return to the **App Firewall > Profile**.

To configure a HTML Cross-Site Scripting relaxation rule by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the Relaxation Rules table, double-click the **HTML Cross-Site Scripting** entry, or select it and click **Edit**.
4. In the **HTML Cross-Site Scripting Relaxation Rules** dialogue box, perform **Add, Edit, Delete, Enable**, or **Disable** operations for relaxation rules.

#### Note

When you add a new rule, the **Value Expression** field is not displayed unless you select **Tag** or **Attribute** or **Pattern** option in the **Value Type** Field.

To manage HTML Cross-Site Scripting relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **HTML Cross-Site Scripting** row in the Relaxation Rules table, and click **Visualizer**. The visualizer for deployed relaxations offers

you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

To view or customize the Cross-Site Scripting patterns by using the GUI

You can use the GUI to view or customize the default list of XSS allowed attributes or allowed tags. You can also view or customize the default list of XSS denied Patterns.

The default lists are specified in **Application Firewall > Signatures > Default Signatures**. If you do not bind any signature object to your profile, the default XSS allowed and denied list specified in the Default Signatures object will be used by the profile for the Cross-Site Scripting security check processing. The Tags, Attributes, and Patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these, make a copy of the Default Signatures object to create a User-Defined signature object. Make changes in the allowed or denied lists in the new User-defined signature object and use this signature object in your profile that is processing the traffic for which you want to use these customized allowed and denied lists.

For more information about [Signatures](#), see the following topic..

1. To view default XSS patterns:

a. Navigate to **Application Firewall > Signatures**, select **\*Default Signatures**, and click **Edit**. Then click **Manage SQL/XSS Patterns**.

The **Manage SQL/XSS Paths** table shows following three rows pertaining to XSS :

`xss/allowed/attribute`

`xss/allowed/tag`

`xss/denied/pattern`

b. Select a row and click **Manage Elements** to display the corresponding XSS Elements (Tag, Attribute, Pattern) used by the Web App Firewall **Cross-Site Scripting** check.

1. **To customize XSS Elements:** You can edit the User-Defined signature object to customize the allowed Tag, allowed Attributes and denied Patterns. You can add new entries or remove the existing ones.

a. Navigate to **Application Firewall > Signatures**, highlight the target User-defined signature, and click **Edit**. Click **Manage SQL/XSS Patterns** to display the **Manage SQL/XSS paths** table.

b. Select the target XSS row.

i. Click Manage Elements, to Add, Edit or Remove the corresponding XSS element.

ii. Click **Remove** to remove the selected row.

#### **Warning**

You must be very careful before you remove or modify any default XSS element, or delete the XSS

path to remove the entire row. The signature rules as well as the Cross-Site Scripting security check rely on these elements for detecting attacks to protect your applications. Customizing the XSS Elements can make your application vulnerable to Cross-Site Scripting attacks if the required pattern is removed during editing.

## Using the Learn Feature with the HTML Cross-Site Scripting Check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, you can deploy the learned rule as a HTML Cross-Site Scripting relaxation rule.

**HTML Cross-Site Scripting Learning enhancement**—An Web App Firewall learning enhancement was introduced in release 11.0 of the Citrix ADC software. To deploy fine grained HTML Cross-Site Scripting relaxation, the Web App Firewall offers fine grained HTML Cross-Site Scripting learning. The learning engine makes recommendations regarding the observed Value Type (Tag, Attribute, Pattern) and the corresponding Value expression observed in the input fields. In addition to checking the blocked requests to determine whether the current rule is too restrictive and needs to be relaxed, you can review the rules generated by the learning engine to determine which value type and value expressions are triggering violations and need to be addressed in relaxation rules.

### Note

The Web App Firewall's learning engine can distinguish only the first 128 bytes of the name. If a form has multiple fields with names that match for the first 128 bytes, the learning engine might not be able to distinguish between them. Similarly, the deployed relaxation rule might inadvertently relax all such fields from HTML Cross-Site Scripting inspection.

### Tip

XSS tags which are longer than 12 characters are not learned or logged correctly.

If you need a larger taglength for learning, you can add a large non-appearing tag in the **AS\_XSS\_ALLOWED\_TAGS\_LIST** for length 'x'.

To view or use learned data by using the command line interface

At the command prompt, type one of the following commands:

- `show appfw learningdata <profilename> crossSiteScripting`
- `rm appfw learningdata <profilename> -crossSiteScripting <string> <formActionURL> [<location>] [<valueType> <valueExpression>]`
- `export appfw learningdata <profilename> **crossSiteScripting*`

To view or use learned data by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.

- In the **Advanced Settings** pane, click **Learned Rules**. You can select the **HTML Cross-Site Scripting** entry in the Learned Rules table and double-click it to access the learned rules. The table displays the **Field Name**, **Action URL**, **Value Type**, **Value** and **Hits** columns. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the **HTML Cross-Site Scripting** entry in the Learned Rules table and clicking **Visualizer** to get a consolidated view of all the learned violations. The visualizer makes it very easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

### Using the Log Feature with the HTML Cross-Site Scripting Check

When the log action is enabled, the HTML Cross-Site Scripting security check violations are logged in the audit log as **APFW\_XSS** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the HTML Cross-Site Scripting violations:

```
1 Shell
2 tail -f /var/log/ns.log | grep APPFW_XSS
3 <!--NeedCopy-->
```

Example of a Cross-Site Scripting security check violation log message in CEF log format

```

  -FC4llF **Cross-site script special characters seen in fields <
  transformed>**
2 <!--NeedCopy-->

```

To access the log messages by using the GUI

The Citrix GUI includes a useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall > Profiles**, select the target profile, and click **Security Checks**. Highlight the **HTML Cross-Site Scripting** row and click **Logs**. When you access the logs directly from the HTML Cross-Site Scripting check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **Citrix ADC > System > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Application Firewall > policies > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **HTML Cross-Site Scripting** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW\_XSS** check box and click the **Apply** button, only log messages pertaining to the HTML Cross-Site Scripting security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, **Client IP** etc. appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

**Click to Deploy** functionality is available only in the GUI. You can use the Syslog Viewer to not only view the logs but also to deploy HTML Cross-Site Scripting relaxation rules based on the log messages for the Web App Firewall security check violations. The log messages must be in CEF log format for this

operation. Click to deploy functionality is available only for log messages that are generated by the block (or not block) action. You cannot deploy a relaxation rule for a log message about the transform operation.

To deploy a relaxation rule from the Syslog Viewer, select the log message. A check box appears in the upper right corner of the Syslog Viewer box of the selected row. Select the check box, and then select an option from the **Action** list to deploy the relaxation rule. **Edit & Deploy**, **Deploy**, and **Deploy All** are available as **Action** options.

The HTML Cross-Site Scripting rules that are deployed by using the **Click to Deploy** option do not include the fine grain relaxation recommendations.

To use Click to Deploy functionality in the GUI

1. In the Syslog Viewer, select **APPFW** in the **Module** options.
2. Select the **APP\_XSS** as the **Event Type** to filter corresponding log messages.
3. Select the check box to identify the rule to deploy.
4. Use the **Action** drop-down list of options to deploy the relaxation rule.
5. Verify that the rule appears in the corresponding relaxation rule section.

### Statistics for the HTML Cross-Site Scripting violations

When the stats action is enabled, the counter for the HTML Cross-Site Scripting check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, the request for a page that contains 3 HTML Cross-Site Scripting violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display HTML Cross-Site Scripting check statistics by using the command line

At the command prompt, type:

```
1 sh appfw stats
2 <!--NeedCopy-->
```

To display stats for a specific profile, use the following command:

```
1 stat appfw profile** <profile name>
2 <!--NeedCopy-->
```

To display HTML Cross-Site Scripting statistics by using the GUI

1. Navigate to **Security > Application Firewall > Profiles > Statistics**.

2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about HTML Cross-Site Scripting violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## Highlights

Note the following points about the HTML Cross-Site Scripting check:

- **Built-in Support for HTML Cross-Site Scripting attack Protection**—The Citrix Web App Firewall protects against Cross-Site Scripting attacks by monitoring a combination of allowed attributes and tags, as well as denied patterns in the received payload. All the built-in default allowed tags, allowed attributes and denied patterns used by the XSS check are specified in the `/netscaler/default_custom_settings.xml` file.
- **Customization**—You can change the default list of tags, attributes, and patterns to customize the Cross-Site Scripting security check inspection for the specific needs of your application. Make a copy of the default signature object, modify existing entries, or add new ones. Bind this signature object to your profile to make use of the customized configuration.
- **Hybrid Security Model**—Both signatures and deep security protections use the SQL/XSS patterns specified in the signature object that is bound to the profile. If no signature object is bound to the profile, the SQL/XSS patterns present in the default signature object are used.
- **Transform**—Note the following about the transform operation:

The transform operation works independently of the other Cross-Site Scripting action settings. If transform is enabled and block, log, stats, and learn are all disabled, XSS tags will be transformed.

If the block action is enabled, it takes precedence over the transform action.

- **Fine Grained Relaxation and Learning**—Fine tune the relaxation rule to relax a subset of XSS elements from security check inspection but detect the rest. The learning engine recommends a specific value type and value expressions based on the observed data.
- **Click to Deploy**—Select one, or multiple XSS violation log messages in the syslog viewer and deploy them as relaxation rules.
- **Charset**—The default charset for the profile should be set based on the need of the application. By default, the profile charset is set to English US (ISO-8859-1). If a request is received without the specified charset, the Web App Firewall processes the request as if it is ISO-8859-1. The open bracket character (<) or the close bracket character (>) will not get interpreted as XSS tags if these characters are encoded in other charsets. For example, if a request contains a UTF-8 character string “%uff1cscript%uff1e” but the charset is not specified on the request page, the XSS violation might not get triggered unless the default charset for the profile is specified as Unicode.

## HTML SQL injection check

October 23, 2020

Many web applications have web forms that use SQL to communicate with relational database servers. Malicious code or a hacker can use an insecure web form to send SQL commands to the web server. The Web App Firewall HTML SQL Injection check provides special defenses against injection of unauthorized SQL code that might break security. If the Web App Firewall detects unauthorized SQL code in a user request, it either transforms the request, to render the SQL code inactive, or blocks the request. The Web App Firewall examines the request payload for injected SQL code in three locations: 1) POST body, 2) headers, and 3) cookies. In order to examine query portion in requests for injected SQL code, please configure appfw profile setting 'InspectQueryContentTypes' for the specific content-types'.

A default set of keywords and special characters provides known keywords and special characters that are commonly used to launch SQL attacks. You can add new patterns, and you can edit the default set to customize the SQL check inspection. The Web App Firewall offers various action options for implementing SQL Injection protection. In addition to the **Block**, **Log**, **Stats** and **Learn** actions, the Web App Firewall profile also offers the option to **transform SQL special characters** to render an attack harmless.

In addition to actions, there are several parameters that can be configured for SQL injection processing. You can check for **SQL wildcard characters**. You can change the SQL Injection type and select one of the 4 options (**SQLKeyword**, **SQLSplChar**, **SQLSplCharANDKeyword**, **SQLSplCharORKeyword**) to indicate how to evaluate the SQL keywords and SQL special characters when processing the payload. The **SQL Comments Handling parameter** gives you an option to specify the type of comments that need to be inspected or exempted during SQL Injection detection.

You can deploy relaxations to avoid false positives. The Web App Firewall learning engine can provide recommendations for configuring relaxation rules.

Following options are available for configuring an optimized SQL Injection protection for your application:

**Block**—If you enable block, the block action is triggered only if the input matches the SQL injection type specification. For example, if **SQLSplCharANDKeyword** is configured as the SQL injection type, a request is not blocked if it contains no key words, even if SQL special characters are detected in the input. Such a request is blocked if the SQL injection type is set to either **SQLSplChar**, or **SQLSplCharORKeyword**.

**Log**—If you enable the log feature, the SQL Injection check generates log messages indicating the actions that it takes. If block is disabled, a separate log message is generated for each input field in which the SQL violation was detected. However, only one message is generated when the request

is blocked. Similarly, one log message per request is generated for the transform operation, even when SQL special characters are transformed in multiple fields. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.

**Stats**—If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.

**Learn**—If you are not sure which SQL relaxation rules might be ideally suited for your application, you can use the learn feature to generate recommendations based on the learned data. The Web App Firewall learning engine monitors the traffic and provides SQL learning recommendations based on the observed values. To get optimal benefit without compromising performance, you might want to enable the learn option for a short time to get a representative sample of the rules, and then deploy the rules and disable learning.

**Transform SQL special characters**—The Web App Firewall considers three characters, Single straight quote (‘), Backslash (\), and Semicolon (;) as special characters for SQL security check processing. The SQL Transformation feature modifies the SQL Injection code in an HTML request to ensure that the request is rendered harmless. The modified HTML request is then sent to the server. All default transformation rules are specified in the `/netscaler/default_custom_settings.xml` file.

The transform operation renders the SQL code inactive by making the following changes to the request:

- Single straight quote (‘) to double straight quote (“).
- Backslash (\) to double backslash (\\).
- Semicolon (;) is dropped completely.

These three characters (special strings) are necessary to issue commands to an SQL server. Unless an SQL command is prefaced with a special string, most SQL servers ignore that command. Therefore, the changes that the Web App Firewall performs when transformation is enabled prevent an attacker from injecting active SQL. After these changes are made, the request can safely be forwarded to your protected web site. When web forms on your protected web site can legitimately contain SQL special strings, but the web forms do not rely on the special strings to operate correctly, you can disable blocking and enable transformation to prevent blocking of legitimate web form data without reducing the protection that the Web App Firewall provides to your protected web sites.

The transform operation works independently of the SQL Injection Type setting. If transform is enabled and the SQL Injection type is specified as SQL keyword, SQL special characters are transformed even if the request does not contain any keywords.

**Tip**

You normally enable either transformation or blocking, but not both. If the block action is enabled, it takes precedence over the transform action. If you have blocking enabled, enabling transformation is redundant.

**Check for SQL Wildcard Characters**—Wild card characters can be used to broaden the selections of a structured query language (SQL-SELECT) statement. These wild card operators can be used in conjunction with **LIKE** and **NOT LIKE** operators to compare a value to similar values. The percent (%), and underscore (\_) characters are frequently used as wild cards. The percent sign is analogous to the asterisk (\*) wildcard character used with MS-DOS and to match zero, one, or multiple characters in a field. The underscore is similar to the MS-DOS question mark (?) wildcard character. It matches a single number or character in an expression.

For example, you can use the following query to do a string search to find all customers whose names contain the D character.

**SELECT \* from customer WHERE name like “%D%”:**

The following example combines the operators to find any salary values that have 0 in the second and third place.

**SELECT \* from customer WHERE salary like ‘\_00%’:**

Different DBMS vendors have extended the wildcard characters by adding extra operators. The Citrix Web App Firewall can protect against attacks that are launched by injecting these wildcard characters. The 5 default Wildcard characters are percent (%), underscore (\_), caret (^), opening square bracket ([), and closing square bracket (]). This protection applies to both HTML and XML profiles.

The default wildcard chars are a list of literals specified in the **\*Default Signatures**:

- `<wildchar type=" LITERAL" >%</wildchar>`
- `<wildchar type=" LITERAL" >_</wildchar>`
- `<wildchar type=" LITERAL" >^</wildchar>`
- `<wildchar type=" LITERAL" >[</wildchar>`
- `<wildchar type=" LITERAL" >]</wildchar>`

Wildcard characters in an attack can be PCRE, like `[^A-F]`. The Web App Firewall also supports PCRE wildcards, but the literal wildcard chars above are sufficient to block most attacks.

**Note**

The SQL wildcard character check is different from the SQL special character check. This option must be used with caution to avoid false positives.

**Check Request Containing SQL Injection Type**—The Web App Firewall provides 4 options to implement the desired level of strictness for SQL Injection inspection, based on the individual need of the

application. The request is checked against the injection type specification for detecting SQL violations. The 4 SQL injection type options are:

- **SQL Special Character and Keyword** — Both an SQL keyword and an SQL special character must be present in the input to trigger SQL violation. This least restrictive setting is also the default setting.
- **SQL Special Character** — At least one of the special characters must be present in the input to trigger SQL violation.
- **SQL key word** — At least one of the specified SQL keywords must be present in the input to trigger an SQL violation. Do not select this option without due consideration. To avoid false positives, make sure that none of the keywords are expected in the inputs.
- **SQL Special Character or Keyword** — Either the key word or the special character string must be present in the input to trigger the security check violation.

#### Tip

If you configure the Web App Firewall to check for inputs that contain an SQL special character, the Web App Firewall skips web form fields that do not contain any special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this option can significantly reduce the load on the Web App Firewall and speed up processing without placing your protected web sites at risk.

**SQL comments handling**—By default, the Web App Firewall checks all SQL comments for injected SQL commands. Many SQL servers ignore anything in a comment, however, even if preceded by an SQL special character. For faster processing, if your SQL server ignores comments, you can configure the Web App Firewall to skip comments when examining requests for injected SQL. The SQL comments handling options are:

- **ANSI**—Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases. For example:
  - - (Two Hypens) - This is a comment that begins with two hyphens and ends with end of line.
  - {} - Braces (Braces enclose the comment. The { precedes the comment, and the } follows it. Braces can delimit single- or multiple-line comments, but comments cannot be nested)
  - `/**/` : C style comments (Does not allow nested comments). Please note `/*!` <comment that begin with slash followed by asterisk and exclamation mark is not a comment > `*/`
  - MySQL Server supports some variants of C-style comments. These enable you to write code that includes MySQL extensions, but is still portable, by using comments of the following form: `/*! MySQL-specific code */`
  - `.#` : Mysql comments : This is a comment that begins with # character and ends with end of the line
- **Nested**—Skip nested SQL comments, which are normally used by Microsoft SQL Server. For

example; – (Two Hypens), and /\* \*/ (Allows nested comments)

- **ANSI/Nested**—Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are still checked for injected SQL.
- **Check all Comments**—Check the entire request for injected SQL without skipping anything. This is the default setting.

#### Tip

In most cases, you should not choose the Nested or the ANSI/Nested option unless your back-end database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they might indicate an attempt to breach security on that server.

**Check Request headers**—Enable this option if, in addition to examining the input in the form fields, you want to examine the request headers for HTML SQL Injection attacks. If you use the GUI, you can enable this parameter in the **Advanced Settings** -> **Profile Settings** pane of the Web App Firewall profile.

#### Note

If you enable the Check Request header flag, you might have to configure relaxation rule for the **User-Agent** header. Presence of the SQL keyword **like** and SQL special character semi-colon (;) might trigger false positive and block requests that contain this header.

#### Warning

If you enable both request header checking and transformation, any SQL special characters found in headers are also transformed. The Accept, Accept-Charset, Accept-Encoding, Accept-Language, Expect, and User-Agent headers normally contain semicolons (;). Enabling both Request header checking and transformation simultaneously might cause errors.

## SQL Fine grained Relaxations

The Web App Firewall gives you an option to exempt a specific form field, header, or Cookie from SQL Injection inspection check. You can completely bypass the inspection for one or more of these fields by configuring relaxation rules for the SQL Injection check.

The Web App Firewall allows you to implement tighter security by fine tuning the relaxation rules. An application might require the flexibility to allow specific patterns, but configuring a relaxation rule to bypass the security inspection might make the application vulnerable to attacks, because the target field is exempted from inspection for any SQL attack patterns. SQL fine grained relaxation provides the option to allow specific patterns and block the rest. For example, the Web App Firewall currently has a default set of more than 100 SQL keywords. Because hackers can use these keywords in SQL Injection attacks, the Web App Firewall flags them as potential threats. You can relax one or more keyword(s)

that are considered safe for the specific location. The rest of the potentially dangerous SQL keywords are still checked for the target location and continue to trigger the security check violations. You now have much tighter control.

The commands used in relaxations have optional parameters for **Value Type** and **Value Expression**. You can specify whether the value expression is a regular expression or a literal string. The value type can be left blank or you have an option to select **Keyword** or **SpecialString** or **WildChar**.

#### Warning

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.\* ) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML SQL Injection check would otherwise have blocked.

#### Points to Consider:

- Value expression is an optional argument. A field name might not have any value expression.
- A field name can be bound to multiple value expressions.
- Value expressions should be assigned a value type. The SQL value type can be: 1) Keyword, 2) SpecialString, or 3) WildChar.
- You can have multiple relaxation rules per field name/URL combination.

## Using the Command Line to Configure the SQL Injection Check

### To configure SQL Injection actions and other parameters by using the command line:

In the command line interface, you can use either the **set appfw profile** command or the **add appfw profile** command to configure the SQL Injection protections. You can enable the block, learn, log, stats action(s) and specify whether you want to transform the special characters used in SQL Injection attack strings to disable the attack. Select the type of SQL attack pattern (key words, wildcard characters, special strings) you want to detect in the payloads, and indicate whether you want the Web App Firewall to also inspect the request Headers for SQL Injection violations. Use the **unset appfw profile** command to revert the configured settings back to their defaults. Each of the following commands sets only one parameter, but you can include multiple parameters in a single command:

- [set appfw profile](#) “Parameter descriptions provided at bottom of the page.”
- `<name> -SQLInjectionAction (([block] [learn] [log] [stats]) | [none])`
- [set appfw profile](#) “Parameter descriptions provided at bottom of the page.”
- `<name> -SQLInjectionTransformSpecialChars (**ON** | OFF)`
- [set appfw profile](#) “Parameter descriptions provided at bottom of the page.”
- `<name> -**SQLInjectionCheckSQLWildChars** (**ON** |**OFF**)`

- `set appfw profile` “Parameter descriptions provided at bottom of the page.”
- `**<name> -SQLInjectionType** ([**SQLKeyword**] | [**SQLSplChar**] | [**SQLSplCharANDKeyword**] | [**SQLSplCharORKeyword**])`
- `set appfw profile` “Parameter descriptions provided at bottom of the page.”
- `<name> -SQLInjectionParseComments** ([**checkall**] | [**ansi|nested**] | [**ansinested**])`
- `**set appfw profile` “Parameter descriptions provided at bottom of the page.”
- `<name> -CheckRequestHeaders (ON | OFF)`
- `<name> -CheckRequestQueryNonHtml (ON | OFF)`

To configure a SQL Injection relaxation rule by using the command line

Use the bind or unbind command to add or delete binding, as follows:

- `bind appfw profile <name> -SQLInjection <String> [isRegex(REGEX | NOTREGEX)] <formActionURL> [-location <location>] [-valueType (Keyword | SpecialString|Wildchar)[<valueExpression>][-isValueRegex (REGEX | NOTREGEX)]]`
- `unbind appfw profile <name> -SQLInjection <String> <formActionURL> [-location <location>] [-valueType (Keyword|SpecialString|Wildchar)[<valueExpression>]]`

#### Note

You can find the list of SQL keywords from default signature file contents by viewing the view signature object, which has list of sql key words and sql special characters.

## Using the GUI to Configure the SQL Injection Security Check

In the GUI, you can configure the SQL Injection security check in the pane for the profile associated with your application.

To configure or modify the SQL Injection check by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

- a. If you just want to enable or disable Block, Log, Stats, and Learn actions for HTML SQL Injection, you can select or clear check boxes in the table, click OK, and then click Save and Close to close the Security Check pane.
- b. If you want to configure additional options for this security check, double click HTML SQL Injection, or select the row and click Action Settings, to display the following options:

**Transform SQL Special character**—Transform any SQL Special characters in the request.

**Check for SQL Wildcard Characters**—Consider SQL Wildcard characters in the payload to be attack patterns.

**Check Request Containing**—Type of SQL injection (SQLKeyword, SQLSplChar, SQLSplCharANDKeyword, or SQLSplCharORKeyword) to check.

**SQL Comments Handling**—Type of comments (Check All Comments, ANSI, Nested, or ANSI/Nested) to check.

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

1. To enable or disable the **Check request Header** setting, in the Advanced Settings pane, click **Profile Settings**. In **Common Settings**, Select or clear the **Check Request Headers** check box. Click **OK**. You can either use the X icon at the top right hand side of the Profile Settings pane to close this section or, if you have finished configuring this profile, you can click **Done** to return to the **Web App Firewall > Profile**.
2. To enable or disable the **InspectQueryContentTypes** setting, in the **Advanced Settings** pane, click **Profile Settings**. In **Common Settings**, Select or clear the **InspectQueryContentTypes** check box. Click **OK**. You can either use the X icon at the top right hand side of the **Profile Settings** pane to close this section or, if you have finished configuring this profile, you can click **Done** to return to the **App Firewall > Profile**.

To configure an SQL Injection relaxation rule by using the GUI

- Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
- In the **Advanced Settings** pane, click **Relaxation Rules**.
- In the Relaxation Rules table, double-click the **HTML SQL Injection** entry, or select it and click **Edit**.
- In the **HTML SQL Injection Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

#### Note

When you add a new rule, the **Value Expression** field is not displayed unless you select **Keyword** or **SpecialString** or **WildChar** option in the **Value Type** Field.

To manage SQL Injection relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **HTML SQL Injection** row and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

To view or customize the SQL Injection patterns by using the GUI

You can use the GUI to view or customize the SQL patterns.

The default SQL patterns are specified in **Application Firewall > Signatures > Default Signatures**. If you do not bind any signature object to your profile, the default SQL patterns specified in the Default Signatures object will be used by the profile for the SQL Injection security check processing. The rules and patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these patterns, make a copy of the Default Signatures object to create a User-Defined signature object. Make changes in the SQL patterns in the new User-defined signature object and use this signature object in your profile that is processing the traffic for which you want to use these customized SQL patterns.

For more information, see [Signatures](#)

#### 1. To view default SQL patterns:

- a. Navigate to **Application Firewall > Signatures**, select **\*Default Signatures**, and click **Edit**.

Then click **Manage SQL/XSS patterns**.

The **Manage SQL/XSS paths** table shows following four rows pertaining to SQL Injection:

- Injection (not\_alphanum, SQL)/ Keyword
- Injection (not\_alphanum, SQL)/ specialstring
- Injection (not\_alphanum, SQL)/ transformrules/transform
- Injection (not\_alphanum, SQL)/ wildchar

- b. Select a row and click **Manage Elements** to display the corresponding SQL patterns (keywords, special strings, transformation rules or the wildcard characters) used by the Web App Firewall SQL injection check.

2. **To customize SQL patterns:** You can edit the User-Defined signature object to customize the SQL key words, special strings, and wildcard characters. You can add new entries or remove the existing ones. You can modify the transformation rules for the SQL special strings.

- a. **Navigate to Application Firewall > Signatures**, highlight the target User-defined signature, and click **Edit**. Click **Manage SQL/XSS patterns** to display the **Manage SQL/XSS paths** table.

- b. Select the target SQL Injection row.

- i. Click **Manage Elements**, to **Add**, **Edit** or **Remove** the corresponding SQL element.

- ii. Click **Remove** to remove the selected row.

#### Warning

You must be very careful before you remove or modify any default SQL element, or delete the SQL path to remove the entire row. The signature rules as well as the SQL Inject security check rely

on these elements for detecting SQL Injection attacks to protect your applications. Customizing the SQL patterns can make your application vulnerable to SQL attacks if the required pattern is removed during editing.

## Using the Learn Feature with the SQL Injection Check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, you can deploy the learned rule as an SQL Injection relaxation rule.

**SQL Injection Learning enhancement**—An Web App Firewall learning enhancement was introduced in release 11.0 of the Citrix ADC software. To deploy fine grained SQL Injection relaxation, the Web App Firewall offers fine grained SQL Injection learning. The learning engine makes recommendations regarding the observed Value Type (keyword, SpecialString, Wildchar) and the corresponding Value expression observed in the input fields. In addition to checking the blocked requests to determine whether the current rule is too restrictive and needs to be relaxed, you can review the rules generated by the learning engine to determine which value type and value expressions are triggering violations and need to be addressed in relaxation rules.

### Important

The Web App Firewall's learning engine can distinguish only the first 128 bytes of the name. If a form has multiple fields with names that match for the first 128 bytes, the learning engine might not be able to distinguish between them. Similarly, the deployed relaxation rule might inadvertently relax all such fields from SQL Injection inspection.

**Note** To bypass SQL check in User-Agent header, use the following relaxation rule:

```
bind appfw profile your_profile_name -SQLInjection User-Agent “.*” -location HEADER
```

To view or use learned data by using the command line interface

At the command prompt, type one of the following commands:

- `show appfw learningdata <profilename> SQLInjection`
- `rm appfw learningdata <profilename> -SQLInjection <string> <formActionURL> <location> [<valueType> <valueExpression>]`
- `export appfw learningdata <profilename> SQLInjection`

To view or use learned data by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Learned Rules**. You can select the **HTML SQL Injection** entry in the Learned Rules table and double-click it to access the learned rules. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you

can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the **HTML SQL Injection** entry in the Learned Rules table and clicking **Visualizer** to get a consolidated view of all the learned violations. The visualizer makes it very easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

### Using the Log Feature with the SQL Injection Check

When the log action is enabled, the HTML SQL Injection security check violations are logged in the audit log as **APPPFW\_SQL** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the SQL Injection violations:

```
> Shell
```

```
## tail -f /var/log/ns.log | grep APPFW_SQL
```

Example of a HTML SQL Injection log message when the request is transformed

```

```

### Note

As part of the streaming changes in 10.5.e build (enhancement builds) as well as 11.0 build onwards, we now process the input data in blocks. RegEx pattern matching is now restricted to 4K for contiguous character string matching. With this change, the SQL violation log messages might include different information compared to the earlier builds. The keyword and special character in the input could be separated by a large number of bytes. We now keep track of the SQL keywords and special strings when processing the data, instead of buffering the entire input value. In addition to the field name, the log message now includes the SQL keyword, or the SQL special character, or both the SQL keyword and the SQL special character, as determined by the configured setting. The rest of the input is no longer included in the log message, as shown in the following example:

### Example:

In 10.5, when the Web App Firewall detects the SQL violation, the entire input string might be included in the log message, as shown below:

```
SQL Keyword check failed for field text=\"select a name from testbed1
;(;)\".*<blocked>
```

In enhancement builds of 10.5.e that support request side streaming as well as 11.0 build onwards, we log only the field name, keyword and special character (if applicable) in the log message, as shown below:

```
SQL Keyword check failed for field **text="select(;)"<blocked>
```

This change is applicable to requests that contain application/x-www-form-urlencoded, or multipart/form-data, or text/x-gwt-rpc content-types. Log messages generated during processing of **JSON** or **XML** payloads are not affected by this change.

To access the log messages by using the GUI

The Citrix GUI includes a useful tool (**Syslog Viewer**) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall > Profiles**, select the target profile, and click **Security Checks**. Highlight the **HTML SQL Injection** row and click **Logs**. When you access the logs directly from the HTML SQL Injection check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.

- You can also access the Syslog Viewer by navigating to **Citrix ADC > System > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Application Firewall > policies > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **HTML SQL Injection** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW\_SQL** check box and click the **Apply** button, only log messages pertaining to the **SQL Injection** security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, **Client IP** etc. appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

**Click to Deploy** functionality is available only in the GUI. You can use the Syslog Viewer to not only view the logs but also to deploy HTML SQL Injection relaxation rules based on the log messages for the Web App Firewall security check violations. The log messages must be in CEF log format for this operation. Click to deploy functionality is available only for log messages that are generated by the block (or not block) action. You cannot deploy a relaxation rule for a log message about the transform operation.

To deploy a relaxation rule from the Syslog Viewer, select the log message. A check box appears in the upper right corner of the Syslog Viewer box of the selected row. Select the check box, and then select an option from the Action list to deploy the relaxation rule. **Edit & Deploy**, **Deploy**, and **Deploy All** are available as **Action** options.

The SQL Injection rules that are deployed by using the Click to Deploy option do not include the fine grain relaxation recommendations.

#### **To use Click to Deploy functionality in the GUI:**

1. In the Syslog Viewer, select **Application Firewall** in the **Module** options.
2. Select the **APP\_SQL** as the **Event Type** to filter corresponding log messages.
3. Select the check box to identify the rule to deploy.
4. Use the **Action** drop-down list of options to deploy the relaxation rule.
5. Verify that the rule appears in the corresponding relaxation rule section.

## Statistics for the SQL Injection violations

When the stats action is enabled, the counter for the SQL Injection check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, the request for a page that contains 3 SQL Injection violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

### To display SQL Injection check statistics by using the command line:

At the command prompt, type:

```
sh appfw stats
```

To display stats for a specific profile, use the following command:

```
> stat appfw profile <profile name>
```

To display HTML SQL Injection statistics by using the GUI

1. Navigate to **System > Security > Application Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about HTML SQL Injection violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## Highlights

### Note the following points about the SQL Injection check:

- **Built-in Support for SQL Injection Protection**—The Citrix Web App Firewall protects against SQL Injection by monitoring a combination of SQL keywords and special characters in the form parameters. All SQL keywords, special characters, wildcard characters, and default transformation rules are specified in the `/netscaler/default_custom_settings.xml` file.
- **Customization**—You can change the default key words, special characters, wildcard characters and transformation rules to customize the SQL security check inspection for the specific needs of your application. Make a copy of the default signature object, modify existing entries, or add new ones. Bind this signature object to your profile to make use of the customized configuration.
- **Hybrid Security Model**—Both signatures and deep security protections use the SQL/XSS patterns specified in the signature object that is bound to the profile. If no signature object is bound to the profile, the SQL/XSS patterns present in the default signature object are used.
- **Transform**—Note the following about the transform operation:

- The transform operation works independently of the other SQL Injection action settings. If transform is enabled and block, log, stats, and learn are all disabled, SQL special characters will be transformed.
- When SQL Transformation is enabled, user requests are sent to the backend servers after the SQL special characters are transformed in non-block mode. If the block action is enabled, it takes precedence over the transform action. If the injection type is specified as SQL special character and block is enabled, the request is blocked despite the transform action.
- **Fine Grained Relaxation and Learning**—Fine tune the relaxation rule to relax a subset of SQL elements from security check inspection but detect the rest. The learning engine recommends a specific value type and value expressions based on the observed data.
- **Click to Deploy**—Select one, or multiple SQL violation log messages in the syslog viewer and deploy them as relaxation rules.

## Buffer overflow check

September 21, 2020

The Buffer Overflow check detects attempts to cause a buffer overflow on the web server. If the Web App Firewall detects that the URL, cookies, or header are longer than the specified maximum length in a request, it blocks that request because it might be an attempt to cause a buffer overflow.

The Buffer Overflow check prevents attacks against insecure operating-system or web-server software that can crash or behave unpredictably when it receives a data string that is larger than it can handle. Proper programming techniques prevent buffer overflows by checking incoming data and either rejecting or truncating overlong strings. Many programs, however, do not check all incoming data and are therefore vulnerable to buffer overflows. This issue especially affects older versions of web-server software and operating systems, many of which are still in use.

The Buffer Overflow security check allows you to configure the **Block**, **Log**, and **Stats** actions. In addition, you can also configure the following parameters:

- **Maximum URL Length.** The maximum length the Web App Firewall allows in a requested URL. Requests with longer URLs are blocked. **Possible Values:** 0-65535. **Default:** 1024
- **Maximum Cookie Length.** The maximum length the Web App Firewall allows for all cookies in a request. Requests with longer cookies trigger the violations. **Possible Values:** 0-65535. **Default:** 4096
- **Maximum Header Length.** The maximum length the Web App Firewall allows for HTTP headers. Requests with longer headers are blocked. **Possible Values:** 0-65535. **Default:** 4096

## Using the command line to configure the Buffer Overflow security check

To configure Buffer Overflow security check actions and other parameters by using the command line

If you use the command-line interface, you can add the following Buffer Overflow Check arguments to the set appfw profile <profileName> command:

- `-bufferOverflowAction [[ block] [ log] [stats]] | [none]`
- `-bufferOverflowMaxURLLength <positiveInteger>`
- `-bufferOverflowMaxCookieLength <positiveInteger>`
- `-bufferOverflowMaxHeaderLength <positiveInteger>`

## Using the GUI to Configure the Buffer Overflow Security Check

In the GUI, you can configure the Buffer Overflow security check in the pane for the profile associated with your application.

To configure or modify the Buffer Overflow security check by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

- a. If you just want to enable or disable **Block**, **Log**, and **Stats** actions for **Buffer Overflow**, you can select or clear check boxes in the table, click **OK**, and then click **Save and Close** to close the Security Check pane.
- b. If you want to configure additional options for this security check, double click **Buffer Overflow**, or select the row and click **Action Settings**, to display the following options:

**Maximum URL Length.**

**Maximum Cookie Length.**

**Maximum Header Length.**

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

## Using the Log Feature with the Buffer Overflow Security Check

When the log action is enabled, the Buffer Overflow security check violations are logged in the audit log as **APPFW\_BUFFEROVERFLOW\_URL**, **APPFW\_BUFFEROVERFLOW\_COOKIE**, and

**APFW\_BUFFEROVERFLOW\_HDR** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

If you use the GUI to review the logs, you can use the click-to-deploy feature to apply relaxations indicated by the logs.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the Buffer overflow violations:

```
1 > **Shell**
2 > **tail -f /var/log/ns.log | grep APPFW_BUFFEROVERFLOW**
3 <!--NeedCopy-->
```

  ** : http://aaron.stratum8.net/ **<blocked>**
2 <!--NeedCopy-->
```

To access the log messages by using the GUI

The Citrix GUI includes a useful tool (**Syslog Viewer**) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall > Profiles**, select the target profile, and click **Security Checks**. Highlight the **Buffer Overflow** row and click **Logs**. When you access the logs directly from the Buffer Overflow Security Check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **NetScaler > System > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Application Firewall > policies > Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The XML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **Buffer Overflow** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers three options, **APPFW\_BUFFEROVERFLOW\_URL**, **APPFW\_BUFFEROVERFLOW\_COOKIE**, and **APPFW\_BUFFEROVERFLOW\_HDR**, to view all the log messages pertaining to buffer overflow security check. You can select one or more options to further refine your selection. For example, if you select the **APPFW\_BUFFEROVERFLOW\_COOKIE** check box and click the **Apply** button, only log messages pertaining to the Buffer Overflow security check violations for the Cookie header appear in the Syslog Viewer. If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, and **Client IP**, appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

**Click-to-Deploy:** The GUI provides click-to-deploy functionality, which is currently supported only for the buffer overflow log messages pertaining to the **URL Length** violations. You can use the Syslog Viewer to not only view the triggered violations, but also execute informed decisions based on the observed lengths of the blocked messages. If the current value is too restrictive and is triggering false positives, you can select a message and deploy it to replace the current value with the URL length value seen in the message. The log messages must be in CEF log format for this operation. If the relaxation can be deployed for a log message, a check box appears at the right edge of the Syslog Viewer box in the row. Select the check box, and then select an option from the **Action** list to deploy the relaxation. **Edit & Deploy**, **Deploy**, and **Deploy All** are available as **Action** options. You can use the **APPFW\_BUFFEROVERFLOW\_URL** filter to isolate all the log messages pertaining to the configured URL length violations.

If you select an individual log message, all three action options **Edit & Deploy**, **Deploy**, and **Deploy**

**All** are available. If you select **Edit & Deploy**, the **Buffer Overflow settings** dialogue is displayed. The new URL length that was observed in the request is inserted into the Maximum URL length input field. If you click **Close** without any edits, the current configured values remain unchanged. If you click the **OK** button, the new value of the Maximum URL length replaces the previous value.

**Note**

The **block**, **log** and **stats** action check boxes are unchecked in the displayed **Buffer Overflow settings** dialogue, and need to be reconfigured if you select the **Edit & Deploy** option. Make sure to enable these check boxes before clicking **OK**, otherwise the new URL length will get configured but the actions will be set to **none**.

If you select the check boxes for multiple log messages, you can use the **Deploy** or **Deploy All** option. If the deployed log messages have different URL lengths, the configured value gets replaced by the highest URL Length value observed in the selected messages. Deploying the rule results only in changing the **bufferOverflowMaxURLLength** value. Configured actions are retained and remain unchanged.

To use Click-to-Deploy functionality in the GUI

1. In the Syslog Viewer, select **APPFW** in the **Module** options.
2. Enable the **APPFW\_BUFFEROVERFLOW\_URL** check box as the **Event Type** to filter corresponding log messages.
3. Enable the check box to select the rule.
4. Use the **Action** drop-down list of options to deploy the relaxation.
5. Navigate to **Application Firewall > Profiles**, select the target profile, and click **Security Checks** to access the **Buffer Overflow** settings pane to verify that the **Maximum URL Length** value is updated.

### Statistics for the Buffer Overflow violations

When the stats action is enabled, the counter for the Buffer Overflow Security Check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, a request for a page that contains three Buffer Overflow violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display Buffer Overflow Security Check statistics by using the command line

At the command prompt, type:

```
> sh appfw stats
```

To display stats for a specific profile, use the following command:

```
> stat appfw profile <profile name>
```

To display Buffer Overflow statistics by using the GUI

1. Navigate to **System > Security > Application Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about Buffer Overflow violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## Highlights

- The buffer overflow security check allows you to configure limits to enforce the maximum length of allowed URLs, Cookies and Headers.
- **Block, Log** and **Stats** actions enable you to monitor the traffic and configure optimal protection for your application.
- Syslog viewer enables you to filter and view all the log messages pertaining to buffer overflow violations.
- **Click-to-Deploy** functionality is supported for the **bufferOverflowMaxURLLength** violations. You can select and deploy an individual rule, or you can select multiple log messages to tweak and relax the current configured value of the maximum allowed length of the URL. The highest value of the URL from the selected group is set as the new value, to allow all these requests that are currently flagged as violations.
- The Web App Firewall now evaluates individual cookies when inspecting the incoming request. If length of any one cookie received in the Cookie header exceeds the configured **BufferOverflowMaxCookieLength**, the Buffer Overflow violation is triggered.

### Important

In release 10.5.e (in a few interim enhancement builds prior to 59.13xx.e build) as well as in the 11.0 release (in builds prior to 65.x), Web App Firewall processing of the Cookie header was changed. In those releases, every cookie is evaluated individually, and if the length of any one cookie received in the Cookie header exceeds the configured **BufferOverflowMaxCookieLength**, the Buffer Overflow violation is triggered. As a result of this change, requests that were blocked in 10.5 and earlier release builds might be allowed, because the length of the entire cookie header is not calculated for determining the cookie length. \*\* In some situations, the total cookie size forwarded to the server might be larger than the accepted value, and the server might respond with “400 Bad Request”.

**Note** that this change has been reverted. The behavior in the 10.5.e ->59.13xx.e and subsequent 10.5.e enhancement builds as well as in the 11.0 release 65.x and subsequent builds is now sim-

ilar to that of the non-enhancement builds of release 10.5. The entire raw Cookie header is now considered when calculating the length of the cookie. Surrounding spaces and the semicolon (;) characters separating the name-value pairs are also included in determining the cookie length.\*\*

## Cookie consistency check

September 21, 2020

The Cookie Consistency check examines cookies returned by users, to verify that they match the cookies that your web site set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the web server. You can also configure the Cookie Consistency check to transform all of the server cookies that it processes, by encrypting the cookies, proxying the cookies, or adding flags to the cookies. This check applies to requests and responses.

An attacker would normally modify a cookie to gain access to sensitive private information by posing as a previously authenticated user, or to cause a buffer overflow. The Buffer Overflow check protects against attempts to cause a buffer overflow by using a very long cookie. The Cookie Consistency check focuses on the first scenario.

If you use the wizard or the GUI, in the Modify Cookie Consistency Check dialog box, on the General tab you can enable or disable the following actions:

- Block
- Log
- Learn
- Statistics
- Transform. If enabled, the Transform action modifies all cookies as specified in the following settings:
  - **Encrypt Server Cookies.** Encrypt cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list, before forwarding the response to the client. Encrypted cookies are decrypted when the client sends a subsequent request, and the decrypted cookies are reinserted into the request before it is forwarded to the protected web server. Specify one of the following types of encryption:
    - \* **None.** Do not encrypt or decrypt cookies. The default.
    - \* **Decrypt only.** Decrypt encrypted cookies only. Do not encrypt cookies.
    - \* **Encrypt session only.** Encrypt session cookies only. Do not encrypt persistent cookies. Decrypt any encrypted cookies.
    - \* **Encrypt all.** Encrypt both session and persistent cookies. Decrypt any encrypted cookies.

**Note:** When encrypting cookies, the Web App Firewall adds the

**HttpOnly** flag to the cookie. This flag prevents scripts from accessing and parsing the cookie. The flag therefore prevents a script-based virus or trojan from accessing a decrypted cookie and using that information to breach security. This is done regardless of the

Flags to Add in Cookies parameter settings, which are handled independently of the Encrypt Server Cookies parameter settings.

- **Proxy Server Cookies.** Proxy all non-persistent (session) cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list. Cookies are proxied by using the existing Web App Firewall session cookie. The Web App Firewall strips session cookies set by the protected web server and saves them locally before forwarding the response to the client. When the client sends a subsequent request, the Web App Firewall reinserts the session cookies into the request before forwarding it to the protected web server. Specify one of the following settings:
  - **None.** Do not proxy cookies. The default.
  - **Session only.** Proxy session cookies only. Do not proxy persistent cookies  
Note: If you disable cookie proxying after having enabled it (set this value to None after it was set to Session only), cookie proxying is maintained for sessions that were established before you disabled it. You can therefore safely disable this feature while the Web App Firewall is processing user sessions.
- **Flags to Add in Cookies.** Add flags to cookies during transformation. Specify one of the following settings:
  - **None.** Do not add flags to cookies. The default.
  - **HTTP only.** Add the HttpOnly flag to all cookies. Browsers that support the HttpOnly flag do not allow scripts to access cookies that have this flag set.
  - **Secure.** Add the Secure flag to cookies that are to be sent only over an SSL connection. Browsers that support the Secure flag do not send the flagged cookies over an insecure connection.
  - **All.** Add the HttpOnly flag to all cookies, and the Secure flag to cookies that are to be sent only over an SSL connection.

If you use the command-line interface, you can enter the following commands to configure the Cookie Consistency Check:

- `set appfw profile <name> -cookieConsistencyAction [**block**] [**learn**] [**log**] [**stats**] [**none**]`
- `set appfw profile <name> -cookieTransforms ([**ON**] | [**OFF**])`
- `set appfw profile <name> -cookieEncryption ([**none**] | [**decryptOnly**] | [**encryptSession**] | [**encryptAll**])`
- `set appfw profile <name> -cookieProxying ([**none**] | [**sessionOnly**])`

- `set appfw profile <name> -addCookieFlags ([**none**] | [**httpOnly**] | [**secure**] | [**all**])`

To specify relaxations for the Cookie Consistency check, you must use the GUI. On the Checks tab of the Modify Cookie Consistency Check dialog box, click Add to open the Add Cookie Consistency Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Cookie Consistency Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of Cookie Consistency check relaxations:

- **Logon Fields.** The following expression exempts all cookie names beginning with the string `logon_` followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

```
1  ^logon_[0-9A-Za-z]{
2  2,15 }
3  $
4  <!--NeedCopy-->
```

- **Logon Fields (special characters).** The following expression exempts all cookie names beginning with the string `türkçe-logon_` followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

```
1  ^txC3xBCrxC3xA7e-logon_[0-9A-Za-z]{
2  2,15 }
3  $
4  <!--NeedCopy-->
```

- **Arbitrary strings.** Allow cookies that contain the string `sc-item_`, followed by the ID of an item that the user has added to his shopping cart (`[0-9A-Za-z]+`), a second underscore (`_`), and finally the number of these items he wants (`[1-9][0-9]?`), to be user-modifiable:

```
1  ^sc-item_[0-9A-Za-z]+_[1-9][0-9]?$
2  <!--NeedCopy-->
```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

**Important**

In release 10.5.e (in a few interim enhancement builds prior to 59.13xx.e build) as well as in the 11.0 release (in builds prior to 65.x), Web App Firewall processing of the Cookie header was changed. In those releases, every cookie is evaluated individually, and if the length of any one cookie received in the Cookie header exceeds the configured `BufferOverflowMaxCookieLength`, the Buffer Overflow violation is triggered. As a result of this change, requests that were blocked in 10.5 and earlier release builds might be allowed, because the length of the entire cookie header is not calculated for determining the cookie length. In some situations, the total cookie size forwarded to the server might be larger than the accepted value, and the server might respond with “400 Bad Request”.

**Note** that this change has been reverted. The behavior in the 10.5.e ->59.13xx.e and subsequent 10.5.e enhancement builds as well as in the 11.0 release 65.x and subsequent builds is now similar to that of the non-enhancement builds of release 10.5. The entire raw Cookie header is now considered when calculating the length of the cookie. Surrounding spaces and the semicolon (;) characters separating the name-value pairs are also included in determining the cookie length.\*\*

**Note**

**Sessionless Cookie Consistency:** The cookie consistency behavior has changed in release 11.0. In earlier releases, the cookie consistency check invokes sessionization. The cookies are stored in the session and signed. A “wlt\_” suffix is appended to transient cookies and a “wlf\_” suffix is appended to the persistent cookies before they are forwarded to the client. Even if the client does not return these signed wlf/wlt cookies, the Web App Firewall uses the cookies stored in the session to perform the cookie consistency check.

In release 11.0, the cookie consistency check is sessionless. The Web App Firewall now adds a cookie that is a hash of all the cookies tracked by the Web App Firewall. If this hash cookie or any other tracked cookie is missing or tampered with, the Web App Firewall strips the cookies before forwarding the request to the back end server and triggers a cookie-consistency violation. The server treats the request as a new request and sends new Set-Cookie header(s).

The Cookie Consistency check in Citrix ADC version 13.0, 12.1, and NetScaler 12.0 and 11.1 does not have sessionless option.

## Web App Firewall support for Google web toolkit

September 21, 2020

**Note:** This feature is available in Citrix ADC release 10.5.e.

Web servers following Google Web Toolkit (GWT) Remote Procedure Call (RPC) mechanisms can be

secured by the Citrix Web Web App Firewall without a need for any specific configuration to enable the GWT support.

## What is GWT

The GWT is used for building and optimizing complex high-performance web applications by people who do not have expertise in XMLHttpRequest, and JavaScript. This open source, free development toolkit is used extensively for developing small and large scale applications and is quite frequently used for displaying browser based data such as search results for flights, hotels, and so on. The GWT provides a core set of Java APIs and widgets for writing optimized JavaScript scripts that can run on most browsers and mobile devices. The GWT RPC framework makes it easy for the client and server components of the web application to exchange Java objects over HTTP. GWT RPC services are not the same as web services based on SOAP or REST. They are simply a lightweight method for transferring data between the server and the GWT application on the client. GWT handles serialization of the Java objects exchanging the arguments in the method calls and the return value.

For popular websites that use GWT, see

<https://www.quora.com/What-web-applications-use-Google-Web-Toolkit-%28GWT%29>

## How a GWT request works

The GWT RPC request is pipe delimited and has variable number of arguments. It is carried as a payload of HTTP POST and has the following values:

1. Content-type = text/x-gwt-rpc. Charset can be any value.
2. Method = POST.

Both GET and POST HTTP requests are considered valid GWT requests if content-type is “text/x-gwt-rpc”. Query strings are now supported as part of GWT requests. Configure the “InspectQueryContent-Types” parameter of the App Firewall profile to “OTHER” to examine the request query portion for content-type “text/x-gwt-rpc”.

The following example shows a valid payload for a GWT request:

```
1 5|0|8|http://localhost:8080/test/|16878339F02B83818D264AE430C20468| com
   .test.client.TestService|testMethod|java.lang.String|java.lang.
   Integer| myInput1|java.lang.Integer/3438268394|1|2|3|4|2|5|6|7|8|1|
2 <!--NeedCopy-->
```

The request can be divided into three parts:

**\*\*a) Header:** 5|0|8|\*\*

|                       |   |   |                                                                                                                            |
|-----------------------|---|---|----------------------------------------------------------------------------------------------------------------------------|
| The first 3 digits “5 | 0 | 8 | ” in the above request, represent “version, subversion, and size of table”, respectively. These must be positive integers. |
|-----------------------|---|---|----------------------------------------------------------------------------------------------------------------------------|

### b) String Table:

```
http://localhost:8080/test/|16878339F02B83818D264AE430C20468| com.test.
client.TestService|testMethod|java.lang.String|java.lang.Integer|myInput1|
java.lang.Integer/3438268394|
```

The members of the above pipe delimited string table contain the user-provided inputs. These inputs are parsed for the Web App Firewall checks and are identified as follows:

- 1st : `http://localhost:8080/test/`  
This is the Request URL.
- 2nd : `16878339F02B83818D264AE430C20468`  
Unique HEX identifier. A request is considered malformed if this string has non-hex characters.
- rd : `com.test.client.TestService`  
Service Class name
- 4th : `testMethod`  
Service method name

|              |                                |                       |                                           |
|--------------|--------------------------------|-----------------------|-------------------------------------------|
| 5th onwards: | <code>java.lang.Integer</code> | <code>myInput1</code> | <code>java.lang.Integer/3438268394</code> |
|              | <code>java.lang.String</code>  |                       |                                           |

- Data-types and data. Non-primitive data-types are specified as  
<container>.<sub-cntr>.name/<integer><identifier>

\*\*c) Payload: 1|2|3|4|2|5|6|7|8|1|\*\*

The payload consists of references to the elements in the string table. These integer values cannot be larger than the number of elements in the string table.

## Web App Firewall protection for GWT applications

The Web App Firewall understands and interprets GWT RPC requests, inspects the payload for security check violations, and takes specified actions.

The Web App Firewall headers and cookies checks for GWT requests are similar to those for other request formats. After appropriate URL decoding and charset conversion, all the parameters in the string table are inspected. The GWT request body does not contain field names, just the field values. The input values can be validated against the specified format by using the Web App Firewall Field Format check, which can also be used to control the length of the input. The **Cross-site Scripting** and **SQL Injection** attacks in the inputs can be easily detected and thwarted by the Web App Firewall.

**Learning and relaxation rules:** Learning and deployment of relaxation rules are supported for GWT requests. Web App Firewall rules are in the form of <actionURL> <fieldName> mapping. The GWT request format does not have the field names and thus requires special handling. The Web App Firewall inserts dummy field names in the learned rules that can be deployed as relaxation rules. The -isRegex flag works as it does for non-GWT rules.

- Action URL:

Multiple services responding to an RPC can be configured on the same web server. The HTTP request has the URL of the web server, not of the actual service handling the RPC. Therefore, relaxation is not applied on the basis of the HTTP request URL, because that would relax all the services on that URL for the target field. For GWT requests, the Web App Firewall uses the URL of the actual service found in the GWT payload, in the fourth field in the string table.

- Field name:

Since the GWT request body contains only field values, the Web App Firewall inserts dummy field names such as 1, 2, and so on when recommending learned rules.

### Example of a GWT learned rule

```

1 POST /abcd/def/gh HTTP/1.1
2 Content-type: text/x-gwt-rpc
3 Host: 10.217.222.75
4 Content-length: 157
5
6 5|0|8|http://localhost:8080/acdtest/|16878339
   F02Baf83818D264AE430C20468|
7 com.test.client.TestService|testMethod|java.lang.String%3b|java.
   lang.Integer|onblur|
8
9 The learn data will be as follows:
10 > sh learningdata pr1 crossSiteScripting
11 Profile: pr1 SecurityCheck: crossSiteScripting
12 1) Url: http://localhost:8080/acdtest/ >> From GWT Payload.
```

```
13     Field:  10
14     Hits:   1
15     Done
16 <!--NeedCopy-->
```

**Example of a GWT relaxation rule**

```
bind appfw profile pr1 -crossSiteScripting 1 abcd -isregex NOTREGEX
```

**Log Messages:** The Web App Firewall generates log messages for the security check violations that are detected in the GWT requests. A log message generated by a malformed GWT request contains the string “GWT” for easy identification.

**Example of a Log message for malformed GWT request:**

```
Dec 5 21:48:02 <local0.notice> 10.217.31.247 12/05/2014:21:48:02 GMT ns
0-PPE-0 : APPFW Message 696 0 : "GWT RPC request with malformed payload. <
blocked>"
```

**Difference in processing of GWT vs non-GWT requests:**

The same payload can trigger different Web App Firewall security check violations for different Content-types. Consider the following example:

```
5|0|8|http://localhost:8080/acdtest/|16878339F02Baf83818D264AE430C20468|com
.test.client.TestService|testMethod|java.lang.String%3b|java.lang.Integer|
select|
```

**Content-type: application/x-www-form-urlencoded:**

A request sent with this content type results in a SQL violation if the SQL Injection Type is configured to use any of the four available options: SQLSplCharANDKeyword, SQLSplCharORKeyword, SQLKeyword, or SQLSplChar. The Web App Firewall considers ‘&’ to be the field separator and ‘=’ to be the name-value separator when processing the above payload. Since neither of these characters appears anywhere in the post body, the entire content is treated as a single field name. The field name in this request contains both an SQL special character (;) and an SQL Keyword (select). Therefore violations are caught for all four SQL Injection type options.

**Content-type: text/x-gwt-rpc:**

A request sent with this content type triggers an SQL violation only if the SQL injection type is set to one of the following three options: **SQLSplCharORKeyword**, **SQLKeyword**, or **SQLSplChar**. No violation is triggered if the SQL injection type is set to **SQLSplCharANDKeyword**, which is the default option. The Web App Firewall considers the vertical bar ‘

’ to be the field separator for the above payload in the GWT request. Therefore, the post body is divided into various form-field values, and form-field names are added (in accordance with the convention described earlier). Because of this splitting, the SQL special character and SQL keyword become parts of separate form fields.

Form field 8: `java.lang.String%3b -> %3b` is the (;) char

Form Field 10: select

As a result, when SQL Injection Type is set to **SQLSplChar**, field 8 indicates the SQL violation. For **SQLKeyword**, field 10 indicates the violation. Either of these two fields can indicate a violation if the SQL Inject type is configured with the **SQLSplCharORKeyword** option, which looks for the presence of either a keyword or a special character. No violation is caught for the default **SQLSplCharANDKeyword** option, because there is no single field that has a value that contains both **SQLSplChar** and **SQLKeyword** together.

#### Tips:

- No special Web App Firewall configuration is needed to enable GWT support.
- The Content-type must be `text/x-gwt-rpc`.
- Learning and deploying of the relaxation rules for all the pertinent Web App Firewall security checks applied to GWT payload works the same as it does for the other supported content-types.
- Only POST requests are considered valid for GWT. All other request methods are blocked if the content-type is `text/x-gwt-rpc`.
- GWT requests are subject to the configured POST body limit of the profile.
- The sessionless setting for the security checks is not applicable and will be ignored.
- CEF log format is supported for the GWT log messages.

## Data leak prevention checks

September 21, 2020

The data-leak-prevention checks filter responses to prevent leaks of sensitive information, such as credit card numbers and social security numbers, to unauthorized recipients.

## Credit card check

October 23, 2020

If you have an application that accepts credit cards, or your websites have access to database servers that store credit card numbers, you must use Data Leak Prevention (DLP) measures and configure protection for each type of credit card that you accept.

The Citrix Web App Firewall Credit Card check prevents attackers from exploiting Data Leak Prevention flaws to obtain credit card numbers of your customers. By following simple configuration steps, you can enforce protection of one or more of the following credit cards: 1) Visa, 2) Master Card, 3) Discover, 4) American Express (Amex), 5) JCB, and 6) Diners Club.

The Credit Card security check examines server responses to identify instances of the target credit card numbers, and applies a specified action when such a number is found. The action can be to transform the response by X'ing out all but the last group of digits in the credit card number, or to block the response if it contains more than a specified number of credit card numbers. If you specify both, the block action takes precedence. The Maximum credit cards allowed per page setting determines when the block action is invoked. The default setting, 0 (no credit card numbers allowed on the page), is the safest, but you can allow up to 255. Depending on where the violation is detected in the response and the block action gets triggered, you might get fewer than the maximum allowed number of credit cards in the response.

To avoid false positives, you can apply relaxations to exempt specific numbers from the Credit Card check. For example, a social security number, purchase order number, or Google account number might be similar to a credit card number. You can specify individual numbers or use a regular expression to indicate the string of digits to be bypassed when processing the response URL for credit card inspection.

If you're not sure which credit card numbers to exempt, you can use the learn feature to generate recommendations based on the learned data. To get optimal benefit without compromising performance, you might want to enable this option for a short time to get a representative sample of the rules, and then deploy the relaxations and disable learning.

If you enable the log feature, the Credit Card check generates log messages indicating the actions that it takes. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate thwarted attempts to gain access. By default, the `doSecureCreditCardLogging` parameter is ON, so the credit card number is not included in the log message generated by the safe commerce (Credit Card) violation.

The stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack.

To configure the Credit Card security check for protecting your application, configure the profile that

governs inspecting the traffic to and from this application.

**Note:**

A website that does not access a SQL database usually does not have access to sensitive private information such as credit card numbers.

### Using the command line to configure the credit card check

In the command line interface, you can use either the `set appfw profile` command or the `add appfw profile` command to activate credit-card checking and specify which actions to perform. You can use the `unset appfw profile` command to revert back to the default settings. To specify relaxations, use the `bind appfw` command to bind credit card numbers to the profile.

To configure a credit card check by using the command line

Use either the `set appfw profile` command or the `add appfw profile` command, as follows:

- `set appfw profile <name> -creditCardAction ( ([block][learn] [log][stats]) | [none])`
- `set appfw profile <name> -creditCard (VISA | MASTERCARD | DISCOVER | AMEX | JCB | DINERSCLUB)`
- `set appfw profile <name> -creditCardMaxAllowed <integer>`
- `set appfw profile <name> -creditCardXOut ([ON] | [OFF])<name> -doSecureCreditCard ([ON] | [OFF])`
- To configure a Credit Card relaxation rule by using the command line

Use the `bind` command to bind the credit card number to the profile. To remove a credit card number from a profile, use the `unbind` command, with the same arguments that you used for the `bind` command. You can use the `show` command to display the credit card numbers bound to a profile.

To bind a credit card number a profile

```

1      `bind appfw profile <profile-name> -creditCardNumber <any number/
      regex> “<url>” `
2
3      **Example**: bind appfw profile test_profile -creditCardNumber
      378282246310005 `http://www.example.com/credit\_card\_test.html`
4
5      -
6      To unbind a credit card number from a profile
7
8      `unbind appfw profile <profile-name>
9      -creditCardNumber <credit card number / regex> “<url>`

```

```
10 -
11     To show the list of credit card numbers bound to a profile.
12
13     show appfw profile <profile>
```

## Using the GUI to configure the credit card check

In the GUI, you configure the credit card security check in the pane for the profile associated with your application.

To add or modify the Credit Card security check by using the GUI

1. Navigate to **Web App Firewall > Profiles**, **highlight** the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

- a) If you just want to enable or disable Block, Log, Stats, and Learn actions for Credit Card, you can select or clear check boxes in the table, click **OK**, and then click **Save** and **Close** to close the **Security Check** pane.
  - b) If you want to configure additional options for this security check, double click Credit Card, or select the row and click **Action Settings** to display additional options as follows:
    - Out—Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter “X.”
    - Maximum credit cards allowed per page—Specify the number of credit cards that can be forwarded to the client without triggering a block action.
    - Protected Credit Cards. Select or clear a check box to enable or disable protection for each type of credit card.
    - You can also edit the Block, Log, Stats and Learn actions in the Credit Card Settings pane.After making any of the above changes, click OK to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click OK to save all the changes you have made in the Security Checks section and then click Save and Close to close the Security Check pane.
3. In the **Advanced Settings** pane, click **Profile settings**. To enable or disable secure logging of credit card Numbers, select or clear the **Secure Credit Card Logging** check box. (By default, it is selected).

Click **OK** to save the changes.

- To configure a Credit Card relaxation rule by using the GUI

1. Navigate to **Web App Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**. The Relaxation Rules table has a Credit Card entry. You can double click, or select this row and click **Edit** to access the **Credit Card Relaxation Rules** dialogue. You can perform Add, Edit, Delete, Enable, or Disable operations for relaxation rules.

### Using the learn feature with the credit card check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, if you want to exempt a specific string of digits from the Credit Card security check, you can by deploy the learned rule as a relaxation rule.

- To view or use learned data by using the command line interface

```
show appfw learningdata <profilename> creditCardNumber
rm appfw learningdata <profilename> -creditcardNumber <credit card
number> "<url>"
export appfw learningdata <profilename> creditCardNumber
```

- To view or use learned data by using the GUI
  1. Navigate to **Web App Firewall > Profiles**, highlight the target profile, and click **Edit**.
  2. In the **Advanced Settings** pane, click **Learned Rules**. You can select the Credit Card entry in the Learned Rules table and double-click it to access the learned rules. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the Credit Card entry in the Learned Rules table and clicking Visualizer to get a consolidated view of all the learned violations. The visualizer makes it very easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

### Using the log feature with the credit card check

When the log action is enabled, the Credit Card security check violations are logged in the audit log as APPFW\_SAFECOMMERCE or APPFW\_SAFECOMMERCE\_XFORM violations. The Web App Firewall sup-

ports both Native and CEF log formats. You can also send the logs to a remote syslog server.

The default setting for `doSecureCreditCardLogging` is ON. If you change it to OFF, both credit card number and type are included in the log message.

Depending on the settings configured for the Credit Card checks, the application-firewall generated log messages might include the following information:

- Response was blocked or not blocked.
- Credit card numbers were transformed (X'd out). A separate log message is generated for each transformed credit card number, so multiple log messages might be generated during processing of a single response.
- Response contained the maximum number of potential credit card numbers.
- Credit card numbers and their corresponding types.
- To access the log messages by using the command line

Switch to the shell and tail the `ns.logs` in the `/var/log/` folder to access the log messages pertaining to the Credit Card violations:

- Shell

```
tail -f /var/log/ns.log
```

```
grep SAFECOMMERCE
```

-

- To access the log messages by using the GUI
  1. The Citrix GUI includes a very useful tool (Syslog Viewer) for analyzing the log messages. You have a couple of options for accessing the Syslog Viewer: Navigate to the **target profile > Security Checks**. Highlight the Credit Card row and click Logs. When you access the logs directly from the Credit Card security check of the profile, it filters out the log messages and displays only the logs pertaining to these security check violations.
  2. You can also access the Syslog Viewer by navigating to **NetScaler > System > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.

The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To access Credit Card security check violation log messages, filter by selecting APPFW in the dropdown options for Module. The Event Type displays a rich set of options to further refine your selection. For example, if you select the

APPFW\_SAFECOMMERCE and APPFW\_SAFECOMMERCE\_XFORM check boxes and click the Apply button, only log messages pertaining to the Credit Card security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as Module and EventType, appear below the log message. You can select any of these options to highlight the corresponding information in the logs.

Example of a Native format log message when the response is not blocked

```

## Statistics for the credit card violations

When the stats action is enabled, the corresponding counter for the Credit Card check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled and the Max Allowed credit card setting is 0, the request for a page that contains 20 credit card numbers increments the stats counter by one when the page is blocked as soon as the first credit card number is detected. However, if block is disabled and transform is enabled, processing the same request increments the statistics counter for logs by 20, because each credit card transformation generates a separate log message.

- To display Credit Card statistics by using command line

At the command prompt, type:

```
sh appfw stats
```

To display stats for a specific profile, use the following command:

```
stat appfw profile <profile name>
```

To display Credit Card statistics by using GUI

1. Navigate to **System > Security > Web App Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about Credit Card violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## Highlights

Note the following points about the Credit Card security check:

- The Web App Firewall enables you to protect credit card information and detect any attempts to access this sensitive data.
- To use the Credit Card protection check, you must specify at least one type of credit card and an action. The check is then applied to HTML, XML, and Web 2.0 profiles.

---

You can pipe the output of `sh appfw profile` command and `grep` for `CreditCard` to see all the Credit Card specific configuration. For example, `sh appfw profile my_profile`

`grep CreditCard` displays the configured settings of various parameters as well as the relaxation rules pertaining to the Credit Card check for the Web App Firewall profile named `my_profile`.

---

-

- You can exclude specific numbers from Credit Card inspection without bypassing the security check inspection for the rest of the credit card numbers.
- Relaxation is available for all Web App Firewall protected credit card patterns. In the GUI, you can use the visualizer to specify Add, Edit, Delete, Enable, or Disable operations on relaxation rules.
- The Web App Firewall learning engine can monitor the outgoing traffic to recommend rules based on observed violations. Visualizer support is also available for managing the learned credit card rules in the GUI. You can edit and deploy the learned rules, or skip them after careful inspection.
- The setting for number of allowed credit cards applies to each response. It does not pertain to the cumulative total of credit card numbers observed during the entire user session.
- The number of X'd out digits depends on the length of the credit card numbers. Ten digits are X'd out for credit cards that have 13 through 15 digits. Twelve digits are X'd out for credit cards that have 16 digits. If your application does not require sending the entire credit card number in the response, Citrix recommends that you enable this action to mask the digits in the credit card numbers.
- The X-out operation transforms all the credit cards and works independently of the configured settings for the maximum number of allowed credit cards. For example, if there are 4 credit cards in the response and the `creditCardMaxAllowed` parameter is set to 10, all 4 credit cards are X'd-out, but they are not blocked. If the credit card numbers are spread out in the document, a partial response with X'd-out numbers might be sent to the client before the response is blocked.
- Do not disable the `doSecureCreditCardLogging` parameter before due consideration. When this parameter is turned off, the credit card numbers are displayed and are accessible in the log messages. These numbers are not masked in the logs, even if the X-out action is enabled. If you are sending logs to a remote syslog server, and the logs are compromised, the credit card numbers can be exposed.
- When the response page is blocked because of a Credit Card violation, the Web App Firewall does not redirect to the error page.

## Safe object check

September 21, 2020

The Safe Object check provides user-configurable protection for sensitive business information, such as customer numbers, order numbers, and country-specific or region-specific telephone numbers or

postal codes. A user-defined regular expression or custom plug-in tells the Web App Firewall the format of this information and defines the rules to be used to protect it. If a string in a user request matches a safe object definition, the Web App Firewall either blocks the response, masks the protected information, or removes the protected information from the response before sending it to the user, depending on how you configured that particular safe object rule.

The Safe Object check prevents attackers from exploiting a security flaw in your web server software or on your web site to obtain sensitive private information, such as company credit card numbers or social security numbers. If your web sites do not have access to these types of information, you do not need to configure this check. If you have a shopping cart or other application that can access such information, or your web sites have access to database servers that contain such information, you should configure protection for each type of sensitive private information that you handle and store.

**Note:**

A web site that does not access an SQL database usually does not have access to sensitive private information.

The Safe Object Check dialog box is unlike that for any other check. Each safe object expression that you create is the equivalent of a separate security check, similar to the Credit Card check, for that type of information. If you use the wizard or the GUI, you add a new expression by clicking Add and configuring the expression in the Add Safe Object dialog box. You modify an existing expression by selecting it, then clicking Open, and then configuring the expression in the Modify Safe Object dialog box.

In the Safe Object dialog box for each safe object expression, you can configure the following:

- **Safe Object Name.** A name for your new safe object. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 255 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) symbols.
- **Actions.** Enable or disable the Block, Log, and Statistics actions, and the following actions:
  - **X-Out.** Mask any information that matches the safe object expression with the letter “X”.
  - **Remove.** Remove any information that matches the safe object expression.
- **Regular Expression.** Enter a PCRE-compatible regular expression that defines the safe object. You can create the regular expression in one of three ways: by typing the regular expression directly into the text box, by using the **Regex Tokens** menu to enter regular expression elements and symbols directly into the text box, or by opening the Regular Expressions Editor and using it to construct the expression. The regular expression must consist of ASCII characters only. Do not cut and paste characters that are not part of the basic 128-character ASCII set. If you want

to include non-ASCII characters, you must manually type those characters in PCRE hexadecimal character encoding format.

Note: Do not use start anchors (^) at the beginning of Safe Object expressions, or end anchors (\$) at the end of Safe Object expressions. These PCRE entities are not supported in Safe Object expressions, and if used, will cause your expression not to match what it was intended to match.

- **Maximum Match Length.** Enter a positive integer that represents the maximum length of the string that you want to match. For example, if you want to match U.S. social security numbers, enter the number eleven (11) in this field. That allows your regular expression to match a string with nine numerals and two hyphens. If you want to match California driver's license numbers, enter the number eight (8).

**Caution:**

If you do not enter a maximum match length in this field, the Web App Firewall uses a default value of one (1) when filtering for strings that match your safe object expressions. As a result, most safe object expressions fail to match their target strings.

You cannot use the command-line interface to configure the Safe Object check. You must configure it by using either the Web App Firewall wizard or the GUI.

Following are examples of Safe Object check regular expressions:

- Look for strings that appear to be U.S. social security numbers, which consist of three numerals (the first of which must not be zero), followed by a hyphen, followed by two more numerals, followed by a second hyphen, and ending with a string of four more numerals:

```
1  [1-9][0-9]{
2  3,3 }
3  -[0-9]{
4  2,2 }
5  -[0-9]{
6  4,4 }
7
8  <!--NeedCopy-->
```

- Look for strings that appear to be California driver's license IDs, which start with a letter and are followed by a string of exactly seven numerals:

```
1  [A-Za-z][0-9]{
2  7,7 }
3
4  <!--NeedCopy-->
```

- Look for strings that appear to be Example Manufacturing customer IDs which, consist of a string of five hexadecimal characters (all the numerals and the letters A through F), followed by a hy-

phen, followed by a three-letter code, followed by a second hyphen, and ending with a string of ten numerals:

```
1  [0-9A-Fa-f]{
2  5,5 }
3  -[A-Za-z]{
4  3,3 }
5  -[0-9]{
6  10,10 }
7
8  <!--NeedCopy-->
```

**Caution:** Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write to ensure that they define exactly the type of string you want to add as a safe object definition, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.) metacharacter/wildcard combination, can have results you did not want or expect, such as blocking access to web content that you did not intend to block.

## Advanced form protection checks

September 21, 2020

The advanced Form Protection checks examine web form data to prevent attackers from compromising your system by modifying the web forms on your web sites or sending unexpected types and quantities of data to your web site in a form.

### Note

SQL, XSS, FFC, and FieldFormat protection checks are applied if the **Exclude Upload Files From Security Checks** is unset.

A file upload is also a form element that has control-name **name** field that is submitted as part of form submission.

Refer to this page, for more information: [Forms](#)

## Field formats check

September 21, 2020

The Field Formats check verifies the data that users send to your web sites in web forms. It examines both the length and type of data to ensure that it is appropriate for the form field in which it appears. If the Web App Firewall detects inappropriate web form data in a user request, it blocks the request.

By preventing an attacker from sending inappropriate web form data to your web site, the Field Formats check prevents certain types of attacks on your web site and database servers. For example, if a particular field expects the user to enter a phone number, the Field Formats check examines the user-submitted input to ensure that the data matches the format of a phone number. If a particular field expects a first name, the Field Formats check ensures that the data in that field is of a type and length appropriate for a first name. It does the same thing for each form field that you configure it to protect.

This check applies to HTML requests only. It does not apply to XML requests. You can configure Field Format Checks in HTML profiles or Web 2.0 profiles to inspect HTML payload for protecting your applications. The Web App Firewall also supports Field Format Check protection for Google Web Toolkit (GWT) applications.

The Field Formats check requires that you enable one or more actions. The Web App Firewall examines the submitted inputs and applies the specified actions.

**Note**

Field format rules are tightening rules. Adding them to relaxation list from learned data acts as a blocking rule.

To relax field format rules, please remove particular “fieldname” from the fieldformat relaxations list.

You have the option to set the default field formats to specify Field Type and the minimum and maximum length of data expected in each form field on each web form that you want to protect. You can deploy relaxation rules to configure a Field Format for an individual field of a specific form. Multiple rules can be added to specify the field name, the action URL, and Field Formats. Specify Field Formats to accept different types of inputs in different form fields. The learning feature can provide recommendations for the relaxation rules.

**Field Format Actions**—You can enable Block, Log, Stats, and Learn actions. At least one of these actions must be enabled to engage the Field Format Check protection.

- **Block.** If you enable block, the block action is triggered if the input does not conform to the specified Field Format. If a rule was configured for the target field, the input is checked against the specified rule. Otherwise, it is checked against the default field format specification. Any mismatch in the Field Type or min/max length specification results in blocking the request.
- **Log.** If you enable the log feature, the Field Format check generates log messages indicating the actions that it takes. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate malicious attempts to launch an attack.

- **Stats.** If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack, or you might have to revisit the configuration to see if the specified field format is too restrictive.
- **Learn.** If you are not sure which Field Types or minimum and maximum length values might be ideally suited for your application, you can use the learn feature to generate recommendations based on the learned data. The Web App Firewall learning engine monitors the traffic and provides field format recommendations based on the observed values. To get optimal benefit without compromising performance, you might want to enable the learn option for a short time to get a representative sample of the rules, and then deploy the rules and disable learning.  
Note: The Web App Firewall's learning engine can distinguish only the first 128 bytes of the name. If a form has multiple fields with names that match for the first 128 bytes, the learning engine might not be able to distinguish between them. Similarly, the deployed relaxation rule might inadvertently relax all such fields.

**Default Field Format**—In addition to configuring the actions, you can configure the default Field Format to specify the type of data expected in all the form fields for your application. A Field Type can be selected as the Field Format type. Minimum length and Maximum length parameters can be used to specify the length of the allowed inputs. As an alternative to Field Types, you can use Character Maps to specify what's allowed in a field (except in cluster deployments).

- **Field Type**—Field Types are named expressions to which you assign assigned priority values. Field Type expressions specify the allowed inputs and are matched against the submitted data to determine whether the received values are consistent with the allowed values. The Field Types are checked in the order of their priority numbers. A lower number indicates a higher priority. The Web App Firewall gives you the option to add your own Field Types and assign them the priorities you want. The priority value can range from 0 through 64000. The following built-in Field Types are provided to help simplify the configuration process:

```

1  > sh appfw fieldtype
2  1)      Name: integer           Regex: "[+-]?[0-9]+$"
3          Priority: 30           Comment: Integer
4          Builtin: IMMUTABLE
5  2)      Name: alpha            Regex: "[a-zA-Z]+$"
6          Priority: 40           Comment: "Alpha
7          characters"
8          Builtin: IMMUTABLE
9  3)      Name: alphanum         Regex: "[a-zA-Z0-9]+$"
10         Priority: 50           Comment: "Alpha-numeric
11         characters"
12         Builtin: IMMUTABLE
13  4)      Name: nohtml          Regex: "[^&<>]*$"
14         Priority: 60           Comment: "Not HTML"
15         Builtin: IMMUTABLE

```

```

14  5)      Name:  any                Regex:  "^.*$"
15          Priority:  70             Comment:  Anything
16          Builtin:  IMMUTABLE
17      Done
18  >
19  <!--NeedCopy-->

```

**Note:** The built-in Field Types are IMMUTABLE. They cannot be modified or removed. Any Field Types that you add are MODIFIABLE. You can edit them or remove them.

Configuring a Field Type as a default Field Format might be useful when you have a PCRE expression that can identify the valid inputs in all or most of the form fields for your application and exclude the invalid inputs. For example, if all the inputs in your application forms are expected to contain only numbers and letters, you might want to use the built-in Field Type `alphanum` as the default Field Type. Any non-alphanumeric character such as a backslash (`\`) or semicolon (`;`) in the input will trigger a violation. You can also add your own customized Field Types and use them to configure default Field Formats. For example, if you want to make the lowercase “x”, “y”, and “z” the only allowed alpha characters, you can configure a customized Field Type with regular expression “`^[x-z]+$`”. You could assign it a higher priority (lower priority number) than the built-in Field Types and use it as the default Field Type.

- **Minimum Length** — The default minimum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 0 by default, which allows the user to leave the field blank. Any higher setting forces users to fill in the field.

**Caution:** If the minimum length value is 0 but the Field Type is `integer`, `alpha`, or `alphanum`, a request is blocked if any input field is left empty, despite the minimum length setting. That is because the `regEx` for these Field Types contains a `+` character, which means one or more characters. Distinguishing an integer from an alpha character requires at least one character.

- **Maximum Length**—The default maximum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 65535 by default.

**Note:** Characters vs bytes. The minimum and the maximum lengths for the field formats represent the number of bytes, not the number of characters. Languages that have greater than one-byte character representation can cause the limit to be exceeded with fewer characters than the number configured for the maximum value. For example, with double-byte character representation, the maximum value of 9 allows no more than 4 characters.

**Tip:** The GUI allows you to cut and paste UTF-8 characters directly into the GUI without having to convert them to hex.

- **Character Maps:** In addition to recommending the Field Types, the Web App Firewall learning engine offers you an additional option, Use Character Maps, to deploy the Format Check rules. A Character Map is a set of all the characters allowed in a particular form field. You can fine tune

the Field format specification to allow or disallow specific characters by using Character Maps. A separate Character Map is generated for each form field. The alpha and numeric characters are treated differently in Character Maps. If any alpha character is seen in the input, all alpha characters [A-Za-z] will be allowed by the recommended PCRE expression in the Character Map. Similarly, if any digit is included, all digits [0-9] will be allowed. Non-printable characters are specified by using the x construct. Only single Byte characters with values between 0-255 are considered for Character Map recommendations.

A Character Map can be more specific than the corresponding Field Type recommendation. In some situations, Character Maps might be a better option, because they give you tighter control over the set of characters allowed as inputs. The deployed character maps are displayed as strings that start with prefix "CM" followed by digits. The priority for the Character Maps starts at 10000. As with user-added Field Types, you can add, edit or remove a Character Map. Character Maps that are currently used in deployed rules cannot be modified or removed.

**Note:** Character Maps are not supported in cluster deployments.

#### Note

When you add a field formats rule with any built-in Field Type and use character map instead of Field Type and save it, the changes do not get saved and rule still shows with Field Type.

When the character map matches one of the built-in type, the field type is reused instead of creating a new character map.

## Using the command line to configure the field format check

In the command line interface, you can use the `add appfw fieldtype` command to add a new Field Type. You can use either the `set appfw profile` command or the `add appfw profile` command to configure the Field Format check and specify which actions to perform. You can use the `unset appfw profile` command to revert the configured settings back to their defaults. To specify a Field Format rule, use the `bind appfw` command to bind a Field Type to a form Field and the action URL, along with the minimum and maximum length specifications.

### To add, remove or view a Field Type by using the command line:

Use the `add` command to add a Field Type. You must specify the Name, Regular expression and Priority when adding a new Field Type. You also have the option to add a Comment. You can use the `show` command to display the configured Field Types. You can also delete a Field Type by using the `remove` command, which requires only the Name of the Field Type.

```
add [appfw] fieldType <name> <regex> <priority> [-comment <string>]
```

where:

<regex> is a regular expression

<priority> is a positive\_integer

Example:

```

1 add fieldtype "Cust_Zipcode" "[0-9]{
2   5 }
3   [-][0-9]{
4   4 }
5   $" 4
6
7 - show [appfw] fieldType [<name>]
8
9   Example: sh fieldType
10
11  sh appfw fieldType
12
13  sh appfw fieldType cust_zipcode
14
15 - `rm [appfw] fieldType <name>`
16
17   Example: rm fieldType cusT_ziPcode
18
19   `rm appfw fieldType cusT_ziPcode`
20 <!--NeedCopy-->

```

**Note:** As shown above, use of “appfw” in the command is optional. For example, “Add Field-Type” or “Add appfw fieldType” are both valid options. The names of the Field Types are case insensitive due to normalization. As shown in the above examples, Cust\_Zipcode, cust\_zipcode, and cUsT\_ziPcode refer to the same Field Type.

To configure a Field Format check by using the command line

Use either the set appfw profile command or the add appfw profile command, as follows:

- set appfw profile <name> -fieldFormatAction ([[block] [learn] [log] [stats]])| [none])
- set appfw profile <name>-defaultFieldFormatType <string>
- set appfw profile <name> -defaultFieldFormatMinLength <integer>
- set appfw profile <name> -defaultFieldFormatMaxLength <integer>

To configure a Field Format relaxation rule by using the command line

```

1 bind appfw profile <name> (-fieldFormat <string> <formActionURL> <
2   fieldType>
3   [-fieldFormatMinLength <positive_integer>] [-fieldFormatMaxLength <
4   positive_integer>]
5   [-isRegex ( REGEX | NOTREGEX )])

```

```
4 <!--NeedCopy-->
```

Example:

```
1 bind appfw profile pr_ffc -fieldFormat "login_name" ".*;/login.php"  
   integer -fieldformatMinLength 3 -FieldformatMaxLength 6  
2 <!--NeedCopy-->
```

## Using the GUI to configure the field formats security check

In the GUI, you can manage the Field Types. You can also configure the Field Formats security check in the pane for the profile associated with your application.

To add, modify or remove a Field Type using the GUI

1. Navigate to Application Firewall node. In the Settings, click **Manage Field Types** to display the Configure Application Firewall Field Type dialog box.
2. Click **Add** to add a new Field Type. Follow the instructions in this pane and click Create. You can also edit or delete any user-added Field Type if it is currently not being used by a deployed rule.

To add or modify the Field Formats security check by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

- a) If you just want to enable or disable **Block, Log, Stats**, and **Learn** actions for Field Formats, you can select or clear check boxes in the table, click **OK**, and then click **Save and Close** to close the Security Check pane.
- b) If you want to configure additional options for this security check, double click Field Formats, or select the row and click Action Settings, to display the following options for **Default Field Format**:
  - **Field Type**—Select the Field Type that you want to configure as the default Field Type. You can select the built-in and user-defined Field Types. The deployed Character Maps are also included in the list and can be selected.
  - **Minimum Length**—Specify the minimum number of characters that must be in each field. Possible values: 0-65535.
  - **Maximum Length**—Specify the maximum number of characters that must be in each field. Possible values: 1-65535.You can also edit the **Block, Log, Stats** and **Learn** actions in the Field Formats Settings pane.

After making any of the above changes, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** **\*\* to save all the changes you have made in the Security Checks section, and then click \*\*Save and Close** to close the Security Check pane.

- To configure a Field Formats relaxation rule by using the GUI
  1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
  2. In the **Advanced Settings** pane, click **Relaxation Rules**. The Relaxation Rules table has a Field Formats entry. You can double click, or select this row and click the Edit button, to access the Field Formats Relaxation Rules dialogue. You can perform **Add, Edit, Delete, Enable, or Disable** operations for relaxation rules.

For a consolidated view of all the relaxation rules, you can highlight the Field Formats row and click Visualizer. The visualizer for deployed relaxations offers you the option to Add a new rule or Edit an existing one. You can also Enable or Disable a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

## Using the learn feature with the Field Formats Check

When the learn action is enabled, the Web App Firewall learning engine monitors the traffic and learns the triggered violations. You can periodically inspect these learned rules. After due consideration, you can deploy the learned rule as a Field Format relaxation rule.

**Field formats learning enhancement**—An Web App Firewall learning enhancement was introduced in release 11.0. In the previous releases, once the learned field format recommendation is deployed, the Web App Firewall learning engine stops monitoring the valid requests for the purpose of recommending new rules on the basis of the new data points. This limits the configured security protection, because the learning database does not include any representations of the new data seen in the valid requests processed by the security check.

Violations are no longer coupled with learning. The learning engine learns and makes recommendations for the field formats regardless of the violations. In addition to checking the blocked requests to determine whether the current field format is too restrictive and needs to be relaxed, the learning engine also monitors the allowed requests to determine whether the current field format is too permissive, and allows elevating the security by deploying a more restrictive rule.

Following is a summary of the Field Formats learning behavior:

**No Field format is bound**—The behavior remains unchanged in this scenario. All learn data is sent to the aslearn engine. The learning engine suggests a field format rule based on the data set.

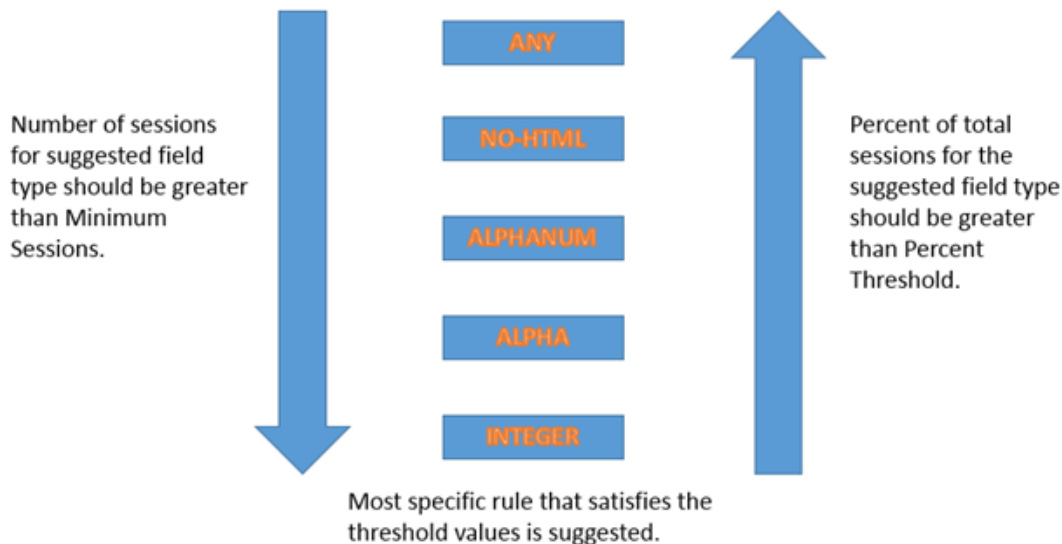

**Field format is bound:** In the previous releases, observed data is sent to the aslearn engine only in the case of a violation. The learning engine suggests a field format rule based on the data set. In the

11.0 release, all data is sent to aslearn engine even if no violation is triggered. The learning engine suggests a field format rule based on the entire data set of all received inputs.

**Use Case for learning enhancement:**

If the initial field format learned rules are based on a small sample of data, a few non typical values might result in a recommendation that is too lenient for the target field. The ongoing learning allows the Web App Firewall to observe data points from every request to collect a representative sample for the learned recommendations. This is helpful in further tightening the security to deploy the optimal input format with an adequate range value.

## HOW FIELD FORMAT RULES ARE SUGGESTED

The field format learning makes use of the priority of the Field Types as well as the configured settings of the following learning thresholds:

- **FieldFormatMinThreshold**—Minimum number of times a specific form field must be observed before a learned relaxation is generated. Default: 1.
- **FieldFormatPercentThreshold**—Percentage of times a form field matched a particular Field Type, before a learned relaxation is generated. Default: 0.

The field format rule recommendations are based on the following criteria:

- **Field Type recommendations**—The Field Type recommendations are determined by the assigned priorities of the existing Field Types and the specified Field Format thresholds. The priorities determine the order in which the Field Types are matched against the inputs. A lower number specifies a higher priority. For example, Field Type integer has the higher priority (30) and is therefore evaluated before Field Type alphanumeric (50). The thresholds determine the number of inputs evaluated to collect a representative sample for the data point. Assigning the right

priority to the configured Field Types, and configuring an appropriate **learningsetting** value for the **fieldFormatPercentThreshold** and **fieldFormatMinThreshold** parameters, is essential for getting the correct Field Format recommendation. The Field Type with the highest priority, based on the configured thresholds, is matched first against the inputs. If there is a match, this Field Type is suggested without considering the other Field Types. For example, three default Field Types, integer, alphanumeric, and any will match if all the inputs contain only numbers. However, integer will be recommended since it has the highest priority.

- **Minimum and Maximum length recommendations**—Calculations for the minimum and maximum lengths for the Field Format are done independently of the determination for the Field Type. The field format length calculations are based on the average length of all the observed inputs. Half of this calculated average is suggested as the min value, and twice the value of this average is suggested as the max value. The range for the Minimum Length is 0-65535 and the range for the Maximum Length is 1-65535. The configured value for the minimum length cannot exceed the maximum length.
- **Handling of space character**—The Field Format check counts every space character when checking for the Field Formats length. Leading or trailing spaces are not stripped, and multiple consecutive spaces in the middle of the input string are no longer consolidated to a single space during input processing.

Example to illustrate the Field Format recommendations:

```

1 Total requests: 100
2 Number of Req with Field Type:
3 Int : 22          (22 int values) - 22%
4 Alpha : 44       (44 alpha values) - 44%
5 Alphanum: 14    (14 + 44 + 22 = 80 alphanum values) = 80%
6 noHTML: 10     (80 + 10 = 90 noHTML values) = 90%
7 any : 10        (90 + 10 = 100 any values) = 100%
8
9 % threshold          Suggested Field Type
10 0-22                int
11 23-44               alpha
12 45-80               alphanum
13 81-90               noHTML
14 91-100              any
15 <!--NeedCopy-->

```

To view or use learned data by using the command line interface

```

1 show appfw learningdata <profilename> FieldFormat
2 rm appfw learningdata <profilename> -fieldFormat <string> <
  formActionURL>
3 export appfw learningdata <profilename> FieldFormat

```

```
4 <!--NeedCopy-->
```

To view or use learned data by using the GUI

1. Navigate to **Application Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Learned Rules**. You can select the Field Formats entry in the Learned Rules table and double-click it to access the learned rules. You can deploy the learned rules or edit a rule before deploying it as a relaxation rule. To discard a rule, you can select it and click the **Skip** button. You can edit only one rule at a time, but you can select multiple rules to deploy or skip.

You also have the option to show a summarized view of the learned relaxations by selecting the Field Formats entry in the Learned Rules table and clicking Visualizer to get a consolidated view of all the learned violations. The visualizer makes it very easy to manage the learned rules. It presents a comprehensive view of the data on one screen and facilitates taking action on a group of rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate multiple rules. You can select a subset of these rules, based on the delimiter and Action URL. You can display 25, 50, or 75 rules in the visualizer, by selecting the number from a drop-down list. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. Or you can skip the rules to ignore them.

### Using the log feature with the field formats check

When the log action is enabled, the Field Formats security check violations are logged in the audit log as APPFW\_FIELDFORMAT violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the Field Formats violations:

- Shell

```
tail -f /var/log/ns.log | grep APPFW_FIELDFORMAT
```

•

To access the log messages by using the GUI

The Citrix GUI includes a very useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Application Firewall > Profiles**, select the target profile, and click **Security**

**Checks.** Highlight the Field Formats row and click **Logs**. When you access the logs directly from the **Field Formats security** check of the profile, it filters out the log messages and displays only the logs pertaining to these security check violations.

- You can also access the Syslog Viewer by navigating to **Citrix ADC > System > Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the **Syslog Viewer**, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Application Firewall > policies > Auditing**. In the **Audit Messages** section, click the Syslog messages link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The HTML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To access Field Formats security check violation log messages, filter by selecting APPFW in the dropdown options for Module. The Event Type displays a rich set of options to further refine your selection. For example, if you select the **APPFW\_FIELDFORMAT** check box and click the **Apply** button, only log messages pertaining to the Field Formats security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as Module and EventType, appear below the log message. You can select any of these options to highlight the corresponding information in the logs.

Example of a Native format log message when the request is not blocked

```

```

## Statistics for the field formats violations

When the stats action is enabled, the corresponding counter for the Field Formats check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, the request for a page that contains 3 Field Format violations increments the stats counter by one, because the page is blocked as soon as the first Field Formats violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by 3, because each Field Formats violation generates a separate log message.

To display Field Formats statistics by using command line

At the command prompt, type:

```
sh appfw stats
```

To display stats for a specific profile, use the following command:

```
stat appfw profile <profile name>
```

To display Field Formats statistics by using GUI

1. Navigate to **System > Security > Application Firewall**.
2. In the right pane, access the Statistics Link.
3. Use the scroll bar to view the statistics about Field Formats violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## Deployment Tip

- Enable Field format actions log, learn and stats.
- After running a representative sample of the traffic to your application, review the learned recommendations.
- If a Field Type is recommended by most of the learned rules, configure that Field Type as the Default Field Type. For minimum and maximum lengths, use the widest range suggested by these rules.
- Deploy rules for other fields for which different Field Types or different minimum/maximum lengths are better suited.
- Enable blocking and disable learning.
- Monitor stats and logs. If a significant number of violations are still being triggered, you might want to review the log messages to confirm that the violations represent malicious requests that should have been blocked. If valid requests are being flagged as violations, you can either edit the configured Field Format rule to further relax it or enable learning again to get recommendations based on the new data points.

**Note:** You can fine tune your configuration by getting new learning recommendations.

## Highlights

Note the following points about the Field Format security check:

- **Protection**—By configuring optimal field format rules, you can protect against many attacks. For example, if you specify that a field can only have integers, hackers will not be able to launch SQL Injection or XSS attacks by using this field, because the inputs required to launch such attacks will not meet the configured field format requirement.
- **Performance**—You can limit the minimum and the maximum allowed length for the inputs in the field format rules. This can prevent a malicious user from entering excessively large input strings in an attempt to add processing overhead to the server, or worse, cause the server to dump core because of stack overflow. By limiting the input size, you can shorten the time required for processing legitimate requests.
- **Configuring Field Formats**—You must enable one of the actions (block, log, stats, learn) to engage the field Format protection. You can also specify the Field format rules to identify the allowed inputs in your form fields.
- **Selecting Character Maps vs. Field Types**—Both Character Maps and Field Types use regular expressions. However, a Character Map provides a more specific expression by narrowing down the list of allowed characters. For example, for an input such as janedoe@citrix.com, the learning engine might recommend the Field Type nohtml but the Character Map [.@-Za-z] might be more specific, because it narrows down the allowed set of non-alpha characters. The Character Map option allows, in addition to alpha characters, only two non-alpha characters: period (.) and at (@).
- **Ongoing Learning**—The Web App Firewall monitors and takes into account all the incoming data (violations as well as allowed inputs) to build a learning table for recommending rules. The rules are revised and updated as new incoming data arrives. New field format rules are suggested for a field even if it already has a bound field format rule. If the configured Field Formats are too restrictive and are blocking the valid requests, you can deploy a more relaxed Field Format. Similarly, if the current Field Formats are too generic, you can further refine and tighten the security by deploying a more restrictive Field Format.
- **Overwriting Rules**—If a rule has already been deployed for a field/URL combination, the GUI allows the user to update the field format. A dialog box asks for confirmation to replace the existing rule. If you are using the command line interface, you have to explicitly unbind the previous binding and then bind the new rule.
- **Multiple match**—If multiple field formats match a given field name and its action URL, the Web App Firewall arbitrarily selects one of them to apply.
- **Buffer boundary**—If a field value extends across multiple streaming buffers, and the format for these two parts of the field value is different, a field format corresponding to “any” is sent to the

learn database.

- **Field Format vs. Field Consistency Check**—Both the Field Format check and the Field Consistency check are form-based protection checks. The Field Formats check provides a different type of protection than does the Form Field Consistency check. The Form Field Consistency check verifies that the structure of the web forms returned by users is intact, that data format restrictions configured in the HTML are respected, and that data in hidden fields has not been modified. It can do this without any specific knowledge about your web forms other than what it derives from the web form itself. The Field Formats check verifies that the data in each form field matches the specific formatting restrictions that you configured manually, or that the learning feature generated and you approved. In other words, the Form Field Consistency check enforces general web form security, while the Field Formats check enforces the specific rules for the allowed inputs for your web forms.

## Form field consistency check

September 21, 2020

The Form Field Consistency check examines the web forms returned by users of your web site, and verifies that web forms were not modified inappropriately by the client. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The Form Field Consistency check prevents clients from making unauthorized changes to the structure of the web forms on your web site when they fill out and submit a form. It also ensures that the data a user submits meets the HTML restrictions for length and type, and that data in hidden fields is not modified. This prevents an attacker from tampering with a web form and using the modified form to gain unauthorized access to web site, redirect the output of a contact form that uses an insecure script and thereby send unsolicited bulk email, or exploit a vulnerability in your web server software to gain control of the web server or the underlying operating system. Web forms are a weak link on many web sites and attract a wide range of attacks.

The Form Field Consistency check verifies all of the following:

- If a field is sent to the user, the check ensures that it is returned by the user.
- The check enforces HTML field lengths and types.

**Note:** The Form Field Consistency check enforces HTML restrictions on data type and length but does not otherwise validate the data in web forms. You can use the Field Formats check to set up rules that validate data returned in specific form fields on your web forms.

- If your web server does not send a field to the user, the check does not allow the user to add that field and return data in it.

- If a field is a read-only or hidden field, the check verifies that the data has not changed.
- If a field is a list box or radio button field, the check verifies that the data in the response corresponds to one of the values in that field.

If a web form returned by a user violates one or more of the Form Field consistency checks, and you have not configured the Web App Firewall to allow that web form to violate the Form Field Consistency checks, the request is blocked.

If you use the wizard or the GUI, in the Modify Form Field Consistency Check dialog box, on the General tab you can enable or disable the Block, Log, Learn, and Statistics actions.

You also configure Sessionless Field Consistency in the General tab. If Sessionless Field Consistency is enabled, the Web App Firewall checks only the web form structure, dispensing with those parts of the Form Field Consistency check that depend upon maintaining session information. This can speed the Form Field Consistency check with little security penalty for web sites that use many forms. To use Sessionless Field Consistency on all web forms, select On. To use it only for forms submitted with the HTTP POST method, select postOnly

If you use the command-line interface, you can enter the following command to configure the Form Field Consistency Check:

- `set appfw profile <name> -fieldConsistencyAction [**block**] [**learn**] [**log**] [**stats**] [**none**]`

To specify relaxations for the Form Field Consistency check, you must use the GUI. On the Checks tab of the Modify Form Field Consistency Check dialog box, click Add to open the Add Form Field Consistency Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Form Field Consistency Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation, as described in “[Manual Configuration By Using the GUI!](#)”

Following are examples of Form Field Consistency check relaxations:

#### Form Field Names:

- Choose form fields with the name UserType:

```
1 ^UserType$
2 <!--NeedCopy-->
```

- Choose form fields with names that begin with UserType\_ and are followed by a string that begins with a letter or number and consists of from one to twenty-one letters, numbers, or the apostrophe or hyphen symbol:

```
1 ^UserType_[0-9A-Za-z][0-9A-Za-z' -]{
2 0,20 }
3 $
4 <!--NeedCopy-->
```

- Choose form fields with names that begin with Turkish-UserType\_ and are otherwise the same as the previous expression, except that they can contain Turkish special characters throughout:

```
1  ^T\xC3\xBCrk\xC3\xA7e-UserType_([0-9A-Za-z]|\x[0-9A-Fa-f][0-9A-
   Fa-f])+&
2  <!--NeedCopy-->
```

**Note:** See “[PCRE Character Encoding Format](#)” for a complete description of supported special characters and how to encode them properly.

- Choose form field names that begin with a letter or number, consist of a combination of letters and/or numbers only, and that contain the string Num anywhere in the string:

```
1  ^[0-9A-Za-z]*Num[0-9A-Za-z]*&
2  <!--NeedCopy-->
```

### Form Field Action URLs:

- Choose URLs beginning with http://www.example.com/search.pl? and containing any string after the query except for a new query:

```
1  ^http://www[.]example[.]com/search[.]pl?[^?]*&
2  <!--NeedCopy-->
```

- Choose URLs that begin with http://www.example-español.com and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

```
1  ^http://www[.]example-espa\xC3\xB1o[.]com/((([0-9A-Za-z]|\x[0-9A-
   Fa-f][0-9A-Fa-f])
2  ([0-9A-Za-z_-]|\x[0-9A-Fa-f][0-9A-Fa-f])*\/)*([0-9A-Za-z]|\x[0-9A-
   -Fa-f][0-9A-Fa-f])
3  ([0-9A-Za-z_-]|\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)
   $
4  <!--NeedCopy-->
```

- Choose all URLs that contain the string /search.cgi?:

```
1  ^[^\<>]*\/search[.]cgi\?[^<>]*&
2  <!--NeedCopy-->
```

**Caution:** Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk ( .\*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

## CSRF form tagging check

September 21, 2020

The Cross Site Request Forgery (CSRF) Form Tagging check tags each web form sent by a protected web site to users with a unique and unpredictable FormID, and then examines the web forms returned by users to ensure that the supplied FormID is correct. This check protects against cross-site request forgery attacks. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The CSRF Form Tagging check prevents attackers from using their own web forms to send high volume form responses with data to your protected web sites. This check requires relatively little CPU processing capacity compared to certain other security checks that analyze web forms in depth. It is therefore able to handle high volume attacks without seriously degrading the performance of the protected web site or the Web App Firewall itself.

Before you enable the CSRF Form Tagging check, you should be aware of the following:

- You need to enable form tagging. The CSRF check depends on form tagging and does not work without it.
- You should disable the Citrix ADC Integrated Caching feature for all web pages containing forms that are protected by that profile. The Integrated Caching feature and CSRF form tagging are not compatible.
- You should consider enabling Referer checking. Referer checking is part of the Start URL check, but it prevents cross-site request forgeries, not Start URL violations. Referer checking also puts less load on the CPU than does the CSRF Form Tagging check. If a request violates Referer checking, it is immediately blocked, so the CSRF Form Tagging check is not invoked.
- The CSRF Form Tagging check does not work with web forms that use different domains in the form-origin URL and form-action URL. For example, CSRF Form Tagging cannot protect a web form with a form-origin URL of `http://www.example.com` and a form action URL of `http://www.example.org/form.pl`, because `example.com` and `example.org` are different domains.

If you use the wizard or the GUI, in the Modify CSRF Form Tagging Check dialog box, on the General tab you can enable or disable the Block, Log, Learn and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the CSRF Form Tagging Check:

- `set appfw profile <name> -CSRFTagAction [**block**] [**log**] [**learn**] [**stats**] [**none**]`

To specify relaxations for the CSRF Form Tagging check, you must use the GUI. On the Checks tab of the Modify CSRF Form Tagging Check dialog box, click Add to open the Add CSRF Form Tagging Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify CSRF Form Tagging Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

An alert is generated when you set the Citrix Web App Firewall session limit to a value of 0 or lower, because such a setting affects advanced protection check functionality that requires a properly functioning Web App Firewall session.

Following are examples of CSRF Form Tagging check relaxations:

**Note:** The following expressions are URL expressions that can be used in both the Form Origin URL and Form Action URL roles.

- Choose URLs beginning with `http://www.example.com/search.pl?` and containing any string after the query, except for a new query:

```
1 ^http://www[.]example[.]com/search[.]pl?[^\?]*$
2 <!--NeedCopy-->
```

- Choose URLs that begin with `http://www.example-español.com` and have paths and file names that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

```
1 ^http://www[.]example-espa\xC3\xB1o\x1[.]com/(([0-9A-Za-z]|\x[0-9A-
  Fa-f][0-9A-Fa-f])
2 ([0-9A-Za-z_-]|\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\x[0-9A-Fa-f
  ][0-9A-Fa-f])([0-9A-Za-z_-]|\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|
  php|s?html?)$
3 <!--NeedCopy-->
```

- Choose all URLs that contain the string `/search.cgi?`:

```
1 ^[\^?<>]*\/search[.]cgi\?[\^?<>]*$
2 <!--NeedCopy-->
```

**Important**

Regular expressions are powerful. If you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the check would otherwise have blocked.

**Tip**

When enableValidate referrer header is enabled under the Start URL Action, ensure that the Referrer Header URL is added to StartURL as well.

**Note**

When Citrix ADC reaches the appfw\_session\_limit and CSRF checks are enabled, the web application freezes.

To prevent web application freeze, decrease the session timeout and increase the session limit by using the following commands:

```
From CLI: > set appfw settings -sessiontimeout 300
```

```
From shell: root@ns# nsapimgr_wr.sh -s appfw_session_limit=200000
```

Logging and generating SNMP alarms when appfw\_session\_limit is reached assists you in troubleshooting and debugging issues.

## Managing CSRF form tagging check relaxations

September 22, 2020

You configure an exception (or relaxation) to the CSRF Form Tagging security check in the Add Cross-Site Request Forgery Tagging Check Relaxation dialog box or the Modify Cross-Site Request Forgery Tagging Check Relaxation dialog box.

### To configure a CSRF form tagging check relaxation by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile you want to configure, and then click **Open**.
3. In the **Configure Web App Firewall Profile** dialog box, click the **Security Checks** tab. The **Security Checks** tab contains the list of Web App Firewall security checks.
4. To add or modify a CSRF relaxation, do one of the following:

- To add a new relaxation, click **Add**.
- To modify an existing relaxation, select the relaxation that you want to modify, and then click **Open**.

The **Add Cross-Site Request Forgery Tagging Check Relaxation** or **Modify Cross-Site Request Forgery Tagging Check Relaxation** dialog box is displayed. Except for the title, these dialog boxes are identical.

5. Fill in the dialog box as described below.
  - **Enabled check box**—Select to place this relaxation or rule in active use; clear to deactivate it.
  - **Form Origin URL**—In the text area, enter a PCRE-format regular expression that defines the URL that hosts the form.
  - **Form Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the form is delivered.
  - **Comments**—In the text area, type a comment. Optional.

**Note:** For any element that requires a regular expression, you can type the regular expression, use the **Regex Tokens** menu to insert regular expression elements and symbols directly into the text box, or click **Regex Editor** to open the **Add Regular Expression** dialog box, and use it to construct the expression.

6. Click **OK**. The **Add Cross-Site Request Forgery Tagging Check Relaxation** or **Modify Cross-Site Request Forgery Tagging Check Relaxation** dialog box closes and you return to the **Modify Cross-Site Request Forgery Tagging Check** dialog box.
7. To remove a relaxation or rule, select it, and then click **Remove**.
8. To enable a relaxation or rule, select it, and then click **Enable**.
9. To disable a relaxation or rule, select it, and then click **Disable**.
10. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click **Visualizer**, and use the display tools.
11. To review and configure learned rules for the CSRF check, click **Learning** and perform the steps in [“To configure and use the Learning feature.”](#)
12. Click **OK**.

## URL protection checks

September 21, 2020

The URL Protection checks examine request URLs to prevent attackers from aggressively attempting to access multiple URLs (forceful browsing) or using a URL to trigger a known security vulnerability in web server software or web site scripts.

## Start URL check

September 21, 2020

The Start URL check examines the URLs in incoming requests and blocks the connection attempt if the URL does not meet the specified criteria. To meet the criteria, the URL must match an entry in the Start URL list, unless the Enforce URL Closure parameter is enabled. If you enable this parameter, a user who clicks a link on your Web site is connected to the target of that link.

The primary purpose of the Start URL check is to prevent repeated attempts to access random URLs on a Web site, (forceful browsing) through bookmarks, external links, or jumping to pages by manually typing in the URLs to skip the pages required to reach that part of the website. Forceful browsing can be used to trigger a buffer overflow, find content that users were not intended to access directly, or find a back door into secure areas of your Web server. The Web App Firewall enforces a website's given traversal or logic path by allowing access to only the URL's that are configured as start URLs.

If you use the wizard or the GUI, in the Modify Start URL Check dialog box, on the General tab you can enable or disable

Block,

Log,

Statistics,

Learn actions, and the following parameters:

- **Enforce URL Closure.** Allow users to access any web page on your web site by clicking a hyperlink on any other page on your web site. Users can navigate to any page on your web site that can be reached from the home page or any designated start page by clicking hyperlinks.

Note: The URL closure feature allows any query string to be appended to and sent with the action URL of a web form submitted by using the HTTP GET method. If your protected web sites use forms to access an SQL database, make sure that you have the SQL injection check enabled and properly configured.

- **Sessionless URL Closure.** From the client's point of view, this type of URL closure functions in exactly the same way as standard, session-aware URL Closure, but uses a token embedded in the URL instead of a cookie to track the user's activity, which consumes considerably fewer resources. When sessionless URL closure is enabled, the Web App Firewall appends a "as\_url\_id" tag to all the URL's that are in URL closure.

**Note:** When enabling sessionless (Sessionless URL Closure), you must also enable regular URL

closure (

Enforce URL Closure) or sessionless URL closure does not work.

- **Validate Referer Header.** Verify that the Referer header in a request that contains web form data from your protected web site instead of another web site. This action verifies that your web site, not an outside attacker, is the source of the web form. Doing so protects against cross-site request forgeries (CSRF) without requiring form tagging, which is more CPU-intensive than header checks. The Web App Firewall can handle the HTTP Referer header in one of the following four ways, depending on which option you select in the drop-down list:
  - **Off**—Do not validate the Referer header.
  - **If-Present**—Validate the Referer header if a Referer header exists. If an invalid Referer header is found, the request generates a referer-header violation. If no Referer header exists, the request does not generate a referer-header violation. This option enables the Web App Firewall to perform Referer header validation on requests that contain a Referer header, but not block requests from users whose browsers do not set the Referer header or who use web proxies or filters that remove that header.
  - **Always Except Start URLs**—Always validate the Referer header. If there is no Referer header and the requested URL is not exempted by the startURL relaxation rule, the request generates a referer-header violation. If the Referer header is present but it is invalid, the request generates a referer-header violation.
  - **Always Except First Request**—Always validate the referer header. If there is no referer header, only the URL that is accessed first is allowed. All other URL's are blocked without a valid referer header. If the Referer header is present but it is invalid, the request generates a referer-header violation.

One Start URL setting, **Exempt Closure URLs from Security Checks**, is not configured in the Modify Start URL Check dialog box, but is configured in the Settings tab of the Profile. If enabled, this setting directs the Web App Firewall not to run further form based checks (such as Cross-Site Scripting and SQL Injection inspection) on URLs that meet the URL Closure criteria.

#### Note

Although the referer header check and Start URL security check share the same action settings, it is possible to violate the referer header check without violating the Start URL check. The difference is visible in the logs, which log referer header check violations separately from Start URL check violations.

The Referer header settings (OFF, if-Present, AlwaysExceptStartURLs, and AlwaysExceptFirstRequest) are arranged in order of least restrictive to most restrictive and work as follows:

#### OFF:

- Referer Header Not checked.

#### If-Present:

- Request has no referer header -> Request is allowed.
- Request has referer header and the referer URL is in URL closure -> Request is allowed.
- Request has referer header and the referer URL is **not** in URL closure -> Request is blocked.

**AlwaysExceptStartURLs:**

- Request has no referer header and the request URL is a start URL -> Request is allowed.
- Request has no referer header and the request URL is not a start URL -> Request is blocked.
- Request has referer header and the referer URL is in URL closure -> Request is allowed.
- Request has referer header and the referer URL is **not** in URL closure -> Request is blocked.

**AlwaysExceptFirstRequest:**

- Request has no referer header and is the first request URL of the session -> Request is allowed.
- Request has no referer header and is **not** the first request URL of the session -> Request is blocked.
- Request has referer header and is either the first request URL of the session or is in URL closure -> Request is allowed.
- Request has referer header and is neither the first request URL of the session nor is in URL closure -> Request is blocked.

If you use the command-line interface, you can enter the following commands to configure the Start URL Check:

- `set appfw profile <name> -startURLAction [block] [learn] [log] [stats] [none]`
- `set appfw profile <name> -startURLClosure ([ON] | [OFF])`
- `set appfw profile <name> -sessionlessURLClosure ([ON] | [OFF])`
- `set appfw profile <name> -exemptClosureURLsFromSecurityChecks ([ON] | [OFF])`
- `set appfw profile <name> -RefererHeaderCheck ([OFF] | [if-present] | [AlwaysExceptStartURLs] | [AlwaysExceptFirstRequest])`

To specify relaxations for the Start URL check, you must use the GUI. On the Checks tab of the Modify Start URL Check dialog box, click Add to open the Add Start URL Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Start URL Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of Start URL check relaxations:

- Allow users to access the home page at www.example.com:

```
1 ^http://www[.]example[.]com$
2 <!--NeedCopy-->
```

- Allow users to access all static HTML (.htm and .html), server-parsed HTML (.htp and .shtml), PHP (.php), and Microsoft ASP (.asp) format web pages at www.example.com:

```
1 ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
2 [0-9A-Za-z][0-9A-Za-z_.-]*[.](asp|htp|php|s?html?)$
3 <!--NeedCopy-->
```

- Allow users to access web pages with pathnames or file names that contain non-ASCII characters at www.example-español.com:

```
1 ^http://www[.]example-espaxC3xB1o1[.]com/((([0-9A-Za-z]|x[0-9A-Fa-
2 f][0-9A-Fa-f])([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-Fa-f])*/)*
3 ([0-9A-Za-z]|x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|x[0-9A-Fa-f
4 ] [0-9A-Fa-f])*[.](asp|htp|php|s?html?)$
5 <!--NeedCopy-->
```

**Note:** In the above expression, each character class has been grouped with the string `x[0-9A-Fa-f][0-9A-Fa-f]`, which matches all properly-constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (`\\`) is an escaped backslash, which tells the Web App Firewall to interpret it as a literal backslash. If you included only one backslash, the Web App Firewall would instead interpret the following left square bracket (`[`) as a literal character instead of the opening of a character class, which would break the expression.

- Allow users to access all GIF (.png), JPEG (.jpg and .jpeg), and PNG (.png) format graphics at www.example.com:

```
1 ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
2 [0-9A-Za-z][0-9A-Za-z_.-]*[.](gif|jpe?g|png)$
3 <!--NeedCopy-->
```

- Allow users to access CGI (.cgi) and PERL (.pl) scripts, but only in the CGI-BIN directory:

```
1 ^http://www[.]example[.]com/CGI-BIN/[0-9A-Za-z][0-9A-Za-z_.-]*[.](
2 cgi|pl)$
3 <!--NeedCopy-->
```

- Allow users to access Microsoft Office and other document files in the docsarchive directory:

```
1 ^http://www[.]example[.]com/docsarchive/[0-9A-Za-z][0-9A-Za-z_
2 -.]*[.](doc|xls|pdf|ppt)$
3 <!--NeedCopy-->
```

**Note**

By default, all Web App Firewall URLs are considered to be regular expressions.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions that you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk ( `.`\*) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the Start URL check would otherwise have blocked.

**Tip**

You can add the `-and-` to the allowed list of SQL keywords for URL naming scheme. For example, example <https://FQDN/bread-and-butter>.

## Deny URL check

September 21, 2020

The Deny URL check examines and blocks connections to URLs that are commonly accessed by hackers and malicious code. This check contains a list of URLs that are common targets of hackers or malicious code and that rarely if ever appear in legitimate requests. You can also add URLs or URL patterns to the list. The Deny URL check prevents attacks against various security weaknesses known to exist in web server software or on many web sites.

The Deny URL check takes priority over the Start URL check, and thus denies malicious connection attempts even when a Start URL relaxation would normally allow a request to proceed.

In the Modify Deny URL Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the Deny URL Check:

- `set appfw profile <name> -denyURLAction [**block**] [**log**] [**stats**] [**none**]`

To create and configure your own deny URLs, you must use the GUI. On the Checks tab of the Modify Deny URL Check dialog box, click Add to open the Add Deny URL dialog box, or select an existing user-defined deny URL and click Open to open the Modify Deny URL dialog box. Either dialog box provides the same options for creating and configuring a deny URL.

Following are examples of Deny URL expressions:

- Do not allow users to access the image server at images.example.com directly:

```
1 ^http://images[.]example[.]com$
2 <!--NeedCopy-->
```

- Do not allow users to access CGI (.cgi) or PERL (.pl) scripts directly:

```
1 ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
2 [0-9A-Za-z][0-9A-Za-z_.-]*[.](cgi|pl)$
3 <!--NeedCopy-->
```

- Here is the same deny URL, modified to support non-ASCII characters:

```
1 ^http://www[.]example[.]com/((([0-9A-Za-z]|x[0-9A-Fa-f][0-9A-Fa-f
2 ([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|x[0-9A-Fa
3 ([0-9A-Za-z_-]|x[0-9A-Fa-f][0-9A-Fa-f])*)[.](cgi|pl)$
4 <!--NeedCopy-->
```

#### Caution:

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL or pattern that you want to block, and nothing else. Careless use of wildcards, and especially of the dot-asterisk ( .\*) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block.

## XML protection checks

September 21, 2020

The XML Protection checks examine requests for XML-based attacks of all types.

**Caution:** The XML security checks apply only to content that is sent with an HTTP content-type header of text/xml. If the content-type header is missing, or is set to a different value, all XML security checks are bypassed. If you plan to protect XML or Web 2.0 web applications, the webmasters of each web server that hosts those applications should ensure that the proper HTTP content-type header is sent.

## XML format check

September 21, 2020

The XML Format check examines the XML format of incoming requests and blocks those requests that are not well formed or that do not meet the criteria in the XML specification for properly-formed XML documents. Some of those criteria are:

- An XML document must contain only properly-encoded Unicode characters that match the Unicode specification.
- No special XML syntax characters—such as <, > and &—can be included in the document except when used in XML markup.
- All begin, end, and empty-element tags must be correctly nested, with none missing or overlapping.
- XML element tags are case-sensitive. All beginning and end tags must match exactly.
- A single root element must contain all the other elements in the XML document.

A document that does not meet the criteria for well-formed XML does not meet the definition of an XML document. Strictly speaking, it is not XML. However, not all XML applications and web services enforce the XML well-formed standard, and not all handle poorly-formed or invalid XML correctly. Inappropriate handling of a poorly-formed XML document can cause security breaches. The purpose of the XML Format check is to prevent a malicious user from using a poorly-formed XML request to breach security on your XML application or web service.

If you use the wizard or the GUI, in the Modify XML Format Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the XML Format Check:

- `set appfw profile <name> -xmlFormatAction [**block**] [**log**] [**stats**] [**none**]`

You cannot configure exceptions to the XML Format check. You can only enable or disable it.

## XML Denial-of-Service check

September 24, 2020

The XML Denial of Service (XML DoS or XDoS) check examines incoming XML requests to determine whether they match the characteristics of a denial-of-service (DoS) attack, and blocks those requests that do. The purpose of the XML DoS check is to prevent an attacker from using XML requests to launch a denial-of-service attack on your web server or web site.

If you use the wizard or the GUI, in the Modify XML Denial-of-Service Check dialog box, on the General tab you can enable or disable the Block, Log, Statistics, and Learn actions:

If you use the command-line interface, you can enter the following command to configure the XML Denial-of-Service check:

- `set appfw profile <name> -xmlDoSAction [**block**] [**log**] [**learn**] [**stats**] [**none**]`

To configure individual XML Denial-of-Service rules, you must use the GUI. On the Checks tab of the Modify XML Denial-of-Service Check dialog box, select a rule and click Open to open the Modify XML Denial-of-Service dialog box for that rule. The individual dialog boxes differ for the different rules but are extremely simple. Some only allow you to enable or disable the rule; others allow you to modify a number by typing a new value in a text box.

**Note:**

The expected behavior of Learning engine for denial-of-service attack is based on the configured action. If the action is set as “Block”, the engine learns the configured bind value +1 and the XML parsing stops when there is a violation. If the configured action is not set as “Block”, the engine learns the actual incoming violation length value.

The individual XML Denial-of-Service rules are:

- **Maximum Element Depth**

Restrict the maximum number of nested levels in each individual element to 256. If this rule is enabled, and the Web App Firewall detects an XML request with an element that has more than the maximum number of allowed levels, it blocks the request. You can modify the maximum number of levels to any value from one (1) to 65,535.

- **Maximum Element Name Length**

Restrict the maximum length of each element name to 128 characters. This includes the name within the expanded namespace, which includes the XML path and element name in the following format:

```
1 {
2  http://prefix.example.com/path/ }
3  target_page.xml
4  <!--NeedCopy-->
```

The user can modify the maximum name length to any value between one (1) character and 65,535.

- **Maximum # Elements**

Restrict the maximum number of any one type of element per XML document to 65,535. You can modify the maximum number of elements to any value between one (1) and 65,535.

- Maximum # Element Children

Restrict the maximum number of children (including other elements, character information, and comments) each individual element is allowed to have to 65,535. You can modify the maximum number of element children to any value between one (1) and 65,535.

- Maximum # Attributes

Restrict the maximum number of attributes each individual element is allowed to have to 256. You can modify the maximum number of attributes to any value between one (1) and 256.

- Maximum Attribute Name Length

Restrict the maximum length of each attribute name to 128 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.

- Maximum Attribute Value Length

Restrict the maximum length of each attribute value to 2048 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.

- Maximum Character Data Length

Restrict the maximum character data length for each element to 65,535. You can modify the length to any value between one (1) and 65,535.

- Maximum File Size

Restrict the size of each file to 20 MB. You can modify the maximum file size to any value.

- Minimum File Size

Require that each file be at least 9 bytes in length. You can modify the minimum file size to any positive integer representing a number of bytes.

- Maximum # Entity Expansions

Limit the number of entity expansions allowed to the specified number. Default: 1024.

- Maximum Entity Expansion Depth

Restrict the maximum number of nested entity expansions to no more than the specified number. Default: 32.

- Maximum # Namespaces

Limit the number of namespace declarations in an XML document to no more than the specified number. Default: 16.

- Maximum Namespace URI Length

Limit the URL length of each namespace declaration to no more than the specified number of characters. Default: 256.

- Block Processing Instructions

Block any special processing instructions included in the request. This rule has no user-modifiable values.

- Block DTD

Block any document type definitions (DTD) included with the request. This rule has no user-modifiable values.

- Block External Entities

Block all references to external entities in the request. This rule has no user-modifiable values.

- SOAP Array Check

Enable or disable the following SOAP array checks:

- **Maximum SOAP Array Size.** The maximum total size of all SOAP arrays in an XML request before the connection is blocked. You can modify this value. Default: 20000000.
- **Maximum SOAP Array Rank.** The maximum rank or dimensions of any single SOAP array in an XML request before the connection is blocked. You can modify this value. Default: 16.

## XML cross-site scripting check

September 21, 2020

The XML Cross-Site Scripting check examines the user requests for possible cross-site scripting attacks in the XML payload. If it finds a possible cross-site scripting attack, it blocks the request.

To prevent misuse of the scripts on your protected web services to breach security on your web services, the XML Cross-Site Scripting check blocks scripts that violate the same origin rule, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

The Web App Firewall offers various action options for implementing XML Cross-Site Scripting protection. You have the option to configure **Block**, **Log**, and **Stats** actions.

The Web App Firewall XML XSS check is performed on the payload of the incoming requests and attack strings are identified even if they are spread over multiple lines. The check looks for XSS attack strings

in the **element** and the **attribute** values. You can apply relaxations to bypass security check inspection under specified conditions. The logs and statistics can help you identify needed relaxations.

The CDATA section of the XML payload might be an attractive area of focus for the hackers because the scripts are not executable outside the CDATA section. A CDATA section is used for content that is to be treated entirely as character data. HTML mark up tag delimiters “<”, “>”, and “/>” will not cause the parser to interpret the code as HTML elements. The following example shows a CDATA Section with XSS attack string:

```
1      <![CDATA[  
2      <script language="Javascript" type="text/javascript">alert ("Got  
3          you")</script>  
4      ]]>  
5  <!--NeedCopy-->
```

## Action Options

An action is applied when the XML Cross-Site Scripting check detects an XSS attack in the request. The following options are available for optimizing XML Cross-Site Scripting protection for your application:

- **Block**—Block action is triggered if the XSS tags are detected in the request.
- **Log**—Generate log messages indicating the actions taken by the XML Cross-Site Scripting check. If block is disabled, a separate log message is generated for each location (ELEMENT, ATTRIBUTE) in which the XSS violation is detected. However, only one message is generated when the request is blocked. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.
- **Stats**—Gather statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.

## Relaxation Rules

If your application requires you to bypass the Cross-Site Scripting check for a specific ELEMENT or ATTRIBUTE in the XML payload, you can configure a relaxation rule. The XML Cross-Site Scripting check relaxation rules have the following parameters:

- **Name**—You can use literal strings or regular expressions to configure the name of the ELEMENT or the Attribute. The following expression exempts all ELEMENTS beginning with the string name\_ followed by a string of uppercase or lowercase letters, or numbers, that is at least two and no more than fifteen characters long:

```
^name_[0-9A-Za-z]{ 2,15 } $
```

### Note

The names are case sensitive. Duplicate entries are not allowed, but you can use capitalization of the names and differences in location to create similar entries. For example, each of the following relaxation rules is unique:

- 1) XMLXSS: ABC      IsRegex: NOTREGEX  
Location: ATTRIBUTE    State: ENABLED
- 2) XMLXSS: ABC      IsRegex: NOTREGEX  
Location: ELEMENT     State: ENABLED
- 3) XMLXSS: abc      IsRegex: NOTREGEX  
Location: ELEMENT     State: ENABLED
- 4) XMLXSS: abc      IsRegex: NOTREGEX  
Location: ATTRIBUTE    State: ENABLED

- **Location**—You can specify the Location of the Cross-site Scripting Check exception in your XML payload. The option ELEMENT is selected by default. You can change it to ATTRIBUTE.
- **Comment**—This is an optional field. You can use up to a 255 character string to describe the purpose of this relaxation Rule.

### Warning

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the name that you want to add as an exception, and nothing else. Careless use of Regular Expressions can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the XML Cross-Site Scripting check would otherwise have blocked.

## Using the Command Line to Configure the XML Cross-Site Scripting check

To configure XML Cross-Site Scripting check actions and other parameters by using the command line

If you use the command-line interface, you can enter the following commands to configure the XML Cross-Site Scripting Check:

```
> set appfw profile <name> -XMLXSSAction ([[block] [log] [stats]] | [none])
```

To configure a XML Cross-Site Scripting check relaxation rule by using the command line

You can add relaxation rules to bypass inspection of XSS script attack inspection in a specific location. Use the bind or unbind command to add or delete the relaxation rule binding, as follows:

```
> bind appfw profile <name> -XMLXSS <string> [isRegex (REGEX | NOTREGEX)]
[-location ( ELEMENT | ATTRIBUTE )] -comment <string> [-state ( ENABLED |
DISABLED )]
```

```
> unbind appfw profile <name> -XMLXSS <String>
```

**Example:**

```
> bind appfw profile test_pr -XMLXSS ABC
```

After executing the above command, the following relaxation rule is configured. The rule is enabled, the name is treated as a literal (NOTREGEX), and ELEMENT is selected as the default location:

```
1 1)      XMLXSS:  ABC              IsRegex:  NOTREGEX
2
3          Location:  ELEMENT        State:  ENABLED
4
5 `> unbind appfw profile test_pr -XMLXSS abc`
6
7 ERROR: No such XMLXSS check
8
9 `> unbind appfw profile test_pr -XMLXSS ABC`
10
11 Done
12 <!--NeedCopy-->
```

**Using the GUI to configure the XML Cross-Site scripting check**

In the GUI, you can configure the XML Cross-Site scripting check in the pane for the profile associated with your application.

To configure or modify the XML Cross-Site Scripting check by using the GUI

1. Navigate to **Web App Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

- a) If you just want to enable or disable **Block**, **Log**, and **Stats** actions for the **XML Cross-Site Scripting check**, you can select or clear check boxes in the table, click **OK**, and then click Save and Close to close the Security Check pane.
- b) You can double click **XML Cross-Site Scripting**, or select the row and click **Action Settings**, to display the action options. After changing any of the action settings, click **OK** to save the changes and return to the Security Checks table.

You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save and Close** to close the Security Check pane.

To configure a XML Cross-Site Scripting relaxation rule by using the GUI

1. Navigate to **Web App Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the Relaxation Rules table, double-click the **XML Cross-Site Scripting** entry, or select it and click **Edit**.
4. In the **XML Cross-Site Scripting Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

To manage XML Cross-Site Scripting relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **XML Cross-Site Scripting** row in the Relaxation Rules table, and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

To view or customize the Cross-Site Scripting patterns by using the GUI

You can use the GUI to view or customize the default list of XSS allowed attributes or allowed tags. You can also view or customize the default list of XSS denied Patterns.

The default lists are specified in **Web App Firewall > Signatures > Default Signatures**. If you do not bind any signature object to your profile, the default XSS Allowed and Denied list specified in the Default Signatures object will be used by the profile for the Cross-Site Scripting security check processing. The Tags, Attributes, and Patterns, specified in the default signatures object, are read-only. You cannot edit or modify them. If you want to modify or change these, make a copy of the Default Signatures object to create a User-Defined signature object. Make changes in the Allowed or Denied lists in the new user-defined signature object and use this signature object in the profile that is processing the traffic for which you want to use these customized allowed and denied lists.

For more information about signatures, see <http://support.citrix.com/proddocs/topic/ns-security-10-map/appfw-signatures-con.html>.

#### To view default XSS patterns:

1. Navigate to **Web App Firewall > Signatures**, select **\*Default Signatures**, and click **Edit**. Then click **Manage SQL/XSS Patterns**.

The **Manage SQL/XSS Paths** table shows following three rows pertaining to XSS :

|   |                       |
|---|-----------------------|
| 1 | xss/allowed/attribute |
| 2 |                       |
| 3 | xss/allowed/tag       |
| 4 |                       |

```
5         xss/denied/pattern
6 <!--NeedCopy-->
```

Select a row and click **Manage Elements** to display the corresponding XSS Elements (Tag, Attribute, Pattern) used by the Web App Firewall **Cross-Site Scripting** check.

**To customize XSS Elements:** You can edit the user-defined signature object to customize the allowed Tag, allowed Attributes and denied Patterns. You can add new entries or remove the existing ones.

1. **Navigate to Web App Firewall > Signatures**, highlight the target user-defined signature, and click **Edit**. Click **Manage SQL/XSS Patterns** to display the **Manage SQL/XSS paths** table.
2. Select the target XSS row.

a) Click **Manage Elements**, to **Add**, **Edit** or **Remove** the corresponding XSS element.

b) Click **Remove** to remove the selected row.

#### Warning

Be very careful when you remove or modify any default XSS element, or delete the XSS path to remove the entire row. The signatures, HTML Cross-Site Scripting security check, and XML Cross-Site Scripting security check rely on these Elements for detecting attacks to protect your applications. Customizing the XSS Elements can make your application vulnerable to Cross-Site Scripting attacks if the required pattern is removed during editing.

### Using the log feature with the XML cross-site scripting check

When the log action is enabled, the XML Cross-Site Scripting security check violations are logged in the audit log as **APPFW\_XML\_XSS** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the XML Cross-Site Scripting violations:

```
1 > **Shell**
2
3 > **tail -f /var/log/ns.log | grep APPFW_XML_XSS**
4 <!--NeedCopy-->
```

### Example of a XML Cross-Site Scripting security check violation log message in Native log format showing <blocked> action

```
1 Oct 7 01:44:34 <local0.warn> 10.217.31.98 10/07/2015:01:44:34 GMT ns
   0-PPE-1 : default APPFW APPFW_XML_XSS 1154 0 : 10.217.253.69 3466-
```

```
PPE1 - owa_profile http://10.217.31.101/FFC/login.html Cross-site
script check failed for field script="Bad tag: script" <***blocked**>
2 <!--NeedCopy-->
```

Example of a XML Cross-Site Scripting security check violation log message in CEF log format showing <not blocked> action

```
1 Oct 7 01:46:52 <local0.warn> 10.217.31.98 CEF:0|Citrix|Citrix ADC|NS11
.0|APPFW|APPFW_XML_XSS|4|src=10.217.30.17 geolocation=Unknown spt
=33141 method=GET request=http://10.217.31.101/FFC/login.html msg=
Cross-site script check failed for field script="Bad tag: script"
cn1=1607 cn2=3538 cs1=owa_profile cs2=PPE0 cs4=ERROR cs5=2015 act=**
not blocked**
2 <!--NeedCopy-->
```

To access the log messages by using the GUI

The Citrix GUI includes a useful tool (**Syslog Viewer**) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to the **Web App Firewall > Profiles**, select the target profile, and click **Security Checks**. Highlight the **XML Cross-Site Scripting** row and click **Logs**. When you access the logs directly from the XML Cross-Site Scripting check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **Citrix ADC > System > Auditing**. In the Audit Messages section, click the Syslog messages link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Web App Firewall > policies > Auditing**. In the **Audit Messages** section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs.

The XML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **XML Cross-Site Scripting** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW\_XML\_XSS** check box and click the **Apply** button, only log messages pertaining to the XML Cross-Site Scripting security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, **Client IP** etc. appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

## Statistics for the XML cross-site scripting violations

When the stats action is enabled, the counter for the XML Cross-Site Scripting check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, a request for a page that contains three XML Cross-Site Scripting violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display XML Cross-Site Scripting check statistics by using the command line

At the command prompt, type:

```
> **sh appfw stats**
```

To display stats for a specific profile, use the following command:

```
> **stat appfw profile** <profile name>
```

To display XML Cross-Site Scripting statistics by using the GUI

1. Navigate to **System > Security > Web App Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about XML Cross-Site Scripting violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## XML SQL injection check

October 23, 2020

The XML SQL injection check examines the user requests for possible XML SQL Injection attacks. If it finds injected SQL in XML payloads, it blocks the requests.

A XML SQL attack can inject source code into a web application such that it can be interpreted and executed as a valid SQL query to perform a database operation with malicious intent. For example, XML SQL attacks can be launched to gain unauthorized access to the contents of a database or to manipulate the stored data. XML SQL Injection attacks are not only common, but can also be very harmful and costly.

Compartmentalizing the privileges of the database users can assist in protecting the database to some extent. All database users should be given only the required privileges to complete their intended tasks, so that they cannot execute SQL queries to perform other tasks. For example, a read-only user should not be allowed to write or manipulate data tables. The Web App Firewall XML SQL Injection

check inspects all XML requests to provide special defenses against injection of unauthorized SQL code that might break security. If the Web App Firewall detects unauthorized SQL code in any XML request of any user, it can block the request.

The Citrix Web App Firewall inspects the presence of SQL keywords and special characters to identify the XML SQL Injection attack. A default set of keywords and special characters provides known keywords and special characters that are commonly used to launch XML SQL attacks. The Web App Firewall considers three characters, single straight quote ('), backslash (\), and semicolon (;) as special characters for SQL security check processing. You can add new patterns, and you can edit the default set to customize the XML SQL check inspection.

The Web App Firewall offers various action options for implementing XML SQL Injection protection. You can **Block** the request, **Log** a message in the ns.log file with details regarding the observed violations, and collect **Stats** to keep track of the number of observed attacks.

In addition to actions, there are several parameters that can be configured for XML SQL injection processing. You can check for **SQL wildcard characters**. You can change the XML SQL Injection type and select one of the 4 options (**SQLKeyword**, **SQLSplChar**, **SQLSplCharANDKeyword**, **SQLSplCharORKeyword**) to indicate how to evaluate the SQL keywords and SQL special characters when processing the XML payload. The XML **SQL Comments Handling** parameter gives you an option to specify the type of comments that need to be inspected or exempted during XML SQL Injection detection.

You can deploy relaxations to avoid false positives. The Web App Firewall XML SQL check is performed on the payload of the incoming requests, and attack strings are identified even if they are spread over multiple lines. The check looks for SQL Injection strings in the **element** and the **attribute** values. You can apply relaxations to bypass security check inspection under specified conditions. The logs and statistics can help you identify needed relaxations.

## Action options

An action is applied when the XML SQL Injection check detects an SQL Injection attack string in the request. The following actions are available for configuring an optimized XML SQL Injection protection for your application:

**Block**—If you enable block, the block action is triggered only if the input matches the XML SQL injection type specification. For example, if **SQLSplCharANDKeyword** is configured as the XML SQL injection type, a request is not blocked if it does not contain any key words, even if SQL special characters are detected in the payload. Such a request is blocked if the XML SQL injection type is set to either **SQLSplChar**, or **SQLSplCharORKeyword**.

**Log**—If you enable the log feature, the XML SQL Injection check generates log messages indicating the actions that it takes. If block is disabled, a separate log message is generated for each location (**ELEMENT**, **ATTRIBUTE**) in which the XML SQL violation was detected. However, only one message is

generated when the request is blocked. You can monitor the logs to determine whether responses to legitimate requests are getting blocked. A large increase in the number of log messages can indicate attempts to launch an attack.

**Stats**—If enabled, the stats feature gathers statistics about violations and logs. An unexpected surge in the stats counter might indicate that your application is under attack. If legitimate requests are getting blocked, you might have to revisit the configuration to see if you need to configure new relaxation rules or modify the existing ones.

## XML SQL parameters

In addition to the block, log and stats actions, you can configure the following parameters for XML SQL Injection check:

**Check for XML SQL wildcard Characters**—Wild card characters can be used to broaden the selections of a structured query language (SQL-SELECT) statement. These wild card operators can be used in conjunction with **LIKE** and **NOT LIKE** operators to compare a value to similar values. The percent (%), and underscore (\_) characters are frequently used as wild cards. The percent sign is analogous to the asterisk (\*) wildcard character used with MS-DOS and to match zero, one, or multiple characters in a field. The underscore is similar to the MS-DOS question mark (?) wildcard character. It matches a single number or character in an expression.

For example, you can use the following query to do a string search to find all customers whose names contain the D character.

```
SELECT * from customer WHERE name like "%D%"
```

The following example combines the operators to find any salary values that have 0 as the second and third character.

```
SELECT * from customer WHERE salary like '_00%
```

Different DBMS vendors have extended the wildcard characters by adding extra operators. The Citrix Web App Firewall can protect against attacks that are launched by injecting these wildcard characters. The 5 default Wildcard characters are percent (%), underscore (\_), caret (^), opening square bracket ([), and closing square bracket (]). This protection applies to both HTML and XML profiles.

The default wildcard chars are a list of literals specified in the **\*Default Signatures:**

```
1 - <wildchar type=" LITERAL" >%</wildchar>
2 - <wildchar type=" LITERAL" >_</wildchar>
3 - <wildchar type=" LITERAL" >^</wildchar>
4 - <wildchar type=" LITERAL" >[</wildchar>
5 - <wildchar type=" LITERAL" >]</wildchar>
6 <!--NeedCopy-->
```

Wildcard characters in an attack can be PCRE, like [^A-F]. The Web App Firewall also supports PCRE wildcards, but the literal wildcard chars above are sufficient to block most attacks.

**Note**

The XML SQL **wildcard character** check is different from the XML SQL **special character** check. This option must be used with caution to avoid false positives.

**Check Request Containing SQL Injection Type**—The Web App Firewall provides 4 options to implement the desired level of strictness for SQL Injection inspection, based on the individual need of the application. The request is checked against the injection type specification for detecting SQL violations. The 4 SQL injection type options are:

- **SQL Special Character and Keyword**—Both an SQL keyword and an SQL special character must be present in the inspected location to trigger SQL violation. This least restrictive setting is also the default setting.
- **SQL Special Character**—At least one of the special characters must be present in the processed payload string to trigger SQL violation.
- **SQL keyword**—At least one of the specified SQL keywords must be present in the processed payload string to trigger an SQL violation. Do not select this option without due consideration. To avoid false positives, make sure that none of the keywords are expected in the inputs.
- **SQL Special Character or Keyword**—Either the keyword or the special character string must be present in the payload to trigger the security check violation.

**Tip**

If you select the SQL Special Character option, the Web App Firewall skips strings that do not contain any special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this option can significantly reduce the load on the Web App Firewall and speed up processing without placing your protected web sites at risk.

**SQL comments handling**—By default, the Web App Firewall parses and checks all comments in XML data for injected SQL commands. Many SQL servers ignore anything in a comment, even if preceded by an SQL special character. For faster processing, if your XML SQL server ignores comments, you can configure the Web App Firewall to skip comments when examining requests for injected SQL. The XML SQL comments handling options are:

- **ANSI**—Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases.
- **Nested**—Skip nested SQL comments, which are normally used by Microsoft SQL Server.
- **ANSI/Nested**—Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are still checked for injected SQL.
- **Check all Comments**—Check the entire request for injected SQL, without skipping anything. This is the default setting.

**Tip**

In most cases, you should not choose the Nested or the ANSI/Nested option unless your back-end database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they might indicate an attempt to breach security on that server.

**Relaxation rules**

If your application requires you to bypass the XML SQL Injection inspection for a specific ELEMENT or ATTRIBUTE in the XML payload, you can configure a relaxation rule. The XML SQL Injection inspection relaxation rules have the following parameters:

- **Name:** You can use literal strings or regular expressions to configure the name of the **ELEMENT** or the **ATTRIBUTE**. The following expression exempts all **ELEMENTS** beginning with the string **PurchaseOrder\_** followed by a string of numbers that is at least two and no more than ten characters long:

Comment: “Exempt XML SQL Check for Purchase Order Elements”

```

1      XMLSQLInjection:  "PurchaseOrder_[0-9A-Za-z]{
2      2,10 }
3      "
4
5      IsRegex:  REGEX          Location:  ELEMENT
6
7      State:  ENABLED
8      <!--NeedCopy-->

```

**Note:** The names are case sensitive. Duplicate entries are not allowed, but you can use capitalization of the names and differences in location to create similar entries. For example, each of the following relaxation rules is unique:

```

1  1)      XMLSQLInjection:  XYZ      IsRegex:  NOTREGEX
2
3          Location:  ELEMENT      State:  ENABLED
4
5  2)      XMLSQLInjection:  xyz      IsRegex:  NOTREGEX
6
7          Location:  ELEMENT      State:  ENABLED
8
9  3)      XMLSQLInjection:  xyz      IsRegex:  NOTREGEX
10
11         Location:  ATTRIBUTE     State:  ENABLED

```

```

12
13 4)      XMLSQLInjection: XYZ      IsRegex: NOTREGEX
14
15      Location: ATTRIBUTE      State: ENABLED
16 <!--NeedCopy-->

```

- **Location:** You can specify the Location of the XML SQL Inspection exception in your XML payload. The option **ELEMENT** is selected by default. You can change it to **ATTRIBUTE**.
- **Comment:** This is an optional field. You can use up to a 255 character string to describe the purpose of this relaxation Rule.

### Warning

Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the name that you want to add as an exception, and nothing else. Careless use of Regular Expressions can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the XML SQL Injection inspection would otherwise have blocked.

## Using the command line to configure the XML SQL Injection Check

### To configure XML SQL Injection actions and other parameters by using the command line:

In the command line interface, you can use either the **set appfw profile** command or the **add appfw profile** command to configure the XML SQL Injection protections. You can enable the block, log, and stats action(s). Select the type of SQL attack pattern (key words, wildcard characters, special strings) you want to detect in the payloads. Use the **unset appfw profile** command to revert the configured settings back to their defaults. Each of the following commands sets only one parameter, but you can include multiple parameters in a single command:

- `set appfw profile <name> **-XMLSQLInjectionAction** (([block] [log] [stats]) | [none])`
- `set appfw profile <name> -XMLSQLInjectionCheckSQLWildChars (ON |OFF)`
- `set appfw profile <name> -XMLSQLInjectionType ([SQLKeyword] | [SQLSplChar] | [SQLSplCharANDKeyword] | [SQLSplCharORKeyword])`
- `set appfw profile <name> -XMLSQLInjectionParseComments ([checkall] | [ansi|nested] | [ansinested])`

To configure a SQL Injection relaxation rule by using the command line

Use the bind or unbind command to add or delete relaxation rules, as follows:

```

1 - bind appfw profile <name> -XMLSQLInjection <string> [isRegex (REGEX
  | NOTREGEX)] [-location ( ELEMENT | ATTRIBUTE )] - comment <string>
  [-state ( ENABLED | DISABLED )]
2 - unbind appfw profile <name> -XMLSQLInjection <String>
3 <!--NeedCopy-->

```

**Example:**

```

1 > bind appfw profile test_profile -XMLSQLInjection "PurchaseOrder_[0-9A
  -Za-z]{
2 2,15 }
3 " -isregex REGEX -location ATTRIBUTE
4
5 > unbind appfw profile test_profile - XMLSQLInjection "PurchaseOrder_
  [0-9A-Za-z]{
6 2,15 }
7 " -location ATTRIBUTE
8 <!--NeedCopy-->

```

**Using the GUI to configure the XMLSQL injection security check**

In the GUI, you can configure the XML SQL Injection security check in the pane for the profile associated with your application.

To configure or modify the XML SQL Injection check by using the GUI

1. Navigate to **Web App Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the Advanced Settings pane, click **Security Checks**.

The security check table displays the currently configured action settings for all the security checks. You have 2 options for configuration:

- a. If you just want to enable or disable Block, Log, and Stats actions for XML SQL Injection, you can select or clear check boxes in the table, click OK, and then click Save and Close to close the Security Check pane.
- b. If you want to configure additional options for this security check, double click XML SQL Injection, or select the row and click **Action Settings**, to display the following options:

Check for SQL Wildcard Characters—Consider SQL Wildcard characters in the payload to be attack patterns.

Check Request Containing—Type of SQL injection (SQLKeyword, SQLSplChar, SQLSplCharANDKeyword, or SQLSplCharORKeyword) to check.

SQL Comments Handling—Type of comments (Check All Comments, ANSI, Nested, or ANSI/Nested) to check.

After changing any of the above settings, click **OK** to save the changes and return to the Security Checks table. You can proceed to configure other security checks if needed. Click **OK** to save all the changes you have made in the Security Checks section, and then click **Save** and **Close** to close the Security Check pane.

To configure a XML SQL Injection relaxation rule by using the GUI

1. Navigate to **Web App Firewall > Profiles**, highlight the target profile, and click **Edit**.
2. In the **Advanced Settings** pane, click **Relaxation Rules**.
3. In the Relaxation Rules table, double-click the **XML SQL Injection** entry, or select it and click **Edit**.
4. In the **XML SQL Injection Relaxation Rules** dialogue box, perform **Add**, **Edit**, **Delete**, **Enable**, or **Disable** operations for relaxation rules.

To manage XML SQL Injection relaxation rules by using the visualizer

For a consolidated view of all the relaxation rules, you can highlight the **XML SQL Injection** row in the Relaxation Rules table, and click **Visualizer**. The visualizer for deployed relaxations offers you the option to **Add** a new rule or **Edit** an existing one. You can also **Enable** or **Disable** a group of rules by selecting a node and clicking the corresponding buttons in the relaxation visualizer.

#### **To view or customize the SQL Injection patterns by using the GUI:**

You can use the GUI to view or customize the SQL patterns.

The default SQL patterns are specified in **Web App Firewall > Signatures > \*Default Signatures**. If you do not bind any signature object to your profile, the default SQL patterns specified in the Default Signatures object will be used by the profile for XML SQL Injection security check processing. The rules and patterns in the Default Signatures object are read-only. You cannot edit or modify them. If you want to modify or change these patterns, create a user-defined signature object by making a copy of the Default Signatures object and changing the SQL patterns. Use the user-defined signature object in the profile that processes the traffic for which you want to use these customized SQL patterns.

For more information, see [Signatures](#).

#### **To view default SQL patterns:**

- a. Navigate to **Web App Firewall > Signatures**, select **\*Default Signatures**, and click **Edit**. Then click **Manage SQL/XSS Patterns**.

The Manage SQL/XSS Paths table shows following four rows pertaining to SQL Injection:

```
1 Injection (not_alphanum, SQL)/ Keyword
2
3 Injection (not_alphanum, SQL)/ specialstring
4
5 Injection (not_alphanum, SQL)/ transformrules/transform
6
```

```
7 Injection (not_alphanum, SQL)/ wildchar
8 <!--NeedCopy-->
```

b. Select a row and click **Manage Elements** to display the corresponding SQL patterns (keywords, special strings, transformation rules or the wildcard characters) used by the Web App Firewall SQL injection check.

**To customize SQL Patterns:** You can edit a user-defined signature object to customize the SQL key words, special strings, and wildcard characters. You can add new entries or remove the existing ones. You can modify the transformation rules for the SQL special strings.

a. Navigate to **Web App Firewall > Signatures**, highlight the target user-defined signature, and click **Edit**. Click **Manage SQL/XSS Patterns** to display the **Manage SQL/XSS paths** table.

b. Select the target SQL row.

i. Click **Manage Elements**, to **Add**, **Edit** or **Remove** the corresponding SQL element.

ii. Click **Remove** to remove the selected row.

#### Warning

You must be very careful when removing or modifying any default SQL element, or deleting the SQL path to remove the entire row. The signature rules as well as the XML SQL Injection security check rely on these elements for detecting SQL Injection attacks to protect your applications. Customizing the SQL patterns can make your application vulnerable to XML SQL attacks if the required pattern is removed during editing.

## Using the log feature with the XML SQL injection check

When the log action is enabled, the **XML SQL Injection** security check violations are logged in the audit log as **APFW\_XML\_SQL** violations. The Web App Firewall supports both Native and CEF log formats. You can also send the logs to a remote syslog server.

### To access the log messages by using the command line:

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the XML Cross-Site Scripting violations:

```
1 > Shell
2
3 > tail -f /var/log/ns.log | grep APPFW_XML_SQL
4 <!--NeedCopy-->
```

To access the log messages by using the GUI

The Citrix GUI includes a useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- Navigate to **Web App Firewall > Profiles**, select the target profile, and click **Security Checks**. Highlight the **XML SQL Injection** row and click **Logs**. When you access the logs directly from the XML SQL Injection check of the profile, the GUI filters out the log messages and displays only the logs pertaining to these security check violations.
- You can also access the Syslog Viewer by navigating to **System > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the Syslog Viewer, which displays all log messages, including other security check violation logs. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Web App Firewall > Policies > Auditing**. In the Audit Messages section, click the **Syslog messages** link to display the **Syslog Viewer**, which displays all log messages, including other security check violation logs.

The XML based Syslog Viewer provides various filter options for selecting only the log messages that are of interest to you. To select log messages for the **XML SQL Injection** check, filter by selecting **APPFW** in the dropdown options for **Module**. The **Event Type** list offers a rich set of options to further refine your selection. For example, if you select the **APPFW\_XML\_SQL** check box and click the **Apply** button, only log messages pertaining to the **XML SQL Injection** security check violations appear in the Syslog Viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module**, **Event Type**, **Event ID**, and **Client IP** appear below the log message. You can select any of these options to highlight the corresponding information in the log message.

### Statistics for the XML SQL injection violations

When the stats action is enabled, the counter for the **XML SQL Injection** check is incremented when the Web App Firewall takes any action for this security check. The statistics are collected for Rate and Total count for Traffic, Violations, and Logs. The size of an increment of the log counter can vary depending on the configured settings. For example, if the block action is enabled, a request for a page that contains three **XML SQL Injection** violations increments the stats counter by one, because the page is blocked as soon as the first violation is detected. However, if block is disabled, processing the same request increments the statistics counter for violations and the logs by three, because each violation generates a separate log message.

To display XML SQL Injection check statistics by using the command line

At the command prompt, type:

```
> sh appfw stats
```

To display stats for a specific profile, use the following command:

```
> stat appfw profile <profile name>
```

To display XML SQL Injection statistics by using the GUI

1. Navigate to **System > Security > Web App Firewall**.
2. In the right pane, access the **Statistics** Link.
3. Use the scroll bar to view the statistics about **XML SQL Injection** violations and logs. The statistics table provides real-time data and is updated every 7 seconds.

## XML attachment check

September 21, 2020

The XML Attachment check examines incoming requests for malicious attachments, and it blocks those requests that contain attachments that might breach applications security. The purpose of the XML Attachment check is to prevent an attacker from using an XML attachment to breach security on your server.

If you use the wizard or the GUI, in the Modify XML Attachment Check dialog box, on the General tab you can enable or disable the Block, Learn, Log, Statistics, and Learn actions:

If you use the command-line interface, you can enter the following command to configure the XML Attachment Check:

- `set appfw profile <name> -xmlAttachmentAction [**block**] [**learn**] [**log**] [**stats**] [**none**]`

You must configure the other XML Attachment check settings in the GUI. In the [Modify XML Attachment Check](#) dialog box, on the Checks tab, you can configure the following settings:

- **Maximum Attachment Size.** Allow attachments that are no larger than the maximum attachment size you specify. To enable this option, first select the Enabled check box, and then type the maximum attachment size in bytes in the [Size](#) text box.
- **Attachment Content Type.** Allow attachments of the specified content type. To enable this option, first select the Enabled check box, and then enter a regular expression that matches the Content-Type attribute of the attachments that you want to allow.
  - You can type the URL expression directly in the text window. If you do so, you can use the [Regex Tokens](#) menu to enter a number of useful regular expressions at the cursor instead of typing them manually.
  - You can click [Regex Editor](#) to open the [Add Regular Expression](#) dialog box and use it to construct the URL expression.

## Web services interoperability check

September 21, 2020

The Web Services Interoperability (WS-I) check examines both requests and responses for adherence to the WS-I standard, and blocks those requests and responses that do not adhere to this standard. The purpose of the WS-I check is to block requests that might not interact with other XML appropriately. An attacker can use inconsistencies in interoperability to launch an attack on your XML application.

If you use the wizard or the GUI, in the Modify Web Services Interoperability Check dialog box, on the General tab you can enable or disable the Block, Log, Statistics, and Learn actions.

If you use the command-line interface, you can enter the following command to configure the Web Services Interoperability check:

- `set appfw profile <name> -xmlWSIAction [block] ][log] [learn] [stats] [none]`

To configure individual Web Services Interoperability rules, you must use the GUI. On the Checks tab of the Modify Web Services Interoperability Check dialog box, select a rule and click Enable or Disable to enable or disable the rule. You can also click Open to open the Web Services Interoperability Detail message box for that rule. The message box displays read-only information about the rule. You cannot modify or make other configuration changes to any of these rules.

The WS-I check uses the rules listed in WS-I Basic Profile 1.0. WS-I delivers best practices for developing interoperable Web Services solutions. WS-I checks are performed only on SOAP Messages.

Description of each WSI standard rule is provided below:

| Rule   | Description                                                                                                                                  |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| BP1201 | Message body should be a soap:envelope with namespace.                                                                                       |
| R1000  | When an ENVELOPE is a Fault, the soap:Fault element MUST NOT have element children other than faultcode, faultstring, faultactor and detail. |
| R1001  | When an ENVELOPE is a Fault, the element children of the soap:Fault element MUST be unqualified.                                             |

| Rule  | Description                                                                                                                                                                                                                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| R1003 | A RECEIVER MUST accept fault messages that have any number of qualified or unqualified attributes, including zero, appearing on the detail element. The namespace of qualified attributes can be anything other than the namespace of the qualified document element Envelope.                                            |
| R1004 | When an ENVELOPE contains a faultcode element, the content of that element SHOULD be either one of the fault codes defined in SOAP 1.1 (supplying additional information if necessary in the detail element), or a QName whose namespace is controlled by the fault's specifying authority (in that order of preference). |
| R1005 | An ENVELOPE MUST NOT contain soap:encodingStyle attribute on any of the elements whose namespace is the same as the namespace of the qualified document element Envelope.                                                                                                                                                 |
| R1006 | An ENVELOPE MUST NOT contain soap:encodingStyle attributes on any element that is a child of soap:Body.                                                                                                                                                                                                                   |
| R1007 | An ENVELOPE described in an rpc-literal binding MUST NOT contain soap:encodingStyle attribute on any element that is a grandchild of soap:Body.                                                                                                                                                                           |
| R1011 | An ENVELOPE MUST NOT have any element children of soap:Envelope following the soap:Body element.                                                                                                                                                                                                                          |
| R1012 | A MESSAGE MUST be serialized as either UTF-8 or UTF-16.                                                                                                                                                                                                                                                                   |
| R1013 | An ENVELOPE containing a soap:mustUnderstand attribute MUST only use the lexical forms 0 and 1.                                                                                                                                                                                                                           |

---

| Rule  | Description                                                                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| R1014 | The children of the soap:Body element in an ENVELOPE MUST be namespace qualified.                                                                                       |
| R1015 | A RECEIVER MUST generate a fault if they encounter an envelope whose document element is not soap:Envelope.                                                             |
| R1031 | When an ENVELOPE contains a faultcode element the content of that element SHOULD NOT use of the SOAP 1.1 dot notation to refine the meaning of the fault.               |
| R1032 | The soap:Envelope, soap:Header, and soap:Body elements in an ENVELOPE MUST NOT have attributes in the same namespace as that of the qualified document element Envelope |
| R1033 | An ENVELOPE SHOULD NOT contain the namespace declaration: <code>xmlns:xml=http://www.w3.org/XML/1998/namespace</code> .                                                 |
| R1109 | The value of the SOAPAction HTTP header field in a HTTP request MESSAGE MUST be a quoted string.                                                                        |
| R1111 | An INSTANCE SHOULD use a 200 OK HTTP status code on a response message that contains an envelope that is not a fault.                                                   |
| R1126 | An INSTANCE MUST return a 500 Internal Server Error HTTP status code if the response envelope is a Fault.                                                               |
| R1132 | A HTTP request MESSAGE MUST use the HTTP POST method.                                                                                                                   |
| R1140 | A MESSAGE SHOULD be sent using HTTP/1.1.                                                                                                                                |
| R1141 | A MESSAGE MUST be sent using either HTTP/1.1 or HTTP/1.0.                                                                                                               |
| R2113 | An ENVELOPE MUST NOT include the soapenc:arrayType attribute.                                                                                                           |

| Rule  | Description                                                                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| R2211 | An ENVELOPE described with an rpc-literal binding MUST NOT have the xsi:nil attribute with a value of 1 or true on the part accessors.                                                                         |
| R2714 | For one-way operations, an INSTANCE MUST NOT return a HTTP response that contains an envelope. Specifically, the HTTP response entity-body must be empty.                                                      |
| R2729 | An ENVELOPE described with an rpc-literal binding that is a response MUST have a wrapper element whose name is the corresponding wsdl:operation name suffixed with the stringResponse.                         |
| R2735 | An ENVELOPE described with an rpc-literal binding MUST place the part accessor elements for parameters and return value in no namespace.                                                                       |
| R2738 | An ENVELOPE MUST include all soapbind:headers specified on a wsdl:input or wsdl:output of a wsdl:operation of a wsdl:binding that describes it.                                                                |
| R2740 | A wsdl:binding in a DESCRIPTION SHOULD contain a soapbind:fault describing each known fault.                                                                                                                   |
| R2744 | A HTTP request MESSAGE MUST contain a SOAPAction HTTP header field with a quoted value equal to the value of the soapAction attribute of soapbind:operation, if present in the corresponding WSDL description. |

---

## XML message validation check

September 21, 2020

The XML Message Validation check examines requests that contain XML messages to ensure that they are valid. If a request contains an invalid XML message, the Web App Firewall blocks the request. The

purpose of the XML Validation check is to prevent an attacker from using specially constructed invalid XML messages to breach the security of your application.

If you use the wizard or the GUI, in the Modify XML Message Validation Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the XML Message Validation Check:

- `set appfw profile <name> -xmlValidationAction [**block**] [**log**] [**stats**] [**none**]`

You must use the GUI to configure the other XML Validation check settings. In the Modify XML Message Validation Check dialog box, on the Checks tab, you can configure the following settings:

- **XML Message Validation.** Use one of the following options to validate the XML message:
  - **SOAP Envelope.** Validate only the SOAP envelope of XML messages.
  - **WSDL.** Validate XML messages by using an XML SOAP WSDL. If you choose WSDL validation, in the WSDL Object drop-down list you must choose a WSDL. If you want to validate against a WSDL that has not already been imported to the Web App Firewall, you can click the Import button to open the Manage WSDL Imports dialog box and import your WSDL. See “[WSDL](#)” for more information.
    - \* If you want to validate the entire URL, leave the Absolute radio button in the End Point Check button array selected. If you want to validate only the portion of the URL after the host, select the Relative radio button.
    - \* If you want the Web App Firewall to enforce the WSDL strictly, and not allow any additional XML headers not defined in the WSDL, you must clear the Allow additional headers not defined in the WSDL check box.  
Caution: If you uncheck the Allow Additional Headers not defined in the WSDL check box, and your WSDL does not define all XML headers that your protected XML application or Web 2.0 application expects or that a client sends, you may block legitimate access to your protected service.
  - **XML Schema.** Validate XML messages by using an XML schema. If you choose XML schema validation, in the XML Schema Object drop-down list you must choose an XML schema. If you want to validate against an XML schema that has not already been imported to the Web App Firewall, you can click the Import button to open the Manage XML Schema Imports dialog box and import your WSDL. See “[WSDL](#)” for more information.
- **Response Validation.** By default, the Web App Firewall does not attempt to validate responses. If you want to validate responses from your protected application or Web 2.0 site, select the Validate Response check box. When you do, the Reuse the XML Schema specified in request validation check box and the XML Schema Object drop-down list are activated.

- Check the Reuse XML Schema check box to use the schema you specified for request validation to do response validation as well.  
Note: If you check this check box, the XML Schema Object drop-down list is grayed out.
- If you want to use a different XML schema for response validation, use the XML Schema Object drop-down list to select or upload that XML schema.

## XML SOAP fault filtering check

September 21, 2020

The XML SOAP fault filtering check examines responses from your protected web services and filters out XML SOAP faults. This prevents leaking of sensitive information to attackers.

If you use the wizard or the GUI, in the Modify XML SOAP Fault Filtering Check dialog box, on the **General** tab you can enable or disable the Block, Log, and Statistics actions, and the Remove action, which removes SOAP faults before forwarding the response to the user.

If you use the command-line interface, you can enter the following command to configure the XML SOAP Fault Filtering Check:

```
set appfw profile <name> -XMLSOAPFaultAction [block] [log] [stats] [none]
```

You cannot configure exceptions to the XML SOAP Fault Filtering check. You can only enable or disable it.

## Managing content types

September 21, 2020

Web servers usually add a Content-Type header that contains a MIME/type definition for the type of content in each file that the web server serves to users. Web servers serve many different types of content. For example, standard HTML is assigned the “text/html” MIME type. JPG images are assigned the “image/jpeg” or “image/jpg” content type. A normal web server can serve dozens or hundreds of different types of content, all defined in the Content Type header by an assigned MIME/type.

Many Web App Firewall filtering rules are designed to filter specific types of content. Because filtering rules that apply to one type of content (such as HTML) are often inappropriate when filtering a different type of content (such as images), the Web App Firewall attempts to determine the content type of requests and responses before it filters them. When a web server or browser does not add a

Content-Type header to a request or response, the Web App Firewall applies a default content type to the connection and filters the content accordingly.

The default content type is normally “application/octet-stream”, the most generic MIME/type definition. This MIME/type is appropriate for any type of content that a web server is likely to serve, but also does not provide much information to the Web App Firewall to allow it to choose appropriate filtering. If a protected web server on your network is configured to add accurate content type headers to the content it serves, or serves only one type of content, you can create a profile for that web server and assign a different default content type to it to improve both the speed and the accuracy of filtering.

You can also configure a list of allowed request content types for a specific profile. When this feature is configured, if the Web App Firewall filters a request that does not match one of the allowed content types, it blocks the request. After upgrade from release 10.5 to 11.0, unknown content-types which are not in the default allowed content-type list do not bind. You can add other content-types which you want to be allowed to the relaxed rules.

Requests must always be of either the “application/x-www-form-urlencoded”, “multipart/form-data”, or “text/x-gwt-rpc” types. The Web App Firewall blocks any request that has any other content type designated.

**Note**

You cannot include the “application/x-www-form-urlencoded” or “multipart/form-data” content types on the allowed response content types list.

**To set the default request content type by using the command line interface**

At the command prompt, type the following commands:

- `set appfw profile <name> -requestContentType <type>`
- `save ns config`

**Example**

The following example sets the “text/html” content type as the default for the specified profile:

```
1 set appfw profile profile1 -requestContentType "text/html"
2 save ns config
3 <!--NeedCopy-->
```

**To remove the user-defined default request content type by using the command line interface**

At the command prompt, type the following commands:

- `unset appfw profile <name> -requestContentType <type>`
- `save ns config`

### Example

The following example unsets the default content type of “text/html” for the specified profile, allowing the type to revert to “application/octet-stream”:

```
1 unset appfw profile profile1 -requestContentType "text/html"
2 save ns config
3 <!--NeedCopy-->
```

### Note

Always use last content-type header for processing and remove remaining content-type headers if any that ensures that the backend server receives a request with only one content-type.

To block requests that can be bypassed, add an Web App Firewall policy with rule as `HTTP.REQ.HEADER ("content-type").COUNT.GT(1)` and profile as `appfw_block`.

If a request is received without a Content-Type header or if the request has Content-Type header without any value, Web App Firewall applies the configured **RequestContentType** value and processes the request accordingly.

## To set the default response content type by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> -responseContentType <type>`
- `save ns config`

### Example

The following example sets the “text/html” content type as the default for the specified profile:

```
1 set appfw profile profile1 -responseContentType "text/html"
2 save ns config
3 <!--NeedCopy-->
```

## To remove the user-defined default response content type by using the command line interface

At the command prompt, type the following commands:

- `unset appfw profile <name> -responseContentType <type>`
- `save ns config`

### Example

The following example unsets the default content type of “text/html” for the specified profile, allowing the type to revert to “application/octet-stream”:

```
1 unset appfw profile profile1 -responseContentType "text/html"
2 save ns config
3 <!--NeedCopy-->
```

### To add a content type to the allowed content types list by using the command line interface

At the command prompt, type the following commands:

- `bind appfw profile <name> -ContentType <contentTypeName>`
- `save ns config`

### Example

The following example adds the “text/shtml” content type to the allowed content types list for the specified profile:

```
1 bind appfw profile profile1 -contentType "text/shtml"
2 save ns config
3 <!--NeedCopy-->
```

### To remove a content type from the allowed content types list by using the command line interface

At the command prompt, type the following commands:

- `unbind appfw profile <name> -ContentType <contentTypeName>`
- `save ns config`

### Example

The following example removes the “text/shtml” content type from the allowed content types list for the specified profile:

```
1 unbind appfw profile profile1 -contentType "text/shtml"  
2 save ns config  
3 <!--NeedCopy-->
```

## To manage the default and allowed content types by using the GUI

1. Navigate to **Security > Web App Firewall > Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**. The **Configure Web App Firewall Profile** dialog box is displayed.
3. The **Configure Web App Firewall Profile** dialog box, click the **Settings** tab.
4. On the **Settings** tab, scroll down about halfway to the Content Type area.
5. In the Content Type area, configure the default request or response content type:
  - To configure the default request content type, type the MIME/type definition of the content type you want to use in the Default Request text box.
  - To configure the default response content type, type the MIME/type definition of the content type you want to use in the Default Response text box.
  - To create a new allowed content type, click **Add**. The **Add Allowed Content Type** dialog box is displayed.
  - To edit an existing allowed content type, select that content type, and then click **Open**. The **Modify Allowed Content Type** dialog box is displayed.
6. To manage the allowed content types, click Manage Allowed Content Types.
7. To add a new content type or modify an existing content type, click Add or Open, and in the **Add Allowed Content Type** or **Modify Allowed Content Type** dialog box, do the following steps.
  - a) Select/clear the Enabled check box to include the content type in, or exclude it from, the list of allowed content types.
  - b) In the Content Type text box, type a regular expression that describes the content type that you want to add, or change the existing content type regular expression.

Content types are formatted exactly as MIME type descriptions are.

**Note:** You can include any valid MIME type on the allowed contents type list. Since many types of document can contain active content and therefore could potentially contain malicious content, you should exercise caution when adding MIME types to this list.
  - c) In the Comments text box, add an optional comment that describes the reason for adding this particular MIME type to the allowed contents type list.
  - d) Click **Create** or **OK** to save your changes.
8. Click **Close** to close the Manage Allowed Content Types dialog box and return to the **Settings** tab.
9. Click **OK** to save your changes.

## Profiles

September 21, 2020

A profile is a collection of security settings that are used to protect specific types of web content or specific parts of your web site. In a profile, you determine how the Web App Firewall applies each of its filters (or checks) to requests to your web sites, and responses from them. The Web App Firewall supports two types of profile: four built-in (default) profiles that do not require further configuration, and user-defined profiles that do require further configuration.

### Built-in profiles

The four Web App Firewall built-in profiles provide simple protection for applications and web sites that either do not require protection, or that should not be directly accessed by users at all. These profile types are:

- **APPFW\_BYPASS.** Skips all Web App Firewall filtering and sends the unmodified traffic to the protected application or web site, or to the client.
- **APPFW\_RESET.** Resets the connection, requiring that the client re-establish his or her session by visiting a designated start page.
- **APPFW\_DROP.** Drops all traffic to or from the protected application or web site, and sends no response of any kind to the client.
- **APPFW\_BLOCK.** Blocks traffic to or from the protected application or web site.

You use the built-in profiles exactly as you do user-defined profiles, by configuring a policy that selects the traffic to which you want to apply the profile and then associating the profile with your policy. Since you do not have to configure a built-in policy, it provides a quick way to allow or block specified types of traffic or traffic that is sent to specific applications or web sites.

### User-defined profiles

User-defined profiles are profiles that are build and configured by users. Unlike the default profiles, you must configure a user-defined profile before it will be of use filtering traffic to and from your protected applications.

There are three types of user-defined profile:

- **HTML.** Protects HTML-based web pages.
- **XML.** Protects XML-based web services and web sites.
- **Web 2.0.** Protects Web 2.0 content that combines HTML and XML content, such as ATOM feeds, blogs, and RSS feeds.

The Web App Firewall has a number of security checks, all of which can be enabled or disabled, and configured in a number of ways in each profile. Each profile also has a number of settings that control how it handles different types of content. Finally, rather than manually configuring all of the security checks, you can enable and configure the learning feature. This feature observes normal traffic to your protected web sites for a period of time, and uses those observations to provide you with a tailored list of recommended exceptions (*relaxations*) to some security checks, and additional rules for other security checks.

During initial configuration, whether by using the Web App Firewall Wizard or manually, you normally create one general purpose profile to protect all content on your web sites that is not covered by a more specific profile. After that, you can create as many specific profiles as you want to protect more specialized content.

The Profiles pane consists of a table that contains the following elements:

**Name.** Displays all the Web App Firewall profiles configured in the appliance.

**Bound signature.** Displays the signatures object that is bound to the profile in the previous column, if any.

**Policies.** Displays the Web App Firewall policy that invokes the profile in the leftmost column of that row, if any.

**Comments.** Displays the comment associated with the profile in the leftmost column of that row, if any.

**Profile Type.** Displays the type of profile. Types are Built-In, HTML, XML, and Web 2.0.

Above the table is a row of buttons and a drop-down list that allow you to create, configure, delete, and view information about your profiles:

- **Add.** Add a new profile to the list.
- **Edit.** Edit the selected profile.
- **Delete.** Delete the selected profile from the list.
- **Statistics.** View the statistics for the selected profile.
- **Action.** Drop-down list that contains additional commands. Currently allows you to import a profile that was exported from another Web App Firewall configuration.

## Creating Web App Firewall profiles

September 22, 2020

You can create an Web App Firewall profile in one of two ways: by using the command line, and by using the GUI. Creating a profile by using the command line requires that you specify options on the

command line. The process is similar to that of [configuring an profile](#), and with a few exceptions the two commands take the same parameters.

Creating a profile by using the GUI requires that you specify only two options. You specify basic or advanced *defaults*, the default configuration for the various security checks and settings that are part of a profile, and choose the profile *type* to match the type of content that the profile is intended to protect. You can also, optionally, add a comment. After you create the profile, you must then configure it by selecting it in the data pane, and then clicking **Edit**.

If you plan to use the learning feature or to enable and configure a large number of advanced protections, you should choose advanced defaults. In particular, if you plan to configure either of the SQL injection checks, either of the cross-site scripting checks, any check that provides protection against Web form attacks, or the cookie consistency check, you should plan to use the learning feature. Unless you include the proper exceptions for your protected Web sites when configuring these checks, they can block legitimate traffic. Anticipating all of the necessary exceptions without creating any that are too broad is difficult. The learning feature makes this task much easier. Otherwise, basic defaults are quick and should provide the protection that your web applications need.

There are three profile types:

- **HTML**. Protects standard HTML-based web sites.
- **XML**. Protects XML-based web services and web sites.
- **Web 2.0 (HTML XML)**. Protects sites that contain both HTML and XML elements, such as ATOM feeds, blogs, and RSS feeds.

There are also a few restrictions on the name that you can give to a profile. A profile name cannot be the same as the name assigned to any other profile or action in any feature on the NetScaler appliance. Certain action or profile names are assigned to built-in actions or profiles, and can never be used for user profiles. A complete list of disallowed names can be found in the Web App Firewall Profile [Supplemental Information](#). If you attempt to create a profile with a name that has already been used for an action or a profile, an error message is displayed and the profile is not created.

### To create an Web App Firewall profile by using the command line interface

At the command prompt, type the following commands:

- `add appfw profile <name> [-defaults ( **basic** | **advanced** )]`
- `set appfw profile <name> -type ( **HTML** | **XML** | **HTML XML** )`
- `set appfw profile <name> -comment "<comment>"`
- `save ns config`

## Example

The following example adds a profile named pr-basic, with basic defaults, and assigns a profile type of HTML. This is the appropriate initial configuration for a profile to protect an HTML Web site.

```
1 add appfw profile pr-basic -defaults basic -comment "Simple profile for
   web sites."
2 set appfw profile pr-basic -type HTML
3 save ns config
4 <!--NeedCopy-->
```

## To create an Web App Firewall profile by using the GUI

Creating an Web App Firewall profile requires that you specify only a few configuration details.

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the details pane, click **Add**.
3. In the **Create Web App Firewall Profile** dialog box, type a name for your profile.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (\_) symbols.

4. Choose the profile type from the drop-down list.
5. Click **Create**, and then click **Close**.

## Enforce HTTP RFC compliance

August 31, 2021

Citrix Web App Firewall inspects the incoming traffic for HTTP RFC compliance and drops any request that has RFC violations by default. However, there are certain scenarios, where the appliance might have to bypass or block a non-RFC compliance request. In such cases, you can configure the appliance to bypass or block such requests at global or profile level.

### Block or bypass non-RFC compliant requests at global level

The HTTP module tags a request as invalid if it is incomplete or invalid and such requests cannot be processed by WAF. For example, an incoming HTTP request having host header missing. To block or bypass such invalid requests, you must configure the “malformedReqAction” option in the application firewall global settings.

**Note:**

If you disable the “block” option in the “malformedReqAction” parameter, the appliance bypasses the entire app firewall processing for all non-RFC compliance requests and forwards the requests to the next module.

**To block or bypass invalid non-RFC complaint HTTP requests by using the command line interface**

To block or bypass invalid requests, enter the following command:

```
set appfw settings -malformedreqaction <action>
```

**Example:**

```
set appfw settings -malformedReqAction block
```

**To display malformed request action settings**

To display malformed request action settings, enter the following command:

```
show appfw settings
```

**Output:**

```
1 DefaultProfile: APPFW_BYPASS UndefAction: APPFW_BLOCK SessionTimeout:
   900 LearnRateLimit: 400 SessionLifetime: 0
   SessionCookieName: citrix_ns_id ImportSizeLimit: 134217728
   SignatureAutoUpdate: OFF SignatureUrl:"https://s3.amazonaws.com/
   NSAppFwSignatures/SignaturesMapping.xml" CookiePostEncryptPrefix:
   ENC GeoLocationLogging: OFF CEFLogging: OFF EntityDecoding:
   OFF UseConfigurableSecretKey: OFF SessionLimit: 100000
   MalformedReqAction: block log stats
2 Done
3 <!--NeedCopy-->
```

**To block or bypass invalid non-RFC complaint HTTP requests by using the Citrix ADC GUI**

1. Navigate to **Security > Citrix Web App Firewall**.
2. In the **Citrix Web App Firewall** page, click **Change Engine Settings** under **Settings**.
3. In the **Configure Citrix Web App Firewall Settings** page, select the **Log Malformed Request** option as Block, Log or Stats.
4. Click **OK** and **Close**.

**Note:**

If you unselect the “block” action or do not select any malformed request action, the appliance bypasses the request without intimating the user.

**Block or bypass non-RFC compliant requests at profile level**

Other non-RFC compliant requests can be configured to block or bypass at profile level. You must set the RFC profile either in “Block” or “Bypass” mode. By doing this, any invalid traffic that matches the Web App Firewall profile is either bypassed or blocked accordingly.

**Note:**

When you set the RFC profile in “Bypass” mode, you must make sure you disable the transformation option in the “HTML Cross-Site Scripting Settings” and in the “HTML SQL Injection Settings” sections. If you enable the option and set the rfc profile in “Bypass” mode, the appliance displays a warning message, “Transform cross-site scripts” and “Transform SQL special characters” are both currently ON. Recommend to turn it off when used with APPFW\_RFC\_BYPASS”.

**Important:**

Also, the appliance displays a warning note, “Appfw Security checks enabled might not be applicable to requests which violates RFC checks when this profile is set. Enabling any transformation setting is not recommended as requests might be partially transformed that contains RFC violations.”

**To configure RFC profile in the Web App Firewall profile by using the command line interface**

At the command prompt, type the following commands:

```
set appfw profile <profile_name> -rfcprofile <rfcprofile_name>
```

**Example**

```
set appfw profile P1 -rfcprofile APPFW_RFC_BLOCK
```

**Note:**

By default, the rfc profile is bound to the Web App Firewall profile in “Block” mode.

**To configure RFC profile in the Web App Firewall profile by using the GUI**

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the **Profiles** page, select a profile and click **Edit**.

3. In the **Web App Firewall Profile** page, click **Profile settings** from the **Advanced Settings** section.
4. In the **HTML Settings** section, set the RFC profile in APPFW\_RFC\_BYPASS mode.  
The system displays a warning message, “Appfw Security checks enabled might not be applicable to requests which violates RFC checks when this profile is set. Enabling any transformation setting is not recommended as requests might be partially transformed that contains RFC violations”.

## Configuring Web App Firewall profiles

September 22, 2020

To configure a user-defined Web App Firewall profile, first configure the security checks, which are called *deep protections* or *advanced protections* in the Web App Firewall wizard. Certain checks require configuration if you are to use them at all. Others have default configurations that are safe but limited in scope; your web sites might need or benefit from a different configuration that takes advantage of additional features of certain security checks.

After you have configured the security checks, you can also configure a number of other settings that control the behavior, not of a single security check, but the Web App Firewall feature. The default configuration is sufficient to protect most web sites, but you should review them to make sure that they are right for your protected web sites.

For more information about the Web App Firewall security checks, see [“Advanced Protections.”](#)

### To configure an Web App Firewall profile by using the command line

At the command prompt, type the following commands:

- `set appfw profile <name> <arg1> [<arg2> ...]`

where:

- `<arg1>` = a parameter and any associated options.
- `<arg2>` = a second parameter and any associated options.
- `...` = additional parameters and options.

For descriptions of the parameters to use when configuring specific security checks, see [“Advanced Protections.”](#)

- `save ns config`

## Example

The following example shows how to enable blocking for the HTML SQL Injection and HTML Cross-Site Scripting checks in a profile named pr-basic. This command enables blocking for those actions while making no other changes to the profile.

```
1 set appfw profile pr-basic -crossSiteScriptingAction block -
   SQLInjectionAction block
2 <!--NeedCopy-->
```

## To configure an Web App Firewall profile by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** dialog box, on the **Security Checks** tab, configure the security checks.

- To enable or disable an action for a check, in the list, select or clear the check box for that action.
- To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check.

You can also select a check and, at the bottom of the dialog box, click **Open** to display the **Configure Relaxation** dialog box or **Configure Rule** dialog box for that check. These dialog boxes also vary from check to check. Most of them include a **Checks** tab and a **General** tab. If the check supports relaxations or user-defined rules, the **Checks** tab includes an **Add** button, which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.) If relaxations have already been configured, you can select one and click **Open** to modify it.

- To review learned exceptions or rules for a check, select the check, and then click **Learned Violations**. In the **Manage Learned Rules** dialog box, select each learned exception or rule in turn.
  - To edit the exception or rule, and then add it to the list, click **Edit & Deploy**.
  - To accept the exception or rule without modification, click **Deploy**.
  - To remove the exception or rule from the list, click **Skip**.
- To refresh the list of exceptions or rules to be reviewed, click **Refresh**.
- open the Learning Visualizer and use it to review learned rules, click **Visualizer**.
- review the log entries for connections that matched a check, select the check, and then click **Logs**. You can use this information to determine which checks are matching attacks,

so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see [“Logs, Statistics, and Reports.”](#)

- To completely disable a check, in the list, clear all of the check boxes to the right of that check.
4. On the **Settings** tab, configure the profile settings.
    - To associate the profile with the set of signatures that you previously created and configured, under Common Settings, choose that set of signatures in the **Signatures** drop-down list.
 

**Note:** You may need to use the scroll bar on the right of the dialog box to scroll down to display the Common Settings section.
    - To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.
 

**Note:** You must first upload the error object that you want to use in the Imports pane. For more information about importing error objects, see [Imports](#).
    - To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types. [“»More...”](#)
  5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile, as described in [“Configuring and Using the Learning Feature”](#).
  6. Click **OK** to save your changes and return to the **Profiles** pane.

## Web Application Firewall profile settings

September 9, 2021

Following are the profile settings that you must configure on the appliance.

At the command prompt, type:

```
add appfw profile <name> [-invalidPercentHandling <invalidPercentHandling>]
[-checkRequestHeaders ( ON | OFF )] [-URLDecodeRequestCookies ( ON | OFF )]
] [-optimizePartialReqs ( ON | OFF )] [-errorURL <expression>]
```

### Example:

```
add appfw profile profile1 [-invalidPercentHandling secure_mode] [-checkRequestHeaders
ON] [-URLDecodeRequestCookies OFF] [-optimizePartialReqs OFF]
```

Where,

**invalidPercentHandling.** Configure the method for handling percent-encoded names and values.

Available settings function as follows:

**asp\_mode** - Strips and Parses Invalid Percent for Parsing. Example:- `curl -v "http://<vip>/forms/login.html?field=sel%zzect -> Invalid percent encoded char(%zz) is stripped of and the rest of the content is inspected and action taken for the SQLInjection check.`

**secure\_mode** - We detect the Invalid Percent coded value and ignore it. Example:- `curl -v "http://<vip>/forms/login.html?field=sel%zzect -> Invalid percent encoded char(%zz) is detected, counters are incremented and content is passed as is to the server.`

**apache\_mode** - This mode works similar to secure mode.

Possible values: `apache_mode`, `asp_mode`, `secure_mode`

Default value: `secure_mode`

**optimizePartialReqs.** When OFF/ON (without safe object), a Citrix ADC appliance sends the partial request to the back-end server. This partial response sent back to the client. `OptimizePartialReqs` makes sense when the Safe object is configured. The appliance sends requests for full response from the server when OFF, requests only partial response when ON.

Available settings are as follows:

ON - Partial requests by the client result in partial requests to the back-end server.

OFF - Partial requests by the client are changed to full requests to the back-end server

Possible values: ON, OFF

Default value: ON

**URLDecodeRequestCookies.** URL Decode request cookies before subjecting them to SQL and cross-site scripting checks.

Possible values: ON, OFF

Default value: OFF

**Signature Post Body Limit (Bytes).** Limits the request payload (in bytes) inspected for signatures with the location specified as 'HTTP\_POST\_BODY'.

Default value: 8096

Minimum value: 0

Maximum Value: 4294967295

**Post Body Limit (Bytes).** Limits the request payload (in bytes) inspected by Web Application Firewall.

Default value: 20000000

Minimum value: 0

Maximum Value: 10 GB

**postBodyLimitAction.** `PostBodyLimit` honors error settings when you specify the maximum size of HTTP body to be allowed. To honor error settings you must configure one or more Post Body Limit actions. The configuration is also applicable for requests where the transfer encoding header is chunked.

```
set appfw profile <profile_name> -PostBodyLimitAction block log stats
```

Where,

**Block** - This action blocks connection that violates the security check and it is based on the maximum size of the configured HTTP body (post body limit). The option must always be enabled.

**Log** - Log violations of this security check.

**Stats** - Generate statistics for this security check.

**Note:**

The log format for post body limit action is now changed to follow the standard audit logging format, for example:

```
ns.log.4.gz:Jun 25 1.1.1.1. <local0.info> 10.101.10.100 06/25/2020:10:10:28
GMT 0-PPE0 : default APPFW APPFW_POSTBODYLIMIT 1506 0 : <Netscaler IP>
4234-PPE0 - testprof ><URL> Request post body length(<Post Body Length
>)exceeds post body limit.
```

**inspectQueryContentTypes** Inspect request query and web forms for injected SQL and cross-site scripts for the following content types.

```
set appfw profile p1 -inspectQueryContentTypes HTML XML JSON OTHER
```

Possible values: HTML, XML, JSON, OTHER

By default, this parameter is set as “InspectQueryContentTypes: HTML JSON OTHER” for both basic and advanced appfw profiles.

**Example for inspect query content type as XML:**

```
1 > set appfw profile p1 -type XML
2 Warning: HTML, JSON checks except “InspectQueryContentTypes” Action
   will not be applicable when profile type is not HTML or JSON
   respectively.
3 <!--NeedCopy-->
```

**Example for inspect query content type as HTML:**

```
1 > set appfw profile p1 -type HTML
2 Warning: XML, JSON checks except “InspectQueryContentTypes” Action
   will not be applicable when profile type is not XML or JSON
   respectively
3 Done
4 <!--NeedCopy-->
```

**Example for inspect query content type as JSON:**

```
1 > set appfw profile p1 -type JSON
2 Warning: HTML, XML checks except "InspectQueryContentTypes" Action
   will not be applicable when profile type is not HTML or XML
   respectively
3 Done
4 <!--NeedCopy-->
```

**errorURL expression.** The URL that the Citrix Web App Firewall uses as an error URL. Maximum Length: 2047.

**Note:**

For blocking violations in a requested URL, if the error URL is similar to the signature URL the appliance resets the connection.

**logEveryPolicyHit** - Log every profile match, regardless of security checks results.

Possible values: ON, OFF.

Default value: OFF.

**stripXmlComments** - Strip XML comments before forwarding a web page sent by a protected web site in response to a user request.

Possible values: none, all, exclude\_script\_tag.

Default value: none

**postBodyLimitSignature** - Maximum allowed HTTP post body size for signature inspection for location HTTP\_POST\_BODY in the signatures, in bytes.

Note that the changes in value could impact CPU and latency profile.

Default value: 2048.

Minimum value: 0

Maximum Value: 4294967295

**fileUploadMaxNum** - Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads.

Default value: 65535

Minimum value: 0

Maximum value: 65535

**canonicalizeHTMLResponse** - Perform HTML entity encoding for any special characters in responses sent by your protected web sites.

Possible values: ON, OFF

Default value: ON

**percentDecodeRecursively** - Configure whether the application firewall should use percentage recursive decoding.

Possible values: ON, OFF

Default value: ON

**multipleHeaderAction** - One or more multiple header actions. Available settings function as follows:

- Block. Block connections that have multiple headers.
- Log. Log connections that have multiple headers.
- KeepLast. Keep only last header when multiple headers are present.

**inspectContentTypes** – One or more InspectContentType lists.

- application/x-www-form-urlencoded
- multipart/form-data
- text/x-gwt-rpc

Possible values: none, application/x-www-form-urlencoded, multipart/form-data, text/x-gwt-rpc

**semicolonFieldSeparator** - Allow ';' as a form field separator in URL queries and POST form bodies.

Possible values: ON, OFF

Default value: OFF

## Changing an Web App Firewall profile type

September 22, 2020

If you chose the wrong profile type for an Web App Firewall profile, or the type of content on the protected web site has changed, you can change the profile type.

**Note:** When you change the profile type, you lose all configuration settings and learned relaxations or rules for the features that the new profile type does not support. For example, if you change the profile type from Web 2.0 to XML, you lose any configuration options for Start URL, Form Field Consistency Check, and the other HTML-specific security checks. The configuration for any options that is supported by both the old and the new profile types remains unchanged.

### To change an Web App Firewall profile type by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> -type ( **HTML** | **XML** | **HTML XML** )`
- `save ns config`

## Example

The following example changes the type of a profile named pr-basic, from HTML to HTML XML, which is equivalent to the Web 2.0 type in the GUI.

```
1 set appfw profile pr-basic -type HTML XML
2 save ns config
3 <!--NeedCopy-->
```

## To change an Web App Firewall profile type by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Policies**.
2. In the details pane, click **Action**, and then **Change Profile Type**.
3. In the **Change Web App Firewall Profile Type** dialog box, **Profile Type** drop-down list, select a new profile type.
4. Click **OK** to save your changes and return to the **Profiles** pane.

## Exporting and importing an Web App Firewall profile

September 21, 2020

You can replicate the entire configuration of an Web App Firewall profile (including all bound objects, such as HTML error object, XML error object, WSDL or XML schema, signatures, and so on) across multiple appliances. You can select a target profile and export the configuration to save it in your computer's local file system, or you can transfer the archived configuration to store it on a server. Similarly, you can browse your computer's local file system or import the archive from the server to select a previously exported profile and import it into your NetScaler appliance.

The option to export the entire profile configuration and then import it into another appliance can be useful in various use cases. For example, you might want to configure an Web App Firewall profile in a test bed set-up to test and validate that it is working as expected. Once you are satisfied, you can export the profile and import the profile configuration to your production NetScaler appliances. This functionality is also useful for backing up your configuration. You can export the profile before making changes, so that you can easily roll back the configuration to a known state if necessary.

### Note

Web App Firewall profiles that are exported and archived from one build cannot be restored to a system running a different build, because changes introduced in the newer releases can lead to compatibility issues. If you attempt to restore an archived profile to a different build than the one from which it was exported, an error message is logged in ns.log.

The export and import profile functionality is available in both the GUI (GUI) and the command line interface (CLI). The GUI is recommended, because it offers easy to use **Action** options. With a click of a button you can **Export** or **Import** the entire configuration of a profile.

## Exporting Web App Firewall profiles with the CLI

If you use CLI to **export** a profile, you must **archive** the configuration and then **export** it. To **import** a profile, you must **import** the archive into the NetScaler appliance and then execute the **restore** command to extract the configuration. The following set of CLI commands can be used for exporting, importing and managing the profile configurations.

### CLI commands to export archives:

- `archive appfw profile <name> <archivename> [-comment <string>]`
- `export appfw archive <name> <target>`

### CLI commands to import archives:

- `import appfw archive <src> <name> [-comment <string>]`
- `restore appfw profile <archivename>`

### CLI commands to manage archives:

- `show appfw archive`
- `rm appfw archive <name>`

Exporting a profile from one appliance and importing it to another requires five steps in CLI. The first 3 steps are performed on the source appliance on which profile configuration is originally created, and the next 2 steps are performed on the target appliance on which the profile configuration is to be replicated.

### Export profile from the source NetScaler appliance:

**Step 1:** Create an archive of the configured profile.

**Step 2:** Export the archive to the NetScaler file system.

**Step 3:** Use a file transfer utility such as scp to transfer the exported archive file from NetScaler appliance A to the target NetScaler appliance.

### Import profile to the target NetScaler appliance:

**Step 4:** Execute the import command to import the archived file. You can import the archive from your NetScaler's local file system, or you can use HTTP or HTTPS protocol to import the archive from a server by using the URL.

**Step 5:** Execute the restore command to restore the profile configuration from the imported archive

### To export an Web App Firewall profile by using the command line interface:

First, **archive** the profile's configuration, and then **export** the archive to a target location. At the command prompt, type the following commands:

```
archive appfw profile <profileName> <archiveName>
```

where:

- <profileName> is the name of the profile to archive.
- <archiveName> is the name of the archive file to create.

Execution of the above command creates 2 instances of the archive file. One in /var/tmp folder and another in the /var/archive/appfw folder.

```
export appfw archive <archiveName> <target>
```

where:

- <archiveName> is the name of the archive to export. (The same name as in the previous command.)
- <target> is a file path starting with local: as the prefix, followed by <archiveName>.

Execution of the export command saves the exported archive file on the file system of your NetScaler appliance in the /var/tmp folder.

#### Examples:

```
> archive appfw profile test_pr archived_test_pr
```

```
> export appfw archive archived_test_pr local:dutA_test_pr
```

After the above two commands are executed, the /var/tmp folder contains the archived\_test\_pr file and the exported copy, dutA\_test\_pr, which are identical in size. From the CLI, you can drop into the shell to navigate to the folder to verify that these files are there.

After exporting the archive file, you can use **scp** or some other such file transfer utility to transfer a copy of the archive file from the NetScaler appliance on which they were created to your target NetScaler appliance.

### Importing Web App Firewall Profiles with the CLI

After you have successfully scp'd the archived file from the source appliance to the target appliance, you are ready to **import** the profile's archive, and then execute the **restore** command to replicate the profile's configuration on the target appliance.

Log onto the target appliance. Drop into the shell and cd to the /var/tmp folder to verify that the size of the scp'd file on this appliance matches the size of the original archived file on the source appliance. Exit the shell to return to the command line.

#### To import a profile by using the CLI:

At the command prompt, type the following commands:

```
import appfw archive <src> <name> [-comment <string>]
```

where

- <src> is the location of the archive file after it has been transferred from the source appliance on which it was created. You can use a local file system and file name. If you have placed the archive on a server, you can use a URL to import the archived file. If the path or file name contains spaces, enclose the URL in straight double quotation marks.
- <name> is the name of the archive file to be imported.
- <string> is an optional description of the purpose of the Archive.

```
restore appfw profile <archiveName>
```

#### Examples:

##### A. Import from local file followed by restore:

```
> import appfw archive local:dutA_test_pr dut2_test_pr  
> restore appfw profile dut2_test_pr
```

##### B. Import from URL followed by restore:

```
import appfw archive http://10.217.30.16/FFC/Profile_ImportExport/  
dutA_test_pr.tgz my_archive  
restore appfw profile my_archive
```

This example restores the test\_pr profile along with all bound objects (such as signatures, html error page, relaxation rules and so on) on the target NetScaler appliance.

You can use the following CLI commands to access man pages for additional details.

- man archive appfw profile
- man export appfw archive
- man import appfw archive
- man restore appfw profile
- man show appfw archive
- man rm appfw archive

## Exporting and Importing Web App Firewall Profiles with the GUI

The GUI is easier to use than the CLI. The utility performs both archive and export operations when you click **Export**. Similarly it executes both import and restore when you click **Import**. The GUI can access the local file system of the computer from which you access the utility. You can export a copy of the archive and save it on your local computer. You can then import this copy directly in the target appliance without having to manually transfer the archive file from one appliance to the other(s).

### To export an Web App Firewall profile by using the GUI:

1. Navigate to **Configuration > Security > Web App Firewall > Profiles**.
2. In the details pane, select a profile to export. Click **Actions** and select **Export** to download and save a copy in your computer's local file system.

### To import an Web App Firewall profile by using the GUI:

1. Navigate to **Configuration > Security > Web App Firewall > Profiles**.
2. In the details pane, click **Actions** and select **Import**. In the Import Web App Firewall Profile pane, the Import From\* selection box gives you 2 options:

**URL:** You can choose to import an archive by specifying a **URL**. When this option is selected, you must provide an absolute path for the archived file in the **URL** input box.

**File:** You can choose to import an archive from the local **File**. When this option is selected, a **Local File** selection field is displayed. You can browse your computer's local files to select the target archive file.

Click **Create** to import the specified archive. Successful completion of the import operation creates the profile configuration on the target appliance.

## Highlights

- You can replicate the entire configuration (including all import objects as well as configured relaxation rules for the profile) on multiple appliances, without needing to repeat configuration steps, by using export and import profile functionality.
- The imported objects, such as signatures, WSDL, Schema, error page and so on, are included in the archived tar file and replicated on the target appliance.
- Customized field types are included in the archived tar file and replicated on the target appliance.
- The policy bindings of the archived profile are not replicated when the configuration is restored. You must configure the policy and bind it to the profile after importing the profile to the appliance.
- The name of the archive file can be up to 31 character long. As with profile names, an archive name must begin with an alphanumeric character or underscore and contain only alphanumeric and underscore (\_), number (#), period (.), space ( ), colon (:), at (@), equals (=) or hyphen (-) characters.
- Comments associated with the archive should be descriptive enough to convey the purpose of the archived configuration. The maximum allowed length for a comment is 255 characters.
- The "clear config -force basic" command does not remove the archived profiles.
- The import and export profile functionality is supported in high availability (HA) deployments.

## Debugging Tips

- Monitor the `/var/log/ns.log` during command executions to see if there are any ERROR messages.
- Additional logs (`_restore.log`, `remove.log`, `import.log`) are generated in the `/var/tmp/` folder. They can help debug issues during the corresponding operations. When these logs reach one MB in size, the log messages are purged to shrink the log file to one fourth of the original size.
- If the import command fails when you are using the URL option instead of the local file system, verify that DNS name server and route settings are accurately configured.
- If you are using the HTTPS protocol to import the archive, the command might fail if the HTTPS server requires client certificate authentication.

## Configuring and using the Learning feature

October 26, 2021

The learning feature is a repetitive pattern filter that observes activity on a website or application protected by the Web App Firewall, to determine what constitutes normal activity on that website or application. It then generates a list of up to 2,000 suggested rules or exceptions (relaxations) for each security checks that include support for the learning feature. Users normally find it easier to configure relaxations by using the learning feature than by entering the necessary relaxations manually.

The security checks that support the learning feature are:

- Start URL check
- Cookie Consistency check
- Form Field Consistency check
- Field Formats check
- CSRF Form Tagging check
- HTML SQL Injection check
- HTML Cross-Site Scripting check
- XML Denial-of-Service check
- XML Attachment check
- Web Services Interoperability check

You perform two different types of activities when using the learning feature. First, you enable and configure the feature to use it. You can use learning on all traffic to your protected web applications, or you can configure a list of IPs (called the *Add Trusted Learning Clients* list) from which the learning feature must generate recommendations. Second, after the feature has been enabled and has processed a certain amount of traffic to your protected websites, you review the list of suggested rules and relaxations (learned rules) and mark each with one of the following designations:

- **Edit & Deploy.** The rule is pulled into the Edit dialog box so that you can modify it, and the modified form is deployed.
- **Deploy.** The unmodified learned rule is placed on the list of rules or relaxations for this security check.
- **Skip.** The learned rule is placed on a list of rules or relaxations that are not deployed. The learned rule is removed when skipped. However, as they are not added to relaxations, they might get learned again.

Learning is not performed only when relaxations are in place, except for field format rules. When rules are skipped, they are only removed from the learned database. As relaxations are not added, they might get learned again. When rules are deployed, they are removed from learned database and also relaxations are added for the rules. As relaxations are added, they would not be learned again. For field format protection, learning is performed irrespective of relaxations.

Although you can use the command line interface for basic configuration of the learning feature, the feature is designed primarily for configuration through the Web App Firewall wizard or the GUI. You can perform only limited configuration of the learning feature by using the command line.

The wizard integrates configuration of learning features with configuration of the Web App Firewall as a whole, and is therefore the easiest method for configuring this feature on a new Citrix ADC appliance or when managing a simple Web App Firewall configuration. The GUI visualizer and manual interface both provide direct access to all learned rules for all security checks, and are therefore often preferable when you must review learned rules for many security checks.

The learning database is limited to 20 MB in size, which is reached after approximately 2,000 learned rules or relaxations are generated per security check for which learning is enabled. If you do not regularly review and either approve or ignore learned rules and this limit is reached, an error is logged to the NetScaler log and no more learned rules are generated until you review the existing learned rules and relaxations.

If learning stops because the database has reached its size limit, you can restart learning either by reviewing the existing learned rules and relaxations or by resetting the learning data. After learned rules or relaxations are approved or ignored, they are removed from the database. After you reset the learning data, all existing learning data is removed from the database and it is reset to its minimum size. When the database falls below 20 MB in size, learning restarts automatically.

### **To configure the learning settings by using the command line interface**

Specify the Web App Firewall profile to be configured and, for each security check that you want to include in that profile, specify the minimum threshold or the percent threshold. The minimum threshold is an integer representing the minimum number of user sessions that the Web App Firewall must process before it learns a rule or relaxation (default: 1). The percent threshold is an integer representing the percentage of user sessions in which the Web App Firewall must observe a particular pattern

(URL, cookie, field, attachment, or rule violation) before it learns a rule or relaxation (default: 0). Use the following commands:

- `set appfw learningsettings <profileName> [-startURLMinThreshold <positive_integer>] [-startURLPercentThreshold <positive_integer>] [-cookieConsistencyMinThreshold <positive_integer>] [-cookieConsistencyPercentThreshold <positive_integer>] [-CSRFTagMinThreshold <positive_integer>] [-CSRFTagPercentThreshold <positive_integer>] [-fieldConsistencyMinThreshold <positive_integer>] [-fieldConsistencyPercentThreshold <positive_integer>] [-crossSiteScriptingMinThreshold <positive_integer>] [-crossSiteScriptingPercentThreshold <positive_integer>] [-SQLInjectionMinThreshold <positive_integer>] [-SQLInjectionPercentThreshold <positive_integer>] [-fieldFormatMinThreshold <positive_integer>] [-fieldFormatPercentThreshold <positive_integer>] [-XMLWSIMinThreshold <positive_integer>] [-XMLWSIPercentThreshold <positive_integer>] [-XMLAttachmentMinThreshold <positive_integer>] [-XMLAttachmentPercentThreshold <positive_integer>]`
- `save ns config`

### Example

The following example enables and configures the learning settings in the profile for the HTML SQL Injection security check. This is an appropriate initial test bed learning configuration, where you have complete control over the traffic that is sent to the Web App Firewall.

```
1 set appfw learningsettings pr-basic -SQLInjectionMinThreshold 10
2 set appfw learningsettings pr-basic -SQLInjectionPercentThreshold 70
3 save ns config
4 <!--NeedCopy-->
```

### To reset learning settings to their defaults by using the command line interface

To remove any custom configuration of the learning settings for the specified profile and security check, and return the learning settings to their defaults, at the command prompt type the following commands:

- `unset appfw learningsettings <profileName> [-startURLMinThreshold ] [-startURLPercentThreshold] [-cookieConsistencyMinThreshold] [-cookieConsistencyPercentThreshold] [-CSRFTagMinThreshold ] [-CSRFTagPercentThreshold ] [-fieldConsistencyMinThreshold ] [-fieldConsistencyPercentThreshold ] [-crossSiteScriptingMinThreshold ] [-crossSiteScriptingPercentThreshold ] [-SQLInjectionMinThreshold ] [-SQLInjectionPercentThreshold ] [-`

```
fieldFormatMinThreshold] [-fieldFormatPercentThreshold ] [-XMLWSIMinThreshold  
] [-XMLWSIPercentThreshold ] [-XMLAttachmentMinThreshold ] [-XMLAttachmentPercent  
]
```

- `save ns config`

### To display the learning settings for a profile by using the command line interface

At the command prompt, type the following command:

```
show appfw learningsettings <profileName>
```

### To display unreviewed learned rules or relaxations for a profile by using the command line interface

At the command prompt, type the following command:

```
show appfw learningdata <profileName> <securityCheck>
```

### To remove specific unreviewed learned rules or relaxations from the learning database by using the command line interface

At the command prompt, type the following command:

```
rm appfw learningdata <profileName> (-startURL <expression> | -cookieConsistency  
<string> | (-fieldConsistency <string> <formActionURL>)| (-crossSiteScripting  
<string> <formActionURL>)| (-SQLInjection <string> <formActionURL>)| (-  
fieldFormat <string><formActionURL>)| (-CSRFtag <expression> <CSRFFormOriginURL  
>)| -XMLDoSCheck <expression> | -XMLWSICheck <expression> | -XMLAttachmentCheck  
<expression>)[-TotalXMLRequests]
```

### Example

The following example removes all unreviewed learned relaxations for the profile, HTML SQL Injection security check, that apply to the **LastName form** field.

```
1 rm appfw learningdata pr-basic -SQLInjection LastName  
2 <!--NeedCopy-->
```

### To remove all unreviewed learned data by using the command line interface

At the command prompt, type the following command:

```
reset appfw learningdata
```

## To export learning data by using the command line interface

At the command prompt, type the following command:

```
export appfw learningdata <profileName> <securitycheck>[-target <string>]
```

### Example

The following example exports learned relaxations for the profile and the HTML SQL Injection security check to a comma-separated values (CSV) format file in the `/var/learned_data/` directory under the file name specified in the `-target` parameter.

```
1 export appfw learningdata pr-basic SQLInjection -target sqli_ld
2 <!--NeedCopy-->
```

## To configure the Learning feature by using the GUI

1. Navigate to **Security > Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. Click **Learnt Rules** under **Advanced Settings** section.
4. In the **Learnt Rules** section, select a security check and click **Settings**.
5. In the **Security Check Settings** page, set the following parameters:
  - a) **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1
  - b) **Percentage of times threshold.** Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0
6. Click **OK** and **Close**.

### Dynamic Profiling & Learning Rules Settings Page

7. Click **Remove All Learned Data** to remove all learned data and reset the learning feature, so that it must start its observations again from the beginning.

**Note:**

This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.

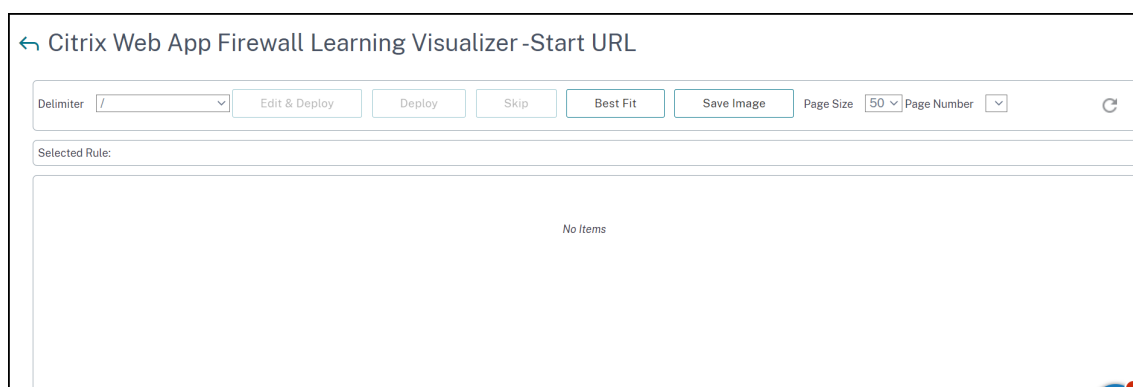

8. To restrict the learning engine to traffic from a specific set of IPs, click **Trusted Learning Clients**, and add the IP addresses that you want to use to the list.
  - a) To add an IP address or IP address range to the Trusted Learning Clients list, click **Add**.
  - b) In the **Add Trusted Learning Clients** dialog box, Trusted Clients IP list box, type the IP address or an IP address range in CIDR format.
  - c) In the Comments text area, type a comment that describes this IP address or range.
  - d) Click **Create** to add your new IP address or range to the list.
  - e) To modify an existing IP address or range, click the IP address or range, and then click **Open**. Except for the name, the dialog box that appears is identical to the **Add Trusted Learning Clients** dialog box.
  - f) To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click **Disable or Enable**, as appropriate.
  - g) To remove an IP address or range completely, click the IP address or range, and then click **Remove**.
9. Click **Close** to return to the Configure Web App Firewall Profile page.

10. Click **Done**.

### To review learned rules or relaxations by using the GUI

1. Navigate to **Security > Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. Click **Learnt Rules** under **Advanced Settings** section.
4. In the **Learnt Rules** section, select a security check and click **Settings**.
5. To review the learned data hierarchically as a branching tree, enabling you to choose general patterns that match many of the learned patterns, click **Visualizer**.
6. If you have chosen to review actual learned patterns, perform the following steps.
7. Select the first learned relaxation and choose how to handle it.
  - a) To modify and then accept the relaxation, click **Edit & Deploy**, edit the relaxation regular expression, and then click **OK**.
  - b) To accept the relaxation without modifications, click **Deploy**.
  - c) To remove the relaxation from the list without deploying it, click **Skip**.
  - d) Repeat the previous step to review each additional learned relaxation.
8. Click **Close** to return to the **Manage Learned Rules** dialog box.
9. Click **Done**.

## Supplemental Information about profiles

September 21, 2020

Following is supplemental information about particular aspects of Web App Firewall profiles. This information explains how to include special characters in a security check rule or relaxation, and how to use variables when configuring profiles.

## Configuration variable support

Instead of using static values, to configure the Web App Firewall's security checks and settings, you can now use standard Citrix ADC named variables. By creating variables, you can more easily export and then import configurations to new Citrix ADC appliances, or update existing Citrix ADC appliances from a single set of configuration files. This simplifies updates when you use a test bed setup to develop a complex Web App Firewall configuration that is tuned for your local network and servers and then transfer that configuration to your production Citrix ADC appliances.

You create Web App Firewall configuration variables in the same manner as you do any other Citrix ADC named variables, following standard Citrix ADC conventions. To create a named expression variable by using the GUI, you use the [Add Expression dialog box](#). To create a named expression variable by using the Citrix ADC command line, you use the add expression command followed by the appropriate parameter.

The following URLs and expressions can be configured with variables instead of static values:

- **Start URL** (-starturl)
- **Deny URL** (-denyurl)
- **Form Action URL** for *Form Field Consistency Check* (-fieldconsistency)
- **Action URL** for *XML SQL Injection Check* (-xmlSQLInjection)
- **Action URL** for *XML Cross-Site Scripting Check* (-xmlXSS)
- **Form Action URL** for *HTML SQL Injection Check* (-sqlInjection)
- **Form Action URL** for *Field Format Check* (-fieldFormat)
- **Form Origin URL** and **Form Action URL** for *Cross-Site Request Forgery (CSRF) Check* (-csrfTag)
- **Form Action URL** for *HTML Cross-Site Scripting Check* (-crossSiteScripting)
- **Safe Object** (-safeObject)
- **Action URL** for *XML Denial-of-Service (XDoS) check* (-XMLDoS)
- **URL** for *Web Services Interoperability check* (-XMLWSIURL)
- **<URL** for *XML Validation check* (-XMLValidationURL)
- **URL** for *XML Attachment check* (-XMLAttachmentURL)

For more information, see "[Policies and Expressions](#)."

To use a variable in the configuration, you enclose the variable name between two at (@) symbols and then use it exactly as you would the static value that it replaces. For example, if you are configuring the Deny URL check by using the GUI and want to add the named expression variable myDenyURL to the configuration, you would type @myDenyURL@ into the Add Deny URL dialog box, Deny URL text area. To do the same task by using the Citrix ADC command line, you would type add appfw profile <name> -denyURLAction @myDenyURL@.

## PCRE character encoding format

The Citrix ADC operating system supports direct entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your Web App Firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular expression.

A number of character types require encoding using a PCRE regular expression if you include them in your Web App Firewall configuration as a URL, form field name, or Safe Object expression. They include:

- **Upper-ASCII characters.** Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.
- **Double-Byte characters.** Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.
- **ASCII control characters.** Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters should never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The Citrix ADC appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, “English US,” the Web App Firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set. This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.
- **Chinese Traditional (Big5).** The Web App Firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.
- **Chinese Simplified (GB2312).** The Web App Firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
- **Japanese (SJIS).** The Web App Firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.

- **Japanese (EUC-JP).** The Web App Firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.
- **Korean (EUC-KR).** The Web App Firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.
- **Turkish (ISO-8859-9).** The Web App Firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.
- **Unicode (UTF-8).** The Web App Firewall supports certain additional characters in the UTF-8 character set, including those used in modern Russian.

When configuring the Web App Firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which are assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8 character set. For example, the exclamation point (!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the Web App Firewall configuration is “xNN” for ASCII characters; “\xNN\xNN” for non-ASCII characters used in English, Russian, and Turkish; and “\xNN\xNN\xNN” for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in an Web App Firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

**Note:**

Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character’s UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as x20 to avoid confusing certain browsers and web server software.

Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the Web App Firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

Actual URL: <http://www.josénuñez.com>

Encoded URL: `^http://www\[.\]jos\xC3\xA9nu\xC3\xB1ez\[.\]com$`

- Another URL containing extended ASCII characters.

Actual URL: <http://www.example.de/trömsö.html>

Encoded URL: `^http://www[.]example\[.]de/tr\xC3\xB6mso[.]html$`

- A form field name containing extended ASCII characters.

Actual Name: `nome_do_usuario`

Encoded Name: `^nome_do_usu\xC3\xA1rio$`

- A safe object expression containing extended ASCII characters.

Unencoded Expression `[A-Z]{3,6}\d{1-9}[0-9]{6,6}`

Encoded Expression: `[A-Z]{3,6}\xC2\xA5[1-9][0-9]{6,6}`

You can find a number of tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful web site that contains this information is located at the following URL:

```
1 http://www.utf8-chartable.de/unicode-utf8-table.pl
2 <!--NeedCopy-->
```

For the characters in the table on this web site to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of web pages will be correct.

## Inverted PCRE Expressions

In addition to matching content that contains a pattern, you can match content that does not contain a pattern by using an inverted PCRE expression. To invert an expression, you simply include an exclamation point (!) followed by white space as the first character in the expression.

**Note:** If an expression consists only of an exclamation point with nothing following, the exclamation point is treated as a literal character, not syntax indicating an inverted expression.

The following Web App Firewall commands support inverted PCRE expressions:

- Start URL (URL)
- Deny URL (URL)
- Form Field Consistency (form action URL)
- Cookie Consistency (form action URL)
- Cross Site Request Forgery (CSRF) (form action URL)
- HTML Cross-site Scripting (form action URL)
- Field Format (form action URL)
- Field Type (type)
- Confidential Field (URL)

Note: If the security check contains an isRegex flag or check box, it must be set to YES or checked to enable regular expressions in the field. Otherwise the contents of that field are treated as literal and no regular expressions (inverted or not) are parsed.

### **Disallowed Names for Web App Firewall Profiles**

The following names are assigned to built-in actions and profiles on the Citrix ADC appliance, and cannot be used as names for a user-created Web App Firewall profile.

- AGRESSIVE
- ALLOW
- BASIC
- CLIENTAUTH
- COMPRESS
- CSSMINIFY
- DEFLATE
- DENY
- DNS-NOP
- DROP
- GZIP
- HTMLMINIFY
- IMGOPTIMIZE
- JSMINIFY
- MODERATE
- NOCLIENTAUTH
- NOCOMPRESS
- NONE
- NOOP
- NOREWRITE
- RESET
- SETASLEARNNSLOG\_ACT
- SETNSLOGPARAMS\_ACT
- SETSYSLOGPARAMS\_ACT
- SETTMSSESSPARAMS\_ACT
- SETVPNPARAMS\_ACT
- SET\_PREAUTHPARAMS\_ACT
- default\_DNS64\_action
- dns\_default\_act\_Cachebypass
- dns\_default\_act\_Drop
- nshttp\_default\_profile

- nshttp\_default\_strict\_validation
- nstcp\_default\_Mobile\_profile
- nstcp\_default\_XA\_XD\_profile
- nstcp\_default\_profile
- nstcp\_default\_tcp\_interactive\_stream
- nstcp\_default\_tcp\_lan
- nstcp\_default\_tcp\_lan\_thin\_stream
- nstcp\_default\_tcp\_lfp
- nstcp\_default\_tcp\_lfp\_thin\_stream
- nstcp\_default\_tcp\_lnp
- nstcp\_default\_tcp\_lnp\_thin\_stream
- nstcp\_internal\_apps

## Policy labels

September 22, 2020

A policy label consists of a set of policies, other policy labels, and virtual server-specific policy banks. The Web App Firewall evaluates each policy bound to the policy label in order of priority. If the policy matches, it filters the connection as specified in the associated profile. Then it does whatever the Goto parameter specifies, which can be to terminate policy evaluation, go to the next policy, or go to the policy with the specified priority. If the Invoke parameter is set, it terminates processing of the current policy label and begins to process the specified policy label or virtual server.

### To create an Web App Firewall policy label by using the command line

At the command prompt, type the following commands:

- `add appfw policylabel <labelName> http_req`
- `save ns config`

### Example

The following example creates a policy label named policylbl1.

```
1 add appfw policylabel policylbl1 http_req
2 save ns config
3 <!--NeedCopy-->
```

## To bind a policy to a policy label by using the command line

At the command prompt, type the following commands:

- `bind appfw policylabel <labelName> <policyName> <priority> [<gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]`
- `save ns config`

### Example

The following example binds the policy `policy1` to the policy label `policylbl1` with a priority of 1.

```
1 bind appfw policylabel policylbl1 policy1 1
2 save ns config
3 <!--NeedCopy-->
```

## To configure an Web App Firewall policy label by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Policy Labels**.
2. In the details pane, do one of the following:
  - To add a new policy label, click **Add**.
  - To configure an existing policy label, select the policy label and the click **Open**.

The **Create Web App Firewall Policy Label** or the **Configure Web App Firewall Policy Label** dialog box opens. The dialog boxes are nearly identical.

3. If you are creating a new policy label, in the Create Web App Firewall Policy Label dialog box, type a name for your new policy label.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (\_) symbols.

4. Select **Insert Policy** to insert a new row and display a drop-down list with all existing Web App Firewall policies.
5. Select the policy you want to bind to the policy label, or select New Policy to create a new policy and follow the instructions in [To create and configure a policy by using the GUI](#). The policy that you selected or created is inserted into the list of globally bound Web App Firewall policies.
6. Make any additional adjustments.
  - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.

- To modify the policy expression, double click that field to open the Configure Web App Firewall Policy dialog box, where you can edit the policy expression.
  - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
  - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression
7. Repeat steps 5 through 7 to bind any additional Web App Firewall policies you want to the policy label.
  8. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that you have successfully created or modified the policy label.

## Policies

September 21, 2020

The Web App Firewall uses two types of policies: firewall policies and auditing policies. Firewall policies control which traffic is sent to the Web App Firewall. Auditing policies control the log server to which Web App Firewall logs are sent.

Firewall policies can be complex because the policy rule can consist of multiple expressions in the Citrix ADC expressions language, which is a full-fledged object oriented programming language capable of defining with extreme precision exactly which connections to filter. Because firewall policies operate within the context of the Web App Firewall, they must meet certain criteria that are connected to how the Web App Firewall functions and what traffic is appropriately filtered by it. As long as you keep these criteria in mind, however, firewall policies are similar to policies for other Citrix ADC features. The instructions here do not attempt to cover all aspects of writing firewall policies, but only provide an introduction to policies and cover those criteria that are unique to the Web App Firewall.

Auditing policies are simple because the policy rule is always `ns_true`. You need only specify the log server that you want to send logs to, the logging levels that you want to use, and a few other criteria that are explained in detail.

## Web App Firewall Policies

September 21, 2020

A firewall policy is a rule associated with a profile. The rule is an expression or group of expressions that define the types of request/response pairs that the Web App Firewall is to filter by applying the

profile. Firewall policy expressions are written in the Citrix ADC expressions language, an object-oriented programming language with special features to support specific Citrix ADC functions. The profile is the set of actions that the Web App Firewall is to use to filter request/response pairs that match the rule.

Firewall policies enable you to assign different filtering rules to different types of web content. Not all web content is alike. A simple web site that uses no complex scripting and accesses and handles no private data might require only the level of protection provided by a profile created with basic defaults. Web content that contains JavaScript-enhanced web forms or accesses an SQL database probably requires more tailored protection. You can create a different profile to filter that content and create a separate firewall policy that can determine which requests are attempting to access that content. You then associate the policy expression with a profile you created and globally bind the policy to put it into effect.

The Web App Firewall processes only HTTP connections, and therefore uses a subset of the overall Citrix ADC expressions language. The information here is limited to topics and examples that are likely to be useful when configuring the Web App Firewall. Following are links to additional information and procedures for firewall policies:

- For procedures that explain how to create and configure a policy, see [Creating and Configuring Web App Firewall Policies](#).
- For a procedure that explains in detail how to create a policy rule (expression), see [To create or configure an Web App Firewall rule \(expression\)](#).
- For a procedure that explains how to use the Add Expression dialog box to create a policy rule, see [To add a firewall rule \(expression\) by using the Add Expression dialog box](#).
- For a procedure that explains how to view the current bindings for a policy, see [Viewing a Firewall Policy's Bindings](#).
- For procedures that explain how to bind an Web App Firewall policy, see [Binding Web App Firewall Policies](#).
- For detailed information about the Citrix ADC expressions language, see [Policies and Expressions](#).

**Note**

Web App Firewall evaluates the policies based on the configured priority and goto expressions. At the end of the policy evaluation, the last policy that evaluates to true is used and the security configuration of the corresponding profile is invoked for processing the request.

For example, Consider a scenario where there are 2 policies.

- Policy\_1 is a generic policy with Expression=ns\_true and has a corresponding profile\_1 which is a basic profile. The priority is set to 100.
- Policy\_2 is more specific with Expression=HTTP.REQ.URL.CONTAINS("XYZ") and has a cor-

responding profile\_2 which is an advance profile. The GoTo Expression is set to NEXT and the priority is set to 95 which is a higher priority compared to Policy\_1.

In this scenario, if the target string “XYZ” is detected in the URL of the processed request, Policy\_2 match is triggered as it has a higher priority even though Policy\_1 is also a match. However, as per the GoTo expression configuration of Policy\_2, the policy evaluation continues and the next policy Policy\_1 is also processed. At the end of the policy evaluation, Policy\_1 evaluates as true and the basic security checks configured in Profile\_1 are invoked.

If the Policy\_2 is modified and the GoTo Expression is changed from

**NEXT** to

**END**, the processed request that has the target string “XYZ”, triggers the Policy\_2 match due to priority consideration and as per the GoTo expression configuration, the policy evaluation ends at this point. Policy\_2 evaluates as true and the advanced security checks configured in Profile\_2 are invoked.

**NEXT**

**END**

Policy evaluation is completed in one pass. Once the policy evaluation is completed for the request and the corresponding profile actions are invoked, the request does not go through another round of policy evaluation.

## Creating and configuring Web App Firewall policies

September 1, 2021

A firewall policy consists of two elements: a *rule*, and an associated *profile*. The rule selects the HTTP traffic that matches the criteria that you set, and sends that traffic to the Web App Firewall for filtering. The profile contains the filtering criteria that the Web App Firewall uses.

The policy rule consists of one or more expressions in the Citrix ADC expressions language. The Citrix ADC expressions syntax is a powerful, object-oriented programming language that enables you to precisely designate the traffic that you want to process with a specific profile. For users who are not completely familiar with the Citrix ADC expressions language syntax, or who prefer to configure their Citrix ADC appliance by using a web-based interface, the GUI provides two tools: the Prefix menu and the Add Expression dialog box. Both help you to write expressions that select exactly the traffic that you want to process. Experienced users who are thoroughly familiar with the syntax may prefer to use the Citrix ADC command line to configure their Citrix ADC appliances.

**Note:** In addition to the default expressions syntax, for backward compatibility the Citrix ADC operating system supports the Citrix ADC classic expressions syntax on Citrix ADC Classic and

nCore appliances and virtual appliances. Classic expressions are not supported on Citrix ADC Cluster appliances and virtual appliances. Current Citrix ADC users who want to migrate existing configurations to the Citrix ADC Cluster must migrate any policies that contain classic expressions to the default expressions syntax.

For detailed information about the Citrix ADC expressions languages, see [“Policies and Expressions.”](#)

You can create a firewall policy by using the GUI or the Citrix ADC command line.

### To create and configure a policy by using the command line interface

At the command prompt, type the following commands:

- `add appfw policy <name><rule> <profileName>`
- `save ns config`

#### Example

The following example adds a policy named pl-blog, with a rule that intercepts all traffic to or from the host blog.example.com, and associates that policy with the profile pr-blog. This is an appropriate policy to protect a blog hosted on a specific hostname.

```
1 add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com  
   ")" pr-blog  
2 <!--NeedCopy-->
```

### To create and configure a policy by using the GUI

1. Navigate to **Security > Web App Firewall > Policies**.
2. In the details pane, do one of the following:
  - To create a new firewall policy, click **Add**. The **Create Web App Firewall Policy** is displayed.
  - To edit an existing firewall policy, select the policy, and then click **Edit**.

The **Create Web App Firewall Policy** or **Configure Web App Firewall Policy** is displayed.

3. If you are creating a new firewall policy, in the **Create Web App Firewall Policy** dialog box, Policy Name text box, type a name for your new policy.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (\_) symbols.

If you are configuring an existing firewall policy, this field is read-only. You cannot modify it.

4. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a new profile to associate with your policy by clicking **New**, and you can modify an existing profile by clicking **Modify**.
5. In the Expression text area, create a rule for your policy.
  - You can type a rule directly into the text area.
  - You can click **Prefix** to select the first term for your rule, and follow the prompts.
  - You can click **Add** to open the Add Expression dialog box, and use it to construct the rule.
6. Click **Create** or **OK**, and then click **Close**.

### To create or configure an Web App Firewall rule (expression)

The policy rule, also called the *expression*, defines the web traffic that the Web App Firewall filters by using the profile associated with the policy. Like other Citrix ADC policy rules (or *expressions*), Web App Firewall rules use Citrix ADC expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the **Web App Firewall** wizard or the Citrix ADC GUI to create your policy rule:
  - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall Wizard**, and then navigate to the **Specify Rule** screen.
  - If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a new policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, the **Create Web App Firewall Profile** dialog box, or the **Configure Web App Firewall Profile** dialog box, click **Prefix**, and then choose the prefix for your expression from the drop-down list. Your choices are:
  - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - **SYS**. The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - **CLIENT**. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
  - **SERVER**. The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

After you choose a prefix, the Web App Firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means

at the bottom.

3. Choose your next term.

If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The Web App Firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you have decided which term you want, double-click it to insert it into the **Expression** window.

4. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.

5. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished.

Following are some examples of expressions for specific purposes.

- **Specific web host.** To match traffic from a particular web host:

```
1 HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
2 <!--NeedCopy-->
```

For shopping.example.com, substitute the name of the web host that you want to match.

- **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

```
1 HTTP.REQ.URL.STARTSWITH("https://www.example.com/folder")
2 <!--NeedCopy-->
```

For www.example.com, substitute the name of the web host. For folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

- **Specific type of content: GIF images.** To match GIF format images:

```
1 HTTP.REQ.URL.ENDSWITH(".png")
2 <!--NeedCopy-->
```

To match other format images, substitute another string in place of .png.

- **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

```
1 HTTP.REQ.URL.STARTSWITH("https://www.example.com/CGI-BIN")
2 <!--NeedCopy-->
```

To match all JavaScripts with .js extensions:

```
1 HTTP.REQ.URL.ENDSWITH(".js")
2 <!--NeedCopy-->
```

For more information about creating policy expressions, see “[Policies and Expressions](#).”

**Note:** If you use the command line to configure a policy, remember to escape any double quotation marks within Citrix ADC expressions. For example, the following expression is correct if entered in the GUI:

```
1 HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
2 <!--NeedCopy-->
```

If entered at the command line, however, you must type this instead:

```
1 HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
2 <!--NeedCopy-->
```

## To add a firewall rule (expression) by using the Add Expression dialog box

The Add Expression dialog box (also referred to as the Expression Editor) helps users who are not familiar with the Citrix ADC expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the **Web App Firewall** wizard or the Citrix ADC GUI:
  - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall Wizard**, and then navigate to the **Specify Rule** screen.
  - If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a new policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, in the **Create Web App Firewall Profile** dialog box, or in the **Configure Web App Firewall Profile** dialog box, click **Add**.
3. In the **Add Expression dialog** box, in the Construct Expression area, in the first list box, choose one of the following prefixes:
  - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.

- **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
  - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the Web App Firewall treats requests and associated responses as a single unit and filters both, you do not need to specific responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the **Preview Expression** window displays your expression.
  5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The **Preview Expression** window updates to display the expression as you have specified it to that point.
  6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or additional terms that you added after the term that you modified are cleared.
  7. When you have finished constructing your expression, click **OK** to close the **Add Expression** dialog box. Your expression is inserted into the **Expression** text area.

## Binding Web App Firewall policies

September 21, 2020

After you have configured your Web App Firewall policies, you bind them to Global or a bind point to put them into effect. After binding, any request or response that matches an Web App Firewall policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the Citrix ADC OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the Web App Firewall feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you configure the Web App Firewall to perform it only if other policies with a higher priority do not match a request. If you give

your first policy a high priority (such as 1), you configure the Web App Firewall to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you bind your policies.

For more information about binding policies on the Citrix ADC appliance, see [“Policies and Expressions.”](#)

### **To bind an Web App Firewall policy by using the command line interface**

At the command prompt, type the following commands:

- `bind appfw global <policyName>`
- `bind appfw profile <profile_name> -crossSiteScripting data`

#### **Example**

The following example binds the policy named pl-blog and assigns it a priority of 10.

```
1 bind appfw global pl-blog 10
2 save ns config
3 <!--NeedCopy-->
```

### **Configure log expressions**

The log expression support for binding Web App Firewall is added to log HTTP header information when a violations occurs.

Log expression is binded at the Application profile, and binding contains the expression that needs to be evaluated and sent to logging frameworks when violation occurs.

The Web App Firewall violation log record with http header information is recorded. You can specify a custom log expression and it helps in analysis and diagnosis when violations are generated for the current flow (request/response).

#### **Example configuration**

```
1 bind appfw profile <profile> -logexpression <string> <expression>
2 add policy expression headers "\" HEADERS(100):\"+HTTP.REQ.FULL_HEADER"
3 add policy expression body_100 "\"BODY:\"+HTTP.REQ.BODY(100)"
4 bind appfw profile test -logExpression log_body body_100
5 bind appfw profile test -logExpression log_headers headers
```

```
6 bind appfw profile test -logExpression "\"URL:\"+HTTP.REQ.URL+\\" IP:\\"+
  CLIENT.IP.SRC"
7 <!--NeedCopy-->
```

```

**Note**

1. Only auditlog support is available. Support for logstream and visibility in security insight would be added in future release versions.
2. If auditlogs are generated, then only 1024 bytes of data can be generated per log message.
3. If log streaming is used, then the limits are based on maximum supported size of log stream/ipfix protocol size limitations. Maximum support size for log stream is larger than 1024 bytes.

**To bind an Web App Firewall policy by using the GUI**

1. Do one of the following:
  - Navigate to **Security > Web App Firewall**, and in the details pane, click Web App Firewall policy manager.
  - Navigate to **Security > Web App Firewall > Policies > Firewall Policies**, and in the details pane, click **Policy Manager**.
2. In the **Web App Firewall Policy Manager** dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:
  - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance, and are applied before any other policies.
  - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
  - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
  - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the Citrix ADC appliance.
  - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
  - **None.** Do not bind the policy to any bind point.
3. Click **Continue**. A list of existing Web App Firewall policies appears.
4. Select the policy you want to bind by clicking it.
5. Make any additional adjustments to the binding.

- To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
  - To modify the policy expression, double click that field to open the **Configure Web App Firewall Policy** dialog box, where you can edit the policy expression.
  - To set the Goto Expression, double click **field** in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
  - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression
6. Repeat steps 3 through 6 to add any additional Web App Firewall policies you want to globally bind.
  7. Click **OK**. A message appears in the status bar, stating that the policy has been successfully bound.

## Viewing a policy bindings

September 22, 2020

You can quickly check to determine what bindings are in place for any firewall policy by viewing the bindings in the GUI.

### To view bindings for an Web App Firewall policy

1. Navigate to **Security > Citrix Web App Firewall > Policies > Firewall Policies**
2. In the details pane, select the policy that you want to check, and then click Show Bindings. The Binding Details for Policy: Policy message box is displayed, with a list of bindings for the selected policy.
3. Click **Close**.

## Supplemental information about Web App Firewall policies

September 21, 2020

Following is supplemental information about particular aspects of Web App Firewall policies that system administrators who manage the Web App Firewall might need to know.

## Correct but unexpected behavior

Web application security and modern web sites are complex. In a number of scenarios, a Citrix ADC policy might cause the Web App Firewall to behave differently in certain situations than a user who is familiar with policies would normally expect. Following are a number of cases where the Web App Firewall may behave in an unexpected fashion.

- **Request with a missing HTTP Host header and an absolute URL.** When a user sends a request, in the majority of cases the request URL is relative. That is, it takes as its starting point the Referer URL, the URL where the user's browser is located when it sends the request. If a request is sent without a Host header, and with a relative URL, the request is normally blocked both because it violates the HTTP specification and because a request that fails to specify the host could under some circumstances constitute an attack. If a request is sent with an absolute URL, however, even if the Host header is missing, the request bypasses the Web App Firewall and is forwarded to the web server. Although such a request violates the HTTP specification, it poses no possible threat because an absolute URL contains the host.

## Auditing policies

September 21, 2020

Auditing policies determine the messages that are generated and logged during an Web App Firewall session. These messages are logged in SYSLOG format to the local NSLOG server or to an external logging server. Different types of messages are logged on the basis of the level of logging selected.

To create an auditing policy, you must first create either an NSLOG server or a SYSLOG server. After specifying the server, you create the policy and specify the type of log and the server to which logs are sent.

### To create an auditing server by using the command line interface

You can create two different types of auditing server: an NSLOG server or a SYSLOG server. The command names are different, but the parameters for the commands are the same.

To create an auditing server, at the command prompt, type the following commands:

- `add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-dateFormat ( MMDDYYYY | DDMMYYYY )] [-logFacility <logFacility>] [-tcp ( NONE | ALL )] [-acl ( ENABLED | DISABLED )] [-timeZone ( GMT_TIME | LOCAL_TIME )] [-userDefinedAuditlog ( YES | NO )] [-appflowExport ( ENABLED | DISABLED )]`
- `save ns config`

### Example

The following example creates a syslog server named `syslog1` at IP `10.124.67.91`, with loglevels of emergency, critical, and warning, log facility set to `LOCAL1`, that logs all TCP connections:

```
1 add audit syslogAction syslog1 10.124.67.91 -logLevel emergency
   critical warning -logFacility
2 LOCAL1 -tcp ALL
3 save ns config
4 <!--NeedCopy-->
```

### To modify or remove an auditing server by using the command line interface

- To modify an auditing server, type the `set audit <type>` command, the name of the auditing server, and the parameters to be changed, with their new values.
- To remove an auditing server, type the `rm audit <type>` command and the name of the auditing server.

### Example

The following example modifies the syslog server named `syslog1` to add errors and alerts to the log level:

```
1 set audit syslogAction syslog1 10.124.67.91 -logLevel emergency
   critical warning alert error
2 -logFacility LOCAL1 -tcp ALL
3 save ns config
4 <!--NeedCopy-->
```

### To create or configure an auditing server by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Policies > Auditing > Nslog**.
2. In the Nslog Auditing page, click **Servers** tab.
3. Do one of the following:
  - To add a new auditing server, click **Add**.
  - To modify an existing auditing server, select the server, and then click **Edit**.
4. In the **Create Auditing Server** page, set the following parameters:
  - Name
  - Server Type

- IP Address
- Port
- Log Levels
- Log Facility
- Date Format
- Time Zone
- TCP Logging
- ACL Logging
- User Configurable Log Messages
- AppFlow Logging
- Large Scale NAT Logging
- ALG messages logging
- Subscriber logging
- SSL Interception
- URL Filtering
- Content Inspection Logging

5. Click **Create** and **Close**.

## To create an auditing policy by using the command line interface

You can create an NSLOG policy or a SYSLOG policy. The type of policy must match the type of server. The command names for the two types of policy are different, but the parameters for the commands are the same.

At the command prompt, type the following commands:

- `add audit syslogPolicy <name> <-rule > <action>`
- `save ns config`

### Example

The following example creates a policy named `syslogP1` that logs Web App Firewall traffic to a syslog server named `syslog1`.

```
1 add audit syslogPolicy syslogP1 rule "ns_true" action syslog1
2 save ns config
3 <!--NeedCopy-->
```

## To configure an auditing policy by using the command line interface

At the command prompt, type the following commands:

- `set audit syslogPolicy <name> [-rule <expression>] [-action <string>]`
- `save ns config`

### Example

The following example modifies the policy named `syslogP1` to log Web App Firewall traffic to a syslog server named `syslog2`.

```
1 set audit syslogPolicy syslogP1 rule "ns_true" action syslog2
2 save ns config
3 <!--NeedCopy-->
```

## To configure an auditing policy by using the GUI

1. Navigate to **Security > Citrix Web App Firewall > Policies**.
2. In the details pane, click **Audit Nslog Policy**.
3. In the Nslog Auditing page, click **Policies** tab and do one of the following:
  - To add a new policy, click **Add**.

- To modify an existing policy, select the policy, and then click **Edit**.
4. In the **Create Auditing Nslog Policy** page, set the following parameters:
    - Name
    - Auditing Type
    - Expression Type
    - Server
  5. Click **Create**.

## Imports

September 21, 2020

Several Web App Firewall features make use of external files that you upload to the Web App Firewall when configuring it. Using the GUI, you manage those files in the Imports pane, which has four tabs corresponding to the four types of files you can import: HTML error objects, XML error objects, XML schemas, and Web Services Description Language (WSDL) files. Using the Citrix ADC command line, you can import these types of files, but you cannot export them.

## HTML error object

When a user's connection to an HTML or Web 2.0 page is blocked, or a user asks for a non-existent HTML or Web 2.0 page, the Web App Firewall sends an HTML-based error response to the user's browser. When configuring which error response the Web App Firewall should use, you have two choices:

- You can configure a redirect URL, which can be hosted on any Web server to which users also have access. For example, if you have a custom error page on your Web server, 404.html, you can configure the Web App Firewall to redirect users to that page when a connection is blocked.
- You can configure an HTML error object, which is an HTML-based Web page that is hosted on the Web App Firewall itself. If you choose this option, you must upload the HTML error object to the Web App Firewall. You do that in the Imports pane, on the HTML Error Object tab.

The error object must be a standard HTML file that contains no non-HTML syntax except for Web App Firewall error object customization variables. It cannot contain any CGI scripts, server-parsed code, or PHP code. The customization variables enable you to embed troubleshooting information in the error object that the user receives when a request is blocked. While most requests that the Web App Firewall blocks are illegitimate, even a properly configured Web App Firewall can occasionally block legitimate requests, especially when you first deploy it or after you make significant changes to your protected Web sites. By embedding information in the error page, you provide the user with the information that he or she needs to give to the technical support person so that any issues can be fixed.

The Web App Firewall error page customization variables are:

- `#{NS_TRANSACTION_ID}`. The transaction ID that the Web App Firewall assigned to this transaction.
- `#{NS_APPFW_SESSION_ID}`. The Web App Firewall session ID.
- `#{NS_APPFW_VIOLATION_CATEGORY}`. The specific Web App Firewall security check or rule that was violated.
- `#{NS_APPFW_VIOLATION_LOG}`. The detailed error message associated with the violation.
- `#{COOKIE}` The contents of the specified cookie. For `<CookieName>`, substitute the name of the specific cookie that you want to display on the error page. If you have multiple cookies whose contents you want to display for troubleshooting, you can use multiple instances of this customization variable, each with the appropriate cookie name.

**Note:** If you have blocking enabled for the Cookie Consistency Check, any blocked cookies are not displayed on the error page because the Web App Firewall blocks them.

To use these variables, you embed them in the HTML or XML of the error page object as if they were an ordinary text string. When the error object is displayed to the user, for each customization variable the Web App Firewall substitutes the information to which the variable refers. An example HTML error page that uses custom variables is shown below.

---

```

1  <!doctype html public "-//w3c//dtd html 4.0//en"> <html> <head> <
    title>Page Not Accessible</title> </head> <body> <h1>Page Not
    Accessible</h1> <p>The page that you accessed is not available. You
    can:</p> <ul> <li>return to the <b><a href="[homePage]">home page
    </a></b>, re-establish your session, and try again, or,</li> <li>
    report this incident to the help desk via <b><a href="mailto:[
    helpDeskEmailAddress]">email</a></b> or by calling [
    helpDeskPhoneNumber].</li> </ul> <p>If you contact the help desk,
    please provide the following information:</p> <table cellpadding=8
    width=80%> <tr><th align="right" width=30%>Transaction ID:</th><td
    align="left" valign="top" width=70%>${
2  NS_TRANSACTION_ID }
3  </td></tr> <tr><th align="right" width=30%>Session ID:</th><td align=
    "left" valign="top" width=70%>${
4  NS_APPFW_SESSION_ID }
5  </td></tr> <tr><th align="right" width=30%>Violation Category:</th><
    td align="left" valign="top" width=70%>${
6  NS_APPFW_VIOLATION_CATEGORY }
7  </td></tr> <tr><th align="right" width=30%>Violation Log:</th><td
    align="left" valign="top" width=70%>${
8  NS_APPFW_VIOLATION_LOG }
9  </td></tr> <tr><th align="right" width=30%>Cookie Name:</th><td align
    ="left" valign="top" width=70%>${
10 COOKIE("[cookieName]") }
11 </td></tr> </table> <body> <html>
12 <!--NeedCopy-->

```

To use this error page, copy it into a text or HTML editor. Substitute the appropriate local information for the following variables, which are enclosed in square brackets to distinguish them from the Citrix ADC variables. (Leave those unchanged.):

- [homePage]. The URL for your web site's home page.
- [helpDeskEmailAddress]. The email address that you want users to use to report blocking incidents.
- [helpDeskPhoneNumber]. The phone number that you want users to call to report blocking incidents.
- [cookieName]. The name of the cookie whose contents you want to display on the error page.

## XML error object

When a user's connection to an XML page is blocked, or a user asks for a nonexistent XML application, the Web App Firewall sends an XML-based error response to the user's browser. You configure the error response by uploading an XML-based error page to the Web App Firewall in the Imports Pane,

on the XML Error Object tab. All XML error responses are hosted on the Web App Firewall. You cannot configure a redirect URL for XML applications.

**Note:**

You can use the same customization variables in an XML error object as in an HTML error object.

## XML Schema

When the Web App Firewall performs a validation check on a user's request for an XML or Web 2.0 application, it can validate the request against the XML schema or design type document (DTD) for that application and reject any request that does not follow the schema or DTD. Both an XML schema and a DTD are standard XML configuration files that describe the structure of a specific type of XML document.

## WSDL

When the Web App Firewall performs a validation check on a user's request for an XML SOAP-based web service, it can validate the request against the web services type definition (WSDL) file for that web service. A WSDL file is a standard XML SOAP configuration file that defines the elements of a specific XML SOAP web service.

## Importing and exporting files

September 22, 2020

You can import HTML or XML error objects, XML schemas, DTDs, and WSDLs to the Web App Firewall by using the GUI or the command line. You can edit any of these files in a web-based text area after importing them, to make small changes directly on the Citrix ADC instead of having to make them on your computer and then reimport them. Finally, you can export any of these files to your computer, or delete any of these files, by using the GUI.

**Note:** You cannot delete or export an imported file by using the command line.

### To import a file by using the command line interface

At the command prompt, type the following commands:

- `import appfw htmlerrorpage <src> <name>`
- `<save> ns config`

## Example

The following example imports an HTML error object from a file named error.html and assigns it the name HTMLError.

```
1 import htmlerrorpage error.html HTMLError
2 save ns config
3 <!--NeedCopy-->
```

## To import a file by using the GUI

Before you attempt to import an XML schema, DTD, or WSDL file, or an HTML or XML error object from a network location, verify that the Citrix ADC can connect to the Internet or LAN computer where the file is located. Otherwise, you cannot import the file or object.

1. Navigate to **Security > Citrix Web App Firewall > Imports**.
2. Navigate to **Application Firewall > Imports**.
3. In the **Application Firewall Imports** pane, select the tab for the type of file you want to import, and then click **Add**.

The tabs are HTML Error Page, XML Error Page, XML Schema or WSDL. The upload process is identical on all four tabs from the user point of view.

4. Fill in the dialog fields.
  - **Name**—A name for the imported object.
  - **Import From**—Choose the location of the HTML file, XML file, XML schema or WSDL that you want to import in the drop-down list:
    - **URL**: A web URL on a website accessible to the appliance.
    - **File**: A file on a local or networked hard disk or other storage device.
    - **Text**: Type or paste the text of the custom response directly into a text field in the GUI.

The third text box changes to the appropriate value. The three possible values are provided below.

- **URL**—Type the URL into the text box.
  - **File**—Type the path and filename to the HTML file directly, or click Browse and browse to the HTML file.
  - **Text**—The third field is removed, leaving a blank space.
5. Click **Continue**. The File Contents dialog is displayed. If you chose URL or File, the File Contents text box contains the HTML file that you specified. If you chose Text, the File Contents text box is empty.

6. If you chose Text, type or copy and paste the custom response HTML that you want to import.
7. Click **Done**.
8. To delete an object, select the object, and then click **Delete**.

### To export a file by using the GUI

Before you attempt to export an XML schema, DTD, or WSDL file, or an HTML or XML error object, verify that the Web App Firewall appliance can access the computer where the file is to be saved. Otherwise, you cannot export the file.

1. Navigate to **Security > Web App Firewall > Imports**.
2. In the **Web App Firewall Imports** pane, select the tab for the type of file you want to export.  
The export process is identical on all four tabs from the user point of view.
3. Select the file that you want to export.
4. Expand the Action drop-down list, and select **Export**.
5. In the dialog box, choose **Save File** and click **OK**.
6. In the **Browse** dialog box, navigate to the local file system and directory where you want to save the exported file, and click **Save**.

### To edit an HTML or XML Error Object in the GUI

You edit the text of HTML and XML error objects in the GUI without exporting and then reimporting them.

1. Navigate to **Security > Citrix Web App Firewall > Imports**, and then select the tab for the type of file that you want to modify.
2. Navigate to **Application Firewall > Imports**, and then select the tab for the type of file that you want to modify.
3. Select the file that you want to modify, and then click **Edit**.

The text of the HTML or XML error object is displayed in a browser text area. You can modify the text by using the standard browser-based editing tools and methods for your browser.

Note: The edit window is designed to allow you to make minor changes to your HTML or XML error object. To make extensive changes, you may prefer to export the error object to your local computer and use standard HTML or XML web page editing tools.

4. Click **OK**, and then click **Close**.

## Global configuration

September 21, 2020

The Web App Firewall global configuration affects all profiles and policies. The Global Configuration items are:

- **Engine Settings.** A collection of global settings—session cookie name, session time-out, maximum session lifetime, logging header name, undefined profile, default profile, and import size limit—that pertain to all connections that the Web App Firewall processes, rather than to a specific subset of connections.
- **Confidential Fields.** A set of form fields in web forms that contain sensitive information that should not be logged to the Web App Firewall logs. Form fields such as password fields on a login page or credit card information on a shopping cart checkout form are normally designated as confidential fields.
- **Field Types.** The list of web form field types used by the Field Formats security check. Each of these field types is defined by a PCRE-compliant regular expression that defines the type of data and the minimum/maximum length of data that should be allowed in that type of form field.
- **XML Content Types.** The list of content types recognized as XML and subjected to XML-specific security checks. Each of these content types is defined by a PCRE-compliant regular expression that defines the exact MIME type assigned to that content.
- **JSON Content Types.** The list of content types recognized as JSON and subjected to JSON-specific security checks. Each of these content types is defined by a PCRE-compliant regular expression that defines the exact MIME type assigned to that content.

## Engine settings

September 21, 2020

The engine settings affect all requests and responses that the Citrix Web App Firewall processes. Following are the settings:

- **Cookie name**—The name of the cookie that stores the Citrix ADC session ID.
- **Session timeout**—The maximum inactive period allowed. If a user session shows no activity for this length of time, the session is terminated and the user is required to reestablish it by visiting a designated start page.
- **Cookie post-encrypts prefix**—The string that precedes the encrypted portion of any encrypted cookies.
- **Maximum session lifetime**—The maximum amount of time, in seconds, that a session is allowed to remain live. After this period is reached, the session is terminated and the user is re-

quired to reestablish it by visiting a designated start page. This setting cannot be less than the session timeout. To disable this setting, so that there is no maximum session lifetime, set the value to zero (0).

- **Logging header name**—The name of the HTTP header that holds the Client IP, for logging.
- **Undefined profile**—The profile applied when the corresponding policy action evaluates as undefined.
- **Default profile**—The profile applied to connections that do not match a policy.
- **Import size limit**—The maximum byte count of all files imported to the appliance, including signatures, WSDLs, schemas, HTML, and XML error pages. During an import, if the size of the imported object causes the cumulative count of all imported files to exceed the configured limit, the import operation fails. And the appliance displays the following error message: “*ERROR: Import failed - exceeding the configured total size limit on the imported objects*”.
- **Learn message rate limit**—The maximum number of requests and responses per second that the learning engine is to process. Any additional requests or responses over this limit are not sent to the learning engine.
- **Entity decoding**—Decode HTML entities when running Web App Firewall checks.
- **Log malformed request**—Enable logging of malformed HTTP requests.
- **Use configurable secret key**—Use a configurable secret key for Web App Firewall operations. This secret key is used for signing and verifying data. When “useConfigurableSecretKey” is turned ON, you must use the key enabled in the “set ns encryptionParams” parameter.
- **Reset learned data**—Remove all learned data from the Web App Firewall. Restarts the learning process by collecting fresh data.

Two settings, *Reset Learned Data* and *Signatures Auto-Update*, are found in different places depending on whether you use the command interface or the Citrix ADC GUI to configure your Citrix Web App Firewall. When using the command interface, you configure Reset Learned Data by using the `reset appfw learning data` command. This takes no parameters and has no other functions. You can configure the signature auto-Update in the `set appfw settings` command. The `-signatureAutoUpdate` parameter enables or disables auto-updating of the signatures, and `-signatureUrl` configures the URL which hosts the updated signatures file.

When using the Citrix ADC GUI, you configure Reset Learned Data in **Security > \*\*Citrix Web App Firewall > Engine Settings**. The **\*\*Reset Learned Data** option is at the bottom of the dialog box. You configure Signatures Auto-Update for each set of signatures in **Security > Citrix Web App Firewall > Signatures**, by selecting the signatures file, clicking the right mouse button and selecting **Auto Update Settings**.

Normally, the default values for the **Web App Firewall** settings are correct. If the default settings cause a conflict with other servers or cause premature disconnection of your users, however, you have to modify them.

The **Web App Firewall** session limit is configurable using the following command:

```

1 > set appfw settings -sessionLimit 500000
2
3 Done
4
5 Default value:100000    Max value:500000 per PE
6 <!--NeedCopy-->

```

## To configure engine settings by using the command line interface

At the command prompt, type the following commands:

- `set appfw settings [-sessionCookieName <name>] [-sessionTimeout <positiveInteger> ] [-sessionLifetime <positiveInteger>][-clientIPLoggingHeader <headerName> ] [-undefaction <profileName>] [-defaultProfile <profileName >] [-importSizeLimit <positiveInteger>] [-logMalformedReq ( ON | OFF )] [-signatureAutoUpdate ( ON | OFF )] [-signatureUrl <expression>] [-cookiePostEncryptPrefix <string>] [-entityDecoding ( ON | OFF )] [-useConfigurableSecretKey ( ON | OFF )][-learnRateLimit <positiveInteger >]`
- `save ns config`

### Example

```

1 set appfw settings -sessionCookieName citrix-appfw-id -sessionTimeout
   3600
2 -sessionLifetime 14400 -clientIPLoggingHeader NS-AppFW-Client-IP -
   undefaction APPFW_RESET
3 -defaultProfile APPFW_RESET -importSizeLimit 4096
4 save ns config
5 <!--NeedCopy-->

```

## To configure engine settings by using the Citrix ADC GUI

1. Navigate to **Security > Citrix Web App Firewall**
2. In the details pane, click **Change Engine Settings** under **Settings**.
3. In the **Web App Firewall Engine Settings** dialog box, set the following parameters:
  - Cookie Name
  - Session Timeout
  - Cookie Post Encrypt Prefix

- Maximum Session Lifetime
- Logging Header Name
- Undefined Profile
- Default Profile
- Import Size Limit
- Learn Messages Rate Limit
- Entity Decoding
- Log Malformed Request
- Use Secret Key
- Learn Message Rate Limit
- Signatures Auto Update

4. Click **OK**.

## Confidential fields

September 21, 2020

You can designate web-form fields as confidential to protect the information users type into them. Normally, any information a user types into a web form on one of your protected web servers is logged in the Citrix ADC logs. The information typed into a web-form field designated as confidential, however, is not logged. That information is saved only where the web site is configured to save such data, normally in a secure database.

Common types of information that you may want to protect with a confidential field designation include:

- Passwords
- Credit card numbers, validation codes, and expiration dates
- Social security numbers
- Tax ID numbers
- Home addresses
- Private telephone numbers

In addition to being good practice, proper use of confidential field designations may be necessary for PCI-DSS compliance on ecommerce servers, HIPAA compliance on servers that manage medical information in the United States, and compliance with other data protection standards.

### **Important:**

In the following two cases, the Confidential Field designation does not function as expected:

- If a Web form has either a confidential field or an action URL longer than 256 characters, the field or action URL is truncated in the Citrix ADC logs.
- With certain SSL transactions, the logs are truncated if either the confidential field or the action URL is longer than 127 characters.

In either of these cases, the Web App Firewall masks a fifteen-character string with the letter “x,” instead of the normal eight character string. To ensure that any confidential information is removed, the user must use form field name and action URL expressions that match the first 256, or (in cases where SSL is used) the first 127 characters.

To configure your Web App Firewall to treat a web-form field on a protected web site as confidential, you add that field to the Confidential Fields list. You can enter the field name as a string, or you can enter a PCRE-compatible regular expression specifying one or more fields. You can enable the confidential-field designation when you add the field, or you can modify the designation later.

## To add a confidential field by using the command line interface

At the command prompt, type the following commands:

- `add appfw confidField <fieldName> <url> [-isRegex ( REGEX | NOTREGEX )] [-comment "<string>"] [-state ( ENABLED | DISABLED )]`
- `save ns config`

### Example

The following example adds all web form fields whose names begin with Password to the confidential fields list.

```
1 add appfw confidField Password "https?://www[.]example[.]com/[^<>]*[^a-z]password[0-9a-z._-]*[.](asp|cgi|htm|html|http|js|php)" -isRegex
  REGEX -state ENABLED
2 save ns config
3 <!--NeedCopy-->
```

## To modify a confidential field by using the command line interface

At the command prompt, type the following commands:

- `set appfw confidField <fieldName> <url> [-isRegex ( REGEX | NOTREGEX )] [-comment "<string>"] [-state ( ENABLED | DISABLED )]`
- 'save ns config'

### Example

The following example modifies the confidential field designation to add a comment.

```
1 set appfw confidField Password "https?://www[.]example[.]com/[^<>]*[^a-z]password[0-9a-z._-]*[.](asp|cgi|htm|html|http|js|php)" -comment "
  Protect password fields." -isRegex REGEX -state ENABLED
2 save ns config
3 <!--NeedCopy-->
```

## To remove a confidential field by using the command line interface

At the command prompt, type the following commands:

- `rm appfw confidField <fieldName> <url>`
- `save ns config`

## To configure a confidential field by using the GUI

1. Navigate to **Security > Application Firewall**.
  2. In the details pane, under **Settings**, click **Manage Confidential Fields**.
  3. In the Manage Confidential Fields dialog box, do one of the following:
    - To add a new form field to the list, click **Add**.
    - To change an existing confidential field designation, select the field, and then click **Edit**.  
The **Web App Firewall Confidential Fields** dialog box appears.
- Note:**
- If you select an existing confidential field designation and then click **Add**, the **Create Confidential Form Field** dialog box displays the information for that confidential field. You can modify that information to create your new confidential field.
4. In the dialog box, fill out the elements. They are:
    - **Enabled check box.** Select or clear to enable/disable this confidential field designation.
    - **Is form field name a regular expression check box.** Select or clear to enable PCRE-format regular expressions in the form field name.
    - **Field Name.** Enter a literal string or PCRE-format regular expression that either represents a specific field name or that matches multiple fields with names that follow a pattern.
    - **Action URL.** Enter a literal URL or a regular expression that defines one or more URLs of the web page(s) on which the web form(s) that contains the confidential field are located.
    - **Comments.** Enter a comment. Optional.
  5. Click **Create** or **OK**.
  6. To remove a confidential field designation from the confidential fields list, select the confidential field listing you want to remove, then click **Remove** to remove it, and then click **OK** to confirm your choice.
  7. When you have finished adding, modifying, and removing confidential field designations, click **Close**.

## Examples

Following are some regular expressions that define form field names that you might find useful:

- `^passwd_` (Applies confidential-field status to all field names that begin with the “passwd\_” string.)

```
^([[0-9a-zA-Z._-]]*)
```

```
\x[0-9A-Fa-f][0-9A-Fa-f]+-
)?passwd_ (Applies
confidential-field status to all
field names that begin with
the string passwd_, or that
contain the string -passwd_
after another string that
might contain non-ASCII
special characters.)
```

•

Following are some regular expressions that define specific URL types that you might find useful. Substitute your own web host(s) and domain(s) for those in the examples.

- If the web form appears on multiple web pages on the web host `www.example.com`, but all of those web pages are named `logon.pl?`, you could use the following regular expression:

```
1 https?://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-.]*)*logon
  [.]pl\?
2 <!--NeedCopy-->
```

- If the web form appears on multiple web pages on the web host `www.example-español.com`, which contains the n-tilde (ñ) special character, you could use the following regular expression, which represents the n-tilde special character as an encoded UTF-8 string containing C3 B1, the hexadecimal code assigned to that character in the UTF-8 charset:

```
1 https?://www[.]example-espa\xC3\xB1o[.]com/([0-9A-Za-z][0-9A-Za-
  z_-.]*)* logon[.]pl\?
2 <!--NeedCopy-->
```

- If the web form containing `query.pl` appears on multiple web pages on different hosts within the `example.com` domain, you could use the following regular expression:

```
1 https?://([0-9A-Za-z][0-9A-Za-z_-.]*[.])*example[.]com/([0-9A-Za-
  z][0-9A-Za-z_-.]*)*logon[.]pl\?
2 <!--NeedCopy-->
```

- If the web form containing `query.pl` appears on multiple web pages on different hosts in different domains, you could use the following regular expression:

```
1 https?://([0-9A-Za-z][0-9A-Za-z_-.]*[.])*[0-9A-Za-z][0-9A-Za-z_
  -.]+[.][a-z]{
```

```
2 2,6 }
3 /([0-9A-Za-z][0-9A-Za-z_-.]*)*logon[.]pl\?
4 <!--NeedCopy-->
```

- If the web form appears on multiple web pages on the web host `www.example.com`, but all of those web pages are named `logon.pl?`, you could use the following regular expression:

```
1 https?://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-.]*)*logon
  [.]pl\?
2 <!--NeedCopy-->
```

## Field types

September 21, 2020

A field type is a PCRE-format regular expression that defines a particular data format and minimum/-maximum data lengths for a form field in a web form. Field types are used in the Field Formats check.

The Web App Firewall comes with several default field types, which are:

- integer. A string of any length consisting of numbers only, without a decimal point, and with an optional preceding minus sign (-).
- alpha. A string of any length consisting of letters only.
- alphanum. A string of any length consisting of letters and/or numbers.
- nohtml. A string of any length consisting of characters, including punctuation and spaces, that does not contain HTML symbols or queries.
- any. Anything at all.

### Important:

Assigning the any field type as the default field type, or to a field, allows active scripts, SQL commands, and other possibly dangerous content to be sent to your protected web sites and applications in that form field. You should use the any type sparingly, if you use it at all.

You can also add your own field types to the Field Types list. For example, you might want to add a field type for a social security number, postal code, or phone number in your country. You might also want to add a field type for a customer identification number or store credit card number.

To add a field type to the Field Types list, you enter the field name as a literal string or PCRE-format regular expression.

## To add a field type by using the command line interface

At the command prompt, type the following commands:

- `add appfw fieldType <name> <regex> <priority> [-comment "<string>"]`
- `save ns config`

### Example

The following example adds a field type named SSN that matches US Social Security numbers to the Field Types list, and sets its priority to 1.

```
1 add appfw fieldType SSN "[1-9][0-9]{
2 2,2 }
3 -[0-9 ]
4 {
5 2,2 }
6 -[0-9]{
7 4,4 }
8 $" 1
9 save ns config
10 <!--NeedCopy-->
```

## To modify a field type by using the command line interface

At the command prompt, type the following commands:

- `set appfw fieldType <name> <regex> <priority> [-comment "<string>"]`
- `save ns config`

### Example

The following example modifies the field type to add a comment.

```
1 set appfw fieldType SSN "[1-9][0-9]{
2 2,2 }
3 -[0-9 ]
4 {
5 2,2 }
6 -[0-9]{
7 4,4 }
8 $" 1 -comment "US Social Security Number"
9 save ns config
10 <!--NeedCopy-->
```

## To remove a field type by using the command line interface

At the command prompt, type the following commands:

- `>rm appfw fieldType <name>`
- `save ns config`

## To configure a field type by using the GUI

1. Navigate to Security > Application Firewall.
2. In the details pane, under **Settings**, click **Manage Field Types**.
3. In the **Manage Field Types** dialog box, do one of the following:
  - To add a new field type to the list, click **Add**.
  - To change an existing field type, select the field type, and then click **Edit**.

The **Configure Field Type** dialog box appears.

**Note:**

If you select an existing field type designation and then click **Add**, the dialog box displays the information for that field type. You can modify that information to create your new field type.

4. In the dialog box, fill out the elements. They are:
  - Name
  - Regular Expression
  - Priority
  - Comment
5. Click Create or OK.
6. To remove a field type from the Field Types list, select the field type listing you want to remove, then click **Remove** to remove it, and then click **OK** to confirm your choice.
7. When you have finished adding, modifying, and removing field types, click **Close**.

## Examples

Following are some regular expressions for field types that you might find useful:

```
1 `^[1-9][0-9]{
2   2,2 }
3   -[0-9 ]
4   {
5   2,2 }
6   -[0-9]{
7   4,4 }
8   $ U.S. Social Security numbers`
```

```
^\[A-C\]\[0-9\]{ 7,7 } $ California driver's license numbers
```

```
^[0-9]{ 1,3 } [0-9()-]{ 1,40 } $ International phone numbers with country codes
```

```

1 `^[0-9]{
2   5,5 }
3   -[0-9]{
4   4,4 }
5   $ U.S. ZIP code numbers`.
6
7
8 `^[0-9A-Za-z][0-9A-Za-z.+_-]{
9   0,25 }
10  @([0-9A-Za-z][0-9A-Za-z_-]*[.]){
11   1,4 }
12  [A-Za-z]{
13   2,6 }
14  $ Email addresses``.
```

## XML content types

September 21, 2020

By default, the Web App Firewall treats files that follow certain naming conventions as XML. You can configure the Web App Firewall to examine web content for additional strings or patterns that indicate that those files are XML files. This can ensure that the Web App Firewall recognizes all XML content on your site, even if certain XML content does not follow normal XML naming conventions, ensuring that XML content is subjected to XML security checks.

To configure the XML content types, you add the appropriate patterns to the XML Content Types list. You can enter a content type as a string, or you can enter a PCRE-compatible regular expression specifying one or more strings. You can also modify the existing XML content types patterns.

### To add an XML content type pattern by using the command line interface

At the command prompt, type the following commands:

- `add appfw XMLContentType <XMLContenttypevalue> [-isRegex ( REGEX | NOTREGEX )]`
- `save ns config`

## Example

The following example adds the pattern `.*xml` to the XML Content Types list and designates it as a regular expression.

```
1 add appfw XMLContentType ".*xml" -isRegex REGEX
2 <!--NeedCopy-->
```

## To remove an XML content type pattern by using the command line interface

At the command prompt, type the following commands:

- `rm appfw XMLContentType <XMLContenttypevalue>`
- `save ns config`

## To configure the XML content type list by using the GUI

1. Navigate to **Security > Web App Firewall**.
2. In the details pane, under **Settings**, click **Manage XML Content Types**.
3. In the **Manage XML Content Types** dialog box, do one of the following:
  - To add a new XML content type, click **Add**.
  - To modify an existing XML content type, select that type and then click **Edit**.  
The Configure Web App Firewall XML Content Type dialog appears. Note: If you select an existing XML content type pattern and then click **Add**, the dialog box displays the information for that XML content type pattern. You can modify that information to create your new XML content type pattern.
4. In the dialog box, fill out the elements. They are:
  - **IsRegex**. Select or clear to enable PCRE-format regular expressions in the form field name.
  - **XML Content Type** Enter a literal string or PCRE-format regular expression that matches the XML content type pattern that you want to add.
5. Click **Create**.
6. To remove an XML content type pattern from the list, select it, then click **Remove** to remove it, and then click **OK** to confirm your choice.
7. When you have finished adding and removing XML content type patterns, click **Close**.

## JSON content types

September 21, 2020

By default, the Web App Firewall treats files with the content type “application/json” as JSON files. The default setting enables the Web App Firewall to recognize JSON content in requests and responses, and to handle that content appropriately.

You can configure the Web App Firewall to examine web content for additional strings or patterns that indicate that those files are JSON files. This can ensure that the Web App Firewall recognizes all JSON content on your site, even if certain JSON content does not follow normal JSON naming conventions, ensuring that JSON content is subjected to JSON security checks.

To configure the JSON content types, you add the appropriate patterns to the JSON Content Types list. You can enter a content type as a string, or you can enter a PCRE-compatible regular expression specifying one or more strings. You can also modify the existing JSON content types patterns.

### To add a JSON content type pattern by using the command line interface

At the command prompt, type the following commands:

- `add appfw JSONContentType <JSONContenttypevalue> [-isRegex ( REGEX | NOTREGEX )]`
- `save ns config`

### Example

The following example adds the pattern `*/json` to the JSON Content Types list and designates it as a regular expression.

```
1 add appfw JSONContentType "*/json" -isRegex REGEX
2 <!--NeedCopy-->
```

### To configure the JSON content type list by using the GUI

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Settings**, click **Manage JSON Content Types**.
3. In the Manage JSON Content Types dialog box, do one of the following:
  - To add a new JSON content type, click Add.
  - To modify an existing JSON content type, select that type and then click Edit. The Configure Web App Firewall JSON Content Type dialog appears.  
Note: If you select an existing JSON content type pattern and then click Add, the dialog box displays the information for that JSON content type pattern. You can modify that information to create your new JSON content type pattern.
4. In the dialog box, fill out the elements. They are:
  - **IsRegex**. Select or clear to enable PCRE-format regular expressions in the form field name.

- **JSON Content Type** Enter a literal string or PCRE-format regular expression that matches the JSON content type pattern that you want to add.
5. Click **Create** or **OK**.
  6. To remove a JSON content type pattern from the list, select it, then click **Remove** to remove it, and then click **OK** to confirm your choice.
  7. When you have finished adding and removing XML content type patterns, click **Close**.

## Statistics and reports

September 21, 2020

The information maintained in the logs and statistics, and displayed in the reports, provides important guidance for configuring and maintaining the Web App Firewall.

### The Web App Firewall statistics

When you enable the statistics action for Web App Firewall signatures or security checks, the Web App Firewall maintains information about connections that match that signature or security check. You can view the accumulated statistics information on the Monitoring tab of the main logon page of your Web App Firewall appliance by selecting one of the following choices in the Select Group list box:

- **Web App Firewall.** A summary of all statistics information gathered by your Web App Firewall appliance for all profiles.
- **Web App Firewall (per profile).** The same information, but displayed per-profile rather than summarized.

You can use this information to monitor how your Web App Firewall is operating and determine whether there is any abnormal activity or abnormal amounts of hits on a signature or security check. If you see such a pattern of abnormal activity, you can check the logs for that signature or security check, to diagnose the issue, and then take corrective action.

### The Web App Firewall Reports

The Web App Firewall reports provide information about your Web App Firewall configuration and how it is handling traffic for your protected web sites.

### The PCI DSS report

The Payment Card Industry (PCI) Data Security Standard (DSS), version 1.2, consists of twelve security criteria that most credit card companies require businesses who accept online payments via credit

and debit cards to meet. These criteria are designed to prevent identity theft, hacking, and other types of fraud. If an internet service provider or online merchant does not meet the PCI DSS criteria, that ISP or merchant risks losing authorization to accept credit card payments through its web site.

ISPs and online merchants prove that they are in compliance with PCI DSS by having an audit conducted by a PCI DSS Qualified Security Assessor (QSA) Company. The PCI DSS report is designed to assist them both before and during the audit. Before the audit, it shows which Web App Firewall settings are relevant to PCI DSS, how they should be configured, and (most important) whether your current Web App Firewall configuration meets the standard. During the audit, the report can be used to demonstrate compliance with relevant PCI DSS criteria.

The PCI DSS report consists of a list of those criteria that are relevant to your Web App Firewall configuration. Under each criterion, it lists your current configuration options, indicates whether your current configuration complies with the PCI DSS criterion, and explains how to configure the Web App Firewall so that your protected web site(s) will be in compliance with that criterion.

The PCI DSS report is located under System > Reports. To generate the report as an Adobe PDF file, click Generate PCI DSS Report. Depending on your browser settings, the report is displayed in the pop-up window or you are prompted to save it to your hard disk.

Note: To view this and other reports, you must have the Adobe Reader program installed on your computer.

The PCI DSS report consists of the following sections:

- **Description.** A description of the PCI DSS Compliance Summary report.
- **Firewall License and Feature Status.** Tells you whether the Web App Firewall is licensed and enabled on your Citrix ADC appliance.
- **Executive Summary.** A table that lists the PCI DSS criteria and tells you which of those criteria are relevant to the Web App Firewall.
- **Detailed PCI DSS Criteria Information.** For each PCI DSS criterion that is relevant to your Web App Firewall configuration, the PCI DSS report provides a section that contains information about whether your configuration is currently in compliance and, if it is not, how to bring it into compliance.
- **Configuration.** Data for individual profiles, which you access either by clicking Web App Firewall Configuration at the top of the report, or directly from the Reports pane. The Web App Firewall Configuration report is the same as the PCI DSS report, with the PCI DSS-specific summary omitted, and is described below.

### **The Web App Firewall configuration report**

The Web App Firewall Configuration report is located under System > Reports. To display it, click Generate Web App Firewall Configuration Report. Depending on your browser settings, the report is

displayed in the pop-up window or you are prompted to save it to your hard disk.

The Web App Firewall Configuration report starts with a Summary page, which consists of the following sections:

- **Web App Firewall Policies.** A table that lists your current Web App Firewall policies, showing the policy name, the content of the policy, the action (or profile) it is associated with, and global binding information.
- **Web App Firewall Profiles.** A table that lists your current Web App Firewall profiles and indicates which policy each profile is associated with. If a profile is not associated with a policy, the table displays INACTIVE in that location.

To download all report pages for all policies, at the top of the Profiles Summary page click **Download All Profiles**. You display the report page for each individual profile by selecting that profile in the table at the bottom of the screen. The Profile page for an individual profile shows whether each check action is enabled or disabled for each check, and the other configuration settings for the check.

To download a PDF file containing the PCI DSS report page for the current profile, click **Download Current Profile** at the top of the page. To return to the Profiles Summary page, click **Web App Firewall Profiles**. To go back to the main page, click **Home**. You can refresh the PCI DSS report at any time by clicking **Refresh** in the upper right corner of the browser. You should refresh the report if you make changes to your configuration.

## Web App Firewall logs

October 28, 2020

The Web App Firewall generated log messages can be quite useful for keeping track of the configurational changes, Web App Firewall policy invocations, and security check violations.

When the log action is enabled for security checks or signatures, the resulting log messages provide information about the requests and responses that the Web App Firewall has observed while protecting your web sites and applications. The most important information is the action taken by the Web App Firewall when a signature or a security check violation was observed. For some security checks, the log message can provide additional useful information, such as the location and the detected pattern that triggered the violation. You can deploy security checks in non-block mode and monitor the logs to determine whether the transactions that are triggering security violations are valid transactions (false positives). If they are, you can either remove, or reconfigure the signature or security checks, deploy relaxations, or take other appropriate measures to mitigate the false positives before you enable blocking for that signature or security check. An excessive increase in the number of violation messages in logs can indicate a surge in malicious requests. This can alert you that your application

might be under attack to exploit a specific vulnerability that is detected and thwarted by Web App Firewall protections.

**Note:**

Citrix Web App Firewall logging must be used only with external SYSLOG servers.

## Citrix ADC (Native) format logs

The Web App Firewall uses the Citrix ADC format logs (also called native format logs) by default. These logs have the same format as those generated by other Citrix ADC features. Each log contains the following fields:

- **Timestamp.** Date and time when the connection occurred.
- **Severity.** Severity level of the log.
- **Module.** Citrix ADC module that generated the log entry.
- **Event Type.** Type of event, such as signature violation or security check violation.
- **Event ID.** ID assigned to the event.
- **Client IP.** IP address of the user whose connection was logged.
- **Transaction ID.** ID assigned to the transaction that caused the log.
- **Session ID.** ID assigned to the user session that caused the log.
- **Message.** The log message. Contains information identifying the signature or security check that triggered the log entry.

You can search for any of these fields, or any combination of information from different fields. Your selection is limited only by the capabilities of the tools you use to view the logs. You can observe the Web App Firewall log messages in the GUI by accessing the Citrix ADC syslog viewer, or you can manually connect to the Citrix ADC appliance and access logs from the command line interface, or you can drop into shell and tail the logs directly from the `/var/log/` folder.

Example of a Native Format Log message

```

1 Jun 22 19:14:37 <local0.info> 10.217.31.98 06/22/2015:19:14:37 GMT ns

  check failed for
8 field text_area="Bad tag: script" <blocked>

```

```
9 <!--NeedCopy-->
```

## Common Event Format (CEF) Logs

The Web App Firewall also supports CEF logs. CEF is an open log management standard that improves the interoperability of security-related information from different security and network devices and applications. CEF enables customers to use a common event log format so that data can easily be collected and aggregated for analysis by an enterprise management system. The log message is broken into different fields so that you can easily parse the message and write scripts to identify important information.

### Analyzing the CEF Log Message

In addition to date, timestamp, client IP, log format, appliance, company, build version, module, and security check information, Web App Firewall CEF Log messages include the following details:

- src – source IP address
- spt – source port number
- request – request URL
- act – action (e.g. blocked, transformed)
- msg – message (Message regarding the observed security check violation)
- cn1 – event ID
- cn2 – HTTP Transaction ID
- cs1 – profile name
- cs2 – PPE ID (e.g. PPE1)
- cs3 – Session ID
- cs4 – Severity (e.g. INFO, ALERT)
- cs5 – event year
- cs6 – Signature Violation Category
- method – Method (e.g. GET/POST)

For example, consider the following CEF format log message, which was generated when a Start URL violation was triggered:

```
1 Jun 12 23:37:17 <local0.info> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11
  .0
2 |APPFW|APPFW_STARTURL|6|src=10.217.253.62 spt=47606 method=GET
3 request=http://aaron.stratum8.net/FFC/login.html msg=Disallow Illegal
  URL. cn1=1340
4 cn2=653 cs1=pr_ffc cs2=PPE1 cs3=EsdGd3VD00aaURLcZnj05Y6D0mE0002 cs4=
  ALERT cs5=2015
5 act=blocked
6 <!--NeedCopy-->
```

The above message can be broken down into different components. Refer to the [CEP log components](#) table.

Example of a request check violation in CEF log format: request is not blocked

## Logging geolocation in the Web App Firewall violation messages

Geolocation, which identifies the geographic location from which requests originate, can help you configure the Web App Firewall for the optimal level of security. To bypass security implementations such as rate limiting, which rely on the IP addresses of the clients, malware or rogue computers can keep changing the source IP address in requests. Identifying the specific region from where requests are coming can help determine whether the requests are from a valid user or a device attempting to launch cyberattacks. For example, if an excessively large number of requests are received from a specific area, it is easy to determine whether they are being sent by users or a rogue machine. Geolocation analysis of the received traffic can be very useful in deflecting attacks such as denial of service (DoS) attacks.

The Web App Firewall offers you the convenience of using the built-in Citrix ADC database for identifying the locations corresponding to the IP addresses from which malicious requests are originating. You can then enforce a higher level of security for requests from those locations. Citrix default syntax (PI) expressions give you the flexibility to configure location based policies that can be used in conjunction with the built-in location database to customize firewall protection, bolstering your defense against coordinated attacks launched from rogue clients in a specific region.

You can use the Citrix ADC built-in database, or you can use any other database. If the database does not have any location information for the particular client IP address, the CEF log shows geolocation as an Unknown geolocation.

**Note:** Geolocation logging uses the Common Event Format (CEF). By default, CEF logging and GeoLocationLogging are OFF. You must explicitly enable both parameters.

Example of a CEF log message showing geolocation information

## Using the command line to configure the log action and other log parameters

To configure the log action for a security checks of a profile by using the command line

At the command prompt, type one of the following commands:

- `set appfw profile <name> SecurityCheckAction ([log] | [none])`
- `unset appfw profile <name> SecurityCheckAction`

Examples

```
set appfw profile pr_ffc StartURLAction log
```

```
unset appfw profile pr_ffc StartURLAction
```

To configure CEF logging by using the command line

The CEF logging is disabled by default. At the command prompt, type one of the following commands to change or display the current setting:

- `set appfw settings CEFLogging on`
- `unset appfw settings CEFLogging`
- `sh appfw settings | grep CEFLogging`

To configure the logging of the credit card numbers by using the command line

At the command prompt, type one of the following commands:

- `set appfw profile <name> -doSecureCreditCardLogging ([ON] | [OFF])`
- `unset appfw profile <name> -doSecureCreditCardLogging`

To configure Geolocation logging by using the command line

1. Use the `set` command to enable `GeoLocationLogging`. You can enable the CEF logging at the same time. Use the `unset` command to disable geolocation logging. The `show` command shows the current settings of all the Web App Firewall parameters, unless you include the `grep` command to show the setting for a specific parameter.

- `set appfw settings GeoLocationLogging ON [CEFLogging ON]`
- `unset appfw settings GeoLocationLogging`
- `sh appfw settings | grep GeoLocationLogging`

## 2. Specify the database

```
add locationfile /var/netscaler/inbuilt_db/Citrix_netscaler_InBuilt_GeoIP_DB
.csv
```

or

```
add locationfile <path to database file>
```

## Customizing Web App Firewall Logs

Default format (PI) expressions give you the flexibility to customize the information included in the logs. You have the option to include the specific data that you want to capture in the Web App Firewall generated log messages. For example, if you are using AAA-TM authentication along with the Web App Firewall security checks, and would like to know the accessed URL that triggered the security check violation, the name of the user who requested the URL, the source IP address, and the source port from which the user sent the request, you can use the following commands to specify customized log messages that include all the data:

```
1 > sh version
2 NetScaler NS12.1: Build 50.0013.nc, Date: Aug 28 2018, 10:51:08 (64-
bit)
3 Done
4 <!--NeedCopy-->
```

```
1 > add audit messageaction custom1 ALERT 'HTTP.REQ.URL + " " + HTTP.REQ.
USER.NAME + " " + CLIENT.IP.SRC + ":" + CLIENT.TCP.SRCPORT'
2 Warning: HTTP.REQ.USER has been deprecated. Use AAA.USER instead.
3 Done
4 <!--NeedCopy-->
```

```
1 > add appfw profile test_profile
2 Done
3 <!--NeedCopy-->
```

```
1 > add appfw policy appfw_pol true test_profile -logAction custom1
2 Done
3 <!--NeedCopy-->
```

## Configuring Syslog policy to segregate Web App Firewall logs

The Web App Firewall offers you an option to isolate and redirect the Web App Firewall security log messages to a different log file. This might be desirable if the Web App Firewall is generating a large

number of logs, making it difficult to view other Citrix ADC log messages. You can also use this option when you are interested only in viewing the Web App Firewall log messages and do not want to see the other log messages.

To redirect the Web App Firewall logs to a different log file, configure a syslog action to send the Web App Firewall logs to a different log facility. You can use this action when configuring the syslog policy, and bind it globally for use by Web App Firewall.

**Example:**

1. Switch to the shell and use an editor such as vi to edit the /etc/syslog.conf file. Add a new entry to use local2.\* to send logs to a separate file as shown in the following example:

```
local2.* /var/log/ns.log.appfw
```

2. Restart the syslog process. You can use the grep command to identify the syslog process ID (PID), as shown in the following example:

```
root@ns## **ps -A | grep syslog**  
1063 ?? Ss 0:03.00 /usr/sbin/syslogd -b 127.0.0.1 -n -v -v -8 -C  
root@ns## **kill -HUP** 1063
```

3. From the command line interface, configure the syslog action and policy. Bind it as a global Web App Firewall policy.

```
> add audit syslogAction sysact 1.1.1.1 -logLevel ALL -logFacility LOCAL2  
> add audit syslogPolicy syspol1 ns_true sysact1  
> bind appfw global syspol1 100
```

1. All Web App Firewall security check violations will now be redirected to the /var/log/ns.log.appfw file. You can tail this file to view the Web App Firewall violations that are getting triggered during the processing of the ongoing traffic.

```
root@ns## tail -f ns.log.appfw
```

Warning: If you have configured the syslog policy to redirect the logs to a different log facility, the Web App Firewall log messages no longer appear in the /var/log/ns.log file.

**Viewing the Web App Firewall Logs**

You can view the logs by using the syslog viewer, or by logging onto the Citrix ADC appliance, opening a UNIX shell, and using the UNIX text editor of your choice.

To access the log messages by using the command line

Switch to the shell and tail the ns.logs in the /var/log/ folder to access the log messages pertaining to the Web App Firewall security check violations:

- `Shell`
- `tail -f /var/log/ns.log`

You can use the vi editor, or any Unix text editor or text search tool, to view and filter the logs for specific entries. For example, you can use grep command to access the log messages pertaining to the Credit Card violations:

- `tail -f /var/log/ns.log | grep SAFECOMMERCE`

To access the log messages by using the GUI

The Citrix GUI includes a very useful tool (Syslog Viewer) for analyzing the log messages. You have multiple options for accessing the Syslog Viewer:

- To view log messages for a specific security check of a profile, navigate to **Web App Firewall > Profiles**, select the target profile, and click Security Checks. Highlight the row for the target security check and click Logs. When you access the logs directly from the selected security check of the profile, it filters out the log messages and displays only the logs pertaining to the violations for the selected security check. Syslog viewer can display Web App Firewall logs in the Native format as well as the CEF format. However, in order for the syslog viewer to filter out the target profile specific log messages, the logs must be in the CEF log format when accessed from the profile.
- You can also access the Syslog Viewer by navigating to **Citrix ADC > System > Auditing**. In the Audit Messages section, click Syslog messages link to display the Syslog Viewer, which displays all log messages, including all Web App Firewall security check violation logs for all profiles. This is useful for debugging when multiple security check violations might be triggered during request processing.
- Navigate to **Web App Firewall > policies > Auditing**. In the Audit Messages section, click Syslog messages link to display the Syslog Viewer, which displays all log messages, including all security check violation logs for all profiles.

The HTML based Syslog Viewer provides the following filter options for selecting only the log messages that are of interest to you:

- **File**—The current `/var/log/ns.log` file is selected by default, and the corresponding messages appear in the Syslog Viewer. A list of other log files in the `/var/log` directory are available in a compressed `.gz` format. To download and un-compress an archived log file, just select the log file from the dropdown option. The log messages pertaining to the selected file are then displayed in the syslog viewer. To refresh the display, click the Refresh icon (a circle of two arrows).
- **Module list box**—You can select the Citrix ADC module whose logs you want to view. You can set it to APPFW for Web App Firewall logs.
- **Event Type list box**—This box contains a set of check boxes for selecting the type of event you are interested in. For example, to view the log messages pertaining to the signature violations,

you can select the **APPFW\_SIGNATURE\_MATCH** check box. Similarly, you can select a check box to enable the specific security check that is of interest to you. You can select multiple options.

- **Severity**—You can select a specific severity level to show just the logs for that severity level. Leave all the check boxes blank if you want to see all logs.

To access the Web App Firewall security check violation log messages for a specific security check, filter by selecting **APPFW** in the dropdown options for Module. The Event Type displays a rich set of options to further refine your selection. For example, if you select the **APPFW\_FIELDFORMAT** check box and click the Apply button, only log messages pertaining to the Field Formats security check violations appear in the Syslog Viewer. Similarly, if you select the **APPFW\_SQL** and **APPFW\_STARTURL** check boxes and click the **Apply** button, only log messages pertaining to these two security check violations will appear in the syslog viewer.

If you place the cursor in the row for a specific log message, multiple options, such as **Module, EventType, EventID, ClientIP, TransactionID**, and so on appear below the log message. You can select any of these options to highlight the corresponding information in the logs.

**Click to Deploy:** This functionality is available only in the GUI. You can use the Syslog Viewer to not only view the logs but also to deploy relaxation rules based on the log messages for the Web App Firewall security check violations. The log messages must be in CEF log format for this operation. If the relaxation rule can be deployed for a log message, a check box appears at the right edge of the Syslog Viewer box in the row. Select the check box, and then select an option from the Action list to deploy the relaxation rule.

**Edit & Deploy, Deploy,** and

**Deploy All** are available as Action options. For example, you can select an individual log message to edit and deploy. You can also select the check boxes for multiple log messages from one or more security checks and use the Deploy or Deploy All option. Click to Deploy functionality is currently supported for the following security checks:

- StartURL
- URL Buffer overflow
- SQL Injection
- XSS
- Field consistency
- Cookie consistency

To use Click to Deploy functionality in the GUI

1. In the **Syslog Viewer**, select **APPFW** in the **Module** options.
2. Select the security check for which to filter corresponding log messages.
3. Enable the check box to select the rule.
4. Use the **Action** drop-down list of options to deploy the relaxation rule.

5. Verify that the rule appears in the corresponding relaxation rule section.

**Note:**

SQL Injection and XSS rules that are deployed by using Click **Deploy** option do not include the fine grain relaxation recommendations.

**Highlights**

- **CEF Log Format support**—The CEF log format option provides a convenient option to monitor, parse, and analyze the Web App Firewall log messages to identify attacks, fine tune configured settings to decrease false positives, and gather statistics.
- **Click to Deploy**—The Syslog viewer provides an option to filter, evaluate, and deploy relaxation rules for single or multiple security check violations from one convenient location.
- **Option to customize log message**—You can use advanced PI expressions to customize log messages and include the data you want to see in the logs.
- **Segregate Web App Firewall specific logs**—You have an option to filter and redirect application-firewall specific logs to a separate log file.
- **Remote Logging**—You can redirect the log messages to a remote syslog server.
- **Geolocation Logging**—You can configure the Web App Firewall to include the geolocation of the area from where the request is received. A built-in geolocation database is available, but you have the option to use an external geolocation database. The Citrix ADC appliance supports both IPv4 and IPv6 static geolocation databases.
- **Information rich log message**—Following are some examples of the type of information that can be included in the logs, depending on the configuration:
  - An Web App Firewall policy was triggered.
  - A security check violation was triggered.
  - A request was considered to be malformed.
  - A request or the response was blocked or not blocked.
  - Request data (such as SQL or XSS special characters) or response data (such as Credit card numbers or safe object strings) was transformed.
  - The number of credit cards in the response exceeded the configured limit.
  - The credit card number and type.
  - The log strings configured in the signature rules, and the signature ID.
  - Geolocation information about the source of the request.
  - Masked (X'd out) user input for protected confidential fields.

**Appendices**

September 21, 2020

The following supplemental material provides additional detail about complex or peripheral Web App Firewall tasks.

## PCRE character encoding format

September 21, 2020

The **Citrix ADC operating system supports direct** entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your Web App Firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular expression.

Various character types require encoding using a PCRE regular expression if you include them in your Web App Firewall configuration as a URL, form field name, or Safe Object expression. They include:

- **Upper-ASCII characters.** Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.
- **Double-Byte characters.** Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.

**ASCII control characters.** Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters should never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The Citrix ADC appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, “English US,” the Web App Firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set. This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.
- **Chinese Traditional (Big5).** The Web App Firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.

- **Chinese Simplified (GB2312).** The Web App Firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
- **Japanese (SJIS).** The Web App Firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.
- **Japanese (EUC-JP).** The Web App Firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.
- **Korean (EUC-KR).** The Web App Firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.
- **Turkish (ISO-8859-9).** The Web App Firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.
- **Unicode (UTF-8).** The Web App Firewall supports certain more characters in the UTF-8 character set, including those used in modern Russian.

When configuring the Web App Firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which is assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8 character set. For example, the exclamation point (!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the Web App Firewall configuration is “\xNN” for ASCII characters; “\xNN\xNN” for non-ASCII characters used in English, Russian, and Turkish; and “\xNN\xNN\xNN” for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in an Web App Firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

**Note:**

Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character's UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as \x20 to avoid confusing certain browsers and web server software.

Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the Web App Firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

Actual URL: <http://www.josénuñez.com>

Encoded URL: `^http://www\[.\]jos\xC3\xA9nu\xC3\xB1ez\[.\]com$`

- Another URL containing extended ASCII characters. Actual URL: <http://www.example.de/trömsö.html>

Encoded URL: `^http://www\[.\]example\[.\]de/tr\xC3\xB6mso\[.\]html$`

A form field name containing extended ASCII characters.

Actual Name: nome\_do\_usuario

Encoded Name: `^nome_do_usu\xC3\xA1rio$`

- A safe object expression containing extended ASCII characters.

Unencoded Expression `[A-Z]{3,6}¥[1-9][0-9]{6,6}`

Encoded Expression: `[A-Z]{3,6}\xC2\xA5[1-9][0-9]{6,6}`

You can find some tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful website that contains this information is at the following URL:

```
1 http://www.utf8-chartable.de/unicode-utf8-table.pl
2 <!--NeedCopy-->
```

For the characters in the table on this website to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of webpages are correct.

## Whitehat WASC signature types for WAF use

October 23, 2020

The Citrix Web App Firewall accepts and generates blocking rules for all vulnerability types that [Whitehat](#) scanners generate. However, certain vulnerabilities are most applicable to a web App Firewall. Following are lists of those vulnerabilities, categorized by whether they are addressed by WASC 1.0, WASC 2.0, or best practices signature types.

### WASC 1.0 signature types

- HTTP Request Smuggling
- HTTP Response Splitting
- HTTP Response Smuggling

- Null Byte Injection
- Remote File Inclusion
- URL Redirector Abuse

### **WASC 2.0 signature types**

- Abuse of Functionality
- Brute Force
- Content Spoofing
- Denial of Service
- Directory Indexing
- Information Leakage
- Insufficient Anti-automation
- Insufficient Authentication
- Insufficient Authorization
- Insufficient Session Expiration
- LDAP Injection
- Session Fixation

### **Best Practices**

- Autocomplete Attribute
- Insufficient Cookie Access Control
- Insufficient Password Strength
- Invalid HTTP Method Usage
- Non-HttpOnly Session Cookie
- Persistent Session Cookie
- Personally Identifiable Information
- Secured Cachable HTTP Messages
- Unsecured Session Cookie

## **Streaming support for request processing**

September 21, 2020

Citrix Web App Firewall supports request side streaming to provide a significant performance boost. Instead of buffering a request, the appliance examines the incoming traffic for security violation such as SQL, cross-site scripting, field consistency, field formats. When the appliance completes processing data for a field, the request is forwarded to the back-end server while the appliance continues

to evaluate other fields. This data processing significantly improves the processing time in handling forms that have many fields.

**Note:**

Citrix Web App Firewall supports a maximum post size of 20 MB without streaming. For better resource utilization, Citrix recommends you to enable streaming only for payloads greater than 20 MB. Also, the back-end server must accept the chunked requests if streaming is enabled.

Although the streaming process is transparent to the users, minor configuration adjustments are required due to the following changes:

**RegEx Pattern Match:** RegEx pattern match is now restricted to 4K for contiguous character string match.

**Field Name Match:** Web App Firewall learning engine can only distinguish the first 128 bytes of the name. If a form has multiple fields with names that have identical string match for the first 128 bytes, the learning engine does not distinguish them. Similarly, the deployed relaxation rule might inadvertently relax all such fields.

Removal of white spaces, percent decoding, unicode decoding, and charset conversion are done during canonicalization to provide security check inspection. The 128 byte limit is applicable for canonicalized representation of the field name in UTF-8 character format. The ASCII characters are 1 byte in length but the UTF-8 representation of the characters in some international languages might range from 1 byte to 4 bytes. If each character in a name takes 4 bytes for converting to UTF-8 format, only first 32 characters in the name might be distinguished by the learned rule.

**Field Consistency Check:** When you enable Field Consistency, all the forms in the session are stored based on the “as\_fid” tag inserted by the Web App Firewall without considering the “action\_url.”

- **Mandatory Form tagging for Form Field consistency:** When the field consistency check is enabled, the form tag must be enabled also. The Field Consistency protection might not work if form tagging is turned off.
- **Sessionless Form Field Consistency:** The Web App Firewall no longer carries out the “GET” to “POST” conversion of forms when sessionless field consistency parameter is enabled. The form tag is required for sessionless field consistency also.
- **Tampering of as\_fid:** If a form is submitted after tampering as\_fid, it triggers field consistency violation even if no field was tampered. In non-streaming requests, this was allowed because the forms can be validated using the “action\_url” stored in the session.

**Signatures:** The signatures now have the following specifications:

- **Location:** It is now a mandatory requirement that location must be specified for each pattern. All patterns in the rule **MUST** have a <Location> tag.
- **Fast Match:** All signature rules must have a fast match pattern. If there is no fast match pattern, an attempt is made to select one if possible. Fast match is a literal string but some PCRE's can

be used for fast match if they contain a usable literal string.

- **Deprecated Locations:** Following locations are no longer supported in signature rules.
  - HTTP\_ANY
  - HTTP\_RAW\_COOKIE
  - HTTP\_RAW\_HEADER
  - HTTP\_RAW\_RESP\_HEADER
  - HTTP\_RAW\_SET\_COOKIE

**XSS/SQL Transform:** Raw data is used for transformation because the SQL special characters such as single quote('), backslash (\), and semicolon (;), and cross-site scripting tags are same and do not require canonicalization of data. Representation of special characters such as HTML entity encoding, percent encoding, or ASCII are evaluated for transform operation.

The Web App Firewall no longer inspects both the attribute name and value for the cross-site scripting transform operation. Now only cross-site scripting attribute names are transformed when streaming is engaged.

**Processing XSS Tags:** As part of the streaming changes in NetScaler 10.5.e build and later, the processing of the cross-site scripting tags has changed. In earlier releases, presence of either open bracket (<), or close bracket (>), or both open and close brackets (<>) was flagged as cross-site scripting Violation. The behavior has changed in 10.5.e build onwards. Presence of only the open bracket character (<), or only the close bracket character (>) is no longer considered as an attack. This is when an open bracket character (<) is followed by a close bracket character (>), the Cross-site scripting attack gets flagged. Both characters must be present in the right order (< followed by >) to trigger Cross-site scripting violation.

**Note:**

**Change in SQL violation log Message:** As part of the streaming changes in 10.5.e build onwards, we now process the input data in blocks. RegEx pattern matching is now restricted to 4K for contiguous character string matching. With this change, the SQL violation log messages might include different information compared to the earlier builds. The keyword and special character in the input are separated by many bytes. The appliance has a track of the SQL keywords and special strings when processing the data, instead of buffering the entire input value. In addition to the field name, the log message includes SQL keyword, SQL special character, or both the SQL keyword and the SQL special character. The rest of the input is no longer included in the log message, as shown in the following example:

**Example:**

In 10.5, when the Web App Firewall detects the SQL violation, the entire input string might be included in the following log message:

SQL Keyword check failed for field **text="select a name from testbed1\;\(\;)"**\*<blocked>

In 11.0, we log only the field name, keyword, and special character (if applicable) in the following log message.

SQL Keyword check failed for field **text="select(;)"**<blocked>

This change is applicable to requests that contain **application/x-www-form-urlencoded**, or **multipart/form-data**, or **text/x-gwt-rpc** content-types. Log messages generated during processing of **JSON** or **XML** payloads are not affected in this change.

**RAW POST Body:** The security check inspections are always done on RAW POST body.

**Form ID:** The Web App Firewall inserted “as\_fid” tag, which is a computed hash of the form is longer unique for the user session. It is an identical value for a specific form irrespective of the user or the session.

**Charset:** If a request does not have a charset, the default charset specified in the application profile is used when processing the request.

**Counters:**

Counters with prefix “se\_” and “appfwreq\_” are added to track the streaming engine and streaming engine request counters.

nsconsmg -d statswt0 -g se\_err\_

nsconsmg -d statswt0 -g se\_tot\_

nsconsmg -d statswt0 -g se\_cur\_

nsconsmg -d statswt0 -g appfwreq\_err\_

nsconsmg -d statswt0 -g appfwreq\_tot\_

nsconsmg -d statswt0 -g appfwreq\_cur\_

\_err counters: indicate the rare event which should have succeeded but failed due to either memory allocation problem or some other resource crunch.

\_tot counters: ever increasing counters.

\_cur counters: counters indicating current values that keep changing based on usage from current transactions.

**Tips:**

- The Web App Firewall security checks must work the same as before.
- There is no set ordering for the processing of the security checks.
- The response side processing is not affected and remains unchanged.
- Streaming is not engaged if CVPN is used.

**Important:**

**Calculating the Cookie length:** In release 10.5.e in addition to 11.0 release (in builds before 65.x), Web App Firewall way of processing the cookie header was changed. The appliance evaluated the cookie individually, and if the length of a cookie in the cookie header exceeded the configured length, the Buffer Overflow violation was triggered. As a result, requests blocked in NetScaler 10.5 version or earlier releases might be allowed. The length of the entire cookie header is not calculated for determining the cookie length. In some situations, the total cookie size might be larger than the accepted value, and the server might respond with “400 Bad Request”.

**Note:**

The change has been reverted. The behavior in NetScaler version 10.5.e to version 59.13xx.e and its subsequent builds is similar to the non-enhancement builds of release 10.5. The entire raw Cookie header is now considered when calculating the length of the cookie. Surrounding spaces and the semicolon (;) characters separating the name-value pairs are also included in determining the cookie length.\*

## Trace HTML requests with security logs

September 21, 2020

**Note:**

This feature is available in Citrix ADC release 10.5.e.

Troubleshooting a problem, which requires analysis of data received in the client request can be quite challenging specially when there is heavy traffic flowing through the box. Diagnosing issues which may affect the functionality or security of the application require a quick response.

The Citrix ADC now offers the option to isolate traffic for a specific Web App Firewall profile and collect nstrace for the HTML requests that trigger a log or block action or malformed requests that might be causing reset or aborts. The nstrace collected in `-appfw` mode will include details of the entire request including the Web App Firewall generated log messages. You can use “Follow TCP stream” in the trace to view the details of the individual transaction including headers, payload, as well as the corresponding log message, together in the same screen.

This gives you a comprehensive overview regarding your traffic. Having a detailed view of the request, payload, and associated log records can be very useful to analyze security check violation. You can easily identify the pattern that is triggering the violation. If the pattern should be allowed, you can take a decision to modify the configuration and/or add a relaxation rule.

This enhancement helps in troubleshooting the Citrix ADC and offers the following benefits:

1. **Isolate traffic for specific profile:** This enhancement can be quite useful when you need to isolate traffic for only one profile or specific transactions of a profile for troubleshooting. You no longer have to skim through the entire data collected in the trace or need special filters to isolate requests that are of interest to you which can be tedious especially with heavy traffic. You now have the option to view only the data that you are interested in.
2. **Collect data for specific requests:** The trace can be collected for a specified duration. You can collect trace for only a couple of requests to isolate, analyze, and debug specific transactions if needed.
3. **Identify resets or aborts:** Unexpected closing of connections are not easily visible. The trace collected in `-appfw` mode captures a reset or an abort, triggered by the Web App Firewall. This allows a quicker isolation of issue when you do not see a security check violation message. Malformed requests or other non-RFC compliant requests terminated by Web App Firewall will now be easier to identify.
4. **View decrypted SSL traffic:** HTTPS traffic is captured in plain text to allow for easier troubleshooting.
5. **Provides comprehensive view:** Allows you to look at the entire request at the packet level, check the payload, look at the logs to check what security check violation is being triggered and identify the match pattern in the payload. If the payload consists of any unexpected data, junk strings, or non-printable characters (null character, `\r` or `\n` etc), they are easy to discover in the trace.
6. **Modify configuration:** The debugging can provide useful information to decide if the observed behavior is the correct behavior or the configuration should be modified.
7. **Expedite response time:** Faster debugging on target traffic can improve the response time to provide explanations and/or root cause analysis by Citrix engineering and support team.

Please see any task topic in eDocs for documenting tasks. [Manual Configuration by using the command line interface](#)

To configure debug tracing for a profile by using the command line interface

Step 1. Enable tracing for the profile. You can use the `show` command to verify the configured setting.

- `set appfw profile <profile> -trace ON`

Step 2. Start collecting trace. You can continue to use all the options which are applicable for the `nstrace` command.

- `start nstrace -mode APPFW`

Stop collecting the trace

- `stop nstrace`

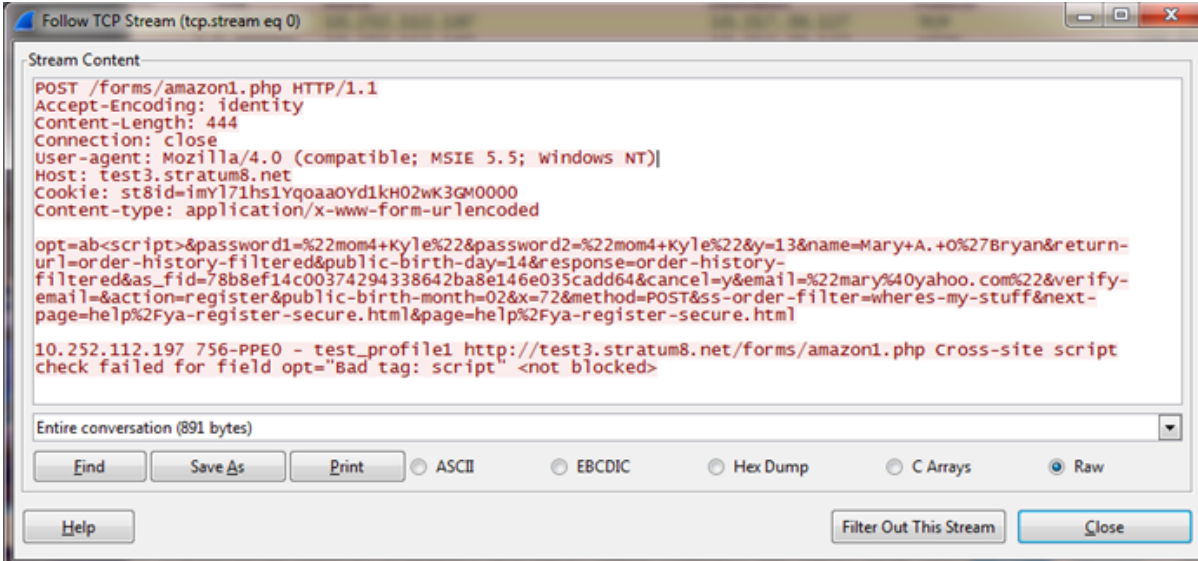

**Location of the trace:** The `nstrace` is stored in a time-stamped folder which is created in the `/var/nstrace` directory and can be viewed using `wireshark`. You can tail the `/var/log/ns.log` to see the log messages providing details regarding the location of the new trace.

**Tips:**

- When `-appfw` mode option is used, the `nstrace` will only collect the data for the profile(s) for which “trace” was enabled.
- Enabling trace on the profile will not automatically start collecting the traces till you explicitly execute the “start nstrace” command to collect the trace.
- Although, enabling trace on a profile may not have any adverse effect on the performance of the Web App Firewall but you may want to enable this feature only for the duration for which you want to collect the data. It is recommended that you turn the `-trace` flag off after you have collected the trace. This will prevent the risk of inadvertently getting data from profiles for which you had enabled this flag in the past.
- The Block or Log action must be enabled for the security check for the transaction record to be included in the `nstrace`.
- Resets and aborts will be logged independently of security checks actions when trace is “On” for the profile(s).
- This feature is only applicable for troubleshooting the requests received from the client. The traces in `-appfw` mode do not include the responses received from the server.
- You can continue to use all the options which are applicable for the `nstrace` command. For example,  

```
start nstrace -tcpdump enabled -size 0 -mode appFW
```
- If a request triggers multiple violations, the `nstrace` for that record will include all the corresponding log messages.
- CEF log message format is supported for this functionality.
- Signature violations triggering block and/or log action for request side checks will also be included in the trace.
- Only HTML (non-XML) requests are collected in the trace.

Example of a Log record in the trace:

```
Follow TCP Stream (tcp.stream eq 0)
Stream Content
POST /forms/amazon1.php HTTP/1.1
Accept-Encoding: identity
Content-Length: 444
Connection: close
User-agent: Mozilla/4.0 (compatible; MSIE 5.5; windows NT)
Host: test3.stratum8.net
Cookie: st8id=imy171hs1yqoaa0Yd1kH02wK3GM0000
Content-type: application/x-www-form-urlencoded

opt=ab<script>&password1=%22mom4+Kyl%22&password2=%22mom4+Kyl%22&y=13&name=Mary+A.+0%27Bryan&return-url=order-history-filtered&public-birth-day=14&response=order-history-filtered&as_fid=78b8ef14c00374294338642ba8e146e035cadd64&cancel=y&email=%22mary%40yahoo.com%22&verify-email=&action=register&public-birth-month=02&x=72&method=POST&ss-order-filter=wheres-my-stuff&next-page=help%2Fya-register-secure.html&page=help%2Fya-register-secure.html

```

## Web App Firewall support for cluster configurations

March 16, 2021

### Note:

Citrix Web App Firewall support for Striped and partially striped configurations was introduced in Citrix ADC 11.0 version.

A cluster is a group of Citrix ADC appliances that are configured and managed as a single system. Each appliance in the cluster is called a node. Depending on the number of nodes the configurations are active on, cluster configurations are referred to as striped, partially striped, or spotted configurations. The Web App Firewall is fully supported in all configurations.

The two main advantages of striped and partially striped virtual server support in cluster configurations are the following:

1. Session failover support—Striped and partially striped virtual server configurations support session failover. The advanced Web App Firewall security features, such as Start URL Closure and the Form Field Consistency check, maintain and use sessions during transaction processing. In ordinary high availability configurations, or in spotted cluster configurations, when the node that is processing the Web App Firewall traffic fails, all the session information is lost and the user has to reestablish the session. In striped virtual server configurations, user sessions are replicated across multiple nodes. If a node goes down, a node running the replica becomes the owner. Session information is maintained without any visible impact to the user.
2. Scalability—Any node in the cluster can process the traffic. Multiple nodes of the cluster can process the incoming requests served by the striped virtual server. This improves the Web App

Firewall's ability to handle multiple simultaneous requests, thereby improving the overall performance.

Security checks and signature protections can be deployed without the need for any additional cluster-specific Web App Firewall configuration. You just do the usual Web App Firewall configuration on the configuration coordinator (CCO) node for propagation to all the nodes.

**Note:**

The session information is replicated across multiple nodes, but not across all the nodes in the striped configuration. Therefore, failover support accommodates a limited number of simultaneous failures. If multiple nodes fail simultaneously, the Web App Firewall might lose the session information if a failure occurs before the session is replicated on another node.

## Highlights

- Web App Firewall offers scalability, high throughput, and session failover support in cluster deployments.
- All Web App Firewall security checks and signature protections are supported in all cluster configurations.
- Character-Maps are not yet supported for a cluster. The learning engine recommends Field-Types in learned rules for the Field Format security check.
- Stats and learned rules are aggregated from all the nodes in a cluster.
- Distributed Hash Table (DHT) provides the caching of the session and offers the ability to replicate session information across multiple nodes. When a request comes to the virtual server, the Citrix ADC appliance creates Web App Firewall sessions in the DHT, and can also retrieve the session information from the DHT.
- Clustering is licensed with the Advanced and Premium licenses. This feature is not available with the Standard license.

## Debugging and troubleshooting

September 21, 2020

Refer to the following troubleshooting and debugging information related to each of the Web App Firewall functionality:

- [Application Firewall - High CPU](#)
- [Memory](#)
- [Large File Upload Failure](#)
- [Learning](#)

- [Signatures](#)
- [Trace log](#)
- [Miscellaneous](#)

## High CPU

September 21, 2020

Following are some of the functionality and high CPU related debugging issues encountered and the best practices to follow when working with Web App Firewall:

- **Check Policy hits, Bindings, Network configuration, Web App Firewall configuration**
  - Identify misconfiguration
  - Identify vserver that is serving the affected traffic
- **Inspect logs in the following log files for security violations and recent configuration changes**
  - `/var/log/ns.log`
  - `/var/nslog/import.log`
  - `/var/nslog/aslearn.log`
  - `tail -f /var/log/ns.log | grep APPFW_SIGNATURE_MATCH`

Example:

```
1 Jun 13 01:11:09 <local0.info> 10.217.31.98 CEF:0|Citrix|NetScaler|NS11
  .0|APPFW| APPFW_SIGNATURE_MATCH|6|src=10.217.253.62 spt=61141 method
  =GET request= http://aaron.stratum8.net/FFC/wwwboard/passwd.txt msg=
  Signature violation rule ID 807: web-cgi /wwwboard/passwd.txt access
  cn1=140 cn2=841 cs1=pr_ffc cs2=PPE0 cs3=
  OyTgjbXBqcpBFENKdlde30kMQ00001 cs4=ALERT cs5=2015 cs6=web-cgi act=
  not blocked
2 <!--NeedCopy-->
```

- **Isolate the traffic that is effected**
  - Isolate the profile
  - Isolate the security check
  - Isolate the URL, vserver and traffic parameters
- **Conditional profile level trace helps identify the traffic and violation records**
  - `set appfw profile <profile> -trace ON`

- `start nstrace -mode APPFW -size 0`
- `stop nstrace`

Note: Ensure that the trace is collected with -size 0 option.

• **Check appfw, dht, IP reputation activity counters**

- `nsconmsg -g as_ -g appfwreq_ -g iprep -d current`

• **Monitor window size for resets in connection**

- Appfw sets the window size to 9845 when Citrix ADC resets the connection due to an invalid http message.

**Examples:**

- Malformed request received - connection reset
  - High CPU related issues
  - Check data sheets for system limits
  - Inspect for cpu usage, appfw, DHT and memory related activity. Monitor appfw sessions
  - `nsconmsg -g cc_cpu_use -g appfwreq -g as -g dht -g mem_AS_OBJ -g mem_AS_COMPONENT -d current`
- Monitor memory allocated and freed from Web App Firewall components and objects during the target time period. It helps in isolating the protection leading to high CPU usage.

- Profiler output

- Observe logs

• **Isolate appfw check leading to high CPU**

- startURLClosure
- Formfiledconsistency
- CSRF
- Cookie protections
- Referer header check

**Ascertain that autoupdate of signatures is not leading to high CPU (Disable to confirm).**

## Memory

September 21, 2020

Following are some of the best practices to follow when encountered with Web App Firewall usage memory related issues:

**nsconmsg command usage:**

- Look for global memory statistics to ascertain that there is enough memory in the system and there are no memory allocation failures by executing the following command:

```
* *- nsconmsg -d memstats
```

- Observe current allocated and maximum memory limits for appsecure, IP reputation, cache and compression by executing the following command:

```
-nsconmsg -d memstats | egrep -i APPSECURE|IPREP|CACHE|CMP
```

- Check appfw, DHT, IP reputation activity counters by executing the following command:

```
-nsconmsg -g as -g appfwreq_ -g iprep -d current
```

- Check all Web App Firewall error counters by executing the following command:

```
-nsconmsg -g as_ -g appfwreq_ -g iprep_ -d stats | grep err
```

- Check all system error counters by executing the following command:

```
-nsconmsg -g err -d current
```

- Inspect for CPU, APPFWREQ, AS and DHT counters by executing the following command:

```
• nsconmsg -g cc_cpu_use -g appfwreq -g as -g dht -d current
```

- Check the configured Cache memory by executing the following command:

```
• show cacheparameter
```

- Check the configured memory by executing the following command:

```
• nsconmsg -d memstats | egrep -i CACHE
```

- Identify distribution of memory in Web App Firewall components and objects:

**Display AS\_OBJ\_memory:**

```
• nsconmsg -K newslog -d stats | grep AS_OBJ | egrep -v AppFW_cpu0|total  
| sort -k3
```

**Display AS\_COMPONENT\_memory:**

```
• nsconmsg -K newslog -d stats | grep AS_COMPONENT | egrep -v AppFW_cpu0  
|total | sort -k3
```

- Check for number of alive sessions by executing the following command:

**Monitor/plot active session counts:**

```
• nsconmsg -g as_alive_sessions -d current
```

**Monitor/plot total allocated, free, updated sessions:**

- `nsconmsg -g as_tot_alloc_sessions -g as_tot_free_sessions -d current`
- `nsconmsg -g as_tot_update_sessions -d current`

If required, reduce session timeout to ensure that session limits are not used by executing the following command:

```
-set appfwsettings -sessionTimeout <300>
```

If required, set maximum lifetime of session by executing the following command:

```
-set appfwsettings -sessionLifetime <7200>
```

## Checking allocated and used memory

To check the total allocated memory and used memory:

- Use the `nsconmsg -d memstats` command. Observe the **MEM\_APPSECURE** field.
- Use the `stat appfw` command to obtain memory consumption information.

Web App Firewall does not automatically delete the logs after certain period of time or size.

- All AppFw logs are archived in the `*/var/log/ns.log*` file. The `ns.log` file performs the rollover task.

For more information, refer to the following link: <http://support.citrix.com/article/CTX121898>

## Increasing Web App Firewall memory:

- There is no CLI option to increase Web App Firewall memory. Web App Firewall memory is platform-specific.
- You may use the `nsapimgr` option to increase memory but it is not recommended.

The max allowed memory for Web App Firewall is determined by the platform and disabling IC does not impact memory allocation.

## Large file upload failure

September 21, 2020

When you encounter large file upload failures, ensure that you check the following:

- Misconfigured application firewall postbody limit.
- Enabled file upload scanning leading to increased processing time.
- Hitting system limits.

For payloads greater than 20 MB, Citrix recommends you to enable streaming on the application firewall profile. Also, you must ensure the back-end server supports chunked requests before enabling streaming.

Since release 11.0, the streaming flag can be enabled on per profile basis to avoid buffering by executing the following command:

```
set appfw profile <profile name> -streaming on
```

## Learning

September 21, 2020

Following are some of the best practices recommended when encountered with Learning functionality issues:

### Aslearn process:

- Verify that the process *aslearn* is running.
- Check top command output
- Check output of ps command by executing the following command:

```
-ps -ax | grep aslearn | grep -v "grep"
```

### Example:

```
1 root@ns\# ps -ax | grep aslearn | grep -v "grep"
2
3 1439 ?? Ss      0:03.86 /netscaler/aslearn -start -f /netscaler/
   aslearn.conf
4 <!--NeedCopy-->
```

• Identify recent configuration commands executed prior to the observed problem by verifying the *ns.log* file:

- `/var/log/ns.log`
- Inspect aslearn logs to check for aslearn messages:
  - `/var/log/aslearn.log`
- Isolate the profile and security check that is effected
- Identify the GUI and CLI command which is failing by executing the following command:
  - `show appfw learningdata <profileName> <securityCheck>`

**Examples:**

- show learningdata test\_profile starturl
  - show learningdata test\_profile crosssiteScripting
  - show learningdata test\_profile sqlInjection
  - show learningdata test\_profile csRFtag
  - show learningdata test\_profile fieldformat
  - show learningdata test\_profile fieldconsistency
- Perform integrity check of sqlite from bsd shell prompt:
    - nsshell ## sqlite3 /var/nslog/asl/<profile\_name\_in\_lowercase>.db 'pragma integrity\_check;'

**Examples:**

```
1 - root@ns# sqlite3 /var/nslog/asl/tsk0247284.db 'pragma integrity_check
;'
```

```
2 Ok
```

```
3 <!--NeedCopy-->
```

- Deploy or remove rules to start learning again:
  - If 2000 learn items (per protection) are reached, you cannot start learning any more for that protection
  - If 20 MB size is reached for the database, stop learning for all protections
  - Restart aslearn process

```
*/netcaler/aslearn -start -f/netcaler/aslearn.conf*
```

- Check the space in the /var folder by executing the following:
  - du -h /var
- Check the learning threshold limits by executing the following command:
  - show appfwlearningsettings <profile\_name> <securityCheck>
- Collect learned data by executing the following command:
  - export appfwlearningdata <profile\_name> <securityCheck>
- Ascertain that learned data is uploaded in the collector.

## Signatures

September 21, 2020

### Getting started with signatures

To add signature:

1. Select the **Default**-signature and click **add** to make a copy.
2. Give a meaningful name. The new sig object is added as a User-Defined object.
3. Enable the target rules that are pertinent to your specific need.
  - The rules are disabled by default.
  - more rules require more processing
- 4; Configure the actions:
  - Block and Log actions are enabled by default. Stats is another option
- 5; Set the signature to be used by your profile.

### Tips for Using Signatures

- Optimize the processing overhead by enabling only those signatures that are applicable for protecting your application.
- Every pattern in the rule must match to trigger a signature match.
- You can add your own customized rules to inspect incoming requests to detect various types of attacks, such as SQL injection or cross-site scripting attacks.
- You can also add rules to inspect the responses to detect and block leakage of sensitive information such as credit card numbers.
- Add multiple security check conditions to create your own customized check.

### Best Practices for Using Signatures

Following are some of the best practices you can follow when encountered with issues related to Signatures:

- Verify that the import command has succeeded on primary as well as secondary.
- Verify that CLI and GUI outputs are consistent.
- Check ns.log to identify any errors during signature import and auto update.

- Check if the DNS name server is configured properly.
- Check schema version incompatibility.
- Check if the device is unable to access the Signature Update URL hosted on AWS for auto-update.
- Check for the version mismatch between Default signature and user-added ones.
- Check for version mismatch between signature objects on the primary and secondary nodes.
- Monitor for High CPU Utilization (disable auto-update to rule out issue with signature update).

## Trace Log

September 21, 2020

To record trace logs:

1. Enable tracing for the profile. You can use the show command to verify the configured setting.

```
set appfw profile <profile> -trace ON
```

2. Start collecting trace. You can continue to use all the options which are applicable for the nstrace command.

```
start nstrace -mode APPFW
```

3. Stop collecting the trace

```
stop nstrace
```

Location of the trace: The nstrace is stored in a time-stamped folder which is created in the `/var/nstrace` directory and can be viewed using Wireshark. You can tail the `/var/log/ns.log` file to see the log messages providing details regarding the location of the new trace.

Advantages of trace logs:

- Isolate traffic for specific profile
- Collect data for specific requests
- Identify resets or aborts
  - View decrypted SSL traffic: HTTPS traffic is captured in plain text to allow for easier troubleshooting.
- Provides comprehensive view: Allows you to look at the entire request at the packet level, check the payload, view logs to check what security check violation is being triggered and identify the match pattern in the payload. If the payload consists of any unexpected data, junk strings, or non-printable characters (null character, `\r` or `\n` etc), they are easy to discover in the trace.
- Expedite response time: Faster debugging on target traffic to do root cause analysis.

## Miscellaneous

September 21, 2020

Following are the resolutions for some of the issues that you might encounter when using Web App Firewall.

- Web App Firewall sets window size to 9845 when resetting connection for invalid http messages.
  - Malformed request received - connection reset [Client/Server sending invalid content-length header]
  - Unknown content-type in request headers
- System Limit: the application appears frozen
  - Occurs when maximum session limit is reached. (100K)
  - Less system memory for operation.
- IP Reputation feature not working
  - The iprep process takes about five minutes to start after you enable the reputation feature. The IP reputation feature might not work for that duration.
- Unexpected Web App Firewall violations being triggered
  - Session timeout has a default value of 900 seconds. If session timeout is set to a low value, browser may trigger false positives for checks which rely on sessionization (e.g CSRF, FFC). Check for session timeout and look at the session ID (cs3 in CEF logs). If the sessionID is different, the session timeout could be the reason.
  - If form is dynamically generated by javascript, it may trigger false FFC violations.
- Empty field name in FFC violation logs (prior to 11.0 release)

This may be seen in scenarios where we come across a form field which is not in the forms in our session.

Scenarios where this may occur:

- The session has timed out from when the form was sent to the client and when it was received.
- The form was generated on the client side using a java script.

## Signature alert Articles

September 21, 2020

Citrix Web Application Firewall (WAF) announces signature updates that you can download and apply on your appliance. When you detect a security attack, you will receive an email notification about the new signature update. You can download the signature and apply it on your appliance.

## How to receive signature alert notification

September 21, 2020

This article explains how to configure signature alert settings to receive email notifications for new signature updates.

## Summary

Network administrators would like to receive an email notification for new Web Application Firewall signature updates and notification.

## Problem

A Network administrator who wants to be notified when a new signature is available for the Web Application Firewall can elect to be notified by email. The administrator receives an email notification when new signatures are available to be downloaded.

Network administrators to receive email notification for new signature updates.

To notify a Citrix ADC administrator about a new signature alert for download. To receive a notification, the user must enable the email and signature alert settings. Once done, the administrator receives a notification through email.

## Solution

To receive email notification for new signature updates, follow the steps given below:

1. Sign into Citrix support website, <https://support.citrix.com/user/alerts>.
2. In the **Alert Settings** section, enable the Notify me through email option.
3. Select **Add Products** to view the product catalog.
4. Click **Application Firewall** and then click the **Signatures** check box.
5. Click **Save Settings**.

## Alert Settings

Notify me through email.

---

**Notify Me About Security Bulletins**  
Citrix occasionally issues security alerts when vulnerabilities are identified in our products.

---

**Notify Me About Software Updates**  
Citrix releases occasional software updates and hotfixes. Add products here to receive notifications.

2. Select **Add Products** to view the product catalog.
3. Click **Application Firewall** and then click the **Signatures** check box.
4. Click **Save Settings**.

## Signature update version 27

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in version 27. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

## Signature version

Signature version 27 applicable to NetScaler VPX 11.1, NetScaler 12.0, and Citrix ADC 12.1 platforms.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID           | Description                                                                               |
|----------------|------------------|-------------------------------------------------------------------------------------------|
| 999921         | cve-2018-1002000 | WEB-MISCWordpress Arigato Autoresponder and Newsletter SQL Injection vulnerability.       |

## Signature update version 28

September 21, 2020

New signature rules are generated for the vulnerabilities identified in version 28. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

### Signature version

Signature version 28 applicable to NetScaler VPX 11.1, NetScaler 12.0, and Citrix ADC 12.1 and Citrix ADM 13.0 platforms.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                  |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------|
| 999898                | CVE-2018-12895 | WEB-MISC WordPress before 4.9.7-Directory Traversal Vulnerability.                                  |
| 999899                | CVE-2019-9618  | WEB-MISC-GraceMedia Media Player WordPress plug-in 1.0 Arbitrary Local File Inclusion Vulnerability |
| 999900                | CVE-2018-20714 | WEB-MISC WordPress plug-in WooCommerce before 3.4.6 - File Deletion Vulnerability.                  |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                          |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------|
| 999901                | CVE-2018-11868 | WEB-MISC FlowPaper FlexPaper before 2.3.7 can Allow Remote Code Execution-Reset of Config Files.            |
| 999902                | CVE-2018-11868 | WEB-MISC FlowPaper FlexPaper before 2.3.7 can Allow Remote Code Execution.                                  |
| 999903                | CVE-2019-9184  | WEB-MISC-Joomla! J2Store Plugin 3.x Before 3.3.7 Allows SQL Injection.                                      |
| 999904                | CVE-2019-9168  | WEB-MISC WordPress plug-in WooCommerce before 3.5.5-XSS via Photoswipe caption.                             |
| 999905                |                | WEB-MISC WordPress plug-in Abandoned Cart before 5.1.3 for WooCommerce-Stored Cross-Site Scripting.         |
| 999906                | CVE-2019-8942  | WEB-MISC WordPress before 4.9.9 and 5.x before 5.0.1-remote code execution.                                 |
| 999907                | CVE-2019-8942  | WEB-MISC WordPress before 4.9.9 and 5.x before 5.0.1-remote code execution.                                 |
| 999908                | CVE-2019-8942  | WEB-MISC WordPress before 4.9.9 and 5.x before 5.0.1-remote code execution                                  |
| 999909                | CVE-2017-16562 | WEB-MISC-Deluxe Theme UserPro WordPress Plugin Security Bypass Vulnerability Via up_auto_log=true Parameter |

|----------------|----------------|-------------------------------------------------------------------------------------|
| 999910         | CVE-2018-20782 | WEB-MISC WordPress Plugin GloBee before 1.1.2 for WooCommerce-IPN Messages Spoofing |
| 999911         | CVE-2019-6340  | Drupal-Arbitrary Remote Code Execution in Drupal Core 8 RESTful WebServices         |

## Signature update version 29

September 21, 2020

New signature rules are generated for the vulnerabilities identified in version 29. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 29 applicable to NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, and Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules may affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID        | Description                           |
|----------------|---------------|---------------------------------------|
| 999896         | CVE-2019-2725 | Weblogic 10.3.6 Remote Code Execution |
| 999897         | CVE-2019-2725 | Weblogic 10.3.6 Remote Code Execution |

## Signature update for May 2019

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in version 30. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version version 30

Signature version 30 applicable to NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, and Citrix ADC 13.0 platforms.

#### Note

Enabling Post body and Response body signature rules may affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID | Description                                                                                         |

## Signature update version 32

September 21, 2020

New signature rules are generated for the vulnerabilities identified in version 32. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 32 applicable to NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, and Citrix ADC 13.0 platforms.

#### Note

Enabling Post body and Response body signature rules may affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>                   | <b>Description</b>                                                                               |

## Signature update version 33

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in version 33. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 32 applicable to NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, and Citrix ADC 13.0 platforms.

#### Note

Enabling Post body and Response body signature rules may affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Rule</b> | <b>CVE</b>     | <b>Description</b>                                                 | <b>Vulnerability Reference</b>                                                                                                                                                                                                              |

## Signature update version 34

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in version 34. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 34 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, and Citrix ADC 13.0 platforms.

#### Note

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID | Description                                                                                                              |
|----------------|--------|--------------------------------------------------------------------------------------------------------------------------|
| 999843         |        | WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to Version 2.0.46 - Setting Arbitrary File For Read                 |
| 999844         |        | WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to Version 2.0.46 - Arbitrary File Read                             |
| 999845         |        | WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to Version 2.0.46 - File Removal Via File Replacement               |
| 999846         |        | WEB-WORDPRESS WordPress Plugin Ultimate Member Prior to Version 2.0.46 - File Removal                                    |
| 999847         |        | WEB-WORDPRESS WordPress Plugin Shortlinks Prior To 2.1.10 - CSV Injection Vulnerability                                  |
| 999848         |        | WEB-WORDPRESS WordPress Plugin Shortlinks Prior To 2.1.10 - Unauthenticated Stored XSS Vulnerability                     |
| 999849         |        | WEB-WORDPRESS WordPress Plugin FV Flowplayer Video Player Prior To 7.3.13.727 - Unauthenticated Stored XSS Vulnerability |

---

## Signature update version 36

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in version 36. You can download and configure the signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 36 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>    | <b>Description</b>                                                                                                             |

| 999833                | CVE-2019-15106 | WEB-MISC Zoho ManageEngine OpManager Through 12.4x - Authentication Bypass Vulnerability (CVE-2019-15106)                |
| 999948                | CVE-2014-0114  | Apache Struts 1 through 1.3.10 allows ClassLoader manipulation allowing arbitrary code execution via HTTP_FORM_FIELD     |
| 999949                | CVE-2013-4316  | Apache Struts 2 before 2.3.15.2 allows Dynamic Method Invocation by affecting confidentiality, integrity or availability |
| 999950                | CVE-2013-4316  | Apache Struts 2 before 2.3.15.2 allows Dynamic Method Invocation by affecting confidentiality, integrity or availability |

---

**Note:**

Signature rule 999947 is deleted because of performance issue.

## Signature update version 37

September 21, 2020

New signature rules are generated for the vulnerabilities identified in version 37. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 37 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

### Note

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID           | Description                                                                                                               |
|----------------|------------------|---------------------------------------------------------------------------------------------------------------------------|

## Signature update version 38

September 21, 2020

New signature rules are generated for the vulnerabilities identified in version 38. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 38 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

**Common Vulnerability Entry (CVE) insight**

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                            |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------|
| 999800                | CVE-2019-12517 | WEB-WORDPRESS SlickQuiz Plugin Version 1.3.7.1 and Prior - XSS Vulnerability (CVE-2019-12517)                 |
| 999801                | CVE-2019-10392 | WEB-MISC Jenkins Git Client Plugin 2.8.4 And Prior - OS Command Injection Vulnerability (CVE-2019-10392)      |
| 999802                | CVE-2019-8371  | WEB-MISC OpenEMR Prior to 5.0.2 - Remote Code Execution Vulnerability Via Form_Filedata Field (CVE-2019-8371) |
| 999803                | CVE-2019-8371  | WEB-MISC OpenEMR Prior to 5.0.2 - Remote Code Execution Vulnerability Via Form_Image Field (CVE-2019-8371)    |
| 999804                | CVE-2019-12516 | WEB-WORDPRESS SlickQuiz Plugin Version 1.3.7.1 and Prior - SQL Injection Vulnerability (CVE-2019-12516)       |
| 999805                | CVE-2019-1262  | WEB-MISC Microsoft Sharepoint Server - Cross Site Scripting Vulnerability (CVE-2019-1262)                     |

## Signature update for December 2019

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in the week 2019-12-19. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 39 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

#### Note

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                          |
|----------------|----------------|----------------------------------------------------------------------------------------------------------------------|
| 999760         |                | WEB-MISC FusionPBX Versions Prior to 4.4.7 and 4.5.5 - Remote Code Execution Vulnerability Via /app/exec/exec.php    |
| 999761         | CVE-2019-12747 | WEB-MISC Typo3 Prior to 8.7.27 and 9.5.8 - Deserialization of Untrusted Data (CVE-2019-12747)                        |
| 999762         | CVE-2019-13608 | WEB-MISC Citrix StoreFront Server - XML External Entity Injection Vulnerability (CVE-2019-13608)                     |
| 999763         |                | WEB-WORDPRESS WordPress Prior To 5.2.4 - Unauthenticated View Of Private or Draft Posts/Pages Vulnerability Via FORM |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                    |

## Signature update version 40

September 21, 2020

New signatures rules are generated for the vulnerabilities identified for the week 2020-01-14. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

### Signature version

Signature version 40 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

The signature update version 40 includes a fix for the incorrect signature rule 1861. Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                         |
|----------------|----------------|---------------------------------------------------------------------------------------------------------------------|
| 999732         | CVE-2019-1620  | WEB-MISC Cisco Data Center Network Manager Prior To 11.2(1) - Arbitrary File Upload Vulnerability (CVE-2019-1620)   |
| 999733         | CVE-2019-16702 | WEB-MISC Integard Pro 2.2.0.9026 - NoJs Buffer Overflow Vulnerability (CVE-2019-16702)                              |
| 999734         | CVE-2019-1621  | WEB-MISC Cisco Data Center Network Manager Prior To 11.2(1) - Arbitrary File Download Vulnerability (CVE-2019-1621) |
| 999735         | CVE-2019-8451  | WEB-MISC Atlassian Jira Server Before 8.4.0 - Server Side Request Forgery Vulnerability (CVE-2019-8451)             |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                          |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| 999736                |                | WEB-WORDPRESS GDPR Cookie Compliance Plugin Prior to 4.0.3 - Authenticated Arbitrary Settings Deletion Vulnerability        |
| 999737                | CVE-2019-11287 | WEB-MISC Pivotal RabbitMQ 3.7.x prior to 3.7.21 and 3.8.x prior to 3.8.1 - Denial of Service Vulnerability (CVE-2019-11287) |
| 999738                |                | WEB-WORDPRESS Ultimate Addons For Elementor Prior To 1.20.1 - Authentication Bypass Via Facebook Login Vulnerability        |
| 999739                |                | WEB-WORDPRESS Ultimate Addons For Elementor Prior To 1.20.1 - Authentication Bypass Via Google Login Vulnerability          |
| 999740                | CVE-2019-19366 | WEB-MISC FusionPBX Prior to 4.4.10 - XSS Vulnerability in xml_cdr_search.php Via Redirect Parameter (CVE-2019-19366)        |
| 999741                | CVE-2019-16931 | WEB-WORDPRESS Visualizer Plugin Prior to Version 3.3.1 - Unauthenticated XSS Vulnerability (CVE-2019-16931)                 |
| 999742                | CVE-2019-16932 | WEB-WORDPRESS Visualizer Plugin Prior to Version 3.3.1 - Unauthenticated SSRF (CVE-2019-16932)                              |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                    |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------|
| 999743                | CVE-2019-1619  | WEB-MISC Cisco Data Center Network Manager Prior To 11.1(1) - Authentication Bypass Vulnerability (CVE-2019-1619)     |
| 999744                | CVE-2019-12562 | WEB-MISC DotNetNuke Before 9.4.0 - Stored Cross Site Scripting Vulnerability (CVE-2019-12562)                         |
| 999745                | CVE-2019-8371  | WEB-MISC OpenEMR Prior to 5.0.2 - Remote Code Execution Vulnerability Via Form_Filedata Field (CVE-2019-8371)         |
| 999746                | CVE-2019-8371  | WEB-MISC OpenEMR Prior to 5.0.2 - Remote Code Execution Vulnerability Via Form_Image Field (CVE-2019-8371)            |

| 999758                | CVE-2019-15036 | WEB-MISC JetBrains TeamCity Before 2019.1 - OS Command Injection Vulnerability (CVE-2019-15036)                       |
| 999759                | CVE-2019-17239 | WEB-WORDPRESS Download Plugins and Themes from Dashboard Plugin Up To 1.5 - Stored XSS Vulnerability (CVE-2019-17239) |

## Signature update version 41

September 21, 2020

New signature rules are generated for the vulnerabilities identified for the week 2020-02-04. You can download and configure these signature rules to protect your appliance from security vulnerable attacks. The signature update includes the signature ID, signature version, and list of CVEs addressed.

### Signature version

Signature version 41 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

The signature update version 41 includes a fix for the incorrect signature rule 1861. Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                              |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| 999717                |                | WEB-WORDPRESS WordPress Version 5.3.x and Prior - Denial of Service Vulnerability Via xmlrpc.php pingback.ping Method           |
| 999718                |                | WEB-WORDPRESS Backup And Staging By WP Time Capsule Plugin Prior To 1.21.16 - Authentication Bypass Vulnerability               |
| 999719                | CVE-2019-19731 | WEB-MISC Roxy Fileman For .NET 1.4.5 - Path Traversal Vulnerability Via RENAMEFILE (CVE-2019-19731)                             |
| 999720                | CVE-2019-19915 | WEB-WORDPRESS 301 Redirects – Easy Redirect Manager Plugin Up To 2.4.0 - Multiple Vulnerabilities (CVE-2019-19915)              |
| 999721                | CVE-2019-17662 | WEB-MISC Cybele Software ThinVNC Prior to Version 1.0b1 - Directory Traversal Vulnerability (CVE-2019-17662)                    |
| 999722                | CVE-2020-6168  | WEB-WORDPRESS Minimal Coming Soon And Maintenance Mode Plugin Prior To 2.17 - Maintenance Setting Vulnerability (CVE-2020-6168) |
| 999723                | CVE-2020-6166  | WEB-WORDPRESS Minimal Coming Soon And Maintenance Mode Plugin Prior To 2.17 - Theme Change Vulnerability (CVE-2020-6166)        |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                          |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| 999724                | CVE-2020-6166  | WEB-WORDPRESS Minimal Coming Soon And Maintenance Mode Plugin Prior To 2.17 - Export Settings Vulnerability (CVE-2020-6166) |
| 999725                |                | WEB-WORDPRESS InifiniteWP Client Plugin Prior to 1.9.4.5 - Authentication Bypass Vulnerability                              |
| 999726                | CVE-2019-16773 | WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - XSS Vulnerability Via REST API With JSON Object (CVE-2019-16773)          |
| 999727                | CVE-2019-16773 | WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - XSS Vulnerability Via REST API With FORM FIELD (CVE-2019-16773)           |
| 999728                | CVE-2019-16773 | WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - XSS Vulnerability Via user-edit.php (CVE-2019-16773)                      |
| 999729                | CVE-2019-16773 | WEB-WORDPRESS WordPress Versions Prior to 5.3.1 - XSS Vulnerability Via profile.php (CVE-2019-16773)                        |
| 999730                | CVE-2019-16113 | WEB-MISC Bludit 3.9.2 - Image Upload Remote Code Execution Vulnerability Via uuid (CVE-2019-16113)                          |

| Signature rule | CVE ID         | Description                                                                                            |
|----------------|----------------|--------------------------------------------------------------------------------------------------------|
| 999731         | CVE-2019-16113 | WEB-MISC Bludit 3.9.2 - Image Upload Remote Code Execution Vulnerability Via filename (CVE-2019-16113) |

## Signature update for February 2020

September 21, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-02-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 42 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

#### Note

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                    |
|----------------|----------------|----------------------------------------------------------------------------------------------------------------|
| 999707         |                | WEB-WORDPRESS WPCentral Plugin Prior to Version 1.4.8 - Privilege Escalation Vulnerability                     |
| 999708         | CVE-2019-15979 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Command Injection Vulnerability (CVE-2019-15979) |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                    |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------|
| 999709                | CVE-2019-15978 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Command Injection Vulnerability (CVE-2019-15978)        |
| 999710                | CVE-2019-15975 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Authentication Bypass Vulnerability (CVE-2019-15975)    |
| 999711                | CVE-2019-15976 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Authentication Bypass Vulnerability (CVE-2019-15976)    |
| 999712                | CVE-2019-16405 | WEB-MISC Centreon Prior to Version 19.10.2 - Remote Code Execution Vulnerability (CVE-2019-16405)                     |
| 999713                | CVE-2020-7048  | WEB-WORDPRESS WP Database Reset Plugin Up To 3.1 - Unauthenticated DataBase Table Reset Vulnerability (CVE-2020-7048) |
| 999714                | CVE-2020-7108  | WEB-WORDPRESS LearnDash Plugin Prior to Version 3.1.2 - Reflected XSS Vulnerability (CVE-2020-7108)                   |
| 999715                | CVE-2019-15977 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - Authentication Bypass Vulnerability (CVE-2019-15977)    |

| <b>Signature rule</b> | <b>CVE ID</b> | <b>Description</b>                                                                              |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------|
| 999716                | CVE-2020-2096 | WEB-MISC Jenkins Gitlab Hook Plugin Version 1.4.2 and Prior - XSS Vulnerability (CVE-2020-2096) |

## Signature update for February 2020

September 21, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-02-27. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 43 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                              |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| 999696                | CVE-2019-15983 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - XML External Entity Vulnerability (CVE-2019-15983) Via CablePlans |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                      |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------|
| 999697                | CVE-2019-20197 | WEB-MISC Nagios XI 5.6.9 - Authenticated Arbitrary Command Execution Vulnerability (CVE-2019-20197)                     |
| 999698                | CVE-2020-8417  | WEB-WORDPRESS Code Snippets Plugin Prior to 2.14.0 - CSRF Vulnerability (CVE-2020-8417)                                 |
| 999699                |                | WEB-WORDPRESS WPCentral Plugin Prior to Version 1.4.8 - Privilege Escalation Vulnerability                              |
| 999700                | CVE-2020-8596  | WEB-WORDPRESS Participants Database Plugin Prior To 1.9.5.6 - Authenticated SQL Injection Vulnerability (CVE-2020-8596) |
| 999701                | CVE-2020-8426  | WEB-WORDPRESS Elementor Page Builder Plugin Prior To 2.8.5 - Authenticated Reflected XSS Vulnerability (CVE-2020-8426)  |
| 999702                | CVE-2019-19509 | WEB-MISC RConfig 3.9.3 - Remote Code Execution Vulnerability Via ajaxArchiveFiles.php (CVE-2019-19509)                  |
| 999703                | CVE-2019-8449  | WEB-MISC Atlassian Jira Server Before 8.4.0 - Information Disclosure Vulnerability (CVE-2019-8449)                      |
| 999704                | CVE-2019-9194  | WEB-MISC eFinder Prior To 2.1.48 - PHP Connector Command Injection Vulnerability (CVE-2019-9194)                        |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                           |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------------------------|
| 999705                | CVE-2019-15985 | WEB-MISC Cisco Data Center Network Manager Prior To 11.3(1) - SQL Injection Vulnerability (CVE-2019-15985) Via getVmHostData |
| 999706                | CVE-2020-8549  | WEB-WORDPRESS Strong Testimonials Plugin Prior To 2.40.1 - Stored Cross Site Scripting Vulnerability (CVE-2020-8549)         |

## Signature update for April 2020

September 21, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-04-27. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 44 is applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                          |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| 999683                | CVE-2020-9043  | WEB-WORDPRESS wpCentral Plugin Prior To 1.5.1 - Connection Key Disclosure Vulnerability (CVE-2020-9043)                     |
| 999684                |                | WEB-WORDPRESS Duplicate-Post Plugin Version 3.2.3 and Prior - Persistent Cross-site Scripting                               |
| 999685                |                | WEB-WORDPRESS Duplicate-Post Plugin Version 3.2.3 and Prior - Persistent Cross-site Scripting                               |
| 999686                | CVE-2020-0618  | WEB-MISC Microsoft SQL Server Reporting Services - Remote Code Execution Vulnerability (CVE-2020-0618)                      |
| 999687                | CVE-2019-16278 | WEB-MISC Nostromo Nhttpd Prior to 1.3.7 - Strcutl Function Allows Unauthenticated Remote Code Execution (CVE-2019-16278)    |
| 999688                | CVE-2019-1937  | WEB-MISC Cisco UCS Director 6.6.0.0 to 6.6.1.0 and 6.7.0.0 to 6.7.1.0 - Authentication Bypass Vulnerability (CVE-2019-1937) |
| 999689                |                | WEB-WORDPRESS Duplicate-Post Plugin Version 3.2.3 and Prior - Persistent Cross-site Scripting                               |
| 999690                | CVE-2020-9006  | WEB-WORDPRESS Popup Builder Plugin Prior to 3.0 - SQL Injection Via PHP Deserialization Vulnerability (CVE-2020-9006)       |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                              |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| 999691                |                | WEB-WORDPRESS Duplicate-Post Plugin Version 3.2.3 and Prior - Persistent Cross-site Scripting                                   |
| 999692                |                | WEB-MISC prevent request smuggling via content-length and transfer-encoding header                                              |
| 999693                |                | WEB-WORDPRESS ThemeGrill Demo Importer Plugin Prior To 1.6.3 - Authentication Bypass And Database Wipe Vulnerability            |

| 999695                | CVE-2019-17237 | WEB-WORDPRESS IgniteUp Coming Soon and Maintenance Mode Plugin Prior to 3.4.1 - CSRF Vulnerability Via Subject (CVE-2019-17237) |

---

## Signature update for May 2020

September 21, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-05-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 45 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

### Note:

Enabling Post body and Response body signature rules might affect Citrix ADC CPU. According to the latest Snort release, the signature rules with ID 1258, 1306, 2520, 2661, 5695, 10996, 11817, 12056, 15471, 17049 and 21634 have been removed.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                                  |
|----------------|----------------|------------------------------------------------------------------------------------------------------------------------------|
| 999666         |                | WEB-WORDPRESS Duplicator Plugin Prior To 1.3.28 - Unauthenticated Arbitrary File Download Vulnerability                      |
| 999667         | CVE-2020-10220 | WEB-MISC rConfig Through 3.94 - SQL Injection Vulnerability (CVE-2020-10220)                                                 |
| 999668         | CVE-2020-5844  | WEB-MISC Artica Pandora FMS 7.0 - Execution of Arbitrary Files of Dangerous Type Via /attachment/files_repo/ (CVE-2020-5844) |
| 999669         | CVE-2020-8813  | WEB-MISC Cacti Prior to 1.2.10 - Remote Code Execution Vulnerability Via graph_realtime.php (CVE-2020-8813)                  |
| 999670         | CVE-2020-8654  | WEB-MISC EyesOfNetwork 5.3 - Remote Code Execution Vulnerability (CVE-2020-8654)                                             |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                            |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| 999671                | CVE-2020-10196 | WEB-WORDPRESS Sygnoos Popup Builder Plugin Prior to 3.64.1 - Unauthenticated XSS Vulnerability (CVE-2020-10196)               |
| 999672                | CVE-2019-15949 | WEB-MISC Nagios XI Prior To 5.6.6 - Remote Code Execution As Root Vulnerability (CVE-2019-15949)                              |
| 999673                | CVE-2020-10879 | WEB-MISC RConfig 3.9.5 and Prior - Remote Code Execution Vulnerability Via search.crud.php (CVE-2020-10879)                   |
| 999674                | CVE-2020-8656  | WEB-MISC EyesOfNetwork 5.3 - EyesOfNetwork API 2.4.2 SQL Injection Vulnerability (CVE-2020-8656)                              |
| 999675                | CVE-2020-10195 | WEB-WORDPRESS Sygnoos Popup Builder Plugin Prior to 3.64.1 - Authenticated System Information Disclosure (CVE-2020-10195)     |
| 999676                | CVE-2020-10195 | WEB-WORDPRESS Sygnoos Popup Builder Plugin Prior to 3.64.1 - Authenticated Subscriber Information Disclosure (CVE-2020-10195) |
| 999677                | CVE-2020-10195 | WEB-WORDPRESS Sygnoos Popup Builder Plugin Prior to 3.64.1 - Authenticated Settings Modification (CVE-2020-10195)             |

| 999678                | CVE-2020-0646  | Microsoft SharePoint Server - .NET Framework Workflow Remote Code Execution Vulnerability Via SOAP 1.2 (CVE-2020-0646) |
| 999679                | CVE-2020-0646  | Microsoft SharePoint Server - .NET Framework Workflow Remote Code Execution Vulnerability Via SOAP 1.1 (CVE-2020-0646) |
| 999680                | CVE-2020-10221 | WEB-MISC rConfig Through 3.94 - Remote Code Execution Vulnerability (CVE-2020-10221)                                   |
| 999681                | CVE-2019-19134 | WEB-WORDPRESS Hero Maps Premium Prior to 2.2.3 - Unauthenticated Reflected XSS Vulnerability (CVE-2019-19134)          |
| 999682                | CVE-2020-10385 | WEB-WORDPRESS WPForms Plugin Prior to 1.5.9 - Stored XSS Vulnerability (CVE-2020-10385)                                |

---

## Signature update for June 2020

September 21, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-06-03. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 46 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

### Note:

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID        | Description                                                                                                                     |
|----------------|---------------|---------------------------------------------------------------------------------------------------------------------------------|
| 999643         |               | WEB-WORDPRESS 10Web Map Builder for Google Maps Plugin Prior to 10.0.64 - Unauthenticated XSS Vulnerability Via gmwd_setup Page |
| 999644         |               | WEB-WORDPRESS 10Web Map Builder for Google Maps Plugin 10.0.64 and Prior - XSS Vulnerability Via options_gmwd Page              |
| 999645         | CVE-2020-5187 | WEB-MISC DNN Up To 9.4.4 - Path Traversal Vulnerability Via URL (CVE-2020-5187)                                                 |
| 999646         | CVE-2020-5187 | WEB-MISC DNN Up To 9.4.4 - Path Traversal Vulnerability Via Local (CVE-2020-5187)                                               |
| 999647         | CVE-2020-9335 | WEB-WORDPRESS Photo Gallery Plugin Prior to 1.5.46 - XSS Vulnerability Via image_alt_text_Field (CVE-2020-9335)                 |
| 999648         | CVE-2020-9335 | WEB-WORDPRESS Photo Gallery Plugin Prior to 1.5.46 - XSS Vulnerability Via Name Field (CVE-2020-9335)                           |

| <b>Signature rule</b> | <b>CVE ID</b>                    | <b>Description</b>                                                                                                         |
|-----------------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| 999649                | CVE-2020-9335                    | WEB-WORDPRESS Photo Gallery Plugin Prior to 1.5.46 - XSS Vulnerability Via Description Fields (CVE-2020-9335)              |
| 999650                | CVE-2020-10189                   | WEB-MISC Zoho ManageEngine Desktop Central Prior to 10.0.479 - Unauthenticated Remote Code Execution Vuln (CVE-2020-10189) |
| 999651                | CVE-2020-10189                   | WEB-MISC Zoho ManageEngine Desktop Central Prior to 10.0.479 - Unauthenticated Arbitrary File Upload Vuln (CVE-2020-10189) |
| 999652                |                                  | WEB-WORDPRESS Flexible Checkout Fields for WooCommerce Plugin Prior to 2.3.2 - Unauthenticated Settings Modification Vuln  |
| 999653                | CVE-2020-0688                    | WEB-MISC Microsoft Exchange Server - Validation Key Remote Code Execution Vulnerability (CVE-2020-0688)                    |
| 999654                | CVE-2020-8947,<br>CVE-2019-20224 | WEB-MISC Artica Pandora FMS 7.0 - Remote Code Execution Vulnerability Via ip_src Parameter (CVE-2020-8947, CVE-2019-20224) |

| <b>Signature rule</b> | <b>CVE ID</b>                    | <b>Description</b>                                                                                                           |
|-----------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| 999655                | CVE-2020-8947,<br>CVE-2019-20224 | WEB-MISC Artica Pandora FMS 7.0 - Remote Code Execution Vulnerability Via dst_port Parameter (CVE-2020-8947, CVE-2019-20224) |
| 999656                | CVE-2020-8947,<br>CVE-2019-20224 | WEB-MISC Artica Pandora FMS 7.0 - Remote Code Execution Vulnerability Via src_port Parameter (CVE-2020-8947, CVE-2019-20224) |
| 999657                | CVE-2020-8947,<br>CVE-2019-20224 | WEB-MISC Artica Pandora FMS 7.0 - Remote Code Execution Vulnerability Via ip_dst Parameter (CVE-2020-8947, CVE-2019-20224)   |
| 999658                | CVE-2020-5186                    | WEB-MISC DNN Up To 9.5.0 - Cross Site Scripting Vulnerability Via Journal XML Upload (CVE-2020-5186)                         |
| 999659                |                                  | WEB-WORDPRESS WP Sitemap Page Plugin 1.6.2 and Prior - XSS Vulnerability Via wsp_exclude_pages                               |
| 999660                | CVE-2020-5188                    | WEB-MISC DNN Up To 9.5.0 - Insecure Permissions Vulnerability Via UploadFromUrl (CVE-2020-5188)                              |
| 999661                | CVE-2020-5188                    | WEB-MISC DNN Up To 9.5.0 - Insecure Permissions Vulnerability Via UploadFromLocal (CVE-2020-5188)                            |

| <b>Signature rule</b> | <b>CVE ID</b> | <b>Description</b>                                                                                               |
|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------|
| 999662                | CVE-2020-7799 | WEB-MISC FusionAuth Prior To 1.11.0 - Remote Code Execution Vulnerability Via API Theme (CVE-2020-7799)          |
| 999663                | CVE-2020-7799 | WEB-MISC FusionAuth Prior To 1.11.0 - Remote Code Execution Vulnerability Via API Email Template (CVE-2020-7799) |
| 999664                | CVE-2020-7799 | WEB-MISC FusionAuth Prior To 1.11.0 - Remote Code Execution Vulnerability Via GUI Theme (CVE-2020-7799)          |
| 999665                | CVE-2020-7799 | WEB-MISC FusionAuth Prior To 1.11.0 - Remote Code Execution Vulnerability Via GUI Email Template (CVE-2020-7799) |

## Signature update for June 2020

September 21, 2020

New signatures rules are generated for the vulnerabilities identified in the week 2020-06-12. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 47 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                                      |
|----------------|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| 999580         | CVE-2020-6010  | WEB-WORDPRESS LearnPress LMS Plugin Prior to 3.2.6.9 - SQL Injection Vulnerability (CVE-2020-6010)                               |
| 999581         |                | WEB-MISC Nagios XI Up To 5.6.13 - Service Command_Test Arbitrary Command Execution Vulnerability                                 |
| 999582         | CVE-2020-0932  | Microsoft SharePoint Server - WebPart Source Markup Remote Code Execution Vulnerability Via SOAP 1.2 (CVE-2020-0932)             |
| 999583         | CVE-2020-0932  | Microsoft SharePoint Server - WebPart Source Markup Remote Code Execution Vulnerability Via SOAP 1.1 (CVE-2020-0932)             |
| 999584         | CVE-2020-12642 | WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.24.2 - Cross-Site Request Forgery Vulnerability via Import Fields (CVE-2020-12642) |
| 999585         | CVE-2020-12642 | WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.24.2 - Cross-Site Request Forgery Vulnerability via Import Form (CVE-2020-12642)   |
| 999586         | CVE-2020-11450 | WEB-MISC Microstrategy Web 10.4 - Information Disclosure Vulnerability (CVE-2020-11450)                                          |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                         |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------------|
| 999587                | CVE-2020-7935  | WEB-MISC Artica Pandora FMS 7.0 - Unrestricted Upload of File With Dangerous Type Vulnerability Allows RCE (CVE-2020-7935) |
| 999588                | CVE-2020-12116 | WEB-MISC Zoho ManageEngine OpManager Prior to Build 125125 - Information Disclosure Vulnerability (CVE-2020-12116)         |
| 999589                |                | WEB-WORDPRESS Elementor Page Builder Prior to 2.9.6 - Privilege Escalation Vulnerability                                   |
| 999590                | CVE-2020-11738 | WEB-WORDPRESS - Snap Creek Duplicator Plugin Prior to 1.3.28 - Path Traversal Vulnerability (CVE-2020-11738)               |
| 999591                | CVE-2020-10389 | WEB-MISC Chadha PHPKB Standard Multi-Language 9 - Remote Code Execution vulnerability (CVE-2020-10389)                     |
| 999592                | CVE-2020-11516 | WEB-WORDPRESS Contact Form 7 Datepicker Plugin Up To 2.6.0 - Stored XSS Vulnerability (CVE-2020-11516)                     |
| 999593                |                | WEB-MISC Nagios XI Up To 5.6.13 - Export-RRD Arbitrary Command Execution Vulnerability Via Step                            |

## Signature update for July 2020

September 21, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-07-01. You can download and configure these signature rules to protect your appliance from vulnerable attacks.

### Signature version

Signature version 48 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                    |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------|
| 999563                |                | WEB-WORDPRESS Page Builder PageLayer Plugin Prior to 1.1.2 - XSS Vulnerability Via pagelayer_cf_to_email              |
| 999564                |                | WEB-WORDPRESS Page Builder PageLayer Plugin Prior to 1.1.2 - XSS Vulnerability Via pagelayer-phone                    |
| 999565                |                | WEB-WORDPRESS Page Builder PageLayer Plugin Prior to 1.1.2 - XSS Vulnerability Via pagelayer-address                  |
| 999566                | CVE-2020-1961  | WEB-MISC Apache Syncope - Server-Side Template Injection Vulnerability (CVE-2020-1961)                                |
| 999567                | CVE-2019-18935 | WEB-MISC Progress Telerik UI For ASP.NET AJAX - RadAsyncUpload .NET Deserialization Vulnerability (CVE-2019-18935)    |
| 999568                | CVE-2020-9463  | WEB-MISC Centreon 19.10 - OS Command Injection Vulnerability (CVE-2020-9463)                                          |
| 999569                |                | WEB-WORDPRESS Support Review Plugin Prior to 3.7.6 - Unauthenticated Stored Cross Site Scripting Vulnerability        |
| 999570                |                | WEB-WORDPRESS Page Builder PageLayer Plugin Prior to 1.1.2 - Improper Access Control Vuln Via pagelayer_save_template |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                        |

## Signature update for September 2020

October 9, 2020

New signatures rules are generated for the vulnerabilities identified in the week 2020-09-26. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 50 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                         |
|----------------|----------------|---------------------------------------------------------------------------------------------------------------------|
| 999532         | CVE-2020-1956  | WEB-MISC Apache Kylin - Cube Migrate Remote Code Execution Via dest-config (CVE-2020-1956)                          |
| 999533         | CVE-2020-1956  | WEB-MISC Apache Kylin - Cube Migrate Remote Code Execution Via src-config (CVE-2020-1956)                           |
| 999534         | CVE-2020-1956  | WEB-MISC Apache Kylin - Cube Migrate Remote Code Execution Via projectName (CVE-2020-1956)                          |

| 999554                | CVE-2019-10068 | WEB-MISC Kentico CMS Multiple Versions - Unauthenticated Remote Code Execution Vulnerability (CVE-2019-10068) |
| 999555                | CVE-2020-11108 | WEB-MISC Pi-hole Up To 4.4 - Authenticated RCE Vulnerability (CVE-2020-11108)                                 |

## Signature update for Oct 2020

October 23, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-10-13. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 51 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b> | <b>Description</b>                                                                                                        |
|-----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------|
| 999505                |               | WEB-WORDPRESS WordPress Plugin wpDiscuz 7.0.0 Up To 7.0.4 - Unauthenticated Arbitrary File Upload Vulnerability           |
| 999506                |               | WEB-WORDPRESS Quiz & Survey Master - XSS Vulnerability in Questions Feature                                               |
| 999507                | CVE-2020-8604 | WEB-MISC Trend Micro IWS VA Prior to 6.5 SP2 Patch 4 - Path Traversal Vuln Via /log_search and cf Param (CVE-2020-8604)   |
| 999508                | CVE-2020-8604 | WEB-MISC Trend Micro IWS VA Prior to 6.5 SP2 Patch 4 - Path Traversal Vuln Via /collection and cf Param (CVE-2020-8604)   |
| 999509                | CVE-2020-8604 | WEB-MISC Trend Micro IWS VA Prior to 6.5 SP2 Patch 4 - Path Traversal Vuln Via /log_search and File Param (CVE-2020-8604) |
| 999510                | CVE-2020-8604 | WEB-MISC Trend Micro IWS VA Prior to 6.5 SP2 Patch 4 - Path Traversal Vuln Via /collection and File Param (CVE-2020-8604) |
| 999511                | CVE-2020-7361 | WEB-MISC ZenTao Enterprise 8.8.3 and Prior - Remote Code Execution Vulnerability Via Repo-Edit (CVE-2020-7361)            |
| 999512                | CVE-2020-7361 | WEB-MISC ZenTao Pro 8.8.3 and Prior - Remote Code Execution Vulnerability Via Repo-Edit (CVE-2020-7361)                   |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                          |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| 999513                | CVE-2020-7361  | WEB-MISC ZenTao Enterprise 8.8.3 and Prior - Remote Code Execution Vulnerability Via Repo-Create (CVE-2020-7361)            |
| 999514                | CVE-2020-7361  | WEB-MISC ZenTao Pro 8.8.3 and Prior - Remote Code Execution Vulnerability Via Repo-Create (CVE-2020-7361)                   |
| 999515                | CVE-2020-5768  | WEB-WORDPRESS Icegram Email Subscribers & Newsletters Plugin Prior to 4.5.1 - SQL Injection Vulnerability (CVE-2020-5768)   |
| 999516                | CVE-2020-5767  | WEB-WORDPRESS Icegram Email Subscribers & Newsletters Plugin Prior to 4.5.1 - CSRF Vulnerability (CVE-2020-5767)            |
| 999517                | CVE-2020-15299 | WEB-WORDPRESS KingComposer Plugin Prior To 2.9.5 - XSS Vulnerability (CVE-2020-15299)                                       |
| 999518                | CVE-2020-13854 | WEB-MISC Artica Pandora FMS - Privilege Escalation Vulnerability (CVE-2020-13854)                                           |
| 999519                | CVE-2020-13852 | WEB-MISC Artica Pandora FMS - Arbitrary File Upload Vulnerability Via File Manager (CVE-2020-13852)                         |
| 999520                | CVE-2020-13700 | WEB-WORDPRESS WordPress Plugin acf-to-rest-api Before 3.3.0 - Information Disclosure Vulnerability Via URI (CVE-2020-13700) |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                            |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| 999521                | CVE-2020-13700 | WEB-WORDPRESS WordPress Plugin acf-to-rest-api Before 3.3.0 - Information Disclosure Vulnerability Via URL (CVE-2020-13700)   |
| 999522                | CVE-2020-13379 | WEB-MISC Grafana 3.0.1 Through 7.0.1 - CSRF Bypass Leading To DOS Vulnerability (CVE-2020-13379)                              |
| 999523                | CVE-2020-12851 | WEB-MISC Pydio Cells Prior to 2.0.7 - Arbitrary File Write Vulnerability (CVE-2020-12851)                                     |
| 999524                | CVE-2020-12848 | WEB-MISC Pydio Cells Prior to 2.0.7 - Login as Temporary Shared User Vulnerability (CVE-2020-12848)                           |
| 999525                | CVE-2020-11749 | WEB-MISC Artica Pandora FMS Prior To 7.47 - XSS Vulnerability Via SNMP Browser (CVE-2020-11749)                               |
| 999526                | CVE-2020-11579 | WEB-MISC PHPKBV9 - File Exfiltration Vulnerability (CVE-2020-11579)                                                           |
| 999527                | CVE-2020-10546 | WEB-MISC rConfig Prior to 3.9.5 - Unauthenticated SQLi Vulnerability in Compliance Policies Via searchColumn (CVE-2020-10546) |
| 999528                | CVE-2020-10546 | WEB-MISC rConfig Prior to 3.9.5 - Unauthenticated SQLi Vulnerability in Compliance Policies Via searchField (CVE-2020-10546)  |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                   |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------|
| 999529                | CVE-2019-16876 | WEB-MISC Portainer Prior To 1.22.1 - Directory Traversal Vulnerability (CVE-2019-16876)              |
| 999530                |                | WEB-WORDPRESS - ADning Plugin Prior to 1.5.6 - Unauthenticated Arbitrary File Deletion Vulnerability |
| 999531                |                | WEB-WORDPRESS - ADning Plugin Prior to 1.5.6 - Unauthenticated Arbitrary File Upload Vulnerability   |

## Signature update for October 2020

November 2, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-10-29. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 52 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU. Also, vulnerable versions are mentioned in some of the signature rule log string. You must enable it accordingly.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

---

| <b>Signature rule</b> | <b>CVE ID</b>                    | <b>Description</b>                                                                                                    |
|-----------------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 999500                | CVE-2018-14667                   | WEB-MISC RichFaces Framework 3.X Through 3.3.4 - EL Injection Via UserResource (CVE-2018-14667)                       |
| 999501                | CVE-2018-12533                   | WEB-MISC RichFaces Framework 3.1.0 Through 3.3.4 - EL Injection Via Paint2DResource (CVE-2018-12533)                  |
| 999502                | CVE-2015-0279,<br>CVE-2018-12532 | WEB-MISC RichFaces Framework 4.X Through 4.5.17 - EL Injection Via MediaOutputResource (CVE-2015-0279,CVE-2018-12532) |
| 999503                | CVE-2013-2165                    | WEB-MISC RichFaces v4 Prior to 4.3.3 - Java Object Deserialization Vulnerability (CVE-2013-2165)                      |
| 999504                | CVE-2013-2165                    | WEB-MISC RichFaces v3 Prior to 3.3.4 - Java Object Deserialization Vulnerability (CVE-2013-2165)                      |

---

## Signature update for November 2020

December 10, 2020

New signature rules are generated for the vulnerabilities identified in the week 2020-11-10. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 53 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

### Note

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                         |
|----------------|----------------|---------------------------------------------------------------------------------------------------------------------|
| 999411         |                | WEB-WORDPRESS WordPress Plugin wpDiscuz 7.0.0 Up To 7.0.4 - Unauthenticated Arbitrary File Upload Vulnerability     |
| 999412         |                | WEB-WORDPRESS Quiz & Survey Master - XSS Vulnerability in Questions Feature                                         |
| 999413         |                | WEB-WORDPRESS WordPress Plugin File Manager Prior To 6.9 - Unauthenticated eFinder Commands Execution Vulnerability |
| 999414         | CVE-2020-11700 | WEB-MISC Titan SpamTitan Prior To 7.08 - Information Disclosure Vulnerability (CVE-2020-11700)                      |
| 999415         | CVE-2020-9446  | WEB-MISC Apache OFBiz 17.12.03 - XML-RPC Unsafe Deserialization Vulnerability (CVE-2020-9446)                       |
| 999416         | CVE-2020-9446  | WEB-MISC Apache OFBiz 17.12.03 - XML-RPC Cross-Site Scripting Vulnerability (CVE-2020-9446)                         |

| <b>Signature rule</b> | <b>CVE ID</b> | <b>Description</b>                                                                                                       |
|-----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------|
| 999417                | CVE-2020-9047 | WEB-MISC exacqVision Web Service Up To 20.06.3.0 - OS Command Injection Vulnerability (CVE-2020-9047)                    |
| 999418                | CVE-2020-8866 | WEB-MISC Horde Groupware Webmail Edition 5.2.22 - Unrestricted Upload of File Vulnerability Via edit.php (CVE-2020-8866) |
| 999419                | CVE-2020-8866 | WEB-MISC Horde Groupware Webmail Edition 5.2.22 - Unrestricted Upload of File Vulnerability Via add.php (CVE-2020-8866)  |
| 999420                | CVE-2020-8865 | WEB-MISC Horde Groupware Webmail Edition 5.2.22 - Arbitrary File Inclusion Vulnerability Via edit.php (CVE-2020-8865)    |
| 999421                | CVE-2020-8816 | WEB-MISC Pi-hole Prior To 4.3.2 - Remote Code Execution Vulnerability Via removestatic (CVE-2020-8816)                   |
| 999422                | CVE-2020-8816 | WEB-MISC Pi-hole Prior To 4.3.2 - Remote Code Execution Vulnerability Via AddMAC (CVE-2020-8816)                         |

## Signature update for December 2020

January 7, 2021

New signature rules are generated for the vulnerabilities identified in the week 2020-12-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 54 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU. As part of signature update version 54, log string for signature 999720 is changed to ensure that it includes only ASCII characters.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID                          | Description                                                                                                       |
|----------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 999394         | CVE-2020-8255                   | WEB-MISC Pulse Connect Secure Prior To 9.1R9 - Information Disclosure Vulnerability (CVE-2020-8255)               |
| 999395         | CVE-2020-6128                   | WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via CoursePeriodModal.php (CVE-2020-6128)                |
| 999396         | CVE-2020-6126,<br>CVE-2020-6127 | WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via CoursePeriodModal.php (CVE-2020-6126, CVE-2020-6127) |
| 999397         | CVE-2020-28328                  | WEB-MISC SuiteCRM Prior to 7.11.16 - Remote Code Execution Vulnerability (CVE-2020-28328)                         |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                     |

| 999407                | CVE-2020-14883                 | WEB-MISC Oracle WebLogic Server - Authenticated Remote Code Execution Vulnerability (CVE-2020-14883)        |
| 999408                | CVE-2020-14882, CVE-2020-14750 | WEB-MISC Oracle WebLogic Server - Authentication Bypass Vulnerability (CVE-2020-14882, CVE-2020-14750)      |
| 999409                | CVE-2020-11975, CVE-2020-13942 | WEB-MISC Apache Unomi Prior to 1.5.2 - Remote Code Execution Vulnerability (CVE-2020-11975, CVE-2020-13942) |
| 999410                | CVE-2020-11803                 | WEB-MISC Titan SpamTitan Prior To 7.08 - Remote Code Execution Vulnerability (CVE-2020-11803)               |

## Signature update for December 2020

January 7, 2021

New signatures rules are generated for the vulnerabilities identified in the week 2020-12-17. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 55 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

### Note:

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID        | Description                                                                                                                                    |

## Signature update for January 2021

January 29, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-01-18. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 56 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

**Common Vulnerability Entry (CVE) insight**

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                           |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------------------------|
| 999366                | CVE-2020-8466  | WEB-MISC Trend Micro IWSSVA 6.5 SP2 Prior to Build 1919 - Unauthenticated OS Command Injection Vulnerability (CVE-2020-8466) |
| 999367                | CVE-2020-6135  | WEB-MISC OS4Ed OpenSIS Prior to 7.5 - SQLi Vulnerability Via Validator.php (CVE-2020-6135)                                   |
| 999368                | CVE-2020-4001  | WEB-MISC VMWare SD-WAN Orchestrator - Pass-the-Hash Vulnerability (CVE-2020-4001)                                            |
| 999369                | CVE-2020-4000  | WEB-MISC VMWare SD-WAN Orchestrator - Path Traversal Vulnerability (CVE-2020-4000)                                           |
| 999370                | CVE-2020-3984  | WEB-MISC VMWare SD-WAN Orchestrator - SQL Injection Vulnerability Via Modulus (CVE-2020-3984)                                |
| 999371                | CVE-2020-35606 | WEB-MISC Webmin Up to 1.962 - Remote Code Execution Vulnerability (CVE-2020-35606)                                           |
| 999372                | CVE-2020-17143 | WEB-MISC Microsoft Exchange Server - Information Disclosure Vulnerability (CVE-2020-17143)                                   |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                               |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| 999373                | CVE-2020-17141 | WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability Via RouteComplaint (CVE-2020-17141)                     |
| 999374                | CVE-2020-10816 | WEB-MISC Zoho ManageEngine Applications Manager 14 Prior to Build 14790 - Improper Authentication Vulnerability (CVE-2020-10816) |
| 999375                | CVE-2019-5533  | WEB-MISC VMWare SD-WAN Orchestrator - Information Disclosure Vulnerability (CVE-2019-5533)                                       |
| 999376                | CVE-2018-15961 | WEB-MISC Adobe ColdFusion 12 Prior to Update 6 or 14 - Arbitrary File Upload Vulnerability (CVE-2018-15961)                      |

## Signature update for February 2021

February 10, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-02-03. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 57 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

**Common Vulnerability Entry (CVE) insight**

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b> | <b>Description</b>                                                                                                         |

## Signature update for February 2021

March 3, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-02-17. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

## Signature version

Signature version 58 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

## Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                                  |
|----------------|----------------|------------------------------------------------------------------------------------------------------------------------------|
| 999328         | CVE-2021-3317  | WEB-MISC KLog Server 2.4.1 and Prior - OS Command Injection Vulnerability (CVE-2021-3317)                                    |
| 999329         | CVE-2021-3110  | WEB-MISC PrestaShop Prior to 1.7.7.1 - SQL Injection Vulnerability Via id_products (CVE-2021-3110)                           |
| 999330         | CVE-2021-3110  | WEB-MISC PrestaShop Prior to 1.7.7.1 - SQL Injection Vulnerability Via /module/productcomments/-CommentGrade (CVE-2021-3110) |
| 999331         | CVE-2021-25646 | WEB-MISC Apache Druid Prior to 0.20.1 - Remote Code Execution Vulnerability (CVE-2021-25646)                                 |
| 999332         | CVE-2020-36171 | WEB-WORDPRESS Elementor Page Builder Plugin Prior to 3.0.14 - XSS Vulnerability (CVE-2020-36171)                             |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                             |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| 999333                | CVE-2020-35765 | WEB-MISC Zoho ManageEngine Applications Manager Prior to Build 15000 - SQL Injection Vulnerability (CVE-2020-35765)            |
| 999334                | CVE-2020-35589 | WEB-WORDPRESS Limit Login Attempts Reloaded Prior to 2.15.2 - Reflected Cross-Site Scripting Vulnerability (CVE-2020-35589)    |
| 999335                | CVE-2020-26282 | WEB-MISC BrowserUp Proxy Prior to 2.1.2 - Template Injection Leading To RCE Vulnerability Via mostRecentEntry (CVE-2020-26282) |
| 999336                | CVE-2020-26282 | WEB-MISC BrowserUp Proxy Prior to 2.1.2 - Template Injection Leading To RCE Vulnerability Via entries (CVE-2020-26282)         |
| 999337                | CVE-2020-14815 | WEB-MISC Oracle Business Intelligence Enterprise Edition - Reflected Cross-Site Scripting Vulnerability (CVE-2020-14815)       |
| 999338                |                | WEB-WORDPRESS Contact Form 7 Database Addon Prior to 1.2.5.4 - SQLi Vulnerability Via Delete Bulk Action                       |

## Signature update for March 2021

March 9, 2021

New signatures rules are generated for the vulnerabilities identified in the week 2021-03-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 59 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                  |
|----------------|----------------|--------------------------------------------------------------------------------------------------------------|
| 999313         | CVE-2021-25299 | WEB-MISC NagiosXI Up to 5.7.5 - XSS Vulnerability via url (CVE-2021-25299)                                   |
| 999314         | CVE-2021-25298 | WEB-MISC NagiosXI Up to 5.7.5 - Remote Code Execution Vulnerability via DigitalOcean Wizard (CVE-2021-25298) |
| 999315         | CVE-2021-25297 | WEB-MISC NagiosXI Up to 5.7.5 - Remote Code Execution Vulnerability via Switch Wizard (CVE-2021-25297)       |
| 999316         | CVE-2021-25296 | WEB-MISC NagiosXI Up to 5.7.5 - Remote Code Execution Vulnerability via WindowsWMI Wizard (CVE-2021-25296)   |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                         |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------|
| 999317                | CVE-2021-24164 | WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.34.1 - Information Disclosure Vulnerability (CVE-2021-24164) |
| 999318                | CVE-2021-24163 | WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.34 - Authorization Bypass Vulnerability (CVE-2021-24163)     |
| 999319                | CVE-2021-21972 | WEB-MISC VMWare vCenter Server Plugin - Remote Code Execution Vulnerability (CVE-2021-21972)               |
| 999320                | CVE-2020-35129 | WEB-MISC Mautic Prior to 3.2.4 - XSS Vulnerability Via New Social Monitoring Form (CVE-2020-35129)         |
| 999321                | CVE-2020-35129 | WEB-MISC Mautic Prior to 3.2.4 - XSS Vulnerability Via Edit Social Monitoring Form (CVE-2020-35129)        |
| 999322                | CVE-2020-35128 | WEB-MISC Mautic Prior to 3.2.4 - XSS Vulnerability Via New Companies Form (CVE-2020-35128)                 |
| 999323                | CVE-2020-35128 | WEB-MISC Mautic Prior to 3.2.4 - XSS Vulnerability Via Edit Companies Form (CVE-2020-35128)                |
| 999324                | CVE-2020-35125 | WEB-MISC Mautic Prior to 3.2.4 - XSS Vulnerability Via Referer Header (CVE-2020-35125)                     |

| Signature rule | CVE ID                           | Description                                                                                                                   |
|----------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 999325         | CVE-2020-35125                   | WEB-MISC Mautic Prior to 3.2.4 - XSS Vulnerability Via mauticform[return] (CVE-2020-35125)                                    |
| 999326         | CVE-2020-13933                   | WEB-MISC Apache Shiro Prior to 1.6.0 - Authentication Bypass Vulnerability Via Semicolon (CVE-2020-13933)                     |
| 999327         | CVE-2020-13921,<br>CVE-2020-9483 | WEB-MISC Apache SkyWalking Prior to 8.4.0 - SQL Injection Vulnerability Via queryLogs Feature (CVE-2020-13921, CVE-2020-9483) |

## Signature update for March 2021

March 9, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-03-09. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 60 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                   |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------|
| 999311                | CVE-2021-26855 | WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability Via X-AnonResource-Backend (CVE-2021-26855) |
| 999312                | CVE-2021-26855 | WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability Via X-BEResource (CVE-2021-26855)           |

## Signature update for March 2021

March 16, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-03-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 61 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                       |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------|
| 999308                | CVE-2021-21302 | WEB-MISC PrestaShop Prior to 1.7.7.2 - CSV Injection Vulnerability (CVE-2021-21302)                      |
| 999309                | CVE-2020-35749 | WEB-WORDPRESS Simple Job Board Prior to 2.9.4 - Arbitrary File Disclosure Vulnerability (CVE-2020-35749) |
| 999310                | CVE-2019-16012 | WEB-MISC Cisco SD-WAN vManage Prior to 19.2.2 - SQL Injection Vulnerability (CVE-2019-16012)             |

## Signature update for March 2021

March 16, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-03-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 62 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                               |
|----------------|----------------|-------------------------------------------------------------------------------------------|
| 999307         | CVE-2021-27065 | WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability (CVE-2021-27065) |

## Signature update for April 2021

April 15, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-04-08. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 63 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID        | Description                                                                                           |
|----------------|---------------|-------------------------------------------------------------------------------------------------------|
| 999294         | CVE-2021-3273 | WEB-MISC NagiosXI Prior to 5.7 - Code Injection Vulnerability (CVE-2021-3273)                         |
| 999295         | CVE-2021-3197 | WEB-MISC SaltStack Prior to 3002.3 - Remote Code Execution Vulnerability Via ssh_priv (CVE-2021-3197) |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                            |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| 999296                | CVE-2021-3197  | WEB-MISC SaltStack Prior to 3002.3 - Remote Code Execution Vulnerability Via ssh_port (CVE-2021-3197)                         |
| 999297                | CVE-2021-3197  | WEB-MISC SaltStack Prior to 3002.3 - Remote Code Execution Vulnerability Via ssh_options (CVE-2021-3197)                      |
| 999298                | CVE-2021-3197  | WEB-MISC SaltStack Prior to 3002.3 - Remote Code Execution Vulnerability Via ProxyCommand in JSON Object (CVE-2021-3197)      |
| 999299                | CVE-2021-25282 | WEB-MISC SaltStack Prior to 3002.3 - Path Traversal Vulnerability Via pillar_roots.write (CVE-2021-25282)                     |
| 999300                | CVE-2021-24166 | WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.34 - CSRF Vulnerability (CVE-2021-24166)                                        |
| 999301                | CVE-2021-24085 | WEB-MISC Microsoft Exchange Server - Spoofing Vulnerability (CVE-2021-24085)                                                  |
| 999302                | CVE-2021-22986 | WEB-MISC F5 iControl REST API - Remote Code Execution Vulnerability (CVE-2021-22986)                                          |
| 999303                | CVE-2021-21978 | WEB-MISC VMWare View Planner Harness 4.x prior to 4.6 Security Patch 1 - Remote Code Execution Vulnerability (CVE-2021-21978) |

## Signature update for April 2021

May 21, 2021

New signatures rules are generated for the vulnerabilities identified in the week 2021-04-22. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 64 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                               |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------------|
| 999275                | CVE-2021-3378  | WEB-MISC FortiLogger 4.4.2.2 - Unauthenticated Arbitrary File Upload Vulnerability (CVE-2021-3378)               |
| 999276                | CVE-2021-28925 | WEB-MISC Nagios Network Analyzer Prior to 2.4.3 - SQL Injection Vulnerability (CVE-2021-28925)                   |
| 999277                | CVE-2021-28924 | WEB-MISC Nagios Network Analyzer Prior to 2.4.3 - XSS Vulnerability (CVE-2021-28924)                             |
| 999278                | CVE-2021-27927 | WEB-MISC Zabbix - CSRF Vulnerability Via action=authentication.update (CVE-2021-27927)                           |
| 999279                | CVE-2021-26295 | WEB-MISC Apache OFBiz 17.12.06 - Unauthenticated Arbitrary Deserialization Vulnerability (CVE-2021-26295)        |
| 999280                | CVE-2021-25770 | WEB-MISC JetBrains YouTrack Prior to 2020.5.3123 - Server-Side Template Injection Vulnerability (CVE-2021-25770) |
| 999281                | CVE-2021-25283 | WEB-MISC SaltStack Prior to 3002.5 - Remote Code Execution Vulnerability (CVE-2021-25283)                        |
| 999282                | CVE-2021-25283 | WEB-MISC SaltStack Prior to 3002.5 - Remote Code Execution Vulnerability Via JSON Object (CVE-2021-25283)        |

| 999283                | CVE-2021-24218 | WEB-WORDPRESS Facebook for WordPress Plugin Prior to 3.0.4 - Stored Cross-Site Scripting Vulnerability (CVE-2021-24218)          |
| 999284                | CVE-2021-24217 | WEB-WORDPRESS Facebook for WordPress Plugin Prior to 3.0.2 - PHP Object Injection Vulnerability (CVE-2021-24217)                 |
| 999285                | CVE-2021-24209 | WEB-WORDPRESS WP Super Cache Plugin Prior to 1.7.2 - Remote Code Execution Vulnerability in wp-cache-config.php (CVE-2021-24209) |
| 999286                | CVE-2021-24209 | WEB-WORDPRESS WP Super Cache Plugin Prior to 1.7.2 - Arbitrary Code Injection Vulnerability (CVE-2021-24209)                     |
| 999287                | CVE-2021-24165 | WEB-WORDPRESS Ninja Forms Plugin Prior to 3.4.34 - Open Redirect Vulnerability (CVE-2021-24165)                                  |
| 999288                | CVE-2021-21975 | WEB-MISC vRealize Operations Manager - Unauthenticated Server Side Request Forgery Vulnerability (CVE-2021-21975)                |
| 999289                | CVE-2020-35578 | WEB-MISC Nagios XI Prior to 5.8.0 - Remote Code Execution Vulnerability (CVE-2020-35578)                                         |

| Signature rule | CVE ID         | Description                                                                                           |
|----------------|----------------|-------------------------------------------------------------------------------------------------------|
| 999290         | CVE-2020-2766  | WEB-MISC Oracle WebLogic Server - Unauthenticated SSRF Vulnerability (CVE-2020-2766)                  |
| 999291         | CVE-2020-17523 | WEB-MISC Apache Shiro Prior to 1.7.1 - Authentication Bypass Vulnerability Via Space (CVE-2020-17523) |
| 999292         | CVE-2020-17523 | WEB-MISC Apache Shiro Prior to 1.7.1 - Authentication Bypass Vulnerability Via Dot (CVE-2020-17523)   |
| 999293         | CVE-2020-15160 | WEB-MISC PrestaShop Prior to 1.7.6.8 - SQL Injection Vulnerability (CVE-2020-15160)                   |

## Signature update for June 2021

June 14, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-06-02. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 65 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                       |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------|
| 999243                | CVE-2021-31761 | WEB-MISC Webmin Prior to 1.974 - XSS Vulnerability Via /servers/link.cgi/ (CVE-2021-31761)                               |
| 999244                | CVE-2021-31761 | WEB-MISC Webmin Prior to 1.974 - XSS Vulnerability Via /tunnel/link.cgi/ (CVE-2021-31761)                                |
| 999245                | CVE-2021-31166 | WEB-IIS Microsoft HTTP Protocol Stack - Remote Code Execution Vulnerability (CVE-2021-31166)                             |
| 999246                | CVE-2021-29447 | WEB-WORDPRESS WordPress Prior to 5.7.1 - Media Library XXE Vulnerability (CVE-2021-29447)                                |
| 999247                | CVE-2021-28157 | WEB-MISC Devolutions Server Prior to 2021.1 and 2020.3.18 - SQL Injection Vulnerability Via User Delete (CVE-2021-28157) |
| 999248                | CVE-2021-27905 | WEB-MISC Apache Solr Prior to 8.2.2 - ReplicationHandler SSRF Vulnerability via leaderUrl (CVE-2021-27905)               |
| 999249                | CVE-2021-27905 | WEB-MISC Apache Solr Prior to 8.2.2 - ReplicationHandler SSRF Vulnerability via masterUrl (CVE-2021-27905)               |
| 999250                | CVE-2021-27890 | WEB-MISC MyBB Prior to 1.8.26 - Theme Properties SQL Injection Vulnerability (CVE-2021-27890)                            |

| <b>Signature rule</b> | <b>CVE ID</b>                    | <b>Description</b>                                                                                                 |

## Signature update for August 2021

August 31, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-08-29. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 67 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                               |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| 999183                | CVE-2021-37557 | WEB-MISC Centreon Multiple Versions - SQL Injection Vulnerability (CVE-2021-37557)                                               |
| 999184                | CVE-2021-35501 | WEB-MISC Artica Pandora FMS Up to 7.54 - Visual Console Stored XSS Vulnerability (CVE-2021-35501)                                |
| 999185                | CVE-2021-35464 | WEB-MISC ForgeRock Access Management and OpenAM - Remote Code Execution Vulnerability (CVE-2021-35464)                           |
| 999186                | CVE-2021-34523 | WEB-MISC Microsoft Exchange Server - Elevation of Privilege Vulnerability (CVE-2021-34523)                                       |
| 999187                | CVE-2021-34473 | WEB-MISC Microsoft Exchange Server - Server Side Request Forgery Authentication Bypass Vulnerability Via Query (CVE-2021-34473)  |
| 999188                | CVE-2021-34473 | WEB-MISC Microsoft Exchange Server - Server Side Request Forgery Authentication Bypass Vulnerability Via Cookie (CVE-2021-34473) |
| 999189                | CVE-2021-33203 | WEB-MISC Django - TemplateDetailView File Existence Disclosure Vulnerability via Absolute Path (CVE-2021-33203)                  |

| <b>Signature rule</b> | <b>CVE ID</b>                    | <b>Description</b>                                                                                                                        |
|-----------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 999190                | CVE-2021-33203                   | WEB-MISC Django -<br>TemplateDetailView File<br>Existence Disclosure<br>Vulnerability via Path<br>Traversal (CVE-2021-33203)              |
| 999191                | CVE-2021-33203                   | WEB-MISC Django -<br>TemplateDetailView File<br>Existence Disclosure<br>Vulnerability via backslash<br>(CVE-2021-33203)                   |

| 999193                | CVE-2021-3287,<br>CVE-2020-28653 | WEB-MISC Zoho<br>ManageEngine OpManager<br>Prior to 12.5.329 -<br>Unauthenticated RCE<br>Vulnerability (CVE-2021-3287,<br>CVE-2020-28653) |
| 999194                | CVE-2021-32789                   | WEB-WORDPRESS<br>WooCommerce Plugin Up to<br>5.5.0 - SQL Injection<br>Vulnerability Via taxonomy<br>and rest_route<br>(CVE-2021-32789)    |
| 999195                | CVE-2021-32789                   | WEB-WORDPRESS<br>WooCommerce Plugin Up to<br>5.5.0 - SQL Injection<br>Vulnerability Via taxonomy<br>(CVE-2021-32789)                      |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                             |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| 999196                | CVE-2021-32604 | WEB-MISC SolarWinds Serv-U Prior to 15.2.3 - Cross-Site Scripting Vulnerability Via SenderEmail Parameter (CVE-2021-32604)     |
| 999197                | CVE-2021-32093 | WEB-MISC National Security Agency Emissary 5.9.0 - Arbitrary File Read Vulnerability (CVE-2021-32093)                          |
| 999198                | CVE-2021-31760 | WEB-MISC Webmin Prior to 1.974 - CSRF Vulnerability Lead to RCE Via run.cgi (CVE-2021-31760)                                   |
| 999199                | CVE-2021-31207 | WEB-MISC Microsoft Exchange Server - Security Feature Bypass Vulnerability (CVE-2021-31207)                                    |
| 999200                | CVE-2021-31195 | WEB-MISC Microsoft Exchange Server - Remote Code Execution Vulnerability (CVE-2021-31195)                                      |
| 999201                | CVE-2021-28474 | WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability (CVE-2021-28474)                                    |
| 999202                | CVE-2021-24385 | WEB-WORDPRESS FileBird Plugin 4.7.3 - SQL Injection Vulnerability Via selectedFolder Parameter and rest_route (CVE-2021-24385) |
| 999203                | CVE-2021-24385 | WEB-WORDPRESS FileBird Plugin 4.7.3 - SQL Injection Vulnerability Via selectedFolder Parameter (CVE-2021-24385)                |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                            |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| 999204                | CVE-2021-24385 | WEB-WORDPRESS FileBird Plugin 4.7.3 - SQL Injection Vulnerability Via JSON-Encoded Body (CVE-2021-24385)                      |
| 999205                | CVE-2021-24356 | WEB-WORDPRESS Simple 301 Redirects Plugin Prior to 2.0.4 - Arbitrary Plugin Activation Vulnerability (CVE-2021-24356)         |
| 999206                | CVE-2021-23024 | WEB-MISC F5 BIG-IQ Multiple Versions - Remote Code Execution Vulnerability (CVE-2021-23024)                                   |
| 999207                | CVE-2021-22911 | WEB-MISC Rocket.Chat Server 3.11, 3.12 and 3.13 - Blind NOSQL Injection Vulnerability (CVE-2021-22911)                        |
| 999208                | CVE-2021-22900 | WEB-MISC Pulse Connect Secure Prior To 9.1R11.4 - Remote Code Execution Vulnerability Via smimeCert.cgi (CVE-2021-22900)      |
| 999209                | CVE-2021-22900 | WEB-MISC Pulse Connect Secure Prior To 9.1R11.4 - Remote Code Execution Vulnerability Via admincert.cgi (CVE-2021-22900)      |
| 999210                | CVE-2021-22900 | WEB-MISC Pulse Connect Secure Prior To 9.1R11.4 - Remote Code Execution Vulnerability Via clientauthcert.cgi (CVE-2021-22900) |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                       |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------|
| 999211                | CVE-2021-22160 | WEB-MISC Apache Pulsar - JSON Web Tokens Authentication Bypass Vulnerability (CVE-2021-22160)                            |
| 999212                | CVE-2021-21809 | WEB-MISC Moodle - Remote Code Execution Vulnerability Via Spellchecker Plugin and getSuggestions Method (CVE-2021-21809) |
| 999213                | CVE-2021-21809 | WEB-MISC Moodle - Remote Code Execution Vulnerability Via Spellchecker Plugin and checkWords Method (CVE-2021-21809)     |
| 999214                | CVE-2021-21809 | WEB-MISC Moodle - Remote Code Execution Vulnerability Via s__aspellpath (CVE-2021-21809)                                 |
| 999215                | CVE-2021-21805 | WEB-MISC Advantech R-SeeNet - Unauthenticated Remote Code Execution Vulnerability (CVE-2021-21805)                       |
| 999216                | CVE-2021-21804 | WEB-MISC Advantech R-SeeNet - Local File Inclusion Vulnerability Via sub_opt (CVE-2021-21804)                            |
| 999217                | CVE-2021-21587 | WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/os/listfiles (CVE-2021-21587) |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                            |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| 999218                | CVE-2021-21587 | WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/app/rsp/listfiles (CVE-2021-21587) |
| 999219                | CVE-2021-21586 | WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/app and fileName (CVE-2021-21586)  |
| 999220                | CVE-2021-21586 | WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/os and fileName (CVE-2021-21586)   |
| 999221                | CVE-2021-21586 | WEB-MISC Dell Wyse Management Suite Prior to 3.3 - Path Traversal Vulnerability Via /image/os and filePath (CVE-2021-21586)   |
| 999222                | CVE-2020-25223 | WEB-MISC Sophos SG UTM - Remote Code Execution Via SID and /var (CVE-2020-25223)                                              |
| 999223                | CVE-2020-25223 | WEB-MISC Sophos SG UTM - Remote Code Execution Via SID and /webadmin.plx (CVE-2020-25223)                                     |
| 999224                | CVE-2020-21056 | WEB-MISC FusionPBX 4.5.7 - Path Traversal Vulnerability Via foldernew (CVE-2020-21056)                                        |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                               |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| 999225                | CVE-2020-21055 | WEB-MISC FusionPBX 4.5.7 - Path Traversal Vulnerability Via File Rename Feature (CVE-2020-21055)                                 |
| 999226                | CVE-2020-16245 | WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability in findSummaryUpdateDeviceListExpo (CVE-2020-16245) |
| 999227                | CVE-2020-16245 | WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via findCfgDeviceListExport (CVE-2020-16245)        |
| 999228                | CVE-2020-14181 | WEB-MISC Atlassian Jira Server - Information Disclosure Vulnerability Via ViewUserHover.jspa (CVE-2020-14181)                    |
| 999229                | CVE-2020-14005 | WEB-MISC SolarWinds Orion Prior to 2020.2.1 HF 2 - Remote Code Execution Via ExecuteVBScript Action Type (CVE-2020-14005)        |
| 999230                | CVE-2020-14005 | WEB-MISC SolarWinds Orion Prior to 2020.2.1 HF 2 - Remote Code Execution Via ExecuteExternalProgram Action Type (CVE-2020-14005) |

---

## Signature update for September 2021

September 20, 2021

New signatures rules are generated for the vulnerabilities identified in the week 2021-09-11. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 68 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 and Citrix ADC 13.1 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| Signature rule | CVE ID         | Description                                                                                                                 |
|----------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| 999163         | CVE-2021-37556 | WEB-MISC Centreon Multiple Versions - SQL Injection Vulnerability Via End Parameter (CVE-2021-37556)                        |
| 999164         | CVE-2021-37556 | WEB-MISC Centreon Multiple Versions - SQL Injection Vulnerability Via Start Parameter (CVE-2021-37556)                      |
| 999165         | CVE-2021-37353 | WEB-MISC Nagios XI Docker Wizard Prior to 1.1.3 - SSRF Vulnerability Via host Parameter Without URI Scheme (CVE-2021-37353) |
| 999166         | CVE-2021-37353 | WEB-MISC Nagios XI Docker Wizard Prior to 1.1.3 - SSRF Vulnerability Via host Parameter With URI Scheme (CVE-2021-37353)    |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                       |
|-----------------------|----------------|--------------------------------------------------------------------------------------------------------------------------|
| 999167                | CVE-2021-34638 | WEB-WORDPRESS Download Manager Plugin Prior to 3.1.25 - Directory Traversal Vulnerability (CVE-2021-34638)               |
| 999168                | CVE-2021-33766 | WEB-MISC Microsoft Exchange Server - Information Disclosure Vulnerability (CVE-2021-33766)                               |
| 999169                | CVE-2021-32682 | WEB-MISC eFinder Prior To 2.1.59 - Command Injection Vulnerability Via Archive (CVE-2021-32682)                          |
| 999170                | CVE-2021-26084 | WEB-MISC Confluence Server and Data Center - OGNL Injection Vulnerability Via doenterpagevariables (CVE-2021-26084)      |
| 999171                | CVE-2021-26084 | WEB-MISC Confluence Server and Data Center - OGNL Injection Vulnerability Via createpage-entervariables (CVE-2021-26084) |
| 999172                | CVE-2021-23394 | WEB-MISC eFinder Prior To 2.1.59 - Remote Code Execution Vulnerability Via Phar Makefile (CVE-2021-23394)                |
| 999173                | CVE-2021-23394 | WEB-MISC eFinder Prior To 2.1.59 - Remote Code Execution Vulnerability Via Phar Rename (CVE-2021-23394)                  |

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                               |
|-----------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| 999174                | CVE-2021-23394 | WEB-MISC eFinder Prior To 2.1.59 - Remote Code Execution Vulnerability Via Phar Upload (CVE-2021-23394)                          |
| 999175                | CVE-2020-36289 | WEB-MISC Atlassian Jira Server - Information Disclosure Vulnerability Via QueryComponentRenderValue (CVE-2020-36289)             |
| 999176                | CVE-2020-16245 | WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via findSummaryCfgDeviceListExport (CVE-2020-16245) |
| 999177                | CVE-2020-16245 | WEB-MISC Advantech iView Prior to 5.7.03.6112 - Path Traversal Vulnerability Via findUpdateDeviceListExport (CVE-2020-16245)     |
| 999178                | CVE-2020-13774 | WEB-MISC Ivanti Endpoint Manager Multiple Versions - RCE Vulnerability Via EditLaunchPadDialog.aspx (CVE-2020-13774)             |
| 999179                | CVE-2020-1147  | WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability Via Custom Page (CVE-2020-1147)                       |
| 999180                | CVE-2020-1147  | WEB-MISC Microsoft SharePoint Server - Remote Code Execution Vulnerability Via quicklinksdialogform.aspx (CVE-2020-1147)         |

## Signature update for October 2021

October 22, 2021

New signature rules are generated for the vulnerabilities identified in the week 2021-10-09. You can download and configure these signature rules to protect your appliance from security vulnerable attacks.

### Signature version

Signature version 69 applicable for NetScaler VPX 11.1, NetScaler 12.0, Citrix ADC 12.1, Citrix ADC 13.0 and Citrix ADC 13.1 platforms.

**Note:**

Enabling Post body and Response body signature rules might affect Citrix ADC CPU.

### Common Vulnerability Entry (CVE) insight

Following is a list of signature rules, CVE IDs, and its description.

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                              |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| 999149                | CVE-2021-38312 | WEB-WORDPRESS Gutenberg Template Library and Redux Framework Plugin Prior to 4.2.12 - REST_ROUTE Vulnerability (CVE-2021-38312) |
| 999150                | CVE-2021-38312 | WEB-WORDPRESS Gutenberg Template Library and Redux Framework Plugin Prior to 4.2.12 - REST API Vulnerability (CVE-2021-38312)   |
| 999151                | CVE-2021-34639 | WEB-WORDPRESS Download Manager Plugin Prior to 3.1.25 - Double Extension Upload Vulnerability (CVE-2021-34639)                  |
| 999152                | CVE-2021-34621 | WEB-WORDPRESS ProfilePress Plugin Prior to 3.1.3 - Elevation of Privilege Vulnerability Via wp_capabilities (CVE-2021-34621)    |
| 999153                | CVE-2021-32682 | WEB-MISC eFinder Prior To 2.1.59 - Path Traversal Vulnerability Via Rename Command (CVE-2021-32682)                             |
| 999154                | CVE-2021-32682 | WEB-MISC eFinder Prior To 2.1.59 - Path Traversal Vulnerability Via Abort Command (CVE-2021-32682)                              |
| 999155                | CVE-2021-26086 | WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via WEB-INF (CVE-2021-26086)              |

---

| <b>Signature rule</b> | <b>CVE ID</b>  | <b>Description</b>                                                                                                  |
|-----------------------|----------------|---------------------------------------------------------------------------------------------------------------------|
| 999156                | CVE-2021-26086 | WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via META-INF (CVE-2021-26086) |
| 999157                | CVE-2021-22005 | WEB-MISC VMWare vCenter - File Upload Vulnerability Via Data App (CVE-2021-22005)                                   |
| 999158                | CVE-2021-22005 | WEB-MISC VMWare vCenter - File Upload Vulnerability Via Telemetry Stage Log (CVE-2021-22005)                        |
| 999159                | CVE-2021-22005 | WEB-MISC VMWare vCenter - File Upload Vulnerability Via Telemetry Prod Log (CVE-2021-22005)                         |
| 999160                | CVE-2021-20081 | WEB-MISC Zoho ManageEngine Service Desk Prior to 11.2.0.5 - Remote Code Execution Vulnerability (CVE-2021-20081)    |
| 999161                | CVE-2020-29453 | WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via WEB-INF (CVE-2020-29453)  |
| 999162                | CVE-2020-29453 | WEB-MISC Atlassian Jira Server and Data Center - Information Disclosure Vulnerability Via META-INF (CVE-2020-29453) |

---

## Cache Redirection

September 21, 2020

In a typical deployment, different clients ask web servers for the same content repeatedly. To relieve the origin web server of processing each request, a Citrix ADC appliance with cache redirection enabled can serve this content from a cache server instead of from the origin server.

The Citrix ADC appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers.

Cache redirection is a policy-based feature. By default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. For testing or maintenance, you might want to skip policy evaluation and direct all requests to the cache or to the origin server.

You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

A Citrix ADC appliance configured for cache redirection can be deployed at the edge of a network, in front of the origin server, or anywhere along the network backbone. In an edge deployment, commonly used by Internet Service Providers (ISPs), cable companies, content delivery distribution networks, and enterprise networks, the Citrix ADC appliance resides directly in front of the clients. In a server-side deployment, the Citrix ADC appliance is closer to the origin servers.

Cache redirection is used most commonly with the HTTP service type, but it also supports the secure HTTPS protocol.

## Cache redirection policies

September 21, 2020

A cache redirection virtual server applies cache redirection policies to each incoming request. By default, if a request matches one of the configured policies, it is considered non-cacheable, and the Citrix ADC appliance sends it to the origin server. Other requests are sent to a cache server. This behavior can be reversed, so that requests that match configured cache redirection policies are sent to cache servers.

The appliance provides a set of policies for cache redirection. If these built-in policies are not adequate for your deployment, you can configure user-defined cache redirection policies.

**Note:** Once you have determined which built-in cache redirection policies to use, or have created user-defined policies, proceed with configuring cache redirection. To use this feature, you must configure

at least one cache redirection virtual server, and, for normal operation, you must bind at least one cache redirection policy to that virtual server.

## Built-in cache redirection policies

September 21, 2020

The Citrix ADC appliance provides built-in cache redirection policies that handle typical cache requests. These policies are based on HTTP methods, the URL or URL tokens of the incoming request, the HTTP version, or the HTTP headers and their values in the request.

Built-in cache redirection policies can be directly bound to a virtual server and do not need further configuration.

Cache redirection policies use two types of appliance expressions languages, classic and default syntax. For more information about these languages, see [Policies and expressions](#).

### Built-in classic cache redirection policies

Built-in cache redirection policies based on classic expressions are called *classic cache redirection policies*. For a complete description of classic expressions and how to configure them, see [Policies and Expressions](#).

The classic cache redirection policies evaluate basic characteristics of traffic and other data. For example, classic cache redirection policies can determine whether an HTTP request or response contains a particular type of header or URL.

The Citrix ADC appliance provides the following built-in classic cache redirection policies:

| Built-In Policy Name | Description                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bypass-non-get       | Bypass the cache if the request uses an HTTP method other than GET.                                                                                           |
| bypass-cache-control | Bypass the cache if the request header contains a Cache-Control: no-cache or Cache-Control: no-store header, or if the HTTP request contains a pragma header. |

---

| Built-In Policy Name | Description                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bypass-dynamic-url   | Bypass the cache if the URL suggests that the content is dynamic, as indicated by the presence of any of the following extensions: cgi, asp, exe, cfm, ex, shtml, or htx. Also bypass the cache if the URL starts with any of the following: /cgi-bin/, /bin/, or /exec/. |
| bypass-urltokens     | Bypass the cache because the request is dynamic, as indicated by one of the following tokens in the URL: ?, !, or =.                                                                                                                                                      |
| bypass-cookie        | Bypass the cache for any URL that has a cookie header and an extension other than .png or .jpg.                                                                                                                                                                           |

---

### Built-in default syntax cache redirection policies

Built-in cache redirection policies based on default syntax expressions are called *default syntax cache redirection policies*. For a complete description of default syntax expressions and how to configure them, see [Policies and Expressions](#).

In addition to the same types of evaluations done by classic cache redirection policies, default syntax cache redirection policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, directing the request to either cache or origin server).

Citrix ADC appliances provide the following two built-in actions for the default syntax cache redirection policies:

- CACHE
- ORIGIN

As implied by their names, they direct the request to the cache server or the origin server, respectively.

**Note:** If you are using the built-in default syntax cache redirection policy, you cannot modify the action.

The Citrix ADC appliance provides the following built-in default syntax cache redirection policies:

| Built-In Policy Name     | Description                                                                                                                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bypass-non-get_adv       | Bypass the cache if the request uses an HTTP method other than GET.                                                                                                                                                                                                       |
| bypass-cache-control_adv | Bypass the cache if the request header contains a Cache-Control: no-cache or Cache-Control: no-store header, or if the HTTP request contains a pragma header.                                                                                                             |
| bypass-dynamic-url_adv   | Bypass the cache if the URL suggests that the content is dynamic, as indicated by the presence of any of the following extensions: cgi, asp, exe, cfm, ex, shtml, or htx. Also bypass the cache if the URL starts with any of the following: /cgi-bin/, /bin/, or /exec/. |
| bypass-urltokens_adv     | Bypass the cache because the request is dynamic, as indicated by one of the following tokens in the URL: ?, !, or =.                                                                                                                                                      |
| bypass-cookie_adv        | Bypass the cache for any URL that has a cookie header and an extension other than .png or .jpg.                                                                                                                                                                           |

## Display the built-in cache redirection policies

You can display the available cache redirection policies by using the command line interface or the configuration utility.

### Display the built-in cache redirection policies by using the CLI

At the command prompt, type:

```
show cr policy [<policyName>]
```

#### Example:

```
1 > show cr policy
2 1)      Cache-By-Pass RULE: NS_NON_GET          Policy:bypass-non-get
3 2)      Cache-By-Pass RULE: (NS_CACHECONTROL_NOSTORE ||
         NS_CACHECONTROL_NOCACHE || NS_HEADER_PRAGMA)    Policy:bypass-cache-
         control
4 3)      Cache-By-Pass RULE: (NS_EXT_CGI || NS_EXT_ASP || NS_EXT_EXE ||
         NS_EXT_CFM || NS_EXT_EX || NS_EXT_SHTML || NS_EXT_HTX) || (
```

```
NS_URL_PATH_CGIBIN || NS_URL_PATH_EXEC || NS_URL_PATH_BIN)
Policy:bypass-dynamic-url
5 4)      Cache-By-Pass RULE: NS_URL_TOKENS      Policy:bypass-
urltokens
6 5)      Cache-By-Pass RULE: (NS_HEADER_COOKIE && NS_EXT_NOT_GIF &&
NS_EXT_NOT_JPEG)      Policy:bypass-cookie
7 Done
8 <!--NeedCopy-->
```

### Display the built-in cache redirection policies by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Policies. The configured cache redirection policies appear in the details pane.
2. Select one of the configured policies to view details.

## Configure a cache redirection policy

September 21, 2020

A cache redirection policy includes one or more expressions (also called *rules*). Each expression represents a condition that is evaluated when the client request is compared to the policy.

You do not explicitly configure actions for cache redirection policies. By default, the Citrix ADC appliance considers any request that matches a policy to be non-cacheable and directs the request to the origin server instead of the cache.

Cache redirection policies based on the classic policy format are called *classic cache redirection policies*. Each such policy has a name and includes a classic expression or a set of classic expressions that are combined by using logical operators.

For classic cache redirection policies, you do not explicitly configure actions for the policies. By default, the Citrix ADC appliance considers any request that matches a policy to be non-cacheable and directs the request to the origin server instead of the cache.

Cache redirection policies based on the newer policy format are called *Advanced redirection policies*. Such policy has a name and includes a default syntax expression, or a set of default syntax expressions that are combined by using logical operators, and the following built-in actions:

- CACHE
- ORIGIN

For more information about classic expressions and default syntax expressions, see [Policies and Expressions](#).

### Add a cache redirection policy by using the CLI

At the command prompt, type the following commands to add a cache redirection policy and verify the configuration:

```
1 - add cr policy <policyName> **-rule** <expression>
2 - show cr policy [<policyName>]
3 <!--NeedCopy-->
```

#### Examples:

Policy with a simple expression:

```
1 > add cr policy Policy-CRD-1 -rule "REQ.HTTP.URL != /*.jpeg"
2 Done
3 > show cr policy Policy-CRD-1
4 Cache-By-Pass RULE: REQ.HTTP.URL != '/*.jpeg' Policy:Policy-
  CRD-1
5 Done
6 <!--NeedCopy-->
```

Policy with a compound expression:

```
1 > add cr policy Policy-CRD-2 -rule "REQ.HTTP.METHOD == POST && (REQ.
  HTTP.URL == /*.cgi || REQ.HTTP.URL != /*.png)"
2 Done
3 > show cr policy Policy-CRD-2
4 Cache-By-Pass RULE: REQ.HTTP.METHOD == POST && (REQ.HTTP.URL
  == '/*.cgi' || REQ.HTTP.URL != '/*.png') Policy:Policy-
  CRD-2
5 Done
6 <!--NeedCopy-->
```

Policy that evaluates a header:

```
1 > add cr policy Policy-CRD-3 -rule "REQ.HTTP.HEADER If-Modified-Since
  EXISTS"
2 Done
3 > show cr policy Policy-CRD-3
4 Cache-By-Pass RULE: REQ.HTTP.HEADER If-Modified-Since EXISTS
  Policy:Policy-CRD-3
5 Done
```

```
6 <!--NeedCopy-->
```

## Add a default syntax cache redirection policy by using the CLI

At the command prompt, type the following commands to add a cache redirection policy and verify the configuration:

```
1 - add cr policy <policyName> **-rule** <expression> [-action<string>]
   [-logAction<string>]
2 - show cr policy [<policyName>]
3 <!--NeedCopy-->
```

### Examples:

Policy with a simple expression:

```
1 > add cr policy crpol1 -rule !(HTTP.REQ.URL.ENDSWITH(".jpeg" )) -action
   origin
2 Done
3 > show cr policy crpoll
4 Policy: crpol1 Rule: !(HTTP.REQ.URL.ENDSWITH(".jpeg")) Action:
   ORIGIN
5 Done
6 <!--NeedCopy-->
```

Policy with a compound expression:

```
1 > add cr policy crpol11 -rule "http.req.method.eq(post) && (HTTP.REQ.
   URL.ENDSWITH(".png") || HTTP.REQ.URL.ENDSWITH(".cgi"))" -action
   cache
2 Done
3 > show cr policy crpol11
4 Policy: crpol11 Rule: http.req.method.eq(post) && (HTTP.REQ
   .URL.ENDSWITH(".png") || HTTP.REQ.URL.ENDSWITH(".cgi"))
   Action: CACHE
5 Done
6 <!--NeedCopy-->
```

Policy that evaluates a header:

```
1 > add cr policy crpol12 -rule http.req.header("If-Modified-Since").
   exists -action origin
2 Done
3 > show cr policy crpol12
```

```
4      Policy: crpol12    Rule: http.req.header("If-Modified-Since").
      exists    Action: ORIGIN
5  Done
6  <!--NeedCopy-->
```

## Modify or remove a cache redirection policy by using the CLI

- To modify a cache redirection policy, use the `set cr policy` command, which is just like `add cr policy` command, except that you enter the name of an existing policy.
- To remove a policy, use the `rm cr policy` command, which accepts only the `<name>` argument. If the policy is bound to a virtual server, you have to unbind the policy, before you can remove it.

For the details of unbinding a cache redirection policy, see “[Unbind a policy from a cache redirection virtual server.](#)”

## Configure a cache redirection policy with a simple expression by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Policies.
2. In the details pane, click Add.
3. In the Create Cache Redirection Policy dialog box, in the Name\* text box, type the name of the policy, and then in the Expression area, click Add.
4. To configure a simple expression, enter the expression. Following is an example of an expression that checks for a .jpeg extension in a URL:
  - Expression Type-General
  - Flow Type -REQ
  - Protocol -HTTP
  - Qualifier -URL
  - Operator - !=
  - Value\* - /\*.jpeg

The simple expression in the following example checks for an If-Modified-Since header in a request:

- Expression Type -General
- Flow Type -REQ
- Protocol -HTTP
- Qualifier -HEADER
- Operator -EXISTS
- Header Name -If-Modified-Since

5. When you are finished entering the expression, click OK or Create, and then click Close.

### Configure a cache redirection policy with a compound expression by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Policies.
2. In the details pane, click Add.
3. In the Name text box, enter a name for the policy.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (\_) symbols. You should choose a name that will make it easy for others to tell what type of content this policy was created to detect.

4. Choose the type of compound expression that you want to create. Your choices are:
  - **Match Any Expression.** The policy matches the traffic if one or more individual expressions match the traffic.
  - **Match All Expressions.** The policy matches the traffic only if every individual expression matches the traffic.
  - **Tabular Expressions.** Switches the Expressions list to a tabular format with three columns. In the rightmost column, you place one of the following operators:
    - The AND [ && ] operator, to require that, to match the policy, a request must match both the current expression and the following expression.

The OR [ ] operator, to require that, to match the policy, a request must match either the current expression or the following expression, or both. Only if the request does not match either expression does it not match the policy.

-

You can also group expressions in nested subgroups by selecting an existing expression and clicking one of the following operators:

- The BEGIN SUBGROUP [+ ( )] operator, which tells the Citrix ADC appliance to begin a nested subgroup with the selected expression. (To remove this operator from the expression, click -(.)

- The END SUBGROUP [+ ) ] operator, which tells the Citrix ADC appliance to end the current nested subgroup with the selected expression. (To remove this operator from the expression, click -) .)

- **Advanced Free-Form.** Switches off the Expressions Editor entirely and turns the Expressions list into a text area in which you can type a compound expression. This is both the most powerful and the most difficult method of creating a policy expression, and is recommended only for those thoroughly familiar with the Citrix ADC classic expressions language.

For more information about creating classic expressions in the Advanced Free-Form text area, see [“Configuring Classic Policies and Expressions”](#).

**Caution:** If you switch to Advanced Free Form expression editing mode, you cannot switch back to any of the other modes. Do not choose this expression editing mode unless you are sure that you want to use it.

5. If you chose Match Any Expression, Match All Expressions, or Tabular Expressions, click **Add** to display the Add Expression dialog box.

You should leave the expression type set to General for cache redirection policies.

6. In the Flow Type drop-down list, choose a flow type for your expression.

The flow type determines whether the policy examines incoming or outgoing connections. You have two choices:

- **REQ.** Configures the Citrix ADC appliance to examine incoming connections, or requests.
- **RES.** Configures the appliance to examine outgoing connections, or responses.

7. In the Protocol drop-down list, choose a protocol for your expression.

The protocol determines the type of information that the policy examines in the request or response. Depending upon whether you chose REQ or RES in the previous drop-down list, either all four or only three of the following choices are available:

- **HTTP.** Configures the appliance to examine the HTTP header.
- **SSL.** Configures the appliance to examine the SSL client certificate. Available only if you chose REQ (requests) in the previous drop-down list.
- **TCP.** Configures the appliance to examine the TCP header.
- **IP.** Configures the appliance to examine the source or destination IP address.

8. Choose a qualifier for your expression from the Qualifier drop-down list.

The contents of the Qualifier drop-down list depend on which protocol you chose. The following table describes the choices available for each protocol.

Table 1. Cache Redirection Policy Qualifiers Available for Each Protocol

| Protocol | Qualifier                | Definition                                                                  |
|----------|--------------------------|-----------------------------------------------------------------------------|
| HTTP     | METHOD                   | HTTP method used in the request.                                            |
| -        | URL                      | Contents of the URL header.                                                 |
| -        | URLTOKENS                | URL tokens in the HTTP header.                                              |
| -        | VERSION                  | HTTP version of the connection.                                             |
| -        | HEADER                   | Header portion of the HTTP request.                                         |
| -        | URLLEN                   | Length of the contents of the URL header.                                   |
| -        | URLQUERY                 | Query portion of the contents of the URL header.                            |
| -        | URLQUERYLEN              | Length of the query portion of the URL header.                              |
| SSL      | CLIENT.CERT              | SSL client certificate as a whole.                                          |
| -        | CLIENT.CERT.SUBJECT      | Contents of the client certificate subject field.                           |
| -        | CLIENT.CERT.ISSUER       | Client certificate issuer.                                                  |
| -        | CLIENT.CERT.SIGALGO      | Signature algorithm used in the client certificate.                         |
| -        | CLIENT.CERT.VERSION      | Client certificate version.                                                 |
| -        | CLIENT.CERT.VALIDFROM    | Date from which the client certificate is valid. (The start date.)          |
| -        | CLIENT.CERT.VALIDTO      | Date after which the client certificate is no longer valid. (The end date.) |
| -        | CLIENT.CERT.SERIALNUMBER | Client certificate serial number.                                           |
| -        | CLIENT.CIPHER.TYPE       | Encryption method used in the client certificate.                           |

| Protocol | Qualifier          | Definition                                        |
|----------|--------------------|---------------------------------------------------|
| -        | CLIENT.CIPHER.BITS | Number of significant bits in the encryption key. |
| -        | CLIENT.SSL.VERSION | SSL version of the client certificate.            |
| TCP      | SOURCEPORT         | Source port of the TCP connection.                |
| -        | DESTPORT           | Destination port of the TCP connection.           |
| -        | MSS                | Maximum segment size (MSS) of the TCP connection. |
| IP       | SOURCEIP           | Source IP address of the connection.              |
| -        | DESTIP             | Destination IP address of the connection.         |

9. Choose the operator for your expression from the Operator drop-down list.

Your choices depend on the qualifier you chose in the previous step. The complete list of operators that can appear in this drop-down list is:

- == . Matches the following text string exactly.
- != . Does not match the following text string.
  - . Is greater than the following integer.
- CONTAINS . Contains the following text string.
- CONTENTS . The contents of the designated header, URL, or URL query.
- EXISTS . The specified header or query exists.
- NOTCONTAINS . Does not contain the following text string.
- NOTEXISTS . The specified header or query does not exist.

If you want this policy to operate on requests sent to a specific Host, you can leave the default, the equals (==) sign.

10. If the Value text box is visible, type the appropriate string or number into the text box.

For example, if you want this policy to select requests sent to the host shopping.example.com, you would type that string in the Value text box.

11. If you chose HEADER as the qualifier, type the header you want in the Header Name text box.
12. Click OK to add your expression to the Expression list.
13. Repeat steps 4 through 11 to create additional expressions.
14. Click Close to close the Add Expression dialog box and return to the Create Cache Redirection Policy dialog box.

## Cache redirection configurations

September 21, 2020

Depending on your deployment and network topology, you can configure one of the following types of cache redirection:

- **Transparent.** A transparent cache can reside on a variety of points along a network backbone to alleviate traffic along the delivery route. In transparent mode, the cache redirection virtual server intercepts all traffic flowing to the Citrix ADC appliance and applies cache redirection policies to determine whether content should be served from the cache or from the origin server.
- **Forward proxy.** A forward proxy cache server resides on the edge of an enterprise LAN and faces the WAN. In the forward proxy mode, the cache redirection virtual server resolves the hostname of the incoming request by using a DNS server and forwards requests for non-cacheable content to the resolved origin servers. Cacheable requests are sent to the configured cache servers.
- **Reverse proxy.** Reverse proxy caches are configured for specific origin servers. Incoming traffic directed to the reverse proxy, can either be served from a cache server or be sent to the origin server with or without modification to the URL.

## Configure transparent redirection

September 21, 2020

When you configure transparent cache redirection, the Citrix ADC appliance evaluates all traffic it receives, to determine whether it is cacheable. This mode alleviates traffic along the delivery route and is often used when the cache server resides on the backbone of an ISP or carrier.

By default, cacheable requests are sent to a cache server, and non-cacheable requests to the origin server. For example, when the Citrix ADC appliance receives a request that is directed to a web server, it compares the HTTP headers in the request with a set of policy expressions. If the request does not match the policy, the appliance forwards the request to a cache server. If the request does match a policy, the appliance forwards the request, unchanged, to the web server.

For details on how to modify this default behavior, see [“Direct policy hits to the cache instead of the origin.”](#)

To configure transparent redirection, first enable cache redirection and load balancing, and configure edge mode. Then, create a cache redirection virtual server with a wildcard IP address (\*), so that this virtual server can receive traffic coming to the appliance on any IP address the appliance owns. To this virtual server, bind cache redirection policies that describe the types of requests that should not be cached. Then, create a load balancing virtual server that will receive traffic from the cache redirection virtual server for cacheable requests. Finally, create a service that represents a physical cache server and bind it to the load balancing virtual server.

## Enable cache redirection and load balancing

September 21, 2020

The appliance cache redirection and load balancing features are not enabled by default. They must be enabled before any cache redirection configuration can take effect.

### Enable cache redirection and load balancing by using the CLI

At the command prompt, type the following command to enable cache redirection and load balancing and verify the settings:

```
1 - enable ns feature cr lb
2 - show ns feature
3 <!--NeedCopy-->
```

#### Example:

```
1 > enable ns feature cr lb
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 -----
7 1) Web Logging WL ON
8 2) Surge Protection SP ON
9 3) Load Balancing LB ON
10 4) Content Switching CS ON
11 5) Cache Redirection CR ON
12 6) Sure Connect
13
```

```

14          ...
15          ...
16          ...
17
18 23)    HTML Injection          HTMLInjection          ON
19 24)    appliance Push         push                   OF
20 Done
21 <!--NeedCopy-->

```

## Enable cache redirection and load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. To enable cache redirection, in the details pane, under Modes and Features, click Configure advanced features.
  - a) In Configure Advanced Features dialog box, select the check box next to the Cache Redirection, and then click OK.
  - b) In Enable/Disable Feature(s)? dialog box, click Yes.
3. To enable load balancing, in the details pane, under Modes and Features, click Configure basic features.
  - a) In Configure Basic Features dialog box, select the check box next to the Load Balancing, and then click OK.
  - b) In Enable/Disable Feature(s)? dialog box, click Yes.

## Configure edge mode

September 21, 2020

When deployed at the edge of a network, the Citrix ADC appliance dynamically learns about the servers on that network. Edge mode enables the appliance to dynamically learn about up to 40,000 HTTP servers and proxy TCP connections for these servers.

This mode turns on the collection of statistics for the dynamically learned services and is typically used in transparent deployments for cache redirection.

### Enable edge mode by using the CLI

At the command prompt, type the following commands to enable edge mode and verify the setting:

```

1 - enable ns mode Edge
2 - show ns mode

```

```
3 <!--NeedCopy-->
```

**Example:**

```
1 > enable ns mode edge
2 Done
3
4 > show ns mode
5
6          Mode                               Acronym           Status
7          -----                               -
8          ...
9          ...
10         ...
11 6)      MAC-based forwarding                MBF                ON
12 7)      Edge configuration                  Edge               ON
13 8)      Use Subnet IP                       USNIP              OFF
14         ...
15         ...
16         ...
17 16)     Bridge BPDUs                       BridgeBPDUs        OFF
18 Done
19 <!--NeedCopy-->
```

**Enable edge mode by using the GUI**

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In Configure Modes dialog box, select the check box next to the Edge Configuration, and then click OK.
4. In Enable/Disable Feature(s)? dialog box, click Yes.

**Configure a cache redirection virtual server**

September 21, 2020

By default, a cache redirection virtual server forwards cacheable requests to the load balancing virtual server for the cache, and forwards non-cacheable requests to the origin server (except in a reverse proxy configuration, in which non-cacheable requests are sent to a load balancing virtual server). There are three types of cache redirection virtual servers: transparent, forward proxy, and reverse proxy.

A transparent cache redirection virtual server uses an IP address of \* and a port number, usually 80, that can accept HTTP traffic sent to any IP address that the appliance represents. As a result, you can configure only one transparent cache redirection virtual server. Any additional cache redirection virtual servers that you configure must be forward proxy or reverse proxy redirection servers.

### add a cache redirection virtual server in transparent mode by using the cli

At the command prompt, type the following commands to add a cache redirection virtual server and verify the configuration:

```

1 - add cr vserver <name> <serviceType> [<IPAddress> <port> ] [-
    cacheType <cacheType>] [-redirect <redirect>]
2 - show cr vserver [<name>]
3 <!--NeedCopy-->

```

#### Example:

```

1 add cr vserver Vserver-CRD-1 HTTP * 80 -cacheType TRANSPARENT -redirect
  POLICY
2 > show cr vserver Vserver-CRD-1
3     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
4     State: UP  ARP:DISABLED
5     Client Idle Timeout: 180 sec
6     Down state flush: ENABLED
7     Disable Primary Vserver On Down : DISABLED
8     Default:          Content Precedence: RULE          Cache:
      TRANSPARENT
9     On Policy Match: ORIGIN L2Conn: OFF      OriginUSIP: OFF
10    Redirect: POLICY      Reuse: ON      Via: ON ARP: OFF
11 Done
12 <!--NeedCopy-->

```

### Modify or remove a cache redirection virtual server by using the CLI

- To modify a virtual server, use the `set cr vserver` command, which is just like using the `add cr vserver` command, except that you enter the name of an existing virtual server.
- To remove a virtual server, use the `rm cr vserver` command, which accepts only the `<name>` argument.

### Add a cache redirection virtual server in transparent mode by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.

2. In the details pane, click Add.
3. In the Create Virtual Server (Cache Redirection) dialog box, specify values for the following parameters as shown:
  - Name\*—name
  - Port\*—port

\*A required parameter
4. In the Protocol drop-down list, select a supported protocol (for example, **HTTP**). If the virtual server is to receive traffic on a port other than the standard port for the selected protocol, enter a new value in the Port field.
5. Click the Advanced tab.
6. Verify that Cache Type is set to TRANSPARENT and Redirect is set to POLICY.
7. Click Create, and then click Close. The Cache Redirection Virtual Servers pane displays the new virtual server.
8. Select the new cache redirection virtual server to display the details of its configuration.

## Bind policies to the cache redirection virtual server

September 21, 2020

Cache redirection policies are not automatically bound to the cache redirection virtual server. A policy based cache redirection virtual server cannot function unless you bind at least one policy to it.

### Bind policies to a cache redirection virtual server by using the CLI

At the command prompt, type:

```
1 - bind cr vserver <name> -policyName <string>
2 - show cr vserver [<name>]
3 <!--NeedCopy-->
```

#### Example:

```
1 > bind cr vserver Vserver-CRD-1 -policyName bypass-cache-control
2 Done
3 > bind cr vserver Vserver-CRD-1 -policyName bypass-dynamic-url
4 Done
5 > bind cr vserver Vserver-CRD-1 -policyName bypass-urltokens
6 Done
```

```
7 > bind cr vserver Vserver-CRD-1 -policyName bypass-cookie
8 Done
9
10 > show cr vserver Vserver-CRD-1
11     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
12     State: UP  ARP:DISABLED
13     Client Idle Timeout: 180 sec
14     Down state flush: ENABLED
15     Disable Primary Vserver On Down : DISABLED
16     Default:          Content Precedence: RULE          Cache:
17     On Policy Match: ORIGIN L2Conn: OFF      OriginUSIP: OFF
18     Redirect: POLICY          Reuse: ON          Via: ON ARP: OFF
19
20 1)     Cache bypass  Policy: bypass-cache-control
21 2)     Cache bypass  Policy: bypass-dynamic-url
22 3)     Cache bypass  Policy: bypass-urltokens
23 4)     Cache bypass  Policy: bypass-cookie
24 Done
25 <!--NeedCopy-->
```

## Bind a user-defined policy to a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. Click the virtual server that you want to configure, and click Open.
3. On the Policies tab, select type of the policy and then click Insert Policy.
4. Under Policy Name column, select the policy that you want to bind.
5. Click OK.

## Unbind a policy from a cache redirection virtual server

September 21, 2020

When you unbind a policy from the cache redirection virtual server, the Citrix ADC appliance no longer applies the policy when evaluating client requests.

## Unbind a policy from a cache redirection virtual server by using the command CLI

At the command prompt, type:

```
1 - unbind cr vserver <name> -policyName <string>
```

```
2 - show cr vserver [<name>]
3 <!--NeedCopy-->
```

**Example:**

```
1 unbind cr vserver Vserver-CR-1 -policyName bypass-non-get
2 > show cr vserver Vserver-CRD-1
3     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
4     State: UP  ARP:DISABLED
5     Client Idle Timeout: 180 sec
6     Down state flush: ENABLED
7     Disable Primary Vserver On Down : DISABLED
8     Default:          Content Precedence: RULE          Cache:
9     TRANSPARENT
10    On Policy Match: ORIGIN L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY          Reuse: ON      Via: ON ARP: OFF
12 1)    Cache bypass  Policy: bypass-cache-control
13 Done
14 <!--NeedCopy-->
```

**Unbind a user-defined policy from a cache redirection virtual server by using the GUI**

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. Click the virtual server that you want to configure, and then click Open.
3. On the Policies tab, under Policy Name, select the policy that you want to unbind.
4. Click Unbind Policy, and then click OK.

**Create a load balancing virtual server**

September 21, 2020

The cache redirection virtual server on the Citrix ADC appliance can send requests to either a cache server farm, if the request is cacheable, or to the origin server farm if the request is not cacheable.

Each cache server is represented on the appliance by a service, which is bound to a load balancing virtual server that receives requests from the cache redirection virtual server and forwards those requests to the servers.

For details on configuring load balancing virtual servers and other configuration options, see [“Load Balancing.”](#)

## Create a load balancing virtual server by using the CLI

At the command prompt, type the following commands to create a load balancing virtual server and verify the configuration:

```
1 - add lb vserver <name> <serviceType> [<IPAddress>] [<port>]
2 - show lb vserver [<name>]
3 <!--NeedCopy-->
```

### Example:

```
1 > add lb vserver Vserver-LB-CR HTTP 10.102.20.30 80
2 Done
3 > show lb vserver Vserver-LB-CR
4     Vserver-LB-CR (10.102.20.30:80) - HTTP  Type: ADDRESS
5     State: DOWN
6     Last state change was at Fri Jul  2 08:47:52 2010
7     Time since last state change: 0 days, 00:00:08.470
8     Effective State: DOWN
9     Client Idle Timeout: 180 sec
10    Down state flush: ENABLED
11    Disable Primary Vserver On Down : DISABLED
12    Port Rewrite : DISABLED
13    No. of Bound Services :  0 (Total)          0 (Active)
14    Configured Method: LEASTCONNECTION
15    Mode: IP
16    Persistence: NONE
17    Vserver IP and Port insertion: OFF
18    Push: DISABLED  Push VServer:
19    Push Multi Clients: NO
20    Push Label Rule: none
21 Done
22 <!--NeedCopy-->
```

## Create a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, specify values for the following parameters as shown:
  - Name\*-name
  - IP Address\*- IPAddress

- Port\*-port

\*A required parameter

4. In the Protocol list, select a supported protocol (for example, **HTTP**). If the virtual server is to receive traffic on a port other than the well-known port for the selected protocol, enter a new value in the Port field.
5. Click Create, and then click Close. The Load Balancing Virtual Servers pane displays the new virtual server.

## Configure an HTTP service

September 21, 2020

On the Citrix ADC appliance, a service represents a physical server on the network. In the transparent cache redirection configuration, the service represents the cache server. Cacheable requests are sent by the cache redirection virtual server to the load balancing virtual server, which in turn forwards each request to the correct service, which passes it on to the cache server.

### Configure an HTTP service by using the CLI

At the command prompt, type the following commands to create an HTTP service and verify the configuration:

```
1 - add service <name> <IP> <serviceType> <port> -cacheType <cacheType>
2 - show service [<name>]
3 <!--NeedCopy-->
```

#### Example:

```
1 > add service Service-HTTP-1 10.102.29.40 HTTP 80 -cacheType
   TRANSPARENT
2 Done
3 > show service Service-HTTP-1
4     Service-HTTP-1 (10.102.29.40:80) - HTTP
5     State: DOWN
6     Last state change was at Fri Jul 2 09:14:17 2010
7     Time since last state change: 0 days, 00:00:13.820
8     Server Name: 10.102.29.40
9     Server ID : 0   Monitor Threshold : 0
10    Max Conn: 0   Max Req: 0   Max Bandwidth: 0 kbits
11    Use Source IP: NO
```

```
12      Client Keepalive(CKA): NO
13      Access Down Service: NO
14      TCP Buffering(TCPB): NO
15      HTTP Compression(CMP): YES
16      Idle timeout: Client: 180 sec   Server: 360 sec
17      Client IP: DISABLED
18      Cache Type: TRANSPARENT Redirect Mode:
19      Cacheable: NO
20      SC: OFF
21      SP: ON
22      Down state flush: ENABLED
23
24 1)      Monitor Name: tcp-default
25          State: DOWN      Weight: 1
26          Probes: 3        Failed [Total: 3 Current: 3]
27          Last response: Failure - Time out during TCP connection
28                          establishment stage
29          Response Time: N/A
30 Done
31 <!--NeedCopy-->
```

## Modify or remove a service by using the CLI

- To modify a service, use the `set service` command, which is just like using the `add service` command, except that you enter the name of an existing service.
- To remove a service, use the `rm service` command, which accepts only the `<name>` argument.

## Add an HTTP service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
  - Service Name\*—name
  - Server\*—IP
  - Port\*—port

\*A required parameter
4. In the Protocol\* drop-down list, select a supported protocol (for example, **HTTP**).
5. Click Create, and then click Close.

## Bind/unbind a service to/from a load balancing virtual server

September 21, 2020

You must bind a service to the load balancing virtual server. This enables the load balancer to forward the request to the server that the service represents. If your configuration changes, you can unbind a service from the load balancing virtual server.

### Bind a service to a load balancing virtual server by using the CLI

At the command prompt, type:

```
1 - bind lb vserver <name> <serviceName>
2 - show lb vserver [<name>]
3 <!--NeedCopy-->
```

#### Example:

```
1 > bind lb vserver vserver-LB-CR service-HTTP-1
2 Done
3 > show lb vserver Vserver-LB-CR
4     Vserver-LB-CR (10.102.20.30:80) - HTTP Type: ADDRESS
5     State: DOWN
6     Last state change was at Fri Jul  2 08:47:52 2010
7     Time since last state change: 0 days, 00:42:25.610
8     Effective State: DOWN
9     Client Idle Timeout: 180 sec
10    Down state flush: ENABLED
11    Disable Primary Vserver On Down : DISABLED
12    Port Rewrite : DISABLED
13    No. of Bound Services : 1 (Total)          0 (Active)
14    Configured Method: LEASTCONNECTION
15    Mode: IP
16    Persistence: NONE
17    Vserver IP and Port insertion: OFF
18    Push: DISABLED Push VServer:
19    Push Multi Clients: NO
20    Push Label Rule: none
21
22 1) Service-HTTP-1 (10.102.29.40: 80) - HTTP State: DOWN Weight: 1
23 Done
24 <!--NeedCopy-->
```

## Unbind a service from a load balancing virtual server by using the CLI

To unbind a service, use the `unbind lb vserver` command instead of `bind lb vserver`.

## Bind/unbind a service from a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers
2. In the details pane, select the virtual server from which you want to bind/unbind the service, and then click Open.
3. On the Services tab, in the Active column, select/clear the check box next to the Service Name.
4. Click OK.

## Disable the use the proxy port setting for transparent caching

September 21, 2020

If the use source IP (USIP) option is disabled on a cache service configured on the Citrix ADC appliance, the appliance forwards client requests to the cache service by using a appliance-owned subnet IP (SNIP) address or mapped IP (MIP) address as the source IP address and a random port as the source port. The randomly selected port is called the proxy port.

However, if you want to configure a fully transparent cache (a cache configuration in which the cache service receives the client's IP address and port number), you must not only enable the USIP option, either globally or on the cache service, but also disable the Use Proxy Port setting, either globally or on the cache service. Disabling the Use Proxy Port setting enables the appliance to use the client's source port as the source port when it connects to the cache service, and ensures a fully transparent cache configuration.

For more information about configuring the Use Proxy Port option globally or on a service, see [Configuring the Source Port for Server-Side Connections](#).

## Assign a port range to the Citrix ADC appliance

September 21, 2020

Sharing of the client IP address may create a conflict that makes network devices, such as routers, cache servers, origin servers, and other Citrix ADC appliances, unable to determine the appliance, and therefore the client, to which the response should be sent.

A method to solve this problem is to assign a source port range to the Citrix ADC appliance. This allotment enables network devices to unambiguously identify the Citrix ADC appliance that sent the request.

### **Assign a source port range to a Citrix ADC appliance by using the CLI**

At the command prompt, type:

```
set ns param -crPortRange <startPortNumber-endPortNumber>
```

### **Assign a source port range to a Citrix ADC appliance by using the appliance GUI**

1. In the navigation pane, click System, and then click Settings.
2. In the Settings group, click the Change global system settings link.
3. In the Cache Redirection Port Range group, specify the port range for the appliance by typing a port number for Start Port and a port number for End Port.
4. Click OK.

## **Enable load balancing virtual servers to redirect requests to cache**

September 21, 2020

If a load balancing virtual server is configured to listen on a particular IP address and port combination, it takes precedence over the cache redirection virtual server for any requests destined for that address-port combination. Therefore, the cache redirection virtual server does not process those requests.

If you want to override this functionality and let the cache redirection virtual server decide whether the request should be served from the cache or not, configure the particular load balancing virtual server to be cacheable.

Such a configuration is typically used when an ISP uses a Citrix ADC appliance at the edge of its network and all traffic flows through the appliance.

### **Enable load balancing virtual servers to redirect requests to the cache by using the CLI**

At the command prompt, type:

```
1 - set lb vserver <name> [-cacheable ( YES | NO)]
2 - show lb vserver [<name>]
3 <!--NeedCopy-->
```

**Example:**

```

1 set lb vserver Vserver-LB-CR - cacheable YES
2 > show lb vserver vserver-LB-CR
3     Vserver-LB-CR (10.102.20.30:80) - HTTP Type: ADDRESS
4     State: DOWN
5     Last state change was at Fri Jul  2 08:47:52 2010
6     Time since last state change: 0 days, 01:05:51.510
7     Effective State: DOWN
8     Client Idle Timeout: 180 sec
9     Down state flush: ENABLED
10    Disable Primary Vserver On Down : DISABLED
11    Port Rewrite : DISABLED
12    No. of Bound Services :  1 (Total)          0 (Active)
13    Configured Method: LEASTCONNECTION
14    Mode: IP
15    Persistence: NONE
16    Cacheable: YES  PQ: OFF SC: OFF
17    Vserver IP and Port insertion: OFF
18    Push: DISABLED  Push VServer:
19    Push Multi Clients: NO
20    Push Label Rule: none
21
22 1) Service-HTTP-1 (10.102.29.40: 80) - HTTP State: DOWN Weight: 1
23 Done
24 <!--NeedCopy-->

```

For transparent cache redirection, the appliance intercepts all traffic and evaluates every request to determine whether it is cacheable. Non-cacheable requests are sent unchanged to the origin server.

When using transparent cache redirection, you may want to turn off cache redirection for load balancing virtual servers that always direct traffic to origin servers.

**Turn off caching for a load balancing virtual server by using the CLI**

To turn off caching for a load balancing virtual, use the `unset lb vserver` command instead of `set lb vserver`. Specify a value of `NO` value for the **cacheable** parameter.

**Enable or disable load balancing virtual servers to redirect requests to the cache by using the GUI**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server from which you want to enable/disable the caching, and then click Open.

3. On the Advanced tab, select/clear Cache Redirection check box.
4. Click OK.

## Configure forward proxy redirection

September 21, 2020

A forward proxy is a single point of contact for a client or group of clients. In this configuration, the Citrix ADC appliance redirects non-cacheable requests to an origin server and redirects cacheable requests to either a forward proxy cache or a transparent cache.

When the appliance is configured as a forward proxy, users must modify their browsers so that the browser sends requests to the forward proxy instead of the destination servers.

A forward proxy cache redirection virtual server on the appliance compares the request with a policy for caching. If the request is not cacheable, the appliance queries a DNS load balancing virtual server for resolution of the destination, and then sends the request to the origin server. If the request is cacheable, the appliance forwards the request to a load balancing virtual server for the cache.

The appliance relies on a host domain name or IP address in the request's HOST header to determine the requested destination. If there is no HOST header in the request, the appliance inserts a HOST header based on the destination IP address in the request.

Typically, the Citrix ADC appliance acts as a forward proxy in an enterprise LAN. In such a configuration, the appliance resides at the edge of an enterprise LAN and intercepts client requests before they are fanned out to the WAN. Configuring the appliance in the forward proxy mode reduces traffic on the WAN.

To configure forward proxy cache redirection, first enable load balancing and cache redirection on the appliance. Then, configure a DNS load balancing virtual server and associated services. Also configure a load balancing virtual server and bind to it appropriate services for the cache. Configure a forward proxy cache redirection virtual server and bind the DNS and load balancing virtual servers to it. You must also configure caching policies and bind them to the cache redirection virtual server. To complete the setup, configure the client browsers to use the forward proxy.

For details on how to enable cache redirection and load balancing on the appliance, see [“Enable cache redirection and load balancing.”](#)

For details on how to create a load balancing virtual server, see [“Create a load balancing virtual server.”](#)

For details on how to configure services that represent the cache server, see [“Configure an HTTP service.”](#)

For details on how to bind the service to a virtual server, see [“Bind/unbind a service to/from a load balancing virtual server.”](#)

For details on how to create a forward proxy cache redirection server, see [“Configure a cache redirection virtual server”](#), and create a virtual server of type TRANSPARENT or FORWARD.

For details on binding cache redirection policies to the cache redirection virtual server, see [“Configure a cache redirection policy.”](#)

## Create a DNS service

September 21, 2020

A DNS service is a representation, on the Citrix ADC appliance, of a physical DNS server in the network. A DNS load balancing virtual server sends DNS requests to the DNS server in the network through such a service.

### Create a DNS service by using the CLI

At the command line, type the following commands to create a DNS service and verify the configuration :

```
1 - add service <name> <IP> <serviceType> <port>
2 - show service [<name>]
3 <!--NeedCopy-->
```

### Example:

```
1 add service Service-DNS-1 10.102.29.41 DNS 53
2 show service Service-DNS-1
3     Service-DNS-1 (10.102.29.41:53) - DNS
4     State: DOWN
5     Last state change was at Fri Jul  2 10:14:32 2010
6     Time since last state change: 0 days, 00:00:13.550
7     Server Name: 10.102.29.41
8     Server ID : 0   Monitor Threshold : 0
9     Max Conn: 0     Max Req: 0       Max Bandwidth: 0 kbits
10    Use Source IP: NO
11    Client Keepalive(CKA): NO
12    Access Down Service: NO
13    TCP Buffering(TCPB): NO
14    HTTP Compression(CMP): NO
15    Idle timeout: Client: 120 sec  Server: 120 sec
```

```
16      Client IP: DISABLED
17      Cacheable: NO
18      SC: OFF
19      SP: OFF
20      Down state flush: ENABLED
21
22 1)      Monitor Name: ping-default
23          State: DOWN      Weight: 1
24          Probes: 3      Failed [Total: 3 Current: 3]
25          Last response: Failure - Probe timed out.
26          Response Time: 2000.0 millisec
27 Done
28 <!--NeedCopy-->
```

## Add a DNS service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, click Add.
3. In the Create Service dialog box, specify values for the following parameters as shown:
  - Service Name\*—name
  - Server\*—IP
  - Port\*—port

\*A required parameter

1. In the Protocol\* drop down list, select a supported protocol (for example, **DNS**).
2. Click Create, and then click Close.

## Create a DNS load balancing virtual server

September 21, 2020

The DNS virtual server enables the forward proxy to perform DNS resolution before forwarding a client request to an origin server. The DNS load balancing virtual server is associated with the DNS service that represents the physical DNS server on the network.

## Create a DNS load balancing virtual server by using the CLI

At the command line, type the following commands to create a DNS load balancing virtual server and verify the configuration:

```
1 - add lb vserver <name> <serviceType>
2 - show lb vserver [<name>]
3 <!--NeedCopy-->
```

**Example:**

```
1 > add lb vserver Vserver-DNS-1 DNS
2 Done
3 > show lb vserver Vserver-DNS-1
4     Vserver-DNS-1 (0.0.0.0:0) - DNS Type: ADDRESS
5     State: DOWN
6     Last state change was at Fri Jul  2 10:32:28 2010
7     Time since last state change: 0 days, 00:00:08.10
8     Effective State: DOWN ARP:DISABLED
9     Client Idle Timeout: 120 sec
10    Down state flush: ENABLED
11    Disable Primary Vserver On Down : DISABLED
12    No. of Bound Services : 0 (Total)          0 (Active)
13    Configured Method: LEASTCONNECTION
14    Mode: IP
15    Persistence: NONE
16 Done
17 <!--NeedCopy-->
```

**Create a DNS load balancing virtual server by using the GUI**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Load Balancing) dialog box, in the Name box, type a name for the virtual server.
4. In the Protocol\* drop down list, select a supported protocol (for example, **DNS**).
5. Click Create, and then click Close. The DNS Virtual Servers pane displays the new virtual server.

**Bind the DNS service to the virtual server**

September 21, 2020

For the DNS server to respond to DNS requests, the service representing the DNS server must be bound to the DNS virtual server.

## Bind the DNS service to the load balancing virtual server by using the CLI

At the command prompt, type the following commands to bind the DNS service to the load balancing virtual server and verify the configuration:

```
1 - bind lb vserver <name> <serviceName>
2 - show lb vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > bind lb vserver Vserver-DNS-1 Service-DNS-1
2 Done
3 > show lb vserver Vserver-DNS-1
4     Vserver-DNS-1 (0.0.0.0:0) - DNS Type: ADDRESS
5     State: DOWN
6     Last state change was at Fri Jul  2 10:32:28 2010
7     Time since last state change: 0 days, 00:12:16.80
8     Effective State: DOWN  ARP:DISABLED
9     Client Idle Timeout: 120 sec
10    Down state flush: ENABLED
11    Disable Primary Vserver On Down : DISABLED
12    No. of Bound Services :  1 (Total)          0 (Active)
13    Configured Method: LEASTCONNECTION
14    Mode: IP
15    Persistence: NONE
16
17 1) Service-DNS-1 (10.102.29.41: 53) - DNS State: DOWN  Weight: 1
18 Done
19 >
20 <!--NeedCopy-->
```

## Unbind a DNS service from the load balancing virtual server by using the CLI

Use the `unbind lb vserver` command instead of `bind lb vserver`.

## Bind/Unbind a DNS service to/from a load balancing virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers
2. In the details pane, select the virtual server to/from which you want to bind/unbind the DNS service, and then click Open.
3. On the Services tab, in the Active column, select/clear the check box next to the Service Name.
4. Click OK.

## Configure a client web browser to use a forward proxy

September 21, 2020

When you configure the Citrix ADC appliance as forward proxy cache redirection virtual server in the network, you must configure the client Web browser to send requests to the forward proxy. Typically, when you use a forward proxy, the only route to the servers in the network is through the forward proxy.

Refer the documentation for your browser to configure the browser to use a forward proxy. Specify the IP address and port number of the forward proxy cache redirection virtual server for this configuration.

## Configure reverse proxy redirection

September 21, 2020

A reverse proxy resides in front of one or more Web servers and shields the origin server from client requests. Often, a reverse proxy cache is a front-end for all client requests to a server. An administrator assigns a reverse proxy cache to a specific origin server. This is unlike transparent and forward proxy caches, which cache frequently requested content for all requests to any origin server, and the choice of a server is based on the request.

Unlike a transparent proxy cache, the reverse proxy cache has its own IP address and can replace destination domains and URLs in a non-cacheable request with new destination domains and URLs.

You can deploy reverse proxy cache redirection at the origin-server side or at the edge of a network. When deployed at the origin server, the reverse proxy cache redirection virtual server is a front-end for all requests to the origin server.

In the reverse proxy mode, when the appliance receives a request, a cache redirection virtual server evaluates the request and forwards it to either a load balancing virtual server for the cache or a load balancing virtual server for the origin. The incoming request can be transformed by changing the host header or the host URL before they it is sent to the backend server.

To configure reverse proxy cache redirection, first enable cache redirection and load balancing. Then, configure a load balancing virtual server and services to send cacheable requests to the cache servers. Also configure a load balancing virtual server and associated services for the origin servers. Then, configure a reverse proxy cache redirection virtual server and bind relevant cache redirection policies to it. Finally, configure mapping policies and bind them to the reverse proxy cache redirection virtual server.

The mapping policies have an associated action that enables the cache redirection virtual server to forward any non-cacheable request to the load balancing virtual server for the origin.

Be sure to create the default cache server destination.

For details on how to enable cache redirection and load balancing on the appliance, see [Enable cache redirection and load balancing](#).

For details on how to create a load balancing virtual server, see [Create a load balancing virtual server](#).

For details on how to configure services that represent the cache server, see [Configure an HTTP service](#).

For details on how to bind the service to a virtual server, see [Bind/unbind a service to/from a load balancing virtual server](#).

For details on how to create a reverse proxy cache redirection server, see [Configure a cache redirection virtual server](#), and create a virtual server of type REVERSE.

For details on binding built-in cache redirection policies to the cache redirection virtual server, see [Bind policies to the cache redirection virtual server](#).

## Configure mapping policies

If an incoming request is non-cacheable, the reverse-proxy cache redirection virtual server replaces the domain and URL in the request with the domain and URL of a target origin server and forwards the request to the load balancing virtual server for the origin.

A mapping policy enables the reverse proxy cache redirection virtual server to replace the destination domain and URL and forward the request to the load balancing virtual server for the origin.

A mapping policy must first translate the domain and the URL, and then pass the request on to the origin load balancing virtual server.

A mapping policy can map a domain, a URL prefix, and a URL suffix, as follows:

- **Domain mapping:** You can map a domain without a prefix or suffix. The domain mapping is the default mapping for the virtual server (for example, mapping `www.mycompany.com` to `www.myrealcompany.com`).
- **Prefix mapping:** You can replace a specified pattern prefixed as part of the URL (for example, mapping `www.mycompany.com/sports/index.html` to `www.mycompany.com/news/index.html`).
- **Suffix mapping:** You can replace the file suffix in the URL (for example, mapping `www.mycompany.com/sports/index.html` to `www.mycompany.com/sports/index.asp`).

The source and the destination strings being mapped must be similar. If you specify a source domain, you must specify a destination domain, and if you specify a source suffix, you must specify a destination suffix. Similarly, if you specify an exact URL from the source, the target URL must also be an exact URL.

Once you configure mapping policies for the reverse proxy mode, you must bind them to the cache redirection virtual server.

You can use combinations of the source URL, target URL, and source and target domains to configure all three types of domain mapping.

### **Configure a mapping policy for reverse proxy mode by using the CLI**

At the command prompt, type the following command to add a policy map and verify the configuration:

```
1 - add policy map <mapPolicyName> -sd <string> [-su <string>] [-td <string>] [-tu <string>]
2 - show policy map [<mapPolicyName>]
3 <!--NeedCopy-->
```

#### **Example:**

The following command maps a domain in a client request to a target domain:

```
1 > add policy map myMappingPolicy -sd www.mycompany.com -td www.myrealcompany.com
2 Done
3 > show policy map myMappingPolicy
4 1)      Name: myMappingPolicy
5         Source Domain: www.mycompany.com           Source Url:
6         Target Domain: www.myrealcompany.com       Target Url:
7 Done
8 <!--NeedCopy-->
```

Following is an example of mapping a URL suffix to a different URL suffix:

```
1 > add policy map myOtherMappingPolicy -sd www.mycompany.com -td www.myrealcompany.com -su /news.html -tu /realnews.html
2 Done
3 > show policy map myOtherMappingPolicy
4 1)      Name: myOtherMappingPolicy
5         Source Domain: www.mycompany.com           Source Url: /news.html
6         Target Domain: www.myrealcompany.com       Target Url: /realnews.html
7 Done
8 <!--NeedCopy-->
```

### Configure a mapping policy for reverse proxy mode by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Map Policies.
2. In the details pane, click Add.
3. In the Create Map Policy dialog box, specify values for the following parameters as shown:
  - Name\*- mapPolicyName
  - Source Domain\*-sd
  - Target Domain\*-td
  - Source URL-su
  - Target URL-tu

\*A required parameter
4. Click Create, and then click Close. The Map pane displays the new mapping policy.

### Bind the mapping policy to the cache redirection virtual server by using the CLI

At the command prompt, type the following commands to bind the mapping policy to the cache redirection virtual server and verify the configuration:

```
1 - bind cr vserver <name> -policyName <string> [<targetVserver>]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > bind cr vserver Vserver-CRD-3 -policyName myMappingPolicy Vserver-LB-
  CR
2 Done
3 > show cr vserver Vserver-CRD-3
4     Vserver-CRD-3 (10.102.29.50:88) - HTTP Type: CONTENT
5     State: UP
6     Client Idle Timeout: 180 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default: Vserver-LB-CR Content Precedence: RULE          Cache:
      REVERSE
10    On Policy Match: ORIGIN L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY          Reuse: ON      Via: ON ARP: OFF
12
13 1) Policy:          Target: Vserver-LB-CR Priority: 0 Hits: 0
14 1) Map: myMappingPolicy Target: Vserver-LB-CR
15 Done
16 <!--NeedCopy-->
```

**Bind the mapping policy to the cache redirection virtual server by using the GUI**

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server from which you want to bind the mapping policy, and then click Open.
3. In the Configure Virtual Server(Cache Redirection), on the Policies tab, select Map, and then click Insert Policy.
4. In the Policy Name column, select the policy from drop down list.
5. In the Target column, click the down arrow, and then select the vserver from drop down list.
6. Click OK.

**Selective cache redirection**

September 21, 2020

Selective cache redirection sends requests for particular types of content, for example, images, to one cache server or group of cache servers and sends other types of content to a different cache server or group of cache servers. You can configure advanced cache redirection in transparent, reverse proxy, or forward proxy modes.

In selective cache redirection, the Citrix ADC appliance intercepts a client request and forwards non-cacheable requests to the original destination in the client request. For cacheable requests, the appliance sends the requests to the destination cache server that can serve content of a specific content type.

Selective cache redirection involves configuring content switching policies in addition to cache redirection policies. The appliance first evaluates the cache redirection policies that are bound to the cache redirection virtual server. If a request matches a cache redirection policy, the cache redirection virtual server sends the request to the origin server or a load balancing virtual server for the origin. If no cache redirection policies match the request, the appliance evaluates the content switching policies bound to the cache redirection virtual server. If a content switching policy matches the request, the cache redirection virtual server redirects the request to a load balancing virtual server for the cache.

To configure selective cache redirection, first enable cache redirection, load balancing, and content switching on the Citrix ADC appliance. Then, configure a load balancing virtual server for the cache and an associated HTTP service. After this, configure a cache redirection virtual server and bind both the cache redirection and content switching policies to it. Once you have bound the policies, you can configure the virtual server to give precedence to either rule based or URL based content-switching policies.

When configured for transparent mode cache redirection in an edge deployment topology, the appliance sends all cacheable HTTP traffic to a transparent cache farm. Clients access the Internet through the appliance, which is configured as a Layer 4 switch that receives traffic on port 80.

The appliance can direct requests for images (for example, .png and .jpg files) to one server in the transparent cache farm, and all other requests for static content to other servers in the farm. For this configuration, you configure content switching policies to send images to the image cache and send all other cacheable content to a default cache.

**Note:** The configuration described here is for transparent selective cache redirection. Therefore, it does not require a load balancing virtual server for the origin, as would a reverse proxy configuration.

To configure this type of selective cache redirection, first enable cache redirection, load balancing, and content switching. Then, configure a load balancing virtual server for the cache and configure an associated HTTP service. Then, configure a cache redirection virtual server and create and bind both cache redirection and content switching policies to this virtual server.

For details on how to enable cache redirection and load balancing on the appliance, see [Enable cache redirection and load balancing](#).

## Enable content switching

September 21, 2020

To configure selective cache redirection, after you enable both the load balancing and cache redirection features on the appliance, you must enable content switching.

### Enable content switching by using the CLI

At the command prompt, type:

```
1 - enable ns feature CS
2
3 - show ns feature
4 <!--NeedCopy-->
```

#### Example:

```
1 > enable ns feature cs
2 Done
3 > show ns feature
4
5 Feature Acronym Status
```

### Enable cache redirection and load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure basic features.
3. In Configure Basic Features dialog box, select the check box next to the Content Switching, and then click OK.
4. In Enable/Disable Feature(s)? dialog box, click Yes.

### Configure a load balancing virtual server for the cache

September 21, 2020

Create a load balancing virtual server and an HTTP service for each type of cache server that will be used. For example, if you want to serve JPEG files from one cache server and GIF files from another cache server, and use a third cache server for the rest of the content, create an HTTP service and virtual server for each of the three types of cache servers. Then bind each service to its respective virtual server.

For details on how to create a load balancing virtual server, see [Create a load balancing virtual server](#).

For details on how to configure services that represent the cache server, see [Configure an HTTP service](#).

For details on how to bind the service to a virtual server, see [Bind/unbind a service to/from a load balancing virtual server](#).

For details on how to create a transparent proxy cache redirection server, see [Configure a cache redirection virtual server](#), and create a virtual server of type TRANSPARENT.

For details on binding built-in cache redirection policies to the cache redirection virtual server, see [Bind policies to the cache redirection virtual server](#).

## Configure a cache redirection policy for a specific type of content

To identify requests that contain a .png or .jpeg extension as cacheable, you configure a cache redirection policy and bind it to the cache redirection virtual server.

**Note:** If a request matches a policy, the Citrix ADC appliance forwards it to the origin server. As a result, in the following procedure, you configure policies to match requests that do *not* have “.png” or “.jpeg” extensions.

To configure cache redirection for a specific type of content, configure a policy that uses a simple expression, as described in [Configure a cache redirection policy](#).

## Configure policies for content switching

September 21, 2020

You must create a content switching policy to identify specific types of content to be cached in one cache server or farm and identify other types of content to serve from another cache server or farm. For example, you can configure a policy to determine the location for image files with .png and .jpeg extensions.

After defining the content switching policy, you bind it to a cache redirection virtual server and specify a load balancing virtual server. Requests that match the policy are forwarded to the named load balancing virtual server. Requests that do not match the content switching policy are forwarded to the default load balancing virtual server for the cache.

For more details about the content switching feature and configuring content switching policies, see [Content switching](#).

You must first create the content switching policy and then bind it to the cache redirection virtual server.

### Create a content switching policy by using the command CLI

At the command line, type:

```
1 - add cs policy <policyName> [-url <string> | -rule <expression>]
2 - show cs policy [<policyName>]
3 <!--NeedCopy-->
```

**Examples:**

```
1 > add cs policy Policy-CS-JPEG -rule "REQ.HTTP.URL == '/*.jpeg'"
2 Done
3 > show cs policy Policy-CS-JPEG
4         Rule: REQ.HTTP.URL == '/*.jpeg'           Policy: Policy-CS-JPEG
5         Hits: 0
6 Done
7 >
8
9 > add cs policy Policy-CS-GIF -rule "REQ.HTTP.URL == '/ *.png'"
10 Done
11 > show cs policy Policy-CS-GIF
12         Rule: REQ.HTTP.URL == '/ *.png'           Policy: Policy-CS-GIF
13         Hits: 0
14 Done
15 >
16
17 > add cs policy Policy-CS-JPEG-URL -url /*.jpg
18 Done
19 > show cs policy Policy-CS-JPEG-URL
20         URL: /*.jpg           Policy: Policy-CS-JPEG-URL
21         Hits: 0
22 Done
23 >
24
25 > add cs policy Policy-CS-GIF-URL -url /*.png
26 Done
27 > show cs policy Policy-CS-GIF-URL
28         URL: /*.png           Policy: Policy-CS-GIF-URL
29         Hits: 0
30 Done
31 <!--NeedCopy-->
```

**Create a URL-based content switching policy by using the GUI**

1. Navigate to Traffic Management > Content Switching > Policies.
2. In the details pane, click Add.
3. In the Create Content Switching Policy dialog box, in the Name text box, type a name for the policy.
4. Select the URL radio button.
5. In the Value text box, type the string value (for example, **/sports**).
6. Click Create and click Close. The policy you created appears in the Content Switching Policies

page.

### Create a rule-based content switching policy by using the GUI

1. Navigate to Traffic Management > Content Switching > Policies.
2. In the details pane, click Add.
3. In the Create Content Switching Policy dialog box, in the Name text box, type a name for the policy.
4. Select the Expression radio button, and then click Configure.
5. In the Create Expression dialog box, choose the expression syntax that you want to use.
  - If you want to use default syntax, accept the default and proceed to the next step.
  - If you want to use classic syntax, click Switch to Classic Syntax.

The Expression portion of the dialog box changes to match your choice. The default syntax Expression view has fewer elements than does the classic syntax Expression view. In the default syntax Expression view, instead of a preview window, a button provides access to an expression evaluator. The evaluator evaluates the expression you entered, to verify that it is valid, and displays an analysis of the expression's effect.

6. Enter your policy expressions.

For information about using the advanced syntax, see [Configure advanced policy expression: Get started](#).

7. Click Create and click Close. The policy you created appears in the Content Switching Policies pane.

### Bind the content switching policy to a cache redirection virtual server by using the CLI

At the command prompt, type the following commands to bind the content switching policy to a cache redirection virtual server and verify the configuration:

```
1 - bind cs vserver <name> <targetVserver> [-policyName <string>]
2 - show cs vserver [<name>]
3 <!--NeedCopy-->
```

#### Example:

```
1 > bind cs vserver Vserver-CR-1 lbcachejpeg -policyName Policy-CS-JPEG
2 Done
3 > bind cs vserver Vserver-CR-1 lbcachegif -policyName Policy-CS-GIF
4 Done
```

```
5 > show cs vserver Vserver-CR-1
6     Vserver-CR-1 (10.102.29.60:80) - HTTP   Type: CONTENT
7     State: UP
8     Last state change was at Fri Jul  2 12:53:45 2010
9     Time since last state change: 0 days, 00:00:58.920
10    Client Idle Timeout: 180 sec
11    Down state flush: ENABLED
12    Disable Primary Vserver On Down : DISABLED
13    Port Rewrite : DISABLED
14    State Update: DISABLED
15    Default:          Content Precedence: RULE
16    Cacheable: YES
17    Vserver IP and Port insertion: OFF
18    Case Sensitivity: ON
19    Push: DISABLED   Push VServer:
20    Push Label Rule: none
21
22 1)    Policy: Policy-CS-JPEG  Target: lbcachejpeg      Priority: 0
        Hits: 0
23 2)    Policy: Policy-CS-GIF  Target: lbcachegif      Priority: 0
        Hits: 0
24 Done
25 >
26 <!--NeedCopy-->
```

## Bind the content switching policy to a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, select the virtual server for which you want to bind the policy (for example, **Vserver-CS-1**), and then click Open.
3. In the Configure Virtual Server (Content Switching) dialog box, on the Policies tab, click CSW, and then click Insert Policy.
4. In the Policy Name column, select the policy that you want to configure for the content switching virtual server.
5. In the Target column, click the green arrow, and select the target load balancing virtual server from the list.
6. Click OK.

## Configure precedence for policy evaluation

September 21, 2020

You can configure a content switching policy based on either a rule, which is a generic configuration to accommodate various content types, or a URL, which is more specific and defines exactly the type of content that has to be sent to a particular cache server. Essentially, the same content can be defined by either a rule based policy or a URL based policy.

Once you bind content switching policies of either type to a cache redirection virtual server, you can configure the virtual server to give precedence to either rule based or URL based policies. This will, in turn, decide which servers the particular requests are directed to.

To configure precedence for policy evaluation, use the precedence parameter, which specifies the type of policy (URL or RULE) that takes precedence on the content redirection virtual server.

Possible values: RULE, URL

Default value: RULE

### Configure precedence for policy evaluation by using the CLI

At the command prompt, type the following commands to configure precedence for policy evaluation and verify the configuration:

```
1 - set cr vserver <name> [-precedence (RULE | URL)]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > set cr vserver Vserver-CRD-1 -precedence URL
2 Done
3 > show cr vserver Vserver-CRD-1
4 Vserver-CRD-1 (*:80) - HTTP Type: CONTENT
5 State: UP ARP:DISABLED
6 Client Idle Timeout: 180 sec
7 Down state flush: ENABLED
8 Disable Primary Vserver On Down : DISABLED
9 Default: Content Precedence: URL Cache: TRANSPARENT
10 On Policy Match: ORIGIN L2Conn: OFF OriginUSIP: OFF
11 Redirect: POLICY Reuse: ON Via: ON ARP: OFF
12
13 1) Cache bypass Policy: bypass-cache-control
14 2) Cache bypass Policy: Policy-CRD
```

```
15 Done
16 >
17 <!--NeedCopy-->
```

## Configure precedence for policy evaluation by using the GUI

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure precedence, (for example, **Vserver-CS-1**), and then click Open.
3. In the Configure Virtual Server (Content Switching) dialog box, on the Advanced tab, next to Precedence, click Rule or URL, and then click OK.

## Administer a cache redirection virtual server

September 21, 2020

To administer a cache redirection virtual server, you need to view cache redirection statistics. You might need to enable or disable cache redirection servers, or direct policy hits to the cache instead of the origin. Administrative tasks also include backing up a cache redirection virtual server and managing client connections.

## View cache redirection virtual server statistics

September 21, 2020

You can view properties of a cache redirection virtual server and statistics on the traffic that has passed through a cache redirection virtual server. You can also view the cache redirection virtual servers and policies that you have bound to load balancing virtual servers.

To view statistics for a specific cache redirection virtual servers, use the name parameter to specify the name of the virtual server for which statistics will be displayed. Otherwise, statistics for all cache redirection virtual servers are displayed. Maximum Length: 127

## View statistics for a cache redirection virtual server by using the CLI

At the command prompt, type:

```
stat cr vservers [<name>]
```

### Example:

```

1 > stat cr vserver Vserver-CRD-1
2
3 Vserver Summary
4
5      IP      port      Protocol      State
6      0.0.0.0  80      HTTP          UP
7
8 VServer Stats:
9
10      Rate (/s)
11      Total
12
13 Requests          0
14 Responses          0
15 Request bytes     0
16 Response bytes    0
17
18 Done
19 >
20 <!--NeedCopy-->

```

### View statistics for a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers
2. In the details pane, select the virtual server for which you want to view statistics, (for example, **Vserver-CRD-1**), and then click Statistics.

Omit the server name to display basic statistics for all cache redirection virtual servers. Include the server name to display detailed statistics for that virtual server, including number and size of requests and responses that pass through the virtual server

### View the statistics of a cache redirection virtual server by using the monitoring and dashboard utilities

1. To view the statistics by using the monitoring utilities, click the Monitoring tab.
2. In the Select Group drop-down menu, choose CR Virtual Servers. A list of cache redirection virtual servers appears.
3. To view the statistics by using the dashboard utilities, click the Dashboard tab.
4. Click Applet Client or Web Start Client next to Statistical Utility.
5. In the Select Group drop-down menu, choose CR Virtual Servers. The dashboard displays summary statistics for the cache redirection virtual servers.

6. To see a chart of virtual server activity, click Chart. A graphical representation of the virtual server statistics appears.

## Enable or disable a cache redirection virtual server

September 21, 2020

When you create a cache redirection virtual server, it is enabled by default. If you disable a cache redirection virtual server, its state changes to OUT OF SERVICE and it stops redirecting cacheable client requests. However, the Citrix ADC appliance continues to respond to ARP and ping requests for the IP address of this virtual server.

### Enable or disable a cache redirection virtual server by using the CLI

At the command line, type one of the following commands:

```
1 - enable cr vserver <name>
2 - show cr vserver <name>
3 - disable cr vserver <name>
4 - show cr vserver <name>
5 <!--NeedCopy-->
```

### Examples:

```
1 > enable cr vserver Vserver-CRD-1
2 Done
3 > show cr vserver Vserver-CRD-1
4     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5     State: UP  ARP:DISABLED
6     Client Idle Timeout: 180 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default:          Content Precedence: URL Cache: TRANSPARENT
10    On Policy Match: ORIGIN L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY          Reuse: ON      Via: ON ARP: OFF
12
13 1)    Cache bypass  Policy: bypass-cache-control
14 2)    Cache bypass  Policy: Policy-CRD
15 Done
16 >
17
18 > disable cr vserver Vserver-CRD-1
```

```
19 Done
20 > show cr vserver Vserver-CRD-1
21     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
22     State: OUT OF SERVICE ARP:DISABLED
23     Client Idle Timeout: 180 sec
24     Down state flush: ENABLED
25     Disable Primary Vserver On Down : DISABLED
26     Default:          Content Precedence: URL Cache: TRANSPARENT
27     On Policy Match: ORIGIN L2Conn: OFF      OriginUSIP: OFF
28     Redirect: POLICY      Reuse: ON        Via: ON ARP: OFF
29
30 1)     Cache bypass Policy: bypass-cache-control
31 2)     Cache bypass Policy: Policy-CRD
32 Done
33 >
34 <!--NeedCopy-->
```

### Enable or disable a cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the navigation pane, expand Cache Redirection, and then click Virtual Servers.
3. In the details pane, select the virtual server that you want to enable or disable, (for example, **Vserver-CRD-1**), and then click Statistics.
4. In the Proceed dialog box, click Yes.

### Direct policy hits to the cache instead of the origin

September 21, 2020

By default, when a request matches a policy, the Citrix ADC appliance forwards the request either to the origin server directly, or to a load balancing virtual server for the origin, depending on how you have configured cache redirection.

You can change the default behavior so that when a request matches a policy, the request is forwarded to a load balancing virtual server for the cache.

To change the destination for a policy hit to the origin or the cache, use the `onPolicyMatch` parameter, which specifies where to send requests that match the cache redirection policy.

The valid options are:

1. CACHE - Directs all matching requests to the cache.

2. ORIGIN - Directs all matching requests to the origin server.

Note: For this option to work, you must select the cacheredirection type as POLICY.

Possible values: CACHE, ORIGIN

Default value: ORIGIN

## Change the destination for a policy hit to the origin or the cache by using the CLI

At the command prompt, type the following commands to change the destination for a policy hit and verify the configuration:

```
1 - set cr vserver <name> [-onPolicyMatch (ORIGIN | CACHE)]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > set cr vserver Vserver-CRD-1 -onPolicyMatch CACHE
2 Done
3 > show cr vserver Vserver-CRD-1
4     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5     State: UP  ARP:DISABLED
6     Client Idle Timeout: 180 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default:          Content Precedence: URL Cache: TRANSPARENT
10    On Policy Match: CACHE L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY      Reuse: ON        Via: ON ARP: OFF
12
13 1)    Cache bypass Policy: bypass-cache-control
14 2)    Cache bypass Policy: Policy-CRD
15 Done
16 <!--NeedCopy-->
```

## Change the destination for a policy hit to the origin or the cache by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to change the destination for a policy hit, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, click Advanced tab.
4. Select CACHE or ORIGIN from the Redirect To drop-down list.
5. Click OK.

## Back up a cache redirection virtual server

September 21, 2020

Cache redirection can fail if the primary virtual server fails, or if it is unable to handle excessive traffic. You can specify a backup virtual server to take over the processing of traffic when the primary virtual server fails.

To specify a backup cache redirection virtual server, use the backupVServer parameter, which specifies Backup Virtual Server. Maximum Length: 127

### Specify a backup cache redirection virtual server by using the CLI

At the command prompt, type the following commands to specify a backup cache redirection virtual server and verify the configuration:

```
1 - set cr vserver <name> [-backupVServer <string>]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > set cr vserver Vserver-CRD-1 -backupVServer Vserver-CRD-2
2 Done
3 > show cr vserver Vserver-CRD-1
4     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5     State: UP  ARP:DISABLED
6     Client Idle Timeout: 180 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default:          Content Precedence: URL Cache: TRANSPARENT
10    On Policy Match: CACHE  L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY      Reuse: ON      Via: ON ARP: OFF
12    Backup: Vserver-CRD-2
13
14 1)     Cache bypass  Policy: bypass-cache-control
15 2)     Cache bypass  Policy: Policy-CRD
16 Done
17 <!--NeedCopy-->
```

### Specify a backup cache redirection virtual server by using the GUI

1. Navigate to Traffic Management > Cache Redirection > irtual Servers.

2. In the details pane, select the virtual server for which you want to change the destination for a policy hit, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. In the Backup Virtual Server drop-down list, select the virtual server.
5. Click OK.

## Manage client connections for a virtual server

September 21, 2020

You can configure timeouts on a cache redirection virtual server so that client connections are not kept open indefinitely. You can also insert *Via* headers in requests. To possibly reduce network congestion, you can reuse open TCP connections. You can enable or disable delayed cleanup of cache redirection virtual server connections.

You can configure the appliance to send ICMP responses to PING requests according to your settings. On the IP address corresponding to the virtual server, set the ICMP RESPONSE to `VSVR_CNTRLD`, and on the virtual server, set the ICMP VSERVER RESPONSE.

The following settings can be made on a virtual server:

- When you set ICMP VSERVER RESPONSE to PASSIVE on all virtual servers, appliance always responds.
- When you set ICMP VSERVER RESPONSE to ACTIVE on all virtual servers, appliance responds even if one virtual server is UP.
- When you set ICMP VSERVER RESPONSE to ACTIVE on some and PASSIVE on others, appliance responds even if one virtual server set to ACTIVE is UP.

This document includes the following information:

- Configure client timeout
- Insert *Via* headers in the requests
- Reuse TCP connections
- Configure delayed connection cleanup

### Configure client timeout

You can specify expiration of client requests by setting a timeout value for the cache redirection virtual server. The timeout value is the number of seconds for which the cache redirection virtual server waits to receive a response for the client request.

To configure a time-out value, use the `cltTimeout` parameter, which specifies the time, in seconds, after which the Citrix ADC appliance closes any idle client connections. The default value is 180sec for HTTP/SSL-based services and 9000sec for TCP-based services.

### Configure client timeout by using the CLI

At the command prompt, type the following commands to configure client timeout and verify the configuration:

```
1 - set cr vserver <name> [-cltTimeout <secs>]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > set cr vserver Vserver-CRD-1 -cltTimeout 6000
2 Done
3 > show cr vserver Vserver-CRD-1
4     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5     State: UP  ARP:DISABLED
6     Client Idle Timeout: 6000 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default:          Content Precedence: URL Cache: TRANSPARENT
10    On Policy Match: CACHE L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY      Reuse: ON        Via: ON ARP: OFF
12    Backup: Vserver-CRD-2
13
14 1)    Cache bypass  Policy: bypass-cache-control
15 2)    Cache bypass  Policy: Policy-CRD
16 Done
17 <!--NeedCopy-->
```

### Configure client timeout by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. In the Client Time-out(secs) text box, enter the time-out value in seconds.
5. Click OK.

## Insert Via headers in the requests

A Via header lists the protocols and recipients between the start and end points for a request or a response and informs the server of proxies through which the request was sent. You can configure the cache redirection virtual server to insert a Via header in each HTTP request. The via parameter is enabled by default when you create a cache redirection virtual server.

To enable or disable Via-header insertion in client requests, use the via parameter, which specifies the state of the system in inserting a Via header in the HTTP requests.

Possible values: ON, OFF

Default value: ON

## Enable or disable Via-header insertion in client requests by using the CLI

At the command prompt, type:

```
1 - set cr vserver <name> [-via (ON|OFF)]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > set cr vserver Vserver-CRD-1 -via ON
2 Done
3 > show cr vserver Vserver-CRD-1
4     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5     State: UP  ARP:DISABLED
6     Client Idle Timeout: 6000 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default:          Content Precedence: URL Cache: TRANSPARENT
10    On Policy Match: CACHE  L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY      Reuse: ON      Via: ON ARP: OFF
12    Backup: Vserver-CRD-2
13
14 1)    Cache bypass  Policy: bypass-cache-control
15 2)    Cache bypass  Policy: Policy-CRD
16 Done
17 >
18 <!--NeedCopy-->
```

### Enable or disable Via-header insertion in client requests by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. Select the Via check box.
5. Click OK.

### Reuse TCP connections

You can configure the Citrix ADC appliance to reuse TCP connections to the cache and origin servers across client connections. This can improve performance by saving the time required to establish a session between the server and the appliance. The reuse option is enabled by default when you create a cache redirection virtual server.

To enable or disable the reuse of TCP connections, use the reuse parameter, which specifies the state of reuse of TCP connections to the cache or origin servers across client connections.

Possible values: ON, OFF

Default value: ON

### Enable or disable the reuse of TCP connections by using the CLI

At the command prompt, type:

```
1 - set cr vserver <name> [-reuse (ON|OFF)]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > set cr vserver Vserver-CRD-1 -reuse ON
2 Done
3 > show cr vserver Vserver-CRD-1
4     Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5     State: UP  ARP:DISABLED
6     Client Idle Timeout: 6000 sec
7     Down state flush: ENABLED
8     Disable Primary Vserver On Down : DISABLED
9     Default:          Content Precedence: URL Cache: TRANSPARENT
10    On Policy Match: CACHE  L2Conn: OFF      OriginUSIP: OFF
11    Redirect: POLICY      Reuse: ON      Via: ON ARP: OFF
12    Backup: Vserver-CRD-2
```

```
13
14 1)      Cache bypass Policy: bypass-cache-control
15 2)      Cache bypass Policy: Policy-CRD
16 Done
17 <!--NeedCopy-->
```

### Enable or disable the reuse of TCP connections by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, select the Advanced tab.
4. Select the Reuse check box.
5. Click OK.

### Configure delayed connection cleanup

The down state flush option performs delayed cleanup of connections on a cache redirection virtual server. The down state flush option is enabled by default when you create a cache redirection virtual server.

To enable or disable the down state flush option, set the `downStateFlush` parameter.

Possible values: ENABLED, DISABLED

Default value: ENABLED

### Enable or disable the down state flush option by using the CLI

At the command prompt, type the following commands to configure delayed connection clean up and verify the configuration:

```
1 - set cr vserver <name> [-downStateFlush (ENABLED | DISABLED)]
2 - show cr vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > set cr vserver Vserver-CRD-1 -downStateFlush ENABLED
2 Done
3 > show cr vserver Vserver-CRD-1
4      Vserver-CRD-1 (*:80) - HTTP      Type: CONTENT
5      State: UP ARP:DISABLED
6      Client Idle Timeout: 6000 sec
```

```
7      Down state flush: ENABLED
8      Disable Primary Vserver On Down : DISABLED
9      Default:          Content Precedence: URL Cache: TRANSPARENT
10     On Policy Match: CACHE L2Conn: OFF      OriginUSIP: OFF
11     Redirect: POLICY      Reuse: ON      Via: ON ARP: OFF
12     Backup: Vserver-CRD-2
13
14 1)      Cache bypass Policy: bypass-cache-control
15 2)      Cache bypass Policy: Policy-CRD
16 Done
17 <!--NeedCopy-->
```

### Enable or disable the reuse of TCP connections by using the GUI

1. Navigate to Traffic Management > Cache Redirection > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure client timeout, (for example, **Vserver-CRD-1**), and then click Open.
3. In Configure Virtual Server (Cache Redirection) dialog box, click Advanced tab.
4. Select the Down state flush check box.
5. Click OK.

## N-Tier cache redirection

September 21, 2020

To efficiently handle large amounts of cached data, typically several gigabytes per second, an Internet Service Provider (ISP) deploys several dedicated cache servers. The cache redirection feature of the Citrix ADC appliance can help load balance the cache servers, but a single appliance or a couple of appliances might not efficiently handle the large volume of traffic.

You can solve the problem by deploying the Citrix ADC appliances in two tiers (layers), where the appliances in the upper tier load balance those in the lower tier and the appliances in the lower tier load balance the cache servers. This arrangement is called *n-tier cache redirection*.

For purposes such as auditing and security, an ISP has to track client details such as the IP address, information provided, and the time of the interaction. Therefore, client connections through a Citrix ADC appliance have to be fully transparent. However, if you configure transparent cache redirection, with the Citrix ADC appliances deployed in parallel, the IP address of the client has to be shared among all the appliances. Sharing of the client IP address creates a conflict that makes network devices, such as routers, cache servers, origin servers, and other Citrix ADC appliances, unable to determine the appliance, and therefore the client, to which the response should be sent.

## How N-tier cache redirection is implemented

To solve the problem, appliance n-tier cache redirection splits the source port range among the appliances in the lower tier and includes the client IP address in the request sent to the cache servers. The upper-tier Citrix ADC appliances are configured to do sessionless load balancing in order to avoid unnecessary load on the appliances.

When the lower-tier Citrix ADC appliance communicates with a cache server, it uses a mapped IP address (MIP) to represent the source IP address. Therefore, the cache server can identify the appliance from which it received the request and send the response to the same appliance.

The lower-tier Citrix ADC appliance inserts the client IP address into the header of the request sent to the cache server. The client IP in the header helps the appliance to determine the client to which the packet should be forwarded when it receives the response from a cache server, or the origin server in case of a cache miss. The origin server determines the response to be sent according to the client IP inserted in the request header.

The origin server sends the response to an upper-tier appliance, including the source port number from which the origin server received the request. The entire source port range, 1024 to 65535, is distributed among the lower-tier Citrix ADC appliances. Each lower-tier appliance is exclusively assigned a group of addresses within the range. This allotment enables the upper-tier appliance to unambiguously identify the lower-tier Citrix ADC appliance that sent the request to the origin server. The upper-tier appliance can therefore forward the response to the correct lower-tier appliance.

The upper-tier Citrix ADC appliances are configured to do policy-based routing, and the routing policies are defined to determine the IP address of the destination appliance from the source port range.

## Setup necessary for configuring N-Tier CRD

The following setup is necessary for the functioning of n-tier cache redirection:

For each upper-tier Citrix ADC appliance:

- Enable Layer 3 mode.
- Define policies for policy-based routes (PBRs) so that traffic is forwarded according to the range of the destination port.
- Configure a load balancing virtual server.
- Configure the virtual server to listen to all the traffic coming from the client. Set the Service Type/Protocol to be ANY and IP Address as asterisk (\*).
- Enable sessionless load balancing with MAC-based redirection mode to avoid unnecessary load on the upper-tier Citrix ADC appliances.
- Make sure that the Use Proxy Port option is enabled.
- Create a service for each lower-tier appliance and bind all the services to the virtual server.

For each lower-tier Citrix ADC appliance,

- Configure the cache redirection port range on the appliance. Assign an exclusive range to each lower-tier appliance.
- Configure a load balancing virtual server and enable MAC-based redirection.
- Create a service for each cache server that is to be load balanced by this appliance. When creating the service, enable insertion of client IP in the header. Then, bind all the services to the load balancing virtual server.
- Configure a transparent mode cache redirection virtual server with the following settings:
  - Enable the Origin USIP option.
  - Add a source IP expression to include the client IP in the header.
  - Enable the Use Port Range option.

### How N-tier cache redirection works during a cache hit

The following figure shows how cache redirection works when a client request is cacheable and the response is sent from a cache server.

Figure 1. Cache Redirection in Case of a Cache Hit

Two Citrix ADC appliances, L1NS1 and L1NS2, are deployed in the upper tier, and four Citrix ADC appliances, L2NS1, L2NS2, L2NS3, and L2NS4, are deployed in the lower tier. Client A sends a request, which is forwarded by the router. Cache servers CRS1, CRS2, and CRS3 service the cache requests. Origin Server O services the uncached requests.

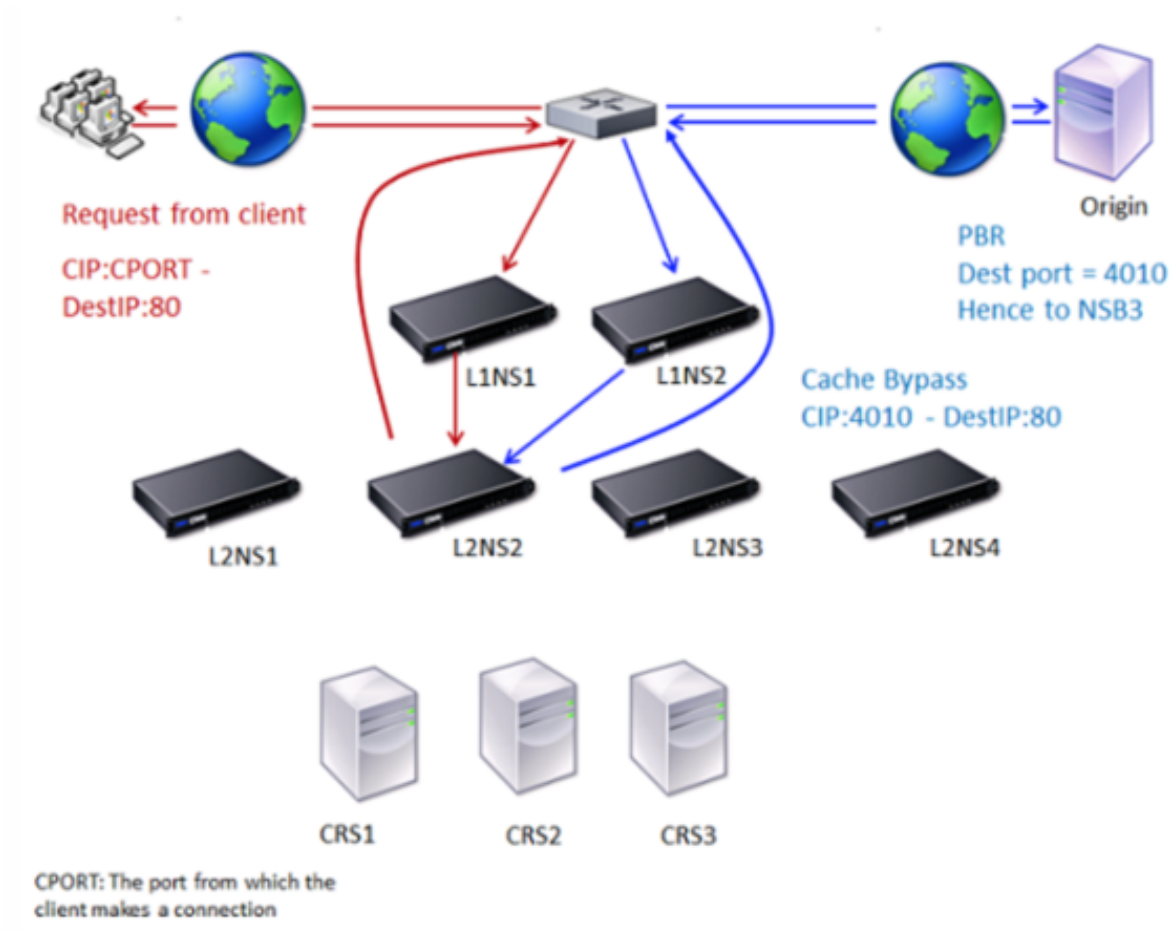

### **Traffic flow**

1. Client sends a request, and the router forwards it to L1NS1.
2. L1NS1 load balances the request to L2NS2.
3. L2NS2 load balances the request to the cache server CRS1, and the request is cacheable. L2NS2 includes the client IP in the request header.
4. CRS1 sends the response to L2NS2 because L2NS2 used its MIP as the source IP address when connecting to CRS1.
5. With the help of the client IP address in the request header, L2NS2 identifies the client from which the request came. L2NS2 directly sends the response to the router, avoiding unnecessary load on the appliance in the upper tier.
6. The router forwards the response to Client A.

### **How N-tier cache redirection works during a cache bypass**

The following figure shows how cache redirection works when a client request is sent to an origin server for a response.

Figure 2. Cache Redirection in Case of a Cache Bypass

Two Citrix ADC appliances, L1NS1 and L1NS2, are deployed in the upper tier, and four Citrix ADC appliances, L2NS1, L2NS2, L2NS3, and L2NS4, are deployed in the lower tier. Client A sends a request, which is forwarded by the router. Cache servers CRS1, CRS2, and CRS3 service the cache requests. Origin Server O services the uncached requests.

### Traffic flow

1. Client sends a request, and the router forwards it to L1NS1.
2. L1NS1 load balances the request to L2NS2.
3. The request is uncacheable (cache bypass). Therefore, L2NS2 sends the request to the origin server through the router.
4. The origin server sends the response to an upper-tier appliance, L1NS2.
5. According to the PBR policies, L1NS2 forwards the traffic to the appropriate appliance in the lower tier, L2NS2.
6. L2NS2 uses the client IP address in the request header to identify the client from which the request came and sends the response directly to the router, avoiding unnecessary load on the appliance in the upper tier.

- The router forwards the response to Client A.

### How N-tier cache redirection works during a cache miss

The following figure shows how cache redirection works when a client request is not cached.

Figure 3. Cache Redirection in Case of a Cache Miss

Two Citrix ADC appliances, L1NS1 and L1NS2, are deployed in the upper tier, and four Citrix ADC appliances, L2NS1, L2NS2, L2NS3, and L2NS4, are deployed in the lower tier. Client A sends a request, which is forwarded by the router. Cache servers CRS1, CRS2, and CRS3 service the cache requests. Origin Server O services the uncached requests.

### Traffic flow

- Client sends a request, and the router forwards it to L1NS1.
- L1NS1 load balances the request to L2NS2.
- L2NS2 load balances the request to the cache server CRS1 because the request is cacheable.

4. CRS1 does not have the response (cache miss). CRS1 forwards the request to the origin server through the appliance in the lower tier. L2NS3 intercepts the traffic.
5. L2NS3 takes the client IP from the header and forwards the request to the origin server. The source port included in the packet is the L2NS3 port from which the request is sent to the origin server.
6. The origin server sends the response to an upper-tier appliance, L1NS2.
7. According to the PBR policies, L1NS2 forwards the traffic to the appropriate appliance in the lower tier, L2NS3.
8. L2NS3 forwards the response to the router.
9. The router forwards the response to Client A.

## Configure the upper-tier Citrix ADC appliances

September 21, 2020

Configure each of the upper-tier Citrix ADC appliances as follows.

### Configure an upper-tier appliance for n-tier cache redirection by using the command CLI

At the command prompt, type the following commands:

```
1 - add service \<name\>@ \<serviceIP\> \<serviceType\> \<port\>
2
3   Run this command for each service to be added.
4
5 - add lb vserver \<name\>@ ANY \* \<port\> -persistenceType \<
  persistenceMethod\> -lbMethod \<lbMethod\> -m MAC -sessionless
  ENABLED -cltTimeout \<client\_Timeout\_Value\>
6
7
8 - bind lb vserver \<name\>@ \<serviceName\>
9
10  Run this command for each service to be bound.
11
12 - enable ns mode l3
13
14 - add ns pbr \<name\> \<action\> -srcPort \<sourcePortNumber\> -
  destPort \<startPortNumber-endPortNumber\> -nextHop \<
  serviceIpAddress\> -protocol TCP
15
```

```
16 - apply ns pbrs
17
18     Run this command after adding all the necessary PBRs.
19 <!--NeedCopy-->
```

## Configure an upper-tier appliance for n-tier cache redirection by using the GUI

1. Enable L3 mode:
  - a) In the navigation pane, click System, and then click Settings.
  - b) In the Settings group, click the Configure modes link.
  - c) Select the Layer 3 Mode (IP Forwarding) check box.
  - d) Click OK.
2. Configure policy-based routing (PBR):
  - a) Navigate to System > Network > PBRs.
  - b) In the Policy-Based Routing (PBRs) pane, click Add.
  - c) Type a name for the PBR.
  - d) Select the action as Allow.
  - e) In the Next Hop box, type the IP address of the service, which represents a lower-tier appliance.
  - f) Select TCP from the Protocol drop-down list.
  - g) Type the source port and the range of the destination port corresponding to the lower-tier appliance being added.
  - h) Click Create.
    - i) In the details pane, select the PBR and click Apply.
    - j) Repeat Step (i) to Step (vii) for each lower-tier appliance.
3. Create a service for each lower-tier appliance:
  - a) Navigate to Traffic Management > Load Balancing > Services.
  - b) In the details pane, click Add.
  - c) Specify the name, protocol, IP address, and port. The protocol should be ANY.
  - d) Click Create.
4. Configure a load balancing virtual server:
  - a) Navigate to Traffic Management > Load Balancing > Virtual Servers.
  - b) In the details pane, click Add.
  - c) Specify the name, protocol, IP address, and port. The protocol should be ANY and the IP address should be \*.
  - d) In the Services tab, select the services that represent the lower-tier Citrix ADC appliances.
  - e) In the Advanced tab, select the Redirection Mode as MAC Based and select the Sessionless check box.
  - f) Click Create.

## Configure the lower-tier Citrix ADC appliances

September 21, 2020

Configure each of the lower-tier Citrix ADC appliances as follows.

### Configure a lower-tier appliance for n-tier cache redirection by using the CLI

At the command prompt, type the following commands:

```
1 - add service <name>@ <cacheServiceIP> <serviceType> <port> -cip
   ENABLED "ClientIP" - cachetype transparent
2
3   Repeat for each cache server.
4
5 - add lb vserver <name>@ <serviceType> -m MAC
6
7 - bind lb vserver <name>@ <cacheServiceName>
8
9   Repeat for each cache server.
10
11 - add cr vserver <name> <serviceType> * <port> -srcIPExpr "HTTP.REQ.
    HEADER("ClientIP")" -originusip ON - usePortRange ON
12
13 - set ns param-crPortRange <startPortNumber-endPortNumber>
14 <!--NeedCopy-->
```

### Configure a lower-tier appliance for n-tier cache redirection by using the GUI

1. Create a service for each cache server. To create a service:
  - a) Navigate to Traffic Management > Load Balancing > Services.
  - b) In the details pane, click Add, and specify the name and protocol. Clear the Directly Addressable check box.
  - c) In the Advanced tab, select the Override Global check box and the Client IP check box, and then in the Header box, type ClientIP.
  - d) In the Cache Type box, select Transparent Cache.
  - e) Click Create.
2. Configure a load balancing virtual server:
  - a) Navigate to Traffic Management > Load Balancing > Virtual Services.
  - b) In the details pane, click Add and specify the name, protocol, IP address, and port. The IP address should be an asterisk (\*).

- c) In the Services tab, select the services that represent the cache servers.
  - d) In the Advanced tab, for Redirection Mode, select MAC Based.
  - e) Click Create.
3. Configure a cache redirection virtual server:
    - a) Navigate to Traffic Management > Load Balancing > Virtual Services.
    - b) In the details pane, click Add and specify the name, protocol, IP address, and port. The IP address should be \*.
    - c) For Cache Type, select Transparent.
    - d) On the Advanced tab, in the Cache Server box, select the new load balancing virtual server and check the Origin USIP and Use Port Range check boxes. In the Source IP Expression box, type HTTP.REQ.HEADER("ClientIP").
    - e) Click Create.
  4. Assign a source port range for the appliance:
    - a) In the navigation pane, click System, and then click Settings.
    - b) In the Settings group, click the Change global system settings link.
    - c) In the Cache Redirection Port Range group, specify the port range for the appliance by typing a port number for Start Port and a port number for End Port.
    - d) Click OK.

## Clustering

March 16, 2021

### Note

This feature is available with a Citrix ADC Advanced or Premium edition license.

A Citrix ADC cluster is a group of nCore appliances working together as a single system image. Each appliance of the cluster is called a node. The cluster can have one appliance or as many as 32 Citrix ADC nCore hardware or virtual appliances as nodes.

The client traffic is distributed between the nodes to provide high availability, high throughput, and scalability.

To create a cluster, you must add the appliances as cluster nodes, set up communication between the nodes, set up links to the client and server networks, configure the appliances, and configure the distribution of client and server traffic.

## Supportability matrix for Citrix ADC cluster

June 29, 2021

Clustering in a Citrix ADC appliance supports a wide-spread of features in Citrix ADC configurations.

The following table lists the Citrix ADC appliance configurations and also provides the status of the features across releases.

### Important

The “Node-level” entry in the table indicates that the feature is supported only on individual cluster nodes.

| Cluster Configuration                                                                                              | 11.1       | 12.1       |
|--------------------------------------------------------------------------------------------------------------------|------------|------------|
| SSL FIPS                                                                                                           | No         | No         |
| SSL Certificate Bundle                                                                                             | No         | No         |
| SSL interception                                                                                                   | NA         | No         |
| Content switching actions;<br><b>Note:</b> The content switching feature is supported from NetScaler 10.1 onwards. | Yes        | Yes        |
| Policy-based logging for content switching policies                                                                | Yes        | Yes        |
| Rate limiting                                                                                                      | Yes        | Yes        |
| Action analytics                                                                                                   | Yes        | Yes        |
| GSLB                                                                                                               | Yes        | Yes        |
| RTSP                                                                                                               | Yes        | Yes        |
| DNSSEC                                                                                                             | No         | No         |
| DNS64                                                                                                              | No         | No         |
| FTP                                                                                                                | Yes        | Yes        |
| TFTP                                                                                                               | No         | Yes        |
| Connection mirroring                                                                                               | No         | No         |
| Integrated caching                                                                                                 | Node-Level | Node-Level |
| Large shared cache                                                                                                 | Node-Level | Node-Level |
| Front end optimization                                                                                             | Node-Level | Node-Level |

| Cluster Configuration                     | 11.1                                                                      | 12.1                                                                      |
|-------------------------------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Application firewall                      | Yes                                                                       | Yes                                                                       |
| HTTP Denial-of-Service Protection (HDOSP) | Node-Level                                                                | Node-Level                                                                |
| Priority queuing (PQ)                     | Node-Level                                                                | Node-Level                                                                |

Also, the following Citrix ADC configurations are supported:

Load balancing, load balancing persistency, DNS load balancing, SIP, maxClient, Spillover (connection and dynamic), Spillover based on bandwidth, DataStream, Compression control, Content filtering, TCP buffering, Cache redirection, distributed denial-of-service (DDoS), Client Keep-alive, Basic networking (IPv4 and IPv6), OSPF (IPv4 and IPv6), RIP (IPv4 and IPv6), VLAN, ICMP, Fragmentation, MBF, ACL, Simple ACL, MSR, Path MTU discovery, IP-IP, SNMP, Policies (classic and advanced), Rewrite, Responder, HTTP callout, Web server logging, Audit logging (NSLog and syslog), USIP, Location commands, HTML injection, NITRO API, AppExpert, KRPC.

## Prerequisites for cluster nodes

March 16, 2021

Citrix ADC appliances that are to be added to a cluster must satisfy the following criteria:

- All appliances must have the same software version and build.
- All appliances must be of the same platform type. This means that a cluster must have either all hardware appliances (MPX) or virtual appliances (VPX) or SDX Citrix ADC instances.

### Note

- For a cluster of hardware appliances (MPX), the appliances must be of the same model type.
- For the formation of the heterogeneous cluster, all appliances must be of MPX platform

type.

- For a cluster of virtual appliances (VPX), the appliances must be deployed on the following hypervisors: XenServer, Hyper-V, VMware ESX, and KVM.
  - Clusters of SDX Citrix ADC instances are supported in NetScaler 10.1 and later releases. To create a cluster of SDX Citrix ADC instances, see [“Set up a cluster of Citrix NetScaler instances”](#).
  - Jumbo frames are supported on a Citrix ADC cluster that is made up of Citrix ADC SDX instances.
  - You can create L3 clusters of SDX instances.
- (For releases prior to NetScaler 11.0) All appliances must be on the same network. In NetScaler 11.0 and later releases, appliances can belong to different networks.
  - All appliances must have the same licenses. Also, depending on the Citrix ADC version, there are some additional aspects to address:
    - For releases prior to NetScaler 10.5 Build 52.x:
      - \* A separate cluster license file is required. This file must be copied to the `/nsconfig/license/` directory of the configuration coordinator.
      - \* Because of the separate cluster license file, the cluster feature is available irrespective of the Citrix ADC license.
    - For releases after NetScaler 10.5 Build 52.x:
      - \* No separate cluster license is required.
      - \* Cluster is licensed with the Advanced and Premium licenses. Cluster is not available for Standard license.
  - Be initially configured and connected to a common client-side and server-side network.

#### Note

For a cluster of virtual appliances, that has large configurations, it is recommended to use 6 GB RAM for each node of the cluster.

## Cluster overview

September 21, 2020

A Citrix ADC cluster is formed by grouping Citrix ADC appliances together. Based on the network location of the Citrix ADC appliances that you intend adding to the cluster, you must be aware of the following cluster setups:

**Note**

Unless specified otherwise, cluster features and configurations are the same for L2 and L3 clusters.

- **L2 cluster:** In this cluster deployment, all cluster nodes belong to the same network.

- **L3 cluster (also referred to as 'cluster in INC mode'):** In this cluster deployment, cluster nodes can belong to different networks. The cluster nodes from a specific network must be grouped into nodegroups that include only nodes from that network. From the following figure, we see that nodes n1, n2, n3 are in the same network and are grouped into Nodegroup1.

Similarly, the case for nodes n4 and n5, that are grouped in Nodegroup2. In the third network, there are two nodegroups. Nodegroup3 includes n6 and n7 and Nodegroup4 includes n8 and n9.

**Note**

Supported from NetScaler 11.0 onwards.

## Synchronization across cluster nodes

September 21, 2020

All configurations on a Citrix ADC cluster are performed on the cluster IP address, which is the management address of the cluster. This cluster IP address is owned by a cluster node that is referred to as the cluster configuration coordinator as shown in the following figure:

The configurations that are available on the configuration coordinator are automatically propagated to the other cluster nodes and therefore all cluster nodes have the same configurations.

- Citrix ADC allows only a few configurations to be performed on individual cluster nodes through their NSIP address. In these cases, you must ensure configuration consistency manually across all nodes in the cluster. These configurations are not propagated across the other cluster nodes. For more information on operations supported on each cluster nodes, see [“Operations Supported on Individual Cluster Nodes”](#).
- The following commands when executed on the cluster IP address are not propagated to other cluster nodes:
  - **shutdown.** Shuts down only the configuration coordinator.
  - **reboot.** Reboots only the configuration coordinator.
  - **rm cluster instance.** Removes the cluster instance from the node that you are executing the command on.
- For a command to propagate to other cluster nodes:
  - The quorum must be configured on cluster instance.
  - The majority of the cluster quorum with  $(n/2 + 1)$  of the cluster nodes must be active for the cluster to be operational.
  - A cluster can run with a minimum number of nodes when majority rule  $(n/2 + 1)$  is relaxed.

When a node is added to a cluster, the configurations and the files (SSL certificates, licenses, DNS, and so on) that are available on the cluster configuration coordinator are synchronized to the newly added cluster node. When an existing cluster node, that was intentionally disabled or that had failed, is once again added, the cluster compares the configurations available on the node with the configurations available on the configuration coordinator. If there is a mismatch in configurations, the node is synchronized by using one of the following:

- **Full synchronization.** If the difference between configurations exceeds 255 commands, all the configurations of the configuration coordinator are applied to the node that is rejoining the clus-

ter. The node remains operationally unavailable for the duration of the synchronization.

- **Incremental Synchronization.** If the difference between configurations is less than or equal to 255 commands, only the configurations that are not available are applied to the node that is rejoining the cluster. The operational state of the node remains unaffected.

**Note**

You can also manually synchronize the configurations and files. For more information, see “[Synchronizing Cluster Configurations](#)” and “[Synchronizing Cluster Files](#)”.

## Striped, partially striped, and spotted configurations

September 21, 2020

By virtue of command propagation, all nodes in a cluster have the same configurations. However, you may want some configurations to be available only on certain cluster nodes. While you cannot restrict the nodes on which the configurations are available, you can specify the nodes on which the configurations are active.

For example, you can:

- define a SNIP address to be active on only one node, or
- define a SNIP address to be active on all nodes, or
- define a VIP address to be active on only one node, or
- define a VIP address to be active on all nodes, or
- define a VIP address to be active only on two nodes of a 3-node cluster

Depending on the number of nodes the configurations are active on, cluster configurations are referred to as striped, partially striped, or spotted configurations.

Figure 1. Three-node cluster with striped, partially striped, and spotted configurations

**NetScaler Cluster**

The following table provides more details on the types of configurations:

| Configuration Type              | Active on                 | Applicable to                              | Configurations                                                                                                                                                 |
|---------------------------------|---------------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Striped configuration           | All the cluster nodes     | All entries                                | No specific configuration required to make an entity striped. By default, all entities defined on a cluster IP address are striped on all the cluster nodes.   |
| Partially striped configuration | A subset of cluster nodes | Refer <a href="#">Cluster Nodegroups</a> . | Bind the entities that you want to be partially striped, to a node group. The configuration is active only on the cluster nodes that belong to the node group. |

| Configuration Type    | Active on           | Applicable to                                                                                       | Configurations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|---------------------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spotted configuration | Single cluster node | SNIP address; SNMP Engine ID; Hostname of cluster nodes; Entities that can be bound to a node group | <p>A spotted configuration can be defined using one of two approaches.</p> <p><b>SNIP address</b> When creating the SNIP address, specify the node on which you want the SNIP address to be active, as the owner node.</p> <p><b>Example</b>, add ns ip 10.102.29.106 255.255.255.0 -type SNIP -ownerNode 2 (assuming node NS2 ID is 2). <b>Note:</b> You cannot change the ownership of a spotted SNIP address at run time. To change the ownership, you must first delete the SNIP address and add it again by specifying the new owner.</p> <p><b>Entities that can be bound to a node group.</b> By binding the entity to a single-member node group.</p> |

**Note**

When you disable USIP, Citrix recommends you to use spotted SNIP addresses. You can use

striped SNIP addresses only if there is a shortage of IP addresses. The use of striped IP addresses can result in ARP flux issues if no spotted IP addresses are present in the same subnet for ARP resolution.

When you enable USIP, Citrix recommends you to use striped SNIP addresses as a gateway for server initiated traffic.

## Communication in a cluster setup

September 21, 2020

The interfaces of Citrix ADC appliances that are added to a cluster, are prefixed with a node ID. This helps identify the cluster node to which the interface belongs. Therefore, the interface identifier  $c/u$ , where  $c$  is the controller number and  $u$  is the unit number, now becomes  $n/c/u$ , where  $n$  is the node ID. For example, in the following figure, interface 1/2 of node n1 is represented as 0/1/2, interface 1/1 of node n2 is represented as 1/1/1, and interface 1/4 of node n3 is represented as 2/1/4.

Figure 1. Interface naming convention in a cluster

- **Server communication-**

The cluster communicates with the server through the physical connections between the cluster node and the server-side connecting device. The logical grouping of these physical connections is called the server data plane.

- **Client communication-** The cluster communicates with the client through the physical connections between the cluster node and the client-side connecting device. The logical grouping of these physical connections is called the client data plane.

- **Inter-node communication-** The cluster nodes can also communicate with each other. The manner in which they communicate depends on whether the node exists on the same network or across networks.

- Cluster nodes within the same network communicate with each other by using the cluster backplane. The backplane is a set of interfaces in which one interface of each node is connected to a common switch, which is called the cluster backplane switch. The different

types of traffic that goes through backplane, which is used by internode communication are:

- \* Node to Node Messaging (NNM)
  - \* Steered traffic
  - \* Configuration propagation and synchronization
- Each node of the cluster uses a special MAC cluster backplane switch address to communicate with other nodes through the backplane. The cluster special MAC is of the form: 0x02 0x00 0x6F <cluster\_id> <node\_id> <reserved>), where `cluster_id` is the cluster instance ID, `node_id` is the node number of the Citrix ADC appliance that are added to a cluster.

The following figures shows the communication interfaces in L2 clusters and L3 clusters.

Figure 2. Cluster communication interfaces - L2 cluster

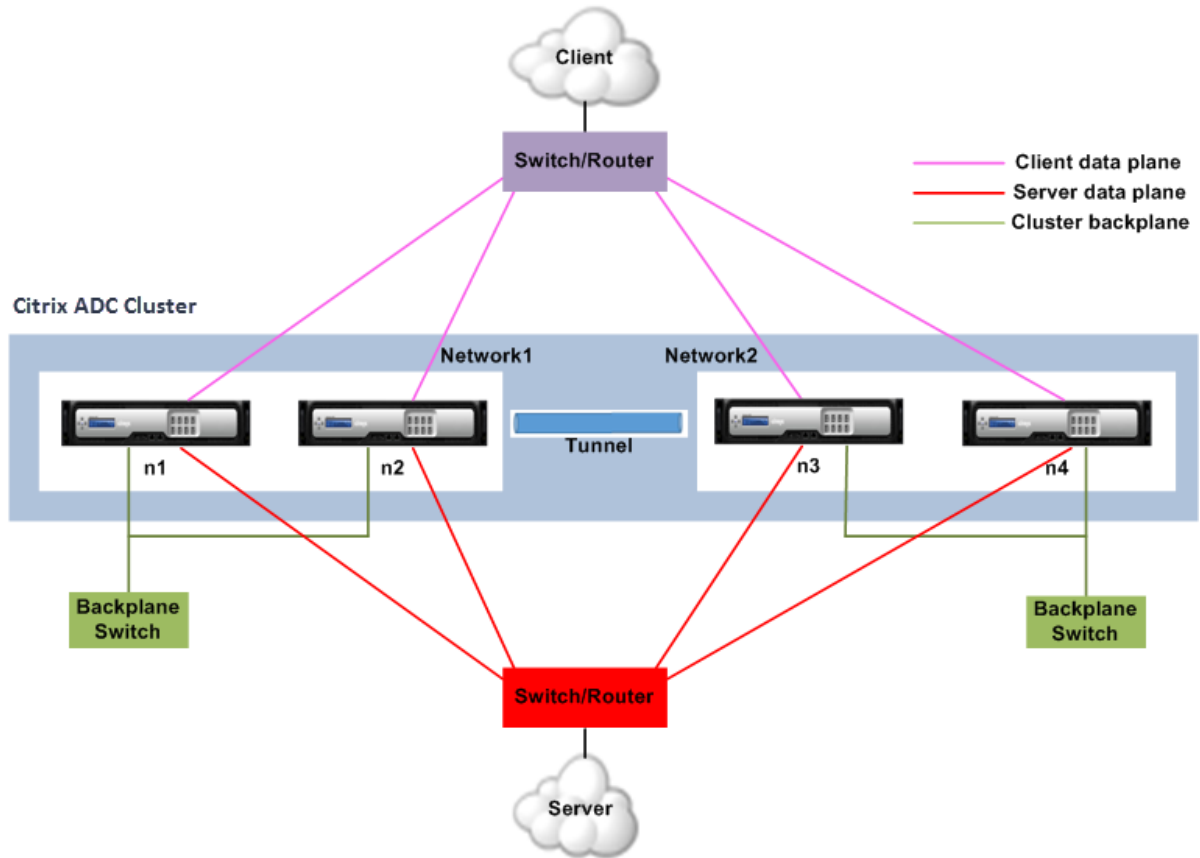

Figure 3. Cluster communication interfaces - L3 cluster

## Traffic distribution in a cluster setup

September 21, 2020

In a cluster setup, external networks view the collection of Citrix ADC appliances as a single entity. So, the cluster must select a single node that must receive the traffic. The cluster does this selection by using Equal Cost Multiple Path (ECMP) or cluster link aggregation traffic distribution mechanism. The selected node is called the flow receiver.

### Note

For an L3 cluster (nodes across different networks), only ECMP traffic distribution can be used.

The flow receiver gets the traffic and then, using internal cluster logic determines the node that must process the traffic. This node is called the flow processor. The flow receiver steers the traffic to the flow processor over the backplane (if the flow receiver and the flow processor are on the same network) or through the tunnel (if the flow receiver and the flow processor are on different networks).

**Note**

- The flow receiver and flow processor must be nodes capable of serving traffic.
- From NetScaler 11 onwards, you can disable steering on the cluster backplane. For more information, see [“Disabling Steering on the Cluster Backplane”](#).

Figure 1. Traffic distribution in a cluster

The above figure shows a client request flowing through the cluster. The client sends a request to a virtual IP (VIP) address. A traffic distribution mechanism configured on the client data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the node that must process the traffic, and steers the request to that node (unless the flow receiver selects itself as the flow processor).

The flow processor establishes a connection with the server. The server processes the request and

sends the response to the subnet IP (SNIP) address that sent the request to the server.

- If the SNIP address is a striped or partially striped IP address, the traffic distribution mechanism configured on the server data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the flow processor, and steers the request to the flow processor through the cluster backplane.
- If the SNIP address is a spotted IP address, the node that owns the SNIP address receives the response from the server.

In an asymmetric cluster topology (all cluster nodes are not connected to the external switch), you must use linksets either exclusively or combined with ECMP or cluster link aggregation. For more information, see “[Using Linksets](#)”.

## Cluster nodegroups

September 21, 2020

### Note

Nodegroups are supported from NetScaler 10.1 onwards.

As the name indicates, a cluster nodegroup is a group of cluster nodes.

Figure 1. Citrix ADC cluster with nodegroups

The above figure shows a cluster which has nodegroups NG1 and NG2 that include 3 cluster nodes each. The cluster also has 3 nodes that are not part of any nodegroup.

A nodegroup can be configured for the following:

- To define spotted and partially striped configurations. For more information, see “[Nodegroups for Spotted and Partially-Striped Configurations](#)”.
- To configure redundancy of nodegroups. For more information, see “[Configuring Redundancy for Nodegroups](#)”.

Note: Supported from NetScaler 10.5 Build 52.1115.e onwards.

- To define an L3 cluster (also called a cluster in INC mode). In an L3 cluster, cluster nodes can be from different networks. You must group nodes that belong to a network in a single nodegroup. For example, if n1, n2, n3 are in network1 and n4, n5, n6 are in network2, then NG1 must include nodes of network1 and NG2 must include nodes of network2. For setting up an L3 cluster, see [“Creating a Citrix ADC Cluster”](#).

**Note**

- Supported from NetScaler 11 onwards.
- The above functions of a nodegroup are mutually exclusive. This means that a nodegroup can provide only one of the above mentioned functionality.

## Cluster and node states

September 21, 2020

For a cluster to be functional, a majority of the nodes ( $n/2 + 1$ ) must be operationally active (operational state is ACTIVE). Check table below.

**Important**

From NetScaler release 10.5, you can configure the cluster to be functional even when the majority criteria is not satisfied. This configuration must be performed when creating a cluster.

For more information on states of a cluster node, refer to [States of a cluster node](#).

## Routing in a cluster

September 21, 2020

Routing in a cluster works in much the same way as routing in a standalone system. A few points to note:

- All routing configurations must be performed from the cluster IP address and the configurations are propagated to the other cluster nodes.
- Routes are limited to the maximum number of ECMP routes supported by the upstream router.
- Node-specific routing configurations must be performed by using the owner-node argument as follows:

```
1 router ospf
```

```
2   owner-node 0
3     ospf router-id 97.131.0.1
4   exit-owner-node
5   !
6 <!--NeedCopy-->
```

The following command displays the consolidated cluster configuration for all nodes in VTYSH.

```
show cluster-config
```

The following command displays the cluster status on each node.

```
show cluser node
```

### IPv4 routing in L2 cluster

The following section contains sample configurations that help you to configure IPv4 OSPF and BGP routing in L2 cluster.

#### Adding spotted SNIP address and enabling dynamic routing

In the following configuration, OSPF, and BGP routing are enabled. Also, spotted SNIP addresses are added and dynamic routing is enabled on these SNIP addresses.

```
1 en ns fea ospf bgp
2 add vlan 10
3 add ns ip 10.10.10.1 255.255.255.0 -dynamicrouting enabled -ownernode 1
4 add ns ip 10.10.10.2 255.255.255.0 -dynamicrouting enabled -ownernode 2
5 add ns ip 10.10.10.3 255.255.255.0 -dynamicrouting enabled -ownernode 3
6 bind vlan 10 -ipaddress 10.10.10.1 255.255.255.0
7 <!--NeedCopy-->
```

#### VTYSH IPv4 OSPF configuration

For configuring IPv4 OSPF in L2 cluster, you must

- Set the priority to zero.
- Configure the Router-id as a spotted configuration.

##### Note

The OSPF configuration guidelines for L2 cluster are applicable for OSPFv3 also.

In the following sample configuration IPv4 OSPF is configured.

```
1      interface vlan10
2      IP OSPF PRIORITY 0
3      !
4      router ospf
5          owner-node 1
6          ospf router-id 97.131.0.1
7          exit-owner-node
8          owner-node 2
9          ospf router-id 97.131.0.2
10         exit-owner-node
11         owner-node 3
12         ospf router-id 97.131.0.3
13         exit-owner-node
14         network 10.10.10.0/24 area 0
15         redistribute kernel
16         !
17 <!--NeedCopy-->
```

### VTYSH IPv4 BGP configuration

In the following VTYSH sample configuration, IPv4 BGP is configured.

```
1      router bgp 100
2          neighbor 10.10.10.10 remote-as 200
3          owner-node 1
4          neighbor 10.10.10.10 update-source 10.10.10.1
5          exit-owner-node
6          owner-node 2
7          neighbor 10.10.10.10 update-source 10.10.10.2
8          exit-owner-node
9          owner-node 3
10         neighbor 10.10.10.10 update-source 10.10.10.3
11         exit-owner-node
12         redistribute kernel
13         !
14 <!--NeedCopy-->
```

#### Note

The update-source command is used for each neighbor with owner-node argument in the following configuration to connect with proper source IP.

## IPv6 routing in L2 cluster

The following section contains sample configurations that help you to configure IPv6 OSPF and BGP routing in L2 cluster.

### Enable IPv6 routing

Before configuring IPv6 routing in a L2 cluster, you must enable the IPv6 feature.

To enable IPv6 routing by using the CLI,

At the command prompt, type:

- `enable ns fea ipv6pt`

### Adding spotted SNIP6 address and enabling dynamic routing

In the following configuration, OSPF, and BGP routing are enabled. Also, spotted SNIP6 addresses are added and dynamic routing is enabled on these SNIP6 addresses.

```
1 add ns ip6 3ffa::1/64 -dynamicrouting enabled -ownernode 1
2 add ns ip6 3ffa::2/64 -dynamicrouting enabled -ownernode 2
3 add ns ip6 3ffa::3/64 -dynamicrouting enabled -ownernode 3
4 add vlan 10
5 bind vlan 10 -ipaddress 3ffa::1/64
6 <!--NeedCopy-->
```

### VTYSH IPv6 BGP configuration

In the following VTYSH sample configuration, IPv6 BGP is configured.

```
1 router bgp 100
2 neighbor 3ffa::10 remote-as 200
3 owner-node 1
4 neighbor 3ffa::10 update-source 3ffa::1
5 exit-owner-node
6 owner-node-2
7 neighbor 3ffa::10 update-source 3ffa::2
8 exit-owner-node
9 owner-node-3
10 neighbor 3ffa::10 update-source 3ffa::3
11 exit-owner-node
12 no neighbor 3ffa::10 activate
13 address-family ipv6
14 redistribute kernel
```

```
15     neighbor 3ffa::10 activate
16     exit-address-family
17     !
18 <!--NeedCopy-->
```

### Install IPv6 learned routes

The Citrix ADC cluster can use routes learned by various routing protocols after you install the routes in the Citrix ADC cluster routing table.

To install IPv6 learned routes to the internal routing table by using the CLI:

At the command prompt, type:

- `ns route-install ipv6 bgp`
- `ns route-install ipv6 ospf`
- `ns route-install default`

#### Note

- If you have to exchange IPv4 routes on a IPv6 neighbor, you must remove the `no neighbor 3ffa::10 activate` VTYSH command from the earlier configuration.
- The `update-source` VTYSH command must be used for each owner node to specify right IPv6 source IP while connecting to BGP peer as given in BPG IPv4 configuration.

### Routing in a L3 cluster

The routing in L3 cluster works only when the following configurations are done on the Citrix ADC appliance.

- Enable the dynamic routing for a VLAN.

```
1  set vlan <id> -dynamicrouting enabled
2  <!--NeedCopy-->
```

- To reach all cluster nodes, the VIP, CLIP, and Citrix ADC IP (NSIP) must be advertised by routing protocols along with `set vlan` command.

### Deployment scenario for BGP in L3 cluster

Consider an example where all the cluster nodes are grouped in AS 100 network, and the upstream routers are in different AS 200.

The following figure depicts the AS 100 and AS 200 deployment in a cluster setup.

In this deployment, CLIP advertises CCO to upstream routers. Some cluster nodes drop the advertised traffic, as AS loop is detected.

To overcome the issue, configure the following command in vtysh BGP router mode for each neighbor.

At the VTYSH command prompt, type:

```
neighbor <peer_ip> allowas-in 1
```

As a best practice, Citrix recommends you to configure any one of the following:

- Configure route-maps to learn only desired networks such as; default route, Citrix ADC IP (NSIP), and NSIP subnets on cluster nodes.
- Configure upstream routes to advertise only desired networks such as; CLIP and Citrix ADC IP (NSIP) in cluster.

## IP addressing for a cluster

September 21, 2020

In addition to the standard types of Citrix ADC-owned IP addresses—Citrix ADC NSIP, Virtual IP (VIP), and Subnet IP (SNIP)—a clustered Citrix ADC appliance can have a cluster management IP (CLIP) address. It can also have striped and spotted IP addresses.

- **CLIP address.** An IP address owned by the cluster coordinator node (CCO). The CLIP address can float between different nodes in a cluster setup. If the CLIP is moved to a different node of

the cluster, that node becomes the CCO. The CCO is the Citrix ADC appliance that is responsible for management tasks in the cluster. A network administrator uses the CLIP address to connect to the cluster to perform configuration and management tasks, such as accessing the unified GUI, reporting, tracing packet flow, and collecting logs. You can add multiple CLIP addresses in a cluster on the same or different networks. Only configurations performed on the CCO through the cluster IP address are propagated to other nodes in the cluster.

- **Striped IP address.** A logical IP address available on all nodes of the cluster, it can be either a VIP or SNIP address.
- **Spotted IP address.** A logical IP (preferably SNIP address) is available only on one node. A spotted IP address has visibility on only that node. To minimize traffic-steering overhead, Citrix recommends that you use a spotted SNIP address for back-end communication with the server.

The following table provides the details of the configurations.

| IP Address | NSIP | VIP | SNIP |
|------------|------|-----|------|
| Spotted    | Yes  | Yes | Yes  |
| Striped    | No   | Yes | Yes  |

For example, in a four-node cluster group, you must configure each node with a spotted SNIP address. For more information on how to configure a spotted IP configuration, see [Striped, Partially Striped, and Spotted Configurations](#).

You can define a SNIP address to be active on only one node, or active on all nodes. If the virtual IP address and subnet IP address are available only on a specific node, it is of spotted configuration. The configuration is defined as striped if the subnet IP address and virtual server IP address are available on all nodes.

#### Note

In an L3 cluster setup, only spotted SNIP configuration is supported.

## Configuring layer 3 clustering

October 27, 2020

### Understanding the L3 cluster

The demand to expand the high availability deployment and increase the scalability of the client traffic across different networks guided to establish the L3 cluster. The L3 cluster lets you group NetScaler

appliances across individual subnets (L2 cluster).

L3 cluster is also referred to as “cluster in Independent Network Configuration (INC) mode”. In L3 cluster deployment, the cluster nodes in the same network are grouped to form a Nodegroup. L3 cluster uses GRE tunneling to steer the packets across networks. The heartbeat messages across the L3 clusters are routed.

This document includes the following details:

- Architecture
- Example

## Architecture

The L3 cluster architecture comprises the following components:

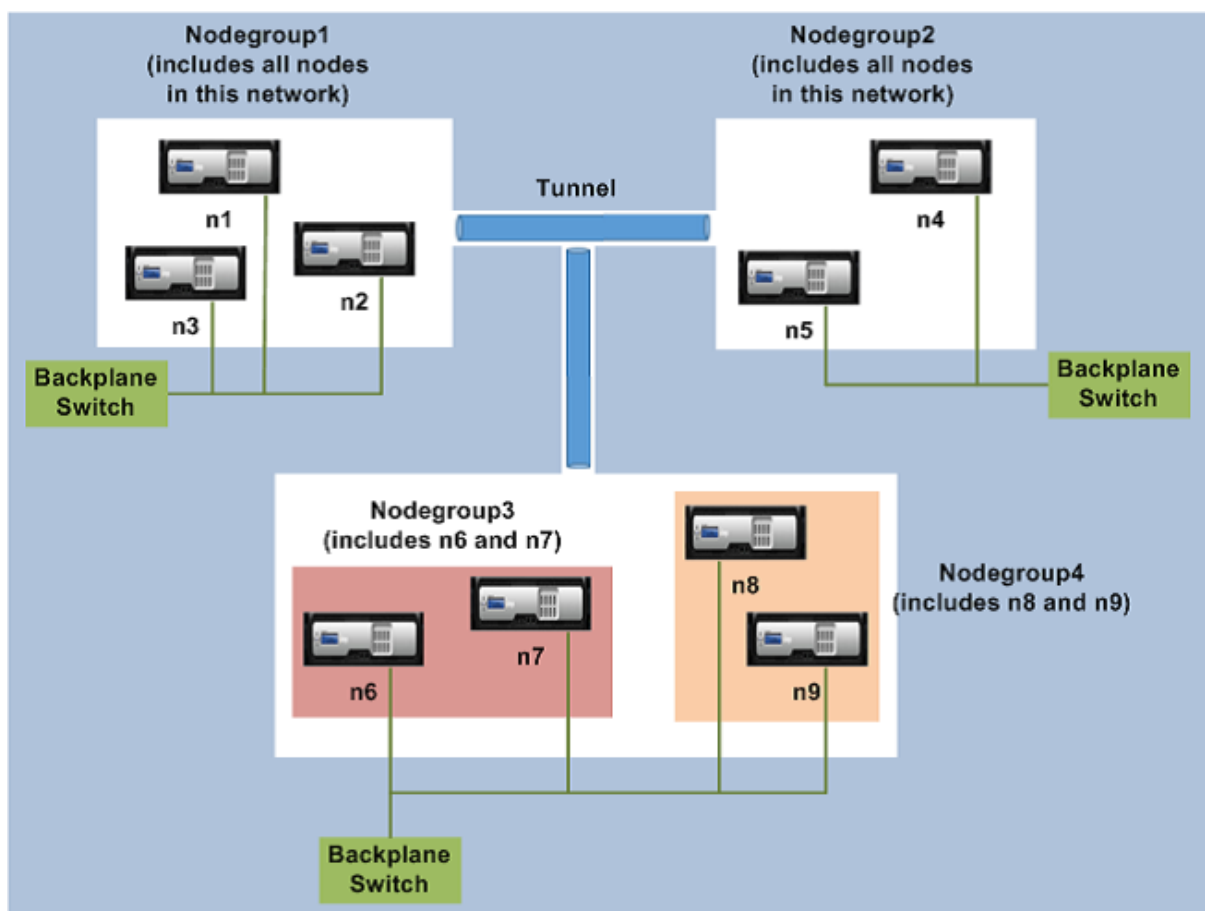

- **Nodegroup.** The cluster nodes from each network (n1, n2) and (n3, n4), as depicted in the following figure, are grouped to form a Nodegroup. These Nodegroups are terminated to the layer 3 switch on either side of the network.
  - The cluster communicates with the client through the physical connections between the cluster node and the client-side connecting device. The logical grouping of these physical connections is called the client data plane.
  - The cluster communicates with the server through the physical connections between the cluster node and the server side connecting device. The logical grouping of these physical connections is called the server data plane.
- **Backplane Switch.** Cluster nodes within the same network communicate with each other by using the cluster backplane. The backplane is a set of interfaces in which one interface of each node is connected to a common switch, which is called the cluster backplane switch.
- **GRE Tunnel.** The packets between nodes in a L3 cluster are exchanged over an unencrypted GRE tunnel that uses the NSIP addresses of the source and destination nodes for routing. The steering mechanism changes for nodes belonging to the different network. The packets are steered through a GRE tunnel to the node on the other subnet, instead of rewriting the MAC.

### Example

Consider an example of an L3 cluster deployment consisting of the following:

- Three NetScaler appliances (n1, n2, and n3) nodes are grouped into Nodegroup1.
- Similarly, the nodes n4 and n5 are grouped in Nodegroup2. In the third network, there are two node groups. Nodegroup3 includes n6 and n7 and Nodegroup4 includes n8 and n9.
- The NetScaler appliances that belong to the same network are combined to form a node group.

### Points to consider before configuring the L3 cluster

Consider the following points before configuring the L3 cluster on a NetScaler appliance:

- The backplane is not mandatory while configuring L3 subnets. If the backplane is not specified, the node does not go to the backplane fail state.

#### Note

If you have some cluster nodes in the L2 network, it is mandatory to enable steering on the cluster backplane, else the nodes go to the backplane fail state.

- The external traffic distribution in the L3 cluster supports only Equal Cost Multiple Path (ECMP).
- The following parameters are processed when steering is disabled in an L3 cluster deployment:
  - ICMP errors
  - Fragmentation
  - Striped SNIPs or MIPs
- The entities (route, route6, pbr, and pbr6) can be bound to configuration node group.
- VLAN, RNAT, and IP tunnel cannot be bound to a config node group.

- Config node group must always have property STRICT “YES.
- The cluster nodes must not be added to a config node group via “add cluster node” command.
- The “clear config extended+” command does not clear the entities (route, route6, pbr, pb6, rnat, IP tunnel, ip6tunnel). These entities must be cleared when an “add cluster instance –INC enabled” command is configured.

## Configuring L3 Cluster

In an L3 cluster configuration, the cluster command has different attributes to configure that is based on nodes, and node groups. The L3 cluster configuration also includes an IPv6 profile apart from IPv4 profiles.

Configuring L3 cluster on a NetScaler appliance consists of the following tasks:

- Create a cluster instance
- Create a node group in L3 cluster
- Add a NetScaler appliance to the cluster and group with node group
- Add cluster IP address to the node
- Enable the cluster instance
- Save the configuration
- Add a new node to an existing node group
- Create a node group in L3 cluster
- Group new nodes to the newly created node group
- Join the node to the cluster

## Configuring the following by Using the Command Line

- **To create a cluster instance by using the NetScaler CLI**

```
add cluster instance <clid> DISABLED> -processLocal DISABLED>  
-inc <ENABLED <ENABLED
```

- **To create a nodegroup in L3 cluster**

```
add cluster nodegroup <ng>
```

- **To add a NetScaler appliance to the cluster and to associate with nodegroup**

```
add cluster node <nodeid> <nodeip> -backplane node group \
```

- **To add the cluster IP address on this node**

```
add ns ip <IPAddress> <netmask> -type clip
```

- **Enable the cluster instance**

```
enable cluster instance <clld>
```

- **Save the configuration**

```
save ns config
```

- **Warm reboot the appliance**

```
reboot -warm
```

- **To add a new node to an existing nodegroup**

```
add cluster node <nodeid> <nodeip> -nodegroup <ng>
```

- **To create a new nodegroup in L3 cluster**

```
add cluster nodegroup <ng>
```

- **To group new nodes to the newly created nodegroup**

```
add cluster node <nodeid> <nodeip> -nodegroup <ng>
```

- **To join the node to the cluster**

```
1    **join cluster - clip** \<ip\_addr\> -password \<password\>**
2
3    add cluster instance 1 -inc ENABLED -processLocal ENABLED
4
5    Done
6    <!--NeedCopy-->
```

#### Note

The “inc” parameter must be ENABLED for an L3 cluster.

```
1    add cluster nodegroup ng1
2
3    Done
4
5    > add cluster node 0 1.1.1.1 - state ACTIVE -backplane 0/1/1 -
    nodegroup ng1
6
7    Done
8
9    > add ns ip 1.1.1.100 255.255.255.255 - type clip
10
11    Done
12
13    > enable cluster instance 1
```

```
14
15     Done
16
17     > save ns config
18
19     Done
20
21     > add cluster node 1 1.1.1.2 - state ACTIVE - nodegroup ng1
22
23     Done
24
25     > add cluster nodegroup ng2
26
27     Done
28
29     > add cluster node 4 2.2.2.1 - state ACTIVE - nodegroup ng2
30
31     Done
32
33     > add cluster node 5 2.2.2.2 - state ACTIVE - nodegroup ng2
34
35     Done
36
37     > join cluster -clip 1.1.1.100 -password nsroot
38 <!--NeedCopy-->
```

### Advertising Cluster IP address of a Layer 3 Cluster

You must configure the cluster IP address to be advertised to the upstream router to make the cluster configuration accessible from any subnet. The cluster IP address is advertised as a kernel route by the dynamic routing protocols configured on a node.

Advertising the cluster IP address consists of the following tasks:

- **Enable the host route option of the cluster IP address.** The host route option pushes the cluster IP address to ZebOS routing table for kernel route redistribution through dynamic routing protocols.
- **Configuring a dynamic routing protocol on a node.** A dynamic routing protocol advertises the cluster IP address to the upstream router. For more information on configuring a dynamic routing protocol, see [Configuring Dynamic Routes](#).

### To enable the host route option of the cluster IP Address by using the NetScaler CLI

At the command prompt, type:

```
1 - **add nsip** \<IPAddress\> \<netmask\> -**hostRoute ENABLED**
2 - **show nsip** \<IPAddress\>
3
4   > add ns ip 10.102.29.60 255.255.255.255 -hostRoute ENABLED
5
6       Done
7 <!--NeedCopy-->
```

### Spotted, partially striped configurations on L3 cluster

The spotted and partially striped configurations on L3 cluster slightly differ from L2 cluster. The configuration might differ from node to node as the nodes reside on different subnets. The network configurations can be node specific in L3 cluster, hence you have to configure the spotted or partially striped configurations based on the below-mentioned parameters.

To configure spotted, partially striped configurations on a NetScaler appliance over L3 cluster perform the following tasks:

- Add a cluster ownergroup to an IPv4 static routing table
- Add a cluster ownergroup to an IPv6 static routing table
- Add a cluster ownergroup to an IPv4 policy based routing (PBR)
- Add a cluster ownergroup to an IPv6 PBR
- Add a VLAN
- Bind a VLAN to a specific ownergroup of cluster node group

### Configuring the following by using the Command Line

- **To add a cluster ownergroup to an IPv4 static route table of the NetScaler appliance**  
**add route** <network> <netmask> <gateway> -ownergroup <ng>
- **To add a cluster ownergroup to an IPv6 static route table of the NetScaler appliance**  
**add route6** <network> -ownergroup <ng>
- **To add a cluster ownergroup to an IPv4 PBR**  
**add pbr** <name> <action> -ownergroup <ng>
- **To add a cluster ownergroup to an IPv6 PBR**  
**add pbr6** <name> <action> -ownergroup <ng>
- **To add a VLAN**  
**add vlan** <id>

- **To bind a VLAN to a specific ownergroup of cluster nodegroup**

```
bind vlan <id> -ifnum -          ipv6_addr          > [-ownergroup <ng>]
[IPAddress <ip_addr
```

The following commands are sample examples of spotted and partially striped configurations which can be configured by using the NetScaler CLI.

```
1      > add route 10.102.29.0 255.255.255.0 10.102.29.2 - ownergroup ng2
2
3      Done
4
5      > add route6 fe80::9404:60ff:fedd:a464/64 - ownergroup ng1
6
7      Done
8
9      > add pbr pbr1 allow - ownergroup ng1
10
11     Done
12
13     > add pbr6 pbr2 allow - ownergroup ng2
14
15     Done
16
17     > add vlan 2
18
19     Done
20
21     > bind vlan 2 - ifnum 1/2 - [IPAddress 10.102.29.80 | fe80::9404:60
22         ff:fedd:a464/64-ownergroup ng1
23
24     Done
25 <!--NeedCopy-->
```

### Configure node group

In an L3 cluster, to replicate the same set of configurations on more than one node group, the following commands are used:

#### Configuring the following by Using the Command Line

- **To add an IPv4 static route to the routing table of the NetScaler appliance**

```
add route <network> <netmask> <gateway> -ownerGroup <ng>
```

**Sample Configuration:**

```
1 add route 0 0 10.102.53.1 - ownerGroup ng1
2
3 add route 0 0 10.102.53.1 - ownerGroup ng2
4 <!--NeedCopy-->
```

You define a new node group ‘all’ to support the preceding configuration, and have to configure the following commands:

**Configuring the following by Using the Command Line**

- **To add a new nodegroup to cluster with strict parameter**

---

```
add cluster node group** <name> -strict <YES NO>
```

---

- **To bind a cluster node or an entity to the given nodegroup**

```
bind cluster nodegroup <name> -node <nodeid>
```

- **To add IPv4 static route to all ownergroup**

```
add route <network> <netmask> <gateway> -ownerGroup <ng>
```

**Sample configuration:**

```
1 add cluster nodegroup all - strict YES
2
3 bind cluster nodegroup all - node 1
4
5 bind cluster nodegroup all - node 2
6
7 add route 0 0 10.102.53.1 - ownerGroup all
8 <!--NeedCopy-->
```

## Setting up a Citrix ADC cluster

September 21, 2020

Citrix ADC appliances that you want to add to the cluster must satisfy the criteria specified in “[Prerequisites for Cluster Nodes](#)”. Before actually setting up a cluster, you must be aware of cluster basics. For information, see “[Cluster Overview](#)”.

Forming a cluster requires you to set up inter-node communication, create the cluster (by adding the first Citrix ADC appliance), and then add the other cluster nodes. Each of these steps is explained with relevant details in subsequent topics.

#### Note

While there are some differences in setting up an L2 and L3 cluster, there are many similarities too. The subsequent topics explain the setup for both cluster types while highlighting the configurations that are specific to L3 clusters.

## Setting up inter-node communication

September 21, 2020

The nodes in a cluster setup communicate with one another using the following inter-node communication mechanisms:

- Nodes that are within the network (same subnet) communicate with each other through the cluster backplane. The backplane must be explicitly set up. The following are the detailed steps
- Across networks, steering of packets is done through a GRE tunnel and other node-to-node communication is routed across nodes as required.

#### Important

- From Release 11.0 all builds, a cluster can include nodes from different networks.
- From Release 12.1 build 56.22, GRE steering is supported on Fortville NICs in an L3 cluster.

### To set up the cluster backplane, do the following for every node

1. Identify the network interface that you want to use for the backplane.
2. Connect an Ethernet or optical cable from the selected network interface to the cluster backplane switch.

For example, to use interface 1/2 as the backplane interface for node 4, connect a cable from the 1/2 interface of node 4 to the backplane switch.

### Important points to note when setting up the cluster backplane

- Do not use the appliance's management interface (0/x) as the backplane interface. In a cluster, the interface 0/1/x is read as:

0 -> node ID 0

1/x -> Citrix ADC interface

- Do not use the backplane interfaces for the client or server data planes.
- Configure a link aggregate (LA) channel to optimize the throughput of the cluster backplane.
- In a two-node cluster, where the backplane is connected back-to-back, the cluster is operationally DOWN under any of the following conditions:
  - One of the nodes is rebooted.
  - Backplane interface of one of the nodes is disabled.

Therefore, Citrix recommends that you dedicate a separate switch for the backplane, so that the other cluster node and traffic are not impacted. You cannot scale out the cluster with a back-to-back link. You might encounter a downtime in the production environment when you scale out the cluster nodes.

- Backplane interfaces of all nodes of a cluster must be connected to the same switch and bound to the same L2 VLAN.
- If you have multiple clusters with the same cluster instance ID, make sure that the backplane interfaces of each cluster are bound to a different VLAN.
- The backplane interface is always monitored, regardless of the HA monitoring settings of that interface.
- The state of MAC spoofing on the different virtualization platforms can affect the steering mechanism on the cluster backplane. Therefore, make sure the appropriate state is configured:
  - XenServer - Disable MAC spoofing
  - Hyper-V - Enable MAC spoofing
  - VMware ESX - Enable MAC spoofing (also make sure “Forged Transmits” is enabled)
- The MTU for the cluster backplane is automatically updated. However, if jumbo frames are configured on the cluster, the MTU of the cluster backplane must be explicitly configured. The value must be set to  $78 + X$ , where  $X$  is the maximum MTU of the client and server data planes. For example, if the MTU of a server data plane is 7500 and of the client data plane is 8922. The MTU of a cluster backplane must be set to  $78 + 8922 = 9000$ . To set this MTU, use the following command:  

```
> set interface <backplane_interface> -mtu <value>
```
- The MTU for the interfaces of the backplane switch must be specified to be greater than or equal to 1,578 bytes. It is applicable if the cluster has features like MBF, L2 policies, ACLs, routing in CLAG deployments, and vPath.

### **GRE based tunnel support for L2 and L3 cluster**

Starting from Citrix ADC release 13.0 build 36.x Citrix ADC L2 and L3 cluster can steer the traffic using GRE based tunneling. It is defined for the inter-node communications of two nodes in a cluster. By

using the “tunnelmode” parameter, you can set GRE tunnel mode from the add and set cluster node command.

In an L3 cluster deployment, packets between Citrix ADC nodes are exchanged over an unencrypted GRE tunnel that uses the NSIP addresses of the source and destination nodes for routing. When this exchange occurs over the internet, in the absence of an IPsec tunnel, the NSIPs is exposed on the internet, and might result in security issues.

### Important

Citrix recommends customers to establish their own IPsec solution when using a L3 cluster.

The following table helps you to categorize the tunnel support based on different deployments.

| Steering Types | AWS           | Microsoft Azure | On -premises |
|----------------|---------------|-----------------|--------------|
| MAC            | Not supported | Not supported   | Supported    |
| GRE tunnel     | Supported     | Not supported   | Supported    |

### Important

In a L3 cluster, the tunnel mode is set to GRE by default.

## Configuring GRE based tunnel

You can add a cluster node by setting the parameters of node ID and mention the state. Configure the backplane by providing the interface name, and select the tunnel mode to GRE.

### CLI procedures

To enable the GRE tunnel mode by using the CLI.

- `add cluster node <nodeId>@ [-state <state>] [-backplane <interface_name >] [-tunnelmode <tunnelmode>]`
- `set cluster node <nodeId>@ [-state <state>] [-tunnelmode <tunnelmode>]`

### Note

Possible values for tunnel mode are NONE, GRE.

### Example

- `add cluster node 1 -state ACTIVE -backplane 1/1/1 -tunnelmode GRE`
- `set cluster node 1 -state ACTIVE -tunnelmode GRE`

## GUI procedures

To enable the GRE tunnel mode by using the GUI.

1. Navigate to **System > Cluster > Nodes**.
2. In the **Cluster Nodes** page, click **Add**.
3. In the **Create Cluster Node**, set the **Tunnel Mode** parameter to GRE and click **Create**.
4. Click **Close**.

## Creating a Citrix ADC cluster

September 21, 2020

To create a cluster, start by taking one of the Citrix ADC appliances that you want to add to the cluster. On this node, you must create the cluster instance and define the cluster IP address. This node is the first cluster node and is called the cluster configuration coordinator. All configurations that are performed on the cluster IP address are stored on this node and then propagated to the other cluster nodes.

The responsibility of configuration coordination in a cluster is not fixed to a specific node. It can change over time depending on the following factors:

- The priority of the node. The node with the highest priority (lowest priority number) is made the configuration coordinator. Therefore, if a node with a priority number lower than that of the existing configuration coordinator is added, the new node takes over as the configuration coordinator.

### Note

Node priority can be configured from NetScaler 10.1 onwards.

- If the current configuration coordinator goes down. The node with the next lowest priority number takes over as the configuration coordinator. If the priority is not set or if there are multiple nodes with the lowest priority number, the configuration coordinator is selected from one of the available nodes.

### Note

The configurations of the appliance (including SNIP addresses and VLANs) are cleared by implicitly executing the `clear ns config extended` command. However, the default VLAN and NSVLAN are not cleared from the appliance. Therefore, if you want the NSVLAN on the cluster, make sure it is created before the appliance is added to the cluster.

For an L3 cluster (cluster nodes on different networks), networking configurations are not cleared from the appliance.

### Important

HA Monitor (HAMON) on a cluster setup is used to monitor the health of an interface on each node. The HAMON parameter should be enabled on each node to monitor the state of the interface. If the operational state of the HAMON enabled interface goes down due to any reason, the respective cluster node is marked as unhealthy (NOT UP) and that node cannot serve traffic.

## To create a cluster by using the command line interface

1. Log on to an appliance (for example, appliance with NSIP address 10.102.29.60) that you want to add to the cluster.
2. Add a cluster instance.

```
add cluster instance <clId> -quorumType <NONE | MAJORITY> -inc <ENABLED
| DISABLED><!--NeedCopy-->
```

### Note

- The cluster instance ID must be unique within a LAN.
- The `-quorumType` parameter must be set to MAJORITY and not NONE in the following scenarios:
  - Topologies which do not have redundant links between cluster nodes. These topologies might be prone to network partition due to a single point of failure.
  - During any cluster operations such as node addition or removal.
- For an L3 cluster, make sure the `-inc` parameter is set to ENABLED. The `-inc` parameter must be disabled for an L2 cluster.

3. [Only for an L3 cluster] Create a nodegroup. In the next step, the newly added cluster node must be associated with this nodegroup.

### Note

This nodegroup will include all or a subset of the Citrix ADC appliances that belong to the same network.

```
add cluster nodegroup <name><!--NeedCopy-->
```

4. Add the Citrix ADC appliance to the cluster.

```
“add cluster node -state -backplane -nodegroup
```

```
1 > **Note** For an L3 cluster:
2 >
```

```

3 >- The nodegroup parameter must be set to the name of the
   nodegroup created above.
4 >- The backplane parameter is mandatory for nodes that are
   associated with a nodegroup that has more than one node, so
   that the nodes within the network can communicate with each
   other.</span>
5
6 Example:
7
8 Adding a node for an L2 cluster (all cluster nodes are in the same
   network).

```

```
add cluster node 0 10.102.29.60 -state PASSIVE -backplane 0/1/1
```

```

1 Adding a node for an L3 cluster which includes a single node from
   each network. Here, you do not have to set the backplane.

```

```
add cluster node 0 10.102.29.60 -state PASSIVE -nodegroup ng1
```

```

1 Adding a node for an L3 cluster which includes multiple nodes from
   each network. Here, you have to set the backplane so that
   nodes within a network can communicate with each other.

```

```
add cluster node 0 10.102.29.60 -state PASSIVE -backplane 0/1/1 -nodegroup ng1
“
```

5. Add the cluster IP address (for example, 10.102.29.61) on this node.

```
add ns ip <IPAddress> <netmask> -type clip
```

#### Example

```

1 > add ns ip 10.102.29.61 255.255.255.255 -type clip
2 <!--NeedCopy-->

```

6. Enable the cluster instance.

```
enable cluster instance <clId><!--NeedCopy-->
```

7. Save the configuration.

```
save ns config<!--NeedCopy-->
```

8. Warm reboot the appliance.

```
reboot -warm<!--NeedCopy-->
```

Verify the cluster configurations by using the show cluster instance command. Verify that the output of the command displays the NSIP address of the appliance as a node of the cluster.

9. After the node is UP, login to the CLIP and change RPC credentials for both cluster IP address and Node IP address. For more information about changing an RPC node password, see [Change an RPC node password](#).

### To create a cluster by using the configuration utility

1. Log on to an appliance (for example, an appliance with NSIP address 10.102.29.60) that you intend to add to the cluster.
2. Navigate to **System > Cluster**.
3. In the details pane, click the **Manage Cluster** link.
4. In the Cluster Configuration dialog box, set the parameters required to create a cluster. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click **Create**.
6. In the Configure cluster instance dialog box, make sure that the Enable cluster instance check box is selected.
7. In the Cluster Nodes pane, select the node and click **Open**.
8. In the Configure Cluster Node dialog box, set the State.
9. Click **OK**, and then click **Save**.
10. Warm reboot the appliance.
11. After the node is UP, login to the CLIP and change RPC credentials for both cluster IP address and Node IP address. For more information about changing an RPC node password, see [Change an RPC node password](#).

## Adding a node to the cluster

November 27, 2020

You can seamlessly scale the size of a cluster to include a maximum of 32 nodes. When a Citrix ADC appliance is added to the cluster, the configurations from that appliance are cleared (by internally running the clear ns config -extended command). The SNIP addresses, MTU settings of the backplane interface, and all VLAN configurations (except the default VLAN and NSVLAN) are also cleared from the appliance.

The cluster configurations are then synchronized on this node. There can be an intermittent drop in traffic while the synchronization is in progress.

#### Important

Before you add a Citrix ADC appliance to a cluster:

- Set up the backplane interface for the node. Check preceding topic.

- Check if the licenses that are available on the appliance match and are available on the configuration coordinator. The appliance is added only if the licenses match.
- If you want the NSVLAN on the cluster, make sure that the NSVLAN is created on the appliance before it is added to the cluster.
- Citrix recommends that you add the node as a passive node. Then, after joining the node to the cluster, complete the node specific configuration from the cluster IP address. Run the force cluster sync command if the cluster has only spotted IP addresses, has L3 VLAN binding, or has static routes.
- When an appliance with a preconfigured link aggregate (LA) channel is added to a cluster, the LA channel continues to exist in the cluster environment. The LA channel is renamed from LA/x to nodeId/LA/x, where LA/x is the LA channel identifier.

### To add a node to the cluster by using the CLI

1. Log on to the cluster IP address and, at the command prompt, do the following:

- Add the appliance (for example, 10.102.29.70) to the cluster.

#### Note

For an L3 cluster:

- The nodegroup parameter must be set to a nodegroup that has nodes of the same network.
  - >
  - >
  - >- If this node belongs to the same network as the first node that was added, then configure the nodegroup that was used for that node.
  - >- If this node belongs to a different network, then create a nodegroup and bind this node to the nodegroup.
  - >- The backplane parameter is mandatory for nodes that are associated with a nodegroup that has more than one node, so that the nodes within the network can communicate with each other.

```
1  add cluster node <nodeId> <IPAddress> -state <state> -
   backplane <interface_name> -nodegroup <name>
2
3  Example:
4
5  add cluster node 1 10.102.29.70 -state PASSIVE -backplane
   1/1/1
6  <!--NeedCopy-->
```

- Save the configuration.

```
1 save ns config
2 <!--NeedCopy-->
```

2. Log on to the newly added node (for example, 10.102.29.70) and join the node to the cluster.

```
1 join cluster -clip <ip_addr> -password <password>
2
3 Example:
4
5 join cluster -clip 10.102.29.61 -password nsroot
6 <!--NeedCopy-->
```

3. Configure the following commands on the CLIP.

- Bind VLAN to an interface

```
1 bind vlan <id> -ifnum <interface_name>
2 <!--NeedCopy-->
```

Example:

```
1 bind vlan 1 -ifnum 2/1/2
2 <!--NeedCopy-->
```

- Add spotted IP address to the newly added node

```
1 add ns ip <IpAddress> <netmask> -ownerNode <positive_integer>
>
2 <!--NeedCopy-->
```

Example:

```
1 add ns ip 97.131.0.3 255.0.0.0 -ownerNode 2
2 <!--NeedCopy-->
```

- Verify VLAN on NSIP

```
1 show vlan <id>
2 <!--NeedCopy-->
```

Example:

```
1 show vlan 1
2 <!--NeedCopy-->
```

#### 4. Perform the following configurations:

- If the node is added to a cluster that has only spotted IPs, the configurations are synchronized before the spotted IP addresses are assigned to that node. In such cases, L3 VLAN bindings can be lost. To avoid this loss, either add a striped IP or add the L3 VLAN bindings.
- Define the required spotted configurations.
- Set the MTU for the backplane interface.

#### 5. Save the configuration.

```
1 save ns config
2 <!--NeedCopy-->
```

#### 6. Warm reboot the appliance.

```
1 reboot -warm
2 <!--NeedCopy-->
```

#### 7. After the node is UP and sync is successful, change RPC credentials for the node from the cluster IP address. For more information about changing an RPC node password, see [Change an RPC node password](#).

```
1 set rpcNode <node-NSIP> -password <passwd>
2
3 Example:
4
5 set rpcNode 192.0.2.4 -password mypassword
6 <!--NeedCopy-->
```

#### 8. Set the cluster node to Active.

```
1 set cluster node <nodeID> -state active.
2
3 Example:
4
5 set cluster node 1 -state active
6 <!--NeedCopy-->
```

### To add a node to the cluster by using the GUI

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Nodes**.
3. In the details pane, click **Add** to add the new node (for example, 10.102.29.70).

4. In the **Create Cluster Node** dialog box, configure the new node. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click **Create**. When prompted to perform a warm reboot, click **Yes**.
6. After the node is UP and sync is successful, change RPC credentials for the node from the cluster IP address. For more information about changing an RPC node password, see [Change an RPC node password](#).
7. Navigate to **System > Cluster > Nodes > Edit**.
8. Modify the State to **ACTIVE** and confirm.

### To join a previously added node to the cluster by using the GUI

If you have used the command line to add a node to the cluster, but have not joined the node to the cluster, you can use the following procedure.

#### Note

When a node joins the cluster, it takes over its share of traffic from the cluster and hence an existing connection can get terminated.

1. Log on to the node that you want to join to the cluster (for example, 10.102.29.70).
2. Navigate to **System > Cluster**.
3. In the details pane, under Get Started, click the Join Cluster link.
4. In the Join to existing cluster dialog box, set the cluster IP address and the `nsroot` password of the configuration coordinator. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click **OK**.

## Viewing the details of a cluster

September 21, 2020

You can view the details of the cluster instance and the cluster nodes by logging on to the cluster IP address.

### To view details of a cluster instance by using the command line interface

Log on to the cluster IP address and, at the command prompt, type:

```
1 show cluster instance <clId>
```

**Note**

When executed from the NSIP address of a cluster node that is not the configuration coordinator, this command displays the status of the cluster on this node.

**To view details of a cluster node by using the command line interface**

Log on to the cluster IP address and, at the command prompt, type:

```
1 show cluster node <nodeId>
```

**To view details of a cluster instance by using the configuration utility**

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster**.
3. In the details pane, under **Get Started**, click the **Manage Cluster** link to view the details of the cluster.

**To view details of a cluster node by using the configuration utility**

1. Log on to the cluster IP address.
2. Navigate to **System > Cluster > Nodes**.
3. In the details pane, click the node for which you want to view the details.

**Distributing traffic across cluster nodes**

October 6, 2020

After you have created the Citrix ADC cluster and performed the required configurations, you must deploy Equal Cost Multiple Path (ECMP) or cluster Link Aggregation (LA) on the client data plane (for client traffic) or server data plane (for server traffic). These mechanisms distribute external traffic across the cluster nodes.

**Policy-based backplane steering**

The policy-based backplane steering (PBS) is a mechanism in cluster deployment, which steers the traffic across cluster nodes based on the hash method defined for the flow. The flow is defined by a combination of L2 and L3 parameters similar to the Access Control List (ACL).

The PBS supports both IPv4 and IPv6 traffic. In the case of IPv6 deployments, the steering supports an extra option `[dfdprefix <positive_integer>].<!--NeedCopy-->` This provides the flexibility to choose the same flow processor for the same IP prefix. The prefix option is supported for source IP or destination IP hash methods only.

**Note**

If the PBS mechanism is not used to steer the traffic, the traffic is steered through the default method.

To configure the new ACL attributes, at the Citrix ADC command prompt, type the following commands:

**CLI commands for IPv4**

- `add ns acl <aclname> <aclaction> [-type (classic | dfd)] [-dfdhash <dfdhash>]`
- `set ns acl <aclname> <aclaction> [-dfdhash <dfdhash>]`
- `show ns acl [<aclname>][-type (classic | DFD)]`
- `apply ns acls [-type (classic | DFD)]`
- `clear ns acls [-type (classic | DFD)]`
- `renumber ns acls [-type (classic | DFD)]`

**CLI commands for IPv6**

- `add ns acl6 <acl6name> <acl6action> [-type (classic | dfd)][-dfdhash <dfdhash>][-dfdprefix <positive_interger>]`
- `set ns acl6 <acl6name> <acl6action> [-dfdhash <dfdhash>][-dfdprefix <positive_interger>]`
- `show ns acl6 [<acl6name>][-type (classic | DFD)]`
- `apply ns acls6 [-type (classic | DFD)]`
- `clear ns acls6 [-type (classic | DFD)]`
- `renumber ns acls6 [-type (classic | DFD)]`

The following are the different types of hash methods that you can specify to steer the packet to the flow processor:

- SIP-SPORT-DIP-DPORT
- SIP
- DIP
- SIP-DIP
- SIP-SPORT

## Limitations

1. The traffic flow distribution across the cluster nodes is not ensured, as the flow processor is decided by the admin configured rules.
2. L2 mode is not supported.
3. The node groups and striped SNIPs are not supported, as there is no deployment scenarios.
4. MPTCP is not supported.
5. Support only for TCP, UDP, and ICMP traffic.
6. Cluster over L3 mode is not supported.
7. Process local at service level is not supported.

## Using Equal Cost Multiple Path (ECMP)

September 21, 2020

By using the Equal Cost Multiple Path (ECMP) mechanism on a cluster deployment, active cluster nodes advertise the virtual server IP addresses. The cluster node which receives the advertised traffic steers the traffic to the node that must process the traffic. There can be redundant steering in spotted and partially striped virtual servers. Therefore, from NetScaler 11 onwards, spotted and partially striped virtual server IP addresses advertise the owner nodes, which reduce the redundant steering.

You must have detailed knowledge of routing protocols to use ECMP. For more information, see [“Configuring Dynamic Routes”](#). For more information on routing in a cluster, see [“Routing in a Cluster”](#).

To use ECMP, you must first perform the following:

- Enable the required routing protocol (OSPF, RIP, BGP, or ISIS) on the cluster IP address.
- Bind the interfaces and the spotted IP address (with dynamic routing enabled) to a VLAN.
- Configure the selected routing protocol and redistribute the kernel routes on the ZebOS by using the vtysh shell.

Perform similar configurations on the cluster IP address and on the external connecting device.

### Note

- Make sure that the licenses on the cluster support dynamic routing, otherwise ECMP does not work.
- ECMP is not supported for wildcard virtual servers since RHI needs a VIP address to advertise to a router and wildcard virtual servers do not have associated VIP addresses.

Figure 1. ECMP topology

When you use ECMP mechanism for traffic distribution on a cluster deployment, the active cluster nodes advertise the virtual server IP addresses to the upstream router. The ECMP router can reach the VIP address via SNIP0, SNIP1, or SNIP2. The traffic flow in the Figure 1 is described as follows:

1. The client sends a request to the VIP hosted on cluster.
2. The upstream router, based on the learned routes of the VIP, forwards the packet to any one of the nodes. Let's say NS1. The node NS1 is the flow receiver.
3. The flow receiver (NS1) determines the node that must process the traffic, which is called the flow processor. For example, Node NS2 is the flow processor.
4. The flow receiver (NS1) with SNIP1 (97.131.0.2) steers the request to the flow processor (NS2) with SNIP2 (97.131.0.3).
5. The flow processor (NS2) establishes a connection with the server.
6. The server processes the request and sends the response to the SNIP address that sent the request to the server.

Notes:

- Only ACTIVE nodes advertise VIP routes.
- INACTIVE nodes do not advertise VIP routes.
- All ACTIVE nodes advertise striped VIPs.

- Only ACTIVE owner nodes advertise spotted or partially striped VIPs.

### To configure ECMP on the cluster by using the command line interface

1. Log on to the cluster IP address.
2. Enable the routing protocol.

```
1 enable ns feature <feature>
```

**Example:** To enable the OSPF routing protocol.

```
1 enable ns feature ospf
```

3. Add a VLAN.

```
1 add vlan <id>
```

**Example**

```
1 add vlan 97
```

4. Bind the interfaces of the cluster nodes to the VLAN.

```
1 bind vlan <id> -ifnum <interface_name>
```

**Example**

```
1 bind vlan 97 -ifnum 0/1/2 1/1/2 2/1/2
```

5. Add a spotted SNIP address for each node and enable dynamic routing on it.

```
1 add ns ip <SNIP> <netmask> -ownerNode <positive_integer> -  
dynamicRouting ENABLED
```

**Example**

```
1 add ns ip 97.131.0.1 255.0.0.0 -ownerNode 0 -dynamicRouting  
ENABLED -type SNIP  
2 add ns ip 97.131.0.2 255.0.0.0 -ownerNode 1 -dynamicRouting  
ENABLED -type SNIP  
3 add ns ip 97.131.0.3 255.0.0.0 -ownerNode 2 -dynamicRouting  
ENABLED -type SNIP
```

6. Bind one of the spotted SNIP addresses to the VLAN. When you bind one spotted SNIP address to a VLAN, all other spotted SNIP addresses defined on the cluster in that subnet are automatically bound to the VLAN.

```
1 bind vlan <id> -IPAddress <SNIP> <netmask>
```

### Example

```
1 bind vlan 97 -ipAddress 97.131.0.1 255.0.0.0
```

### Note

You can use NSIP addresses of the cluster nodes instead of adding SNIP addresses. If so, you do not have to perform steps 3–6.

7. Configure the routing protocol on ZebOS using vtysh shell.

### Example:

To configure an OSPF routing protocol on node IDs 0, 1, and 2.

```
1 vtysh
2 ! interface vlan97 !
3 router ospf owner-node 0
4 ospf router-id 97.131.0.1 exit-owner-node
5 owner-node 1 ospf router-id 97.131.0.2
6 exit-owner-node
7 owner-node 2
8 ospf router-id 97.131.0.3 exit-owner-node redistribute kernel
   network 97.0.0.0/8 area 0 !
```

### Note

For VIP addresses to be advertised, RHI setting is done by using the vserverRHILevel parameter as follows:

```
1 add ns ip <IPAddress> <netmask> -type VIP -vserverRHILevel <
   vserverRHILevel>
```

For OSPF specific RHI settings, there are more settings that can be done as follows:

```
1 add ns ip <IPAddress> <netmask> -type VIP -ospfLSAType ( TYPE1 |
   TYPE5 ) -ospfArea <positive_integer>
```

Use the add ns ip6 command to perform the preceding commands on IPv6 addresses.

8. Configure ECMP on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

```
1 //For OSPF (IPv4 addresses) Global config: Configure terminal
  feature ospf      Interface config: Configure terminal
  interface Vlan10  no shutdown      ip address 97.131.0.5/8
    Configure terminal router ospf 1 network 97.0.0.0/8 area
    0.0.0.0 -----
2
3 //For OSPFv3 (IPv6 addresses) Global config: Configure terminal
  feature ospfv3    Configure terminal interface Vlan10    no
  shutdown          ipv6 address use-link-local-only      ipv6 router
  ospfv3 1 area 0.0.0.0  Configure terminal router ospfv3 1
```

### Router monitoring cluster nodes in ECMP deployment

In a cluster setup, on an owner node that has a spotted SNIP address configuration, you can now disable the ownerDownResponse option. By default, the option is enabled, allowing the node to respond to an ICMP/ARP/ICMP6/ND6 request coming from the upstream router. You can now disable this option to allow the router to monitor if a cluster node is active or inactive. When the router sends a request, if the option is disabled, it identifies the owner node to be inactive and unavailable for traffic distribution.

### To configure ECMP for static routes traffic distribution by using the command line interface

```
1 add ns ip <ipaddress> <netmask> -ownernode <node-id> - ownerDownResponse
  disable
```

## Use Case: ECMP with BGP routing

September 21, 2020

To configure ECMP with BGP routing protocol, perform the following steps:

1. Log on to the cluster IP address.
2. Enable BGP routing protocol.

```
1 > enable ns feature bgp
```

3. Add VLAN and bind the required interfaces.

```
1 > add vlan 985
2 > bind vlan 985 -ifnum 0/0/1 1/0/1
```

4. Add the spotted IP address and bind them to the VLAN.

```
1 > add ns ip 10.100.26.14 255.255.255.0 -ownerNode 1 -
    dynamicRouting ENABLED
2 > add ns ip 10.100.26.15 255.255.255.0 -ownerNode 2 -
    dynamicRouting ENABLED
3 > bind vlan 985 -ipAddress 10.100.26.10 255.255.255.0
```

5. Configure BGP routing protocol on ZebOS using vtysh shell.

```
1 > vtysh conf t router bgp 65535 neighbor 10.100.26.1 remote-as
    65535
```

6. Configure BGP on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

```
1 > router bgp 65535 no synchronization
2   bgp log-neighbor-changes neighbor 10.100.26.14 remote-as 65535
   neighbor 10.100.26.15 remote-as 65535 no auto-summary
3   dont-capability-negotiate
4   dont-capability-negotiate
5   no dynamic-capability
```

## Using cluster link aggregation

November 9, 2020

Cluster link aggregation is a group of interfaces of cluster nodes. It is an extension of Citrix ADC link aggregation. The only difference is that, while link aggregation requires the interfaces to be from the same device, in cluster link aggregation, the interfaces are from different nodes of the cluster. For more information about link aggregation, see [Configuring Link Aggregation](#).

### Important

- Cluster link aggregation is supported for a cluster of hardware (MPX) appliances.
- Cluster link aggregation is supported for a cluster of virtual (VPX) appliances that are de-

ployed on ESX and KVM hypervisors, with the following restrictions:

- Dedicated interfaces must be used. It means that the interfaces must not be shared with other virtual machines.
- When a node becomes INACTIVE, the corresponding cluster LA interface is marked as power DOWN, so that the data traffic is not sent to an INACTIVE node.
- When a node becomes ACTIVE, the corresponding cluster LA interface is marked as power ON.
- If the cluster link aggregation member interfaces are manually disabled or if cluster link aggregation itself is manually disabled, then interface power down capability is achieved only by the LACP timeout mechanism.
- Jumbo MTU is not supported on LACP cluster link aggregation.

**Note:** Cluster link aggregation is not supported on VPX appliances that are deployed on XenServer, AWS, and Hyper-V.

- Starting from 12. 0 release, cluster link aggregation is supported on Citrix ADC SDX appliances.
- The number of interfaces that can be bound to cluster LA is 16 (from each node). The maximum number of interfaces in cluster LA can be  $(16 * n)$ , where n is the number of nodes in a cluster. The total number of interfaces in cluster LA depends on the number of interfaces for every port channel on the upstream switch.
- If a Citrix ADC appliance uses Intel Fortville interfaces, the switchover of a Citrix ADC cluster node to passive mode might cause a few seconds of outage with CLAG. The issue occurs because LACP is enabled for CLAG to function properly, and the outage time depends on NIC LACP timers.

For example, consider a three-node cluster where all three nodes are connected to the upstream switch. A cluster LA channel (CLA/1) is formed by binding interfaces 0/1/2, 1/1/2, and 2/1/2.

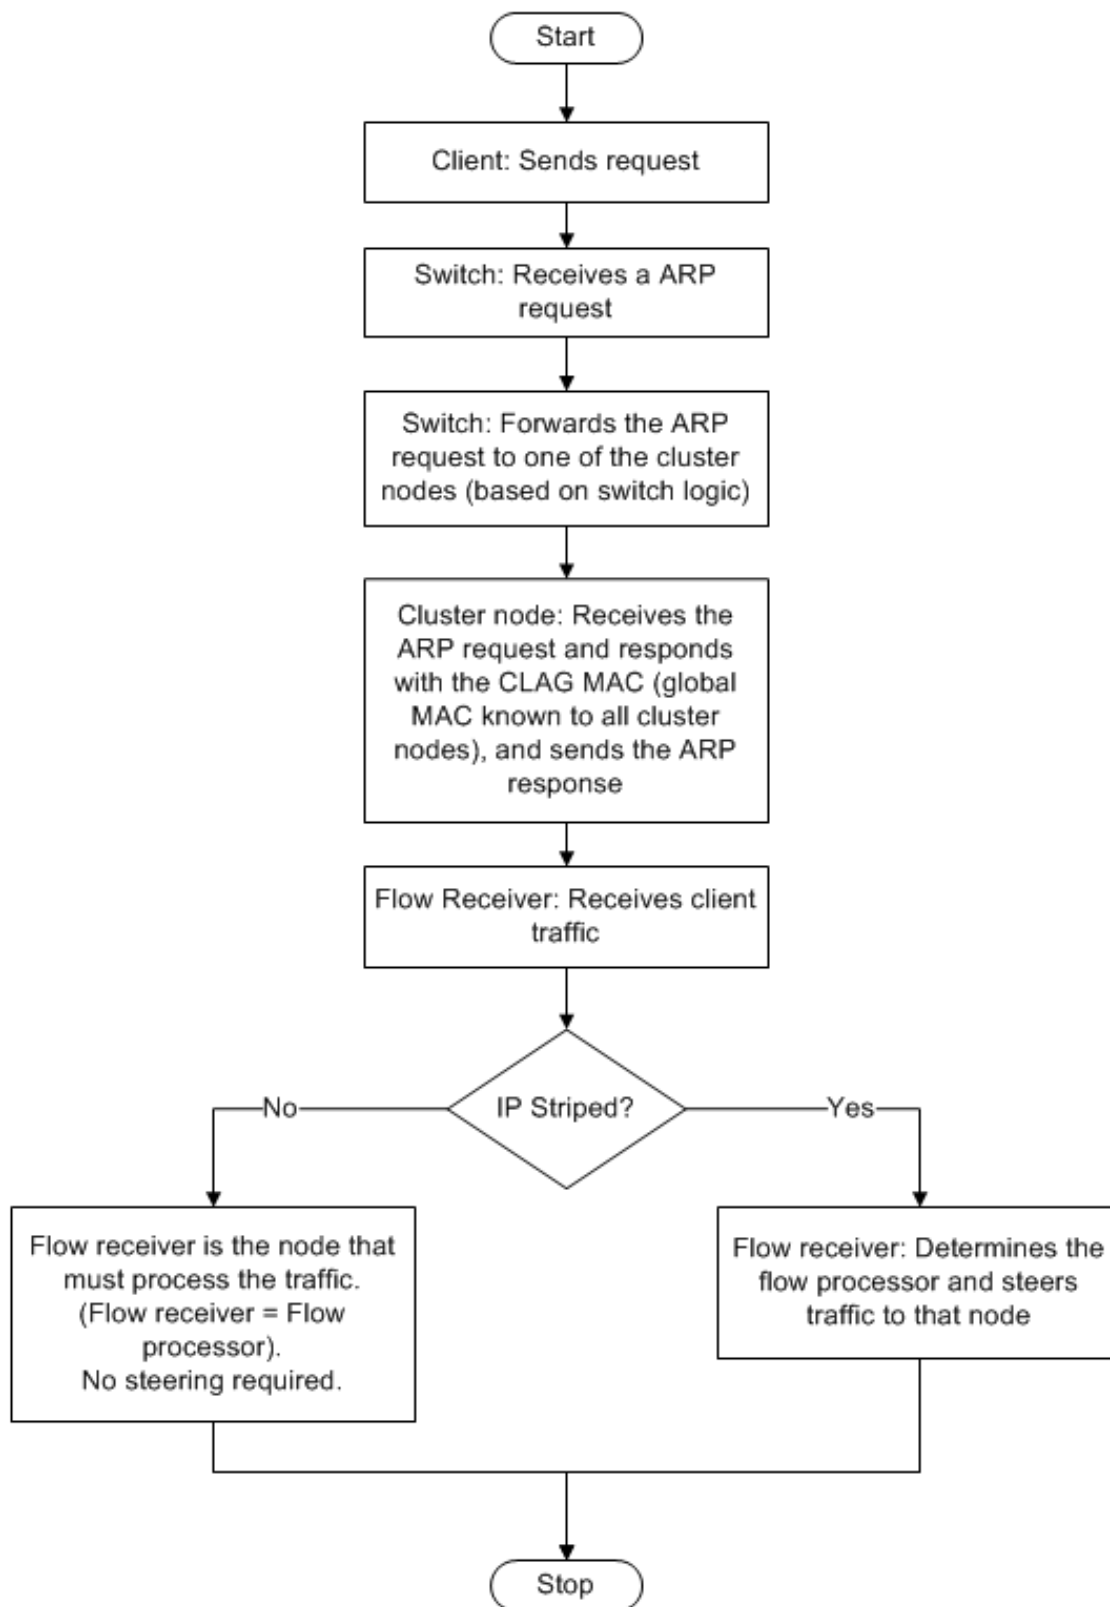

Figure 1. Cluster Link Aggregation topology

A cluster LA channel has the following attributes:

- Each channel has a unique MAC agreed upon by cluster nodes.
- The channel can bind both local and remote nodes' interfaces.
- A maximum of four cluster LA channels are supported in a cluster.
- Backplane interfaces cannot be part of a cluster LA channel.
- When an interface is bound to a cluster LA channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to one channel only.
- Management access to a cluster node, must not be configured on a cluster LA channel (for example, CLA/1) or its member interfaces. This is because when the node is INACTIVE, the corresponding cluster LA interface is marked as power down, and therefore loses management access.

Figure 2. Traffic distribution flow using cluster LA

## Static cluster link aggregation

September 21, 2020

You must configure a static cluster LA channel on the cluster IP address and on the external connecting device. If possible, configure the upstream switch to distribute traffic based on IP address or port instead of MAC address.

### To configure a static cluster LA channel by using the command line interface

1. Log on to the cluster IP address.

#### Note

Make sure that you configure the cluster LA channel on the cluster IP address before configuring link aggregation on the external switch. Otherwise, the switch will forward traffic to the cluster even though the cluster LA channel is not configured. This can lead to loss of traffic.

2. Create a cluster LA channel.

```
1 add channel <id> -speed <speed> ``
```

#### Example

```
1 add channel CLA/1 -speed 1000
```

#### Note

You must not specify the speed as AUTO. Rather, you must explicitly specify the speed as 10, 100, 1000, or 10000. Only interfaces that have the speed matching the <speed> attribute in the cluster LA channel are added to the active distribution list.

3. Bind the required interfaces to the cluster LA channel. Make sure that the interfaces are not used for the cluster backplane.

```
1 bind channel <id> <ifnum>
```

#### Example

```
1 bind channel CLA/1 0/1/2 1/1/2 2/1/2 <!--NeedCopy--> ``
```

4. Verify the configurations.

```
1 show channel <id>
```

**Example**

```
1 show channel CLA/1
```

**Note**

You can bind the cluster LA channel to a VLAN by using the `bind vlan` command. The interfaces of the channel are automatically bound to the VLAN.

5. Configure static LA on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1). Similar configurations must be performed on other switches.

```
1 Global config:
2 Configure terminal
3
4 Interface level config:
5
6 interface Ethernet2/47
7 switchport
8 switchport access vlan 10
9 channel-group 7 mode on
10 no shutdown
11
12 interface Ethernet2/48
13 switchport
14 switchport access vlan 10
15 channel-group 7 mode on
16 no shutdown
```

## Dynamic cluster link aggregation

September 21, 2020

Dynamic cluster LA channel uses Link Aggregation Control Protocol (LACP).

You must perform similar configurations on the cluster IP address and on the external connecting device. If possible, configure the upstream switch to distribute traffic based on IP address or port instead of MAC address.

**Points to remember:**

- Enable LACP (by specifying the LACP mode as either ACTIVE or PASSIVE).

**Note**

Make sure the LACP mode is not set as PASSIVE on both the Citrix ADC cluster and the external connecting device.

- Specify the same LACP key on each interface that you want to be the part of the channel. For creating a cluster LA channel, the LACP key can have a value from 5 through 8. For example, if you set the LACP key on interfaces 0/1/2, 1/1/2, and 2/1/2 to 5, CLA/1 is created. The interfaces 0/1/2, 1/1/2, and 2/1/2 are automatically bound to CLA/1. Similarly, if you set the LACP key to 6, CLA/2 channel is created.
- Specify the LAG type as Cluster.

**To configure a dynamic cluster LA channel by using the command line interface**

On the cluster IP address, for each interface that you want to add to the cluster LA channel, type:

```
set interface <id> -lacpMode <lacpMode> -lacpKey <positive_integer> -lagType CLUSTER<!--NeedCopy-->
```

**Example:**

To configure a cluster LA channel CLA/1 of 3 interfaces.

```
1 > set interface 0/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
2 > set interface 1/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
3 > set interface 2/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
```

**Note**

Optionally, you can enable [Link Redundancy in a Cluster with LACP](#).

Similarly, configure dynamic LA on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1). Similar configurations must be performed on other switches.

```
1 Global config:
2 Configure terminal
3 feature lacp
4 Interface level config:
5
6 interface Ethernet2/47
7 switchport
8 switchport access vlan 10
9 channel-group 7 mode active
10 no shutdown
```

```

11
12 interface Ethernet2/48
13 switchport
14 switchport access vlan 10
15 channel-group 7 mode active
16 no shutdown

```

## Link redundancy in a cluster with LACP

September 21, 2020

A Citrix ADC cluster provides link redundancy for LACP to ensure that all nodes have the same partner key.

To understand the need for link redundancy, let us consider the example of the following cluster setup along with the accompanying cases (with attention to case 3):

In this setup, interfaces I1, I2, I3 and I4 are bound to LACP channel with KEY 5. On the partner side, I1 and I2 are connected to Switch 1 to form a single LA channel with KEY 1. Similarly, I3 and I4 are connected to Switch 2 to form a single LA channel with KEY 2.

Now let us consider the following cases to understand the need for link redundancy:

- **Case 1: Switch 1 is up and Switch 2 is down**

In this case, cluster LA on both the nodes would stop receiving LACPDU from Key2 and would start receiving LACPDU from Key1. On both the nodes, cluster LA is connected to KEY 1 and I1 and I2 will be UP and channel on both the nodes would be UP.

- **Case 2: Switch1 goes down and Switch2 becomes UP**

In this case, cluster LA on both the nodes would stop receiving LACPDUs from Key1 and would start receiving LACPDUs from Key2. On both the nodes, cluster LA is connected to Key2 and I3 and I4 will be UP and channel on both the nodes would be UP.

- **Case 3: Both Switch1 and Switch2 are UP**

In this case, it is possible that cluster LA on node1 chooses Key1 as its partner and cluster LA on node2 chooses Key2 as its partner. This means that I1 on node1 and I4 on node2 are receiving traffic which is undesirable. This can happen because the LACP state machine is node-level and chooses its partners on first-come first-serve basis.

To solve these concerns, link redundancy of dynamic cluster LA is supported. To configure link redundancy on a channel or interface, you must enable it and optionally specify the threshold throughput as follows:

```
set channel CLA/1 -linkRedundancy ON -lrMinThroughput <positive_integer>
```

The throughput of the partner channels is checked against the configured threshold throughput. The partner channel that satisfies the threshold throughput is selected in first-in-first-out (FIFO) manner. If none of the partner channel meets the threshold, or if threshold throughput is not configured, the partner channel with the maximum number of links is selected.

**Note**

The threshold throughput can be configured from NetScaler 11 onwards.

## Managing the Citrix ADC cluster

September 21, 2020

After you have created a cluster and configured the required traffic distribution mechanism, the cluster is able to serve traffic. During the lifetime of the cluster, you can perform cluster tasks such as configuring nodegroups, disabling nodes of a cluster, discovering Citrix ADC appliances, viewing statistics, synchronizing cluster configurations, cluster files, and the time across the nodes, and upgrading or downgrading the software of cluster nodes.

## Configuring linksets

September 21, 2020

Linksets must be used when some cluster nodes are not physically connected to the external network. In such a cluster topology, the unconnected cluster nodes use the interfaces specified in the linkset to

communicate with the external network through the cluster backplane. Linksets are typically used in scenarios when the connecting devices have insufficient ports to connect the cluster nodes.

**Note**

Linksets are a mandatory configuration in the following scenarios:

- For deployments that require MAC-Based Forwarding (MBF).
- To improve manageability of ACL and L2 policies involving interfaces. You must define a linkset of the interfaces and add ACL and L2 policies based on linksets.

Linksets must be configured only through the cluster IP address.

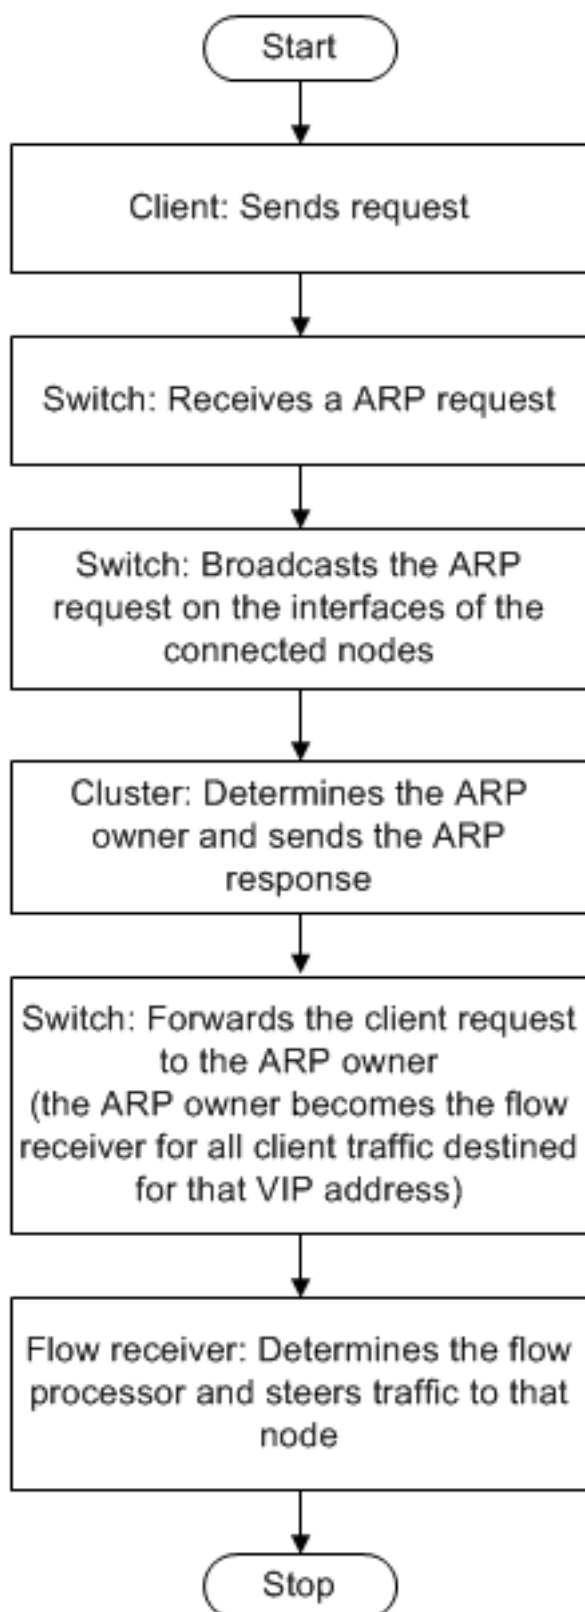

For example, consider a three node cluster where the upstream switch has only two ports available. Using linksets, you can connect two nodes to the switch and leave the third node unconnected. In the following figure, a linkset (LS/1) is formed by binding the interfaces 0/1/2 and 1/1/2. NS2 is the unconnected node of the cluster.

Figure 1. Linksets topology

The linkset informs NS2 that it can use interfaces 0/1/2 and 1/1/2 to communicate with the network devices. All traffic to and from NS2 is now routed through interfaces 0/1/2 or 1/1/2.

Figure 2. Traffic distribution flow using linksets

## To configure a linkset by using the command line interface

1. Log on to the cluster IP address.
2. Create a linkset.

“add linkset

```
1  **Example**
2
3  ``add linkset LS/1<!--NeedCopy-->
```

3. Bind the required interfaces to the linkset. Make sure the interfaces are not used for the cluster backplane.

“bind linkset -ifnum ...

```
1  **Example**
2
3  ``bind linkset LS/1 -ifnum 0/1/2 1/1/2<!--NeedCopy-->
```

4. Verify the linkset configurations.

“show linkset

```
1  **Example**
2
3  ``show linkset LS/1<!--NeedCopy-->
```

### Note

You can bind the linkset to a VLAN by using the bind vlan command. The interfaces of the linkset are automatically bound to the VLAN.

## To configure a linkset by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to **System > Network > Linksets**.
3. In the details pane, click **Add**.
4. In the **Create Linkset** dialog box:
  - Specify the name of the linkset by setting the Linkset parameter.
  - Specify the Interfaces to be added to the linkset and click Add. Repeat this step for each interface you want to add to the linkset.
5. Click **Create**, and then click **Close**.

## Nodegroups for spotted and partially-striped configurations

September 21, 2020

By virtue of the default cluster behavior, all configurations performed on the cluster IP address are available on all nodes of the cluster. However, there might be cases where you need some configurations to be available only on specific cluster nodes.

You can achieve this requirement by defining a nodegroup that includes the specific cluster nodes, and then binding the configuration to that nodegroup. This ensures that the configuration is active only on those cluster nodes. These configurations are called partially-striped or spotted (if active only on a single node). For more information, see [Striped, Partially Striped, and Spotted Configurations](#).
