- **Create feature entities on the traffic domain.** Create the required feature entities in the traffic domain. The CLI commands and configuration dialog boxes of all the supported features in a nondefault traffic domain include a parameter called a *traffic domain identifier* (td). When configuring a feature entity, if you want the entity to be associated with a particular traffic domain, you must specify the td. Any feature entity that you create without setting the td is automatically associated with the default traffic domain.

To give you an idea of how feature entities are associated with a traffic domain, this topic covers the procedures for configuring all the entities mentioned in the figure titled How Traffic Domains Work.

The CLI has two commands for these two tasks, but the GUI combines them in a single dialog box.

### CLI procedures

To create a VLAN and bind interfaces to it by using the CLI:

At the command prompt, type:

- **add vlan** <id>
- **bind vlan** <id> -ifnum <slot/port>
- **show vlan** <id>

To create a traffic domain entity and bind VLANs to it by using the CLI:

At the command prompt, type:

- **add ns trafficdomain** <td>
- **bind ns trafficdomain** <td> -vlan <id>
- **show ns trafficdomain** <td>

To create a service by using the CLI:

At the command prompt, type:

- **add service** <name> <IP> <serviceType> <port> -td <id>
- **show service** <name>

To create a load balancing virtual server and bind services to it by using the CLI:

At the command prompt, type:

- **add lb vserver** <name> <serviceType> <IPAddress> <port> -td <id>
- **bind lb vserver** <name> <serviceName>
- **show lb vserver** <name>

### GUI procedures

To create a VLAN by using the GUI:

Navigate to **System > Network > VLANs**, click **Add**, and set the parameters.

To create a traffic domain entity by using the GUI:

Navigate to **System > Network > Traffic Domains**, click **Add**, and in the **Create Traffic Domain** dialog box, set the parameters.

To create a service by using the GUI:

Navigate to **Traffic Management > Load Balancing > Services**, click **Add**, and set the parameters.

To create a load balancing virtual server by using the GUI:

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, click **Add**, and set the parameters.

## Inter Traffic Domain Entity Bindings

September 21, 2020

You can bind services in one traffic domain to a virtual server in another traffic domain. All the services to be bound to a virtual server in a different traffic domain must reside in the same traffic domain.

You configure this support by using the existing `bind lb vserver` command or the related GUI procedure.

This capability can facilitate interaction between different traffic domains. In an enterprise, servers can be grouped in different traffic domains. Virtual servers are created in a traffic domain that faces the internet. A virtual server from this traffic domain can be configured to load balance servers in another traffic domain. This virtual server receives connection requests from the Internet to be forwarded to the bound servers.

When a Citrix ADC is used in a cloud infrastructure, each tenant can be assigned a separate traffic domain, and all the resources (including servers) for a tenant can be grouped together in the tenant's

traffic domain. For each tenant, a virtual server is created for load balancing servers in its traffic domain. All of these virtual servers are grouped together in a single traffic domain that faces the Internet.

Consider an example of in which cloud service provider Example-Cloud-A has three traffic domains, with IDs 10, 20, and 30, configured on Citrix ADC appliance NS1.

Example-Org-A and Example-Org-B are tenants of Example-Cloud-A. Tenant A is assigned traffic domain 20, and tenant B is assigned domain 30. Servers S1 and S2 reside in traffic domain 20 and servers S3 and S4 reside in traffic domain 30.

Traffic domain 10 faces the internet. Virtual servers LBVS-1 and LBVS-2 are created in traffic domain 10. LBVS-1, in traffic domain 10, is configured to load balance servers S1 and S2, which are in traffic domain 20. LBVS-2, in traffic domain 10, is configured to load balance servers S3 and S4, which are in traffic domain 30.

Therefore, these virtual servers accept Internet connection requests for servers that are in a different traffic domain than that of the virtual servers.

## Virtual MAC Based Traffic Domains

September 21, 2020

You can associate a traffic domain with a Virtual MAC address instead of with VLANs. The Citrix ADC then sends the traffic domain's Virtual MAC address in all responses to ARP queries for network entities in that domain. As a result, the ADC can segregate subsequent incoming traffic for different traffic domains on the basis of the destination MAC address, because the destination MAC address is the Virtual MAC address of a traffic domain. After creating entities on a traffic domain, you can easily manage and monitor them by performing traffic domain level operations.

Consider an example in which two traffic domains, with IDs 1 and 2, are configured on Citrix ADC appliance NS1. The Citrix ADC creates a Virtual MAC address VMAC1 and associates it with traffic domain 1. Similarly, the Citrix ADC created another Virtual MAC address Virtual MAC2 and associates with traffic domain 2.

In traffic domain 1, load balancing virtual server LBVS-TD1 is configured to load balance traffic across servers S1 and S2. On the Citrix ADC appliance, servers S1 and S2 are represented by services SVC1-TD1 and SVC2-TD1, respectively. A subnet IP address (SNIP) SNIP1 is configured for enabling the Citrix ADC to communicate with S1 and S2. Because VMAC1 is associated with traffic domain 1, the appliance sends VMAC1 as the MAC address in all ARP announcements and ARP responses for LBVS-TD1 and SNIP1.

Similarly in traffic domain 2, load balancing virtual server LBVS-TD2 is configured to load balance traffic across S3 and S4. On the Citrix ADC appliance, servers S3 and S4 are represented by services

SVC3-TD2 and SVC4-TD2, respectively. A SNIP address SNIP2 is configured for enabling the Citrix ADC to communicate with S3 and S4. Because VMAC2 is associated with traffic domain 2, the appliance sends VMAC2 as the MAC address in all ARP announcements and ARP responses for LBVS-TD2 and SNIP2.

The Citrix ADC segregate subsequent incoming traffic for traffic domains 1 or 2 on the basis of the desti-

nation MAC address, if the destination MAC address is VMAC1 or VMAC2.

The following table lists the settings used in the example: [VMAC based traffic domain example settings](#).

## Before you Begin

Following are points to consider before you configure Virtual MAC based traffic domain:

1. Virtual MAC based traffic domains are easiest way to achieve network traffic segregation.
2. Because Virtual MAC based traffic domains segregate network traffic based on Virtual MAC addresses and not VLANS, you cannot create duplicate IP addresses on different Virtual MAC based traffic domains on a Citrix ADC.
3. Virtual MAC based traffic domains do not work when the Citrix ADC is deployed only in L2 Mode.
4. Both VLAN and Virtual MAC based traffic domains can coexist on a Citrix ADC. Virtual MAC based traffic domains actually runs on all VLANS that are not bound to any VLAN based traffic domain.

## Configuration Steps

Configuring a Virtual MAC based traffic domain on a Citrix ADC appliance consists of the following tasks:

- Create a traffic domain entity and enable the Virtual MAC option. Create a traffic domain entity uniquely identified by an ID, which is an integer value, and then enable the Virtual MAC option. After creating the traffic domain entity, the Citrix ADC creates a virtual MAC address and then associates it to the traffic domain entity.
- Create feature entities on the traffic domain. Create the required feature entities in the traffic domain by specifying the traffic domain identifier (td) when configuring these feature entities. Citrix ADC owned network entities created in a Virtual MAC based traffic domain are associated with the Virtual MAC address, which is associated with the traffic domain. The Citrix ADC then sends the traffic domain's Virtual MAC address in ARP announcements and ARP responses for these network entities.

### CLI procedures

To create a Virtual MAC based traffic domain by using the CLI:

At the command prompt, type:

```
add ns trafficDomain <td> [-vmac ( ENABLED   DISABLED )]
```

- 
- show ns trafficdomain <td>

To configure a SNIP address by using the CLI:

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type SNIP -td <id>
- show ns ip <IPAddress> -td <id>

To create a service by using the CLI:

At the command prompt, type:

- add service <name> <IP> <serviceType> <port> -td <id>
- show service <name> -td <id>

To create a load balancing virtual server and bind services to it by using the CLI:

At the command prompt, type:

- add lb vserver <name> <serviceType> <IPAddress> <port> -td <id>
- bind lb vserver <name> <serviceName>
- show lb vserver <name> -td <id>

### Example:

```
1 > add ns trafficDomain 1 -vmac ENABLED
2 Done
3 > add ns trafficDomain 2 -vmac ENABLED
4 Done
5
6 > add ns ip 192.0.2.5 255.255.255.0 -type -SNIP -td 1
7 Done
8 > add service SVC-S1-TD1 192.0.2.10 HTTP 80 -td 1
9 Done
10 > add service SVC-S2-TD1 192.0.2.20 HTTP 80 -td 1
11 Done
12 > add lb vserver LBVS-TD1 HTTP 203.0.113.15 80 -td 1
13 Done
14 > bind lb vserver LBVS-TD1 SVC-S1-TD1
15 Done
16 > bind lb vserver LBVS-TD1 SVC-S2-TD1
17 Done
18
19 > add ns ip 192.0.2.6 255.255.255.0 -type -SNIP -td 2
20 Done
21 > add service SVC-S3-TD2 192.0.2.30 HTTP 80 -td 2
22 Done
23 > add service SVC-S4-TD2 192.0.2.40 HTTP 80 -td 2
24 Done
25 > add lb vserver LBVS-TD2 HTTP 203.0.113.16 80 -td 1
26 Done
27 > bind lb vserver LBVS-TD2 SVC-S3-TD2
28 Done
29 > bind lb vserver LBVS-TD2 SVC-S4-TD2
30 Done
31 <!--NeedCopy-->
```

## GUI procedures

To create a Virtual MAC based traffic domain by using the GUI:

1. Navigate to System > Network > Interfaces.
2. In the details pane, click Add.
3. On the Create Traffic Domain page, set the following parameters:
  - Traffic Domain ID\*
  - Enable Mac
4. Click Create.

To configure a SNIP address by using the GUI:

1. Navigate to System > Network > IPs > IPv4
2. Navigate to Network > IPs > IPv4
3. In the details pane, click Add
4. In the Create IP page, set the following parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
  - IP Address
  - Netmask
  - IP Type
  - Traffic Domain ID
5. Click Create.

To create a service by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, click Add.
3. In the Basic Settings Page, set the following parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
  - Service Name
  - Server
  - Protocol
  - Port
  - Traffic Domain ID
4. Click Continue, and click Done.
5. Repeat steps 2-4 to create another service.
6. Click Close.

To create a load balancing virtual server and bind services to it by using the GUI:

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the Load Balancing Virtual Servers pane, click Add.
3. In the Create Virtual Servers (Load Balancing) dialog box, set the following parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
  - Name
  - IP Address
  - Protocol
  - Port
  - Traffic Domain ID
4. Click Continue, on the Service Pane, click >.
5. On the Service page, click Insert, and then select the check box for the services that you want to bind to the virtual server.
6. Click Continue, and click Done.

7. Repeat steps 2-5 to create another virtual server

## VXLAN

September 21, 2020

Citrix ADC appliances support Virtual eXtensible Local Area Networks (VXLANs). A VXLAN overlays Layer 2 networks onto a layer 3 infrastructure by encapsulating Layer-2 frames in UDP packets. Each overlay network is known as a VXLAN Segment and is identified by a unique 24-bit identifier called the VXLAN Network Identifier (VNI). Only network devices within the same VXLAN can communicate with each other.

VXLANs provide the same Ethernet Layer 2 network services that VLANs do, but with greater extensibility and flexibility. The two main benefits of using VXLANs are the following:

- **Higher scalability.** Server virtualization and cloud computing architectures have dramatically increased the demand for isolated Layer 2 networks in a datacenter. The VLAN specification uses a 12-bit VLAN ID to identify a Layer 2 network, so you cannot scale beyond 4094 VLANs. That number can be inadequate when the requirement is for thousands of isolated Layer 2 networks. The 24-bit VNI accommodates up to 16 million VXLAN segments in the same administrative domain.
- **Higher flexibility.** Because VXLAN carries Layer 2 data frames over Layer 3 packets, VXLANs extend L2 networks across different parts of a datacenter and across geographically separated datacenters. Applications that are hosted in different parts of a datacenter and in different datacenters but are part of the same VXLAN appear as one contiguous network.

### How VXLANs Work

VXLAN Segments are created between VXLAN Tunnel End Points (VTEPs). VTEPs support the VXLAN protocol and perform VXLAN encapsulation and decapsulation. You can think of a VXLAN segment as a tunnel between two VTEPs, where one VTEP encapsulates a Layer2 frame with a UDP header and an IP header and sends it through the tunnel. The other VTEP receives and decapsulates the packet to get the Layer 2 frame. A Citrix ADC is one example of a VTEP. Other examples are third-party hypervisors, VXLAN aware virtual machines, and VXLAN capable switches.

The following illustration displays virtual machines and physical servers connected through VXLAN tunnels.

The following illustration displays the format of a VXLAN packet.

VXLANs on a Citrix ADC use a Layer 2 mechanism for sending broadcast, multicast, and unknown unicast frames. A VXLAN supports the following modes for sending these L2 frames.

- **Unicast mode:** In this mode, you specify the IP addresses of VTEPs while configuring a VXLAN on a Citrix ADC. The Citrix ADC sends broadcast, multicast, and unknown unicast frames over Layer 3 to all VTEPs of this VXLAN.
- **Multicast mode:** In this mode, you specify a multicast group IP address while configuring a VXLAN on a Citrix ADC. Citrix ADCs do not support Internet Group Management Protocol (IGMP) protocol. Citrix ADCs rely on the upstream router to join a multicast group, which shares a common multicast group IP address. The Citrix ADC sends broadcast, multicast, and unknown unicast frames over Layer 3 to the multicast group IP address of this VXLAN.

Similar to a Layer 2 bridge table, Citrix ADCs maintain VXLAN mapping tables based on the inner and outer header of the received VXLAN packets. This table maps remote host MAC addresses to VTEP IP addresses for a particular VXLAN. The Citrix ADC uses the VXLAN mapping table to look up the destination MAC address of a Layer 2 frame. If an entry for this MAC address is present in the VXLAN table, the Citrix ADC sends the Layer 2 frame over Layer 3, using the VXLAN protocol, to the mapped VTEP IP address specified in the mapping entry for a VXLAN.

Because VXLANs function similarly to VLANs, most of the Citrix ADC features that support VLAN as a classification parameter support VXLAN. These features include an optional VXLAN parameter setting,

which specifies the VXLAN VNI.

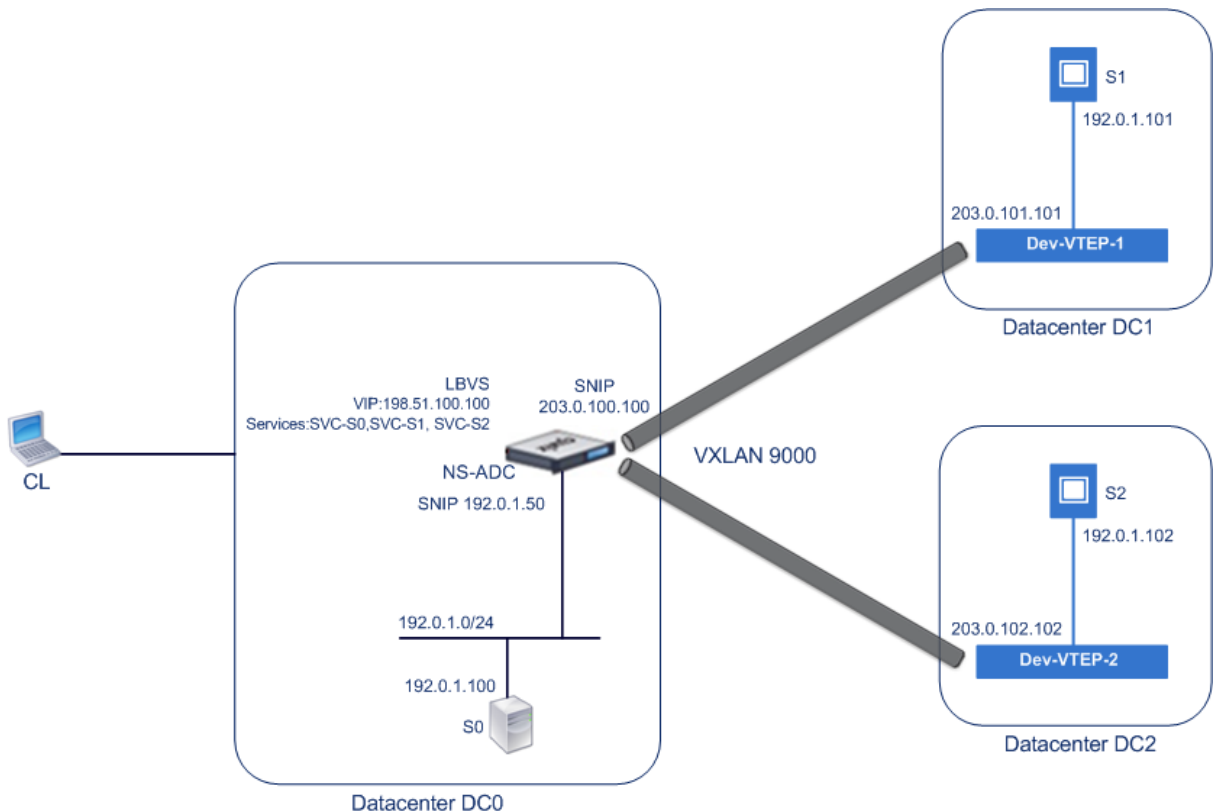

In a high availability (HA) configuration, the VXLAN configuration is propagated or synchronized to the secondary node.

### VXLAN Use Case: Load Balancing across Datacenters

To understand the VXLAN functionality of a Citrix ADC, consider an example in which Example Corp hosts a site at [www.example.com](http://www.example.com). To ensure application availability, the site is hosted on three servers, S0, S1, and S2. A load balancing virtual server, LBVS, on Citrix ADC NS-ADC is used to load balance these servers. S0, S1, and S2 reside in datacenters DC0, DC1, and DC2, respectively. In DC0, server S0 is connected to NS-ADC.

S0 is a physical server, and S1 and S2 are virtual machines (VMs). S1 runs on virtualization host device Dev-VTEP-1 in datacenter DC1, and S2 runs on host device Dev-VTEP-2 in DC2. NS-ADC, Dev-VTEP-1, and Dev-VTEP-2 support the VXLAN protocol.

S0, S1, and S2 are part of the same private subnet, 192.0.1.0/24. S0, S1, and S2 be part of a common broadcast domain, VXLAN 9000 is configured on NS-ADC, Dev-VTEP-1, and Dev-VTEP-2. Servers S1 and S2 are made part of VXLAN9000 on Dev-VTEP-1 and Dev-VTEP-2, respectively.

The following table lists the settings used in this example:

[VXLAN settings.](#)

Services SVC-S0, SVC-S1, and SVC-S2 on NS-ADC represent S0, S1, and S2. As soon as these services are configured, NS-ADC broadcasts ARP requests for S0, S1, and S2 to resolve IP-to-MAC mapping. These ARP requests are also sent over VXLAN 9000 to Dev-VTEP-1 and Dev-VTEP-2.

Following is the traffic flow for resolving the ARP request for S2:

1. NS-ADC broadcasts an ARP request for S2 to resolve IP-to-MAC mapping. This packet has:
  - Sourced IP address = Subnet IP address SNIP-for-Servers (192.0.1.50)
  - Source MAC address = MAC address of the NS-ADC's interface from which the packet is sent out = NS-MAC-1
2. NS-ADC prepares the ARP packet to be sent over the VXLAN 9000 by encapsulating the packet with following headers:
  - VXLAN header with an ID (VNI) of 9000
  - Standard UDP header, UDP checksum set to 0x0000, and destination port set to 4789.
3. NS-ADC sends the resulting encapsulated packet to Dev-VTEP-1 and Dev-VTEP-2 on VXLAN-9000. The encapsulated packet has:
  - Source IP address = SNIP-VTEP-0 (203.0.100.100).
4. Dev-VTEP-2 receives the UDP packet and decapsulates the UDP header, from which Dev-VTEP-2 learns that the packet is a VXLAN related packet. Dev-VTEP-2 then decapsulates the VXLAN header and learns the VXLAN ID of the packet. The resulting packet is the ARP request packet for S2, which is same as in step 1.
5. From the inner and outer header of the VXLAN packet, Dev-VTEP-2 makes an entry in its VXLAN mapping table that shows the mapping of MAC address (NS-MAC-1) and SNIP-VTEP-0 (203.0.100.100) for VXLAN9000.
6. Dev-VTEP-2 sends the ARP packet to S2. S2's response packet reaches Dev-VTEP-2. Dev-VTEP-2 performs a lookup in its VXLAN mapping table and gets a match for the destination MAC address NS-MAC-1. The Dev-VTEP-2 now knows that NS-MAC-1 is reachable through SNIP-VTEP-0 (203.0.100.100) over VXLAN 9000.
7. S2 responds with its MAC address (MAC-S2). The ARP response packet has:
  - Destination IP address = Subnet IP address SNIP-for-Servers (192.0.1.50)
  - Destination MAC address = NS-MAC-1
8. S2's response packet reaches Dev-VTEP-2. Dev-VTEP-2 performs a lookup in its VXLAN mapping table and gets a match for the destination MAC address NS-MAC-1. The Dev-VTEP-2 now knows that NS-MAC-1 is reachable through SNIP-VTEP-0 (203.0.100.100) over VXLAN 9000. Dev-VTEP-2 encapsulates the ARP response with VXLAN and UDP headers, and sends the resultant packet to SNIP-VTEP-0 (203.0.100.100) of NS-ADC.
9. NS-ADC on receiving the packet, decapsulates the packet by removing the VXLAN and UDP headers. The resultant packet is S2's ARP response. NS-ADC updates its VXLAN mapping table for S2's MAC address (MAC-S2) with Dev-VTEP-2's IP address (203.0.102.102) for VXLAN 9000. NS-ADC also updates its ARP table for S2's IP address (192.0.1.102) with S2's MAC address (MAC-S2).

Following is the traffic flow for load balancing virtual server LBVS in this example:

1. Client CL sends a request packet to LBVS of NS-ADC. The request packet has:
  - Source IP address = IP address of client CL (198.51.100.90)
  - Destination IP address = IP address (VIP) of LBVS = 198.51.110.100
2. LBVS of NS-ADC receives the request packet, and its load balancing algorithm selects server S2 of datacenter DC2.
3. NS-ADC processes the request packet, changing its destination IP address to the IP address of S2 and its source IP address to one of the Subnet IP (SNIP) addresses configured on NS-ADC. The request packet has:
  - Source IP address = Subnet IP address on NS-ADC= SNIP-for-Servers (192.0.1.50)
  - Destination IP address = IP address of S2 (192.0.1.102)
4. NS-ADC finds a VXLAN mapping entry for S2 in its bridge table. This entry indicates that S2 is reachable through Dev-VTEP-2 over VXLAN 9000.
5. NS-ADC prepares the packet to be sent over the VXLAN 9000 by encapsulating the packet with following headers:
  - VXLAN header with an ID (VNI) of 9000
  - Standard UDP header, UDP checksum set to 0x0000, and destination port set to 4789.
6. NS-ADC sends the resulting encapsulated packet to Dev-VTEP-2. The request packet has:
  - Source IP address = SNIP address = SNIP-VTEP-0 (203.0.100.100)
  - Destination IP address = IP address of Dev-VTEP-2 (203.0.102.102)
7. Dev-VTEP-2 receives the UDP packet and decapsulates the UDP header, from which Dev-VTEP-2 learns that the packet is a VXLAN related packet. Dev-VTEP-2 then decapsulates the VXLAN header and learns the VXLAN ID of the packet. The resulting packet is the same packet as in step 3.
8. Dev-VTEP-2 then forwards the packet to S2.
9. S2 processes the request packet and sends the response to the SNIP address of NS-ADC. The response packet has:
  - Source IP address = IP address of S2 (192.0.1.102)
  - Destination IP address = Subnet IP address on NS-ADC= SNIP-for-Servers (192.0.1.50)
10. Dev-VTEP-2 encapsulates the response packet in the same way that NS-ADC encapsulated the request packet in steps 4 and 5. Dev-VTEP-2 then sends the encapsulated UDP packet to SNIP address SNIP-for-Servers (192.0.1.50) of NS-ADC.
11. NS-ADC, upon receiving the encapsulated UDP packet, decapsulates the packet by removing the UDP and VXLAN headers in the same way that Dev-VTEP-2 decapsulated the packet in step 7. The resultant packet is the same response packet as in step 9.
12. NS-ADC then uses the session table for load balancing virtual server LBVS, and forwards the response packet to client CL. The response packet has:
  - Source IP address = IP address of client CL (198.51.100.90)
  - Destination IP address = IP address (VIP) of LBVS (198.51.110.100)

## Points to Consider for Configuring VXLANs

Consider the following points before configuring VXLANs on a Citrix ADC:

- A maximum of 2048 VXLANs can be configured on a Citrix ADC.
- VXLANs are not supported in a cluster.
- Link-local IPv6 addresses cannot be configured for each VXLAN.
- Citrix ADCs do not support Internet Group Management Protocol (IGMP) protocol to form a multicast group. Citrix ADCs rely on the IGMP protocol of its upstream router to join a multicast group, which share a common multicast group IP address. You can specify a multicast group IP address while creating VXLAN bridge table entries but the multicast group must be configured on the upstream router. The Citrix ADC sends broadcast, multicast, and unknown unicast frames over Layer 3 to the multicast group IP address of this VXLAN. The upstream router then forwards the packet to all the VTEPs that are part of the multicast group.

- VXLAN encapsulation adds an overhead of 50 bytes to each packet:

Outer Ethernet Header (14) + UDP header (8) + IP header (20) + VXLAN header (8) = 50 bytes

To avoid fragmentation and performance degradation, you must adjust the MTU settings of all network devices in a VXLAN pathway, including the VXLAN VTEP devices, to handle the 50 bytes of overhead in the VXLAN packets.

Important: Jumbo frames are not supported on the Citrix ADC VPX virtual appliances, Citrix ADC SDX appliances, and Citrix ADC MPX 15000/17000 appliances. These appliances support an MTU size of only 1500 bytes and cannot be adjusted to handle the 50 bytes overhead of VXLAN packets. VXLAN traffic might be fragmented or suffer performance degradation, if one of these appliances is in the VXLAN pathway or acts as a VXLAN VTEP device.

- On Citrix ADC SDX appliances, VLAN filtering does not work for VXLAN packets.
- You cannot set a MTU value on a VXLAN.
- You cannot bind interfaces to a VXLAN.

## Configuration Steps

Configuring a VXLAN on a Citrix ADC appliance consists of the following tasks.

- **Add a VXLAN entity.** Create a VXLAN entity uniquely identified by a positive integer, which is also called the VXLAN Network Identifier (VNI). In this step, you can also specify the destination UDP port of remote VTEP on which the VXLAN protocol is running. By default, the destination UDP port parameter is set to 4789 for the VXLAN entity. This UDP port setting must match the settings on all remote VTEPs for this VXLAN. You can also bind VLANs to this VXLAN. The traffic (which includes broadcasts, multicasts, unknown unicasts) of all bound VLANs are allowed over

this VXLAN. If no VLANs are bound to the VXLAN, the Citrix ADC allows traffic of all VLANs, on this VXLAN, that are not part of any other VXLANs.

- **Bind the local VTEP IP address and to the VXLAN entity.** Bind one of the configured SNIP address to the VXLAN to source outgoing VXLAN packets.
- **Add a bridgetable entry.** Add a bridgetable entry specifying the VXLAN ID and the remote VTEP IP address for the VXLAN to be created.
- **(Optional) Bind different feature entities to the configured VXLAN.** VXLANs function similarly to VLANs, most of the Citrix ADC features that support VLAN as a classification parameter also support VXLAN. These features include an optional VXLAN parameter setting, which specifies the VXLAN VNI.
- **(Optional) Display the VXLAN mapping table.** Display the VXLAN mapping table, which includes mapping entries for remote host MAC address to VTEP IP address for a particular VXLAN. In other words, a VXLAN mapping states that a host is reachable through the VTEP on a particular VXLAN. The Citrix ADC learns VXLAN mappings and updates its mapping table from the VXLAN packets it receives. The Citrix ADC uses the VXLAN mapping table to lookup for the destination MAC address of a Layer 2 frame. If an entry for this MAC address is present in the VXLAN table, the Citrix ADC sends the Layer 2 frame over Layer 3, using the VXLAN protocol, to the mapped VTEP IP address specified in the mapping entry for a VXLAN.

### CLI procedures

To add a VXLAN entity by using CLI:

At the command prompt, type

- **add vxlan** <id>
- **show vxlan** <id>

To bind the local VTEP IP address to the VXLAN by using CLI:

At the command prompt, type

- **bind vxlan** <id> -SrcIP <IPAddress>
- **show vxlan** <id>

To add a bridgetable by using CLI:

At the command prompt, type

- **add bridgetable -mac** <macaddress> -vxlan <ID> -vtep <IPAddress>
- **show bridgetable**

To display the VXLAN forwarding table by using the command line:

At the command prompt, type:

- **show bridgetable**

## GUI procedures

To add a VXLAN entity and bind a local VTEP IP address by using the GUI:

Navigate to **System > Network > VXLANs**, and add a new VXLAN entity or modify an existing VXLAN entity.

To add a bridgetable by using the GUI:

Navigate to **System > Network > Bridge Table**, set the following parameters while adding or modifying a VXLAN bridge table entry:

- MAC
- VTEP
- VXLAN ID

To display the VXLAN forwarding table by using the GUI:

Navigate to **System > Network > Bridge Table**.

```
1 Example
2 > add vxlan 9000
3 Done
4 > bind vxlan 9000 -srcIP 203.0.100.100
5
6 Done
7 > add bridgetable -mac 00:00:00:00:00:00 -vxlan 9000 -vtep
   203.0.101.101
8
9 Done
10 > add bridgetable -mac 00:00:00:00:00:00 -vxlan 9000 -vtep
   203.0.102.102
11
12 Done
```

## Support of IPv6 Dynamic Routing Protocols on VXLANs

The Citrix ADC appliance supports IPv6 dynamic routing protocols for VXLANs. You can configure various IPv6 Dynamic Routing protocols (for example, OSPFv3, RIPng, BGP) on VXLANs from the VTYSH command line. An option IPv6 Dynamic Routing Protocol has been added to VXLAN command set for enabling or disabling IPv6 dynamic routing protocols on a VXLAN. After enabling IPv6 dynamic routing protocols on a VXLAN, processes related to the IPv6 dynamic routing protocols are required to be started on the VXLAN by using the VTYSH command line.

To enable IPv6 Dynamic routing protocols on a VXLAN by using the CLI:

- **add vxlan <ID> [-ipv6DynamicRouting ( ENABLED | DISABLED )]**

- **show vxlan**

```
1 In the following sample configuration, VXLAN-9000 is created and has
  IPv6 dynamic routing protocols enabled on it. Then, using the VTYSH
  command line, process for the IPv6 OSPF protocol is started on the
  VXLAN.
2
3 > add vxlan 9000 -ipv6DynamicRouting ENABLED
4
5 Done
6 > bind vxlan 9000 -srcIP 203.0.100.100
7
8 Done
9 > add bridgetable -mac 00:00:00:00:00:00 -vxlan 9000 -vtep
  203.0.101.101
10
11 Done
12 > VTYSH
13 NS# configure terminal
14 NS(config)# ns IPv6-routing
15 NS(config)# interface VXLAN-9000
16 NS(config-if)# ipv6 router OSPF area 3
```

## Extending VLANs from Multiple Enterprises to a Cloud using VXLAN-VLAN Maps

CloudBridge Connector tunnels is used to extend an enterprise's VLAN to a cloud. VLANs extended from multiple enterprises can have overlapping VLAN IDs. You can isolate each enterprise's VLANs, by mapping them to a unique VXLAN in the cloud. On a Citrix ADC appliance, which is the CloudBridge connector endpoint in the cloud, you can configure a VXLAN-VLAN map that links an enterprise's VLANs to a unique VXLAN in the cloud. VXLANs support VLAN tagging for extending multiple VLANs of an enterprise from CloudBridge Connector to the same VXLAN.

Perform the following tasks for extending VLANs of multiple enterprises to a cloud:

1. Create a VXLAN-VLAN map.
2. Bind the VXLAN-VLAN map to a network bridge based or PBR based CloudBridge Connector tunnel configuration on the Citrix ADC appliance on cloud.
3. (Optional) Enable VLAN tagging in a VXLAN configuration.

### CLI procedures

To add a VXLAN-VLAN map by using the CLI:

- **add vxlanVlanMap** <name>

- **show vxlanVlanMap** <name>

To bind a VXLAN and VLANS to a VXLAN-VLAN map by using the CLI:

- **bind vxlanVlanMap** <name> [-vxlan <positive\_integer> -vlan <int[-int]> ...]
- **show vxlanVlanMap** <name>

To bind a VXLAN-VLAN map to a network bridge based CloudBridge Connector tunnel by using the CLI:

At the command prompt, type one of the following sets of commands.

if adding a new network bridge:

- **add netbridge** <name> [-vxlanVlanMap <string>]
- **show netbridge** <name>

if reconfiguring an existing network bridge:

- **set netbridge** <name> [-vxlanVlanMap <string>]
- **show netbridge** <name>

To bind a VXLAN-VLAN map to a PBR based CloudBridge Connector tunnel by using the CLI:

At the command prompt, type one of the following sets of commands.

if adding a new PBR:

- **add pbr** <name> **ALLOW** (-ipTunnel <ipTunnelName> [-vxlanVlanMap <name>])
- **show pbr** <name>

if reconfiguring an existing PBR:

- **set pbr** <name> **ALLOW** (-ipTunnel <ipTunnelName> [-vxlanVlanMap <name>])
- **show pbr** <name>

To include VLAN tags in packets related to a VXLAN by using the CLI:

At the command prompt, type one of the following sets of commands.

if adding a new VXLAN:

- **add vxlan** <vnid> -vlanTag (**ENABLED** | **DISABLED**)
- **show vxlan** <vnid>

if reconfiguring an existing VXLAN:

- **set vxlan** <vnid> -vlanTag (**ENABLED** | **DISABLED**)
- **show vxlan** <vnid>

## GUI procedures

To add a VXLAN-VLAN map by using the GUI:

Navigate to **System > Network > VXLAN VLAN Map**, add a VXLAN VLAN map.

To bind a VXLAN-VLAN map to a netbridge based CloudBridge Connector tunnel by using the GUI:

Navigate to **System > CloudBridge Connector > Network Bridge**, select a VXLAN-VLAN map from the **VXLAN VLAN** drop down list while adding a new network bridge, or reconfiguring an existing network bridge.

To bind a VXLAN-VLAN map to a PBR based CloudBridge Connector tunnel by using the GUI:

Navigate to **System > Network > PBRs**, on the Policy Based Routing (PBRs) tab, select a **VXLAN-VLAN** map from the **VXLAN VLAN** drop down list while adding a new PBR, or reconfiguring an existing PBR.

To include VLAN tags in packets related to a VXLAN by using the GUI:

Navigate to **System > Network > VXLANs**, enable **Inner VLAN Tagging** while adding a new VXLAN, or reconfiguring an existing VXLAN.

```
1 > add vxlanVlanMap VXLANVLAN-DC1
2
3 Done
4
5 > bind vxlanvlanmap VXLANVLAN-DC1 -vxlan 3000 -vlan 3
6
7 Done
8
9 > bind vxlanvlanmap VXLANVLAN-DC1 -vxlan 3500 -vlan 4
10
11 Done
12
13 >add vxlanVlanMap VXLANVLAN-DC2
14
15 Done
16
17 > bind vxlanvlanmap VXLANVLAN-DC1 -vxlan 8000 -vlan 3 4
18
19 Done
20
21 > set pbr PBR-CBC-DC-1-CLOUD ALLOW -ipTunnel CBC-DC-1-CLOUD -
    vxlanVlanMap VXLANVLAN-DC1
22
23 Done
24
25 > set pbr PBR-CBC-DC-2-CLOUD ALLOW -ipTunnel CBC-DC-2-CLOUD -
    vxlanVlanMap VXLANVLAN-DC2
26
27 Done
```

## Priority Load Balancing

September 21, 2020

The priority load balancing feature enables you to assign a priority number for each of the services or service groups that are bound to a priority load balancing virtual server. A service or a service group with the lowest number has the highest priority. The application traffic is distributed only to this service or a service group as long as this service or the service group is UP. The service or the service group that is assigned the next priority number becomes operational only when all the services or members in the service group with the highest priority are DOWN. However, when any of the services or a member in the service group with the highest priority becomes available again, the traffic is redirected to that service or the service group.

For example, consider the service groups SVG1, SVG2, and SVG3 that are bound to a priority load balancing virtual server. The maximum number of priority groups is set to three. You assign the priority for each group as follows:

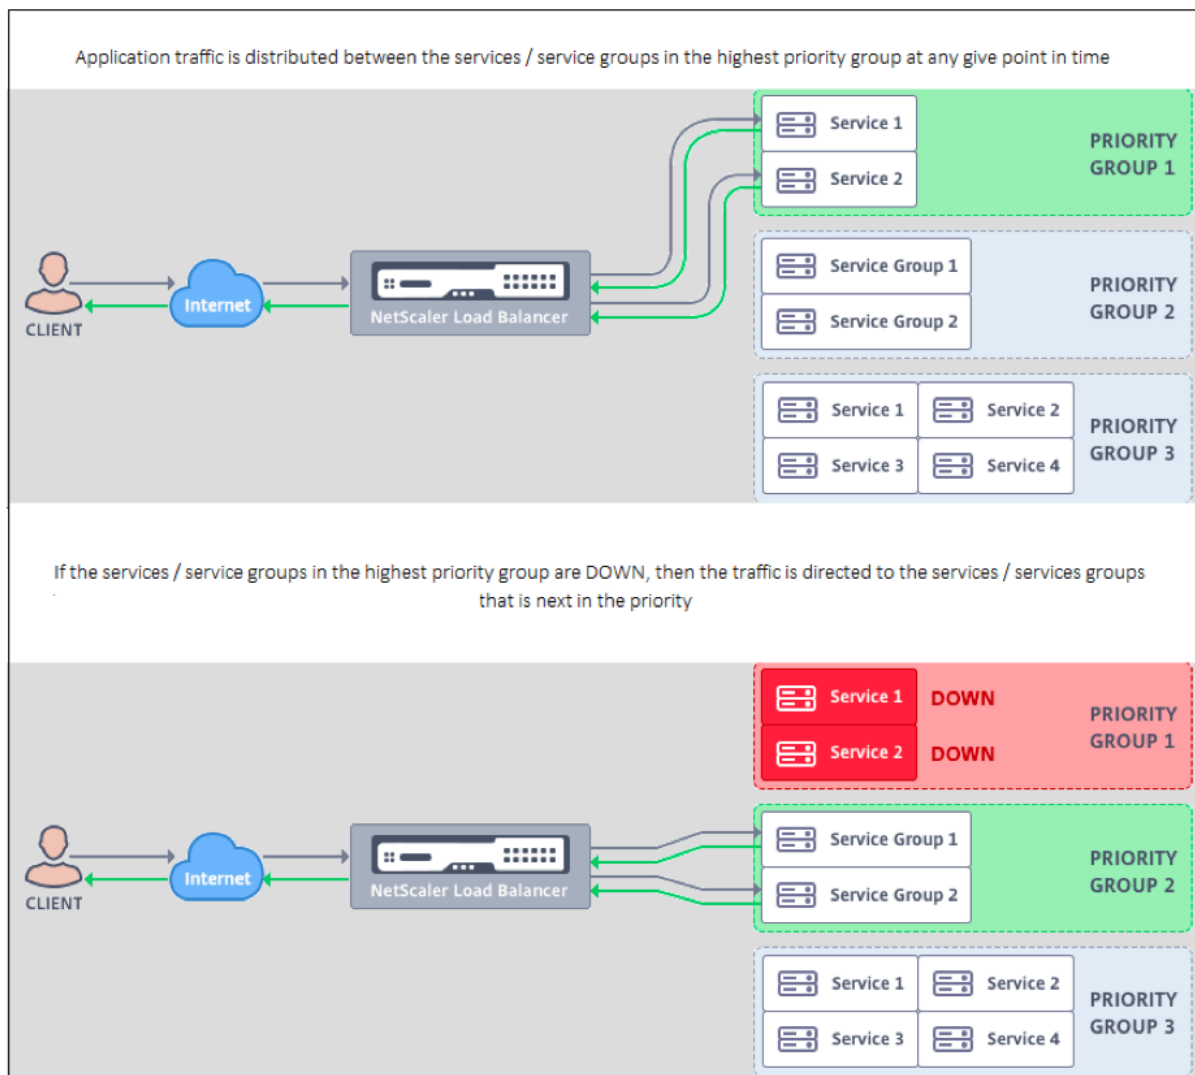

- SVG1 – priority 1
- SVG2 – priority 2
- SVG3 – priority 3

In this scenario, the application traffic is directed to service group SVG1 because this group is assigned the lowest priority number. If all the members in SVG1 are DOWN, the traffic is distributed to service group SVG2 as this group is assigned the next lower priority number. If all the members in SVG2 are also DOWN, the traffic is distributed to SVG3. However, when any of the members in SVG1 is UP, the traffic is redirected to SVG1 because SVG1 is assigned the lowest number and has the highest priority.

Assigning priorities to a service or a service group enables you to upgrade the specific service or service group that has the highest priority, whenever required with minimal or no impact to the production traffic.

Also, if the upgrade is not successful, you can safely switch to the service or the service group that is next in the priority, with minimal or no impact to the production traffic.

The following figure illustrates the priority load balancing feature.

## To configure priority load balancing

### Note

The Citrix ADC priority load balancing configuration is supported only through the GUI. You cannot configure priority load balancing by using the CLI.

1. Navigate to **Traffic Management > Priority Load Balancing > Virtual Servers** and specify the protocol for the virtual server, the IP address, and the port number of the virtual server.
2. In the **Maximum Priority Groups** box, enter the number of priority services or the service groups that can be bound to this virtual server. Default value is 2, and the maximum priority that can be set is 10. This parameter is noneditable after it is configured.

### Note:

After you specify the maximum number of priority groups and click **OK**, a content switching vir-

tual server and “n” number of backup load balancing virtual servers are created. The alphabet “n” represents the maximum number of priority groups.

For example, if you have entered the virtual server name as vs1, and have set the maximum priority group as 5, then a content switching virtual server with the name `_Pri.LB#vs1#MaxPri=5` and the following 5 load balancing virtual servers are created.

- `_Pri.LB#vs1#MaxPri=5_LB1`
- `_Pri.LB#vs1#MaxPri=5_LB2`
- `_Pri.LB#vs1#MaxPri=5_LB3`
- `_Pri.LB#vs1#MaxPri=5_LB4`
- `_Pri.LB#vs1#MaxPri=5_LB5`

3. After you specify the maximum number of priority groups and click **OK**, you are prompted to choose the services or service groups that must be bound to this content switching virtual server.

- To bind services to the virtual server, click **Insert** in the Services section. Next, either select an existing service or create a service and set the priority for this service. Also, set the priority number at which this service should be bound.
- To bind service groups to the virtual server, click **Insert** in the Service Groups section. Next, either select an existing service group or create a service group and set the priority for this service group. Also, set the priority number at which this service group should be bound.

Repeat step 3, depending on the maximum number of priority groups that you have entered.

**Note:**

- The service or the service group with the highest priority is bound to the load balancing virtual server that represents the highest priority.

For example, if you have assigned priority 1 and 2 to service groups SG\_App1 and SG\_App2 respectively, then SG\_App1 is bound to virtual server `_Pri.LB#vs1#MaxPri=5_LB1` and SG\_App2 is bound to virtual server `_Pri.LB#vs1#MaxPri=5_LB2` created in step 2.

- To change the priority of the service group or service, click the edit icon in the Priority Load Balancing Virtual Server page and change the priority as required.
- You cannot set the load balancing methods and persistence for each virtual server explicitly, because the configuration of all load balancing virtual servers is identical.

4. From the **Advanced Setting** sections, complete the other configuration that meets your requirement.

**Important**

The entities created during priority load balancing configuration must not be modified from other tabs in the GUI and also from the CLI. It is recommended that you modify the priority load

balancing entities from the Priority Load Balancing tab only.

## Citrix ADC Extensions

September 21, 2020

Citrix ADC extensions can be used to customize a Citrix ADC appliance by writing extension code. Presently, policy extensions and protocol extensions are supported. Policy extensions can be used to extend the policy language. Protocol extensions can be used to add support for custom protocols on a Citrix ADC appliance.

This document includes the following information:

- [Citrix ADC Extensions - Language Overview](#)
- [Citrix ADC Extensions - Library Reference](#)
- [Citrix ADC Extensions API Reference](#)
- [Protocol Extensions](#)
- [Policy Extensions](#)

## Citrix ADC extensions - language overview

September 21, 2020

The extension language is based on the Lua 5.2 programming language. Lua provides a compact execution engine with good performance that is designed for embedding in C programs, like Citrix ADC software.

The extension language is dynamically typed, which means each object carries its own type information. Any variable can hold any type at any time during execution, so variable types are not declared.

The language is also free form, where white space between tokens is ignored. Statements may be separated by semicolons, but that is not required and usually not done. Blocks of statements are typically terminated by end. There are no brackets around blocks like the { and } in C or Java.

Identifiers are sequences of letters (a through z and A through Z), digits (0 through 9), and underscores (\_), not starting in a digit. Identifiers are case-sensitive, so var, VAR, and Var are all different identifiers.

Comments are started by -. Everything after - is ignored to the end of the line. Example:

```
-- This is a comment.
```

## Simple types

September 21, 2020

The language allows values of the following simple types:

- Numbers
- Strings
- Boolean
- Nil
- Other Types

### Numbers

All numbers (even integers) are represented by IEEE 754 floating point values. Integers up to  $2^{54}$  have exact representations. Numeric values can be represented by:

- Signed and unsigned decimal integers (examples: 10, -5)
- Real numbers with decimal points (10.5, 3.14159)
- Real numbers with exponents (1.0e+10)
- Hexadecimals (0xffff0000)

Citrix ADC policy expressions have three numeric types:

- 32-bit integers (`num_at`)
- 64-bit integers (`unsigned_long_at`)
- 64-bit floating point (`double_at`)

All of these are converted into the number type when passed into an extension function, and numbers are converted to the expected policy numeric type when returned.

### Strings

Strings are byte sequences of any length. They correspond to the policy **text\_at** type. Strings can contain null (0x00) bytes. Arbitrary binary data can be held in strings, including any character code representation (e.g. UTF-8 and full Unicode). However, string functions **likestring.upper()** assume 8-bit ASCII.

Strings are automatically allocated when used. There is no need (or even way) to explicitly allocate buffers for strings. Strings are also automatically deallocated by garbage collection when no longer in use. There is no need (or even way) to explicitly free strings. This automatic allocation and deallocation avoids some common problems in languages like C, such as memory leaks and dangling pointers.

String literals are character strings enclosed in double or single quotes. There is no difference between the two types of quotes: "a string literal" is the same as 'a string literal'. The usual backslash escaping is available: \s (bell), \b (backspace), \f (form feed), \n (newline/line feed), \t (horizontal tab), \\ (backslash), \" (double quote), and \' (single quote). Decimal byte values can be entered by a backslash and one to three digits (\d, \dd, \ddd). Hexadecimal byte values can be entered by a backslash, an x, and two hex digits (\xhh)

A special syntax call the long bracket notation can be used for long, multi-line string literals. This notation encloses the string in double square brackets with zero or more equal signs between the brackets – the idea is to come up with a combination of brackets and equals that is not in the string. No escape sequences are honored in the string. Some examples:

```
[[This is a multi-line string  
using long bracket notation.]]
```

```
[=[This is a multi-line string  
using long notation  
with [[ and ]] and  
and an unescaped in it.]=]
```

Long bracket notation can be used to make a multi-line comment. Example:

```
-[[  
This is a multi-line  
comment.  
-]]
```

## **Boolean**

The usual true and false boolean values are provided. Note that boolean values are different than number values, in contrast to C where zero is assumed to be false and any non-zero value is true.

## **Nil**

nil is a special value that means "no value". It is its own type and is not equivalent to any other value, in contrast to C where NULL is defined to be zero.

## **Other types**

There are two other types, userdata and threads. These are advanced topics and are not covered here.

## Variables

September 21, 2020

Variables hold values that may change during extension execution. Because of dynamic typing, any variable may hold values of any type. There are no type declarations for variables. Instead, a variable's type is determined at run time. In fact, the type of a variable's value may change during execution, although this is not a recommended practice. A variable initially has the value `nil`.

Variable names are identifiers, so are strings of letters, digits, and underscores not beginning in a digit. Examples: `headers`, `combined_headers`.

### Global variables

In Lua, variables that are not otherwise declared are global within the program. However, global variables are not allowed in policy extension functions, because there are multiple Packet Engines in which a function can be executed, and each Packet Engine has its own memory.

If you use a global variable in your extension, you will get a runtime error: attempt to update or create a global reported in **`/var/log/ns.log`**.

Typos in variable names are a potential problem, because the variable with the typo will be interpreted as another, global variable, and will not cause a syntax error as in language like C or Java. As noted above, you will get a runtime error instead.

### Local variables

A variable may be declared to be local to a block of statements, such as a function. This is done by local variable-name. The variable will be scoped to the block, that is, it will only exist within the block. The local declaration may optionally assign a value to the variable.

#### Examples:

```
local headers = {}
```

```
local combined_headers = {}
```

## Expressions

September 21, 2020

Expressions compute values from variable and literal values.

- Arithmetic Operations

- Relational Operations
- Logical Operations
- Concatenation
- Length
- Precedence

## Arithmetic operations

Arithmetic operations are performed on number values. If a string value is used in an arithmetic operation, it is converted to a number – if that fails, an error is returned.

---

|          |                                             |
|----------|---------------------------------------------|
| $a + b$  | add a and b                                 |
| $a - b$  | subtract b from a                           |
| $a * b$  | multiply a and b                            |
| $a / b$  | divide a by b                               |
| $a \% b$ | modulo = $a - \text{math.floor}(a/b)*b$     |
| $a ^ b$  | raise a to the b power; b can be any number |
| $-a$     | negate a                                    |

---

## Relational operations

Relational operations compare two values and return true if the relation is satisfied and false if it is not. Relational operations can be performed between values of any type. If the values are not the same type, false is returned. Numbers are compared in the usual way. Strings are compared using the collating sequence for the current locale.

---

|          |                                 |
|----------|---------------------------------|
| $a == b$ | a is equal to b                 |
| $a ~= b$ | a is not equal to b             |
| $a < b$  | a is less than b                |
| $a > b$  | a is greater than b             |
| $a <= b$ | a is less than or equal to b    |
| $a >= b$ | a is greater than or equal to b |

---

## Logical operations

Logical operations are traditionally performed on Boolean values, but in this language they can be performed on any two values. nil and false is considered false and any other value is considered true. Logical operations use short-cut evaluation, where if the first value determines the result of the operation, the second value is not evaluated.

---

|         |                                                           |
|---------|-----------------------------------------------------------|
| a and b | if a is false or nil then return a else return b          |
| a or b  | if a is not false and not nil then return a else return b |
| not a   | if a is not false or nil return false else return true    |

---

The and and or operations can be used for conditional evaluation within an expression:

---

|              |                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a or b       | can be used to provide a default value b if a is uninitialized (nil). This is useful for optional parameters in functions.                                                                                                                                   |
| a and b or c | can be used to chose non-nil b or c based on the condition a. If a is true, then a and b returns b, and b or c returns b. If a is false, then a and b returns false and false or c returns c. This is equivalent to a ? b : c in the C programming language. |

---

## Concatenation

String concatenation is `s1 .. s2`. This creates a new string large enough to hold the contents of `s1` and `s2` and copies the contents to the new string. An error results if `s1` or `s2` are not strings. Note that repeated concatenation may have considerable copying overhead. If you build a string of `n` bytes by concatenating one byte at a time, this will copy  $n*(n+1)/2$  bytes. For better performance, you can put pieces of a string to be concatenated into a table (discussed later) and then use the `table.concat()` function. An example of this is shown in the `COMBINE_HEADERS()` example.

## Length

The length of a string `s` is returned by `#s`. The `#` operator is also used with array tables, as discussed later.

## Precedence

Operator precedence determines the order in which operations are performed in an expression, with higher precedence operations done before those with lower precedence. Precedence order can as usual be overridden by parentheses. For example, in `a + b \* c`, `*` has higher precedence than `+`, so the expression is evaluated as `a + (b \* c)`.

---

|         |                                                                                                         |
|---------|---------------------------------------------------------------------------------------------------------|
| highest | <code>^</code>                                                                                          |
| -       | not # - (unary)                                                                                         |
| -       | <code>*</code> / <code>%</code>                                                                         |
| -       | <code>..</code>                                                                                         |
| -       | <code>=</code> <code>~</code> <code>&lt;</code> <code>&gt;</code> <code>&lt;=</code> <code>&gt;=</code> |
| -       | and                                                                                                     |
| lowest  | or                                                                                                      |

---

Operations with the same precedence are performed left to right (left associative), except `^` and `..` that are performed right to left (right associative). So `a^b^c` is evaluated as `a^(b^c)`.

## Assignment

September 21, 2020

The assignment statement evaluates an expression and assigns the resulting value to a variable.

```
variable = expression
```

As noted earlier, values of any type can be assigned to any variable, so the following is allowed:

```
local v1 = "a string literal"  
v1 = 10
```

An assignment statement can actually set multiple variables, using the form

```
variable1, variable2, ... = expression1, expression2, ...
```

If there are more variables than expressions, the extra variables are assigned nil. If there are more expressions than variables, the extra expression values are discarded. The expressions are all evaluated before the assignments, so this can be used to succinctly exchange the values of two variables:

```
v1, v2 = v2, v1
```

is equivalent to

```
tmp = v1
```

```
v2 = v1
```

```
v1 = tmp
```

## Tables

September 21, 2020

Tables are collections of entries with keys and values. They are the only aggregate data structure provided. All other data structures (arrays, lists, sets, and so on) are built from tables. Table keys and values can be any type, including other tables. Keys and values within the same table can mix types.

- Table Constructors
- Table Usage
- Tables as Arrays
- Tables as Records

### Table constructors

Table constructors allow you to specify a table with keys and associated values. The syntax is:

```
{[key1] = value1, [key2] = value2, ...}
```

where the keys and values are expressions. If the keys are strings that are not reserved words, the brackets and quotes around the keys can be omitted. Example:

```
{key1 = "value1", key2 = "value2", key3 = "value3"}
```

An empty table is specified simply by {}.

A table constructor may be used in an assignment to set a variable to refer to a table. Examples:

```
local t1 = {} – set t1 to an empty table
```

```
local t2 = {key1 = "value1", key2 = "value2", key3 = "value3"}
```

Note that tables themselves are anonymous. More than one variable may refer to the same table. Continuing the above example:

local t3 = t2 – both t2 and t3 refer to the same table

### Table usage

As you would expect, you can use keys to find values in a table. The syntax is table[key], where table is a table reference (typically a variable assigned a table), and key is an expression providing the key. If this is used in an expression and the key exists in the table, this returns the value associated with the key. If the key is not in the table, this returns nil. If this is used as the variable in an assignment, and the key does not exist in the table, it creates a new entry for the key and value. If the key already exists in the table, it replaces the key's value with the new value. Examples:

```
local t = {} – sets t to an empty table
t["k1"] = "v1" – creates an entry for key "k1" and value "v1"
v1 = t["k1"] – sets v1 to the value for key "k1" = "v1"
t["k1"] = "new_v1" – sets the value for key "k1" to "new_v1"
```

### Table as arrays

The traditional array can be implemented using a table with integer keys as indices. An array can have any indices, including negative ones, but the convention is to start arrays at index 1 (not 0 as is the case with languages like C and Java). There is a special purpose table constructor for such arrays:

```
{value1, value2, value3, ... }
```

Array references are then array[index].

The length operator # returns the number of elements in an array with consecutive indices starting at 1. Example:

```
local a = {"value1", "value2", "value3"}
local length = #a – sets length to the length of array a = 3
```

Arrays can be sparse, where only the defined elements are allocated. But # cannot be used on a sparse array with non-consecutive indices. Example:

```
local sparse_array = {} – set up an empty array
sparse_array[1] = "value1" – add an element at index 1
sparse_array[99] = "value99" – add an element at index 99
```

Multidimensional arrays can be set up as tables of tables. For example, a 3x3 matrix could be set up by:

```
local m = {{1, 2, 3}, {4, 5, 6}, {7, 8, 9}}
local v22 = m[2][2] – sets v22 to 5
```

## Tables as records

Records with fields can be implemented as tables with field name keys. The reference form `table.field` can be used for `table["field"]`. Examples:

```
local person = {name = "John Smith", phone = "777-777-7777"}
```

```
local name = person.name – sets name to "John Smith"
```

An array of tables can be used for a sequence of records. Example:

```
local people = {  
{name = "John Smith", phone = "777-777-7777"},  
{name = "Jane Doe", phone = "888-888-8888"}  
...  
}
```

```
name = people[2].name – sets name to "Jane Doe"
```

## Control structures

September 21, 2020

The extension function language provides the usual statements to control program execution.

- If Then Else
- While Do and Repeat Until
- Numeric For
- Break
- Goto

### If Then Else

If statements select blocks of statements to execute based on one or more conditions. There are three forms:

#### If then Form

```
1 if expression then  
2     statements to execute if expression is not false or nil  
3 end  
4 <!--NeedCopy-->
```

**If then else Form**

```
1 if expression then
2     statements to execute if expression is not false or nil
3 else
4     statements to execute if expression is false or nil
5 end
6 <!--NeedCopy-->
```

**If then elseif else Form**

```
1 if expression1 then
2     statements to execute if expression1 is not false or nil
3     elseif expression2 then
4         statements to execute if expression2 is not false or nil
5     . . .
6 else
7     statements to execute if all expressions are false or nil
8 end
9 <!--NeedCopy-->
```

**Example:**

```
1 if headers[name] then
2
3     local next_value_index = #(headers[name]) + 1
4     headers[name][next_value_index] = value
5
6 else
7
8     headers[name] = {
9     name .. ":" .. value }
10
11
12 end
13 <!--NeedCopy-->
```

**Note:**

- The expression is not enclosed in parentheses as is the case in C and Java.
- There is no equivalent to the C/Java switch statement. You have to use a series of if elseif statements to do the equivalent.

## While Do and Repeat Until

The **while** and **repeat** statements provide loops controlled by an expression.

```
1 while expression do
2     statements to execute while expression is not false or nil
3 end
4
5 repeat
6
7     statements to execute until expression is not false or nil
8
9 until expression
10 <!--NeedCopy-->
```

### Example for while:

```
1 local a = {
2     1, 2, 3, 4 }
3
4 local sum, i = 0, 1 -- multiple assignment initializing sum and i
5 while i <= #a do -- check if at the end of the array
6     sum = sum + a[i] -- add array element with index i to sum
7     i = i + 1 -- move to the next element
8 end
9 <!--NeedCopy-->
```

### Example for repeat:

```
1 sum, i = 0, 1 -- multiple assignment initializing sum and i
2 repeat
3     sum = sum + a[i] -- add array element with index i to sum
4     i = i + 1 -- move to the next element
5 until i > #a -- check if past the end of the array
6 <!--NeedCopy-->
```

Of course it is possible to write a loop that does not terminate, for example, if you omit the `i = i + 1` statement in either of these examples. When such a function is executed, Citrix ADC will detect that the function did not complete in a reasonable time and will kill it with a runtime error:

```
Cpu limit reached. Terminating extension execution in [[string "function
extension function..."]]: line line-number.
```

will be reported in `/var/log/ns.log`.

## Numeric For

There are two types of for loops. The first is the numeric for, which is similar to the usual use of the for statement in C and Java. The numeric for statement initializes a variable, tests if the variable has passed a final value, and if not executes a block of statements, increments the variable, and repeats. The syntax for the numerical for loop is:

```
for variable = initial, final, increment do
    statements in the loop body
end
```

where initial, final, and increment are all expressions that yield (or can be converted to) numbers. variable is considered to be local to the for loop statement block; it cannot be used outside of the loop. increment can be omitted; the default is 1. The expressions are evaluated once at the beginning of the loop. The terminating condition is variable > final if the increment is positive and variable < final if the increment is negative. The loop terminates immediately if the increment is 0.

Example (equivalent to the while and repeat loops in the preceding section):

```
1 sum = 0
2 for i = 1, #a do -- increment defaults to 1
3     sum = sum + a[i]
4 end
5 <!--NeedCopy-->
```

The second type of for loop is the generic for, which can be used for more flexible types of loops. It involves the use of functions, so will be discussed later after functions have been introduced.

## Break

The break statement is used inside a while, repeat, or for loop. It will terminate the loop and resume execution at the first statement after the loop. Example (also equivalent to the preceding while, repeat, and for loops):

```
1 sum, i = 0, 1
2 while true do
3     if i > #a then
4         break
5     end
6     sum = sum + a[i]
7     i = i + 1
8 end
9 <!--NeedCopy-->
```

## Goto

The goto statement can be used to jump forward or backward to a label. The label is an identifier, and its syntax is `::label::`. The goto statement is `goto label`. Example (once again equivalent to the preceding loops):

```
1 sum, i = 0, 1
2 ::start_loop::
3     if i > #a then
4         goto end_loop -- forward jump
5     end
6     sum = sum + a[i]
7     i = i + 1
8     goto start_loop -- backwards jump
9 ::end_loop::
10 . . .
11 <!--NeedCopy-->
```

There has been a long running controversy over using gotos in programming. In general, you should try to use the other control structures to make your functions more readable and reliable. But occasional judicious use of gotos may lead to better programs. In particular, gotos may be useful in handling errors.

## Functions

September 21, 2021

Functions are a basic building block of programming – they are a convenient and powerful way to group statements that perform a task. They are the interface between the Citrix ADC appliance and extension code. For policies, you define policy extension functions. For protocols, you implement callback functions for the protocol behaviors. Functions consist of function definitions that specify what values are passed into and out of the function and what statements are run for the function, and function calls, which run functions with specific input data and get results from the function.

### Protocol behavior callback functions

The TCP client behavior consists of a callback function (`on_data`) that processes TCP client data stream events. To implement Message Based Load Balancing (MBLB) for a TCP based protocol, you can add code for this callback function to process the TCP data stream from the client and parse the byte stream into protocol messages.

The callback functions in a behavior are called with a context, which is the processing module state. The context is the instance of the processing module. For example, the TCP client behavior callbacks are called with different contexts for different client TCP connections.

In addition to the context, the behavior callbacks can have other arguments. Usually the rest of the arguments are passed as payload, which is the collection of all the arguments. So, the programmable processing module instances can be seen as a combination of instance state plus an event callback functions, that is, the context plus behavior. And the traffic flows through the pipeline as an event payload.

### **Prototype of TCP client callback function:**

Function client on\_data (ctxt, payload)

```
//.code
```

```
end
```

Where,

- ctxt - TCP client processing context
- payload – an event payload
  - payload.data - TCP data received, available as a stream of bytes

### **Policy extension functions**

Since the NetScaler policy expression language is typed, the definition of an extension function must specify the types of its inputs and its return value. The **Lua function** definition has been extended to include these types:

```
1 function self-type:function-name(parameter1: parameter1-type, etc.):  
    return-type  
2 statements  
3 end  
4  
5 where,  
6  
7 the types are NSTEXT, NSNUM, NSBOOL, or NSDOUBLE.  
8 <!--NeedCopy-->
```

Self-type is the type of the implicit self-parameter that is passed into the function. When the extension function is used in a Citrix ADC policy expression, this is the value generated by the expression to the left of the function. Another way to view this is that the function extends that type in the Citrix ADC policy language.

The parameter-types are the types of each parameter specified in the extension function call in the policy expression. An extension function can have zero or more parameters.

Return-type is the type of the value returned by the extension function call. It is the input to the part of the policy expression, if any, to the right of the function, or else is the value of the expression result.

**Example:**

```
function NSTEXT:COMBINE_HEADERS(): NSTEXT
```

Use of the extension function in a policy expression:

```
HTTP.REQ.FULL_HEADER.AFTER_STR("HTTP/1.1\r\n").COMBINE_HEADERS()
```

Here the self-parameter is the result of `HTTP.REQ.FULL_HEADER.AFTER_STR("HTTP/1.1\r\n")`, which is a text value. The result of the `COMBINE_HEADERS()` call is text, and since there is nothing to the right of this call, the result of the entire expression is text.

**Local function definition**

Besides extension functions, no global functions can be defined in an extension file. But local functions can be defined within extension functions using the normal Lua function statement. This declares the name of the function and the names of its parameters (also known as arguments), and like all declarations in Lua, does not specify any types. The syntax for this is:

```
1 local function function-name(parameter1-name, parameter2-name, etc.)
2 statements
3 end
4 <!--NeedCopy-->
```

The function and parameter names are all identifiers. (The function name is actually a variable and the function statement is shorthand for `local function-name = function(parameter1, and so on)`, but you don't have to understand this subtlety to use functions.), so on is used here for continuation of the pattern of parameter names instead of the usual.... This is because... itself actually means a variable parameter list, which will not be discussed here.

**Function body and return**

The block of statements between the function and end statements is the function body. In the function body, the function parameters act like local variables, with values supplied by the function calls, as described previously.

The return statement supplies values to be returned to the caller of the function. It must appear at the end of a block (in a function, if then, for loop, and so on; It can be in its own block `do return ... end`). It may specify no, one, or more than one return values:

```
1 return -- returns nil
2 return expression -- one return value
```

```
3 return expression1, expression2, ... -- multiple return values
4 <!--NeedCopy-->
```

### Examples:

```
1 local function fsum(a)
2 local sum = 0
3 for i = 1, #a do
4 sum = sum + a[i]
5 end
6 return sum
7 end
8
9 local function fsum_and_average(a)
10 local sum = 0
11 for i = 1, #a do
12 sum = sum + a[i]
13 end
14 return sum, sum/#a
15 end
16 <!--NeedCopy-->
```

### Function calls

A function call runs the body of a function, supplying values for its parameters, and receiving results. The syntax for a function call is function-name(expression1, expression2, and so on), where the function parameters are set to the corresponding expressions. The number of expressions and parameters need not be the same. If there are fewer expressions than parameters, the remaining parameters are set to nil. So you can make one or more parameters at the end of the call optional, and your function can check if they are specified by checking if they are not nil. A common way to do this is with the `or` operation:

```
1 function f(p1, p2) -- p2 is optional
2 p2 = p2 or 0 -- if p2 is nil, set to a default of 0
3 . . .
4 end
5 <!--NeedCopy-->
```

If there are more expressions than parameters, the remaining expression values are ignored.

As noted previously, functions can return multiple values. These returns can be used in a multiple assignment statement. Example:

```
1 local my_array = {
```

```
2  1, 2, 3, 4 }
3
4  local my_sum, my_ave = sum_and_average(my_array)
5  <!--NeedCopy-->
```

## Iterator functions and generic for loops

Now that we have introduced functions, we can talk about generic for loops. The syntax for the generic for loop (with one variable) is:

```
1  for variable in iterator(parameter1, parameter2, etc.) do
2  statements in the for loop body
3  end
4  <!--NeedCopy-->
```

Where `iterator()` is a function with zero or more parameters that provide a value for a variable on each iteration of the loop body. The iterator function keeps track of where it is in the iteration using a technique called closure, which you don't have to worry about here. It signals the end of the iteration by returning `nil`. Iterator functions can return more than one value, for use in a multiple assignments.

Writing an iterator function is beyond the scope of this paper, but there are few useful built-in iterators that illustrate the concept. One is the `pairs()` iterator, which iterates through the entries in a table and returns two values, the key and the value of the next entry.

### Example:

```
1  local t = {
2    k1 = "v1", k2 = "v2", k3 = "v3" }
3
4  local a = {
5    }
6    -- array to accumulate key-value pairs
7  local n = 0 -- number of key-value pairs
8  for key, value in pairs(t) do
9    n = n + 1
10 a[n] = key .. " = " .. value -- add key-value pair to the array
11 end
12 local s = table.concat(a, "; ") -- concatenate all key-value pairs into
    one string
13 <!--NeedCopy-->
```

Another useful iterator is the `string.gmatch()` function, which will be used in the following `COMBINE_HEADERS()` example.

## Citrix ADC extensions - library reference

September 21, 2020

The list of libraries supported in policy extensions.

- Basic library
- String library
- Regular Expression Patterns - Character Classes
- Regular Expression Patterns - Pattern Items
- Table library
- Math library
- Bitwise library
- Operating System library
- Citrix ADC library

### Basic library

---

|                                    |                                                                                                                                                                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>assert(v[,message])</code>   | Issues an error, with an optional message, when <code>v</code> is false.                                                                                                                                                |
| <code>error(message)</code>        | Terminates a function and reports the error message.                                                                                                                                                                    |
| <code>ipairs(a)</code>             | Iterator for an array <code>a</code> . Returns an index and value for each iteration.                                                                                                                                   |
| <code>pairs(t)</code>              | Iterator for a table <code>t</code> . Returns a key and value for each iteration.                                                                                                                                       |
| <code>tonumber(e[,base])</code>    | Converts <code>e</code> to a number, with an optional base.                                                                                                                                                             |
| <code>tostring(v)</code>           | Converts <code>v</code> to a string                                                                                                                                                                                     |
| <code>type(v)</code>               | Returns the type of <code>v</code> : number, string, boolean, table, etc.                                                                                                                                               |
| <code>getmetatable (object)</code> | Returns nil if the object does not have a metatable. Otherwise, if the object's metatable has a " <code>__metatable</code> " field, returns the associated value. Otherwise, returns the metatable of the given object. |

|                                              |                                                                                                                                                                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>setmetatable (table, metatable)</code> | Sets the metatable for the given table. (You cannot change the metatable of other types from Lua, only from C.) If metatable is nil, removes the metatable of the given table. If the original metatable has a “__metatable” field, raises an error.                      |
| <code>select (index, ...)</code>             | Returns all arguments after argument number index. If index is string “#”, then it returns the total number of extra arguments it received.                                                                                                                               |
| <code>pcall (f [, arg1, ...])</code>         | Calls function f with the given arguments in protected mode. It returns status code as first result which tells whether call succeeded or not. If call succeeded, then along with status code it also returns all results from the call, otherwise returns error message. |
| <code>xpcall (f, msgch [, arg1, ...])</code> | This function is similar to pcall, except that it also takes an argument for error handling.                                                                                                                                                                              |
| <code>_VERSION</code>                        | Returns the current interpreter version.                                                                                                                                                                                                                                  |

---

## String library

---

|                                                    |                                                                                                                                                                                                  |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>string.byte(s[,i[,j]])</code>                | Returns the byte values for s[i] to s[j].<br>Default i = 1 and j = i                                                                                                                             |
| <code>string.char(...)</code>                      | Returns a string constructed of the integer parameters.                                                                                                                                          |
| <code>string.find(s,pattern[,init[,plain]])</code> | Looks for the first match of a regular expression pattern in s. Return the first and last indices of match or nil. init is index to start, default 1. plain = true means pattern is not a regex. |
| <code>string.format(form,...)</code>               | Returns a formatted version of the parameters.                                                                                                                                                   |
| <code>string.gmatch(s,pattern)</code>              | Iterator for searching s with the regex pattern.<br>Returns matching values.                                                                                                                     |

---

|                                              |                                                                                                                                                                     |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>string.gsub(s,pattern,repl[,n])</code> | Returns a copy of <code>s</code> in which all (or <code>n</code> ) occurrences of the pattern have been replaced by <code>repl</code> .                             |
| <code>string.len(s)</code>                   | Returns the string length.                                                                                                                                          |
| <code>string.lower(s)</code>                 | Returns a copy of the string converted to lowercase.                                                                                                                |
| <code>string.match(s,pattern[,init])</code>  | Looks for the first match of the regex pattern in <code>s</code> and returns the captures or the whole pattern. <code>init</code> is the index to start, default 1. |
| <code>string.rep(s,n[,sep])</code>           | Returns a string that is <code>n</code> copies of <code>s</code> , with separator <code>sep</code> , default no separator                                           |
| <code>string.reverse(s)</code>               | Returns a string that is <code>s</code> reversed.                                                                                                                   |
| <code>string.sub(s,i[,j])</code>             | Returns the substring of <code>s</code> from <code>s[i]</code> to <code>s[j]</code> , default <code>j</code> is the end of the string.                              |
| <code>string.upper(s)</code>                 | Returns a copy of the string converted to uppercase.                                                                                                                |
| <code>string.dump (function)</code>          | Returns a string containing a binary representation of the given function.                                                                                          |

---

## Regular expression patterns - character classes

---

---

|                 |                                                                                       |
|-----------------|---------------------------------------------------------------------------------------|
| <code>x</code>  | the character <code>x</code> , except for magic characters <code>^\$()%.[]*+-?</code> |
| <code>.</code>  | any character                                                                         |
| <code>%a</code> | any letter                                                                            |
| <code>%c</code> | any control character                                                                 |
| <code>%d</code> | any digit                                                                             |
| <code>%g</code> | any printable character except space                                                  |
| <code>%l</code> | any lowercase letter                                                                  |
| <code>%p</code> | any punctuation character                                                             |

---

---

|                     |                                                                                   |
|---------------------|-----------------------------------------------------------------------------------|
| <code>%s</code>     | any white space character                                                         |
| <code>%u</code>     | any uppercase letter                                                              |
| <code>%w</code>     | any alphanumeric letter                                                           |
| <code>%x</code>     | an escaped magic character x (for example <code>%%</code> )                       |
| <code>[set]</code>  | a set of characters: sequence of individual characters, ranges x-y, and % classes |
| <code>[^set]</code> | characters not in the set.                                                        |

---

### Regular expression patterns - pattern items

---

---

|                      |                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>X</code>       | a character class                                                                                                                        |
| <code>X*</code>      | 0 or more longest repetitions of characters in X                                                                                         |
| <code>X+</code>      | 1 or more repetitions of characters in X                                                                                                 |
| <code>X-</code>      | 0 or more shortest repetitions of characters in X                                                                                        |
| <code>X?</code>      | 0 or 1 character in X                                                                                                                    |
| <code>%n</code>      | n=1 to 9; matches nth captured string                                                                                                    |
| <code>%bxy</code>    | matches substring between two balanced characters x and y. Example <code>%b()</code> matches substring between two balanced parentheses. |
| <code>%f[set]</code> | matches an empty string at any position such that the next character belongs to set and the previous character does not belong to set.   |

---

A pattern is a sequence of pattern items. `^pattern` matches the beginning of a string and `pattern$` matches the end of the string.

Matched substrings can be captured using `(pattern)`. Parentheses with no pattern `()` capture the current string position (a number).

### Table library

---

---

|                                              |                                                                                                                                                                                                                      |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table.concat(list[,sep[,i[,j]])</code> | Returns a string <code>list[i] .. sep .. list[i+1] .. sep . . . list[j]</code> . Default <code>sep</code> is the empty string. Default <code>i</code> is 1, <code>j</code> is <code>#list</code> .                   |
| <code>table.insert(list[,pos,]value)</code>  | Inserts <code>value</code> into <code>list</code> at index <code>pos</code> . Default for <code>pos</code> is <code>#list</code> (end of the list).                                                                  |
| <code>table.pack(...)</code>                 | Returns an array containing the parameters starting at index 1, and a key <code>n</code> with the total number of parameters.                                                                                        |
| <code>table.remove(list[,pos])</code>        | Removes from <code>list</code> the element at position <code>pos</code> , shifting elements to fill the position. Returns the removed element. Default for <code>pos</code> is <code>#list</code> (end of the list.) |
| <code>table.sort(list[,comp])</code>         | Sort the elements of <code>list</code> in place. <code>comp</code> is the comparison function to use. Default for <code>comp</code> is <code>&lt;</code> .                                                           |
| <code>table.unpack(list[,i[,j]])</code>      | Returns <code>list[i]</code> through <code>list[j]</code> . Default for <code>i</code> is 1 and <code>j</code> is <code>#list</code> .                                                                               |

---

## Math library

Various trigonometric and logarithmic functions not shown.

---

---

|                              |                                                                               |
|------------------------------|-------------------------------------------------------------------------------|
| <code>math.abs(x)</code>     | Returns the absolute value of <code>x</code> .                                |
| <code>math.ceil(x)</code>    | Returns the smallest integer $\geq x$ .                                       |
| <code>math.floor(x)</code>   | Returns the largest integer $\leq x$ .                                        |
| <code>math.fmod(x,y)</code>  | Returns the remainder of <code>x/y</code> rounding the quotient towards zero. |
| <code>math.huge</code>       | A value $\geq$ any other number.                                              |
| <code>math.max(x,...)</code> | Returns the maximum argument.                                                 |
| <code>math.min(x,...)</code> | Returns the minimum argument.                                                 |
| <code>math.modf(x)</code>    | Returns the integral and fractional parts of <code>x</code> .                 |
| <code>math.random()</code>   | Returns a pseudo-random number between 0 and 1.                               |

---

---

|                                   |                                                                                                              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>math.random(m)</code>       | Returns a pseudo-random integer between 1 and m.                                                             |
| <code>math.random(m, n)</code>    | Returns a pseudo-random integer between m and n.                                                             |
| <code>math.randomseed(x)</code>   | Sets the pseudo-random number generator set to x.                                                            |
| <code>math.sqrt(x)</code>         | Returns the square root of x ( $x^{0.5}$ ).                                                                  |
| <code>math.acos(x)</code>         | Returns the arc cosine of x (in radians).                                                                    |
| <code>math.asin(x)</code>         | Returns the arc sine of x (in radians).                                                                      |
| <code>math.atan(x)</code>         | Returns the arc tangent of x (in radians).                                                                   |
| <code>math.atan2(y, x)</code>     | Returns the arc tangent of y/x (in radians).                                                                 |
| <code>math.cos(x)</code>          | Returns the cosine of x.                                                                                     |
| <code>math.cosh(x)</code>         | Returns the hyperbolic cosine of x.                                                                          |
| <code>math.sin(x)</code>          | Returns the sine of x.                                                                                       |
| <code>math.sinh(x)</code>         | Returns the hyperbolic sine of x.                                                                            |
| <code>math.tan(x)</code>          | Returns the tangent of x.                                                                                    |
| <code>math.tanh(x)</code>         | Returns the hyperbolic tangent of x.                                                                         |
| <code>math.deg(x)</code>          | Returns the angle x (given in radians) in degrees.                                                           |
| <code>math.exp(x)</code>          | Returns the value $e^x$ .                                                                                    |
| <code>math.frexp(x)</code>        | Returns m and e such that $x = m2^e$ , e is an integer and the absolute value of m is in the range [0.5, 1). |
| <code>math.ldexp(m, e)</code>     | Returns $m2^e$ (e should be an integer).                                                                     |
| <code>math.log(x [, base])</code> | Returns the logarithm of x in the given base. The default for base is e.                                     |
| <code>math.pow(x, y)</code>       | Returns $x^y$ .                                                                                              |
| <code>math.rad(x)</code>          | Returns the angle x (given in degrees) in radians.                                                           |
| <code>math.pi</code>              | The value of $\pi$ .                                                                                         |

---

## Bitwise library

Unless otherwise stated:

- All functions accept numeric arguments in the range  $(-2^{51}, 2^{51})$ .
  - Each argument is normalized to the remainder of its division by  $2^{32}$  and truncated to an integer (in some unspecified way), so that its final value falls in the range  $[0, 2^{32} - 1]$ .
  - All results are in the range  $[0, 2^{32} - 1]$ .
- 

|                                               |                                                                                                                             |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>bit32.arshift(x,disp)</code>            | Returns x arithmetically shifted disp bits to the right (+disp) or left (-disp).                                            |
| <code>bit32.band(...)</code>                  | Returns the bitwise and of the arguments.                                                                                   |
| <code>bit32.bnot(x)</code>                    | Returns the bitwise negation of x.                                                                                          |
| <code>bit32.bor(...)</code>                   | Returns the bitwise or of the arguments.                                                                                    |
| <code>bit32.btest(...)</code>                 | Returns true if the bitwise and of the arguments is not zero.                                                               |
| <code>bit32.bxor(...)</code>                  | Returns the bitwise exclusive or of the arguments.                                                                          |
| <code>bit32.extract(n,field[,width])</code>   | Returns the bits in n from field to field + width - 1 (bits number from most to least significant). Default for width is 1. |
| <code>bit32.replace(n,v,field[,width])</code> | Returns a copy of n with bits from field to field + width -1 replaced by v. Default width is 1.                             |
| <code>bit32.lrotate(x,disp)</code>            | Returns x rotated disp bits to the left (+disp) or right (-disp).                                                           |
| <code>bit32.lshift(x,disp)</code>             | Returns x shifted disp bits to the left (+disp) or right (-disp).                                                           |
| <code>bit32.rrotate(x,disp)</code>            | Returns x rotated disp bits to the right (+disp) or left (-disp).                                                           |
| <code>bit32.rshift(x,disp)</code>             | Returns x shifted disp bits to the right (+disp) or left (-disp).                                                           |

---

## Operating system library

---

|                                          |                                                                                                                                |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <code>os.clock ()</code>                 | Returns an approximation of the amount in seconds of CPU time.                                                                 |
| <code>os.date ([format [, time]])</code> | Returns a string or a table containing date and time, formatted according to the given string format.                          |
| <code>os.time ([table])</code>           | Returns the current time when called without arguments, or a time representing the date and time specified by the given table. |
| <code>os.difftime (t2, t1)</code>        | Returns the number of seconds from time t1 to time t2.                                                                         |

---

## Citrix ADC library

---

---

|                                       |                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ns.logger:level(message)</code> | To log messages where level is emergency, alert, critical, error, warning, notice, info, or debug. The parameters are the same as the C <code>printf()</code> function: a format string, and a variable number of arguments to supply values for the % specifiers in the format string. |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Citrix ADC extensions API reference

September 21, 2020

Behaviors are a formalization of common programmable patterns that are available on a Citrix ADC appliance. For example, a TCP virtual server supports a TCP client behavior and a TCP server behavior. A behavior is a pre-defined set of callback functions. You can implement behaviors by providing callback functions. For example, a TCP client behavior can consist of the `on_data` function, which processes the TCP data stream.

### TCP client behavior

**on\_data** - function callback for TCP client data events. The callback takes two arguments:

- **ctxt** - TCP client processing context
- **payload** – event payload
  - **payload.data** - TCP data received, available as a stream of bytes

### TCP server behavior

**on\_data** - function callback for TCP server data events, the callback takes two arguments:

- **ctxt** - TCP server processing context
- **payload** – event payload
  - **payload.data** - tcp data received, available as a stream of bytes

### TCP client context

The context that is passed to the TCP client event callbacks:

- **ctxt.output** - The next processing context in the pipeline. Extension call back handlers can send ns.tcp.stream type data to ctxt.output using the events DATA, which means partial message or EOM which means end of protocol message. The EOM event may or may not have TCP data with it. An EOM event with TCP data can be sent without a preceding DATA event to send a whole protocol message data and mark the end of message. The load balancing decision is made, downstream by the load balancing virtual server, on the first data received. A new load balancing decision is made after the receipt of the EOM message. So, to stream protocol message data, send multiple DATA events with the last event as EOM. All the contiguous DATA events and the following EOM events are sent to the same server connection selected by the load balancing decision on the first DATA event in the sequence.
- **ctxt.input** - The previous processing context in the pipeline where the TCP stream data is coming from.
- **ctxt:hold(data)** - Function to store the data for future processing. On calling hold with data, the data is stored in the context. Later, when more data is received on the same context, newly received data is appended to the previously stored data and the combined data stream is then passed to the on\_data callback function. After calling a hold, the data reference is no longer usable and gives error on any usage.
- **ctxt.vserver** - The virtual server context.
- **ctxt.client** – Client connection processing context. This processing context can be used to send data to the client, and to fetch some connection related information like IP address, source and destination ports.
- **ctxt:close()** – Close the client connection by sending FIN to the client. After calling this API, the client processing context is no longer usable and gives error on any usage.

## TCP server context

The context that is passed to the TCP server event callbacks:

- **ctxt.output** – The next processing context in the pipeline. Extension call back handlers can send ns.tcp.stream type data to ctxt.output using the events DATA, which means partial message or EOM which means end of protocol message.
- **ctxt.input** - The previous processing context in the pipeline where the TCP stream data is coming from.
- **ctxt:hold(data)** - Function to store the data for future processing. On calling hold with data, the data is stored in the context. Later, when more data is received on the same context, newly received data is appended to the previously stored data and the combined data stream is then passed to the on\_data callback function. After calling a hold, the data reference is no longer usable and gives error on any usage.
- **ctxt.vserver** - The virtual server context.
- **ctxt.server** - Server connection processing context. This processing context can be used to send data to the server, and to fetch some connection related information like IP address, source and destination ports.
- **ctxt:reuse\_server\_connection ()** - This API is used to allow the server connection to be reused for other client connections in the server context only. This API can be used only if an EOM event is used (in ns.send() API) to send the data in the client context. Otherwise, the ADC appliance throws an error.

To allow a server connection to be reused by other clients, this API must be called at the end of each response message. After calling this API, if more data is received on this server connection, this is treated as an error and the server connection is closed. If this API is not used, then the server connection can be used only for that client for which it was opened. Also, if the same server is selected for another load balancing decision for that client, then the same server connection is used to send the client data. After using this API, server connection stops being tied to the client connection for which it was opened, and can be reused for a new load balancing decision for any other client connection. After calling this API, the server context is no longer usable and throws an error on any usage.

**Note:** This API is available in Citrix ADC 12.1 build 49.xx and later.

- **ctxt:close()** – Close the server connection by sending FIN to the server. After calling this API, the client processing context is no longer usable and displays an error on any usage.

**Note:** This API is available in Citrix ADC 12.1 build 50.xx and later.

## Vserver context

The user virtual server context available through the contexts passed to callbacks:

- **vserver:counter\_increment(counter\_name)** - Increments the value of a virtual server counter passed as argument. Currently the following built-in counters are supported.
  - - **invalid\_messages** – Number of invalid requests/responses on this virtual server.
  - - **invalid\_messages\_dropped** – Number of invalid requests/responses dropped by this virtual server.
- **vserver.params** - The configured parameters for the user virtual server. Parameters provide configurability of extensions. The extension code can access parameters that are specified in the CLI to add a user virtual server.

## Client connection context

Client connection processing context to get connection related information.

- **client.ssl** – SSL context
- **client.tcp** – TCP context
- **client.is\_ssl** – True if client connection is SSL-based

## Server connection context

Server connection processing context to get connection related information.

- **server.ssl** – SSL context
- **server.tcp** – TCP context
- **server.is\_ssl** – True if server connection is SSL-based

## TCP context

TCP context operates on TCP protocol.

- **tcp.srcport** – Source port as a number
- **tcp.dstport** - Destination port as a number

## IP context

IP context works on IP or IPv6 protocol data.

- **ip.src** - Source IP address context.
- **ip.dst** - Destination IP address context.

**Note:** This API is available in Citrix ADC 12.1 build 51.xx and later.

## IP address context

IP address context works on IP or IPv6 address data.

- **<address>.to\_s** - The address string in the appropriate ASCII notation.
- **<address>.to\_n** - The address' numeric value as a string of bytes in network order (4 bytes for IPv4 and 16 bytes for IPv6).
- **<address>.version** - Returns 4 for IPv4 and 6 for IPv6.
- **<address>:subnet(<prefix value>)** - Returns the subnet address string after applying the prefix number.
  - For IPv4 address, value must be between 0 and 32
  - For IPv6 address, value must be between 0 and 128.
- **<address>:apply\_mask(<mask string>)** - Returns the address string after applying mask string. API validates the version of argument and does appropriate error checking.
- **address:eq(<address string>)** - Returns true or false based on whether the argument is equivalent to the address object. API validates the version of the arguments.

**Note:** This API is available in Citrix ADC 12.1 build 51.xx and later.

## SSL context

The SSL context provides information related to frontend SSL connection.

- **ssl.cert** – SSL certificate context. For the client connection, it provides client certificate context and for the server connection, it provides server certificate context.
- **ssl.version** - A number that represents the SSL protocol version of the current transaction, as follows:
  - - 0: The transaction is not SSL-based
  - - 0x002: The transaction is SSLv2
  - - 0x300: The transaction is SSLv3
  - - 0x301: The transaction is TLSv1
  - - 0x302: The transaction is TLSv1.1
  - - 0x303: The transaction is TLSv1.2
- **ssl.cipher\_name** - SSL Cipher name as string if invoked from an SSL connection, otherwise gives NULL string.
- **ssl.cipher\_bits** – Number of bits in cryptographic key.

## SSL certificate context

- **Cert.version** – Version number of the certificate. If the connection is not SSL based, returns 0.

- **Cert.valid\_not\_before** – Date in string format before which certificate is not valid.
- **Cert.valid\_not\_after** – Date in string format after which certificate is no longer valid.
- **Cert.days\_to\_expire** – Number of days before which certificate is valid. Returns -1 for expired certificate.
- **Cert.to\_pem** – Certificate in binary format.
- **cert.issuer** - Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign (“=”) is the delimiter for the name and the value, and the slash (“/”) is the delimiter that separates the name-value pairs.

Following is an example of the returned DN:

```
/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com
```

- **cert.auth\_keyid** – Context of Authority Key Identifier extension of the X.509 V3 certificate.
  - **auth\_keyid.exists** - TRUE if the certificate contains an Authority Key Identifier extension.
  - **auth\_keyid.issuer\_name** - Issuer Distinguished Name in the certificate as a name-value list.

An equals sign (“=”) is the delimiter for the name and the value, and the slash (“/”) is the delimiter that separates the name-value pairs.

Following is an example:

```
/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com
```
  - **auth\_keyid.keyid** - KeyIdentifier field of the Authority Key Identifier as a blob
  - **auth\_keyid.cert\_serialnumber** - SerialNumber field of the Authority Key Identifier as a blob.
- **cert.pk\_algorithm** - Name of the public key algorithm used by the certificate.
- **cert.pk\_size** - Size of the public key used in the certificate.
- **cert.serialnumber** - Serial number of the client certificate. If this is a non-SSL transaction or there is an error in the certificate, this gives an empty string.
- **cert.signature\_algorithm** - Name of the cryptographic algorithm used by the CA to sign this certificate.
- **cert.subject\_keyid** - Subject KeyID of the client certificate. If there is no Subject KeyID, this gives a zero-length text object.
- **cert.subject** - Distinguished Name of the Subject as a name-value. An equals sign (“=”) separates names and values and a slash (“/”) delimits name-value pairs.

Following is an example:

```
/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com
```

## Citrix ADC libraries

- **ns.tcp.stream** - String like library for handling TCP data as a stream of bytes. The maximum size of TCP stream data on which these APIs can work is 128 KB. The ns.tcp.stream library functions can also be called in the usual extension object oriented style of calling. For example, data:len() is the same as ns.tcp.stream.len(data)
  - **ns.tcp.stream.len(data)** - Returns length of data in bytes, similar to Lua's string.len
  - **ns.tcp.stream.find(data, pattern [, init])** - Function similar to Lua's string.find. In addition, it also does partial matching at the end of data. Upon partial match, the start index is returned and the end index becomes nil.
  - **ns.tcp.stream.split(data, length)** - Splits the data into two chunks, the first chunk is of the specified length. After a successful split the original data is no longer usable as a TCP data stream. Any attempt to use it that way causes an error.
  - **ns.tcp.stream.byte(data[, i [, j]])** - Function similar to Lua's string.byte. Returns the internal numerical codes of the characters data[i], data[i+1], ..., data[j].
  - **ns.tcp.stream.sub(data, i [, j])** - Function similar to Lua's string.sub. Returns the substring of s that starts at i and continues until j.
  - **ns.tcp.stream.match(data, pattern, [, init])** - Function similar to Lua's string.match. Looks for the first *match* of pattern in string s.
- **ns.send(processing\_ctxt, event\_name, event\_data)** - Generic function to send events to a processing context. Event data is a Lua table that can have any content. The contents depend on the event. After the ns.send() API is called, the data reference is no longer usable. Any attempt to use it causes an error.
- **ns.pipe(src\_ctxt, dest\_ctxt)** - Using a call to pipe() API, extension code can connect source context to a destination context. After a call to pipe, all the events that are sent from source context to the next module in the pipeline go directly to the destination context. This API is typically used by the module that makes the pipe() call, to remove itself from the pipeline.

## Protocol extensions

September 21, 2020

The Citrix ADC appliances have native support for protocols such as HTTP. In addition to this, you can use protocol extensions to add support for custom protocols. Presently only TCP-based custom protocols are supported, for example, Message Queuing Telemetry Transport (MQTT) protocol. For secure transactions, TCP over SSL is also supported.

The protocol extensions on the Citrix ADC appliance are part of the high-level scripting infrastructure available on the Citrix ADC appliance. The scripting language is based on the Lua 5.2 programming

language. To add a custom protocol to a Citrix ADC appliance, the user has to write extension code to implement the applicable behaviors. For example, the `ns.tcp.client` and `ns.tcp.server` behaviors are applicable to TCP based protocols. To implement a behavior, implement only the callbacks that you want to customize. If callback is not implemented, its default takes effect. For more information about the scripting language, see [Citrix ADC Extensions - Language Overview](#). For details on behaviors, see [Citrix ADC Extensions API Reference](#).

The Citrix ADC protocol extensions can be used for the following:

- Add new protocol support on the Citrix ADC appliance programmatically, using extensions.
- Parse protocol traffic and do protocol-specific message based load balancing (MLB).
- Configure user defined load balancing persistence.

## Protocol extensions - architecture

September 21, 2020

To achieve traffic-level extensibility, the traffic processing on a Citrix ADC appliance is exposed as a pipeline of separate processing modules. Traffic flows through them as it processes it from ingress to egress. These modules in the pipeline follow a shared nothing model. Message passing is used to send the traffic data from one module in the pipeline to the next module.

Certain points in the traffic processing pipeline are made extensible, so that you can add code to customize the Citrix ADC behavior.

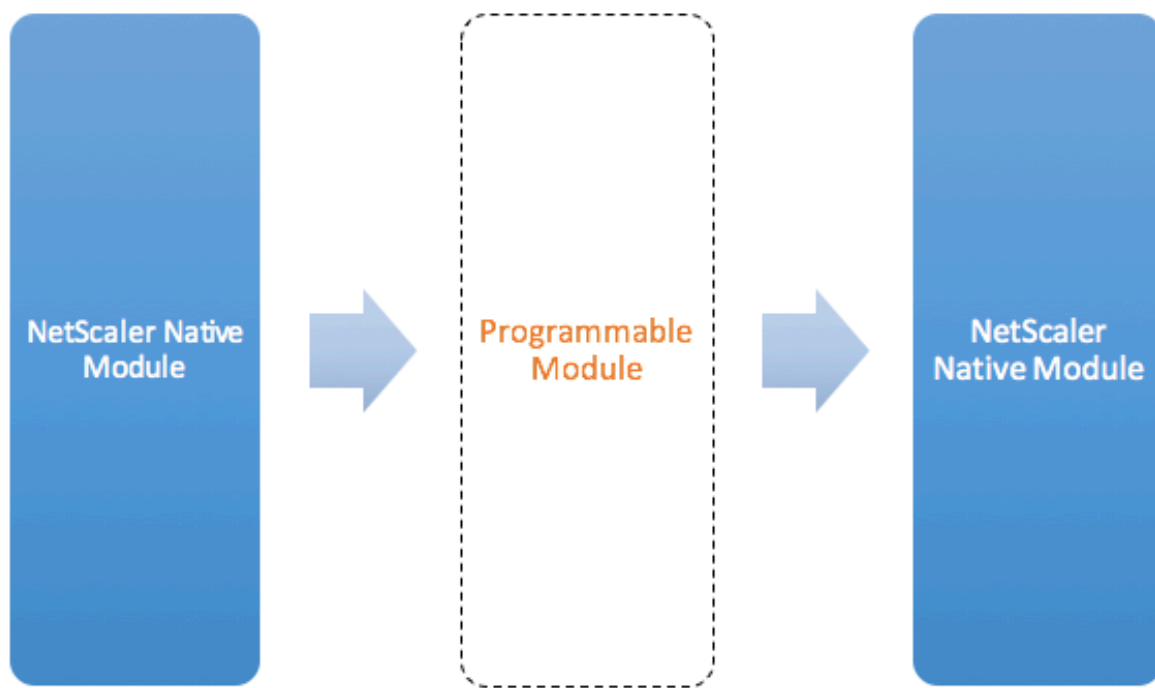

Figure: A Programmable Module In the Traffic Pipeline

By default, the traffic bypasses a programmable module to which you do not add any code.

Figure: User Defined Traffic Module

## Behaviors

The programmable interfaces for customizing the traffic handling are called behaviors. Behaviors are basically a formalization of common programmable patterns that are available on a Citrix ADC appliance. The behaviors consist of a pre-defined set of event callback functions. You can implement a behavior by providing callback functions conforming to the behavior.

For example, the TCP client behavior consists of a callback function (`on_data`) that processes TCP client data stream events. To implement Message Based Load Balancing (MBLB) for a TCP based protocol, you can add code for this callback function to process the TCP data stream from the client and parse the byte stream into protocol messages.

### Context:

The callback functions in a behavior are called with a context, which is the processing module state. The context is the instance of the processing module. For example, the TCP client behavior callbacks are called with different contexts for different client TCP connections.

### Payload:

In addition to the context, the behavior callbacks can have other arguments. Usually the rest of the arguments are passed as payload, which is the collection of all the arguments.

So, the programmable processing module instances can be seen as a combination of instance state plus event callback functions, that is, the context plus behavior. And the traffic flows through the pipeline as event payload.

For Citrix ADC API extensions, see [Citrix ADC extension API reference](#).

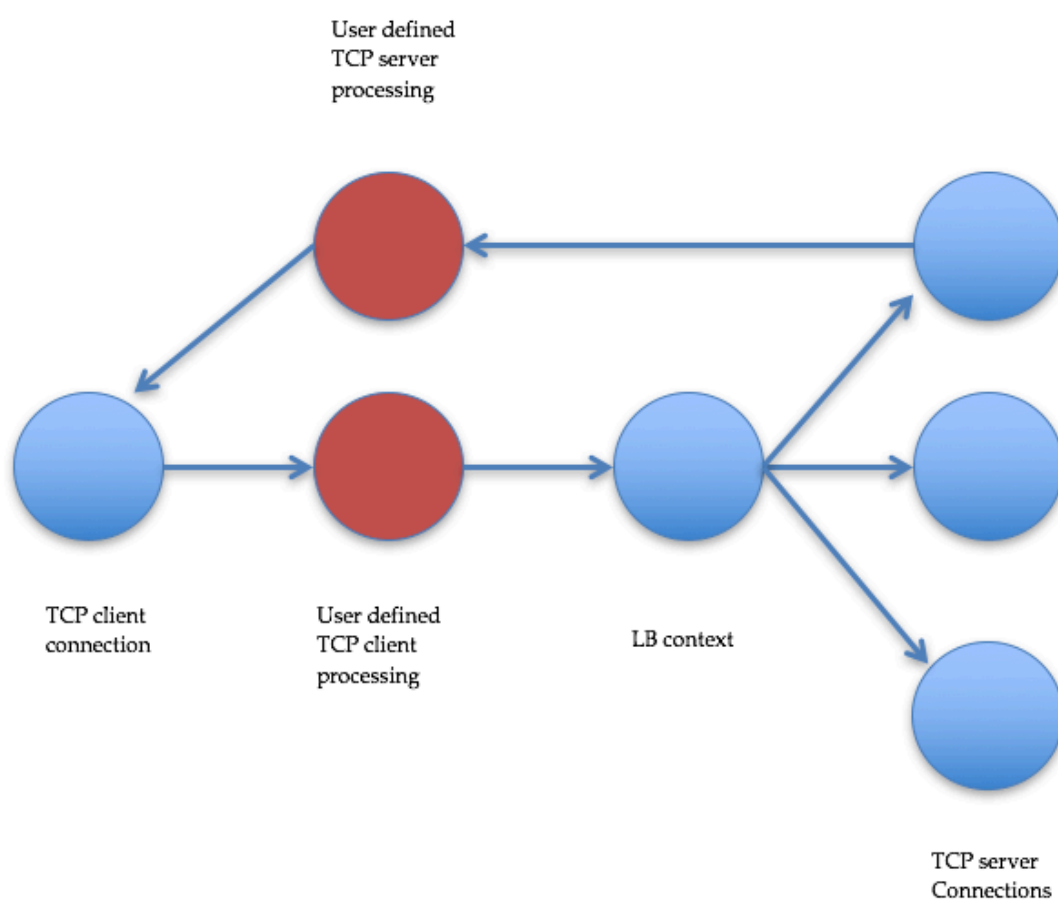

The following code snippet shows a user defined function to handle TCP client data stream events. The context and payload are passed to the function by Citrix ADC code. This code simply forwards the TCP data received in every call to the next processing module context in the pipeline. In this case, the next module is the load balancing (LB) context, which is a Citrix ADC native module.

```
1 function client.on_data(ctxt, payload)
2     ns.send(ctxt.output, "DATA", {
3     data = payload.data }
4 )
5 end
6 <!--NeedCopy-->
```

## Protocol extensions - traffic pipeline for user defined TCP client and server behaviors

September 21, 2020

The following figure illustrates the sample protocol extension - traffic pipeline for user defined TCP client and server behaviors

**Traffic Pipeline For User Defined TCP Client And Server Behaviors**

### Add a custom protocol by using protocol extensions

The command line interface (CLI) commands for custom protocol use the keyword “user” to signify the user defined nature of the underlying configuration entities. With the help of extension code, you can add a new user protocol to the system and add user virtual servers for user-defined protocols. The user virtual servers are in turn configurable by setting parameters. Configured values for virtual server parameters are available in the extension code.

The following example illustrates the user flow for adding support for a new protocol. The example adds MQTT protocol support to the system. MQTT is a machine-to-machine “Internet of Things” connectivity protocol. It is a lightweight publish/subscribe messaging transport. Useful for connections with remote locations, this protocol uses client and broker tools to publish messages to subscribers.

1. Import the MQTT protocol extension implementation file to Citrix ADC system. The code listing for `mqtt.lua` is given below. The example below imports the MQTT extension file hosted on a webserver.

```
import extension http://10.217.24.48/extensions/mqtt.lua mqtt_code
```

2. Add a new user TCP based protocol to the system using the extension.

```
add user protocol MQTT -transport TCP -extension mqtt_code
```

3. Add a user load balancing vserver and bind backend services to it.

```
1 add service mqtt_svr1 10.217.24.48 USER_TCP 1501
2 add service mqtt_svr2 10.217.24.48 USER_TCP 1502
3 add lb vserver mqtt_lb USER_TCP -lbmethod USER_TOKEN
4 bind lb vserver mqtt_lb mqtt_svr1
5 bind lb vserver mqtt_lb mqtt_svr2
6 <!--NeedCopy-->
```

4. Add a user vserver for the newly added protocol. Set the defaultlb to the LB vserver configured above.

```
add user vserver mqtt_vs MQTT 10.217.24.28 8765 -defaultlb mqtt_lb
```

5. Optionally, enable MQTT session persistence based on ClientID, set the persistence type to USERSESSION.

```
set lb vserver mqtt_lb -persistenceType USERSESSION
```

## Protocol extensions - use cases

September 21, 2020

Protocol extensions can be used for the following use cases.

- Message based load balancing (MBLB)
- Streaming
- Token based load balancing
- Load balancing persistence
- TCP connection based load balancing
- Content based load balancing
- SSL

- Modify traffic
- Originate traffic to client or server

## Message based load balancing

Protocol extensions support Message Based Load Balancing (MBLB), which can parse any protocol on a Citrix ADC appliance and load balance the protocol messages arriving on one client connection, that is, distribute the messages over multiple server connections. MBLB is achieved by user code that parses the client TCP data stream.

The TCP data stream is passed to the `on_data` callbacks for client and server behaviors. The TCP data stream is available to the extension functions through a Lua string like interface. You can use an API similar to the Lua string API to parse the TCP data stream.

Useful APIs include:

```
data:len()
```

```
data:find()
```

```
data:byte()
```

```
data:sub()
```

```
data:split()
```

Once the TCP data stream has been parsed into a protocol message, the user code achieves load balancing by just sending the protocol message to the next context available from the context passed to the `on_data` callback for the client.

The `ns.send()` API is used to send messages to other processing modules. In addition to the destination context, the `send` API takes the event name and optional payload as arguments. There is one-to-one correspondence between the event name and the callback function names for the behaviors. The callbacks for events are called `on_<event_name>`. The callback names use only lowercase.

For example, the TCP client and server `on_data` callbacks are user-defined handlers for events named "DATA." For sending the whole protocol message in one `send` call, the EOM event is used. EOM, which stands for end of message, signifies the end of protocol message to the LB context down stream, so a new load balancing decision is made for data that follows this message.

The extension code might sometimes not receive the whole protocol message in the `on_data` event. In such a case, the data can be held by using the `ctxt:hold()` API. The `hold` API is available for both TCP-client and server-callback contexts. When "hold with data" is called, the data is stored in the context. When more data is received in the same context, the newly received data is appended to the previously stored data and the `on_data` callback function is called again with the combined data.

**Note:** The load balancing method used depends on the configuration of the load balancing virtual server corresponding to the load balancing context.

The following code snippet shows the use of the send API to send the parsed protocol message.

**Example:**

```
1     function client.on_data(ctxt, payload)
2         --
3         -- code to parse payload.data into protocol message comes here
4         --
5         -- sending the message to lb
6         ns.send(ctxt.output, "EOM", {
7 data = message }
8     )
9     end -- client.on_data
10
11    function server.on_data(ctxt, payload)
12        --
13        -- code to parse payload.data into protocol message comes here
14        --
15        -- sending the message to client
16        ns.send(ctxt.output, "EOM", {
17 data = message }
18    )
19
20    end -- server.on_data
21 <!--NeedCopy-->
```

**Streaming**

In some scenarios, holding the TCP data stream until the whole protocol message is collected might not be necessary. In fact, it is not advised unless it is required. Holding the data increases memory usage on Citrix ADC appliance and can make the appliance susceptible to DDoS attacks by exhausting the memory on Citrix ADC appliance with incomplete protocol messages on many connections.

Users can achieve streaming of TCP data in the extension callback handlers by using the send API. Instead of holding the data until the whole message is collected, data can be sent in chunks. Sending data to ctxt.output by using the DATA event sends a partial protocol message. It can be followed by more DATA events. An EOM event must be sent to mark the end of the protocol message. The load balancing context downstream makes the load balancing decision on the first data received. A new load balancing decision is made after the receipt of the EOM message.

To stream protocol message data, send multiple DATA events followed by an EOM event. The contiguous DATA events and the following EOM event are sent to the same server connection selected by load balancing decision for the first DATA event in the sequence.

For a send to client context, EOM and DATA events are effectively the same, because there is no special handling by the client context downstream for EOM events.

### Token based load balancing

For natively supported protocols, a Citrix ADC appliance supports a token based load balancing method that uses PI expressions to create the token. For extensions, the protocol is not known in advance, so PI expressions cannot be used. For token based load balancing, you have to set the default load balancing vserver to use the USER\_TOKEN load balancing method, and provide the token value from the extension code by calling the send API with a user\_token field. If the token value is sent from the send API and the USER\_TOKEN load balancing method is configured on the default load balancing vserver, the load balancing decision is made by calculating a hash based on the token value. The maximum length of token value is 64 bytes.

```
add lb vserver v\\_mqtalb USER\\_TCP -lbMethod USER\\_TOKEN
```

The code snippet in the following example uses a send API to send an LB token value.

#### Example:

```
1      -- send the message to lb
2
3
4
5
6      -- user_token is set to do LB based on clientID
7
8
9
10
11     ns.send(ctxt.output, "EOM", {
12 data = message,
13
14                                     user_token = token_info }
15 )
16 <!--NeedCopy-->
```

### Load balancing persistence

Load balancing persistence is closely related to token based load balancing. Users have to be able to programmatically calculate the persistence session value and use it for load balancing persistence. The send API is used to send persistence parameters. To use load balancing persistence, you have to set the USERSESSION persistence type on the default load balancing virtual server and provide a

persistence parameter from the extension code by calling the send API with a `user_session` field. The maximum length of the persistence parameter value is 64 bytes.

If you need multiple types of persistence for a custom protocol, you have to define user persistence types and configure them. The names of the parameters used to configure the virtual servers are decided by the protocol implementer. A parameter's configured value is also available to the extension code.

The following CLI and code snippet shows the use of a send API to support load balancing persistence. The code listing in the section [Code Listing for mqtt.lua](#) also illustrates the use of the `user_session` field.

For persistency, you have to specify the `USERSESSION` persistency type on the load balancing virtual server and pass the `user_session` value from the `ns.send` API.

```
add lb vserver v\\_mqttlb USER\\_TCP -persistencetype USERSESSION
```

Send the MQTT message to the load balancer, with the `user_session` field set to `clientID` in the payload.

**Example:**

```
1 -- send the data so far to lb
2
3 -- user_session is set to clientID as well (it will be used to persist
  session)
4
5 ns.send(ctxt.output, "DATA" , {
6   data = data, user_session = clientID }
7 )
8 <!--NeedCopy-->
```

**TCP connection based load balancing**

For some protocols, MBLB might not be needed. Instead, you might need TCP connection based load balancing. For example, the MQTT protocol must parse the initial part of the TCP stream to determine the token for load balancing. And, all the MQTT messages on the same TCP connection must be sent to the same server connection.

TCP connection based load balancing can be achieved by using the send API with only DATA events and not sending any EOM. That way the downstream load balancing context bases the load balancing decision on the data received first, and sends all the subsequent data to the same server connection selected by the load balancing decision.

Also, some use cases might require the ability to bypass extension handling after the load balancing decision has been made. Bypassing the extension calls results in better performance, because the traffic is processed purely by native code. Bypass can be done by using the `ns.pipe()` API. A call to the

pipe() API extension code can connect input context to an output context. After the call to pipe(), all the events coming from input context directly go to the output context. Effectively, the module from which the pipe() call is made is removed from the pipeline.

The following code snippet shows streaming and the use of the pipe() API to bypass a module. The code listing in the section [Code Listing for mqtt.lua](#) also illustrates how to do streaming and the use of pipe() API to bypass the module for rest of the traffic on the connection.

**Example:**

```
1      -- send the data so far to lb
2      ns.send(ctxt.output, "DATA", {
3  data = data,
4                                     user_token = clientID }
5  )
6      -- pipe the subsequent traffic to the lb - to bypass the client
7      ns.pipe(ctxt.input, ctxt.output)
8  <!--NeedCopy-->
```

**Content based load balancing**

For native protocols, content switching like feature for protocol extensions is supported. With this feature, instead of sending the data to the default load balance, you can send the data to the selected load balancer.

Content switching feature for protocol extensions is achieved by using the ctxt:lb\_connect(<lbname >) API. This API is available to the TCP client context. Using this API, the extension code can obtain a load balancing context corresponding to an already configured load balancing virtual server. You can then use the send API with the load balancing context thus obtained.

The lb context can be NULL sometimes:

- Virtual server does not exist
- Virtual server is not of user protocol type
- Virtual server's state is not UP
- Virtual server is user vserver, not load balancing virtual server

If you remove the target load balancing virtual server when it is in use, then all connections associated with that load balancing virtual server is reset.

The following code snippet shows the use of lb\_connect() API. The code maps the client ID to load balancing virtual server names (lbname) using the Lua table lb\_map and then gets the LB context for lbname using lb\_connect(). And finally sends to the LB context using send API.

```
1     local lb_map = {
2
3         ["client1*"] = "lb_1",
4         ["client2*"] = "lb_2",
5         ["client3*"] = "lb_3",
6         ["client4*"] = "lb_4"
7     }
8
9
10    -- map the clientID to the corresponding LB vserver and connect to
11    it
12    for client_pattern, lbname in pairs(lb_map) do
13        local match_idx = string.find(clientID, client_pattern)
14        if (match_idx == 1) then
15            lb_ctxt = ctxt:lb_connect(lbname)
16            if (lb_ctxt == nil) then
17                error("Failed to connect to LB vserver: " .. lbname)
18            end
19            break
20        end
21        if (lb_ctxt == nil) then
22            -- If lb context is NULL, the user can raise an error or send data
23            to default LB
24            error("Failed to map LB vserver for client: " .. clientID)
25        end
26    -- send the data so far to lb
27    ns.send(lb_ctxt, "DATA", {
28        data = data }
29    <!--NeedCopy-->
```

## SSL

SSL for protocols using extensions is supported in ways similar to how SSL for native protocols is supported. Using the same parsing code for creating custom protocols, you can create a protocol instance over TCP or over SSL which can then be used to configure the virtual servers. Similarly, you can add user services over TCP or SSL.

For more information, see [Configuring SSL Offloading for MQTT](#) and [Configuring SSL Offloading for MQTT With End-To-End Encryption](#).

## Server connection multiplexing

In some cases, the client sends one request at a time and sends the next request only after the response for the first request is received from the server. In such a case, server connection can be reused for other client connections, and for the next message on the same connection, after the response has been sent to the client. To allow reuse of server connection by other client connections, you must use the `ctxt: reuse_server_connection()` API on the server side context.

**Note:** This API is available in Citrix ADC 12.1 build 49.xx and later.

## Modify traffic

To modify data in the request or response, you must use the native rewrite feature that uses an advanced policy PI expression. Because you cannot use PI expressions in extensions, you can use the following APIs to modify a TCP stream data.

```
1 data:replace(offset, length, new_string)
2 data:insert(offset, new_string)
3 data:delete(offset, length)
4 data:gsub(pattern, replace [,n]))
```

The following code snippet shows the use of `replace()` API.

```
1 -- Get the offset of the pattern, we want to replace
2   local old_pattern = "pattern to repalace"
3   local old_pattern_length = old_pattern:len()
4   local pat_off, pat_end = data:find(old_pattern)
5   -- pattern is not present
6   if (not pat_off) then
7     goto send_data
8   end
9   -- If the data we want to modify is not completely present, then
10  -- wait for more data
11  if (not pat_end) then
12    ctxt:hold(data)
13    data = nil
14    goto done
15  end
16  data:replace(pat_off, old_pattern_length, "new pattern" )
17  ::send_data::
18  ns.send(ctxt.output, "EOM" , {
19    data = data }
20  )
21  ::done::
```

The following code snippet shows the use of insert() API.

```
1 data:insert(5, "pattern to insert" )
```

The following code snippet shows the use of insert() API, when we want to insert after or before some pattern:

```
1 -- Get the offset of the pattern, after or before which we want to
  insert
2   local pattern = "pattern after/before which we need to insert"
3   local pattern_length = pattern:len()
4   local pat_off, pat_end = data:find(pattern)
5   -- pattern is not present
6   if (not pat_off) then
7     goto send_data
8   end
9   -- If the pattern after which we want to insert is not
10  -- completely present, then wait for more data
11  if (not pat_end) then
12    ctxt:hold(data)
13    data = nil
14    goto done
15  end
16  -- Insert after the pattern
17  data:insert(pat_end + 1, "pattern to insert" )
18  -- Insert before the pattern
19  data:insert(pat_off, "pattern to insert" )
20  ::send_data::
21    ns.send(ctxt.output, "EOM" , {
22    data = data }
23  )
24  ::done::
```

The following code snippet shows the use of delete() API.

```
1 -- Get the offset of the pattern, we want to delete
2   local delete_pattern = "pattern to delete"
3   local delete_pattern_length = delete_pattern:len()
4   local pat_off, pat_end = data:find(old_pattern)
5   -- pattern is not present
6   if (not pat_off) then
7     goto send_data
8   end
9   -- If the data we want to delete is not completely present,
10  -- then wait for more data
```

```

11  if (not pat_end) then
12      ctxt:hold(data)
13      data = nil
14      goto done
15  end
16  data:delete(pat_off, delete_pattern_length)
17  ::send_data::
18  ns.send(ctxt.output, "EOM" , {
19      data = data }
20  )
21  ::done::

```

The following code snippet shows the use of `gsub()` API.

```

1      -- Replace all the instances of the pattern with the new string
2  data:gsub( "old pattern" , "new string" )
3  -- Replace only 2 instances of "old pattern"
4  data:gsub( "old pattern" , "new string" ,2)
5  -- Insert new_string before all instances of "http"
6  data:gsub( "input data" , "(http)" , "new_string%1" )
7  -- Insert new_string after all instances of "http"
8  data:gsub( "input data" , "(http)" , "%1new_string" )
9  -- Insert new_string before only 2 instances of "http"
10 data:gsub( "input data" , "(http)" , "new_string%1" , 2)

```

**Note:** This API is available in Citrix ADC 12.1 build 50.xx and later.

### Originate traffic to client or server

You can use the `ns.send()` API to send data that originates from the extension code to a client and a back-end server. To send or receive response directly with a client, from client context, you must use `ctxt.client` as the target. To send or receive response directly with a back-end server from server context, you must use `ctxt.server` as the target. The data in the payload can be a TCP stream data or a Lua string.

To stop traffic processing on a connection, you can use `ctxt:close()` API from either the client or the server context. This API closes the client-side connection or any server connections linked to it.

When you call the `ctxt:close()` API, extension code sends TCP FIN packet to the client and server connections and if more data is received from the client or server on this connection, then the appliance resets the connection.

The following code snippet shows the use of `ctxt.client` and `ctxt:close()` APIs.

```

1      -- If the input packet is not MQTT CONNECT type, then

```

```

2 -- send some error response to the client.
3 function client.on_data(ctxt, payload)
4     local data = payload.data
5     local offset = 1
6     local msg_type = 0
7     local error_response = "Missing MQTT Connect packet."
8     byte = data:byte(offset)
9     msg_type = bit32.rshift(byte, 4)
10 if (msg_type ~= 1) then
11 -- Send the error response
12     ns.send(ctxt.client, "DATA" , {
13     data = error_response }
14     )
15 -- Since error response has been sent, so now close the connection
16     ctxt:close()
17 end

```

The following code snippet shows the example when user can inject the data in the normal traffic flow.

```

1 -- After sending request, send some log message to the server.
2 function client.on_data(ctxt, payload)    local data = payload.data
3     local log_message = "client id : "..data:sub(3, 7).. " user name :
4     " data:sub(9, 15)
5 -- Send the request we get from the client to backend server
6 ns.send(ctxt.output, "DATA" , {
7     data = data }
8 ) -- After sending the request, also send the log message
9 ns.send(ctxt.output, "DATA" , {
10    data = log_message" }
11 )
12 end

```

The following code snippet shows the use of ctxt.to\_server API.

```

1 -- If the HTTP response status message is "Not Found" ,
2 -- then send another request to the server.
3 function server.on_data(ctxt, payload)
4     local data = payload.data
5     local request "GET /default.html HTTP/1.1\r\n\r\n" ss
6     local start, end = data:find( "Not Found" )
7     if (start) then
8         -- Send the another request to server
9         ns.send(ctxt.server, "DATA" , {
10    data = request }
11    )

```

**Note:** This API is available in Citrix ADC 12.1 build 50.xx and later.

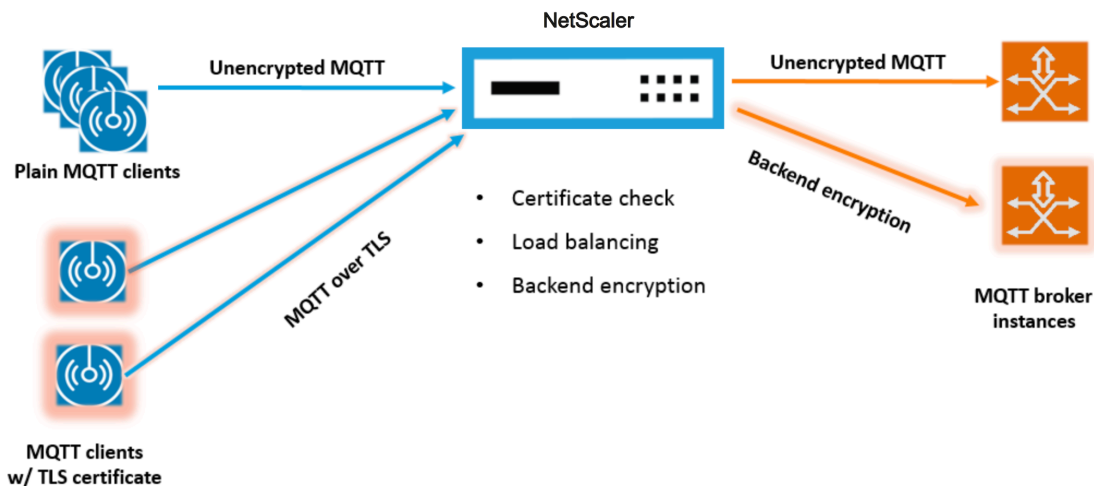

## Tutorial – Add MQTT protocol to the Citrix ADC appliance by using protocol extensions

September 21, 2020

The command line interface (CLI) commands for custom protocol use the keyword “user” to signify the user defined nature of the underlying configuration entities. With the help of extension code, you can add a new user protocol to the system and add user virtual servers for user-defined protocols. The user virtual servers are in turn configurable by setting parameters. Configured values for virtual server parameters are available in the extension code.

MQTT protocol is used for illustration purposes.

The following diagram illustrates a Citrix ADC appliance and MQTT client and broker tools.

## Code listing for mqtt.lua

September 21, 2020

The code listing below, mqtt.lua, gives the code to implement the MQTT protocol on Citrix ADC using protocol extensions. The code only has the TCP client data callback function defined - client.on\_data(). For server data, it does not add a callback function and the server to client takes

the fast native path. For client data, the code parses the CONNECT MQTT protocol message and extracts the ClientID. It then uses the ClientID for user\_token value, which is used to load balance all the client traffic for the connection based on the ClientID by setting LB method for the LB vserver as USER\_TOKEN. It uses the ClientID also for user\_session value, which can be used for LB persistence by setting persistence type for the LB vserver as USERSESSION. The code uses the ns.send() to do LB and send the initial data. It uses the ns.pipe() API to send the rest of the client traffic directly to server connection, bypassing calls to extension callback handler.

```
1  --[[
2
3  MQTT event handler for TCP client data
4
5  ctxt - TCP client side App processing context.
6
7  data - TCP Data stream received.
8
9  - parse the client ID from the connect message - the first message
   should be connect
10
11  - send the data to LB with ClientID as user token and session
12
13  - pipe the subsequent data to LB directly. This way the subsequent
   MQTT traffic will
14
15  bypass the tcp client on_data handler
16
17  - if a parse error is seen, throw an error so the connection is
   reset
18
19 --]]
20
21 function client.on_data(ctxt, payload)

161     -- user_session is set to clientID as well (it will be used to
    persist session)
162
163     ns.send(ctxt.output, "DATA", {
```

```
164 data = data,
165
166             user_token = clientID,
167
168             user_session = clientID }
169 )
170
171     -- pipe the subsequent traffic to the lb - to bypass the
extension handler
172
173     ns.pipe(ctxt.input, ctxt.output)
174
175     goto parse_done
176
177     ::need_more_data::
178
179     ctxt:hold(data)
180
181     ::parse_done::
182
183     return
184
185 end
186 <!--NeedCopy-->
```

## Configure MQTT by using protocol extensions

September 21, 2020

The following steps add a MQTT protocol to the Citrix ADC appliance.

Import the extension file to the Citrix ADC appliance, from either a web server (using HTTP) or your local workstation. For details about importing the extension file, see [Import extensions](#).

```
import ns extension local:mqtt_generic_fs.lua mqtt_code
```

Add a new user TCP based protocol to the system by using the extension.

```
add user protocol MQTT -transport TCP -extension mqtt_code
```

Add a service of type USER\_TCP to indicate that this is a user-defined protocol.

```
add service s1 10.102.90.112 USER_TCP 80
```

Add a user load balancing vserver and bind backend services to it.

```
add lb vs mysv USER_TCP
```

```
bind lb vs mysv s1
```

Add a user virtual server for the newly added protocol and make the load balancing virtual server configured in the previous step the default load balancer.

```
add user vs v_mqtt MQTT 10.217.24.28 80 -defaultlb mysv
```

Optionally, enable MQTT session persistence based on ClientID, set the persistence type to USERSESSION.

```
set lb vserver mqtt_lb -persistenceType USERSESSION
```

## Configuring SSL offloading for MQTT

October 14, 2020

You can implement SSL offloading for user protocols by adding an SSL instance for the protocol. The following example shows how to do SSL offloading for a user protocol. The traffic to back-end services is unencrypted with this configuration.

Note: This example does not provide details related to adding or updating a certificate-key pair and binding it to a virtual server. For those details, see [SSL certificates](#).

The following commands add the MQTT\_SSL protocol by including `mqtt.lua` with the transport value "SSL."

```
1 import extension http://10.217.24.48/extensions/mqtt.lua mqtt_code
2 add user protocol MQTT_SSL -transport SSL -extension mqtt_code
3 <!--NeedCopy-->
```

The following commands add a user load balancing virtual server and bind back-end services to it.

```
1 add service mqtt_svr1 10.217.24.48 USER_TCP 1501
2 add service mqtt_svr2 10.217.24.48 USER_TCP 1502
3 add lb vserver mqtt_lb USER_TCP -lbMethod ROUNDROBIN
4 bind lb vserver mqtt_lb mqtt_svr1
5 bind lb vserver mqtt_lb mqtt_svr2
6 <!--NeedCopy-->
```

The following command adds a user virtual server for the newly added protocol MQTT\_SSL. Using MQTT\_SSL means the Citrix ADC appliance does SSL offloading, because MQTT\_SSL was configured with SSL transport. The command also sets the `defaultlb` to the load balancing virtual server configured in the previous step.

```
add user vserver mqtt_vs MQTT_SSL 10.217.24.28 8765 -defaultLb mqtt_lb
```

For SSL offloading, you also need to enable the SSL feature and bind a certificate-key pair to the user virtual server. For more information, see the following topics:

[Add or update a certificate-key pair](#)

[Bind the certificate-key pair to the SSL virtual server](#)

**Example:**

```
1 enable ns feature SSL
2
3 add SSL certKey mqtt_svr_cert_key -cert server1.cert -key server1.key
4
5 bind ssl vserver mqtt_vs -certkeyName mqtt_svr_cert_key
6 <!--NeedCopy-->
```

## Configuring SSL offloading with end-to-end encryption for MQTT

October 14, 2020

The following example shows how to do SSL offloading for MQTT with end-to-end encryption.

**Note:** This example does not provide details related to adding or updating a certificate-key pair and binding it to a virtual server. For those details, see [SSL certificates](#).

The following commands import the extension file and add the MQTT\_SSL protocol with SSL transport.

```
1 import extension http://10.217.24.48/extensions/mqtt.lua mqtt_code
2 add user protocol MQTT_SSL -transport SSL -extension mqtt_code
3 <!--NeedCopy-->
```

The following commands add a user load balancing virtual server and bind back-end services to it. Both the load balancing virtual server and the services are configured for the service type USER\_SSL\_TCP.

```
1 add service mqtt_svr1 10.217.24.48 USER_SSL_TCP 1501
2 add service mqtt_svr2 10.217.24.48 USER_SSL_TCP 1502
3 add lb vserver mqtt_lb USER_SSL_TCP -lbmethod RR
4 bind lb vserver mqtt_lb mqtt_svr1
5 bind lb vserver mqtt_lb mqtt_svr2
6 <!--NeedCopy-->
```

The following command adds a user virtual server for the newly added protocol MQTT\_SSL. Using MQTT\_SSL means the Citrix ADC appliance does SSL offloading, because MQTT\_SSL was configured with SSL transport. The command also makes the load balancing virtual server, configured in the previous step, the default load balancer.

```
add user vserver mqtt_vs MQTT_SSL 10.217.24.28 8765 -defaultLb mqtt_lb
```

For end-to-end encryption, you also need to enable the SSL feature and bind a certificate-key pair to the user and default load balancing virtual servers. For more information, see the following topics:

[Add or update a certificate-key pair](#)

[Bind the certificate-key pair to the SSL virtual server](#)

```
1 enable ns feature SSL
2
3 add SSL certKey mqtt_svr_cert_key -cert server1.cert -key server1.key
4
5 bind ssl vserver mqtt_lb -certkeyName mqtt_svr_cert_key
6
7 bind ssl vserver mqtt_vs -certkeyName mqtt_svr_cert_key
8 <!--NeedCopy-->
```

## Tutorial - load balancing syslog messages by using protocol extensions

September 21, 2020

Syslog protocol available on the Citrix ADC appliance works only for the messages generated on the Citrix ADC appliance. It does not load balance the messages coming from external nodes. To load balance such messages, you need to use the protocol extensions feature and write the syslog message parsing logic by using the Lua 5.2 programming language.

### Code for parsing syslog message

The code only has the TCP client data callback function defined - `client.on_data()`. For server data, it does not add a callback function and the server to client takes the fast native path. The code identifies message boundary based on the trailing character. If the TCP packet contains more than one syslog messages, then we split the packet based on the trailing character and load balance each message.

```
1 --[[
2
3   Syslog event handler for TCP client data
4
```

```
5     ctxt - TCP client side App processing context.
6
7     data - TCP Data stream received.
8
9 --]]
10
11 function client.on_data(ctxt, payload)
12
13     local message = nil
14
15     local data_len
16
17     local data = payload.data
18
19     local trailing_character = "\n"
20
21     ::split_message::
22
23         -- Get the offset of trailing
24         character
25
26         local new_line_character_offset =
27         data:find(trailing_character)
28
29         -- If trailing character is not
30         found, then wait for more data.
31
32         if (not new_line_character_offset)
33         then
34
35             goto
36             need_more_data
37
38         end
39
40         -- Get the length of the current
41         message
42
43         data_len = data:len()
44
45         -- Check whether we have more than
46         one message
47
48         -- by comparing trailing character
49         offset and
```

```
42
43         -- current data length
44
45         if (data_len >
46 new_line_character_offset) then
47
48             -- If we have
49             more than one message, then split
50
51             -- the data into
52             two parts such that first part
53
54             -- will contain
55             message upto trailing character
56
57             -- offset and
58             second part will contain
59
60             -- remaining
61             message.
62
63             message, data =
64             data:split(new_line_character_offset)
65
66         else
67
68             message = data
69
70             data = nil
71
72         end
73
74     -- Send the data to the backend server.
75
76     ns.send(ctxt.output, "EOM", {
77     data = message }
78 )
79
80     goto done
81
82     ::need_more_data::
83
84     -- Wait for more
85     data
```

```
79         ctxt:hold(data)
80
81         data = nil
82
83         goto done
84
85         ::done::
86
87         -- If we have
88         more data to parse,
89         -- then do
90         parsing again.
91
92         if (data) then
93
94         goto split_message
95
96         end
97 end
98 <!--NeedCopy-->
```

## Configuring syslog protocol by using protocol extensions

September 21, 2020

The following steps add an user SYSLOG protocol to the Citrix ADC appliance.

Import the extension file to the Citrix ADC appliance, from either a web server (using HTTP) or your local workstation. For details about importing the extension file, see [Importing Extensions](#).

```
import ns extension local:syslog_parser.lua syslog_parser_code
```

Add a new user TCP-based protocol to the system by using the extension.

```
add user protocol USER_SYSLOG -transport TCP -extension syslog_parser_code
```

Add a service of type USER\_TCP to indicate that this is a user-defined protocol.

```
add service s1 10.102.90.112 USER_TCP 80
```

Add a user load balancing vserver and bind backend services to it.

```
1 add lb vs mysv USER_TCP
```

```
2
3 bind lb vs mysv s1
4 <!--NeedCopy-->
```

Add a user virtual server for the newly added protocol and make the load balancing virtual server configured in the previous step the default load balancer.

```
add user vs v_syslog USER_SYSLOG 10.217.24.28 80 -defaultlb mysv
```

## Protocol extensions command reference

September 21, 2020

The following table lists all the new commands added for custom protocols, and the existing commands that have been modified for custom protocols.

```
show lb persistentSessions [<vserv-name>]
```

- **CLI command:**

```
add user protocol <name> -transport ( TCP | SSL )-extension <string> -
comment <string>]>
```

- **Description:**

Adds a new user protocol to the Citrix ADC appliance by using extensions. Currently only user protocols with transport value TCP or SSL are supported.

**Example:**

```
add user protocol MQTT -transport TCP -extension mqtt_code
```

- **CLI command:**

```
rm user protocol <name>
```

- **Description:**

Removes a user protocol previously added to the Citrix ADC appliance.

**Example:**

```
rm user protocol mqtt
```

- **CLI command:**

```
set user protocol <name> -comment <string>
```

- **Description:**

Changes settings for a user protocol previously added to the Citrix ADC appliance.

**Example:**

```
set user protocol mqtt -comment "MQTT protocol implementation"
```

**• CLI command:**

```
unset user protocol <name> -comment
```

**• Description:**

Removes settings for a user protocol previously added to the Citrix ADC appliance.

**Example:**

```
unset user protocol mqtt -comment "MQTT protocol implementation"
```

**• CLI command:**

```
update ns extension <extension name>
```

**• Description:**

Updates the implementation for a previously added user protocol by using extensions.

You can update the protocol implementation only if the protocol is not being used by any user virtual server.

**Example:**

```
update ns extension my-extension
```

**• CLI command:**

```
add lb vserver <name> [USER_TCP | USER_SSL_TCP] [-lbmethod USER_TOKEN]  
[-persistencetype USERSESSION] [-timeout <value>]
```

**• Description:**

Adds a load balancing virtual server to the Citrix ADC appliance. This is an existing CLI command.

For load balancing user virtual servers, the service type to use is USER\_TCP or USER\_SSL\_TCP. The IP address and port are not allowed with user load balancing virtual servers.

For user load balancing virtual servers, only the ROUNDROBIN load balancing method is allowed, and the token value is provided by the extension code. Similarly, only USERSESSION persistence is allowed, and the persistence setting is provided by the extension code.

**Example:**

```
add lb vserver mysv USER_TCP -lbmethod ROUNDROBIN
```

**• CLI command:**

```
add user vserver <name> <userProtocol> <IPAddress> <port> -defaultLB <  
string> [-params <string>] [-comment <string>]
```

- **Description:**

Adds a virtual server for a user protocol by using extensions. The configured default user load balancing virtual server is available to the TCP client data extension handler as `ctxt.output`. For a virtual server, extension parameters can be set by using the `-params` option with a name and a value pair. The corresponding parameter value is available to the extension handlers as `ctxt.vserver.params.<paramName>`.

**Example:**

```
add user vs v_mqtt MQTT 10.217.24.28 80 -defaultlb mysv
```

- **CLI command:**

```
rm user vserver <name>
```

- **Description:**

Removes a user virtual server previously added to to the Citrix ADC appliance.

**Example:**

```
rm user vserver v_mqtt
```

- **CLI command:**

```
set user vserver <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-defaultLB <string>] [-params <string>] [-comment <string>]
```

- **Description:**

Changes settings for a user virtual server previously added to to the Citrix ADC appliance. When an extension parameter is assigned a new value by the `-params` option, the old value is overwritten.

**Example:**

```
set user vs v_mqtt MQTT 10.217.24.28 -defaultlb mysv -comment "MQTT protocol implementation"
```

- **CLI command:**

```
unset user vserver <name> [-params] [-comment]
```

- **Description:**

Removes the settings for a user virtual server previously added to to the Citrix ADC appliance. If you use the `-params` option to unset an extension parameter, the corresponding parameter value available to extension handlers is changed to nil.

**Example:**

```
unset user vs v_mqtt MQTT 10.217.24.28 -defaultlb mysv -comment "MQTT protocol implementation"
```

**• CLI command:**

```
show user protocol [<name>]
```

**• Description:**

Displays information about a user protocol, such as extension and callbacks.

**Example:**

```
show user protocol mqtt
```

**• CLI command:**

```
show user vserver [<name>]
```

**• Description:**

Displays information about a user virtual server.

**Example:**

```
show user vserver vs_mqtt
```

**• CLI command:**

```
stat user vserver [<name>]
```

**• Description:**

Displays statistics about a user virtual server.

**Example:**

```
stat user vserver vs_mqtt
```

**• CLI command:**

```
show lb persistentSessions [<vserv-name>]
```

**• Description:**

Displays information about persistent sessions. This is an existing CLI. For user protocols, the persistence type is shown as USERSESSION.

**• CLI command:**

```
rm lb vserver <name>
```

**• Description:**

Removes a user LB vserver previously added to the Citrix ADC appliance.

**Example:**

```
rm lb vserver mysv
```

**• CLI command:**

```
add service <name> <IPAddr> (USER_TCP | USER_SSL_TCP)<Port>
```

**• Description:**

Adds a backend service to be used for a user protocol. This is an existing CLI command with new service types USER\_TCP and USER\_SSL\_TCP.

**Example:**

```
add service mqtt_svr1 10.217.24.48 USER_TCP 1501
```

**Note:** The existing “set service and unset service” commands can be used to remove or change the settings of a previously added service for a user protocol.

**• CLI command:**

```
bind lb vserver <name> <serviceName>
```

**• Description:**

Binds a service to a user LB vserver. The service type should be USER\_TCP/USER\_SSL\_TCP for binding to an LB vserver with type of USER\_TCP/USER\_SSL\_TCP.

**Example:**

```
bind lb vserver mysv mqtt_svr1
```

**• CLI command:**

```
unbind lb vserver <name> <serviceName>
```

**• Description:**

Unbinds a previously bound service to a user LB vserver.

**Example:**

```
unbind lb vserver mysv mqtt_svr1
```

**• CLI command:**

```
rm service <name>
```

**• Description:**

Removes a service that is previously added for a user protocol.

**Example:**

```
rm service mqtt_svr1
```

## Troubleshooting protocol extensions

September 21, 2020

If your extension function is not behaving as expected, you can use extension tracing functionality to verify the behavior of your extension function. You can also add logging to your extension function by using the custom logging functionality, where you can define the log level to be captured on the Citrix ADC appliance.

### Custom logging

You can also add your own logging to your extension function. To do so, use the built-in `ns.logger:level()` function, where `level` is `emergency`, `alert`, `critical`, `error`, `warning`, `notice`, `info`, or `debug`. The parameters are the same as the C `printf()` function: a format string, and a variable number of arguments to supply values for the `%` specified in the format string. For example, you might add the following to the `COMBINE_HEADERS` function to log the result of a call:

```
1 local result\_str = table.concat(combined\_headers, "\\r\\n") .. "\\r\\n\\r\\n"
2
3 ns.logger:info("Result: %s", result\_str)
4
5 return result\_str
6 <!--NeedCopy-->
```

The above function would log the following message to `/var/log/ns.log` for the sample input shown in the abbreviated log messages examples in the Extension Tracing section above.

```
... : default NSEXTENSION Message 143 0 : "Result: Host: 10.217.24.7:2000^M
H1: abcd, 1234^M User-Agent: curl/7.24.0 (amd64-portbld-freebsd8.4)libcurl
/7.24.0 OpenSSL/0.9.8y zlib/1.2.3^M Accept: */.*^M H2: h2val1, h2val2,
h2val3^M ^M"
```

## Policy extensions

September 21, 2020

The policy extension feature enables you to write extension functions for built-in policy types. The extensions can be used in policy expressions, just like built-in functions. They are executed when the corresponding policy expressions are evaluated. This feature is useful for:

- Adding customized functions to existing Policies.
- Implementing logical constructs for complex customer requirements.

The policy extension feature addresses these limitations by enabling users to write extension functions for built in Policy types. The extensions can then be used in the policy expressions, just like built-in functions. They are executed when the corresponding policy expressions are evaluated.

The following table lists the policy types that can be used when writing an extension, and their associated mappings.

| Policy Type | Mapped Policy Type | Output                                   |
|-------------|--------------------|------------------------------------------|
| TEXT_T      | NSTEXT             | String                                   |
| BOOL_AT     | NSBOOL             | Boolean                                  |
| NUM_AT      | NSNUM              | Number (double-precision floating point) |
| DOUBLE_AT   | NSDOUBLE           | Number (double-precision floating point) |

### **Prerequisites for using policy extensions**

The imported functions must conform to the existing policy standards. Therefore:

- The function name must start with a letter and may contain numbers or underscores.
- The function name is treated as case insensitive by Citrix ADC policies.
- The function must return a single value even if the extension language returns multiple values.
- Functions with a variable number of arguments are not supported.

### **How do policy extensions work?**

The existing policies on a Citrix ADC appliance use an interpreter to evaluate the functions, which are imported in a policy extension file. When a user imports a new function in a policy extension file:

1. The extension file is validated for syntax and other conditions.
2. If the validation fails, the error is reported to the user.
3. If the validation succeeds, the extension file is imported to the Citrix ADC appliance and its contents can be used in policy expressions, just like any built-in policy function

- a) If the policy expression evaluation returns an error during runtime, it is reported as an undef event and the associated error counter is incremented.

**Note:** If a policy undef event occurs and the policy rule contains one or more policy extension functions, the

`show ns extension <name>` command displays the undef hits when applied to those policy extensions. If the extension function is aborted, the abort counter value is incremented.

- b) If the policy expression evaluation is successful, expression evaluation resumes until the entire expression is evaluated, or until it is aborted because of an error.

If the extension function takes too long to run, it is aborted, and the error counter pertaining to that extension function is incremented. The extension function is sandboxed, which prevents:

- Excessive CPU usage on the Citrix ADC appliance.
- Excessive memory usage on the Citrix ADC appliance.
- Usage of harmful built-in libraries or third-party libraries or binaries.
- Long-running scripts that could potentially cause the Citrix ADC appliance to reboot.

## Configuring policy extensions

February 25, 2021

When your policy extension file is ready, import it to the Citrix ADC appliance. The import process copies the extension file into a directory on the Citrix ADC appliance and checks for syntax errors.

After the import, you have to make the extension file available for use in the policy expressions.

**Note:** The import command is used to download the file content from an external source `<src>`, or an internal source, onto the Citrix ADC file system. To load this file content into one or more packet engines for the first time, use the add command. If there is an update to the file content, the updated content can be downloaded to the Citrix ADC file system by issuing the import command with the overwrite argument. The command updates the contents in the file system. To load the updated content to one or more packet engines, use the update command.

### Configure policy extensions by using the CLI

1. Import the policy extension file to the Citrix ADC Appliance, from either a web server (using HTTP) or your local workstation.
  - a) HTTP Import

If you have a web server available, you can store the extension file in the webserver directory and import it to the Citrix ADC appliance.

```
import ns extension <src> <name> [-comment<string>] [-overwrite]
```

**Example:**

```
import ns extension http://myhost/path/to/extension myextension -
comment "Custom crc calculation"
```

## b) Local Import

You can use the SSH client to copy the extension file from your workstation to the /var/tmp directory of the Citrix ADC appliance

```
scp extension-file-name <ns-userid@ns-ip-addr>:/var/tmp
```

where

- `extension-file-name` is the name of the extension file on your client machine.
- `ns-userid` is the Citrix ADC appliance user with permission to write to /var/tmp.
- `ns-ip-addr` is the Citrix ADC IP address.

After copying the file to the Citrix ADC appliance, run the import command on the Citrix ADC appliance.

```
1 import ns extension local:\<extension-file-name extension-name
  \>
2 <!--NeedCopy-->
```

**Note:** The CLI must be used to import a local extension file, by running the **import** command.

## 2. Add the policy extension to the packet engine for evaluation.

```
1 add ns extension <name> [-comment <string>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add ns extension myextension
2 <!--NeedCopy-->
```

After an extension file is imported, you can update it, if you included the -overwrite parameter in the import command, or remove it. You can also display the details of an imported extension file.

**Update an extension file on the Citrix ADC appliance from the source**

At the command prompt, type:

```
1 update ns extension <name>
2 <!--NeedCopy-->
```

**Note:** You can update the extension file only after importing the specified extension file to the Citrix ADC appliance with the -overwrite parameter.

**Example:**

“update ns extension myextension

```
1 ### Remove an extension file from the Citrix ADC appliance
2
3 At the command prompt type:
```

rm ns extension

```
1 **Example:**
```

rm ns extension myextension

```
1 ### Display the details of the specified extension function on the
   Citrix ADC appliance
2
3 At the command prompt, type:
```

show ns extension

```
1 **Example:**
```

show ns extension myextension

“

### Configure policy extensions by using the GUI

1. Import the policy extension file to the Citrix ADC Appliance, from either a web server (using HTTP) or your local workstation.
  - a) Navigate to **AppExpert > Policy Extensions**, click **Policy Extension**, from the **Import From** drop-down list, select the URL for the location of the extension file that you want to import.
  - b) Navigate to **AppExpert > Policy Extensions, Policy Extension** and import the extension file by selecting File in the **Import From** drop-down list.
2. Add the policy extension to the packet engine for evaluation.

Navigate to **AppExpert > Policy Extensions** and, on the **Policy Extensions** tab, add the extension file.

### **Update an extension file on the Citrix ADC appliance from the source**

Navigate to **AppExpert > Policy Extensions** and, on the **Policy Extensions** tab, update the extension file.

### **Remove an extension file from the Citrix ADC appliance**

Navigate to **AppExpert > Policy Extensions** and, **Policy Extensions** tab, remove the extension file.

### **Display the details of the specified extension function on the Citrix ADC appliance**

Navigate to **AppExpert > Policy Extensions** and, on the **Policy Extensions Functions** tab, click the click drop-down list arrow of the extension function that you want to see the details.

## **Policy extensions - use cases**

September 21, 2020

Certain customer applications have requirements that cannot be addressed with existing policies and expressions. The policy extension feature enables customers to add customized functions to their applications to meet their requirement.

The following use cases illustrate the addition of new functions using the policy extension feature on the Citrix ADC appliance.

- Case 1: Custom hash
- Case 2: Collapse double slashes in URLs
- Case 3: Combine headers

### **Case 1: Custom hash**

The CUSTOM\_HASH function provides a mechanism to insert any type of hash value in the responses sent to the client. In this use case, the hash function is used to compute the hash of the query string for a rewrite HTTP request and insert an HTTP header named CUSTOM\_HASH with the computed value. The CUSTOM\_HASH function implements the DJB2 hash algorithm.

### **Sample Usage of CUSTOM\_HASH:**

```
1 > add rewrite action test_custom_hash insert_http_header "CUSTOM_HASH"  
    "HTTP.REQ.URL.QUERY.CUSTOM_HASH"  
2 <!--NeedCopy-->
```

**Sample Definition of CUSTOM\_HASH():**

```
1      -- Extension function to compute custom hash on the text
2
3      -- Uses the djb2 string hash algorithm
4      function NTEXT:CUSTOM_HASH() : NTEXT
5
6          local hash = 5381
7
8          local len = string.len(self)
9
10         for i = 1, len do
11
12             hash = bit32.bxor((hash * 33), string.byte(self, i))
13
14         end
15
16         return tostring(hash)
17
18     end
19 <!--NeedCopy-->
```

**Line-by-line description of the above sample:**

```
1 function NTEXT:CUSTOM_HASH() : NTEXT
2
3 Defines the CUSTOM_HASH() function, with text input and a text return
  value.
4
5 local hash = 5381
6 local len = string.len(self)
7
8 Declares two local variables:
9
10 - hash. Accumulates the compute hash value and is seeded with the
   number 5381
11
12 - len. Sets to the length of the self input text string, using the
   built-in string.len() function.
13
14 for i = 1, len do
15     hash = bit32.bxor((hash * 33), string.byte(self, i))
16 end
17
18 Iterates through each byte of the input string and adds the byte to the
```

```

    hash. It uses the built-in string.byte() function to get the byte
    and the built-in bit32.bxor() function to compute the XOR of the
    existing hash value (multiplied by 33) and the byte.
19
20 return tostring(hash)
21
22 Calls the built-in tostring() function to convert the numeric hash
    value to a string and returns the string as the value of the
    function.
23 <!--NeedCopy-->

```

## Case 2: Collapse double slashes in URLs

Collapsing double slashes in URLs improves the website rendering time, because browsers parse the single slash URLs more efficiently. The single slash URLs also to maintain compatibility with applications that do not accept double slashes. The policy extension feature allows customers to add a function that replaces the double slashes with single slashes in the URLs. The following example illustrates the addition of a policy extension function that that collapses double slashes in URLs.

### Sample Definition of COLLAPSE\_DOUBLE\_SLASHES():

```

1    -- Collapse double slashes in URL to a single slash and return the
    result
2    function NSTEXT:COLLAPSE_DOUBLE_SLASHES() : NSTEXT
3
4        local result = string.gsub(self, "//", "/")
5
6        return result
7
8    end
9 <!--NeedCopy-->

```

### Line-by-line description of the above sample:

```

1 function NSTEXT:COLLAPSE_DOUBLE_SLASHES() : NSTEXT
2
3 Declares the COLLAPSE_DOUBLE_SLASHES() function with text input and
  return.
4
5 local result = string.gsub(self, "//", "/")
6
7 Declares a local variable named result and uses the built-in string.
  gsub() function to replace all double slashes with single slashes in
  the self input text.

```

```
8
9 The second parameter of string.gsub() is actually a regular expression
  pattern, although here a simple string is used for the pattern.
10
11 return result
12
13 Returns the resulting string.
14 <!--NeedCopy-->
```

### Case 3: Combine headers

Certain customer applications cannot handle multiple headers in a request. Also, parsing of duplicate headers with same header values, or multiple headers with same name but different values in a request, consumes time and network resources. The policy extension feature allows customers to add a function to combine these headers into single headers with a value combining the original values. For example, combining the values of the headers H1 and H2.

#### Original request:

```
1 GET /combine_headers HTTP/1.1
2 User-Agent: amigo unit test
3 Host: myhost
4 H2: h2val1
5 H1: abcd
6 Accept: */*
7 H2: h2val2
8 Content-Length: 0
9 H2: h2val3
10 H1: 1234
11 <!--NeedCopy-->
```

#### Modified request:

```
1 GET /combine_headers HTTP/1.1
2 User-Agent: amigo unit test
3 Host: myhost
4 H2: h2val1, h2val2, h2val3
5 H1: abcd, 1234
6 Accept: */*
7 Content-Length: 0
8 <!--NeedCopy-->
```

In general, this type of request modification is done using the Rewrite feature, using policy expressions to delineate the part of the request to be modified (the target) and the modification to be performed

(the string builder expression). However, policy expressions do not have the ability to iterate over an arbitrary number of headers.

The solution to this problem requires an extension to the policy facility. To do this, we will define an extension function, called `COMBINE_HEADERS`. With this function, we can set up the following rewrite action:

```
> add rewrite action combine_headers_act replace 'HTTP.REQ.FULL_HEADER.
AFTER_STR("HTTP/1.1\r\n")' 'HTTP.REQ.FULL_HEADER.AFTER_STR("HTTP/1.1\r\n").
COMBINE_HEADERS'
```

Here, the rewrite target is `HTTP.REQ.FULL_HEADER.AFTER_STR("HTTP/1.1\r\n")`. The `AFTER_STR("HTTP/1.1\r\n")` is required because `FULL_HEADER` includes the first line of the HTTP request (e.g. `GET /combine_headers HTTP/1.1`).

The string builder expression is `HTTP.REQ.FULL_HEADER.AFTER_STR("HTTP/1.1\r\n").COMBINE_HEADERS`, where the headers (minus the first line) are fed into the `COMBINE_HEADERS` extension function, which combines and returns the values for headers.

#### Sample Definition of `COMBINE_HEADERS()`:

```
1      -- Extension function to combine multiple headers of the same name
      into one header.
2
3
4
5      function NSTEXT:COMBINE_HEADERS(): NSTEXT
6
7          local headers = {
8      }
9      -- headers
10
11         local combined_headers = {
12     }
13     -- headers with final combined values
14         -- Iterate over each header (format "name:valuer\r\n")
15
16         -- and build a list of values for each unique header name.
17
18         for name, value in string.gmatch(self, "([^:]+):([^\r\n]*)\r\n"
19     ) do
20
21             if headers[name] then
22
23                 local next_value_index = #(headers[name]) + 1
```

```
24         headers[name][next_value_index] = value
25
26         else
27
28             headers[name] = {
29 name .. ":" .. value }
30
31
32         end
33
34     end
35
36
37
38     -- iterate over the headers and concat the values with
39     separator ","
40
41     for name, values in pairs(headers) do
42
43         local next_header_index = #combined_headers + 1
44
45         combined_headers[next_header_index] = table.concat(values,
46 ",")
47
48     end
49
50     -- Construct the result headers using table.concat()
51
52     local result_str = table.concat(combined_headers, "\r\n") .. "\r\n\r\n"
53
54     return result_str
55
56 end
57 <!--NeedCopy-->
```

**Line-by-line description of the above sample:**

```
1 function NSTEXT:COMBINE_HEADERS(): NSTEXT
2
3 Defines the COMBINE_HEADERS extension function, with the text input
  into the function from the policy expression and a text return type
  to the policy expression.
```

```

4
5 local headers = {
6 }
7 -- headers
8 local combined_headers = {
9 }
10 -- headers with final combined values
11
12 Declares local variables headers and combined_headers and initialize
   these variables to empty tables. headers will be a table of arrays
   of strings, where each array holds one or more values for a header.
   combined_headers will be an array of strings, where each array
   element is a header with its combined values.
13
14 for name, value in string.gmatch(self, "([^:]+):([^\\r\\n]*)\\r\\n") do
15 . . .
16 end
17 <!--NeedCopy-->

```

This generic for loop parses each header in the input. The iterator is the built-in `string.gmatch()` function. This function takes two parameters: a string to search, and a pattern to use to match pieces of the string. The string to search is supplied by the implicit `self` parameter, which is the text for the headers input into the function.

The pattern is expressed using a regular expression (regex for short). This regex matches the header name and value for each header, which the HTTP standard defines as `name:value\r\n`. The parentheses in the regex specify the matching parts to be extracted, so the regex schematic is `(match-name):(match-value)\r\n`. The `match-name` pattern needs to match all characters except the colon. This is written `[^:]+` (`[^:]` is any character except `:` and `+` is one or more repetitions). Similarly, the `match-value` pattern has to match any characters except the `\r\n`, so it is written `[^\\r\\n]` (`[^\\r\\n]` matches any character except `\r` and `\n` and `*` is zero or more repetitions). This makes the complete regex `([^:]+):([^\r\n]*)\r\n`.

The `for` statement uses a multiple assignment to set `name` and `value` to the two matches returned by the `string.gmatch()` iterator. These are implicitly declared as local variables within the body of the `for` loop.

```

1 if headers[name] then
2     local next_value_index = #(headers[name]) + 1
3     headers[name][next_value_index] = value
4 else
5     headers[name] = {
6     name .. ":" .. value }
7

```

```

8 end
9 <!--NeedCopy-->

```

These statements within the for loop put the header names and values into the headers table. The first time a header name is parsed (say H2: h2val1 in the example input), there is no headers entry for the name and headers[name] is nil.

Since nil is treated as false, the else clause is executed. This sets the headers entry for name to an array with one string value *name:value*.

**Note:** The array constructor in the else loop is equivalent to {[1] = name .. ":" .. value}, which sets the first element of the array.) For the first H2 header, it sets headers["H2"] = {"H2:h2val1"}.

On subsequent instances of a header, (say, H2: h2val2 in the example input). headers[name] is not nil, so the then clause is executed. This determines the next available index in the array value for headers[name], and puts the header value into that index. For the second H2 header, it sets headers["H2"] = {"H2:h2val1", "h2val2"}.

```

1 for name, values in pairs(headers) do
2     local next_header_index = #combined_headers + 1
3     combined_headers[next_header_index] = table.concat(values, ",")
4 end
5 <!--NeedCopy-->

```

After the original headers have been parsed and the headers table filled in, this loop builds the combined\_headers array. It uses the pairs() function as the for loop iterator.

Each call to pairs() returns the name and value of the next entry in the headers table.

The next line determines the next available index in the combined\_headers array, and the next line sets that array element to the combined header. It uses the built-in table.concat() function, which takes as its arguments an array of strings and a string to use as a separator, and returns a string that is the concatenation of the array strings, separated by the separator.

For example, for values = {"H2:h2val1", "h2val2"}, this produces "H2:h2val1, h2val2"

```

1 local result_str = table.concat(combined_headers, "\r\n") .. "\r\n\r\n"
2 <!--NeedCopy-->

```

After the combined\_headers array are built, it concatenates the elements into one string, and adds a double \r\n that terminates the HTTP headers.

```

1 return result_str
2 <!--NeedCopy-->

```

Returns a string as the result of the COMBINE\_HEADERS extension function.

## Troubleshooting policy extensions

September 21, 2020

If your extension function is not behaving as expected, you can use extension tracing functionality to verify the behavior of your extension function. You can also add logging to your extension function by using the custom logging functionality, where you can define the log level to be captured on the Citrix ADC appliance.

This topic provides information on:

- Extension tracing
- Custom logging

### Extension tracing

To show what your extension function is doing, extension tracing functionality logs the execution of the function to the Citrix ADC system log ( `/var/log/ns.log` ). The trace logging uses the DEBUG log level, which normally is not enabled. Therefore, you have to enable ALL log levels. Then you can enable tracing by setting the `-trace` option of the `set ns extension` command. The available settings are:

- `off` turn off tracing (equivalent to `unset ns extension -trace`).
- `calls` trace function calls with arguments and function returns with the first return value.
- `lines` trace the above plus line numbers for executed lines.
- `all` trace the above plus local variables changed by executed lines.

#### Example:

```
1 set audit syslogParams -loglevel ALL
2
3 set ns extension combine_headers -trace all
4 <!--NeedCopy-->
```

Each trace message has the format

```
log-header : default NSEXTENSION Message message-number 0 : "TRACE function
-name CALL call-number: event"
```

Where,

- `log-header` supplies timestamps, the Citrix ADC IP address, and the Packet Engine ID.
- `message-number` is a sequential number identifying the log message.
- `function-name` is the extension function name.

- call-number is a sequential number for each extension function call. It can be used to group all the trace messages for an extension function call.
- event is one of the following:
  - CALL function-name ; parameter-values indicates that the function has been called with the specified parameters.
  - RETURN FROM function-name ; return = value indicates that a function has returned the specified (first) value. (Additional return values are not reported.)
  - LINE line-number ; variable-values indicates that a line has been executed and lists any variables with changed values.

Where,

- value or values is
  - a number, with or without a decimal point,
  - a string, enclosed in double quotes and with escaped characters as described earlier,
  - a boolean true or false,
  - nil,
  - a table constructor, of the format {[key1]=value1,[key2]=value2, ...}.
- parameter-values is parameter1 = value1 ; parameter2 = value2 , ...
- variable-values is variable1 = value1 ; variable2 = value2 , ...

An example of abbreviated log messages:

```
1 >shell tail -f /var/log/ns.log | grep TRACE | more
2
3 ... NSEXTENSION Message 3035 0 : "TRACE combine_headers CALL 30 : CALL
  COMBINE_HEADERS; self = "User-Agent: curl/7.24.0 (amd64-portbld-
  freebsd8.4) libcurl/7.24.0 OpenSSL/0.9.8y zlib/1.2.3\r\nHost:
  10.217.24.7\r\nAccept: */*\r\nH2: h2val1\r\nH1: abcd\r\nH2: h2val2\r
  \nH2: h2val3\r\n\r\n"
4
5 ... NSEXTENSION Message 3036 0 : "TRACE combine_headers CALL 30 : LINE
  4; headers = {
6   }
7   "
8
9 ... NSEXTENSION Message 3037 0 : "TRACE combine_headers CALL 30 : LINE

16  
17 ... NSEXTENSION Message 3040 0 : "TRACE combine_headers CALL 30 : CALL  
    for iterator"  
18  
19 ... NSEXTENSION Message 3041 0 : "TRACE combine_headers CALL 30 :  
    RETURN FROM for iterator; return = " curl/7.24.0 (amd64-portbld-  
    freebd8.4) libcurl/7.24.0 OpenSSL/0.9.8y zlib/1.2.3"  
20  
21 ... NSEXTENSION Message 3042 0 : "TRACE combine_headers CALL 30 : LINE  
    9; name = "User-Agent"; value = " curl/7.24.0 (amd64-portbld-  
    freebd8.4) libcurl/7.24.0 OpenSSL/0.9.8y zlib/1.2.3"  
22  
23 ... NSEXTENSION Message 3043 0 : "TRACE combine_headers CALL 30 : LINE  
    10"  
24  
25 ... NSEXTENSION Message 3044 0 : "TRACE combine_headers CALL 30 : LINE  
    14; headers = {  
26 ["User-Agent"]={  
27 [1]="User-Agent: curl/7.24.0 (amd64-portbld-freebd8.4) libcurl/7.24.0  
    OpenSSL/0.9.8y zlib/1.2.3" }  
28 }  
29 "  
30  
31 . . .  
32  
33 ... NSEXTENSION Message 3117 0 : "TRACE combine_headers CALL 30 : CALL  
    for iterator"  
34  
35 ... NSEXTENSION Message 3118 0 : "TRACE combine_headers CALL 30 :  
    RETURN FROM for iterator; return = nil"  
36  
37 ... NSEXTENSION Message 3119 0 : "TRACE combine_headers CALL 30 : LINE  
    19"  
38  
39 ... NSEXTENSION Message 3120 0 : "TRACE combine_headers CALL 30 : CALL  
    concat"  
40  
41 ... NSEXTENSION Message 3121 0 : "TRACE combine_headers CALL 30 :  
    RETURN FROM concat; return = "User-Agent: curl/7.24.0 (amd64-portbld-  
    freebd8.4) libcurl/7.24.0 OpenSSL/0.9.8y zlib/1.2.3\r\nH1: abcd\r\n  
    nAccept: */*\r\nH2: 10.217.24.7\r\nH2: h2val1, h2val2, h2val3"  
... NSEXTENSION Message 3122 0 : "TRACE combine_headers CALL 30 :  
    LINE 25; result_str = "User-Agent: curl/7.24.0 (amd64-portbld-
```

```

    freesbsd8.4) libcurl/7.24.0 OpenSSL/0.9.8y zlib/1.2.3\r\nH1: abcd\r\n
    nAccept: */*\r\nHost: 10.217.24.7\r\nH2: h2val1, h2val2, h2val3\r\n\r\n"
42
43 ... NSEXTENSION Message 3123 0 : "TRACE combine_headers CALL 30 :
    RETURN FROM COMBINE_HEADERS; return = "User-Agent: curl/7.24.0 (
    amd64-portbld-freesbsd8.4) libcurl/7.24.0 OpenSSL/0.9.8y zlib/1.2.3\r
    \nH1: abcd\r\nAccept: */*\r\nHost: 10.217.24.7\r\nH2: h2val1, h2val2
    , h2val3\r\n\r\n\r\n"
44 <!--NeedCopy-->

```

## Custom logging

You can also add your own logging to your extension function. To do so, use the built-in `ns.logger:level()` function, where *level* is emergency , alert , critical , error , warning , notice , info , or debug. The parameters are the same as the C `printf()` function: a format string, and a variable number of arguments to supply values for the % specified in the format string. For example, you might add the following to the `COMBINE_HEADERS` function to log the result of a call:

```

1 local result_str = table.concat(combined_headers, "\r\n") .. "\r\n\r\n"
2
3 ns.logger:info("Result: %s", result_str)
4
5 return result_str
6 <!--NeedCopy-->

```

The above function would log the following message to `/var/log/ns.log` for the sample input shown in the abbreviated log messages examples in the Extension Tracing section above.

```

... : default NSEXTENSION Message 143 0 : "Result: Host: 10.217.24.7:2000^M
H1: abcd, 1234^M User-Agent: curl/7.24.0 (amd64-portbld-freesbsd8.4)libcurl
/7.24.0 OpenSSL/0.9.8y zlib/1.2.3^M Accept: */*^M H2: h2val1, h2val2,
h2val3^M ^M"

```

## Optimization

September 21, 2020

The Citrix ADC optimization features reduce transaction times between the clients and the servers, and they reduce bandwidth consumption. They also enhance server performance by offloading some tasks and making others more efficient.

| Feature                | Description                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client Keep-Alive      | Handles multiple requests on a single client connection. The client does not have to negotiate a new connection for each request to the server.                                                |
| HTTP Compression       | Compresses HTTP responses sent from the servers to compression-aware browsers. The smaller responses reduce download time and save bandwidth.                                                  |
| Integrated Caching     | Stores responses to client requests. Subsequent requests for the same content are served from the Citrix ADC cache instead of being forwarded to the origin server.                            |
| Front End Optimization | Reduces the load and render time of web pages by simplifying and optimizing the content served to the client browser. <b>Note:</b> Supported from NetScaler 10.5 onwards.                      |
| Content Accelerator    | Stores server responses on a Citrix ByteMobile T2100 appliance. <b>Note:</b> Supported from NetScaler 10.1 onwards.                                                                            |
| SPDY (Speedy)          | Acts as a SPDY gateway between clients and your servers, providing SPDY support without the need to configure/upgrade SPDY on the servers. <b>Note:</b> Supported from NetScaler 10.1 onwards. |

---

## Client keep-alive

February 18, 2021

The client keep-alive feature enables multiple clients requests to be sent on a single connection. This feature benefits transaction management. When the Client Keep-Alive mode is enabled on an appliance and the server response to the client request contains the Connection: close the HTTP header and performs the following tasks:

- Renames the existing Connection header name by shuffling the characters in the header name.

- Adds a new Connection: header with Keep-Alive as the value for the header.

The Client Keep-Alive mode enables the Citrix ADC appliance to process multiple requests and responses using the same socket connection. The feature keeps the connection between the client and the client-side connection opens even after the server closes the connection with the appliance. This feature allows multiple clients requests using a single connection and saves the round trips associated in opening and closing a connection. Client keep-alive is most beneficial in SSL sessions.

Client keep-alive is useful for the following scenarios:

- If the server does not support the client keep-alive.
- If the server supports but an application on the server does not support the client keep-alive.

**Note:**

Client keep-alive is applicable for HTTP and SSL traffic. Client-keep alive can be configured globally to handle all traffic. Also, you can activate it on specific services.

In the client keep-alive environment, the configured services intercept the client traffic and the client request is directed to the origin server. The server sends the response and closes the connection between the server and the appliance. If a “Connection: Close” header is present in the server response, the appliance corrupts this header in the client-side response, and the client-side connection is kept open. As a result, the client does not have to open a new connection for the next request. Instead, the connection to the server is reopened.

**Note:**

If a server sends back two “Connection: Close” headers, only one is edited. This results in significant delays on the client rendering of the object because a client does not assume that the object has been delivered completely until the connection is closed.

## Configure client keep-alive

Client keep-alive, by default, is disabled on the Citrix ADC, both globally and at service level. Therefore, you must enable the feature at the required scope.

**Note:**

If you enable the client keep-alive globally, it is enabled for all services, regardless of whether you enable it at the service level. Also, you must configure some HTTP parameters to specify the following:

- the maximum number of HTTP connections retained in the connection reuse pool.
- enable connection multiplexing, and enable persistence Etag.

**Note:**

When Persistent ETag is enabled, the ETag header includes information about the server that

served the content. This ensures that cache validation conditional requests or browser requests, for that content, always reaches the same server.

### Configure client keep-alive by using Citrix ADC command interface

At the command prompt, do the following:

1. Enable client keep-alive on the Citrix ADC.
  - At global level - `enable ns mode cka`
  - At service level - `set service <name> -CKA YES`

**Note:**

Client keep-alive can be enabled only for HTTP and SSL services.

2. Configure HTTP parameters on the HTTP profile that is bound to one or more services.

```
1 set ns httpProfile <name> -maxReusePool <value> -conMultiplex
   ENABLED -persistentETag ENABLED
2 <!--NeedCopy-->
```

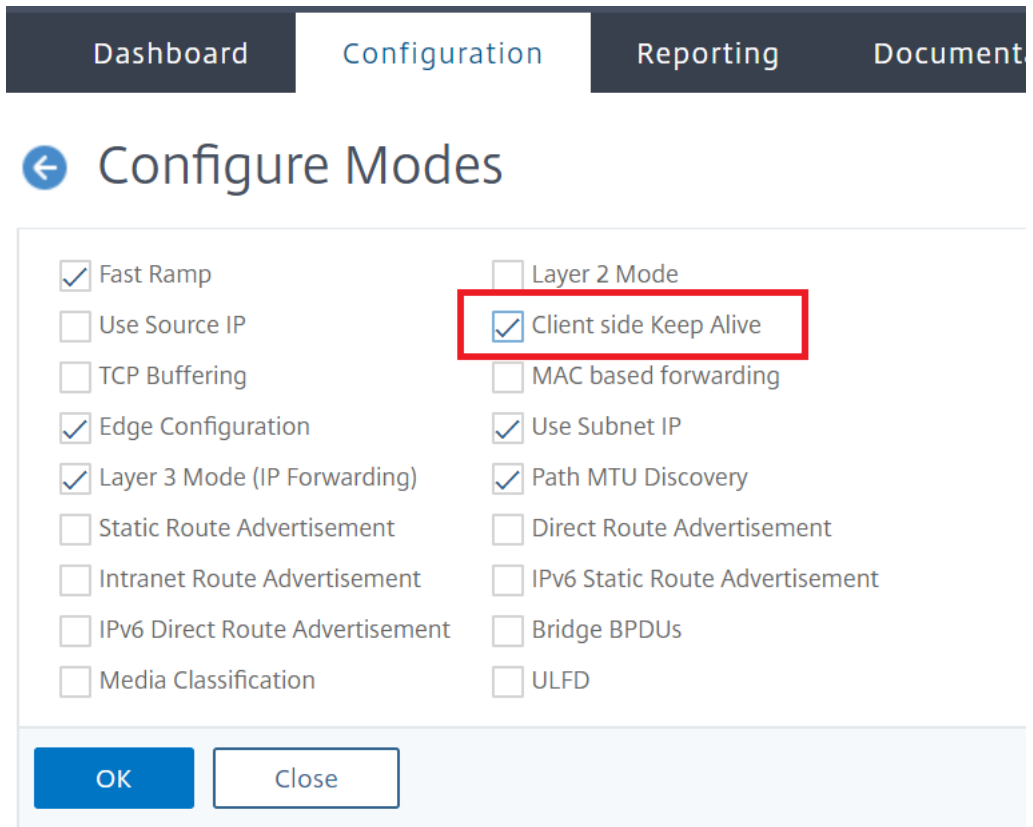

**Note:**

Configure these parameters on the `nshttp_default _profile` HTTP profile, to make them available globally.

### Configure client keep-alive by using Citrix ADC GUI

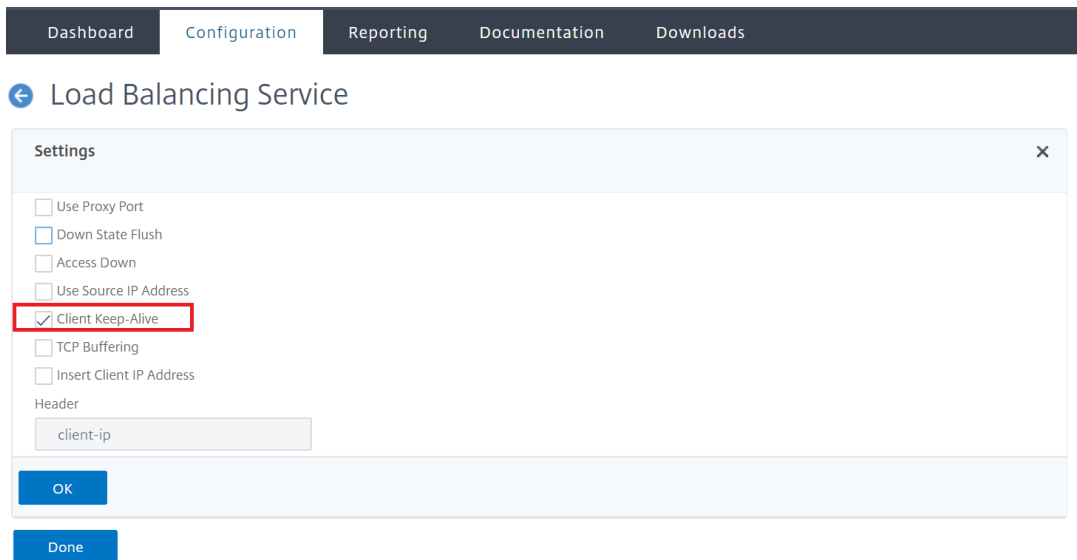

1. Enable client keep-alive on the Citrix ADC.
  - At global level  
Navigate to **System > Settings**, click **Configure Modes** and select **Client side Keep Alive**.

- At service level

Navigate to **Traffic Management > Load Balancing > Services**, and select the required service. In the **Settings** section, select **Client Keep-Alive** check box.

2. Configure the required HTTP parameters on the HTTP profile that is bound to one or more ser-

vices.

3. Navigate to **System > Profiles**, and on **HTTP Profiles** tab, select the required profile and update the required HTTP parameters.

## HTTP compression

September 21, 2020

For websites with compressible content, the HTTP compression feature implements lossless compression to alleviate latency, long download times, and other network-performance problems by compressing the HTTP responses sent from servers to compression-aware browsers. You can improve server performance by offloading the computationally intensive compression task from your servers to the Citrix ADC appliance.

The following table describes the capabilities of the HTTP compression feature:

| Functionality        | Description                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Compression Ratio    | Compression ratio depends on the types of files in the responses, but is always significant, noticeably reducing amount of data transmitted over the network.                                               |
| Browser Awareness    | Citrix ADC serves compressed data to compression aware browsers only, reducing the transaction time between the client and the server. Most modern web browsers support HTTP compression.                   |
| Compression blocking | You can define content filters to selectively block compression by applying built-in actions.                                                                                                               |
| Compression Caching  | With the integrated caching feature enabled, subsequent requests for the same content are served from the local cache, reducing the number of round trips to the server and improving transaction times.    |
| HTTPS Support        | Compression is particularly useful on SSL connections, because it reduces the amount of content that has to be encrypted, either on the server or by the Citrix ADC appliance, and decrypted by the client. |

| Functionality                  | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Intelligent Response Filtering | The Citrix ADC compression engine intelligently filters server responses on the basis of defined compression parameters. For example, the compression engine detects zero-content-length responses and compressed responses and does not compress them. The detection of compressed responses enables origin sites to use server-based compression in conjunction with the Citrix ADC compression feature. |
| Compression Switching          | The Citrix ADC appliance transparently directs requests from compression aware clients to compression capable servers, so that responses to those clients are compressed, and responses to other clients are not delayed by compression processing.                                                                                                                                                        |

## How HTTP compression works

A Citrix ADC can compress both static and dynamically generated data. It applies the GZIP or the DEFLATE compression algorithm to remove extraneous and repetitive information from the server responses and represent the original information in a more compact and efficient format. This compressed data is sent to the client's browser and uncompressed as determined by the browser's supported algorithm or algorithms (GZIP or DEFLATE).

Citrix ADC compression treats static and dynamic content differently.

- Static files are compressed only once, and a compressed copy is stored in local memory. Subsequent client requests for cached files are serviced from that memory.
- Dynamic pages are dynamically created each time a client requests them.

When a client sends a request to the server:

1. The client request arrives at the Citrix ADC. The ADC examines the headers and stores information about what kind of compression, if any, the browser supports.
2. The ADC forwards the request to the server and receives the response.
3. The Citrix ADC compression engine examines the server response for compressibility by matching it against policies.
4. If the response matches a policy associated with a compression action, and the client browser

supports a compression algorithm specified by the action, the Citrix ADC applies the algorithm and sends the compressed response to the client browser.

5. The client applies the supported compression algorithm to decompress the response.

## Configure HTTP compression

By default, compression is disabled on the Citrix ADC. You must enable the feature before configuring it. If the feature is enabled, the ADC compresses server requests specified by compression policies.

To enable HTTP compression by using the CLI

Compression can be enabled for HTTP and SSL services only. You can enable it globally, so that it applies to all HTTP and SSL services, or you can enable it just for specific services.

At the command prompt, enter one of the following commands to enable compression globally or for a specific service:

- `enable ns feature cmp`  
OR
- `set service \<name\> -CMP YES`

To configure compression by using the GUI

Do one of the following:

To enable compression globally, navigate to System > Settings, click Configure Basic Features, and select HTTP Compression.

To enable compression for a specific service, navigate to Traffic Management > Load Balancing > Services, select the service, and click Edit. In the Settings group, click the pencil icon and enable Compression.

## Configuring a compression action

A compression action specifies the action to take when a request or response matches the rule (expression) in the policy with which the action is associated. For example, you can configure a compression policy that identifies requests that will be sent to a particular server, and associate the policy with an action that compresses the server's response.

There are four built-in compression actions:

- **COMPRESS:** Uses the GZIP algorithm to compress data from browsers that support either GZIP or both GZIP and DEFLATE. Uses the DEFLATE algorithm to compress data from browsers that support only the DEFLATE algorithm. If the browser does not support either algorithm, the browser's response is not compressed.
- **NOCOMPRESS:** Does not compress data.

- GZIP: Uses the GZIP algorithm to compress data for browsers that support GZIP compression. If the browser does not support the GZIP algorithm, the browser's response is not compressed.
- DEFLATE: Uses the DEFLATE algorithm to compress data for browsers that support the DEFLATE algorithm. If the browser does not support the DEFLATE algorithm, the browser's response is not compressed. After creating an action, you associate the action with one or more compression policies.

At the command prompt, enter the following command to create a compression action:

```
add cmp action <name> <cmpType> [-addVaryHeader <addVaryHeader> -varyHeaderValue <string>]
```

To configure a compression policy by using the CLI

A compression policy contains a rule, which is a logical expression that enables the Citrix ADC appliance to identify the traffic that should be compressed.

When the Citrix ADC receives an HTTP response from a server, it evaluates the built-in compression policies and any custom compression policies to determine whether to compress the response and, if so, the type of compression to apply. Priorities assigned to the policies determine the order in which the policies are matched against the requests.

At the command prompt, enter the following command to create a compression policy:

```
add cmp policy <name> -rule <expression> -resAction <string>
```

To create a compression action by using the GUI

Navigate to **Optimization > HTTP Compression > Actions** , click **Add** , and create a compression action to specify the type of compression to be performed on the HTTP response.

### Configuring a compression policy

A compression policy contains a rule, which is a logical expression that enables the Citrix ADC appliance to identify the traffic that should be compressed.

When the Citrix ADC receives an HTTP response from a server, it evaluates the built-in compression policies and any custom compression policies to determine whether to compress the response and, if so, the type of compression to apply. Priorities assigned to the policies determine the order in which the policies are matched against the requests.

The following table lists the built-in HTTP compression policies. These policies are activated globally when you enable compression.

| Built-in Classic or Default Syntax Policy    | Description                                                                                                                                                       |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ns_nocmp_mozilla_47, ns_adv_nocmp_mozilla_   | Prevents compression of CSS files when a request is sent from a Mozilla 4.7 browser.                                                                              |
| ns_cmp_mscss, ns_adv_cmp_mscss               | Compresses CSS files when the request is sent from a Microsoft Internet Explorer browser.                                                                         |
| ns_cmp_msapp, ns_adv_cmp_msapp               | Compresses files that are generated by the following applications: Microsoft Office Word, Microsoft Office Excel, Microsoft Office PowerPoint.                    |
| ns_cmp_content_type, ns_adv_cmp_content_type | Compresses data when the response contains Content-Type header and contains text.                                                                                 |
| ns_nocmp_xml_ie, ns_adv_nocmp_xml_ie         | Prevents compression when a request is sent, from a Microsoft Internet Explorer browser and the response contains a Content-Type header and contains text or xml. |

## Binding a compression policy

To put a compression policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the Citrix ADC, or to a specific virtual server, so that the policy applies only to requests whose destination is the VIP address of that virtual server.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

To bind a Compression Policy by using the CLI

At the command prompt, enter one of the following commands to bind a compression policy globally or to a specific virtual server:

- `bind cmp global <policyName> [-priority <positive_integer>] [-state (ENABLED|DISABLED)]...`
- `bind lb vserver <vserverName> -policyName <policyName> -priority <positive_integer>.`

Repeat this command for each virtual server to which you want to bind the compression policy.

To bind a compression policy by using the GUI

Do one of the following:

At global level Navigate to **Optimization > HTTP Compression > Policies**, click **Policy Manager** and bind the required policies by specifying the relevant Bind Point and Connection Type (Request/Response).

At virtual server level

For load balancing virtual server, Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select the required virtual server, click **Policies**, and bind the relevant policy.

For content switching virtual server, Navigate to Traffic Management > Content Switching > Virtual Servers, select the required virtual server, click Policies, and bind the relevant policy.

Set the Global Compression Parameters for Optimal Performance

Many users accept the default values for the global compression parameters, but you might be able to provide more effective compression by customizing these settings.

**Note**

After you configure the global compression parameters, you do not have to reboot your appliance. They get applied to the new flows immediately.

The following table describes the compression parameters that you can set on the Citrix ADC.

| Compression Parameters          | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Quantum size                    | Size, in KB, of the buffer maintained for accumulating server responses. The responses are compressed when the buffer size exceeds this value. For example, if you set the quantum size to 50 KB, the Citrix ADC compresses the buffer's contents when its size becomes larger than 50 KB. Minimum value: 1. Maximum value: 63488. Default: 57344. |
| Compression level               | Level of compression to apply to server responses. Possible values: Best Speed, Best Compression, optimal.                                                                                                                                                                                                                                         |
| Minimum HTTP response size      | Minimum size, in bytes, of an HTTP response that is compressed. Responses smaller than the value specified by this parameter are sent without being compressed.                                                                                                                                                                                    |
| Bypass compression on CPU usage | Citrix ADC CPU usage, as a percentage, at or above which no compression is done. Default: 100.                                                                                                                                                                                                                                                     |

| Compression Parameters        | Description                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy Type*                  | Type of policies used for compression. Possible values: Classic, Default Syntax. Default: Classic.                                                       |
| Allow Server-side compression | Allow servers to send compressed data to the Citrix ADC.                                                                                                 |
| Compress push packet          | Upon receipt of a packet with a TCP PUSH flag, compress the accumulated packets immediately, without waiting for the quantum buffer to be filled.        |
| External Cache                | Issue a private response directive indicating that the response message is intended for a single user and must not be cached by a shared or proxy cache. |

To configure HTTP compression by using the GUI

Do one of the following:

- To enable compression globally, navigate to **System > Settings**, click **Configure Basic Features**, and select **HTTP Compression**.
- To enable compression for a specific service, navigate to **Traffic Management > Load Balancing > Services**, select the service, and click **Edit**.
- In the **Settings** group, click the pencil icon and enable **Compression**.

To create a compression action by using the GUI

Navigate to **Optimization > HTTP Compression > Actions**, click **Add**, and create a compression action to specify the type of compression to be performed on the HTTP response

To create a compression policy by using the GUI

Navigate to **Optimization > HTTP Compression > Policies**, click **Add**, and create a compression policy by specifying the condition and the corresponding action to be executed.

## Evaluate compression configuration

You can view the compression statistics in the dashboard utility or in an SNMP monitor. The dashboard utility displays summary and detailed statistics in a tabular and graphic format.

Optionally, you can also view statistics for a compression policy, including the number of hits that the policy counter increments during the policy based compression.

**Note**

- For more information about the statistics and charts, see the Dashboard help on the Citrix ADC appliance.
- For more information about SNMP, see [SNMP](#) topic.

To view compression statistics by using the CLI

At the command prompt, enter the following commands to display the compression statistics:

1. To display compression statistics summary.

```
stat cmp
```

**Note**

The `stat cmp` policy command displays statistics for default syntax compression policies only.

2. To display compression policy hits and details

```
show cmp policy \<name\>
```

3. To display detailed compression statistics

```
stat cmp -detail
```

To view compression statistics by using the dashboard:

In the Dashboard utility, you can display the following types of compression statistics:

- Select Compression to display a summary of the compression statistics.
- To display detailed compression statistics by protocol type, click the Details
- To display the rate of requests processed by the compression feature, click the Graphical View tab.

To view compression statistics by using SNMP

You can view the following compression statistics by using the SNMP network management application.

- Number of compression requests (OID: 1.3.6.1.4.1.5951.4.1.1.50.1)
- Number of compressed bytes transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.2)
- Number of compressible bytes received (OID: 1.3.6.1.4.1.5951.4.1.1.50.3)
- Number of compressible packets transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.4)
- Number of compressible packets received (OID: 1.3.6.1.4.1.5951.4.1.1.50.5)
- Ratio of compressible data received and compressed data transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.6)
- Ratio of total data received to total data transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.7)

To view additional compression statistics by using the GUI

1. To display HTTP compression statistics:

Navigate to **Optimization > HTTP Compression** and click **Statistics**.

2. To display statistics of a compression policy.

Navigate to **Optimization > HTTP Compression > Policies** > select the policy, and click **Statistics**.

3. To display statistics of a compression policy label

4. Navigate to **Optimization > HTTP Compression > Policies** > select a policy label, and click **Statistics**.

## Offloading HTTP compression

Performing compression on a server can affect the server's performance. A Citrix ADC placed in front of your web servers and configured for HTTP compression offloads compression of both static and dynamic content, saving server CPU cycles and resources.

You can offload compression from the Web servers in either of two ways:

Disable compression on the web servers, enable the Citrix ADC Compression feature at a global level, and configure services for compression.

Leave the compression feature enabled on the web servers and configure the Citrix ADC appliance to remove the "Accept Encoding" header from all HTTP client requests. The servers then send uncompressed responses. The Citrix ADC compresses the server responses before sending them to the clients.

### Note

The second option does not work if the servers automatically compress all responses. The Citrix ADC does not attempt to compress a response that is already compressed.

The `Servercmp` parameter enables the Citrix ADC appliance to handle offload HTTP compression. By default, this parameter is set ON for the server to send compressed data to the Citrix ADC appliance. To offload HTTP compression, you need to set the `servercmp` parameter to OFF. At the command prompt, enter the following commands:

```
set service <service name> -CMP YES
```

Repeat this command for each service for which you want to enable compression.

```
show service <service name>
```

Repeat this command for each service, to verify that compression is enabled.

```
Save config
```

```
set cmp parameter -serverCmp OFF
```

### Note:

When `Servercmp` parameter is turned on and if the appliance receives compressed response from the server, the appliance does not further compress the data. Instead, it forwards the com-

pressed response to the client.

## Integrated caching

September 21, 2020

The integrated cache provides in-memory storage on the Citrix ADC appliance and serves Web content to users without requiring a round trip to an origin server. For static content, the integrated cache requires little initial setup. After you enable the integrated cache feature and perform basic setup (for example, determining the amount of Citrix ADC appliance memory the cache is permitted to use), the integrated cache uses built-in policies to store and serve specific types of static content, including simple webpages and image files. You can also configure the integrated cache to store and serve dynamic content that is marked as non-cacheable by Web and application servers (for example, database records and stock quotes).

### Note

The term Integrated Cache can be interchangeably used with AppCache; note that from a functionality point of view, both terms mean the same.

When a request or response matches the rule (logical expression) specified in a built-in policy or a policy that you have created. The Citrix ADC appliance performs the action associated with the policy. By default, all policies store cached objects in and retrieve them from the default content group. You can create your own content groups for different types of content.

To enable the appliance to find cached objects in a content group, you can configure selectors. The selectors match cached objects against expressions, or you can specify parameters for finding objects in the content group. If you use selectors as recommended by Citrix, configure them first, so that you can specify selectors when you configure content groups. Next, set up any content groups that you want to add, so that they are available when you configure the policies. To complete the initial configuration, create policy banks by binding each policy to a global bind point or a virtual server. Or, you can bind a label that can be called from other policy banks.

Integrated caching can be improved using pre-loading cached object method before they are scheduled to expire. To manage the handling of cached data, you can configure caching-related headers inserted into the responses. The integrated cache can also act as a forward proxy for other cache servers.

### Note:

Integrated caching requires some familiarity with HTTP requests and responses.

For information about the structure of HTTP data, see *Live HTTP Headers* at "<http://livehttpheaders.mozdev.org/>."

## How integration cache works

The integrated cache monitors HTTP and SQL requests that flow through the Citrix ADC appliance and compares the requests with stored policies. Depending on the outcome, the integrated cache feature either searches the cache for the response or forwards the request to the origin server. For HTTP requests, integrated caching serves as partial content from the cache in response to single byte-range and multi-part byte-range requests.

Cached data is compressed if the client accepts compressed content. You can configure expiration times for a content group, and you can selectively expire entries in a content group.

Data that is served from the integrated cache is a **hit**, and data served from the origin is a cache miss, as described in the following table.

| Transaction Type    | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache Hit           | Responses that the Citrix ADC appliance serves from the cache, including: Static objects, for example, image files and static webpages, 200 OK pages, 203 Non-Authoritative Response pages, 300 Multiple Choices pages, 301 Moved Permanently pages, 302 Found pages, 304 Not Modified pages, These responses are known as positive responses. The Citrix ADC appliance also caches the following negative responses: 307 Temporary Redirect pages, 403 Forbidden pages, 404 Not Found pages, 410 Gone pages. To further improve performance, you can configure the Citrix ADC appliance to cache more types of content. |
| Storable Cache Miss | For a storable cache miss, the Citrix ADC appliance fetches the response from the origin server, and stores the response in the cache before serving it to the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Transaction Type        | Specification                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Non-Storable Cache Miss | A non-storable cache miss is inappropriate for caching. By default, any response that contains the following status codes is a non-storable cache miss: 201, 202, 204, 205, 206 status codes, All 4xx codes, except 403, 404 and 410, 5xx status codes |

**Note:**

To integrate dynamic caching with your application infrastructure, use the NITRO API to issue cache commands remotely. For example, you can configure triggers that expire cached responses when a database table is updated.

To ensure the synchronization of cached responses with the data on the origin server, you configure expiration methods. When the Citrix ADC appliance receives a request that matches an expired response, it refreshes the response from the origin server.

**Note:**

Citrix recommends that you synchronize the times on the Citrix ADC appliance and one or more back-end servers.

**How dynamic cache works**

Dynamic caching evaluates HTTP requests and responses based on parameter-value pairs, strings, string patterns, or other data. For example, suppose that a user searches for Bug 31231 in a bug reporting application. The browser sends the following request on the user's behalf:

```

1 GET /mybugreportingsystem/mybugreport.dll?IssuePage&RecordId=31231&
   Template=view&TableId=1000
2
3 Host: mycompany.net
4
5 User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9)
   Gecko/2008052906 Firefox/3.0
6
7 Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
8
9 Accept-Language: en-us,en;q=0.5
10
11 . . .

```

In this example, GET requests for this bug reporting application always contain the following parameters:

- IssuePage
- RecordID
- Template
- TableId

GET requests do not update or alter the data, so you can configure these parameters in caching policies and selectors, as follows:

- You configure a caching policy that looks for the string `mybugreportingsystem` and the GET method in HTTP requests. This policy directs matching requests to a content group for bugs.
- In the content group for bugs, you configure a `hit` selector that matches various parameter-value pairs, including `IssuePage`, `RecordID`, and so on.

#### Note

A browser can send multiple GET requests based on one user action. The following is a series of three separate GET requests that a browser issues when a user searches for a bug based on a bug ID.

```
1 GET /mybugreportingsystem/mybugreport.dll?IssuePage&RecordId=31231&
   Template=view&TableId=1000
2
3 GET /mybugreportingsystem/mybugreport.dll?IssuePage&Template=viewbtns&
   RecordId=31231&TableId=1000
4
5 GET /mybugreportingsystem/mybugreport.dll?IssuePage&Template=viewbody&
   RecordId=31231&tableid=1000
```

To fulfill these requests, multiple responses are sent to the user's browser, and the webpage that the user sees is an assembly of the responses.

If a user updates a bug report, the corresponding responses in the cache must be refreshed with data from the origin server. The bug reporting application issues HTTP POST requests when a user updates a bug report. In this example, you configure the following to ensure that POST requests trigger invalidation in the cache:

- A request-time invalidation policy that looks for the string `mybugreportingsystem` and the POST HTTP request method, and directs matching requests to the content group for bug reports.
- An invalidation selector for the content group for bug reports that expires cached content based on the `RecordID` parameter. This parameter appears in all the responses, so the invalidation selector can expire all relevant items in the cache.

The following excerpt shows a POST request that updates the sample bug report.

```
1 POST /mybugreportingsystem/mybugreport.dll?TransitionForm HTTP/1.1\r\n
2
3 User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.0) Opera
   7.23 [en]\r\n
4
5 Host: mybugreportingsystem\r\n
6
7 Cookie:ttSearch.134=%23options%3Afalse%23active%23owner%3Afalse%23
   unowned%3Afalse%23submitter%3Afalse%23incsub%3Atrue;
8
9 Cookie2: $Version=1\r\n
10
11 . . .
12
13 \r\n
14
15 ProjectId=2&RecordId=31231&TableId=1000&TransitionId=1&Action=Update&
   CopyProjectId=0&ReloadForm=0&State=&RecordLockId=49873+issues+in+
   HTTP&F43. . .
```

When the Citrix ADC appliance receives this request, it does the following:

- Matches the request with an invalidation policy.
- Finds the content group that is named in the policy.
- Applies the invalidation selector for this content group and expires all responses that match RecordID=31231.

When a user issues a new request for this bug report, the Citrix ADC appliance goes to the origin server for updated copies of all the responses that are associated with the report instance. It stores the responses in the content group, and serves them to the user's browser, which reassembles the report and displays it.

### Configure integrated cache

To use the integrated cache, you must install the license and enable the feature. After you enable the integrated cache, the Citrix ADC® appliance automatically caches static objects as specified by built-in policies and generates statistics on cache behavior. (Built-in policies have an underscore in the initial position of the policy name.)

Even if the built-in policies are adequate for your situation, you might want to modify the global attributes. For example, you might want to modify the amount of Citrix ADC appliance memory allocated to the integrated cache.

If you would like to observe cache operation before changing settings, see [“Displaying Cached Objects and Cache Statistics.”](#)

**Note**

The Citrix ADC cache is an in-memory store that is purged when you restart the appliance.

To install integrated cache license

- An integrated cache license is required. For information about licenses, see information about [obtaining the licenses](#) topic.
- Obtain a license code from Citrix, go to the command line interface, and log in.

At the command line interface, copy the license file to the `/nsconfig/license` folder.

- Reboot the Citrix ADC appliance by using the following command:

```
reboot
```

**To enable integrated caching:**

When you enable integrated caching, the Citrix ADC appliance begins caching server responses. If you have not configured any policies or content groups, the built-in policies store cached objects in the Default content group.

At the command prompt, type one of the following commands to enable or disable integrated caching:

```
1 enable ns feature IC
```

To configure global attributes for caching

Global attributes apply to all cached data. You can specify the amount of Citrix ADC memory allocated to the integrated cache, via header insertion. A criterion for verifying that a cached object must be served. The maximum length of a POST body permitted in the cache, whether to bypass policy evaluation for HTTP GET requests, and an action to take when a policy cannot be evaluated.

The cache memory capacity is limited only by the memory of the hardware appliance. Also, any packet engine (central distribution hub of all incoming TCP requests) in the nCore Citrix ADC appliance is aware of objects cached by other packet engines in the nCore Citrix ADC appliance.

**Note:**

When the default global memory limit is set as 0 and the Integrated Caching (IC) feature is enabled, the appliance does not cache any objects. For caching, you must explicitly configure the global memory limit. However, if you enable “set authentication, authorization, and auditing parameter enableStaticPageCaching” option, there will be some default memory configured in the appliance. This memory is insufficient for caching large Objects and so it is necessary to assign a higher memory limit for IC. You can perform this by configuring the “set cache parameter -memLimit” command. The new setting is applied only after you save the configuration and

reboot the appliance.

You can modify the global memory limit configured for caching objects. However, when you update the global memory limit to a value lower than the existing value (for example, from 10 GB to 4 GB), the appliance continues to use the memory limit.

It means that even though the integrated caching limit is configured to some value, the actual limit used can be higher. This excessive memory is however released when the objects are removed from cache.

The output of the show cache parameter command indicates the configured value (memory Usage limit) and the actual value being used (memory usage limit (active value)).

At the command prompt, type:

```
1 set cache parameter [-memLimit <MBytes>] [-via <string>] [-verifyUsing
  <criteria>] [-maxPostLen <positiveInteger>] [-prefetchMaxPending <
  positiveInteger>] [-enableBypass(YES|NO)] [-undefAction (NOCACHE|
  RESET)]
```

#### To enable integrated caching by using the GUI:

Navigate to **System > Settings**, click **Configure Basic Features**, and select **Integrated Caching**.

#### To configure global settings for caching by using the GUI:

Navigate to **Optimization > Integrated Caching**, click **Change Cache Settings**, and configure the global settings for caching.

#### To set up built-in content group, pattern set, and policies for Integrated Cache:

The Citrix ADC appliance includes a built-in integrated caching configuration that you can use for caching content. The configuration consists of a content group called `ctx_cg_poc`, a pattern set called `ctx_file_extensions`, and a set of integrated cache policies. In the content group `ctx_cg_poc`, only objects that are 500 KB or smaller are cached. The content is cached for 86000 seconds, and the memory limit for the content group is 512 MB. The pattern set is an indexed array of common extensions for file-type matching.

The following table lists the built-in integrated caching policies. By default, the policies are not bound to any bind point. You must bind the policies to a bind point if you want the Citrix ADC appliance to evaluate traffic against the policies. The policies cache objects in the `ctx_cg_poc` content group.

| Integrated caching policy name         | Policy rule                                                    |
|----------------------------------------|----------------------------------------------------------------|
| <code>_cacheVPNStaticObjects</code>    | <code>HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).CONTAINS_M</code> |
| <code>_cacheTCPVPNStaticObjects</code> | <code>HTTP.REQ.URL.ENDSWITH(".css")</code>                     |
| <code>_cacheOCVPNStaticObjects</code>  | <code>HTTP.REQ.URL.ENDSWITH(".pdf")</code>                     |

| Integrated caching policy name | Policy rule                                                          |
|--------------------------------|----------------------------------------------------------------------|
| _cacheWFStaticObjects          | HTTP.REQ.URL.ENDSWITH(".js")                                         |
| _mayNoCacheReq                 | HTTP.RES.HEADER("Content-Type").CONTAINS("application/x-javascript") |
| _noCacheRest                   | TRUE                                                                 |

## Flush cache configuration

You can flush a cache group, cache groups, or cache object locator. Following are the commands to flush cache objects.

At the command prompt, type:

```
flush cache contentgroup all
```

### Example

```

1      0x00000089bae000000004 DEFAULT GET //1.1.1.1:80/html/index.html?
      name=hello
2      0x00000089bae000000005 DEFAULT GET //1.1.1.1:80/html/index.html?
      name=hi
3
4      Flush cache contentGroup all
5      done

```

```
flush cache contentgroup <content group name>
```

### Example

```

1      0x00000089bae000000004 DEFAULT GET //1.1.1.1:80/html/index.html?
      name=hello
2      0x00000089bae000000005 DEFAULT GET //1.1.1.1:80/html/index.html?
      name=hi
3
4      Flush cache ob -| 0x00000089bae000000004
5      done

```

```
flush cache object (-locator <positive_integer> | (-url <URL> (-host <
string> [-port <port>] [-groupName <string>] [-httpMethod ( GET | POST )
])))
```

## Example

```
1 0x000000089bae000000006 DEFAULT GET //1.1.1.1:80/html/index.html
2
3 flush cache ob -URL /html/index.html -host 1.1.1.1 -groupName
  DEFAULT
4 done
```

## Flush cache configuration by using the Citrix ADC GUI

Complete the steps given below to configure cache flushing using the Citrix ADC GUI

1. Navigate to **Optimization > Content Groups**.
2. In the **Content Groups** detailed pane, click **Add**.
3. In the **Create Cache Content Groups** page, set the following parameter under **Others** tab:
  - a) Flush Cache. Select the check box to flush the cache object.
4. Click **Create** and **Close**.

← Create Cache Content Group

Flash Crowd and Prefetch

By default, Prefetch interval is based on the cache object's expiry.

Prefetch

Interval in seconds (Optional)

Maximum number of pending prefetches

Prefetch Current

Flush Cache

Evaluate policy every miss

## Configure integrated caching for various scenarios

The following section describes the configuration of integrated caching on NetScaler appliance for various scenarios.

Starting from NetScaler 9.2 release, the integrated caching has more memory for caching. The integrated caching memory is only limited by the memory available on the hardware appliance. You can allocate up to 50 percent of the available memory to the integrated caching feature.

To set the memory allocation for the cache by using the CLI

At the command prompt, type:

```
set cache parameter -memlimit <value>
```

**Note**

The default global memory limit for integrated caching is zero. Therefore, even if you enable the integrated caching feature, the NetScaler appliance does not cache any objects until the global memory limit is explicitly set.

The following section instructs you to configure integrated caching on different scenarios.

**Note**

The memory limit of the NetScaler appliance is identified when the appliance starts. Therefore, any changes to the memory limit require you to restart the appliance to make the changes applicable across the packet engines.

**Integrated caching is enabled and cache memory limit is set to non-zero**

Consider a scenario, where you start the appliance, the integrated caching feature is enabled and the global memory limit is set to a positive number. The memory you had set earlier is allocated to the integrated caching feature during the boot process. You might want to change the memory limit to another value depending on the available memory on the appliance.

**Configuring by using the CLI**

1. Display the cache parameter

```
1 > show cache parameter
2     Integrated cache global configuration:
3     Memory usage limit: 500 MBytes
4     Memory usage limit (active value): 500 MBytes
5     Maximum value for Memory usage limit: 843 MBytes
6     Via header: NS-CACHE-9.3: 18
7     Verify cached object using: HOSTNAME_AND_IP
8     Max POST body size to accumulate: 0 bytes
9     Current outstanding prefetches: 0
10    Max outstanding prefetches: 4294967295
11    Treat NOCACHE policies as BYPASS policies: YES
12    Global Undef Action: NOCACHE
```

## 2. Set a non-zero memory limit

```
1 set cache parameter -memLimit 600
```

### Note

The preceding command displays the following warning message: **Warning: To use a new Integrated Cache memory limit, save the configuration and restart the NetScaler appliance.**

## 1. Save the configuration

```
1 save config
```

## 2. From the shell prompt, run the following command to verify in the configuration file.

```
1 root@ns# cat /nsconfig/ns.conf | grep memLimit
```

## 3. Change the memory limit

```
1 set cache parameter -memLimit 600 -via NS-CACHE-9.3: 18 -  
    verifyUsing HOSTNAME_AND_IP -maxPostLen 0 -enableBypass YES -  
    undefAction NOCACHE
```

## 4. Reboot the appliance

```
1 root@ns# reboot
```

## 5. Verify the new value for the memory limit

```
1 > show cache parameter  
2     Integrated cache global configuration:  
3     Memory usage limit: 600 MBytes  
4     Memory usage limit (active value): 600 MBytes  
5     Maximum value for Memory usage limit: 843 MBytes  
6     Via header: NS-CACHE-9.3: 18  
7     Verify cached object using: HOSTNAME_AND_IP  
8     Max POST body size to accumulate: 0 bytes  
9     Current outstanding prefetches: 0  
10    Max outstanding prefetches: 4294967295  
11    Treat NOCACHE policies as BYPASS policies: YES  
12    Global Undef Action: NOCACHE
```

After all packet engines start successfully, the integrated caching feature negotiates the memory you had configured. If the appliance cannot use the configured memory, then the memory is allocated accordingly. If the available memory is less than the one you allocated, the appliance recommends a lesser number. The integrated caching feature uses same as the active value.

## Integrated caching is disabled and cache memory limit is set to non-zero

In this scenario, when you start the appliance, the integrated caching feature is disabled and the global memory limit is set to a positive number. Therefore, no memory is allocated to the integrated caching during the boot process.

### Configuring by using the CLI

1. Display the cache parameter

```
1 > show cache parameter
2     Integrated cache global configuration:
3     Memory usage limit: 600 MBytes
4     Maximum value for Memory usage limit: 843 MBytes
5     Via header: NS-CACHE-9.3: 18
6     Verify cached object using: HOSTNAME_AND_IP
7     Max POST body size to accumulate: 0 bytes
8     Current outstanding prefetches: 0
9     Max outstanding prefetches: 4294967295
10    Treat NOCACHE policies as BYPASS policies: YES
11    Global Undef Action: NOCACHE
```

2. Set a new memory limit

```
1 set cache parameter -memlimit 500
```

#### Note

The preceding command displays the following warning message: **Warning: Feature not enabled [IC]**.

1. Save the configuration

```
1 save config
```

2. From the shell prompt, run the following command to verify in the configuration file

```
1 root@ns# cat /nsconfig/ns.conf | grep memLimit
```

3. Change the memory limit

```
1 set cache parameter -memLimit 500 -via NS-CACHE-9.3: 18 -
   verifyUsing HOSTNAME_AND_IP -maxPostLen 0 -enableBypass YES -
   undefAction NOCACHE
```

4. Verify the new value for the memory limit

```
1 > show cache parameter
2     Integrated cache global configuration:
3     Memory usage limit: 500 MBytes
4     Maximum value for Memory usage limit: 843 MBytes
5     Via header: NS-CACHE-9.3: 18
6     Verify cached object using: HOSTNAME_AND_IP
7     Max POST body size to accumulate: 0 bytes
8     Current outstanding prefetches: 0
9     Max outstanding prefetches: 4294967295
10    Treat NOCACHE policies as BYPASS policies: YES
11    Global Undef Action: NOCACHE
```

#### 5. Enable the integrated caching feature

```
1 enable ns feature IC
```

#### 6. Verify the new value for the memory limit

```
1 > show cache parameter
2     Integrated cache global configuration:
3     Memory usage limit: 500 Mbytes
4     Memory usage limit (active value): 500 Mbytes
5     Maximum value for Memory usage limit: 843 MBytes
6     Via header: NS-CACHE-9.3: 18
7     Verify cached object using: HOSTNAME_AND_IP
8     Max POST body size to accumulate: 0 bytes
9     Current outstanding prefetches: 0
10    Max outstanding prefetches: 4294967295
11    Treat NOCACHE policies as BYPASS policies: YES
12    Global Undef Action: NOCACHE
```

#### Note

500 MB of memory is allocated to the integrated caching feature.

1. Save the configuration to ensure that the memory is automatically allocated to the feature when the appliance is restarted.

### **Integrated caching is enabled and cache memory is set to zero**

In this scenario, when you start the appliance, the integrated caching feature is enabled and the global memory limit is set to zero. Therefore, no memory is allocated to the integrated caching during the boot process.

## Configuring by using the CLI

1. Verify the memory limits set in the ns.conf file from shell prompt

```
1 root@ns# cat ns.conf | grep memLimit
```

2. Change the memory limit

```
1 set cache parameter -memLimit 0 -via NS-CACHE-9.3: 18 -verifyUsing
  HOSTNAME_AND_IP -maxPostLen 4096 -enableBypass YES -
  undefAction NOCACHE
```

3. Verify the value for the memory limit

```
1 > show cache parameter
2     Integrated cache global configuration:
3     Memory usage limit: 0 Mbytes
4     Maximum value for Memory usage limit: 843 MBytes
5     Via header: NS-CACHE-9.3: 18
6     Verify cached object using: HOSTNAME_AND_IP
7     Max POST body size to accumulate: 0 bytes
8     Current outstanding prefetches: 0
9     Max outstanding prefetches: 4294967295
10    Treat NOCACHE policies as BYPASS policies: YES
11    Global Undef Action: NOCACHE
```

### Note

The memory limit is set to 0 MB and no memory is allocated to the integrated caching feature.

1. Set the memory limits to ensure the integrated caching feature caches objects

```
1 set cache parameter -memLimit 600
```

Once you run the preceding command, the appliance negotiates memory for the integrated caching feature and the available memory is assigned to the feature. It results in appliance caching objects without restarting the appliance.

1. Verify the value for the memory limit

```
1 > show cache parameter
2     Integrated cache global configuration:
3     Memory usage limit: 600 Mbytes
4     Memory usage limit (active value): 600 Mbytes
5     Maximum value for Memory usage limit: 843 MBytes
6     Via header: NS-CACHE-9.3:
7     Verify cached object using: HOSTNAME_AND_IP
```

```
8      Max POST body size to accumulate: 0 bytes
9      Current outstanding prefetches: 0
10     Max outstanding prefetches: 4294967295
11     Treat NOCACHE policies as BYPASS policies: YES
12     Global Undef Action: NOCACHE
```

**Note**

600 MB of memory is allocated to the integrated caching feature.

1. Save the configuration. Ensure that the memory is automatically allocated to the feature when the appliance is restarted.
2. Verify the memory limits set in the ns.conf file from shell prompt

```
1 root@ns# cat /nsconfig/ns.conf | grep memLimit
```

3. Change the memory limit

```
1 set cache parameter -memLimit 600 -via NS-CACHE-9.3: -verifyUsing
  HOSTNAME_AND_IP -maxPostLen 4096 -enableBypass YES -undefAction
  NOCACHE
```

**Integrated caching is disabled and cache memory is set to zero**

In this scenario, when you start the appliance, the integrated caching feature is disabled and the global memory limit is set to zero. Therefore, no memory is allocated to the integrated caching during the boot process.

**Configuring by using the CLI**

1. Verify the memory limits set in the ns.conf file from shell prompt

```
1 root@ns# cat /nsconfig/ns.conf | grep memLimit
```

2. Change the memory limit

```
1 set cache parameter -memLimit 0 -via NS-CACHE-9.3: 18 -verifyUsing
  HOSTNAME_AND_IP -maxPostLen 4096 -enableBypass YES -
  undefAction NOCACHE
```

3. Verify the value for the memory limit

```
1 > show cache parameter
2      Integrated cache global configuration:
```

```
3      Memory usage limit: 0 Mbytes
4      Maximum value for Memory usage limit: 843 MBytes
5      Via header: NS-CACHE-9.3: 18
6      Verify cached object using: HOSTNAME_AND_IP
7      Max POST body size to accumulate: 0 bytes
8      Current outstanding prefetches: 0
9      Max outstanding prefetches: 4294967295
10     Treat NOCACHE policies as BYPASS policies: YES
11     Global Undef Action: NOCACHE
```

#### Note

The memory limit is set to 0 MB and no memory is allocated to the integrated caching feature. Also, when you run any cache configuration command, the following warning message is displayed: **Warning: Feature not enabled [IC]**.

1. Enable the integrated caching feature

```
1 enable ns feature IC
```

#### Note

At this stage, when you enable the integrated caching feature, the appliance does not allocate memory to the feature. As a result, no object is cached to the memory. Also, when you run any cache configuration command, the following warning message is displayed: **No memory is configured for IC. Use set cache parameter command to set the memory limit.**

1. Set the memory limits to ensure the integrated caching feature caches objects

```
1 set cache parameter -memLimit 500
```

Once you run the preceding command, the appliance negotiates memory for the integrated caching feature and the available memory is assigned to the feature. It results in the appliance caching objects without restarting the appliance.

#### Note

The order in which you enable the feature and set the memory limits is important. If you set the memory limits before enabling the feature, then the following warning message is displayed: **Warning: Feature not enabled [IC]**.

1. Verify the value for the memory limit

```
1 > show cache parameter
2      Integrated cache global configuration:
3      Memory usage limit: 500 Mbytes
4      Memory usage limit (active value): 500 Mbytes
```

```
5      Maximum value for Memory usage limit: 843 MBytes
6      Via header: NS-CACHE-9.3:
7      Verify cached object using: HOSTNAME_AND_IP
8      Max POST body size to accumulate: 0 bytes
9      Current outstanding prefetches: 0
10     Max outstanding prefetches: 4294967295
11     Treat NOCACHE policies as BYPASS policies: YES
12     Global Undef Action: NOCACHE
```

**Note**

500 MB of memory is allocated to the integrated caching feature.

1. Save the configuration

```
1 save config
```

2. Verify the memory limits set in the ns.conf file from shell prompt

```
1 root@ns# cat /nsconfig/ns.conf | grep memLimit
```

3. Change the memory limit

```
1 set cache parameter -memLimit 500 -via NS-CACHE-9.3: 18 -
   verifyUsing HOSTNAME_AND_IP -maxPostLen 4096 -enableBypass YES
   -undefAction NOCACHE
```

## Configure selectors and basic content groups

September 21, 2020

You can configure selectors and apply them to content groups. When you add a selector to one or more content groups, you specify whether the selector is to be used for identifying cache hits or identifying cached objects to be invalidated (expired). Selectors are optional. Alternatively, you can configure content groups to use hit parameters and invalidation parameters. However, Citrix recommends that you configure selectors.

After configuring selectors, or deciding to use parameters instead, you are ready to set up a basic content group. After creating the basic content group, you need to decide how objects should be expired from the cache, and configure cache expiration. You can further modify the cache as described in [“Improving Cache Performance”](#) and [“Configuring Cookies, Headers, and Polling”](#), but you might first want to configure caching policies.

**Note:**

Content group parameters and selectors are used only at request time, and you typically associate them with policies that use MAY\_CACHE or MAY\_NOCACHE actions.

**Advantages of selectors**

A selector is a filter that locates particular objects in a content group. If you do not configure a selector, the Citrix® ADC appliance looks for an exact match in the content group. This can lead to multiple copies of the same object residing in a content group. For example, a content group that does not have a selector may need to store URLs for host1.domain.com\mypage.htm, host2.domain.com\mypage.htm, and host3.domain.com\mypage.htm. In contrast, a selector can match just the URL (mypage.html, using the expression http.req.url) and the domain (.com, using the expression http.req.hostname.domain), allowing the requests to be satisfied by the same URL.

Selector expressions can perform simple matching of parameters (for example, to find objects that match a few query string parameters and their values). A selector expression can use Boolean logic, arithmetic operations, and combinations of attributes to identify objects (for example, segments of a URL stem, a query string, a string in a POST request body, a string in an HTTP header, a cookie). Selectors can also perform programmatic functions to analyze information in a request. For example, a selector can extract text in a POST body, convert the text into a list, and extract a specific item from the list.

For more information about expressions and what you can specify in an expression, see [“Policies and Expressions.”](#)

**Use parameters Instead of selectors**

Although Citrix recommends the use of selectors with a content group, you can instead configure hit parameters and invalidation parameters. For example, suppose that you configure three hit parameters in a content group for bug reports: BugID, Issuer, and Assignee. If a request contains BugID=456, with Issuer=RohitV and Assignee=Robert, the Citrix ADC appliance can serve responses that match these parameter-value pairs.

Invalidation parameters in a content group expire cached entries. For example, suppose that BugID is an invalidation parameter and a user issues a POST request to update a bug report. An invalidation policy directs the request to this content group, and the invalidation parameter for the content group expires all cached responses that match the BugID value. (The next time a user issues a GET request for this report, a caching policy can enable the Citrix ADC appliance to refresh the cached entry for the report from the origin server.)

Note that the same parameter can be used as a hit parameter or an invalidation parameter.

Content groups extract request parameters in the following order:

- URL query
- POST body
- Cookie header

After the first occurrence of a parameter, regardless of where it occurred in the request, all its subsequent occurrences are ignored. For example, if a parameter exists both in the URL query and in the POST body, only the one in the URL query is considered.

If you decide to use hit and invalidation parameters for a content group, configure the parameters when you configure the content group.

**Note:**

Citrix recommends that you use selectors rather than parameterized content groups, because selectors are more flexible and can be adapted to more types of data.

## Configure a selector

A content group can use a hit selector to retrieve cache hits or use an invalidation selector to expired cached objects and fetch new ones from the origin server.

A selector contains a name and a logical expression, called an *advanced expression*.

For more information about advanced expressions, see [“Policies and Expressions.”](#)

To configure a selector, you assign it a name and enter one or more expressions. As a best practice, a selector expression should include the URL stem and host, unless there is a strong reason to omit them.

To configure a selector by using the CLI

At the command prompt, type:

```
add cache selector <selectorName> ( <rule> ... )
```

For information about configuring the expression or expressions, see [“To configure a selector expression by using the command line interface.”](#)

```
1 >add cache selector product_selector "http.req.url.query.value(\"
    ProductId\")" "http.req.url.query.value(\"BatchNum\")" "http.req.url
    .query.value(\"depotLocation\")"
2
3 > add cache selector batch_selector "http.req.url.query.value(\"
    ProductId\")" "http.req.url.query.value(\"BatchId\")" "http.req.url.
    query.value(\"depotLocation\")"
4
5 > add cache selector product_id_selector "http.req.url.query.value(\"
    ProductId\")"
```

```
6
7 > add cache selector batchnum_selector "http.req.url.query.value(\"
      BatchNum\")" "http.req.url.query.value(\"depotLocation\")"
8
9 > add cache selector batchid_selector "http.req.url.query.value(\"
      depotLocation\")" "http.req.url.query.value(\"BatchId\")"
10
11 <!--NeedCopy-->
```

To configure a selector by using the GUI

Navigate to **Optimization > Integrated Caching > Cache Selectors**, and add the cache selector.

## Content groups

A content group is a container for cached objects that can be served in a response. When you first enable the integrated cache, cacheable objects are stored in a content group named Default. You can create new content groups that have unique properties. For example, you can define separate content groups for image data, bug reports, and stock quotes, and you can configure the stock quote content group to be refreshed more often than the other groups.

You can configure expiration of an entire content group or selected entries in a content group.

The data in a content group can be static or dynamic, as follows:

- **Static content groups.** Finds an exact match between the URL stem and host name on the request and the URL stem and host name of the response.
- **Dynamic content groups.** Looks for objects that contains particular parameter-value pairs, arbitrary strings, or string patterns. Dynamic content groups are useful when caching data that is updated frequently (for example, a bug report or a stock quote).

Serve a hit from a content group

1. A user enters search criteria for an item, such as a bug report, and clicks the Find button in an HTML form.
2. The browser issues one or more HTTP GET requests. These requests contain parameters (for example, the bug owner, bug ID, and so on).
3. When the Citrix ADC appliance receives the requests, it searches for a matching policy, and if it finds a caching policy that matches these requests, it directs the requests to a content group.
4. The content group looks for appropriate objects in the content group, usually based on criteria that you configure in a selector.

For example, the content group can retrieve responses that match NameField=username and BugID=ID.

1. If it finds matching objects, the Citrix ADC appliance can serve them to the user's browser, where they are assembled into a complete response (for example, a bug report).

Invalidate an object in a content group

1. A user modifies data (for example, the user modifies the bug report and clicks the Submit button).
2. The browser sends this data in the form of one or more HTTP requests. For example, it can send a bug report in the form of several HTTP POST requests that contain information about the bug owner and bug ID.
3. The Citrix ADC appliance matches the requests against invalidation policies. Typically, these policies are configured to detect the HTTP POST method.
4. If the request matches an invalidation policy, the Citrix ADC appliance searches the content group that is associated with this policy, and expires responses that match the configured criteria for invalidation.

For example, an invalidation selector can find responses that match NameField=username and BugID=ID.

1. The next time the Citrix ADC appliance receives a GET request for these responses, it fetches refreshed versions from the origin server, caches the refreshed responses, and serves these responses to the user's browser, where they are assembled into a complete bug report.

### Set up a basic content group

By default, all cached data is stored in the default content group. You can configure additional content groups and specify these content groups in one or more policies.

You can configure content groups for static content, and you must configure content groups for dynamic content. You can modify the configuration of any content group, including the default group.

To set up a basic content group by using the command line interface

At the command prompt, type:

```
add cache contentgroup <name> (-hitSelector <hitSelectorName> -invalSelector  
<invalidationSelectorName> | -hitParams <hitParamName> -invalParams<  
invalidationParamName>)-type <type> [-relExpiry <sec> | -relExpiryMilliSec  
<msec>] [-heurExpiryParam <positiveInteger>]
```

```
> add cache contentgroup Products_Details -hitSelector product_selector -  
invalSelector id_selector
```

```
> add cache contentgroup bugrep -hitParams IssuePage RecordID Template  
TableId -invalParams RecordID -relExpiry 864000
```

To set up a basic content group by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, and create the content group.

### Expire or flush cached objects

If a response does not have an Expires header or a Cache-Control header with an expiration time (Max-Age or Smax-Age), you must expire objects in a content group by using one of the following methods:

- Configure content group expiration settings to determine whether and how long to keep the object.
- Configure an invalidation policy and action for the content group. For more information, see [“Configuring Policies for Caching and Invalidation.”](#)
- Expire the content group or objects within it manually.

After a cached response expires, the Citrix ADC appliance refreshes it the next time the client issues a request for the response. By default, when the cache is full, the Citrix ADC appliance replaces the least recently used response first.

The following list describes methods for expiring cached responses using settings for a content group. Typically, these methods are specified as a percent or in seconds:

- **Manual.** Manually invalidate all responses in a content group or all responses in the cache.
- **Response-based.** Specific expiration intervals for positive and negative responses. Response-based expiry is considered only if the Last-Modified header is missing in the response.
- **Heuristic expiry.** For responses that have a Last-Modified header, heuristic expiry is a percentage of the time since the response was modified (calculated as current time minus the Last-Modified time, multiplied by the heuristic expiry value). For example, if a Last-Modified header indicates that a response was updated 2 hours ago, and the heuristic expiry setting is 10%, cached objects expire after 0.2 hours. This method assumes that frequently updated responses need to be expired more often.
- **Absolute or relative.** Specify an exact (absolute) time when the response expires every day, in HH:MM format, local time or GMT. Local time may not work in all time zones.

Relative expiration specifies a number of seconds or milliseconds from the time a cache miss causes a trip to the origin server to the expiration of the response. If you specify relative expiration in milliseconds, enter a multiple of 10. This form of expiration works for all positive responses. Last-Modified, Expires, and Cache-Control headers in the response are ignored.

Absolute and relative expiration override any expiration information in the response itself.

- **On download.** The option Expire After Complete Response Received expires a response as soon as it is downloaded. This is useful for frequently updated responses, for example, stock quotes. By default, this option is disabled.

Enabling both Flash Cache and Expire After Complete Response Received accelerates the performance of dynamic applications. When you enable both options, the Citrix ADC appliance fetches only one

response for a block of simultaneous requests.

- **Pinned.** By default, when the cache is full the Citrix ADC appliance replaces the least recently used response first. The Citrix ADC appliance does not apply this behavior to content groups that are marked as pinned.

If you do not configure expiration settings for a content group, the following are additional options for expiring objects in the group:

- Configure a policy with an INVALID action that applies to the content group.
- Enter the names of content groups when configuring a policy that uses an INVALID action.

### How expiration methods are applied

Expiration works differently for positive and negative responses. Positive and negative responses are described in the table, *Expiration of Positive and Negative Responses* mentioned below.

The following are rules of thumb for understanding the expiration method that is applied to a content group:

- You can control whether the Citrix ADC appliance evaluates response headers when deciding whether to expire an object.
- Absolute and relative expiration cause the Citrix ADC appliance to ignore the response headers (they override any expiration information in the response).
- Heuristic expiration settings and “Weak Positive” and “Weak Negative” expiration (labeled as **Default** values in the configuration utility) cause the Citrix ADC appliance to examine the response headers. These settings work together as follows:
  - The value in an Expires or Cache-Control header overrides these content group settings.
  - For positive responses that lack an Expires or Cache-Control header but have a Last-Modified header, the Citrix ADC appliance compares heuristic expiration settings with the header value.
  - For positive responses that lack an Expires, Cache-Control, or Last-Modified header, Citrix ADC appliance uses the “weak positive” value.
  - For negative responses that lack an Expires or Cache-Control header, Citrix ADC appliance uses the “weak negative” value.

The following table describes how these methods are applied.

| Response type | Expiration header type | Content Group Setting                                   | Period the Object Remains in the Cache             |
|---------------|------------------------|---------------------------------------------------------|----------------------------------------------------|
| Positive      | Any header             | Expire Content After (relExpiry) with no other settings | Use the value of the Expire Content After setting. |

| Response type | Expiration header type                              | Content Group Setting                                                                                         | Period the Object Remains in the Cache                                                                                                           |
|---------------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive      | Any header                                          | Expire Content At (absExpiry) with no other settings                                                          | Subtract current date from the value of the Expire Content At setting.                                                                           |
| Positive      | Any header                                          | Expire Content After (relExpiry) and Expire content at (absExpiry)                                            | Use the smaller of the two values for the content group settings. See the previous rows in this table.                                           |
| Positive      | Last-Modified (with any other headers)              | Heuristic (heurExpiry Param) with any other setting                                                           | Subtract the Last-Modified date from the current date, multiply the result by the value of the heuristic expiry setting, and then divide by 100. |
| Positive      | Last-Modified (with any other headers)              | Default (positive) (weakPosRel Expiry) and no other setting                                                   | Use the value of the Default (positive) expiry setting.                                                                                          |
| Positive      | Expires or Cache-Control: Max-Age header is present | Last-Modified header is absent, Heuristic (heurExpiry Param), Default (positive) (weakPosRel Expiry), or both | Subtract the current date from the Expires or the Cache-Control:Max-Age date.                                                                    |
| Positive      | no caching headers                                  | Default (positive) (weakPosRel Expiry) and any other expiration setting                                       | Use the value of the Default (positive) setting.                                                                                                 |

| Response type | Expiration header type                               | Content Group Setting                                                                              | Period the Object Remains in the Cache                                                                                                                                                    |
|---------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive      | no caching headers                                   | Heuristic (heurExpiry Param) is present, Default (positive) (weakPosRel Expiry) setting is absent. | If the Last-Modified header is absent, the response is not cached or it is cached with an Already Expired status. If the Last-Modified header is present, use the heuristic expiry value. |
| Negative      | Expires or Cache-Control:Max-Age                     | Expire Content After (relExpiry), Expire Content At (absExpiry), or both settings                  | Subtract the current date from the value of the Expires header, or use the value of the Cache-Control:Max-Age header.                                                                     |
| Negative      | Expires or Cache-Control headers are absent          | Expire Content After (relExpiry), Expire Content At (absExpiry), or both settings                  | Response is not cached, or is cached with an Already Expired status.                                                                                                                      |
| Negative      | Expires or Cache-Control:Max-Age                     | Any setting                                                                                        | Subtract the current date from the Expires or Cache-Control:Max-Age date.                                                                                                                 |
| Negative      | Expires and Cache-Control:Max-Age headers are absent | Default (negative) (weakNegRel Expiry)                                                             | Use the value of the Default (negative) setting.                                                                                                                                          |
| Negative      | Expires and Cache-Control:Max-Age headers are absent | Any setting other than Default (negative) (weakNegRel Expiry)                                      | Object is not cached or is cached with an Already Expired status.                                                                                                                         |

### Expire a content group by manual method

You can manually expire all of the entries in a content group.

To manually expire all responses in a content group by using the command line interface

At the command prompt, type:

```
expire cache contentGroup <name>
```

To manually expire all responses in a content group by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, select the content group, and click **Invalidate** to expire all the responses in a content group.

To manually expire all responses in the cache by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, and click **Invalidate All** to expire all the responses in cache.

### Configure periodic expiration of a content group

You can configure a content group so that it performs selective or full expiration of its entries. The expiration interval can be fixed or relative.

To configure content group expiration by using the command line interface

At the command prompt, type:

```
set cache contentgroup \<name> (-relExpiry|-relExpiryMilliSec|-absExpiry  
|-absExpiryGMT| -heurExpiryParam|-weakPosRelExpiry|-weakNegRelExpiry| -  
expireAtLastBye)\<expirationValue>
```

To configure content group expiration by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, select the content group, and specify expiry method.

### Expire individual responses

Expiring a response forces the Citrix ADC appliance to fetch a refreshed copy from the origin server. Responses that do not have validators, for example, ETag or Last-Modified headers, cannot be revalidated. As a result, flushing these responses has the same effect as expiring them.

To expire a cached response in a content group for static data, you can specify a URL that must match the stored URL. If the cached response is part of a parameterized content group, you must specify the group name as well as the exact URL stem. The host name and the port number must be the same as in the host HTTP request header of the cached response. If the port is not specified, port 80 is assumed.

To expire individual responses in a content group by using the command line interface

At the command prompt, type:

```
expire cache object -url <URL> -host <hostName> [-port <port>] [-groupName<contentGroupName>] [-httpMethod GET|POST]
```

To expire individual responses in a content group by using the CLI

At the command prompt, type the following command:

```
expire cache object -locator <positiveInteger>
```

To expire a cached response by using the GUI

Navigate to **Optimization > Integrated Caching > Cached Objects**, select the cached response, and expire.

To expire a response by using the GUI

Navigate to **Optimization > Integrated Caching > Cached Objects**, click **Search** and, set the search criteria to find the required cached response and expire.

### Flushing responses in a content group

You can remove, or flush, all responses in a content group, some responses in a group, or all responses in the cache. Flushing a cached response frees up memory for new cached responses.

#### Note:

To flush responses for more than one object at a time, use the configuration utility method. The command line interface does not offer this option.

To flush responses from a content group by using the command line interface

At the command prompt, type:

```
flush cache contentGroup <name> [-query <queryString> | [-selectorValue <selectorExpressionIDList> -host <hostName>]]
```

To flush responses from a content group by using the GUI

1. Navigate to **Optimization > Integrated Caching > Content Groups**.
2. In details pane, flush the responses as follows:
  - To flush all responses in all content groups, click **Invalidate All**, and flush all the responses.
  - To flush responses in a particular content group, select the content group, click **Invalidate**, and flush all the responses.

**Note:**

If this content group uses a selector, you can selectively flush responses by entering a string in the Selector value text box, entering a host name in the Host text box. Then click **Flush and OK**. The Selector value can be a query string of up to 2319 characters that is used for parameterized invalidation.

If the content group uses an invalidation parameter, you can selectively flush responses by entering a string in the Query field.

If the content group uses an invalidation parameter and Invalidate objects belonging to target host is configured, enter strings in the Query and Host fields.

To flush a cached response by using the command line interface

At the command prompt, type:

```
flush cache object -locator <positiveInteger> | -url <URL> -host <hostName>
[-port <port>] [-groupName <contentGroupName>] [-httpMethod GET|POST]
```

To flush a cached response by using the GUI

Navigate to **Optimization > Integrated Caching > Cached Objects**, select the cached object, and flush.

### Deleting a content group

You can remove a content group if it is not used by any policy that stores responses in the cache. If the content group is bound to a policy, you must first remove the policy. Removing the content group removes all responses stored in that group.

You cannot remove the Default, BASEFILE, or Deltaajs group. The Default group stores cached responses that do not belong in any other content group.

To delete a content group by using the command line interface

At the command prompt, type:

```
rm cache contentgroup <name>
```

To delete a content group by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, select the content group, and delete.

## Configure policies for caching and invalidation

April 21, 2021

Policies enable the integrated cache to determine whether to try to serve a response from the cache or the origin. The NetScaler appliance provides built-in policies for integrated caching, and you can configure more policies. When you configure a policy, you associate it with an action. An action either caches the objects to which the policy applies or invalidates (expires) the objects. Typically, you based caching policies on information in GET and POST requests. You typically base invalidation policies on the presence of the POST method in requests, along with other information. You can use any information in a GET or POST request in a caching or an invalidation policy.

You can view some of the built-in policies in the integrated cache's Policies node in the configuration utility. The built-in policy names begin with an underscore (\_).

Actions determine what the NetScaler appliance does when traffic matches a policy. The following actions are available:

- **Caching actions.** Policies that you associate with the CACHE action store responses in the cache and serve them from the cache.
- **Invalidation actions.** Policies that you associate with the INVALID action immediately expire cached responses and refresh them from the origin server. For Web-based applications, invalidation policies often evaluate POST requests.
- **“Do not cache” actions.** Policies that you associate with a NOCACHE action never store objects in the cache.
- **Provisionally cache actions.** Policies that you associate with a MAYCACHE or MAYNOCACHE action depend on the outcome of more policy evaluations.

Although the integrated cache does not store objects specified by the LOCK method, you can invalidate cached objects upon receipt of a LOCK request. For invalidation policies only, you can specify LOCK as a method by using the expression `http.req.method.eq( "lock" )`. Unlike policies for GET and POST requests, you must enclose the LOCK method in quotes because the NetScaler appliance recognizes this method name as a string only.

After you create a policy, you bind it to a particular point in the overall processing of requests and responses. Although you create a policy before binding it, you must understand how the bind points affect the order of processing before you create your policies.

The policies bound to a particular bind point constitute a policy bank. You can use goto expressions to modify the order of execution in a policy bank. You can also invoke policies in other policy banks. In addition, you can create labels and bind policies to them. Such a label is not associated with a processing point, but the policies bound to it can be invoked from other policy banks.

## Actions to associate with integrated caching policies

The following table describes actions for integrated caching policies.

| Action  | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CACHE   | Serves a response from the cache if the response has not expired. If the response must be fetched from the origin server, the NetScaler appliance caches the response before serving it. Even data that is updated and accessed frequently can be cached. For example, stock quotes are updated frequently, but they can be cached so that they can be served quickly to multiple users. If necessary, cached data can be refreshed immediately after it is downloaded. A CACHE action can be overridden by built-in policies. |
| NOCACHE | Always fetches the response from the origin server and marks the response as non-storable. You typically configure NOCACHE policies for data that is sensitive or personalized.                                                                                                                                                                                                                                                                                                                                                |

| Action    | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAY_CACHE | <p>Used in a request-time policy, this setting provisionally enables a response to be stored in a content group, pending evaluation of response-time policies. The following are possible:</p> <ol style="list-style-type: none"><li>1. If a matching response-time policy has a CACHE action but does not specify a content group, the response is stored in the Default group unless built-in policies override this policy.</li><li>2. If a matching response-time policy has a CACHE action and specifies the same content group as the one in the request-time policy, the response is stored in the named content group unless built-in policies override this policy.</li><li>3. If a matching response-time policy has a CACHE action but specifies a different content group from the one in the request-time policy, a NOCACHE action is applied.</li><li>4. If a matching response-time policy has a NOCACHE action, perform a NOCACHE action.</li><li>5. If there is no matching response-time policy, a CACHE action is applied, unless a built-in policy overrides this policy.</li></ol> |

| Action      | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAY_NOCACHE | For a request-time policy, this setting provisionally prevents caching the response. At response time, one of the following actions is taken: - If no response-time policy matches the request, the final action is NOCACHE. - If a matching response-time policy contains a CACHE action, the final action is CACHE, unless built-in policies override this policy. - If a matching response-time policy contains a NOCACHE action, the final action is NOCACHE. -If a matching response-time policy has a CACHE action but does not specify a content group, the final action is to CACHE the response in the Default content group, unless built-in policies override this policy. |
| INVAL       | Expires cached responses. Depending on how the policy and the content group are configured, all responses in one or more content groups are expired, or selected objects in the content group are expired. Note: You can specify INVAL actions in request-time policies only.                                                                                                                                                                                                                                                                                                                                                                                                         |

## Bind points for a policy

You can bind the policy to one of the following bind points:

- **A global policy bank.** These are the request-time default, request-time override, response-time default, and response-time override policy banks, as described in “[Order of Policy Evaluation.](#)”
- **A virtual server.** Policies that you bind to a virtual server are processed after the global override policies and before the global default policies, as described in “[Order of Policy Evaluation.](#)” When binding a policy to a virtual server, you bind it to either request-time or response-time processing.
- **An ad-hoc policy label.** A policy label is a name assigned to a policy bank. In addition to the global labels, the integrated cache has two built-in custom policy labels:
  - `_reqBuiltinDefaults`. This policy label, by default, is invoked from the request-time default policy bank.

- `_resBuiltinDefaults`. This policy label, by default, is invoked from the response-time default policy bank.

You can also define new policy labels. Policies bound to a user-defined policy label must be invoked from within a policy bank for one of the built-in bind points.

**Important:**

You must bind a policy with an `INVALID` action to a request-time override or a response-time override bind point. To delete a policy, you must first unbind it.

## Order of policy evaluation

For an advanced policy to take effect, you must ensure that the policy is invoked at some point during the NetScaler appliance's processing of traffic. To specify the invocation time, you associate the policy with a bind point. The following are the bind points, listed in order of evaluation:

- **Request-time override.** If a request matches a request-time override policy, by default the request-time policy evaluation ends and the NetScaler appliance stores the action that is associated with the matching policy.
- **Request-time load balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies are evaluated, the NetScaler appliance processes request-time policies that are bound to load balancing virtual servers. If the request matches one of these policies, evaluation ends and the NetScaler appliance store the action that is associated with the matching policy.
- **Request-time content switching virtual server.** Policies that are bound to this bind point are evaluated after the request-time policies that are bound to load balancing virtual servers.
- **Request-time default.** If policy evaluation cannot be completed after all the request-time, virtual server-specific policies are evaluated, the NetScaler appliance processes the request-time default policies. If the request matches a request-time default policy, by default the request-time policy evaluation ends and the NetScaler appliance stores the action that is associated with the matching policy.
- **Response-time override.** Similar to request-time override policy evaluation.
- **Response-time load balancing virtual server.** Similar to request-time virtual server policy evaluation.
- **Response-time content switching virtual server.** Similar to request-time virtual server policy evaluation.
- **Response-time default.** Similar to request-time default policy evaluation.

You can associate multiple policies with each bind point. To control the order of evaluation of the policies associated with the bind point you configure a priority level. In the absence of any other flow control information, policies are evaluated according to priority level, starting with the lowest numeric priority value.

**Note:**

Request-time policies for POST data or cookie headers must be invoked during request-time override evaluation, because the built-in request-time policies in the integrated cache return a NOCACHE action for POST requests and a MAY\_NOCACHE action for requests with cookies. You would associate MAY\_CACHE or MAY\_NOCACHE actions with a request-time policy that points to a parameterized content group. The response time policy determines whether the transaction is stored in the cache.

**Configure a policy for integrated caching**

You configure new policies to handle data that the built-in policies cannot process. You configure separate policies for caching, preventing caching from occurring, and for invalidating cached data. Following are the main components of a policy for integrated caching:

- Rule: A logical expression that evaluates an HTTP request or response.
- Action: You associate a policy with an action to determine what to do with a request or response that matches the policy rule.

Content groups: You associate the policy with one or more content groups to identify where the action is to be performed.

To configure a policy for caching by using the command line interface

At the command prompt, type:

```
add cache policy <policyName> -rule <expression> -actionCACHE|MAY_CACHE
|NOCACHE|MAY_NOCACHE [-storeInGroup <contentGroupName>] [-undefAction
NOCACHE|RESET]
> add cache policy image_cache -rule "http.req.url.contains("\jpg\") || http
.req.url.contains("\jpeg\")"-action CACHE -storeingroup myImages_group -
undefaction NOCACHE
> add cache policy bugReportPolicy -rule "http.req.url.query.contains("\
IssuePage\")"-action CACHE -storeInGroup bugReportGroup
> add cache policy my_form_policy -rule "http.req.header("\Host\").contains
("\my.company.com\")&& http.req.method.eq("\GET\")&& http.req.url.query.
contains("\v=7\")"-action CACHE -storeInGroup my_form_event
> add cache policy viewproducts_policy -rule "http.req.url.contains("\
viewproducts.aspx\")"-action CACHE -storeInGroup Product_Details
```

To configure a policy for invalidation by using the command line interface

At the command prompt, type:

```

1 add cache policy <policyName> -rule <expression> -action INVALID [-
  invalObjects "\<contentGroupName1>[,<selectorName1>"]. . .]] | [-
  invalGroup \<contentGroupName1>[, <contentGroupName2>. . .]] [-
  undefAction NOCACHE|RESET]
2 <!--NeedCopy-->

```

```

1 > add cache policy invalidation_events_policy -rule "http.req.header("
  Host")contains("my.company.com") && http.req.method.eq("GET") &&
  http.req.url.query.contains("v=8") -action INVALID -invalObjects
  my_form_event -undefaction NOCACHE
2 <!--NeedCopy-->

```

```

1 > add cache policy inval_all -rule "http.req.method.eq("POST") && http.
  req.url.contains("jpeg)" -action INVALID -invalGroups myImages_group
  myApps_group PDF_group
2 <!--NeedCopy-->

```

```

1 > add cache policy bugReportInvalidationPolicy -rule "http.req.url.
  query.contains(\"TransitionForm\")" -action INVALID -invalObjects
  bugReport`
2 `> add cache policy editproducts_policy -rule "http.req.url.contains
  (\"editproducts.aspx\")" -action INVALID -invalObjects "
  Product_Details,batchnum_sel" "Products_In_Depots,batchid_sel"
3 <!--NeedCopy-->

```

To configure a policy for caching or invalidation by using the GUI

Navigate to **Optimization > Integrated Caching > Policies**, and create the new policy.

### Globally binding an integrated caching policy

When you globally bind a policy, it is available to all virtual servers on the NetScaler appliance.

To bind an integrated caching policy globally by using the command line interface:

At the command prompt, type:

```

1 bind cache global <policy> -priority <positiveInteger> [-
  typeREQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] [-
  gotoPriorityExpression <expression>] [-invoke <labelType> <labelName
  >]
2 <!--NeedCopy-->

```

```
1 > bind cache global myCachePolicy -priority 100 -type req_default
2 <!--NeedCopy-->
```

**Note:**

The type argument is optional for globally bound policies, to maintain backward compatibility with policies that you defined using earlier versions of the NetScaler appliance. If you omit the type, the policy is bound to REQ\_DEFAULT or RES\_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. If the rule contains both request time and response time parameters, it is bound to RES\_DEFAULT. Following is an example of a binding that omits the type

Following is an example of a binding that omits the type.

```
> bind cache global myCache Policy 200
```

To bind an integrated caching policy globally by using the configuration utility

Navigate to **Optimization > Integrated Caching**, click **Cache Policy Manager** and bind policies by specifying the relevant bind point and connection type (Request/Response).

**Bind an integrated caching policy to a virtual server**

When you bind a policy to a virtual server, it is available only to requests and responses that match the policy and that flow through the relevant virtual server.

When using the GUI, you can bind the policy using the configuration dialog box for the virtual server. This enables you to view all of the policies from all Citrix ADC modules that are bound to this virtual server. You can also use the **Policy Manager configuration** dialog for the integrated cache. This enables you to view only the integrated caching policies that are bound to the virtual server.

To bind an integrated caching policy to a virtual server by using the command line interface:

At the command prompt, type:

```
1 bind lb vserver <name>@ -policyName <policyName> -priority <
   positiveInteger> -type(REQUEST|RESPONSE)
2 <!--NeedCopy-->
```

```
1 bind cs vserver <name>@ -policyName <policyName> -priority <
   positiveInteger> -type(REQUEST|RESPONSE)
2 <!--NeedCopy-->
```

To bind an integrated caching policy to a virtual server by using the configuration utility (virtual server method)

- CS Virtual Server - Navigate to **Traffic Management > Content Switching > Virtual Servers**, select the virtual server, and bind relevant cache policies.
- LB Virtual Server - Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select the virtual server, and bind relevant cache policies.

To bind an integrated caching policy to a virtual server by using the GUI (Policy Manager method).

Navigate to **Optimization > Integrated Caching**, click **Cache Policy Manager**, and bind cache policies by specifying the relevant bind point and connection type.

**Note:**

You can bind cache policies to both load balancing virtual server and content switching virtual server by selecting the appropriate bind point.

## How to cache compressed and uncompressed versions of a file

By default, a client that can handle compression can be served uncompressed responses or compressed responses in gzip, deflate, compress, and pack200-gzip format. If the client handles compression, an `Accept-Encoding:compression` format header is sent in the request. The compression type accepted by the client must match the compression type of the cached object. For example, a `cached.gzip` file cannot be served in response to a request with an `Accept-Encoding:deflate` header.

A client that cannot handle compression is served a cache miss if the cached response is compressed.

For dynamic caching, you need to configure two content groups, one for compressed data and one for uncompressed versions of the same data. The following is an example of configuring the selectors, content groups, and policies for serving uncompressed files from the cache to clients that cannot handle compression, and serving compressed versions of the same files to the client that can handle compression.

```
add cache selector uncompressed_response_selector http.req.url "http.req.
header(\"Host\")"

add cache contentGroup uncompressed_group -hitSelector uncompressed_responst_selector
-invalSelector uncomp_resp_sel

add cache policy cache_uncompressed -rule "HTTP.REQ.URL.CONTAINS(\"xyz\")&&
!HTTP.REQ.HEADER(\"Accept-Encoding\").EXISTS"-action CACHE -storeInGroup
uncompressed_group

bind cache global cache_uncompressed -priority 100 -gotoPriorityExpression
END -type REQ_OVERRIDE

add cache selector compressed_response_selector HTTP.REQ.URL "HTTP.REQ.
HEADER(\"Host\")(\"HTTP.REQ.HEADER(\"Accept-Encoding\")"
```

```
add cache contentGroup compressed_group -hitSelector compressed_response_selector

add cache policy cache_compressed -rule "HTTP.REQ.URL.CONTAINS(\"xyz\")&&
HTTP.REQ.HEADER(\"Accept-Encoding\").EXISTS"-action CACHE -storeInGroup
compressed_group

bind cache global cache_compressed -priority 200 -gotoPriorityExpression
END -type REQ_OVERRIDE
```

## Configure a policy bank for caching

All of the policies that are associated with a particular bind point are collectively known as a policy bank. In addition to configuring priority levels for policies in a bank, you can modify the order of evaluation in a bank by configuring Goto expressions. You can further modify the evaluation order by invoking an external policy bank from within the current policy bank. You can also configure new policy banks, to which you assign your own labels. Because such policy banks are not bound to any point in the processing cycle, they can be invoked only from within other policy banks. For convenience, policy banks whose labels do not correspond to a built-in bind point are called policy labels.

In addition to controlling the order of policy evaluation by binding the policy and assigning a priority level, as described in “[Binding Policies](#)”, you can establish the flow within a bank of policies by configuring a Goto expression. A Goto expression overrides the flow that is determined by the priority levels. You can also control the evaluation flow by invoking an external policy bank after evaluating an entry in the current bank. Evaluation always returns to the current bank after evaluation has completed.

The following table summarizes the entries to control evaluation in a policy bank.

| Attribute | Specifies                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name      | The name of a policy, or, to invoke another policy bank without evaluating the policy, the keyword NOPOLICY. You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once. |
| Priority  | An integer. The lower the integer, the higher the priority.                                                                                                                                                          |

| Attribute       | Specifies                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Goto Expression | Determines the next policy or policy bank to evaluate. You can provide one of the following values: 1. NEXT: Go to the policy with the next higher priority. 2. END: Stop evaluation. 3. USE_INVOCATION_RESULT: Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT. 4. Positive number: Priority number of the next policy to be evaluated. 5. Numeric expression: Expression that produces the priority number of the next policy to be evaluated. The Goto can only proceed forward in a policy bank. Omitting the Goto expression is the same as specifying END. |
| Invocation Type | Designates a policy bank type. The value can be one of the following - 1. Request virtual server: Invokes request-time policies that are associated with a virtual server. 2. Response virtual server: Invokes response-time policies that are associated with a virtual server. 3. Policy label: Invokes another policy bank, as identified by the policy label for the bank.                                                                                                                                                                                                                                                                                                                                                           |
| Invocation Name | Name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The integrated cache has two built-in policy labels, and you can configure more policy labels:

`_reqBuiltInDefaults`: This policy label is invoked from the request-time default bind point.

`_resBuiltInDefaults`: This policy label is invoked from the response-time default bind point.

To invoke a policy label in a caching policy bank by using the command line interface

At the command prompt, type:

```
1 bind cache policylabel <labelName> -policname<policyName> -priority<
  priority> [-gotoPriorityExpression <gotopriorityExpression>] [-
```

```

    invoke <labelType> <labelName>]
2 <!--NeedCopy-->

```

To invoke a policy label in a caching policy bank by using the GUI:

1. Navigate to **Optimization > Integrated Caching**, click **Cache policy manager**, and specify the relevant bind point (Override Global or Default Global) and connection type to view the list of policies bound to this bind point.
2. If you want to invoke a policy label without evaluating a policy, click **NOPOLICY**.

**Note:**

To invoke an external policy bank, click the field in the Invoke Type column, and select the type of policy bank that you want to invoke at this point in the policy bank. This can be a global label or a virtual server bank. In the Invoke Name field, enter the label or virtual server name.

To invoke a caching policy label in a virtual server policy bank by using the command line interface

At the command prompt, type:

```

1 bind lb vserver <name>@ -policyName <policyName>|<NOPOLICY-CACHE> -
  priority<positiveInteger> -gotoPriorityExpression <expression> -type
  REQUEST|RESPONSE -invoke<labelType> <labelName>
2 <!--NeedCopy-->

```

```

1 bind cs vserver <name> -policyName <policyName>|<NOPOLICY-CACHE> -
  priority<positiveInteger> -gotoPriorityExpression <expression> -type
  REQUEST|RESPONSE -invoke<labelType> <labelName>
2 <!--NeedCopy-->

```

To invoke a caching policy label in a virtual server policy bank by using the GUI

1. Navigate to **Traffic Management > Load Balancing/Content Switching > Virtual Servers**, select the virtual server, and click **Policies**.
2. If you are configuring an existing entry in this bank, skip this step. If you are adding a new policy to this policy bank, or you want to use the “dummy” NOPOLICY entry, click **Add** and do one of the following:
  - To configure a new policy, click Cache and configure the new policy as described in Configuring a Policy in the Integrated Cache.
  - To invoke a policy bank without processing a policy a rule, select the **NOPOLICY-CACHE** option.

**Note:**

To invoke an external policy bank, click the field in the Invoke Type column, and select the type

of policy bank that you want to invoke at this point in the policy bank. This can be a global label or a virtual server bank. In the Invoke Name field, enter the label or virtual server name.

## Configure a policy label in an integrated cache

In addition to configuring policies in a policy bank for one of the built-in bind points or a virtual server, you can create caching policy labels and configure banks of policies for these new labels.

A policy label for the integrated cache can be invoked only from one of the bind points that you can view in the Policy Manager in the **Integrated Caching** details pane (request override, request default, response override, or response default) or the built-in policy labels `\\_reqBuiltinDefaults` and `\\_resBuiltinDefaults`. You can invoke a policy label any number of times unlike a policy, which can only be invoked once.

The Citrix ADC GUI provides an option to rename a policy label. Renaming a policy label does not affect the process of evaluation of the policies bound to the label.

### Note:

You can use the `NOPOLICY` “dummy” policy to invoke any policy label from another policy bank. The `NOPOLICY` entry is a placeholder that does not process a rule.

To configure a policy label for caching by using the command line interface

At the command prompt, type the following command to create a policy label and verify the configuration:

- `add cache policylabel <labelName> -evaluates (REQ|RES)`
- `show cache policylabel <labelName>`

Invoke this policy label from a policy bank.

To configure a policy label for caching by using the GUI:

Navigate to **Optimization > Integrated Caching > Policy Labels**, add a policy label, and bind the cached policies.

### Note:

To ensure that the Citrix ADC processes the policy label at the right time, configure an invocation of this label in one of the policy banks that are associated with the built-in bind points.

To rename a policy label by using the GUI:

Navigate to **Optimization > Integrated Caching > Policy Labels** select the policy label, and rename.

## Unbind and delete an integrated caching policy and policy label

You can unbind a policy from a policy bank, and you can delete it. To delete the policy, you must first unbind it. You can also remove a policy label invocation and delete a policy label. To delete the policy

label, you must first remove any invocations that you have configured for the label.

You cannot unbind or delete the labels for the built-in bind points (request default, request override, response default, and response override).

To unbind a global caching policy by using the command line interface

At the command prompt, type:

```
unbind cache global <policy>
```

To unbind a virtual server-specific caching policy by using the command line interface

At the command prompt, type:

```
(unbind lb vserver|unbind cs vserver)<vserverName> -policyName <policyName>  
-type (REQUEST|RESPONSE)
```

To delete a caching policy by using the command line interface

At the command prompt, type:

```
rm cache policy <policyName>
```

To unbind a caching policy by using the GUI:

Navigate to **Optimization > Integrated Caching**, click **Cache Policy Manager**, and unbind policies by specifying the relevant bind point and connection type (Request/Response).

To delete a policy label invocation by using the GUI:

1. Navigate to **Optimization > Integrated Caching**, click **Cache policy manager**, and specify the relevant binding point (load balancing virtual server or content switching virtual server) and connection type to view the list of cache policies bound to this virtual server.
2. In the policy Invoke column, clear the entry.

## Cache support for database protocols

September 21, 2020

The integrated cache feature monitors and caches database request as determined by the cache policies. Users must configure the cache policies for MYSQL and MSSQL protocols as the Citrix ADC appliance does not provide any default policies. When configuring the default protocols, remember the request-based policies support only CACHE and INVALID actions, while response-based policies support only "NOCACHE" action. After configuring the policies, you must bind them to virtual servers. MYSQL and MSSQL policies, both request and response, are bound only to virtual servers.

Before creating a cache policy, you must create a cache content group of type MYSQL or MSSQL. When you create a cache content group, associate at least one select selector with it. See [Setting Up a Basic Content Group](#) for setting up a cache content group.

The following example explains how to configure and verify cache support for SQL protocols.

```
1 > enable feature IC
2 > set cache parameter -memlimit 100
3 > add cache selector sel1 mssql.req.query.text
4
5 > add cache contentgroup cg1 -type "MSSQL" -hitselector "sel1" -
  invalselector "inval_sel" -relExpiry "500" -maxResSize
6 "100"
7 > add cache policy cp1 -rule "mssql.req.query.command.contains(\"
  select\")" -action "CACHE" -storeInGroup "cg1"
8 > add cache policy cp2 -invalObjects "cg1" -rule "mssql.req.query.text
  .contains(\"insert\")" -action "INVALID"
9 > add db user user1 -password "Pass1"
10 > add service svc_sql_1 10.102.147.70 mssql 64834 -healthMonitor "NO" -
  downstateflush "ENABLED"
11 > add lb vserver lb_mssql1 mssql 10.102.147.77 1433 -lbmethod "
  roundrobin"
12 > bind lb vserver lb_mssql1 svc_sql_1
13 > bind lb vserver lb_mssql1 -policyName cp1 -type "REQUEST" -priority
  "2"
14 > bind lb vserver lb_mssql1 -policyName cp2 -type "REQUEST" -priority
  "1"
15
16 > show cache selector sel1
17     Name:sel1
18         Expressions:
19         1)mssql.req.query.text
20 > show cache policy cp1
21     Name:cp1
22     Rule:mssql.req.query.command.contains("select")
23     CacheAction:CACHE
24     Stored in group: cg1
25     UndefAction:Use Global
26     Hits:2
27     Undef Hits:0
28     Policy is bound to following entities
29     1) Bound to:
30         REQ VSERVER lb_mssql1
31         Priority:2
32         GotoPriorityExpression: END
```

```
33 <!--NeedCopy-->
```

**Note:**

The methods for reducing flash crowds, as explained in [Reducing Flash Crowds](#), are not supported for MYSQL and MSSQL protocols.

## Configure expressions for caching policies and selectors

August 26, 2021

A request-time expression examines data in request-time transaction, and a response-time expression examines data in a response-time transaction. In a policy for caching, if an expression matches data in a request or response, the Citrix ADC appliance takes the action associated with the policy. In a selector, request-time expressions are used to find matching responses that are stored in a content group.

Before configuring policies and selectors for the integrated cache, you need to know, at minimum, the host names, paths, and IP addresses that appear in HTTP request and response URLs. And you probably need to know the format of entire HTTP requests and responses. Programs such as Live HTTP Headers <http://livehttpheaders.mozdev.org/> or HTTPFox <https://addons.mozilla.org/en-US/firefox/addon/6647> can help you investigate the structure of the HTTP data that your organization works with.

Following is an example of an HTTP GET request for a stock quote program:

```
1 GET /quote.dll?page=dynamic&mode=data&mode=stock&symbol=CTXS&page=multi
   &selected=CTXS&random=0.00792039478975548 HTTP/1.1
2
3 Host: quotes.mystockquotes.com
4
5 User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9)
   Gecko/2008052906 Firefox/3.0
6
7 Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
8
9 Accept-Language: en-us,en;q=0.5
10
11 Accept-Encoding: gzip,deflate,compress,pack200-gzip
12
13 Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7
14
15 Keep-Alive: 300
```

```

16
17 Connection: keep-alive
18
19 Referer: http://quotes.mystockquotes.com/quote.dll?mode=stock&symbol=
      CTXS&page=multi&selected=CTXS
20
21 Cookie: __qca=1210021679-72161677-10297606
22 <!--NeedCopy-->

```

When configuring an expression, note the following limitations:

When configuring an expression, note the following limitations:

| Expression Type | Restrictions                                                                                                                                                                                                                                                                                                                                |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request         | Do not configure request-time expressions in a policy with a CACHE or NOCACHE action. Use MAY_CACHE or MAY_NOCACHE instead.                                                                                                                                                                                                                 |
| Response        | Configure response-time expressions in caching policies only. Selectors can use only request-time expressions, Do not configure response-time expressions in a policy with an INVALID action. Note: Do not configure response-time expressions in a policy with a CACHE action and a parameterized content group. Use the MAY_CACHE action. |

#### Note

For a comprehensive discussion of advanced expressions, see [Policies and Expressions](#).

## Expression syntax

Following are basic components of the syntax:

- Separate keywords with periods (.), as follows:

```
http.req.url
```

- Enclose string values in parentheses and quotes, as follows:

```
http.req.url.query.contains("this")
```

- When configuring an expression from the command line, you must escape internal quote marks

(the quotes that delimit values in the expression, as opposed to the quotes that delimit the expression). One method is to use a slash, as followings:

```
\ "abc\"
```

Selector expressions are evaluated in order of appearance, and multiple expressions in a selector definition are joined by a logical AND. Unlike selector expressions, you can specify Boolean operators and modify the precedence in an advanced expression for a policy rule.

## Configure an expression in a caching policy or a selector

### Note:

The syntax for a policy expression is somewhat different from a selector expression. For a comprehensive discussion of advanced expressions, see “Policies and Expressions.”

To configure a policy expression by using the command line interface

1. Start the policy definition as described in “Globally Binding an Integrated Caching Policy.”
2. To configure the policy rule, delimit the entire rule in quotes, and delimit string values within the rule in escaped quotes.

The following is an example:

```
"http.req.url.contains("jpg")"
```

To add Boolean values, insert `&&`, `&`, `!`, `&`, or `!` operators.

- 1.

The following are examples:

```
"http.req.url.contains(\"jpg\") || http.req.url.contains(\"jpeg\")"
```

```
"http.req.url.query.contains(\"IssuePage\")"
```

```
"http.req.header(\"Host\")contains(\"my.company.com\")&& http.req.method.eq(\"GET\")&& http.req.url.query.contains(\"v=7\")"
```

1. To configure an order of evaluation for the constituent parts of a compound

```
"http.req.url.contains(\"jpg\") || (http.req.url.contains(\"jpeg\")&& http.req.method.eq(\"GET\"))"
```

To configure a selector expression by using the command line interface

1. Start the selector definition as described in “About Content Groups.”
2. To configure the selector expression, delimit the entire rule in quotes, and delimit string values within the rule in escaped quotes.

The following is an example:

```
"http.req.url.contains(\"jpg\")"
```

You cannot add Boolean values, insert &&,

, or ! operators. Enter each expression element delimited in quotes. Multiple expressions in the definition are treated as a compound expression joined by logical ANDs.

1.

The following are examples:

```
"http.req.url.query.value(\"ProductId\")" "http.req.url.query.value(\"BatchNum\")" "http.req.url.query.value(\"depot"
```

To configure a policy or selector expression by using the GUI

1. Start the policy or selector definition as described in “To configure a policy for caching or invalidation by using the configuration utility” or “To configure a selector by using the configuration utility.”
2. In the **Expression** field, you can either manually type the default syntax by clicking Switch to Classic Syntax or create expression using **Expression Editor**.

To insert an operator between two parts of a compound expression, click the Operators button and select the operator type. The following is an example of a configured expression with a Boolean OR (signaled by double vertical bars,

):

3.

4. Click **Frequently Used Expressions** drop-down list to insert the commonly used expressions.
5. To test the expression, click the **Evaluate**. In the **Expression Evaluator** dialog box, select the Flow Type that matches the expression. In the data field, paste the HTTP request or response that you hope to parse using the expression, and click **Evaluate**.

## Display cached objects and cache statistics

You can view particular cached objects, and you can view summary statistics on cache hits, misses, and memory usage. The statistics provide insight on the amount of data that is being served from the cache, what items are responsible for the largest performance benefit, and what you can tune to improve cache performance.

This section includes the following details:

- Viewing Cached Objects
- Finding Particular Cached Responses
- Viewing Cache Statistics

### View cached objects

After enabling caching, you can view details for cached objects. For example, you can view the following items:

- Response sizes and header sizes
- Status codes
- Content groups
- ETag, Last-Modified, and Cache-Control headers
- Request URLs
- Select parameters
- Destination IP addresses
- Request and response times

To view a list of cached objects by using the command line interface

At the command prompt, type:

```
show cache object
```

---

| Properties                   | Description                                                                                                           |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Response size (bytes)        | The size of the response header and body.                                                                             |
| Response header size (bytes) | The size of the header portion of the response.                                                                       |
| Response status code         | The status code sent with the response.                                                                               |
| ETag                         | The ETag header inserted in the response. Typically, this header indicates whether the response has changed recently. |
| Last-Modified                | The Last-Modified header inserted in the response. This header indicates the date that the response was last changed. |

---

| <b>Properties</b>    | <b>Description</b>                                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------------|
| Cache-Control        | The Cache-Control header inserted in the response.                                                         |
| Date                 | The Date header that indicates when the response was sent.                                                 |
| Contentgroup         | The content group where the response is stored.                                                            |
| Complex match        | If this object was cached based on parameterized values, this field value is YES.                          |
| Host                 | The host specified in the URL that requested this response.                                                |
| Host port            | The listen port for the host specified in the URL that requested this response                             |
| URL                  | The URL issued for the stored response.                                                                    |
| Destination IP       | The IP address of the server from which this response was fetched.                                         |
| Destination port     | The listen port for the destination server.                                                                |
| Select parameters    | If the content group that stores the response uses Hit parameters, they are listed in this field.          |
| Hit selector         | If this content group uses a hit selector, it is listed in this field.                                     |
| Inval selector       | If this content group uses an invalidation selector, it is listed in this field.                           |
| Selector Expressions | If this content group uses a selector, this field displays the expression that defines the selection rule. |
| Request time         | The time in milliseconds since the request was issued.                                                     |
| Response time        | The time in milliseconds since the cache started to receive the response.                                  |
| Age                  | Amount of time the object has been in the cache.                                                           |
| Expiry               | Amount of time after which the object is marked as expired.                                                |

---

| <b>Properties</b>        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flushed                  | Whether the response has been flushed after expiry.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Prefetch                 | If Prefetch has been configured for this content group, the amount of time before expiry during which the object is fetched from the origin. Prefetch does not apply to negative objects (for example, 404 “object not found” responses).                                                                                                                                                                                                                       |
| Current readers          | Approximately the current number of hits being served. When a response with a Content-Length header object is being downloaded, the current misses and the current readers values are each typically 1. When a chunked response object is being downloaded, the current misses value is typically 1, but the current readers value is typically 0, because the chunked response that is served to the client does not come from the integrated caching buffers. |
| Current misses           | The current number of requests that resulted in a cache miss and fetching from the origin server. This value is typically 0 or 1. If Poll Every Time is enabled for a content group, the count can be greater than 1.                                                                                                                                                                                                                                           |
| Select                   | The number of cache hits for this object.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Misses                   | The number of cache misses for this object.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Compression format       | The type of compression applied to this object. Compression formats include gzip, deflate, compress, and pack200-gzip.                                                                                                                                                                                                                                                                                                                                          |
| HTTP version in response | The version of HTTP that was used to send the response.                                                                                                                                                                                                                                                                                                                                                                                                         |

| Properties                                  | Description                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Weak etag present in response               | Strong etag headers change of the bits of an entity change. Strong headers are based on the octet values of an object. Weak etag headers change if the meaning of an entity changes. Weak etag values are based on semantic identity. Weak etags values start with a “W.”                                      |
| Negative marker cell                        | A marker object is cacheable, but it does not yet meet all the criteria for being cached. For example, the object may exceed the maximum response size for the content group. A marker cell is created for objects of this type. The next time a user sends a request for this object, a cache miss is served. |
| Reason marker created                       | The reason a marker cell was created (for example, “Waiting for minhit,” “Content-length response data is not in group size limit”).                                                                                                                                                                           |
| Auto poll every time                        | If the integrated cache receives an already expired 200 OK response with validators (either the Last-Modified or the ETag response headers) it stores the response and marks it as Auto-PET (automatically poll every time).                                                                                   |
| Citrix ADC Etag inserted in response        | A variation of the ETag header generated by the Citrix ADC appliance. A value of YES appears if the Citrix ADC inserts an Etag in the response.                                                                                                                                                                |
| Full response present in cache              | Indicates whether this is a complete response.                                                                                                                                                                                                                                                                 |
| Destination IP verified by DNS              | Indicates whether DNS resolution was performed when storing the object.                                                                                                                                                                                                                                        |
| Object stored through a cache forward proxy | Indicates whether this response was stored due to a forward proxy that is configured in the integrated cache.                                                                                                                                                                                                  |
| Object is a Delta basefile                  | A response that is delta-compressed.                                                                                                                                                                                                                                                                           |
| Waiting for minhits                         | Indicates whether this content group requires a minimum number of origin server hits before caching a response.                                                                                                                                                                                                |

| Properties                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Minhit count                              | If this content group requires a minimum number of origin servers hit before caching an object, this field displays a count of the number of hits received so far.                                                                                                                                                                                                                                                                    |
| HTTP Request Method                       | The method, GET or POST, used in the request that obtained this object.                                                                                                                                                                                                                                                                                                                                                               |
| Stored by policy                          | The name of the caching policy that caused this object to be stored. A value of NOT AVAILABLE indicates that the policy has been deactivated or deleted. A value of NONE indicates that the object did not match a visible policy, but was stored according to internal criteria for caching.                                                                                                                                         |
| Application firewall metadata exists      | This parameter is used when the application firewall and the integrated cache are both enabled. The application firewall analyzes the contents of a response page, stores its metadata (for example, URLs and forms contained in page), and exports the metadata with the response to the cache. The cache stores the page and the metadata, and when the cache serves the page, it sends the metadata back to the request's session. |
| HTTP callout object, name, type, response | These cells indicate whether this data was stored as a result of an HTTP Callout expression, and provide information about various aspects of the callout and the corresponding response. For more information about HTTP callouts, see "HTTP Callouts".                                                                                                                                                                              |

To view cached objects by using the GUI

Navigate to **Optimization > Integrated Caching > Cache Objects**. You can view all the cached objects and sort them accordingly as per your requirement.

## Cache Objects

**Cache Object View Options**

### Find particular cached responses

You can find individual items in the cache based on search criteria. There are different methods for finding cached items, depending on whether the content group that contains the data uses Hit and invalidation selectors, as follows:

- If the content group uses selectors, you can only conduct the search using the Locator ID for the cached item.
- If the content group does not use selectors, you conduct the search using criteria such as URL, host, content group name.

When searching for a cached response, you can locate some items by URL and host. If the response is in a content group that uses a selector, you can find it only by using a Locator number (for example, 0x00000000ad7af0000050). To save a Locator number for later use, right-click the entry and select **Copy**. For more information about selectors, see “[Configuring Selectors and Basic Content Groups.](#)”

To display cached responses in content groups that do not have a selector by using the command line interface

At the command prompt, type:

```
show cache object [-locator <positiveInteger>] | [(-url <URL> (-host <
hostName> [-port <port>] [-groupName <contentGroupName>] [-httpMethod GET
| POST ])] | [-httpStatus <positive integer>] | -group <contentGroupName> |
-ignoreMarkerObjects (ON | OFF) | -includeNotReadyObjects (ON | OFF)]
```

To display cached responses in content groups that have a selector by using the command line interface

At the command prompt, type:

```
show cache object -locator <locatorString> MarkerObjects ( ON | OFF ) | -
includeNotReadyObjects ( ON | OFF ) | [-httpStatus<positive integer>]
```

To display cached responses in content groups that do not have a selector by using the configuration utility

Navigate to **Optimization > Integrated Caching > Cache Objects**, click **Search**, and set the search criteria to view the required cached response.

If you have not yet configured any content groups, all of the objects are in the Default group.

### View cache statistics

The following table summarizes the detailed cache statistics that you can view.

| Counter                                                                                                          | Description                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select                                                                                                           | Responses that are found in and served from the integrated cache. Includes static objects such as image files, pages with status codes 200, 203, 300, 301, 302, 304, 307, 403, 404, 410, and responses that match a user-defined policy with a CACHE action. |
| Misses                                                                                                           | Intercepted HTTP requests where the response was ultimately fetched from origin server.                                                                                                                                                                      |
| Requests                                                                                                         | Total cache Hit plus total cache misses.                                                                                                                                                                                                                     |
| Non-304 hit                                                                                                      | If the user requests an item more than once, and the item in the cache is unchanged since the last time the Citrix ADC appliance served it, the Citrix ADC appliance serves a 304 response instead of the cached object.                                     |
| This statistic indicates how many items the Citrix ADC appliance served from the cache, excluding 304 responses. |                                                                                                                                                                                                                                                              |
| 304 hits                                                                                                         | Number of 304 (object not modified) responses the Citrix ADC appliance served from the cache.                                                                                                                                                                |
| 304 hits ratio (%)                                                                                               | Percentage of 304 responses that the Citrix ADC appliance served, relative to other responses.                                                                                                                                                               |
| Select ratio (%)                                                                                                 | Percentage of responses that the Citrix ADC appliance served from the cache (cache hits) relative to responses that might not be served from the cache.                                                                                                      |

| Counter                                                       | Description                                                                                                                                                                                               |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Origin bandwidth saved (%)                                    | An estimate of the processing capacity that the Citrix ADC appliance saved on the origin server due to serving responses from the cache.                                                                  |
| Bytes served by the Citrix ADC                                | Total number of bytes that the Citrix ADC appliance served from the origin server and the cache.                                                                                                          |
| Bytes served by cache                                         | Total number of bytes that the Citrix ADC appliance served from the cache.                                                                                                                                |
| Byte hit ratio(%)                                             | Percentage of data that the Citrix ADC appliance served from the cache, relative to all of the data in all served responses.                                                                              |
| Compressed bytes from cache                                   | Amount of data, in bytes, that the Citrix ADC appliance served in compressed form.                                                                                                                        |
| Storable misses                                               | If the Citrix ADC appliance does not find a requested object in the cache, it fetches the object from the origin server. This is known as a cache miss. A storable cache miss can be stored in the cache. |
| Non-storable misses                                           | A non-storable cache miss cannot be stored in the cache.                                                                                                                                                  |
| Misses                                                        | All cache misses.                                                                                                                                                                                         |
| Revalidations                                                 | Max-Age setting in a Cache-Control header determines, in number of seconds, when an intervening cache must revalidate the content with the integrated cache before serving it to the user.                |
| For more information, see “Inserting a Cache-Control Header.” |                                                                                                                                                                                                           |
| Successful revalidations                                      | Number of revalidations that have been performed.                                                                                                                                                         |
| For more information, see “Inserting a Cache-Control Header.” |                                                                                                                                                                                                           |
| Conversions to conditional req                                | A user-agent request for a cached PET object is always converted to a conditional request and sent to the origin server.                                                                                  |

| Counter                                                                                 | Description                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| For more information, see “Polling the Origin Server Every Time a Request Is Received.” |                                                                                                                                                                                                 |
| Storable miss ratio (%)                                                                 | Storable cache misses as a percentage of non-storable cache misses.                                                                                                                             |
| Successful reval ratio (%)                                                              | Successful revalidations as a percentage of all revalidation attempts.                                                                                                                          |
| For more information, see “Inserting a Cache-Control Header.”                           |                                                                                                                                                                                                 |
| Expire at last byte                                                                     | Number of times that the cache expired content immediately after receiving the last body byte. Only applicable to positive responses, as described in the table “Cache hits and Misses.”        |
| For more information, see “Example of Performance Optimization.”                        |                                                                                                                                                                                                 |
| Flashcache misses                                                                       | If you enable Flash Cache, the cache allows only one request to reach the server, eliminating flash crowds. This statistic indicates the number of Flash Cache requests that were cache misses. |
| For more information, “Queuing Requests to the Cache.”                                  |                                                                                                                                                                                                 |
| Flash cache hits                                                                        | Number of Flash Cache requests that were cache hits.                                                                                                                                            |
| For more information, see “Queuing Requests to the Cache.”                              |                                                                                                                                                                                                 |
| Parameterized inval requests                                                            | Requests that match a policy with an invalidation (INVAL) action and a content group that uses an invalidation selector or parameters to selectively expire cached objects in the group.        |
| Full inval requests                                                                     | Requests that match an invalidation policy where the invalGroups parameter is configured and expires one or more content groups.                                                                |

| Counter                                                                                 | Description                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inval requests                                                                          | Requests that match an invalidation policy and result in expiration of specific cached responses or entire content groups.                                                                          |
| Parameterized requests                                                                  | Number of cache requests that were processed using a policy with a parameterized content group.                                                                                                     |
| Parameterized non-304 hit                                                               | Number of cache requests that were processed using a policy with a parameterized content group, where full cached response was found, and the response was not a 304 (object not updated) response. |
| Parameterized 304 hits                                                                  | Number of cache requests that were processed using a policy with a parameterized content group, where the cached object was found, and the object was a 304 (object not updated) response.          |
| Total parameterized hits                                                                | Number of cache requests that were processed using a policy with a parameterized content group, where the cached object was found.                                                                  |
| Parameterized 304 hit ratio (%)                                                         | Percentage of 304 (object not updated) responses that were found using a parameterized policy, relative to all cache hits.                                                                          |
| Poll every time requests                                                                | If Poll Every Time is enabled, the Citrix ADC appliance always consults the origin server before serving a stored object.                                                                           |
| For more information, see “Polling the Origin Server Every Time a Request Is Received.” |                                                                                                                                                                                                     |
| Poll every time hits                                                                    | Number of times a cache hit was found using the Poll Every Time method.                                                                                                                             |
| For more information, see “Polling the Origin Server Every Time a Request Is Received.” |                                                                                                                                                                                                     |

---

| Counter                          | Description                                                                                                                                                                                                                                |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll every time hit ratio (%)    | Percentage of cache hits using the Poll Every Time method, relative to all searches for cached objects using Poll Every Time. For more information, see “Polling the Origin Server Every Time a Request Is Received.”                      |
| Maximum memory (KB)              | Maximum amount of memory in the Citrix ADC appliance that is allocated to the cache. For more information, see “Configuring Global Attributes for Caching.”                                                                                |
| Maximum memory active value (KB) | Maximum amount of memory (active value) that will be set after the memory is actually allocated to the cache. For more information, see “How to Configure the Integrated Caching Feature of a Citrix ADC Appliance for various Scenarios.” |
| Utilized memory (KB)             | Amount of memory that is actually being used.                                                                                                                                                                                              |
| Memory allocation failures       | Number of failed attempts to utilize memory for the purpose of storing a response in the cache.                                                                                                                                            |
| Largest response so far          | Largest response in bytes found in either the cache or the origin server and sent to the client.                                                                                                                                           |
| Cached objects                   | Number of objects in the cache, including responses that have not yet been fully downloaded and responses that have been expired but not yet flushed.                                                                                      |
| Marker objects                   | Marker objects are created when a response exceeds the maximum or minimum response size for the content group, or has not yet received the minimum number of hits for the content group.                                                   |
| Hits being served                | Number of hits that have been served from the cache.                                                                                                                                                                                       |

| Counter              | Description                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Misses being handled | Responses that were fetched from the origin server, stored in the cache, and then served. Should approximate the number for storable misses. Does not include non-storable misses. |

**To view summary cache statistics by using the command line interface:**

At the command prompt, type:

```
stat cache
```

**To view specific cache statistics by using the command line interface:**

At the command prompt, type:

```
stat cache -detail
```

```

1 > stat cache -detail

To view summary cache statistics by using the GUI

1. Click the **Dashboard** tab at the top of the page.
2. Scroll down to the **Integrated Caching** section of the window.
3. To see detailed statistics, click the More... link at the bottom of the table.

To view specific cache statistics by using the GUI

1. Click the **Reporting** tab at the top of the page.
2. Under Built-In Reports, expand **Integrated Cache**, and then click the report with the statistics you want to view.

3. To save the report as a template, click **Save As** and name the report. The saved report appears under **Custom** Reports.

## Display cached objects and cache statistics

September 21, 2020

You can view particular cached objects, and you can view summary statistics on cache hits, misses, and memory usage. The statistics provide insight on the amount of data that is being served from the cache, what items are responsible for the largest performance benefit, and what you can tune to improve cache performance.

This section includes the following details:

- Viewing Cached Objects
- Finding Particular Cached Responses
- Viewing Cache Statistics

### View cached objects

After enabling caching, you can view details for cached objects. For example, you can view the following items:

- Response sizes and header sizes
- Status codes
- Content groups
- ETag, Last-Modified, and Cache-Control headers
- Request URLs
- Hit parameters
- Destination IP addresses
- Request and response times

To view a list of cached objects by using the command line interface

At the command prompt, type:

```
show cache object
```

---

| Properties                   | Specification                                   |
|------------------------------|-------------------------------------------------|
| Response size (bytes)        | The size of the response header and body.       |
| Response header size (bytes) | The size of the header portion of the response. |

---

---

| Properties           | Specification                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------|
| Response status code | The status code sent with the response.                                                                               |
| ETag                 | The ETag header inserted in the response. Typically, this header indicates whether the response has changed recently. |
| Last-Modified        | The Last-Modified header inserted in the response. This header indicates the date that the response was last changed. |
| Cache-Control        | The Cache-Control header inserted in the response.                                                                    |
| Date                 | The Date header that indicates when the response was sent.                                                            |
| Contentgroup         | The content group where the response is stored.                                                                       |
| Complex match        | If this object was cached on the basis of parameterized values, this field value is YES.                              |
| Host                 | The host specified in the URL that requested this response.                                                           |
| Host port            | The listen port for the host specified in the URL that requested this response                                        |
| URL                  | The URL issued for the stored response.                                                                               |
| Destination IP       | The IP address of the server from which this response was fetched.                                                    |
| Destination port     | The listen port for the destination server.                                                                           |
| Hit parameters       | If the content group that stores the response uses hit parameters, they are listed in this field.                     |
| Hit selector         | If this content group uses a hit selector, it is listed in this field.                                                |
| Inval selector       | If this content group uses an invalidation selector, it is listed in this field.                                      |
| Selector Expressions | If this content group uses a selector, this field displays the expression that defines the selection rule.            |
| Request time         | The time in milliseconds since the request was issued.                                                                |

| Properties         | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Response time      | The time in milliseconds since the cache started to receive the response.                                                                                                                                                                                                                                                                                                                                                                                       |
| Age                | Amount of time the object has been in the cache.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Expiry             | Amount of time after which the object is marked as expired.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Flushed            | Whether the response has been flushed after expiry.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Prefetch           | If Prefetch has been configured for this content group, the amount of time before expiry during which the object is fetched from the origin. Prefetch does not apply to negative objects (for example, 404 “object not found” responses).                                                                                                                                                                                                                       |
| Current readers    | Approximately the current number of hits being served. When a response with a Content-Length header object is being downloaded, the current misses and the current readers values are each typically 1. When a chunked response object is being downloaded, the current misses value is typically 1, but the current readers value is typically 0, because the chunked response that is served to the client does not come from the integrated caching buffers. |
| Current misses     | The current number of requests that resulted in a cache miss and fetching from the origin server. This value is typically 0 or 1. If Poll Every Time is enabled for a content group, the count can be greater than 1.                                                                                                                                                                                                                                           |
| Hits               | The number of cache hits for this object.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Misses             | The number of cache misses for this object.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Compression format | The type of compression applied to this object. Compression formats include gzip, deflate, compress, and pack200-gzip.                                                                                                                                                                                                                                                                                                                                          |

| Properties                                  | Specification                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP version in response                    | The version of HTTP that was used to send the response.                                                                                                                                                                                                                                                        |
| Weak etag present in response               | Strong etag headers change if the bits of an entity change. Strong headers are based on the octet values of an object. Weak etag headers change if the meaning of an entity changes. Weak etag values are based on semantic identity. Weak etags values start with a "W."                                      |
| Negative marker cell                        | A marker object is cacheable, but it does not yet meet all the criteria for being cached. For example, the object may exceed the maximum response size for the content group. A marker cell is created for objects of this type. The next time a user sends a request for this object, a cache miss is served. |
| Reason marker created                       | The reason a marker cell was created (for example, "Waiting for minhit," "Content-length response data is not in group size limit").                                                                                                                                                                           |
| Auto poll every time                        | If the integrated cache receives an already expired 200 OK response with validators (either the Last-Modified or the ETag response headers) it stores the response and marks it as Auto-PET (automatically poll every time).                                                                                   |
| Citrix ADC Etag inserted in response        | A variation of the ETag header generated by the Citrix ADC appliance. A value of YES appears if the Citrix ADC inserts an Etag in the response.                                                                                                                                                                |
| Full response present in cache              | Indicates whether this is a complete response.                                                                                                                                                                                                                                                                 |
| Destination IP verified by DNS              | Indicates whether DNS resolution was performed when storing the object.                                                                                                                                                                                                                                        |
| Object stored through a cache forward proxy | Indicates whether this response was stored due to a forward proxy that is configured in the integrated cache.                                                                                                                                                                                                  |
| Object is a Delta basefile                  | A response that is delta-compressed.                                                                                                                                                                                                                                                                           |

---

| Properties                                | Specification                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Waiting for minhits                       | Indicates whether this content group requires a minimum number of origin server hits before caching a response.                                                                                                                                                                                                                                                                                                                       |
| Minhit count                              | If this content group requires a minimum number of origin server hits before caching an object, this field displays a count of the number of hits received so far.                                                                                                                                                                                                                                                                    |
| HTTP Request Method                       | The method, GET or POST, used in the request that obtained this object.                                                                                                                                                                                                                                                                                                                                                               |
| Stored by policy                          | The name of the caching policy that caused this object to be stored. A value of NOT AVAILABLE indicates that the policy has been deactivated or deleted. A value of NONE indicates that the object did not match a visible policy, but was stored according to internal criteria for caching.                                                                                                                                         |
| Application firewall metadata exists      | This parameter is used when the application firewall and the integrated cache are both enabled. The application firewall analyzes the contents of a response page, stores its metadata (for example, URLs and forms contained in page), and exports the metadata with the response to the cache. The cache stores the page and the metadata, and when the cache serves the page, it sends the metadata back to the request's session. |
| HTTP callout object, name, type, response | These cells indicate whether this data was stored as a result of an HTTP Callout expression, and provide information about various aspects of the callout and the corresponding response. For more information about HTTP callouts, see "HTTP Callouts".                                                                                                                                                                              |

---

## Find particular cached responses

You can find individual items in the cache based on search criteria. There are different methods for finding cached items, depending on whether the content group that contains the data uses hit and invalidation selectors, as follows:

If the content group uses selectors, you can only conduct the search using the Locator ID for the cached item.

If the content group does not use selectors, you conduct the search using criteria such as URL, host, content group name, and so on.

When searching for a cached response, you can locate some items by URL and host. If the response is in a content group that uses a selector, you can find it only by using a Locator number (for example, 0x00000000ad7af0000050). To save a Locator number for later use, right-click the entry and select Copy. For more information about selectors, see “Configuring Selectors and Basic Content Groups.”

To display cached responses in content groups that do not have a selector by using the command line interface

At the command prompt, type:

```
show cache object locator <positive|
[(-url POST [-group - OFF) - OFF]]
<URL> ))) httpStatu <content( ignoreMa includeN objects
object [- (-host inte- (ON (ON
locator <hostNan ger>]
<positive| [-port
<port>]
[-
groupNar
<content(
[-
httpMeth
GET
```

To display cached responses in content groups that have a selector by using the command line interface

At the command prompt, type:

|                 |       |                  |       |                     |
|-----------------|-------|------------------|-------|---------------------|
| show cache      | OFF ) | -                | OFF ) | [-                  |
| object -locator |       | includeNotReadyC |       | httpStatus<positive |
| <locatorString> |       | ( ON             |       | integer>]           |
| MarkerObjects ( |       |                  |       |                     |
| ON              |       |                  |       |                     |

To display cached responses in content groups that do not have a selector by using the GUI

Navigate to **Optimization > Integrated Caching > Cache Objects**, click **Search**, and set the search criteria to view the required cached response.

If you have not yet configured any content groups, all of the objects are in the Default group.

To display cached responses in content groups that have a selector by using the GUI

Navigate to **Optimization > Integrated Caching > Cache Objects**, click **Search**, and set the selector search criteria to view the required cached response.

## View cache statistics

The following table summarizes the cache statistics.

Counter

Specification

## Viewing cache statistics

Updated: 2013-10-28

The following table summarizes the detailed cache statistics that you can view.

|Counter|Specifies|

|—|—|

|Hits|Responses that are found in and served from the integrated cache. Includes static objects such as image files, pages with status codes 200, 203, 300, 301, 302, 304, 307, 403, 404, 410, and responses that match a user-defined policy with a CACHE action..|

|Misses|Intercepted HTTP requests where the response was ultimately fetched from origin server.|

|Requests|Total cache hits plus total cache misses.|

|Non-304 hits|If the user requests an item more than once, and the item in the cache is unchanged since the last time the Citrix ADC appliance served it, the Citrix ADC appliance serves a 304 response instead of the cached object.

This statistic indicates how many items the Citrix ADC appliance served from the cache, excluding 304 responses.|

|304 hits|Number of 304 (object not modified) responses the Citrix ADC appliance served from the cache.|

|304 hit ratio (%)|Percentage of 304 responses that the Citrix ADC appliance served, relative to other responses.|

|Hit ratio (%)|Percentage of responses that the Citrix ADC appliance served from the cache (cache hits) relative to responses that could not be served from the cache.|

|Origin bandwidth saved (%)|An estimate of the processing capacity that the Citrix ADC appliance saved on the origin server due to serving responses from the cache.|

|Bytes served by the Citrix ADC|Total number of bytes that the Citrix ADC appliance served from the origin server and the cache.|

|Bytes served by cache|Total number of bytes that the Citrix ADC appliance served from the cache.|

|Byte hit ratio (%)|Percentage of data that the Citrix ADC appliance served from the cache, relative to all of the data in all served responses.|

|Compressed bytes from cache|Amount of data, in bytes, that the Citrix ADC appliance served in compressed form.|

|Storable misses|If the Citrix ADC appliance does not find a requested object in the cache, it fetches the object from the origin server. This is known as a cache miss. A storable cache miss can be stored in the cache.|

|Non-storable misses|A non-storable cache miss cannot be stored in the cache.|

|Misses|All cache misses.|

|Revalidations|Max-Age setting in a Cache-Control header determines, in number of seconds, when an intervening cache must revalidate the content with the integrated cache before serving it to the user. For more information, see “Inserting a Cache-Control Header.”|

|Successful revalidations|Number of re-validations that have been performed. For more information, see “Inserting a Cache-Control Header.”|

|Conversions to conditional req|A user-agent request for a cached PET object is always converted to a conditional request and sent to the origin server. For more information, see “Polling the Origin Server Every Time a Request Is Received.”|

|Storable miss ratio (%)|Storable cache misses as a percentage of non-storable cache misses.|

|Successful reval ratio (%)|Successful revalidations as a percentage of all revalidation attempts. For more information, see “Inserting a Cache-Control Header.”|

|Expire at last byte|Number of times that the cache expired content immediately after receiving the last body byte. Only applicable to positive responses, as described in the table “Cache Hits and Misses.” For more information, see “Example of Performance Optimization.”|

|Flashcache misses|If you enable Flash Cache, the cache allows only one request to reach the server, eliminating flash crowds. This statistic indicates the number of Flash Cache requests that were cache misses. For more information, “Queuing Requests to the Cache.”|

|Flashcache hits|Number of Flash Cache requests that were cache hits. For more information, see “Queuing Requests to the Cache.”|

|Parameterized inval requests|Requests that match a policy with an invalidation (INVAL) action and a content group that uses an invalidation selector or parameters to selectively expire cached objects in the group.|

|Full inval requests|Requests that match an invalidation policy where the invalGroups parameter is configured and expires one or more content groups.|

|Inval requests|Requests that match an invalidation policy and result in expiration of specific cached responses or entire content groups.|

|Parameterized requests|Number of cache requests that were processed using a policy with a parameterized content group.|

|Parameterized non-304 hits|Number of cache requests that were processed using a policy with a parameterized content group, where full cached response was found, and the response was not a 304 (object not updated) response.|

|Parameterized 304 hits|Number of cache requests that were processed using a policy with a parameterized content group, where the cached object was found, and the object was a 304 (object not updated) response.|

|Total parameterized hits|Number of cache requests that were processed using a policy with a parameterized content group, where the cached object was found.|

|Parameterized 304 hit ratio (%)|Percentage of 304 (object not updated) responses that were found using a parameterized policy, relative to all cache hits.|

|Poll every time requests|If Poll Every Time is enabled, the Citrix ADC appliance always consults the origin server before serving a stored object. For more information, see “Polling the Origin Server Every Time a Request Is Received.”|

|Poll every time hits|Number of times a cache hit was found using the Poll Every Time method. For more information, see “Polling the Origin Server Every Time a Request Is Received.”|

|Poll every time hit ratio (%)|Percentage of cache hits using the Poll Every Time method, relative to all searches for cached objects using Poll Every Time. For more information, see “Polling the Origin Server Every Time a Request Is Received.”|

|Maximum memory (KB)|Maximum amount of memory in the Citrix ADC appliance that is allocated to the cache. For more information, see “Configuring Global Attributes for Caching.”|

|Maximum memory active value (KB)|Maximum amount of memory (active value) that will be set after the memory is actually allocated to the cache. For more information, see “How to Configure the Integrated Caching Feature of a Citrix ADC Appliance for various Scenarios.”|

|Utilized memory (KB)|Amount of memory that is actually being used.|

|Memory allocation failures|Number of failed attempts to utilize memory for the purpose of storing a response in the cache.|

|Largest response so far|Largest response in bytes found in either the cache or the origin server and sent to the client.|

|Cached objects|Number of objects in the cache, including responses that have not yet been fully downloaded and responses that have been expired but not yet flushed.|

|Marker objects|Marker objects are created when a response exceeds the maximum or minimum response size for the content group, or has not yet received the minimum number of hits for the content group.

|Hits being served|Number of hits that have been served from the cache.

|Misses being handled|Responses that were fetched from the origin server, stored in the cache, and then served. Should approximate the number for storable misses. Does not include non-storable misses.

To view summary cache statistics by using the command line interface

At the command prompt, type:

```
stat cache
```

To view specific cache statistics by using the command line interface

At the command prompt, type:

```

1 stat cache -detail
2
3 > stat cache -detail

To view summary cache statistics by using the GUI

1. Click the **Dashboard** tab at the top of the page.
2. Scroll down to the Integrated Caching section of the window.
3. To see detailed statistics, click the More... link at the bottom of the table.

To view specific cache statistics by using the GUI

1. Click the Reporting tab at the top of the page.
2. Under Built-In Reports, expand Integrated Cache, and then click the report with the statistics you want to view.
3. To save the report as a template, click Save As and name the report. The saved report appears under Custom Reports.

## Improve cache performance

September 21, 2020

You can improve the performance of integrated cache, including handling simultaneous requests for the same cached data, avoiding delays that are associated with refreshing cached responses from the origin server, and ensuring that a response is requested often enough to be worth caching.

### Reduce flash crowds

Flash crowds occur when many users simultaneously request the same data. All of the requests in a flash crowd can become cache misses if you configured the cache to serve hits only after the entire object is downloaded.

The following techniques can reduce or eliminate flash crowds:

- **PREFETCH:** Refreshes a positive response before it expires to ensure that it never becomes stale or inactive. For more information, see “Refreshing a Response Prior to Expiration” section.

- **Cache buffering:** Starts serving a response to multiple clients as soon as it receives the response header from the origin server, rather than waiting for the entire response to be downloaded. The only limit on the number of clients that can download a response simultaneously is the available system resources. The Citrix ADC appliance downloads and serves responses even if the client that initiated the download halts before the download is complete. If the size of the response exceeds the cache size or if the response is chunked, the cache stops storing the response, but service to the clients is not disrupted.
- **Flash Cache:** Flash Cache queues requests to the cache, and allows only one request to reach the server at a time.

For more information, see “Queuing Requests to the Cache” section.

### Refresh a response before expiration

To ensure that a cached response is fresh whenever it is needed, the PREFETCH option refreshes a response before its calculated expiration time. The prefetch interval is calculated after receiving the first client request. From that point onward, the Citrix ADC appliance refreshes the cached response at a time interval that you configure in the PREFETCH parameter.

This setting is useful for data that is updated frequently between requests. It does not apply to negative responses (for example, 404 messages).

To configure prefetch for a content group by using the command line interface

At the command prompt, type:

```
set cache contentgroup <name> -prefetch YES [-prefetchPeriod <seconds> | -prefetchPeriodMilliSec <milliseconds>] [-prefetchMaxPending <positiveInteger>]
```

\*To configure prefetch for a content group by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, and select the **content group**.

On **Others** tab, in the Flash Crowd and Prefetch group, select **Prefetch** option, and specify the values in Interval and Maximum number of pending prefetches text boxes.

### Queue requests to the cache

The Flash Cache option queues requests that arrive simultaneously (a flash crowd), retrieves the response, and distributes it to all the clients whose requests are in the queue. If, during this process, the response becomes non-cacheable, the Citrix ADC appliance stops serving the response from the cache and instead serves the origin server’s response to the queued clients. If the response is not available, the clients receive an error message.

Flash Cache is disabled by default. You cannot enable Poll Every Time (PET) and Flash Cache on the same content group.

One disadvantage of Flash Cache is if the server replies with an error (for example, a 404 that is quickly remedied), the error is fanned out to the waiting clients.

**Note:**

If Flash Cache is enabled, in some situations the Citrix ADC appliance is unable to correctly match the Accept-Encoding header in the client request with the Content-Encoding header in the response. The Citrix ADC appliance can assume that these headers match and mistakenly serve a hit. As a work-around, you can configure Integrated Caching policies to disallow serving hits to clients that do not have an appropriate Accept-Encoding header.

To enable Flash Cache by using the command line interface

At the command prompt, type:

```
set cache contentgroup <contentGroupName> -flashcache yes
```

To enable Flash Cache by using the GUI

Navigate to **Optimization > Integrated Caching > Content Groups**, and select the content group.

On **Others** tab, in the Flash Crowd and Prefetch group, select **Prefetch** option.

### Cache a response after a client halts a download

You can set the Quick Abort parameter to continue caching a response, even if the client halts a request before the response is in the cache.

If the downloaded response size is less than or equal to the Quick Abort size, the Citrix ADC appliance stops downloading the response. If you set the Quick Abort parameter to 0, all downloads are halted.

To configure quick abort size by using the command line interface

At the command prompt, type:

```
set cache contentgroup <name> -quickAbortSize <integerInKBytes>
```

To configure quick abort size by using the GUI

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and select the content group.
2. On **Memory** tab, set the relevant value in Quick Abort: Continue caching if more than text box.

### Requiring a minimum number of server hits before caching

You can configure the minimum number of times that a response must be found on the origin server before it can be cached. You should consider increasing the minimum hits if the cache memory fills

up quickly and has a lower-than-expected hit ratio.

The default value for the minimum number of hits is 0. This value caches the response after the first request.

To configure the minimum number of hits that are required before caching by using the command line interface

At the command prompt, type:

```
set cache contentgroup <name> -minhits <positiveInteger>
```

To configure the minimum number of hits that are required before caching by using the GUI

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and select the content group.
2. On **Memory** tab, set the relevant value in Do not cache, if hits are less than text box.

### Example for performance optimization

In this example, a client accesses a stock quote. Stock quotes are highly dynamic. You configure the integrated cache to serve the same stock quote to concurrent clients without sending multiple requests to the origin server. The stock quote expires after it is downloaded to all of the clients, and the next request for a quote for the same stock is fetched from the origin server. This ensures that the quote is always up to date.

The following task overview describes the steps to configure the cache for the stock quote application.

Configure caching for a stock quote application

Create a content group for stock quotes

For more information, see “About Content Groups.”

Configure the following for this content group:

1. On the **Expiry Method** tab, select the Expire after complete response received check box.
2. On the **Others** tab, select the **Flash Cache** check box, and click **Create**.
3. Add a cache policy to cache the stock quotes.

For more information, see “Configuring a Policy in the Integrated Cache.”

Configure the following for the policy

1. In the **Action and Store in Group lists**, select **CACHE** and select the group that you defined in the previous step.
2. Click **Add**, and in the **Add Expression** dialog box configure an expression that identifies stock quote requests, for example: `http.req.url.contains(“cgi-bin/stock-quote.pl”)`
3. Activate the policy.

For more information, see “Globally Binding an Integrated Caching Policy.” In this example, you bind this policy to request-time override processing and set the priority to a low value.

## Configure cookies, headers, and polling

September 21, 2020

This topic explains how to configure cache manages cookies, HTTP headers, and origin server polling. This includes modifying the default behavior that causes the cache to diverge from documented standards, overriding HTTP headers that might cause cacheable content to not be stored in the cache, and configuring cache to always poll the origin for updated content.

### Divergence of cache behavior from the standards

By default, the integrated cache adheres to the following RFC standards:

- RFC 2616, “HTTP HTTP/1.1”
- The caching behaviors described in RFC 2617, “HTTP Authentication: Basic and Digest Access Authentication”
- The caching behavior described in RFC 2965, “HTTP State Management Mechanism”

The built-in policies and the Default content group attributes ensure conformance with most of these standards.

The default integrated cache behavior diverges from the specification as follows:

- There is a limited support for the Vary header. By default, any response containing a Vary header is considered to be non-cacheable unless it is compressed. A compressed response contains content-encoding: gzip, content-encoding: deflate, or content-encoding: pack200-gzip and is cacheable even if it contains the Vary: Accept-encoding header.
- The integrated cache ignores the values of the headers cache-control: no-cache and cache-control: private. For example, a response that contains cache-control: no-cache="Set-Cookie" is treated as if the response contained Cache-Control: no-cache. By default, the response is not cached.
- An image (content-type = image/\*) is always considered cacheable, even if an image response contains set-cookie or set-cookie2 headers, or if an image request contains a cookie header. The integrated cache removes set-cookie and set-cookie2 headers from a response before caching it. This diverges from RFC 2965. You can configure RFC-compliant behavior as follows:

```
1 add cache policy rfc_compliant_images_policy -rule "http.res.header.set
  -cookie2.exists || http.res.header.set-cookie.exists" -action
  NOCACHE
```

```
2
3
4 bind cache global rfc_compliant_images_policy -priority 100 -type REQ\
  _OVERRIDE
5 <!--NeedCopy-->
```

- The following cache-control headers in a request force an RFC-compliant cache to reload a cached response from the origin server:

```
Cache-control: max-age=0
```

```
Cache-control: no-cache
```

To guard against denial-of-service attacks, this behavior is not the default.

- By default, the caching module considers a response to be cacheable unless a response header state otherwise. To make this behavior RFC 2616 compliant, set `-weakPosRelExpiry` and `-weakNegResExpiry` to 0 for all content groups.

## Remove cookies from a response

Cookies are often personalized for a user, and typically should not be cached. The `Remove Response Cookies` parameter removes `Set-Cookie` and `Set-Cookie2` headers before caching a response. By default, the `Remove Response Cookies` option for a content group prevents caching of responses with `Set-Cookie` or `Set-Cookie2` headers.

### Note:

When images are cached, the built-in behavior is to remove the `Set-Cookie` and `Set-Cookie2` headers before caching, no matter how the content group is configured.

Citrix recommends that you accept the default `Remove Response Cookies` for every content group that stores embedded responses, for example, images.

To configure `Remove Response Cookies` for a content group by using the command line interface:

At the command prompt, type:

```
set cache contentgroup <name> -removeCookies YES
```

## Configure Remove Response Cookies for a content group by using Citrix ADC GUI

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and select the content group.
2. On **Others** tab, in the **Settings** group, select Remove response cookies option.

## Inserting HTTP headers at response time

The integrated cache can insert HTTP headers in responses that result from cache hits. The Citrix ADC appliance does not alter headers in responses that result from cache misses.

The following table describes headers that you can insert in a response.

| Header | Specification                                                                                                                                                                                                                                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Age    | Provides the age of the response in seconds, calculated from the time the response was generated at the origin server. By default, the cache inserts an Age header for every response that is served from the cache.                                                                                                                                                    |
| via    | Lists protocols and recipients between the start and end points for a request or a response. The Citrix ADC appliance inserts a Via header in every response that it serves from the cache. The default value of the inserted header is “NS-CACHE-9.2: last octet of the Citrix ADC IP address.” For more information, see “Configuring Global Attributes for Caching.” |

---

| Header        | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ETag          | <p>The cache supports response validation using Last-Modified and ETag headers to determine if a response is stale. The cache inserts an ETag in a response only if it caches the response and the origin server has not inserted its own ETag header. The ETag value is an arbitrary unique number. The ETag value for a response changes if it is refreshed from the origin server, but it stays the same if the server sends a 304 (object not updated) response. Origin servers typically do not generate validators for dynamic content because dynamic content is considered non-cacheable. You can override this behavior. With ETag header insertion, the cache is permitted to not serve full responses. Instead, the user agent is required to cache the dynamic response sent by the integrated cache the first time. To force a user agent to cache a response, you configure the integrated cache to insert an ETag header and replace the origin-provided Cache-Control header.</p> |
| Cache-Control | <p>The Citrix ADC appliance typically does not modify cacheability headers in responses that it serves from the origin server. If the origin server sends a response that is labeled as non-cacheable, the client treats the response as non-cacheable even if the Citrix ADC appliance caches the response. To cache dynamic responses in a user agent, you can replace Cache-Control headers from the origin server. This applies only to user agents and other intervening caches. They do not affect the integrated cache.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

---

| Header | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Age    | Provides the age of the response in seconds, calculated from the time the response was generated at the origin server. By default, the cache inserts an Age header for every response that is served from the cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| via    | Lists protocols and recipients between the start and end points for a request or a response. The Citrix ADC appliance inserts a Via header in every response that it serves from the cache. The default value of the inserted header is “NS-CACHE-9.2: last octet of the Citrix ADC IP address.” For more information, see “Configuring Global Attributes for Caching.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ETag   | The cache supports response validation using Last-Modified and ETag headers to determine if a response is stale. The cache inserts an ETag in a response only if it caches the response and the origin server has not inserted its own ETag header. The ETag value is an arbitrary unique number. The ETag value for a response changes if it is refreshed from the origin server, but it stays the same if the server sends a 304 (object not updated) response. Origin servers typically do not generate validators for dynamic content because dynamic content is considered non-cacheable. You can override this behavior. With ETag header insertion, the cache is permitted to not serve full responses. Instead, the user agent is required to cache the dynamic response sent by the integrated cache the first time. To force a user agent to cache a response, you configure the integrated cache to insert an ETag header and replace the origin-provided Cache-Control header. |

| Header        | Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache-Control | The Citrix ADC appliance typically does not modify cacheability headers in responses that is serves from the origin server. If the origin server sends a response that is labeled as non-cacheable, the client treats the response as non-cacheable even if the Citrix ADC appliance caches the response. To cache dynamic responses in a user agent, you can replace Cache-Control headers from the origin server. This applies only to user agents and other intervening caches. They do not affect the integrated cache. |

---

### Insert an age, via, or ETag header

The following procedures describe how to insert Age, Via, and ETag headers.

#### Insert an Age, Via, or Etag header by using the Citrix ADC command interface:

At the command prompt, type:

```
set cache contentgroup <name> -insertVia YES -insertAge YES -insertETag YES
```

#### Configure Age, Via, or Etag header by using the Citrix ADC GUI

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and select the **content group**.
2. On **Others** tab, in the HTTP Header Insertions group, select the **Via, Age, or ETag** options, as appropriate.
3. The values for the other header types are calculated automatically. You configure the Via value in the main settings for the cache.

## ← Configure Cache Content Group

**HTTP Header Insertions**

Via

Age

ETag

Cache-Control

### Insert a cache-control header

When the integrated cache replaces a Cache-Control header that the origin server inserted, it also replaces the Expires header. The new Expires header contains an expiration time in the past. This ensures that HTTP/1.0 clients and caches (that do not understand the Cache-Control header) do not cache the content.

### Insert a cache-control header by using the Citrix ADC command interface

At the command prompt, type:

```
set cache contentgroup <name> -cacheControl <value>
```

### Insert a cache-control header by using the Citrix ADC GUI

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and
  - a) Click **Expiry Method** tab, clear the heuristic and default expiry settings and set the relevant value in Expire content after text box.
  - b) Click **Others** tab and type the header you want to insert in the Cache-Control text box. Alternatively, click Configure to set the Cache-Control directives in cached responses.

### Ignore cache-control and pragma headers in requests

By default, the caching module processes Cache-Control and Pragma headers. The following tokens in Cache-Control headers are processed as described in RFC 2616.

- max-age
- max-stale
- only-if-cached
- no-cache

A Pragma: no-cache header in a request is treated in the same way as a Cache-Control: no-cache header.

If you configure the caching module to ignore Cache-Control and Pragma headers, a request that contains a Cache-Control: No-Cache header causes the Citrix ADC appliance to retrieve the response from the origin server, but the cached response is not updated. If the caching module processes Cache-Control and Pragma headers, the cached response is refreshed.

The following table summarizes the implications of various settings for these headers and the Ignore Browser's Reload Request setting.

| <b>Setting for Ignore Cache-Control and Pragma Headers</b> | <b>Setting for Ignore Browser's Reload Request</b> | <b>Outcome</b>                                                                                                          |
|------------------------------------------------------------|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Yes                                                        | Yes or No                                          | Ignore the Cache-Control and Pragma headers from the client, including the Cache-Control: no-cache directive.           |
| No                                                         | Yes                                                | The Cache-Control: no-cache header produces a cache miss, but a response that is already in the cache is not refreshed. |
| No                                                         | No                                                 | A request that contains a Cache-Control: no-cache header causes a cache miss and the stored response is refreshed.      |

To ignore Cache-Control and Pragma headers in a request by using the command line interface

At the command prompt, type:

```
set cache contentgroup <name> -ignoreReqCachingHdrs YES
```

To ignore browser reload requests by using the command line interface

At the command prompt, type:

```
set cache contentgroup <name> -ignoreReLoadReq NO
```

**Note:**

By default, the `-ignoreReloadReq` parameter is set to YES.

**Ignore Cache-Control and Pragma headers in a request by using the GUI**

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and select the content group.
2. On **Others** tab, in the **Settings** group, select **Ignore Cache-control and Pragma Headers in Requests** option.

## ← Configure Cache Content Group

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |        |               |        |

| Name<br>DEFAULT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |        |               |        |
| Type<br>HTTP                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |        |               |        |
| Expiry Method                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Parameterization | Memory | <b>Others</b> | Policy |
| <b>Settings</b> <ul style="list-style-type: none"> <li><input type="checkbox"/> Poll every time (validate cached content with origin for each request)</li> <li><input type="checkbox"/> Ignore browser's reload request</li> <li><input type="checkbox"/> Remove response cookies</li> <li><input checked="" type="checkbox"/> Ignore Cache-control and Pragma Headers in Requests</li> <li><input type="checkbox"/> Lazy DNS resolution</li> <li><input type="checkbox"/> Persist HA</li> </ul> |                  |        |               |        |

**Example of a policy to ignore Cache-Control headers:**

In the following example, you configure a request-time override policy to cache responses that contain `Content-type: image/*` regardless of the Cache-Control header in the response.

To configure a request-time override policy to cache all responses with `image/*`

Flush the cache using the Invalidate All option.

Configure a new cache policy, and direct the policy to a particular content group. For more information, see “Configuring a Policy in the Integrated Cache.”

Ensure the content group that the policy uses is configured to ignore Cache-Control headers, as described in “Ignoring Cache-Control and Pragma Headers in Requests.”

Bind the policy to the request-time override policy bank.

For more information, see [Globally Binding an Integrated Caching Policy](#) topic.

### **Poll origin server every time a request is received**

You can configure the Citrix ADC appliance to always consult the origin server before serving a stored response. This is known as Poll Every Time (PET). When the Citrix ADC appliance consults the origin server and the PET response has not expired, a full response from the origin server does not overwrite cached content. This property is useful when serving client-specific content.

After a PET response expires, the Citrix ADC appliance refreshes it when the first full response arrives from the origin server.

The Poll Every Time (PET) function works as follows:

For a cached response that has validators in the form of an ETag or a Last-Modified header, if the response expires it is automatically marked PET and cached.

You can configure PET for a content group.

If you configure a content group as PET, every response in the content group is marked PET. The PET content group can store responses that do not have validators. Responses that are automatically marked PET are always expired. Responses that belong to a PET content group can expire after a delay, based on how you configure the content group.

Two types of requests are affected by polling:

- **Conditional Requests:** A client issues a conditional request to ensure that the response that it has is the most recent copy. A user-agent request for a cached PET response is always converted to a conditional request and sent to the origin server. A conditional request has validators in If-Modified-Since or If-None-Match headers. The If-Modified-Since header contains the time from the Last-Modified header. An If-None-Match header contains the response’s ETag header value. If the client’s copy of the response is fresh, the origin server replies with 304 Not Modified. If the copy is stale, a conditional response generates a 200 OK that contains the entire response.
- **Non-Conditional Requests:** A non-conditional request can only generate a 200 OK that contains the entire response.

| Origin Server Response                                                                                           | Action                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Send the full response                                                                                           | The origin server sends the response as-is to the client. If the cached response has expired, it is refreshed.                                                                                             |
| 304 Not Modified                                                                                                 | The following header values in the 304 response are merged with the cached response and the cached response is served to the client: Date, Expires, Age, Cache-Control header Max-Age, and S-Maxage tokens |
| 401 Unauthorized; 400 Bad Request; 405 Method Not Allowed; 406 Not Acceptable; 407 Proxy Authentication Required | The origin's response is served as-is to the client. The cached response is not changed.                                                                                                                   |
| Any other error response, for example, 404 Not Found                                                             | The origin's response is served as-is to the client. The cached response is removed.                                                                                                                       |

**Note:**

The Poll Every Time parameter treats the affected responses as non-storable.

To configure poll every time by using the command line interface

At the command prompt, type:

```
add cache contentgroup <contentGroupName> -pollEveryTime YES
```

**Poll by using the GUI**

1. Navigate to **Optimization > Integrated Caching > Content Groups**, and select the content group.
2. On **Others** tab, in the Settings group, select Poll every time (validate cached content with origin for every request) option.

## ← Configure Cache Content Group

|                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |        |        |        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|--------|--------|--------|
| Name<br>DEFAULT                                                                                                                                                                                                                                                                                                                                                                                                      |                  |        |        |        |

### PET and client-specific content

The PET function can ensure that content is customized for a client. For example, a website that serves content in multiple languages examines the Accept-Language request header to select the language for the content that it is serving. For a multi-language website where English is the predominant language, all English language content can be cached in a PET content group. This ensures that every request goes to the origin server to determine the language for the response. If the response is English, and the content has not changed, the origin server can serve a 304 Not Modified to the cache.

The following example shows commands to cache English responses in a PET content group, configure a named expression that identifies English responses in the cache, and configure a policy that uses this content group and named expression. Bold is used for emphasis:

```

1 add cache contentgroup EnglishLanguageGroup -pollEveryTime YES
2 add expression containsENExpression -rule "http.res.header(\\\"Content-
  Language\\\")\".contains(\\\"en\\\")"
3 add cache policy englishPolicy -rule containsENExpression -action CACHE
  -storeInGroup englishLanguageGroup
4 bind cache policy englishPolicy -priority 100 -precedeDefRules NO
5 <!--NeedCopy-->

```

## PET and authentication, authorization, and auditing

Outlook Web Access (OWA) is a good example of dynamically generated content that benefits from PET. All mail responses (\*.EML objects) have an ETag validator that enables them to be stored as PET responses.

Every request for a mail response travels to the origin server, even if the response is cached. The origin server determines whether the requestor is authenticated and authorized. It also verifies that the response exists in the origin server. If all results are positive, the origin server sends a 304 Not Modified response.

## Configure integrated cache as a forward proxy

September 21, 2020

The integrated cache can service as a forward proxy device that passes requests to other Citrix ADC appliances or to other types of cache servers. You configure the integrated cache as a forward proxy by identifying the IP addresses of the cache server or servers. After configuring the forward proxy, the Citrix ADC appliance sends requests that contain the configured IP address on to the cache server instead of involving the integrated cache.

To configure the Citrix ADC as a forward cache proxy by using the command line interface

At the command prompt, type:

```
add cache forwardProxy <IPAddress> <port>
```

To configure the Citrix ADC as a forward cache proxy by using the GUI

1. Navigate to **Optimization > Integrated Caching > Forward Proxy**, and add a forward proxy by specifying the IP address and port number.

## Default settings for the integrated cache

September 21, 2020

The Citrix ADC integrated cache feature provides built-in policies with default settings as well as initial settings for the Default content group. The information in this section defines the parameters for the built-in policies and Default content group.

## Default caching policies

The integrated cache has built-in policies. The Citrix ADC appliance evaluates the policies in a particular order, as discussed in the following sections.

You can override these built-in policies with a user-defined policy that is bound to a request-time override or response-time override policy bank.

### Note

If you configured policies prior to release 9.0 and specified the `-precedeDefRules` parameter when binding the policies, they are automatically assigned to override-time bind points during migration.

## View default policies

The built-in policy names start with an underscore (`_`). You can view the built-in policies from the command line and the administrative console using the `show cache policy` command.

## Default request policies

You can override the following built-in request time policies by configuring new policies and binding them to the request-time override processing point. In the following policies, note that the `MAY_NOCACHE` action stipulates that the transaction is cached only when there is a user-configured or built-in `CACHE` directive at response time.

The following policies are bound to the `_reqBuiltinDefaults` policy label. They are listed in priority order.

Do not cache a response for a request that uses any method other than GET.

The policy name is `_nonGetReq`. The following is the policy rule:

```
!HTTP.REQ.METHOD.eq(GET)
```

Set a `NOCACHE` action for a request with header value that contains `If-Match` or `If-Unmodified-Since`.

The policy name is `_advancedConditionalReq`. The following is the policy rule:

```
HTTP.REQ.HEADER("If-Match").EXISTS || HTTP.REQ.HEADER("If-Unmodified-Since").EXISTS
```

Set a `MAY_NOCACHE` action for a request with the following header values: `Cookie`, `Authorization`, `Proxy-authorization` or a request which contains the `NTLM` or `Negotiate` header.

The policy name is `_personalizedReq`. The following is the policy rule:

```
HTTP.REQ.HEADER("Cookie").EXISTS || HTTP.REQ.HEADER("Authorization").EXISTS
|| HTTP.REQ.HEADER("Proxy-Authorization").EXISTS || HTTP.REQ.IS_NTLM_OR_NEGOTIATE
```

## Default response policies

You can override the following default response-time policies by configuring new policies and binding them to the response-time override processing point.

The following policies are bound to the **\_resBuiltinDefaults** policy label and are evaluated in the order in which they are listed:

1. Do not cache HTTP responses unless they are of type 200, 304, 307, 203 or if the types are between 400 and 499 or between 300 and 302.

The policy name is **\_uncacheableStatusRes**. The following is the policy rule:

```
!((HTTP.RES.STATUS.EQ(200)) || (HTTP.RES.STATUS.EQ(304)) || (HTTP.RES.STATUS.BETWEEN(400,499)) || (HTTP.RES.STATUS.BETWEEN(300, 302)) || (HTTP.RES.STATUS.EQ(307)) || (HTTP.RES.STATUS.EQ(203)))
```

2. Do not cache an HTTP response if it has a Vary header with a value of anything other than Accept-Encoding.

The compression module inserts the Vary: Accept-Encoding header. The name of this expression is **\_uncacheableVaryRes**. The following is the policy rule:

```
((HTTP.RES.HEADER("Vary").EXISTS)&& ((HTTP.RES.HEADER("Vary").INSTANCE(1).LENGTH > 0) || (!HTTP.RES.HEADER("Vary").STRIP_END\\_WS.SET_TEXT_MODE(IGNORECASE).eq("Accept-Encoding"))))
```

3. Do not cache a response if its Cache-Control header value is No-Cache, No-Store, or Private, or if the Cache-Control header is not valid.

The policy name is **\_uncacheableCacheControlRes**. The following is the policy rule:

```
((HTTP.RES.CACHE\\_CONTROL.IS\\_PRIVATE) || (HTTP.RES.CACHE\\_CONTROL.IS\\_NO\\_CACHE) || (HTTP.RES.CACHE\\_CONTROL.IS\\_NO\\_STORE) || (HTTP.RES.CACHE\\_CONTROL.IS\\_INVALID))
```

4. Cache responses if the Cache-Control header has one of the following values: Public, Must-Revalidate, Proxy-Revalidate, Max-Age, S-Maxage.

The policy name is **\_cacheableCacheControlRes**. The following is the policy rule:

```
((HTTP.RES.CACHE_CONTROL.IS_PUBLIC) || (HTTP.RES.CACHE_CONTROL.IS_MAX_AGE) || (HTTP.RES.CACHE_CONTROL.IS_MUST_REVALIDATE) || (HTTP.RES.CACHE_CONTROL.IS_PROXY_REVALIDATE) || (HTTP.RES.CACHE_CONTROL.IS_S_MAXAGE))
```

- Do not cache responses that contain a Pragma header.

The name of the policy is **\_uncacheablePragmaRes**. The following is the policy rule:

```
HTTP.RES.HEADER("Pragma").EXISTS
```

- Cache responses that contain an Expires header.

The name of the policy is **\_cacheableExpiryRes**. The following is the policy rule:

```
HTTP.RES.HEADER("Expires").EXISTS
```

- If the response contains a Content-Type header with a value of Image, remove any cookies in the header and cache it.

The name of the policy is **\_imageRes**. The following is the policy rule:

```
HTTP.RES.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).STARTSWITH("image/")
```

You could configure the following content group to work with this policy:

```
add cache contentgroup nocookie -group -removeCookies YES
```

- Do not cache a response that contains a Set-Cookie header.

The name of the policy is **\_personalizedRes**. The following is the policy rule:

```
HTTP.RES.HEADER("Set-Cookie").EXISTS
```

```
HTTP.RES.HEADER("Set-Cookie2").EXISTS
```

## Restrictions on default policies

You cannot override the following built-in request time policies with user-defined policies.

These policies are listed in priority order.

- Do not cache any responses if the corresponding HTTP request lacks a GET or POST method.
- Do not cache any responses for a request if the HTTP request URL length plus host name exceeds 1744 bytes.
- Do not cache a response for a request that contains an If-Match header.
- Do not cache a request that contains an If-Unmodified-Since header.

### Note

This is different from the If-Modified-Since header.

- Do not cache a response if the server does not set an expiry header.

You cannot override the following built-in response time policies. These policies are evaluated in the order in which they are listed:

1. Do not cache responses that have an HTTP response status code of 201, 202, 204, 205, or 206.
2. Do not cache responses that have an HTTP response status code of 4xx, with the exceptions of status codes 403, 404, and 410.
3. Do not cache responses if the response type is FIN terminated, or the response does not have one of the following attributes: Content-Length, or Transfer-Encoding: Chunked.
4. Do not cache the response if the caching module cannot parse its Cache-Control header.

### **Initial settings for the default content group**

When you first enable integrated caching, the Citrix ADC appliance provides one predefined content group named the Default content group. For detailed information, see [Default content group settings](#) table.

## **Troubleshooting**

September 21, 2020

If the integrated cache feature does not work as expected after you have configured it, you can use some common tools to access Citrix ADC resources and diagnose the problem.

### **Resources for troubleshooting**

For more information about the resources available for troubleshooting and sample configurations, see [Resource for troubleshooting](#) pdf.

## **Front end optimization**

March 16, 2021

**Note:** Front end optimization is available if you have an Advanced or Premium Citrix ADC license and are running Citrix ADC release 10.5 or later.

The HTTP protocols that underlie web applications were originally developed to support transmission and rendering of simple webpages. New technologies such as JavaScript and cascading style sheets (CSS), and new media types such as Flash videos and graphics-rich images, place heavy demands on front-end performance, that is, on performance at the browser level.

The Citrix ADC front end optimization (FEO) feature addresses such issues and reduces the load time and render time of webpages by:

- Reducing the number of requests.
- Required for rendering each page.
- Reducing the number of bytes in page responses.

Simplifying and optimizing the content served to the client browser.

You can customize your FEO configuration to provide the best results for your users. Citrix ADCs support numerous web content optimizations for both desktop and mobile users. The following tables describe the front-end optimizations provided by the FEO feature, and the operations performed on different types of files.

### Optimizations performed by the FEO feature

| Web Optimization | Problem                                                                                                                                                                                         | What Citrix ADC FEO feature does                                    | Benefits                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inlining         | Client browsers often send multiple requests to servers for loading external CSS, images, and JavaScript associated with the webpage.                                                           | CSS inline, JavaScript inline, CSS combine                          | Loading the external CSS, images, and JavaScript inline with the HTML files improves page-rendering time. This optimization is beneficial for content that will be viewed only once, and for mobile devices that have limited cache sizes. |
| Minification     | Data fetched from servers includes inessential characters such as white spaces, comments, and newline characters. The time that browsers spend in processing such data creates website latency. | CSS minification, JavaScript minification, Removal of HTML comments | Minified files consume less bandwidth and avoid the latency caused by special processing.                                                                                                                                                  |

| Web Optimization      | Problem                                                                                                                                                                                                                | What Citrix ADC FEO feature does                                                                                                                                                        | Benefits                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Image optimization    | Mobile browsers often have slow connection speeds and limited cache memory. Downloading images on mobile clients consumes more bandwidth, processing time, and cache space, resulting in website latency.              | JPEG optimization, CSS image inlining, <b>Image shrink-to</b> attributes, GIF to PNG conversion, HTML image inlining, WebP image conversion, JPEG, GIF, PNG to JPEG-XR image conversion | Reduces the image to the size indicated in image tag by Citrix ADC, enabling client browsers to load images faster.                         |
| Repositioning         | Inefficient processing of external CSS, images, and JavaScript increases page-load time.                                                                                                                               | Image lazy loading, CSS move to Head, JavaScript move to end                                                                                                                            | Repositions HTML elements, to reduce rendering time for webpages and enable client browsers to load the objects faster.                     |
| Connection Management | Many browsers set limits on the number of simultaneous connections that can be established to a single domain. This can cause browsers to download webpage resources one at a time, resulting in higher browsers time. | Domain sharding                                                                                                                                                                         | Overcomes the connection limitation, which improves page-rendering time by enabling client browsers to download more resources in parallel. |

### Web Optimizations on different file types:

Citrix ADC can perform web optimizations on CSS, images, Javascript, and HTML. For more information, see [Web Optimizations](#) PDF.

**Note:**

The front end optimization feature supports ASCII characters only. It does not support the uni-code character set.

## How front end optimization works

After the Citrix ADC receives the response from the server:

1. Parses the contents of the page, creates an entry in the cache (wherever applicable), and applies the FEO policy.

For example, a Citrix ADC can apply the following optimization rules:

- Remove white spaces or comments present within a CSS or JavaScript.
  - Combine one or more CSS files to one file.
  - Convert GIF image format to PNG format.
2. Rewrites the embedded objects and saves the optimized content in the cache, with a different signature than the one used for the initial cache entry.
  3. For subsequent requests, fetches the optimized objects from the cache, not from the server, and forwards the responses to the client.

\*\*

Remove extraneous information such as white spaces and comments.

The period during which the browser can use the cached resource without checking to see if fresh content is available on the server.

## Configure front end optimization

Optionally, you can change the values of the front end optimization global settings. Otherwise, begin by creating actions that specify the optimization rules to be applied to the embedded objects.

After configuring actions, create policies, each with a rule specifying a type of request for which to optimize the response, and associate the actions with the policies.

**Note:** The Citrix ADC evaluates front end optimization policies at request time only, not at response time.

To put the policies into effect, bind them to bind points. You can bind a policy globally, so that it applies to all traffic that flows through the Citrix ADC, or you can bind the policy to a load balancing or content switching virtual server of type HTTP or SSL. When you bind a policy, assign it a priority. A lower priority number indicates a higher value. The Citrix ADC applies the policies in the order of their priorities.

## Prerequisites

Front end optimization requires the Citrix ADC integrated caching feature to be enabled. Also, you must perform the following integrated caching configurations:

- Allocate cache memory.
- Set the maximum response size and memory limit for a default cache content group.

For more information on configuring integrated caching, see [Integrated Caching](#).

**Note:** The term Integrated Cache can be interchangeably used with AppCache; note that from a functionality point of view, both terms mean the same.

## Configure front end optimization by using Citrix ADC command interface

At the command prompt, do the following:

1. Enable the front end optimization feature.

```
enable ns feature FEO
```

1. Create one or more front end optimization actions.

```
add feo action <name> [-imgShrinkToAttrib] [-imgGifToPng] ...
```

**Example:** To add a front end optimization action for converting images in GIF format to PNG format and to extend cache expiry period:

```
add feo action allact -imgGifToPng -pageExtendCache
```

1. [Optional] Specify non-default values for front end optimization global settings.

```
set feo parameter [-cacheMaxage <integer>] [-JpegQualityPercent <integer>]  
[-cssInlineThresSize <integer>] [-inlineJsThresSize <integer> [-inlineImgThresSize  
<integer>]
```

Example: To specify the cache maximum expiry period:

```
set feo parameter -cacheMaxage 10
```

1. Create one or more front end optimization policies.

```
add feo policy <name> <rule> <action>
```

Example: To add a front end optimization policy and associate it with the above specified allact action:

```
'>add feo policy pol1 TRUE all act
```

```
add feo policy pol1 "(HTTP.REQ.URL.CONTAINS("testsite"))" allact1'
```

1. Bind the policy to a load balancing or content switching virtual server, or bind it globally.

```
1 bind lb vserver <name> -policyName <string> -priority <num>
2
3 bind cs vserver <name> -policyName <string> -priority <num>
4
5 bind feo global <policyName> <priority> -type <type> <
   gotoPriorityExpression>
6 <!--NeedCopy-->
```

Example: To apply the front end optimization policy to a virtual server named “abc”:

```
> bind lb vserver abc -policyName pol1 -priority 1 -type NONE
```

Example: To apply the front end optimization policy for all the traffic reaching the ADC:

```
> bind feo global pol1 100 -type REQ_DEFAULT
```

1. Save the configuration. save ns config

## Configure front end optimization by using the GUI

1. Navigate to **Optimization > Front End Optimization > Actions**, click **Add** and create a front end optimization action by specifying the relevant details.
2. [Optional] Specify the front end optimization global settings.
3. Navigate to **Optimization > Front End Optimization**, and on the right-pane, under Settings, click **Change Front End Optimization** settings and specify the front end optimization global settings.
4. Create a front end optimization policy.
5. Navigate to **Optimization > Front End Optimization > Policies**, click **Add** and create a front end optimization policy by specifying the relevant details.
6. Bind the policy to a load balancing or content switching virtual server.
  - a) Navigate to **Optimization > Front End optimization > Policies**.
  - b) Select a front end optimization policy and click **Policy Manager**.
  - c) Under **Front End Optimization Policy Manager**, bind the front end optimization policy to a load balancing or content switching virtual server.

## Verify front end optimization configuration

The dashboard utility displays summary and detailed statistics in tabular and graphic formats. You can view the FEO statistics to evaluate your FEO configuration.

Optionally, you can also display statistics for an FEO policy, including the number of select that the policy counter increments during policy based FEO.

**Note:**

For more information about statistics and charts, see the Dashboard help on the Citrix ADC appliance.

### View FEO statistics by using Citrix ADC command interface

At the command prompt, type the following commands to display a summary of FEO statistics, FEO policy select and details, and detailed FEO statistics, respectively:

- `stat feo` Note: The `stat feo policy` command displays statistics only for advanced FEO policies.
- `show feo policy name`
- `stat feo -detail`

### View FEO statistics on Citrix ADC dashboard

In the dashboard GUI, you can:

- Select Front End Optimization to display a summary of FEO statistics.
- Click the **Graphical View** tab to display the rate of requests processed by the FEO feature.

### Sample optimization:

Refer to the [Sample](#) PDF for some examples of content optimization actions that are applied on HTML content and the embedded objects within the HTML content.

## Content accelerator

March 16, 2021

**Important**

The content accelerator feature is no longer supported on the Citrix ADC appliance.

Content accelerator is a Citrix ADC feature that you can use in a Citrix ByteMobile T1100 deployment, to store data on a Citrix ByteMobile T2100 appliance.

Storing data on a T2100 appliance saves bandwidth and improves response time. This is because Citrix ADC does not have to connect to the server for repeated requests for the same data.

**Note:** Content accelerator works with a Citrix ByteMobile Premium license. Contact customer support for more information and for obtaining the license.

## How content accelerator works

When a load balancing or content switching virtual server receives a client request, the Citrix ADC appliance evaluates a content accelerator policy that you have bound to the virtual server. The policy filters the requests to identify the ones to which to apply the content accelerator feature.

**Note:**

For HTTP requests, the content accelerator feature can serve partial content in response to single byte-range requests.

The following figure illustrates the operations that the appliance performs when a client request arrives at a virtual server configured to use the content accelerator feature:

The process flow is as follows:

1. Client sends request.
2. Citrix ADC forwards the request to the server.
3. Server responds with the predefined size of the response (specified by the `accumResSize` parameter of the `add ca` action command).
4. Citrix ADC computes a hash of the response sent by the server.
5. Citrix ADC looks up the hash on the T2100 appliance.
6. A successful lookup indicates that the data is available and the T2100 appliance sends the data to the Citrix ADC.

**Note:**

When a lookup does not succeed, the Citrix ADC fetches all of the requested data from the server, and simultaneously serves the data to the client and updates the data on the T2100 appliance.

The T2100 appliance can be configured to specify the number of requests after which to cache the data.

7. Citrix ADC sends the response to the client.

## Configure content accelerator

Before configuring the content accelerator feature, you must enable it on the Citrix ADC appliance.

You can configure the content accelerator feature to use one or multiple T2100 appliances. You must add each T2100 appliance as a service and bind these services to a load balancing virtual server that is dedicated to distributing the load between the configured T2100 appliances.

You must also configure a content accelerator action to lookup the data on the T2100 appliance. The action must also specify the T2100 load balancing virtual server and the size of data (in KB) to be fetched from the server to calculate the hash.

The action must be bound to a content accelerator policy that defines the traffic on which to perform content acceleration. The content accelerator policy must be bound to a content switching or load balancing virtual server that receives client traffic. Alternatively, you can bind the policy globally to be applicable to all virtual servers.

To configure content accelerator by using the command line interface

At the command prompt, do the following:

1. Enable the content accelerator feature.

```
enable ns feature ca
```

2. Identify the T2100 appliances and add each as a service on the Citrix ADC appliance.

```
add service <name> <IPAddress> <serviceType> <port>
```

### Example:

```
1 > add service T2100-A 10.102.29.61 HTTP 30
2 > add service T2100-B 10.102.29.62 HTTP 40
3 > add service T2100-C 10.102.29.63 HTTP 50
4 <!--NeedCopy-->
```

### Note:

The services must be of type HTTP only.

3. Create a load balancing virtual server for the T2100 appliances. Specify the token load balancing method and the rule shown in the following syntax.

```
1 add lb vserver <name> <serviceType> <IPAddress> <port> -lbMethod
  TOKEN -rule "http.req.url.after_str(\"/lookup/\") alt http.req.
  url.path.SKIP(1).PREFIX(64) "
```

```
2 <!--NeedCopy-->
```

**Example:**

```
1 add lb vserver T2100-lbvserver HTTP 10.102.29.64 99 -lbMethod
  TOKEN -rule "http.req.url.after_str(\"/lookup/\") alt http.req.
  url.path.SKIP(1).PREFIX(64)"
2 <!--NeedCopy-->
```

4. Bind the T2100 services to the load balancing virtual server that you created for them.

```
bind lb vserver <name> <serviceName>
```

**Example:**

```
1 > bind lb vserver T2100-lbvserver T2100-A
2 > bind lb vserver T2100-lbvserver T2100-B
3 > bind lb vserver T2100-lbvserver T2100-C
4 <!--NeedCopy-->
```

5. Define a content accelerator action.

```
add ca action <name> accumResSize <KBytes> -lbvserver <string> -type
lookup
```

**Example:**

```
> add ca action ca_action1 -type lookup -lbvserver T2100-lbvserver -
accumResSize 60
```

6. Define a content accelerator policy.

```
add ca policy <name> -rule <expression> -action <name>
```

**Example:** To create a content accelerator policy that caches all video formats.

```
> add ca policy ca_mp4_pol -rule ns_video -action ca_action1
```

where `ns_video` is a built-in expression.

7. Bind the content accelerator policy to either a virtual server that receives traffic or globally to the Citrix ADC system.

```
bind lb vserver <name> -policyName <string>
```

```
bind cs vserver <name> -policyName <string>
```

```
bind ca global -policyName <string> -priority <num> -type <type>
```

**Example:** To apply the content accelerator policy to a virtual server named “traf\_rec”

```
> bind lb vserver traf_rec -policyName ca_mp4_pol
```

**Example:** To apply the content accelerator policy for all traffic reaching the Citrix ADC.

```
> bind ca global -policyName ca_mp4_pol -priority 100 -type RES_DEFAULT
```

8. Save the configuration.

```
save ns config
```

Configuring content accelerator by using the GUI

1. Navigate to **System > Settings > Configure Advanced Features** and select **Content Accelerator**.
2. Create a service for each of the T2100 appliances.
  - a) Navigate to **Traffic Management > Load Balancing > Services**.
  - b) Click **Add** and specify the relevant details. In the **Server** field, make sure you specify the IP address of the T2100 appliance. In the **Protocol** field select HTTP.
3. Create a virtual server and bind the T2100 services to it.
  - a) Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
  - b) Click **Add** and specify the relevant details.
  - c) In the **Method and Persistence** tab, specify the Method as **Token**.
  - d) In the **Policies** tab, specify the rule as `http.req.url.after_str("/lookup/") alt http.req.url.path.SKIP(1).PR`
  - e) In the **Services** tab, select the T2100 services that you want to bind to the virtual server.
4. Create a content accelerator action.
  - a) Navigate to **Optimization > Content Accelerator > Actions**.
  - b) Specify the relevant details.
5. Create a content accelerator policy.
  - a) Navigate to **Optimization > Content Accelerator > Policies**.
  - b) Click **Add**, specify the policy rule, and associate the content accelerator action.
6. Bind the content accelerator policy globally or to a virtual server.
  - a) Navigate to **Optimization > Content Accelerator**.
  - b) Under the **Content Accelerator Policy Manager [REQUEST]** or **Content Accelerator Policy Manager [RESPONSE]** sections, bind the content accelerator policy globally or to a virtual server.

## Media classification

September 21, 2020

Understanding the type of traffic in the network helps network administrators to manage bandwidth consumption for optimal network performance. The media classification mode monitors and displays the statistics of media traffic going through the Citrix ADC appliance.

With this mode enabled, a network administrators can collect stats showing the amount of data accessed, and the types of devices from which the media files have been accessed. The Citrix ADC appliance also supports byte-range requests in this mode.

Currently the Citrix ADC appliance can monitor and display statistics for the following media file types:

---

| Media                              | File type       |
|------------------------------------|-----------------|
| Microsoft Smooth Streaming         | Video           |
| Apple Live Streaming               | Video           |
| Audio Data Transport Stream (ADTS) | Audio           |
| Advanced Audio Coding (AAC)        | Audio           |
| Flash Video (FLV)                  | Audio and Video |
| 3GP                                | Audio and Video |

---

The appliance can display stats for the following devices:

---

| Device Platform   | Device Type                                |
|-------------------|--------------------------------------------|
| iOS               | iPad and iPod                              |
| Android           | Mobiles and tablets                        |
| Laptop or Desktop | Windows laptop and desktop computers       |
| Others            | Other mobile devices (mobiles and tablets) |

---

The network administrators can check the following stats counters to know the amount of data accessed through the Citrix ADC appliance for various media traffic types.

| Media File Name                    | Stats Counter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Microsoft Smooth Streaming         | <p>mcmssmthstrmvid—This counter records the total number of Microsoft Smooth Streaming videos served by the Citrix ADC appliance; Mcmssmthstrvidpl—This counter records the total number of Microsoft Smooth Streaming video playlists served by the Citrix ADC appliance; Mcmssmthstrmvidbytes—This counter records the total number of data bytes served for Microsoft Smooth Streaming media traffic on the Citrix ADC appliance; Mcmssmthstrmplvidbytespl—This counter records the total number of Microsoft Smooth Streaming playlist bytes served by the Citrix ADC appliance.</p>    |
| Apple Live Streaming               | <p>mccapplelivestrnmngvid—This counter records the total number of Apple Live Streaming videos served by the Citrix ADC appliance. Mccapplelivestrnmngvidpl—This counter records the total number of Apple Live Streaming video playlists served by the Citrix ADC appliance. Mcapplelivestreamingvidbytes—This counter records the total number of data bytes served for Apple Live Streaming media traffic on the Citrix ADC appliance. Mcapplelivestreamingplaylistvidbytespl—This counter records the total number of Apple Live Playlist bytes served by the Citrix ADC appliance.</p> |
| Audio Data Transport Stream (ADTS) | <p>mcadtsaudio—This counter records the total number of ADTS audio clips served by the Citrix ADC appliance. Mcadtsaudiobytes—This counter records the total number of data bytes served for ADTS media traffic on the Citrix ADC appliance.</p>                                                                                                                                                                                                                                                                                                                                            |

| Media File Name             | Stats Counter                                                                                                                                                                                                                         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advanced Audio Coding (AAC) | Mcaacaudio—This counter records the total number of AAC audio clips served by the Citrix ADC appliance. Mcaacaudiobytes—This counter records the total number of data bytes served for AAC media traffic on the Citrix ADC appliance. |
| Flash Video (FLV)           | Mcflvvid—This counter records the total number of flash videos served by the Citrix ADC appliance. Mcflvvidbytes—This counter records the total number of data bytes served for flash videos on the Citrix ADC appliance.             |
| 3GP                         | mc3gpvidbytes—This counter records the total number of data bytes served for 3GP media traffic on the Citrix ADC appliance.                                                                                                           |

The Citrix ADC appliance detects media file types by their signatures in the *initial body bytes* of the responses. For example, the initial body bytes for an mp4 file has the following signature in the response:

```
**....ftypmp42** ....isommp42....moov...lmvhd.....c.\!.c.\!..
```

The Citrix ADC appliance detects the client device type by the *user agent string* that the client device includes in the HTTP GET request. For example, a windows phone using a UC browser will have the following user agent string in the HTTP GET request:

```
User-Agent: **UCWEB**/2.0 (**Windows**; U; wds 8.10; en-US; HTC; 8X by HTC)
U2/1.0.0
```

## Enable media classification

By default, media classification is disabled on the Citrix ADC appliance. You have to enable the mode before using it.

To enable media classification by using the command line interface

At the command prompt, type:

```
enable ns mode Mediaclassification
```

To enable media classification by using the GUI

Enable media classification on Citrix ADC appliance

Navigate to **System > Settings > Configure Modes** and select **Media Classification**.

To view media traffic statistics on the Citrix ADC appliance

Navigate to **Optimization** and click **Media Classification** to view the media traffic statistics.

## Verify media classification statistics

You can view the media traffic statistics in the dashboard utility or using the command line interface. The dashboard utility displays summary and detailed statistics in a tabular and graphic format.

### Note

For more information about statistics and charts, see the Dashboard help on your Citrix ADC appliance.

To View media classification statistics by using the command line interface

At the command prompt, type one of the following commands to display a summary of media classification statistics, display detailed statistics, or clear the display:

```
stat Mediaclassification
```

```
stat Mediaclassification -detail
```

```
stat Mediaclassification -clearstats
```

To view Media Classification statistics on the Dashboard

In the **Dashboard** utility, you can display the following types of media classification statistics:

1. Select **Media Classification** to display a summary of the media traffic statistics.
2. To display detailed media traffic statistics, click the **Details**.
3. To clear the media traffic statistics, click **Clear**.

## Reputation

September 21, 2020

Citrix offers reputation based security. Using reputation assessment to determine the risk of processing requests, you can take actions such as blocking or dropping certain requests to improve the performance of your application.

The Citrix ADC IP reputation feature uses IP reputation checks to prevent Zero day attacks and provide protection against malicious sources associated with web attacks, phishing activity, or web scanning.

For additional details, see [IP Reputation](#).

## IP Reputation

October 25, 2021

IP reputation is an effective tool in identifying the IP address that is sending unwanted requests. Use the IP reputation list to preemptively reject requests that are coming from the IP with the bad reputation. For example, use this feature to optimize application firewall performance by filtering out the requests that you do not want to process. Reset or drop the connection, or you can configure a responder policy to take a specific responder action.

Following are some examples of attacks that you can prevent by using IP Reputation:

- **Virus Infected personal computers** (home PCs) are the single biggest source of Spam on the Internet. IP Reputation can identify the IP address that is sending unwanted requests. IP reputation can be especially useful for blocking large-scale DDoS, DoS, or anomalous SYN flood attacks from known infected sources.
- **Centrally managed and automated botnet** attacks have gained popularity for stealing passwords, because it doesn't take long when hundreds of computers work together to crack your password. It is easy to launch botnet attacks to figure out passwords that use commonly used dictionary words.
- **Compromised web-server** attacks are not as common as they used to be, because awareness and server security have increased, so hackers and spammers look for easier targets. There are still web servers and online forms that hackers can compromise and use to send spam (often the more vicious types, such as viruses and porn). Usually this type of activity is easier to detect and quickly shut down, or block with a reputation list such as SpamRats.
- **Windows Exploits** (such as Active IPs offering/distributing malware, shell code, rootkits, worms, or viruses).
- **Known spammers and hackers.**
- **Mass e-mail marketing campaigns.**
- **Phishing Proxies** (IP addresses hosting phishing sites, and other fraud such as ad click fraud or gaming fraud).
- **Anonymous proxies** (IPs providing proxy and anonymization services including The Onion Router aka TOR).

A Citrix ADC appliance uses **Webroot** as the service provider for the dynamically generated malicious IP database and the metadata for those IP addresses. Metadata might include geolocation details, threat category, threat count, and so on. The [Webroot](#) threat Intelligence engine receives real-time data from millions of sensors. It automatically and continuously captures, scans, analyses and scores the data, using advanced machine learning and behavioral analysis. Intelligence about a threat is continually updated.

The Citrix ADC appliance validates an incoming request for its bad reputation using the Webroot's uses

IP reputation database. The database has a huge collection of IP address classified based IP threat categories. Following are the IP threat categories and its description.

- **Spam Sources.** Spam Sources includes Tunneling Spam messages through proxy, anomalous SMTP activities, Forum Spam activities.
- **Windows Exploits.** Windows exploit category includes active IP Address offering or distributing malware, shell code, rootkits, worms, or viruses
- **Web Attacks.** Web attacks category includes cross site scripting, iFrame injection, SQL injection, cross domain injection, or domain password brute force attack
- **Botnets.** Botnet category includes Botnet C&C channels, and infected zombie machine controlled by Bot master
- **Scanners.** Scanners category includes all reconnaissance such as probes, host scan, domain scan and password brute force attack
- **Denial of Service.** Denial of Services category includes DOS, DDOS, anomalous sync flood, anomalous traffic detection
- **Reputation.** Deny access from IP addresses currently known to be infected with malware. This category also includes IPs with average low Webroot Reputation Index score. Enabling this category will prevent access from sources identified to contact malware distribution points
- **Phishing.** Phishing category includes IP addresses hosting phishing sites, other kind of fraud activities such as Ad Click Fraud or Gaming fraud
- **Proxy.** Proxy category includes IP addresses providing proxy and def services.
- **Mobile Threats.** Mobile Threat category includes IP addresses of malicious and unwanted mobile applications. This category leverages data from Webroot mobile threat research team.
- **Tor Proxy.** Tor proxy category includes IP addresses acting as exit nodes for the Tor Network. Exit nodes are the last point along the proxy chain and make a direct connection to the originator's intended destination.

When a threat is detected anywhere in the network, the IP address is flagged as malicious and all appliances connected to the network are immediately protected. The dynamic changes in the IP addresses are processed with high speed and accuracy by using advanced machine learning.

As stated in the data sheet from Web root, the [Webroot's](#) sensor network identifies many key IP threat types, including spam sources, Windows exploits, botnets, scanners, and others. (See the flow diagram on the data sheet.)

The Citrix ADC appliance uses an [iprep](#) client process to get the database from Web root. The [iprep](#) client uses the HTTP GET method to get the absolute IP list from [Webroot](#) for the first time. Later, it checks delta changes once every 5 minutes.

#### **Important**

- Make sure the Citrix ADC appliance has internet access and DNS is configured before you use the IP Reputation feature.

- To access the [Webroot](#) database, the Citrix ADC appliance can connect to **api.bcti.brightcloud.com** on **port 443**. Each node in the high availability or cluster deployment gets the database directly from [Webroot](#) and can access this Fully Qualified Domain Name (FQDN).
- [Webroot](#) hosts its reputation database in AWS currently. Therefore, Citrix ADC can resolve AWS domains for downloading the reputation database. Also, the firewall is open for AWS domains.
- Citrix ADC appliance can connect to [wiprep-daily.\\*.amazonaws.com](#) on **port 443** to obtain IP data from AWS.

**Note:**

Each packet engine requires at least 4 GB to function properly when the IP Reputation feature is enabled.

**PI Expressions.** The IP Reputation feature can be configured by using default syntax expressions in the policies bound to supported modules, such as Web AppFirewall and responder. Following are two examples showing expressions that can be used to detect whether the client IP address is malicious

1. **CLIENT.IP.SRC.IPREP\_IS\_MALICIOUS:** This expression evaluates to TRUE if the client is included in the malicious IP list.
2. **CLIENT.IP.SRC.IPREP\_THREAT\_CATEGORY (CATEGORY):** This expression evaluates to TRUE if the client IP is malicious IP and is in the specified threat category.

Following are the possible values for the threat category:

SPAM\_SOURCES, WINDOWS\_EXPLOITS, WEB\_ATTACKS, BOTNETS, SCANNERS, DOS, REPUTATION, PHISHING, PROXY, NETWORK, CLOUD\_PROVIDERS, MOBILE\_THREATS, TOR\_PROXY.

**Note:**

The IP reputation feature checks both source and destination IP addresses. It detects malicious IPs in the header. If the PI Expression in a policy can identify the IP address, the IP reputation check determines whether it is malicious.

**IPRep log message.** The `/var/log/iprep.log` file contains useful messages that capture information about communication with the [Webroot](#) database. The information can be about the credentials used during [Webroot](#) communication, failure to connect with Webroot, information included in an update (such as the number of IP addresses in the database).

**Creating a blacklist or whitelist of IPs using a policy data set.** You can maintain an allow list to allow access to specific IP addresses that are blacklisted in the [Webroot](#) database. You can also create a customized block list of IP addresses to supplement the [Webroot](#) reputation check. These lists can be created by using a policy **data set**. A data set is a specialized form of pattern set that is ideally suited for IPv4 address matching. To use data sets, first create the data set and bind IPv4 addresses

to it. Then, configure a policy for comparing a string in a packet using an appropriate operator, and pass the name of the pattern set or data set as an argument.

To use the dataset to create a customized allow list of addresses to treat as exceptions during IP reputation evaluation:

- Configure the policy so that the default syntax expression evaluates to False even if an address in the allow list is listed as malicious by [Webroot](#) (or any service provider).

**Enabling or disabling IP reputation.** IP reputation is a part of the general reputation feature, which is license-based. When you enable or disable the reputation feature, it enables or disables IP Reputation.

**General procedure.** Deploying IP reputation involves the following tasks

- Verify that the license installed on the Citrix ADC appliance has IP reputation support. Premium and standalone application firewall licenses support the IP reputation feature.
- Enable the IP reputation and application firewall features.
- Add an application firewall profile.
- Add an application firewall policy using the PI expressions to identify the malicious IP addresses in the IP Reputation database.
- Bind the application firewall policy to an appropriate bind point.
- Verify that any request received from a malicious address gets logged in the ns.log file to show that the request was processed as specified in the profile.

## Using the command line to configure the IP reputation feature

To enable or disable IP reputation using the CLI, you can use the following commands:

- `enable feature reputation`
- `disable feature reputation`

The following examples show how you can add an application firewall policy using the PI expression to identify malicious addresses. You can use the built-in profiles, or add a profile, or configure an existing profile to invoke the desired action when a request matches a policy match.

Examples 3 and 4 show how to create a policy dataset to generate a Black (to be blocked) or White (to be allowed) list of IP addresses.

### Example 1:

The following command creates a policy that identifies malicious IP addresses and block the request if a match is triggered:

```
add appfw policy pol1 CLIENT.IP.SRC.IPREP_IS_MALICIOUS APPFW_BLOCK
```

### Example 2:

The following command creates a policy that uses the reputation service to check the client IP address in the `X-Forwarded-For` header and reset the connection if a match is triggered.

```
> add appfw policy pol1 "HTTP.REQ.HEADER(\"X-Forwarded-For\").TYPECAST_IP_ADDRESS_AT
.IPREP_IS_MALICIOUS"APPFW_RESET**
```

**Example 3:**

The following example shows how to add a list to add exceptions that allow specified IP addresses:

```
> add policy dataset Allow_list ipv4
> bind policy dataset Allow_list 10.217.25.17 -index 1
> bind policy dataset Allow_list 10.217.25.18 -index 2
```

**Example 4:**

The following example shows how to add the customized list to flag specified IP addresses as malicious:

```
> add policy dataset Block_List ipv4
> bind policy dataset Block_List 10.217.31.48 -index 1
> bind policy dataset Block_List 10.217.25.19 -index 2
```

**Example 5:**

The following example shows a policy expression to block the client IP if it matches an IP address:

- Configured in the customized block list (example 4), OR
- Listed in the `Webroot` database unless relaxed by inclusion in the allow list (example 3).

```
1 > add appfw policy "Ip_Rep_Policy" "((CLIENT.IP.SRC.IPREP_IS_MALICIOUS
|| CLIENT.IP.SRC.TYPECAST_TEXT_T.CONTAINS_ANY(\"Block_List\")) && !
(CLIENT.IP.SRC.TYPECAST_TEXT_T.CONTAINS_ANY(\"Allow_List\")))"
APPFW_BLOCK
2 <!--NeedCopy-->
```

**Using Proxy server:**

If the Citrix ADC appliance does not have direct access to the Internet and is connected to a proxy, configure the IP Reputation client to send requests to the proxy.

```
set reputation settings -proxyServer <proxy server ip> -proxyPort <proxy
server port>
```

**Example:**

```
> set reputation settings proxyServer 10.102.30.112 proxyPort 3128
```

```
> set reputation settings -proxyServer testproxy.citrite.net -proxyPort 3128
```

```
> unset reputation settings -proxyserver -proxyport
```

```
> sh reputation settings
```

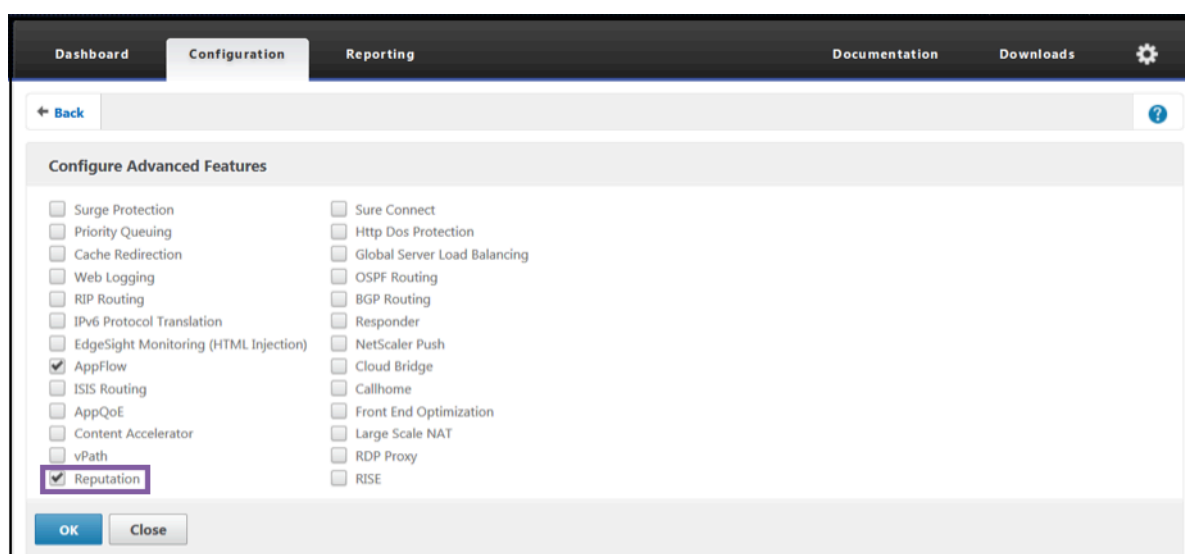

### Note

The Proxy Server IP can be an IP address or a fully qualified domain name (FQDN).

## Using the GUI to configure the IP reputation feature

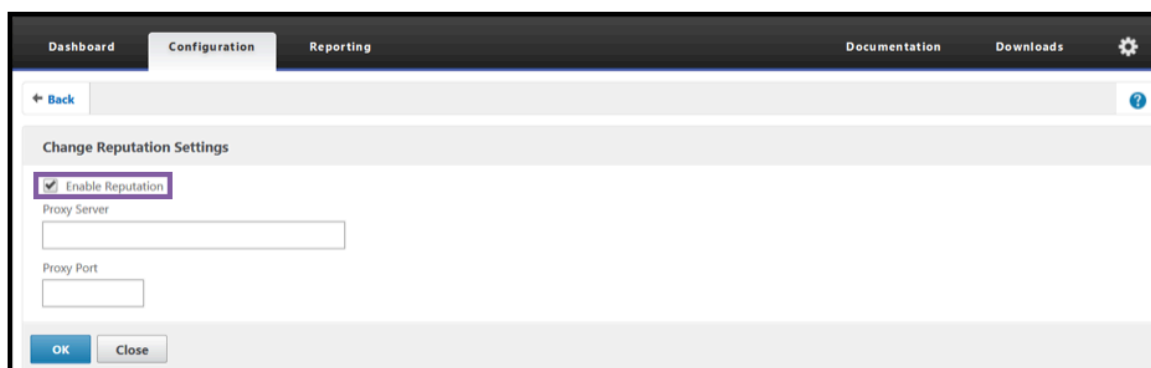

### To enable reputation (which enables IP reputation) feature in GUI:

Navigate to the **System > Settings**. In the **Modes and Features** section, click the link to access the **Configure Advanced Features** pane and enable the **Reputation** check box. Click **OK**.

### To configure a proxy server by using the configuration utility:

1. On the configuration tab, navigate to **Security > Reputation**. Under **Settings**, click **Change Reputation Settings** to configure a proxy server. You can also enable or disable the reputation feature. **Proxy Server** can be an IP address or a fully qualified domain name (FQDN). **Proxy port** accepts values between [1–65535].

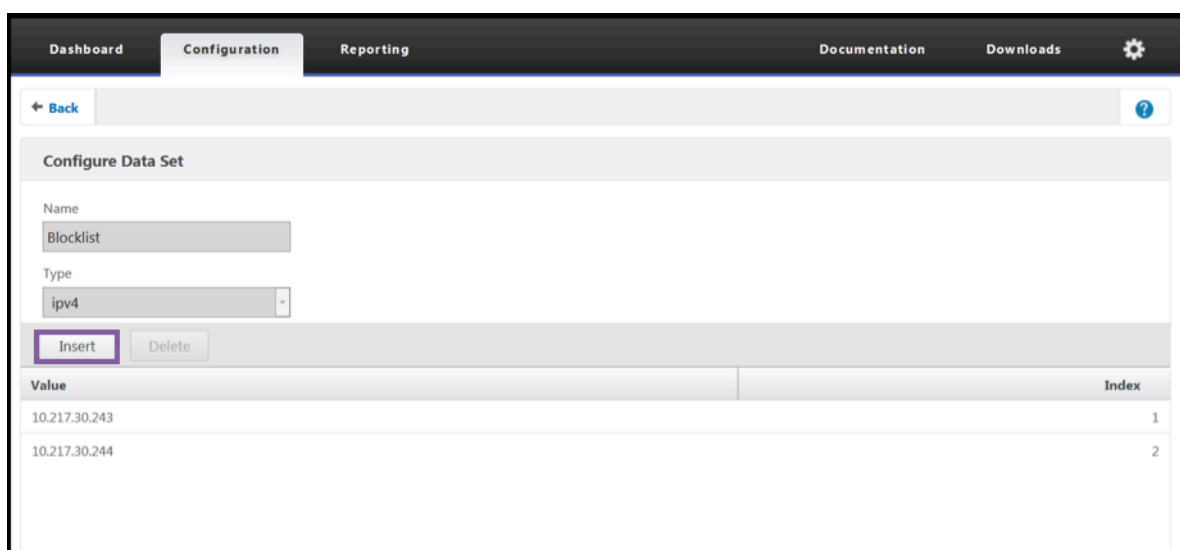

**To use a dataset to create a whitelist (list of safe IPs) and blacklist (list of unsafe IPs) of Client IP addresses:**

- On the **Configuration** tab, navigate to **AppExpert > Data Sets**.
- Click **Add**.

- In the **Create Data Set** (or **Configure Data set**) pane, provide a meaningful name for the list of the IP addresses. The name must reflect the purpose of the list.
- Select **Type** as **IPv4**.
- Click **Insert** to add an entry.

- In the Configure Policy dataset binding pane, add an IPv4 format IP address in the Value input

box.

- Provide an index.
- Add a comment that explains the purpose of the list. This step is optional, but is recommended because a descriptive comment is helpful in managing the list.

Similarly, you can create a block list and add the IP addresses that are to be considered malicious.

Also see, [Pattern sets and data sets](#) for more details regarding using data sets and configuring default syntax policy expressions.

### **To configure an application firewall policy by using the configuration utility:**

1. On the **Configuration** tab, navigate to **Security > Citrix Web App Firewall > Policies**. Click **Add** to add a policy using the PI expressions to use IP reputation.

You can also use the Expression editor to build your own policy expression. The list shows preconfigured options that are useful for configuring an expression using the threat categories.

## **Highlights**

- Quickly and accurately stop bad traffic at the network's edge from known malicious IP addresses posing different types of threats. You can block the request without parsing the body.
- Dynamically configure IP reputation functionality for multiple applications.
- Secure your network against data breach without a performance penalty, and consolidate protections onto a single services fabric using fast and easy deployments.
- You can do IP Reputation checks on source and destination IPs.
- You can also inspect the headers to detect malicious IPs.
- IP reputation check is supported in both forward proxy and reverse proxy deployments.
- The IP Reputation process connects with [Webroot](#) and updates the database every 5 minutes.
- Each node in the High Availability (HA) or Cluster deployment gets the database from [Webroot](#).
- The IP reputation data is shared across all partitions in admin-partition deployments.
- You can use an AppExpert data set to create lists of IP addresses to add exceptions for IPs black-listed in the [Webroot](#) database. You can also create your own customized block list to designate specific IPs as malicious.
- The `iprep.db` file is created in the `/var/nslog/iprep` folder. Once created, it is not deleted even if the feature is disabled.
- When the reputation feature is enabled, the Citrix ADC [Webroot](#) database is downloaded. After that, it is updated every 5 minutes.
- The Webroot database major version is a version: 1.
- The minor version gets updated every day. The update version is incremented after every 5 minutes and is reset back to 1 when the minor version is incremented.
- PI expressions enable you to use IP reputation with other features, such as responder and rewrite.

- The IP addresses in the database are in decimal notation.

### Debugging tips

- If you cannot see the reputation feature in the GUI, verify that you have the right license
- Monitor the messages in `/var/log/iprep.log` for debugging.
- **Webroot connectivity:** If you see the `ns iprep: Not able to connect/resolve WebRoot` message, make sure that the appliance has internet access and DNS is configured.
- **Proxy server:** If you see the `ns iprep: iprep_curl_download:88 curl_easy_perform failed. Error code: 5 Err msg:couldnt resolve proxy name` message, make sure that the proxy server configuration is accurate.
- **IP Reputation feature not working:** The IP Reputation process takes about five minutes to start after you enable the reputation feature. The IP reputation feature might not work for that duration.
- **Database download:** If the IP DB data download is failing after enabling the IP Reputation feature, the following error is seen in the logs.

```
iprep: iprep_curl_download:86 curl_easy_perform failed. Error code:7 Err  
msg:Couldn't connect to server
```

**Solution:** Allow the out-bound traffic to the following URLs or configure a proxy to resolve the issue.

```
1 localdb-ip-daily.brightcloud.com:443  
2 localdb-ip-rtu.brightcloud.com:443  
3 api.bcti.brightcloud.com:443  
4 <!--NeedCopy-->
```

## SSL offload and acceleration

September 21, 2020

A Citrix ADC appliance configured for SSL acceleration transparently accelerates SSL transactions by offloading SSL processing from the server. To configure SSL offloading, you configure a virtual server to intercept and process SSL transactions, and send the decrypted traffic to the server (unless you configure end-to-end encryption, in which case the traffic is re-encrypted). Upon receiving the response from the server, the appliance completes the secure transaction with the client. From the client's perspective, the transaction seems to be directly with the server. A Citrix ADC configured for SSL acceleration also performs other configured functions, such as load balancing.

Configuring SSL offloading requires an SSL certificate and key pair, which you must obtain if you do not already have an SSL certificate. Other SSL-related tasks that you might need to perform include

managing certificates, managing certificate revocation lists, configuring client authentication, and managing SSL actions and policies.

A non-FIPS Citrix ADC appliance stores the server's private key on the hard disk. On a FIPS appliance, the key is stored in a cryptographic module known as a hardware security module (HSM).

All Citrix ADC appliances that do not support a FIPS card (including virtual appliances) support the Thales nShield® Connect and SafeNet external HSMs. (MPX 9700/10500/12500/15500 appliances do not support an external HSM.)

**Note:** FIPS-related options for some of the SSL configuration procedures described in this document are specific to a FIPS-enabled Citrix ADC appliance.

## SSL offloading configuration

June 15, 2021

To configure SSL offloading, you must enable SSL processing on the Citrix ADC appliance. Configure an SSL based virtual server that will intercept SSL traffic, decrypt the traffic, and forward it to a service that is bound to the virtual server. To secure time-sensitive traffic, such as media streaming, you can configure a DTLS virtual server. To enable SSL offloading, you must import a valid certificate and key and bind the pair to the virtual server.

### Enable SSL

To process SSL traffic, you must enable SSL processing. You can configure SSL based entities, such as virtual servers and services, without enabling SSL processing, but they do not work until SSL processing is enabled.

### Enable SSL processing by using the CLI

At the command prompt, type:

```
1 enable ns feature ssl
2
3 show ns feature
4 <!--NeedCopy-->
```

### Example:

```
1 enable ns feature SSL
2 Done
```

```

3 show ns feature
4
5         Feature                               Acronym           Status
6         -----                               -
7 1)      Web Logging                           WL                OFF
8 2)      Surge Protection                       SP                ON
9 3)      Load Balancing                        LB                ON
10      .
11      .
12      .
13 9)      SSL Offloading                        SSL              ON
14      .
15      .
16      .
17 24)     NetScaler Push                        push             OFF
18 Done
19 <!--NeedCopy-->

```

### Enable SSL processing by using the GUI

Navigate to **System > Settings** and, in the Modes and Features group, select **Configure Basic Features**, and select **SSL Offloading**.

### Configure services

On the Citrix ADC appliance, a service represents a physical server or an application on a physical server. Once configured, services are in the disabled state until the appliance can reach the physical server on the network and monitor its status.

### Add a service by using the CLI

At the command prompt, type the following commands to add a service and verify the configuration:

```

1 add service <name> (<IP> | <serverName>) <serviceType> <port>
2 show service <serviceName>
3 <!--NeedCopy-->

```

### Example:

```

1 add service sslsvc 198.51.100.225 SSL 443
2
3 Done
4

```

```
5 sh ssl service sslsvc
6
7         Advanced SSL configuration for Back-end SSL Service sslsvc:
8         DH: DISABLED
9         DH Private-Key Exponent Size Limit: DISABLED      Ephemeral
          RSA: DISABLED
10        Session Reuse: ENABLED          Timeout: 300 seconds
11        Cipher Redirect: DISABLED
12        SSLv2 Redirect: DISABLED
13        ClearText Port: 0
14        Server Auth: DISABLED
15        SSL Redirect: DISABLED
16        Non FIPS Ciphers: DISABLED
17        SNI: DISABLED
18        OCSP Stapling: DISABLED
19        SSLv2: DISABLED  SSLv3: ENABLED  TLSv1.0: ENABLED  TLSv1.1:
          ENABLED  TLSv1.2: ENABLED  TLSv1.3: DISABLED
20        Send Close-Notify: YES
21        Strict Sig-Digest Check: DISABLED
22        Zero RTT Early Data: ???
23        DHE Key Exchange With PSK: ???
24        Tickets Per Authentication Context: ???
25
26        ECC Curve: P_256, P_384, P_224, P_521
27
28        1) Cipher Name: DEFAULT_BACKEND
29        Description: Default cipher list for Backend SSL session
30        Done
31 <!--NeedCopy-->
```

### Modify or remove a service by using the CLI

To modify a service, use the `set service` command, which is just like using the `add service` command, except that you enter the name of an existing service. To remove a service, use the `rm service` command, which accepts only the `<name>` argument.

### Configure a service by using the GUI

Navigate to **Traffic Management > Load Balancing > Services**, create a service, and specify the protocol as SSL.

## SSL virtual server configuration

Secure sessions require establishing a connection between the client and an SSL-based virtual server on the Citrix ADC appliance. The SSL virtual server intercepts SSL traffic, decrypts it and processes it before sending it to services that are bound to the virtual server.

**Note:** The SSL virtual server is marked as down on the Citrix ADC appliance until a valid certificate / key pair and at least one service are bound to it. An SSL based virtual server is a load balancing virtual server of protocol type SSL or SSL\_TCP. The load balancing feature must be enabled on the Citrix ADC appliance.

### Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

```
1 add lb vserver <name> (serviceType) <IPAddress> <port>
2 show ssl vserver <name>
3 <!--NeedCopy-->
```

### Example:

```
1 add lb vserver sslvs SSL 192.0.2.240 443
2 Done
3
4 sh ssl vserver sslvs
5
6         Advanced SSL configuration for VServer sslvs:
7         DH: DISABLED
8         DH Private-Key Exponent Size Limit: DISABLED      Ephemeral
          RSA: ENABLED          Refresh Count: 0
9         Session Reuse: ENABLED          Timeout: 120 seconds
10        Cipher Redirect: DISABLED
11        SSLv2 Redirect: DISABLED
12        ClearText Port: 0
13        Client Auth: DISABLED
14        SSL Redirect: DISABLED
15        Non FIPS Ciphers: DISABLED
16        SNI: DISABLED
17        OCSP Stapling: DISABLED
18        HSTS: DISABLED
19        HSTS IncludeSubDomains: NO
20        HSTS Max-Age: 0
21        SSLv2: DISABLED  SSLv3: ENABLED  TLSv1.0: ENABLED  TLSv1.1:
          ENABLED  TLSv1.2: ENABLED  TLSv1.3: DISABLED
```

```
22         Push Encryption Trigger: Always
23         Send Close-Notify: YES
24         Strict Sig-Digest Check: DISABLED
25         Zero RTT Early Data: DISABLED
26         DHE Key Exchange With PSK: NO
27         Tickets Per Authentication Context: 1
28         ECC Curve: P_256, P_384, P_224, P_521
29
30     1)     Cipher Name: DEFAULT
31           Description: Default cipher list with encryption strength
32           >= 128bit
33         Done
34 <!--NeedCopy-->
```

### Modify or remove an SSL-based virtual server by using the CLI

To modify the load balancing properties of an SSL virtual server, use the `set lb vservice` command, which is just like using the `add lb vservice` command, except that you enter the name of an existing virtual server. To modify the SSL properties of an SSL-based virtual server, use the `set ssl vservice` command. For more information, see the “SSL virtual server parameters” section later in this page.

To remove an SSL virtual server, use the `rm lb vservice` command, which accepts only the `<name>` argument.

### Configure an SSL-based virtual server by using the GUI

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, create a virtual server, and specify the protocol as SSL.

### Bind services to the SSL virtual server

The ADC appliance forwards decrypted SSL data to servers in the network, when services representing these physical servers are bound to the virtual server that receives the SSL data.

Because the link between the Citrix ADC appliance and the physical server is typically secure, data transfer between the appliance and the physical server can be unencrypted. However, you can provide end-to-end-encryption by encrypting data transfer between the appliance and the server. For details, see [Configure SSL offloading with end-to-end encryption](#).

**Note:** Enable the load balancing feature on the Citrix ADC appliance before you bind services to the SSL based virtual server.

**Bind a service to a virtual server by using the CLI**

At the command prompt, type the following commands to bind the service to the virtual server and verify the configuration:

```
1 bind lb vserver <name> <serviceName>
2 show lb vserver <name>
3 <!--NeedCopy-->
```

**Example:**

```
1 bind lb vserver sslvs sslsvc
2     Done
3
4 sh lb vserver sslvs
5
6     sslvs (192.0.2.240:443) - SSL      Type: ADDRESS
7     State: DOWN[Certkey not bound]
8     Last state change was at Wed May  2 11:43:04 2018
9     Time since last state change: 0 days, 00:13:21.150
10    Effective State: DOWN
11    Client Idle Timeout: 180 sec
12    Down state flush: ENABLED
13    Disable Primary Vserver On Down : DISABLED
14    Appflow logging: ENABLED
15    No. of Bound Services :  1 (Total)      0 (Active)
16    Configured Method: LEASTCONNECTION      BackupMethod:
17    ROUNDROBIN
18    Mode: IP
19    Persistence: NONE
20    Vserver IP and Port insertion: OFF
21    Push: DISABLED  Push VServer:
22    Push Multi Clients: NO
23    Push Label Rule: none
24    L2Conn: OFF
25    Skip Persistency: None
26    Listen Policy: NONE
27    IcmpResponse: PASSIVE
28    RHlstate: PASSIVE
29    New Service Startup Request Rate: 0 PER_SECOND, Increment
30    Interval: 0
31    Mac mode Retain Vlan: DISABLED
32    DBS_LB: DISABLED
33    Process Local: DISABLE
34    Traffic Domain: 0
```

```
33          TROFS Persistence honored: ENABLED
34          Retain Connections on Cluster: NO
35      1) sslsvc (198.51.100.225: 443) - SSL State: DOWN      Weight: 1
36          Done
37 <!--NeedCopy-->
```

### Unbind a service from a virtual server by using the CLI

At the command prompt, type the following command:

```
1 unbind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

#### Example:

```
1 unbind lb vserver sslvs sslsvc
2     Done
3 <!--NeedCopy-->
```

### Bind a service to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open a virtual server, and click in the Services section to bind a service to the virtual server.

### Configure an SNI virtual server for secure hosting of multiple sites

Virtual hosting is used by web servers to host more than one domain name with the same IP address. The appliance supports hosting of multiple secure domains by offloading SSL processing from the Web servers using transparent SSL services or virtual server-based SSL offloading. However, when multiple websites are hosted on the same virtual server, the SSL handshake is completed before the expected host name is sent to the virtual server. As a result, the appliance cannot determine which certificate to present to the client after a connection is established. This problem is resolved by enabling Server Name Indication (SNI) on the virtual server. SNI is a Transport Layer Security (TLS) extension used by the client to provide the host name during handshake initiation. The Citrix ADC appliance compares this host name to the common name and, if it does not match, compares it to the subject alternative name (SAN). If the name matches, the appliance presents the corresponding certificate to the client.

A wildcard SSL Certificate helps enable SSL encryption on multiple subdomains if the domains are controlled by the same organization and share the second-level domain name. For example, a wildcard

certificate issued to a sports network using the common name “\*.sports.net” can be used to secure domains, such as “login.sports.net” and “help.sports.net” but not “login.ftp.sports.net.”

**Notes:**

- On a Citrix ADC appliance, only domain name, URL, and email ID DNS entries in the SAN field are compared.
- If an existing certificate-key pair (for example, `certkey A`) is bound to an SSL virtual server, and a second certificate-key pair (for example, `certkey B`) is added using SNI and bound to the same virtual server, `certkey A` must also be configured as `-SNI Cert`. If a Client Hello message includes an SNI extension with the domain name of `certkey A` and the preceding configuration is not in place, TLS connections to the domains in (`certkey A`) do not work.

You can bind multiple server certificates to a single SSL virtual server or transparent service using the `-SNI Cert` option. These certificates are issued by the virtual server or service if SNI is enabled on the virtual server or service. You can enable SNI at any time.

**Bind multiple server certificates to a single SSL virtual server by using the CLI**

At the command prompt, type the following commands to configure SNI and verify the configuration:

```
1 set ssl vserver <vServerName>@ [-SNIEnable ( ENABLED | DISABLED )]
2
3 bind ssl vserver <vServerName>@ -certkeyName <string> -SNI Cert
4
5 show ssl vserver <vServerName>
6 <!--NeedCopy-->
```

To bind multiple server certificates to a transparent service by using the CLI, replace `vserver` with `service` and `vservername` with `servicename` in the preceding commands.

**Note:** Create the SSL service with the `-clearTextPort 80` option.

**Bind multiple server certificates to a single SSL virtual server by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open an SSL virtual server and, in Certificates, click Server Certificate.
3. Add a certificate or select a certificate from the list, and select Server Certificate for SNI.
4. In Advanced Settings, click SSL Parameters.
5. Select SNI Enable.

**Support for SNI on the back-end service**

**Note:** SNI is not supported on a DTLS back-end service.

The Citrix ADC appliance supports Server Name Indication (SNI) at the back end. That is, the common name is sent as the server name in the client hello to the back-end server for successful completion of the handshake. In addition to helping meet federal system integrator customer security requirements, this enhancement provides the advantage of using only one port instead of opening hundreds of different IP addresses and ports on a firewall.

Federal system integrator customer security requirements include support for Active Directory Federation Services (ADFS) 3.0 in 2012R2 and WAP servers. This requires supporting SNI at the back end on a Citrix ADC appliance.

**Note:**

For SNI to work, the server name in the client hello must match the host name configured on the back-end service that is bound to an SSL virtual server. For example, if the host name of the back end server is `www.mail.example.com`, the SNI-enabled back-end service must be configured with the server name as <https://www.mail.example.com>, and this host name must match the server name in the client hello.

### Configure SNI on the back-end service by using the CLI

At the command prompt, type:

```
1 add service <name> <IP> <serviceType> <port>
2
3 add lb vserver <name> <IPAddress> <serviceType> <port>
4
5 bind lb vserver <name> <serviceName>
6
7 set ssl service <serviceName> -SNIEnable ENABLED -commonName <string>
8 <!--NeedCopy-->
```

### Example:

```
1 add service service_ssl 198.51.100.100 SSL 443
2
3 add lb vserver ssl-vs 203.0.113.200 SSL 443
4
5 bind lb vserver ssl-vs service_ssl
6
7 set ssl service service_ssl -SNIEnable ENABLED - commonName www.
  example.com
8 <!--NeedCopy-->
```

### Configure SNI on the back-end service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Select an SSL service, and in **Advanced Settings**, select **SSL Parameters**.
3. Select **SNI Enable**.

### Bind a secure monitor to an SNI-enabled back-end service

You can also bind secure monitors of type HTTP-ECV or TCP-ECV to the back-end services that support SNI. To do so, the custom header in the monitor must be set to the server name that is sent as the SNI extension in the client hello.

### Configure and bind a secure monitor to an SNI-enabled back-end service by using the CLI

At the command prompt, type:

```
1 add lb monitor <monitorName> <type>
2
3 set lb monitor <monitorName> <type> -customHeaders <string>
4
5 bind service <name> -monitorName <string>
6 <!--NeedCopy-->
```

#### Example:

```
1 add monitor https-ecv-mon http-ecv
2     Done
3 set monitor https-ecv-mon HTTP-ECV -customHeaders "Host: example.com\r\
4     n"
5     Done
6 bind service ssl_service - monitorName https-ecv
7 <!--NeedCopy-->
```

### Configure and bind a secure monitor to an SNI-enabled back-end service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Monitor**.
2. Add a monitor of type **HTTP-ECV** or **TCP-ECV**, and specify a **Custom Header**.
3. Click **Create**.
4. Navigate to **Traffic Management > Load Balancing > Services**.
5. Select an SSL service and click **Edit**.
6. In **Monitors**, click **Add Binding**, select the monitor created in step 3, and click **Bind**.

## Add or update a certificate-key pair

**Caution:** If while adding a certificate-key pair, you add a certificate file with the same name as an existing certificate file but with different content, the original certificate file is overwritten with no warning. This action might cause issues after the appliance is restarted because the original certificate file is no longer available in the `/nsconfig/ssl` directory.

**Note:**

If you don't have an existing certificate and key, see [Create a certificate](#).

To create an ECDSA certificate-key pair, click [Create an ECDSA certificate-key pair](#).

From release 12.1 build 50.x, the password of the private key used while adding an SSL certificate-key pair is now saved using a unique encryption key for each Citrix ADC appliance.

For any SSL transaction, the server needs a valid certificate and the corresponding private and public key pair. The SSL data is encrypted with the server's public key, which is available through the server's certificate. Decryption requires the corresponding private key.

Because the Citrix ADC appliance offloads SSL transactions from the server, the server's certificate and private key must be present on the appliance, and the certificate must be paired with its corresponding private key. This certificate-key pair must then be bound to the virtual server that processes the SSL transactions.

**Note:** From release 11.0, the default certificate on a Citrix ADC appliance is 2048 bits. In earlier builds, the default certificate was 512 bits or 1024 bits. After upgrading to release 11.0, you must delete all your old certificate-key pairs starting with "ns-", and then restart the appliance to automatically generate a 2048-bit default certificate.

Both the certificate and the key must be in local storage on the Citrix ADC appliance before they can be added to the appliance. If your certificate or key file is not on the appliance, upload it to the appliance before you create the pair.

**Important:** Certificates and keys are stored in the `/nsconfig/ssl` directory by default. If your certificates or keys are stored in any other location, you must provide the absolute path to the files on the Citrix ADC appliance. The Citrix ADC FIPS appliances do not support external keys (non-FIPS keys). On a FIPS appliance, you cannot load keys from a local storage device such as a hard disk or flash memory. The FIPS keys must be present in the Hardware Security Module (HSM) of the appliance.

On a Citrix ADC MPX appliance and a Citrix ADC FIPS appliance, only RSA private keys are supported. On a VPX virtual appliance, both RSA and DSA private keys are supported. On an SDX appliance if SSL chips are assigned to an instance, then only RSA private keys are supported. However, if SSL chips are not assigned to an instance, then both RSA and DSA private keys are supported. In all the cases, you can bind a CA certificate with either RSA or DSA keys.

Set the notification period and enable the expiry monitor to issue a prompt before the certificate ex-

pires.

The Citrix ADC appliance supports the following input formats of the certificate and the private-key files:

- PEM - Privacy Enhanced Mail
- DER - Distinguished Encoding Rule
- PFX - Personal Information Exchange

The software automatically detects the format. Therefore, you are no longer required to specify the format in the `inform` parameter. If you do specify the format (correct or incorrect), the software ignores it. The format of the certificate and the key file must be the same.

**Note:** A certificate must be signed by using one of the following hash algorithms:

- MD5
- SHA-1
- SHA-224
- SHA-256
- SHA-384 (supported only on the front end)
- SHA-512 (supported only on the front end)

An MPX appliance supports certificates of 512 or more bits, up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back-end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A VPX virtual appliance supports certificates of 512 or more bits, up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back-end server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

**Note**

A Citrix ADC SDX appliance supports certificates of 512 or more bits. Each Citrix ADC VPX instance hosted on the appliance supports the certificate sizes listed earlier for a VPX virtual appliance. However, if an SSL chip is assigned to an instance, that instance supports the certificate sizes supported by an MPX appliance.

### Add a certificate-key pair by using the CLI

At the command prompt, type the following commands to add a certificate-key pair and verify the configuration:

```

1 add ssl certKey <certkeyName> -cert <string>[(-key <string> [-password
   ]) | -fipsKey <string>] [-inform ( DER | PEM )] [<passplain>] [-
   expiryMonitor ( ENABLED | DISABLED ) [-notificationPeriod <
   positive_integer>]]
2
3 show ssl certKey [<certkeyName>]
4 <!--NeedCopy-->

```

### Example:

```

1 add ssl certKey sslckey -cert server_cert.pem -key server_key.pem -
   password ssl -expiryMonitor ENABLED -notificationPeriod 30
2 Done
3 Note: For FIPS appliances, replace -key with -fipskey
4
5 show ssl certKey sslckey
6     Name: sslckey           Status: Valid,   Days to expiration
   :8418
7     Version: 3
8     Serial Number: 01
9     Signature Algorithm: md5WithRSAEncryption
10    Issuer:  C=US,ST=SJ,L=SJ,O=NS,OU=NSSL,CN=www.root.com
11    Validity
12           Not Before: Jul 15 02:25:01 2005 GMT
13           Not After  : Nov 30 02:25:01 2032 GMT
14    Subject: C=US,ST=SJ,L=SJ,O=NS,OU=NSSL,CN=www.server.com
15    Public Key Algorithm: rsaEncryption
16    Public Key size: 2048
17 Done
18 <!--NeedCopy-->

```

### Update or remove a certificate-key pair by using the CLI

To modify the expiry monitor or notification period in a certificate-key pair, use the `set ssl certkey` command. To replace the certificate or key in a certificate-key pair, use the `update ssl certkey` command. The `update ssl certkey` command has an extra parameter for overriding the domain check. For both commands, enter the name of an existing certificate-key pair. To remove an SSL certificate-key pair, use the `rm ssl certkey` command, which accepts only the `<certkeyName>` argument.

**Example:**

```
1 set ssl certKey <certkeyName> [-expiryMonitor ( ENABLED | DISABLED )
2     [-notificationPeriod <positive_integer>]]
3
4 update ssl certKey <certkeyName> [-cert <string> [-password]] [-key
5     <string> | -fipsKey <string>] [-inform <inform>] [-noDomainCheck
6     ]
7 <!--NeedCopy-->
```

**Add or update a certificate-key pair by using the GUI**

Navigate to **Traffic Management > SSL > Certificates**, and configure a certificate-key pair.

**Bind the certificate-key pair to the SSL virtual server**

An SSL certificate is an integral element of the SSL encryption and decryption process. The certificate is used during an SSL handshake to establish the identity of the SSL server.

The certificate being used for processing SSL transactions must be bound to the virtual server that receives the SSL data. If you have multiple virtual servers receiving SSL data, a valid certificate-key pair must be bound to each of them.

You can use a valid, existing SSL certificate that you have uploaded to the Citrix ADC appliance. As an alternative for testing purposes, you can create your own SSL certificate on the appliance. Intermediate certificates created by using a FIPS key on the appliance cannot be bound to an SSL virtual server.

As a part of the SSL handshake, in the certificate request message during client authentication, the server lists the distinguished names (DNs) of all the certificate authorities (CAs) bound to the server from which it accepts a client certificate. If you do not want the DN name of a specific CA certificate to be sent to the SSL client, set the skipCA flag. This setting indicates that the particular CA certificate's distinguished name must not be sent to the SSL client.

For details on how to create your own certificate, see [Managing Certificates](#).

Note: Citrix recommends that you use only valid SSL certificates issued by a trusted certificate authority.

**Bind an SSL certificate-key pair to a virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL certificate-key pair to a virtual server and verify the configuration:

```
1 - bind ssl vs1 <vServerName> -certkeyName <certificate-KeyPairName>
  > -CA -skipCAName
2 - show ssl vs1 <vServerName>
3 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vs vs1 -certkeyName cert2 -CA -skipCAName
2 Done
3 sh ssl vs vs1
4

### Unbind an SSL certificate-key pair from a virtual server by using the CLI

If you try to unbind a certificate-key pair from a virtual server by using the `unbind ssl certKey <certKeyName>` command, an error message appears because the syntax of the command has changed. At the command prompt, type the following command:

```

1  unbind ssl vserver <vServerName> -certKeyName <string>
2  <!--NeedCopy-->

```

#### Example:

```

1  unbind ssl vserver vssl -certKeyName sslkey
2  <!--NeedCopy-->

```

### Bind an SSL certificate-key pair to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open an SSL virtual server and, in Advanced Settings, click SSL Certificate.
3. Bind a server certificate or CA certificate to the virtual server. To add a server certificate as an SNI certificate, select Server Certificate for SNI.

### SSL virtual server parameters

You can set the advanced SSL configuration for an SSL virtual server. Many of these parameters can also be set in an SSL profile. For information about the parameters that can be set in an SSL profile,

see [SSL profile parameters](#).

### Set SSL virtual server parameters by using the CLI

At the command prompt, type:

```

1 set ssl vserver <vServerName>@ [-clearTextPort <port>] [-dh ( ENABLED |
  DISABLED ) -dhFile <string>] [-dhCount <positive_integer>][ -
  dhKeyExpSizeLimit ( ENABLED | DISABLED )] [-eRSA ( ENABLED |
  DISABLED )] [-eRSACount <positive_integer>]] [-sessReuse ( ENABLED |
  DISABLED )] [-sessTimeout <positive_integer>]] [-cipherRedirect (
  ENABLED | DISABLED )] [-cipherURL <URL>]] [-sslv2Redirect ( ENABLED |
  DISABLED )] [-sslv2URL <URL>]] [-clientAuth ( ENABLED | DISABLED )] [-
  clientCert ( Mandatory | Optional )]] [-sslRedirect ( ENABLED |
  DISABLED )] [-redirectPortRewrite ( ENABLED | DISABLED )] [-ssl2 (
  ENABLED | DISABLED )] [-ssl3 ( ENABLED | DISABLED )] [-tls1 (
  ENABLED | DISABLED )] [-tls11 ( ENABLED | DISABLED )] [-tls12 (
  ENABLED | DISABLED )] [-tls13 ( ENABLED | DISABLED )] [-SNIEnable (
  ENABLED | DISABLED )] [-ocspStapling ( ENABLED | DISABLED )] [-
  pushEncTrigger <pushEncTrigger>] [-sendCloseNotify ( YES | NO )] [-
  dtlsProfileName <string>] [-sslProfile <string>] [-HSTS ( ENABLED |
  DISABLED )] [-maxage <positive_integer>] [-IncludeSubdomains ( YES |
  NO )] [-strictSigDigestCheck ( ENABLED | DISABLED )] [-
  zeroRttEarlyData ( ENABLED | DISABLED )] [-
  tls13SessionTicketsPerAuthContext <positive_integer>] [-
  dhKeyExchangeWithPsk ( YES | NO )]
2 <!--NeedCopy-->

```

### Diffie-Hellman (DH) parameters

If you are using ciphers on the appliance that require a DH key exchange to set up the SSL transaction, enable DH key exchange on the appliance and configure other settings based on your network.

To list the ciphers for which DH parameters must be set by using the CLI, type: `sh cipher DH`.

To list the ciphers for which DH parameters must be set by using the configuration utility, navigate to **Traffic Management > SSL > Cipher Groups**, and double-click **DH**.

For details on how to enable DH key exchange, see [Generate a Diffie-Hellman \(DH\) key](#).

### Configure DH parameters by using the CLI

At the command prompt, type the following commands to configure DH parameters and verify the configuration:

```

1 - `set ssl vsserver <vserverName> -dh <Option> -dhCount <
    RefreshCountValue> -filepath <string>
2 - show ssl vsserver <vServerName>`
3 <!--NeedCopy-->

```

**Example:**

```

1 set ssl vsserver vs-server -dh ENABLED -dhFile /nsconfig/ssl/ns-server.
    cert -dhCount 1000
2 Done
3
4 show ssl vsserver vs-server
5
6         Advanced SSL configuration for VServer vs-server:
7         DH: ENABLED
8         Ephemeral RSA: ENABLED           Refresh Count: 1000
9         Session Reuse: ENABLED          Timeout: 120 seconds
10        Cipher Redirect: DISABLED
11        SSLv2 Redirect: DISABLED
12        ClearText Port: 0
13        Client Auth: DISABLED
14        SSL Redirect: DISABLED
15        Non FIPS Ciphers: DISABLED
16        SNI: DISABLED
17        OCSP Stapling: DISABLED
18        HSTS: DISABLED
19        HSTS IncludeSubDomains: NO
20        HSTS Max-Age: 0
21        SSLv2: DISABLED SSLv3: ENABLED  TLSv1.0: ENABLED TLSv1.2:
    ENABLED  TLSv1.2: ENABLED
22
23        1)        Cipher Name: DEFAULT
24                Description: Predefined Cipher Alias
25 Done
26 <!--NeedCopy-->

```

**Configure DH Parameters by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the SSL Parameters section, select Enable DH Param, and specify a refresh count and file path.

## Ephemeral RSA

Ephemeral RSA allows export clients to communicate with the secure server even if the server certificate does not support export clients (1024-bit certificate). If you want to prevent export clients from accessing the secure web object or resource, you need to disable ephemeral RSA key exchange.

By default, this feature is enabled on the Citrix ADC appliance, with the refresh count set to zero (infinite use).

### Note:

The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted but reused later when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the system restarts.

## Configure Ephemeral RSA by using the CLI

At the command prompt, type the following commands to configure ephemeral RSA and verify the configuration:

```
1 set ssl vserver <vServerName> -eRSA (enabled | disabled) -eRSACount <
   positive_integer>
2 show ssl vserver <vServerName>
3 <!--NeedCopy-->
```

### Example:

```
1 set ssl vserver vs-server -eRSA ENABLED -eRSACount 1000
2 Done
3
4 show ssl vserver vs-server
5
6     Advanced SSL configuration for VServer vs-server:
7     DH: DISABLED
8     Ephemeral RSA: ENABLED           Refresh Count: 1000
9     Session Reuse: ENABLED          Timeout: 120 seconds
10    Cipher Redirect: DISABLED
11    SSLv2 Redirect: DISABLED
12    ClearText Port: 0
13    Client Auth: DISABLED
14    SSL Redirect: DISABLED
15    Non FIPS Ciphers: DISABLED
16    SNI: DISABLED
17    OCSP Stapling: DISABLED
18    HSTS: DISABLED
```

```

19      HSTS IncludeSubDomains: NO
20      HSTS Max-Age: 0
21      SSLv2: DISABLED SSLv3: ENABLED  TLSv1.0: ENABLED TLSv1.2:
        ENABLED  TLSv1.2: ENABLED
22
23 1)    Cipher Name: DEFAULT
24      Description: Predefined Cipher Alias
25 Done
26 <!--NeedCopy-->

```

### Configure Ephemeral RSA by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the **SSL Parameters** section, select **Enable Ephemeral RSA**, and specify a refresh count.

### Session reuse

For SSL transactions, establishing the initial SSL handshake requires CPU-intensive public key encryption operations. Most handshake operations are associated with the exchange of the SSL session key (client key exchange message). When a client session is idle for some time and is then resumed, the SSL handshake is typically conducted all over again. With session reuse enabled, session key exchange is avoided for session resumption requests received from the client.

Session reuse is enabled on the Citrix ADC appliance by default. Enabling this feature reduces server load, improves response time, and increases the number of SSL transactions per second (TPS) that the server can support.

### Configure session reuse by using the CLI

At the command prompt, type the following commands to configure session reuse and verify the configuration:

```

1 set ssl vserver <vServerName> -sessReuse ( ENABLED | DISABLED ) -
  sessTimeout <positive_integer>
2 show ssl vserver <vServerName>
3 <!--NeedCopy-->

```

### Example:

```

1 set ssl vserver vs-ssl -sessreuse enabled -sesstimeout 600
2 Done
3
4 show ssl vserver vs-ssl

```

```
5
6     Advanced SSL configuration for VServer vs-ssl:
7     DH: DISABLED
8     Ephemeral RSA: ENABLED           Refresh Count: 1000
9     Session Reuse: ENABLED           Timeout: 600 seconds
10    Cipher Redirect: DISABLED
11    SSLv2 Redirect: DISABLED
12    ClearText Port: 0
13    Client Auth: DISABLED
14    SSL Redirect: DISABLED
15    Non FIPS Ciphers: DISABLED
16    SNI: DISABLED
17    OCSP Stapling: DISABLED
18    HSTS: DISABLED
19    HSTS IncludeSubDomains: NO
20    HSTS Max-Age: 0
21    SSLv2: DISABLED SSLv3: ENABLED   TLSv1.0: ENABLED TLSv1.2:
22                                     ENABLED TLSv1.2: ENABLED
23 1)    CertKey Name: Auth-Cert-1       Server Certificate
24
25 1)    Cipher Name: DEFAULT
26       Description: Predefined Cipher Alias
27 Done
28 <!--NeedCopy-->
```

### Configure session reuse by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the SSL Parameters section, select Enable Session Reuse, and specify a time for which to keep the session active.

### SSL protocol settings

The Citrix ADC appliance supports the SSLv3, TLSv1, TLSv1.1, and TLSv1.2 protocols. These protocols can be set on the appliance as required by your deployment and the type of clients that connect to the appliance.

TLS protocol versions 1.0, 1.1, and 1.2 are more secure than older versions of the TLS/SSL protocol. However, to support legacy systems, many TLS implementations maintain backward compatibility with the SSLv3 protocol. In an SSL handshake, the highest protocol version common to the client and the SSL virtual server configured on the Citrix ADC appliance is used.

In the first handshake attempt, a TLS client offers the highest protocol version that it supports. If the handshake fails, the client offers a lower protocol version. For example, if a handshake with TLS version 1.1 is not successful, the client attempts to renegotiate by offering the TLSv1.0 protocol. If that attempt is unsuccessful, the client reattempts with the SSLv3 protocol. A “man in the middle” (MITM) attacker can break the initial handshake and trigger renegotiation with the SSLv3 protocol, and then exploit a vulnerability in SSLv3. To mitigate such attacks, you can disable SSLv3 or not allow renegotiation using a downgraded protocol. However, this approach might not be practical if your deployment includes legacy systems. An alternative is to recognize a signaling cipher suite value (TLS\_FALLBACK\_SCSV) in the client request.

A TLS\_FALLBACK\_SCSV value in a client hello message indicates to the virtual server that the client has previously attempted to connect with a higher protocol version and that the current request is a fallback. If the virtual server detects this value, and it supports a version higher than the one indicated by the client, it rejects the connection with a fatal alert. If a TLS\_FALLBACK\_SCSV is not included in the client hello message, or if the protocol version in the client hello is the highest protocol version supported by the virtual server, the handshake succeeds.

### Configure SSL protocol support by using the CLI

At the command prompt, type the following commands to configure SSL protocol support and verify the configuration:

```
1 set ssl vserver <vServerName> -ssl2 ( ENABLED | DISABLED ) -ssl3 (
    ENABLED | DISABLED ) -tls1 ( ENABLED | DISABLED ) -tls11 ( ENABLED |
    DISABLED ) -tls12 ( ENABLED | DISABLED )
2
3 show ssl vserver <vServerName>
4 <!--NeedCopy-->
```

### Example:

```
1 set ssl vserver vs-ssl -tls11 ENABLED -tls12 ENABLED
2 Done
3
4 sh ssl vs vs-ssl
5
6     Advanced SSL configuration for VServer vs-ssl:
7         DH: DISABLED
8         Ephemeral RSA: ENABLED                                Refresh
9         Session Reuse: ENABLED                                Timeout
10        : 120 seconds
11        Cipher Redirect: DISABLED
12        SSLv2 Redirect: DISABLED
```

```
12      ClearText Port: 0
13      Client Auth: DISABLED
14      SSL Redirect: DISABLED
15      Non FIPS Ciphers: DISABLED
16      SNI: DISABLED
17      SSLv2: DISABLED          SSLv3: ENABLED      TLSv1.0: ENABLED
18      TLSv1.1: ENABLED  TLSv1.2: ENABLED
19      Push Encryption Trigger: Always
20      Send Close-Notify: YES
21      1 bound certificate:
22      1)      CertKey Name: mycert  Server Certificate
23      1 configured cipher:
24
25      1)      Cipher Name: DEFAULT
26      Description: Predefined Cipher Alias
27
28 Done
29 <!--NeedCopy-->
```

### Configure SSL protocol support by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the SSL Parameters section, select a protocol to enable.

### Close-notify

A close-notify is a secure message that indicates the end of SSL data transmission. A close-notify setting is required at the global level. This setting applies to all virtual servers, services, and service groups. For information about the global setting, see the **Global SSL parameters** section later in this page.

In addition to the global setting, you can set the close-notify parameter at the virtual server, service, or service group level. You therefore have the flexibility of setting the parameter for one entity and unsetting it for another entity. However, make sure that you set this parameter at the global level. Otherwise, the setting at the entity level does not apply.

### Configure the close-notify parameter at the entity level by using the CLI

At the command prompt, type any of the following commands to configure the close-notify parameter and verify the configuration:

1. To configure the close-notify parameter at the virtual server level, type:

```

1 set ssl vserver <vServerName> -sendCloseNotify ( YES | NO )
2 show ssl vserver <vServerName>
3 <!--NeedCopy-->

```

1. To configure the close-notify parameter at the service level, type:

```

1 set ssl service <serviceName> -sendCloseNotify ( YES | NO )
2 show ssl service <serviceName>
3 <!--NeedCopy-->

```

1. To configure the close-notify parameter at the service group level, type:

```

1 set ssl serviceGroup <serviceGroupName> -sendCloseNotify ( YES | NO )
2 show ssl serviceGroup <serviceGroupName>
3 <!--NeedCopy-->

```

#### Example:

```

1 set ssl vserver sslsvr -sendCloseNotify YES
2
3 Done
4 <!--NeedCopy-->

```

#### Configure a close-notify parameter at the entity level by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the **SSL Parameters** section, select **Send Close-Notify**.

#### Global SSL parameters

Advanced customization of your SSL configuration addresses specific issues. You can use the `set ssl parameter` command or the configuration utility to specify the following:

- Quantum size to be used for SSL transactions.
- CRL memory size.
- OCSP cache size.
- Deny SSL renegotiation.
- Set the PUSH flag for decrypted, encrypted, or all records.
- Drop requests if the client initiates the handshake for one domain and sends an HTTP request for another domain.
- Set the time after which encryption is triggered.

Note: The time that you specify applies only if you use the

`set ssl vserver` command or the configuration utility to set timer-based encryption.

## Configure global SSL parameters by using the CLI

At the command prompt, type the following commands to configure advanced SSL settings and verify the configuration:

```

1 set ssl parameter [-quantumSize <quantumSize>] [-crlMemorySizeMB <
  positive_integer>] [-strictCAChecks (YES | NO)] [-sslTriggerTimeout <
  positive_integer>] [-sendCloseNotify (YES | NO)] [-
  encryptTriggerPktCount <positive_integer>] [-denySSLReneg <
  denySSLReneg>] [-insertionEncoding (Unicode|UTF-8)] [-ocspCacheSize <
  positive_integer>] [- pushFlag <positive_integer>] [-
  dropReqWithNoHostHeader (YES | NO)] [-pushEncTriggerTimeout <
  positive_integer>]
2 show ssl parameter
3 <!--NeedCopy-->

```

### Example:

```

1 set ssl parameter -quantumSize 8 -crlMemorySizeMB 256 -strictCAChecks
  no -sslt
2 iggerTimeout 100 -sendClosenotify no -encryptTriggerPktCount 45 -
  denySSLReneg no
3 -insertionEncoding unicode -ocspCacheSize 10 -pushFlag 3 -
  dropReqWithNoHostHeader YES -pushEncTriggerTimeout 100 ms
4 Done
5
6 show ssl parameter
7 Advanced SSL Parameters
8 -----
9      SSL quantum size:                8 kB
10     Max CRL memory size:             256 MB
11     Strict CA checks:                 NO
12     Encryption trigger timeout       100 mS
13     Send Close-Notify                 NO
14     Encryption trigger packet count:  45
15     Deny SSL Renegotiation           NO
16     Subject/Issuer Name Insertion Format: Unicode
17     OCSP cache size:                 10 MB
18     Push flag:                        0x3 (On every decrypted and encrypted record
19                                     )
20                                     Strict Host Header check for SNI
21                                     enabled SSL sessions:           YES
22                                     PUSH encryption trigger timeout 100 ms
21 Done
22 <!--NeedCopy-->

```

## Configure global SSL parameters by using the GUI

Navigate to **Traffic Management > SSL** and, in the Settings group, select **Change advanced SSL** settings.

## PUSH flag based encryption trigger mechanism

The encryption trigger mechanism that is based on the PSH TCP flag now enables you to do the following:

- Merge consecutive packets in which the PSH flag is set into a single SSL record, or ignore the PSH flag.
- Perform timer-based encryption, in which the time-out value is set globally by using the `set ssl parameter -pushEncTriggerTimeout <positive_integer>` command.

## Configure PUSH flag-based encryption by using the CLI

At the command prompt, type the following commands to configure PUSH flag-based encryption and verify the configuration:

```
1 set ssl vserver <vServerName> [-pushEncTrigger <pushEncTrigger>]
2
3 show ssl vserver
4 <!--NeedCopy-->
```

## Example:

```
1 set ssl vserver vserver1 -pushEncTrigger always
2
3 Done
4
5 sh ssl vserver vserver1
6
7         Advanced SSL configuration for VServer vserver1:
8         DH: DISABLED
9         DH Private-Key Exponent Size Limit: DISABLED      Ephemeral
        RSA: ENABLED
                                Refresh Count: 0
10         Session Reuse: ENABLED          Timeout: 120 seconds
11         Cipher Redirect: DISABLED
12         SSLv2 Redirect: DISABLED
13         ClearText Port: 0
14         Client Auth: DISABLED
15         SSL Redirect: DISABLED
```

```

16         Non FIPS Ciphers: DISABLED
17         SNI: DISABLED
18         OCSP Stapling: DISABLED
19         HSTS: DISABLED
20         HSTS IncludeSubDomains: NO
21         HSTS Max-Age: 0
22         SSLv2: DISABLED  SSLv3: ENABLED  TLSv1.0: ENABLED  TLSv1.1:
23         ENABLED  TLSv1.2: ENABLED  TLSv1.3: DISABLED

25         Send Close-Notify: YES
26         Strict Sig-Digest Check: DISABLED
27         Zero RTT Early Data: DISABLED
28         DHE Key Exchange With PSK: NO
29         Tickets Per Authentication Context: 1
30         ECC Curve: P_256, P_384, P_224, P_521
31     1)     Cipher Name: DEFAULT
32           Description: Default cipher list with encryption strength
33           >= 128bit
34 Done
35 <!--NeedCopy-->

```

### Configure PUSH flag-based encryption by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual servers** and open an SSL virtual server.
2. In the **SSL Parameters** section, from the **PUSH Encryption Trigger** list, select a value.

### Support for TLS1.2 signature hash algorithm

The Citrix ADC appliance is completely TLS1.2 signature hash extension compliant.

In an SSL handshake, a client sends a list of supported signature hash (`sighash`) algorithms. The client uses the “signature\_algorithms” extension to indicate to the server which `sighash` algorithm pairs might be used in the SSL handshake messages (SKE and CCV). The “extension\_data” field of this extension contains a “supported\_signature\_algorithms” value in the Client Hello message. The SSL handshake proceeds if the server supports one of these `sighash` algorithms. If the server does not support any of these algorithms, the connection is dropped.

Similarly, if the server requests a client certificate for client authentication, the Certificate Request message contains a “supported\_signature\_algorithms” value. The client certificate is selected based on this `sighash` algorithm.

**Note:**

The Citrix ADC appliance acts as a server to a client and as a client to the back-end server.

Previously, the appliance supported only RSA-SHA1 and RSA-SHA256 on the front end, and RSA-MD5, RSA-SHA1, and RSA-SHA256 on the back end. In addition, the VPX appliance supported DSA-SHA1 on the front end and back end.

The MPX/SDX/VPX appliance supports the following `sighash` combinations. On an SDX appliance, if an SSL chip is assigned to a VPX instance, the cipher support of an MPX appliance applies. Otherwise, the normal cipher support of a VPX instance applies.

- On a VPX instance:
  - RSA-MD5
  - RSA-SHA1
  - RSA-SHA224
  - RSA-SHA256
  - RSA-SHA384
  - RSA-SHA512
  - DSA-SHA1
  - DSA-SHA224
  - DSA-SHA256
  - DSA-SHA384
  - DSA-SHA512
- On an MPX/SDX appliance with N3 chips:
  - RSA-MD5
  - RSA-SHA1
  - RSA-SHA224
  - RSA-SHA256
  - RSA-SHA384
  - RSA-SHA512
  - ECDSA-SHA1
  - ECDSA-SHA224
  - ECDSA-SHA256
  - ECDSA-SHA384
  - ECDSA-SHA512
- On an MPX/SDX appliance without N3 chips:
  - RSA-MD5
  - RSA-SHA1
  - RSA-SHA224
  - RSA-SHA256
  - RSA-SHA384

## - RSA-SHA512

By default, all the `sighash` algorithms are enabled. However, you can enable only a few `sighash` algorithms by using the following command:

```
1 set ssl parameter -sigDigestType <sigDigestType>
2
3 Parameters
4
5 sigDigestType
6
7 Signature digest algorithms supported by the appliance. The platform
  determines the list of algorithms supported by default.
8
9      On VPX: RSA-MD5 RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384
10     RSA-
11     SHA512 DSA-SHA1 DSA-SHA224 DSA-SHA256 DSA-SHA384 DSA-
12     SHA512
13     On MPX with N3 cards: RSA-MD5 RSA-SHA1 RSA-SHA224 RSA-
14     SHA256 RSA-SHA384 RSA-SHA512 ECDSA-SHA1 ECDSA-SHA224
15     ECDSA-
16     SHA256 ECDSA-SHA384 ECDSA-SHA512
17
18     Other MPX Platforms: RSA-MD5 RSA-SHA1 RSA-SHA224 RSA-
19     SHA256 RSA-SHA384 RSA-
20     SHA512.
21
22
23     set ssl parameter -sigDigestType RSA-SHA224 RSA-SHA256 RSA-SHA384
24     RSA-SHA512
25 <!--NeedCopy-->
```

### Validate the peer certificate

According to RFC 5246, the peer certificate must be signed using one of the `sighash` algorithms included in the Client Hello extension. To do so, use the `strictSigDigestCheck` parameter. Depending on the `sighash` list sent by the client, if you enable `strictSigDigestCheck`, the appliance returns a certificate signed by one of the `sighash` algorithms mentioned in the Client Hello extension. If the peer does not have a proper certificate, the connection is dropped. If this parameter is disabled, `sighash` is not checked in the peer certificate.

You can configure a strict signature digest check on an SSL virtual server and service. If you enable this parameter on an SSL virtual server, the server certificate sent by the server must be signed by one of the `sighash` algorithms listed in the Client Hello extension. If client authentication is enabled, then the client certificate received by the server must be signed using one of the `sighash` algorithms listed in the certificate request sent by the server.

If you enable this parameter on an SSL service, the server certificate received by the client must be signed by one of the `sighash` algorithms listed in the Client Hello extension. The client certificate must be signed using one of the `sighash` algorithms listed in the certificate request message.

If the default profile is enabled, you can use it to configure a strict signature digest check on an SSL virtual server, SSL service, and SSL profile.

### Configure strict signature digest check on an SSL virtual server, service, or profile by using the CLI

At the command prompt, type:

```
1 set ssl vserver <vServerName> -strictSigDigestCheck ( ENABLED |
   DISABLED )
2
3 set ssl service <serviceName> -strictSigDigestCheck ( ENABLED |
   DISABLED )
4
5 set ssl profile <name>-strictSigDigestCheck ( ENABLED | DISABLED )
6
7 Parameters
8
9 strictSigDigestCheck
10
11     Check whether peer entity certificate is signed using one
   of the signature-hash algorithms supported by the Citrix ADC
   appliance.
12
13     Possible values: ENABLED, DISABLED
14
15     Default: DISABLED
16 <!--NeedCopy-->
```

#### Example:

```
1 set ssl vserver v1 - strictSigDigestCheck Enabled
2 set ssl service s1 - strictSigDigestCheck Enabled
3 set ssl profile p1 - strictSigDigestCheck Enabled
4 <!--NeedCopy-->
```

**Important:**

If DH, ECDHE, or ECDSA ciphers are configured on the appliance, the SKE message must be signed using one of the `sighash` common to the client list and the list configured on the appliance. If there is no common `sighash`, the connection is dropped.

## TLSv1.3 protocol support as defined in RFC 8446

September 21, 2020

The Citrix ADC VPX and Citrix ADC MPX appliances now support the TLSv1.3 protocol, specified in RFC 8446.

**Notes:**

- Software-only support for TLSv1.3 protocol is available on all Citrix ADC MPX appliances except Citrix ADC FIPS appliances.
- TLSv1.3 is only supported with the enhanced profile. To enable the enhanced profile, see [Enable the enhanced profile](#).
- To use TLS1.3, you must use a client that conforms to the RFC 8446 specification.

### Supported Citrix ADC features

The following SSL features are supported:

1. TLSv1.3 cipher suites:
  - TLS1.3-AES256-GCM-SHA384 (0x1302)
  - TLS1.3\_CHACHA20\_POLY1305\_SHA256 (0x1303) (supported only on VPX, and VPX instance on SDX without SSL chip assigned)
  - TLS1.3-AES128\_GCM-SHA256 (0x1301)
2. ECC curves for ephemeral Diffie-Hellman key exchange:
  - P\_256
  - P\_384
  - P\_521
3. Abbreviated handshakes when ticket-based session resumption is enabled
4. 0-RTT early application data
5. Optional or mandatory certificate-based client authentication, with support for OCSP and/or CRL validation of client certificates

6. Server name extension: server certificate selection by using SNI
7. Application protocol negotiation (ALPN) by using the `application_level_protocol_negotiation` extension.
8. OCSP stapling
9. Log messages and AppFlow records are produced for TLSv1.3 handshakes.
10. Optional logging of TLS 1.3 traffic secrets by the `nstrace` packet capture utility.
11. Interoperability with TLS clients implementing RFC 8446. For example, Mozilla Firefox, Google Chrome, and OpenSSL.

## Configuration

TLSv1.3 is disabled by default on an SSL profile.

### Add an SSL profile by using the CLI

At the command prompt, type:

```
1 add ssl profile <tls13-profile-name>
2 <!--NeedCopy-->
```

### Example:

```
1 add ssl profile tls13profile
2
3 sh ssl profile tls13profile
4 1) Name: tls13profile          (Front-End)
5   SSLv3: DISABLED            TLSv1.0: ENABLED  TLSv1.1: ENABLED
6   TLSv1.2: ENABLED  TLSv1.3: DISABLED
7   Client Auth: DISABLED
8   Use only bound CA certificates: DISABLED
9   Strict CA checks: NO
10  Session Reuse: ENABLED          Timeout: 120 seconds
11  DH: DISABLED
12  DH Private-Key Exponent Size Limit: DISABLED  Ephemeral RSA:
13     ENABLED                      Refresh Count: 0
14  Deny SSL Renegotiation          ALL
15  Non FIPS Ciphers: DISABLED
16  Cipher Redirect: DISABLED
17  SSL Redirect: DISABLED
18  Send Close-Notify: YES
19  Strict Sig-Digest Check: DISABLED
```

```

18 Zero RTT Early Data: DISABLED
19 DHE Key Exchange With PSK: NO
20 Tickets Per Authentication Context: 1
21 Push Encryption Trigger: Always
22 PUSH encryption trigger timeout: 1 ms
23 SNI: DISABLED
24 OCSP Stapling: DISABLED
25 Strict Host Header check for SNI enabled SSL sessions: NO
26 Push flag: 0x0 (Auto)
27 SSL quantum size: 8 kB
28 Encryption trigger timeout 100 mS
29 Encryption trigger packet count: 45
30 Subject/Issuer Name Insertion Format: Unicode
31
32 SSL Interception: DISABLED
33 SSL Interception OCSP Check: ENABLED
34 SSL Interception End to End Renegotiation: ENABLED
35 SSL Interception Maximum Reuse Sessions per Server: 10
36 Session Ticket: DISABLED
37 HSTS: DISABLED
38 HSTS IncludeSubDomains: NO
39 HSTS Max-Age: 0
40
41 ECC Curve: P_256, P_384, P_224, P_521
42
43 1) Cipher Name: DEFAULT Priority :1
44 Description: Predefined Cipher Alias
45 Done
46 <!--NeedCopy-->

```

### Bind an SSL profile to an SSL virtual server by using the CLI

At the command prompt, type:

```

1 set ssl vserver <vServerName> -sslProfile <tls13-profile-name>
2 <!--NeedCopy-->

```

#### Example:

```
set ssl vserver ssl-vs -sslProfile tls13profile
```

### SSL profile parameters for TLSv1.3 protocol

1. Enable or disable TLS1.3 parameters in an SSL profile.

**tls13:** State of TLSv1.3 protocol support for the SSL profile.

Possible values: ENABLED, DISABLED

Default value: DISABLED

```
1 set ssl profile tls13profile -tls13 enable
2 <!--NeedCopy-->
```

```
1 set ssl profile tls13profile -tls13 disable
2 <!--NeedCopy-->
```

2. Set number of session tickets issued.

**tls13SessionTicketsPerAuthContext:** Number of tickets the SSL virtual server issues when TLS1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) client authentication completes after the handshake.

This value can be increased to enable clients to open multiple parallel connections using a fresh ticket for each connection.

No tickets are sent if resumption is disabled.

Default value: 1

Minimum value: 1

Maximum value: 10

```
1 set ssl profile tls13profile -tls13sessionTicketsPerAuthContext 1
2
3 set ssl profile tls13profile -tls13sessionTicketsPerAuthContext 10
4 <!--NeedCopy-->
```

3. Set DH key exchange

**dheKeyExchangeWithPsk:** Specifies whether an SSL virtual server requires a DHE key exchange to occur when a pre-shared key is accepted during a TLS 1.3 session resumption handshake. A DHE key exchange ensures forward secrecy, even if ticket keys are compromised, at the expense of extra resources required to carry out the **DHE** key exchange.

Available settings work as follows, if session ticket is enabled:

**YES:** DHE key exchange is required when a pre-shared key is accepted, regardless of whether the client supports the key exchange. The handshake is aborted with a fatal alert, if the client does not support DHE key exchange when offering a pre-shared key.

**NO:** DHE key exchange is performed when a pre-shared key is accepted, only if requested by the client.

Possible values: YES, NO

Default value: NO

```
1 set ssl profile tls13profile dheKeyExchangeWithPsk yes
2
3 set ssl profile tls13profile dheKeyExchangeWithPsk no
4 <!--NeedCopy-->
```

#### 4. Enable or disable 0-RTT early data acceptance

**zeroRttEarlyData:** State of TLS 1.3 early application data. Applicable settings work as follows:

**ENABLED:** Early application data might be processed before the handshake is complete.

**DISABLED:** Early application data is ignored.

Possible values: ENABLED, DISABLED

Default value: DISABLED

```
1 set ssl profile tls13profile -zeroRttEarlyData ENABLED
2
3 set ssl profile tls13profile -zeroRttEarlyData DISABLED
4 <!--NeedCopy-->
```

### Default cipher group

The default cipher group includes TLS1.3 ciphers.

```
1 sh cipher DEFAULT
2 1) Cipher Name: TLS1-AES-256-CBC-SHA      Priority : 1
3     Description: SSLv3 Kx=RSA      Au=RSA  Enc=AES(256)  Mac=SHA1
4     HexCode=0x0035
5
6 2) Cipher Name: TLS1-AES-128-CBC-SHA      Priority : 2
7     Description: SSLv3 Kx=RSA      Au=RSA  Enc=AES(128)  Mac=SHA1
8     HexCode=0x002f
9
10 ...
11 ...
12 27) Cipher Name: TLS1.3-AES256-GCM-SHA384      Priority : 27
13     Description: TLSv1.3 Kx=any      Au=any  Enc=AES-GCM(256) Mac=AEAD
14     HexCode=0x1302
15
16 28) Cipher Name: TLS1.3_CHACHA20_POLY1305_SHA256      Priority : 28
17     Description: TLSv1.3 Kx=any      Au=any  Enc=CHACHA20/POLY1305(256)
18     Mac=AEAD  HexCode=0x1303
19
20 29) Cipher Name: TLS1.3-AES128_GCM-SHA256      Priority : 29
21     Description: TLSv1.3 Kx=any      Au=any  Enc=AES-GCM(128) Mac=AEAD
22     HexCode=0x1301
```

```
17 Done
18 <!--NeedCopy-->
```

## Limitations

- On the Citrix ADC MPX platform, TLSv1.3 processing is not offloaded to crypto hardware.
- TLSv1.3 is not supported on the back end.
- TLSv1.3 is not supported on a Citrix Secure Web Gateway appliance and on a Citrix ADC FIPS appliance.
- This release provides limited protection against early data replay attacks when the virtual server is configured to accept early data. You can enable or disable this feature at configuration time.

## Operational considerations

**TLS 1.3 draft version compatibility note:** A Citrix ADC appliance implements the RFC 8446 variant of the TLS 1.3 protocol (as opposed to earlier draft versions of the protocol). Use a TLS 1.3 client that supports RFC 8446 (or an interoperable draft # - 26, 27 or 28) to complete a TLS 1.3 handshake with a Citrix ADC appliance. Clients and servers that implement different draft versions of the TLS 1.3 protocol might not interoperate with each other.

## Security restrictions

TLSv1.3 server operators must keep in mind the following security restrictions for backward compatibility outlined in RFC 8446. The default configuration on a NetScaler appliance is compliant with these restrictions. However, a NetScaler appliance does not enforce that these rules are adhered to.

- The security of RC4 cipher suites is considered insufficient as described in RFC7465. Implementations must not offer or negotiate RC4 cipher suites for any version of TLS.
- Old versions of TLS allowed the use of low strength ciphers. Ciphers with a strength less than 112 bits must not be offered or negotiated for any version of TLS.
- The security of SSL 3.0 [SSLv3] is considered insufficient as described in RFC7568, and must not be negotiated. Disable SSLv3 when TLSv1.3 is enabled (SSLv3 is disabled by default.)
- The security of SSL 2.0 [SSLv2] is considered insufficient as described in RFC6176, and must not be negotiated. Disable SSLv2 when TLS 1.3 is enabled (SSLv2 is disabled by default.)
- Application data sent in 0-RTT early data is susceptible to replay attacks.

### Note:

For information about troubleshooting protocols that run over TLS1.3, see [Decrypting TLS1.3](#)

[traffic from packet trace.](#)

## SSL certificates

September 21, 2020

An SSL certificate, which is an integral part of any SSL transaction, is a digital data form (X509) that identifies a company (domain) or an individual. The certificate has a public key component that is visible to any client that wants to initiate a secure transaction with the server. The corresponding private key, which resides securely on the Citrix ADC appliance, is used to complete asymmetric key (or public key) encryption and decryption.

You can obtain an SSL certificate and key in either of the following ways:

- From an authorized certificate authority (CA), such as Verisign
- By generating a new SSL certificate and key on the Citrix ADC appliance

Alternately, you can use an existing SSL certificate on the appliance.

### **Cautions:**

- Citrix recommends that you use certificates obtained from authorized CAs, such as Verisign, for all your SSL transactions. Use certificates generated on the Citrix ADC appliance for testing purposes only, not in any live deployment.
- If while adding a certificate-key pair, you add a certificate file with the same name as an existing certificate file but with different content, the original certificate file is overwritten with no warning. This might cause issues after the appliance is restarted because the original certificate file is no longer available in the `/nsconfig/ssl` directory.

## Create a certificate

December 22, 2020

A certificate authority (CA) is an entity that issues digital certificates for use in public key cryptography. Applications, such as web browsers, that conduct SSL transactions trust certificates issued or signed by a certificate authority. These applications maintain a list of the CAs that they trust. If any of the trusted CAs sign the certificate being used for the secure transaction, the application proceeds with the transaction.

**Caution:** Citrix recommends that you use certificates obtained from authorized CAs, such as Verisign, for all your SSL transactions. Use certificates generated on the Citrix ADC appliance for testing purposes only, not in any live deployment.

To obtain an SSL certificate from an authorized CA, you must create a private key. Use that key to create a certificate signing request (CSR), and submit the CSR to the certificate authority. The only

special characters allowed in the file names are underscore and dot.

To import an existing certificate and key, see [Import a Certificate](#).

Video link to [How do I create and install a new certificate](#).

## Create a private key

The private key is the most important part of a digital certificate. By definition, this key is not to be shared with anyone and must be kept securely on the Citrix ADC appliance. Any data encrypted with the public key can be decrypted only by using the private key.

The appliance supports two encryption algorithms, RSA and DSA, for creating private keys. You can submit either type of private key to the certificate authority. The certificate that you receive from the CA is valid only with the private key that was used to create the CSR. The key is required for adding the certificate to the Citrix ADC appliance.

**Caution:** Be sure to limit access to your private key. Anyone who has access to your private key can decrypt your SSL data.

### Note:

- From release 12.1 build 49.x, you can use the AES256 algorithm with PEM key format to encrypt a private key on the appliance. AES with 256-bit key is more mathematically efficient and secure compared to the 56-bit key of the Data Encryption Standard (DES).
- From release 12.1 build 50.x, you can create an RSA or DSA key in PKCS#8 format.

All SSL certificates and keys are stored in the `/nsconfig/ssl` folder on the appliance. For added security, you can use the DES or triple DES (3DES) algorithm to encrypt the private key stored on the appliance.

### Note:

The length of the SSL key name allowed includes the length of the absolute path name if the path is included in the key name.

## Create an RSA private key by using the CLI

At the command prompt, type:

```
1 create ssl rsakey <keyFile> <bits> [-exponent ( 3 | F4 )] [-keyform (
   DER | PEM )] [-des | -des3 | -aes256] {
2   -password }
3   [-pkcs8]
4 <!--NeedCopy-->
```

**Example:**

```
1 create rsakey testkey 2048 -aes256 -password 123456 -pkcs8
2 <!--NeedCopy-->
```

**Create an RSA private key by using the GUI**

Navigate to **Traffic Management > SSL** and, in the **SSL Keys** group, select **Create RSA Key**, and create an RSA key.

**Select the AES256 encoding algorithm in an RSA key by using the GUI**

1. Navigate to **Traffic Management > SSL > SSL Files > Create RSA Key**.
2. In **Key Format**, select **PEM**.
3. In **PEM Encoding Algorithm**, select **AES256**.
4. Select **PKCS8**.

**Create a DSA private key by using the CLI**

At the command prompt, type:

```
1 create ssl dsakey <keyfile> <bits> [-keyform (DER | PEM)] [-pkcs8]
2 <!--NeedCopy-->
```

**Example:**

```
1 create ssl dsakey Key-DSA-1 2048 -keyform PEM
2 <!--NeedCopy-->
```

**Create a DSA private key by using the GUI**

1. Navigate to **Traffic Management > SSL** and, in the **SSL Keys** group, select **Create DSA Key**, and create a DSA key.
2. To create a key in PKCS#8 format, select **PKCS8**.

**Support for SHA 256 digest algorithm in a certificate signing request**

The certificate signing request (CSR) is a collection of information. It includes the domain name, other important company details, and the public key to be used to create the certificate. To avoid generating an invalid certificate, make sure that the details you provide are accurate.

The Citrix ADC appliance supports creating a CSR signed with the SHA1 digest algorithm by default. In earlier releases, to create a CSR signed with the SHA256 digest algorithm, you had to use OpenSSL.

The appliance supports creating a CSR signed with the SHA256 digest algorithm. The encryption hash algorithm used in SHA256 makes it stronger than SHA1.

### Create a certificate signing request by using the CLI

At the command prompt, type:

```
1 create ssl certreq <reqFile> -keyFile <input_filename> | -fipsKeyName <
  string>) [-keyForm (DER | PEM) {
2   -PEMPassPhrase  }
3   ] -countryName <string> -stateName <string> -organizationName <string>
    -organizationUnitName <string> -localityName <string> -commonName
    <string> -emailAddress <string> {
4   -challengePassword  }
5   -companyName <string> -digestMethod ( SHA1 | SHA256 )
6 <!--NeedCopy-->
```

#### Example:

```
1 create ssl certreq priv_csr_sha256 -keyfile priv_2048_2 -keyform PEM -
  countryName IN -stateName Karnataka -localityName Bangalore -
  organizationName Citrix -organizationUnitName NS -digestMethod
  SHA256
2 <!--NeedCopy-->
```

### Create a certificate signing request by using the GUI

1. Navigate to **Traffic Management > SSL**.
2. In **SSL Certificate**, click **Create Certificate Signing Request (CSR)**.
3. In **Digest Method**, select **SHA256**.

### Support for subject alternative name in a certificate signing request

The subject alternative name (SAN) field in a certificate allows you to associate multiple values, such as domain names and IP addresses, with a single certificate. In other words, you can secure multiple domains, such as www.example.com, www.example1.com, www.example2.com, with a single certificate.

Some browsers, such as Google Chrome, no longer support a common name in a certificate signing request (CSR). They enforce SAN in all publicly trusted certificates.

The Citrix ADC appliance supports adding SAN values when creating a CSR. You can send a CSR with a SAN entry to a certificate authority to obtain a signed certificate with the SAN entry. When the appliance receives a request, it checks for a matching domain name in the SAN entries in the server certificate. If a match is found, it sends the certificate to the client and completes the SSL handshake. You can use the CLI or the GUI to create a CSR with SAN values.

**Note:**

The Citrix ADC appliance processes only DNS based SAN values.

**Create a CSR with the subject alternative name by using the CLI**

```

1 create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
   <string>) [-subjectAltName <string>] [-keyform ( DER | PEM ) {
2 -PEMPassPhrase }
3 ] -countryName <string> -stateName <string> -organizationName <string>
   [-organizationUnitName <string>] [-localityName <string>] [-
   commonName <string>] [-emailAddress <string>] {
4 -challengePassword }
5 [-companyName <string>] [-digestMethod ( SHA1 | SHA256 )]
6 <!--NeedCopy-->

```

**Parameters:**

**subjectAltName:** The subject alternative name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called “Subject Alternative Names” (SAN). Names include:

1. IP addresses (Prefix with “IP:” Example: IP:198.51.10.5 IP:192.0.2.100)
2. DNS names (Prefix with “DNS:” Example: DNS:www.example.com DNS:www.example.org DNS:www.example.net)

On the CLI, enter values within quotation marks. Separate two values with a space. Quotation marks are not required in the GUI.

Maximum Length: 127

**Example:**

```

1 create certReq test1.csr -keyFile test1.ky -countryName IN -stateName
   Kar -organizationName citrix -commonName ctx.com -subjectAltName "
   DNS:*.example.com DNS:www.example.org DNS:www.example.net"
2 <!--NeedCopy-->

```

**Note:**

On a FIPS appliance, you must replace the key file name with the FIPS key name if you create the FIPS key directly on the appliance.

```
1 create certReq <csrname> -fipsKeyName fipskey.ky -countryName IN -
   stateName Kar -organizationName citrix -commonName ctx.com -
   subjectAltName "DNS:www.example.com DNS:www.example.org DNS:www.
   example.net"
2 <!--NeedCopy-->
```

**Create a CSR by using the GUI**

1. Navigate to **Traffic Management > SSL > SSL Files**.
2. In the **CSR** tab, click **Create Certificate Signing Request (CSR)**.
3. Enter the values and click **Create**.

**Limitations**

To use SAN when creating an SSL certificate, you must explicitly specify the SAN values. The values are not read automatically from the CSR file.

**Submit the CSR to the CA**

Most CAs accept certificate submissions by email. The CA returns a valid certificate to the email address from which you submit the CSR.

The CSR is stored in the `/nsconfig/ssl` folder.

**Generate a test certificate****Note:**

To generate a server test certificate, see [Generating a Server Test Certificate](#).

The Citrix ADC appliance has a built-in CA tools suite that you can use to create self-signed certificates for testing purposes.

**Caution:** Because the Citrix ADC appliance signs these certificates, and not an actual CA, you must not use them in a production environment. If you attempt to use a self-signed certificate in a production environment, users receive a “certificate invalid” warning each time the virtual server is accessed.

The appliance supports creation of the following types of certificates

- Root-CA certificates

- Intermediate-CA certificates
- End-user certificates
  - server certificates
  - client certificates

Before generating a certificate, create a private key and use that to create a certificate signing request (CSR) on the appliance. Then, instead of sending the CSR out to a CA, use the Citrix ADC CA Tools to generate a certificate.

### Create a certificate by using a wizard

1. Navigate to **Traffic Management > SSL**.
2. In the details pane, under Getting Started, select the wizard for the type of certificate that you want to create.
3. Follow the instructions on the screen.

### Create a root-CA certificate by using the CLI

At the command prompt, type the following command:

```
1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
    input_filename>] [-keyform ( DER | PEM )] [-days <positive_integer>]
2 <!--NeedCopy-->
```

In the following example, csreq1 is the CSR and rsa1 is the private key that was created earlier.

#### Example:

```
1 create ssl cert cert1 csreq1 ROOT_CERT -keyFile rsa1 -keyForm PEM -days
    365
2
3 Done
4 <!--NeedCopy-->
```

### Create an intermediate-CA certificate by using the CLI

```
1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
    input_filename>] [-keyform ( DER | PEM )] [-days <positive_integer>]
    [-certForm ( DER | PEM )] [-CAcert <input_filename>] [-CAcertForm (
    DER | PEM )] [-CAkey <input_filename>] [-CAkeyForm ( DER | PEM )]
    [-CAserial <output_filename>]
2 <!--NeedCopy-->
```

In the following example, `csr1` is the CSR created earlier. `cert1` and `rsakey1` are the certificate and corresponding key of the self-signed (root-CA) certificate, and `pvtkey1` is the private key of the intermediate-CA certificate.

**Example:**

```
1 create ssl cert certsy csr1 INTM_CERT -CAcert cert1 -CAkey rsakey1 -
   CAserial 23
2 Done
3
4 create ssl rsakey pvtkey1 2048 -exponent F4 -keyform PEM
5 Done
6 <!--NeedCopy-->
```

**Create a root-CA certificate by using the GUI**

Navigate to **Traffic Management > SSL** and, in the Getting Started group, select **Root-CA Certificate Wizard**, and configure a root CA certificate.

**Create an intermediate-CA certificate by using the GUI**

Navigate to **Traffic Management > SSL** and, in the Getting Started group, select **Intermediate-CA Certificate Wizard**, and configure an intermediate CA certificate.

**Create an end-user certificate**

An end-user certificate can be a client certificate or a server certificate. To create a test end-user certificate, specify the Intermediate CA certificate or the self-signed root-CA certificate.

**Note:**

To create an end-user certificate for production use, specify a trusted CA certificate and send the CSR to a certificate authority (CA).

**Create a test end-user certificate by using the command line interface**

```
1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
   input_filename>] [-keyform ( DER | PEM )] [-days<positive_integer>]
   [-certForm ( DER | PEM )] [-CAcert <input_filename>] [-CAcertForm (
   DER | PEM )] [-CAkey<input_filename>] [-CAkeyForm ( DER | PEM )] [-
   CAserial <output_filename>]
2 <!--NeedCopy-->
```

If there is no intermediate certificate, use the certificate (cert1) and private key (rsakey1) values of the root-CA certificate in `CAcert` and `CAkey`.

**Example:**

```
1 create ssl cert cert12 csr1 SRVR_CERT -CAcert cert1 -CAkey rsakey1 -
   CAserial 23
2
3 Done
4 <!--NeedCopy-->
```

If there is an intermediate certificate, use the certificate (certsy) and private key (pvtkey1) values of the intermediate certificate in `CAcert` and `CAkey`.

**Example:**

```
1 create ssl cert cert12 csr1 SRVR_CERT -CAcert certsy -CAkey pvtkey1 -
   CAserial 23
2
3 Done
4 <!--NeedCopy-->
```

## Install, link, and update certificates

December 22, 2020

To install a certificate, see [Add or update a certificate-key pair](#).

### Link certificates

Many server certificates are signed by multiple hierarchical Certificate Authorities (CAs), which means that the certificates form a chain like the following:

```
Root CA
|
+----- Intermediate CA
|
+----- End-Entity (Server) Certificate
```

Sometimes, the Intermediate CA is split into a primary and secondary intermediate certificate authority. Then the certificates form a chain like the following:

```
Root CA
|
+----- Primary Intermediate CA
|+----- Secondary Intermediate CA
|
+----- End-Entity (Server) Certificate
```

Client machines usually contain the root CA certificate in their local certificate store, but not one or more the intermediate CA certificates. The ADC appliance must send one or more intermediate CA certificates to the clients.

**Note:** The appliance must not send the root CA certificate to the client. The Public Key Infrastructure (PKI) trust relationship model requires root CA certificates to be installed on clients through an out-of-band method. For example, the certificates are included with the operating system or web browser. The client ignores a root CA certificate sent by the appliance.

Sometimes, an intermediate CA that standard web browsers do not recognize as a trusted CA, issues the server certificate. In this case, one or more CA certificates must be sent to the client with the server's own certificate. Otherwise, the browser terminates the SSL session because it fails to authenticate the server certificate.

Video link to [How do I link an intermediate authority certificate.](#)

There are two ways to add the server and intermediate certificates:

- Create a certificate set that contains the chain of certificates.
- Create a chain of certificates manually by adding and linking the certificates individually.

### Add and link a certificate set

**Note:** This feature is not supported on the Citrix ADC FIPS platform and in a cluster setup.

Instead of adding and linking individual certificates, you can now group a server certificate and up to nine intermediate certificates in a single file. You can specify the file's name when adding a certificate-key pair. Before you do so, make sure that the following prerequisites are met.

- The certificates in the file are in the following order:
  - Server certificate (must be the first certificate in the file)
  - Optionally, a server key

- Intermediate certificate 1 (ic1)
- Intermediate certificate 2 (ic2)
- Intermediate certificate 3 (ic3), and so on

Note: Intermediate certificate files are created for each intermediate certificate with the name “<certificatebundlename>.pem\_ic<n>” where n is between 1 and 9. For example, bundle.pem\_ic1, where bundle is the name of the certificate set and ic1 is the first intermediate certificate in the set.

- Bundle option is selected.
- No more than nine intermediate certificates are present in the file.

The file is parsed and the server certificate, intermediate certificates, and server key (if present) are identified. First, the server certificate and key are added. Then, the intermediate certificates are added, in the order in which they were added to the file, and linked accordingly.

An error is reported if any of the following conditions exist:

- A certificate file for one of the intermediate certificates exists on the appliance.
- The key is placed before the server certificate in the file.
- An intermediate certificate is placed before the server certificate.
- Intermediate certificates are not placed in the file in the same order as they are created.
- No certificates are present in the file.
- A certificate is not in the proper PEM format.
- The number of intermediate certificates in the file exceeds nine.

### **Add a certificate set by using the CLI**

At the command prompt, type the following commands to create a certificate set and verify the configuration:

```
1 add ssl certKey <certkeyName> -cert <string> -key <string> -bundle (YES
  | NO)
2
3 show ssl certKey
4
5 show ssl certlink
6 <!--NeedCopy-->
```

In the following example, the certificate set (bundle.pem) contains the following files:

Server certificate (bundle) linked to bundle\_ic1

First intermediate certificate (bundle\_ic1) linked to bundle\_ic2

Second intermediate certificate (bundle\_ic2) linked to bundle\_ic3

Third intermediate certificate (bundle\_ic3)

```
1 add ssl certKey bundletest -cert bundle9.pem -key bundle9.pem -bundle
  yes
2
3 sh ssl certkey

### Add a certificate set by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. In the details pane, click **Install**.
3. In the **Install Certificate** dialog box, type the details, such as the certificate and key file name, and then select **Certificate Bundle**.
4. Click **Install**, and then click **Close**.

### Create a chain of certificates

Instead of using a set of certificates (a single file), you can create a chain of certificates. The chain links the server certificate to its issuer (the intermediate CA). This approach requires that the intermediate CA certificate file is installed on the ADC appliance, and the client application must trust one of the certificates in the chain. For example, link Cert-Intermediate-A to Cert-Intermediate-B, where Cert-Intermediate-B is linked to Cert-Intermediate-C, which is a certificate trusted by the client application.

**Note:** The appliance supports sending a maximum of 10 certificates in the chain of certificates sent to the client (one server certificate and nine CA certificates).

### Create a certificate chain by using the CLI

At the command prompt, type the following commands to create a certificate chain and verify the configuration. (Repeat the first command for each new link in the chain.)

```
1 link ssl certkey <certKeyName> <linkCertKeyName>
```

```
2 show ssl certlink
3 <!--NeedCopy-->
```

**Example:**

```
1 link ssl certkey siteAcertkey CAcertkey
2 Done
3
4 show ssl certlink
5
6 linked certificate:
7     1) Cert Name: siteAcertkey CA Cert Name: CAcertkey
8 Done
9 <!--NeedCopy-->
```

**Create a certificate chain by using the GUI**

1. Navigate to **Traffic Management > SSL > Certificates**.
2. Select a server certificate, and in the **Action** list, select **Link**, and specify a CA certificate name.

**Update an existing server certificate**

To change an existing server certificate manually, you must perform the following steps:

1. Unbind the old certificate from the virtual server.
2. Remove the certificate from the appliance.
3. Add the new certificate to the appliance.
4. Bind the new certificate to the virtual server.

To reduce downtime when replacing a certificate-key pair, you can update an existing certificate. If you want to replace a certificate with a certificate that was issued to a different domain, you must disable domain checks before updating the certificate.

To receive notifications about certificates due to expire, you can enable the expiry monitor.

When you remove or unbind a certificate from a configured SSL virtual server or service, the virtual server or service becomes inactive. They are active after a new valid certificate is bound to them. To reduce downtime, you can use the update feature to replace a certificate-key pair that is bound to an SSL virtual server or an SSL service.

Overview diagram of how to update an SSL certificate on the Citrix ADC appliance.

Video link to [How do I update an existing certificate.](#)

### Update an existing certificate-key pair by using the CLI

At the command prompt, type the following commands to update an existing certificate-key pair and verify the configuration:

```
1 update ssl certkey <certkeyName> -cert <string> -key <string>
2
3 show ssl certKey <certkeyName>
4 <!--NeedCopy-->
```

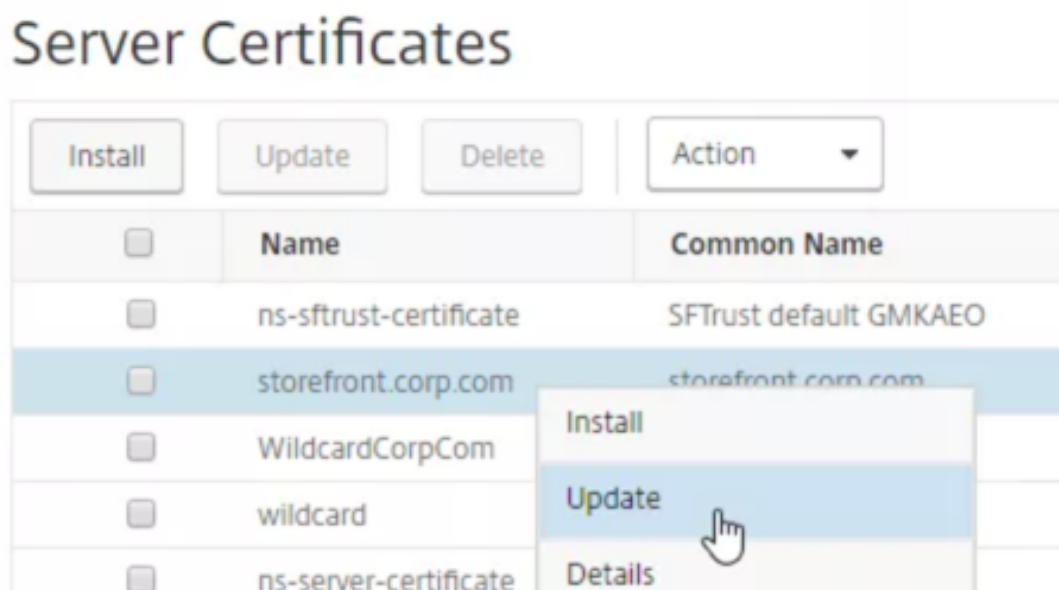

### Example:

```
1 update ssl certkey siteAcertkey -cert /nsconfig/ssl/cert.pem -key /
   nsconfig/ssl/pkey.pem
2
3 Done
4
5 show ssl certkey siteAcertkey
6
7 Name: siteAcertkey      Status: Valid
8     Version: 3
9     Serial Number: 02
10    Signature Algorithm: md5WithRSAEncryption
11    Issuer: /C=US/ST=CA/L=Santa Clara/O=siteA/OU=Tech
12    Validity
13        Not Before: Nov 11 14:58:18 2001 GMT
```

```
14           Not After: Aug 7 14:58:18 2004 GMT
15           Subject: /C=US/ST=CA/L=San Jose/O=CA/OU=Security
16           Public Key Algorithm: rsaEncryption
17           Public Key size: 2048
18 Done
19 <!--NeedCopy-->
```

### Update an existing certificate-key pair by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates > Server Certificates**.
2. Select the certificate that you want to update, and click **Update**.

3. Select **Update the certificate and key**.

7. After replacing the certificate, you might have to update the certificate link to a new intermediate certificate. For more information about updating an intermediate certificate without breaking the links, see [Update an intermediate certificate without breaking the links](#).
- Right-click the updated certificate, and click **Cert Links**, to see if it is linked to an intermediate certificate.
  - If the certificate is not linked, then right-click the updated certificate, and click **Link** to link it to an intermediate certificate. If you don't see an option to link, then you must first have to install a new intermediate certificate on the appliance under the **CA Certificates** node.

**Update an existing CA certificate**

The steps to update an existing CA certificate are the same as updating an existing server certificate. The only difference is that you do not need a key in the case of CA certificates.

## ← Update Certificate

Certificate-Key Pair Name

Update the certificate and key

Certificate File Name\*

No Domain Check

Notify When Expires

### Disable domain checks

When an SSL certificate is replaced on the appliance, the domain name mentioned on the new certificate must match the domain name of the certificate being replaced. For example, if you have a certificate issued to abc.com, and you are updating it with a certificate issued to def.com, the certificate update fails.

However, if you want the server that has been hosting a particular domain to now host a new domain, disable the domain check before updating its certificate.

### Disable the domain check for a certificate by using the CLI

At the command prompt, type the following commands to disable the domain check and verify the configuration:

```
1 update ssl certKey <certkeyName> -noDomainCheck
2
3 show ssl certKey <certkeyName>
4 <!--NeedCopy-->
```

### Example:

```
1 update ssl certKey sv -noDomainCheck
2
3 Done
4
5 show ssl certkey sv
6
7 Name: sv
8 Cert Path: /nsconfig/ssl/complete/server/server_rsa_512.pem
9 Key Path: /nsconfig/ssl/complete/server/server_rsa_512.ky
10 Format: PEM
11 Status: Valid, Days to expiration:9349
12 Certificate Expiry Monitor: DISABLED
13 Done
14 <!--NeedCopy-->
```

### Disable the domain check for a certificate by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates**, select a certificate, and click **Update**.
2. Select **No Domain Check**.

### Replace the default certificate of an ADC appliance with a trusted CA certificate that matches the host name of the appliance

The following procedure assumes that the default certificate (`ns-server-certificate`) is bound to the internal services.

1. Navigate to **Traffic Management > SSL > SSL Certificates > Create Certificate Request**.
2. In common name, type `test.citrixadc.com`.
3. Submit the CSR to a trusted certificate authority.
4. After receiving the certificate from the trusted CA, copy the file to the `/nsconfig/ssl` directory.
5. Navigate to **Traffic Management > SSL > Certificates > Server Certificates**.
6. Select the default server certificate (`ns-server-certificate`) and click **Update**.
7. In the **Update Certificate** dialog box, in **Certificate File Name**, browse to the certificate received from the CA after signing.
8. In the **Key File Name** field, specify the default private key file name (`ns-server.key`).
9. Select **No Domain Check**.
10. Click **OK**.

## Enable the expiry monitor

An SSL certificate is valid for a specific period. A typical deployment includes multiple virtual servers that process SSL transactions, and the certificates bound to them can expire at different times. An expiry monitor configured on the appliance creates entries in the appliance's syslog and ns audit logs when a certificate configured is due to expire.

If you want to create SNMP alerts for certificate expiration, you must configure them separately.

### Enable an expiry monitor for a certificate by using the CLI

At the command prompt, type the following commands to enable an expiry monitor for a certificate and verify the configuration:

```
1 set ssl certKey <certkeyName> [-expiryMonitor ( ENABLED | DISABLED ) [-
  notificationPeriod <positive_integer>]]
2
3 show ssl certKey <certkeyName>
4 <!--NeedCopy-->
```

#### Example:

```
1 set ssl certKey sv -expiryMonitor ENABLED - notificationPeriod 60
2 Done
3 <!--NeedCopy-->
```

### Enable an expiry monitor for a certificate by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates**, select a certificate, and click **Update**.
2. Select **Notify When Expires**, and optionally specify a notification period.

### Update an intermediate certificate without breaking the links

You can now update an intermediate certificate without breaking any existing links. The 'AuthorityKeyIdentifier' extension, in the linked certificate issued by the certificate to be replaced, must not contain an authority certificate serial number ('authorityCertSerialNumber') field. If the 'AuthorityKeyIdentifier' extension contains a serial number field, then the certificate serial numbers of the old and new certificate must be the same. You can update any number of certificates in the link, one at a time, if the preceding condition is met. Previously, the links broke if an intermediate certificate was updated.

For example, there are four certificates: *CertA*, *CertB*, *CertC*, and *CertD*. Certificate *CertA* is the issuer for *CertB*, *CertB* is the issuer for *CertC*, and so on. If you want to replace an intermediate

certificate `CertB` with `CertB_new`, without breaking the link, the following condition must be met:

The certificate serial number of `CertB` must match the certificate serial number of `CertB_new` if both of the following conditions are met:

- The `AuthorityKeyIdentifier` extension is present in `CertC`.
- This extension contains a serial number field.

If the common name in a certificate changes, while updating the certificate specify `nodomaincheck`.

In the preceding example, to change “www.example.com” in `CertD` to “\*.example.com”, select the ‘No Domain Check’ parameter.

### Update the certificate by using the CLI

At the command prompt, type:

```
1 update ssl certKey <certkeyName> -cert <string> [-password] -key <
  string> [-noDomainCheck]
2 <!--NeedCopy-->
```

#### Example:

```
1 update ssl certkey siteAcertkey -cert /nsconfig/ssl/cert.pem -key /
  nsconfig/ssl/pkey.pem -noDomainCheck
2 <!--NeedCopy-->
```

### Display a certificate chain

A certificate contains the name of the issuing authority and the subject to whom the certificate is issued. To validate a certificate, you must look at the issuer of that certificate and confirm if you trust the issuer. If you do not trust the issuer, you must see who issued the issuer certificate. Go up the chain until you reach the root CA certificate or an issuer that you trust.

As part of the SSL handshake, when a client requests a certificate, the appliance presents a certificate and the chain of issuer certificates present on the appliance. An administrator can view the certificate chain for the certificates present on the appliance and install any missing certificates.

### View the certificate chain for the certificates present on the appliance by using the CLI

At the command prompt, type:

```
1 show ssl certchain <cert_name>
2 <!--NeedCopy-->
```

**Examples**

There are 3 certificates: c1, c2, and c3. Certificate c3 is the root CA certificate and signs c2, and c2 signs c1. The following examples illustrate the output of the `show ssl certchain c1` command in different scenarios.

**Scenario 1:**

Certificate c2 is linked to c1, and c3 is linked to c2.

Certificate c3 is a root CA certificate.

If you run the following command, the certificate links up to the root CA certificate are displayed.

```
1 show ssl certchain c1
2
3 Certificate chain details of certificate name c1 are:
4     1) Certificate name: c2           linked; not a root
        certificate
5     2) Certificate name: c3           linked; root certificate
6 Done
7 <!--NeedCopy-->
```

**Scenario 2:**

Certificate c2 is linked to c1.

Certificate c2 is not a root CA certificate.

If you run the following command, the information that certificate c3 is a root CA certificate but is not linked to c2 is displayed.

```
1 show ssl certchain c1
2
3 Certificate chain details of certificate name c1 are:
4     1) Certificate Name: c2           linked; not a root
        certificate
5     2) Certificate Name: c3           not linked; root
        certificate
6 Done
7 <!--NeedCopy-->
```

**Scenario 3:**

Certificate c1, c2, and c3 are not linked but are present on the appliance.

If you run the following command, information about all the certificates starting with the issuer of certificate c1 is displayed. It is also specified that the certificates are not linked.

```
1 show ssl certchain c1
2
3 Certificate chain details of certificate name c1 are:
4     1) Certificate Name: c2             not linked; not a root
        certificate
5     2) Certificate Name: c3             not linked; root
        certificate
6     Done
7 <!--NeedCopy-->
```

**Scenario 4:**

Certificate c2 is linked to c1.

Certificate c3 is not present on the appliance.

If you run the following command, information about the certificate linked to c1 is displayed. You are prompted to add a certificate with the subject name specified in c2. In this case, the user is asked to add the root CA certificate c3.

```
1 show ssl certchain c1
2
3 Certificate chain details of certificate name c1 are:
4     1) Certificate Name: c2             linked; not a root
        certificate
5     2) Certificate Name: /C=IN/ST=ka/O=netScaler/CN=test
6         Action: Add a certificate with this subject name.
7     Done
8 <!--NeedCopy-->
```

**Scenario 5:**

A certificate is not linked to certificate c1 and the issuer certificate of c1 is not present on the appliance.

If you run the following command, you are prompted to add a certificate with the subject name in certificate c1.

```
1 sh ssl certchain c1
2
3 Certificate chain details of certificate name c1 are:
4     1) Certificate Name: /ST=KA/C=IN
5         Action: Add a certificate with this subject name.
6 <!--NeedCopy-->
```

## Generate a server test certificate

September 21, 2020

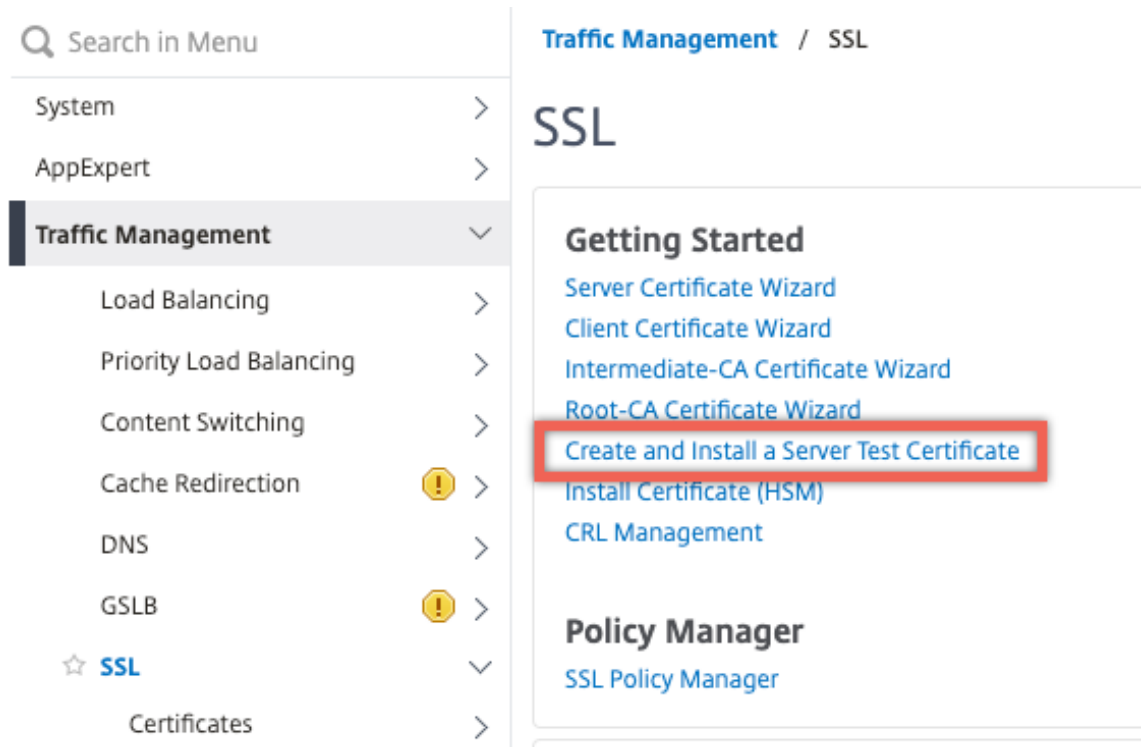

The Citrix ADC appliance allows you to create a test certificate for server authentication by using a GUI wizard in the configuration utility. A server certificate is used to authenticate and identify a server in an SSL handshake. Typically, a trusted CA issues a server certificate. The server sends the certificate to a client who uses it to authenticate the server.

For issuing a server test certificate, the appliance operates as a certificate authority. This certificate can be bound to an SSL virtual server for authentication in an SSL handshake with a client. This certificate is for testing purposes only. Do not use in a production environment.

You can install the server test certificate on any virtual server that uses the SSL or the SSL\_TCP protocol.

### Generate a server test certificate by using the GUI

1. Navigate to **Traffic Management > SSL** and, in the **SSL Certificates group**, select **Create and Install a Server Test Certificate**.

2. Enter details for the parameters and click **Create**.

## ← Create and Install Test Certificate

Certificate File Name\*

Fully Qualified Domain Name\*

Country\*

### Import and convert SSL files

September 21, 2020

You can now import SSL resources, such as certificates, private keys, CRLs, and DH keys, from remote hosts even if FTP access to these hosts is not available. This process is especially helpful in environments where shell access to the remote host is restricted. Default folders are created in `/nsconfig/ssl` as follows:

- For certificate files: `/nsconfig/ssl/certfile`
- For private keys: `/nsconfig/ssl/keyfile`
- For CRLs: `/var/netscaler/ssl/crlfile`
- For DH keys: `/nsconfig/ssl/dhfile`

Imports from both HTTP and HTTPS servers are supported. However, the import fails if the file is on an HTTPS server that requires client certificate authentication for access.

**Note:**

The import command is not stored in the configuration (`ns.conf`) file, because reimporting the

file after a restart might cause an error.

## Import a certificate file

You can use the CLI and GUI to import a file (resource) from a remote host.

### Import a certificate file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl certFile [<name>] [<src>]
2 <!--NeedCopy-->
```

#### Example:

```
1 import ssl certfile my-certfile http://www.example.com/file_1
2 <!--NeedCopy-->
```

```
1 show ssl certfile
2     Name : my-certfile
3     URL  : http://www.example.com/file_1
4 <!--NeedCopy-->
```

To remove a certificate file, use the `rm ssl certFile` command, which accepts only the 'name' argument.

### Import a key file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl keyFile [<name>] [<src>]
2 <!--NeedCopy-->
```

#### Example:

```
1 import ssl keyfile my-keyfile http://www.example.com/key_file
2 <!--NeedCopy-->
```

```
1 show ssl keyfile
2     Name : my-keyfile
3     URL  : http://www.example.com/key_file
4 <!--NeedCopy-->
```

To remove a key file, use the `rm ssl keyFile` command, which accepts only the 'name' argument.

### Import a CRL file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl crlFile [<name>] [<src>]
2 <!--NeedCopy-->
```

To remove a CRL file, use the `rm ssl crlFile` command, which accepts only the name argument.

#### Example:

```
1 import ssl crlfile my-crlfile http://www.example.com/crl_file
2
3 show ssl crlfile
4
5     Name : my-crlfile
6     URL  : http://www.example.com/crl_file
7 <!--NeedCopy-->
```

### Import a DH file from a remote host by using the CLI

At the command prompt, type:

```
1 import ssl dhFile [<name>] [<src>]
2 <!--NeedCopy-->
```

#### Example:

```
1 import ssl dhfile my-dhfile http://www.example.com/dh_file
2 show ssl dhfile
3     Name : my-dhfile
4     URL  : http://www.example.com/dh_file
5 <!--NeedCopy-->
```

To remove a DH file, use the `rm ssl dhFile` command, which accepts only the name argument.

### Import an SSL resource by using the GUI

Navigate to **Traffic Management > SSL > Imports**, and then select the appropriate tab.

### Import PKCS#8 and PKCS#12 certificates

If you want to use certificates and keys that you already have on other secure servers or applications in your network, export them. Then import them to the Citrix ADC appliance. You might have to convert exported certificates and keys before you can import them to the Citrix ADC appliance.

For information about exporting certificates from secure servers or applications in your network, see the documentation of the server or application from which you want to export.

**Note:**

For installation on the Citrix ADC appliance, key and certificate names cannot only contain spaces or special characters that are supported by the UNIX file system. Follow the appropriate naming convention when you save the exported key and certificate.

A certificate and private key pair is commonly sent in the PKCS#12 format. The appliance supports PEM and DER formats for certificates and keys. To convert PKCS#12 to PEM or DER, or PEM or DER to PKCS#12, see the “Convert SSL certificates for import or export” section later in this page.

The Citrix ADC appliance does not support PEM keys in PKCS#8 format. However, you can convert these keys to a supported format by using the OpenSSL interface, which you can access from the CLI or the configuration utility. Before you convert the key, you need to verify that the private key is in PKCS#8 format. Keys in PKCS#8 format typically start with the following text:

```
1 -----BEGIN ENCRYPTED PRIVATE KEY-----
2
3
4
5  euSSZQZKgrgUQ==
6
7
8
9 -----END ENCRYPTED PRIVATE KEY-----
10 <!--NeedCopy-->
```

**Open the OpenSSL interface from the CLI**

1. Open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance by using the administrator credentials.
3. At the command prompt, type **shell**.
4. At the shell prompt type **openssl**.

**Open the OpenSSL interface from the GUI**

Navigate to **Traffic Management > SSL** and, in the Tools group, select **OpenSSL interface**.

### Convert a non-supported PKCS#8 key format to an encrypted supported key format by using the OpenSSL interface

At the OpenSSL prompt, type one of the following commands, depending on whether the non-supported key format is of type RSA or DSA:

```
1 OpenSSL>rsa- in <PKCS#8 Key Filename> -des3 -out <encrypted Key
   Filename>
2
3 OpenSSL>dsa -in <PKCS#8 Key Filename> -des3 -out <encrypted Key
   Filename>
4 <!--NeedCopy-->
```

### Parameters for converting an unsupported key format to a supported key format

- **PKCS#8 Key Filename:** The input file name of the incompatible PKCS#8 private key.
- **encrypted Key Filename:** The output file name of the compatible encrypted private key in PEM format.
- **unencrypted Key Filename:** The output file name of the compatible unencrypted private key in PEM format.

### Convert SSL certificates for import or export

A Citrix ADC appliance supports the PEM and DER formats for SSL certificates. Other applications, such as client browsers and some external secure servers, require various public key cryptography standard (PKCS) formats. The Citrix ADC appliance can convert the PKCS#12 format to PEM or DER format for importing a certificate to the appliance. It can convert the PEM or DER format to PKCS#12 for exporting a certificate. For extra security, conversion of a file for import can include encryption of the private key with the DES or DES3 algorithm.

#### Note:

If you use the GUI to import a PKCS#12 certificate, and the password contains a dollar sign (\$), back quote (`), or escape () character, the import might fail. If it does, the ERROR: Invalid password message appears. If you must use a special character in the password, be sure to prefix it with an escape character () unless all imports are performed by using the CLI.

### Convert the format of a certificate by using the CLI

At the command prompt, type the following command:

---

```

1 convert ssl pkcs12 <outfile> [-import [-pkcs12File <inputFilename>] [-
  des | -des3] [-export [-certFile <inputFilename>] [-keyFile <
  inputFilename>]]
2 <!--NeedCopy-->

```

During the operation, you are prompted to enter an import password or an export password. For an encrypted file, you are also prompted to enter a passphrase.

### Example:

```

1 convert ssl pkcs12 Cert-Import-1.pem -import -pkcs12File Cert-Import-1.
  pfx -des
2
3 convert ssl pkcs12 Cert-Client-1.pfx -export -certFile Cert-Client-1 -
  keyFile Key-Client-1
4 <!--NeedCopy-->

```

## Convert the format of a certificate by using the GUI

1. Navigate to **Traffic Management > SSL** and, in the **Tools** group, select **Import PKCS#12**.

2. Specify the PEM certificate name in the **Output File Name** field.
3. Browse to the location of the PFX certificate on your local computer or the appliance.

## ← Import PKCS12 File

### SSL profiles

September 21, 2020

An SSL profile is a collection of settings for SSL entities. It offers ease of configuration and flexibility. Instead of configuring the settings on each entity, you can configure them in a profile and bind the profile to all the entities that the settings apply to.

The SSL profile infrastructure has been enhanced to use the latest ciphers and protocols. Differences between the legacy profile (old profile) and the enhanced SSL profile (new profile) are highlighted.

### Differences between the old and the new SSL profile infrastructure

| Differences                                                          | Old Profile                                                                  | New Profile                                                                                                                                                                                                                         |
|----------------------------------------------------------------------|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ciphers and ECC Curves included in the profile                       | No                                                                           | Yes                                                                                                                                                                                                                                 |
| Inserting a cipher or cipher group in the middle of an existing list | Unbind all the ciphers and bind again in the order of the required priority. | Add a cipher and assign it a priority. If a priority is not specified, the cipher is assigned the lowest priority in the list.                                                                                                      |
| Unbinding all the ciphers                                            | > unbind ssl vserver <name> ciphername -ALL                                  | unbind ssl profile -cipherName FlushAllCiphers (Release 11.0 build 64.x or later includes the FlushAllCiphers parameter for unbinding all the ciphers or cipher groups from a profile, because ALL is treated like a cipher group.) |
| State of SSLv3                                                       | n/a                                                                          | Disabled on the default front-end profile (ns_default_ssl_profile_frontend).<br>Note: Before you enable this profile, SSLv3 is enabled globally. After enabling the profile, SSLv3 is disabled on the front-end default profile.    |

## SSL profile infrastructure

September 21, 2020

Vulnerabilities in SSLv3 and RC4 implementation have emphasized the need to use the latest ciphers and protocols to negotiate the security settings for a network connection. Implementing any changes

to the configuration, such as disabling SSLv3 across thousands of SSL end points, is a cumbersome process. Therefore, settings that were part of the SSL end points configuration have been moved to the SSL profiles, along with the default ciphers. To implement changes in the configuration, including cipher support, you need only modify the profile that is bound to the entities.

The default SSL profiles (default front-end and default back-end) contain all the default ciphers and ECC curves, in addition to the settings that were part of the old profiles. Sample outputs for the default profiles are provided in the appendix. The Enable Default Profile operation automatically binds the default front-end profile to all front-end entities, and the default back-end profile to all back-end entities. You can modify a default profile to suit your deployment. You can also create custom profiles and bind them to SSL entities.

**Important:**

After the upgrade, if you enable the default profiles, you cannot undo the changes. That is, the profiles cannot be disabled. Save the configuration and create a copy of the configuration file (ns.conf) before enabling the profiles. However, if you do not want to use the features in the default profile, you can continue to use the old SSL profiles. For more information about these profiles, see [Legacy SSL profile](#).

From release 11.1 51.x, in the GUI and CLI, a confirmation prompt is added when you enable the default profile to avoid enabling it by mistake.

**Command:**

```
1 set ssl parameter -defaultProfile ENABLED
2     Save your configuration before enabling the Default profile. You
      cannot undo the changes. Are you sure you want to enable the
      Default profile? [Y/N]Y
3 Done
4 <!--NeedCopy-->
```

By default, some SSL parameters, called *global parameters*, apply to all the SSL end points. However, if a profile is bound to an SSL end point, the global parameters do not apply. The settings specified in the profile apply instead.

**Points to note**

1. A profile can be bound to multiple virtual servers, but a virtual server can have only one profile bound to it.
2. To delete a profile that is bound to a virtual server, first unbind the profile.
3. A cipher or cipher group can be bound to multiple profiles at different priorities.
4. A profile can have multiple ciphers and cipher groups bound at different priorities.

5. Changes to a cipher group are immediately reflected in all the profiles and in all the virtual servers that one of the profiles is bound to.
6. If a cipher suite is part of a cipher group, you cannot remove the cipher suite from the profile without first editing the cipher group to remove the specific cipher suite.
7. If you do not assign a priority to a cipher suite or cipher group that you attach to a profile, it is assigned the lowest priority within the profile.
8. You can create a custom cipher group (also called a user-defined cipher group) from existing cipher groups and cipher suites. If you create cipher group A and add existing cipher groups X and Y to it, in that order, cipher group Y is assigned at a lower priority than cipher group X. That is, the group that is added first has a higher priority.
9. If a cipher suite is already part of a cipher group that is attached to a profile, and the same cipher suite is part of another cipher group that is also attached to the same profile, the cipher suite is not added again as part of the second cipher group. The cipher suite at the higher priority is in effect when traffic is processed.
10. Cipher groups are not expanded in the profile. As a result, the number of lines in the configuration file (ns.conf) is greatly reduced. For example, if there are a thousand SSL virtual servers to which two cipher groups are bound, and each cipher group contains 15 ciphers, expansion would result in 30\*1000 entries related to ciphers in the configuration file. With the new profile, it would have only two entries: one for each cipher group that is bound to a profile.
11. Creating a user defined cipher group from existing ciphers and cipher groups is a copy-paste operation. Any changes in the original group are not reflected in the new group.
12. A user-defined cipher group lists all the profiles that it is a part of.
13. A profile lists all the SSL virtual server, services, and service groups that it is bound to.
14. If the default SSL profile feature is enabled, you must use the profile to set or change any of the attributes of a virtual server, service, service group, or an internal service.

### Save the configuration by using the CLI

At the command prompt, type:

```
1 save config
2
3 shell
4
5 root@ns# cd /nsconfig
6
7 root@ns# cp ns.conf ns.conf.NS<currentreleasenum><currentbuildnumber>
8 <!--NeedCopy-->
```

#### Example:

```
1 save config
2 shell
3 root@ns# cd /nsconfig
4 root@ns# cp ns.conf ns.conf.NS.11.0.jun.16
5 <!--NeedCopy-->
```

## Enable the default profile

### Important:

Save your configuration before you upgrade the software and enable the default profiles.

From release 11.1 build 51.x, in the GUI and CLI, a confirmation prompt appears when you enable the default profile to avoid enabling it by mistake.

**Command:** The following command enables the default profile and binds this profile to the SSL entities to which a profile is already bound. That is, if a profile (for example P1) is already bound to an SSL entity, P1 is replaced by the default front-end profile or the default back-end profile. The older profile (P1) is not deleted. It is now an enhanced SSL profile and contains the earlier settings, and the ciphers and ECC curves. If you do not want the default profile, you can explicitly bind P1 to the SSL entity.

```
1 set ssl parameter -defaultProfile ENABLED
2     Save your configuration before enabling the Default profile. You
3     cannot undo the changes. Are you sure you want to enable the
4     Default profile? [Y/N]Y
3 Done
4 <!--NeedCopy-->
```

Upgrade the software to a build that supports the enhanced profile infrastructure, and then enable the default profiles.

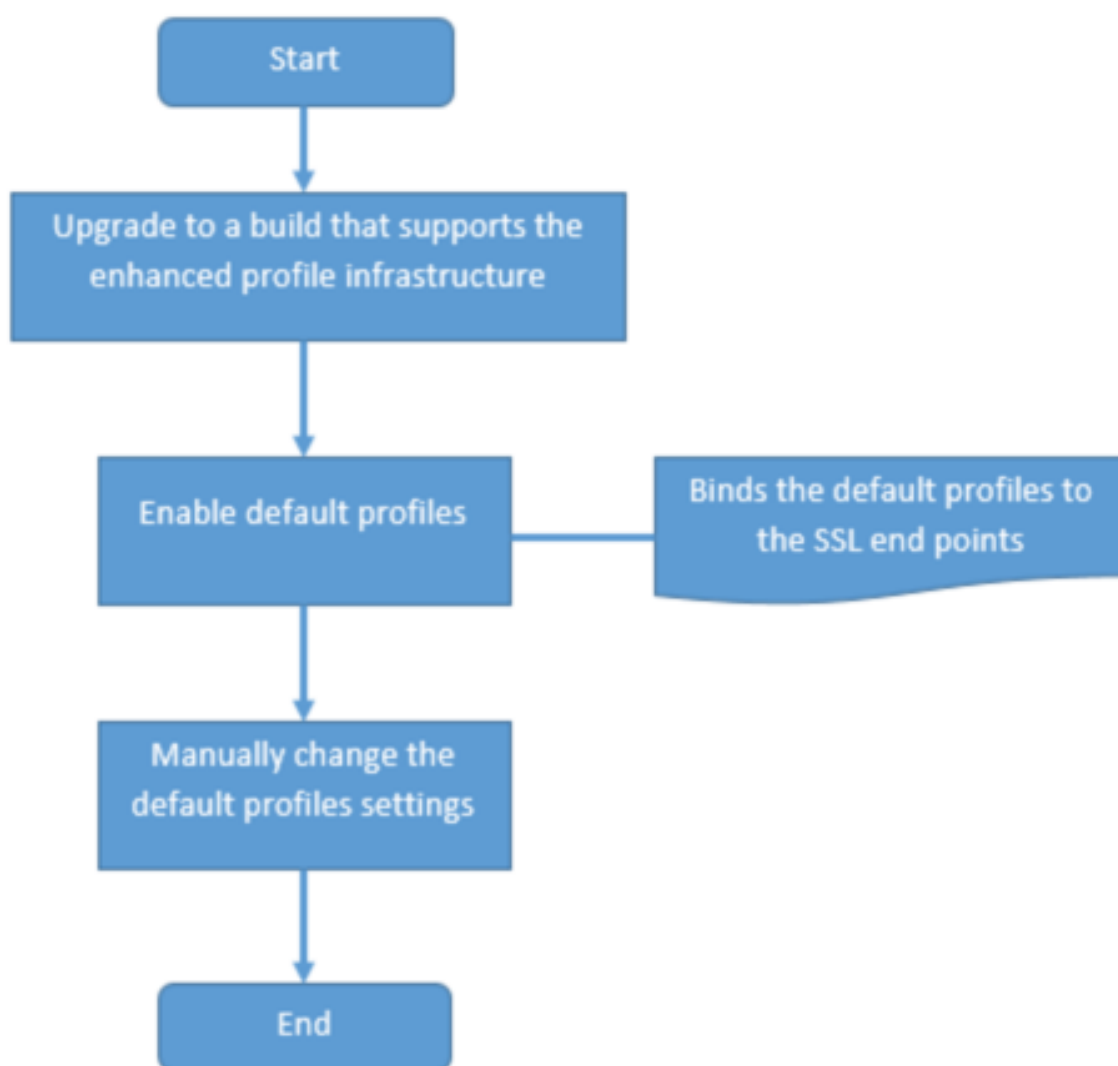

### Notes:

- If a legacy profile (P1) is already bound to an SSL entity, and you enable the default profile, the default profile overrides the earlier binding. That is, the default profile is bound to the SSL entities. If you do not want the default profile to be bound, you must bind P1 to the SSL entity again.
- A single operation (Enable Default Profile or `set ssl parameter -defaultProfile ENABLED`) enables (binds) both the default front-end profile and the default back-end profile.

## Use case

After you enable the default profiles, they are bound to all the SSL end points. The default profiles are editable. If your deployment uses most of the default settings and changes only a few parameters, you can edit the default profiles. The changes are immediately reflected across all the end points. You can also create custom SSL profiles with some custom and some default parameters and bind it to the SSL entities.

The following flowchart explains the steps that you must perform:

1. For information about upgrading the software, see [Upgrading the System Software](#).
2. Enable the default profiles by using the CLI or GUI.
  - At the command line, type: `set ssl parameter -defaultProfile ENABLED`
  - If you prefer to use the GUI, navigate to **Traffic Management > SSL > Change advanced SSL**

**settings**, scroll down, and select **Enable Default Profile**.

If a profile was not bound to an end point before the upgrade, a default profile is bound to the SSL end point. If a profile was bound to an end point before the upgrade, the same profile is bound after the upgrade, and default ciphers are added to the profile.

1. (Optional) Manually change any settings in the default profile.
  - At the command line, type: `set ssl profile <name>` followed by the parameters to modify.
  - If you prefer to use the GUI, navigate to **System > Profiles**. In **SSL Profiles**, select a profile and click **Edit**.

## SSL profile parameters

You can set the following SSL parameters in an SSL profile. You can set some of these parameters in an SSL virtual server. For more information about SSL virtual server parameters, see [SSL virtual server parameters](#).

### Set SSL profile parameters by using the CLI

At the command prompt, type:

```

1  set ssl profile <name> [-ssllogProfile <string>] [-dh ( ENABLED |
2      DISABLED ) -dhFile <string>] [-dhCount <positive_integer>]
3      [-dhKeyExpSizeLimit ( ENABLED | DISABLED )] [-eRSA ( ENABLED |
4      DISABLED )] [-eRSACount <positive_integer>]] [-sessReuse ( ENABLED |
5      DISABLED )] [-sessTimeout <positive_integer>]] [-cipherRedirect ( ENABLED |
6      DISABLED )] [-cipherURL <URL>]] [-clientAuth ( ENABLED | DISABLED
7      )] [-clientCert ( Mandatory | Optional )]] [-sslRedirect ( ENABLED
8      |
9      DISABLED )] [-redirectPortRewrite ( ENABLED | DISABLED )] [-ssl3

    sslInterception (
21     ENABLED | DISABLED ))] [-ssliReneg ( ENABLED | DISABLED ))]
22     [-ssliOCSPCheck ( ENABLED | DISABLED ))] [-ssliMaxSessPerServer
23     <positive_integer>] [-HSTS ( ENABLED | DISABLED ))] [-maxage
24     <positive_integer>] [-IncludeSubdomains ( YES | NO ))] [-
    sessionTicket (
25     ENABLED | DISABLED ))] [-sessionTicketLifeTime <positive_integer
    >]
26     [-sessionTicketKeyRefresh ( ENABLED | DISABLED ))]
27     {
28 -sessionTicketKeyData }
29     [-sessionKeyLifeTime <positive_integer>]
30     [-prevSessionKeyLifeTime <positive_integer>] [-cipherName <
    string>
31     -cipherPriority <positive_integer>] [-strictSigDigestCheck (
    ENABLED |
32     DISABLED ))] [-skipClientCertPolicyCheck ( ENABLED | DISABLED ))]
33     [-zeroRttEarlyData ( ENABLED | DISABLED ))]
34     [-tls13SessionTicketsPerAuthContext <positive_integer>]
35     [-dheKeyExchangeWithPsk ( YES | NO ))]
36 <!--NeedCopy-->

```

### TLS session ticket extension

An SSL handshake is a CPU-intensive operation. If session reuse is enabled, the server/client key exchange operation is skipped for existing clients. They are allowed to resume their sessions. This action improves the response time and increases the number of SSL transactions per second that a server can support. However, the server must store details of each session state, which consumes memory and is difficult to share among multiple servers if requests are load balanced across servers.

Citrix ADC appliances support the SessionTicket TLS extension. Use of this extension indicates that the session details are stored on the client instead of on the server. The client must indicate that it supports this mechanism by including the session ticket TLS extension in the client Hello message. For new clients, this extension is empty. The server sends a new session ticket in the NewSessionTicket handshake message. The session ticket is encrypted by using a key-pair known only to the server. If

a server cannot issue a new ticket now, it completes a regular handshake.

This feature is available only in front-end SSL profiles, and only at the front end of communication in which the Citrix ADC appliance acts as a server and generates session tickets.

### Limitations

- This feature is not supported on a FIPS platform.
- This feature is supported only with TLS versions 1.1 and 1.2.
- SSL session ID persistency is not supported with session tickets.

### Enable TLS session ticket extension by using the CLI

At the command prompt, type:

```
1 set ssl profile <name> -sessionTicket (ENABLED | DISABLED ) [-  
    sessionTicketLifeTime <positive_integer>  
2 <!--NeedCopy-->
```

### Arguments:

**sessionTicket:** State of TLS session ticket extension. Use of this extension indicates that the session details are stored on the client instead of on the server, as defined in RFC 5077.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**sessionTicketLifeTime:** Specify a time, in seconds, after which the session ticket expires and a new SSL handshake must be initiated.

Default value: 300

Minimum value: 0

Maximum value: 172800

### Example:

```
1 add ssl profile profile1 -sessionTicket ENABLED -sessionTicketlifeTime  
    300  
2 Done  
3 <!--NeedCopy-->
```

### Enable TLS session ticket extension by using the GUI

1. Navigate to **System > Profiles**. Select **SSL Profiles**.

2. Click **Add** and specify a name for the profile.
3. Select **Session ticket**.
4. Optionally, specify **Session Ticket Lifetime (secs)**.

### Secure implementation of session tickets

By using TLS session tickets, clients can use abbreviated handshakes for faster reconnection to servers. However, if session tickets aren't encrypted or changed for long periods of time, they can pose a security risk. You can secure session tickets by encrypting them with a symmetric key. To achieve forward secrecy, you can specify a time interval at which the session-ticket key is refreshed.

The appliance generates the session ticket keys by default. However, if multiple appliances in a deployment need to decrypt each other's session tickets, they must all use the same session-ticket key. Therefore, you must set (add or load) the same session-ticket key data manually on all the appliances. Session-ticket key data includes the following information:

- Session ticket name.
- Session AES key used to encrypt or decrypt the ticket.
- Session HMAC key used to compute the digest of the ticket.

You can now configure session ticket key data of length 64 bytes to support 256-bit HMAC keys as recommended in RFC 5077. Key lengths of 48 bytes are also supported for backward compatibility.

#### Note:

If you are typing the session-ticket key data manually, ensure that the configuration across all the Citrix ADC appliances in an HA setup or in a cluster setup is the same.

The `sessionTicketKeyLifeTime` parameter specifies how often a session-ticket key is refreshed. In addition, you can set the `prevSessionTicketKeyLifeTime` parameter to specify how long the previous session-ticket key will be maintained for decrypting tickets using that key, after a new key is generated. The `prevSessionTicketKeyLifeTime` setting extends the time for which a client can use an abbreviated handshake to reconnect. For example, if `sessionTicketKeyLifeTime` is set to 10 minutes and `prevSessionTicketKeyLifeTime` to 5 minutes, a new key is generated after 10 minutes and used for all new sessions. However, previously connected clients have another 5 minutes for which previously issued tickets are honored for an abbreviated handshake.

### Configure SSL session-ticket data by using the CLI

At the command prompt, type:

```
1 set ssl profile <name> -sessionTicket ENABLED -sessionTicketLifeTime <
  positive_integer> -sessionTicketKeyRefresh ( ENABLED | DISABLED )] -
  sessionTicketKeyLifeTime <positive_integer> [-
  prevSessionTicketKeyLifeTime <positive_integer>]
```

```
2 <!--NeedCopy-->
```

**Arguments:**

**sessionTicket:** Use session tickets as described by RFC 5077. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the **ENABLED** setting, a server issues a session ticket to a client, which the client can use to perform an abbreviated handshake.

Possible values: ENABLED, DISABLED. Default: DISABLED

**sessionTicketLifeTime:** Lifetime, in seconds, of the session ticket. After this time expires, clients cannot use this ticket to resume their sessions.

Maximum value: 172800. Minimum value: 0. Default: 300.

**sessionTicketKeyRefresh:** When the time specified by the session-ticket key lifetime parameter expires, regenerate the session-ticket key used to encrypt or decrypt the session tickets. Automatically enabled if sessionTicket is enabled. Disabled if the administrator enters the session-ticket data.

Possible values: ENABLED, DISABLED. Default: ENABLED

**sessionKeyLifeTime:** Lifetime, in seconds, of a symmetric key used to encrypt the session tickets issued by a Citrix ADC appliance.

Maximum value: 86400. Minimum value: 600. Default: 3000

**prevSessionKeyLifeTime:** Time, in seconds, for which the previous symmetric key used to encrypt session tickets remains valid for existing clients after the session-ticket key lifetime expires. Within this time, existing clients can resume their sessions by using the previous session ticket key. Session tickets for new clients are encrypted by using the new key.

Maximum value: 172800. Minimum value: 0. Default: 0

**Example:**

```
1 set ssl profile ns_default_ssl_profile_frontend -sessionTicket ENABLED
   -sessionTicketLifeTime 120 -sessionTicketKeyRefresh ENABLED -
   sessionTicketKeyLifeTime 100 -prevSessionTicketKeyLifeTime 60
2
3 Done
4
5 show ssl profile ns_default_ssl_profile_frontend
6
7     Session Ticket: ENABLED
8     Session Ticket Lifetime: 120 (secs)
9     Session Key Auto Refresh: ENABLED
10    Session Key Lifetime: 100 (secs)
11    Previous Session Key Lifetime: 60 (secs)
12 <!--NeedCopy-->
```

**Configure SSL session-ticket data by using the GUI**

1. Navigate to **System > Profiles**, and select **SSL Profile**.
2. Select **ns\_default\_ssl\_profile\_frontend** and click **Edit**.
3. In the **Basic Settings** section, click the pencil icon and set the following parameters:
  - Session Ticket
  - Session Ticket Lifetime (secs)
  - Session Ticket Key Auto Refresh
  - Session Ticket Key Lifetime (secs)
  - Previous Session Ticket Key Lifetime (secs)
4. Click **OK**.

**Type SSL session ticket data manually by using the CLI**

At the command prompt, type:

```
1 set ssl profile <name> -sessionTicket ENABLED
2
3 set ssl profile <name> -sessionTicketKeyData
4
5 show ssl profile ns_default_ssl_profile_frontend
6 <!--NeedCopy-->
```

**Arguments:**

**sessionTicket:** Use of session tickets as described by RFC 5077. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the **ENABLED** setting, a server issues a session ticket to a client, which the client can use to perform an abbreviated handshake.

Possible values: ENABLED, DISABLED. Default: DISABLED

**sessionTicketKeyData:** Contains the session ticket name (0–15 bytes), the session AES key used to encrypt or decrypt the session ticket (16–31 bytes), and the session HMAC key used to compute the digest of the ticket (32–63 bytes). Externally generated by an administrator and added to a Citrix ADC appliance.

Maximum length: 64 bytes

**Example:**

```
1 set ssl profile ns_default_ssl_profile_frontend -sessionticket ENABLED
2
3 Done
4
```

```
5 set ssl profile ns_default_ssl_profile_frontend -sessionticketkey
  11
6
7 Done
8
9 show ssl profile ns_default_ssl_profile_frontend
10
11     1) Name: ns_default_ssl_profile_frontend (Front-End)

55 Done
56 <!--NeedCopy-->
```

### Type SSL session ticket data manually by using the GUI

1. Navigate to **System > Profiles**, and select **SSL Profile**.
2. Select **ns\_default\_ssl\_profile\_frontend** and click **Edit**.
3. In the **Basic Settings** section, click the pencil icon and set the following parameters:
  - Session Ticket
  - Session Ticket Key Data
  - Confirm Session Ticket Key Data
4. Click **OK**.

### Load an old configuration

Enabling the default profiles is not reversible. However, if you decide that your deployment does not require the default profiles, you can load an older configuration that you saved before you enabled the default profiles. The changes are effective after you restart the appliance.

### Load an old configuration by using the CLI

At the command prompt, type:

```
1 shell
2
3 root@ns# clear config
4
5 root@ns# cd /nsconfig
6
7 root@ns# cp ns.conf.NS.11.0.jun.16 ns.conf
```

```
8
9 root@ns# reboot
10 <!--NeedCopy-->
```

## Secure front-end profile

September 21, 2020

In addition to a default front-end and a default back-end profile, a new default secure front-end profile is available from release 12.1. The settings required for an A+ rating (as of May 2018) from Qualys SSL Labs are preloaded into this profile. Earlier, you had to explicitly set each of the parameters required for an A+ rating on an SSL front-end profile or an SSL virtual server. Now you can bind the `ns_default_ssl_profile_secure_frontend` profile to your SSL virtual server and the required parameters are automatically set on your SSL virtual server.

### Note:

The secure front-end profile is not editable.

When you enable the default profile, the default front-end profile is automatically bound to all the SSL virtual servers. To get an A+ rating, you must explicitly bind the `ns_default_ssl_profile_secure_frontend` profile and also bind an SHA2/SHA256 server certificate to your SSL virtual server.

## Secure front-end profile parameters

The parameters with their default settings are listed below:

```
1 SSLv3: DISABLED  TLSv1.0: DISABLED  TLSv1.1: DISABLED  TLSv1.2:
   ENABLED  TLSv1.3: DISABLED
2
3 Deny SSL Renegotiation: NONSECURE
4
5 HSTS: ENABLED
6
7 HSTS IncludeSubDomains: YES
8
9 HSTS Max-Age: 15552000
10
11 Cipher Name: SECURE  Priority :1
12 <!--NeedCopy-->
```

## Secure cipher alias

A new secure cipher alias is added and bound to the secure front-end profile. To list the ciphers that are part of this alias, at the command prompt type: show cipher SECURE

```

1 show cipher SECURE
2
3     1) Cipher Name: TLS1.2-ECDHE-RSA-AES256-GCM-SHA384 Priority : 1
4         Description: TLSv1.2 Kx=ECC-DHE Au=RSA Enc=AES-GCM(256)
5         Mac=AEAD HexCode=0xc030
6     2) Cipher Name: TLS1.2-ECDHE-RSA-AES128-GCM-SHA256 Priority : 2
7         Description: TLSv1.2 Kx=ECC-DHE Au=RSA Enc=AES-GCM(128)
8         Mac=AEAD HexCode=0xc02f
9     3) Cipher Name: TLS1.2-ECDHE-ECDSA-AES256-GCM-SHA384
10        Priority : 3
11        Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=AES-GCM(256)
12        Mac=AEAD HexCode=0xc02c
13     4) Cipher Name: TLS1.2-ECDHE-ECDSA-AES128-GCM-SHA256
14        Priority : 4
15        Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=AES-GCM(128)
16        Mac=AEAD HexCode=0xc02b
17 Done
18 <!--NeedCopy-->

```

## Configuration

Perform the following steps:

1. Add a load balancing virtual server of type SSL.
2. Bind a SHA2/SHA256 certificate.
3. Enable the default profile.
4. Bind the secure front-end profile to the SSL virtual server.

### Get an A+ rating for an SSL virtual server by using the CLI

At the command prompt, type:

```

1 add lb vserver <name> <serviceType> <IPAddress> <port>
2 bind ssl vserver <vServerName> -certkeyName <string>
3 set ssl parameter -defaultProfile ENABLED
4 set ssl vserver <vServerName> -
5     sslProfile ns_default_ssl_profile_secure_frontend
6 show ssl vserver [<vServerName>]
7 <!--NeedCopy-->

```

**Example:**

```
1 add lb vserver ssl-vsvr SSL 192.0.2.240 443
2
3 bind ssl vserver ssl-vsvr -certkeyName letrsa
4
5 set ssl parameter -defaultProfile ENABLED
6
7 Save your configuration before enabling the Default profile. You cannot
  undo the changes. Are you sure you want to enable the Default
  profile? [Y/N]y
8
9 set ssl vserver ssl-vsvr -sslProfile
  ns_default_ssl_profile_secure_frontend
10 <!--NeedCopy-->
```

```
1 sh ssl vserver ssl-vsvr
2
3   Advanced SSL configuration for VServer ssl-vsvr:
4   Profile Name :ns_default_ssl_profile_secure_frontend
5   1) CertKey Name: letrsa      Server Certificate
6   Done
7 <!--NeedCopy-->
```

```
1 sh ssl profile ns_default_ssl_profile_secure_frontend
2
3   1) Name: ns_default_ssl_profile_secure_frontend (Front-End)
4   SSLv3: DISABLED  TLSv1.0: DISABLED  TLSv1.1: DISABLED  TLSv1.2:
   ENABLED  TLSv1.3: DISABLED
5   Client Auth: DISABLED
6   Use only bound CA certificates: DISABLED
7   Strict CA checks: NO
8   Session Reuse: ENABLED  Timeout: 120 seconds
9   DH: DISABLED
10  DH Private-Key Exponent Size Limit: DISABLED  Ephemeral RSA:
   ENABLED  Refresh Count: 0
11  Deny SSL Renegotiation NONSECURE
12  Non FIPS Ciphers: DISABLED
13  Cipher Redirect: DISABLED
14  SSL Redirect: DISABLED
15  Send Close-Notify: YES
16  Strict Sig-Digest Check: DISABLED
17  Zero RTT Early Data: DISABLED
18  DHE Key Exchange With PSK: NO
```

```
19 Tickets Per Authentication Context: 1
20 Push Encryption Trigger: Always
21 PUSH encryption trigger timeout: 1 ms
22 SNI: DISABLED
23 OCSP Stapling: DISABLED
24 Strict Host Header check for SNI enabled SSL sessions:
      NO
25 Push flag: 0x0 (Auto)
26 SSL quantum size: 8 kB
27 Encryption trigger timeout 100 mS
28 Encryption trigger packet count: 45
29 Subject/Issuer Name Insertion Format: Unicode
30 SSL Interception: DISABLED
31 SSL Interception OCSP Check: ENABLED
32 SSL Interception End to End Renegotiation: ENABLED
33 SSL Interception Maximum Reuse Sessions per Server: 10
34 Session Ticket: DISABLED
35 HSTS: ENABLED
36 HSTS IncludeSubDomains: YES
37 HSTS Max-Age: 15552000
38 ECC Curve: P_256, P_384, P_224, P_521
39 1) Cipher Name: SECURE Priority :1
40 Description: Predefined Cipher Alias
41 1) Vserver Name: v2
42 Done
43 <!--NeedCopy-->
```

### Get an A+ rating for an SSL virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, and select an SSL virtual server.
2. In Advanced Settings, click SSL Profile.
3. Select ns\_default\_ssl\_profile\_secure\_frontend.
4. Click OK.
5. Click Done.

## Appendix A: Sample migration of the SSL configuration after upgrade

September 21, 2020

**Note:** This content has been removed because the SSL migration script for the new default profile is

no longer supported.

## Appendix B: Default front-end and back-end SSL profile settings

September 21, 2020

A default front-end profile has the following settings:

```
1  sh ssl profile ns_default_ssl_profile_frontend
2
3  1)Name: ns_default_ssl_profile_frontend
4
5      Configuration for Front-End SSL profile
6      DH: DISABLED
7      Ephemeral RSA: ENABLED           Refresh Count: 0
8      Session Reuse: ENABLED           Timeout: 120 seconds
9      Non FIPS Ciphers: DISABLED
10     Cipher Redirect: ENABLED   Redirect URL: http://10.102.28.212/
    redirect.html
11     Client Auth: DISABLED
12     SSL Redirect: DISABLED
13     SNI: DISABLED
14     SSLv3: DISABLED TLSv1.0: ENABLED  TLSv1.1: ENABLED  TLSv1.2:
    ENABLED
15     Push Encryption Trigger: Always
16     PUSH encryption trigger timeout:    1 ms
17     Send Close-Notify: YES
18     Push flag: 0x0 (Auto)
19     Deny SSL Renegotiation             NO
20     SSL quantum size:                   8 kB
21     Strict CA checks:                   NO
22     Encryption trigger timeout 100 mS
23     Encryption trigger packet count:    45
24     Use only bound CA certificates: DISABLED
25     Subject/Issuer Name Insertion Format: Unicode
26     Strict Host Header check for SNI enabled SSL sessions:    NO
27
28     ECC Curve: P_256, P_384, P_521
29
30  1)  Cipher Name: AES      Priority :2
31     Description: Predefined Cipher Alias
32
33  1)  Vserver Name: v1
```

```
34 2) Vserver Name: nshttps-::1l-443
35 3) Vserver Name: nsrpcs-::1l-3008
36 4) Vserver Name: nskrpcs-127.0.0.1-3009
37 5) Vserver Name: nshttps-127.0.0.1-443
38 6) Vserver Name: nsrpcs-127.0.0.1-3008
39 Done
40 <!--NeedCopy-->
```

A default back-end profile has the following settings:

```
1 sh ssl profile ns_default_ssl_profile_backend
2
3 1)Name: ns_default_ssl_profile_backend
4
5     Configuration for Back-End SSL profile
6     Session Reuse: ENABLED           Timeout: 300 seconds
7     Non FIPS Ciphers: DISABLED
8     Server Auth: DISABLED
9     SSLv3: DISABLED TLSv1.0: ENABLED  TLSv1.1: DISABLED  TLSv1.2:
10    DISABLED
11     Push Encryption Trigger: Always
12     PUSH encryption trigger timeout: 1 ms
13     Send Close-Notify: YES
14     Push flag: 0x0 (Auto)
15     Deny SSL Renegotiation          ALL
16     SSL quantum size:                8 kB
17     Strict CA checks:                NO
18     Encryption trigger timeout 100 mS
19     Encryption trigger packet count: 45
20     Use only bound CA certificates: DISABLED
21
22     ECC Curve: P_256, P_224, P_521
23
24 1) Cipher Name: AES      Priority :1
25     Description: Predefined Cipher Alias
26
27 2) Cipher Name: RC4     Priority :2
28     Description: Predefined Cipher Alias
29
30 1) Service Name: s2
31 2) Service Name: s1
32 Done
33 <!--NeedCopy-->
```

## Legacy SSL profile

September 21, 2020

### Note:

Citrix recommends using the enhanced profiles instead of legacy profiles. For information about the enhanced profile infrastructure, see [SSL profile infrastructure](#).

### Important:

You must bind an SSL profile to an SSL virtual server. Do not bind a DTLS profile to an SSL virtual server. For information about DTLS profiles, see [DTLS Profiles](#).

You can use an SSL profile to specify how a Citrix ADC processes SSL traffic. The profile is a collection of SSL parameter settings for SSL entities, such as virtual servers, services, and service groups, and offers ease of configuration and flexibility. You are not limited to configuring only one set of global parameters. You can create multiple sets (profiles) of global parameters and assign different sets to different SSL entities. SSL profiles are classified into two categories:

- Front end profiles, containing parameters applicable to the front-end entity. That is, they apply to the entity that receives requests from a client.
- Backend profiles, containing parameters applicable to the back-end entity. That is, they apply to the entity that sends client requests to a server.

Unlike a TCP or HTTP profile, an SSL profile is optional. Therefore, there is no default SSL profile. The same profile can be reused across multiples entities. If an entity does not have a profile attached, the values set at the global level apply. For dynamically learned services, current global values apply.

The following table lists the parameters that are part of each profile.

| Front end profile         | Backend profile        |
|---------------------------|------------------------|
| cipherRedirect, cipherURL | denySSLReneg           |
| clearTextPort*            | encryptTriggerPktCount |
| clientAuth, clientCert    | nonFipsCiphers         |
| denySSLReneg              | pushEncTrigger         |
| dh, dhFile, dhCount       | pushEncTriggerTimeout  |
| dropReqWithNoHostHeader   | pushFlag               |
| encryptTriggerPktCount    | quantumSize            |
| eRSA, eRSACount           | serverAuth             |
| insertionEncoding         | commonName             |

| Front end profile      | Backend profile        |
|------------------------|------------------------|
| nonFipsCiphers         | sessReuse, sessTimeout |
| pushEncTrigger         | SNIEnable              |
| pushEncTriggerTimeout  | ssl3                   |
| pushFlag               | sslTriggerTimeout      |
| quantumSize            | strictCAChecks         |
| redirectPortRewrite    | tls1                   |
| sendCloseNotify        | -                      |
| sessReuse, sessTimeout | -                      |
| SNIEnable              | -                      |
| ssl3                   | -                      |
| sslRedirect            | -                      |
| sslTriggerTimeout      | -                      |
| strictCAChecks         | -                      |
| tls1, tls11, tls12     | -                      |

\* The clearTextPort parameter applies only to an SSL virtual server.

An error message appears if you try to set a parameter that is not part of the profile (for example, if you try to set the clientAuth parameter in a backend profile).

Some SSL parameters, such as CRL memory size, OCSP cache size,.UndefAction Control, and.UndefAction Data, are not part of any of the above profiles, because these parameters are independent of entities.

An SSL profile supports the following operations:

- Add—Creates an SSL profile on the Citrix ADC. Specify whether the profile is front end or back-end. Front end is the default.
- Set—Modifies the settings of an existing profile.
- Unset—Sets the specified parameters to their default values. If you do not specify any parameters, an error message appears. If you unset a profile on an entity, the profile is unbound from the entity.
- Remove—Deletes a profile. A profile that is being used by any entity cannot be deleted. Clearing the configuration deletes all the entities. As a result, the profiles are also deleted.
- Show—Displays all the profiles that are available on the Citrix ADC. If a profile name is specified, the details of that profile are displayed. If an entity is specified, the profiles associated with that

entity are displayed.

### Create an SSL profile by using the CLI

- To add an SSL profile, type:

```
1 add ssl profile <name> [-sslProfileType ( BackEnd | FrontEnd )]  
2 <!--NeedCopy-->
```

- To modify an existing profile, type:

```
1 set ssl profile <name>  
2 <!--NeedCopy-->
```

- To unset an existing profile, type:

```
1 unset ssl profile <name> [-dh] [-dhFile] [-dhCount] [-eRSA] ...  
2 <!--NeedCopy-->
```

- To unset an existing profile from an entity, type:

```
1 unset ssl vservice <vServerName> - sslProfile  
2 <!--NeedCopy-->
```

- To remove an existing profile, type:

```
1 rm ssl profile <name>  
2 <!--NeedCopy-->
```

- To display an existing profile, type:

```
1 sh ssl profile <name>  
2 <!--NeedCopy-->
```

### Create an SSL profile by using the GUI

Navigate to **System > Profiles**, select the SSL Profiles tab, and create an SSL profile.

### Enable stricter control on client certificate validation

The Citrix ADC appliance accepts valid Intermediate-CA certificates if they are issued by a single Root-CA. That is, if only the Root-CA certificate is bound to the virtual server, and any intermediate certificate sent with the client certificate is validated by that Root-CA, the appliance trusts the certificate chain and the handshake is successful.

However, if a client sends a chain of certificates in the handshake, none of the intermediate certificates can be validated by using a CRL or OCSP responder unless that certificate is bound to the SSL virtual server. Therefore, even if one of the intermediate certificates is revoked, the handshake is successful. As part of the handshake, the SSL virtual server sends the list of CA certificates that are bound to it. For stricter control, you can configure the SSL virtual server to accept only a certificate that is signed by one of the CA certificates bound to that virtual server. To do so, you must enable the `ClientAuthUseBoundCACChain` setting in the SSL profile bound to the virtual server. The handshake fails if the client certificate is not signed by one of the CA certificates bound to the virtual server.

For example, say two client certificates, `clientcert1` and `clientcert2`, are signed by the intermediate certificates `Int-CA-A` and `Int-CA-B`, respectively. The intermediate certificates are signed by the root certificate `Root-CA`. `Int-CA-A` and `Root-CA` are bound to the SSL virtual server. In the default case (`ClientAuthUseBoundCACChain` disabled), both `clientcert1` and `clientcert2` are accepted. However, if `ClientAuthUseBoundCACChain` is enabled, only `clientcert1` is accepted by the Citrix ADC appliance

### Enable stricter control on client certificate validation by using the CLI

At the command prompt, type: `set ssl profile <name> -ClientAuthUseBoundCACChain Enabled`

### Enable stricter control on client certificate validation by using the GUI

1. Navigate to **System > Profiles**, select the **SSL Profiles** tab, and create an SSL profile, or select an existing profile.
2. Select **Enable Client Authentication using bound CA Chain**.

## Certificate revocation lists

December 23, 2020

A certificate issued by a CA typically remains valid until its expiration date. Sometimes, the CA revokes the issued certificate before the expiration date. For example, when an owner's private key is compromised, a company's or individual's name changes, or the association between the subject and the CA changes.

A Certificate Revocation List (CRL) identifies invalid certificates by serial number and issuer.

Certificate authorities issue CRLs regularly. You can configure the Citrix ADC appliance to use a CRL to block client requests that present invalid certificates.

If you already have a CRL file from a CA, add that to the Citrix ADC appliance. You can configure refresh options. You can also configure the Citrix ADC to sync the CRL file automatically at a specified interval,

from either a web location or an LDAP location. The appliance supports CRLs in either the PEM or the DER file format. Be sure to specify the file format of the CRL file being added to the Citrix ADC appliance.

If you use the ADC appliance as a CA to create certificates that are used in SSL deployments, you can create a CRL to revoke a particular certificate. This feature can be used, for example, to ensure that self-signed certificates that are created on the ADC are not used either in a production environment or beyond a particular date.

**Note:**

By default, CRLs are stored in the `/var/netScaler/ssl` directory on the Citrix ADC appliance.

### Create a CRL on the ADC appliance

Since you can use the ADC appliance to act as a CA and create self-signed certificates, you can also revoke the following certificates:

- Certificates that you have created.
- Certificates whose CA certificate you own.

The appliance must revoke invalid certificates before creating a CRL for those certificates. The appliance stores the serial numbers of revoked certificates in an index file and updates the file each time it revokes a certificate. The index file is automatically created the first time a certificate is revoked.

### Revoke a certificate or create a CRL by using the CLI

At the command prompt, type the following command:

```
1 create ssl crl <CAcertFile> <CAkeyFile> <indexFile> (-revoke <
  input_filename> | -genCRL <output_filename>)
2 <!--NeedCopy-->
```

**Example:**

```
1 create ssl crl Cert-CA-1 Key-CA-1 File-Index-1 -revoke Invalid-1
2
3 create ssl crl Cert-CA-1 Key-CA-1 File-Index-1 -genCRL CRL-1
4 <!--NeedCopy-->
```

### Revoke a certificate or create a CRL by using the GUI

1. Navigate to **Traffic Management > SSL** and, in the Getting Started group, select CRL Management.

2. Enter the certificate details and, in the **Choose Operation** list, select **Revoke Certificate**, or **Generate CRL**.

### Add an existing CRL to the ADC appliance

Before you configure the CRL on the Citrix ADC appliance, make sure that the CRL file is stored locally on the Citrix ADC appliance. In an HA setup, the CRL file must be present on both Citrix ADC appliances, and the directory path to the file must be the same on both appliances.

### Add a CRL on the ADC appliance by using the CLI

At the command prompt, type the following commands to add a CRL on the ADC appliance and verify the configuration:

```
1 add ssl crl <crlName> <crlPath> [-inform (DER | PEM)]
2
3 show ssl crl [<crlName>]
4 <!--NeedCopy-->
```

### Example:

```
1 > add ssl crl crl-one /var/netscaler/ssl/CRL-one -inform PEM
2
3 Done
4
5 > show ssl crl crl-one
6
7         Name: crl-one   Status: Valid, Days to expiration: 29
8         CRL Path: /var/netscaler/ssl/CRL-one
9         Format: PEM     CAcert: samplecertkey
10        Refresh: DISABLED
11        Version: 1
12        Signature Algorithm: sha1WithRSAEncryption
13        Issuer: C=US,ST=California,L=Santa Clara,O=NetScaler Inc.,
14        OU=SSL Acceleration,CN=www.ns.com/emailAddress=support@Citrix
15        ADC appliance.com
16        Last_update:Jun 15 10:53:53 2010 GMT
17        Next_update:Jul 15 10:53:53 2010 GMT
18
19        1) Serial Number: 00
20        Revocation Date:Jun 15 10:51:16 2010 GMT
21
22 Done
23 <!--NeedCopy-->
```

## Add a CRL on the ADC appliance by using the GUI

Navigate to **Traffic Management > SSL > CRL**, and add a CRL.

## Configure CRL refresh parameters

A CA generates and publishes a CRL periodically or, sometimes, immediately after a particular certificate is revoked. Citrix recommends that you update CRLs on the Citrix ADC appliance regularly, for protection against clients trying to connect with certificates that are not valid.

The Citrix ADC appliance can refresh CRLs from a web location or an LDAP directory. When you specify refresh parameters and a web location or an LDAP server, the CRL does not have to be present on the local hard disk drive when you run the command. The first refresh stores a copy on the local hard disk drive, in the path specified by the CRL File parameter. The default path for storing the CRL is `/var/netscaler/ssl`.

**Note:** In release 10.0 and later, the method for refreshing a CRL is not included by default. Explicitly specify an HTTP or LDAP method. If you are upgrading from an earlier release to release 10.0 or later, you must add a method and run the command again.

## Configure CRL autorefresh by using the CLI

At the command prompt, type the following commands to configure CRL auto refresh and verify the configuration the following commands to configure CRL auto refresh and verify the configuration:

```

1 set ssl crl <crlName> [-refresh ( ENABLED | DISABLED )] [-CAcert <
  string>] [-url <URL | -server <ip_addr|ipv6_addr>] [-method HTTP | (
  LDAP [-baseDN <string>] [-bindDN <string>] [-scope ( Base | One )]
  [-password <string>] [-binary ( YES | NO )])] [-port <port>] [-
  interval <interval>]
2
3 show ssl crl [<crlName>]
4 <!--NeedCopy-->

```

### Example:

```

1 set CRL crl1 -refresh enabled -method ldap -inform DER -CAcert ca1
  -server 10.102.192.192 -port 389 -scope base -baseDN "cn=
  clnt_rsa4_multicert_der,ou=eng,o=ns,c=in" -time 00:01
2
3 set ssl crl crl1 -refresh enabled -method http -cacert ca1 -port 80
  -time 00:10 -url http://10.102.192.192/crl/ca1.crl
4
5

```

```
6 > sh crl
7
8 1)          Name: crl1          Status: Valid,      Days to expiration:
          355
9           CRL Path: /var/netscaler/ssl/crl1
10          Format: PEM          CAcert: ca1
11          Refresh: ENABLED      Method: HTTP
12          URL: http://10.102.192.192/crl/ca1.crl
          Port:80
13          Refresh Time: 00:10
14          Last Update: Successful, Date:Tue Jul 6 14:38:13 2010
15 Done
16 <!--NeedCopy-->
```

### Configure CRL autorefresh using LDAP or HTTP by using the GUI

1. Navigate to **Traffic Management > SSL > CRL**.
2. Open a CRL, and select **Enable CRL Auto Refresh**.

#### Note

If the new CRL has been refreshed in the external repository before its actual update time as specified by the **Last Update time** field of the CRL, you must do the following:

Immediately refresh the CRL on the Citrix ADC appliance.

To view the last update time, select the CRL, and click **Details**.

### Synchronize CRLs

The Citrix ADC appliance uses the most recently distributed CRL to prevent clients with revoked certificates from accessing secure resources.

If CRLs are updated often, the Citrix ADC appliance needs an automated mechanism to fetch the latest CRLs from the repository. You can configure the appliance to update CRLs automatically at a specified refresh interval.

The appliance maintains an internal list of CRLs that need to be updated at regular intervals. At these specified intervals, the appliance scans the list for CRLs that need to be updated. It then connects to the remote LDAP server or HTTP server, retrieves the latest CRLs, and then updates the local CRL list with the new CRLs.

#### Note:

If the CRL check is set to mandatory when the CA certificate is bound to the virtual server, and

the initial CRL refresh fails, the following action is taken for connections:

All client-authentication connections with the same issuer as the CRL are rejected as REVOKED until the CRL is successfully refreshed.

You can specify the interval at which the CRL refresh must be carried out. You can also specify the exact time.

### Synchronize CRL autorefresh by using the CLI

At the command prompt, type the following command:

```
1 set ssl crl <crlName> [-interval <interval>] [-day <integer>] [-time <
  HH:MM>]
2 <!--NeedCopy-->
```

#### Example:

```
1 set ssl crl CRL-1 -refresh ENABLE -interval MONTHLY -days 10 -time
  12:00
2 <!--NeedCopy-->
```

### Synchronize CRL refresh by using the GUI

1. Navigate to **Traffic Management > SSL > CRL**.
2. Open a CRL, select enable CRL Auto Refresh, and specify the interval.

### Perform client authentication by using a certificate revocation list

If a certificate revocation list (CRL) is present on a Citrix ADC appliance, a CRL check is performed regardless of whether performing the CRL check is set to mandatory or optional.

The success or failure of a handshake depends on a combination of the following factors:

- Rule for CRL check
- Rule for client certificate check
- State of the CRL configured for the CA certificate

The following table lists the results of the possible combinations for a handshake involving a revoked certificate.

Table 1. Result of a Handshake with a Client Using a Revoked Certificate

| Rule for CRL Check | Rule for Client Certificate Check | State of the CRL Configured for the CA certificate | Result of a Handshake with a Revoked Certificate |
|--------------------|-----------------------------------|----------------------------------------------------|--------------------------------------------------|
| Optional           | Optional                          | Missing                                            | Success                                          |
| Optional           | Mandatory                         | Missing                                            | Success                                          |
| Optional           | Mandatory                         | Present                                            | Failure                                          |
| Mandatory          | Optional                          | Missing                                            | Success                                          |
| Mandatory          | Mandatory                         | Missing                                            | Failure                                          |
| Mandatory          | Optional                          | Present                                            | Success                                          |
| Mandatory          | Mandatory                         | Present                                            | Failure                                          |
| Optional/Mandatory | Optional                          | Expired                                            | Success                                          |
| Optional/Mandatory | Mandatory                         | Expired                                            | Failure                                          |

**Note:**

- The CRL check is optional by default. To change from optional to mandatory or the opposite way, you must first unbind the certificate from the SSL virtual server, and then bind it again after changing the option.
- In the output of the `sh ssl vsrvr` command, OCSP check: optional implies that a CRL check is also optional. The CRL check settings are displayed in the output of the `sh ssl vsrvr` command only if the CRL check is set to mandatory. If the CRL check is set to optional, the CRL check details do not appear.

**To configure CRL check by using the CLI**

At the command prompt, type the following command:

```
1 bind ssl vsrvr <vServerName> -certkeyName <string> [(-CA -crlCheck (
    Mandatory | Optional ))]
2 sh ssl vsrvr
3 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vs v1 -certkeyName ca -CA -crlCheck mandatory
2 > sh ssl vs v1
3
4 Advanced SSL configuration for VServer v1:
```

```
5
6 DH: DISABLED
7 DH Private-Key Exponent Size Limit: DISABLED
8 Ephemeral RSA: ENABLED Refresh Count: 0
9 Session Reuse: ENABLED Timeout: 120 seconds
10 Cipher Redirect: DISABLED
11 SSLv2 Redirect: DISABLED
12 ClearText Port: 0
13 Client Auth: ENABLED Client Cert Required: Mandatory
14 SSL Redirect: DISABLED
15 Non FIPS Ciphers: DISABLED
16 SNI: DISABLED
17 OCSP Stapling: DISABLED
18 HSTS: DISABLED
19 HSTS IncludeSubDomains: NO
20 HSTS Max-Age: 0
21 SSLv2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.1: ENABLED TLSv1
    .2: ENABLED
22 Push Encryption Trigger: Always
23 Send Close-Notify: YES
24
25 ECC Curve: P_256, P_384, P_224, P_521
26
27 1) CertKey Name: ca CA Certificate CRLCheck: Mandatory CA_Name Sent
28
29 1) Cipher Name: DEFAULT
30 Description: Predefined Cipher Alias
31 Done
32 <!--NeedCopy-->
```

### Configure CRL check by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open an SSL virtual server.
2. Click in the **Certificates** section.
3. Select a certificate and, in the **OCSP and CRL Check** list, select **CRL Mandatory**.

### Result of a handshake with a revoked or valid certificate

| Rule for CRL check | Rule for client certificate check | State of the CRL configured for the CA certificate | Result of a handshake with a revoked certificate | Result of a handshake with a valid certificate |
|--------------------|-----------------------------------|----------------------------------------------------|--------------------------------------------------|------------------------------------------------|
| Mandatory          | Mandatory                         | Present                                            | Failure                                          | Success                                        |
| Mandatory          | Mandatory                         | Expired                                            | Failure                                          | Failure                                        |
| Mandatory          | Mandatory                         | Missing                                            | Failure                                          | Failure                                        |
| Mandatory          | Mandatory                         | Undefined                                          | Failure                                          | Failure                                        |
| Optional           | Mandatory                         | Present                                            | Failure                                          | Success                                        |
| Optional           | Mandatory                         | Expired                                            | Success                                          | Success                                        |
| Optional           | Mandatory                         | Missing                                            | Success                                          | Success                                        |
| Optional           | Mandatory                         | Undefined                                          | Success                                          | Success                                        |
| Mandatory          | Optional                          | Present                                            | Success                                          | Success                                        |
| Mandatory          | Optional                          | Expired                                            | Success                                          | Success                                        |
| Mandatory          | Optional                          | Missing                                            | Success                                          | Success                                        |
| Mandatory          | Optional                          | Undefined                                          | Success                                          | Success                                        |
| Optional           | Optional                          | Present                                            | Success                                          | Success                                        |
| Optional           | Optional                          | Expired                                            | Success                                          | Success                                        |
| Optional           | Optional                          | Missing                                            | Success                                          | Success                                        |
| Optional           | Optional                          | Undefined                                          | Success                                          | Success                                        |

## Monitor certificate status with OCSP

September 21, 2020

Online Certificate Status Protocol (OCSP) is an Internet protocol that is used to determine the status of a client SSL certificate. Citrix ADC appliances support OCSP as defined in RFC 2560. OCSP offers significant advantages over certificate revocation lists (CRLs) in terms of timely information. Up-to-date revocation status of a client certificate is especially useful in transactions involving large sums of money and high-value stock trades. It also uses fewer system and network resources. Citrix ADC implementation of OCSP includes request batching and response caching.

## OCSP implementation

OCSP validation on a Citrix ADC appliance begins when the appliance receives a client certificate during an SSL handshake. To validate the certificate, the appliance creates an OCSP request and forwards it to the OCSP responder. To do so, the appliance uses a locally configured URL. The transaction is in a suspended state until the appliance evaluates the response from the server and determines whether to allow the transaction or reject it. If the response from the server is delayed beyond the configured time and no other responders are configured, the appliance will allow the transaction or display an error, depending on whether the OCSP check was set to optional or mandatory, respectively.

The appliance supports batching of OCSP requests and caching of OCSP responses to reduce the load on the OCSP responder and provide faster responses.

## OCSP request batching

Each time the appliance receives a client certificate, it sends a request to the OCSP responder. To help avoid overloading the OCSP responder, the appliance can query the status of more than one client certificate in the same request. For this to work efficiently, a timeout needs to be defined so that processing of a single certificate is not inordinately delayed while waiting to form a batch.

## OCSP response caching

Caching of responses received from the OCSP responder enables faster responses to the clients and reduces the load on the OCSP responder. Upon receiving the revocation status of a client certificate from the OCSP responder, the appliance caches the response locally for a predefined length of time. When a client certificate is received during an SSL handshake, the appliance first checks its local cache for an entry for this certificate. If an entry is found that is still valid (within the cache timeout limit), it is evaluated and the client certificate is accepted or rejected. If a certificate is not found, the appliance sends a request to the OCSP responder and stores the response in its local cache for a configured length of time.

**Note:** From release 12.1 build 49.x, the cache timeout limit is now increased to a maximum of 43200 minutes (30 days). Earlier the limit was 1440 minutes (one day). The increased limit helps reduce the lookups on the OCSP server and avoid any SSL/TLS connection failures in case the OCSP server is not reachable due to network or other problems.

## OCSP responder configuration

Configuring OCSP involves adding an OCSP responder, binding the OCSP responder to a certification authority (CA) certificate, and binding the certificate to an SSL virtual server. If you need to bind a different certificate to an OCSP responder that has already been configured, you need to first unbind the responder and then bind the responder to a different certificate.

**Add an OCSP responder by using the CLI**

At the command prompt, type the following commands to configure OCSP and verify the configuration:

```
1 add ssl ocsponder <name> -url <URL> [-cache ( ENABLED | DISABLED )
  [-cacheTimeout <positive_integer>]] [ -batchingDepth <
  positive_integer>][ -batchingDelay <positive_integer>] [-resptimeout
  <positive_integer>] [-responderCert <string> | -trustResponder] [-
  producedAtTimeSkew <positive_integer>][ -signingCert <string>][ -
  useNonce ( YES | NO )][ -insertClientCert( YES | NO )]
2 <!--NeedCopy-->
```

```
1 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
  positive_integer>]
2 <!--NeedCopy-->
```

```
1 bind ssl vsrver <vServerName>@ (-certkeyName <string> ( CA [-ocspCheck
  ( Mandatory | Optional )]))
2 <!--NeedCopy-->
```

```
1 show ssl ocsponder [<name>]
2 <!--NeedCopy-->
```

**Example:**

```
1 add ssl ocsponder ocsponder1 -url "http:// www.myCA.org:80/
  ocs/" -cache ENABLED -cacheTimeout 30 -batchingDepth 8 -
  batchingDelay 100 -resptimeout 100 -responderCert responder_cert -
  producedAtTimeSkew 300 -signingCert sign_cert -insertClientCert YES
2 <!--NeedCopy-->
```

```
1 bind ssl certKey ca_cert -ocspResponder ocsponder1 -priority 1
2 <!--NeedCopy-->
```

```
1 bind ssl vsrver vs1 -certkeyName ca_cert -CA -ocspCheck Mandatory
2 <!--NeedCopy-->
```

```
1 sh ocsponder ocsponder1
2
3 1)Name: ocsponder1
4 URL: http://www.myCA.org:80/ocs/, IP: 192.128.22.22
5 Caching: Enabled Timeout: 30 minutes
```

```

6   Batching: 8 Timeout: 100 mS
7   HTTP Request Timeout: 100mS
8   Request Signing Certificate: sign_cert
9   Response Verification: Full, Certificate: responder_cert
10  ProducedAt Time Skew: 300 s
11  Nonce Extension: Enabled
12  Client Cert Insertion: Enabled
13  Done
14 <!--NeedCopy-->

```

```

1  show certkey ca_cert
2
3   Name: ca_cert      Status: Valid,   Days to expiration:8907
4   Version: 3
5   ...
6
7   1) VServer name: vs1      CA Certificate
8   1) OCSP Responder name: ocsponder1   Priority: 1
9  Done
10 <!--NeedCopy-->

```

```

1  sh ssl vs vs1
2
3   Advanced SSL configuration for VServer vs1:
4   DH: DISABLED
5   ...
6
7   1) CertKey Name: ca_cert CA Certificate OCSPCheck: Mandatory
8   1) Cipher Name: DEFAULT
9   Description: Predefined Cipher Alias
10 Done
11 <!--NeedCopy-->

```

### Modify an OCSP responder by using the CLI

You cannot modify the responder name. All other parameters can be changed using the `set ssl ocsponder` command.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1  set ssl ocsponder <name> [-url <URL>] [-cache ( ENABLED | DISABLED)
   ] [-cacheTimeout <positive_integer>] [-batchingDepth <
   positive_integer>] [-batchingDelay <positive_integer>] [-resptimeout

```

```
    <positive_integer>] [ -responderCert <string> | -trustResponder][-
    producedAtTimeSkew <positive_integer>][-signingCert <string>] [-
    useNonce ( YES | NO )]
2
3 unbind ssl certKey [<certkeyName>] [-ocspResponder <string>]
4
5 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
    positive_integer>]
6
7 show ssl ocspResponder [<name>]
8 <!--NeedCopy-->
```

### Configure an OCSP responder by using the GUI

1. Navigate to **Traffic Management > SSL > OCSP Responder**, and configure an OCSP responder.
2. Navigate to **Traffic Management > SSL > Certificates**, select a certificate, and in the **Action** list, select **OCSP Bindings**. Bind an OCSP responder.
3. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, open a virtual server, and click in the Certificates section to bind a CA certificate.
4. Optionally, select **select OCSP Mandatory**.

## OCSP stapling

October 14, 2020

The Citrix ADC implementation of CRL and OCSP reports the revocation status of client certificates only. To check the revocation status of a server certificate received during an SSL handshake, a client must send a request to a certificate authority.

For websites with heavy traffic, many clients receive the same server certificate. If each client sent a query for the revocation status of the server certificate, the certificate authority would be inundated with OCSP requests to check the validity of the certificate.

### OCSP stapling solution

To avoid unnecessary congestion, the Citrix ADC appliance now supports OCSP stapling. That is, the appliance can now send the revocation status of a server certificate to a client, at the time of the SSL handshake, after validating the certificate status from an OCSP responder. The revocation status of a server certificate is “stapled” to the response the appliance sends to the client as part of the SSL

handshake. To use the OCSP stapling feature, you must enable it on an SSL virtual server and add an OCSP responder on the appliance.

**Note:**

- Citrix ADC appliances support OCSP stapling as defined in RFC 6066.
- OCSP stapling is supported only on the front-end of Citrix ADC appliances.

**Important:**

Citrix ADC support for OCSP stapling is limited to handshakes using TLS protocol version 1.0 or higher.

### OCSP response caching of server certificates

During the SSL handshake, when a client requests the revocation status of the server certificate, the appliance first checks its local cache for an entry for this certificate. If a valid entry is found, it is evaluated and the server certificate and its status are presented to the client. If a revocation status entry is not found, the appliance sends a request for the revocation status of the server certificate to the OCSP responder. If it receives a response, it sends the certificate and the revocation status to the client. If the next update field is present in the OCSP response, the response is cached for the configured length of time (value specified in the timeout field.)

**Note:** From release 12.1 build 49.x, you can clear the cached response, of the server certificate, from the OCSP responder even before the timeout expires. Earlier, it was not possible to discard the cached status in the certificate-key pair until the configured timeout was over.

To clear the cached status by using the CLI, at the command prompt, type:

```
1 clear ssl certKey <certkey name> -ocspstaplingCache
2 <!--NeedCopy-->
```

**Example:**

```
1 clear ssl certKey s1 -ocspstaplingCache
2 <!--NeedCopy-->
```

To clear the cached status by using the GUI

1. In the GUI, navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. In the details pane, select a certificate.
3. In the **Select Action** list, select **Clear**. When prompted to confirm, click **Yes**.

## OCSP stapling configuration

Configuring OCSP stapling involves enabling the feature and configuring OCSP. To configure OCSP, you must add an OCSP responder, bind the OCSP responder to a CA certificate, and bind the certificate to an SSL virtual server.

**Note:**

OCSP responders with only HTTP based URL are supported.

### Enable OCSP stapling by using the CLI

At the command prompt, type:

```
1 set ssl vserver <name> -ocspstapling [ENABLED | DISABLED]
2 <!--NeedCopy-->
```

**Example:**

```
1 set ssl vserver vip1 -ocspStapling ENABLED
2 Done
3
4 sh ssl vserver vip1
5
6     Advanced SSL configuration for VServer vip1:
7     DH: DISABLED
8     DH Private-Key Exponent Size Limit: DISABLED Ephemeral RSA:
9         ENABLED Refresh Count: 0
10    Session Reuse: ENABLED Timeout: 120 seconds
11    Cipher Redirect: DISABLED
12    SSLv2 Redirect: DISABLED
13    ClearText Port: 0
14    Client Auth: DISABLED
15    SSL Redirect: DISABLED
16    Non FIPS Ciphers: DISABLED
17    SNI: ENABLED
18    OCSP Stapling: ENABLED
19    SSLv2: DISABLED SSLv3: DISABLED TLSv1.0: ENABLED TLSv1.1: ENABLED
20    TLSv1.2: ENABLED
21    Push Encryption Trigger: Always
22    Send Close-Notify: YES
23
24    ECC Curve: P_256, P_384, P_224, P_521
25
26    1) CertKey Name: server_certificate1 Server Certificate
```

```

26     1) Cipher Name: DEFAULT
27     Description: Default cipher list with encryption strength >= 128
           bit
28 Done
29 <!--NeedCopy-->

```

**Note:** If the default (enhanced) profile is enabled, use the `set ssl profile <profile name> -ocspStapling [ENABLED | DISABLED]` command to enable or disable OCSP.

### Enable OCSP stapling by using the GUI

1. Navigate to **Traffic Management > SSL > Virtual Server**.
2. Open a virtual server and, in **SSL Parameters**, select **OCSP Stapling**.

### OCSP configuration

An OCSP responder is added dynamically or manually to send OCSP stapling requests. An internal responder is dynamically added when you add a server certificate and its issuer certificate based on the OCSP URL in the server certificate. A manual OCSP responder is added from the CLI or GUI. To send an OCSP request for a server certificate, the Citrix ADC appliance selects an OCSP responder based on the priority assigned to it when binding it to an issuer certificate. If a responder fails to send an OCSP stapling request, the responder with the next highest priority is selected for sending the request. For example, if only one responder is manually configured and it fails and a dynamically bound responder exists, it is selected for sending the OCSP request.

If the OCSP URL is other than HTTP, an internal OCSP responder is not created.

#### Note

A manually added OCSP responder takes precedence over a dynamically added responder.

### Difference between a manually created OCSP responder and an internally created OCSP responder

#### Manually created OCSP responder

Created manually and explicitly bound to the issuer certificate with a priority.

#### Internally (dynamically) created OCSP responder

Created and bound by default, while adding a server certificate and its issuer certificate (CA certificate). Name starts with “ns\_internal\_”.

|                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority between 1 and 127 is reserved for a configured responder.                                                                                                             | Priority is automatically assigned from 128 onwards.                                                                                                                                                                                                                                                                                               |
| URL and batching depth can be changed.                                                                                                                                         | URL and batching depth cannot be changed.                                                                                                                                                                                                                                                                                                          |
| Deleted directly.                                                                                                                                                              | Deleted only when you delete the server certificate or the CA certificate.                                                                                                                                                                                                                                                                         |
| Can be bound to any CA certificate.                                                                                                                                            | Bound by default to one CA certificate. Cannot be bound to any other CA certificate.                                                                                                                                                                                                                                                               |
| Saved in the configuration (ns.conf).                                                                                                                                          | Add commands are not saved in the configuration. Only set commands are saved.                                                                                                                                                                                                                                                                      |
| If you bind three OCSP responders to the same issuer certificate with priorities 1, 2, and 3 respectively, and later unbind priority 2, the other priorities are not affected. | Three OCSP responders are automatically bound to an issuer certificate with priorities 128, 129, and 130 respectively. If you remove the server certificate that was used to create a responder bound with priority 129, then that responder is deleted. Also, the priority for the next responder (priority 130) is automatically changed to 129. |

#### Example of request handling:

1. Add a virtual server (VIP1).
2. Add issuer certificate (CA1) and bind it to VIP1.
3. Add three certificates S1, S2, and S3. Internal responders resp1, resp2, and resp3 respectively are created by default.
4. Bind S3 to VIP1.
5. A request comes to VIP1. Responder resp3 is selected.

To create an internal OCSP responder dynamically, the appliance needs the following:

- Certificate of the issuer of the server certificate (usually the CA certificate).
- Certificate-key pair of the server certificate. This certificate must contain the OCSP URL provided by the certificate authority. The URL is used as the name of the dynamically added internal responder.

An internal OCSP responder has the same default values as a manually configured responder.

#### Note:

Caching is disabled by default on an internal responder. Use the `set ssl ocsponder`

command to enable caching.

### Configure OCSP by using the CLI

At the command prompt, type the following commands to configure OCSP and verify the configuration:

```

1 add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <
  string> | -fipsKey <string> | -hsmKey <string>] [-inform <inform>]
  [-expiryMonitor ( ENABLED | DISABLED ) [-notificationPeriod <
  positive_integer>]] [-bundle ( YES | NO )]
2
3 add ssl ocsponder <name> -url <URL> [-cache ( ENABLED | DISABLED )
  [-cacheTimeout <positive_integer>]] [-resptimeout <positive_integer
  >] [-responderCert <string> | -trustResponder] [-producedAtTimeSkew
  <positive_integer>][--signingCert <string>][--useNonce ( YES | NO )][
  -insertClientCert ( YES | NO )]
4
5 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
  positive_integer>]
6
7 show ssl ocsponder [<name>]
8 <!--NeedCopy-->

```

#### Parameters:

#### httpMethod:

HTTP method used to send OCSP requests. For requests, less than 255 bytes long, you can configure the HTTP GET method for queries to an OCSP server. If you specify the GET method but the length is greater than 255 bytes, the appliance uses the default method (POST).

Possible values: GET, POST

Default value: POST

#### ocspUrlResolveTimeout:

Time, in milliseconds, to wait for an OCSP URL resolution. After this time elapses, the responder with the next higher priority is selected. If all the responders fail, an error message appears or the connection is dropped, depending on the settings on the virtual server.

Minimum value: 100

Maximum value: 2000

#### Example:

```

1 add ssl certkey root_ca1 - cert root_cacert.pem
2 add ssl ocsponder ocsponder1 -url "http:// www.myCA.org:80/
  ocsponder/" -cache ENABLED -cacheTimeout 30 -resptimeout 100 -
  responderCert responder_cert -producedAtTimeSkew 300 -signingCert
  sign_cert -insertClientCert YES
3 bind ssl certKey root_ca1 -ocsponder ocsponder1 -priority 1
4 sh ocsponder ocsponder1
5     1)Name: ocsponder1
6     URL: http://www.myCA.org:80/ocsponder/, IP: 192.128.22.22
7     Caching: Enabled      Timeout: 30 minutes
8     Batching: 8 Timeout: 100 mS
9     HTTP Request Timeout: 100mS
10    Request Signing Certificate: sign_cert
11    Response Verification: Full, Certificate: responder_cert
12    ProducedAt Time Skew: 300 s
13    Nonce Extension: Enabled
14    Client Cert Insertion: Enabled
15    Done
16
17 show certkey root_ca1
18     Name: root_ca1      Status: Valid,   Days to expiration:8907
19     Version: 3
20     ...
21     1) OCSP Responder name: ocsponder1      Priority: 1
22     Done
23 <!--NeedCopy-->

```

### Modify OCSP by using the CLI

You cannot modify the name of an OCSP responder, but you can use the `set ssl ocsponder` command to change any of the other parameters.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```

1 set ssl ocsponder <name> [-url <URL>] [-cache ( ENABLED | DISABLED)
  ] [-cacheTimeout <positive_integer>] [-resptimeout <
  positive_integer>] [ -responderCert <string> | -trustResponder][
  producedAtTimeSkew <positive_integer>][-signingCert <string>] [-
  useNonce ( YES | NO )]
2
3 unbind ssl certKey [<certkeyName>] [-ocsponder <string>]
4

```

```
5 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
    positive_integer>]
6
7 show ssl ocspResponder [<name>]
8 <!--NeedCopy-->
```

### Configure OCSP by using the GUI

1. Navigate to **Traffic Management > SSL > OCSP Responder**, and configure an OCSP responder.
2. Navigate to **Traffic Management > SSL > Certificates**, select a certificate, and in the **Action** list, select **OCSP Bindings. Bind an OCSP responder**.
3. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, open a virtual server, and click in the Certificates section to bind a CA certificate.
4. Optionally, select **OCSP Mandatory**.

#### Note:

The insert client certificate parameter in the `add ssl ocspResponder` and the `set ssl ocspResponder` commands is no longer valid. That is, the parameter is ignored during configuration.

## Ciphers available on the Citrix ADC appliances

September 21, 2020

Your Citrix ADC appliance ships with a predefined set of cipher groups. To use ciphers that are not part of the DEFAULT cipher group, you have to explicitly bind them to an SSL virtual server. You can also create a user-defined cipher group to bind to the SSL virtual server.

For the list of ciphers supported on the different platforms, such as FIPS, VPX, and MPX (N3), see [Ciphers available on the NetScaler appliances](#).

### ECDHE ciphers

September 21, 2020

All Citrix ADC appliances support the ECDHE cipher group on the front end and the back end. On an SDX appliance, if an SSL chip is assigned to a VPX instance, the cipher support of an MPX appliance applies. Otherwise, the normal cipher support of a VPX instance applies.

For more information about the builds and platforms that support these ciphers, see [Ciphers available on the Citrix ADC appliances](#).

ECDHE cipher suites use elliptical curve cryptography (ECC). Because of its smaller key size, ECC is especially useful in a mobile (wireless) environment or an interactive voice response environment, where every millisecond is important. Smaller key sizes save power, memory, bandwidth, and computational cost.

A Citrix ADC appliance supports the following ECC curves:

- P\_256
- P\_384
- P\_224
- P\_521

**Note:** If you upgrade from a build earlier than release 10.1 build 121.10, you must explicitly bind ECC curves to your existing SSL virtual servers or front end services. The curves are bound by default to any virtual servers or front end services that you create after the upgrade.

You can bind an ECC curve to SSL front-end entities only. By default all four curves are bound, in the following order: P\_256,P\_384,P\_224,P\_521. To change the order, you must first unbind all the curves, and then bind them in the desired order.

### Unbind and bind ECC curves to an SSL virtual server by using the CLI

At the command prompt, type:

```
1 unbind ssl vserver <vServerName > -eccCurveName ALL
2
3 bind ssl vserver <vServerName > -eccCurveName <eccCurveName >
4 <!--NeedCopy-->
```

#### Example:

```
1 unbind ssl vs v1 - eccCurvename ALL
2
3 bind ssl vserver v1 -eccCurveName P_224
4
5 sh ssl vserver v1
6
7 Advanced SSL configuration for VServer v1:
8 DH: DISABLED
9 Ephemeral RSA: ENABLED Refresh Count: 0
10 Session Reuse: ENABLED Timeout: 120 seconds
11 Cipher Redirect: DISABLED
12 SSLv2 Redirect: DISABLED
```

```
13 ClearText Port: 0
14 Client Auth: DISABLED
15 SSL Redirect: DISABLED
16 Non FIPS Ciphers: DISABLED
17 SNI: DISABLED
18 SSLv2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.1: DISABLED
   TLSv1.2: DISABLED
19 Push Encryption Trigger: Always
20 Send Close-Notify: YES
21 ECC Curve: P_224
22
23 1) Cipher Name: DEFAULT
24 Description: Predefined Cipher Alias
25 Done
26 <!--NeedCopy-->
```

## Diffie-Hellman parameters generation and achieving PFS with DHE

September 21, 2020

The Diffie-Hellman (DH) key exchange is a way for two parties involved in an SSL transaction to agree upon a shared secret over an insecure channel. These parties have no prior knowledge about each other. This secret can be converted into cryptographic keying material for symmetric key cipher algorithms that require such a key exchange.

This feature is disabled by default. Configured the feature to support ciphers that use DH as the key exchange algorithm.

**Note:**

Generating 2048-bit DH parameters might take a long time (up to 30 minutes).

### Generate DH parameters by using the CLI

At the command prompt, type the following command:

```
1 create ssl dhparam <dhFile> [<bits>] [-gen (2 | 5)]
2 <!--NeedCopy-->
```

**Example:**

```
1 create ssl dhparam Key-DH-1 512 -gen 2
2 <!--NeedCopy-->
```

## Generate DH parameters by using the GUI

Navigate to **Traffic Management > SSL** and, in the **Tools** group, select **Create Diffie-Hellman (DH) key**, and **Configure SSL DH Param**.

### Note:

For information about DH parameters, see [Diffie-Hellman parameters](#).

## Achieve perfect forward secrecy with DHE

Generating DH parameters is a CPU-intensive operation. In earlier releases, parameter generation, on a VPX appliance, took a long time because it was done in the software. Parameter generation is optimized by setting the `dhKeyExpSizeLimit` parameter. You can set this parameter for an SSL virtual server or an SSL profile and then bind the profile to a virtual server.

You can maintain perfect forward secrecy (PFS) on Citrix ADC MPX appliances by setting DH count equal to zero. As a result, DH parameters are generated for each transaction (minimum `DHcount` is 0) on Citrix ADC MPX appliances. These parameters are generated without a significant drop in performance, because the operation is optimized. Earlier, the minimum DH count allowed was 500. That is, you could not regenerate the key for up to 500 transactions.

On a Citrix ADC VPX appliance, you can generate DH parameters for every 500 transaction at the minimum (`DHcount` = 500). If you set `DHcount` equal to 0, then the DH parameters are not regenerated.

### Limitation:

You cannot achieve PFS in VPX today with DH ciphers.

## Optimize DH parameters generation by using the CLI

At the command prompt, type commands 1 and 2, or type command 3:

```
1 1. add ssl profile <name> [-sslProfileType ( BackEnd | FrontEnd )] [-
    dhCount <positive_integer>] [-dh ( ENABLED | DISABLED) -dhFile <
    string>] [-dhKeyExpSizeLimit ( ENABLED | DISABLED)]
2 2. set ssl vserver <vServerName> [-sslProfile <string>]
3 <!--NeedCopy-->
```

```
1 3. set ssl vserver <vServerName> [-dh ( ENABLED | DISABLED) -dhFile <
    string>] [-dhCount <positive_integer>] [-dhKeyExpSizeLimit ( ENABLED
    | DISABLED )]
2 <!--NeedCopy-->
```

## Optimize DH parameters generation by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the **SSL Parameters** section, select **Enable DH Key Expire Size Limit**.

## Cipher redirection

September 21, 2020

During the SSL handshake, the SSL client (usually a web browser) announces the suite of ciphers that it supports, in the configured order of cipher preference. From that list, the SSL server then selects a cipher that matches its own list of configured ciphers.

If the ciphers announced by the client do not match those configured on the SSL server, the SSL handshake fails, and the failure is announced by a cryptic error message displayed in the browser. These messages rarely mention the exact cause of the error.

With cipher redirection, you can configure an SSL virtual server to deliver accurate, meaningful error messages when an SSL handshake fails. When SSL handshake fails, the Citrix ADC appliance redirects the user to a previously configured URL or, if no URL is configured, displays an internally generated error page.

## Configure cipher redirection by using the CLI

At the command prompt, type the following commands to configure cipher redirection and verify the configuration:

```
1 - set ssl vserver <vServerName> -cipherRedirect < ENABLED | DISABLED>
   -cipherURL < URL>
2 - show ssl vserver <vServerName>
3 <!--NeedCopy-->
```

### Example:

```
1 set ssl vserver vs-ssl -cipherRedirect ENABLED -cipherURL http://
   redirectURL
2
3 Done
4
5 show ssl vserver vs-ssl
6
7 Advanced SSL configuration for VServer vs-ssl:
8 DH: DISABLED
```

```
9 Ephemeral RSA: ENABLED Refresh Count: 1000
10 Session Reuse: ENABLED Timeout: 600 seconds
11 Cipher Redirect: ENABLED Redirect URL: http://redirectURL
12 SSLv2 Redirect: DISABLED
13 ClearText Port: 0
14 Client Auth: DISABLED
15 SSL Redirect: DISABLED
16 Non FIPS Ciphers: DISABLED
17 SNI: DISABLED
18 OCSP Stapling: DISABLED
19 HSTS: DISABLED
20 HSTS IncludeSubDomains: NO
21 HSTS Max-Age: 0
22 SSLv2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.2: ENABLED
    TLSv1.2: ENABLED
23 1) CertKey Name: Auth-Cert-1 Server Certificate
24 1) Cipher Name: DEFAULT
25 Description: Predefined Cipher Alias
26 Done
27 <!--NeedCopy-->
```

## Configure cipher redirection by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open a virtual server.
2. In the **SSL Parameters** section, select **Enable Cipher Redirect**, and specify a redirect URL.

## Leverage hardware and software to improve ECDHE and ECDSA cipher performance

November 5, 2020

### Note:

This enhancement is applicable only to the following platforms:

- MPX/SDX 11000
- MPX/SDX 14000
- MPX 22000, MPX 24000, and MPX 25000
- MPX/SDX 14000 FIPS

Previously, ECDHE and ECDSA computation on a Citrix ADC appliance was performed only on the hardware (Cavium chips), which limited the number of SSL sessions at any given time. With this enhance-

ment, some operations are also performed in the software. That is, processing is done both on the Cavium chips and on the CPU cores to improve ECDHE and ECDSA cipher performance.

The processing is first performed in software, up to the configured software crypto threshold. After this threshold is reached, the operations are offloaded to the hardware. Therefore, this hybrid model leverages both hardware and software to improve SSL performance. You can enable the hybrid model by setting the “softwareCryptoThreshold” parameter to suit your requirement. To disable the hybrid model, set this parameter to 0.

Benefits are greatest if the current CPU utilization is not too high, because the CPU threshold is not exclusive to ECDHE and ECDSA computation. For example, if the current workload on the Citrix ADC appliance consumes 50% of the CPU cycles, and the threshold is set to 80%, ECDHE and ECDSA computation can use an extra 30% of the cycles. After the configured software crypto threshold of 80% is reached, further ECDHE and ECDSA computation is offloaded to the hardware. In that case, actual CPU utilization might exceed 80%, because performing ECDHE and ECDSA computations in hardware consumes some CPU cycles.

### Enable the hybrid model by using the CLI

At the command prompt, type:

```
1 set ssl parameter -softwareCryptoThreshold <positive_integer>
2
3 Synopsis:
4
5 softwareCryptoThreshold:
6
7 Citrix ADC CPU utilization threshold (as a percentage) beyond which
   crypto operations are not done in software. A value of zero implies
   that CPU is not utilized for doing crypto in software.
8
9 Default = 0
10
11 Min = 0
12
13 Max = 100
14 <!--NeedCopy-->
```

### Example:

```
1 >set ssl parameter - softwareCryptoThreshold 80
2 Done
3
4 >show ssl parameter
```

```
5 Advanced SSL Parameters
6
7 SSL quantum size           : 8 KB
8 Max CRL memory size       : 256 MB
9 Strict CA checks           : NO
10 Encryption trigger timeout : 100 ms
11 Send Close-Notify         : YES
12 Encryption trigger packet c : 45
13 Deny SSL Renegotiation    : ALL
14 Subject/Issuer Name Insertion Format : Unicode
15 OCSP cache size           : 10 MB

17 Strict Host Header check for SNI enabled SSL sessions : NO
18 PUSH encryption trigger timeout : 1 ms
19 Crypto Device Disable Limit : 0
20 Global undef action for control policies : CLIENTAUTH
21 Global undef action for data policies : NOOP
22 Default profile            : DISABLED
23 Disable TLS 1.1/1.2 for SSL_BRIDGE secure monitors : NO
24 Disable TLS 1.1/1.2 for dynamic and VPN services : NO
25 Software Crypto acceleration CPU Threshold : 80
26 Signature and Hash Algorithms supported by TLS1.2 : ALL
27 <!--NeedCopy-->
```

## Enable the hybrid model by using the GUI

1. Navigate to **Traffic Management > SSL > Change advanced SSL settings**.
2. Enter a value for **Software Crypto Threshold (%)**.

## ECDSA cipher suites support

September 21, 2020

ECDSA cipher suites use elliptical curve cryptography (ECC). Because of its smaller size, it is helpful in environments where processing power, storage space, bandwidth, and power consumption are constrained.

The following Citrix ADC appliances now support the elliptical curve digital signature algorithm (ECDSA) cipher group:

- Citrix ADC MPX and SDX appliances with N3 chips
- Citrix ADC MPX 5900/8900/15000/26000

- Citrix ADC SDX 8900/15000
- Citrix ADC VPX appliances

When the ECDHE\_ECDSA cipher group is used, the server's certificate must contain an ECDSA-capable public key.

**Note:** From release 12.1 build 50.x, you can create an ECDSA key in PKCS#8 format.

**Example:**

```

1 sh ssl cipher ECDSA
2
3 1)      Cipher Name: TLS1-ECDHE-ECDSA-AES256-SHA      Priority : 1
4 Description: SSLv3 Kx=ECC-DHE Au=ECDSA Enc=AES(256) Mac=SHA1
      HexCode=0xc00a
5 2)      Cipher Name: TLS1-ECDHE-ECDSA-AES128-SHA      Priority : 2
6 Description: SSLv3 Kx=ECC-DHE Au=ECDSA Enc=AES(128) Mac=SHA1
      HexCode=0xc009
7 3)      Cipher Name: TLS1.2-ECDHE-ECDSA-AES256-SHA384 Priority : 3
8 Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=AES(256) Mac=SHA-384
      HexCode=0xc024
9 4)      Cipher Name: TLS1.2-ECDHE-ECDSA-AES128-SHA256 Priority : 4
10 Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=AES(128) Mac=SHA-256
      HexCode=0xc023
11 5)      Cipher Name: TLS1.2-ECDHE-ECDSA-AES256-GCM-SHA384
      Priority : 5
12 Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=AES-GCM(256) Mac=AEAD
      HexCode=0xc02c
13 6)      Cipher Name: TLS1.2-ECDHE-ECDSA-AES128-GCM-SHA256
      Priority : 6
14 Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=AES-GCM(128) Mac=AEAD
      HexCode=0xc02b
15 7)      Cipher Name: TLS1-ECDHE-ECDSA-DES-CBC3-SHA      Priority : 7
16 Description: SSLv3 Kx=ECC-DHE Au=ECDSA Enc=3DES(168) Mac=SHA1
      HexCode=0xc008
17 8)      Cipher Name: TLS1-ECDHE-ECDSA-RC4-SHA      Priority : 8
18 Description: SSLv3 Kx=ECC-DHE Au=ECDSA Enc=RC4(128) Mac=SHA1
      HexCode=0xc007
19 9)      Cipher Name: TLS1.2-ECDHE-ECDSA-CHACHA20-POLY1305
      Priority : 9
20 Description: TLSv1.2 Kx=ECC-DHE Au=ECDSA Enc=CHACHA20/POLY1305(256)
      Mac=AEAD HexCode=0xcca9
21 Done
22 <!--NeedCopy-->

```

The following table lists the ECDSA ciphers that are supported on the Citrix ADC MPX and SDX ap-

pliances with N3 chips, Citrix ADC VPX appliances, MPX 5900/26000, and MPX/SDX 8900/15000 appliances.

| Cipher Name                          | Priority | Description | Key Exchange Algorithm | Authentication Algorithm | Encryption Algorithm (Key Size) | Message Authentication Code (MAC) Algorithm | HexCode |
|--------------------------------------|----------|-------------|------------------------|--------------------------|---------------------------------|---------------------------------------------|---------|
| TLS1-ECDHE-ECDSA-AES128-SHA          | 1        | SSLv3       | ECC-DHE                | ECDSA                    | AES(128)                        | SHA1                                        | 0xc009  |
| TLS1-ECDHE-ECDSA-AES256-SHA          | 2        | SSLv3       | ECC-DHE                | ECDSA                    | AES(256)                        | SHA1                                        | 0xc00a  |
| TLS1.2-ECDHE-ECDSA-AES128-SHA256     | 3        | TLSv1.2     | ECC-DHE                | ECDSA                    | AES(128)                        | SHA-256                                     | 0xc023  |
| TLS1.2-ECDHE-ECDSA-AES256-SHA384     | 4        | TLSv1.2     | ECC-DHE                | ECDSA                    | AES(256)                        | SHA-384                                     | 0xc024  |
| TLS1.2-ECDHE-ECDSA-AES128-GCM-SHA256 | 5        | TLSv1.2     | ECC-DHE                | ECDSA                    | AES-GCM(128)                    | SHA-256                                     | 0xc02b  |

| Cipher Name                          | Priority | Description | Key Exchange Algorithm | Authentication Algorithm | Encryption Algorithm (Key Size) | Message Authentication Code (MAC) Algorithm | HexCode |
|--------------------------------------|----------|-------------|------------------------|--------------------------|---------------------------------|---------------------------------------------|---------|
| TLS1.2-ECDHE-ECDSA-AES256-GCM-SHA384 | 6        | TLSv1.2     | ECC-DHE                | ECDSA                    | AES-GCM(256)                    | SHA-384                                     | 0xc02c  |
| TLS1-ECDHE-ECDSA-RC4-SHA             | 7        | SSLv3       | ECC-DHE                | ECDSA                    | RC4(128)                        | SHA1                                        | 0xc007  |
| TLS1-ECDHE-ECDSA-DES-CBC3-SHA        | 8        | SSLv3       | ECC-DHE                | ECDSA                    | 3DES(168)                       | SHA1                                        | 0xc008  |
| TLS1.2-ECDHE-ECDSA-CHACHA20-POLY1305 | 9        | TLSv1.2     | ECC-DHE                | ECDSA                    | CHACHA20/                       | AEAD                                        | 0xc0a9  |

**Important**

Use the **show ns hardware** command to find out if your appliance has N3 chips.

**Example:**

```

1 sh ns hardware
2           Platform: NSMPX-22000 16*CPU+24*IX+12*E1K+2*E1K+4*CVM N3
           2200100
3           Manufactured on: 8/19/2013
4           CPU: 2900MHZ
5           Host Id: 1006665862

```

```
6          Serial no: ENUK6298FT
7          Encoded serial no: ENUK6298FT
8      Done
9 <!--NeedCopy-->
```

## ECDSA/RSA cipher and certificate selection

You can bind both ECDSA and RSA server certificates at the same time to an SSL virtual server. When both ECDSA and RSA certificates are bound to the virtual server, it automatically selects the appropriate server certificate to present to the client. If the client cipher list includes RSA ciphers, but does not include ECDSA ciphers, the virtual server presents the RSA server certificate. If both ciphers are present in the client's list, then the server certificate presented depends on the cipher priority set on the virtual server. That is, if RSA has a higher priority, the RSA certificate is presented. If ECDSA has a higher priority, the ECDSA certificate is presented to the client.

## Client authentication by using an ECDSA or an RSA certificate

For client authentication, the CA certificate bound to the virtual server can be ECDSA or RSA signed. The appliance supports a mixed certificate chain. For example, the following certificate chain is supported.

Client certificate (ECDSA) <-> CA certificate (RSA) <-> Intermediate certificate (RSA) <-> Root certificate (RSA)

### Note

ECDSA certificates with only the following curves are supported:

- prime256v1
- secp384r1
- secp521r1 (VPX only)
- secp224r1 (VPX only)

## Create an ECDSA certificate-key pair

You can create an ECDSA certificate-key pair directly on a Citrix ADC appliance by using the CLI or the GUI. Earlier, you could install and bind an ECC certificate-key pair on the appliance, but you had to use OpenSSL to create a certificate-key pair.

Only P\_256 and P\_384 curves are supported.

**Note**

This support is available on all platforms except MPX 9700/1050/12500/15500.

**To create an ECDSA certificate-key pair by using the CLI:**

At the command prompt, type:

```
1 create ssl ecdsaKey <keyFile> -curve ( P_256 | P_384 ) [-keyform ( DER
  | PEM )] [-des | -des3] {
2   -password }
3   [-pkcs8]
4 <!--NeedCopy-->
```

**Example:**

```
1 create ecdsaKey ec_p256.ky -curve P_256 -pkcs8
2 Done
3 create ecdsaKey ec_p384.ky -curve P_384
4 Done
5 <!--NeedCopy-->
```

**To create an ECDSA certificate-key pair by using the GUI:**

1. Navigate to **Traffic Management > SSL > SSL Files > Keys** and click **Create ECDSA Key**.
2. To create a key in PKCS#8 format, select **PKCS8**.

## Configure user-defined cipher groups on the ADC appliance

September 21, 2020

A cipher group is a set of cipher suites that you bind to an SSL virtual server, service, or service group on the Citrix ADC appliance. A cipher suite comprises a protocol, a key exchange (**Kx**) algorithm, an authentication (**Au**) algorithm, an encryption (**Enc**) algorithm, and a message authentication code (**Mac**) algorithm. Your appliance ships with a predefined set of cipher groups. When you create an SSL service or SSL service group, the ALL cipher group is automatically bound to it. However, when you create an SSL virtual server or a transparent SSL service, the DEFAULT cipher group is automatically bound to it. In addition, you can create a user-defined cipher group and bind it to an SSL virtual server, service, or service group.

**Note:** If your MPX appliance does not have any licenses, then only the EXPORT cipher is bound to your SSL virtual server, service, or service group.

To create a user-defined cipher group, first you create a cipher group and then you bind ciphers or cipher groups to this group. If you specify a cipher alias or a cipher group, all the ciphers in the cipher

alias or group are added to the user-defined cipher group. You can also add individual ciphers (cipher suites) to a user-defined group. However, you cannot modify a predefined cipher group. Before removing a cipher group, unbind all the cipher suites in the group.

Binding a cipher group to an SSL virtual server, service, or service group, appends the ciphers to the existing ciphers that are bound to the entity. To bind a specific cipher group to the entity, you must first unbind the ciphers or cipher group that is bound to the entity. Then bind the specific cipher group to the entity. For example, to bind only the AES cipher group to an SSL service, you perform the following steps:

1. Unbind the default cipher group ALL that is bound by default to the service when the service is created.

```
1 unbind ssl service <service name> -cipherName ALL
2 <!--NeedCopy-->
```

2. Bind the AES cipher group to the service

```
1 bind ssl service <Service name> -cipherName AE
2 <!--NeedCopy-->
```

If you want to bind the cipher group DES in addition to AES, at the command prompt, type:

```
1 bind ssl service <service name> -cipherName DES
2 <!--NeedCopy-->
```

**Note:** The free Citrix ADC virtual appliance supports only the DH cipher group.

### Configure a user-defined cipher group by using the CLI

At the command prompt, type the following commands to add a cipher group, or to add ciphers to a previously created group, and verify the settings:

```
1 add ssl cipher <cipherGroupName>
2 bind ssl cipher <cipherGroupName> -cipherName <string>
3 show ssl cipher <cipherGroupName>
4 <!--NeedCopy-->
```

#### Example:

```
1 add ssl cipher test
2
3 Done
4
5 bind ssl cipher test -cipherName ECDHE
```

```
6
7 Done
8
9 sh ssl cipher test
10
11 1)      Cipher Name: TLS1-ECDHE-RSA-AES256-SHA Priority : 1
12 Description: SSLv3 Kx=ECC-DHE Au=RSA Enc=AES(256) Mac=SHA1 HexCode
    =0xc014
13 2)      Cipher Name: TLS1-ECDHE-RSA-AES128-SHA Priority : 2
14 Description: SSLv3 Kx=ECC-DHE Au=RSA Enc=AES(128) Mac=SHA1 HexCode
    =0xc013
15 3)      Cipher Name: TLS1.2-ECDHE-RSA-AES-256-SHA384 Priority : 3

```

### Unbind ciphers from a cipher group by using the CLI

At the command prompt, type the following commands to unbind ciphers from a user-defined cipher group, and verify the settings:

```

1 show ssl cipher <cipherGroupName>
2
3 unbind ssl cipher <cipherGroupName> -cipherName <string>
4
5 show ssl cipher <cipherGroupName>
6 <!--NeedCopy-->

```

### Remove a cipher group by using the CLI

**Note:** You cannot remove a built-in cipher group. Before removing a user-defined cipher group, make sure that the cipher group is empty.

At the command prompt, type the following commands to remove a user-defined cipher group, and verify the configuration:

```

1 rm ssl cipher <userDefCipherGroupName> [<cipherName> ...]
2 show ssl cipher <cipherGroupName>
3

```

```
4 <!--NeedCopy-->
```

**Example:**

```
1 rm ssl cipher test Done
2
3 sh ssl cipher test ERROR: No such resource [cipherGroupName, test]
4 <!--NeedCopy-->
```

**Configure a user-defined cipher group by using the GUI**

Navigate to **Traffic Management > SSL > Cipher Groups**, and configure a cipher group.

**To bind a cipher group to an SSL virtual server, service, or service group by using the CLI:**

At the command prompt, type one of the following:

```
1 bind ssl vserver <vServerName> -cipherName <string>
2
3 bind ssl service <serviceName> -cipherName <string>
4
5 bind ssl serviceGroup <serviceGroupName> -cipherName <string>
6
7 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vserver ssl_vserver_test -cipherName test
2 Done
3
4 bind ssl service nshttps -cipherName test
5 Done
6
7 bind ssl servicegroup ssl_svc -cipherName test
8 Done
9 <!--NeedCopy-->
```

**To bind a cipher group to an SSL virtual server, service, or service group by using the GUI:**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.

For service, replace virtual servers with services. For service groups, replace virtual servers with service groups.

Open the virtual server, service, or service group.

2. In **Advanced Settings**, select **SSL Ciphers**.

3. Bind a cipher group to the virtual server, service, or service group.

### Binding individual ciphers to an SSL virtual server or service

You can also bind individual ciphers, instead of a cipher group, to a virtual server or service.

#### To bind a cipher by using the CLI:

At the command prompt, type:

```
1 bind ssl vserver <vServerName> -cipherName <string>
2 bind ssl service <serviceName> -cipherName <string>
3 <!--NeedCopy-->
```

#### Example:

```
1 bind ssl vserver v1 -cipherName TLS1.2-ECDHE-RSA-AES256-GCM-SHA384
2 Done
3
4 bind ssl service sslsvc -cipherName TLS1.2-ECDHE-RSA-AES256-GCM-SHA384
5 Done
6 <!--NeedCopy-->
```

#### To bind a cipher to an SSL virtual server by using the GUI:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Select an SSL virtual server and click **Edit**.
3. In **Advanced Settings**, select **SSL Ciphers**.
4. In **Cipher Suites**, select **Add**.
5. Search for the cipher in the available list and click the arrow to add it to the configured list.
6. Click **OK**.
7. Click **Done**.

To bind a cipher to an SSL service, repeat the preceding steps after replacing virtual server with service.

## Server certificate support matrix on the ADC appliance

September 21, 2020

The Citrix ADC appliance supports the following server certificates.

Table 1: Support on Frontend (FE) and Backend (BE) Service

| Server certificate/- Platform | MPX/SDX (N2 CHIPS) FE           | MPX/SDX (N2 CHIPS) BE           | MPX/SDX (N3 CHIPS) FE           | MPX/SDX (N3 CHIPS) BE           | VPX FE                          | VPX BE                          |
|-------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|
| MD5                           | Y                               | Y                               | Y                               | Y                               | Y                               | Y                               |
| SHA1                          | Y                               | Y                               | Y                               | Y                               | Y                               | Y                               |
| SHA224                        | Y                               | Y                               | Y                               | Y                               | Y                               | Y                               |
| SHA256                        | Y                               | Y                               | Y                               | Y                               | Y                               | Y                               |
| SHA384                        | Y                               | Y                               | Y                               | Y                               | Y                               | Y                               |
| SHA512                        | Y                               | Y                               | Y                               | Y                               | Y                               | Y                               |
| RSA Key                       | 1024, 2048, 3072, and 4096 bits | 1024, 2048, 3072, and 4096 bits | 1024, 2048, 3072, and 4096 bits | 1024, 2048, 3072, and 4096 bits | 1024, 2048, 3072, and 4096 bits | 1024, 2048, 3072, and 4096 bits |
| DH Key                        | 1024 and 2048 bits              | 1024 and 2048 bits              | 1024 and 2048 bits              | 1024 and 2048 bits              | 1024, 2048, 3072, and 4096 bits | 1024, 2048, 3072, and 4096 bits |

| Server certificate/Platform | MPX 9700/10500/12500/15000 FIPS with FW 2.2 FE | MPX 9700/10500/12500/15000 FIPS with FW 2.2 BE | MPX/SDX 14030/14060/14080 FIPS FE | MPX/SDX 14030/14060/14080 FIPS BE |
|-----------------------------|------------------------------------------------|------------------------------------------------|-----------------------------------|-----------------------------------|
| MD5                         | Y                                              | Y                                              | Y                                 | Y                                 |
| SHA1                        | Y                                              | Y                                              | Y                                 | Y                                 |
| SHA224                      | Y                                              | Y                                              | Y                                 | Y                                 |
| SHA256                      | Y                                              | Y                                              | Y                                 | Y                                 |
| SHA384                      | Y                                              | Y                                              | Y                                 | Y                                 |
| SHA512                      | Y                                              | Y                                              | Y                                 | Y                                 |
| RSA Key                     | 2048 bits                                      | 2048 bits                                      | 2048 and 3072 bits                | 2048 and 3072 bits                |
| DH Key                      | N                                              | N                                              | N                                 | N                                 |

**Note:**

- In release 11.1 and earlier, a Citrix ADC appliance supports the following “signature algorithms” extensions in the back end client hello message: RSA-MD5, RSA-SHA1, and RSA-SHA256.  
Because SHA 384 and SHA 512 signature algorithms extensions are not supported by the Citrix ADC appliance, some servers, such as Windows IIS servers, reset the connection.
- Starting release 12.0, a Citrix ADC appliance supports all the signature\_extensions extensions.

## Client authentication

September 21, 2020

In a typical SSL transaction, the client that is connecting to a server over a secure connection checks the validity of the server by checking the server’s certificate before initiating the SSL transaction. In some cases, however, you might want to configure the server to authenticate the client that is connecting to it.

With client authentication enabled on an SSL virtual server, the Citrix ADC appliance asks for the client certificate during the SSL handshake. The appliance checks the certificate presented by the client for normal constraints, such as the issuer signature and expiration date.

**Note:** For the appliance to verify issuer signatures, the certificate of the CA that issued the client certificate must be installed on the appliance and bound to the virtual server that the client is transacting with.

If the certificate is valid, the appliance allows the client to access all secure resources. But if the certificate is invalid, the appliance drops the client request during the SSL handshake.

The appliance verifies the client certificate by first forming a chain of certificates, starting with the client certificate and ending with the root CA certificate for the client (for example, VeriSign). The root CA certificate may contain one or more intermediate CA certificates (if the client certificate is not directly issued by the root CA).

Before you enable client authentication on the Citrix ADC appliance, make sure that a valid client certificate is installed on the client. Then, enable client authentication for the virtual server that will handle the transactions. Finally, bind the certificate of the CA that issued the client certificate to the virtual server on the appliance .

**Note:** A Citrix ADC MPX appliance supports a certificate-key pair size from 512 to 4096 bits. The certificate must be signed by using one of the following hash algorithms:

- MD5
- SHA-1

- SHA-224
- SHA-256
- SHA-384
- SHA-512

On an SDX appliance, if an SSL chip is assigned to a VPX instance, the certificate-key pair size support of an MPX appliance applies. Otherwise, the normal certificate-key pair size support of a VPX instance applies.

A Citrix ADC virtual appliance (VPX instance) supports certificates of at least 512 bits, up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate
- 4096-bit certificate on the physical server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

### **Provide the client certificate**

Before you configure client authentication, a valid client certificate must be installed on the client. A client certificate includes details about the specific client system that will create secure sessions with the Citrix ADC appliance. Each client certificate is unique and should be used by only one client system.

Whether you obtain the client certificate from a CA, use an existing client certificate, or generate a client certificate on the Citrix ADC appliance, you must convert the certificate to the correct format. On the Citrix ADC appliance, certificates are stored in either the PEM or DER format and must be converted to PKCS#12 format before they are installed on the client system. After converting the certificate and transferring it to the client system, make sure that it is installed on that system and configured for the client application that will be part of the SSL transactions (for example, the web browser).

For instructions on how to convert a certificate from PEM or DER format to PKCS#12 format, see [Import and convert SSL files](#).

For instructions on how to generate a client certificate, see [Create a certificate](#).

### **Enable client-certificate based authentication**

By default, client authentication is disabled on the Citrix ADC appliance, and all SSL transactions proceed without authenticating the client. You can configure client authentication to be either optional or mandatory as part of the SSL handshake.

If client authentication is optional, the appliance requests the client certificate but proceeds with the SSL transaction even if the client presents an invalid certificate. If client authentication is mandatory, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate.

**Caution:** Citrix recommends that you define proper access control policies before changing client-certificate-based authentication check to optional.

**Note:** Client authentication is configured for individual SSL virtual servers, not globally.

### Enable client-certificate based authentication by using the CLI

At the command prompt, type the following commands to enable the client-certificate-based authentication and verify the configuration:

```
1 set ssl vserver <vServerName> [-clientAuth (ENABLED | DISABLED)] [-
  clientCert (MANDATORY | OPTIONAL)]
2 show ssl vserver <vServerName>
3 <!--NeedCopy-->
```

### Example:

```
1 set ssl vserver vssl -clientAuth ENABLED -clientCert Mandatory
2 Done
3 show ssl vserver vssl
4
5 Advanced SSL configuration for VServer vssl:
6 DH: DISABLED
7 Ephemeral RSA: ENABLED Refresh Count: 0
8 Session Reuse: ENABLED Timeout: 120 seconds
9 Cipher Redirect: DISABLED
10 SSLv2 Redirect: DISABLED
11 ClearText Port: 0
12 Client Auth: ENABLED Client Cert Required: Mandatory
13 SSL Redirect: DISABLED
14 Non FIPS Ciphers: DISABLED
15     SNI: DISABLED
16     OCSP Stapling: DISABLED
17     HSTS: DISABLED
18     HSTS IncludeSubDomains: NO
19     HSTS Max-Age: 0
20 SSLv2: DISABLED SSLv3: ENABLED TLSv1.0: ENABLED TLSv1.2: ENABLED TLSv1
    .2: ENABLED
21
22 1) CertKey Name: sslkey Server Certificate
23
```

```
24 1) Policy Name: client_cert_policy Priority: 0
25
26 1) Cipher Name: DEFAULT
27 Description: Predefined Cipher Alias
28 Done
29 <!--NeedCopy-->
```

### Enable client-certificate based authentication by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, and open a virtual server.
2. In the SSL Parameters section, select Client Authentication, and in the Client Certificate list, select Mandatory.

#### Note:

If client authentication is set to mandatory and if the client certificate contains policy extensions, certificate validation fails. From release 12.0-56.x, you can set a parameter in the front-end SSL profile to skip this check. The parameter is disabled by default. That is, the check is performed by default.

### Skip the policy extension check during client authentication by using the CLI

At the command prompt, type:

```
1 set ssl profile ns_default_ssl_profile_frontend -clientauth ENABLED -
  skipClientCertPolicyCheck ENABLED
2
3 Parameter
4
5 skipClientCertPolicyCheck
6
7           Control policy extension check, if present inside the
           X509 certificate chain. Applicable only if client authentication is
           enabled and client certificate is set to mandatory. Possible values
           functions as follows:
8
9 - ENABLED: Skip the policy check during client authentication.
10
11 - DISABLED: Perform policy check during client authentication.
12
13 Possible values: ENABLED, DISABLED
14
15 Default: DISABLED
16 <!--NeedCopy-->
```

### Skip the policy extension check during client authentication by using the GUI

1. Navigate to **System > Profiles > SSL Profiles**.
2. Create a new front-end profile or edit an existing front-end profile.
3. Verify that client authentication is enabled and client certificate is set to mandatory.
4. Select **Skip Client Certificate Policy Check**.

Client Authentication ?

Client Certificate\*

MANDATORY ?

Skip Client Certificate Policy Check ?

### Bind CA certificates to the virtual server

A CA whose certificate is present on the Citrix ADC appliance must issue the client certificate used for client authentication. You must bind this certificate to the Citrix ADC virtual server that will carry out client authentication.

You must bind the CA certificate to the SSL virtual server in such a way that the appliance can form a complete certificate chain when it verifies the client certificate. Otherwise, certificate chain formation fails and the client is denied access even if its certificate is valid.

You can bind CA certificates to the SSL virtual server in any order. The appliance forms the proper order during client certificate verification.

For example, if the client presents a certificate issued by **CA\_A**, where **CA\_A** is an intermediate CA whose certificate is issued by **CA\_B**, whose certificate is in turn issued by a trusted root CA, **Root\_CA**, a chain of certificates that contain all three of these certificates must be bound to the virtual server on the Citrix ADC appliance.

For instructions on binding one or more certificates to the virtual server, see [Bind the certificate-key pair to the SSL virtual server](#).

For instructions on creating a chain of certificates, see [Create a chain of certificates](#).

### Stricter control on client certificate validation

The Citrix ADC appliance accepts valid Intermediate-CA certificates if they are issued by a single Root-CA. That is, if only the Root-CA certificate is bound to the virtual server, and any intermediate certificate sent with the client certificate is validated by that Root-CA, the appliance trusts the certificate chain and the handshake is successful.

However, if a client sends a chain of certificates in the handshake, none of the intermediate certificates can be validated by using a CRL or OCSP responder unless that certificate is bound to the SSL

virtual server. Therefore, even if one of the intermediate certificates is revoked, the handshake is successful. As part of the handshake, the SSL virtual server sends the list of CA certificates that are bound to it. For stricter control, you can configure the SSL virtual server to accept only a certificate that is signed by one of the CA certificates bound to that virtual server. To do so, you must enable the `ClientAuthUseBoundCACChain` setting in the SSL profile bound to the virtual server. The handshake fails if the client certificate is not signed by one of the CA certificates bound to the virtual server.

For example, say two client certificates, `clientcert1` and `clientcert2`, are signed by the intermediate certificates `Int-CA-A` and `Int-CA-B`, respectively. The intermediate certificates are signed by the root certificate `Root-CA`. `Int-CA-A` and `Root-CA` are bound to the SSL virtual server. In the default case (`ClientAuthUseBoundCACChain` disabled), both `clientcert1` and `clientcert2` are accepted. However, if `ClientAuthUseBoundCACChain` is enabled, only `clientcert1` is accepted by the Citrix ADC appliance

### Enable stricter control on client certificate validation by using the CLI

At the command prompt, type:

```
1 set ssl profile <name> -ClientAuthUseBoundCACChain Enabled
2 <!--NeedCopy-->
```

### Enable stricter control on client certificate validation by using the GUI

1. Navigate to **System > Profiles**, select the **SSL Profiles** tab, and create an SSL profile, or select an existing profile.
2. Select **Enable Client Authentication using bound CA Chain**.

## Server authentication

September 21, 2020

Since the Citrix ADC appliance performs SSL offload and acceleration on behalf of a web server, the appliance does not usually authenticate the Web server's certificate. However, you can authenticate the server in deployments that require end-to-end SSL encryption.

In such a situation, the appliance becomes the SSL client, carries out a secure transaction with the SSL server, verifies that a CA whose certificate is bound to the SSL service has signed the server certificate, and checks the validity of the server certificate.

To authenticate the server, you must first enable server authentication and then bind the certificate of the CA that signed the server's certificate to the SSL service on the Citrix ADC appliance. When binding the certificate, you must specify the `bind as CA` option.

## Enable (or disable) server certificate authentication

You can use the CLI and the GUI to enable and disable server certificate authentication.

### Enable (or disable) server certificate authentication using the CLI

At the command prompt, type the following commands to enable server certificate authentication and verify the configuration:

```
1 set ssl service <serviceName> -serverAuth ( ENABLED | DISABLED )
2 show ssl service <serviceName>
3 <!--NeedCopy-->
```

#### Example:

```
1 set ssl service ssl-service-1 -serverAuth ENABLED
2 <!--NeedCopy-->
```

```
1 show ssl service ssl-service-1
2
3         Advanced SSL configuration for Back-end SSL Service ssl-
         service-1:`
4         DH: DISABLED
5         Ephemeral RSA: DISABLED
6         Session Reuse: ENABLED           Timeout: 300 seconds
7         Cipher Redirect: DISABLED
8         SSLv2 Redirect: DISABLED
9         Server Auth: ENABLED
10        SSL Redirect: DISABLED
11        Non FIPS Ciphers: DISABLED
12        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED
13    1)   Cipher Name: ALL
14        Description: Predefined Cipher Alias
15 Done
16 <!--NeedCopy-->
```

### Enable (or disable) server certificate authentication by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services, and open an SSL service.
2. In the SSL Parameters section, select Enable Server Authentication, and specify a Common Name.
3. In Advanced Settings, select Certificates, and bind a CA certificate to the service.

### Bind the CA certificate to the service by using the CLI

At the command prompt, type the following commands to bind the CA certificate to the service and verify the configuration:

```
1 bind ssl service <serviceName> -certkeyName <string> -CA
2
3 show ssl service <serviceName>
4 <!--NeedCopy-->
```

#### Example:

```
1 bind ssl service ssl-service-1 -certkeyName samplecertkey -CA
2 <!--NeedCopy-->
```

```
1 show ssl service ssl-service-1
2
3           Advanced SSL configuration for Back-end SSL Service ssl-
           service-1:
4           DH: DISABLED
5           Ephemeral RSA: DISABLED
6           Session Reuse: ENABLED           Timeout: 300 seconds
7           Cipher Redirect: DISABLED
8           SSLv2 Redirect: DISABLED
9           Server Auth: ENABLED
10          SSL Redirect: DISABLED
11          Non FIPS Ciphers: DISABLED
12          SSLv2: DISABLED SSLv3: ENABLED   TLSv1: ENABLED
13          1)   CertKey Name: samplecertkey   CA Certificate
           CRLCheck: Optional
14          1)   Cipher Name: ALL
15              Description: Predefined Cipher Alias
16 Done
17 <!--NeedCopy-->
```

### Configure a common name for server certificate authentication

In end-to-end encryption with server authentication enabled, you can include a common name in the configuration of an SSL service or service group. The name that you specify is compared to the common name in the server certificate during an SSL handshake. If the two names match, the handshake is successful.

If the common names do not match, the common name specified for the service or service group is compared to values in the subject alternative name (SAN) field in the certificate. If it matches one

of those values, the handshake is successful. This configuration is especially useful if there are, for example, two servers behind a firewall and one of the servers spoofs the identity of the other. If the common name is not checked, a certificate presented by either server is accepted if the IP address matches.

**Note:** Only domain name, URL, and email ID DNS entries in the SAN field are compared.

### Configure common-name verification for an SSL service or service group by using the CLI

At the command prompt, type the following commands to specify server authentication with common-name verification and verify the configuration:

1. To configure common name in a service, type:

```
1 set ssl service <serviceName> -commonName <string> -serverAuth
  ENABLED
2 show ssl service <serviceName>
3 <!--NeedCopy-->
```

2. To configure common name in a service group, type:

```
1 set ssl serviceGroup <serviceGroupName> -commonName <string> -
  serverAuth ENABLED
2 show ssl serviceGroup <serviceGroupName>
3 <!--NeedCopy-->
```

### Example:

```
1 > set ssl service svc1 -commonName xyz.com -serverAuth ENABLED
2 <!--NeedCopy-->
```

```
1 show ssl service svc
2
3     Advanced SSL configuration for Back-end SSL Service svc1:
4     DH: DISABLED
5     Ephemeral RSA: DISABLED
6     Session Reuse: ENABLED Timeout: 300 seconds
7     Cipher Redirect: DISABLED
8     SSLv2 Redirect: DISABLED
9     Server Auth: ENABLED Common Name: www.xyz.com
10    SSL Redirect: DISABLED
11    Non FIPS Ciphers: DISABLED
12    SNI: DISABLED
13    SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
14    1) CertKey Name: cacert CA Certificate OCSPCheck: Optional
```

```
15     1) Cipher Name: ALL
16     Description: Predefined Cipher Alias
17 Done
18 <!--NeedCopy-->
```

### Configure common-name verification for an SSL service or service group by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services or Navigate to Traffic Management > Load Balancing > Service Groups, and open a service or service group.
2. In the SSL Parameters section, select Enable Server Authentication, and specify a common name.

## SSL actions and policies

September 21, 2020

An SSL policy evaluates incoming traffic and applies a predefined action to requests that match a rule (expression). You have to configure the actions before creating the policies, so that you can specify an action when you create a policy. To put a policy into effect, you must either bind it to a virtual server on the appliance, so that it applies only to traffic flowing through that virtual server, or bind it globally, so that it applies to all traffic flowing through the appliance.

SSL actions define SSL settings that you can apply to the selected requests. You associate an action with one or more policies. Data in client connection requests or responses is compared to a rule specified in the policy, and the action is applied to connections that match the rule (expression).

You can configure classic policies with classic expressions and default syntax policies with default syntax expressions for SSL.

**Note:** Users who are not experienced in configuring policies at the CLI usually find using the configuration utility to be considerably easier.

You can associate a user-defined action or a built-in action to a default syntax policy. Classic policies allow only user-defined actions. In default syntax policy, you can also group policies under a policy label, in which case they are applied only when invoked from another policy.

Common uses of SSL actions and policies include per-directory client authentication, support for Outlook web access, and SSL-based header insertions. SSL-based header insertions contain SSL settings required by a server whose SSL processing has been offloaded to the Citrix ADC appliance.

## SSL policies

September 21, 2020

Policies on the Citrix ADC appliance help identify specific connections that you want to process. The processing is based on the actions that are configured for that particular policy. Once you create the policy and configure an action for it, you must either bind it to a virtual server on the appliance, so that it applies only to traffic flowing through that virtual server, or bind it globally, so that it applies to all traffic flowing through any virtual server configured on the Citrix ADC appliance.

The Citrix ADC appliance SSL feature supports default syntax (advanced) policies. For a complete description of default syntax expressions, how they work, and how to configure them manually, see [Policies and Expressions](#).

**Note:**

Users who are not experienced in configuring policies at the CLI will usually find using the configuration utility considerably easier.

SSL policies require that you create an action before creating a policy, so that you can specify the actions when you create the policies.

In SSL default syntax policies, you can also use the built-in actions. For more information about built-in actions, see [SSL built-in actions and user-defined actions](#).

### SSL default syntax policies

An SSL default syntax policy, also known as advanced policy, defines a control or a data action to be performed on requests. SSL policies can therefore be categorized as control policies and data policies:

- **Control policy.** A control policy uses a control action, such as forcing client authentication.  
Note: In release 10.5 or later, deny SSL renegotiation (`denySSLReneg`) is set, by default, to ALL. However, control policies, such as CLIENTAUTH, trigger a renegotiation handshake. If you use such policies, you must set `denySSLReneg` to NO.
- **Data policy.** A data policy uses a data action, such as inserting some data into the request.

The essential components of a policy are an expression and an action. The expression identifies the requests on which the action is to be performed.

You can configure a default syntax policy with a built-in action or a user-defined action. You can configure a policy with a built-in action without creating a separate action. However, to configure a policy with a user-defined action, first configure the action and then configure the policy.

You can specify an additional action, called an UNDEF action, to be performed in the event that applying the expression to a request has an undefined result.

## SSL policy configuration

You can configure an SSL default syntax policy by using the CLI and the GUI.

### Configure an SSL policy by using the CLI

At the command prompt, type:

```
1 add ssl policy <name> -rule <expression> -Action <string> [-undefAction  
   <string>] [-comment <string>]  
2 <!--NeedCopy-->
```

### Configure an SSL policy by using the GUI

Navigate to Traffic Management > SSL > Policies and, on the Policies tab, click Add.

## SSL built-in actions and user-defined actions

September 21, 2020

Unless you need only the built-in actions in your policies, you have to create the actions before creating the policies, so that you can specify the actions when you create the policies. The built-in actions are of two types, control actions and data actions. You use control actions in control policies, and data actions in data policies.

The built-in control actions are:

- CLIENTAUTH—Perform client certificate authentication.
- NOCLIENTAUTH—Do not perform client certificate authentication.

The built-in data actions are:

- RESET—Close the connection by sending a RST packet to the client.
- DROP—Drop all packets from the client. The connection remains open until the client closes it.
- NOOP—Forward the packet without performing any operation on it.

You can create user-defined data actions. For example, if you enable client authentication, you can create an SSL action to insert client-certificate data into the request header before forwarding the request to the web server.

If a policy evaluation results in an undefined state, an UNDEF action is performed. For either a data policy or a control policy, you can specify RESET, DROP, or NOOP as the UNDEF action. For a control policy, you also have the option of specifying CLIENTAUTH or NOCLIENTAUTH.

## Examples of built-in actions in a policy

In the following example, if the client sends a cipher other than an EXPORT category cipher, the Citrix ADC appliance requests client authentication. The client has to provide a valid certificate for a successful transaction.

```
1 add ssl policy pol1 -rule CLIENT.SSL.CIPHER_EXPORTABLE.NOT -reqAction
  CLIENTAUTH
2 <!--NeedCopy-->
```

The following examples assume that client authentication is enabled.

If the version in the certificate provided by the user matches the version in the policy, no action is taken and the packet is forwarded:

```
1 add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -
  reqAction NOOP
2 <!--NeedCopy-->
```

If the version in the certificate provided by the user matches the version in the policy, the connection is dropped:

```
1 add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -
  reqAction DROP
2 <!--NeedCopy-->
```

If the version in the certificate provided by the user matches the version in the policy, the connection is reset:

```
1 add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -
  reqAction RESET
2 <!--NeedCopy-->
```

## User-defined SSL actions

In addition to built-in actions, you can also configure other SSL actions depending on your deployment. These are called user-defined actions.

### Configure a user-defined SSL action by using the CLI

At the command prompt, type the following commands to configure an action and verify the configuration:

```

1 add SSL action <name> -clientAuth(DOCLIENTAUTH | NOCLIENTAUTH) -
  clientCert (ENABLED | DISABLED) certHeader <string> -clientHeader <
  string> -clientCertSerialNumber (ENABLED | DISABLED) -
  certSerialHeader <string> -clientCertSubject (ENABLED | DISABLED) -
  certSubjectHeader <string> -clientCertHash (ENABLED | DISABLED) -
  certHashHeader <string> -clientCertIssuer (ENABLED | DISABLED) -
  certIssuerHeader <string> -sessionID (ENABLED | DISABLED) -
  sessionIDheader <string> -cipher (ENABLED | DISABLED) -cipherHeader
  <string> -clientCertNotBefore (ENABLED | DISABLED) -
  certNotBeforeHeader <string> -clientCertNotAfter (ENABLED | DISABLED
  ) -certNotAfterHeader <string> -OWASupport (ENABLED | DISABLED)
2 <!--NeedCopy-->

```

```

1 show ssl action [<name>]
2 <!--NeedCopy-->

```

**Example:**

```

1 add ssl action Action-SSL-ClientCert -clientCert ENABLED -certHeader "X
  -Client-Cert"
2 <!--NeedCopy-->

```

```

1 show ssl action Action-SSL-ClientCert
2
3 1)      Name: Action-SSL-ClientCert
4         Data Insertion Action:
5         Cert Header: ENABLED           Cert Tag: X-Client-Cert
6 Done
7 <!--NeedCopy-->

```

**Configure a user-defined SSL action by using the GUI**

Navigate to Traffic Management > SSL > Policies and, on the Actions tab, click Add.

**Configure an SSL action to forward client traffic to another virtual server**

**Note:** This feature is available in release 12.1 build 49.x and later.

Admins can configure an SSL action to forward the client traffic received on an SSL virtual server to another virtual server to avoid SSL offloading or terminating the connection on the ADC appliance. For example, if the appliance does not have a certificate or it does not support a specific cipher, instead of terminating the connection, admins can choose to forward the request to another virtual server for further action. This virtual server can be of type: SSL, TCP, or SSL\_BRIDGE.

To achieve the above, a new bind point 'CLIENTHELLO\_REQ' is added to evaluate client traffic when a client hello is received. If the policy bound to the virtual server receiving client traffic evaluates to true after parsing the client hello, the traffic is forwarded to another virtual server. If this virtual server is of type SSL, it performs the handshake. If this virtual server is of type TCP or SSL\_BRIDGE, the backend server performs the handshake.

In release 12.1-49.x, only the forward and reset actions are supported for CLIENTHELLO\_REQ bind point. The following expression prefixes are available:

- CLIENT.SSL.CLIENT\_HELLO.CIPHERS.HAS\_HEXCODE
- CLIENT.SSL.CLIENT\_HELLO.CLIENT\_VERSION
- CLIENT.SSL.CLIENT\_HELLO.IS\_RENEGOTIATE
- CLIENT.SSL.CLIENT\_HELLO.IS\_REUSE
- CLIENT.SSL.CLIENT\_HELLO.IS\_SCSV
- CLIENT.SSL.CLIENT\_HELLO.IS\_SESSION\_TICKET
- CLIENT.SSL.CLIENT\_HELLO.LENGTH
- CLIENT.SSL.CLIENT\_HELLO.SNI

For a description of these prefixes, see [Advanced policy expressions: parsing SSL](#)

A new parameter 'forward' is added to the 'add SSL action' command and new bind point 'CLIENTHELLO\_REQ' is added to the 'bind ssl vsrver' command.

### Configuration using the CLI

At the command prompt, type:

```
1 add ssl action <name> -forward <virtual server name>
2
3 add ssl policy <name> -rule <expression> -action <string>
4
5 bind ssl vsrver <vServerName> -policyName <string> -priority <
  positive_integer> -type <type>
6 <!--NeedCopy-->
```

### EXAMPLE:

```
1 add ssl action act1 -forward v2
2
3 add ssl policy pol1 -rule client.ssl.client_hello.ciphers.has_hexcode(0
  x002f) -action act1
4
5 bind ssl vsrver v1 -policyName pol1 -priority 1 -type CLIENTHELLO_REQ
6 <!--NeedCopy-->
```

## Configuration using the GUI

Navigate to Traffic Management > SSL > Policies.

### Create SSL action:

1. In **SSL Actions**, click **Add**.
2. In **Create SSL Action**, specify a name for the action.
3. In **Forward Action Virtual Server**, select an existing virtual server or add a new virtual server to forward the traffic to.
4. Optionally, set other parameters.
5. Click **Create**.

### Create SSL policy:

1. In **SSL Policies**, click **Add**.
2. In **Create SSL Policy**, specify a name for the policy.
3. In **Action**, select the action that you created above.
4. In **Expression Editor**, enter the rule to evaluate.
5. Click **Create**.

### Create or add a virtual server and bind policy:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Add or select a virtual server.
3. In **Advanced Settings**, click **SSL Policies**.
4. Click in the SSL Policy section.
5. In **Select Policy**, select the policy that you created earlier.
6. In **Policy Binding**, specify a priority for the policy.
7. In **Type**, select **CLIENTHELLO\_REQ**.
8. Click **Bind**.
9. Click **Done**.

For the end-to-end configuration for the most popular use cases, see [Configure SSL action to forward client traffic if the appliance does not have a domain specific \(SNI\) certificate](#) and [Configure SSL action to forward client traffic if a cipher is not supported on the ADC](#).

## SSL action to selectively pick CAs based on SNI for client authentication

Starting Citrix ADC release 12.1 build 50.x, you can send only the list of CAs based on SNI (domain) in the client certificate request rather than the list of all the CAs bound to an SSL virtual server. For example, when a client hello is received, only the CA certificates based on the SSL policy expression (for example, SNI) are sent. To send a specific set of certificates, you must create a CA certificates group, bind this group to an SSL action, and bind the action to an SSL policy. If the policy bound to

the virtual server receiving client traffic evaluates to true after parsing the client hello, only a specific CA certificates group is sent in the client request certificate.

Earlier, you had to bind CA certificates to an SSL virtual server. With this enhancement, you can simply add CA certificate groups and associate them to an SSL action.

**Note:** Client authentication and SNI must be enabled on the SSL virtual server, and the correct SNI certificates must be bound to the virtual server.

Perform the following steps:

1. Add a CA certificate group.
2. Add certificate-key pairs.
3. Bind the certificate-key pairs to this group.
4. Add an SSL action.
5. Add an SSL policy. Specify the action in the policy.
6. Bind the policy to an SSL virtual server. Specify the bind point as CLIENTHELLO\_REQ.

### Configuration using the CLI

At the command prompt, type the following commands in a sequence:

```
1 add ssl caCertGroup <caCertGroupName>
2 add ssl certkey <certkey_name> -cert <cert> -key <key>
3 bind ssl caCertGroup <caCertGroupName> <certkey_name>
4 add ssl action <name> -caCertGrpName <string>
5 add ssl policy <name> -rule <expression> -action <string>
6 bind ssl vserver <vServerName> -policyName <string> -priority <
  positive_integer> -type CLIENTHELLO_REQ
7 <!--NeedCopy-->
```

### Example:

```
1 add ssl cacertGroup ca_cert_group
2
3 add ssl certkey ca_certkey1 -cert cacert1 -key cakey1
4 add ssl certkey ca_certkey2 -cert cacert2 -key cakey2
5 add ssl certkey snicert -cert snicert -key snikey
6
7 bind ssl cacertGroup ca_cert_group ca_certkey1
8 bind ssl caCertGroup ca_cert_group ca_certkey2
9 <!--NeedCopy-->
```

```
1 sh ssl caCertGroup ca_cert_group
2
3 CA GROUP NAME:      ca_cert_group
4 ACTIONS REFERRING: 1
5
6 1) CertKey Name: ca_certkey1   CA Certificate   CRLCheck: Optional
   CA_Name Sent
7 2) CertKey Name: ca_certkey2   CA Certificate   CRLCheck: Optional
   CA_Name Sent
8 <!--NeedCopy-->
```

```
1 add ssl action pick_ca_group -cacertGrpName ca_cert_group
2 <!--NeedCopy-->
```

```
1 sh ssl action pick_ca_group
2 1) Name: sniaction
3   Type: Data Insertion
4   PickCaCertGroup: ca_cert_group
5   Hits: 0
6   Undef Hits: 0
7   Action Reference Count: 1
8 <!--NeedCopy-->
```

```
1 add ssl policy snipolicy -rule client.ssl.client_hello.sni.contains("
   abc") -action pick_ca_group
2 bind ssl vserver v_SSL -policyName snipolicy -type CLIENTHELLO_REQ -
   priority 10
3 <!--NeedCopy-->
```

```
1 sh ssl policy snipolicy
2   Name: pol1
3   Rule: client.ssl.client_hello.sni.contains("abc")
4   Action: pick_ca_group
5   UndefAction: Use Global
6   Hits: 0
7   Undef Hits: 0
8
9
10  Policy is bound to following entities
11 1) Bound to: CLIENTHELLO_REQ VSERVER v_SSL
12   Priority: 10
13 <!--NeedCopy-->
```

```
1 set ssl vserver v_SSL -clientauth ENABLED -SNIEnable ENABLED
2 bind ssl vserver v_SSL -certkeyName snicert -sniCert
3 <!--NeedCopy-->
```

```
1 sh ssl vserver v_SSL
2
3     Advanced SSL configuration for VServer v_SSL:

```

## Configuration using the GUI

### Create CA certificates group and bind certificates to the group:

1. Navigate to Traffic Management > SSL > CA Certificates Group.
2. Click Add and specify a name for the group.
3. Click Create.
4. Select the CA certificate group and then click Show Bindings.
5. Click Bind.
6. In the CA Certificate Binding page, select an existing certificate or click Add to add a new certificate.
7. Click Select and then click Bind.
8. To bind another certificate, repeat steps 5 through 7.
9. Click Close.

Navigate to Traffic Management > SSL > Policies.

### Create SSL action:

1. In **SSL Actions**, click **Add**.
2. In **Create SSL Action**, specify a name for the action.
3. In **Forward Action Virtual Server**, select an existing virtual server or add a new virtual server to forward the traffic to.
4. Optionally, set other parameters.
5. Click **Create**.

### Create SSL policy:

1. In **SSL Policies**, click **Add**.
2. In **Create SSL Policy**, specify a name for the policy.
3. In **Action**, select the action that you created above.
4. In **Expression Editor**, enter the rule to evaluate.
5. Click **Create**.

### Create or add a virtual server and bind policy:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Add or select a virtual server.
3. In **Advanced Settings**, click **SSL Policies**.
4. Click in the SSL Policy section.
5. In **Select Policy**, select the policy that you created earlier.
6. In **Policy Binding**, specify a priority for the policy.
7. In **Type**, select **CLIENTHELLO\_REQ**.

8. Click **Bind**.
9. Click **Done**.

### **Unbind a CA certificate group by using the GUI**

1. Navigate to Traffic Management > SSL > CA Certificates Group.
2. Select a certificate group and click Show Bindings.
3. Select the certificate to remove from the group and click Unbind.
4. If prompted for confirmation, click Yes.
5. Click Close.

### **Remove a CA certificate group by using the GUI**

1. Navigate to Traffic Management > SSL > CA Certificates Group.
2. Select a certificate group and click Delete.
3. If prompted for confirmation, click Yes.

## **SSL policy binding**

September 21, 2020

You can bind SSL policies globally or to an SSL virtual server. Globally bound policies are evaluated after all policies bound to services, virtual servers, or other Citrix ADC bind points are evaluated. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered, and the action associated with it is carried out.

When binding an SSL policy to a virtual server, you must select from one of the following bind points:

- REQUEST (Default bind point. Policy evaluation is done in the HTTP layer after the SSL handshake is completed.)
- INTERCEPT\_REQ (This option applies to a Citrix Secure Web Gateway setup. For more information, see <https://docs.citrix.com/en-us/netscaler-secure-web-gateway/12-1/ssl-interception/policy.html>).
- CLIENTHELLO\_REQ (supported in release 12.1-49.x and later)

Similarly, when unbinding a policy from a virtual server, you must specify the bind point.

If you specify CLIENTHELLO\_REQ as the bind point, the policy is evaluated when a client hello message is received. The allowed actions are RESET and FORWARD. The reset action terminates the connection. The forward action forwards the request to a load balancing virtual server for processing. For more information about the forward action, see [Configure an SSL action to forward client traffic to another virtual server](#).

## Bind an SSL policy globally by using the CLI

At the command prompt, type the following command to bind a global SSL policy and verify the configuration:

```
1 bind ssl global - policyName <string> [- priority <positive_integer>]
2 show ssl global
3 <!--NeedCopy-->
```

### Example:

```
1 bind ssl global -policyName Policy-SSL-2 -priority 90
2 Done
3
4 sh ssl global
5
6     1) Name: Policy-SSL-2 Priority: 90
7     2) Name: Policy-SSL-1 Priority: 100
8     Done
9 <!--NeedCopy-->
```

## Bind an SSL policy globally by using the GUI

1. Navigate to **Traffic Management > SSL > Policies**.
2. In the details pane, click **Global Bindings**.
3. In the **Bind/Unbind SSL Policies to Global** dialog box, click **Insert Policy**.
4. In the **Policy Name** drop-down list, select a policy.
5. Optionally, drag the entry to a new position in the policy bank to automatically update the priority level.
6. Click **OK**. A message appears in the status bar, stating that the policy has been bound successfully.

## Bind or unbind an SSL policy to a virtual server by using the CLI

At the command prompt, type the following command to bind an SSL policy to a virtual server and verify the configuration:

```
1 bind ssl vsrver <vServerName> -policyName <string> -priority <
   positive_integer> -type <type>
2
3 unbind ssl vsrver <vServerName> -policyName <string> -priority <
   positive_integer> -type <type>
4
```

```
5 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vserver v1 -policyName pol1 -priority 1 -type CLIENTHELLO_REQ
2 <!--NeedCopy-->
```

```
1 unbind ssl vserver v1 -policyName pol1 -priority 1 -type
  CLIENTHELLO_REQ
2 <!--NeedCopy-->
```

```
1 show ssl vserver vs-server
2
3 Advanced SSL configuration for VServer vs-server:
4
5 DH: DISABLED
6
7 Ephemeral RSA: ENABLED           Refresh Count: 1000
8
9 Session Reuse: ENABLED           Timeout: 120 seconds
10
11 Cipher Redirect: DISABLED
12
13 SSLv2 Redirect: DISABLED
14
15 ClearText Port: 80
16
17 Client Auth: DISABLED
18
19 SSL Redirect: ENABLED
20
21 SSL-REDIRECT Port Rewrite: ENABLED
22
23 Non FIPS Ciphers: DISABLED
24
25 SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED
26
27 1)      Policy Name: ssl-policy-1      Priority: 10
28
29 1)      Cipher Name: DEFAULT
30
31          Description: Predefined Cipher Alias
32
33 Done
```

```
34 <!--NeedCopy-->
```

## Bind an SSL policy to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open an SSL virtual server.
2. In **Advanced Settings**, select **SSL Policy**. Click in the **SSL policy** section to bind a policy to the virtual server.
3. In the **Policy Binding** page, select an existing policy or add a new policy.
4. Specify priority and type (bind point) for the policy.
5. Select **Bind**.
6. Select **Done**.

## SSL policy labels

September 21, 2020

Policy labels are holders for policies. A policy label helps in managing a group of policies, called a policy bank, which can be invoked from another policy. SSL policy labels can be control labels or data labels, depending on the type of policies that are included in the policy label. You can add only data policies in a data policy label and only control policies in a control policy label. To create the policy bank, you bind policies to the label and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. At the CLI, you enter two commands to create a policy label and bind policies to the policy label. In the configuration utility, you select options from a dialog box.

## Create an SSL policy label and bind policies to the label by using the CLI

At the command prompt, type:

```
1 add ssl polyclabel <labelName> -type ( CONTROL | DATA )
2
3 bind ssl polyclabel <labelName> <policyName> <priority> [<
  gotoPriorityExpression>] [-invoke (<labelType> <labelName> ) ]
4 <!--NeedCopy-->
```

### Example:

```
1 add ssl polyclabel cpl1 -type CONTROL
2
3 add ssl polyclabel dpl1 -type DATA
```

```
4
5 bind ssl policylabel cpl1 -policyName ctrlpol -priority 1
6
7 bind ssl policylabel dpl1 -policyName datapol -priority 1
8 <!--NeedCopy-->
```

## Configure an SSL policy label and bind policies to the label by using the GUI

Navigate to Traffic Management > SSL > Policy Labels, and configure an SSL policy label.

## Selective SSL logging

September 21, 2020

In a large deployment comprising thousands of virtual servers, all SSL-related information is logged. Earlier, filtering the client authentication and SSL handshake successes and failures for a few critical virtual servers was not easy. Perusing through the entire log to get this information was a time-consuming and tedious task because the infrastructure did not offer the control to filter the logs. Now, you can log SSL-related information in `ns.log`, for a specific virtual server or for a group of virtual servers. This information is especially helpful in debugging failures. To log this information, you must add an SSL log profile.

See sample `ns.log` output for successful client authentication at the end of this page.

### SSL log profile

An SSL log profile provides control over logging the following events for a virtual server or a group of virtual servers:

- Client authentication success and failures, or only failures.
- SSL handshake success and failures, or only failures.

By default, all the parameters are disabled.

An SSL log profile can be set on an SSL profile, or on an SSL action. If set to an SSL profile, you can log both client authentication and SSL handshake success and failure information. If set to an SSL action, you can only log client authentication success and failure information because the handshake is complete before the policy is evaluated.

Client authentication and SSL handshake success and failures are logged even if you do not configure an SSL log profile. However, selective logging is possible only if SSL log profile is used.

**Note:**

SSL log profile is supported in high availability and cluster setups.

**Add an SSL log profile by using the CLI**

At the command prompt, type:

```
1 add ssl logprofile <name> [-sslLogClAuth ( ENABLED | DISABLED )] [-  
  ssllogClAuthFailures ( ENABLED | DISABLED )] [-sslLogHS ( ENABLED |  
  DISABLED )] [-sslLogHSfailures ( ENABLED | DISABLED )]  
2 <!--NeedCopy-->
```

**Parameters:****Name:**

Name for the SSL log profile. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created.

Name is a mandatory argument. Maximum Length: 127

**sslLogClAuth:**

Log all client authentication events. Includes both success and failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**ssllogClAuthFailures:**

Log all client authentication failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**sslLogHS:**

Log all SSL handshake related events. Includes both success and failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**sslLogHSfailures:**

Log all SSL handshake related failure events.

Possible values: ENABLED, DISABLED

Default value: DISABLED

**Example:**

```

1 > add ssl logprofile ssllog10 -sslLogClAuth ENABLED -sslLogHS ENABLED
2
3 Done
4
5 sh ssllogprofile ssllog10
6
7 1)      Name: ssllog10
8
9         SSL log ClientAuth [Success/Failures] : ENABLED
10
11        SSL log ClientAuth [Failures] : DISABLED
12
13        SSL log Handshake [Success/Failures] : ENABLED
14
15        SSL log Handshake [Failures] : DISABLED
16
17 Done
18 <!--NeedCopy-->

```

**Add an SSL log profile by using the GUI\*\***

Navigate to **System > Profiles > SSL Log Profile** and add a profile.

**Modify an SSL log profile by using the CLI**

At the command prompt type:

```

1 set ssl logprofile <name> [-sslLogClAuth ( ENABLED | DISABLED )][-
  ssllogClAuthFailures ( ENABLED | DISABLED )] [-sslLogHS ( ENABLED |
  DISABLED )] [-sslLogHSfailures ( ENABLED | DISABLED )]
2 <!--NeedCopy-->

```

**Example:**

```

1 set ssllogprofile ssllog10 -ssllogClAuth en -ssllogClAuthFailures en -
  ssllogHS en -ssllogHSfailures en
2
3 Done
4
5 sh ssllogprofile ssllog10

```

```

6
7     1)           Name: ssllog10
8
9             SSL log ClientAuth [Success/Failures] : ENABLED
10            SSL log ClientAuth [Failures] : ENABLED
11            SSL log Handshake [Success/Failures] : ENABLED
12            SSL log Handshake [Failures] : ENABLED
13            Done
14 <!--NeedCopy-->

```

### Modify an SSL log profile by using the GUI

1. Navigate to **\*\*System > Profiles > SSL Log Profile**, select a profile, and click **\*\*Edit**.
2. Make changes and click **OK**.

### View all the SSL log profiles by using the CLI

At the command prompt, type:

```

1 sh ssl logprofile
2 <!--NeedCopy-->

```

### Example:

```

1 sh ssl logprofile
2
3     1)           Name: ssllogp1
4             SSL log ClientAuth [Success/Failures] : ENABLED
5             SSL log ClientAuth [Failures] : ENABLED
6             SSL log Handshake [Success/Failures] : DISABLED
7             SSL log Handshake [Failures] : ENABLED
8
9     2)           Name: ssllogp2
10            SSL log ClientAuth [Success/Failures] : DISABLED
11            SSL log ClientAuth [Failures] : DISABLED
12            SSL log Handshake [Success/Failures] : DISABLED
13            SSL log Handshake [Failures] : DISABLED
14
15    3)           Name: ssllogp3
16            SSL log ClientAuth [Success/Failures] : DISABLED
17            SSL log ClientAuth [Failures] : DISABLED
18            SSL log Handshake [Success/Failures] : DISABLED
19            SSL log Handshake [Failures] : DISABLED
20

```

```

21      4)          Name: ssllog10
22                SSL log ClientAuth [Success/Failures] : ENABLED
23                SSL log ClientAuth [Failures] : ENABLED
24                SSL log Handshake [Success/Failures] : ENABLED
25                SSL log Handshake [Failures] : ENABLED
26 Done
27 <!--NeedCopy-->

```

### View all the SSL log profiles by using the GUI

Navigate to **System > Profiles > SSL Log Profile**. All the profiles are listed.

### Attach an SSL log profile to an SSL profile

You can attach (set) an SSL log profile on an SSL profile when you are creating an SSL profile, or later by editing the SSL profile. You can log both client authentication and handshake successes and failures.

#### Important:

The default SSL profile must be enabled before you can attach an SSL log profile.

### Attach an SSL log profile on an SSL profile by using the CLI

At the command prompt, type:

```

1 set ssl profile <name> [-ssllogProfile <string>]
2 <!--NeedCopy-->

```

#### Example:

```

1 set ssl profile fron_1 -ssllogProfile ssllog10
2 <!--NeedCopy-->

```

### Attach an SSL log profile to an SSL profile by using the GUI

1. Navigate to **System > Profiles > SSL Profile**.
2. Click **Edit** and in SSL Log Profile, specify a profile.

### Attach an SSL log profile to an SSL action

You can set an SSL log profile only while creating an SSL action. You cannot modify an SSL action to set the log profile. Associate the action to a policy. You can only log client authentication successes and failures.

## Attach an SSL log profile to an SSL action by using the CLI

At the command prompt, type:

```
1 add ssl action <name> -clientAuth ( DOCLIENTAUTH | NOCLIENTAUTH ) -
  ssllogProfile <string>
2 <!--NeedCopy-->
```

### Example:

```
1 > add ssl action act1 -clientAuth DoCLIENTAUTH -ssllogProfile ssllog10
2
3 Done
4
5 > sh ssl action act1
6
7     1)           Name: act1
8                 Type: Client Authentication (DOCLIENTAUTH)
9                 Hits: 0
10                Undef Hits: 0
11                Action Reference Count: 0
12                SSLlogProfile: ssllog10
13 Done
14 <!--NeedCopy-->
```

## Attach an SSL log profile to an SSL action by using the GUI

1. Navigate to **Traffic Management > SSL > Policies** and click **SSL Actions**.
2. Click **Add**.
3. In Client Authentication, select **ENABLED**.
4. In SSL Log Profile, select a profile from the list, or click "+" to create a profile.
5. Click **Create**.

### Sample output from the log file

The following is a sample log output from `ns.log` for successful client authentication.

```
1 Jan 24 16:24:25 <local0.debug> 10.102.57.80 01/24/2019:10:54:25 GMT 0-

## Support for DTLSv1.0 protocol

December 23, 2020

### Notes:

- DTLSv1.0 protocol is supported on Citrix ADC MPX/SDX (N2 and N3 based), VPX, and MPX 14000 FIPS appliances. It is not supported on external HSMs.
- Citrix ADC MPX 14000 FIPS platform is supported in build 12.1-49.x and later.
- Support for Intel Coletto based appliances is added in build 12.1-50.x and later. The following appliances ship with Intel Coletto chips:
  - MPX 5901/5905/5910
  - MPX 8905/8910/8920/8930
  - MPX/SDX 26100-100G/26160-100G/26100-200G
  - MPX/SDX 15020-50G/15030-50G/15040-50G/15060-50G/15080-50G/15100-50G/15120-50G

- MPX/SDX 15020/15030/15040/15060/15080/15100/15120

The SSL and TLS protocols have traditionally been used to secure streaming traffic. Both of these protocols are based on TCP, which is slow. In addition, TLS cannot handle lost or reordered packets.

UDP is the preferred protocol for audio and video applications, such as Lync, Skype, iTunes, YouTube, training videos, and flash. However, UDP is not secure or reliable. The DTLS protocol is designed to secure data over UDP and is used for applications such as media streaming, VOIP, and online gaming for communication. In DTLS, each handshake message is assigned a specific sequence number within that handshake. When a peer receives a handshake message, it can quickly determine whether that message is the next one expected. If it is, the peer processes the message. If not, the message is queued for handling after all the previous messages have been received.

Create a DTLS virtual server and a service of type UDP. By default, a DTLS profile (nsdtls\_default\_profile) is bound to the virtual server. Optionally, you can create and bind a user-defined DTLS profile to the virtual server.

Note: RC4 ciphers are not supported on a DTLS virtual server.

## DTLS configuration

You can use the command line (CLI) or the configuration utility (GUI) to configure DTLS on your ADC appliance.

### Create a DTLS configuration by using the CLI

At the command prompt, type:

```
1 add lb vserver <vserver_name> DTLS <IPAddress> <port>
2 add service <service_name> <IPAddress> UDP 443
3 bind lb vserver <vserver_name> <udp_service_name>
4 <!--NeedCopy-->
```

The following steps are optional:

```
1 add dtlsProfile dtls1 -maxretryTime <positive_integer>
2 set ssl vserver <vserver_name> -dtlsProfileName <dtls_profile_name>
3 <!--NeedCopy-->
```

### Create a DTLS configuration by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Create a virtual server of type DTLS, and bind a UDP service to the virtual server.

3. A default DTLS profile is bound to the DTLS virtual server. To bind a different profile, in SSL Parameters, select a different DTLS profile. To create a profile, click the plus (+) next to DTLS Profile.

### Support for SNI on a DTLS virtual server

From release 12.1 build 49.x, SNI is supported on a DTLS virtual server. For information about SNI, see [Configure an SNI virtual server for secure hosting of multiple sites](#).

### Configure SNI on a DTLS virtual server by using the CLI

At the command prompt, type:

```
1 set dtls vserver <vServerName> -SNIEnable ENABLED
2 bind dtls vserver <vServerName> -certkeyName <string> -SNI Cert
3 show dtls vserver <vServerName>
4 <!--NeedCopy-->
```

### Example:

```
1 set ssl vserver v1 -sniEnable ENABLED
2 bind ssl vserver v1 -certkeyName san2 -sniCert
3 bind ssl vserver v1 -certkeyName san13 -sniCert
4 bind ssl vserver v1 -certkeyName san17 -sniCert
5 <!--NeedCopy-->
```

```
1 sh ssl vserver v1
2
3 Advanced SSL configuration for VServer v1:
4 DH: DISABLED
5 DH Private-Key Exponent Size Limit: DISABLED
6 Ephemeral RSA: ENABLED
7 Refresh Count: 0
8 Session Reuse: ENABLED
9 Timeout: 1800 seconds
10 Cipher Redirect: DISABLED
11
12 ClearText Port: 0
13 Client Auth: DISABLED
14 SSL Redirect: DISABLED
15 Non FIPS Ciphers: DISABLED
16 SNI: ENABLED
17 OCSP Stapling: DISABLED
18 HSTS: DISABLED
```

```
19 HSTS IncludeSubDomains: NO
20 HSTS Max-Age: 0
21 DTLSv1: ENABLED
22 Send Close-Notify: YES
23 Strict Sig-Digest Check: DISABLED
24 Zero RTT Early Data: DISABLED
25 DHE Key Exchange With PSK: NO
26 Tickets Per Authentication Context: 1
27
28 DTLS profile name: nsdtls_default_profile
29
30 ECC Curve: P_256, P_384, P_224, P_521
31
32 1) CertKey Name: ca
33 CA Certificate OCSPCheck: OptionalCA_Name Sent
34 2) CertKey Name: san2 Server Certificate for SNI
35 3) CertKey Name: san17 Server Certificate for SNI
36 4) CertKey Name: san13 Server Certificate for SNI
37
38
39 1) Cipher Name: DEFAULT
40 Description: Default cipher list with encryption strength >= 128bit
41 Done
42 <!--NeedCopy-->
```

### Configure SNI on a DTLS virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open a DTLS virtual server and, in Certificates, click **Server Certificate**.
3. Add a certificate or select a certificate from the list and select **Server Certificate for SNI**.
4. In **Advanced Settings**, click **SSL Parameters**.
5. Select **SNI Enable**.

### Features not supported by a DTLS virtual server

The following options cannot be enabled on a DTLS virtual server:

- SSLv2
- SSLv3
- TLSv1
- TLSv1.1
- TLSv1.2
- Push encrypt trigger

- SSLv2Redirect
- SSLv2URL
- Secure renegotiation

### Parameters not used by a DTLS virtual server

A DTLS virtual server ignores the following SSL parameters, even if set:

- Encryption trigger packet count
- PUSH encryption trigger timeout
- SSL quantum size
- Encryption trigger timeout
- Subject/Issuer Name Insertion Format

### Configure renegotiation on a DTLS service

From build 49.x, non-secure renegotiation is supported on a DTLS service. You can use the CLI or the GUI to configure this setting.

#### Configure renegotiation on a DTLS service by using the CLI

At the command prompt, type:

```
1 set ssl parameter -denysslreneg NONSECURE
2 <!--NeedCopy-->
```

#### Example:

```
1 set ssl parameter -denysslreneg NONSECURE
2 <!--NeedCopy-->
```

```
1 sh ssl parameter
2 Advanced SSL Parameters
3 -----
4 SSL quantum size : 8 KB
5 Max CRL memory size : 256 MB
6 Strict CA checks : NO
7 Encryption trigger timeout : 100 ms
8 Send Close-Notify : YES
9 Encryption trigger packet count : 45
10 Deny SSL Renegotiation : NONSECURE
11 Subject/Issuer Name Insertion Format : Unicode
12 OCSP cache size : 10 MB
```

```
13 Push flag : 0x0 (Auto)
14 Strict Host Header check for SNI enabled SSL sessions : NO
15 PUSH encryption trigger timeout : 1 ms
16 Crypto Device Disable Limit : 0
17 Global undef action for control policies : CLIENTAUTH
18 Global undef action for data policies : NOOP
19 Default profile : DISABLED
20 SSL Insert Space in Certificate Header : YES
21 Disable TLS 1.1/1.2 for SSL_BRIDGE secure monitors : NO
22 Disable TLS 1.1/1.2 for dynamic and VPN services : NO
23 Software Crypto acceleration CPU Threshold : 0
24 Hybrid FIPS Mode : DISABLED
25 Signature and Hash Algorithms supported by TLS1.2 : ALL
26 SSL Interception Error Learning and Caching : DISABLED
27 SSL Interception Maximum Error Cache Memory : 0 Bytes
28 Done
29 <!--NeedCopy-->
```

### Configure renegotiation on a DTLS service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Select a DTLS service and click **Edit**.
3. Navigate to **SSL > Advanced Settings**.
4. Select **Deny SSL Renegotiation**.

### Features not supported by a DTLS service

The following options cannot be enabled on a DTLS service:

- SSLv2
- SSLv3
- TLSv1
- TLSv1.1
- TLSv1.2
- Push encrypt trigger
- SSLv2Redirect
- SSLv2URL
- SNI
- Secure renegotiation

## Parameters not used by a DTLS service

A DTLS service ignores the following SSL parameters, even if set:

- Encryption trigger packet count
- PUSH encryption trigger timeout
- SSL quantum size
- Encryption trigger timeout
- Subject/Issuer Name Insertion Format

**Note:**

SSL session reuse handshake fails on a DTLS service because session reuse is not currently supported on DTLS services.

**Workaround:** Manually disable session reuse on a DTLS service. At the CLI, type:

```
set ssl service <dtls-service-name> -sessReuse DISABLED
```

## DTLS profile

A DTLS profile with the default settings is automatically bound to a DTLS virtual server. However, you can create a DTLS profile with specific settings to suit your requirement.

Use a DTLS profile with a DTLS virtual server or a VPN DTLS virtual server. You cannot use an SSL profile with a DTLS virtual server.

### Create a DTLS profile by using the CLI

```
1 add ssl dtlsProfile <name>
2
3 show ssl dtlsProfile<name>
4 <!--NeedCopy-->
```

**Example:**

```
1 add dtlsProfile dtls1 -helloVerifyRequest ENABLED -maxretryTime 4
2
3 Done
4
5 show dtlsProfile dtls1
6
7 1)      Name: dtls1
8         PMTU Discovery: DISABLED
9         Max Record Size: 1460 bytes
10        Max Retry Time: 4 sec
```

```
11         Hello Verify Request: ENABLED
12         Terminate Session: DISABLED
13         Max Packet Count: 120 bytes
14     Done
15 <!--NeedCopy-->
```

### Create a DTLS profile by using the GUI

Navigate to **System > Profiles > DTLS Profiles** \*\* and configure a new profile.

### Example for an end-to-end DTLS configuration

```
1  enable ns feature SSL LB
2
3  add server s1 198.51.100.2
4
5  en ns mode usnip
6
7  add service svc_dtls s1 DTLS 443
8
9  add lb vserver v1 DTLS 10.102.59.244 443
10
11 bind ssl vserver v1 -ciphername ALL
12
13 add ssl certkey servercert -cert servercert_aia_valid.pem -key
    serverkey_aia.pem
14
15 bind ssl vserver v1 -certkeyname servercert
16
17 bind lb vserver lb1 svc_dtls
18
19 sh lb vserver v1

## DTLS cipher support

### Note:

From release 12.1 build 49.x, ADH ciphers are no longer supported with the DTLS protocol.

### How to read the tables:

Unless a build number is specified, a cipher suite is supported for all builds in a release.

### Example:

- **10.5, 11.0, 11.1, 12.0, 12.1:** All builds of 10.5, 11.0, 11.1, 12.0, 12.1 releases.
- **NA:** not applicable.

## DTLS cipher support on Citrix ADC VPX, MPX/SDX (N2 and N3 based) appliances

| Cipher Suite Name         | Hex Code | Wireshark Cipher Suite Name     | Builds Supported (front end) | Builds Supported (back end) |
|---------------------------|----------|---------------------------------|------------------------------|-----------------------------|
| TLS1-AES-256-CBC-SHA      | 0x0035   | TLS_RSA_WITH_AES_256_GCM_SHA384 | 11.0, 11.1, 12.0, 12.1       | 12.0, 12.1                  |
| TLS1-AES-128-CBC-SHA      | 0x002f   | TLS_RSA_WITH_AES_128_GCM_SHA256 | 11.0, 11.1, 12.0, 12.1       | 12.0, 12.1                  |
| SSL3-DES-CBC-SHA          | 0x0009   | TLS_RSA_WITH_DES_CBC_SHA        | 11.0, 11.1, 12.0, 12.1       | An                          |
| SSL3-DES-CBC3-SHA         | 0x000a   | TLS_RSA_WITH_3DES_EDE_CBC_SHA   | 11.0, 11.1, 12.0, 12.1       | 12.0, 12.1                  |
| SSL3-EDH-RSA-DES-CBC3-SHA | 0x0016   | TLS_DHE_RSA_WITH_DES_CBC_SHA    | 11.0, 11.1, 12.0, 12.1       | NA                          |
| SSL3-EDH-RSA-DES-CBC-SHA  | 0x0015   | TLS_DHE_RSA_WITH_DES_CBC_SHA    | 11.0, 11.1, 12.0, 12.1       | NA                          |

| Cipher Suite Name            | Hex Code | Wireshark Cipher Suite Name        | Builds Supported (front end) | Builds Supported (back end) |
|------------------------------|----------|------------------------------------|------------------------------|-----------------------------|
| TLS1-ECDHE-RSA-AES256-SHA    | 0xc014   | TLS_ECDHE_RSA_                     | 12.1                         | 12.1                        |
| TLS1-ECDHE-RSA-AES128-SHA    | 0xc013   | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA | 12.1                         | 12.1                        |
| TLS1-ECDHE-RSA-DES-CBC3-SHA  | 0xc012   | TLS_ECDHE_RSA_                     | 12.1                         | NA                          |
| TLS1-DHE-RSA-AES-128-CBC-SHA | 0x0033   | TLS_DHE_RSA_WITH_AES_128_CBC_SHA   | 12.1                         | 12.1                        |
| TLS1-DHE-RSA-AES-256-CBC-SHA | 0x0039   | TLS_DHE_RSA_WI                     | 12.1                         | 12.1                        |

### DTLS cipher support on the Citrix ADC MPX 14000 FIPS platform

**Note:** Enlightened Data Support (EDT) is supported on the FIPS platform in build 49.x and later if the following conditions are met:

- UDT MSS value set on StoreFront is 900.
- Windows client version is 4.12 or later.
- DTLS enabled VDA version is 7.17 or later.
- Non-DTLS VDA version is 7.15 LTSR CU3 or later.

| Cipher suite Name    | Hex Code | Wireshark Cipher suite Name  | Builds Supported (front end) | Builds Supported (back end) |
|----------------------|----------|------------------------------|------------------------------|-----------------------------|
| TLS1-AES-256-CBC-SHA | 0x0035   | TLS_RSA_WITH_AI              | 11.0, 11.1, 12.0, 12.1-49.x  | 12.0, 12.1-49.x             |

## Support for Intel Coletto SSL chip based platforms

September 21, 2020

The following appliances ship with Intel Coletto chips:

- MPX 5900
- MPX/SDX 8900
- MPX/SDX 15000
- MPX/SDX 15000-50G
- MPX/SDX 26000
- MPX/SDX 26000-50S

- MPX/SDX 26000-100G

Use the 'show hardware' command to identify whether your appliance has Coletto (COL) chips.

```
1 > sh hardware
2
3
4 Platform: NSMPX-8900 8*CPU+4*F1X+6*E1K+1*E1K+1*COL 8955 30010
5
6
7 Manufactured on: 10/18/2016
8
9
10 CPU: 2100MHZ
11
12
13 Host Id: 0
14
15
16 Serial no: CRAC5CR8UA
17
18
19 Encoded serial no: CRAC5CR8UA
20
21
22 Done
23 <!--NeedCopy-->
```

**Limitations:**

- DH 512 cipher is not supported.
- SSLv3 protocol is not supported.
- GnuTLS is not supported.
- Hardware security module (HSM) is not supported.
- ECDSA certificates with ECC curves P\_224 and P521 are not supported (Not supported on platforms with Cavium chips also.)
- DNSSEC offload is not supported. (DNSSEC is supported in software but offload to hardware is not supported.)

**View the SSL chip utilization on Citrix ADC MPX platforms**

From release 13.0 build 47.x, you can view the SSL chip utilization on MPX platforms that ship with Intel Coletto chips. The command is not supported on the SDX platform.

At the command prompt, type:

```
1 > stat ssl
2
3
4 SSL Summary
5
6
7 # SSL cards present           4
8
9 # SSL cards UP               4
10
11 SSL engine status            1
12
13 SSL sessions (Rate)         0
14
15 SSL Crypto Utilization Asym (%) 67
16

```

## MPX 9700/10500/12500/15500 FIPS appliances

July 1, 2021

**Note:**

The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.

The Federal Information Processing Standard (FIPS), issued by the US National Institute of Standards and Technologies, specifies the security requirements for a cryptographic module used in a security system. The Citrix ADC FIPS appliance complies with the second version of this standard, FIPS-140-2.

**Note:** Henceforth, all references to FIPS imply FIPS-140-2.

The FIPS appliance is equipped with a tamper-proof (tamper-evident) cryptographic module—and a Cavium CN1620-NFBE3-2.0-G on the MPX 9700/10500/12500/15500 FIPS appliances—designed to comply with the FIPS 140-2 Level-2 specifications. The Critical Security Parameters (CSPs), primarily the server's private-key, are securely stored and generated inside the cryptographic module, also referred to as the Hardware Security Module (HSM). The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (`nsroot`) can perform operations on the keys stored inside the HSM.

The following table summarizes the differences between standard Citrix ADC and Citrix ADC FIPS appliances.

| Setting        | Citrix ADC appliance | Citrix ADC FIPS appliance |
|----------------|----------------------|---------------------------|
| Key storage    | On the hard disk     | On the FIPS card          |
| Cipher support | All ciphers          | FIPS approved ciphers     |
| Accessing keys | From the hard disk   | Not accessible            |

Configuring a FIPS appliance involves configuring the HSM immediately after completing the generic configuration process. You then create or import a FIPS key. After creating a FIPS key, export it for backup. You might also need to export a FIPS key so that you can import it to another appliance. For example, configuring FIPS appliances in a high availability (HA) setup requires transferring the FIPS key from the primary node to the secondary node immediately after completing the standard HA setup.

You can upgrade the firmware version on the FIPS card from version 4.6.0 to 4.6.1, and you can reset an HSM that has been locked to prevent unauthorized logon. Only FIPS approved ciphers are supported on a Citrix ADC FIPS appliance.

## HSM configuration

Before you can configure the HSM of your Citrix ADC FIPS appliance, you must complete the initial hardware configuration. For more information about MPX appliances, see [Initial Configuration](#). For information about SDX appliances, click [here](#).

Configuring the HSM of your Citrix ADC FIPS appliance erases all existing data on the HSM. To configure the HSM, you must be logged on to the appliance as the superuser (`nsroot` account). The HSM is preconfigured with default values for the Security Officer (SO) password and User password, which you use to configure the HSM or reset a locked HSM. The maximum length allowed for the password is 14 alphanumeric characters. Symbols are not allowed.

**Important:** Run the

`set ssl fips` command only after resetting the FIPS card and restarting the MPX FIPS appliance.

Although the FIPS appliance can be used with the default password values, you must modify them before using it. The HSM can be configured only when you log on to the appliance as the superuser and specify the SO and User passwords.

**Important:** Due to security constraints, the appliance does not provide a means for retrieving the SO password. Store a copy of the password safely. If you need to reinitialize the HSM, you need to specify this password as the old SO password.

Before initializing the HSM, you can upgrade to the latest build of the software. To upgrade to the latest build, see [Upgrading or Downgrading the System Software](#).

After upgrading, verify that the /nsconfig/fips directory has been successfully created on the appliance.

### Configure the HSM on an MPX 9700/10500/12500/15500 FIPS appliance by using the CLI

After logging on to the appliance as the superuser and completing the initial configuration, at the command prompt, type:

```
1 show ssl fips
2
3 reset ssl fips
4
5 reboot
6
7 set ssl fips -initHSM Level-2 <newS0password> <oldS0password> <
  userPassword> [-hsmLabel <string>]
8
9 save ns config
10
11 reboot
12
13 show ssl fips
14 <!--NeedCopy-->
```

### Example:

```
1 show fips
2
3 FIPS Card is not configured
4 Done
5 reset fips
6 reboot
7 Are you sure you want to restart NetScaler (Y/N)? [N]:y
8
9 set ssl fips -initHSM Level-2 sopin12345 so12345 user123 -hsmLabel
  cavium
10
11 This command will erase all data on the FIPS card. You must save
  the configuration
12
13 (saveconfig) after executing this command.
14
15
16 Do you want to continue?(Y/N)y
17 Done
```

```
18
19   save ns config
20
21   reboot
22
23   Are you sure you want to restart NetScaler (Y/N)? [N]:y
24
25   show fips
26

### Configure the HSM on an MPX 9700/10500/12500/15500 FIPS appliance by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
  2. In the details pane, on the **FIPS Infotab**, click **Reset FIPS**.
  3. In the navigation pane, click **System**.
  4. In the details pane, click **Reboot**.
  5. In the details pane, on the FIPS Info tab, click **Initialize HSM**.
  6. In the Initialize HSM dialog box, specify values for the following parameters:
    - Security Officer (SO) Password\*—new SO password
    - Old SO Password\*—old SO password
    - User Password\*—user password
    - Level—initHSM (Currently set to Level2 and cannot be changed)
    - HSM Label—hsmLabel
- \*A required parameter
7. Click **OK**.
  8. In the details pane, click **Save**.
  9. In the navigation pane, click **System**.
  10. In the details pane, click **Reboot**.
  11. Under FIPS HSM Info, verify that the information displayed is correct for the FIPS HSM that you configured.

### Create and transfer FIPS keys

After configuring the HSM of your FIPS appliance, you are ready to create a FIPS key. The FIPS key is created in the appliance's HSM. You can then export the FIPS key to the appliance's CompactFlash card as a secured backup. Exporting the key also enables you to transfer it by copying it to the /flash of another appliance and then importing it into the HSM of that appliance. Enable SIM between two standalone nodes before you export and transfer the keys. In an HA setup, if one of the nodes is replaced with a new appliance, enable SIM between this new appliance and the existing appliance of the HA setup before you export or import FIPS keys.

Instead of creating a FIPS key, you can import an existing FIPS key or import an external key as a FIPS key. If you are adding a certificate-key pair of 2048 bits on the MPX 9700/10500/12500/15500 FIPS appliances, make sure that you have the correct certificate and key pair.

**Note:** If you are planning an HA setup, make sure that the FIPS appliances are configured in an HA setup before creating a FIPS key.

### Create FIPS keys

Before creating a FIPS key, make sure that the HSM is configured.

Specify the key type (RSA or ECDSA) and specify the curve for ECDSA keys.

#### Create a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Add**.
3. In the Create FIPS Key dialog box, specify values for the following parameters:
  - FIPS Key Name\*—fipsKeyName
  - Modulus\*—modulus
  - Exponent\*—exponent

\*A required parameter
4. Click **Create**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you created are correct.

#### Create a FIPS key by using the CLI

At the command prompt, type the following commands to create a FIPS key and verify the settings:

```
1 create ssl fipsKey <fipsKeyName> -modulus <positive_integer> [-exponent
   ( 3 | F4 )]
2
3 show ssl fipsKey [<fipsKeyName>]
4 <!--NeedCopy-->
```

#### Example:

```
1 create fipskey Key-FIPS-1 -keytype RSA -modulus 2048 -exponent 3
2
3 show ssl fipsKey Key-FIPS-1
```

```
4
5           FIPS Key Name: Key-FIPS-1 Key Type: RSA Modulus: 2048
           Public Exponent: F4 (Hex: 0x10001)
6 <!--NeedCopy-->
```

## Export FIPS keys

Citrix recommends that you create a backup of any key created in the FIPS HSM. If a key in the HSM is deleted, there is no way to create the same key again, and all the certificates associated with it are rendered useless.

In addition to exporting a key as a backup, you might need to export a key for transfer to another appliance.

The following procedure provides instructions on exporting a FIPS key to the **/nsconfig/ssl** folder on the appliance's CompactFlash and securing the exported key by using a strong asymmetric key encryption method.

## Export a FIPS key by using the CLI

At the command prompt, type:

```
1 export ssl fipsKey <fipsKeyName> -key <string>
2 <!--NeedCopy-->
```

### Example:

```
1 export fipskey Key-FIPS-1 -key Key-FIPS-1.key
2 <!--NeedCopy-->
```

## Export a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
  2. In the details pane, on the FIPS Keys tab, click **Export**.
  3. In the Export FIPS key to a file dialog box, specify values for the following parameters:
    - FIPS Key Name\*—fipsKeyName
    - File Name\*—key (To put the file in a location other than the default, you can either specify the complete path or click the Browse button and navigate to a location.)
- \*A required parameter
4. **Click Export**, and then click **Close**.

### Import an existing FIPS key

To use an existing FIPS key with your FIPS appliance, you need to transfer the FIPS key from the hard disk of the appliance into its HSM.

**Note:** To avoid errors when importing a FIPS key, ensure that the imported key name is the same as the original key name when it was created.

### Import a FIPS key on the MPX 9700/10500/12500/15500 FIPS appliances by using the CLI

At the command prompt, type the following commands to import a FIPS key and verify the settings:

```
1 - import ssl fipsKey <fipsKeyName> -key <string> -inform SIM -exponent  
   (F4 | 3)  
2 - show ssl fipskey <fipsKeyName>  
3 <!--NeedCopy-->
```

#### Example:

```
1 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4  
2 show ssl fipskey key-FIPS-2  
3 FIPS Key Name: Key-FIPS-2 Modulus: 2048 Public Exponent: F4 (Hex  
   value 0x10001)  
4 <!--NeedCopy-->
```

### Import a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Import**.
3. In the Import as a FIPS Key dialog box, select the FIPS key file and set values for the following required parameters:
  - FIPS Key Name
  - Key File Name—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.
  - Exponent
4. Click **Import**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

## Import an external key

In addition to transferring FIPS keys that are created within the Citrix ADC appliance's HSM, you can transfer external private keys (such as keys created on a standard Citrix ADC, Apache, or IIS) to a FIPS Citrix ADC appliance. External keys are created outside the HSM, by using a tool such as OpenSSL. Before importing an external key into the HSM, copy it to the appliance's flash drive under `/nsconfig/ssl`.

On the MPX 9700/10500/12500/15500 FIPS appliances, the `-exponent` parameter in the `import ssl fipskey` command is not required while importing an external key. The correct public exponent is detected automatically when the key is imported, and the value of the `-exponent` parameter is ignored.

The Citrix ADC FIPS appliance does not support external keys with a public exponent other than 3 or F4.

You do not need a wrap key on the MPX 9700/10500/12500/15500 FIPS appliances.

You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 FIPS appliance. To import the key you need to first decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

```
1 openssl rsa -in <EncryptedKey.key> > <DecryptedKey.out>
2 <!--NeedCopy-->
```

**Note:** If you import an RSA key as a FIPS key, Citrix recommends that you delete the RSA key from the appliance for security purposes.

## Import an external key as a FIPS key to an MPX 9700/10500/12500/15500 FIPS appliance by using the CLI

1. Copy the external key to the appliance's flash drive.
2. If the key is in .pfx format, you must first convert it to PEM format. At the command prompt, type:

```
1 convert ssl pkcs12 <output file> -import -pkcs12File <input .pfx
   file name> -password <password>
2 <!--NeedCopy-->
```

3. At the command prompt, type the following commands to import the external key as a FIPS key and verify the settings:

```
1 import ssl fipsKey <fipsKeyName> -key <string> -informPEM
2 show ssl fipskey<fipsKeyName>
3 <!--NeedCopy-->
```

**Example:**

```
1 convert ssl pkcs12 iis.pem -password 123456 -import -pkcs12File iis.pfx
2
3 import fipskey Key-FIPS-2 -key iis.pem -inform PEM
4
5 show ssl fipskey key-FIPS-2
6
7 FIPS Key Name: Key-FIPS-2 Modulus: 0 Public Exponent: F4 (Hex value 0
  x10001)
8 <!--NeedCopy-->
```

**Import an external key as a FIPS key to an MPX 9700/10500/12500/15500 FIPS appliance by using the GUI**

1. If the key is in .pfx format, you must first convert it to PEM format.
  - a) Navigate to **Traffic Management > SSL**.
  - b) In the details pane, under **Tools**, click **Import PKCS#12**.
  - c) In the Import PKCS12 File dialog box, set the following parameters:
    - Output File Name\*
    - PKCS12 File Name\*—Specify the .pfx file name.
    - Import Password\*
    - Encoding Format\*A required parameter
2. Navigate to **Traffic Management > SSL > FIPS**.
3. In the details pane, on the FIPS Keys tab, click **Import**.
4. In the Import as a FIPS Key dialog box, select PEM file, and set values for the following parameters:
  - FIPS Key Name\*
  - Key File Name\*—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.\*A required parameter
5. Click **Import**, and then click **Close**.
6. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

## Configure FIPS appliances in a high availability setup

July 1, 2021

### Note:

The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.

You can configure two appliances in a high availability (HA) pair as FIPS appliances. For information about configuring an HA setup, see [High availability](#).

**Note:** Citrix recommends that you use the configuration utility (GUI) for this procedure. If you use the command line (CLI), make sure that you carefully follow the steps as listed in the procedure. Changing the order of steps or specifying an incorrect input file might cause an inconsistency that requires that you restart the appliance. In addition, if you use the CLI, the `create ssl fipskey` command is not propagated to the secondary node. When you run the command with the same input values for modulus size and exponent on two different FIPS appliances, the keys generated are not identical. Create the FIPS key on one of the nodes and then transfer it to the other node. But if you use the configuration utility to configure FIPS appliances in an HA setup, the FIPS key that you create is automatically transferred to the secondary node. The process of managing and transferring the FIPS keys is known as secure information management (SIM).

**Important:** On the MPX 9700/10500/12500/15500 FIPS appliances, the HA setup must be completed within six minutes. If the process takes longer than six minutes, the internal timer of the FIPS card expires and the following error message appears:

```
ERROR: Operation timed out or repeated, please wait for 10 mins and redo the SIM/HA configuration steps.
```

If this message appears, restart the appliance or wait for 10 minutes, and then repeat the HA setup procedure.

In the following procedure, appliance A is the primary node and appliance B is the secondary node.

### Configure FIPS appliances in a high availability setup by using the CLI

1. **On appliance A**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance, using the administrator credentials.
3. Initialize appliance A as the source appliance. At the command prompt, type:

```
1 init ssl fipsSIMsource <certFile>
2 <!--NeedCopy-->
```

### Example:

```
init fipsSIMsource /nsconfig/ssl/nodeA.cert
```

4. Copy this <certFile> file to appliance B, in the /nconfig/ssl folder.

**Example:**

```
scp /nsconfig/ssl/nodeA.cert nsroot@198.51.100.10:/nsconfig/ssl
```

5. **On appliance B**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
6. Log on to the appliance, using the administrator credentials.
7. Initialize appliance B as the target appliance. At the command prompt, type:

```
1 init ssl fipsSIMtarget <certFile> <keyVector> <targetSecret>
2 <!--NeedCopy-->
```

**Example:**

```
init fipsSIMtarget /nsconfig/ssl/nodeA.cert /nsconfig/ssl/nodeB.key /
nsconfig/ssl/nodeB.secret
```

8. Copy this <targetSecret> file to appliance A.

**Example:**

```
scp /nsconfig/ssl/fipslbdal0801b.secret nsroot@198.51.100.20:/nsconfig/
ssl
```

9. **On appliance A**, enable appliance A as the source appliance. At the command prompt, type:

```
1 enable ssl fipsSIMSource <targetSecret> <sourceSecret>
2 <!--NeedCopy-->
```

**Example:**

```
enable fipsSIMsource /nsconfig/ssl/nodeB.secret /nsconfig/ssl/nodeA.
secret
```

10. Copy this <sourceSecret> file to appliance B.

**Example:**

```
scp /nsconfig/ssl/fipslbdal0801b.secret nsroot@198.51.100.10:/nsconfig/
ssl
```

11. **On appliance B**, enable appliance B as the target appliance. At the command prompt, type:

```
1 enable ssl fipsSIMtarget <keyVector> <sourceSecret>
2 <!--NeedCopy-->
```

**Example:**

```
enable fipsSIMtarget /nsconfig/ssl/nodeB.key /nsconfig/ssl/nodeA.secret
```

12. **On appliance A**, create a FIPS key, as described in [Create a FIPS key](#).
13. Export the FIPS key to the appliance's hard disk, as described in [Export a FIPS key](#).
14. Copy the FIPS key to the hard disk of the secondary appliance by using a secure file transfer utility, such as SCP.
15. **On appliance B**, import the FIPS key from the hard disk into the HSM of the appliance, as described in [Import an existing FIPS key](#).

### Configure FIPS appliances in a high availability setup by using the GUI

1. On the appliance to be configured as the source appliance, navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Info tab, click **Enable SIM**.
3. In the **Enable HA Pair for SIM** dialog box, go to the **Certificate File Name** text box. Type the file name, with the path to the location at which the FIPS certificate must be stored on the source appliance.
4. In the **Key Vector File Name** text box, type the file name, with the path to the location at which the FIPS key vector must be stored on the source appliance.
5. In the **Target Secret File Name** text box, type the location for storing the secret data on the target appliance.
6. In the **Source Secret File Name** text box, type the location for storing the secret data on the source appliance.
7. Click **OK**. The FIPS appliances are now configured in HA mode.
8. Create a FIPS key, as described in [Create a FIPS key](#). The FIPS key is automatically transferred from the primary to the secondary.

The following diagram summarizes the transfer process.

Figure 1. Transfer the FIPS key-summary

## Update the firmware to version 2.2 on a FIPS card

July 1, 2021

### Note:

The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.

FIPS firmware version 2.2 supports TLS protocol versions 1.1 and 1.2. From the command line, you can update the firmware version of the FIPS card of a Citrix ADC MPX 9700/10500/12500/15500 FIPS appliance from version 1.1 to version 2.2.

For successful SIM key propagation from primary to secondary in a high availability (HA) pair, the Cavium firmware version on each appliance must be identical. Perform the firmware update on the secondary appliance first. If the firmware update is performed on the primary appliance first, the long-running update process causes a failover.

### Limitations

- Secure renegotiation is supported only on SSL virtual servers and front-end SSL services.
- Creating a certificate signing request by using a key that was created on firmware version 1.1 and updated to firmware version 2.2 fails.
- You cannot create a 1024-bit RSA key on firmware version 2.2. However, if you have imported or created a 1024-bit FIPS key on firmware version 1.1 and you then update to firmware version

2.2, you can use that FIPS key on firmware version 2.2.

- 1024-bit RSA keys are not supported.
- Secure renegotiation using the SSLv3 protocol is not supported.
- After upgrading the firmware, TLSv1.1 and TLSv1.2 are disabled by default on the existing virtual server, internal, front end, and back-end services. To use TLS 1.1/1.2, you must explicitly enable these protocols, on the SSL entities, after the upgrade.
- FIPS keys that are created in firmware version 2.2 are not available if you downgrade the firmware to version 1.1.

## Prerequisites

Download the following files from the download page on [www.citrix.com](http://www.citrix.com). The files must be stored in the `/var/nsinstall` directory on the appliance.

- FW 2.2 File: FW-2.2-130013
- FW 2.2 Signature File: FW-2.2-130013.sign

FW-2.2-130013 is the recommended firmware version. It includes fixes to improve DRBG.

## Update the FIPS firmware to version 2.2 on a standalone appliance

1. Log on to the appliance by using the administrator credentials.
2. At the prompt, type the following command to confirm that the FIPS card is initialized.

```
1 show fips
2
3 FIPS HSM Info:
4 HSM Label      : Citrix ADC FIPS
5 Initialization : FIPS-140-2 Level-2
6 HSM Serial Number : 3.0G1235-ICM000264
7 HSM State      : 2
8 HSM Model      : NITROX XL CN1620-NFBE
9
10 Hardware Version : 2.0-G
11 Firmware Version : 1.1
12 Firmware Release Date : Jun04,2010
13
14 Max FIPS Key Memory : 3996
15 Free FIPS Key Memory : 3992
16 Total SRAM Memory : 467348
17 Free SRAM Memory : 62512
18 Total Crypto Cores : 3
19 Enabled Crypto Cores : 1
```

```
20 Done
21 <!--NeedCopy-->
```

3. Save the configuration. At the prompt, type:

```
1 save config
2 <!--NeedCopy-->
```

4. Perform the update. At the prompt, type:

```
1 update ssl fips -fipsFW <path to the extracted contents>/CN16XX-
  NFBE-FW-2.2-1300013
2 <!--NeedCopy-->
```

Press Y when the following prompt appears:

```
1 This command will update compatible version of the FIPS firmware.
  You must save the current configuration (saveconfig) before
  executing this command. You must reboot the system after
  execution of this command, for the firmware update to take
  effect. Do you want to continue?(Y/N)Y
2
3 Done
4 <!--NeedCopy-->
```

**Note:** You only need to specify the firmware file, because the firmware signature file is placed in the same location.

The update takes up to 10 seconds. The update command is blocking, which means that no other actions are performed until the command finishes. The command prompt reappears when execution of the command is completed.

1. Restart the appliance. At the prompt, type:

```
1 reboot
2
3 Are you sure you want to restart NetScaler (Y/N)? [N]:Y
4 <!--NeedCopy-->
```

2. Verify that the update is successful. At the prompt, type:

```
1 show fips
2 <!--NeedCopy-->
```

The firmware version displayed in the output must be 2.2. For example:

```
1 sh fips
2     FIPS HSM Info:
3         HSM Label      : Citrix ADC FIPS
4         Initialization  : FIPS-140-2 Level-2
5         HSM Serial Number : 2.1G1207-IC002429
6         HSM State      : 2
7         HSM Model      : NITROX XL CN1620-NFBE
8
9         Hardware Version : 2.0-G

```

### Update the FIPS firmware to version 2.2 on appliances in a high availability pair

1. Log on to the secondary node and perform the update as described in “Update the FIPS firmware to version 2.2 on a standalone appliance”.

Force the secondary node to become primary. At the prompt, type:

```
1 force failover
2 <!--NeedCopy-->
```

Press **Y** at the confirmation prompt.

2. Log on to the new secondary node (old primary) and perform the update as described in “Update the FIPS firmware to version 2.2 on a standalone appliance”.
3. Force the new secondary node to become primary again. At the prompt, type:

```
1 force failover
2 <!--NeedCopy-->
```

Press **Y** at the confirmation prompt.

## Update the FIPS firmware to version 1.1 on a standalone appliance

1. Download the nfb\_firmware-r1235\_100604 and nfb\_firmware-r1235\_100604.sign files, to the same directory on the appliance, from the download page on [www.citrix.com](http://www.citrix.com).
2. Log on to the appliance by using the administrator credentials.
3. At the prompt, type:

```
1 update ssl fips -fipsFW /<full path to the file>/nfb_firmware-  
  r1235_100604  
2 <!--NeedCopy-->
```

## Reset a locked HSM

July 1, 2021

### Note:

The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.

The HSM becomes locked (no longer operational) if you change the SO password, restart the appliance without saving the configuration, and make three unsuccessful attempts to change the password. The locking is a security measure for preventing unauthorized access attempts and changes to the HSM settings.

**Important:** To avoid this situation, save the configuration after initializing the HSM.

If the HSM is locked, you must reset the HSM and restart the appliance to restore the default passwords. You can then use the default passwords to access the HSM and configure it with new passwords. When finished, you must save the configuration and restart the appliance.

**Caution:** Do not reset the HSM unless it has become locked.

## Reset a locked HSM by using the CLI

At the command prompt, type the following commands to reset and reinitialize a locked HSM:

```
1 reset ssl fips  
2 reboot -warm  
3 set ssl fips -initHSM Level-2 <new SO password> <old SO password> <user  
  password> [-hsmLabel <string>]  
4 save ns config  
5 reboot -warm  
6 <!--NeedCopy-->
```

**Example:**

```
1 reset fips
2
3 reboot -warm
4
5 set fips -initHSM Level-2 newsopin123 sopin123 userpin123 -hsmLabel
   NSFIPS
6
7 saveconfig
8
9 reboot -warm
10
11 Note: By default the HSM passwords are preconfigured. The <
   Old_SO_Password> = so12345, <User_Password> = user123, <
   New_SO_Password> = sopin12345, <New_User_Password> = userpin123.
12 <!--NeedCopy-->
```

**Reset a locked HSM by using the GUI**

1. Navigate to **Traffic Management > SSL > FIPS**
2. In the details pane, on the **FIPS Info** tab, click **Reset FIPS**.
3. Configure the HSM, as described in [Configuring the HSM](#).
4. In the details pane, click **Save**.

**Citrix ADC VPX FIPS certified appliances**

October 14, 2021

The Citrix ADC VPX FIPS appliance is validated for FIPS 140-2 Level 1 (Certificate #3732: <https://csrc.nist.gov/projects/cryptographic-module-validation-program/certificate/3732>) by the National Institute of Standards and Technology (NIST). More information about the FIPS 140-2 standard and validation program is available on the NIST and the Canadian Center for Cyber Security (CCCS) Cryptographic Module Validation Program (CMVP) website at <https://csrc.nist.gov/projects/cryptographic-module-validation-program>.

**Prerequisites**

- For on-prem hypervisors download the special build from the Citrix website. Download the complete VPX FIPS package for the respective hypervisor.

- VPX FIPS is supported only on platforms on which the underlying Intel CPU supports RDRAND and RDSEED instruction sets. For more information about Intel CPU supporting RDRAND and RDSEED instruction sets, check the Intel architecture document.
- Citrix ADC VPX FIPS license.

## Configuration

The module is available as a software package that includes both the application software and the operating system. After purchasing the Citrix ADC VPX FIPS license, get the latest Citrix ADC VPX FIPS image from the Citrix website.

Perform the following steps:

1. Upload the latest Citrix ADC VPX FIPS image to one of the following hypervisors: ESXi, Citrix Hypervisor, Hyper-V, KVM, AWS, Azure, or GCP.

### Note

VPX FIPS is qualified on ESX 6.5 U2 and ESX 7.0.1.c.

2. Apply the Citrix ADC VPX FIPS license and warm reboot the appliance.
3. After the appliance starts, run the following command at the CLI:

```
1 > show system fipsStatus
2 <!--NeedCopy-->
```

You must get the following output.

```
1 FipsStatus: "System is operating in FIPS mode"
2 Done
3 >
4 <!--NeedCopy-->
```

In case you get the following output, see the troubleshooting section for steps to resolve.

```
1 FipsStatus: "System is operating in non FIPS mode"
2 Done
3 >
4 <!--NeedCopy-->
```

4. Follow the configuration guidelines in [Secure Deployment Guide](#).

## Ciphers supported on a VPX FIPS appliance

All ciphers supported on a Citrix ADC MPX/SDX 14000 FIPS appliance, except the 3DES cipher, are supported on a VPX FIPS appliance. For the complete list of ciphers supported on a Citrix ADC VPX FIPS appliance, see [Cipher support on Citrix ADC VPX FIPS and MPX FIPS certified appliances](#).

## Upgrade a Citrix ADC VPX FIPS certified appliance

Follow the steps in [Upgrade a Citrix ADC standalone appliance](#) to upgrade the VPX FIPS certified appliance.

**Important:** Replace the `./installns` command with `./installns -F`.

## Limitations

- RADIUS and TACACS authentication are not supported on the VPX FIPS appliance.
- VPX FIPS is a separate image. Software version upgrade from VPX version to VPX FIPS version is not supported. Also, the VPX FIPS software version cannot be downgraded or upgraded to the VPX software version.
- VPX FIPS image is not supported on a Citrix ADC SDX and Citrix ADC SDX FIPS appliance.
- Citrix ADC VPX FIPS on GCP currently supports standalone deployment only. HA deployment is not supported.

## Troubleshooting

When you run the `show system fipsStatus` command and the output is as follows:

```
1 FipsStatus: "System is operating in non FIPS mode"  
2 Done  
3 >  
4 <!--NeedCopy-->
```

The reason might be one of the following;

1. License is expired or incorrect.
2. Hardware is not supported.
3. The system is unable to come up in FIPS mode due to POST failure on the management core or packet engine.

To resolve:

1. Check that the correct Citrix ADC VPX FIPS license is installed and that the license has not expired.
2. Check that the underlying CPU supports RDRAND and RDSEED instruction sets. Run the following command:

```
1 >shell
2 #nsconmsg -g drbg -g ssl_err -g fips -d statswt0
3 <!--NeedCopy-->
```

If the `nsssl_err_fips_drbg_rdrand_not_supported` counter increments, the underlying hardware does not support the RDRAND and RDSEED instruction set.

3. To check for Power-on self-test (POST) failure on the management core or on a packet engine, run the following command:

```
1 >shell
2 #nsconmsg -g drbg -g ssl_err -g fips -d statswt0
3 <!--NeedCopy-->
```

The `nsssl_err_fips_post_failed` counter increments if POST fails during bootup on the packet engine. That is, there is a data plane failure.

If the counter does not increment, check the log file (`/var/log/FIPS-post.log`) for a failed algorithm test entry. That is, check for POST failure on the management core (control plane failure).

In both cases, contact Citrix support.

## Citrix ADC MPX FIPS certified appliances

October 22, 2021

The Citrix ADC MPX 8900 FIPS and MPX 15000-50G FIPS certified appliances [Cert #4043](#) have been tested by a third party laboratory for the security requirements of FIPS 140-2 Level-2. More information about the FIPS 140-2 standard and validation program is available on the National Institute of Standards and Technology (NIST) and the Canadian Center for Cyber Security (CCCS) Cryptographic Module Validation Program (CMVP) website at <https://csrc.nist.gov/projects/cryptographic-module-validation-program>.

### Note

The MPX 8900 FIPS and the MPX 15000-50G FIPS appliances no longer use a third-party Hardware Security Module. The requirements to be FIPS validated are build into the system.

## Prerequisites

- FIPS license
- Platform license

## Ciphers supported on MPX 8900 FIPS and MPX 15000-50G FIPS certified appliances

All ciphers supported on a Citrix ADC MPX/SDX 14000 FIPS appliance, except the 3DES cipher, are supported on the MPX 8900 and MPX 15000-50G FIPS certified appliances. For the complete list of ciphers supported on these appliances, see [Cipher support on Citrix ADC VPX FIPS and MPX FIPS certified appliances](#).

## Limitation

RADIUS and TACACS authentication is not supported on the MPX FIPS certified appliance.

## Configuration

1. After the appliance starts, run the following command at the CLI:

```
1 > show system fipsStatus
2 <!--NeedCopy-->
```

2. You must get the following output.

```
1 FipsStatus: "System is operating in FIPS mode"
2 Done
3 >
4 <!--NeedCopy-->
```

3. In case you get the following output, check the license.

```
1 FipsStatus: "System is operating in non FIPS mode"
2 Done
3 >
4 <!--NeedCopy-->
```

Perform the following steps to initialize the MPX appliance for the FIPS mode of operation.

1. Enforce strong passphrase requirements.

2. Replace the default TLS certificate.
3. Disable HTTP access to the web GUI.
4. Create the KEK `master` key.
5. After initial configuration, disable local authentication and configure remote authentication using LDAP.

### Enforce strong passphrase requirements using the GUI

Passphrases are used to derive keys using PBKDF2. As an admin, enable strong passphrase requirements using the GUI.

1. Navigate to **System > Settings**.
2. In the Settings section, click **Change Global System Settings**.
3. In the **Strong Password** field, select **Enable All**.
4. In the **Min Password Length** field, type “8.”
5. Click **OK**.

### Replace the default TLS certificate

By default, the MPX FIPS certified appliance includes a factory-provisioned RSA certificate for TLS connections (`ns-server.cert` and `ns-server.key`). This certificate is not intended for use in production deployments and must be replaced. Replace the default certificate with a new certificate after the initial installation.

#### To replace the default TLS certificate:

1. At the command prompt, type the following command to set the host name of the appliance.

```
set ns hostName <hostname>
```

### Create a Certificate Signing Request (CSR) using the GUI

1. Navigate to **Traffic Management > SSL > SSL Files**.
2. In the **CSR** tab, click **Create Certificate Signing Request (CSR)**.
3. Enter the values and click **Create**.  
Note: The **Common Name** field contains the value of the host name set using the ADC CLI.
4. Submit the CSR file to a trusted certificate authority (CA). The CSR file is available in the `/nsconfig/ssl` directory.
5. After receiving the certificate from the CA, copy the file to the `/nsconfig/ssl` directory.
6. Navigate to **Traffic Management > SSL > Certificates > Server Certificates**.
7. Select **ns-server-certificate**.
8. Click **Update**.
9. Click **Update the certificate and key**.

10. In the **Certificate File Name** field, choose the certificate file that was received from the certificate authority (CA). Choose **Local** if the file is on your local computer. Otherwise, choose **Appliance**.
11. In the **Key File Name** field, specify the default private key file name (`ns-server.key`).
12. Select the **No Domain Check** option.
13. Click **OK**.

### **Disable HTTP access to the web GUI**

To protect traffic to the administrative interface and web GUI, the appliance must be configured to use HTTPS. After adding new certificates, use the CLI to disable HTTP access to the GUI management interface.

At the command prompt, type:

```
set ns ip <NSIP> -gui SECUREONLY
```

### **Create the KEK key**

The KEK `master` key is used to encrypt passphrases and other sensitive information. To prevent the default KEK from being used, use the CLI to create a KEK.

To create the KEK, at the command prompt, type:

```
create system kek
```

When prompted, enter a strong passphrase. The KEK is derived from this passphrase.

### **Disable local authentication and configure remote authentication using LDAP**

The superuser account is a default account with root CLI access privileges that is required for initial configuration. During initial configuration, disable local system authentication to block access to all local accounts (including the superuser account), and to ensure that superuser privileges are not assigned to any user account.

To disable local system authentication and enable external system authentication using the CLI

At the command prompt, type:

```
set system parameter -localauth disabled
```

Follow the instructions in [Configuring LDAP authentication](#) to configure external system authentication to use LDAP.

## MPX 14000 FIPS appliances

October 14, 2021

### Important:

- The MPX 9700/10500/12500/15500 FIPS platform has reached end of life.
- Configuration steps for NetScaler MPX 14000 FIPS and NetScaler MPX 9700/10500/12500/15500 FIPS appliances are different. MPX 14000 FIPS appliances do not use firmware v2.2. A FIPS key created on the Hardware Security Module (HSM) of the MPX 9700 platform cannot be transferred to the HSM of the MPX 14000 platform. The other way round is also not supported. However, if you have imported an RSA key as a FIPS key, you can copy the RSA key to the MPX 14000 platform. Then import it as a FIPS key. Only 2048-bit and 3072-bit keys are supported.

A FIPS appliance is equipped with a tamper-proof (tamper-evident) cryptographic module—a Cavium CNN3560-NFBE-G—designed to comply with the FIPS 140-2 Level-3 specifications (from release 12.0 build 56.x). The Critical Security Parameters (CSPs), primarily the server's private-key, are securely stored and generated inside the cryptographic module, also referred to as the HSM. The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (`nsroot`) can perform operations on the keys stored inside the HSM.

Before configuring a FIPS appliance, you must check the state of the FIPS card and then initialize the card. Create a FIPS key and server certificate, and add any additional SSL configuration.

For information about the FIPS ciphers supported, see [FIPS Approved Algorithms and Ciphers](#).

For information about configuring FIPS appliances in an HA setup, see [Configure FIPS on appliances in an HA setup](#).

### Limitations

1. SSL renegotiation using the SSLv3 protocol is not supported on the back end of an MPX FIPS appliance.
2. 1024-bit and 4096-bit keys and exponent value of 3 aren't supported.
3. 4096-bit server certificate isn't supported.
4. 4096-bit client certificate isn't supported (if client authentication is enabled on the back-end server).

### Configure the HSM

Before configuring the HSM on an MPX 14000 FIPS appliance, check the state of your FIPS card to verify that the driver loaded correctly. Then initialize the card.

At the command prompt, type:

```
1 show fips
2
3 FIPS Card is not configured
4
5 <!--NeedCopy-->
```

The message “ERROR: Operation not permitted - no FIPS card present in the system” appears if the driver is not loaded correctly.

### Initialize the FIPS card

The appliance must be restarted three times for proper initialization of the FIPS card.

#### Important

- Verify that the `/nsconfig/fips` directory has been successfully created on the appliance.
- Do not save the configuration before you restart the appliance for the third time.

Perform the following steps to initialize the FIPS card:

1. Reset the FIPS card (`reset fips`).
2. Restart the appliance (`reboot`).
3. Set the security officer password for partitions 0 and 1, and the user password for partition ( `set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -hsmLabel NSFIPS` ).)

Note: The set or reset command takes more than 60 seconds to run.

4. Save the configuration (`saveconfig`).
5. Verify that the password encrypted key for the main partition (`master_pek.key`) has been created in the `/nsconfig/fips/` directory.
6. Restart the appliance (`reboot`).
7. Verify that the password encrypted key for the default partition (`default_pek.key`) has been created in the `/nsconfig/fips/` directory.
8. Restart the appliance (`reboot`).
9. Verify that the FIPS card is UP (`show fips`).

### Initialize the FIPS card by using the CLI

The `set fips` command initializes the Hardware Security Module (HSM) on the FIPS card and sets a new security officer password and user password.

**Caution:** This command erases all data on the FIPS card. You are prompted before proceeding with the command execution. A restart is required before and after running this command for the changes to apply. Save the configuration after running this command and before restarting the appliance.

At the command prompt, type the following commands:

```
1 reset fips
2
3 reboot
4
5 set fips -initHSM Level-2 so12345 so12345 user123 -hsmLabel NSFIPS
6
7 This command will erase all data on the FIPS card. You must save the
  configuration (saveconfig) after executing this command. Do you want
  to continue?(Y/N)y
8
9 <!--NeedCopy-->
```

**Note:** The following message appears when you run the `set fips` command:

```
1 This command will erase all data on the FIPS card. You must save the
  configuration (saveconfig) after executing this command. [Note: On
  MPX/SDX 14xxx FIPS platform, the FIPS security is at Level-3 by
  default, and the -initHSM Level-2 option is internally converted to
  Level-3] Do you want to continue?(Y/N)y
2
3 saveconfig
4
5 reboot
6
7 reboot
8
9 show fips
10
11          FIPS HSM Info:
12              HSM Label           : NetScaler FIPS
13              Initialization       : FIPS-140-2 Level-3
14              HSM Serial Number    : 3.1G1836-ICM000136
15              HSM State            : 2
16              HSM Model            : NITROX-III CNN35XX-NFBE
17              Hardware Version     : 0.0-G
```

```

18      Firmware Version      : 1.0
19      Firmware Build       : NFBE-FW-1.0-48
20      Max FIPS Key Memory   : 102235
21      Free FIPS Key Memory  : 102231
22      Total SRAM Memory     : 557396
23      Free SRAM Memory     : 262780
24      Total Crypto Cores   : 63
25      Enabled Crypto Cores : 63
26
27 <!--NeedCopy-->

```

### Create a FIPS key

You can create a FIPS key on your MPX 14000 FIPS appliance or import an existing FIPS key to the appliance. The MPX 14000 FIPS appliance supports only 2048-bit and 3072-bit keys and an exponent value of F4 (whose value is 65537). For PEM keys, an exponent is not required. Verify that the FIPS key is created correctly. Create a certificate signing request and a server certificate. Finally, add the certificate-key pair to your appliance.

Specify the key type (RSA or ECDSA). For ECDSA keys, specify only the curve. ECDSA key creation with curve P\_256 and P\_384 are supported.

#### Note:

1024-bit and 4096-bit keys and an exponent value of 3 are not supported.

### Create a FIPS key by using the CLI

At the command prompt, type:

```

1 create ssl fipsKey <fipsKeyName> -keytype ( RSA | ECDSA ) [-exponent (
   3 | F4 )] [-modulus <positive_integer>] [-curve ( P_256 | P_384 )]
2 <!--NeedCopy-->

```

#### Example1:

```

1 create fipsKey f1 -keytype RSA -modulus 2048 -exponent F4
2
3 show ssl fipskey f1
4
5 FIPS Key Name: f1  Key Type: RSA Modulus: 2048  Public Exponent: F4 (
   Hex: 0x10001)
6
7 <!--NeedCopy-->

```

**Example2:**

```
1 > create fipskey f2 -keytype ECDSA -curve P_256
2
3
4 > sh fipskey f2
5     FIPS Key Name: f2    Key Type: ECDSA Curve: P_256
6
7 <!--NeedCopy-->
```

**Create a FIPS key by using the GUI**

1. Navigate to **Traffic Management > SSL > FIPS**.
  2. In the details pane, on the FIPS Keys tab, click **Add**.
  3. In the Create FIPS Key dialog box, specify values for the following parameters:
    - FIPS Key Name\*—fipsKeyName
    - Modulus\*—modulus
    - Exponent\*—exponent
- \*A required parameter
4. Click **Create**, and then click **Close**.
  5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you created are correct.

**Import a FIPS key**

To use an existing FIPS key with your FIPS appliance, you need to transfer the FIPS key from the hard disk of the appliance into its HSM.

**Note:** To avoid errors when importing a FIPS key, ensure that the name of the key imported is the same as the original key name when it was created.

**Import a FIPS key by using the CLI**

At the command prompt, type:

```
1 import ssl fipsKey <fipsKeyName> -key <string> [-inform <inform>] [-
  wrapKeyName <string>] [-iv<string>] -exponent F4 ]
2 <!--NeedCopy-->
```

**Example:**

```
1 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4
2
3 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform PEM
4
5 <!--NeedCopy-->
```

Verify that the FIPS key is created or imported correctly by running the `show fipskey` command.

```
1 show fipskey
2 1)      FIPS Key Name: Key-FIPS-2
3
4 <!--NeedCopy-->
```

### Import a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Import**.
3. In the Import as a FIPS Key dialog box, select FIPS key file and set values for the following parameters:
  - FIPS Key Name\*
  - Key File Name\* — To put the file in a location other than the default, specify the complete path or click **Browse** and navigate to a location.
  - Exponent\*

\*A required parameter
4. Click **Import**, and then click **Close**.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

### Export a FIPS key

Citrix recommends that you create a backup of any key created in the FIPS HSM. If a key in the HSM is deleted, you cannot create the same key again, and all the certificates associated with it are rendered useless.

In addition to exporting a key as a backup, you might need to export a key for transfer to another appliance.

The following procedure provides instructions on exporting a FIPS key to the `/nsconfig/ssl` folder on the appliance's CompactFlash and securing the exported key by using a strong asymmetric key encryption method.

### Export a FIPS key by using the CLI

At the command prompt, type:

```
1 export ssl fipsKey <fipsKeyName> -key <string>
2 <!--NeedCopy-->
```

#### Example:

```
1 export fipskey Key-FIPS-1 -key Key-FIPS-1.key
2 <!--NeedCopy-->
```

### Export a FIPS key by using the GUI

1. Navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Keys tab, click **Export**.
3. In the Export FIPS key to a file dialog box, specify values for the following parameters:
  - FIPS Key Name\*—fipsKeyName
  - File Name\*—key (To put the file in a location other than the default, you can either specify the complete path or click the Browse button and navigate to a location.)

\*A required parameter
4. Click **Export**, and then click **Close**.

### Import an external key

You can transfer FIPS keys that are created within the Citrix ADC appliance's HSM. You can also transfer external private keys (such as keys created on a standard Citrix ADC, Apache, or IIS) to a Citrix ADC FIPS appliance. External keys are created outside the HSM, by using a tool such as OpenSSL. Before importing an external key into the HSM, copy it to the appliance's flash drive under `/nsconfig/ssl`.

On the MPX 14000 FIPS appliances, the `-exponent` parameter in the `import ssl fipskey` command is not required while importing an external key. The correct public exponent is detected automatically when the key is imported, and the value of the `-exponent` parameter is ignored.

The Citrix ADC FIPS appliance does not support external keys with a public exponent other than 3 or F4.

You do not need a wrap key on the MPX 14000 FIPS appliances.

You cannot import an external, encrypted FIPS key directly to an MPX 14000 FIPS appliance. To import the key you need to first decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

```
1 openssl rsa -in <EncryptedKey.key> > <DecryptedKey.out>
2 <!--NeedCopy-->
```

**Note:** If you import an RSA key as a FIPS key, Citrix recommends that you delete the RSA key from the appliance for security purposes.

### Import an external key as a FIPS key by using the CLI

1. Copy the external key to the appliance's flash drive.
2. If the key is in .pfx format, you must first convert it to PEM format. At the command prompt, type:

```
1 convert ssl pkcs12 <output file> -import -pkcs12File <input .pfx
   file name> -password <password>
2 <!--NeedCopy-->
```

3. At the command prompt, type the following commands to import the external key as a FIPS key and verify the settings:

```
1 import ssl fipsKey <fipsKeyName> -key <string> -informPEM
2 show ssl fipskey<fipsKeyName>
3 <!--NeedCopy-->
```

### Example:

```
1 convert ssl pkcs12 iis.pem -password 123456 -import -pkcs12File iis.pfx
2
3 import fipskey Key-FIPS-2 -key iis.pem -inform PEM
4
5 show ssl fipskey key-FIPS-2
6
7 FIPS Key Name: Key-FIPS-2 Modulus: 0   Public Exponent: F4 (Hex value 0
   x10001)
8 <!--NeedCopy-->
```

### Import an external key as a FIPS key by using the GUI

1. If the key is in .pfx format, you must first convert it to PEM format.
  - a) Navigate to **Traffic Management > SSL**.
  - b) In the details pane, under Tools, click **Import PKCS#12**.
  - c) In the Import PKCS12 File dialog box, set the following parameters:

- Output File Name\*
- PKCS12 File Name\*—Specify the .pfx file name.
- Import Password\*
- Encoding Format

\*A required parameter

2. Navigate to **Traffic Management > SSL > FIPS**.
  3. In the details pane, on the FIPS Keys tab, click **Import**.
  4. In the Import as a FIPS Key dialog box, select PEM file, and set values for the following parameters:
    - FIPS Key Name\*
    - Key File Name\*—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.
- \*A required parameter
5. Click **Import**, and then click **Close**.
  6. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you imported are correct.

## Configure FIPS on appliances in an HA setup

You can configure two appliances in an HA pair as FIPS appliances.

### Prerequisites

- The Hardware Security Module (HSM) must be configured on both the appliances. For more information, see [Configure the HSM](#).
- When using the GUI, ensure that the appliances are already in an HA setup. For more information about configuring an HA setup, see [High availability](#).

#### Note:

Citrix recommends that you use the configuration utility (GUI) for this procedure. If you use the command line (CLI), make sure that you carefully follow the steps as listed in the procedure. Changing the order of steps or specifying an incorrect input file might cause an inconsistency that requires an appliance restart. In addition, if you use the CLI, the `create ssl fipskey` command is not propagated to the secondary node. When you run the command with the same input values for modulus size and exponent on two different FIPS appliances, the keys generated are not the same. Create the FIPS key on one of the nodes and then transfer it to the other node. But if you use the configuration utility to configure FIPS appliances in an HA setup, the FIPS key

that you create is automatically transferred to the secondary node. The process of managing and transferring the FIPS keys is known as secure information management (SIM).

**Important:** The HA setup must be completed within six minutes. If the procedure fails at any step, do the following:

1. Restart the appliance or wait for 10 minutes.
2. Remove all the files created by the procedure.
3. Repeat the HA setup procedure.

Do not reuse existing file names.

In the following procedure, appliance A is the primary node and appliance B is the secondary node.

### Configure FIPS on appliances in an HA setup by using the CLI

The following diagram summarizes the transfer process on the CLI.

Figure 1. Transfer the FIPS key-summary

1. **On appliance A**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance, using the administrator credentials.
3. Initialize appliance A as the source appliance. At the command prompt, type:

```
1 init ssl fipsSIMsource <certFile>
2 <!--NeedCopy-->
```

#### Example:

```
init fipsSIMsource /nsconfig/ssl/nodeA.cert
```

4. Copy this <certFile> file to appliance B, in the /nconfig/ssl folder.

**Example:**

```
scp /nsconfig/ssl/nodeA.cert nsroot@198.51.100.10:/nsconfig/ssl
```

5. **On appliance B**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
6. Log on to the appliance, using the administrator credentials.
7. Initialize appliance B as the target appliance. At the command prompt, type:

```
1 init ssl fipsSIMtarget <certFile> <keyVector> <targetSecret>
2 <!--NeedCopy-->
```

**Example:**

```
init fipsSIMtarget /nsconfig/ssl/nodeA.cert /nsconfig/ssl/nodeB.key /
nsconfig/ssl/nodeB.secret
```

8. Copy this <targetSecret> file to appliance A.

**Example:**

```
scp /nsconfig/ssl/fipslbda10801b.secret nsroot@198.51.100.20:/nsconfig/
ssl
```

9. **On appliance A**, enable appliance A as the source appliance. At the command prompt, type:

```
1 enable ssl fipsSIMsource <targetSecret> <sourceSecret>
2 <!--NeedCopy-->
```

**Example:**

```
enable fipsSIMsource /nsconfig/ssl/nodeB.secret /nsconfig/ssl/nodeA.
secret
```

10. Copy this <sourceSecret> file to appliance B.

**Example:**

```
scp /nsconfig/ssl/fipslbda10801b.secret nsroot@198.51.100.10:/nsconfig/
ssl
```

11. **On appliance B**, enable appliance B as the target appliance. At the command prompt, type:

```
1 enable ssl fipsSIMtarget <keyVector> <sourceSecret>
2 <!--NeedCopy-->
```

**Example:**

```
enable fipsSIMtarget /nsconfig/ssl/nodeB.key /nsconfig/ssl/nodeA.secret
```

12. **On appliance A**, create a FIPS key, as described in Create a FIPS key.
13. Export the FIPS key to the appliance's hard disk, as described in Export a FIPS key.
14. Copy the FIPS key to the hard disk of the secondary appliance by using a secure file transfer utility, such as SCP.
15. **On appliance B**, import the FIPS key from the hard disk into the HSM of the appliance, as described in Import a FIPS key.

### Configure FIPS on appliances in an HA setup by using the GUI

1. On the appliance to be configured as the source (primary) appliance, navigate to **Traffic Management > SSL > FIPS**.
2. In the details pane, on the FIPS Info tab, click **Enable SIM**.
3. In the **Enable SIM for HA Pair** dialog box, in the **Certificate File Name** text box, type the file name. The file name must contain the path to the location at which the FIPS certificate must be stored on the source appliance.
4. In the **Key Vector File Name** text box, type the file name. The file name must contain the path to the location at which the FIPS key vector must be stored on the source appliance.
5. In the **Target Secret File Name** text box, type the location for storing the secret data on the target appliance.
6. In the **Source Secret File Name** text box, type the location for storing the secret data on the source appliance.
7. Under **Secondary System Login Credential**, enter the values for **User Name** and **Password**.
8. Click **OK**. The FIPS appliances are now configured in HA mode.

**Note:** After configuring the appliances in HA, create a FIPS key, as described in Create a FIPS key. The FIPS key is automatically transferred from the primary to the secondary appliance.

### Create a certificate signing request by using the CLI

At the command prompt, type:

```

1 create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
   <string>) [-keyform ( DER | PEM ) {
2   -PEMPassPhrase  }
3   ] -countryName <string> -stateName <string> -organizationName<string>
   [-organizationUnitName <string>] [-localityName <string>] [-
   commonName <string>] [-emailAddress <string>] {
4   -challengePassword  }
5   [-companyName <string>] [-digestMethod ( SHA1 | SHA256 )]
6 <!--NeedCopy-->

```

**Example:**

```
1 >create certreq f1.req - fipsKeyName f1 -countryName US -stateName CA
   -organizationName Citrix -companyName Citrix -commonName ctx -
   emailAddress test@example.com
2
3 <!--NeedCopy-->
```

**Create a server certificate by using the CLI**

At the command prompt, type:

```
1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
   input_filename>] [-keyform ( DER | PEM ) {
2 -PEMPassPhrase }
3 ] [-days <positive_integer>] [-certForm ( DER | PEM )] [-CAcert <
   input_filename>] [-CAcertForm ( DER | PEM )] [-CAkey <
   input_filename>][-CAkeyForm ( DER | PEM )] [-CAserial <
   output_filename>]
4 <!--NeedCopy-->
```

**Example:**

```
1 create cert f1.cert f1.req SRVR_CERT -CAcert ns-root.cert -CAkey ns-
   root.key -CAserial ns-root.srl -days 1000
2
3 <!--NeedCopy-->
```

The preceding example creates a server certificate using a local root CA on the appliance.

**Add a certificate-key pair by using the CLI**

At the command prompt, type:

```
1 add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <
   string> | -fipsKey <string> | -hsmKey <string>] [-inform <inform>][-
   expiryMonitor ( ENABLED | DISABLED ) [-notificationPeriod <
   positive_integer>]] [-bundle ( YES | NO )]
2 <!--NeedCopy-->
```

**Example:**

```
1 add certkey cert1 -cert f1.cert -fipsKey f1
2
```

```
3 <!--NeedCopy-->
```

After creating the FIPS key and server certificate, you can add the generic SSL configuration. Enable the features that are required for your deployment. Add servers, services, and SSL virtual servers. Bind the certificate-key pair and the service to the SSL virtual server. Save the configuration.

```
1 enable ns feature SSL LB
2
3 add server s1 10.217.2.5
4
5 add service sr1 s1 HTTP 80
6
7 add lb vserver v1 SSL 10.217.2.172 443
8
9 bind ssl vserver v1 - certkeyName cert1
10
11 bind lb vserver v1 sr1
12
13 saveconfig
14
15 <!--NeedCopy-->
```

The basic configuration of your MPX 14000 FIPS appliance is now complete.

For information about configuring secure HTTPS, click [Configure FIPS](#).

For information about configuring secure RPC, click [Configure FIPS for the first time](#).

## Update the license on an MPX 14000 FIPS appliance

Any update to the license on this platform requires two reboots.

1. Update the license in the `/nsconfig/license` folder.
2. Restart the appliance.
3. Log on to the appliance.
4. Restart the appliance again.  
**Note:** Do not add new commands, save the config, or check the system state before the second reboot.
5. Log on to the appliance and ensure that FIPS is initialized by running the `show ssl fips` command.

## Support for hybrid FIPS mode on the MPX 14000 FIPS and SDX 14000 FIPS platforms

**Note:**

This feature is supported only on the new MPX/SDX 14000 FIPS platform containing one primary FIPS card and one or more secondary cards. It is not supported on a VPX platform or a platform containing only one type of hardware card.

On a FIPS platform, the asymmetric and symmetric encryption and decryption are performed on the FIPS card for security reasons. However, you can perform part of this activity (asymmetric) on a FIPS card and offload the bulk encryption and decryption (symmetric) to another card without compromising the security of your keys.

The new MPX/SDX 14000 FIPS platform contains one primary card and one or more secondary cards. If you enable the hybrid FIPS mode, the pre-master secret decryption commands are run on the primary card because the private key is stored on this card. However, the bulk encryption and decryption is offloaded to the secondary card. This offload significantly increases the bulk encryption throughput on an MPX/SDX 14000 FIPS platform as compared to non-hybrid FIPS mode and the existing MPX 9700/10500/12500/15000 FIPS platform. Enabling the hybrid FIPS mode also improves the SSL transaction per second on this platform.

**Notes:**

- The hybrid FIPS mode is disabled by default to meet the strict certification requirements where all the crypto computation must be done inside a FIPS certified module. Enable the hybrid mode to offload the bulk encryption and decryption to the secondary card.
- On an SDX 14000 FIPS platform, you must first assign an SSL chip to the VPX instance before you enable the hybrid mode.

**Enable hybrid FIPS mode by using the CLI**

At the command prompt, type:

```
1 set SSL parameter -hybridFIPSMODE {
2   ENABLED|DISABLED }
3
4
5 Arguments
6
7 hybridFIPSMODE
8
9 When this mode is enabled, system will use additional crypto hardware
   to accelerate symmetric crypto operations.
10
11 Possible values: ENABLED, DISABLED
12
```

```

13 Default value: DISABLED
14 <!--NeedCopy-->

```

**Example:**

```

1 set SSL parameter -hybridFIPSMODE ENABLED
2 show SSL parameter
3 Advanced SSL Parameters
4 -----
5 . . . . .
6 Hybrid FIPS Mode : ENABLED
7 . . . . .
8
9 <!--NeedCopy-->

```

**Enable hybrid FIPS mode by using the GUI**

1. Navigate to **Traffic Management > SSL**.
2. In the details pane, under **Settings**, click **Change advanced SSL settings**.
3. In the **Change Advanced SSL Settings** dialog box, select **Hybrid FIPS Mode**.

**Limitations:**

1. Renegotiation is not supported.
2. The `stat ssl parameter` command on an SDX 14000 platform does not display the correct secondary card utilization percentage. It always displays 0.00% utilization.

```

1 stat ssl
2
3 SSL Summary
4 # SSL cards present 1
5 # SSL cards UP 1
6 # Secondary SSL cards present 4
7 # Secondary SSL cards UP 4
8 SSL engine status 1
9 SSL sessions (Rate) 963
10 Secondary card utilization (%) 0.00
11 <!--NeedCopy-->

```

**SDX 14000 FIPS appliances**

September 21, 2020

A Citrix ADC SDX appliance is a multitenant platform on which you can provision and manage multiple virtual Citrix ADC instances. The SDX appliance addresses cloud computing and multitenancy requirements by allowing a single administrator to configure and manage the appliance and delegate the administration of each hosted instance to tenants.

A Citrix ADC SDX 14030/14060/14080 FIPS appliance provides the capabilities of an SDX appliance with FIPS functionality. It is equipped with a tamper-proof (tamper-evident) cryptographic module—a Cavium CNN3560-NFBE-G—designed to comply with the FIPS 140-2 Level-3 specifications (from release 12.0 build 56.x). The Critical Security Parameters (CSPs), primarily the server's private-key, are securely stored and generated inside the cryptographic module, also referred to as the Hardware Security Module (HSM). The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (nsroot) can perform operations on the keys stored inside the HSM.

A Citrix ADC SDX 14030/14060/14080 FIPS appliance contains one FIPS HSM module with 63 cores. The FIPS HSM module can be partitioned up to a maximum of 32 partitions. The SDX administrator can assign dedicated key storage, cryptographic resources, and number of crypto SSL FIPS cores to each partition. Keys and resources allocated to a partition are dedicated and secure and cannot be accessed or shared by another partition.

The FIPS HSM partition that you create can be assigned or attached to a VPX instance at the time of provisioning the instance, or later by editing the instance. The FIPS partition created and attached to an instance acts like a virtual HSM module for that particular instance.

The VPX instances on an SDX 14030/14060/14080 FIPS appliance are assigned a FIPS virtual function (VF) partition, which is treated as an isolated FIPS virtual card or HSM. Therefore, the steps to configure a FIPS partition inside a VPX instance are similar to the steps to configure an MPX FIPS appliance. For compliance details, see the security policy details on the U.S. National Institute of Standards and Technology (NIST) website.

For information about configuring FIPS appliances in a high availability setup, see [FIPS Appliances in a High Availability Setup](#).

#### **Important**

Each key includes a private and a public key. As a result, it occupies two key spaces. Therefore, the maximum number of keys is limited to one less than half the key store size.

The SDX 14000 FIPS platform supports a hybrid FIPS mode. In this mode, you can offload part of the encryption and decryption activity to a non-FIPS card. For more information, see [Hybrid FIPS mode](#).

## **Limitations**

September 21, 2020

1. SSL renegotiation using the SSLv3 protocol is not supported on the back end of an SDX FIPS appliance.
2. 1024-bit and 4096-bit keys and an exponent value of 3 are not supported.
3. Backup and restore is not supported.
4. Cluster and administrative domains are not supported.
5. You can attach only one FIPS partition to an instance.
6. An instance with a FIPS partition can be assigned only one CPU core.
7. You can assign either a FIPS partition or an SSL core to an instance, but not both.

## Terminology

September 21, 2020

**Zeroize:** Reset the HSM. All the data on the HSM is deleted. This is a mandatory step before the HSM is initialized.

**Initialize:** Set the HSM capabilities. The Citrix ADC SDX FIPS appliance complies with FIPS-140-2 level 2. You can create partitions after you initialize the chip.

**Key store size:** Number of keys that can be stored on a partition. A maximum of 102235 keys can be specified. The maximum number of keys that can be stored is one less than half the number specified. For example, if you specify 100, you can create only 49 keys because one of the keys is the RSA key pair that consumes 2 key stores.

**Crypto Core Capacity:** Number of crypto cores assigned to a partition. A maximum of 63 cores are available.

**SSL Context:** Number of concurrent SSL connections that can be created on a partition.

## Initialize the HSM

September 21, 2020

Before initializing the HSM, you must first zeroize it.

### Zeroize the HSM by using the Management Service

1. Open a browser and log on to the appliance.
2. On the **Configuration** tab, navigate to **System > HSM Administration**, and in the details plane, click **Zeroize**.

All data is wiped from the FIPS chip, and the state appears as “Zeroized.” Any HSM partitions created earlier are deleted.

NetScaler SDX > System > HSM Administration

Initialize Zeroize Upgrade

|                  |                         |
|------------------|-------------------------|
| State            | Zeroized                |
| Model            | NITROX-III CNN35XX-NFBE |
| Label            |                         |
| Firmware Version | CNN35XX-NFBE-FW-1.0-48  |
| Build            | 48                      |
| Part Number      | CNN3560-NFBE-G          |
| Serial Number    | 3.0G1444-ICM000023      |

### Initialize the HSM by using the Management Service

1. On the **Configuration** tab, navigate to **System > HSM Administration**, and in the details plane, click **Initialize**.
2. Type a new user name, specify a password, and click **OK**.

The card state appears as “Initialized.”

NetScaler SDX > System > HSM Administration

Initialize Zeroize Upgrade

|                         |                         |
|-------------------------|-------------------------|
| <b>State</b>            | ● Initialized           |
| <b>Model</b>            | NITROX-III CNN35XX-NFBE |
| <b>Label</b>            | cavium                  |
| <b>Firmware Version</b> | CNN35XX-NFBE-FW-1.0-48  |
| <b>Build</b>            | 48                      |
| <b>Part Number</b>      | CNN3560-NFBE-G          |
| <b>Serial Number</b>    | 3.0G1444-ICM000023      |

## Create partitions

September 21, 2020

Create partitions for different tenants and specify the cryptographic resources for each partition. Each instance is assigned one partition, and a partition can be assigned to only one instance. Deleting an instance deletes the partition assigned to the instance. As a result, the partition data is also deleted and not left unsecured or accessible later. Number of keys and SSL context assignment depends on your application. For information about number of cores to assign, see the Citrix ADC datasheet.

### Important

After you assign a key store size and cores to an HSM partition, you cannot change them at run time. You must first detach the partition from the instance.

### Create a partition by using the Management Service

1. On the Configuration tab, navigate to **System > HSM Administration > Partitions**, and in the details plane, click **Add**.
2. Specify a name for the partition, and the resources to be assigned to this partition.

3. Click **OK**.

Name\*

Key Store Size\*

Crypto Core Capacity\*

SSL Core Contexts\*

**Create** **Close**

The summary page displays all the partitions that were created. Some partitions are assigned an instance while some are free partitions.

NetScaler SDX > System > HSM Administration > Partitions ↻

|            |                |                    |                        |                    |                        |
|------------|----------------|--------------------|------------------------|--------------------|------------------------|
| Total Keys | Available Keys | Total Crypto Cores | Available Crypto Cores | Total SSL Contexts | Available SSL Contexts |
| 102,235    | 97,035         | 63                 | 23                     | 1,000,000          | 610,000                |

Add Edit Delete

| Name            | Key Store Size | Crypto Core Capacity | SSL Core Contexts | Instance Name         |
|-----------------|----------------|----------------------|-------------------|-----------------------|
| Part-3          | 2000           | 8                    | 10000             |                       |
| Part-4          | 200            | 2                    | 10000             |                       |
| Partition-1234  | 100            | 4                    | 20000             |                       |
| Partition-12345 | 300            | 4                    | 20000             |                       |
| Partition-5     | 300            | 8                    | 100000            |                       |
| Part-6          | 200            | 8                    | 200000            |                       |
| Part-1          | 100            | 2                    | 10000             | NSVPX-1-10.217.202.35 |
| Part-2          | 2000           | 4                    | 20000             | NSVPX-2-10.217.202.36 |

## Provision a new instance or modify an existing instance and assign a partition

September 21, 2020

After creating the partitions, you must assign them to instances.

### Important:

- You can attach only one FIPS partition to an instance.
- An instance with a FIPS partition can be assigned only one CPU core.

### Provision a new instance or modify an existing instance

1. On the Configuration tab, navigate to **NetScaler > Instances**, and add or modify an instance.
2. Select **Enable FIPS**, and from the **Partitions** list, select a partition to attach to this instance.

The screenshot shows the 'Configure NetScaler' configuration page. The fields are as follows:

- Name\***: NS-VPX (with a help icon)
- IP Address\***: 10 . 217 . 202 . 37
- Netmask\***: 255 . 255 . 255 . 0
- Gateway**: 10 . 217 . 202 . 1
- Nexthop**: . . .
- Feature License\***: Standard (dropdown)
- Admin Profile\***: ns\_root\_profile (dropdown with a plus icon)
- Description**: (empty text box)
- Enable FIPS**
- Partitions**: Part-3 (dropdown)

You can verify that the partition is attached to an instance by using either the GUI or the CLI.

In the GUI, navigate to **System > HSM Administration > Partitions**. The instance name attached to the partition is displayed.

| Name       | Key Store Size | Crypto Core Capacity | # | SSL Core Count | Instance Name      |
|------------|----------------|----------------------|---|----------------|--------------------|
| Instance-1 | 2000           | 8                    | 1 | 10000          | NS-1000            |
| Instance-2 | 200            | 8                    | 1 | 100000         |                    |
| Instance-3 | 200            | 8                    | 1 | 200000         |                    |
| Instance-4 | 100            | 4                    | 1 | 30000          |                    |
| Instance-5 | 200            | 4                    | 1 | 20000          |                    |
| Instance-6 | 2000           | 4                    | 1 | 30000          | NS-1000-1821728218 |
| Instance-7 | 200            | 2                    | 1 | 10000          |                    |
| Instance-8 | 100            | 2                    | 1 | 10000          | NS-1000-1821728218 |

To unassign a FIPS partition, navigate to **NetScaler > Instances**. Edit the instance and clear the **Enable FIPS** check box.

In the CLI, at the command prompt, type the following commands:

```

1 show fips
2
3 FIPS Card is not configured
4 Done
5 <!--NeedCopy-->

```

If you see the following output, see the troubleshooting section for debugging.

ERROR: Operation not permitted - no FIPS card present in the system

## Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance

October 22, 2021

First check the state of your FIPS card to verify that the driver loaded correctly, and then initialize the card.

At the command prompt, type:

```

1 show fips
2
3 FIPS Card is not configured
4
5 Done
6 <!--NeedCopy-->

```

If the driver is not loaded correctly, the message “ERROR: Operation not permitted - no FIPS card present in the system” appears.

## Initialize the FIPS card

### Important:

Verify that the `/nsconfig/fips` directory has successfully been created on the appliance.

Do not save the configuration before you restart the appliance for the third time.

Perform the following steps to initialize the FIPS card:

1. Reset the FIPS card (`reset fips`).
2. Restart the appliance (`reboot`).
3. Set the security officer password for partitions 0 and 1, and the user password for partition (`set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -hsmLabel NSFIPS`).

Note: The set or reset command takes more than 60 seconds to run.

4. Save the configuration (`saveconfig`).
5. Verify that the password encrypted key for the main partition (`master_pek.key`) has been created in the `/nsconfig/fips/` directory.
6. Restart the appliance (`reboot`).
7. Verify that the FIPS card is UP (`show fips`).

## Initialize the FIPS card by using the CLI

At the command prompt, type the following commands:

```
1 reset fips
2
3 reboot
4
5 set fips -initHSM Level-2 <soPassword> <oldsoPassword> <userPassword> -
  hsmLabel <string>
6 <!--NeedCopy-->
```

**Note:** The following message appears when you run the `set fips` command:

```
1 This command will erase all data on the FIPS card. You must save the
  configuration (saveconfig) after executing this command. [Note: On
  MPX/SDX 14xxx FIPS platform, the FIPS security is at Level-3 by
  default, and the -initHSM Level-2 option is internally converted to
  Level-3] Do you want to continue?(Y/N)y
2
3 saveconfig
4
5 reboot
6
7 show fips
8 <!--NeedCopy-->
```

**Example:**

```
1 reset fips
2
3 Done
4
5 reboot
6
7 set fips -initHSM Level-2 so12345 so12345 user123 -hsmLabel NSFIPS
8
9 This command will erase all data on the FIPS card. You must save the
  configuration (saveconfig) after executing this command. [Note: On
  MPX/SDX 14xxx FIPS platform, the FIPS security is at Level-3 by
  default, and the -initHSM Level-2 option is internally converted to
  Level-3] Do you want to continue?(Y/N)y
10
11 Done
12
13 saveconfig
14
15 Done
16
17 reboot
18
19 show fips
20
21     FIPS HSM Info:
22     HSM Label : NSFIPS
23     Initialization : FIPS-140-2 Level-2
24     HSM Serial Number : 3.0G1532-ICM000228
25     HSM State : 2
```

```
26   HSM Model : NITROX-III CNN35XX-NFBE
27   Hardware Version : 0.0-G
28   Firmware Version : 1.0
29   Firmware Build : NFBE-FW-1.0-48
30   Max FIPS Key Memory : 1000
31   Free FIPS Key Memory : 1000
32   Total SRAM Memory : 557396
33   Free SRAM Memory : 238088
34   Total Crypto Cores : 4
35   Enabled Crypto Cores : 4
36 Done
37 <!--NeedCopy-->
```

## Create a FIPS key for an instance on an SDX 14030/14060/14080 FIPS appliance

September 21, 2020

You can create a FIPS key on your instance or import an existing FIPS key into the instance. An SDX 14030/14060/14080 FIPS appliance supports only 2048-bit and 3072-bit keys and an exponent value of F4. For PEM keys, an exponent is not required. Verify that the FIPS key is created correctly. Create a certificate signing request and a server certificate. Finally, add the certificate-key pair to your instance.

### Note:

1024-bit and 4096-bit keys and an exponent value of 3 are not supported.

### Create a FIPS key by using the CLI

At the command prompt, type:

```
1 create ssl fipsKey <fipsKeyName> -keytype ( RSA | ECDSA ) [-exponent (3
   | F4 )] [-modulus <positive_integer>] [-curve ( P_256 | P_384 )]
2 <!--NeedCopy-->
```

### Example:

```
1 create fipsKey f1 -keytype RSA -modulus 2048 -exponent F4
2
3 Done
4
5 show ssl fipskey ddvws
```

```

6
7 FIPS Key Name: f1 Key Type: RSA Modulus: 2048 Public Exponent: F4 (
  Hex: 0x10001)
8
9 Done
10 <!--NeedCopy-->

```

## Import a FIPS key by using the CLI

At the command prompt, type:

```

1 import ssl fipsKey <fipsKeyName> -key <string> [-inform <inform>] [-
  wrapKeyName <string>] [-iv<string>] [-exponent F4 ]
2 <!--NeedCopy-->

```

### Example:

```

1 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4
2 Done
3 import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform PEM
4 Done
5 <!--NeedCopy-->

```

Verify that the FIPS key is created or imported correctly by running the **show fipskey** command.

```

1 show fipskey
2 1) FIPS Key Name: Key-FIPS-2
3 Done
4 <!--NeedCopy-->

```

## Create a certificate signing request by using the CLI

At the command prompt, type:

```

1 create ssl certReq <reqFile> (-keyFile <input_filename> | -fipsKeyName
  <string>) [-keyform ( DER | PEM ) ] {
2 -PEMPassPhrase }
3 ] -countryName <string> -stateName <string> -organizationName<string>
  [-organizationUnitName <string>] [-localityName <string>] [-
  commonName <string>] [-emailAddress <string>] {
4 -challengePassword }
5 [-companyName <string>] [-digestMethod ( SHA1 | SHA256 )]
6 <!--NeedCopy-->

```

**Example:**

```
1 create certreq f1.req - fipsKeyName f1 -countryName US -stateName CA -
   organizationName Citrix -companyName Citrix -commonName ctx -
   emailAddress test@example.com`
2 `Done
3 <!--NeedCopy-->
```

**Create a server certificate by using the CLI**

At the command prompt, type:

```
1 create ssl cert <certFile> <reqFile> <certType> [-keyFile <
   input_filename>] [-keyform ( DER | PEM ) {
2 -PEMPassPhrase }
3 ] [-days <positive_integer>] [-certForm ( DER | PEM )] [-CAcert <
   input_filename>] [-CAcertForm ( DER | PEM )] [-CAkey <
   input_filename>] [-CAkeyForm ( DER | PEM )] [-CAserial <
   output_filename>]
4 <!--NeedCopy-->
```

**Example:**

```
1 create cert f1.cert f1.req SRVR_CERT -CAcert ns-root.cert -CAkey ns-
   root.key -CAserial ns-root.srl -days 1000
2 Done
3 <!--NeedCopy-->
```

The above example creates a server certificate using a local root CA on the appliance.

**Add a certificate-key pair by using the CLI**

At the command prompt, type:

```
1 add ssl certKey <certkeyName> (-cert <string> [-password]) [-key <
   string> | -fipsKey <string> | -hsmKey <string>] [-inform <inform>]
   [-expiryMonitor ( ENABLED | DISABLED ) [-notificationPeriod <
   positive_integer>]] [-bundle ( YES | NO )]
2 <!--NeedCopy-->
```

**Example:**

```
1 add certkey cert1 -cert f1.cert -fipsKey f1
2 Done
```

```
3 <!--NeedCopy-->
```

After creating the FIPS key and server certificate, you can add the generic SSL configuration. Enable the features that are required for your deployment. Add servers, services, and SSL virtual servers. Bind the certificate-key pair and the service to the SSL virtual server, and save the configuration.

```
1 enable ns feature SSL LB
2 Done
3 add server s1 10.217.2.5
4 Done
5 add service sr1 s1 HTTP 80
6 Done
7 add lb vserver v1 SSL 10.217.2.172 443
8 Done
9 bind ssl vserver v1 - certkeyName cert1
10 Done
11 bind lb vserver v1 sr1
12 Done
13 saveconfig
14 Done
15 <!--NeedCopy-->
```

For information about configuring secure HTTPS and secure RPC, click [here](#).

## Upgrade the FIPS firmware

September 21, 2020

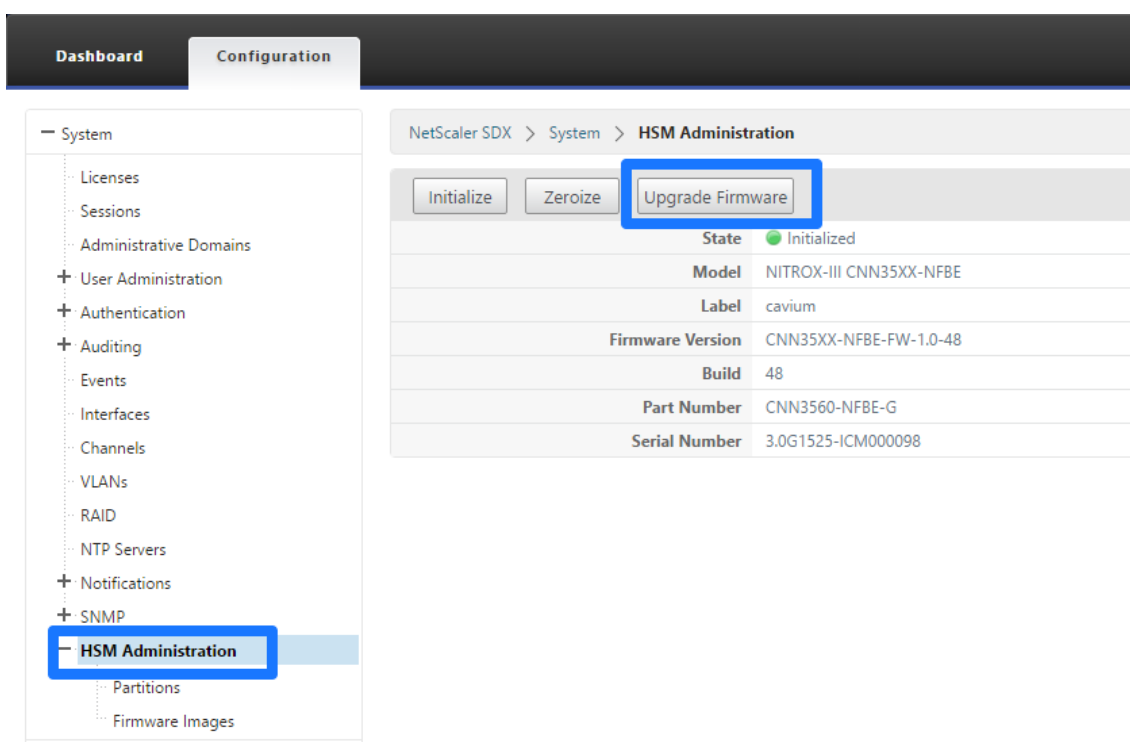

FIPS firmware updates are released from time to time. Download the latest firmware from the Citrix download page and upload it to the appliance. The upgrade process might take up to 10 minutes to complete. The instance is restarted after the upgrade.

### Upgrade the FIPS firmware

1. Navigate to **System > HSM Administration > Firmware Images**.
2. Select **Upload**.

3. Navigate to the folder that contains the firmware image and select the file.
4. Navigate to **System > HSM Administration**, and select **Upgrade Firmware**.

5. Select the firmware image to upgrade to, and click **OK**.

## Support for Entrust nShield® HSM

March 24, 2021

A non-FIPS Citrix ADC appliance stores the server's private key on the hard disk. On a FIPS appliance, the key is stored in a cryptographic module known as a hardware security module (HSM). Storing a key in the HSM protects it from physical and software attacks. In addition, the keys are encrypted by using special FIPS approved ciphers.

Only the Citrix ADC MPX 9700/10500/12500/15500 FIPS appliances support a FIPS card. Support for FIPS is not available on other MPX appliances, or on the SDX and VPX appliances. This limitation is

addressed by supporting an Entrust nShield® Connect external HSM on all Citrix ADC MPX, SDX, and VPX appliances except the MPX 9700/10500/12500/15500 FIPS appliances.

Entrust nShield® Connect is an external FIPS-certified network-attached HSM. With an Entrust HSM, the keys are securely stored as application key tokens on a remote file server (RFS) and can be reconstituted inside the Entrust HSM only.

If you are already using an Entrust HSM, you can now use a Citrix ADC to optimize, secure, and control the delivery of all enterprise and cloud services.

**Note:**

- Entrust HSMs comply with FIPS 140-2 Level 3 specifications, while the MPX FIPS appliances comply with level 2 specifications.
- You cannot decrypt the trace while using the Entrust HSM. Only the [Hardserver](#) can read the response from the HSM to the Citrix ADC appliance, because it is encrypted.

**Supported versions matrix**

---

| Citrix ADC Version            | Entrust Client Version | <a href="#">Hardserver</a> Version | Entrust Firmware Version |
|-------------------------------|------------------------|------------------------------------|--------------------------|
| 10.5e, 11.0, 11.1, 12.0, 12.1 | 11.70, 11.72           | 2.71.2                             | 2.50.16, 2.51.10         |

---

**Architecture overview**

March 24, 2021

The three entities that are part of a Citrix ADC-Entrust deployment are an Entrust nShield Connect module, a remote file server (RFS), and a Citrix ADC.

The Entrust nShield Connect is a network-attached hardware security module. The RFS is used to configure the HSM and to store the encrypted key files.

[Hardserver](#), a proprietary daemon provided by Entrust, is used for communication between the client (ADC), the Entrust HSM, and the RFS. It uses the IMPATH secure communication protocol. A gateway daemon, called the [Hardserver](#) Gateway, is used to communicate between the Citrix ADC packet engine and the [Hardserver](#).

**Note:** The terms Entrust nShield Connect, Entrust HSM, and HSM are used interchangeably in this documentation.

The following figure illustrates the interaction between the different components.

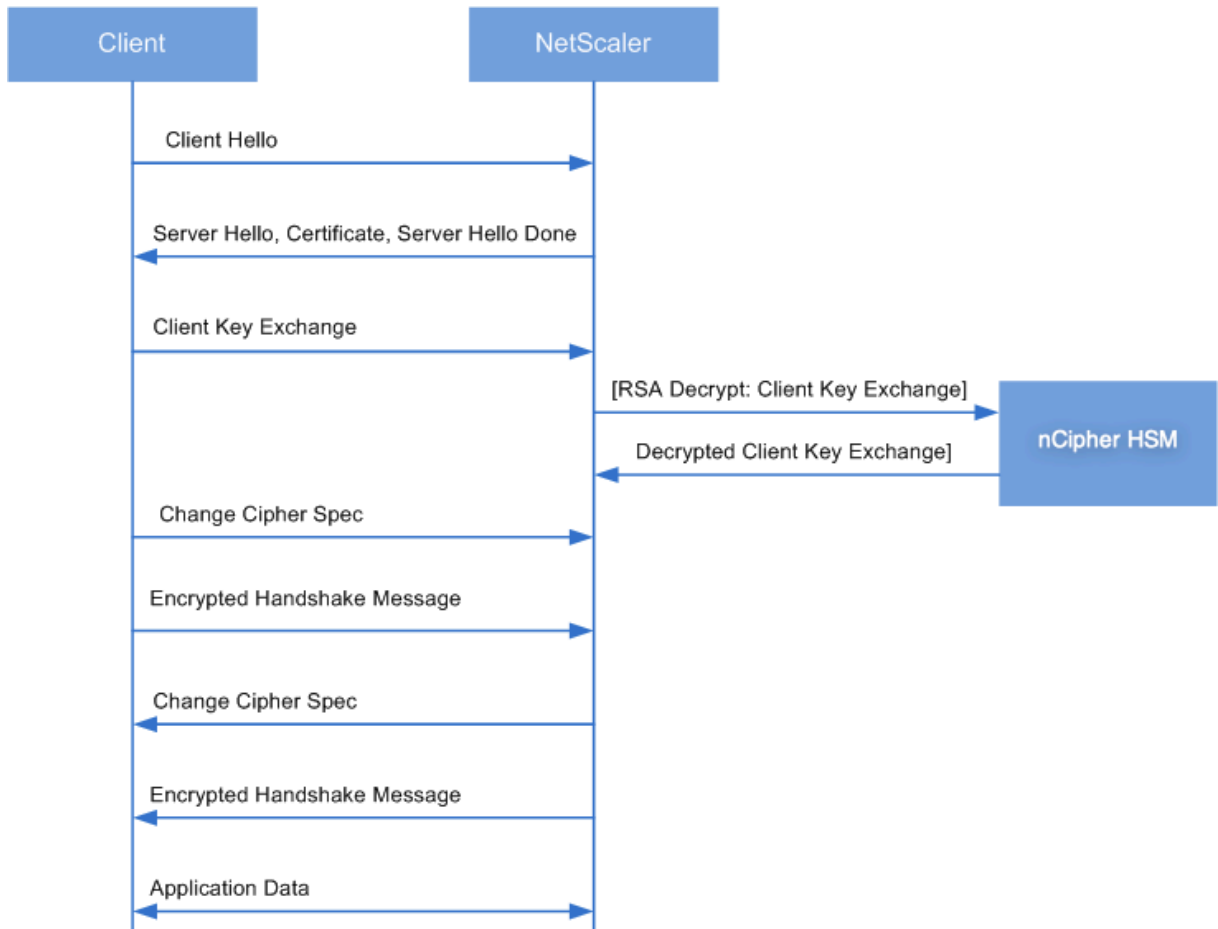

In a typical deployment, the RFS is used to securely store keys generated by the HSM. After the keys are generated, you can securely transfer them to the ADC and then use the GUI or command line to load the keys to the HSM. A virtual server on the ADC uses Entrust to decrypt the client key exchange to complete the SSL handshake. Thereafter, all the SSL operations are performed on the ADC.

Note: The terms keys and application key tokens are used interchangeably in this documentation.

The following figure illustrates the packet flow in the SSL handshake with the Entrust HSM.

Figure 1. SSL Handshake Packets Flow Diagram with Citrix ADC Using Entrust HSM

**Note:** The communication between the ADC and the HSM uses an Entrust proprietary communication protocol, called IMPATH.

## Prerequisites

March 24, 2021

Before you can use an Entrust nShield Connect with a Citrix ADC, make sure that the following prerequisites are met:

- A Entrust nShield Connect device is installed in the network, ready to use, and accessible to the Citrix ADC. That is, the NSIP address is added as an authorized client on the HSM.
- A usable Security World exists. Security World is a unique key management architecture used by the Entrust nShield line of HSMs. It protects and manages keys as application key tokens, enabling unlimited key capacity, and automatic key backup and recovery. For more information about creating a Security World, see the nShield Connect Quick Start Guide from Entrust. You can also find the guide in the CD provided with the Entrust HSM module at CipherTools-linux-

dev-xx.xx.xx/document/nShield\_Connect\_Quick\_Start\_Guide.pdf.

Note: [Softcard](#) or token/OCS protected keys are currently not supported on the Citrix ADC.

- Licenses are available to support the number of clients that connect to the Entrust HSM. The ADC and remote file server (RFS) are clients of the HSM.
- An RFS is installed in the network and is accessible to the Citrix ADC.
- The Entrust nShield Connect device, the RFS, and the Citrix ADC can initiate connections with each other through port 9004.
- You are using NetScaler release 10.5 build 52.1115.e or later.
- The Citrix ADC appliance does not contain a FIPS Cavium card.

Important: Entrust HSM is not supported on the MPX 9700/10500/12500/15500 FIPS appliances.

## Configure the ADC-Entrust integration

March 24, 2021

The following flowchart depicts the tasks that you need to perform to use Entrust HSM with a Citrix ADC:

As shown in the preceding flowchart, you perform the following tasks:

1. Enable remote configuration push, on the HSM.
2. Configure the ADC to use the Entrust HSM.
  - Add the NSIP address on the HSM.
  - Configure access permission for the ADC on the RFS.
  - Configure automatic start of the **Hardserver** at boot time.
  - Enroll the HSM on the ADC.
  - Add RFS details on the ADC.
  - Synchronize the ADC to the RFS.
  - Verify that Entrust HSM is successfully enrolled on the ADC.
3. (Optional) Create an HSM RSA key.
4. Configure the entities on the Citrix ADC.
  - Add the HSM key.
  - Add a certificate-key pair by using the HSM key.
  - Add a virtual server.
  - Add a server object.
  - Add a service.
  - Bind the service to the virtual server.
  - Bind the certificate-key pair to the virtual server.
  - Verify the configuration.

### **Configure the Entrust HSM**

Specify the IP address of the RFS on the Entrust HSM so that it accepts the configuration that the RFS pushes to it. Use the nShield Connect front panel on the Entrust HSM to perform the following procedure.

#### **Specify the IP address of a remote computer on the Entrust HSM**

1. Navigate to **System Configuration > Config file options > Allow auto push**.
2. Select **ON**, and specify the IP address of the computer (RFS) from which to accept the configuration.

#### **Enable remote configuration push, on the HSM**

Specify the IP address of the RFS on the Entrust HSM so that it accepts the configuration that the RFS pushes to it. Use the nShield Connect front panel on the Entrust HSM to perform the following procedure.

### Specify the IP address of a remote computer on the Entrust HSM

1. Navigate to **System Configuration > Config file options > Allow auto push**.
2. Select **ON**, and specify the IP address of the computer (RFS) from which to accept the configuration.

### Configure the ADC to use the Entrust HSM

Sample values used in this topic:

NSIP address=10.217.2.43

Entrust HSM IP address=10.217.2.112

RFS IP address=10.217.2.6

### Add the NSIP address on the HSM

Typically you use the nShield Connect front panel to add clients to the HSM. For more information, see the nShield Connect Quick Start Guide.

Alternately, use the RFS to add the ADC as a client to the HSM. To do so, you must add the NSIP address in the HSM configuration on the RFS, and then push the configuration to the HSM. Before you can do so, you must know the electronic serial number (ESN) of the HSM.

To get the ESN of your HSM, run the following command on the RFS:

```
1 root@ns# /opt/nfast/bin/anonkneti <Entrust HSM IP address>
2 <!--NeedCopy-->
```

### Example:

```
1 root@ns# /opt/nfast/bin/anonkneti 10.217.2.112
2 BD17-C807-58D9 5e30a698f7bab3b2068ca90a9488dc4e6c78d822
3 <!--NeedCopy-->
```

The ESN number is BD17-C807-58D9.

After you have the ESN number, use an editor, such as vi, to edit the HSM configuration file on the RFS.

```
1 vi /opt/nfast/kmdata/hsm-BD17-C807-58D9/config/config
2 <!--NeedCopy-->
```

In the `hs_clients` section, add the following entries:

```
1 # Amount of data in bytes to encrypt with a session key before session
   key# renegotiation, or 0 for unlimited. (default=1024*1024*8b=8Mb).
```

```

2 # datalimit=INT
3 addr=10.217.2.43
4 clientperm=unpriv
5 keyhash=00
6 esn=
7 timelimit=86400
8 datalimit=8388608
9 -----
10 <!--NeedCopy-->

```

**Note:** Include one or more hyphens as delimiters to add multiple entries in the same section.

To push the configuration to the HSM, run the following command on the RFS:

```

1 /opt/nfast/bin/cfg-pushnethsm --address=<Entrust HSM IP address> --
  force /opt/nfast/kmdata/hsm-BD17-C807-58D9/config/config
2 <!--NeedCopy-->

```

**Example:**

```

1 /opt/nfast/bin/cfg-pushnethsm --address=10.217.2.112 --force
2 /opt/nfast/kmdata/hsm-BD17-C807-58D9/config/config
3 <!--NeedCopy-->

```

**Configure access permission for the ADC on the RFS**

To configure access permission for the ADC on the RFS, run the following command on the RFS:

```

1 /opt/nfast/bin/rfs-setup --force -g --write-noauth <NetScaler IP
  address>
2 <!--NeedCopy-->

```

**Example:**

```

1 [root@localhost bin]# /opt/nfast/bin/rfs-setup --force -g --write-
  noauth 10.217.2.43
2 Adding read-only remote_file_system entries
3 Ensuring the directory /opt/nfast/kmdata/local exists
4 Adding new writable remote_file_system entries
5 Ensuring the directory /opt/nfast/kmdata/local/sync-store exists
6 Saving the new config file and configuring the hardserver
7 Done
8 <!--NeedCopy-->

```

Verify that the ADC can reach both the RFS and Entrust HSM by using port 9004.

### Configure automatic start of the hardserver at boot time

Create a file and then restart the appliance. Now, whenever you restart the appliance, and if this file is found, the `Hardserver` is automatically started.

At the shell prompt, type:

```
1 touch /var/opt/nfast/bin/thales_hsm_is_enrolled
2 <!--NeedCopy-->
```

At the command prompt, type:

```
1 reboot
2 <!--NeedCopy-->
```

### Enroll the HSM on the ADC

Change directory to `/var/opt/nfast/bin`.

To add HSM details into the ADC configuration, run the following command on the ADC:

```
nethsmenroll --force <Thales_nShield_Connect_ip_address> $(anonkneti <
Thales_nShield_Connect_ip_address>)
```

#### Example:

```
1 root@ns# ./nethsmenroll --force 10.217.2.112 $(anonkneti 10.217.2.112)
2 OK configuring hardserver's nethsm imports
3 <!--NeedCopy-->
```

This step adds the following entries after the line `# ntoken_esn=ESN` in the `nethsm_imports` section of the `/var/opt/nfast/kmdata/config/config` file.

```
1 ...
2 local_module=0
3 remote_ip=10.217.2.112
4 remote_port=9004
5 remote_esn=BD17-C807-58D9
6 keyhash=5e30a698f7bab3b2068ca90a9488dc4e6c78d822
7 timelimit=86400
8 datalimit=8388608
9 privileged=0
10 privileged_use_high_port=0
11 ntoken_esn=
12 <!--NeedCopy-->
```

Change the directory to `/var/opt/nfast/bin` and run the following command on the ADC:

```
1 touch "thales_hsm_is_enrolled"
2 <!--NeedCopy-->
```

**Note:** To remove an HSM that is enrolled on the ADC, type:

```
1 ./nethsmenroll - --remove <NETHSM-IP>
2 <!--NeedCopy-->
```

### Add RFS details on the ADC

To add RFS details, change the directory to `/var/opt/nfast/bin/` and then run the following command:

```
1 ./rfs-sync --no-authenticate --setup <rfs_ip_address>
2 <!--NeedCopy-->
```

### Example:

```
1 ./rfs-sync --no-authenticate --setup 10.217.2.6
2 No current RFS synchronization configuration.
3 Configuration successfully written; new config details:
4 Using RFS at 10.217.2.6:9004: not authenticating.
5 <!--NeedCopy-->
```

This step adds the following entries after the `# local_esn=ESN` line in the `rfs_sync_client` section of the `/var/opt/nfast/kmdata/config/config` file.

```
1 ... ..
2 remote_ip=10.217.2.6
3 remote_port=9004
4 use_kneti=no
5 local_esn=
6 <!--NeedCopy-->
```

**Note:** To remove an RFS that is enrolled on the ADC, type:

```
1 ./rfs_sync - remove
2 <!--NeedCopy-->
```

### Synchronize the ADC to the RFS

To synchronize all the files, change the directory to `/var/opt/nfast/bin` and then run the following command on the ADC:

```
1 ./rfs-sync - -update
2 <!--NeedCopy-->
```

This command fetches all the World files, module files, and key files from the `/opt/nfast/kmdata/local` directory on the RFS and puts them into the `/var/opt/nfast/kmdata/local` directory on the ADC. Citrix recommends that you manually copy the World files, the `module_XXXX_XXXX_XXXX` files, where `XXXX_XXXX_XXXX` is the ESN of the enrolled HSM, and only the required RSA key and certificate files.

### Verify that the Entrust HSM is successfully enrolled on the ADC

After you synchronize the ADC to the RFS, do the following:

- Verify that the local `Hardserver` is UP and running. (nCipher server running).
- Get the state of the configured HSMs, and verify that the values for the `n_modules` (number of modules) field and the `km info` fields are non-zero.
- Verify that the HSM is enrolled correctly and is usable (state `0x2 Usable`) by the ADC.
- Load tests using `sigtest` run properly.

Change the directory to

`/var/opt/nfast/bin`, and at the shell prompt, run the following commands:

```
1 root@ns# ./chkserv root@ns# ./nfkminfo root@ns# ./sigtest
2 <!--NeedCopy-->
```

See

[Appendix](#) for an example.

### Create an HSM RSA Key

Only RSA keys are supported as HSM keys.

**Note:** Skip this step if keys are already present in the `/opt/nfast/kmdata/local` folder on the RFS.

Create an RSA key, a self-signed certificate, and a Certificate Signing Request (CSR). Send the CSR to a certificate authority to get a server certificate.

The following files are created in the example:

- Embed RSA key: `key_embed_2ed5428aaeae1e159bdbd63f25292c7113ec2c78`
- Self-Signed Certificate: `example_selfcert`
- Certificate Signing Request: `example_req`

**Note:** The

`generatekey` command is supported in strict FIPS 140-2 Level 3 Security World. An administrator

card set (ACS) or an operator card set (OCS) is needed to control many operations, including the creation of keys and OCSs. When you run the `generatekey` command, you are prompted to insert an ACS or OCS card. For more information about strict FIPS 140-2 Level 3 Security World, see the nShield Connect User Guide.

The following example uses Level-2 Security World. In the example, the commands are in boldface type.

**Example:**

```

1 [root@localhost bin]# ./generatekey embed
2 size: Key size? (bits, minimum 1024) [1024] > 2048
3 OPTIONAL: pubexp: Public exponent for RSA key (hex)? []
4 >
5 embedsavefile: Filename to write key to? []
6 > example
7 plainname: Key name? [] > example
8 x509country: Country code? [] > US
9 x509province: State or province? [] > CA
10 x509locality: City or locality? [] > Santa Clara
11 x509org: Organisation? [] > Citrix
12 x509orgunit: Organisation unit? [] > NS
13 x509dnscommon: Domain name? [] > www.citrix.com
14 x509email: Email address? [] > example@citrix.com
15 nvram: Blob in NVRAM (needs ACS)? (yes/no) [no] >
16 digest: Digest to sign cert req with? (md5, sha1, sha256, sha384,
    sha512)
17 [default sha1] > sha512
18 key generation parameters:
19 operation      Operation to perform          generate
20 application    Application                    embed
21 verify        Verify security of key        yes
22 type          Key type                       RSA
23 size          Key size                       2048
24 pubexp        Public exponent for RSA key (hex)
25 embedsavefile  Filename to write key to      example
26 plainname     Key name                       example
27 x509country   Country code                   US
28 x509province  State or province             CA
29 x509locality  City or locality              Santa Clara
30 x509org       Organisation                   Citrix
31 x509orgunit   Organisation unit             NS
32 x509dnscommon  Domain name                   www.citrix.com
33 x509email     Email address                 example@citrix.com
34 nvram         Blob in NVRAM (needs ACS)     no

```

```

35  digest          Digest to sign cert req with      sha512
36  Key successfully generated.
37  Path to key: /opt/nfast/kmdata/local/
      key_embed_2ed5428aaeae1e159bdbd63f25292c7113ec2c78
38  You have new mail in /var/spool/mail/root
39  <!--NeedCopy-->

```

**Result:**

You have created a CSR (example\_req), a self-signed certificate (example\_selfcert), and an application key token file in embed format (/opt/nfast/kmdata/local/key\_embed\_2ed5428aaeae1e159bdbd63f25292c7113ec2c78).

Because the ADC supports keys in simple format only, you must convert the embed key to a simple key.

**To convert the embed key to a simple key, run the following command on the RFS:**

```

1  [root@localhost bin]# ./generatekey -r simple
2  from-application: Source application? (embed, simple) [embed] > embed
3  from-ident: Source key identifier? (
      c6410ca00af7e394157518cb53b2db46ff18ce29,
4
      2
      ed5428aaeae1e159bdbd63f25292c7113ec2c78
      )
5  [default c6410ca00af7e394157518cb53b2db46ff18ce29]
6  > 2ed5428aaeae1e159bdbd63f25292c7113ec2c78
7  ident: Key identifier? [] > examplersa2048key
8  plainname: Key name? [] > examplersa2048key
9  key generation parameters:
10 operation          Operation to perform      retarget
11 application        Application                simple
12 verify             Verify security of key    yes
13 from-application   Source application        embed
14 from-ident         Source key identifier      2
      ed5428aaeae1e159bdbd63f25292c7113ec2c78
15 ident              Key identifier            examplersa2048key
16 plainname          Key name                  examplersa2048key
17 Key successfully retargetted.
18 Path to key: /opt/nfast/kmdata/local/key_simple_examplersa2048key
19 <!--NeedCopy-->

```

**Important:**

When prompted for the source key identifier, enter **2ed5428aaeae1e159bdbd63f25292c7113ec2c78** as the embed key.

**Result:**

A key with the prefix `key_simple` (for example `key_simple_examplersa2048key`) is created.

**Note:** `examplersa2048key` is the key identifier (ident) and is referred to as the HSM key name on the ADC. A key identifier is unique. All the simple files have the prefix `key_simple`.

## Configure the Entities on the ADC

Before the ADC can process traffic, you must do the following:

1. Enable features.
2. Add a subnet IP (SNIP) address.
3. Add the HSM key to the ADC.
4. Add a certificate-key pair by using the HSM key.
5. Add a virtual server.
6. Add a server object.
7. Add a service.
8. Bind the service to the virtual server.
9. Bind the certificate-key pair to the virtual server.
10. Verify the configuration.

## Enable features on the ADC

Licenses must be present on the ADC before you can enable a feature.

## Enable a feature by using the CLI

At the command prompt, run the following commands:

```
1 enable feature lb
2 enable feature ssl
3 <!--NeedCopy-->
```

## Enable a feature by using the GUI

Navigate to **System > Settings** and, in the **Modes and Features** group, select **Configure basic features**, and then select **SSL Offloading**.

## Add a subnet IP address

For more information about subnet IP addresses, see [Configuring Subnet IP Addresses](#).

## Add a SNIP address and verify the configuration by using the CLI

At the command prompt, run the following commands:

```
1 add ns ip <IPAddress> <netmask> -type SNIP
2 show ns ip
3 <!--NeedCopy-->
```

### Example:

```
1 add ns ip 192.168.17.253 255.255.248.0 -type SNIP
2 Done
3 show ns ip
4      Ipaddress      Traffic Domain  Type              Mode      Arp
5      Icmp           Vserver  State
6 1)      192.168.17.251  0              NetScaler IP     Active
7      Enabled Enabled  NA              Enabled
8 2)      192.168.17.252  0              VIP              Active
9      Enabled Enabled Enabled Enabled
10 3)      192.168.17.253  0              SNIP            Active
11      Enabled Enabled NA              Enabled
12 Done
13 <!--NeedCopy-->
```

## Add a SNIP address and verify the configuration by using the GUI

Navigate to **System > Network > IPs**, add an IP address, and select the **IP Type as Subnet IP**.

### Copy the HSM key and certificate to the ADC

Use a secure file transfer utility to securely copy the key (key\_simple\_examplera2048key) to the `/var/opt/nfast/kmdata/local` folder, and the certificate (example\_selfcert) to the `/nsconfig/ssl` folder on the ADC.

### Add the key on the ADC

All the keys have a key-simple prefix. When adding the key to the ADC, use the ident as the HSM key name. For example, if the key that you added is key\_simple\_XXXX, the HSM key name is XXXX.

### Important:

- The HSM key name must be the same as the ident that you specified when you converted an embed key to a simple key format.

- The keys must be present in the `/var/opt/nfast/kmdata/local/` directory on the ADC.

### Add an HSM key by using the CLI

At the shell prompt, run the following command:

```
1 add ssl hsmKey <hsmKeyName> -key <string>
2 <!--NeedCopy-->
```

#### Example:

```
1 add ssl hsmKey examplersa2048key -key key_simple_examplersa2048key
2 Done
3 <!--NeedCopy-->
```

### Add an HSM key by using the GUI

Navigate to **Traffic Management > SSL > HSM**, and add an HSM key.

### Add a certificate-key pair on the ADC

For information about certificate-key pairs, see

[Add or update a certificate-key pair](#).

### Add a certificate-key pair by using the CLI

At the command prompt, run the following command:

```
1 add ssl certKey <certkeyName> -cert <string> -hsmKey <string>
2 <!--NeedCopy-->
```

#### Example:

```
1 add ssl certKey key22 -cert example_selfcert -hsmKey examplersa2048key
2 Done
3 <!--NeedCopy-->
```

### Add a certificate-key pair by using the GUI

Navigate to **Traffic Management > SSL > Certificates**, and add a certificate-key pair.

## Add a virtual server

For information about a virtual server, see [SSL virtual server configuration](#).

## Configure an SSL-based virtual server by using the CLI

At the command prompt, run the following command:

```
1 add lb vserver <name> <serviceType> <IPAddress> <port>
2 <!--NeedCopy-->
```

### Example:

```
1 add lb vserver v1 SSL 192.168.17.252 443
2 <!--NeedCopy-->
```

## Configure an SSL-based virtual server by using the GUI

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, create a virtual server, and specify the protocol as SSL.

## Add a server object

Before you can add a server object on the ADC, make sure that you have created a back-end server. The following example uses the built-in python HTTP Server module on a Linux system.

### Example:

```
1 %python -m SimpleHTTPServer 80
2 <!--NeedCopy-->
```

## Add a server object by using the CLI

At the command prompt, run the following command:

```
1 add server <name> <IPAddress>
2 <!--NeedCopy-->
```

### Example:

```
1 add server s1 192.168.17.246
2 <!--NeedCopy-->
```

### Add a server object by using the GUI

Navigate to **Traffic Management > Load Balancing > Servers**, and add a server.

### Add a service

For more information, see

[Configuring services](#).

### Configure a service by using the CLI

At the command prompt, run the following command:

```
1 add service <name> <serverName> <serviceType> <port>
2 <!--NeedCopy-->
```

#### Example:

```
1 add service sr1 s1 HTTP 80
2 <!--NeedCopy-->
```

### Configure a service by using the GUI

Navigate to **Traffic Management > Load Balancing > Services**, and create a service.

### Bind the service to the virtual server

For more information, see

[Bind services to the SSL virtual server](#).

### Bind a service to a virtual server by using the CLI

At the command prompt, run the following command:

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

#### Example:

```
1 bind lb vserver v1 sr1
2 <!--NeedCopy-->
```

**Bind a service to a virtual server by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open a virtual server, and click in the Services pane to bind a service to the virtual server.

**Bind the certificate-key pair to the virtual server on the ADC**

For more information, see

[Bind the certificate-key pair to the SSL virtual server.](#)

**Bind a certificate-key pair to a virtual server by using the CLI**

At the command prompt, run the following command:

```
1 bind ssl vserver <vServerName> -certkeyName <string>
2 <!--NeedCopy-->
```

**Example:**

```
1 bind ssl vserver v1 -certkeyName key22
2 Warning: Current certificate replaces the previous binding
3 <!--NeedCopy-->
```

**Bind a certificate-key pair to a virtual server by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. Open an SSL virtual server and, in **Advanced Settings**, click **SSL Certificate**.
3. Bind a server certificate to the virtual server.

**Verify the configuration****To view the configuration by using the CLI:**

At the command prompt, run the following commands:

```
1 show lb vserver <name>
2 show ssl vserver <vServerName>
3 <!--NeedCopy-->
```

**Example:**

```
1 show lb vserver v1
2           v1 (192.168.17.252:443) - SSL   Type: ADDRESS
3           State: UP
```

```
4      Last state change was at Wed Oct 29 03:11:11 2014

```

### To view the configuration by using the GUI:

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and double-click an SSL virtual server to open it and view the configuration.

## Limitations

March 24, 2021

- SSL version 3 (SSLv3) is not supported on an MPX appliance but is supported on a VPX virtual appliance. A VPX instance provisioned on an SDX appliance supports SSLv3 only if an SSL chip is not assigned to the instance.
- Export ciphers are not supported.
- SSL server key exchange using HSM keys is not supported.
- If you have added or removed keys after you last saved the configuration, you must save the configuration before you perform a warm restart. If you do not save the configuration, there will be a key mismatch between the ADC and the HSM.
- You cannot bind an HSM key to a DTLS virtual server.
- You cannot bind a certificate-key pair that is created by using an HSM key to an SSL service.
- You cannot use the GUI to enroll the ADC as a client of the HSM or check the status of the HSM from the configuration utility.
- From release 11 build 62.x, SSL renegotiation is supported.
- You cannot sign OCSP requests by using a certificate-key pair that is created by using an HSM key.
- A certificate bundle with HSM keys is not supported.
- An error does not appear if the HSM key and certificate do not match. Therefore, while adding a certificate-key pair, you need to make sure that the HSM key and certificate match.

- Clustering and admin partitions are not supported.

## Appendix

```

## Support for Thales Luna Network hardware security module

March 23, 2021

A non-FIPS Citrix ADC appliance stores the server's private key on the hard disk. On a FIPS appliance, the key is stored in a cryptographic module known as a hardware security module (HSM). Storing a key in the HSM protects it from physical and software attacks. In addition, the keys are encrypted with special FIPS approved ciphers.

Only the Citrix ADC MPX 9700/10500/12500/15500 FIPS appliances and the MPX/SDX 14000 FIPS appliances support a FIPS card. Support for FIPS is not available on other MPX/SDX appliances, or on the Citrix ADC VPX appliances. This limitation is addressed by supporting a SafeNet network HSM on all Citrix ADC MPX, SDX, and VPX appliances except the MPX 9700/10500/12500/15500 FIPS and the MPX/SDX 14000 FIPS appliances.

A SafeNet network HSM is designed to protect critical cryptographic keys and to accelerate sensitive cryptographic operations across a wide range of security applications.

### Supported versions matrix

| Citrix ADC Version | Software Appliance |                  |                |
|--------------------|--------------------|------------------|----------------|
|                    | Version            | Firmware Version | Client Version |
| 11.1, 12.0, 12.1   | 5.2.3-1            | 6.2.1            | 6.0.0          |
| 11.1, 12.0, 12.1   | 6.2.2-5            | 6.10.9           | 6.2.2          |

## Prerequisites

March 23, 2021

Before you can use a Thales Luna network HSM with a Citrix ADC, make sure that the following prerequisites are met:

- A Thales Luna network HSM is installed in the network, ready to use, and accessible to the Citrix ADC. That is, the NSIP address or the SNIP address is added as an authorized client on the HSM.
- Licenses are available to support the required number of partitions on the HSM.
- The Thales Luna network HSM and the Citrix ADC can initiate connections with each other through port 1792.
- You are using NetScaler release 11.1 or later.
- The Citrix ADC appliance does not contain a FIPS Cavium card.

### Important

Thales Luna network HSMs are not supported on the MPX 9700/10500/12500/15500 FIPS appliances.

## Configure a Thales Luna client on the ADC

March 23, 2021

After you have configured the Thales Luna HSM and created the required partitions, you must create clients and assign them to partitions. Begin by configuring the Thales Luna clients on the Citrix ADC and setting up the network trust links (NTLs) between the Thales Luna clients and the Thales Luna HSM. A sample configuration is given in the [Appendix](#).

1. Change directory to `/var/safenet` and install the Thales Luna client. At the shell prompt, type:

```
1 cd /var/safenet
2 <!--NeedCopy-->
```

To install Thales Luna client version 6.0.0, type:

```
1 install_client.sh -v 600
2 <!--NeedCopy-->
```

To install Thales Luna client version 6.2.2, type:

```
1 install\_client.sh -v 622
2 <!--NeedCopy-->
```

#### Note

Thales Luna client version 6.2.2 is supported in release 12.0 build 51.x and later.

2. Configure the NTLs between Thales Luna client (ADC) and HSM.

After the '/var/safenet/' directory is created, perform the following tasks on the ADC.

a) Change directory to '/var/safenet/config/' and run the 'safenet\_config' script. At the shell prompt, type:

```
1 cd /var/safenet/config
2
3 sh safenet_config
4 <!--NeedCopy-->
```

This script copies the "Chrystoki.conf" file into the /etc/ directory. It also generates a symbolic link 'libCryptoki2\_64.so' in the '/usr/lib/' directory.

b) Create and transfer a certificate and key between the ADC and the Thales Luna HSM.

In order to communicate securely, the ADC and the HSM must exchange certificates. Create a certificate and key on the ADC and then transfer it to the HSM. Copy the HSM certificate to the ADC.

i) Change directory to /var/safenet/safenet/lunaclient/bin.

ii) Create a certificate on the ADC. At the shell prompt, type:

```
1 ./vtl createCert -n <ip address of Citrix ADC>
2 <!--NeedCopy-->
```

This command also adds the certificate and key path to the "/etc/Chrystoki.conf" file.

iii) Copy this certificate to the HSM. At the shell prompt, type:

```
1 scp /var/safenet/safenet/lunaclient/cert/client/<ip address of NS>.pem
   <LunaSA_HSM account>@<IP address of Luna SA>
2 <!--NeedCopy-->
```

iv) Copy the HSM certificate to the Citrix ADC. At the shell prompt, type:

```
1 scp <HSM account>@<HSM IP>:server.pem /var/safenet/safenet/lunaclient/  
server_<HSM ip>.pem  
2 <!--NeedCopy-->
```

### 3) Register the Citrix ADC as a client and assign it a partition on the Thales Luna HSM.

Log on to the HSM and create a client. Enter the NSIP as the client IP. This must be the IP address of the ADC from which you transferred the certificate to the HSM. After the client is successfully registered, assign a partition to it. Run the following commands on the HSM.

a) Use SSH to connect to the Thales Luna HSM and enter the password.

b) Register the Citrix ADC on the Thales Luna HSM. The client is created on the HSM. The IP address is the client's IP address. That is, the NSIP address.

At the prompt, type:

```
1 client register -client <client name> -ip <Citrix ADC ip>  
2 <!--NeedCopy-->
```

c) Assign the client a partition from the partition list. To view the available partitions, type:

```
1 <luna_sh> partition list  
2 <!--NeedCopy-->
```

Assign a partition from this list. Type:

```
1 <lunash:> client assignPartition -client <Client Name> -par <Partition  
Name>  
2 <!--NeedCopy-->
```

### 4) Register the HSM with its certificate on the Citrix ADC.

On the ADC, change directory to “/var/safenet/safenet/lunaclient/bin” and, at the shell prompt, type:

```
1 ./vtl addserver -n <IP addr of HSM> -c /var/safenet/safenet/lunaclient/  
server_<HSM_IP>.pem  
2 <!--NeedCopy-->
```

To remove the HSM that is enrolled on the ADC, type:

```
1 ./vtl deleteServer -n <HSM IP> -c <cert path>  
2 <!--NeedCopy-->
```

To list the HSM servers configured on the ADC, type:

```
1 ./vtl listServer
2 <!--NeedCopy-->
```

**Note:**

Before removing the HSM by using vtl, make sure all the keys for that HSM are manually removed from the appliance. HSM keys cannot be deleted after the HSM server is removed.

5) Verify the network trust links (NTLs) connectivity between the ADC and HSM. At the shell prompt, type:

```
1 ./vtl verify
2 <!--NeedCopy-->
```

If verification fails, review all the steps. Errors are generally due to an incorrect IP address in the client certificates.

6) Save the configuration.

The above steps update the “/etc/Chrystoki.conf” configuration file. This file is deleted when the ADC is started. Copy the configuration to the default configuration file, which is used when an ADC is restarted.

At the shell prompt, type:

```
1 root@ns# cp /etc/Chrystoki.conf /var/safenet/config/
2 <!--NeedCopy-->
```

Recommended practice is to run this command every time there is a change to the Thales Luna-related configuration.

7) Start the Thales Luna gateway process.

At the shell prompt, type:

```
1 sh /var/safenet/gateway/start_safenet_gw
2 <!--NeedCopy-->
```

8) Configure automatic start of the gateway daemon at boot time.

Create the “safenet\_is\_enrolled” file, which indicates that Thales Luna HSM is configured on this ADC. Whenever the ADC restarts and this file is found, the gateway is automatically started.

At the shell prompt, type:

```
1 touch /var/safenet/safenet_is_enrolled
2 <!--NeedCopy-->
```

## Configure Thales Luna HSMs in a high availability setup on the ADC

March 23, 2021

Configuring Thales Luna HSMs in a high availability (HA) ensures uninterrupted service even if all but one of the devices are unavailable. In an HA setup, each HSM joins an HA group in active-active mode. Thales Luna HSMs in an HA setup provide load balancing of all the group members to increase performance and response time while providing the assurance of high availability service. For more information, contact Thales Luna Sales and Support.

### Prerequisites:

- Minimum two Thales Luna HSM devices. All the devices in an HA group must have either PED (trusted path) authentication or password authentication. A combination of trusted path authentication and password authentication in an HA group is not supported.
- Partitions on each HSM device must have the same password even if the label (name) is different.
- All partitions in HA must be assigned to the client (Citrix ADC appliance).

After configuring a Thales Luna client on the ADC as described in [Configure a Thales Luna client on the ADC](#), perform the following steps to configure Thales Luna HSMs in HA:

1. On the Citrix ADC shell prompt, launch “lunacm” (/usr/safenet/lunaclient/bin)

### Example:

```
1 root@ns# cd /var/safenet/safenet/lunaclient/bin/
2
3 root@ns# ./lunacm
4 <!--NeedCopy-->
```

2. Identify the slot IDs of the partitions. To list the available slots (partitions), type:

```
1 lunacm:> slot list
2 <!--NeedCopy-->
```

### Example;

```
1          Slot Id ->          0
2          HSM Label ->        trinity-p1
3          HSM Serial Number -> 481681014
4          HSM Model ->        LunaSA 6.2.1
5          HSM Firmware Version -> 6.10.9
6          HSM Configuration -> Luna SA Slot (PED) Signing With Cloning
          Mode
7          HSM Status ->       OK
```

```
8
9     Slot Id ->                1
10    HSM Label ->              trinity-p2
11    HSM Serial Number ->      481681018
12    HSM Model ->              LunaSA 6.2.1
13    HSM Firmware Version ->   6.10.9
14    HSM Configuration ->      Luna SA Slot (PED) Signing With Cloning
15    HSM Status ->             OK
16
17    Slot Id ->                2
18    HSM Label ->              neo-p1
19    HSM Serial Number ->      487298014
20    HSM Model ->              LunaSA 6.2.1
21    HSM Firmware Version ->   6.10.9
22    HSM Configuration ->      Luna SA Slot (PED) Signing With
23    HSM Status ->             OK
24
25    Slot Id ->                3
26    HSM Label ->              neo-p2
27    HSM Serial Number ->      487298018
28    HSM Model ->              LunaSA 6.2.1
29    HSM Firmware Version ->   6.10.9
30    HSM Configuration ->      Luna SA Slot (PED) Signing With Cloning
31    HSM Status ->             OK
32
33    Slot Id ->                7
34    HSM Label ->              hsmha
35    HSM Serial Number ->      1481681014
36    HSM Model ->              LunaVirtual
37    HSM Firmware Version ->   6.10.9
38    HSM Configuration ->      Luna Virtual HSM (PED) Signing With
39    HSM Status ->             N/A - HA Group
40
41    Slot Id ->                8
42    HSM Label ->              newha
43    HSM Serial Number ->      1481681018
44    HSM Model ->              LunaVirtual
45    HSM Firmware Version ->   6.10.9
46    HSM Configuration ->      Luna Virtual HSM (PED) Signing With
47    HSM Status ->             N/A - HA Group
```

```
48
49         Current Slot Id: 0
50 <!--NeedCopy-->
```

3. Create the HA group. The first partition is called the primary partition. You can add more than one secondary partitions.

```
1 lunacm:> hgroup createGroup -slot <slot number of primary partition> -
   label <group name> -password <partition password >
2
3 lunacm:> hgroup createGroup -slot 1 -label gp12 -password *****
4 <!--NeedCopy-->
```

4. Add the secondary members (HSM partitions). Repeat this step for all partitions to be added to the HA group.

```
1 lunacm:> hgroup addMember -slot <slot number of secondary partition to
   be added> -group <group name> -password <partition password>
2 <!--NeedCopy-->
```

**Code:**

```
1 lunacm:> hgroup addMember -slot 2 -group gp12 -password *****
2 <!--NeedCopy-->
```

5. Enable HA only mode.

```
1 lunacm:> hgroup HAOnly - enable
2 <!--NeedCopy-->
```

6. Enable active recovery mode.

```
1 lunacm:.>hgroup recoveryMode - mode active
2 <!--NeedCopy-->
```

7. Set auto recovery interval time (in seconds). Default is 60 seconds.

```
1 lunacm:.>hgroup interval - interval <value in seconds>
2 <!--NeedCopy-->
```

**Example:**

```
1 lunacm:.>hgroup interval - interval 120
2 <!--NeedCopy-->
```

8. Set recovery retry count. A value of -1 allows infinite number of retries.

```
1 lunacm:> hagroup retry -count <xxx>
2 <!--NeedCopy-->
```

**Example:**

```
1 lunacm:> hagroup retry -count 2
2 <!--NeedCopy-->
```

After configuring Thales Luna HSM in HA, see [Additional ADC configuration](#) for further configuration on the ADC.

## Additional ADC configuration

March 23, 2021

1) Generate a key on the HSM.

Use third party tools to create keys on the HSM.

2) Add an HSM key on the ADC.

**Important!:** The # character is not supported in a key name. If the key name include this character, the load key operation fails.

**To add a Thales Luna HSM key by using the CLI:**

At the command prompt, type:

```
1 add ssl hsmkey <KeyName> -hsmType SAFENET -serialNum <serial #> -
  password
2 <!--NeedCopy-->
```

where:

-keyName is the key created on the HSM by using third party tools.

-serialNum is the serial number of the partition on the HSM on which the keys are generated.

**Note:** For HSM in a high availability setup, use the serial number of the high availability group.

-password is the password of the partition on which the keys are present.

**To add a Thales Luna HSM key by using the GUI:**

Navigate to **Traffic Management > SSL > HSM** and add an HSM key. You must specify the HSM Type as **SAFENET**.

3) Add a certificate-key pair on the ADC. You must first use a third party tool to generate a certificate associated with the key. Then, copy the certificate to the `/nsconfig/ssl/` directory on the ADC.

**Note:** The key must be an HSM key.

**To add a certificate-key pair on the ADC by using the CLI:**

At the command prompt, type:

```
1 add ssl certkey <CertkeyName> -cert <cert name> -hsmkey <KeyName>
2 <!--NeedCopy-->
```

**To add a certificate-key pair on the ADC by using the GUI:**

1. Navigate to **Traffic Management > SSL**.
2. In **Getting Started**, select **Install Certificate (HSM)** and create a certificate-key pair using an HSM key.

4) Create a virtual server and bind the certificate-key pair to this virtual server.

For information about creating a virtual server, click [SSL virtual server configuration](#).

For information about adding a certificate-key pair, click [Add or update a certificate-key pair](#).

For information about binding a certificate-key pair to an SSL virtual server, click [Bind the certificate-key pair to the SSL virtual server](#).

## Citrix ADC appliances in a high availability setup

March 23, 2021

You can configure a high availability (HA) setup on the Citrix ADC appliances with a Thales Luna HSM configuration in either of the following two ways:

- First, configure a Thales Luna HSM on the two nodes, using the same HSM and partition. Then create an HA pair. Finally, add the Citrix ADC configuration, such as keys, certificate-key pairs, and virtual servers, on the primary node.
- If a Thales Luna HSM is already configured on one node with the Citrix ADC configuration, add a similar configuration on the other node. Copy `/var/safenet/sfgw_ident_file` from the first node to the other and restart the `safenet_gw` binary. After the gateway is up and running, add the nodes in an HA setup.

## Limitations

September 24, 2021

1. For any changes to the HSM-related configuration in an existing setup, such as adding or removing an HSM, or creating a high availability setup, copy `/etc/Chrystoki.conf` to `/var/safenet/config`.
2. After adding, removing, or restarting an HSM, you must restart the `/var/safenet/gateway/safenet_gw` binary. If you don't restart the gateway binary, the HSM will not serve any traffic after it is added back or after it restarts.
3. To reboot or stop the current `/var/safenet/gateway/safenet_gw` binary, use

```
1 kill -SIGTERM <PID>
2 kill -SIGINT <PID>
3 <!--NeedCopy-->
```

**Important!** Do not use `kill -9 <PID>` or `kill -6 <PID>`

4. Before removing an existing HSM from the ADC, remove, from the ADC, all the keys and certificate-key pairs that are associated with that HSM. You can't delete these files from the ADC after you remove the HSM.
5. On a standalone Citrix ADC appliance, Thales Luna HSMs in HA are not supported.
6. EXPORT ciphers are not supported.
7. Update certificate-key pair operation is not supported.
8. When you generate an HSM key on a third-party tool, the private and public key names must be the same. When you add the HSM key on the appliance, provide this name as the key name.
9. The # character is not supported in a key name and partition password.
10. Cluster and admin partitions are not supported.

## Appendix

March 23, 2021

Sample commands with their outputs are given below.

### Run the script

```
1 root@ns# pwd
2 /var/safenet/config
3 root@ns# sh safenet_config
4 <!--NeedCopy-->
```

### Create a certificate

```
1 root@ns# cd /var/safenet/safenet/lunaclient/bin
2 root@ns# ./vtl createcert -n 10.102.59.175
3 Private Key created and written to: /var/safenet/safenet/lunaclient
  /cert/client/10.102.59.175Key.pem
4 Certificate created and written to: /var/safenet/safenet/lunaclient
  /cert/client/10.102.59.175.pem
5 <!--NeedCopy-->
```

### Copy the certificate to the HSM

```
1 root@ns# scp /var/safenet/safenet/lunaclient/cert/client
  /10.102.59.175.pem admin@10.217.2.7:
2 admin@10.217.2.7's password:
3
4 10.102.59.175.pem          100% 818      0.8KB/s   00:00
5 <!--NeedCopy-->
```

### Copy the certificate and key from the HSM to the Citrix ADC appliance

```
1 root@ns# scp admin@10.217.2.7:server.pem /var/safenet/safenet/
  lunaclient/server.2.7.pem
2 admin@10.217.2.7's password:
3
4 server.pem                100% 1164     1.1KB/s   00:01
5 <!--NeedCopy-->
```

### Use SSH to connect to the Thales Luna HSM

```
1 ssh admin@10.217.2.7
2 Connecting to 10.217.2.7:22...
3 Connection established.
4 To escape to local shell, press 'Ctrl+Alt+]'.

```

```
5
6   Last login: Thu Jun 23 02:20:29 2016 from 10.252.243.11

## Register the HSM with its certificate on the Citrix ADC

```
1 root@ns# ./vtl addserver -n 10.217.2.7 -c /var/safenet/safenet/
   lunaclient/server.2.7.pem
2
3 New server 10.217.2.7 successfully added to server list.
4 <!--NeedCopy-->
```

## Verify the network trust links (NTLs) connectivity between the ADC and HSM

```
1 root@ns# ./vtl verify
2
3 The following Luna SA Slots/Partitions were found:
4
5 Slot          Serial #          Label
6 =====
7 0             477877010        p2
8 <!--NeedCopy-->
```

## Save the configuration

```
1 root@ns# cp /etc/Chrystoki.conf /var/safenet/config/
2 <!--NeedCopy-->
```

## Configure automatic start of the gateway daemon at boot time

```
1 touch /var/safenet/safenet_is_enrolled
2 <!--NeedCopy-->
```

## FAQ

March 23, 2021

- **How do I check that the Thales Luna process is running?**

At the Citrix ADC shell prompt, type:

```
1 ps - aux | grep safenet_gw
2 <!--NeedCopy-->
```

- **How do I verify the network trust links (NTLs) connectivity between the ADC and HSM?**

After configuring Thales Luna, change directory to “/var/safenet/safenet/lunaclient/bin” and type:

```
1 ./vtl verify
2 <!--NeedCopy-->
```

## Troubleshooting

September 21, 2020

If the SSL feature does not work as expected after you have configured it, you can use some common tools to access Citrix ADC resources and diagnose the problem.

### Resources for troubleshooting

For best results, use the following resources to troubleshoot an SSL issue on a Citrix ADC appliance:

- The relevant ns.log file
- The latest ns.conf file
- The messages file
- The relevant `newslog` file
- Trace files
- A copy of the certificate files, if possible
- A copy of the key file, if possible
- The error message, if any

In addition to the preceding resources, you can use the Wireshark application customized for the Citrix ADC trace files to expedite troubleshooting.

### Troubleshooting SSL issues

To troubleshoot an SSL issue, proceed as follows:

- Verify that the Citrix ADC appliance is licensed for SSL Offloading and load balancing.
- Verify that SSL Offloading and load balancing features are enabled on the appliance.
- Verify that the status of the SSL virtual server is not displayed as DOWN.
- Verify that the status of the service bound to the virtual server is not displayed as DOWN.
- Verify that a valid certificate is bound to the virtual server.
- Verify that the service is using an appropriate port, preferably port 443.

## Decrypting TLS1.3 traffic from packet trace

To troubleshoot protocols that run over TLS1.3, you must first decrypt the TLS1.3 traffic. To decrypt TLS 1.3 in Wireshark, the secrets must be exported in the NSS key log format. For more information about the key log format, see [NSS Key Log Format](#).

For information about how to capture a packet trace, see [Capturing SSL Session Keys During a Trace](#).

**Note:** Citrix ADC automatically logs each connection's secrets in the appropriate format for the TLS/SSL protocol version in use.

## CRL refresh does not happen on the secondary node in an HA setup

The refresh does not happen because the CRL server is accessible only to the primary node through a private network.

**Workaround:** Add a service on the primary node with the IP address of the CRL server. This service acts as a proxy for the CRL server. When the configuration is synchronized between the nodes, CRL refresh works for both primary and secondary nodes through the service configured on the primary node.

## SSL FAQs

March 16, 2021

### Basic questions

#### HTTPS access to the GUI fails on a VPX instance. How do I gain access?

A certificate-key pair is required for HTTPS access to the GUI. On a Citrix ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes and bind it to the internal service for HTTPS access to the configuration utility or update the ns-server-certificate to 1024 bytes. You can use HTTP access to the configuration utility or the CLI to install the certificate.

**If I add a license to an MPX appliance, the certificate-key pair binding is lost. How do I resolve this problem?**

If a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding. You must reinstall the certificate and bind it to the internal service

Citrix recommends that you install an appropriate license before starting the appliance.

**What are the various steps involved in setting up a secure channel for an SSL transaction?**

Setting up a secure channel for an SSL transaction involves the following steps:

1. The client sends an HTTPS request for a secure channel to the server.
2. After selecting the protocol and cipher, the server sends its certificate to the client.
3. The client checks the authenticity of the server certificate.
4. If any of the checks fail, the client displays the corresponding feedback.
5. If the checks pass or the client decides to continue even if a check fails, the client creates a temporary, disposable key called the *pre-master secret* and encrypts it by using the public key of the server certificate.
6. The server, upon receiving the pre-master secret, decrypts it by using the server's private key and generates the session keys. The client also generates the session keys from the pre-master secret. Thus both client and server now have a common session key, which is used for encryption and decryption of application data.

**I understand that SSL is a CPU-intensive process. What is the CPU cost associated with the SSL process?**

The following two stages are associated with the SSL process:

- The initial handshake and secure channel setup by using the public and private key technology.
- Bulk data encryption by using the asymmetric key technology.

Both of the preceding stages can affect server performance, and they require intensive CPU processing for of the following reasons:

1. The initial handshake involves public-private key cryptography, which is very CPU intensive because of large key sizes (1024bit, 2048bit, 4096bit).
2. Encryption/decryption of data is also computationally expensive, depending on the amount of data that needs to be encrypted or decrypted.

### **What are the various entities of an SSL configuration?**

An SSL configuration has the following entities:

- Server certificate
- Certificate Authority (CA) certificate
- Cipher suite that specifies the protocols for the following tasks:
  - Initial key exchange
  - Server and client authentication
  - Bulk encryption algorithm
  - Message authentication
- Client authentication
- CRL
- SSL Certificate Key Generation Tool that enables you to create the following files:
  - Certificate request
  - Self signed certificate
  - RSA and DSA keys
  - DH parameters

### **I want to use the SSL offloading feature of the Citrix ADC appliance. What are the various options for receiving an SSL certificate?**

You must receive an SSL certificate before you can configure the SSL setup on the Citrix ADC appliance. You can use any of the following methods to receive an SSL certificate:

- Request a certificate from an authorized CA.
- Use the existing server certificate.
- Create a certificate-key pair on the Citrix ADC appliance.

**Note:** This is a test certificate signed by the test Root-CA generated by the Citrix ADC appliance. Test certificates signed by this Root-CA are not accepted by browsers. The browser throws a warning message stating that the server's certificate cannot be authenticated.

- For anything other than test purposes, you must provide a valid CA certificate and CA key to sign the server certificate.

### **What are the minimum requirements for an SSL setup?**

The minimum requirements for configuring an SSL setup are as follows:

- Obtain the certificates and keys.
- Create a load balancing SSL virtual server.
- Bind HTTP or SSL services to the SSL virtual server.

- Bind certificate-key pair to the SSL virtual server.

### **What are the limits for the various components of SSL?**

SSL components have the following limits:

- Bit size of SSL certificates: 4096.
- Number of SSL certificates: Depends on the available memory on the appliance.
- Maximum linked intermediate CA SSL certificates: 9 per chain.
- CRL revocations: Depends on the available memory on the appliance.

### **What are the various steps involved in the end-to-end data encryption on a Citrix ADC appliance?**

The steps involved in the server-side encryption process on a Citrix ADC appliance are as follows:

1. The client connects to the SSL VIP configured on the Citrix ADC appliance at the secure site.
2. After receiving the secure request, the appliance decrypts the request, applies layer 4-7 content switching techniques and load balancing policies, and selects the best available backend Web server for the request.
3. The Citrix ADC appliance creates an SSL session with the selected server.
4. After establishing the SSL session, the appliance encrypts the client request and sends it to the Web server by using the secure SSL session.
5. When the appliance receives the encrypted response from the server, it decrypts and re-encrypts the data, and sends the data to the client by using the client side SSL session.

The multiplexing technique of the Citrix ADC appliance enables the appliance to reuse SSL sessions that have been established with the Web servers. Therefore, the appliance avoids the CPU intensive key exchange, known as *full handshake*. This process reduces the overall number of SSL sessions on the server and maintains end-to-end security.

## **Certificates and Keys**

### **Can I place the certificate and key files at any location? Is there any recommended location to store these files?**

You can store the certificate and key files on the Citrix ADC appliance or a local computer. However, Citrix recommends that you store the certificate and key files in the `/nsconfig/ssl` directory of the Citrix ADC appliance. The `/etc` directory exists in the flash memory of the Citrix ADC appliance. This provides portability and facilitates backup and restoration of the certificate files on the appliance.

**Note:** Make sure that the certificate and the key files are stored in the same directory.

### **What is the maximum size of the certificate key supported on the Citrix ADC appliance?**

A Citrix ADC appliance running a software release earlier than release 9.0 supports a maximum certificate key size of 2048 bits. Release 9.0 and later support a maximum certificate key size of 4096 bits. This limit is applicable to both RSA and DSA certificates.

An MPX appliance supports certificates from 512-bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A virtual appliance supports certificates from 512-bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server from release 12.0-56.x. Older releases support 2048-bit certificates.
- 2048-bit client certificate (if client authentication is enabled on the virtual server) from release 12.0-56.x.

### **What is the maximum size of the DH parameter supported on the Citrix ADC appliance?**

The Citrix ADC appliance supports a DH parameter of maximum 2048 bits.

### **What is the maximum certificate-chain length, that is, the maximum number of certificates in a chain, supported on a Citrix ADC appliance?**

A Citrix ADC appliance can send a maximum of 10 certificates in a chain when sending a server certificate message. A chain of the maximum length includes the server certificate and nine intermediate CA certificates.

### **What are the various certificate and key formats supported on the Citrix ADC appliance?**

The Citrix ADC appliance supports the following certificate and key formats:

- Privacy Enhanced Mail (PEM)
- Distinguished Encoding Rule (DER)

**Is there a limit for the number of certificates and keys that I can install on the Citrix ADC appliance?**

No. The number of certificates and keys that can be installed is limited only by the available memory on the Citrix ADC appliance.

**I have saved the certificate and key files on the local computer. I want to transfer these files to the Citrix ADC appliance by using the FTP protocol. Is there any preferred mode for transferring these files to the Citrix ADC appliance?**

Yes. If using the FTP protocol, you should use binary mode to transfer the certificate and key files to the Citrix ADC appliance.

**Note:** By default, FTP is disabled. Citrix recommends using the SCP protocol for transferring certificate and key files. The configuration utility implicitly uses SCP to connect to the appliance.

**What is the default directory path for the certificate and key?**

The default directory path for the certificate and key is '/nsconfig/ssl'.

**When adding a certificate and key pair, what happens if I do not specify an absolute path to the certificate and key files?**

When adding a certificate and key pair, if you do not specify an absolute path to the certificate and key files, the Citrix ADC appliance searches the default directory, /nsconfig/ssl, for the specified files and attempts to load them to the kernel. For example, if the cert1024.pem and rsa1024.pem files are available in the /nsconfig/ssl directory of the appliance, both of the following commands are successful:

```
1 add ssl certKey cert1 -cert cert1204.pem -key rsa1024.pem
2 <!--NeedCopy-->
```

```
1 add ssl certKey cert1 -cert /nsconfig/ssl/cert1204.pem -key /nsconfig/
  ssl/rsa1024.pem
2 <!--NeedCopy-->
```

**I have configured a high availability setup. I want to implement the SSL feature on the setup. How should I handle the certificate and key files in a high availability setup?**

In a high availability setup, you must store the certificate and key files on both the primary and the secondary Citrix ADC appliance. The directory path for the certificate and key files must be the same on both appliances before you add an SSL certificate-key pair on the primary appliance.

## Thales nShield® HSM

### **When integrating with Thales nShield® HSM, do we have to keep in mind any specific configuration when adding the Citrix ADC appliance to HA?**

You must configure the same Thales device(s) on both the nodes in HA. Thales configuration commands don't synchronize in HA. For information about the prerequisites for Thales nShield® HSM, see [Prerequisites](#).

### **Do we have to individually integrate both the appliances with Thales nShield® HSM and RFS? Do we need to do this before or after the HA setup?**

You can complete the integration before or after the HA setup. However, if the integration is done after the HA setup, the keys imported on the primary node prior to configuring the secondary node are not synced to the secondary node. Therefore, Citrix recommends Thales integration before the HA setup.

### **Do we have to import the key into both the primary and secondary Citrix ADC appliances, or are the keys synchronized from the primary node to the secondary node?**

If Thales is integrated on both devices before forming the HA, the keys are automatically synchronized from RFS in the process of integration.

### **Given that the HSM is not on the Citrix ADC appliance, but on Thales, what happens to the keys and certificates when a node fails and is replaced?**

If a node fails, it is possible to synchronize the keys and certificates to the new node, by first integrating Thales on the new node and then running the following commands:

```
1 sync ha files ssl
2 force ha sync
3 <!--NeedCopy-->
```

The certificates are synchronized and added if the keys are synchronized in the process of integrating Thales.

## Ciphers

### **What is a NULL-Cipher?**

Ciphers with no encryption are known as NULL-Ciphers. For example, NULL-MD5 is a NULL-Cipher.

**Are the NULL-Ciphers enabled by default for an SSL VIP or an SSL service?**

No. NULL-Ciphers are not enabled by default for an SSL VIP or an SSL service.

**What is the procedure to remove NULL-Ciphers?**

To remove the NULL-Ciphers from an SSL VIP, run the following command:

```
1 bind ssl cipher <SSL_VIP> REM NULL
2 <!--NeedCopy-->
```

To remove the NULL-Ciphers from an SSL Service, run the following command:

```
1 bind ssl cipher <SSL_Service> REM NULL -service
2 <!--NeedCopy-->
```

**What are the various cipher aliases supported on the Citrix ADC appliance?**

To list the cipher aliases supported on the appliance, at the command prompt, type:

```
1 sh cipher
2 <!--NeedCopy-->
```

**What is the command to display all the predefined ciphers of the Citrix ADC appliance?**

To display all the predefined ciphers of the Citrix ADC appliance, at the CLI, type:

```
1 show ssl cipher
2 <!--NeedCopy-->
```

**What is the command to display the details of an individual cipher of the Citrix ADC appliance?**

To display the details of an individual cipher of the Citrix ADC appliance, at the CLI, type:

```
1 show ssl cipher <Cipher_Name/Cipher_Alias_Name/Cipher_Group_Name>
2 <!--NeedCopy-->
```

**Example:**

```
1 show cipher SSL3-RC4-SHA
2     1) Cipher Name: SSL3-RC4-SHA
3     Description: SSLv3 Kx=RSA Au=RSA Enc=RC4(128)
4     Mac=SHA1
```

```
5 Done
6 <!--NeedCopy-->
```

### What is the significance of adding the predefined ciphers of the Citrix ADC appliance?

Adding the predefined ciphers of the Citrix ADC appliance causes the NULL-Ciphers to get added to an SSL VIP or an SSL service.

## Certificates

### Is the distinguished name in a client certificate available for the length of the user session?

Yes. You can access the distinguished name of the client certificate in subsequent requests during the length of the user session, that is even after the SSL handshake is complete and the certificate is not sent again by the browser. To do this, use a variable and an assignment as detailed in the following sample configuration:

#### Example:

```
1 add ns variable v2 -type "text(100)"
2
3 add ns assignment a1 -variable "$v2" -set "CLIENT.SSL.CLIENT_CERT
4 .SUBJECT.TYPECAST_NVLIST_T('=', '/').VALUE("CN")"
5 add rewrite action act1 insert_http_header subject "$v2" // example:
6 to insert the distinguished name in the header
7 add rewrite policy pol1 true a1
8
9 add rewrite policy pol2 true act1
10
11 bind rewrite global pol1 1 next -type RES_DEFAULT
12
13 bind rewrite global pol2 2 next -type RES_DEFAULT
14
15 set rewrite param -undefAction RESET
16 <!--NeedCopy-->
```

### Why do I need to bind the server certificate?

Binding the server certificates is the basic requirement for enabling the SSL configuration to process SSL transactions.

To bind the server certificate to an SSL VIP, at the CLI, type:

```
1 bind ssl vserver <vServerName> -certkeyName <cert_name>
2 <!--NeedCopy-->
```

To bind the server certificate to an SSL service, at the CLI, type:

```
1 bind ssl service <serviceName> -certkeyName <cert_name>
2 <!--NeedCopy-->
```

### **How many certificates can I bind to an SSL VIP or an SSL service?**

On a Citrix ADC virtual appliance, you can bind a maximum of three certificates to an SSL VIP or an SSL service, one each of type RSA, ECDSA, and DSA. On a Citrix ADC MPX (N2) or MPX-FIPS appliance, if SNI is enabled, you can bind multiple server certificates of type RSA. If SNI is disabled, you can bind a maximum of one certificate of type RSA. On a Citrix ADC MPX (N3) and Citrix ADC MPX/SDX FIPS appliance, you can bind a maximum of two certificates to an SSL VIP or an SSL service, one each of type RSA and type ECDSA.

**Note:** DSA certificates are not supported on MPX or MPX-FIPS platforms.

### **Does SNI support Subject Alternative Name (SAN) certificates?**

No. On a Citrix ADC appliance, SNI is not supported with a SAN extension certificate.

### **What happens if I unbind or overwrite a server certificate?**

When you unbind or overwrite a server certificate, all the connections and SSL sessions created by using the existing certificate are terminated. When you overwrite an existing certificate, the following message appears:

```
1 ERROR:
2
3 Warning: Current certificate replaces the previous binding.
4 <!--NeedCopy-->
```

### **How do I install an intermediate certificate on Citrix ADC and link to a server certificate?**

See the article at

<http://support.citrix.com/article/ctx114146> for information about installing an intermediate certificate.

**Why am I getting a “resource already exists” error when I try to install a certificate on the Citrix ADC?**

See the article at

<http://support.citrix.com/article/CTX117284> for instructions for resolving the “resource already exists” error.

**I want to create a server certificate on a Citrix ADC appliance to test and evaluate the product. What is the procedure to create a server certificate?**

Perform the following procedure to create a test certificate.

**Note:** A certificate created with this procedure cannot be used to authenticate all the users and browsers. After using the certificate for testing, you should obtain a server certificate signed by an authorized Root CA.

To create a self-signed server certificate:

1. To create a Root CA certificate, at the CLI, type:

```
1 create ssl rsakey /nsconfig/ssl/test-ca.key 1024
2
3 create ssl certreq /nsconfig/ssl/test-ca.csr -keyfile /nsconfig/
  ssl/test-ca.key
4
5 Enter the required information when prompted, and then type the
  following command:
6
7 create ssl cert /nsconfig/ssl/test-ca.cer /nsconfig/ssl/test-ca.
  csr ROOT_CERT -keyfile /nsconfig/ssl/test-ca.key
8 <!--NeedCopy-->
```

2. Perform the following procedure to create a server certificate and sign it with the root CA certificate that you just created

- a) To create the request and the key, at the CLI, type:

```
1 create ssl rsakey /nsconfig/ssl/test-server.key 1024
2
3 create ssl certreq /nsconfig/ssl/test-server.csr -keyfile
  /nsconfig/ssl/test-server.key
4 <!--NeedCopy-->
```

- b) Enter the required information when prompted.

- c) To create a serial-number file, at the CLI, type:

```
1 shell
2 # echo '01' >
3 /nsconfig/ssl/serial.txt
4 # exit
5 <!--NeedCopy-->
```

- d) To create a server certificate signed by the root CA certificate created in step 1, at the CLI, type:

```
1 create ssl cert /nsconfig/ssl/test-server.cer /nsconfig/ssl/
  test-server.csr SRVR_CERT -CAcert /nsconfig/ssl/test-ca.cer
  -CAkey /nsconfig/ssl/test-ca.key -CAserial /nsconfig/ssl/
  serial.txt
2 <!--NeedCopy-->
```

- e) To create a Citrix ADC certkey, which is the in-memory object that holds the server certificate information for SSL handshakes and bulk encryption, at the CLI, type:

```
1 add ssl certkey test-certkey -cert /nsconfig/ssl/test-server.
  cer -key /nsconfig/ssl/test-server.key
2 <!--NeedCopy-->
```

- f) To bind the certkey object to the SSL virtual server, at the CLI, type:

```
1 bind ssl vserver <vServerName> -certkeyName <cert_name>
2 <!--NeedCopy-->
```

**I have received a Citrix ADC appliance on which NetScaler software release 9.0 is installed. I have noticed an additional license file on the appliance. Is there any change in the licensing policy starting with NetScaler software release 9.0?**

Yes. Starting with Citrix NetScaler software release 9.0, the appliance might not have a single license file. The number of license files depends on the Citrix ADC software release edition. For example, if you have installed the Advanced edition, you might need additional license files for the full functionality of the various features. However, if you have installed the Premium edition, the appliance has only one license file.

**How do I export the certificate from Internet Information Service (IIS)?**

There are many ways to do this, but by using the following method the appropriate certificate and private key for the Web site are exported. This procedure must be performed on the actual IIS server.

1. Open the Internet Information Services (IIS) Manager administration tool.
2. Expand the Web Sites node and locate the SSL-enabled Web site that you want to serve through the Citrix ADC appliance.
3. Right-click this Web site and click Properties.
4. Click the Directory Security tab and, in the Secure Communications section of the window, select the View Certificate box.
5. Click the Details tab, and then click Copy to File.
6. On the Welcome to the Certificate Export Wizard page, click Next.
7. Select Yes, export the private key and click Next.  
**Note:** The private key MUST be exported for SSL Offload to work on the Citrix ADC.
8. Make sure that the Personal Information Exchange -PKCS #12 radio button is selected, and select *only* the Include all certificates in the certification path if possible check box. Click Next.
9. Enter a password and click Next.
10. Enter a file name and location, and then click Next. Give the file an extension of .PFX.
11. Click Finish.

#### How do I convert the PKCS#12 certificate and install it on the Citrix ADC?

1. Move the exported .PFX certificate file to a location from where it may be copied to the Citrix ADC (that is, to a machine that permits SSH access to the management interface of a Citrix ADC appliance). Copy the certificate to the appliance by using a secure copy utility such as SCP.
2. Access the BSD shell and convert the certificate (for example, cert.PFX) to .PEM format:

```
1 root@ns# openssl pkcs12 -in cert.PFX -out cert.PEM
2 <!--NeedCopy-->
```

3. To make sure that the converted certificate is in correct x509 format, verify that the following command produces no error:

```
1 root@ns# openssl x509 -in cert.PEM -text
2 <!--NeedCopy-->
```

4. Verify that the certificate file contains a private key. Begin by issuing the following command:

```
1 root@ns# cat cert.PEM
2
3 Verify that the output file includes an RSA PRIVATE KEY section.
4
```

```
5 -----BEGIN RSA PRIVATE KEY-----
6 Mkm^s9KMs9023pz/s...
7 -----END RSA PRIVATE KEY-----
8 <!--NeedCopy-->
```

The following is another example of an RSA PRIVATE KEY section:

```
1 Bag Attributes
2 1.3.6.1.4.1.311.17.2: <No Values>
3 localKeyID: 01 00 00 00
4 Microsoft CSP Name: Microsoft RSA SChannel Cryptographic
5 Provider
6 friendlyName:
7 4b9cef4cc8c9b849ff5c662fd3e0ef7e_76267e3e-6183-4d45-886e-6
   e067297b38f
8
9 Key Attributes
10 X509v3 Key Usage: 10
11 -----BEGIN RSA PRIVATE KEY-----
12 Proc-Type: 4, ENCRYPTED
13 DEK-Info: DES-EDE3-CBC,43E7ACA5F4423968
14 pZJ2SfsSVqMbRRf6ug37Clua5gY0Wld4frPIxFXyJquUhr31diW5ta3hbIaQ+
   Rg
15
16 ... (more random characters)
17 v8dMugeRplkaH2Uwt/mWBk4t71Yv7GeHmcmjafK8H8iW80ooP03D/ENV8X4U/
   tlh
18
19 5eU6ky3WYZ1BTy6thxxLlwAu1lynVXZEF1NLxq1oX+ZYl6djgjE3qg==
20 -----END RSA PRIVATE KEY-----
21 <!--NeedCopy-->
```

The following is a SERVER CERTIFICATE section:

```
1 Bag Attributes
2 localKeyID: 01 00 00 00
3 friendlyName: AG Certificate
4 subject=/C=AU/ST=NSW/L=Wanniassa/O=Dave Mother
5 Asiapacific/OU=Support/CN=davemother.food.lan
6 issuer=/DC=lan/DC=food/CN=hotdog
7 -----BEGIN CERTIFICATE-----
8 MIIFI TCCBH GgAwIBAgIKCGryDgAAAAAAHzANBgkqhkiG9w0BAQUFADA8MRMwEQYK
9
10 ... (more random characters) 5
```

```

        pLDWYVHhLkA1pSxvFjNJHRSIydWHc5ltGyKqIUcBezVaXyel94pNSUYx07NpPV
        /
11
12     MY2ovQyQZM8gGe3+lGFum0VHbv/y/gB9HhFesog=
13     -----END CERTIFICATE-----
14 <!--NeedCopy-->

```

The following is an INTERMEDIATE CA CERTIFICATE section:

```

1     Bag Attributes: <Empty Attributes>
2     subject=/DC=lan/DC=food/CN=hotdog
3     issuer=/DC=lan/DC=food/CN=hotdog
4     -----BEGIN CERTIFICATE-----
5     MIIESDCCAzCgAwIBAgIQah20fCRYTY9LRXYMIRaKGjANBgkqhkiG9w0BAQUFADA8
6
7     ... (more random characters)
        Nt0nksawDnbKo86rQcNnY5xUs7c7pj2zxj/I0sgNHUp5W6dDI9pQoqFFaDk
        =
8
9     -----END CERTIFICATE-----
10 <!--NeedCopy-->

```

Further Intermediate CA certificates may follow, depending on the certification path of the exported certificate.

5. Open the .PEM file in a text editor
6. Locate the first line of the .PEM file and the first instance of the following line, and copy those two lines and all the lines between them:

```

1     -----END CERTIFICATE-----
2
3     Note: Make sure that last copied line is the first
4
5     -----END CERTIFICATE----- line in the .PEM file.
6 <!--NeedCopy-->

```

1. Paste the copied lines into a new file. Call the new file something intuitive, such as cert-key.pem. This is the certificate-key pair for the server hosting the HTTPS service. This file should contain both the section labeled RSA PRIVATE KEY and the section labeled SERVER CERTIFICATE in the example above.

**Note:** The certificate-key pair file contains the private key and must therefore be kept secure.

2. Locate any subsequent sections beginning with `---BEGIN CERTIFICATE---` and ending with `---END CERTIFICATE---`, and copy each such section to a separate new file.

These sections correspond to certificates of trusted CAs that have been included in the certification path. These sections should be copied and pasted into new individual files for these certificates. For example, the INTERMEDIATE CA CERTIFICATE section of the example above should be copied and pasted into a new file).

For multiple intermediate CA certificates in the original file, create new files for each intermediate CA certificate in the order in which they appear in the file. Keep track (using appropriate filenames) of the order in which the certificates appear, as they need to be linked together in the correct order in a later step.

3. Copy the certificate-key file (cert-key.pem) and any additional CA certificate files into the /nsconfig/ssl directory on the Citrix ADC appliance.
4. Exit the BSD shell and access the Citrix ADC prompt.
5. Follow the steps in “Install the certificate-key files on the appliance” to install the key/certificate once uploaded on the device.

### **How do I convert the PKCS#7 certificate and install it on the Citrix ADC appliance?**

You can use OpenSSL to convert a PKCS #7 Certificate to a format recognizable by the Citrix ADC appliance. The procedure is identical to the procedure for PKCS #12 certificates, except that you invoke OpenSSL with different parameters. The steps for converting PKCS #7 certificates are as follows:

1. Copy the certificate to the appliance by using a secure copy utility, such as SCP.
2. Convert the certificate (for example, cert.P7B ) to PEM format:

```
1 openssl pkcs7 -inform DER -in cert.p7b -print_certs -text -out
  cert.pem
2 <!--NeedCopy-->
```

3. Follow steps 3 through 7 as described in the answer for PKCS #12 certificates.

Note: Before loading the converted PKCS #7 certificate to the appliance, be sure to verify that it contains a private key, exactly as described in step 3 for the PKCS #12 procedure. PKCS #7 certificates, particularly those exported from IIS, do not typically contain a private key.

### **When I bind a cipher to a virtual server or service by using the bind cipher command, I see the error message “Command deprecated.”?**

The command for binding a cipher to a virtual server or service has changed.

Use the `bind ssl vservice <vserviceName> -ciphername <ciphername>` command to bind an SSL cipher to an SSL virtual server.

Use the `bind ssl service <serviceName> -ciphername <ciphername>` command to bind an SSL cipher to an SSL service.

**Note:** New ciphers and cipher groups are added to the existing list and not replaced.

### **Why can't I create a new cipher group and bind ciphers to it by using the add cipher command?**

The add cipher command functionality has changed in release 10. The command only creates a cipher group. To add ciphers to the group, use the bind cipher command.

## **OpenSSL**

### **How do I use OpenSSL to convert certificates between PEM and DER?**

To use OpenSSL, you must have a working installation of the OpenSSL software and be able to execute Openssl from the command line.

x509 certificates and RSA keys can be stored in a number of different formats.

Two common formats are DER (a binary format used primarily by Java and Macintosh platforms) and PEM (a base64 representation of DER with header and footer information, which is used primarily by UNIX and Linux platforms). There is also an obsolete NET (Netscape server) format that was used by earlier versions of IIS (up to and including 4.0) and various other less common formats that are not covered in this article.

A key and the corresponding certificate, as well as the root and any intermediate certificates, can also be stored in a single PKCS#12 (.P12, .PFX) file.

#### Procedure

Use the Openssl command to convert between formats as follows:

1. To convert a certificate from PEM to DER:

```
1 x509 -in input.crt -inform PEM -out output.crt -outform DER
2 <!--NeedCopy-->
```

2. To convert a certificate from DER to PEM:

```
1 x509 -in input.crt -inform DER -out output.crt -outform PEM
2 <!--NeedCopy-->
```

3. To convert a key from PEM to DER:

```
1 rsa -in input.key -inform PEM -out output.key -outform DER
2 <!--NeedCopy-->
```

#### 4. To convert a key from DER to PEM:

```
1 rsa -in input.key -inform DER -out output.key -outform PEM
2 <!--NeedCopy-->
```

**Note:** If the key you are importing is encrypted with a supported symmetric cipher, you are prompted to enter the pass-phrase.

**Note:** To convert a key to or from the obsolete NET (Netscape server) format, substitute NET for PEM or DER as appropriate. The stored key is encrypted in a weak unsalted RC4 symmetric cipher, so a pass-phrase will be requested. A blank pass-phrase is acceptable.

## System Limits

### What are the important numbers to remember?

#### 1. Create Certificate Request:

- Request File Name: Maximum 63 characters
- Key File Name: Maximum 63 characters
- PEM Passphrase (For Encrypted Key): Maximum 31 characters
- Common Name: Maximum 63 characters
- City: Maximum 127 characters
- Organization Name: Maximum 63 characters
- State/Province Name: Maximum 63 characters
- Email Address: Maximum 39 Characters
- Organization Unit: Maximum 63 characters
- Challenge Password: Maximum 20 characters
- Company Name: Maximum 127 characters

#### 2. Create Certificate:

- Certificate File Name: Maximum 63 characters
- Certificate Request File Name: Maximum 63 characters
- Key File Name: Maximum 63 characters
- PEM Passphrase: Maximum 31 characters
- Validity Period: Maximum 3650 days
- CA Certificate File Name: Maximum 63 characters
- CA Key File Name: Maximum 63 characters
- PEM Passphrase: Maximum 31 characters

- CA Serial Number File: Maximum 63 characters
3. Create and Install a Server Test Certificate:
    - Certificate File Name: Maximum 31 characters
    - Fully Qualified Domain Name: Maximum 63 characters
  4. Create Diffie-Hellman (DH) key:
    - DH Filename (with path): Maximum 63 characters
    - DH Parameter Size: Maximum 2048 bits
  5. Import PKCS12 key:
    - Output File Name: Maximum 63 characters
    - PKCS12 File Name: Maximum 63 characters
    - Import Password: Maximum 31 characters
    - PEM Passphrase: Maximum 31 characters
    - Verify PEM Passphrase: Maximum 31 characters
  6. Export PKCS12
    - PKCS12 File Name: Maximum 63 characters
    - Certificate File Name: Maximum 63 characters
    - Key File Name: Maximum 63 characters
    - Export Password: Maximum 31 characters
    - PEM Passphrase: Maximum 31 characters
  7. CRL Management:
    - CA Certificate File Name: Maximum 63 characters
    - CA Key File Name: Maximum 63 characters
    - CA Key File Password: Maximum 31 characters
    - Index File Name: Maximum 63 characters
    - Certificate File Name: Maximum 63 characters
  8. Create RSA Key:
    - Key Filename: Maximum 63 characters
    - Key Size: Maximum 4096 bits
    - PEM Passphrase: Maximum 31 characters
    - Verify Passphrase: Maximum 31 characters
  9. Create DSA Key:
    - Key Filename: Maximum 63 characters
    - Key Size: Maximum 4096 bits
    - PEM Passphrase: Maximum 31 characters
    - Verify Passphrase: Maximum 31 characters

10. Change advanced SSL settings:
  - Maximum CRL memory size: Maximum 1024 Mbytes
  - Encryption trigger timeout (10 mS ticks): Maximum 200
  - Encryption trigger packet count: Maximum 50
  - OCSP cache size: Maximum 512 Mbytes
11. Install Certificate:
  - Certificate-Key pair Name: Maximum 31 characters
  - Certificate File Name: Maximum 63 characters
  - Private Key File Name: Maximum 63 characters
  - Password: Maximum 31 characters
  - Notification Period: Maximum 100
12. Create Cipher Group:
  - Cipher Group Name: Maximum 39 characters
13. Create CRL:
  - CRL Name: Maximum 31 characters
  - CRL File: Maximum 63 characters
  - URL: Maximum 127 characters
  - Base DN: Maximum 127 characters
  - Bind DN: Maximum 127 characters
  - Password: Maximum 31 characters
  - Day(s): Maximum 31
14. Create SSL Policy:
  - Name: Maximum 127 characters
15. Create SSL Action:
  - Name: Maximum 127 characters
16. Create OCSP Responder:
  - Name: Maximum 32 characters
  - URL: Maximum 128 characters
  - Batching Depth: Maximum 8
  - Batching Delay: Maximum 10000
  - Produced At Time Skew: Maximum 86400
  - Request Time-out: Maximum 120000
17. Create Virtual Server:
  - Name: Maximum 127 characters

- Redirect URL: Maximum 127 characters
- Client Time-out: Maximum 31536000 secs

18. Create Service:

- Name: Maximum 127 characters
- Idle Time-out (secs):  
Client: Maximum 31536000  
Server: Maximum 31536000

19. Create Service Group:

- Service Group Name: Maximum 127 characters
- Server ID: Maximum 4294967295
- Idle Time-out (secs):  
Client: Maximum value 31536000  
Server: Maximum 31536000

20. Create Monitor:

- Name: Maximum 31 characters

21. Create Server:

- Server Name: Maximum 127 characters
- Domain Name: Maximum 255 characters
- Resolve Retry: Maximum 20939 secs

## Security

September 21, 2020

The following topics cover configuration and installation information for Citrix ADC security features. Most of these features are policy based.

---

|                                               |                                                                                                                                                                  |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication, Authorization, Auditing (AAA) | Keeps unauthorized users out of the network, denies users access to tasks for which they are not authorized, and tracks the resources used during user sessions. |
| Application Firewall                          | Prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information.              |

---

|                                   |                                                                                                                                                               |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content Filtering                 | Blocks inappropriate HTML requests, preventing the requests from reaching the Web servers.                                                                    |
| HTTP Denial-of-Service Protection | Prevents hackers from attacking your Web site with large numbers of HTTP requests.                                                                            |
| Priority Queuing                  | Detects high-priority connections and allows those connections to proceed ahead of other connections, guaranteeing unimpeded access to those users.           |
| SureConnect                       | Serves all incoming connections with either the requested content or a custom Web page that displays information about a delay in the request being serviced. |
| Surge Protection                  | Detects any rapid rise in connection attempts and adjusts the rate at which connections are allowed to proceed to the server, preventing server overload.     |

---

## Content filtering

September 16, 2021

**Warning:**

Filter actions are deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the Responder, Rewrite, or Content Switching features. However, Filter actions are removed and no longer available on the Citrix ADC appliance release 13.1 onwards. For more information, see [Responder](#), [Rewrite](#), or [Content Switching](#) topics.

Content filtering can do some of the same tasks as the Citrix Web App Firewall, and is a less CPU-intensive tool. It is limited, however, to examining the header portion of the HTTP request or response and to performing a few simple actions on connections that match. If you have a complex Web site that makes extensive use of scripts and accesses back-end databases, the Application Firewall may be the better tool for protecting that Web site. For more information about the Citrix Web App Firewall, see [Application Firewall](#).

Content filtering is based on regular expressions that you can apply to either HTTP requests or HTTP

responses. To block requests from a particular site, for example, you could use an expression that compares each request's URL to the URL specified in the expression. The expression is part of a policy, which also specifies an action to be performed on requests or responses that match the expression. For example, an action might drop a request or reset the connection.

Following are some examples of things you can do with content filtering policies:

- Prevent users from accessing certain parts of your Web sites unless they are connecting from authorized locations.
- Prevent inappropriate HTTP headers from being sent to your Web server, possibly breaching security.
- Redirect specified requests to a different server or service.

To configure content filtering, once you have made sure that the feature is enabled, you configure filtering actions for your servers to perform on selected connections (unless the predefined actions are adequate for your purposes). Then you can configure policies to apply the actions to selected connections. Your policies can use predefined expressions, or you can create your own. To activate the policies you configured, you bind them either globally or to specific virtual servers.

## Enabling content filtering

September 21, 2020

By default, content filtering is enabled on Citrix ADC appliances running the Citrix ADC operating system 8.0 or above. If you are upgrading an existing appliance from an operating system version earlier than 8.0, you must update the licenses before you can use content filtering, and you may need to enable the content filtering feature itself manually.

### Enable content filtering by using the CLI

At the command prompt, type the following commands to enable content filtering and verify the configuration:

```
1 - enable ns feature ContentFiltering
2 - show ns feature
3 <!--NeedCopy-->
```

#### Example:

```
1 > enable ns feature ContentFiltering
2 Done
3 > show ns feature
```

|    | Feature                 | Acronym       | Status |
|----|-------------------------|---------------|--------|
|    | -----                   | -----         | -----  |
| 7  | 1) Web Logging          | WL            | ON     |
| 8  | 2) Surge Protection     | SP            | OFF    |
| 9  | .                       |               |        |
| 10 | .                       |               |        |
| 11 | .                       |               |        |
| 12 | .                       |               |        |
| 13 | 11) Http DoS Protection | HDOSP         | OFF    |
| 14 | 12) Content Filtering   | CF            | ON     |
| 15 | .                       |               |        |
| 16 | .                       |               |        |
| 17 | 23) HTML Injection      | HTMLInjection | ON     |
| 18 | 24) Citrix ADC Push     | push          | OFF    |
| 19 | Done                    |               |        |
| 20 | <!--NeedCopy-->         |               |        |

## Enable content by filtering by using the GUI

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Configure basic features.
3. In the Configure Basic Features pane, select the Content Filter check box, and then click OK.

## Configure a content filtering action

September 21, 2020

After you enable the content filtering feature, you create one or more actions to tell your Citrix ADC appliance how to handle the connections it receives.

Content filtering supports the following actions for HTTP requests:

- **Add:** Adds the specified HTTP header before sending the request to the web server.
- **Reset:** Terminates the connection, sending the appropriate termination notice to the user's browser.
- **Forward:** Redirects the request to the designated service.
- **Drop:** Silently deletes the request, without sending a response to the user's browser.
- **Corrupt:** Modifies the designated HTTP header in a manner that prevents it from performing the function it was intended to perform, then sends the request to the server.

Content filtering supports the following actions for HTTP responses:

- **Add:** Adds the specified HTTP header before sending the response to the user's browser.
- **ErrorCode:** Returns the designated HTTP error code to the user's browser.
- **Corrupt:** Modifies the designated HTTP header in a manner that prevents it from performing the function it was intended to perform, then sends the response to the user's browser.

### Configure a content filtering action by using the CLI

At the command prompt, type the following commands to configure a Content Filtering action and verify the configuration:

```
1 - add filter action <name> <qualifier> [<serviceName>] [<value>] [<
    respCode>] [<page>]
2 - show filter action <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > add filter action act_drop Drop
2 Done
3 > show filter action act_drop
4 1)      Name: act_drop   Filter Type: drop
5 Done
6 <!--NeedCopy-->
```

### Configure a content filtering action by using the GUI

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, do one of the following:
  - To create a new action, click Add.
  - To modify an existing action, select the action, and then click Open.
3. In the Add Filter Action or Configure Filter Action dialog box, specify values for the parameters:
  - Action Name\*—name
  - Qualifier\*—qualifier ( Determines which of the following parameters you can configure)
  - Service Name—servicename
  - HeaderName:Value—value
  - Response Code—respcode
  - Response Page—page
4. Fill in any other required information. For example, if you are configuring an action to send an HTTP error code, you must choose the appropriate error code from a drop-down list. If neces-

sary, you can then modify the text of the error message, which is displayed beneath the drop-down list.

5. Click Create or OK, and then click Close. The Actions list displays the action you configured, and a message in the status bar indicates that your action has been created.

## Configure a content filtering policy

September 21, 2020

To implement content filtering, you must configure at least one policy to tell your Citrix ADC appliance how to distinguish the connections you want to filter. You must first have configured at least one filtering action, because when you configure a policy, you associate it with an action.

Content filtering policies examine a combination of one or more of the following elements to select requests or responses for filtering:

- **URL:** The URL in the HTTP request.
- **URL query:** Only the query portion of the URL, which is the portion after the query (?) symbol.
- **URL token:** Only the tokens in the URL, if any, which are the parts that begin with an ampersand (&) and consist of the token name, followed by an equals sign (=), followed by the token value.
- **HTTP method:** The HTTP method used in the request, which is usually GET or POST, but can be any of the eight defined HTTP methods.
- **HTTP version:** The HTTP version in the request, which is usually HTTP 1.1.
- **Standard HTTP header:** Any of the standard HTTP headers defined in the HTTP 1.1 specification.
- **Standard HTTP header value:** The value portion of the HTTP header, which is the portion after the colon and space (: ).
- **Custom HTTP header:** A non-standard HTTP header issued by your Web site or that appears in a user request.
- **Custom header value:** The value portion of the custom HTTP header, which (as with the standard HTTP header) is the portion after the colon and space (: ).
- **Client Source IP:** The IP from which the client request was sent.

Content filtering policies use the simpler of two Citrix ADC expressions languages, called classic expressions. For a complete description of classic expressions, how they work, and how to configure them manually, see “[Policies and Expressions](#).”

**Note:** Users who are not experienced in configuring policies at the Citrix ADC command line will usually find using the configuration utility considerably easier.

## Configure a content filtering policy by using the CLI

At the command prompt, type the following commands to configure a content filtering policy and verify the configuration:

```
1 - add filter policy <name> -rule <expression> (-reqAction <action> | -
   resAction <string>
2 - show filter policy <name>
3 <!--NeedCopy-->
```

### Example:

```
1 > add filter policy cf-pol -rule "REQ.HTTP.URL CONTAINS http://abc.com"
   -reqaction DROP
2 Done
3 > show filter policy cf-pol
4 1)      Name: cf-pol      Rule: REQ.HTTP.URL CONTAINS http://abc.com
5         Request action: DROP
6         Response action:
7         Hits: 0
8 Done
9 <!--NeedCopy-->
```

## Configure a content filtering policy by using the GUI

1. Navigate to Security > Protection Features > Filter.
2. Navigate to Protection Features > Filter.
3. In the details pane, to create a new policy, click Add.
4. If you are creating a new policy, in the Create Filter Policy dialog box, in the Filter Name text box, type a name for your new policy.
5. Select either Request Action or Response Action to activate the drop-down list to the right of that item.
6. Click the down arrow to the right of the drop-down list and select the action to be performed on the request or response. The default choices are RESET and DROP. Any other actions you have created will also appear in this list.  
**Note:** You can also click New to create a new Content Filtering action, or Modify to modify an existing Content Filtering action. You can only modify actions you created; the default actions are read-only.
7. If you want to use a predefined expression (or named expression) to define your policy, choose one from the Named Expressions list.
  - a) Click the down arrow to the right of the first Named Expressions drop-down list, and

choose the category of named expressions that contains the named expression you want to use.

- b) Click the down arrow to the right of the second Named Expressions drop-down list, and choose the named expression you want. As you choose a named expression, the regular expression definition of that named expression appears in the Preview Expression pane beneath the Named Expression list boxes.
  - c) Click Add Expression to add that named expression to the Expression list.  
Note: You should perform either this step or step 7, but not both.
8. If you want to create a new expression to define your policy, use the Expression Editor.
- a) Click the Add button. The Add Expression dialog box appears.
  - b) In the Add Expression dialog box, choose the type of connection you want to filter. The Flow Type is set to REQ by default, which tells the Citrix ADC appliance to look at incoming connections, or requests. If you want to filter outgoing connections (responses), you click the right arrow beside the drop-down list and choose RES.
  - c) If the Protocol is not already set to HTTP, click the down arrow to the right of the Protocol drop-down list and choose HTTP.  
Note: In the Citrix ADC classic expressions language, “HTTP” includes HTTPS requests, as well.
  - d) Click the down arrow to the right of the Qualifier drop-down list, and then choose a qualifier for your expression. Your choices are:
    - **METHOD:** The HTTP method used in the request.
    - **URL:** The contents of the URL header.
    - **URLTOKENS:** The URL tokens in the HTTP header.
    - **VERSION:** The HTTP version of the connection.
    - **HEADER:** The header portion of the HTTP request.
    - **URLLEN:** The length of the contents of the URL header.
    - **URLQUERY:** The query portion of the contents of the URL header.
    - **URLQUERYLEN:** The length of the query portion of the URL header.The contents of the remaining list boxes change to the choices appropriate to the Qualifier you pick. For example, if you choose HEADER, a text field labeled Header Name\* appears below the Flow Type list box.
  - e) Click the down arrow to the right of the Operator drop-down list, and choose an operator for your expression. Your choices will vary depending on the Protocol you chose in the preceding step. The following list includes all of the operators:
    - **==:** Matches the following text string exactly.
    - **!=:** Does not exactly match the following text string.
    - **>:** Is greater than the following integer.
    - **CONTAINS:** Contains the following text string.
    - **CONTENTS:** The contents of the designated header, URL, or URL query.

- **EXISTS:** The specified header or query exists.
  - **NOTCONTAINS:** Does not contain the following text string.
  - **NOTEXISTS:** The specified header or query does not exist.
- f) If the Value text box is visible, type the appropriate string or number. If you are testing a string in any way, type the string into the Value text box. If you are testing an integer in any way, type the integer into the Value text box.
  - g) If you chose HEADER as the Protocol, type the header you want in the Header Name\* text box.
  - h) Click OK to add your expression to the Expressions list.
  - i) Repeat steps B through H to create any additional expressions you want for your profile.
  - j) Click Close to close the Expressions Editor.
9. If you created a new expression, in the Expression frame select an option from the Match Any Expression drop-down list. Your choices are:
    - Match Any Expression. If a request matches any expression in the Expressions list, the request matches this policy.
    - Match All Expressions If a request matches all expressions in the Expressions list, the request matches this policy. If it does not match all of them, it does not match this policy.
    - Tabular Expression Switches the Expressions list to a tabular format with three columns. In the first column you can place a BEGIN [(] operator. The second column contains the expressions you have selected or created. In the third column, you can place any of the other operators in the following list, to create complex policy groups in which each group can be configured for match any expression or match all expressions.
    - The AND [&&] operator tells the appliance to require that a request match both the current expression and the following expression.

The OR [ ] operator tells the appliance to require that a request match either the current expression or the following expression, or both. Only if the request does not match either expression does it not match the policy.

- 
- The END [)] operator tells the appliance that this is the last expression in this expression group or policy.

Note: The Tabular format allows you to create a complex policy that contains both “Match Any Expression” and “Match All Expressions” on a per-expression basis. You are not limited

to just one or the other.

- Advanced Free-Form Switches off the Expressions Editor entirely and modifies the Expressions list into a text area. In the text area, you can type the PCRE-format regular expression of your choice to define this policy. This is both the most powerful and the most difficult method of creating a policy, and is recommended only for those thoroughly familiar with the Citrix ADC appliance and PCRE-format regular expressions.

Caution: If you switch to Advanced Free Form expression editing mode, you cannot switch back to any of the other modes. Do not choose this expression editing mode unless you are sure that is what you want.

10. Repeat steps 6 through 8 to add any additional expressions you want to the Expressions list. You can mix named expressions and expressions created in the Expressions Editor. To the Citrix ADC appliance, they are all the same.
11. Click **Create** to create your new policy. Your new policy appears in the Policies pane list.
12. Click **Close**. To create additional Content Filtering policies, repeat the previous procedure. To remove a Content Filtering policy, select the policy in the **Policies** tab and click **Remove**.

## Binding a content filtering policy

September 21, 2020

You must bind each content filtering policy to put it into effect. You can bind policies globally or to a particular virtual server. Globally bound policies are evaluated each time traffic directed to any virtual server matches the policy. Policies bound to a specific vserver are evaluated only when that vserver receives traffic that matches the policy.

### Bind a policy to a virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to a virtual server and verify the configuration:

```
1 - bind lb vserver <name>@ -policyName <string> -priority <
    positive_integer>
2 - show lb vserver <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > bind lb vserver vs-loadbal -policyName policyTwo -priority 100
2 Done
```

```

3 > show lb vserver vs-loadbal
4 1)      vs-loadbal (10.102.29.20:80) - HTTP      Type: ADDRESS
5         State: OUT OF SERVICE
6         Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)
7         Time since last state change: 2 days, 00:58:03.260
8         Effective State: DOWN
9         Client Idle Timeout: 180 sec
10        Down state flush: ENABLED
11        Disable Primary Vserver On Down : DISABLED
12        Port Rewrite : DISABLED
13        No. of Bound Services : 0 (Total)          0 (Active)
14        Configured Method: LEASTCONNECTION
15        Mode: IP
16        Persistence: NONE
17        Vserver IP and Port insertion: OFF
18        Push: DISABLED Push VServer:
19        Push Multi Clients: NO
20        Push Label Rule: none
21
22 Done
23 <!--NeedCopy-->

```

### Globally bind a policy by using the CLI

At the command prompt, type the following commands to globally bind a policy and verify the configuration:

```

1 - bind filter global (<policyName> [-priority <positive_integer>]) [-
   state ( ENABLED | DISABLED )]
2 - show filter global
3 <!--NeedCopy-->

```

#### Example:

```

1 bind filter global cf-pol -priority 1
2 Done show filter global
3 1)      Policy Name: cf-pol      Priority: 1
4 Done
5 <!--NeedCopy-->

```

### Bind a policy to a virtual server by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.

2. In the details pane, select the virtual server to which you want to bind the content filtering policy from the list, and click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab, and then select the check box in the Active column of the filter policy that you want to bind to the virtual server.
4. Click OK. The policies you have bound display a check mark and the word Yes in the Policies Bound column of the Policies tab.

### **Globally bind a policy by using the GUI**

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, in the Policies tab, select the policy that you want to bind, and then click Global Bindings.
3. In the Bind/Unbind Filter Policies dialog box, in the Policy Name drop-down list, select a policy, and then click Add. The policy is added to the Configured list.  
Note: To select multiple policies from the list, press and hold the Ctrl key, then click each policy you want.
4. Click OK, and then click Close. The policies you have bound display a check mark and the word Yes in the Globally Bound column of the Policies tab.

## **Configuring content filtering for a commonly used deployment scenario**

September 21, 2020

This example provides instructions for using the configuration utility to implement a content filtering policy in which, if a requested URL contains root.exe or cmd.exe, the content filtering policy filter-CF-nimda is evaluated and the connection is reset.

To configure this content filtering policy, you must do the following:

- Enable content filtering
- Configure content filtering policy
- Bind content filtering policy globally or to a virtual server
- Verify the configuration

Note: Since this example uses a default content filtering action, you do not need to create a separate content filtering action.

### **Enable content filtering**

1. In the navigation pane, expand System, and click Settings.

2. In the details pane, under Modes & Features, click Change Basic Features.
3. In the Configure Basic Features dialog box, select the Content Filtering check box, and then click OK.
4. In the Enable/Disable feature(s) dialog box, click Yes. A message appears in the status bar, stating that the selected feature is enabled.

### **Configure the content filtering policy filter-CF-nimda**

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, click Add. The Create Filter Policy dialog box appears.
3. In the Create Filter Policy dialog box, in the Filter Name text box, type the name filter-CF-nimda.
4. Select the Request Action option, and in the drop-down list, select RESET.
5. In the Expression frame, select Match Any Expression from the drop-down list, and then click Add.
6. In the Add Expression dialog box, Expression Type drop-down list, select General.
7. In the Flow Type drop-down list, select REQ.
8. In the Protocol drop-down list, select HTTP.
9. In the Qualifier drop-down list, select URL.
10. In the Operator drop-down list, select CONTAINS.
11. In the Value text box, type cmd.exe, and then click OK. The expression is added in the Expression text box.
12. To create another expression, repeat Steps 7 through 11, but in the Value text box, type root.exe. Then click OK, and finally click Close.
13. Click Create on the Create Filter Policy dialog box. The filter policy filter-CF-nimda appears in the Filter list.
14. Click Close.

### **Globally bind the content filtering policy**

1. Navigate to Security > Protection Features > Filter. The Filter page appears in the right pane.
2. In the details pane, Policies tab, select the policy that you want to bind and click Global Bindings. The Bind/Unbind Filter Policies dialog box appears.
3. In the Bind/Unbind Filter Policies dialog box, in the Policy Name drop-down list, select the policy filter-CF-nimda, and click Add. The policy is added to the Configured list.
4. Click OK, and then click Close. The policy you have bound displays a check mark and Yes in the Globally Bound column of the Policies tab.

### **Bind the content filtering policy to a virtual server**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.

2. In the details pane virtual servers list, select vserver-CF-1 to which you want to bind the content filtering policy and click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab.
4. In the Active column, select the check box for the policy filter-CF-nimda, and then click OK. Your content filtering policy is now active, and should be filtering requests. If it is functioning correctly, the Hits counter is incremented every time there is a request for a URL containing either root.exe or cmd.exe. This allows you to confirm that your content filtering policy is working. The content filtering policy is bound to the virtual server.

### Verify the content filtering configuration by using the command line interface

At the command prompt, type the following command to verify the content filtering configuration:

```
show filter policy filter-CF-nimda
```

#### Example:

```
1 sh filter policy filter-CF-nimda
2     Name: filter-CF-nimda   Rule: REQ.HTTP.URL CONTAINS cmd.exe ||
   REQ.HTTP.URL CONTAINS root.exe
3     Request action: RESET
4     Response action:
5     Hits: 0
6 Done
7 <!--NeedCopy-->
```

#### Note: The

Hits counter displays an integer that denotes the number of times the filter-CF-nimda policy is evaluated. In the preceding steps, the Hits counter is set to zero because no requests for a URL containing either cmd.exe or root.exe have been made yet. If you want to see the counter increment in real time, you can simply request a URL that contains either of these strings.

### Verify the content filtering configuration by using the GUI

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, select the filter policy filter-CF-nimda. The bottom of the pane should display the following:

```
1     **Request Action:**
2
3     RESET
4
5     **Rule:**
```

```
6
7     REQ.HTTP.URL CONTAINS cmd.exe || REQ.HTTP.URL CONTAINS root.exe
8
9     **Hits:**
10
11     0
12 <!--NeedCopy-->
```

## Troubleshooting

September 21, 2020

If the content filtering feature does not work as expected after you have configured it, you can use some common tools to access Citrix ADC resources and diagnose the problem.

### Resources for troubleshooting

You can use the following tools and resources to troubleshoot most Content Filtering issues on a Citrix ADC appliance:

- The Wireshark application customized for the Citrix ADC trace files
- Trace files recorded when accessing the resource
- The configuration files
- The ns.log file
- The iehhttpheaders, or a Fiddler trace or a similar utility

### Troubleshooting content filtering issues

To troubleshoot a content filtering issue, proceed as follows:

- Verify that the feature is enabled.
- Verify that the content filtering policy is configured correctly. Pay special attention to the expression that evaluates the incoming requests.  
**Note:** Most content filtering issues are caused by incorrect configuration, and the error is most often in the policy configuration.
- Check the policy's Hits counter to verify that it is incrementing. If it is not, the policy is not getting evaluated.
- If the policy is getting evaluated and the required filtering is still not performed, you need to look into the policy expressions and action.

- If the policy's expression seems valid, test it by assigning a simple NSTRUE value to see if the evaluation of the expression is creating any issue.
- Reevaluate whether the filtering should be based on the request or the response.
- Verify that the action is configured correctly. For example, if a custom action is used to corrupt a header in the request, verify that the header name in the action is correct. If you are not sure about the header name, start a browser with `iehttpheaders` or a similar utility, and then verify the headers in the request. When this feature is used, you can use `nstrace` to find out if appropriate action is performed when the packets leave Citrix ADC appliance.
- An `iehttpheaders` or Fiddler trace can help you find header options and names, client-side request headers, and response headers recorded on the client.
- To check the modifications made to the request header, record an `nstrace` on the Citrix ADC appliance or a Wireshark trace on the server.
- If none of the above measures resolves the issue, verify that the connection has not become untrackable, which can happen in certain circumstances. If a connection becomes untrackable, the appliance does not perform any application-level processing of the requests. In that event, contact Citrix Technical Support.

## HTTP denial-of-service protection

September 21, 2020

### Warning

HTTP Denial of Service Protection (HDoSP) is deprecated from Citrix ADC 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use AppQoE. For more information, see [AppQoE](#).

Internet hackers can bring down a site by sending a surge of GET requests or other HTTP-level requests. HTTP Denial-of-Service (HTTP Dos) Protection provides an effective way to prevent such attacks from being relayed to your protected Web servers. The HTTP DoS feature also ensures that a Citrix ADC appliance located between the internet cloud and your Web servers is not brought down by an HTTP DoS attack.

Most attackers on the Internet use applications that discard responses to reduce computation costs, and minimize their size to avoid detection. The attackers focus on speed, devising ways to send attack packets, establish connections or send HTTP requests as rapidly as possible.

Real HTTP clients such as Internet Explorer, Firefox, or NetScape browsers can understand HTML Refresh meta tags, Java scripts, and cookies. In standard HTTP the clients have most of these features enabled. However, the dummy clients used in DoS attacks cannot parse the response from the server. If malicious clients attempt to parse and send requests intelligently, it becomes difficult for them to

launch the attack aggressively.

When the Citrix ADC appliance detects an attack, it responds to a percentage of incoming requests with a Java or HTML script containing a simple refresh and cookie. (You configure that percentage by setting the Client Detect Rate parameter.) Real Web browsers and other Web-based client programs can parse this response and then resend a POST request with the cookie. DoS clients drop the Citrix ADC appliance's response instead of parsing it, and their requests are therefore dropped as well.

Even when a legitimate client responds correctly to the Citrix ADC appliance's refresh response, the cookie in the client's POST request may become invalid in the following conditions:

- If the original request was made before the Citrix ADC appliance detected the DoS attack, but the resent request was made after the appliance had come under attack.
- When the client's think time exceeds four minutes, after which the cookie becomes invalid.

Both of these scenarios are rare, but not impossible. In addition, the HTTP DoS protection feature has the following limitations:

- Under an attack, all POST requests are dropped, and an error page with a cookie is sent.
- Under an attack, all embedded objects without a cookie are dropped, and an error page with a cookie is sent.

The HTTP DoS protection feature may affect other Citrix ADC features. Using DoS protection for a particular content switching policy, however, creates additional overhead because the policy engine must find the policy to be matched. There is some overhead for SSL requests due to SSL decryption of the encrypted data. Because most attacks are not on a secure network, though, the attack is less aggressive.

If you have implemented priority queuing, while it is under attack a Citrix ADC appliance places requests without proper cookies in a low-priority queue. Although this creates overhead, it protects your Web servers from false clients. HTTP DoS protection typically has minimal effect on throughput, since the test JavaScript is sent for a small percentage of requests only. The latency of requests is increased, because the client must re-issue the request after it receives the JavaScript. These requests are also queued

To implement HTTP DoS protection, you enable the feature and define a policy for applying this feature. Then you configure your services with the settings required for HTTP DoS. You also bind a TCP monitor to each service and bind your policy to each service to put it into effect.

## **Layer 3-4 SYN Denial-of-Service protection**

September 21, 2020

Any Citrix ADC appliance with system software version 8.1 or later automatically provides protection against SYN DoS attacks.

To mount such an attack, a hacker initiates a large number of TCP connections but does not respond to the SYN-ACK messages sent by the victimized server. The source IP addresses in the SYN messages received by the server are typically spoofed. Because new SYN messages arrive before the half-open connections initiated by previous SYN messages time out, the number of such connections increases until the server no longer has enough memory available to accept new connections. In extreme cases, the system memory stack can overflow.

A Citrix ADC appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted.

SYN DoS protection on the Citrix ADC appliance ensures the following:

- The memory of the Citrix ADC is not wasted on false SYN packets. Instead, memory is used to serve legitimate clients.
- Normal TCP communications with legitimate clients continue uninterrupted, even when the Web site is under SYN flood attack.

In addition, because the Citrix ADC appliance allocates memory for HTTP connection state only after it receives an HTTP request, it protects Web sites from idle connection attacks.

SYN DoS protection on your Citrix ADC appliance requires no external configuration. It is enabled by default.

## Disable SYN Cookies

SYN cookies are enabled by default on a Citrix ADC appliance to prevent SYN attacks. If your deployment requires you to disable SYN cookies, for example, for server-initiated data connections or in cases where a connection is not established because the first packet is dropped or reordered, use one of the following methods to disable SYN cookies.

### Disable SYN cookies by using the CLI

At the command prompt, type:

```
1 set nstcpprofile nstcp_default_profile -synCookie DISABLED
2
3 **Arguments**
```

```
4
5 synCookie
6
7 Enable or disable the SYNCOOKIE mechanism for TCP handshake with
  clients. Disabling SYNCOOKIE prevents SYN attack protection on the
  Citrix ADC appliance.
8
9           Possible values: ENABLED, DISABLED
10
11          Default: ENABLED
12 <!--NeedCopy-->
```

### Disable SYN cookies by using the GUI

1. Navigate to **System > Profiles > TCP Profiles**.
2. Select a profile and click **Edit**.
3. Clear the **TCP SYN Cookie** check box.
4. Click **OK**.

### Enable HTTP DoS protection

September 21, 2020

To configure HTTP DoS protection, you must first enable the feature.

### Enable HTTP DoS protection by using the CLI

At the command prompt, type the following commands to enable HTTP DoS protection and verify the configuration:

```
1 - enable ns feature HttpDoSProtection
2 - show ns feature
3 <!--NeedCopy-->
```

### Example:

```
1 > enable ns feature HttpDoSProtection
2 Done
3 > show ns feature
4
5           Feature                               Acronym           Status
```

|    |                 |                              |               |       |
|----|-----------------|------------------------------|---------------|-------|
| 6  |                 | -----                        | -----         | ----- |
| 7  | 1)              | Web Logging                  | WL            | ON    |
| 8  | 2)              | Surge Protection             | SP            | OFF   |
| 9  | .               |                              |               |       |
| 10 | .               |                              |               |       |
| 11 | .               |                              |               |       |
| 12 | 10)             | Global Server Load Balancing | GSLB          | ON    |
| 13 | 11)             | Http DoS Protection          | HDOSP         | ON    |
| 14 | 12)             | Content Filtering            | CF            | ON    |
| 15 | .               |                              |               |       |
| 16 | .               |                              |               |       |
| 17 | 23)             | HTML Injection               | HTMLInjection | ON    |
| 18 | 24)             | Citrix ADC Push              | push          | OFF   |
| 19 | Done            |                              |               |       |
| 20 | <!--NeedCopy--> |                              |               |       |

## Enable HTTP DoS protection by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the HTTP DoS Protection check box.
4. Click OK.

## Define an HTTP DoS policy

September 21, 2020

After you enable HTTP DoS protection, you next create a policy.

**Note:** Before changing the default setting for Client Detect Rate, see [Tuning the Client Detection/JavaScript Challenge Response Rate](#).

## Configure a HTTP DoS policy by using the CLI

At the command prompt, type one of the following commands to configure an HTTP DoS policy and verify the configuration:

```

1 - add dos policy <name> -qDepth <positive_integer> [-cltDetectRate <
    positive_integer>]
2 - set dos policy <name> -qDepth <positive_integer> [-cltDetectRate <
    positive_integer>]
```

```
3 <!--NeedCopy-->
```

**Example:**

```
1 > add dos policy pol-HTTP-DoS -qDepth 30
2 Done
3 > set dos policy pol-HTTP-DoS -qDepth 40
4 Done
5 > show dos policy
6 1) Policy: pol-HTTP-DoS QDepth: 40
7 Done
8 <!--NeedCopy-->
```

**Configure an HTTP DoS policy by using the GUI**

1. Navigate to Security > Protection Features > HTTP DoS.
2. In the details pane, do one of the following:
  - To create a new policy, click Add.
  - To modify an existing policy, select the policy, and then click Open.
3. In the Create HTTP DoS Policy or Configure HTTP DoS Policy dialog box, specify values for the parameters:
  - Name\*—name (You cannot change the name of an existing policy.)
  - QDepth\*—qdepth
  - Client Detect Rate—cltDetectRate (Before changing the default setting for cltDetectRate, see [Tuning the Client Detection/JavaScript Challenge Response Rate](#))
4. Click OK to create your new policy. The policy that you created appears in the details pane, and the status bar displays a message indicating that the DoS policy is successfully configured.

**Configuring an HTTP DoS service**

September 21, 2020

After you configure an HTTP DoS policy, you must configure a service for your policy. The service accepts HTTP traffic that is protected by the HTTP DoS policy.

**Configure an HTTP DoS service by using the CLI**

At the command prompt, type one of the following commands to configure an HTTP DoS service and verify the configuration:

```
1 - add service <name>@ (<IP>@ | <serverName>@) HTTP <port> [-maxClient
   <positive_integer>] [-maxReq <positive_integer>] -state ENABLED
2 - set service <name>@ (<IP>@ | <serverName>@) HTTP <port> [-maxClient
   <positive_integer>] [-maxReq <positive_integer>] -state ENABLED
3 <!--NeedCopy-->
```

**Example:**

```
1 > add service ser-HTTP-Dos1 10.102.29.40 HTTP 87
2 Done
3 > set service ser-HTTP-Dos1 -maxReq 20
4 Done
5 > show service
6 1)      srv-http-10 (10.102.29.30:80) - HTTP
7         State: DOWN
8         Last state change was at Wed Jul  8 07:49:52 2009
9         Time since last state change: 34 days, 00:48:18.700
10        Server Name: 10.102.29.30
11        Server ID : 0   Monitor Threshold : 0
12        Max Conn: 0    Max Req: 0        Max Bandwidth: 0 kbits
13        Use Source IP: NO
14        Client Keepalive(CKA): NO
15        Access Down Service: NO
16        TCP Buffering(TCPB): NO
17        HTTP Compression(CMP): NO
18        Idle timeout: Client: 180 sec   Server: 360 sec
19        Client IP: DISABLED
20        Cacheable: NO
21        SC: OFF
22        SP: OFF
23        Down state flush: ENABLED
24        .
25        .
26        .
27
28 5)      ser-HTTP-Dos1 (10.102.29.40:87) - HTTP
29        State: DOWN
30        Last state change was at Tue Aug 11 08:23:40 2009
31        Time since last state change: 0 days, 00:14:30.300
32        Server Name: 10.102.29.40
33        Server ID : 0   Monitor Threshold : 0
34        Max Conn: 0    Max Req: 20      Max Bandwidth: 0 kbits
35        Use Source IP: NO
36        Client Keepalive(CKA): NO
```

```
37      Access Down Service: NO
38      TCP Buffering(TCPB): NO
39      HTTP Compression(CMP): YES
40      Idle timeout: Client: 180 sec   Server: 360 sec
41      Client IP: DISABLED
42      Cacheable: NO
43      SC: OFF
44      SP: OFF
45      Down state flush: ENABLED
46      Done
47      <!--NeedCopy-->
```

### Configure an HTTP DoS service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, do one of the following:
  - To create a new service, click Add.
  - To modify an existing service, select the service, and then click Open.
3. In the Create Server or Configure Server dialog box, specify values for the following parameters, which correspond to the descriptions in “Parameters for configuring an HTTP DoS service” as follows (asterisk indicates a required parameter):
  - Service Name\*—name (You cannot change the name of an existing service.)
  - Server\*—IP or serverName (Specify one or the other, not both.)
  - Port\*—port
4. If the Enable Service check box is not selected, select it.
5. Select the Advanced tab, and select the Override Global check box to enable those choices.
6. Specify values for the following parameters.
  - Max Clients\*—maxClient
  - Max Requests\*—maxReq
7. Click Create or OK, and then click Close. The service appears in the list of services.

### Bind an HTTP DoS monitor and policy

September 21, 2020

To put HTTP DoS protection into effect after you have configured an HTTP DoS service, you must bind the monitor, and then bind the service to the HTTP DoS policy.

## Bind the monitor to the service by using the CLI

At the command prompt, type the following commands to bind the monitor to the service and verify the configuration:

```
1 - bind lb monitor <monitorName> <serviceName>
2 - show lb monitor
3 <!--NeedCopy-->
```

### Example:

```
1 > bind lb monitor tcp ser-HTTP-DoS
2 Done
3 > show lb monitor
4 1) Name.....: ping-default Type.....: PING State....
   ENABLED
5 2) Name.....: tcp-default Type.....: TCP State....
   ENABLED
6 3) Name.....: ping Type.....: PING State....
   ENABLED
7 4) Name.....: tcp Type.....: TCP State....
   ENABLED
8 5) Name.....: http Type.....: HTTP State....
   ENABLED
9 .
10 .
11 .
12 17) Name.....: ldns-dns Type.....: LDNS-DNS State....
   ENABLED
13 Done
14 <!--NeedCopy-->
```

## Bind the policy to the service by using the CLI

At the command prompt, type the following commands to bind the policy to the service and verify the configuration:

```
bind service <serviceName> -policyName <policyname>
```

### Example:

```
1 > bind service ser-HTTP-DoS -policyName pol-HTTP-DoS
2 Done
3 > show service
4 1) srv-http-10 (10.102.29.30:80) - HTTP
```

```
5      State: DOWN
6      Last state change was at Wed Jul  8 07:49:52 2009
7      Time since last state change: 34 days, 01:24:58.510
8      Server Name: 10.102.29.30
9      Server ID : 0   Monitor Threshold : 0
10     Max Conn: 0     Max Req: 0     Max Bandwidth: 0 kbits
11     Use Source IP: NO
12     Client Keepalive(CKA): NO
13     Access Down Service: NO
14     TCP Buffering(TCPB): NO
15     HTTP Compression(CMP): NO
16     Idle timeout: Client: 180 sec   Server: 360 sec
17     Client IP: DISABLED
18     Cacheable: NO
19     SC: OFF
20     SP: ON
21     Down state flush: ENABLED
22     .
23     .
24     .
25 4)   ser-HTTP-Dos (10.102.29.18:88) - HTTP
26     State: DOWN
27     Last state change was at Tue Aug 11 08:19:45 2009
28     Time since last state change: 0 days, 00:55:05.40
29     Server Name: 10.102.29.18
30     Server ID : 0   Monitor Threshold : 0

## Bind the monitor and policy to the service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service that you want to bind, and then click Open.
3. In the Configure Service dialog box, select the Monitor tab, click the name of the monitor you want in the Monitors list, and then click Add. The selected monitor is added to the Configured frame.
4. Select the Policies tab, then select the HTTP DoS tab.
5. Select a policy from the Available Policies list, and then click Add. The policy appears in the Configured Policies list.
6. Click OK, and then click Close. A message appears in the status bar, stating that the service has been configured.

## Tuning the client detection/JavaScript challenger response rate

September 21, 2020

After you have enabled and configured HTTP DoS protection, if more than the maximum specified number of clients are waiting in the Citrix ADC surge queue for the HTTP DoS service, the HTTP DoS protection function is triggered. The default rate of challenged JavaScript responses sent to the client is one percent of the server response rate. The default response rate is inadequate in many real attack scenarios, however, and may need to be tuned.

For example, assume that the Web server is capable of a maximum of 500 responses/sec, but is receiving 10,000 Gets/sec. If 1% of the server responses are sent as JavaScript challenges, responses are reduced to almost none: 5 client (500 \* 0.01) JavaScript responses, for 10000 waiting client requests.

Only about 0.05% of the real clients receive JavaScript challenge responses. However, if the client detection/JavaScript challenge response rate is very high (for example, 10%, generating 1000 challenge JavaScript responses per second), it may saturate the upstream links or harm the upstream network devices. Exercise care when modifying the default **Client Detect Rate** value.

If the configured triggering surge queue depth is, for example, 200, and the surge queue size is toggling between 199 and 200, the Citrix ADC toggles between the “attack” and “no-attack” modes, which is not desirable. The HTTP DoS feature includes a window mechanism with a default size of 20. After the surge queue size reaches the specified queue depth value, triggering “attack” mode, the surge queue size must fall to 20 less than the specified queue depth for the Citrix ADC appliance to enter “no-attack” mode. In the example, the surge queue size must fall below 180 before the appliance enters “no-attack” mode. During configuration, you must specify a value more than 20 for the **QDepth** parameter when adding a DoS policy or setting a DoS policy.

The triggering surge queue depth should be configured on the basis of previous observations of traffic characteristics. For more information about setting up a correct configuration, see [Guidelines for HTTP DoS protection deployment](#).

## Guidelines for HTTP DoS protection deployment

September 21, 2020

Citrix recommends you to deploy the HTTP DoS protection feature in a tested and planned manner and closely monitor its performance after the initial deployment. Use the following information to fine-tune the deployment of HTTP DoS Protection.

- The maximum number of concurrent connections supported by your servers.
- The average and normal values of the concurrent connections supported by your servers.
- The maximum output rate (responses/sec) that your server can generate.
- The average traffic that your server handles.
- The typical bandwidth of your network.
- The maximum bandwidth available upstream.
- The limits affecting bandwidth (such as external links, a particular router, or other critical devices on the path that may suffer from a traffic surge).
- Whether allowing a greater number of clients to connect is more important than protecting upstream network devices.

To determine the characteristics of a HTTP DoS attack, you should consider the following issues.

- What is the rate of incoming fake requests that you have experienced in the past?
- What types of requests have you received (complete posts, incomplete gets)?
- Did previous attacks saturate your downstream links? If not, what was the bandwidth?

- What types of source IP addresses and source ports did the HTTP requests have (e.g., IP addresses from one subnet, constant IP, ports increasing by one).
- What types of attacks do you expect in future? What type have you seen in the past?
- Any or all information that can help you tune DoS attack protection.

## Priority queuing

March 16, 2021

### Warning

Priority Queuing (PQ) is deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use AppQoE. For more information, see [AppQoE](#).

The priority queuing feature lets you filter incoming HTTP traffic on the basis of categories that you create and define, and prioritize those HTTP requests accordingly. Priority queuing directs high-priority requests to the server ahead of low-priority requests, so that users who need resources for important business uses receive expedited access to your protected Web servers.

### Note:

This feature is available with a Citrix ADC Advanced or Premium edition license.

To implement priority queuing, you create priority queuing policies that specify a priority, weight, threshold, and implicit action. When an incoming request matches a priority queuing policy, the request is processed as the associated action indicates. For example, you can create a priority queuing policy that places all matching requests above a certain threshold in a surge queue, while giving priority treatment to other requests.

You can bind up to three priority queuing policies to a single load balancing virtual server. The priority levels are:

- **Level 1:** A Level 1 policy processes priority requests.
- **Level 2:** A Level 2 policy processes requests that should receive responses as soon as Level 1 requests have been cleared from the queue.
- **Level 3:** A Level 3 policy processes non-priority requests that receive responses only after requests in the first two queues have been cleared.

You can use weighted queuing to adjust the relative priority of each of these queues. Weights can range from 0 to 101. A weight of 101 tells the Citrix ADC appliance to clear all requests in that queue before forwarding any requests in the lower-priority queues to the Web server. A weight of 0 tells the appliance to send requests in that queue to the Web server only when there are no requests waiting in any of the other queues.

You must assign a unique name to each priority queuing policy. Policy names can be up to 127 characters. Multiple policies bound to the same load balancing virtual server cannot have the same priority level. No two virtual servers that have one or more common underlying physical services can have priority queuing configured or enabled on both virtual servers simultaneously.

To configure priority queuing the Citrix ADC, you perform the following steps:

- Enable the load balancing feature
- Define a server and service
- Define a load balancing virtual server
- Bind the service to the load balancing virtual server
- Enable the priority queuing feature
- Create the priority queuing policies
- Bind the priority queuing policies to the load balancing virtual server
- Enable priority queuing on load balancing virtual server

## Enable priority queuing

September 21, 2020

To use the priority queuing feature the Citrix ADC appliance, you must first enable it.

### Enable priority queuing by using the CLI

At the command prompt, type the following commands to enable priority queuing and verify the configuration:

```
1 - enable ns feature PriorityQueuing
2 - show ns feature
3 <!--NeedCopy-->
```

#### Example:

```
1 > enable ns feature PriorityQueuing
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 -----
7 1) Web Logging WL ON
8 2) Surge Protection SP OFF
9 3) Load Balancing LB ON
```

```

10  .
11  .
12  .
13  8)    Priority Queuing          PQ          ON
14  .
15  23)   HTML Injection           HTMLInjection  ON
16  24)   Citrix ADC Push          push          OFF
17  Done
18  <!--NeedCopy-->

```

### Enable priority queuing by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Configure advanced features.
3. In the Configure Advanced Features dialog box, select the Priority Queuing check box.
4. Click OK.

### Configure a priority queuing policy

September 21, 2020

To configure a priority queuing policy, you can use either the configuration utility or the command line.

Note: For more information about using the command line, see “[Command Reference](#).”

### Configure a priority queuing policy by using the CLI

At the command prompt, type the following command to configure a priority queuing policy and verify the configuration:

```

add pq policy <policyName> -rule <expression> -priority <positive_integer>
> [-weight <positive_integer>] [-qDepth <positive_integer> | -polqDepth <
positive_integer>]

```

#### Example:

```

1 > add pq policy pol_cgibin -rule "URL == '/cgi-bin/'" -priority 1
2 Done
3 > show pq policy pol_cgibin

```

```
4 1)      Policy: pol_cgibin      Rule: URL == '/cgi-bin/'
      Priority: 1      Weight: 10
5      Hits: 0
6 Done
7 <!--NeedCopy-->
```

## Configure a priority queuing policy by using the GUI

1. Navigate to Security > Protection Features > Priority Queuing.
2. In the details pane, do one of the following:
  - To create a new policy, click Add.
  - To modify an existing policy, select the policy, and then click Open.
3. If you are creating a new policy, in the Create PQ Policy dialog box, in the Name text box, type a name for your new policy.

The name can consist of from one to 127 letters, numbers and the hyphen and underscore symbol.

If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the Rule text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
  - a) In the Create Expression dialog box, click Add.
  - b) In the Add Expression dialog box, leave Expression Type set to General, and in the Flow Type drop-down list, select a Flow Type. Your choices are REQ (for requests) and RES (for responses).
  - c) In the Protocol drop-down list, select a protocol. If you selected REQ in the previous step, your choices are HTTP (Web-based connections), SSL (secure Web connections), TCP and IP. If you selected RES in the previous step, your choices are HTTP, TCP and IP.
  - d) In the Qualifier drop-down list, select a qualifier.

Your choices depend upon your selections in the previous step. Common choices are HTTP VERSION (the version of the HTTP connection), HTTP HEADER (the specified HTTP header), TCP SOURCEPORT/ DESTPORT (the source or destination port of a TCP connection), and IP SOURCEIP/DESTIP (the source or destination IP of the connection).

If you choose HTTP HEADER, the Header text box appears beneath the original row of text boxes. You fill in the name of the HTTP header you want.

For a complete description of the available choices, see “[Policies and Expressions](#).”

- e) In the Operator drop-down list, select an operator.  
For a complete description of the available choices, see “[Policies and Expressions.](#)”
  - f) In the Value text box, type the value you want to test for.  
This may be a text string or a number, depending upon the context. For a complete description of values appropriate to the specific context, see “[Policies and Expressions.](#)”
  - g) Click OK. The expression is added in the Expression text box.
  - h) Click Create. The expression appears in the Rule text box.
5. In the Priority and Weight text boxes, type numeric values, for example, 1 and 30. For more information about Priority and Weight, see “[Set up weighted queuing.](#)”
  6. Enter a numeric value for either Queue Depth or Policy Queue Depth, for example 234, and click Create.
    - Queue Depth Defines the total number of waiting clients or requests on the virtual server to which the policy is bound.
    - Policy Queue Depth Defines the total number of waiting clients or requests belonging to the policy.

The policy is created and appears in the Priority Queuing page.

**Note:** To create additional priority queuing policies, repeat the procedure in the preceding section, and click Close after you finish.

## Bind a priority queuing policy

September 21, 2020

After you create a priority queuing policy, you must bind it to the appropriate virtual server to put it into effect.

### Bind a priority queuing policy by using the CLI

At the command prompt, type the following commands to bind a policy and verify the configuration:

```
1 - bind lb vsrver <name> -policyName <policyname>
2 - show lb vsrver <name>
3 <!--NeedCopy-->
```

#### Example:

```
1 > bind lb vserver lbvip -policyname pol_cgibin
2 Done
3 > show lb vserver lbvip
4     lbvip (8.7.6.6:80) - HTTP          Type: ADDRESS
5     State: DOWN
6     Last state change was at Wed Jul 15 05:54:24 2009 (+782 ms)
7     Time since last state change: 26 days, 05:44:37.370
8     Effective State: DOWN
9     Client Idle Timeout: 180 sec
10    Down state flush: ENABLED
11    Disable Primary Vserver On Down : DISABLED
12    Port Rewrite : DISABLED
13    No. of Bound Services : 0 (Total)      0 (Active)
14    Configured Method: LEASTCONNECTION
15    Mode: IP
16    Persistence: NONE
17    Vserver IP and Port insertion: OFF
18    Push: DISABLED Push VServer:
19    Push Multi Clients: NO
20    Push Label Rule: none
21
22 1) Policy : ns_cmp_msapp Priority:0
23
24 1) Priority Queuing Policy : pol_cgibin
25 Done
26 <!--NeedCopy-->
```

## Bind a priority queuing policy by using the GUI

1. In the navigation pane, locate and select the virtual server to which you want to bind the priority queuing policy.
  - To select a load balancing virtual server, expand Traffic Management > Load Balancing > Virtual Servers, then select the load balancing virtual server that you want..
  - To select a content switching virtual server, expand Traffic Management > Content Switching > Virtual Servers, then select the content switching virtual server that you want..
2. In the Configure Virtual Server dialog box, select the Policies tab.
3. Click the double right-arrow (») symbol to display the complete list of policy types, and then select Priority Queuing from the drop-down list.
4. Click Insert Policy.
5. In the Policy Name row, select the policy that you want to bind from the drop-down list.
6. Click OK to save your changes.

## Set up weighted queuing

September 21, 2020

When priority queuing is implemented, lower-priority requests are typically kept on hold while higher-priority requests are served. The lower-priority requests may therefore be delayed if there is a constant flow of higher-priority requests.

To prevent delays for low-priority requests across multiple priority levels, you can configure weighted queuing for serving requests. The default weights for the priorities are:

- Gold - Priority 1 - Weight 3
- Silver - Priority 2 - Weight 2
- Bronze - Priority 3 - Weight 1

You assign the minimum weight, zero (0), to requests that the Citrix ADC appliance should send to the server only if no requests are stored in any of the other queues. You assign the maximum weight, 101, to requests that the appliance should send to the server immediately, ahead of any requests stored in any of the other queues. Weights between these two set the relative priority of a particular queue in relation to the other queues. Queues with a higher weight are processed first; queues with a lower weight after the others have been processed. To assign the weights, see “[Configure a priority queuing policy](#).”

**Note:** The weight assigned to a higher-priority queue must be larger than the weight assigned to a lower-priority queue. For example, the weight assigned to The Gold (Priority 1) queue must be greater than the weight assigned to the Silver (Priority 2) queue.

## SureConnect

March 30, 2021

### Warning

SureConnect (SC) is deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the AppQoE feature. For more information, see [AppQoE](#).

You can use the SureConnect feature of the Citrix ADC appliance to service all incoming connections with either the requested content or a custom Web page that displays information about a delay in the request being serviced.

When servers are overloaded with the requests, the servers might either respond slowly or not at all. The SureConnect feature enables the Citrix ADC appliance to detect and compensate such conditions

by ensuring that every client request gets serviced in some way, such as either a custom Web page or actual content is sent to the client.

SureConnect is activated when the response time or maximum server connections to a client request exceeds a limit that you have set. The SureConnect browser window displays one of the following:

- A progress bar with the amount of time remaining until the requested content will be available.
- Alternate Web content of your choice (alternate page).
- Both a progress bar and alternate page.
- Complete custom content of your choice.

You can configure whether the SureConnect progress bar alone is displayed or both the progress bar and the alternate page are displayed.

When the server becomes responsive again, the original request for content is served. If the user chooses, the alternate content window can remain in focus.

Subsequent requests from the same user within the same session are served immediately. This can be configured using the settings described later in this section.

SureConnect can be activated when a response is delayed, and when the number of user connections to a given URL exceeds a specified threshold.

SureConnect works with all standard browsers, including Microsoft Internet Explorer, Netscape Navigator, and Mozilla Firefox.

SureConnect is advantageous in the following situations:

- **Full server queue:** The server can respond fast, but there are too many users. This results in the server's queue being full and unable to process additional client requests.

**SureConnect Solution:** In this situation, the SureConnect window is displayed, showing the time left until the content will be available. The alternate page is displayed under the progress bar, if an alternate page has been configured.

- **Large response delay:** The server response is slow. Typically, if a Web server does not respond to a client request quickly, the user will leave the site.

**SureConnect Solution:** When the predicted delay reaches a configured time threshold, the SureConnect window displays the progress bar and the optional alternate page in the client browser.

- **Client time-out:** When the client requests content from a very slow Web site, a time-out message displays in the client browser, and the content is not delivered. The user may leave the site.

**SureConnect Solution:** The appliance stores the request until the server is no longer busy and delivers the requested content to the client.

- **Server experiencing a traffic surge:** The server typically responds quickly, but the current load of open connections is greater than the server capacity to serve them. Therefore, the server response is delayed.

**SureConnect Solution:** A SureConnect window is displayed in the client browser, showing the time left. The alternate page from the server is also displayed if it has been configured.

## Installing SureConnect

September 21, 2020

SureConnect files must be installed on the alternate content server, which can be the same as the primary server.

On a Windows server, extract the sc\_xx.exe file (where xx is the build number), or on a UNIX server, extract the sc\_xx.tar file (where xx is the build number).

**Note:** You must install SureConnect in the default Web root directory.

If the alternate content server is the same as the primary server, place the SureConnect and alternate content files in any directory under the Web root directory. Specify this path when you add a policy to configure SureConnect. By default, SureConnect files are installed in the /NetScaler appliance directory under the default Web root directory.

If the alternate content server is different than the primary server, the SureConnect and alternate content files must be in a unique directory under the Web root directory. By default, this unique directory is the /NetScaler system directory. Specify this path when you add a policy to configure SureConnect.

The following files are extracted:

- Alternate content files (progressbar.htm, alternatepage.htm, and barandpage.htm)
- System-Logo.png
- Customer-Logo.png
- Sample.png
- README.txt.

## Installing on UNIX

This section describes how to install SureConnect alternate content on a UNIX server. The following are the prerequisites:

- The UNIX server is running the Apache server.
- The shell with the # prompt is in use.
- Apache is installed in the default location.

- The sc\_xx.tar file is downloaded from the organization's Web site into the /var/ftp/incoming directory.

### To install SureConnect

1. At the command prompt, navigate to the htdocs directory:

```
cd /usr/local/apache/htdocs
```

2. Type the following command:

```
tar xvpf/var/ftp/incoming/sc_xx.tar
```

The output from the

.tar file is displayed. A

/NetScaler system directory is created under the specified path and the SureConnect files are installed.

### Installing on Windows

This section describes how to install SureConnect alternate content on a Windows server. The following are the prerequisites:

- The server is running the Microsoft Internet Information Server.
- The DOS prompt is being used.
- The SureConnect zip (self-extracting) file is downloaded from the organization Web site using FTP into the C:\inetpub\wwwroot directory.

### To install SureConnect on Windows

Do one of the following:

- At the command prompt, navigate to the wwwroot directory:

```
cd c:\inetpub\wwwroot
```

- Type the name of the executable file:

```
sc_xx.exe
```

- Double-click the sc\_xx.exe icon from the Microsoft Windows Explorer Web browser, extract from the compressed file into the default path (for example, the c:\inetpub\wwwroot directory).

Output from the

zip file is displayed. A

/NetScaler system directory is created under the specified path, and the SureConnect files are installed.

## Configure SureConnect

September 21, 2020

The following topics describe how to configure SureConnect for scenarios involving alternate server failure.

### Configure the response for alternate server failure

If the alternate server fails, and the primary server cannot immediately deliver the requested content to the client, SureConnect does not display alternate content from the failed alternate server in the client Web browser.

The Citrix ADC appliance automatically sends a response to the client browser. You can customize the server response to display information suited to your needs.

The default response is:

Your Request is being processed... Estimated Time: \_\_ Secs

### Customize the default response

The Citrix ADC appliance automatically sends the response to the client if the alternate server fails, or if the appliance is configured to send the default response.

To customize the default response of the appliance, create a vsr.htm file (a sample is provided in this section) as follows:

- The file can contain any valid HTML statements other than embedded objects.
- The file size cannot exceed 800 bytes.
- The file must reside on the Citrix ADC appliance. If you have a high availability (HA) setup, the file must reside on the primary and secondary nodes. Any changes made to the file on the primary node must also be applied to the file on the secondary node.
- Put vsr.htm file in the /etc directory.

### To customize the default response

Change any of the contents between the </HEAD> and </HTML> tags in the vsr.htm file. Following is the sample content from vsr.htm file. The sections that you can edit are in bold text.

```
1 HTTP/1.1 200 OK
2 Server: NS_WS3.0
3 Content-Type: text/html
4 Cache-control: no-cache
```

```

5 Pragma: no-cache
6 Set-Cookie: NSC_BP_IP=@@SID@@; path=/
7 <HTML> <HEAD> <META HTTP-EQUIV="Refresh" CONTENT="0">
8 </HEAD> <font color=blue size=5>Your request is being processed...
9 <br>Estimated Delay: @@DELAY@@ Sec </font> </HTML>
10 <!--NeedCopy-->

```

**Note:** Include @@DELAY@@ to display the predicted delayed response time in seconds.

### SureConnect with in-memory response (NS action)

When defining the SureConnect policy by using the `add sc policy` command, you can configure the Citrix ADC appliance to serve alternative content to the client.

To enable SureConnect and configure the in-memory response, perform the following tasks:

- Enable the SureConnect feature on the appliance by using the `enable feature SC` command
- Define the services by using the `add service <servicename> <IP address> <servicetype> <port>` command. This identifies the original server for which the SureConnect is configured and the types of services.
- Add a SureConnect policy by using the `add sc policy` command. You can configure a URL-based policy or a rule-based policy. The incoming requests are validated against the URL or rule you specify in the policy.

**Note:** You can configure the SureConnect feature on a load balancing virtual server. In that case, perform the following additional actions:

- Enable Load Balancing by using the `enable feature LB` command.
- Enable SureConnect feature on the virtual server by using the `set lb vserver <vservname> -sc ON` command.
- Bind services to the virtual server by using the `bind lb vserver <name> <serviceName>` command.
- Bind policies to the virtual server by using the `bind lb vserver <name> -policyname <name>` command.

The following example illustrates how to configure SureConnect for the load balancing feature so that SureConnect will display alternative content from the Citrix ADC appliance.

In this example, two physical servers, with IP addresses, 10.101.3.187 and 10.101.3.188 are load balanced by the Citrix ADC appliance. The appliance has one configured virtual server, vs-NSact, whose IP address is 10.101.3.201. The file that contains the alternative content is vsr.htm. It is copied from the file system into system memory. Services are loaded until the SureConnect policy triggers, and the appliance supplies the alternate content.

```
1 enable feature SC LB
```

```

2 add service psvc1 10.101.3.187 http 80
3 add service psvc2 10.101.3.188 http 80
4 add lb vserver vs-NSact HTTP 10.101.3.201 80
5 bind lb vserver vs-NSact psvc1
6 bind lb vserver vs-NSact psvc2
7 add sc policy policyNS -url /cgi-bin/*.cgi -delay 400000
8 -action NS
9 set sc parameter -vsr /nsconfig/ssl/vsr.htm
10 bind lb vserver vs-NSact -policyName policyNS
11 set lb vserver vs-NSact -sc ON
12 save config
13 <!--NeedCopy-->

```

Table 1. Parameter values used in this example

|                               |                            |
|-------------------------------|----------------------------|
| Service                       |                            |
| Name                          | psvc1, psvc2               |
| Server                        | 10.101.3.187, 10.101.3.188 |
| Protocol                      | HTTP                       |
| Port                          | 80                         |
| Load Balancing Virtual Server |                            |
| Name                          | vs-NSact                   |
| IP Address                    | 10.101.3.201               |
| Protocol                      | HTTP                       |
| Port                          | 80                         |
| SureConnect Policy            |                            |
| Name                          | policyNS                   |
| URL                           | /cgi-bin/*.cgi             |
| Delay(microseconds)           | 400000                     |
| SC Parameter                  |                            |
| VSR File Name                 | vsr.htm                    |

### To configure this example by using the GUI

1. In the In the navigation pane, navigate to System > Settings. In the Modes and Features pane, perform the following actions:
  - a) Click Configure Basic Features, select Load Balancing, and Click Go.
  - b) Click Configure Advanced Features, select SureConnect, and Click Go.
2. In the navigation pane, navigate to Security > Protection Features > SureConnect. In the details pane, click Parameters. In the Configure SureConnect Parameters window, browse and select the VSR filename.
3. Navigate to Traffic Management > Load Balancing > Services. In the details pane, click Add. In the **Create Services** window, enter the parameter values as shown in Table 5-1, and click **OK**.
4. Navigate to Traffic Management > Load Balancing > Virtual servers. In the details pane, click Add. In the Create Virtual Server (Load Balancing) dialog box, enter the values shown in Table 5.1 for the Load Balancing Virtual Server parameters and click OK.
5. In the navigation pane, navigate to Traffic Management > Load Balancing > Virtual servers. Select the virtual server vs-NSact and click Open in the details pane. The Configure Virtual system (Load Balancing) dialog box, displays the list of configured services. Select services psvc1 and psvc2 and click OK.
6. In the navigation pane, expand Security > Protection Features > SureConnect. In the details pane, click Add. Create the policy with the values as given in the parameters table.
7. In the navigation pane, navigate to Traffic Management > Load Balancing > Virtual servers. Select the virtual server vs-NSact and click Open in the details pane. In the Configure Virtual system (Load Balancing) dialog box, click the Policies tab. Click » to expand the features. Select **SureConnect**. When the list of SureConnect policies appear, select policyNS and click OK.
8. In the navigation pane, navigate to Traffic Management > Load Balancing > Virtual servers. Select the virtual server vs-NSact and click Open in the details pane. In the Configure Virtual system (Load Balancing) dialog box, on the Advanced tab, select SC and click OK.

## Configure the SureConnect policies

You can configure the following SureConnect policies. The Citrix ADC appliance matches incoming requests in the order the policies are configured:

- Exact URL-based policies
- Wildcard rule-based policies

### Configure exact URL based policies

When you configure an exact URL based policy, the Citrix ADC appliance matches the incoming request against the URL that has been configured in the policy. URL based policies take precedence over rule based policies.

### Configure an exact URL based policy by using the CLI

At the command prompt, type:

```
1 add sc policy <name> [-url <URL> | -rule <expression>] [ -delay <usecs
    >] [ -maxConn <positive_integer>] [ -action (ACS <altContentSvcName>
    <altContentPath>) | NS | NOACTION)]
2 <!--NeedCopy-->
```

### Configure an exact URL based policy by using the GUI

1. Navigate to Security > Protection Features > SureConnect.
2. In the details pane, click Add.
3. In the Create SureConnect Policy dialog box, set the following parameters:
  - Name\*
  - URL (Make sure that the URL check box is selected)
  - Value\*
  - Delay (microseconds)\*
  - Maximum Client Connections
  - Action (Select from the Choose Action list.)
  - Alternate Service Name (if you select ACS as the Action)
  - Alternate Content Path (if you select ACS as the Action)\*A required parameter
4. Click Create, and click Close. The URL based policy appears in the right pane, and a message displays in the status bar that the policy is successfully configured.

### Configure wildcard rule-based policies

SureConnect matches the incoming requests to a defined rule, if you configure a rule-based policy.

### Configure a SureConnect policy based on a wildcard rule by using the CLI

1. Create the expression(s).  
Use the add expression command to create each expression.
2. Create the rule(s).  
Use the add sc policy command with the -rule expression\_logic argument to specify the rule(s).  
In the -rule expression\_logic argument, refer to the expression(s) you created in step 1.  
Repeat this command to create and name each rule.

The following example creates a rule “rule = /\*.cgi”:

```
1 add vserver vs-lb http 1.1.1.1 80
2 add expression expr1 url == /cgi-bin/*.cgi
3 add expression expr2 url == /index.html
4 add sc policy surecpolicy1 -rule (expr1||expr2) -delay 1000000 -action
  NS
5 bind lb vserver vs-lb -policyName surecpolicy1
6 <!--NeedCopy-->
```

To complete the SureConnect configuration, you will need to enter additional commands, beyond those shown in the example.

### Configure a wildcard rule-based policy by using the GUI

1. Navigate to Security > Protection Features > SureConnect.
2. In the details pane, click Add.
3. In the Create SureConnect Policy dialog box, in the Name text box, type the name of the policy.
4. Under What to Monitor, click Expression, and then click Configure.
5. In the Create Expression dialog box, click Add.
6. In the Add Expression dialog box, enter an expression. For example, you can select an Expression Type of General, a Flow Type of REQ, a Protocol of HTTP, a Qualifier of URLQUERY, an Operator of CONTAINS, and in the Value text box, type AA. For more information about expressions, see [“Policies and Expressions.”](#)
7. Click OK, and click Close.
8. In the Create Expression dialog box, click Create.

Examples of wildcard rules:

“/sports/\*” matches all URLs under /sports

“/sports\*” matches all URLs whose prefix matches “/sports”, starting at the beginning of the URL.

“/\*.jsp” matches all URLs whose file extension is “jsp”

When configuring rule-based policies, first add the more specific rule-based policies, before adding more generic rules (for example, add /cgi-bin/sports.cgi before adding /cgi-bin/.cgi).

### Display the configured SureConnect policy

To view the SureConnect policy that you have configured, at the Citrix ADC command prompt, enter the show sc policy command.

## Customize the alternate content file

When SureConnect activates, it can display alternate content from one of the following files that you have configured:

- **progressbar.htm.** Displays the progress information.
- **alternatepage.htm.** Displays an alternate page.
- **barandpage.htm.** Displays both the progress information and an alternate page.

The alternate content files are JavaScript files. During SureConnect installation, these files are copied onto the server that contains the alternate content. These files can contain alternate content (including an alternate page) or references to other files that contain the alternate content.

This section describes the changes you can make to the alternate content file provided by the appliance.

```
1  //**** DEFINE YOUR VALUES HERE ****
2  var alt_url = "/netscaler system /sample.png";
3  var alt_url = "http://www.DomainName.com";
4  var netscaler system _logo = "netscaler_logo.png";
5  var our_logo = "netscaler_logo.png";
6  var height = 450;
7  var width = 550;
8  var top = 200;
9  var left = 200;
10 var popunder = "no"; //specify yes for pop-under & no for pop-up
11 var shift_focus = "yes" //if you want to send pop-up to background on
    getting primary content else specify no
12 //**** YOUR DEFINITIONS ENDS HERE ****
13 <!--NeedCopy-->
```

You can make these changes:

- **var alt\_url.** Specify the URL for the alternate content if a file provides the alternate content. For example:

```
1  var alt_url = "/netscaler system/sports.htm"
2  <!--NeedCopy-->
```

**Note:** The alternate content file must be present in the /netscaler system directory under the documents root of the Web server.

- **var our\_logo.** Specify the image file of your organization logo.
- **var height.** Specify the height of the SureConnect window.
- **var width.** Specify the width of the SureConnect window.

- **var top and var left.** Specify the position of the SureConnect window.
- **var popunder.** Specifies the position of the alternate content window. Specify the value as NO to place the alternate content window above the original window. Specify the value as YES to place the alternate content window beneath the original window.
- **var shift\_focus.** Specify the focus of the alternate content window. YES places the pop-up window in the background when getting the primary content. NO always keeps the pop-up window in focus, even when getting the primary content.

**Note:** For more information, see the README.txt file provided by the appliance with other alternate content files.

## Configure SureConnect for Citrix ADC features

This section describes how SureConnect works in combination with the load balancing, content switching, cache redirection, and high availability features of the Citrix ADC appliance.

### Configure SureConnect for load balancing

You can use SureConnect in environments where the primary servers use the load balancing feature, with or without alternate servers. If the load balancing virtual server configured for SureConnect fails, the backup virtual server (if there is one) handles the traffic. Backup virtual servers do not support SureConnect policies.

Note: For information about load balancing, see [Load Balancing](#).

### Configure SureConnect for cache redirection

You can use SureConnect in environments where cache redirection is configured. The primary server is a load balancing virtual server bound to the cache redirection virtual server. Regardless of any rules configured for the cache redirection feature:

- You can configure any URL for SureConnect.
- Once SureConnect is activated for a client, requests from the client are always sent to the origin server.

### Configure SureConnect for high availability

SureConnect is compatible with Citrix ADC appliances operating in high availability mode.

**Note:** If the optional vsr.htm file is used, it must be present in both nodes (primary and secondary) and must use the same name and directory.

## Activating SureConnect

September 21, 2020

You can set the Citrix ADC appliance to activate SureConnect if either of two criteria match. Both criteria are arguments to the add sc policy command, as described here:

- -delay <microseconds>

The first time the client requests the URL, the appliance records how long the server takes to respond. The appliance will not activate SureConnect until the second time the URL is requested. The first and second requests may be from the same or different clients.

If you set -delay argument, SureConnect will be activated the second time the delay reaches the threshold you set.

</div>

- -maxConn

When the appliance receives a request, it checks the number of connections to the server for the configured URL. SureConnect is activated if the number of connections is greater than or equal to the value that you set for the -maxConn argument.

If you will be providing alternate content to be displayed in the client's Web browser, you should configure the -action argument of the add sc policy command. This specifies for the Citrix ADC appliance whether the alternate content is coming from a dedicated alternate server (-action ACS) or the appliance (-action NS).

When SureConnect is activated by the -maxConn argument, the SureConnect window and progress bar are displayed in the client's browser (with an alternate page, if configured).

## SureConnect environments

September 21, 2020

The following topics describe SureConnect environments.

## Primary and alternate servers

The SureConnect environment uses a dedicated server to provide alternate content when the requested content is not available. The alternate content may include an alternate page, plus optional components such as frame set, organization logo, and so on. The alternate and primary servers can be the same server.

You can configure SureConnect to display a progress bar when the requested content is not available (or the progress bar and an alternate page).

The following figure illustrates the SureConnect environment.

Figure 1. SureConnect - Primary and Alternate Servers

## Configuration checklist

Complete the following checklist before you start configuration:

- The same builds are running for the appliance and for the SureConnect files as suggested by appliance staff.

- Appliance Build Number: \_\_\_\_\_
- SureConnect (sc\_xx.exe) Build Number: \_\_\_\_\_
- The latest SureConnect files (style files) are extracted to:
  - All primary servers (required for NS action).
  - The alternate content server (required for ACS action).
- All customizations to the latest style and vsr.htm files are applied.
- The alternate content server is accessible from the Internet (required for ACS action).
- If the -redirectURL URL argument of the add vserver CLI command needs to be specified:
  - The URL is up and running.
  - This URL is not on the configured servers.
  - This URL does not match any content in the vserver (that is, do not redirect a missing URL to itself). Redirecting a missing URL to itself can send some browsers into an infinite loop.
- All URLs to be configured for SureConnect are top-level URLs only. (Only the URLs that occupy the whole window or frame can be configured, not the embedded objects).

Following are the steps to configure SureConnect in a setup with a primary server and a dedicated alternate server:

- Enable the SureConnect feature
- Add the SureConnect policy
- Bind the SureConnect policy

You can optionally configure the following:

- Redirect the client to another URL if the primary server fails, or send a customized response to the client if the alternate server fails.
- If the servers do not provide alternate content, send a default or customized response.

### **Redirect the client to another URL**

1. Enable the SureConnect feature.
2. Define the primary server and its service.

You must identify the original server for which SureConnect support is being configured. At the Citrix ADC command prompt, type the following command:

```
1 add service <serviceName> <IP> HTTP <port>
2 <!--NeedCopy-->
```

where <serviceName> assigns a name for the service; <IP> is the server's IP address; and <port> is the port number that the service will use.

Repeat use of the add service CLI command for each service that is to be added.

You can also configure SureConnect on a load balancing virtual server. At the Citrix ADC command prompt, type the following command:

```
1 add vservice <name> HTTP <IP> <port>
2 <!--NeedCopy-->
```

3. Define and bind the SureConnect policy as follows. If you are configuring a rule-based policy, perform this step as described in “[Configure wildcard rule-based policies](#).” To configure a URL-based policy, at the Citrix ADC command prompt, type the following command:

```
1 add sc policy <name> [-url <URL>] [-delay <microsec>] [-maxConn <
  positiveInteger>]
2 <!--NeedCopy-->
```

For a detailed description of the add sc policy command, see “[Command Reference]<https://developer-docs.citrix.com/projects/netScaler-command-reference/en/latest/>.”

To bind the SureConnect policy, at the Citrix ADC command prompt, type the following command:

```
1 bind service <serviceName> -policyname <string>
2 <!--NeedCopy-->
```

where `<serviceName>` is the name of the service defined in step 2, and `<string>` is the name of the SureConnect policy.

Repeat the bind service command for each policy created.

You must include the alternate content page in the altContSvcName argument, and in the altContPath argument of the add sc policy command.

In the following example, the name of the alternate content file is /Citrix ADC system /barand-page.htm, and this file resides in svc2.

4. To save the configuration, at the netScaler command prompt, type the following command:

```
1 save config
2 <!--NeedCopy-->
```

## Example configurations

The following examples illustrate various SureConnect configurations.

The examples assume that monitoring of physical services is enabled. If the alternate system is down, SureConnect will deliver the alternate content from the system itself.

### Example 1 - SureConnect progress bar and alternate page

You can configure SureConnect to display both the progress bar and an alternate page to the user.

To bind a SureConnect policy to a load balancing virtual server, at the command prompt, type the following commands:

```
1 bind lb vserver <virtualServerName> -policyName <string>
2 <!--NeedCopy-->
```

where <virtualServerName> is the name of the load balancing virtual server defined in step 2 of the configuration process, and <string> is the name of the SureConnect policy defined in step 3.

Figure 2. SureConnect Configuration - Example 1

At the Citrix ADC command prompt, type the following commands:

```
1 enable feature SC
2 show ns info
3 add service svc2 192.2.3.6 HTTP 9002
4 show server
5 show service svc2
6 add service svc9 192.2.3.5 HTTP 8002
```

```
7 add sc policy policy8 -url /cgi-bin/slow.asp
8 -delay 3000000 -action ACS svc2 /netscaler 9000 system barandpage.htm
9 bind service svc9 -policyname policy8
10 set service svc9 -sc ON
11 save config
12 <!--NeedCopy-->
```

After you configure SureConnect, you can enter commands that show information to verify what you have configured.

### Example 2 - SureConnect progress bar only

In this example, SureConnect will display only the progress bar. The server orgsrvr with IP address 10.101.8.187 has service orgsvc. This server is connected to the appliance. The service is bound to the appliance. The progressbar.htm file specifies that only the progress bar will be displayed.

At the Citrix ADC command prompt, type the following commands:

```
1 enable feature SC
2 add service orgsvc 10.101.3.187 HTTP 80
3 add sc policy policy9 -url /cgi-bin/slow.asp
4 -delay 4000000 -action ACS orgsvc /netscaler 9000 system / progressbar.
  htm
5 bind service orgsvc -policyname policy9
6 set service orgsvc -sc ON
7 save config
8 <!--NeedCopy-->
```

### Example 3 - SureConnect with load balancing

This example illustrates how to configure the load balancing feature so that SureConnect will display alternate contents from the primary server. For information about load balancing, see [Load Balancing](#).

In this example, two physical servers with IP 10.101.3.187 and 10.101.3.188 are being load balanced by the appliance. The name and location of the alternate page file is specified in the file alternatpage.htm, which resides on both servers.

The appliance has one configured virtual server address: 10.101.3.201. At the Citrix ADC command prompt, type the following commands:

```
1 enable feature SC LB
2 add service psvc1 10.101.3.187 HTTP 80
3 add service psvc2 10.101.3.188 HTTP 80
```

```
4 add vserver vs-SureC HTTP 10.101.3.201 80
5 bind lb vserver vs-SureC psvc1
6 bind lb vserver vs-SureC psvc2
7 add sc policy policy9 -url /cgi-bin/slow.asp -delay 4000000
8 -action ACS vs-SureC /netscaler system /alternatepage.htm
9 bind lb vserver vs-SureC -policyName policy9
10 set lb vserver vs-SureC -sc ON
11 save config
12 <!--NeedCopy-->
```

#### Example 4 - SureConnect with load balancing (ACS action)

This example illustrates how to configure the Citrix ADC appliance load balancing feature so that SureConnect will display alternate content from the alternate server. For information about load balancing, see [Load Balancing](#).

In this case, there are two physical servers, IP 10.101.3.187 and 10.101.3.188. Both are being load balanced by the appliance.

The name and location of the alternate page file are specified in file `barandpage.htm`, which resides on a third server not being load balanced.

The third server's IP address is 10.101.3.189. Because `barandpage.htm` is specified, the progress bar and alternate page will both be displayed.

The appliance has one configured virtual server "vsr" whose IP address (Virtual Server) is 10.101.3.200.

At the Citrix ADC command prompt, type the following commands:

```
1 enable feature SC LB
2 add service psvc1 10.101.3.187 HTTP 80
3 add service psvc2 10.101.3.188 HTTP 80
4 add service alt-cont-svc 10.101.3.189 HTTP 80
5 add vserver vsr HTTP 10.101.3.200 80
6 bind lb vserver vsr psvc1
7 bind lb vserver vsr psvc2
8 add sc policy policy10 -url /cgi-bin/slow.asp
9 -delay 4000000 -action ACS alt-cont-svc
10 /netscaler 9000 system /barandpage.htm
11 bind lb vserver vsr -policyName policy10
12 set lb vserver vsr -sc ON
13 save config
14 <!--NeedCopy-->
```

### **Example 5 - SureConnect with content switching**

This example illustrates how to configure SureConnect where the Citrix ADC content switching and load balancing features are being used. SureConnect is configured on a load balancing virtual server bound to a content switching virtual server.

The alternate content is distributed under the content switching virtual server according to the content switching rules. For more information about load balancing and content switching, see “[Load Balancing](#)” and “[Content Switching](#).”

In this case, three physical services with IP addresses 10.100.100.104, 10.100.100.105, and 10.100.100.106 are bound to three load balancing virtual servers with IP addresses 10.100.100.101, 10.100.100.102, and 10.100.100.103. These three load balancing virtual servers are bound to a content switching virtual server with IP address 10.100.100.100.

In this setup, lbvip1 contains .cgi content, lbvip2 contains .png content, and lbvip3 contains .html content.

The name and location of the alternate page file is specified in the file alternatepage.htm, which resides on lbvip3. The embedded objects in this file must be distributed according to the content switching rules (any embedded gif will reside on lbvip2, any embedded htm will reside on lbvip3, and so on).

Figure 3. SureConnect Configuration - Example 5

At the Citrix ADC command prompt, type the following commands:

```

1 enable feature CS LB SC
2 add vservice cswvip HTTP 10.100.100.100 80 -type CONTENT
3 add vservice lbvip1 HTTP 10.100.100.101 80 -type ADDRESS
4 add vservice lbvip2 HTTP 10.100.100.102 80 -type ADDRESS
5 add vservice lbvip3 HTTP 10.100.100.103 80 -type ADDRESS
6 add service psvc1 10.100.100.104 HTTP 80
7 add service psvc2 10.100.100.105 HTTP 80
8 add service psvc3 10.100.100.106 HTTP 80
9 bind lb vservice lbvip1 psvc1
10 bind lb vservice lbvip2 psvc2
11 bind lb vservice lbvip3 psvc3
12 add cs policy CSWpolicy1 -url /*.cgi

```

```
13 bind cs vserver cswvip lbvip1 -policyName CSWpolicy1
14 add cs policy CSWpolicy2 -url /*.png
15 bind cs vserver cswvip lbvip2 -policyName CSWpolicy2
16 add cs policy CSWpolicy3 -url /*.htm
17 bind cs vserver cswvip lbvip3 -policyName CSWpolicy3
18 add sc policy SCpol -url /cgi-bin/delay.cgi -delay 4000000 -action ACS
    cswvip /alternatepage.htm
19 bind lb vserver lbvip1 -policyName SCpol
20 set lb vserver lbvip1 -sc ON
21 save config
22 <!--NeedCopy-->
```

## Surge protection

September 21, 2020

When a surge in client requests overloads a server, server response becomes slow, and the server is unable to respond to new requests. The Surge Protection feature ensures that connections to the server occur at a rate that the server can handle. The response rate depends on how surge protection is configured. The Citrix ADC appliance also tracks the number of connections to the server, and uses that information to adjust the rate at which it opens new server connections.

Surge protection is enabled by default. If you do not want to use surge protection, as will be the case with some special configurations, you must disable it.

The default surge protection settings are sufficient for most uses, but you can configure surge protection to tune it for your needs. First, you can set the throttle value to tell it how aggressively to manage connection attempts. Second you can set the base threshold value to control the maximum number of concurrent connections that the Citrix ADC appliance will allow before triggering surge protection. (The default base threshold value is set by the throttle value, but after setting the throttle value you can change it to any number you want.)

The following figure illustrates how surge protection is configured to handle traffic to a Web site.

Figure 1. A Functional Illustration of Citrix ADC Surge Protection

**Note:** If the Citrix ADC appliance is installed at the edge of the network, where it interacts with network devices on the client side of the Internet, the surge protection feature must be disabled. Surge protection must also be disabled if you enable USIP (Using Source IP) mode on your appliance.

The following example and illustration show the request and response rates for two cases. In one case, surge protection is disabled, and in the other it is enabled.

When surge protection is disabled and a surge in requests occurs, the server accepts as many requests as it can process concurrently, and then begins to drop requests. As the server becomes more overloaded, it goes down and the response rate is reduced to zero. When the server recovers from the crash, usually several minutes later, it sends resets for all pending requests, which is abnormal behavior, and also responds to new requests with resets. The process repeats for each surge in requests. Therefore, a server that is under DDoS attack and receives multiple surges of requests can become unavailable to legitimate users.

When surge protection is enabled and a surge in requests occurs, surge protection manages the rate of requests to the server, sending requests to the server only as fast as the server can handle those requests. This enables the server to respond to each request correctly in the order it was received. When the surge is over, the backlogged requests are cleared as fast as the server can handle them, until the request rate matches the response rate.

The following figure compares the request and response scenarios when surge protection is enabled to that when it is disabled.

Figure 2. Request/Response Rate with and without Surge Protection

## Disable and reenable surge protection

September 21, 2020

The surge protection feature is enabled by default. When surge protection is enabled, it is active for any service that you add.

### Disable or reenable surge protection by using the CLI

At the command prompt, type one of the following sets of commands to disable or reenable surge protection and verify the configuration:

```
1 - disable ns feature SurgeProtection
2 - show ns feature
3 - enable ns feature SurgeProtection
4 - show ns feature
5 <!--NeedCopy-->
```

#### Example:

```
1 disable ns feature SurgeProtection
2 Done show ns feature
3
```

| 4  | Feature             | Acronym       | Status |
|----|---------------------|---------------|--------|
| 5  | -----               | -----         | -----  |
| 6  | 1) Web Logging      | WL            | ON     |
| 7  | 2) Surge Protection | SP            | OFF    |
| 8  | .                   |               |        |
| 9  | .                   |               |        |
| 10 | .                   |               |        |
| 11 | 23) HTML Injection  | HTMLInjection | ON     |
| 12 | 24) Citrix ADC Push | push          | OFF    |
| 13 | Done                |               |        |
| 14 | <!--NeedCopy-->     |               |        |

```

1 enable ns feature SurgeProtection
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 -----
7 1) Web Logging WL ON
8 2) Surge Protection SP ON
9 .
10 .
11 .
12
13 23) HTML Injection HTMLInjection ON
14 24) Citrix ADC Push push OFF
15 Done
16 >
17 <!--NeedCopy-->

```

### Disable or reenable surge protection by using the GUI

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Change Advanced Features.
3. In the Configure Advanced Features dialog box, clear the selection from the Surge Protection check box to disable the surge protection feature, or select the check box to enable the feature.
4. Click OK.
5. In the Enable/Disable Feature(s) dialog box, click Yes. A message appears in the status bar, stating that the feature has been enabled or disabled.

## Disable or reenable surge protection for a particular service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services. The list of configured services is displayed in the details pane.
2. In the details pane, select the service for which you want to disable or reenable the surge protection feature, and then click Open.
3. In the Configure Service dialog box, click the Advanced tab and scroll down.
4. In the Others frame, clear the selection from the Surge Protection check box to disable the surge protection feature, or select the check box to enable the feature.
5. Click OK. A message appears in the status bar, stating that the feature has been enabled or disabled.

**Note:** Surge protection works only when both the feature and the service setting are enabled.

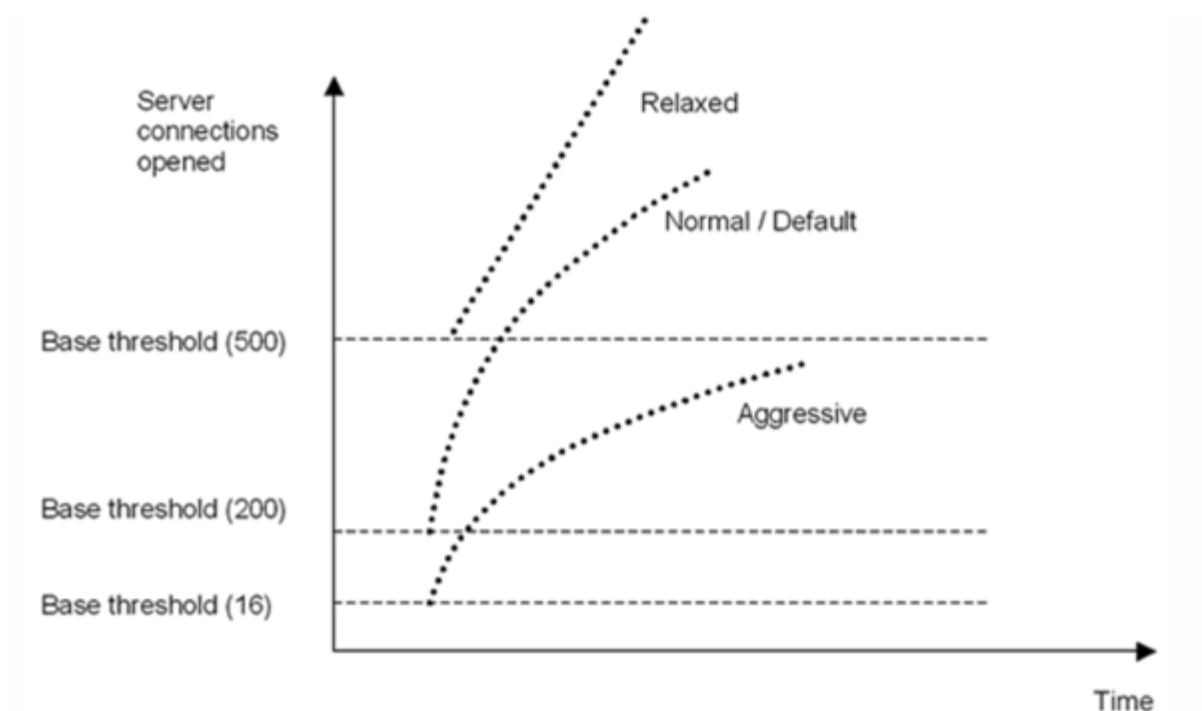

## Set thresholds for surge protection

September 21, 2020

To set the rate at which the Citrix ADC appliance opens connections to the server, you must configure the threshold and throttle values for surge protection.

The following figure shows the surge protection curves that result from setting the throttle rate to relaxed, normal, or aggressive. Depending on the configuration of the server capacity, you can set base threshold values to generate appropriate surge protection curves.

Figure 1. Surge Protection Curves

Your configuration settings affect the behavior of surge protection in the following manner:

- If you do not specify a throttle rate, it is set to normal (the default value), and the base threshold is set to 200, as shown in the preceding figure.
- If you specify a throttle rate (aggressive, normal, or relaxed) without specifying a base threshold, the curve reflects the default values of the base threshold for that throttle rate. For example, if you set the throttle rate to relaxed, the resulting curve will have the base threshold value of 500.
- If you specify only the base threshold, the entire surge protection curve shifts up or down, depending on the value you specify, as shown in the figure that follows.
- If you specify both a base threshold and a throttle rate, the resulting surge protection curve is based on the set throttle rate and adjusted according to the value set for the base threshold.

In the following figure, the lower curve (Aggressive 1) results when the throttle rate is set to aggressive but the base threshold is not set. The upper curve (Aggressive 2) results when the base threshold is set to 500, but the throttle rate is not set. The second upper curve (Aggressive 2) also results when the base threshold is set to 500, and the throttle rate is set to aggressive.

Figure 2. Aggressive Rate with the Default or a Set Base Threshold

### Set the threshold for surge protection by using the GUI

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Global System Settings.
3. If you want to set a base threshold different from the default for the throttle rate, in the Configure Global Settings dialog box, Base Threshold text box, enter the maximum number of concurrent server connections allowed before surge protection is triggered. The base threshold is the maximum number of server connections that can be open before surge protection is activated. The maximum value for this setting is 32,767 server connections. The default setting for this value is controlled by the throttle rate you choose in the next step.  
**Note:** If you do not set an explicit value here, the default value will be used.
4. In the Throttle drop-down list, select a throttle rate. The throttle is the rate at which the Citrix ADC appliance allows connections to the server to be opened. The throttle can be set to the following values:
  - **Aggressive:** Choose this option when the connection-handling and surge-handling capacity of the server is low and the connection needs to be managed carefully. When you set the throttle to aggressive, the base threshold is set to a default value of 16, which means that surge protection is triggered whenever there are 17 or more concurrent connections to the server.

- **Normal:** Choose this option when there is no external load balancer behind the Citrix ADC appliance or downstream. The base threshold is set to a value of 200, which means that surge protection is triggered whenever there are 201 or more concurrent connections to the server. Normal is the default throttle option.
- **Relaxed:** Choose this option when the Citrix ADC appliance is performing load balancing between a large number of Web servers, and can therefore handle a high number of concurrent connections. The base threshold is set to a value of 500, which means that surge protection is triggered only when there are 501 or more concurrent connections to the server.

5. Click OK. A message appears in the status bar, stating that the global settings are configured.

## Flush the surge queue

September 21, 2020

When a physical server receives a surge of requests, it becomes slow to respond to the clients that are currently connected to it, which leaves users dissatisfied and disgruntled. Often, the overload also causes clients to receive error pages. To avoid such overloads, the Citrix ADC appliance provides features such as surge protection, which controls the rate at which new connections to a service can be established.

The appliance does connection multiplexing between clients and physical servers. When it receives a client request to access a service on a server, the appliance looks for an already established connection to the server that is free. If it finds a free connection, it uses that connection to establish a virtual link between the client and the server. If it does not find an existing free connection, the appliance establishes a new connection with the server, and establishes a virtual link between client and the server. However, if the appliance cannot establish a new connection with the server, it sends the client request to a surge queue. If all the physical servers bound to the load balancing or content switching virtual server reach the upper limit on client connections (max client value, surge protection threshold or maximum capacity of the service), the appliance cannot establish a connection with any server. The surge protection feature uses the surge queue to regulate the speed at which connections are opened with the physical servers. The appliance maintains a different surge queue for each service bound to the virtual server.

The length of a surge queue increases whenever a request comes for which the appliance cannot establish a connection, and the length decreases whenever a request in the queue gets sent to the server or a request gets timed out and is removed from the queue.

If the surge queue for a service or service group becomes too long, you may want to flush it. You can flush the surge queue of a specific service or service group, or of all the services and service groups

bound to a load balancing virtual server. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. For those requests, the client has to make a fresh request.

You can also flush the surge queue of a content switching virtual server. If a content switching virtual server forwards some requests to a particular load balancing virtual server, and the load balancing virtual server also receives some other requests, when you flush the surge queue of the content switching virtual server, only the requests received from this content switching virtual server are flushed; the other requests in the surge queue of the load balancing virtual server are not flushed.

**Note:**

- You cannot flush the surge queues of cache redirection, authentication, VPN or GSLB virtual servers or GSLB services.
- Do not use the Surge Protection feature if Use Source IP (USIP) is enabled.

**Flush a surge queue by using the CLI**

The flush ns surgeQ command works in the following manner:

- You can specify the name of a service, service group, or virtual server whose surge queue has to be flushed.
- If you specify a name while executing the command, surge queue of the specified entity will be flushed. If more than one entity has the same name, the appliance flushes surge queues of all those entities.
- If you specify the name of a service group, and a server name and port while executing the command, the appliance flushes the surge queue of only the specified service group member.
- You cannot directly specify a service group member <serverName> and <port> without specifying the name of the service group <name> and you cannot specify <port> without a <serverName>. Specify the <serverName> and <port> if you want to flush the surge queue for a specific service group member.
- If you execute the command without specifying any names, the appliance flushes the surge queues of all the entities present on the appliance.
- If a service group member is identified with a server name, you must specify the server name in this command; you cannot specify its IP address.

At the command prompt, type:

```
flush ns surgeQ [-name <name>] [-serverName <serverName> <port>]
```

**Examples**

```
1 1. flush ns surgeQ - name SVC1ANZGB - serverName 10.10.10.1 80
```

```

2 The above command flushes the surge queue of the service or virtual
  server that is named SVC1ANZGB and has IP address as 10.10.10
3 2. flush ns surgeQ
4 The above command flushes all the surge queues on the appliance.
5 <!--NeedCopy-->

```

## Flush a surge queue by using the GUI

Navigate to Traffic Management > Content Switching > Virtual Servers, select a virtual server and, in the Action list, select Flush Surge Queue.

## DNS security options

September 21, 2020

You can now configure the DNS security options from the Add DNS Security Profile page in the Citrix ADC GUI. To configure the DNS security options from the Citrix ADC CLI or the NITRO API, use the App-Expert components. For instructions, see the NITRO API documentation and the Citrix ADC Command Reference Guide.

One option, cache poisoning protection, is enabled by default and cannot be disabled. You can apply the other options to all DNS endpoints or to specific DNS virtual servers in your deployment, as shown in the following table:

| Security option                                 | Can be applied to all DNS endpoints? | Can be applied to specific DNS virtual servers? |
|-------------------------------------------------|--------------------------------------|-------------------------------------------------|
| DNS DDoS protection                             | Yes                                  | Yes                                             |
| Manage exceptions – whitelist/blacklist servers | Yes                                  | Yes                                             |
| Prevent random subdomain attacks                | Yes                                  | Yes                                             |
| Bypass the cache                                | Yes                                  | No                                              |
| Enforce DNS transactions over TCP               | Yes                                  | Yes                                             |
| Provide root details in the DNS response        | Yes                                  | No                                              |

## Cache poisoning protection

A cache poisoning attack redirects users from legitimate sites to malicious websites.

For example, the attacker replaces a genuine IP address in the DNS cache with a fake IP address that they control. When the server responds to requests from these addresses, the cache is poisoned and the subsequent requests for the addresses of the domain are redirected to the attacker's site.

The Cache Poisoning Protection option prevents insertion of corrupt data into the database that caches DNS server requests and responses. This is an inbuilt feature of the Citrix ADC appliances and is always enabled.

## DNS DDoS protection

You can configure the DNS DDoS Protection option for each type of request that you suspect might be used in a DDoS attack. For each type, the Citrix ADC appliance drops any requests received after a threshold value for the number of requests received in a specified period of time (time slice) is exceeded. You can also configure this option to log a warning to the SYSLOG server. For example:

- **DROP:** - Assume that you have enabled A record protection with threshold value 15, time slice as 1 second and chosen DROP. When the incoming requests exceed 15 in 1 second, then the packets start getting dropped.
- **WARN:** - Assume that you have enabled A record protection with threshold value 15, time slice as 1 second and chosen WARN. When the incoming requests exceeds around 15 queries in 1 second, a warning message is logged indicating a threat and then the packets start getting dropped. It is recommended to set threshold values for WARN smaller than that of DROP for a record type. This will help administrators identify an attack by logging a warning message before the actual attack happens and Citrix ADC starts dropping incoming requests.

## Set a threshold for incoming traffic by using the Citrix ADC GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profile** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
4. Expand **DNS DDoS Protection**.
  - a) Select the record type and enter the threshold limit and the time slice value.
  - b) Select **DROP** or **WARN**.
  - c) Repeat steps a and b for each of the other record types that you want to protect against.
5. Click **Submit**.

## Manage exceptions – whitelist/blacklist servers

Manage exceptions enables you to add exceptions either to blacklist or whitelist domain name and IP addresses. For example:

- When a particular IP address is identified posting an attack, such IP address can be blacklisted.
- When administrators find that there is unexpectedly high request for a particular domain name, then that domain name can be blacklisted.
- NXDomains and some of the existent domains which can consume the server resources can be blacklisted.
- When administrators whitelist domain names or IP addresses, queries or requests only from these domains or IP addresses are answered and all others are dropped.

### Create a whitelist or blacklist by using the GUI

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
  - a) Expand **Manage exceptions – Whitelist/Blacklist Servers**.
  - b) Select **Block** to block queries from blacklisted domains/addresses, or select **Allow** only to allow queries from whitelisted domains/addresses.
  - c) In the **Domain name / IP Address** box, enter the domain names, IP addresses, or IP address ranges. Use commas to separate the entries.

**Note:** If you select **Advanced Option**, you can use the “start with,” “contains,” and “ends with” options to set the criteria.

For example, you can set criteria to block a DNS query that starts with “image” or ends with “.co.ru” or contains “mobilesites.”
4. Click **Submit**.

### Prevent random subdomain attacks

In random subdomain attacks, queries are sent to random, nonexistent subdomains of legitimate domains. This increases the load on the DNS resolvers and servers. As a result, they can become overloaded and slow down.

The Prevent Random Subdomain Attacks option directs the DNS responder to drop DNS queries that exceed a specified length.

Assume that example.com is a domain name owned by you and hence the resolution request comes to your DNS server. The attacker can append a random subdomain to example.com and send a request. Based on the specified query length and the FQDN, the random queries will be dropped.

For example, if the query is `www.image987trending.example.com`, it will be dropped if the query length is set to 20.

### **Specify a DNS query length by using the GUI**

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
  - a) Expand **Prevent Random Subdomain Attacks**.
  - b) Enter the numerical value for the query length.
4. Click **Submit**.

### **Bypassing the cache**

During an attack, the data that is already cached must be protected. To protect the cache, new requests for certain domains or record types or response codes can be sent to the origin servers instead of cached.

The Bypassing the cache option directs the Citrix ADC appliance to bypass the cache for specified domains, record types, or response codes when an attack is detected.

### **Bypass the cache for specified domains or record types or response types by using the GUI**

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, expand **Bypassing the cache** and enter the domain names and / or choose the record types or the response types for which the cache has to be bypassed.
  - Click **Domains** and enter the domain names. Use commas to separate the entries.
  - Click **Record Types** and choose the record types.
  - Click **Response Types** and choose the response type.
4. Click **Submit**.

### **Enforce DNS transactions over TCP**

Some DNS attacks can be prevented if the transactions are forced to use TCP instead of UDP. For example, during a bot attack, the client sends a flood of queries but cannot handle responses. If the use of TCP is enforced for these transactions, then the bots cannot understand the responses and therefore cannot send requests over TCP.

### **Force domains or record types to operate at the TCP level by using the GUI**

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, expand **Enforce DNS Transactions over TCP** and enter the domain names and / or choose the record types for which the DNS transactions must be enforced over TCP.
  - Click **Domains** and enter the domain names. Use commas to separate the entries.
  - Click **Record Types** and choose the record types.
4. Click **Submit**.

### **Provide root details in the DNS response**

In some attacks, the attacker sends a flood of queries for unrelated domains that are not configured or cached on the Citrix ADC appliance. If the dnsRootReferral parameter is ENABLED, it exposes all the root servers.

The Provide Root Details in the DNS Response option directs the Citrix ADC appliance to restrict access to root referrals for a query that is not configured or cached. The appliance sends a blank response.

The Provide Root Details in the DNS Response option can also mitigate or block amplification attacks. When the dnsRootReferral parameter is DISABLED, there will be no root referral in the Citrix ADC responses and hence they do not get amplified.

### **Enable or disable access to the root server by using the GUI**

1. Navigate to **Configuration > Security > DNS Security**.
2. On the **DNS Security Profiles** page, click **Add**.
3. On the **Add DNS Security Profile** page, do the following:
  - a) Expand **Provide Root Details in the DNS Response**.
  - b) Click **ON** or **OFF** to allow or restrict access to the root server.
4. Click **Submit**.

## **ICAP for remote content inspection**

March 16, 2021

The Internet Content Adaptation Protocol (ICAP) is a simple lightweight protocol for executing value-added transformation service on HTTP messages. In a typical scenario, an ICAP client forwards HTTP

requests and responses to one or more ICAP servers for processing. The ICAP servers perform content transformation on the requests and send back responses with appropriate actions to take on the request or response.

### **ICAP on a Citrix ADC appliance**

In a Citrix ADC setup, the appliance acts as an ICAP client interoperating with third-party ICAP servers such as antimalware and Data Leak Prevention (DLP). When the appliance receives an incoming web traffic, the appliance intercepts the traffic and uses a Content Inspection policy to evaluate if the HTTP request needs an ICAP processing. If yes, the appliance decrypts and sends the message as a plain text to the ICAP servers. The ICAP servers execute the content transformation service on the request message and send back a response to the appliance. The adapted messages can either be an HTTP request or an HTTP response. If the appliance interoperates with multiple ICAP servers, the appliance performs load balancing of ICAP servers. This happens in scenarios where one ICAP server is not sufficient to handle all the traffic load. Once the ICAP servers return a modified message, the appliance forwards the modified message to the back-end origin server.

The Citrix ADC appliance also provides a secured ICAP service if the incoming traffic is an HTTPS type. The appliance uses a SSL based TCP service to establish a secured connection between the appliance and ICAP servers.

### **How ICAP request modification (REQMOD) works**

In the request modification (REQMOD) mode, the Citrix ADC appliance forwards the HTTP request received from client to the ICAP server. The ICAP server then performs one of the following:

1. Sends back a modified version of the request and the appliance in turn sends the modified request to the back-end origin server or it pipelines the modified request to another ICAP server.
2. Responds with a message indicating no adaptation is required.
3. Returns an error and the appliance in turn sends the error message back to the user.

### **How ICAP response modification (RESPMOD) works**

In the response modification (RESPMOD) mode, the Citrix ADC appliance sends an HTTP response to the ICAP server (the response sent by the appliance is typically the response sent by the origin server). The ICAP server then performs one of the following:

1. Sends back a modified version of the response and the appliance in turn sends the modified response to the user or pipeline the modified response to another ICAP server.
2. Responds with a message indicating no adaptation is required.
3. Returns an error and the appliance in turn sends the error message to the user.

## ICAP license

The ICAP feature works on a Citrix ADC standalone or high availability setup with Citrix ADC Premium or Advanced license edition.

## Configure ICAP for content transformation service

To use ICAP for content transformation service, you must begin by enabling the Content inspection and load balancing features. Once you enable the features, you can complete the following tasks

### To enable content inspection

If you want the Citrix ADC appliance to act as an ICAP client and send requests or responses to third-party ICAP server, you must first enable the Content Inspection and load balancing features.

At the command prompt, type:

```
1 enable ns feature contentInspection LoadBalancing
2 <!--NeedCopy-->
```

### Add ICAP profile

ICAP configurations for a Citrix ADC appliance can be specified in an entity called ICAP profile. The profile has a collection of ICAP settings. The ICAP profile is then associated to content Inspection action that want to use the ICAP configurations.

At the command prompt, type:

```
1 add nsicapProfile <name> -uri <string> -Mode ( REQMOD | RESPMOD )
2 <!--NeedCopy-->
```

### Example:

```
1 add nsicapProfile icap_reqmod -uri "servicename" - mode REQMOD
2
3 add nsicapProfile icap_respmod -uri "servicename" - mode RESPMOD
4
5 add nsicapProfile icap_reqmod_query -uri "servicename?query=data" -
  mode REQMOD
6 <!--NeedCopy-->
```

**Add ICAP service as a TCP or SSL\_TCP service**

After you enable the Content Inspection feature, you must add an ICAP service for the ICAP servers that will be part of the load balancing setup. The service that you add provides the ICAP connection between the Citrix ADC appliance and load balancing virtual servers.

**Note:** As an administrator, you can add an ICAP service and directly configure the ICAP server IP address in the Content Inspection action.

At the command prompt, type the following:

```
1 add service <name> <IP> <serviceType> <port>
2 <!--NeedCopy-->
```

**Example:**

```
1 add service icapsv1 10.102.29.200 TCP 80 - gslb NONE - maxclient 0
  - maxReq 0 - cip DISABLED - usip NO - useproxport YES - sp ON -
  cltTimeout 9000 - svrTimeout 9000 - CKA NO - TCPB NO - CMP NO
2
3 add service icapsv2 10.102.29.200 SSL_TCP 11344 - gslb NONE - maxclient
  0 - maxReq 0 - cip DISABLED - usip NO - useproxport YES - sp ON -
  cltTimeout 9000 - svrTimeout 9000 - CKA NO - TCPB NO - CMP NO
4 <!--NeedCopy-->
```

**Add a TCP or SSL\_TCP based load balancing virtual server**

After creating an ICAP service, you must create a virtual server to accept ICAP traffic and load balance the ICAP servers.

Note: You can also use a SSL based TCP service over a secured channel. To do this, you must use a SSL\_TCP service and bind to the Content Inspection action.

At the command prompt, type the following:

```
1 add lb vserver <name> <serviceType> <port>
2 <!--NeedCopy-->
```

**Example:**

```
1 add lb vserver vicap TCP 0.0.0.0.0 - persistenceType NONE -cltTimeout
  9000
2
3 add lb vserver vicap SSL_TCP 0.0.0.0 0 - persistenceType NONE -
  cltTimeout 9000
4 <!--NeedCopy-->
```

### Bind ICAP service to the load balancing virtual server

After you create an ICAP service and virtual server, you must bind the ICAP service to the virtual server.

At the command prompt, type the following:

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

#### Example:

```
1 bind lb vserver vicap icapsv1
2 <!--NeedCopy-->
```

### Add content inspection action

After you enable the Content Inspection feature, you must add an ICAP action for handling the ICAP request information. The ICAP profile and services, or load balancing virtual server that are created are bound to the ICAP action.

At the command prompt, type the following:

```
1 add contentInspection action <name> -type ICAP -serverName <string> -
  icapProfileName <string>
2
3 **add ContentInspection action <name> -type ICAP -serverip <ip> -
  serverport <port> -icapProfileName <string>**
4 <!--NeedCopy-->
```

#### Note:

If you can configuring ICAP service instead of a load balancing virtual server, you can mention the service name in the <-serverip> option. When adding the Content Inspection action, the TCP service is automatically created for the given IP address with port 1344 and it is used for ICAP communication.

#### Example:

```
1 add ContentInspection action ci_act_lb -type ICAP -serverName vicap -
  icapProfileName icap_reqmod
2
3 add ContentInspection action ci_act_svc -type ICAP -serverName icapsv1
  -icapProfileName icap_reqmod
4
5 add ContentInspection action ci_act_svc -type ICAP -serverip <ip> -
  serverport <port> -icapProfileName icap_reqmod
```

```
6 <!--NeedCopy-->
```

### Add content inspection policies

After you create a Content Inspection action, you must create content inspection policies to evaluate requests for ICAP processing and audit logging. The policy is based on a rule which consists of one or more expressions. The rule is associated to the content inspection action that is associated if a request matches the rule.

At the command prompt, type the following:

```
1 add ContentInspection policy <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

### Example:

```
1 add ContentInspection policy ci_pol_basic - rule true - action
  ci_act_svc
2
3 add ContentInspection policy ci_pol_HTTP - rule HTTP.REQ.URL.CONTAINS(
  "html" ) - action ci_act_svc
4 <!--NeedCopy-->
```

### Bind content inspection policies to the content switching or load balancing virtual server

To put an ICAP policy into effect, you must bind it globally or bind it to a Content Switching or load balancing virtual server, which frontend the application. When you bind the policy, you must assign a priority to it. The priority determines the order in which the policies you define are evaluated.

For information about configuring a load balancing setup for forwarding the traffic to back-end origin server after content transformation, see [Load Balancing](#).

### Configure secured ICAP service

To establish a secured connection between the Citrix ADC appliance and the ICAP web servers, the appliance uses an SSL-based TCP service or load balancing virtual server bound to an ICAP action.

To establish a secured ICAP connection, complete the following tasks:

1. Add SSL-based TCP service.
2. Bind SSL-based TCP service to load balancing virtual server of type TCP or SSL\_TCP.
3. Bind SSL-based TCP service or load balancing virtual server to Content Inspection action.

**Add SSL-based TCP service to load balancing virtual server**

To establish a secured connection between the Citrix ADC appliance and the ICAP web servers, the appliance uses an SSL-based TCP service or load balancing virtual server bound to an ICAP action.

To establish a secured ICAP connection, complete the following tasks:

1. Add SSL-based TCP service.
2. Bind SSL-based TCP service to load balancing virtual server of type TCP or SSL\_TCP.

Bind SSL-based TCP service or load balancing virtual server to Content Inspection action

**Add SSL-based TCP service to load balancing virtual server**

After you enable the Content Inspection feature, you must add a secured ICAP service that will be part of the load balancing setup. The service that you add provides a secured ICAP connection between the Citrix ADC appliance and load balancing virtual servers.

At the command prompt, type the following:

```
1 add service <name> <IP> <serviceType> <port>
2 <!--NeedCopy-->
```

**Example:**

```
1 add service icapsv2 10.102.29.200 SSL_TCP 11344 - gslb NONE - maxclient
  0 - maxReq 0 - cip DISABLED - usip NO - useproxport YES - sp ON -
  cltTimeout 9000 - svrTimeout 9000 - CKA NO - TCPB NO - CMP NO
2 <!--NeedCopy-->
```

**Bind SSL-based TCP service to SSL\_TCP or TCP load balancing virtual server**

After you create a secured ICAP service, you must bind the service to the load balancing virtual server (if you are using a load balancing virtual server to load balance the ICAP servers).

At the command prompt, type the following:

```
1 bind lb vserver <name> <serviceName>
2 <!--NeedCopy-->
```

**Example:**

```
1 bind lb vserver vicap icapsv2
2 <!--NeedCopy-->
```

## Bind SSL-based TCP service or load balancing virtual server to the Content Inspection action

You must add an ICAP action for handling the ICAP request information and also bind the SSL-based TCP service to the action.

At the command prompt, type the following:

```
1 add contentInspection action <name> -type ICAP -serverName <string> -
  icapProfileName <string>
2 <!--NeedCopy-->
```

### Example:

```
1 add ContentInspection action ci_act_svc -type ICAP -serverName icapsv2
  -icapProfileName icap_reqmod
2
3 add ContentInspection action ci_act_svc -type ICAP -serverName vicap -
  icapProfileName icap_reqmod
4 <!--NeedCopy-->
```

## Configure ICAP protocol by using the GUI

1. Navigate to **Load Balancing > Services** and click **Add**.
2. In the **Services** page, enter the service details.
3. Navigate to **Load Balancing > Servers**. Add a virtual server of type TCP. Or, you can select a virtual server and click **Edit**.
4. After entering the server details, click **OK** and again **OK**.
5. In the **Advanced Settings** section, click **Policies**.
6. Go the **Policies** section and click the **Pencil** icon to configure Content Inspection policy.
7. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
8. In the **Policy Binding** section, click “+” to add a Content Inspection policy.
9. In the **Create ICAP Policy** page, enter a name for the policy.
10. In the **Action** field, click the “+” sign to add an ICAP action.
11. In the **Create ICAP Action** page, enter a name for the action.
12. Enter a name for the action.
13. In the **Server Name** field, enter the name of the TCP service already created.
14. In **ICAP Profile** field, click the “+” sign to add an ICAP profile.
15. In the **Create ICAP Profile** page, enter a profile name, URI, and MODE.
16. Click **Create**.
17. In the **Create ICAP Action** page, click **Create**.
18. In the **Create ICAP Policy** page, enter “true” in the **Expression Editor** and then click **Create**.
19. Click **Bind**.

20. When prompted to enable the Content Inspection feature, click **Yes**.
21. Click **Done**.

For information about the Citrix ADC GUI configuration for load balancing and forwarding the traffic to back-end origin server after content transformation, see [Load Balancing](#).

### Configure secured ICAP protocol by using the GUI

1. Navigate to **Load Balancing > Services** and click **Add**.
2. In the **Services** page, enter the service details.
3. Navigate to **Load Balancing > Servers**. Add a virtual server of type TCP\_SSL. Or, you can select a virtual server of type TCP\_SSL and click **Edit**.
4. After entering the server details, click **OK** and again **OK**.
5. In the **Advanced Settings** section, click **Policies**.
6. Go the **Policies** section and click the **Pencil** icon to configure Content Inspection policy.
7. On the **Choose Policy** page, select **Content Inspection**. Click **Continue**.
8. In the **Policy Binding** section, click “+” to add a Content Inspection policy.
9. In the **Create ICAP Policy** page, enter a name for the policy.
10. In the **Action** field, click the “+” sign to add an ICAP action.
11. In the **Create ICAP Action** page, enter a name for the action.
12. Enter a name for the action.
13. In the **Server Name** field, enter the name of the TCP\_SSL service already created.
14. In **ICAP Profile** field, click the “+” sign to add an ICAP profile.
15. In the **Create ICAP Profile** page, enter a profile name, URI, and MODE.
16. Click **Create**.
17. In the **Create ICAP Action** page, click **Create**.
18. In the **Create ICAP Policy** page, enter “true” in the **Expression Editor** and then click **Create**.
19. Click **Bind**.
20. When prompted to enable the Content Inspection feature, click **Yes**.
21. Click **Done**.

### Auditlog support for remote content inspection

If an incoming request or outgoing response is content inspected, the Citrix ADC appliance logs the ICAP details. The appliance stores the details as a log message in the ns.log file.

Each log message typically contains the following details:

```
1 <Source IP> <Destination IP> <Domain> <ICAP server IP><ICAP Mode> <
  Service URI> <ICAP response> <Policy action>
2 <!--NeedCopy-->
```

**Example for content inspected request log message:**

```
1 Apr 18 14:45:41 <local0.info> 10.106.97.104 04/18/2018:14:45:41 GMT 0-
  PPE-0 : default CI ICAP_LOG 788 0 : Source 10.102.1.98:39048 -
  Destination 10.106.97.89:8011 - Domain 10.106.97.89 - Content-Type
  application/x-www-form-urlencoded - ICAP Server 10.106.97.99:1344 -
  Mode REQMOD - Service /example - Response 204 - Action FORWARD
2 <!--NeedCopy-->
```

**Example for content inspected response log message:**

```
1 Apr 18 12:34:08 <local0.info> 10.106.97.104 04/18/2018:12:34:08 GMT 0-
  PPE-0 : default CI ICAP_LOG 71 0 : Source 10.106.97.105:18552 -
  Destination 10.106.97.99:80 - Domain NA - Content-Type NA - ICAP
  Server 10.106.97.99:1344 - Mode RESPMOD - Service /example -
  Response 400 - Action Internal Error
2 <!--NeedCopy-->
```

## Inline device integration with Citrix ADC

March 16, 2021

Security devices such as Intrusion Prevention System (IPS) and Next Generation Firewall (NGFW) protect servers from network attacks. These devices are deployed in layer 2 inline mode and their primary function is to protect servers from network attacks and report security threats on the network.

To prevent vulnerable threats and provide advanced security protection, a Citrix ADC appliance is integrated with one or more inline devices. The inline devices can be any security device such as IPS, NGFW.

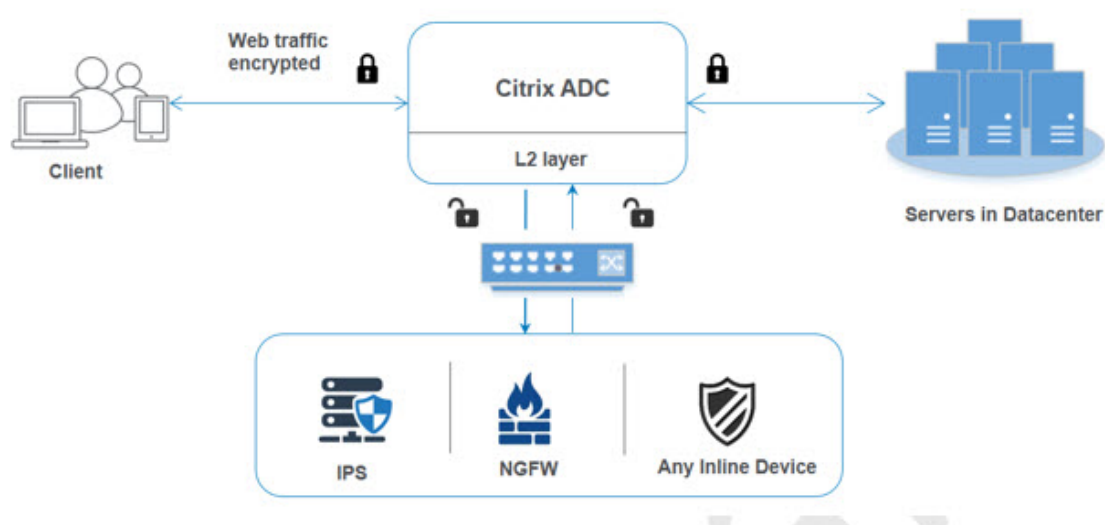

Following are some of the use cases that benefit in using the inline device integration with Citrix ADC appliance:

- **Inspecting encrypted traffic.** Most IPS and NGFW appliances bypass encrypted traffic, thereby leaving servers vulnerable to attacks. A Citrix ADC appliance can decrypt traffic and send it to inline devices for inspection. This enhances customer's network security.
- **Offloading inline devices from TLS/SSL processing.** TLS/SSL processing is expensive and this issue can result in high system CPU in IPS or NGFW appliances if they decrypt the traffic. As encrypted traffic is growing at a fast pace, these systems fail to decrypt and inspect encrypted traffic. Citrix ADC helps in offloading inline devices from TLS/SSL processing. This results in inline device supporting a high volume of traffic inspection.
- **Loading balancing inline devices.** The Citrix ADC appliance load balances multiple inline devices when there is a high volume of traffic.

- **Smart selection of traffic.** Every packet flowing into the appliance might be content inspected, for example download of text files. User can configure the Citrix ADC appliance to select specific traffic (for example .exe files) for inspection and send the traffic to inline devices for processing the data

## How Citrix ADC is integrated with inline devices

The following diagram shows how a Citrix ADC is integrated with inline security devices.

When you integrate inline devices with Citrix ADC appliance, the component interacts as given below:

1. A client sends a request to Citrix ADC appliance.
2. The appliance receives the request and sends it to an inline device based on policy evaluation.  
**Note:** If there are two or more inline devices, the appliance load balances the devices and sends the traffic.  
If the incoming traffic is an encrypted one, the appliance decrypts the data and sends it as a plain text to the inline device for content inspection.
3. The inline device inspects the data for threats and decides whether to drop, reset, or send the data back to the appliance.
4. If there are security threats, the device modifies the data and sends it to the appliance.
5. The Citrix ADC in turn re-encrypts the data and forwards the request to the back-end server.
6. The back-end server sends the response to the Citrix ADC appliance.
7. The appliance again decrypts the data and sends it to the inline device for inspection.
8. Appliance re-encrypts the data and sends the response to the client

## Software licensing

To deploy the inline device integration, your Citrix ADC appliance must be provisioned with one of the licenses given below:

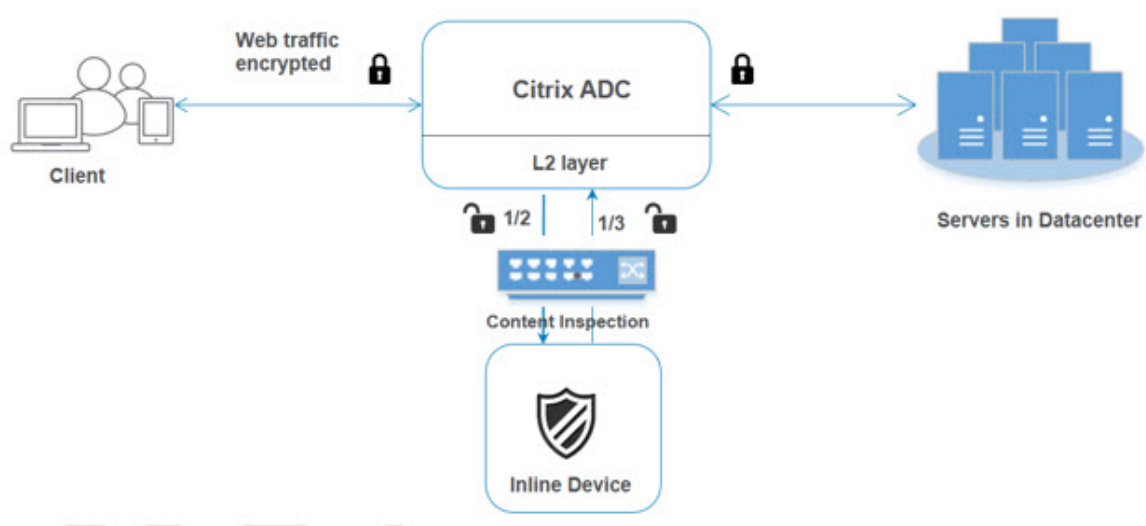

1. ADC Premium
2. ADC Advanced
3. Telco Advanced
4. Telco Premium
5. SWG license

## Configuring inline device integration

You can configure a Citrix ADC appliance with an inline device in three different ways. The configuration scenarios are given below.

### Scenario 1 for using a single inline device

If you want to integrate a security device (IPS or NGFW) in inline mode, you must begin by first enabling the Content Inspection feature and enabling Citrix ADC in MBF (MAC-based forwarding) in global mode. Once you have enabled the features, you must add the Content Inspection profile, add Content Inspection action for inline devices to reset, block, or drop the traffic based on inspection. Then, add the Content Inspection policy for the appliance to decide what subset of traffic to send to the inline devices. Then, configure the load balancing virtual server with layer 2 connection enabled on the server. Finally, bind the content inspection policy to the load balancing virtual server.

### Enable MBF (MAC-based forwarding) mode

If you want the Citrix ADC appliance to be integrated to inline devices such as IPS, or firewalls, you must enable this mode. For more information about MBF, see [Configure MAC-based Forwarding](#) topic.

At the command prompt, type:

```
enable ns mode mbf
```

### Enable Content Inspection

If you want Citrix ADC appliance to decrypt and then send the content for inspection to the inline devices, you must enable the Content Inspection and load balancing features.

```
enable ns feature contentInspection LoadBalancing
```

### Add Content Inspection profile for service

Inline device configuration for a Citrix ADC appliance can be specified in an entity called Content Inspection profile. The profile has a collection of settings that explains how to integrate with an inline device.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface  
<interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer  
>] [-ingressVlan <positive_integer>]
```

#### Example:

```
add contentInspection profile Inline_profile1 -type InlineInspection -  
ingressinterface "1/2" -egressInterface "1/3"
```

### Add IPS-TCP monitor

If you want to configure monitors, you first decide whether to use a built-in monitor or add a TCP monitor.

**Note:** If you want to configure monitors, you must use a custom monitor. When adding a monitor, you must enable the transparent parameter.

```
add lb monitor <monitorName> <type> [-destIP <ip_addr|ipv6_addr>] [-destPort  
<port>] [-transparent ( YES | NO )]
```

#### Example:

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent  
YES
```

**Add a service**

Add a service. Specify a dummy IP address that is not owned by any of the devices, including the inline devices. Set `use source IP address` (USIP) to YES. Set `useproxyport` to NO. By default, health monitoring is ON, bind the service to a health monitor, and also set the TRANSPARENT option in the monitor ON.

At the command prompt, type:

```
add service <Service_name> <IP> TCP * - contentinspectionProfileName <Name>
-healthMonitor YES -usip ON -useproxyport OFF
```

**Example:**

```
add service ips_service 198.51.100.2 TCP * -healthMonitor YES -usip YES -
useproxyport NO -contentInspectionProfileName ipsprof
```

**Add a health monitor**

By default the health monitor is turned on and you also have the option to disable it, if required. At the command prompt, type:

```
add lb monitor <name> TCP -destIP <ip address> -destPort 80 -transparent <
YES, NO>
```

**Example:**

```
add lb monitor ips_tcp TCP -destIP 192.168.10.2 -destPort 80 -transparent
YES
```

**Bind the service to the health monitor**

After configuring the health monitor, you must bind the service to the health monitor. At the command prompt, type:

```
“bind service -monitorName ‘
```

**Example:**

```
bind service ips_svc -monitorName ips_tcp
```

**Add Content Inspection action for service**

After you enable the Content Inspection feature and then after add the inline profile and service, you must add the Content Inspection action for handling the request. Based on the content inspection action, the inline device can drop, reset, or block action after it has inspected the data.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string> [-ifserverdown <ifserverdown>] [-reqTimeout <positive_integer>] [-reqTimeoutAction <reqTimeoutAction>])
```

```
add ContentInspection action < action_name > -type InlineINSPECTION -serverName Service_name/Vserver_name>
```

**Example:**

```
add ContentInspection action <Inline_action> -type InlineSPECTION -serverName Inline_service1
```

**Add content inspection policy for inspection**

After you create a Content Inspection action, you must add Content Inspection policies to evaluate requests for inspection. The policy is based on a rule which consists of one or more expressions. The policy evaluates and selects the traffic for inspection based on the rule.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> -rule <Rule> -action <action_name >
```

**Example**

```
add contentInspection policy Inline_pol1 -rule true -action Inline_action
```

**Add content switching or load balancing virtual server of type HTTP/SSL**

To receive the web traffic, you must add a load balancing virtual server. Also you must enable the layer2 connection on the virtual server.

At the command prompt, type:

```
add lb vserver <name> <vserver name> -l2Conn ON
```

**Example:**

```
add lb vserver HTTP_vserver HTTP 10.102.29.200 8080 -l2Conn ON
```

**Bind Content Inspection policy to content switching virtual server or load balancing virtual server of type HTTP/SSL**

You must bind the load balancing virtual server or content switching virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority < priority > -type <REQUEST>
```

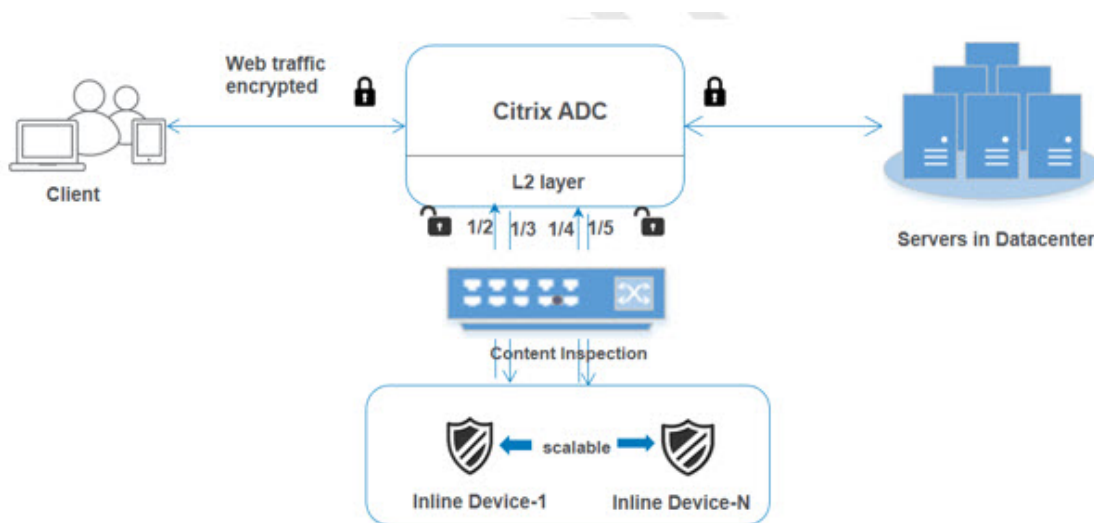

**Example:**

```
bind lb vserver HTTP_vserver -policyName Inline_pol1 -priority 100 -type
REQUEST
```

**Scenario 2: Load balancing multiple inline devices using dedicated interfaces**

If you are using two or more inline devices, you must load balance the devices using different content inspection services in a dedicated VLAN setup. In this case, the Citrix ADC appliance load balances the devices on top of sending a subset of traffic to each device through a dedicated interface.

For basic configuration steps, refer to scenario 1.

**Add content inspection profile1 for service1**

Inline configurations for a Citrix ADC appliance can be specified in an entity called Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for inline service 1 and the communication is through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer>
>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile1 -type InlineInspection -ingressinterface "1/2" -
egressInterface "1/3"
```

**Add content inspection profile2 for service2**

The Content Inspection profile2 is added for service2 and the inline device communicates with the appliance through 1/4 and 1/5 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface
<interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer
>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile2 -type InlineInspection -
ingressinterface "1/4" -egressInterface "1/5"
```

**Add service 1 for inline device 1**

After you enable the Content Inspection feature and add the inline profile, you must add an inline service 1 for inline device 1 to be part of the load balancing setup. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> TCP * -contentInspectionProfileName
<Inline_Profile_1> -healthmonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service Inline_service1 10.102.29.200 TCP 80 -contentInspectionProfileName
Inline_profile1 -healthmonitor OFF -usip ON -useproxyport OFF
```

**Add service 2 for inline device 2**

After you enable the Content Inspection feature and add the inline profile, you must add an inline service 2 for inline device 2. The service that you add, provides all the inline configuration details.

At the command prompt, type:

```
add service <Service_name_1> <Pvt_IP1> TCP * -contentInspectionProfileName
<Inline_Profile_2> -healthmonitor OFF -usip ON -useproxyport OFF
```

**Example:**

```
add service Inline_service1 10.29.20.205 TCP 80 -contentInspectionProfileName
Inline_profile2 -healthmonitor OFF -usip ON -useproxyport OFF
```

**Add load balancing virtual server**

After you have added the inline profile and the services, you must add a load balancing virtual server for load balancing the services.

At the command prompt, type:

```
add lb vserver <vserver_name> TCP <Pvt_IP3> <port>
```

**Example:**

```
add lb vserver lb-Inline_vserver TCP *
```

**Bind service 1 to the load balancing virtual server**

After you add the load balancing virtual server, now bind the load balancing virtual server to the first service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-Inline_vserver Inline_service1
```

**Bind service 2 to the load balancing virtual server**

After you add the load balancing virtual server, now bind the server to the second service.

At the command prompt, type:

```
bind lb vserver <Vserver_name> <Service_name_1>
```

**Example:**

```
bind lb vserver lb-Inline_vserver Inline_service2
```

**Add content inspection action for the service**

After you enable the Content Inspection feature, you must add the Content Inspection action for handling the inline request information. Based on the action selected, the inline device drops, resets, or blocks after it has examined the given subset of traffic.

At the command prompt, type:

```
add contentInspection action <name> -type <type> (-serverName <string> [-ifserverdown <ifserverdown>] [-reqTimeout <positive_integer>] [-reqTimeoutAction <reqTimeoutAction>])
```

```
add ContentInspection action < action_name > -type InlineINSPECTION -
serverName Service_name/Vserver_name>
```

**Example:**

```
add ContentInspection action Inline_action -type InlineINSPECTION -serverName
lb-Inline_vserver
```

**Add content inspection policy for inspection**

After you create a Content Inspection action, you must add Content Inspection policy to evaluate requests for service. The policy is based on a rule which consists of one or more expressions. The rule is associated to the Content Inspection action that is associated if a request matches the rule.

At the command prompt, type the following:

```
add contentInspection policy <policy_name> -rule <Rule> -action <action_name
>
```

**Example:**

```
add contentInspection policy Inline_pol1 -rule true -action Inline_action
```

**Add content switching or load balancing virtual server of type HTTP/SSL**

Add a content switching or load balancing virtual server to accept web traffic. Also you must enable the layer2 connection on the virtual server.

For more information about load balancing, see [How load balancing works](#) topic.

At the command prompt, type:

```
add lb vserver <name> <vserver name> -l2Conn ON
```

**Example:**

```
add lb vserver http_vserver HTTP 10.102.29.200 8080 -l2Conn ON
```

**Bind Content Inspection policy to load balancing virtual server of type HTTP/SSL**

You must bind the content switching or load balancing virtual server of type HTTP/SSL to the Content Inspection policy.

At the command prompt, type the following:

```
bind lb vserver <vserver name> -policyName < policy_name > -priority <> -
type <L7InlineREQUEST | L4Inline-REQUEST>
```

**Example:**

```
bind lb vserver http_vserver -policyName Inline_pol1 -priority 100 -type
REQUEST
```

### Scenario 3: Load balancing multiple inline devices using shared interfaces

You can refer to this configuration, if you are using multiple inline devices and if you want to load balance the devices using different services in a shared VLAN interface.

This configuration using shared VLAN interfaces is similar to use case 2. For basic configuration, refer to scenario 2.

#### Bind VLAN A with sharing option enabled

At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

#### Example:

```
bind vlan 100 -ifnum 1/2 tagged
```

#### Bind VLAN B with sharing option enabled

At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

#### Example:

```
bind vlan 200 -ifnum 1/3 tagged
```

**Bind VLAN C with sharing option enabled**

At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
bind vlan 300 -ifnum 1/2 tagged
```

**Bind VLAN D with sharing option enabled**

At the command prompt, type the following:

```
bind vlan <id> -ifnum <interface> -tagged
```

**Example:**

```
bind vlan 400 -ifnum 1/3 tagged
```

**Add content inspection profile1 for service1**

Inline configurations for a Citrix ADC appliance can be specified in an entity called Content Inspection profile. The profile has a collection of device settings. The Content Inspection profile1 is created for inline service 1 and the communication is through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface  
<interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer  
>] [-ingressVlan <positive_integer>]
```

**Example:**

```
add contentInspection profile Inline_profile1 -type InlineInspection -  
ingressinterface "1/2" -egressInterface "1/3" -egressVlan 100 -ingressVlan  
300
```

**Add content inspection profile2 for service2**

The Content Inspection profile2 is added for service2 and the inline device communicates with the appliance through 1/2 and 1/3 dedicated interfaces.

At the command prompt, type:

```
add contentInspection profile <name> -type InlineInspection -egressInterface  
<interface_name> -ingressInterface <interface_name>[-egressVlan <positive_integer  
>] [-ingressVlan <positive_integer>]
```

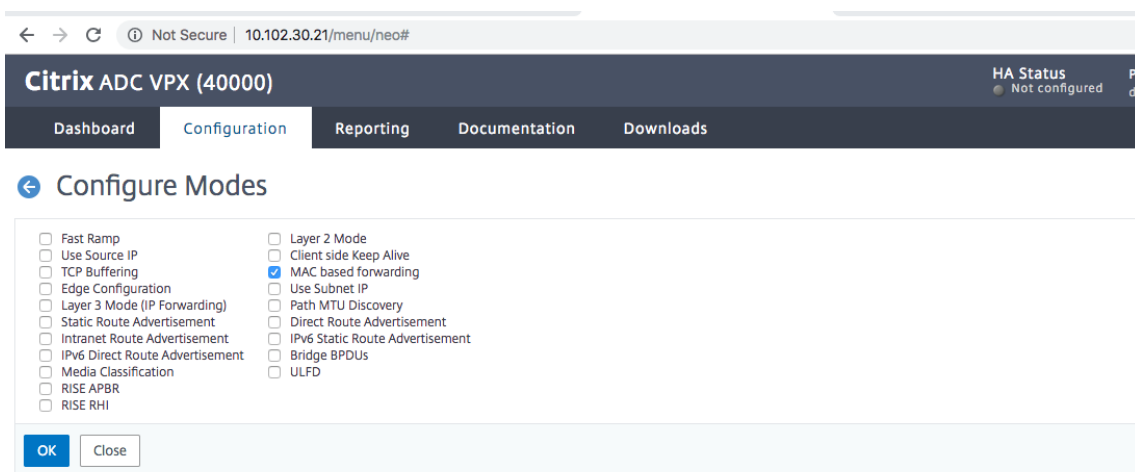

**Example:**

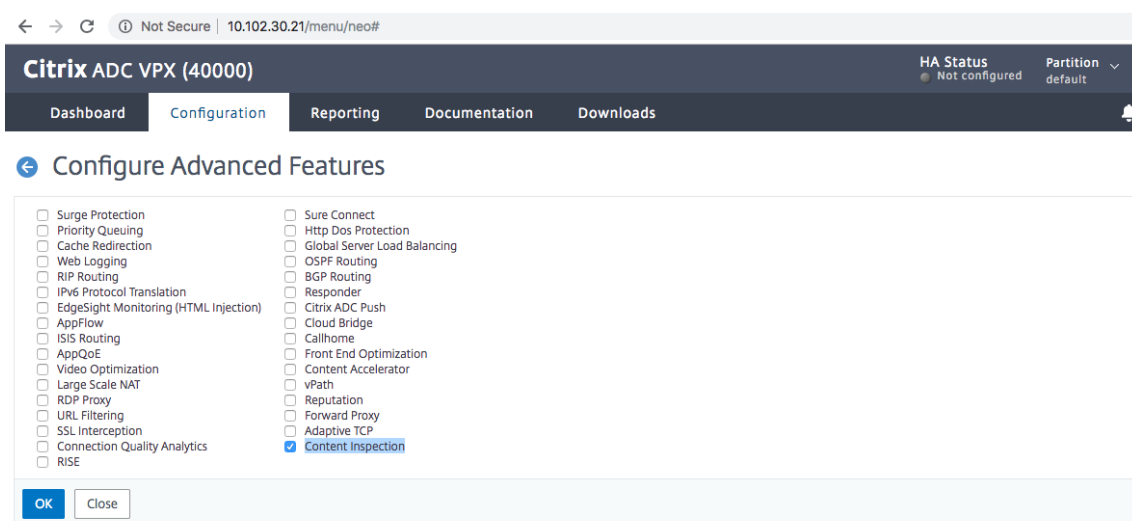

```
add contentInspection profile Inline_profile2 -type InlineInspection -  
ingressinterface "1/2" -egressInterface "1/3" -egressVlan 200 -ingressVlan  
400
```

**Configure inline service integration using the Citrix ADC GUI**

1. Log on to Citrix ADC appliance and navigate to **Configuration** tab page.
2. Navigate to **System > Settings > Configure Modes**.
3. In the **Configure Modes** page, select **Mac Based Forwarding**.
4. Click **OK** and **Close**.

5. Navigate to **System > Settings > Configure Advanced Features**.
6. In the **Configure Advanced Feature** page, select **Content Inspection**.
7. Click **OK** and **Close**.

8. Navigate to **Security > Content Inspection > ContentInspection Profiles**.
9. In the **ContentInspection Profiles** page, click **Add**.
10. In the **Create ContentInspection Profiles** page, set the following parameters.
  - a) Profile Name. Name of the content inspection profile.
  - b) Type. Select the profile type as inlineInspection.
  - c) Egress Interface. Interface through which the appliance sends traffic from Citrix ADC to the Inline device.
  - d) Ingress Interface. Interface through which the appliance receives traffic from Inline device to Citrix ADC.
  - e) Egress VLAN. Interface VLAN ID through which the traffic is sent to the Inline device.
  - f) Ingress VLAN. Interface VLAN ID through which the appliance receives traffic from Inline to Citrix ADC (if it is configured).

19. Click **Done**.
20. Navigate to **Traffic Management > Load Balancing > Virtual Servers**. Add a virtual server of type HTTP or SSL.
21. After entering the server details, click **OK** and again **OK**.
22. In the **Traffic Settings** section of Load Balancing Virtual Server, turn Layer 2 Parameters ON.
23. In the **Advanced Settings** section, click **Policies**.

24. Go the **Policies** section and click the “+” icon to configure content inspection policy.
25. On the **Choose Policy** page, select Content Inspection. Click **Continue**.
26. In the **Policy Binding** section, click **Add** to add a Content Inspection policy.

27. In the **Create ContentInspection Policy** page, enter a name for the Inline content inspection policy.
28. In the **Action** field, click **Add** to create an Inline content inspection action.
29. In the **Create CI Action** page, set the following parameters:
  - a) Name. Name of the content inspection Inline policy.
  - b) Type. Select the type as inlineInspection.
  - c) Server. Select the server/service as Inline devices.
  - d) If Server Down. Select an operation if server goes down.
  - e) Request Time-out. Select a time-out value. You can use default values.
  - f) Request Time-out Action. Select a time-out action. You can use default values.
30. Click **Create**.

31. Click **Create**.
32. In the **Create CI Policy** page, enter other details:
33. Click **OK** and **Close**.

## System

September 21, 2020

This section provides system-level information of the Citrix ADC. This includes a detailed explanation of system-level features, the scenarios in which the features can be used, the configuration steps, and examples to help you better understand the features.

- [Basic Operations](#)
- [Authentication and Authorization](#)
- [TCP Configurations](#)
- [HTTP Configurations](#)
- [SNMP](#)
- [Audit Logging](#)
- [Web Server Logging](#)
- [Call Home](#)
- [Reporting Tool](#)
- [CloudBridge Connector](#)

- [High Availability](#)
- [TCP Optimization](#)

## Basic operations

September 21, 2020

Any changes you make to the configuration of a Citrix ADC appliance are not saved automatically. You have to save the settings manually. When an appliance is restarted, it loads the latest saved configuration.

### View and save configurations

Configurations are stored in the `/nsconfig/ns.conf` directory. For configurations to be available across sessions, you must save the configuration after every configuration change.

To view the running configuration by using the command line interface

At the command prompt, type:

```
show ns runningConfig
```

To view the running configuration by using the GUI

- Navigate to **System > Diagnostics** and, in the **View Configuration group**, click **Running Configuration**.

To find the difference between two configuration files by using the command line interface

At the command prompt, type:

```
diff ns config <configfile> <configfile2>
```

To find the difference between two configuration files by using the GUI

- Navigate to **System > Diagnostics** and, in the **View Configuration group**, click **Configuration difference**.

To save configurations by using the command line interface

At the command prompt, type:

```
save ns config
```

To save configurations by using the GUI

On the **Configuration** tab, in the top-right corner, click the **Save** icon.

To view the saved configurations by using the command line interface

At the command prompt, type:

```
show ns ns.conf
```

To view the saved configurations by using the GUI

Navigate to **System > Diagnostics** and, in the **View Configuration** group, click **Saved Configuration**.

## Clear configuration

You have the following three options for clearing the Citrix ADC configuration.

**Basic level.** Clearing your configuration at the basic level clears all settings except the following:

- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions
- Feature and mode settings
- Default administrator password (nsroot)

**Extended level.** Clearing your configuration at the extended level clears all settings except the following:

- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions

Feature and mode settings revert to their default values.

**Full level.** Clearing your configuration at the full level returns all settings to their factory default values. However, the NSIP and default gateway are not changed, because changing them could cause the appliance to lose network connectivity.

To clear the configuration by using the command line interface

At the command prompt, type:

```
clear ns config -force
```

**Example:** To forcefully clear the basic configurations on an appliance.

```
1 clear ns config -force basic
2 <!--NeedCopy-->
```

To clear the configuration by using the GUI

- Navigate to **System > Diagnostics** and, in the Maintenance group, click **Clear Configuration** and select the configuration level to be cleared from the appliance.

## Clock synchronization

September 21, 2020

You can configure your Citrix ADC appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network.

You can configure clock synchronization on your appliance by adding NTP server entries to the `ntp.conf` file from either the GUI or the command line interface, or by manually modifying the `ntp.conf` file and then starting the NTP daemon (NTPD). The clock synchronization configuration does not change if the appliance is restarted, upgraded, or downgraded. However, the configuration does not get propagated to the secondary Citrix ADC in a high availability setup.

**Note:**

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site,

<http://www.ntp.org>, under Public Time Servers List. Before configuring your Citrix ADC to use a public NTP server, be sure to read the Rules of Engagement page (link included on all Public Time Servers pages).

In Citrix ADC release 11, the NTP version has been updated from 4.2.6p3 to 4.2.8p2.

### Set clock synchronization

To configure clock synchronization, you must add NTP servers and then enable NTP synchronization.

#### To add an NTP server by using the command line interface

At the command prompt, type the following commands to add an NTP server and verify the configuration:

- `add ntp server (<serverIP> | <serverName>)[-minpoll <positive_integer>]  
[-maxpoll <positive_integer>]`
- `show ntp server`

Example

```
> add ntp server 10.102.29.30 -minpoll 6 -maxpoll 11
```

#### To configure an NTP server by using the GUI

Navigate to **System > NTP Servers**, and create the NTP server.

Note:

You can now configure the time zone and the NTP server IP address required for clock synchronization through the first-time-user (FTU) screen.

## Start NTP daemon

When you enable NTP synchronization, the Citrix ADC starts the NTP daemon and uses the NTP server entries in the `ntp.conf` file to synchronize its local time setting. If you do not want to synchronize the appliance time with the other servers in the network, you can disable NTP synchronization, which stops the NTP daemon (NTPD).

### To enable NTP synchronization by using the command line interface

At the command prompt, type one of the following commands:

```
enable ntp sync
```

### To enable NTP synchronization by using the GUI

Navigate to **System > NTP Servers**, click **Action** and select NTP Synchronization.

## Configure clock synchronization

You can configure clock synchronization manually by logging on to the Citrix ADC appliance and editing the `ntp.conf` file.

### To enable clock synchronization on your Citrix ADC appliance by modifying the `ntp.conf` file

1. Log on to the command line interface.
2. Switch to the shell prompt.
3. Copy the `/etc/ntp.conf` file to `/nsconfig/ntp.conf`, unless the `/nsconfig` directory already contains an `ntp.conf` file.
4. For each NTP server you want to add, you must add the following two lines to the `/nsconfig/ntp.conf` file:

```
server <IP address for NTP server> iburst
```

```
restrict <IP address for NTP server> mask <netmask> nomodify notrap nopeer noquery
```

**Note:**

For security reasons, there should be a corresponding restrict entry for each server entry.

**Example:**

In the following example, an administrator has inserted # characters to “comment out” an existing NTP entry, and then added a new entry:

```
##server 1.2.3.4 iburst
##restrict 1.2.3.4 mask 55.255.255.255 nomodify notrap nopeer noquery
server 10.102.29.160 iburst
restrict 10.102.29.160 mask 255.255.255.255 nomodify notrap nopeer noquery
```

5. If the `/nsconfig` directory does not contain a file named `rc.netscaler`, create the file.

1. Add the following entry to `/nsconfig/rc.netscaler`: `/bin/sh /etc/ntpd_ctl full_start`

This entry starts the `ntpd` service, checks the `ntp.conf` file, and logs messages in the `/var/log` directory.

This process runs every time the Citrix ADC is restarted.

7. Restart the Citrix ADC appliance to enable clock synchronization. Or, to start the time synchronization process without restarting the appliance, enter the following commands at the shell prompt:

- `rm /etc/ntp.conf`
- `ln -s /nsconfig/ntp.conf /etc/ntp.conf`
- `/bin/sh /etc/ntpd_ctl full_start`

## Session timeout

September 21, 2020

A session timeout interval is provided to restrict the time duration for which a session (GUI, CLI, or API) remains active when not in use. For the Citrix ADC, the system session timeout can be configured at the following levels:

- **User level timeout.** Applicable to the specific user.

| Interface type | Time out configuration                                                                                               |
|----------------|----------------------------------------------------------------------------------------------------------------------|
| GUI            | Navigate to System > User Administration > Users, select a user, and edit the user's timeout setting.                |
| CLI            | At the command prompt, enter the following command: <code>set system user &lt;name&gt; - timeout &lt;secs&gt;</code> |

- **User group level timeout.** Applicable to all users in the

| Interface type | Time out configuration                                                                                                     |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| GUI            | Navigate to System > User Administration > Groups, select a group, and edit the group's timeout setting.                   |
| CLI            | At the command prompt, enter the following command: <code>set system group &lt;groupName&gt; - timeout &lt;secs&gt;</code> |

- **Global system timeout.** Applicable to all users and users from groups who do not have a timeout configured.

| Interface type | Time out configuration                                                                                        |
|----------------|---------------------------------------------------------------------------------------------------------------|
| GUI            | Navigate to System > Settings, click Change global system settings, and update the timeout value as required. |
| CLI            | At the command prompt, enter the following command: <code>set system parameter - timeout &lt;secs&gt;</code>  |

The timeout value specified for a user has the highest priority. If timeout is not configured for the user, the timeout configured for a member group is considered. If timeout is not specified for a group (or the user does not belong to a group), the globally configured timeout value is considered. If timeout is not configured at any level, the default value of 900 seconds is set as the system session timeout.

Additionally, you can specify timeout durations for each of the interfaces you are accessing. However, the timeout value specified for a specific interface is restricted to the timeout value configured for the

user that is accessing the interface. For example, let us consider an user "publicadmin" who has a timeout value of 20 minutes. Now, when accessing an interface, the user must specify a timeout value that is within 20 minutes.

**Note:**

You can choose to keep a check on the minimum and maximum timeout values by specifying the timeout as restricted (in CLI by specifying the *restrictedTimeout* parameter). This parameter is provided to account for previous Citrix ADC versions where the timeout value was not restricted.

- When enabled, the minimum configurable timeout value is 5 minutes (300 secs) and the maximum value is 1 day (86400 secs). If the timeout value is already configured to a value larger than 1 day, when this parameter is enabled, you are prompted to change it. If you do not change the value, the timeout value will automatically be reconfigured to the default timeout duration of 15 minutes (900 secs) on next reboot. The same will happen is the configured timeout value is less than 5 minutes.
- When disabled, the configured timeout durations are considered.

To configure the timeout duration at each interface:

| Interface type | Time out configuration                                                                                                          |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| CLI            | Specify the timeout value on the command prompt by using the following command: <code>set cli mode -timeout &lt;secs&gt;</code> |
| API            | Specify the timeout value in the login payload.                                                                                 |

## System date and time

July 20, 2021

The Time Zone settings enables you to set the date and time for the Citrix ADC appliance. When you set your time zone, you must configure the same local time and date in Citrix ADC GUI and CLI. To change the local time zone, you must use the shell interface to the underlying FreeBSD OS. However, to view the system date and time, you can use the command line interface or the GUI.

### To view the system date and time by using the command line interface

At the command prompt, type:

```
show ns param
```

## Sample configuration

```

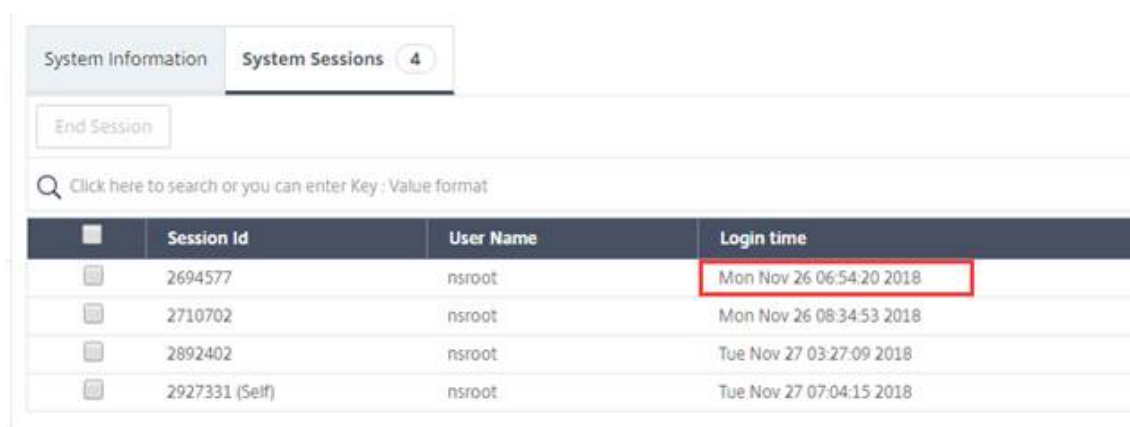

1 > show nsparam
2 Timezone: GMT+06:54-CST-Asia/Shanghai
3 <!--NeedCopy-->

```

## View system date and time by using the Citrix ADC GUI

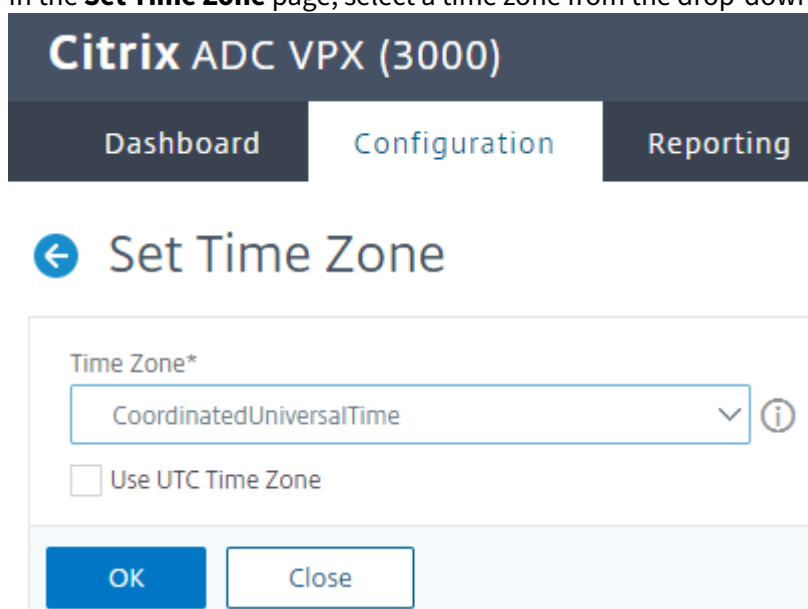

Follow the procedure given below to view the system date and time.

1. Sign into Citrix ADC and navigate to **System > Settings > Change Time Zone**.

|  | Session Id     | User Name | Login time               |
|--|----------------|-----------|--------------------------|
|  | 2694577        | nsroot    | Mon Nov 26 06:54:20 2018 |
|  | 2710702        | nsroot    | Mon Nov 26 08:34:53 2018 |
|  | 2892402        | nsroot    | Tue Nov 27 03:27:09 2018 |
|  | 2927331 (Self) | nsroot    | Tue Nov 27 07:04:15 2018 |

2. In the **Set Time Zone** page, select a time zone from the drop-down list.

**Citrix ADC VPX (3000)**

Dashboard Configuration Reporting

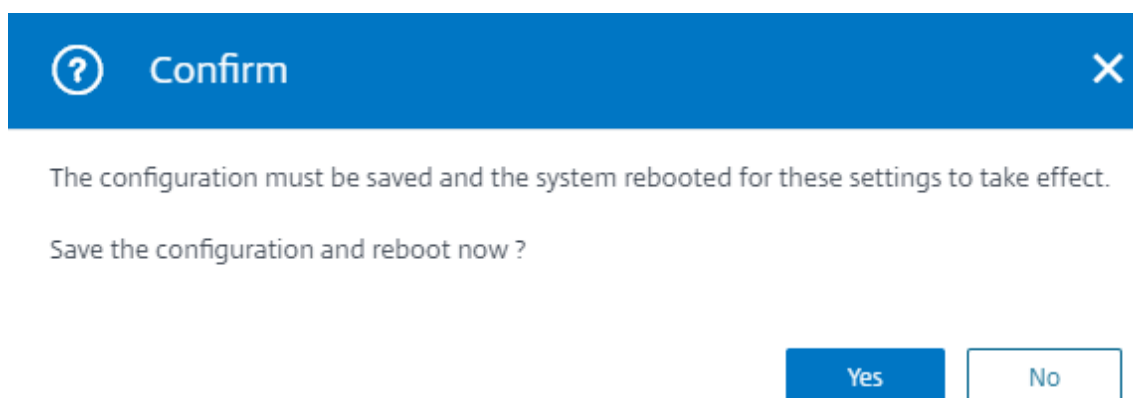

### ← Set Time Zone

Time Zone\*

CoordinatedUniversalTime

Use UTC Time Zone

3. Click **OK**.
4. The system asks you to confirm if the configuration must be saved and the system must be re-booted for the new time zone settings to take effect.

5. Click **Yes**.

## Backup and restore a Citrix ADC appliance

October 14, 2020

When your appliance gets corrupted or needs an upgrade, you can back up your system configuration. This is done either through the Citrix CLI or GUI interface. The appliance also enables you to import the backup file from an external source. However, you can do this only through the GUI interface and there is no support through the CLI interface.

### Points to remember

You must remember the following points when your backup and restore your appliance.

- There must be a support for network configuration on a new platform.
- The new platform build must be same as the backup file or a later version.

### Back up a Citrix ADC appliance

Depending on data and backup requirement, you can create a “basic” backup or a “full” backup.

- **Basic backup.** You can perform this type of backup if you want to back up files that constantly change. The files that you can back up are in the following table.

For information about the basic backup details, see the [Table](#) topic.

- **Full backup.** In addition to the files that are backed up by a basic backup, a full backup has less frequently updated files. The files that are backed up when you use the “Full” backup option are:

| Directory | Sub-Directory or Files                                                                              |
|-----------|-----------------------------------------------------------------------------------------------------|
| nsconfig  | ssl, license, fips*                                                                                 |
| /var/     | netscaler/ssl/, wi-<br>java_home/jre/lib/security/cacerts/, wi-<br>java_home/lib/security/cacerts/* |

The backed-up data is stored as a compressed TAR file in the `/var/ns_sys_backup/` directory. To avoid issues due to non-availability of disk space, you can store up to 50 backup files in this directory. You can use the `rm system backup` command to delete existing backup files and create more backups.

**Note:**

When the backup operation is in progress, do not execute commands that affect the configuration.

If a file that is required to be backed up is not available, the operation skips that file.

### To back up a Citrix ADC appliance

Follow the procedure given below to back up a Citrix ADC appliance by using the Citrix ADC command line interface.

At the command prompt, do the following:

1. Save the Citrix ADC configurations.

```
save ns config
```

1. Create the backup file.

```
create system backup [<fileName>] -level <basic | full> -comment <string>
```

**Note:**

If the file name is not specified, the appliance creates a TAR file with the following naming convention: `backup_<level>_<nsip_address>_<date-timestamp>.tgz`.

**Example:** To back up the full appliance using the default naming convention for the backup file.

```
> create system backup -level full
```

1. Verify that the backup file was created.

```
show system backup
```

You can view properties of a specific backup file by using the `fileName` parameter.

## Restore a Citrix ADC appliance

### Important:

You cannot successfully restore your appliance, if you rename or modify your backup file.

When you restore your appliance, the restore operation untars the backup file from the `/var/ns_sys_backup/` directory. Once the files are untarred, the files are copied to the respective directories.

### To restore the Citrix ADC from a local backup file by using the command line interface

**Note:** Citrix recommends you to back up the current configuration before restoring a previous configuration. However, if you do not want the restore command to automatically create a backup of the current configuration, use the `-skipBackup` parameter.

At the command prompt, do the following:

1. Obtain a list of the backup files available on the appliance.

```
show system backup
```

2. Restore the appliance by specifying one of the backup files.

```
restore system backup <filename> [-skipBackup]
```

**Example:** To restore by using a full backup of an appliance

```
> restore system backup backup_full_<nsip_address>_<date-timestamp>.tgz
```

3. Reboot the appliance.

```
reboot
```

### To backup and restore a Citrix ADC appliance by using the GUI

1. Navigate to **System > Backup and Restore**.

## Welcome to Backup and Restore

The backup and restore functionality of the NetScaler appliance restores configurations to the previous state.

To create a backup, click the "**Backup...**" link shown below. \

Backup/Import

2. Click **Backup/Import** to start the process.
3. In the **Backup/Import** page, select **Create** and set the following parameters.
  - a) File Name. Name of the appliance backup file.
  - b) Level. Select a backup level as basic or full.
  - c) Comment. Provide a brief description for the backup.
4. Click **Backup**.

For more information on how to backup and restore Citrix ADC instances, see [Backup and Restore using Citrix ADM](#) topic.

For more information on how to backup and restore an SDX appliance, see [Backup and restore SDX appliance](#)

For information about operations performed on system backup, see [System Backup](#) topic.

## Restart or shut down

July 20, 2021

The Citrix ADC appliance can be remotely restarted or shut down from the available user interfaces. When a standalone Citrix ADC appliance is restarted or shut down, the unsaved configurations (configurations performed since the last `save ns config` command was issued) are lost.

In a high availability setup, when the primary appliance is rebooted/shut down, the secondary appliance takes over and becomes the primary. The unsaved configurations from the old primary are available on the new primary appliance.

You can also restart the appliance by only rebooting the Citrix ADC software and not rebooting the underlying operating system. This is called a warm reboot. For example, when you add a new license or change the IP address, you can warm reboot the Citrix ADC appliance for these changes to take place.

### Note

Warm reboot can be performed only on nCore appliances.

To restart by using the command line interface

At the command prompt, type:

```
reboot [-warm]
```

To restart the Citrix ADC by using the GUI

1. In the GUI, click Reboot on the home page of the Configuration tab.
2. When prompted to reboot, select Save configuration to make sure that you do not lose any configurations.

### Note:

You can perform a warm reboot by selecting Warm reboot.

To shut down the Citrix ADC by using the command line interface

At the command prompt, type:

- **shutdown -p now:** Shuts down the software and switches off the Citrix ADC . To restart Citrix ADC MPX, press the AC power switch. To Restart Citrix ADC VPX , restart the VPX instance.
- **shutdown -h now:** Shuts down the software and leaves the Citrix ADC switched on. Press any key to restart the Citrix ADC. This command does not switch off the Citrix ADC. Therefore, do not switch off the AC power or remove the AC power cables.

**Note:**

The appliance cannot be shut down from the GUI.

## Generate technical support bundle

September 21, 2020

For help with analyzing and resolving any issues with a Citrix ADC appliance, you can generate a technical support bundle on the appliance and send the bundle to Citrix Technical Support. The Citrix ADC technical support bundle is a gzipped tar archive of system configuration data and statistics. It collects the following data from the Citrix ADC appliance on which you generate the bundle:

- **Configuration files.** All files in the `/flash/nsconfig` directory.
- **Newslog files.** The currently running newslog and some previous files. To minimize the archive file size, newslog collection is restricted to 500 MB, 6 files, or 7 days, whichever occurs first. If older data is needed, it might require manual collection.
- **Log files.** Files in `/var/log/messages`, `/var/log/ns.log`, and other files under `/var/log` and `/var/nslog`.
- **Application core files.** Files created in the `/var/core` directory within the last week, if any.
- **Output of some CLI show commands.**
- **Output of some CLI stat commands.**
- **Output of BSD shell commands.**

You can use a single command to generate the technical support bundle and securely upload it to the Citrix Technical Support server. To upload, you must specify your Citrix credentials. When you generate the bundle, you can specify the case or service request number that was allotted to you by Citrix Technical Support. If you have already generated a technical support bundle, you can upload the existing archive file to the Citrix Technical Support server by specifying the file name with the full path.

The technical support bundle is saved on the Citrix ADC appliance in an archive at the following location:

```
/var/tmp/support/support.tgz
```

The above path is a symlink to the most recent collector for easy access. The full filename varies, depending on the deployment topology, but generally follows a format similar to:

```
collector_<P/S>_<NS IP>_<DateTime>.tgz.
```

If your Citrix ADC appliance does not have direct Internet connectivity, you can use a proxy server to directly upload the technical support bundle to the Citrix Technical Support server. The basic format of the proxy string is:

```
proxy_IP:<proxy_port>
```

If the proxy server requires authentication, the format is:

```
username:password@proxsy_IP:<proxy_port>
```

#### Note

For Citrix ADC appliances in a high availability pair, you must generate the technical support bundle on each of the two nodes.

For Citrix ADC appliances in a Cluster setup, you can generate the technical support bundle on each node individually, or you can generate smaller abbreviated archives for all nodes by using the cluster IP address.

For Citrix ADC Admin Partitions, you must generate the technical support bundle from the default admin partition. To get the technical support bundle for a specific partition, you must specify the name of the partition for which you want to generate the technical support bundle. If you do not specify the name of the partition, data is collected from all admin partitions.

To generate the Citrix ADC technical support bundle by using the command line interface

At the command prompt, type:

```
show techsupport [-scope <scope> <partitionName>] [-upload [-proxy <string>] [-casenumber <string>] [-file <string>] [-description <string>] [-userName <string> -password ]]
```

| Sr. No | Task                                                                                     | Command                                                      |
|--------|------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| 1      | Generate and upload the technical support bundle to the Citrix Technical Support server. | show techsupport -upload -userName account1 -password xxxxxx |

| Sr. No | Task                                                                                                                        | Command                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 2      | Generate and upload the technical support bundle to the Citrix Technical Support server through a proxy server              | <code>show techsupport -upload -proxy 1.1.1.1:80 -userName account1 -password xxxxxxx</code>                             |
| 3      | Upload an existing technical support bundle to the Citrix Technical Support server.                                         | <code>show techsupport -upload -file,/var/tmp/support/collector_P_10.102.29. -userName account1 -password xxxxxxx</code> |
| 4      | Generate small, abbreviated archives for all nodes in a Cluster setup. Execute this command by using the cluster IP address | <code>show techsupport -scope CLUSTER</code>                                                                             |
| 5      | Generate a technical support bundle specific to an admin partition. Execute this command on the default admin partition.    | <code>show techsupport -scope PARTITION partition1</code>                                                                |

## Extra management CPU

September 21, 2020

If you need better performance for configuration and monitoring of a Citrix ADC MPX appliance, you can allocate an extra management CPU from the appliance's packet engine pool. This feature is supported on certain Citrix ADC MPX models and all VPX models except the VPX instances that run on Citrix ADC SDX appliances. It affects the output of the `stat system cpu` and `stat system` commands.

Supported Citrix ADC MPX models:

- 25xxx
- 22xxx
- 14xxx
- 115xx
- 15xxx
- 26xxx

**Note**

For Citrix ADC MPX 26xxx models with more than 20 cores, the mandatory extra management CPU feature is enabled by default. For Citrix ADC VPX models, a license that supports at least 12 vCPUs is required to enable this feature.

**Allocate or deallocate an extra management CPU by using the Citrix ADC CLI**

At the command prompt, type one of the following commands:

- `enable extramgmtcpu`
- `disable extramgmtcpu`

**Note**

After you enable and disable this feature, the Citrix ADC appliance displays a warning to restart the appliance, for the changes to take effect.

To show the configured and effective state of an extra management CPU.

At the command prompt, type:

```
1 `show extramgmtcpu`
```

**Example**

```
1 > show extramgmtcpu
2
3
4 ConfiguredState:  ENABLED EffectiveState:  ENABLED
5 <!--NeedCopy-->
```

**Note**

In this example, the show command is entered before restarting the appliance.

**Parameter descriptions of commands listed in the command line interface**

- `enable extramgmtcpu`

Enables and dedicates extra CPU for management from PE pool.

See also:

`disable system extramgmtcpu`

`show system extramgmtcpu`

- **`disable extramgmtcpu`**

Disables extra CPU for management and returns it to the PE pool.

See also:

```
enable system extramgmtcpu
```

```
show system extramgmtcpu
```

- **show extramgmtcpu**

Displays configured and effective states of the extra management CPU.

Configured and effective state are different if enable extramgmtcpu command has been entered but system is has not been restarted.

See also:

```
enable system extramgmtcpu
```

```
disable system extramgmtcpu
```

### Allocate an extra management CPU by using the GUI

To allocate an extra management CPU by using the GUI, navigate to **System > Settings** and click **Configure Extra Management CPU**. From the **Configured State** drop-down menu, select **Enabled** and then select **OK**.

The screenshot shows the Citrix ADC GUI navigation bar with 'Dashboard', 'Configuration', 'Reporting', and 'Documentation' tabs. Below the navigation bar is the 'Configure Extra Management CPU' dialog box. The dialog box contains the following information:

- Effective State: **ENABLED**
- Configured State\*: **ENABLED** (highlighted with a red box)
- Buttons: **OK** and **Close**

To check CPU usage, go to **System > Settings > Dashboard**.

## Configure an extra management CPU by using the NITRO API

Use the following NITRO methods and formats to enable, disable, and show an extra management CPU.

### To enable an extra management CPU:

HTTP Method: POST

URL: `http://<NSIP>/nitro/v1/config/systemextramgmtcpu?action=enable`

Payload: `{ "systemextramgmtcpu":{ } }`

```
1 curl -v -X POST -H "Content-Type: application/json" -u nsroot:
   nsroot http://10.102.201.92/nitro/v1/config/systemextramgmtcpu?
   action=enable -d '{
2  "systemextramgmtcpu":{
3  }
4  }
5  '
6 <!--NeedCopy-->
```

### To disable an extra management CPU

HTTP Method: POST

URL: `http://<NSIP>/nitro/v1/config/systemextramgmtcpu?action=disable`

```
1 Payload: {
2  "systemextramgmtcpu":{
3  }
4  }
5
6
7 curl -v -X POST -H "Content-Type: application/json" -u nsroot:
   nsroot http://10.102.201.92/nitro/v1/config/systemextramgmtcpu?
   action=disable -d '{
8  "systemextramgmtcpu":{
9  }
10 }
11 '
12 <!--NeedCopy-->
```

### To show an extra management CPU

HTTP Method: GET

URL: `http://<NSIP>/nitro/v1/config/systemextramgmtcpu`

### Example

```
1 curl -v -X GET -H "Content-Type: application/json" -u nsroot:nsroot
   http://10.102.201.92/nitro/v1/config/systemextramgmtcpu
2 <!--NeedCopy-->
```

## Statistics and monitoring

The following examples show the differences in the output of the `stat system cpu` and `stat system` commands before and after adding an extra management CPU.

1. `stat system cpu`

This command displays statistics of CPUs.

Here is a sample output before adding an extra management CPU on one of the supported models.

Example output

```
1 > stat system cpu
2
3 CPU statistics
4
5 ID          Usage
6
7 8            1
8
9 7            1
10
11 11           2
12
13 1            1
14
15 6            1
16
17 9            1
18
19 3            1
20
21 5            1
22
23 4            1
24
25 10           1
26
27 2            1
28 <!--NeedCopy-->
```

Here is the output after adding an extra management CPU on the same MPX appliance.

```
1 > stat system cpu
2
3 CPU statistics
4
5 ID          Usage
6
7 9           1
8
9 7           1
10
11 5           1
12
13 8           1
14
15 11          2
16
17 10          1
18
19 6           1
20
21 4           1
22
23 3           1
24
25 2           1
26 <!--NeedCopy-->
```

## 2. stat system

This command displays CPU use. In the following example, the output before adding an extra management CPU on one of the supported models is:

Mgmt Additional-CPU usage (%) 0.00

Example output

```
1 > stat system
2
3 Citrix ADC Executive View
4
5 System Information:
6
7 Up since          Wed Oct 11 11:17:54 2017
8
9 /flash Used (%)  0
```

```
10
11     Packet CPU usage (%)           1.30
12
13     Management CPU usage (%)       4.00
14
15     Mgmt CPU0 usage (%)            4.00
16
17     Mgmt Additional-CPU usage (%)   0.00
18
19     Memory usage (MB)               2167
20
21     InUse Memory (%)                5.76
22
23     /var Used (%)                   0
24 <!--NeedCopy-->
```

In the following example, the output after adding an extra management CPU on the same MPX appliance is:

Mgmt Additional-CPU usage (%) 0.80

```
1     > stat system
2
3     Citrix ADC Executive View
4
5     System Information:
6
7     Up since      Wed Oct 11 11:55:56 2017
8
9     /flash Used (%)           0
10
11     Packet CPU usage (%)      1.20
12
13     Management CPU usage (%)   5.70
14
15     Mgmt CPU0 usage (%)        10.60
16
17     Mgmt Additional-CPU usage (%) 0.80
18
19     Memory usage (MB)         1970
20
21     InUse Memory (%)          5.75
22
23     /var Used (%)             0
24
```

## Configure HTTP and HTTPS management ports

September 21, 2020

In a single-IP mode deployment of a Citrix ADC appliance, a single IP address is used as NSIP, SNIP, and VIP addresses. This single IP address uses different port numbers to function as NSIP, SNIP, and VIP addresses.

Port numbers 80 and 443 are well-known ports for HTTP and HTTPS services. Earlier, port 80 and 443 of Citrix ADC IP address (NSIP) were dedicated ports for internal HTTP and HTTPS management services. Because these ports were reserved for internal services, you cannot use these well-known ports for providing HTTP and HTTPS data services from a VIP address, which has the same address as the NSIP address in a single-IP mode deployment.

To address this requirement, you can now configure ports for internal HTTP and HTTPS management services (of the NSIP address) other than port 80 and 443.

The following lists the default port numbers for internal HTTP and HTTPS management services in Citrix ADC MPX, VPX, and CPX appliances:

- Citrix ADC MPX and VPX appliances: 80 (HTTP) and 443 (HTTPS)
- Citrix ADC CPX appliances: 9080 (HTTP) and 9443 (HTTPS)

### Configure HTTP and HTTPS management ports

You can configure HTTP and HTTPS ports to any value on a Citrix ADC appliance to support HTTP and HTTPS management service. However, by default, the Citrix ADC appliance uses 80 and 443 ports for HTTP and HTTPS connection.

At the command prompt, type:

```
set ns param -mgmtHttpPort<port>
```

#### Example:

```
set ns param -mgmtHttpPort 2000
```

To configure HTTPS port by using the command interface

At the command prompt, type:

```
set ns param -mgmtHttpsPort<port>
```

#### Example:

```
set ns param -mgmtHttpsPort 3000
```

## Configure HTTP and HTTPS management ports by using Citrix ADC GUI

Follow the steps given below to configure HTTP and HTTPS port values:

1. Navigate to **System > settings > Change global system settings**.
2. In **Configure Global System Settings Parameters** page, under **Other Setting** section, set the following parameters.
  - a) Management HTTP Port. set port value to 2000. Default = 80, Min = 1, Max = 65534.
  - b) Management HTTPS Port. set port value to 3000. Default = 443, Min = 1, Max = 65534.

### ← Configure Global System Settings Parameters

The screenshot shows the 'Configure Global System Settings Parameters' page in the Citrix ADC GUI. The 'Other Settings' section is expanded, showing several configuration fields. The 'Management HTTP Port' and 'Management HTTPS Port' fields are highlighted with a red box. The 'Management HTTP Port' field contains the value '2000' and the 'Management HTTPS Port' field contains the value '3000'. Other visible fields include 'Idle Session Timeout (secs)' set to '900', 'Secure ICA port(s)' set to '443', and 'ICA port(s)' set to 'No items'.

## How to collect technical support bundle from a Citrix ADC VPX and SDX appliances

September 21, 2020

A Citrix ADC appliance has a built-in mechanism to collect log files. The log files are in turn sent to Citrix Insight Services for analysis.

**Note:** All procedures are applicable for software release 9.2 or later.

### Download technical support bundle from Citrix ADC MPX and VPX appliances

To run a collector file by using the Citrix ADC GUI, you must complete the following procedure:

**Note:**

The procedure is applicable for software release 9.2 or later.

1. Navigate to **System > Diagnostic**.
2. In the **Technical Support Tools** section, click **Generate Support File** link.
3. In the **Tech Support** page, set the following parameters:
  - a) Scope. To collect data from one or more nodes.
  - b) Partition. Name of the partition.
  - c) Citrix Technical Support pload Options. Set all options such as proxy server, service case number, collector archive file name. and a brief description of the archive file for uploading the technical support bundle.
  - d) Citrix Account. Enter your Citrix credentials.
4. Click **Run**.
5. The Technical Support bundle is generated.
6. Click **Yes** to download the Technical support bundle to your local desktop.

### **Obtain technical support bundle by using the command interface**

1. Download the file from the appliance using a Secure FTP (SFTP) or Secure Copy (SCP) utility, such as WinSCP, and upload it to Citrix Insight Services for analysis.

**Note:**

In Citrix ADC software release earlier than 9.0, the collector script must be downloaded separately and executed.

> `show techsupport -scope CLUSTER`

1. This collects show techsupport information from all nodes in the cluster and compress the files into a single archive.
2. After the appliance generates the collector archive the location of the file is displayed as shown in the following screenshot.

```
TEST> sh techsupport

showtechsupport data collector tool - $Revision: #1 $!
NetScaler version 9.2
The NS IP of this box is ...
Current HA state: Primary (or this is not part of HA pair!)
This tool was just run in the last one minute!
The data in this directory will be overwritten!
All the data will be collected under
/var/tmp/support/collector_10_104_00_00_P_21Nov2013_19_50
Copying selected configuration files from nsconfig ....
Running shell commands ....
Running CLI show commands ....
Running CLI stat commands ....
Running vtysh commands ....
```

The file is stored in `/var/tmp/support` and you can verify it by logging into a Citrix ADC appliance and running the following command from a shell prompt.

```
root@NS## cd /var/tmp/support/
root@NS## ls -l
```

### Obtain diagnostic bundle from Citrix ADC SDX

1. Open the Citrix SDX GUI.
2. Expand the **Diagnostics** node.
3. Select the **Technical Support** node.
4. Click Generate Technical Support File.
5. Select **Appliance** (Including Instances) from the drop-down menu.
6. Click **Add**.
7. Select one or more instances to add in.
8. Click **OK**. Wait for the process to complete.
9. Select the bundle name that was generated and then click **Download**
10. Upload the bundle file to [Citrix Insight Services](#).

## Authentication and authorization

September 21, 2020

To configure Citrix ADC authentication and authorization, you must first define the users who have access to the Citrix ADC appliance, and then you can organize these users into groups. After configuring users and groups, you need to configure command policies to define types of access, and assign the policies to users and/or groups.

You must log on as an administrator to configure users, groups, and command policies. The default Citrix ADC administrator user name is *nsroot*. After logging on as the default administrator, you should change the password for the *nsroot* account. Once you have changed the password, no user can access the Citrix ADC appliance until you create an account for that user. If you forget the administrator password after changing it from the default, you can reset it to *nsroot*.

**Note**

Local users can authenticate to the Citrix ADC even if external authentication servers are configured. You can restrict this by disabling the *localAuth* parameter of the *set system parameter* command.

## Configuring users, user groups, and command policies

October 21, 2020

Define your users by configuring accounts for them. To simplify the management of user accounts, you can organize them into groups. You can create command policies, or use built-in command policies, to regulate user access to commands.

You can also customize the command-line prompt for a user. Prompts can be defined in a user's configuration, in a user-group configuration, and in the global system configuration settings. The prompt displayed for a given user is determined by the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user's group.
3. Display the prompt as defined in the system global configuration settings.

You can now specify a timeout value for inactive CLI sessions for a system user. If a user's CLI session is idle for a time that exceeds the timeout value, the Citrix ADC appliance terminates the connection. The timeout can be defined in a user's configuration, in a user-group configuration, and in the global system configuration settings. The timeout for inactive CLI sessions for a user is determined by the following order of precedence:

1. User's configuration.
2. TGroup configuration for the user's group.
3. Global system configuration settings.

A Citrix ADC root administrator can configure the maximum concurrent session limit for system users. By restricting the limit, you can reduce the number of open connections and improve server performance. As long as the CLI count is within the configured limit, concurrent users can log on the GUI any number of times. However, if the number of CLI sessions reaches the configured limit, users can no longer log on to the GUI. For example, if the number of concurrent sessions is configured to 20, concurrent users can log on to 19 CLI sessions. But if the user is logged on to the 20th CLI session, any attempt to log on to the GUI, CLI, or NITRO results in an error message ((ERROR: Connection limit to CFE exceeded).

**Note:**

The default the number of concurrent sessions is configured to 20 and the maximum number of concurrent sessions is configured to 40.

## Configuring user accounts

To configure user accounts, you simply specify user names and passwords. You can change passwords and remove user accounts at any time.

**Note:**

All characters in a password are not accepted. However, it works if you type the characters within quotes.

Also, the string must not exceed a maximum length of 127 characters.

To create a user account by using the command line interface

At the command prompt, type the following commands to create a user account and verify the configuration:

- `add system user <username> [-externalAuth ( ENABLED | DISABLED )] [-promptString <string>] [-timeout \<secs>] [-logging ( ENABLED | DISABLED )] [-maxsession <positive_integer>]`
- `show system user <userName>`

External users can configure the “logging” parameter to collect external logs using the web logging or audit logging mechanism. If the parameter is enabled, the auditing client authenticates itself with the Citrix ADC appliance to collect logs.

**Example:**

```
> add system user johnd -promptString user-%u-at-%T
```

```
1 Enter password:
2
3 Confirm password:
```

```
4
5 > show system user johnd
6
7 user name: john
8
9     Timeout:900 Timeout Inherited From: Global
10
11     External Authentication: ENABLED
12
13     Logging: DISABLED
14
15     Maximum Client Sessions: 20
16 <!--NeedCopy-->
```

### To configure a user account by using the GUI

Navigate to **System > User Administration > Users**, and create the user.

### Configuring user groups

After configuring a user group, you can easily grant the same access rights to everyone in the group. To configure a group, you create the group and bind users to the group. You can bind each user account to more than one group. Binding user accounts to multiple groups might allow more flexibility when applying command policies.

### To create a user group by using the command line interface

At the command prompt, type the following commands to create a user group and verify the configuration:

- `add system group <groupName> [-promptString <string>] [-timeout <secs>]`
- `show system group <groupName>`

#### Example:

```
> add system group Managers -promptString Group-Managers-at-%h
```

### To bind a user to a group by using the command line interface

At the command prompt, type the following commands to bind a user account to a group and verify the configuration:

- `bind system group <groupName> -userName <userName>`

- `show system group <groupName>`

**Example:**

```
bind system group Managers -userName user1
```

**To configure a user group by using the GUI**

Navigate to **System > User Administration > Groups**, and create the user group.

**Note:**

To add members to the group, in the Members section, click **Add**. Select users from the available list and add them to the configured list.

**Configuring command policies**

Command policies regulate which commands, command groups, virtual servers, and other entities that users and user groups are permitted to use.

The appliance provides a set of built-in command policies, and you can configure custom policies. To apply the policies, you bind them either to users or to groups.

Here are the key points to keep in mind when defining and applying command policies.

- You cannot create global command policies. Command policies must be bound directly to the users and groups on the appliance.
- Users or groups with no associated command policies are subject to the default (DENY-ALL) command policy, and are therefore unable to run any configuration commands until the proper command policies are bound to their accounts.
- All users inherit the policies of the groups to which they belong.
- You must assign a priority to a command policy when you bind it to a user account or group account. It enables the appliance to determine which policy has priority when two or more conflicting policies apply to the same user or group.
- The following commands are available by default to any user and are unaffected by any command you specify:
  - help, show CLI attribute, set CLI prompt, clear CLI prompt, show CLI prompt, alias, unalias, history, quit, exit, whoami, config, set CLI mode, unset CLI mode, and show CLI mode.

**Built-in Command Policies**

The following table describes the built-in policies.

| Policy name | Allows                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| read-only   | Read-only access to all show commands except show ns runningConfig, show ns ns.conf, and the show commands for the Citrix ADC command group.                                                                                                                                                                                                                                                           |
| operator    | Read-only access and access to commands to enable and disable services and servers.                                                                                                                                                                                                                                                                                                                    |
| network     | Full access, except to the set and unset SSL commands, show ns ns.conf, show ns runningConfig, and show gslb runningConfig commands.                                                                                                                                                                                                                                                                   |
| sysadmin    | [Included in Citrix ADC 12.0 and later] A sysadmin is lower than a superuser in terms of access allowed on the appliance. A sysadmin user can perform all Citrix ADC operations with the following exceptions: no access to the Citrix ADC shell, cannot perform user configurations, cannot perform partition configurations, and some other configurations as stated in the sysadmin command policy. |
| superuser   | Full access. Same privileges as the administrator.                                                                                                                                                                                                                                                                                                                                                     |

### Creating custom command policies

Regular expression support is offered for users with the resources to maintain more customized expressions, and for those deployments that require the flexibility that regular expressions offer. For most users, the built-in command policies are sufficient. Users who need more levels of control but are unfamiliar with regular expressions might want to use only simple expressions. You can see the examples provided in this section, to maintain policy readability.

When you use a regular expression to create a command policy, keep the following in mind.

- When you use regular expressions to define commands that is affected by a command policy, you must enclose the commands in double quotation marks. For example, to create a command policy that includes all commands that begin with show, type the following:
  - “^show.\*\$”
- To create a command policy that includes all commands that begin with rm, type the following:
  - “^rm.\*\$”

- Regular expressions used in command policies are not case sensitive.

The following table lists examples of regular expressions:

| Command specification                     | Matches these commands                                                                                                                                                                        |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>“^rm\s+.*\$”</code>                 | All remove actions, because all remove actions begin with the rm string, followed by a space and more parameters such as command groups, command object types, and arguments.                 |
| <code>“^show\s+.*\$”</code>               | All show commands, because all show actions begin with the show string, followed by a space and more parameters such as command groups, command object types, and arguments.                  |
| <code>“^shell\$”</code>                   | The shell command alone, but not combined with any additional parameters such as command groups, command object types, and arguments.                                                         |
| <code>“^add\s+vserver\s+.*\$”</code>      | All create virtual server actions, which consist of add virtual server command followed by a space and more parameters such as command groups, command object types, and arguments.           |
| <code>“^add\s+(lb\s+vserver)\s+.*”</code> | All create lb virtual server actions, which consist of the add lb virtual server command followed by a space and more parameters such as command groups, command object types, and arguments. |

For information about built-in command policies, see table [Built-in command policy](#) table.

To create a command policy by using the command line interface

At the command prompt, type the following commands to create a command policy and verify the configuration:

- `add system cmdPolicy <policyname> <action> <cmdspec>`
- `show system cmdPolicy <policyName>`

Example

**Example:**

```
add system cmdPolicy USER-POLICY ALLOW (server )|(service(Group)* )|(
vserver )|(policy)|(policylabel )|(limitIdentifier)|(^show (?!(system|ns
(ns.conf|runningConfig))))|(save)|(stat .*serv)
```

**To configure a command policy by using the GUI**

Navigate to **System > User Administration > Command Policies**, and create the command policy.

**Binding command policies to users and groups**

Once you have defined your command policies, you must bind them to the appropriate user accounts and groups. When you bind a policy, you must assign it a priority so that the appliance can determine which command policy to follow when two or more applicable command policies are in conflict.

Command policies are evaluated in the following order:

- Command policies bound directly to users and the corresponding groups are evaluated according to priority number. A command policy with a lower priority number is evaluated before one with a higher priority number. Therefore, any privileges the lower-numbered command policy explicitly grants or denies are not overridden by a higher-numbered command policy.
- When two command policies, one bound to a user account and the other to a group, have the same priority number, the command policy bound directly to the user account is evaluated first.

To bind command policies to a user by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user and verify the configuration:

- `bind system user <userName> -policyName <policyName> <priority>`
- `show system user <userName>`

**Example:**

```
bind system user user1 -policyName read_all 1
```

To bind command policies to a user by using the GUI

Navigate to **System > User Administration > Users**, select the user and bind command policies.

Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

To bind command policies to a group by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user group and verify the configuration:

- `bind system group <groupName> -policyName <policyName> <priority>`
- `show system group <groupName>`

**Example:**

```
bind system group Managers -policyName read_all 1
```

**To bind command policies to a group by using the GUI**

Navigate to **System > User Administration > Groups**, select the group and bind command policies.

Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

**Resetting the default administrator password**

September 21, 2020

The administrator account provides complete access to all ADC features. Therefore, to preserve security, the administrator account must be used only if necessary and if you require full access to know the password for the nsroot account. It is recommended that you frequently change your password. If you lose the password, you must reset it to the default and then change it to a new one.

To reset your administrator password, you must log on to your appliance and change the password. However, if you do not remember the password, you can reboot the appliance in single user mode. Mount the file system in read/write mode and then remove the **Citrix ADC** entry from the ns.conf file. As a final step, reboot and log on to your appliance with the default password and set a new password.

**To reset the administrator password**

1. Connect a computer to the console port of the Citrix ADC and log on.

**Note**

You cannot log on by using SSH to perform this procedure; you must connect directly to the appliance.

2. Reboot the Citrix ADC.
3. Press CTRL+C when the following message appears:

Press [Ctrl-C] for command prompt, or any other key to boot immediately.

Booting [kernel] in # seconds.

4. Run the following command to start the Citrix ADC in a single user mode:

```
boot -s
```

**Note**

If `boot -s` does not work, then try `reboot -- -s` and appliance reboot in single user mode.

After the appliance boots, it displays the following message:

Enter full path name of shell or RETURN **for** `/bin/sh`:

5. Press the ENTER key to display the # prompt, and type the following commands to mount the file systems:

- a) Run the following command to check the disk consistency:

```
fsck_ufs /dev/ad0s1a
```

**Note**

Your flash drive has a specific device name depending on your Citrix ADC; hence, you have to replace `ad0s1a` in the preceding command with the appropriate device name.

- b) You must access the `dev` directory and enter `ls` to check the drive details.

- c) Run the following command to display the mounted partitions:

```
df
```

If the flash partition is not listed, you must mount it manually.

- d) Run the following command to mount the flash drive:

```
mount/dev/ad0s1a /flash
```

6. Run the following command to change to the `ns` config directory:

```
cd/flash/nsconfig
```

7. Run the following commands to rewrite the `ns.conf` file and remove the set of system commands defaulting to the admin:

- a) Run the following command to create a configuration file that does not have commands defaulting to the administrator:

```
grep -v "set system user nsroot" ns.conf > new.conf
```

- b) Run the following command to make a backup of the existing configuration file:

```
mv ns.conf old.ns.conf
```

- c) Run the following command to rename the `new.conf` file to `ns.conf`:

```
mv new.conf ns.conf
```

8. Run the following command to reboot the Citrix ADC:

```
reboot
```

9. Log on using the default administrator credentials.
10. Run the following command to reset the administrator password:

```
set system user nsroot <New_Password>
```

**Note**

To use the “?” character in a password string, precede this character with the “\” character.

For example, `yourexamplepasswd?` is set for the administrator account after you perform the following operation:

```
> set system user nsroot yourexamplepasswd?
```

**Note**

For resetting a forgotten (nsroot) password in a high availability setup, Citrix recommends you to shut down the peer node. If the peer node is active, the password is overwritten, as the config sync is triggered when the node comes up after reboot.

## Example of a user scenario

September 21, 2020

The following example shows how to create a complete set of user accounts, groups, and command policies and bind each policy to the appropriate groups and users. The company, Example Manufacturing, Inc., has three users who can access the Citrix ADC appliance:

- **John Doe.** The IT manager. John needs to be able to see all parts of the Citrix ADC configuration but does not need to modify anything.
- **Maria Ramiez.** The lead IT administrator. Maria needs to be able to see and modify all parts of the Citrix ADC configuration except for Citrix ADC commands (which local policy dictates must be performed while logged on as nsroot).
- **Michael Baldrock.** The IT administrator in charge of load balancing. Michael needs to be able to see all parts of the Citrix ADC configuration, but needs to modify only the load balancing functions.

The following table shows the breakdown of network information, user account names, group names, and command policies for the sample company.

| Field                | Value                               | Note                                                                                                      |
|----------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Citrix ADC host name | ns01.example.net                    | N/A                                                                                                       |
| User accounts        | johnd, mariar, and michaelb         | John Doe, IT manager, Maria Ramirez, IT administrator and Michael Baldrock, IT administrator.             |
| Groups               | Managers and SysOps                 | All managers and all IT administrators.                                                                   |
| Command Policies     | read_all, modify_lb, and modify_all | Allow complete read-only access, Allow modify access to load balancing, and Allow complete modify access. |

The following description walks you through the process of creating a complete set of user accounts, groups, and command policies on the Citrix ADC appliance named ns01.example.net.

The description includes procedures for binding the appropriate user accounts and groups to one another, and binding appropriate command policies to the user accounts and groups.

This example illustrates how you can use prioritization to grant precise access and privileges to each user in the IT department.

The example assumes that initial installation and configuration have already been performed on the Citrix ADC.

## Configuration steps

1. Use the procedure described in [“Configuring User Accounts”](#) to create user accounts **johnd**, **mariar**, and **michaelb**.
2. Use the procedure described in [“Configuring User Groups”](#) to create user groups **Managers** and **SysOps**, and then bind the users **mariar** and **michaelb** to the **SysOps** group and the user **johnd** to the **Managers** group.
3. Use the procedure described in “[Creating Custom Command Policies]” to create the following command policies:
  - **read\_all** with action **Allow** and command spec `"(^show\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*)|(^stat.*)"`
  - **modify\_lb** with action as **Allow** and the command spec `"^set\s+lb\s+.*"`
  - **modify\_all** with action as **Allow** and the command spec `"^\S+\s+(?!system).*"`

4. Use the procedure described in “[Binding Command Policies to Users and Groups](#)” to bind the **read\_all** command policy to the **SysOps** group, with priority value **1**.
5. Use the procedure described in “[Binding Command Policies to Users and Groups](#)” to bind the **modify\_lb** command policy to user **michaelb**, with priority value **5**.

The configuration you just created results in the following:

- John Doe, the IT manager, has read-only access to the entire Citrix ADC configuration, but he cannot make modifications.
- Maria Ramirez, the IT lead, has near-complete access to all areas of the Citrix ADC configuration, having to log on only to perform Citrix ADC-level commands.
- Michael Baldrock, the IT administrator responsible for load balancing, has read-only access to the Citrix ADC configuration, and can modify the configuration options for load balancing.

The set of command policies that applies to a specific user is a combination of command policies applied directly to the user’s account and command policies applied to the group(s) of which the user is a member.

Each time a user enters a command, the operating system searches the command policies for that user until it finds a policy with an ALLOW or DENY action that matches the command. When it finds a match, the operating system stops its command policy search and allows or denies access to the command.

If the operating system finds no matching command policy, it denies the user access to the command, in accordance with the Citrix ADC appliance’s default deny policy.

#### Note

When placing a user into multiple groups, take care not to cause unintended user command restrictions or privileges. To avoid these conflicts, when organizing your users in groups, bear in mind the Citrix ADC command policy search procedure and policy ordering rules.

## Configuring external user authentication

September 21, 2020

Authentication in a Citrix ADC appliance can be local or external. For authenticating external users, the appliance uses an external authentication server such as LDAP, RADIUS, and TACACS+. To authenticate an external user and grant the user access into the appliance, you must use an authentication policy. The Citrix ADC system authentication uses the Advanced authentication policy. Advanced authentication policies use Citrix ADC advanced policy expressions. Advanced authentication policies are used for system user management in a partitioned Citrix ADC appliance.

**Note:**

If your appliance has Classic policies and its expressions, you must stop using it and migrate Classic policy usage to the Advanced policy infrastructure.

Once you create an authentication policy, you must bind it to the system global entity. You can configure an external authentication server (for example, TACACS) by binding a single authentication policy to the system global entity. Or, you can configure a cascade of authentication servers by binding multiple policies to the system global entity.

**Note:**

When an external user logs into the appliance, the system generates an error message, “User does not exist” in the ns.log file. This occurs because the system runs the `system_muser_systemcmdpolicy_binding` command to initialize the GUI for the user.

## Configuring LDAP authentication

You can configure the Citrix ADC appliance to authenticate user access with one or more LDAP servers. LDAP authorization requires identical group names in the Active Directory, on the LDAP server, and on the appliance. The characters and case must also be the same.

By default, LDAP authentication is secured by using the SSL/TLS protocol. There are two types of secure LDAP connections. In the first type, the LDAP server accepts the SSL/TLS connection on a port separate from the port used to accept clear LDAP connections. After users establish the SSL/TLS connection, LDAP traffic is sent over the connection. The second type allows both unsecure and secure LDAP connections. In this scenario, to create a secure connection, the client first establishes a clear LDAP connection. Then the **LDAP** command `StartTLS` is sent to the server over the connection. If the LDAP server supports `StartTLS`, the connection is converted to a secure LDAP connection by using TLS.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections
- 636 for secure LDAP connections
- 3268 for Microsoft unsecure LDAP connections
- 3269 for Microsoft secure LDAP connections

LDAP connections that use the `StartTLS` command use port number 389. If port numbers 389 or 3268 are configured on the appliance, it tries to use `StartTLS` to make the connection. If any other port number is used, connection attempts use SSL/TLS. If `StartTLS` or SSL/TLS cannot be used, the connection fails.

When configuring the LDAP server, the case of the alphabetic characters must match that on the server and on the appliance. If the root directory of the LDAP server is specified, all the subdirectories are

also searched to find the user attribute. In large directories, this can affect performance. For this reason, Citrix recommends that you use a specific organizational unit (OU).

The following table lists examples of the base distinguished name (DN).

| LDAP server                          | Base DN                      |
|--------------------------------------|------------------------------|
| Microsoft Active Directory           | DC=Citrix, DC=local          |
| Novell eDirectory                    | dc=Citrix, dc=net            |
| IBM Directory Server                 | cn=users                     |
| Lotus Domino                         | OU=City, O=Citrix, C=US      |
| Sun ONE directory (formerly iPlanet) | ou=People, dc=Citrix, dc=com |

Table 2. Examples of Base Distinguished Name

The following table lists examples of the bind distinguished name (DN).

| LDAP server                          | Bind DN                                                             |
|--------------------------------------|---------------------------------------------------------------------|
| Microsoft Active Directory           | CN=Administrator, CN=Users, DC=Citrix, DC=local                     |
| Novell eDirectory                    | cn=admin, dc=Citrix, dc=net                                         |
| IBM Directory Server                 | LDAP_dn                                                             |
| Lotus Domino                         | CN=Notes Administrator, O=Citrix, C=US                              |
| Sun ONE directory (formerly iPlanet) | uid=admin, ou=Administrators, ou=TopologyManagement, o=NetscapeRoot |

Table 3. Examples of Bind Distinguished Name

|LDAP server|Bind DN|

|— |— |

|Microsoft Active Directory|CN=Administrator, CN=Users, DC=Citrix, DC=local|

|Novell eDirectory|cn=admin, dc=Citrix, dc=net|

|IBM Directory Server|LDAP\_dn|

|Lotus Domino|CN=Notes Administrator, O=Citrix, C=US|

|Sun ONE directory (formerly iPlanet)|uid=admin, ou=Administrators, ou=TopologyManagement, o=NetscapeRoot|

## Configure LDAP authentication by using the command line interface

### To configure LDAP policy

At the command prompt, do the following:

Step 1: Create an LDAP action.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr|*> | {  
-serverName <string> } } >] [-authTimeout <positive_integer>] [-ldapBase <  
string>] [-ldapBindDn <string>] { -ldapBindDnPassword } [-ldapLoginName <  
string>] [-groupAttrName <string>] [-subAttributeName <string>]
```

#### Example:

```
1 add authentication ldapAction ldap_act -serverIP <IP> -authTimeout 30 -  
  ldapBase "CN=xxxxx,DC=xxxx,DC=xxx" -ldapBindDn "CN=xxxxx,CN=xxxxx,DC  
  =xxxx,DC=xxx" -ldapBindDnPassword abcd -ldapLoginName sAMAccountName  
  -groupattrName memberOf -subAttributeName CN  
2 <!--NeedCopy-->
```

Step 2: Create a classic LDAP policy.

```
add authentication ldapPolicy <name> <rule> [<reqAction>]
```

#### Example:

```
add authentication ldappolicy ldap_pol_classic ns_true ldap_act.
```

Step 3: Create an LDAP advanced authentication policy

```
add authentication Policy <name> <rule> [<reqAction>]
```

#### Example:

```
add authentication policy ldap_pol_advance -rule true -action ldap_act
```

Step 4: Bind the LDAP policy to system global

```
System Global: bind system global <policyName> [-priority <positive_integer  
>]
```

## Configure LDAP authentication by using the GUI

Navigate to **System > Authentication > LDAP**, and create the LDAP authentication policy.

### Determining attributes in the LDAP directory

If you need help with determining your LDAP directory attributes, you can easily look them up with the free LDAP browser from Softerra.

You can download the LDAP browser from the Softerra LDAP Administrator website at <http://www.ldapbrowser.com>. After the browser is installed, set the following attributes:

- The host name or IP address of your LDAP server.
- The port of your LDAP server. The default is 389.
- The base DN field can be left blank.
- The information provided by the LDAP browser can help you determine the base DN needed for the Authentication tab.
- The Anonymous Bind check determines whether the LDAP server requires user credentials for the browser to connect to it. If the LDAP server requires credentials, leave the check box cleared.

After completing the settings, the LDAP browser displays the profile name in the left pane and connects to the LDAP server.

### **Configuring RADIUS authentication**

You can configure the Citrix ADC appliance to authenticate user access with one or more RADIUS servers. If you are using RSA SecurID, SafeWord, or Gemalto Protiva products, use a RADIUS server.

Your configuration might require using a network access server IP address (NAS IP) or a network access server identifier (NAS ID). When configuring the appliance to use a RADIUS authentication server, use the following guidelines:

- If you enable use of the NAS IP, the appliance sends its configured IP address to the RADIUS server, rather than the source IP address used in establishing the RADIUS connection.
- If you configure the NAS ID, the appliance sends the identifier to the RADIUS server. If you do not configure the NAS ID, the appliance sends its host name to the RADIUS server.
- When the NAS IP is enabled, the appliance ignores any NAS ID that was configured by using the NAS IP to communicate with the RADIUS server.

### **To configure RADIUS authentication by using the GUI**

Navigate to **System > Authentication > Radius**, and create the RADIUS authentication policy.

### **Choosing RADIUS authentication protocols**

The Citrix ADC appliance supports implementations of RADIUS that are configured to use any of several protocols for user authentication, including:

- Password Authentication Protocol
- Challenge-Handshake Authentication Protocol (CHAP)
- Microsoft Challenge-Handshake Authentication Protocol (MS-CHAP Version 1 and Version 2)

If your deployment of the appliance is configured to use RADIUS authentication and your RADIUS server is configured to use a Password Authentication Protocol, you can strengthen user authentication by assigning a strong shared secret to the RADIUS server. Strong RADIUS shared secrets consist of random sequences of uppercase and lowercase letters, numbers, and punctuation, and are at least 22 characters long. If possible, use a random character generation program to determine RADIUS shared secrets.

To further protect RADIUS traffic, assign a different shared secret to each appliance or virtual server. When you define clients on the RADIUS server, you can also assign a separate shared secret to each client. If you do this, you must configure separately each policy that uses RADIUS authentication.

Shared secrets are configured on the appliance when a RADIUS policy is created.

### **Configuring IP address extraction**

You can configure the appliance to extract the IP address from a RADIUS server. When a user authenticates with the RADIUS server, the server returns a framed IP address that is assigned to the user. The following are attributes for IP address extraction:

- Allows a remote RADIUS server to supply an IP address from the internal network for a user logged on to the appliance.
- Allows configuration for any RADIUS attribute using the type IP address, including those that are vendor encoded.

When configuring the RADIUS server for IP address extraction, you configure the vendor identifier and the attribute type.

The vendor identifier enables the RADIUS server to assign an IP address to the client from a pool of IP addresses that are configured on the RADIUS server. The vendor ID and attributes are used to make the association between the RADIUS client and the RADIUS server. The vendor ID is the attribute in the RADIUS response that provides the IP address of the internal network. A value of zero indicates that the attribute is not vendor encoded. The attribute type is the remote IP address attribute in a RADIUS response. The minimum value is one and the maximum value is 255.

A common configuration is to extract the **RADIUS** attribute *framed IP address*. The vendor ID is set to zero or is not specified. The attribute type is set to eight.

### **To configure IP address extraction by using the GUI**

1. Navigate to **System > Authentication > Radius**, and select a policy.
2. Modify the server parameters and set relevant values in **Group Vendor Identifier** and **Group Attribute Type** fields.

## Configuring TACACS+ authentication

### Important

- Citrix recommends you do not modify any TACACS related configurations when you run a “clear ns config” command.
- TACACS related configuration related to advanced policies is cleared and reapplied when the “RBAconfig” parameter is set to NO in “clear ns config” command for advanced policy.

You can configure a TACACS+ server for authentication. Similar to RADIUS authentication, TACACS+ uses a secret key, an IP address, and the port number. The default port number is 49. To configure the appliance to use a TACACS+ server, provide the server IP address and the TACACS+ secret. The port must be specified only when the server port number in use is something other than the default port number of 49.

### To configure TACACS+ authentication by using the GUI

Navigate to **System > Authentication > TACACS**, and create the TACACS authentication policy.

After the TACACS+ server settings are configured on the appliance, bind the policy to the system global entity.

### Binding authentication policies to the system global entity

When the authentication policies are configured, bind the policies to the system global entity.

### To bind a classic authentication policy to the system global using the command line interface

At the command line prompt, do the following:

```
bind system global <policyName> [-priority <positive_integer>]
```

#### Example:

```
1 bind system global pol_classic -priority 10
2 <!--NeedCopy-->
```

### To bind advanced authentication policy to system global using the command line interface

At the command line prompt, do the following:

```
bind system global <policyName> [-priority <positive_integer>]
```

#### Example:

```
1 bind system global pol_advanced -priority 10
2 <!--NeedCopy-->
```

### To bind an authentication policy to the system global using the GUI

1. Navigate to **System > Authentication**, and select the authentication type.
2. On the **Policies** tab, click **Global Bindings** and bind the authentication policies.

Also, read the Citrix article, [CTX113820](#) to know about external authentication using TACACS.

## SSH Key-based authentication for Citrix ADC administrators

January 28, 2021

SSH key-based authentication is preferred over traditional username/password type authentication for the following reasons:

- Provides better cryptographic strength than user passwords.
- Eliminates the need of remembering complicated passwords and prevents shoulder-surfing attacks which are possible if passwords are used.
- Provides a password-less login for making automation scenarios more secured.

Citrix ADC supports SSH key-based authentication by using the public and private key concept. The SSH key-based authentication in Citrix ADC can be enabled either at a user-specific level for Citrix ADC local users or enabled for Citrix ADC local users in common.

#### Note

This is supported only for Citrix ADC local users and not supported for external users.

### Configuring SSH key-based authentication for local system users

In a Citrix ADC appliance, an administrator can set up SSH key-based authentication for a secured system access. When a user logs into a Citrix ADC using a private key, the system authenticates using the public key configured on the appliance.

#### To configure SSH key-based authentication for Citrix ADC local system users by using the CLI

The following configuration helps you to configure key-based authentication for Citrix ADC local system users.

1. Log on to a Citrix ADC appliance using administrator credentials.

2. By default your `sshd_config` file accesses this path: **AuthorizedKeysFile /nsconfig/ssh/authorized\_keys**.
3. Append the public key to the `authorized_keys` file: **/nsconfig/ssh/authorized\_keys**. The file path for `sshd_config` is `/etc/sshd_config`.
4. You must copy the `sshd_config` file into `/nsconfig` to ensure that the changes persist even after restarting the appliance.
5. You can use the following command to restart your `sshd` process.

```
kill -HUP 'cat /var/run/sshd.pid'
```

### Configuring user-specific SSH key-based authentication for local system users

In a Citrix ADC appliance, an administrator can now set up a user specific key-based authentication for a secured system access. The administrator must first configure the `Authorizedkeysfile` option in the `sshd_config` file and then add the public key in the `authorized_keys` file for a system user.

#### Note

If the `authorized_keys` file is not available for a user, the administrator must first create one and then add the public key to it.

### To configure user-specific SSH key-based authentication by using the CLI

The following procedure helps you to configure user-specific SSH key-based authentication for Citrix ADC local system users.

1. Log on to a Citrix ADC appliance using administrator credentials.
2. At the shell prompt, access the `sshd_config` file and add the following configuration line:  

```
AuthorizedKeysFile ~/.ssh/authorized_keys
```
3. Change the directory to a system user folder and add the public keys in the `authorized_keys` file.

```
/var/pubkey/<username>/.ssh/authorized_keys
```

Once you have completed the earlier steps, restart the `sshd` process on your appliance.

```
kill -HUP 'cat /var/run/sshd.pid'
```

#### Note

If the `authorized_keys` file is not available, you must first create one and then add the public key.

```
1 > shell
2
```

```

```

## Display unsuccessful external user logon attempts

September 21, 2020

When an external LDAP user successfully logs on to a Citrix ADC appliance, the command interface now displays the number of unsuccessful logon attempts since the last successful logon. The feature works only if the `persistentLoginAttempts` option is enabled on the appliance.

A Citrix ADC administrator can use this information to verify if any unauthorized activity has occurred on a secured LDAP user account.

To use this feature, at the Citrix ADC command prompt, type:

```
set aaa parameter -maxloginAttempts <value> -failedLoginTimeout <value> -
persistentLoginAttempts (ENABLED | DISABLED )]
```

```
1 `Set aaa parameter - maxloginAttempts 5 -failedLoginTimeout 4 -
  persistentLoginAttempts ENABLED`
```

## Two Factor Authentication for Citrix ADC Console

September 21, 2020

Two factor authentication is a security mechanism where a Citrix ADC appliance authenticates a system user at two authenticator levels. The appliance grants access to the user only after successful validation of passwords by both levels of authentication. If a user is authenticated locally, the user profile must be created in the Citrix ADC database. If the user is authenticated externally then, the user name and password must match the user identity registered in the external authentication server.

### Note

Two factor authentication feature works only from Citrix ADC 12.1 build 51.16 onwards.

### How two factor authentication works

Consider a user trying to log on to a Citrix ADC appliance. The requested application server sends the user name and password to the first external authentication server (RADIUS, TACACS, LDAP, or AD). Once the user name and password are validated, the user is prompted for a second level of authentication. The user can now provide the second password. Only if both passwords are correct, the user is allowed to access the Citrix ADC appliance. The following diagram is an illustration of how two-factor authentication works for a Citrix ADC appliance.

Following are the different use cases for configuring two factor authentication for external and system users.

You can configure two-factor authentication on a Citrix ADC appliance in different ways. The following are the different configuration scenarios for two factor authentication on a Citrix ADC appliance.

1. Two factor authentication (2FA) across Citrix ADC, GUI, CLI, API and SSH.
2. External authentication enabled and local authentication disabled for system users.
3. External authentication enabled with policy based local authentication for system users.
4. External authentication disabled for system users with local authentication enabled.
5. External authentication enabled and local authentication enabled for system users.
6. External authentication enabled for selected LDAP users

### Use case 1: Two factor authentication (2FA) across Citrix ADC, GUI, CLI, API and SSH interfaces

Two-factor authentication is enabled and available across all Citrix ADC management access for GUI, API, and SSH.

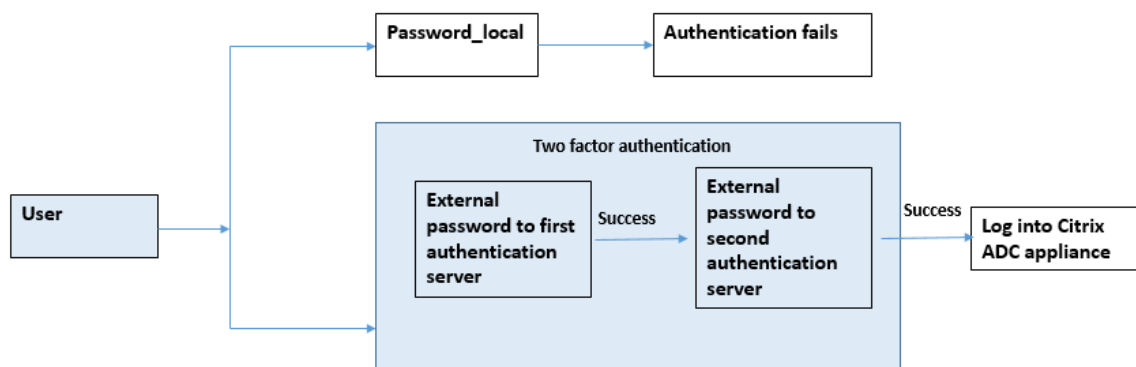

### Use case 2: Two factor authentication supported on external authentication servers such as LDAP, RADIUS, Active Directory and TACACS

You can configure two-factor authentication on the following external authentication servers for first-level and second-level user authentication.

- RADIUS
- LDAP
- Active Directory
- TACACS

### Use case 3: External authentication enabled and local authentication disabled for system users

You begin the authentication process by enabling the external authentication option and disabling local authentication for system users.

Complete the following steps by using the command line interface:

1. Add authentication action for LDAP policy
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add and bind authentication policy label to RADIUS server
7. Bind system global authentication for LDAP policy

## 8. Disable local authentication in system parameter

### **Add authentication action for LDAP server (first level authentication)**

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password>-ldaploginname <loginname> -groupattrname <grp attribute name> -subAttributeName <string>-ssoNameAttribute <string>
```

#### **Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName name -groupAttrName name -subAttributeName name -ssoNameAttribute name
```

### **Add authentication policy for LDAP server (first level authentication)**

At the command prompt, type:

```
add authentication policy <ldap policy name> -rule true -action <ldap action name>
```

#### **Example:**

```
add authentication policy pol1 -rule true -action ldapact1
```

### **Add authentication action for RADIUS server (second level authentication)**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad attribute type>
```

#### **Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123 -radVendorID 1234 -radAttributeType 2
```

### **Add authentication policy for RADIUS server (second level authentication)**

At the command prompt, type:

```
add authentication policy <radius policy name> -rule true -action <rad action name>
```

#### **Example:**

```
add authentication policy radpol11 -rule true -action radact11
```

### Add authentication login schema

You can use the “SingleAuth.xml” login schema for system users to provide the second password for the Citrix ADC appliance. At the command prompt, type:

```
add authentication loginSchema <login schema name> -authenticationSchema LoginSchema/SingleAuth.xml
```

#### Example:

```
add authentication loginSchema radschema -authenticationSchema LoginSchema/SingleAuth.xml
```

### Add and bind authentication policy label to RADIUS server

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ | RBA_REQ )] [-comment <string>][-loginSchema <string>]
bind authentication policylabel <labelName> -policyName <string> -priority <positive_integer> [-gotoPriorityExpression <expression>][-nextFactor <string>]
```

#### Example:

```
add authentication policylabel label1 -type RBA_REQ -loginSchema radschema
bind authentication policylabel label1 -policyName rad_pol11 -priority 1
```

### Bind authentication system global for LDAP policy

At the command prompt, type:

```
bind system global ldappolicy -priority <priority> -nextFactor <policy label name>
```

#### Example:

```
bind system global pol11 -priority 1 -nextFactor label11
```

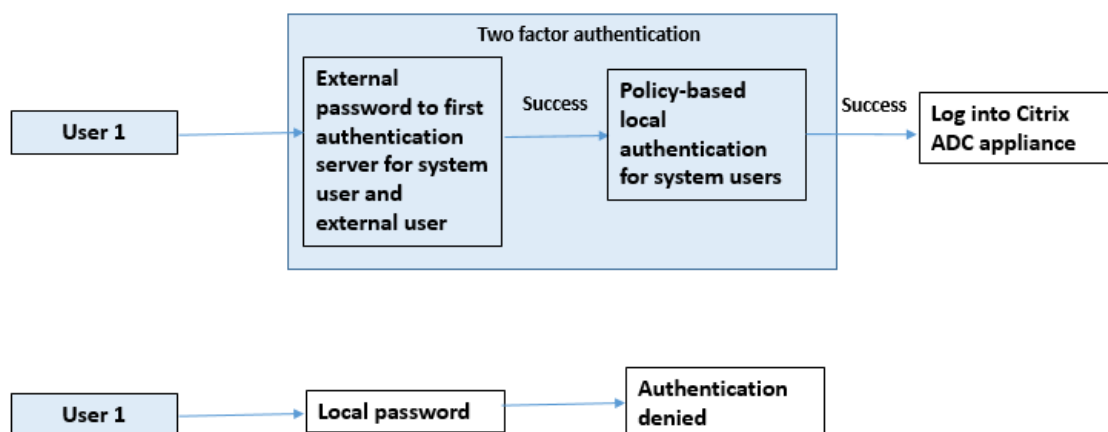

### Disable local authentication in system parameter

At the command prompt, type:

```
set system parameter -localauth disabled
```

### Use case 4: External authentication enabled for system user with local authentication policy attached

In this scenario, the user is allowed to log on to the appliance using two-factor authentication with local authentication policy evaluation at the second level of user identification.

Complete the following steps by using the command line interface.

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add local authentication policy
4. Add authentication policy label
5. Bind LDAP policy as system global
6. Disable local authentication in system parameter

#### Add authentication action for LDAP server (first level authentication)

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password> -ldaploginname <loginname> -groupattrname <grp attribute name> -subAttributeName <string> -ssoNameAttribute <string>
```

#### Example:

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName name -groupAttrName name -subAttributeName name -ssoNameAttribute name -ssoNameAttribute name
```

**Add authentication policy for LDAP server (first level authentication)**

At the command prompt, type:

```
add authentication policy <ldap policy name> -rule true -action <ldap action name>
```

**Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase base -  
ldapbindDn name -ldapbindDNpassword password -ldapLoginName name -groupAttrName  
name -subAttributeName name -ssoNameAttribute name
```

**Add local authentication policy for system users (second level authentication)**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad server ip>  
-radkey <key> -radVendorID <ID >-radattributetype <rad attribute type
```

**Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123 -  
radVendorID 1234 -radAttributeType 2
```

**Add and bind authentication policy label**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ | RBA_REQ )]  
[-comment <string>][-loginSchema <string>]  
bind authentication policylabel <labelName> -policyName <string> -priority  
<positive_integer> [-gotoPriorityExpression <expression>][-nextFactor <  
string>]
```

**Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema radschema  
bind authentication policylabel label1 -policyName rad_pol11 -priority 1
```

**Disable local authentication in system parameter**

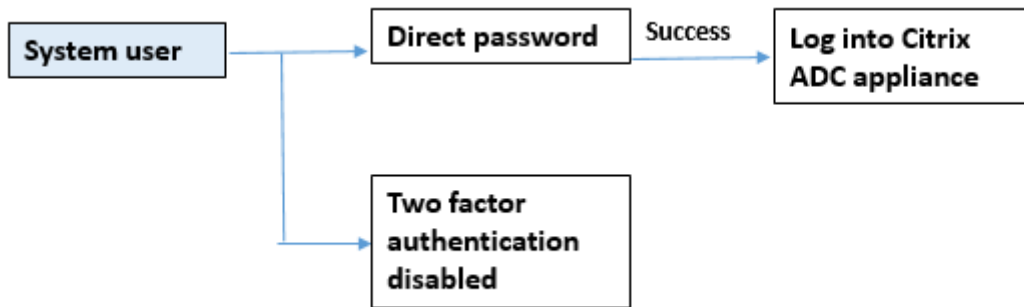

At the command prompt, type:

```
set system parameter -localauth disabled
```

### Use case 5: External authentication disabled and local authentication enabled for system user

If the user has “externalAuth” disabled, it indicates the user does not exist on the authentication server. User is not authenticated with the external authentication server even if a user with the same user name exists on the external authenticated server. User is authenticated locally.

#### To enable system user password and disable external authentication

At the command prompt, type the following:

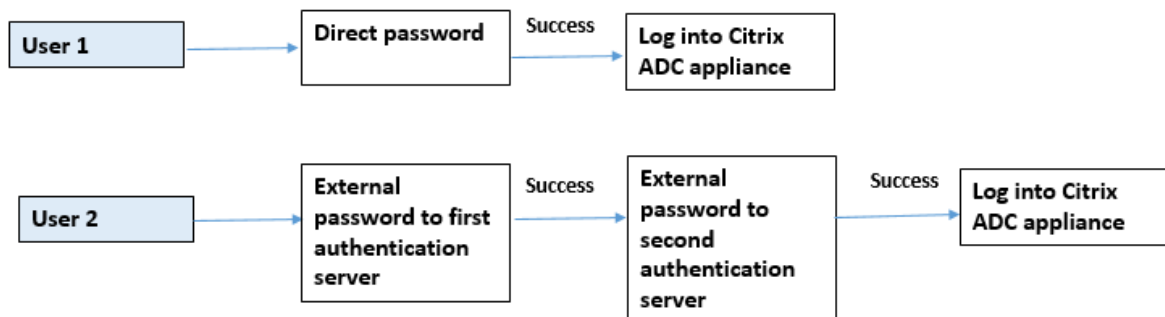

```
add system user <name> <password> -externalAuth DISABLED
```

#### Example:

```
add system user user1 password1 -externalAuth DISABLED
```

### Use case 6: External authentication enabled and local authentication enabled for system users

To configure the appliance to authenticate system users by using a local password. If this authentication fails, the user is then authenticated by using an external authentication password on the external authentication servers at two levels.

To configure by using the command line interface, follow the steps given below:

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add authentication policy label
7. Bind authentication policy label for login schema
8. Bind authentication system global for RADIUS policy
9. Bind authentication system global for LDAP policy

### **Add authentication action for LDAP server**

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -ldapbase  
<> -ldapbinddn <binddn name> -ldapbinddnpassword <password>-ldaploginname  
<loginname> -groupattrname <grp attribute name> -subAttributeName <>-  
ssoNameAttribute <>
```

#### **Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase base -  
ldapbindDn name -ldapbindDNpassword password -ldapLoginName name -groupAttrName  
name -subAttributeName name -ssoNameAttribute name
```

### **Add authentication policy for LDAP policy**

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap action  
name>
```

#### **Example:**

```
add authentication policy pol1 -rule true -action ldapact1
```

### **Add authentication action for RADIUS server**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad server ip>  
-radkey <key> -radVendorID <ID >-radattributetype <rad attribute type>
```

#### **Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123 -  
radVendorID 1234 -radAttributeType 2
```

### **Add advanced authentication policy for RADIUS server**

At the command prompt, type:

```
add authentication policy <policy name> -rule true -action <rad action name>  
>
```

#### **Example:**

```
add authentication policy radpol11 -rule true -action radact11
```

### **Add authentication login schema**

You can use the SingleAuth.xml login schema to display the login page and authenticate the system user at the second level authentication.

At the command prompt, type:

```
add authentication loginSchema <name> -authenticationSchema <string>
```

#### **Example:**

```
add authentication loginSchema radschema -authenticationSchema LoginSchema/  
SingleAuth.xml
```

### **Add and bind authentication policy label to RADIUS authentication policy for user login**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ | RBA_REQ )]  
[-comment <string>][-loginSchema <string>]
```

#### **Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema radschema  
bind authentication policylabel <labelName> -policyName <string> -priority  
<positive_integer> [-gotoPriorityExpression <expression>][-nextFactor <  
string>]
```

#### **Example:**

```
bind authentication policylabel label1 -policyName rad_pol11 -priority 1
```

**Bind authentication policy global**

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>] [-nextFactor <string>] [-gotoPriorityExpression <expression>]]
```

**Example:**

```
bind system global radpol11 -priority 1 -nextFactor label11
```

**Use case 7: External authentication enabled for selected external users only**

To configure selective external users with two-factor authentication as per the search filter configured in the LDAP action while other system users are authenticated using single factor authentication.

To configure using the command line interface, follow the steps given below:

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP policy
3. Add authentication action for RADIUS policy
4. Add authentication policy for RADIUS policy
5. Add authentication login schema
6. Add authentication policy label
7. Bind authentication policy label for login schema
8. Bind authentication system global for RADIUS policy

**Add authentication action for LDAP server**

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -ldapbase <> -ldapbinddn <binddn name> -ldapbinddnpassword <password> -ldaploginname <loginname> -groupattrname <grp attribute name> -subAttributeName <> -ssoNameAttribute <>
```

**Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase base -ldapbindDn name -ldapbindDNpassword password -ldapLoginName name -groupAttrName name -subAttributeName name -ssoNameAttribute name
```

**Add authentication policy for LDAP policy**

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap action name>
```

**Example:**

```
add authentication policy pol1 -rule true -action ldapact1
```

**Add authentication action for RADIUS server**

At the command prompt, type:

```
add authentication radiusaction <rad action name> -serverip <rad server ip> -radkey <key> -radVendorID <ID >-radattributetype <rad attribute type>
```

**Example:**

```
add authentication radiusaction radact1 -serverip 1.1.1.1 -radkey 123 -radVendorID 1234 -radAttributeType 2
```

**Add advanced authentication policy for RADIUS server**

At the command prompt, type:

```
add authentication policy <policy name> -rule true -action <rad action name >
```

**Example:**

```
add authentication policy radpol11 -rule true -action radact11
```

**Add authentication login schema**

You can use the SingleAuth.xml login schema to provide the login page for the appliance to authenticate a system user at a second level of authentication.

At the command prompt, type:

```
add authentication loginSchema <name> -authenticationSchema <string>
```

**Example:**

```
add authentication loginSchema radschema -authenticationSchema LoginSchema/SingleAuth.xml
```

**Add and bind authentication policy label to RADIUS authentication policy for user login**

At the command prompt, type:

```
add authentication policylabel <labelName> [-type ( AAATM_REQ | RBA_REQ )]  
[-comment <string>][-loginSchema <string>]
```

**Example:**

```
add authentication policylabel label1 -type RBA_REQ -loginSchema radschema  
bind authentication policylabel <labelName> -policyName <string> -priority  
<positive_integer> [-gotoPriorityExpression <expression>][-nextFactor <  
string>]
```

**Example:**

```
bind authentication policylabel label1 -policyName rad_pol11 -priority
```

**Bind authentication policy global**

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>] [-nextFactor  
<string>] [-gotoPriorityExpression <expression>]]
```

**Example:**

```
bind system global radpol11 -priority 1 -nextFactor label11
```

To configure without two-factor authentication for group users using the search filter:

1. Add authentication action for LDAP server
2. Add authentication policy for LDAP server
3. Bind authentication system global for LDAP server

**Add authentication action for LDAP server**

At the command prompt, type:

```
add authentication ldapaction <ldap action name> -serverip <IP> -ldapbase  
<> -ldapbinddn <binddn name> -ldapbinddnpassword <password>-ldaploginname  
<loginname> -groupattrname <grp attribute name> -subAttributename <>-  
searchFilter<>
```

**Example:**

```
add authentication ldapaction ldapact1 -serverip 1.1.1.1 -ldapbase base -  
ldapbindDn name -ldapbindDNpassword password -ldapLoginName name -groupAttrName  
name -subAttributeName name - searchFilter "memberOf=CN=grp4,CN=Users,DC=  
aaatm-test,DC=com"
```

### Add authentication policy for LDAP server

At the command prompt, type:

```
add authentication policy <policy name> --rule true -action <ldap action name>
```

#### Example:

```
add authentication policy pol1 -rule true -action ldapact1
```

### Bind authentication system global for LDAP policy

At the command prompt, type:

```
bind system global ldappolicy -priority <priority> -nextFactor <policy label name>
```

#### Example:

```
bind system global pol11 -priority 1 -nextFactor label11
```

### Display customized prompt message for two factor authentication

When you configure two factor password field with SingleAuth.xml file at `/flash/nsconfig/loginschema/LoginSchema`

Following is the snippet of a SingleAuth.xml file where 'SecondPassword:' is the second password field name which is prompted to the user to enter a second password.

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <AuthenticateResponse xmlns="http://citrix.com/authentication/response/1">
3 <Status>success</Status>
4 <Result>more-info</Result>
5 <StateContext/>
6 <AuthenticationRequirements>
7 <PostBack>/nf/auth/doAuthentication.do</PostBack>
8 <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
9 <CancelButtonText>Cancel</CancelButtonText>
10 <Requirements>
11 <Requirement><Credential><ID>login</ID><SaveID>ExplicitForms-Username</SaveID><Type>username</Type></Credential><Label><Text>singleauth_user_name</Text><Type>nsg-login-label</Type></Label><Input><AssistiveText>singleauth_please_supply_either_domain\username_or_user@fully.qualified.domain</AssistiveText><Text><Secret>false</Secret><ReadOnly>false</ReadOnly><InitialValue/><Constraint>.+</Constraint></Text></Input></Requirement>
```

```

12 <Requirement><Credential><ID>passwd</ID><SaveID>ExplicitForms-Password

17 </AuthenticationRequirements>
18 </AuthenticateResponse>
19 <!--NeedCopy-->

```

## Configuring two-factor authentication by using the Citrix ADC GUI

1. Log on to Citrix ADC appliance.
2. Go to **System > Authentication > Advanced Policies > Policy**.
3. Click Add to create the first level authentication policy.
4. In **Create Authentication Policy** page, set the following parameters.
  - a) Name. Name of the policy
  - b) Action Type. Select action type as LDAP, Active Directory, RADIUS, TACACS, and so on
  - c) Action. The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create an action of the proper type.
  - d) Expression. Provide an advanced policy expression.
5. Click **Create** and then **Close**.
  - a) Expression. Provide an advanced policy expression.
6. Click **Create**.
7. Click **Add** to create the second level authentication policy.
8. In the **Create Authentication Policy** page, set the follow parameters
  - a) Name. Name of the policy
  - b) Action Type. Select action type as LDAP, Active Directory, RADIUS, TACACS, and so on

- c) Action. The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the + icon to create an action of the proper type.
  - d) Expression. Provide an advanced policy expression
9. Click **Create** and then **Close**.
  - a) Expression. Provide an advanced policy expression.
10. Click **Create**.
11. In the **Authentication Policies** page, click **Global Binding**.
12. In the **Create Global Authentication Policy Binding** page, select the first level authentication policy, and click **Add Binding**.
13. In the **Policy Binding** page, select the authentication policy and set the following policy binding parameter.
  - a) Next Factor. Select the second level authentication policy label.
14. Click **Bind** and **Close**.

Bind Close

15. Click **Done**.
16. Log on to the Citrix ADC appliance for the second level authentication. The user can now provide the second password. Only if both passwords are correct, the user is allowed to access the Citrix ADC appliance.

#### Note

The TACACS configured for a second factor authentication does not support authorization and

accounting even if you enable it on the “tacacsAction” command. The second factor is used for the authentication purpose only.

Also, see [Two factor authentication in Citrix ADC nFactor authentication](#) topic.

## Transmission Control Protocol (TCP) Configurations

August 23, 2021

TCP configurations for a Citrix ADC appliance can be specified in an entity called a TCP profile, which is a collection of TCP settings. The TCP profile can then be associated with services or virtual servers that want to use these TCP configurations.

A default TCP profile can be configured to set the TCP configurations by default, globally to all services and virtual servers.

### Note

When a TCP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence. The Citrix ADC appliance also provides other approaches for configuring TCP. Read on for more information.

### Supported TCP configuration

The Citrix ADC appliance supports the following TCP capabilities:

#### Defending TCP against spoofing attacks

The Citrix ADC implementation of window attenuation is RFC 4953 compliant.

#### Explicit Congestion Notification (ECN)

The appliance sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption. The Citrix ADC implementation of ECN is RFC 3168 compliant.

#### Round trip time measurement (RTTM) using the timestamp option

For the TimeStamp option to work, at least one side of the connection (client or server) must support it. The Citrix ADC implementation of the TimeStamp option is RFC 1323 compliant.

### **Detection of spurious retransmissions**

This can be done using TCP duplicate selective acknowledgment (D-SACK) and forward RTO-Recovery (F-RTO). If there are spurious retransmissions, the congestion control configurations are reverted to their original state. The Citrix ADC implementation of D-SACK is RFC 2883 compliant, and F-RTO is RFC 5682 compliant.

### **Congestion control**

This functionality use New-Reno, BIC, CUBIC, Nile, and TCP Westwood algorithms.

### **Window scaling**

The **TCP receive** window size increases beyond its maximum value of 65,535 bytes.

Points to consider before you configure window scaling

- You do not set a high value for the scale factor, because this can have adverse effects on the appliance and the network.
- You do not configure window scaling unless you clearly know why you want to change the window size.
- Both hosts in the TCP connection send a window scale option during connection establishment. If only one side of a connection sets this option, window scaling is not used for the connection.
- Each connection for the same session is an independent window scaling session. For example, when a client's request and the server's response flow through the appliance, it is possible to have window scaling between the client and the appliance without window scaling between the appliance and the server.

### **TCP maximum congestion window**

The window size is a user configurable one. The default value is 8190 bytes.

### **Selective acknowledgment (SACK)**

This uses the data receiver (either a Citrix ADC appliance or a client) notifies the sender about all the segments that have been received successfully.

### **Forward acknowledgment (FACK)**

This functionality avoids TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either a Citrix ADC or a client) control the amount of data injected into the network during retransmission timeouts.

### **TCP connection multiplexing**

This functionality enables reuse of existing TCP connections. The Citrix ADC appliance stores established TCP connections to the reuse pool. Whenever a client request is received, the appliance checks for an available connection in the reuse pool and serves the new client if the connection is available. If it is unavailable, the appliance creates a connection for the client request and stores the connection to the reuse pool. Citrix ADC supports connection multiplexing for HTTP, SSL, and DataStream connection types.

### **Dynamic receive buffering**

This allows the receive buffer to be adjusted dynamically based on memory and network conditions.

### **MPTCP Connection**

MPTCP connections between client and Citrix ADC. MPTCP connections are not supported between Citrix ADC and the back-end server. The Citrix ADC implementation of MPTCP is RFC 6824 compliant.

You can view MPTCP statistics such as active MPTCP connections and active subflow connections by using the command line interface.

At the command prompt, type one of the following commands to display a summary or detailed summary of MPTCP statistics, or to clear the statistics display:

1. Stat MPTCP
2. Stat mptcp -detail
3. Clearstats basic

#### **Note:**

To establish an MPTCP connection, both the client and the Citrix ADC appliance must support the same MPTCP version. If you use the Citrix ADC appliance as an MPTCP gateway for your servers, the servers do not have to support MPTCP. When the client starts a new MPTCP connection, the appliance identifies the client's MPTCP version from the `MP_CAPABALE` option in the SYN packet. If the client's version is higher than the one supported on the appliance, the appliance indicates its highest version in the `MP_CAPABALE` option of the SYN-ACK packet. The client then falls back to a lower version and sends the version number in the `MP_CAPABALE` option of the ACK packet. If that version is supportable, the appliance continues the MPTCP connection. Otherwise, the appliance falls back to a regular TCP. The Citrix ADC appliance does not initiate subflows (MP\_JOIN's). The appliance expects the client to initiate subflows.

### **Extracting the TCP/IP path overlay option and inserting the client-IP HTTP header**

Extracting TCP/IP path overlay and inserting client-IP HTTP header. Data transport through overlay networks often uses connection termination or Network Address Translation (NAT), in which the IP address of the source client is lost. To avoid this, the Citrix ADC appliance extracts the TCP/IP path overlay option and inserts the source client's IP address into the HTTP header. With the IP address in the header, the web server can identify the source client that made the connection. The extracted data is valid for a lifetime of the TCP connection and therefore, this prevents the next hop host from having to interpret the option again. This option is applicable only for web services that have the client-IP insertion option enabled.

### **TCP segmentation offload**

Offloads TCP segmentation to the NIC. If you set the option as "AUTOMATIC", TCP segmentation is offloaded to the NIC, if NIC is supported.

### **Synchronizing cookie for TCP handshake with clients**

This is used for resisting SYN flood attacks. You can enable or disable the `SYNCOOKIE` mechanism for TCP handshake with clients. Disabling `SYNCOOKIE` prevents SYN attack protection on the Citrix ADC appliance.

### **Learning MSS to enable MSS learning for all the virtual servers configured on the appliance**

#### **Supportable TCP Parameters**

The following table provides a list of TCP parameters and its default value configured on a Citrix ADC appliance.

| Parameter                                            | Default Value  | Description                                                                                                                                |
|------------------------------------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Window Management                                    |                |                                                                                                                                            |
| TCP Delayed-ACK Timer                                | 100 millisecc  | Timeout for TCP delayed ACK, in milliseconds.                                                                                              |
| TCP minimum Retransmission Timeout(RTO) in millisecc | 1000 millisecc | Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10) |

| Parameter                                              | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection idle time before starting keep-alive probes | 900 seconds   | Silently drop TCP established connections on idle timeouttcp established connections on idle timeout                                                                                                                                                                                                                                                                                                                                                                          |
| TCP Timestamp Option                                   | DISABLED      | The timestamp option allows for accurate RTT measurement. Enable or Disable TCP Timestamp option.                                                                                                                                                                                                                                                                                                                                                                             |
| Multipath TCP session timeout                          | 0 seconds     | MPTCP session timeout in seconds. If this value is not set, idle. MPTCP sessions are flushed after the virtual server's client idle timeout.                                                                                                                                                                                                                                                                                                                                  |
| Silently Drop HalfClosed connections on idle timeout   | 0 seconds     | Silently drop TCP half closed connections on idle timeout.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Silently Drop Established connections on idle timeout  | DISABLED      | Silently drop TCP established connections on idle timeout                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Memory Management                                      |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TCP Buffer Size                                        | 131072 bytes  | TCP buffer size is the receive buffer size on the Citrix ADC. This buffer size is advertised to clients and servers from Citrix ADC and it controls their ability to send data to Citrix ADC. The default buffer size is 8K and usually it is safe to increment this when talking to internal server farms. The buffer size is also impact by the actual application layer in Citrix ADC like for SSL endpoint cases it is set to 40 K and for Compression it is set to 96 K. |

| Parameter                                                                         | Default Value | Description                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note: The buffer size argument must be set for dynamic adjustments to take place. |               |                                                                                                                                                                                                                                             |
| TCP Send Buffer Size                                                              | 8190 bytes    | TCP Send Buffer Size                                                                                                                                                                                                                        |
| TCP Dynamic Receive Buffering                                                     | DISABLED      | Enable or disable dynamic receive buffering. When enabled, it allows the receive buffer to be adjusted dynamically based on memory and network conditions. Note: The buffer size argument must be set for dynamic adjustments to take place |
| TCP Max congestion window(CWND)                                                   | 524288 bytes  | TCP Maximum Congestion Window                                                                                                                                                                                                               |
| Window Scaling status                                                             | ENALBED       | Enable or disable window scaling.                                                                                                                                                                                                           |
| Window Scaling factor                                                             | 8             | Factor used to calculate the new window size. This argument is needed only when window scaling is enabled.                                                                                                                                  |
| <b>Connection Setup</b>                                                           |               |                                                                                                                                                                                                                                             |
| Keep-alive probes                                                                 | DISABLED      | Send periodic TCP keep-alive (KA) probes to check if peer is still up.                                                                                                                                                                      |
| Connection idle time before starting keep-alive probes                            | 900 seconds   | Duration, in seconds, for the connection to be idle, before sending a keep-alive (KA) probe.                                                                                                                                                |

---

| Parameter                                                          | Default Value | Description                                                                                                                                           |
|--------------------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Keep-alive probe interval                                          | 75 seconds    | Time interval, in seconds, before the next keep-alive (KA) probe, if the peer does not respond.                                                       |
| Maximum keep-alive probes to be missed before dropping connection. | 3             | Number of keep-alive (KA) probes to be sent when not acknowledged, before assuming the peer to be down.                                               |
| RST window attenuation (spoof protection).                         | DISABLED      | Enable or disable RST window attenuation to protect against spoofing. When enabled, will reply with corrective ACK when a sequence number is invalid. |
| Accept RST with last acknowledged sequence number.                 | ENABLED       |                                                                                                                                                       |
| Data transfer                                                      |               |                                                                                                                                                       |
| Immediate ACK on PUSH packet                                       | ENABLED       | Send immediate positive acknowledgment (ACK) on receipt of TCP packets with PUSH flag.                                                                |
| Maximum packets per MSS                                            | 0             | Maximum number of octets to allow in a TCP data segment                                                                                               |

| Parameter                                 | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nagle's Algorithm                         | DISABLED      | Nagle's Algorithm fights with the problem of small packets in TCP transmission. Applications like Telnet and other real time engines which require every key stroke to be passed to the other side often create small packets. With Nagle's algorithm Citrix ADC can buffer such small packets and sends them together to increase on the connection efficiency. This algorithm needs to work along with other TCP optimization techniques in the Citrix ADC. |
| Maximum TCP segments allowed in a burst   | 10 MSS        | Maximum number of TCP segments allowed in a burst                                                                                                                                                                                                                                                                                                                                                                                                             |
| Maximum out-of-order packets to queue     | 300           | Maximum size of out-of-order packets queue. A value of 0 means no limit                                                                                                                                                                                                                                                                                                                                                                                       |

| TCP Flavor                                | CUBIC         |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Initial congestion window(cwnd) setting   | 4 MSS         | Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server                                                                                                                                                                                                                                                                                                                                                |
| TCP Explicit Congestion Notification(ECN) | DISABLED      | Explicit Congestion Notification (ECN) provides end to end notification of network congestion without dropping packets.                                                                                                                                                                                                                                                                                                                                       |

| Parameter                                           | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Max congestion window(CWND)                     | 524288 bytes  | TCP maintains a congestion window (CWND), limiting the total number of unacknowledged packets that may be in transit end-to-end. In TCP, the congestion window is one of the factors that determines the number of bytes that can be outstanding at any time. The congestion window is a means of stopping a link between the sender and the receiver from becoming overloaded with too much traffic. It is calculated by estimating how much congestion there is on the link. |
| TCP Hybrid Start (HYSTART)                          | 8 bytes       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| TCP minimum Retransmission Timeout(RTO) in millisec | 1000          | Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10).                                                                                                                                                                                                                                                                                                                                    |
| TCP dupack threshold                                | DISABLED      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Burst Rate Control                                  | 3             | TCP Burst Rate Control DISABLED/FIXED/DYNAMIC. FIXED requires a TCP rate to be set                                                                                                                                                                                                                                                                                                                                                                                             |
| TCP Rate                                            | DISABLED      | TCP connection payload send rate in Kb/s                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TCP Rate Maximum Queue                              | 0             | Maximum connection queue size in bytes, when BurstRateControl is used.                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter                                          | Default Value | Description                                                                                                                                                                                                       |
|----------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MPTCP</b>                                       |               |                                                                                                                                                                                                                   |
| Multipath TCP                                      | DISABLED      | Multipath TCP (MPTCP) is a set of extensions to regular TCP to provide a Multipath TCP service, which enables a transport connection to operate across multiple paths simultaneously.                             |
| Multipath TCP drop data on pre-established subflow | DISABLED      | Enable or disable silently dropping the data on Pre-Established subflow. When enabled, DSS data packets are dropped silently instead of dropping the connection when data is received on pre established subflow. |
| Multipath TCP fastopen                             | DISABLED      | Enable or disable Multipath TCP fastopen. When enabled, DSS data packets are accepted before receiving the third ack of SYN handshake.                                                                            |
| Multipath TCP session timeout                      | 0 seconds     | MPTCP session timeout in seconds. If this value is not set, idle MPTCP sessions are flushed after virtual server's client idle timeout.                                                                           |
| <b>Security</b>                                    |               |                                                                                                                                                                                                                   |
| SYN spoof protection                               | DISABLED      | Enable or disable drop of invalid SYN packets to protect against spoofing. When disabled, established connections are reset when a SYN packet is received.                                                        |

| Parameter                                  | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Syncookie                              | DISABLED      | This is used for resisting SYN flood attacks. Enable or disable the SYNCOOKIE mechanism for TCP handshake with clients. Disabling SYNCOOKIE prevents SYN attack protection on the Citrix ADC appliance.                                                                                                                                                                                                                                                                                      |
| Loss Detection and Recovery                |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Duplicate Selective Acknowledgment (DSACK) | ENABLED       | A Citrix ADC appliance uses Duplicate Selective Acknowledgment (DSACK) to determine if a retransmission was sent in error.                                                                                                                                                                                                                                                                                                                                                                   |
| Forward RTO recovery (FRTO)                | ENABLED       | Detects spurious TCP retransmission timeouts. After retransmitting the first unacknowledged segment triggered by a timeout, the algorithm of the TCP sender monitors the incoming acknowledgments to determine whether the timeout was spurious. It then decides whether to send new segments or retransmit unacknowledged segments. The algorithm effectively helps to avoid additional unnecessary retransmissions and thereby improves TCP performance in the case of a spurious timeout. |
| TCP Forward Acknowledgment (FACK)          | ENABLED       | Enable or disable FACK (Forward ACK).                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter                              | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Selective Acknowledgement(SACK) status | ENABLED       | TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgment the receiver can inform the sender about all the segments which are received successfully, enabling the sender to only retransmit the segments which were lost. This technique helps Citrix ADC improve overall throughput and reduce the connection latency. |
| Maximum packets per retransmission     | 1             | Allows Citrix ADC to control how many packets to be retransmitted in one attempt. When Citrix ADC receives a partial ACK and it has to do retransmission then this setting is considered. This does not impact the RTO based retransmissions.                                                                                                                                                     |
| TCP Delayed-ACK Timer                  | 100 millisec  | Timeout for TCP delayed ACK, in milliseconds                                                                                                                                                                                                                                                                                                                                                      |

|-----------------|---------------|-----------------------------------|
| ACK Aggregation | DISABLED      | Enable or disable ACK Aggregation |

## Setting Global TCP Parameters

The Citrix ADC appliance allows you to specify values for TCP parameters that are applicable to all Citrix ADC services and virtual servers. This can be done using:

- Default TCP profile
- Global TCP command
- TCP buffering feature

### Note:

The `recvBuffSize` parameter of the `set ns tcpParam` command is deprecated from release 9.2 onwards. In later releases, set the buffer size by using the `bufferSize` parameter of the `set ns tcpProfile` command. If you upgrade to a release where the `recvBuffSize` parameter is deprecated, the `bufferSize` parameter is set to its default value.

## Default TCP profile

A TCP profile, named as `nstcp_default_profile`, is used to specify TCP configurations that will be used if no TCP configurations are provided at the service or virtual server level.

### Note:

Not all TCP parameters can be configured through the default TCP profile. Some settings have to be performed by using the global TCP command.

The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default TCP profile

- Using the command line interface, at the command prompt enter:

```
1 set ns tcpProfile nstcp_default_profile ...
2 <!--NeedCopy-->
```

- On the GUI, navigate to **System > Profiles**, click **TCP Profiles** and update `nstcp_default_profile`.

## Global TCP command

Another approach you can use to configure global TCP parameters is the global TCP command. In addition to some unique parameters, this command duplicates some parameters that can be set by

using a TCP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default TCP profile.

For example, if the SACK parameter is updated using this approach, the value is reflected in the SACK parameter of the default TCP profile (nstcp\_default\_profile).

**Note:**

Citrix recommends that you use this approach only for TCP parameters that are not available in the default TCP profile.

To configure the global TCP command

- Using the command line interface, at the command prompt enter:

```
set ns tcpParam ...
```

- On the GUI, navigate to **System > Settings**, click Change TCP parameters, and update the required TCP parameters.

**TCP buffering feature**

Citrix ADC provides a feature called TCP buffering that you can use to specify the TCP buffer size. The feature can be enabled globally or at service level.

Note. The buffer size can also be configured in the default TCP profile. If the buffer size has different values in the TCP buffering feature and the default TCP profile, the greater value is applied.

**To configure the TCP buffering feature globally**

- At the command prompt enter:

```
enable ns mode TCPB
```

```
set ns tcpbufParam -size <positiveInteger> -memLimit <positiveInteger>
```

- On the GUI, navigate to **System > Settings**, click **Configure Modes**, and select **TCP Buffering**. And, navigate to **System > Settings**, click **Change TCP parameters**, and specify the values for **Buffer size** and **Memory usage limit**.

**Setting Service or Virtual Server Specific TCP Parameters**

Using TCP profiles, you can specify TCP parameters for services and virtual servers. You must define a TCP profile (or use a built-in TCP profile) and associate the profile with the appropriate service and virtual server.

**Note:**

You can also modify the TCP parameters of default profiles as per your requirements. You can specify the TCP buffer size at service level using the parameters specified by the TCP buffering feature.

To specify service or virtual server level TCP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the TCP profile.

```
set ns tcpProfile <profile-name>...
```

2. Bind the TCP profile to the service or virtual server.

```
set service <name> ....
```

**Example:**

```
1 > set service service1 -tcpProfileName profile1
2 <!--NeedCopy-->
```

To bind the TCP profile to the virtual server:

```
1 set lb vserver <name> ....
2 <!--NeedCopy-->
```

**Example:**

```
1 > set lb vserver lbvserver1 -tcpProfileName profile1`
2 <!--NeedCopy-->
```

To specify service or virtual server level TCP configurations by using the GUI

At the GUI, perform the following:

1. Configure the TCP profile.

Navigate to **System > Profiles > TCP Profiles**, and create the TCP profile.

2. Bind the TCP profile to the service or virtual server.

Navigate to **Traffic Management > Load Balancing > Services/Virtual Servers**, and create the TCP profile, which should be bound to the service or virtual server.

**Built-in TCP Profiles**

For convenience of configuration, the Citrix ADC provides some built-in TCP profiles. Review the built-in profiles listed below and select a profile and use it as it is or modify it to meet your requirements. You can bind these profiles to your required services or virtual servers.

---

| Built-in profile                     | Description                                                                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nstcp_default_profile                | Represents the default global TCP settings on the appliance.                                                                                                                                                                                             |
| nstcp_default_tcp_lan                | Useful for back-end server connections, where these servers reside on the same LAN as the appliance.                                                                                                                                                     |
| nstcp_default_WAN                    | useful for WAN deployments.                                                                                                                                                                                                                              |
| nstcp_default_tcp_lan_thin_stream    | Similar to the nstcp_default_tcp_lan profile. However, the settings are tuned to small size packet flows.                                                                                                                                                |
| nstcp_default_tcp_interactive_stream | Similar to the nstcp_default_tcp_lan profile. However, it has a reduced delayed ACK timer and ACK on PUSH packet settings.                                                                                                                               |
| nstcp_default_tcp_lfp                | Useful for long fat pipe networks (WAN) on the client side. Long fat pipe networks have long delay, high bandwidth lines with minimal packet drops.                                                                                                      |
| nstcp_default_tcp_lfp_thin_stream    | Similar to the nstcp_default_tcp_lfp profile. However, the settings are tuned for small size packet flows.                                                                                                                                               |
| nstcp_default_tcp_lnp                | Useful for long narrow pipe networks (WAN) on the client side. Long narrow pipe networks have considerable packet loss occasionally.                                                                                                                     |
| nstcp_default_tcp_lnp_thin_stream    | Similar to the nstcp_default_tcp_lnp profile. However, the settings are tuned for small size packet flows.                                                                                                                                               |
| nstcp_internal_apps                  | Useful for internal applications on the appliance (for example, GSLB site syncing). This contains tuned window scaling and SACK options for the desired applications. This profile should not be bound to applications other than internal applications. |
| nstcp_default_Mobile_profile         | Useful for mobile devices.                                                                                                                                                                                                                               |
| nstcp_default_XA_XD_profile          | Useful for a XenApp or XenDesktop deployment.                                                                                                                                                                                                            |

---

## Sample TCP Configurations

Sample command line interface examples for configuring the following:

### Defending TCP against spoofing attacks

Enable the Citrix ADC to defend TCP against spoof attacks. By default the “rstWindowAttenuation” parameter is disabled. This parameter is enabled to protect the appliance against spoofing. If you enable, it replies with corrective acknowledgment (ACK) for an invalid sequence number. Possible values are Enabled, Disabled.

Where the RST window attenuate parameter protects the appliance against spoofing. When enabled, will reply with corrective ACK when a sequence number is invalid.

```
1      set ns tcpProfile profile1 -rstWindowAttenuate ENABLED -
      spoofSynDrop ENABLED
2      Done
3      set lb vserver lbvserver1 -tcpProfileName profile1
4      Done
5 <!--NeedCopy-->
```

### Explicit Congestion Notification (ECN)

Enable ECN on the required TCP profile

```
1      set ns tcpProfile profile1 -ECN ENABLED
2      Done
3      set lb vserver lbvserver1 -tcpProfileName profile1
4      Done
5 <!--NeedCopy-->
```

### Selective Acknowledgment (SACK)

Enable SACK on the required TCP profile.

```
1      > set ns tcpProfile profile1 -SACK ENABLED
2      Done
3      > set lb vserver lbvserver1 -tcpProfileName profile1
4      Done
5 <!--NeedCopy-->
```

**Forward Acknowledgment (FACK)**

Enable FACK on the required TCP profile.

```
1     set ns tcpProfile profile1 -FACK ENABLED
2     Done
3     set lb vserver lbvserver1 -tcpProfileName profile1
4     Done
5 <!--NeedCopy-->
```

**Window Scaling (WS)**

Enable window scaling and set the window scaling factor on the required TCP profile.

```
1     set ns tcpProfile profile1 - WS ENABLED - WSVal 9
2     Done
3     set lb vserver lbvserver1 -tcpProfileName profile1
4     Done
5 <!--NeedCopy-->
```

**Maximum Segment Size (MSS)**

Update the MSS related configurations.

```
1     set ns tcpProfile profile1 - mss 1460 - maxPktPerMss 512
2     Done
3     set lb vserver lbvserver1 -tcpProfileName profile1
4     Done
5 <!--NeedCopy-->
```

**Citrix ADC to learn the MSS of a virtual server**

Enable the Citrix ADC to learn the VSS and update other related configurations.

```
1     set ns tcpParam -learnVsvrMSS ENABLED - mssLearnInterval 180 -
      mssLearnDelay 3600
2     Done
3 <!--NeedCopy-->
```

**TCP keep-alive**

Enable TCP keep-alive and update other related configurations.

```
1 > set ns tcpProfile profile1 - KA ENABLED -  
    KaprobeUpdateLastactivity ENABLED -KAconnIdleTime 900 -  
    KAmaxProbes 3 -KaprobeInterval 75  
2 Done  
3 > set lb vserver lbvserver1 -tcpProfileName profile1  
4 Done  
5 <!--NeedCopy-->
```

### Buffer size - using TCP profile

Specify the buffer size.

```
1 > set ns tcpProfile profile1 - bufferSize 8190  
2 Done  
3 > set lb vserver lbvserver1 -tcpProfileName profile1  
4 Done  
5 <!--NeedCopy-->
```

### Buffer size - using TCP buffering feature

Enable the TCP buffering feature (globally or for a service) and then specify the buffer size and the memory limit.

```
1 > enable ns feature TCPB  
2 Done  
3 > set ns tcpbufParam -size 64 -memLimit 64  
4 Done  
5 <!--NeedCopy-->
```

### MPTCP

Enable MPTCP and then set the optional MPTCP configurations.

```
1 > set ns tcpProfile profile1 -mptcp ENABLED  
2 Done  
3 > set ns tcpProfile profile1 -mptcpDropDataOnPreEstSF ENABLED -  
    mptcpFastOpen ENABLED -mptcpSessionTimeout 7200  
4 Done  
5 > set ns tcpParam -mptcpConCloseOnPassiveSF ENABLED -mptcpChecksum  
    ENABLED -mptcpSFtimeout 0 -mptcpSFReplaceTimeout 10  
6 -mptcpMaxSF 4 -mptcpMaxPendingSF 4 -mptcpPendingJoinThreshold 0 -  
    mptcpRTOsToSwitchSF 2 -mptcpUseBackupOnDSS ENABLED
```

```
7 Done
8 <!--NeedCopy-->
```

### **Congestion control**

Set the required TCP congestion control algorithm.

```
1 > set ns tcpProfile profile1 -flavor Westwood
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

### **Dynamic receive buffering**

Enable dynamic receive buffering on the required TCP profile.

```
1 > set ns tcpProfile profile1 -dynamicReceiveBuffering ENABLED
2 Done
3 > set lb vserver lbvserver1 -tcpProfileName profile1
4 Done
5 <!--NeedCopy-->
```

### **Support for TCP Fast Open (TFO) in Multipath TCP (MPTCP)**

A Citrix ADC appliance now supports TCP Fast Open (TFO) mechanism for establishing Multipath TCP (MPTCP) connections and speed up data transfers. The mechanism allows subflow data to be carried during the initial MPTCP connection handshake in SYN and SYN-ACK packets and also enables data to be consumed by the receiving node during the MPTCP connection establishment.

For more information, see [TCP Fast Open](#) topic.

### **Support for Variable TFO Cookie Size for MPTCP**

A Citrix ADC appliance now enables you to configure a variable length TCP Fast Open (TFO) cookie of a minimum size of 4 bytes and a maximum size of 16 bytes in a TCP profile. By doing this, the appliance can respond with the configured TFO cookie size in the SYN-ACK packet to the client.

To configure TCP Fast Open (TFO) cookie in a TCP profile by using the command line interface

At the command prompt, type:

```
set tcpProfile nstcp_default_profile -tcpFastOpenCookieSize <positive_integer>
```

#### Example

```
set tcpProfile nstcp_default_profile -tcpFastOpenCookieSize 8
```

To configure TCP Fast Open (TFO) cookie in a TCP profile by using GUI

1. Navigate to **Configuration > System > Profiles**.
2. In the details pane, go to **TCP Profiles** tab and select a TCP profile.
3. In the **Configure TCP Profile** page, set the **TCP Fast Open** cookie size.
4. Click **OK** and **Done**.

### SYN-Cookie timeout interval

The `TCPsyncookie` parameter is enabled by default in TCP profiles to provide robust (RFC 4987) based protection against SYN Attacks. If you need to accommodate custom TCP clients that are not compatible with this protection but still want to ensure a fallback in attack, the `synAttackDetection` handles this for you by automatically activating the `SYNCookie` behavior internally for time determined by the `autosyncookietimeout` parameter.

To configure the maximum SYN ACK retransmission threshold by using the command line interface:

At the command prompt, type:

```
1 set ns tcpparam [-maxSynAckRetx <positive_integer>]
2
3 set ns tcpparam [-maxSynAckRetx 150]
4 <!--NeedCopy-->
```

To configure auto SYN cookie timeout interval by using the command line interface

At the command prompt, type:

```
1 set ns tcpparam [-autosyncookietimeout <positive_integer>]
2
3 set ns tcpparam [-autosyncookietimeout
4 <!--NeedCopy-->
```

## HTTP configurations

November 5, 2020

HTTP configurations for a Citrix ADC appliance can be specified in an entity called an HTTP profile, which is a collection of HTTP settings. The HTTP profile can then be associated with services or virtual servers that want to use these HTTP configurations.

A default HTTP profile can be configured to set the HTTP configurations that will be applied by default, globally to all services and virtual servers.

**Note:** When a HTTP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence.

The Citrix ADC appliance also provides other approaches for configuring HTTP. Read on for more information.

The Citrix ADC supports

WebSocket protocol which allows browsers and other clients to create a bi-directional, full duplex TCP connection to the servers. The Citrix ADC implementation of WebSocket is RFC [6455](#) compliant.

**Note:**

A Citrix ADC appliance now supports the User Source IP (USIP) address configuration for both HTTP/1.1 and HTTP/2 protocols.

## Setting global HTTP parameters

The Citrix ADC appliance allows you to specify values for HTTP parameters that are applicable to all Citrix ADC services and virtual servers. This can be done using:

- Default HTTP profile
- Global HTTP command

### Default HTTP profile

A HTTP profile, named as `nshttp_default_profile`, is used to specify HTTP configurations that will be used if no HTTP configurations are provided at the service or virtual server level.

**Note:**

- Not all HTTP parameters can be configured through the default HTTP profile. Some settings have to be performed by using the global HTTP command (see section below).
- The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default HTTP profile

- Using the command line interface, at the command prompt enter:

```
set ns httpProfile nshttp_default_profile ...
```

- On the GUI, navigate to **System > Profiles**, click **HTTP Profiles** and update nshttp\_default\_profile.

### Global HTTP command

Another approach you can use to configure global HTTP parameters is the global HTTP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using a HTTP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default HTTP profile.

For example, if the maxReusePool parameter is updated using this approach, the value is reflected in the maxReusePool parameter of the default HTTP profile (nshttp\_default\_profile).

#### Note:

Citrix recommends that you use this approach only for HTTP parameters that are not available in the default HTTP profile.

To configure the global HTTP command

- Using the command line interface, at the command prompt enter:

```
set ns httpParam ...
```

- On the GUI, navigate to System > Settings, click Change HTTP parameters and update the required HTTP parameters.

To configure the ignore Coding scheme for connect request

To enable HTTP/2 and set HTTP/2 parameters to ignore the Coding scheme in the connect request, at the command prompt, type:

```
set ns httpParam [-ignoreConnectCodingScheme ( ENABLED | DISABLED )]
```

#### Example:

```
set ns httpParam -ignoreConnectCodingScheme ENABLED
```

### Setting service or virtual server specific HTTP parameters

Using HTTP profiles, you can specify HTTP parameters for services and virtual servers. You must define a HTTP profile (or use a built-in HTTP profile) and associate the profile with the appropriate service and virtual server.

#### Note:

You can also modify the HTTP parameters of default profiles as per your requirements.

## To specify service or virtual server level HTTP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the HTTP profile.

```
set ns httpProfile <profile-name>...
```

2. Bind the HTTP profile to the service or virtual server.

To bind the HTTP profile to the service:

```
set service <name> .....
```

```
1  **Example:**
2
3  ```
4  > set service service1 -httpProfileName profile1
5  <!--NeedCopy--> ```
6
7  To bind the HTTP profile to the virtual server:
8
9  `set lb vserver \<name\> .....`
10
11 **Example:**
12
13 ```
14 > set lb vserver lbvserver1 -httpProfileName profile1
15 <!--NeedCopy--> ```
```

## To specify service or virtual server level HTTP configurations by using the GUI

At the GUI, perform the following:

1. Configure the HTTP profile.

Navigate to **System > Profiles > HTTP Profiles**, and create the HTTP profile.

2. Bind the HTTP profile to the service or virtual server.

Navigate to **Traffic Management > Load Balancing > Services/Virtual Servers**, and create the HTTP profile, which should be bound to the service/virtual server.

## Built-in HTTP profiles

For convenience of configuration, the Citrix ADC provides some built-in HTTP profiles. Review the profiles listed below and use it as it is or modify it to meet your requirements. You can bind these

profiles to the required services or virtual servers.

---

| Built-in profile                              | Description                                                                             |
|-----------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>nshttp_default_profile</code>           | Represents the default global HTTP settings on the appliance.                           |
| <code>nshttp_default_strict_validation</code> | Settings for deployments that require strict validation of HTTP requests and responses. |

---

## Sample HTTP configurations

Sample command line interface examples to configure the following:

- HTTP band statistics
- WebSocket connections

### HTTP band statistics

Specify the band size for HTTP requests and responses.

```
> set protocol httpBand reqBandSize 300 respBandSize 2048
> show protocol httpband -type REQUEST
```

### WebSocket connections

Enable webSocket on the required HTTP profile.

```
> set ns httpProfile http_profile1 -webSocket ENABLED
> set lb vserver lbvserver1 -httpProfileName profile1
```

## Configuring HTTP/2 on the Citrix ADC appliance

November 2, 2020

**Note:** The HTTP/2 functionality is supported on the Citrix ADC MPX, VPX, and SDX models. For Citrix ADC VPX, the HTTP/2 functionality is supported from 11.0 release onwards.

The problem with web application performance is directly related to the trend toward increasing the page size and the number of objects on the web pages. HTTP/1.1 was developed to support smaller web pages, slower Internet connections, and more limited server hardware than are common today. It is not well suited for newer technologies such as JavaScript and cascading style sheets (CSS), nor

for new media types such as Flash videos and graphics-rich images, because it can request only one resource per connection to the server. This limitation significantly increases the number of round trips, causing longer page-rendering time and reduced network performance.

The HTTP/2 protocol addresses these limitations by allowing communication to occur with less data transmitted over the network, and providing the ability to send multiple requests and responses across a single connection. At its core, HTTP/2 addresses the key limitations of HTTP/1.1 by using the underlying network connections more efficiently. It changes the way requests and responses travel over the network.

HTTP/2 is a binary protocol. It is more efficient to parse, more compact on the wire, and most importantly, it is less error-prone, compared to textual protocols like HTTP/1.1. The HTTP/2 protocol uses a binary framing layer that defines the frame type and how HTTP messages are encapsulated and transferred between the client and server. The HTTP/2 functionality supports the use of the CONNECT method to establish a tunnel connection through a single HTTP/2 stream to a remote host.

The HTTP/2 protocol includes a lot of performance-enhancing changes that significantly improve performance, particularly for clients connecting over a mobile network.

The following table lists the major improvements in HTTP/2 over HTTP/1.1:

| HTTP/2 Features         | Description                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Header Compression      | HTTP headers have a lot of repetitive information and therefore consume unnecessary bandwidth during data transmission. HTTP/2 reduces bandwidth requirements by compressing the header and minimizing the requirement to transport HTTP headers with every request and response. |
| Connection Multiplexing | Latency can have a huge impact on page load times and the end user experience. Connection multiplexing overcomes this problem by sending multiple requests and responses across a single connection.                                                                              |

| HTTP/2 Features          | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Push              | Server push enables the server to proactively push content to the client browser, avoiding round trip delay. This feature caches the responses it thinks the client will need, reduces the number round trips, and improves the page rendering time. Important: The Citrix ADC appliance does not support the server push functionality.                                                                                     |
| No Head-of-line Blocking | Under HTTP/1.1, browsers can download one resource at a time per connection. When a browser has to download a large resource, it blocks all other resources from downloading until the first download is complete. HTTP/2 overcomes this problem with a multiplexing approach. It allows the client browser to download other web components in parallel over the same connection and display them as they become available. |

| HTTP/2 Features        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request Prioritization | Not all resources have equal priority when the browser renders a web page. To accelerate the load time, all modern browsers prioritize requests by type of asset, their location on the page, and even by learned priority from previous visits. With HTTP/1.1, the browser has limited ability to leverage the priority data, because this protocol does not support multiplexing, and there is no way to communicate request prioritization by the server. The result is unnecessary network latency. HTTP/2 overcomes this problem by allowing the browser to dispatch all requests. The browser can communicate its stream prioritization preference via stream dependencies and weights, enabling the servers to optimize response delivery. Important: The Citrix ADC appliance does not support the request prioritization functionality. |

### **How HTTP/2 works on a Citrix ADC appliance**

A Citrix ADC appliance supports HTTP/2 on the client side as well on the server side. On the client side, the Citrix ADC appliance acts as a server that hosts an HTTP/HTTPS virtual server for HTTP/2. On the backend side, the Citrix ADC acts as a client to the servers that are bound to the virtual server.

Therefore, the Citrix ADC appliance maintains separate connections on the client side as well on the server side. The Citrix ADC appliance has separate HTTP/2 configurations for the client side and the server side.

### **HTTP/2 for HTTPS (SSL) load balancing configuration**

For an HTTPS load balancing configuration, the Citrix ADC appliance uses the TLS ALPN extension (RFC 7301) to determine whether the client/server supports HTTP/2. If it does, the appliance chooses HTTP/2 as the application-layer protocol to transmit data (as described in RFC 7540 - Section 3.3) on the client/server side.

The appliance uses the following order of preference when choosing the application-layer protocol through the TLS ALPN extension:

- HTTP/2 (if enabled in the HTTP profile)
- SPDY (if enabled in the HTTP profile)
- HTTP/1.1

## HTTP/2 for HTTP load balancing configuration

For an HTTP load balancing configuration, the Citrix ADC appliance uses one of the following methods to start communicating with the client/server using HTTP/2.

### Note:

In the following method descriptions, client and server are general terms for an HTTP/2 connection. For example, for a load balancing setup of a Citrix ADC appliance using HTTP/2, the Citrix ADC appliance acts as a server on the client side and acts as a client to the server side.

- **HTTP/2 Upgrade.** A client sends an HTTP/1.1 request to a server. The request includes an upgrade header, which asks the server for upgrading the connection to HTTP/2. If the server supports HTTP/2, the server accepts the upgrade request and notifies it in its response. The client and the server start communicating using HTTP/2 after the client receives the upgrade confirmation response.
- **Direct HTTP/2.** A client directly starts communicating to a server in HTTP/2 instead of using the HTTP/2 upgrade method. If the server does not support HTTP/2 or is not configured to directly accept HTTP/2 requests, it drops the HTTP/2 packets from the client. This method is helpful if the admin of the client device already knows that the server supports HTTP/2.
- **Direct HTTP/2 using Alternative Service (ALT-SVC).** A server advertises that it supports HTTP/2 to a client by including an Alternative Service (ALT-SVC) field in its HTTP/1.1 response. If the client is configured to understand the ALT-SVC field, the client and the server starts directly communicating using HTTP/2 after the client receives the response.

The Citrix ADC appliance provides configurable options in an HTTP profile for the HTTP/2 methods. These HTTP/2 options can be applied to the client side as well to the server side of an HTTPS or HTTP load balancing setup. For more information for HTTP/2 methods and options, refer to the [HTTP/2 options](#) pdf.

## Before you Begin

Before you begin configuring HTTP/2 on a Citrix ADC appliance, note the following points:

- The Citrix ADC appliance supports HTTP/2 on the client side as well on the server side.
- The Citrix ADC appliance does not support the HTTP/2 server push functionality.

- The Citrix ADC appliance does not support the HTTP/2 request prioritization functionality.
- The Citrix ADC appliance does not support HTTP/2 SSL renegotiation for HTTPS load balancing setups.
- The Citrix ADC appliance does not support HTTP/2 NTLM authentication.
- HTTP/2 does not work if User Source IP (USIP) mode is enabled and the Proxy mode is disabled on the Citrix ADC appliance.

## Configuring HTTP/2

Configuring HTTP/2 for a load balancing setup (HTTPS or HTTP) consists of the following tasks:

- **Enable HTTP/2 and set optional HTTP/2 parameters in an HTTP Profile.** Enable HTTP/2 in an HTTP profile. When you only enable HTTP/2 in an HTTP profile, the Citrix ADC appliance uses only the upgrade method (for HTTP) or TLS ALPN method (for HTTPS) for communicating in HTTP/2.

For the Citrix ADC appliance to use the direct HTTP/2 method, **Direct HTTP/2** option must be enabled in the HTTP profile. For the Citrix ADC appliance to use the direct HTTP/2 using the alternative service method, **Alternative Service (altsvc)** option must be enabled in the HTTP profile.

- **Bind the HTTP profile to a virtual server or a service.** Bind the HTTP profile to a virtual server to configure HTTP/2 for the client side of the load balancing setup. Bind the HTTP profile to a service to configure HTTP2 for the server side of the load balancing setup.

### Note:

Citrix recommends binding separate HTTP profiles for the client side and the server side.

- **Enable the global parameter for HTTP/2 server side support.** Enable the **HTTP/2 Service Side (HTTP2Serverside)** global HTTP parameter for enabling the HTTP/2 support on the server side of all the load balancing setups that has HTTP/2 configured.

HTTP/2 does not work on the server side of any load balancing setups if **HTTP/2 Service Side** is disabled even if the **HTTP/2** is enabled on the HTTP profile bound to the related load balancing services.

### Citrix ADC Command Line procedures:

To enable HTTP/2 and set HTTP/2 parameters by using the Citrix ADC command line

- To enable HTTP/2 and set HTTP/2 parameters while adding an HTTP profile, at the command prompt, type:
  - `add ns httpProfile <name> - http2 ( ENABLED | DISABLED )[-http2Direct ( ENABLED | DISABLED )][-altsvc ( ENABLED | DISABLED )]`
  - `show ns httpProfile <name>`

- To enable HTTP/2 and set HTTP/2 parameters while modifying an HTTP profile, at the command prompt, type:
  - `set ns httpProfile <name> -http2 ( ENABLED | DISABLED )\[-http2Direct ( ENABLED |DISABLED)\]\[-altsvc (ENABLED | DISABLED )\]`
  - `show ns httpProfile <name>`

### Bind HTTP profile to a virtual server by using the Citrix ADC command line

At the command prompt, type:

- `set lb vserver <name> - httpProfileName** <string>`
- `show lb vserver** <name>`

To bind the HTTP profile to a load balancing service by using the Citrix ADC command line

At the command prompt, type:

- `set service <name> -httpProfileName <string>`
- `show service <name>`

To enable HTTP/2 support globally on the server side by using the Citrix ADC command line

At the command prompt, type:

- `set ns httpParam -HTTP2Serverside( ENABLED | DISABLED )`
- `show ns httpParam`

### Configure HTTP/2 and set HTTP/2 parameters by using the GUI

1. Navigate to **System > Profiles**, and click **HTTP Profiles** tab.
2. Enable **HTTP/2** while adding an HTTP profile or modifying an existing HTTP profile.

To bind the HTTP profile to a virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and open the virtual server.
2. In **Advanced Settings**, click **+ HTTP Profile** to bind the created HTTP profile to the virtual server.

To bind the HTTP profile to a load balancing service by using the GUI

1. Navigate to **Traffic Management > Load Balancing > service**, and open the service.
2. In **Advanced Settings**, click **+ HTTP Profile** to bind the created HTTP profile to the service.

To enable HTTP/2 support globally on the server side by using the GUI

Navigate to **System > Settings**, click **Change HTTP parameters** and enable **HTTP/2 Server Side**.

## Sample configurations

In the following sample configuration, HTTP/2 and direct HTTP/2 is enabled on HTTP profile HTTP-PROFILE-HTTP2-CLIENT-SIDE. The profile is bound to virtual server LB-VS-1.

```
1 > set ns httpProfile HTTP-PROFILE-HTTP2-CLIENT-SIDE -http2 enabled
   -http2Direct enabled
2 Done
3 > set lb vserver LB-VS-1 -httpProfileName HTTP-PROFILE-HTTP2-CLIENT
   -SIDE
4 Done
5 <!--NeedCopy-->
```

In the following sample configuration, HTTP/2 and alternative service (ALT-SVC) is enabled on HTTP profile HTTP-PROFILE-HTTP2-SERVER-SIDE. The profile is bound to service LB-SERVICE-1.

```
1 > set ns httpparam -HTTP2Serverside ENABLED
2 Done
3
4 > set ns httpProfile HTTP-PROFILE-HTTP2-SERVER-SIDE -http2 ENABLED
   -altsvc ENABLED
5 Done
6
7 > set service LB-SERVICE-1 -httpProfileName HTTP-PROFILE-HTTP2-
   SERVER-SIDE
8 Done
9 <!--NeedCopy-->
```

## SNMP

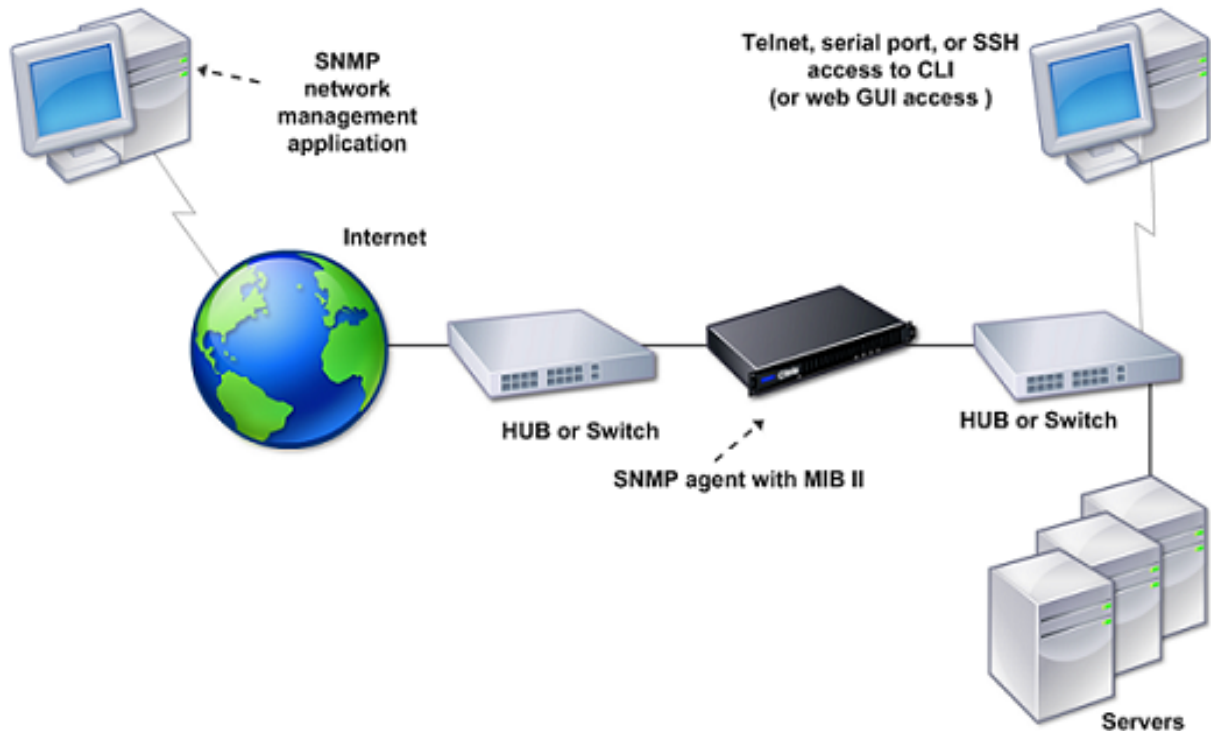

July 30, 2021

You can use SNMP to configure the SNMP agent on the Citrix ADC appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the Citrix ADC. The traps are then sent to a remote device called a *trap listener*, which signals the abnormal condition on the Citrix ADC appliance. Or, you can query the SNMP agent for System-specific information from a remote device called an *SNMP manager*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The SNMP agent on the Citrix ADC can generate traps compliant with SNMPv1, SNMPv2, and SNMPv3. For querying, the SNMP agent supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3).

For information about SNMP parameters, traps, and its descriptions, see [Citrix ADC SNMP OID Reference](#).

The following figure illustrates a network with a Citrix ADC that has SNMP enabled and configured. In the figure, each SNMP network management application uses SNMP to communicate with the SNMP agent on the Citrix ADC. The SNMP agent searches its management information base (MIB) to collect the data requested by the SNMP Manager and provides the information to the application.

### Important

The SNMP module in a Citrix ADC appliance supports a maximum length of 128 bytes (as compliant with RFC 3416) for an SNMP OID. A long index variable name for an object can result in an SNMP OID exceeding 128 bytes in length.

To resolve this issue, the Citrix ADC SNMP module supports a maximum length of 31 characters for an index variable name. If an index variable name exceeds 31 characters in length, the SNMP module using a hash algorithm converts the name to a 31 characters hash value. This hashed value is used in the SNMP OID for that variable.

The original index variable name is stored in another variable, which has the following name format: `<variable type>FullName`. For example, When the name of a load balancing virtual server has more the 31 characters, `vserverName` SNMP OID contains the hashed value and `vsvrFullName` SNMP OID contains the full (original) name of the virtual server.

Similarly, for SNMP traps, the index variable displays a hashed valued. `<variable type>`

`FullName`, which stores the full name of the original index variable name, is also part of the trap messages.

## Importing MIB Files to the SNMP Manager and Trap Listener

To monitor a Citrix ADC appliance, you must download the MIB object definition files. The Citrix ADC appliance supports the following enterprise-specific MIBs:

- **A subset of standard MIB-2 groups.** Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- **A system enterprise MIB.** Provides system-specific configuration and statistics.

You can obtain the MIB object definition files from the `/netscaler/snmp` directory of the Citrix ADC appliance or from the `Downloads` tab of the GUI.

## Configuring the Citrix ADC to generate SNMP traps

September 21, 2020

You can configure the Citrix ADC appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the appliance. The traps are sent to a remote device called a *trap listener*. This helps administrators monitor the appliance and respond promptly to any issues.

The Citrix ADC appliance provides a set of condition entities called *SNMP alarms*. When the condition in any SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

To configure the Citrix ADC appliance to generate traps, you need to enable and configure alarms. Then, you specify trap listeners to which the appliance will send the generated trap messages.

### Enabling an SNMP alarm

The Citrix ADC appliance generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the appliance generates corresponding trap messages when some events occur. Some alarms are enabled by default.

### To enable an SNMP alarm by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `enable snmp alarm <trapName>`
- `show snmp alarm <trapName>`

### To enable an SNMP alarm by using the GUI

1. Navigate to **System > SNMP > Alarms**, and select the alarm.
2. Click **Actions** and select **Enable**.

### Configuring alarms

The Citrix ADC appliance provides a set of condition entities called *SNMP alarms*. When the condition set for an SNMP alarm is met, the appliance generates SNMP traps messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

You can assign an SNMP alarm with a severity level. When you do this, the corresponding trap messages are assigned that severity level.

The following are the severity levels, defined on the appliance, in decreasing order of severity.

- Critical
- Major
- Minor
- Warning
- Informational

For example, if you set a warning severity level for the SNMP alarm named LOGIN-FAILURE, the trap messages generated when there is a login failure will be assigned with the warning severity level.

You can also configure an SNMP alarm to log the corresponding trap messages generated whenever the condition on that alarm is met.

### To configure an SNMP alarm by using the command line interface

At the command prompt, type the following commands to configure an SNMP alarm and verify the configuration:

- `set snmp alarm <trapName> [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-time <secs>] [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]`
- `show snmp alarm <trapName>`

Where,

**ThresholdValue:** Value for the high threshold. The Citrix ADC appliance generates an SNMP trap message when the value of the attribute associated with the alarm is greater than or equal to the specified high threshold value.

**NormalValue:** Value for the normal threshold. A trap message is generated if the value of the respective attribute falls to or below this value after exceeding the high threshold.

### **To configure SNMP alarms by using the GUI**

Navigate to System > SNMP > Alarms, select an alarm and configure the alarm parameters.

### **Configuring SNMPv1 or SNMPv2 traps**

After configuring the alarms, you need to specify the trap listener to which the appliance sends the trap messages. Apart from specifying parameters such as IP or IPv6 address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

You can also configure the appliance to send SNMP trap messages with a source IP address other than the Citrix ADC IP (NSIP or NSIP6) address to a particular trap listener. For a trap listener that has an IPv4 address, you can set the source IP to either a mapped IP (MIP) address or a subnet IP (SNIP) address configured on the appliance. For a trap listener that has an IPv6 address, you can set the source IP to subnet IPv6 (SNIP6) address configured on the appliance.

You can also configure the appliance to send trap messages to a trap listener on the basis of a severity level. For example, if you set the severity level as Minor for a trap listener, all trap messages of the severity level equal to or greater than Minor (Minor, Major, and Critical) are sent to the trap listener.

If you have defined a community string for the trap listener, you must also specify a community string for each trap that is to be sent to the listener. A trap listener for which a community string has been defined accepts only trap messages that include a community string matching the community string defined in the trap listener. Other trap messages are dropped.

### **To add an SNMP trap by using the command line interface**

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp trap <trapClass> <trapDestination> -version ( V1 | V2 ) -destPort <port> -communityName <string> -srcIP <ip_addr> -severity <severity>`
- `show snmp trap`

**Example:**

```
1 > `add snmp trap specific 10.102.29.3 -version V2 -destPort 80 -
   communityName com1 -severity Major`
2 <!--NeedCopy-->
```

**To configure SNMP traps by using the GUI**

Navigate to **System > SNMP > Traps**, and create the SNMP trap.

**Configuring SNMPv3 traps**

SNMPv3 provides security capabilities such as authentication and encryption by using the credentials of SNMP users. An SNMP manager can receive SNMPv3 trap messages only if its configuration includes the password assigned to the SNMP user.

The trap destination can now receive SNMPv1, SNMPv2, and SNMPv3 trap messages.

**To configure an SNMPv3 trap by using the command line interface**

At the command prompt, do the following:

1. Add an SNMPv3 trap.

```
add snmp trap <trapClass> <trapDestination> -version ( V1 | V2 | V3)
-destPort <port> -communityName <string> -srcIP <ip_addr> -severity <
severity>
```

**Note:**

Once set, the SNMP trap version cannot not be modified.

**Example**

```
1 > add snmp trap specific 10.102.29.3 -version V3 -destPort 80 -
   communityName com1 -severity Major
2 <!--NeedCopy-->
```

2. Add an SNMP user.

```
add snmp user <name> -group <string> [ -authType ( MD5 | SHA ){ -
authPasswd } [-privType ( DES | AES ){ -privPasswd } ]]
```

**Example**

```
1 > add snmp user edocs_user -group edocs_group
2 <!--NeedCopy-->
```

3. Bind the SNMPv3 trap to the SNMP user.

```
bind snmp trap <trapClass> <trapDestination> [-version <version>] (-userName <string> [-securityLevel <securityLevel>])
```

**Example:**

```
> bind snmp trap specific 10.102.29.3 -version V3 -userName edocs_user -securityLevel authPriv
```

**To configure an SNMPv3 trap by using the GUI**

1. Add an SNMPv3 trap.

Navigate to **System > SNMP > Traps**, and create the SNMP trap by selecting V3 as the SNMP version.

2. Add an SNMP user.

Navigate to **System > SNMP > Users** and create the SNMP user.

3. Bind the SNMPv3 trap to the SNMP user.

- Navigate to **System > SNMP > Traps**, and select the SNMP version 3 trap.
- Select the user to which the trap should be bound and define the appropriate Security Level.

**SNMP trap logging**

A Citrix ADC appliance can log SNMP trap messages (for SNMP alarms in which logging capability is enabled) when you enable the SNMP trap logging option and at least one trap listener is configured on the appliance. Now, you can specify the audit log level of trap messages sent to an external log server. The default log level is Informational. Possible values are Emergency, Alert, Critical, Error, Warning, Debug, and Notice.

For example, you can set the audit log level to Critical for an SNMP trap message generated by a logon failure. That information is then available on the NSLOG or SYSLOG server for troubleshooting.

**To enable SNMP trap logging and configure trap log level by using the command line interface**

At the command prompt, type the following commands to configure SNMP trap logging and verify the configuration:

- `set snmp option [-snmpTrapLogging (ENABLED | DISABLED)][-snmpTrapLoggingLevel <snmpTrapLoggingLevel>]`
- `show snmp option`

### To enable SNMP trap logging and configure SNMP trap log level by using the GUI

Navigate to **System > SNMP**, click Change SNMP Options and set the following parameters:

1. SNMP Trap Logging—Select this check box to enable SNMP trap logging when at least one trap listener is configured on the appliance.
2. SNMP Trap Logging Level—Select an audit log level for the SNMP trap. By default, the audit level for SNMP trap is set to “Informational.”

## Configuring Citrix ADC for SNMP v1 and v2 queries

September 21, 2020

You can query the Citrix ADC SNMP agent for system-specific information from a remote device called *SNMP managers*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The following types of SNMP v1 and v2 queries are supported by the SNMP agent:

- GET
- GET NEXT
- ALL
- GET BULK

You can create strings called community strings and associate each of these to query types. You can associate one or more community strings to each query type. Community strings are passwords and used to authenticate SNMP queries from SNMP managers.

For example, if you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the Citrix ADC appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

### Specifying an SNMP manager

You must configure the Citrix ADC appliance to allow the appropriate SNMP managers to query it. You must also provide the SNMP manager with the required Citrix ADC-specific information. You can add up to a maximum of 100 SNMP managers or networks.

For an IPv4 SNMP manager you can specify a host name instead of the manager's IP address. If you do so, you must add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host-name based SNMP managers.

**Note:**

The appliance does not support use of host names for SNMP managers that have IPv6 addresses. You must specify the IPv6 address.

If you do not configure at least one SNMP manager, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds only to SNMP queries from those specific IP addresses.

If you remove an SNMP manager from the configuration, that manager can no longer query the appliance.

**To add SNMP managers by specifying IP addresses by using the command line interface**

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp manager <IPAddress> ... [-netmask <netmask>]`
- `show snmp manager`

**Example**

```
> add snmp manager 10.102.29.10 10.102.29.15 10.102.29.30
```

**To add an SNMP manager by specifying its host name by using the command line interface**

Important: If you specify the SNMP manager's host name instead of its IP address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see [“Adding a Name Server.”](#)

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp manager <IPAddress> [-domainResolveRetry ****<integer>]`
- `show snmp manager`

**Example**

```
add nameserver 10.103.128.15
add snmp manager engwiki.eng.example.net -domainResolveRetry 10
```

### To add an SNMP manager by using the GUI

1. Navigate to **System > SNMP > Managers**, and create the SNMP manager.

**Important:**

If you specify the SNMP manager's host name instead of its IPv4 address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address.

**Note:**

The appliance does not support host names for SNMP managers that have IPv6 addresses.

### Specifying an SNMP community

You can create strings called community strings and associate them with the following SNMP query types on the appliance:

- GET
- GET NEXT
- ALL
- GET BULK

You can associate one or more community strings to each query types. For example, when you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

If you do not associate any community string to a query type then the SNMP agent responds to all SNMP queries of that type.

### To specify an SNMP community by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp community <communityName> <permissions>`
- `show snmp community`

#### Example

```
> add snmp community com all
```

### To configure an SNMP community string by using the GUI

Navigate to **System > SNMP > Community**, and create the SNMP community.

## Configuring Citrix ADC for SNMPv3 queries

September 21, 2020

Simple Network Management Protocol Version 3 (SNMPv3) is based on the basic structure and architecture of SNMPv1 and SNMPv2. However, SNMPv3 enhances the basic architecture to incorporate administration and security capabilities, such as authentication, access control, data integrity check, data origin verification, message timeliness check, and data confidentiality.

To implement message level security and access control, SNMPv3 introduces the user-based security model (USM) and the view-based access control model (VACM).

- **User-Based Security Model.** The user-based security model (USM) provides message-level security. It enables you to configure users and security parameters for the SNMP agent and the SNMP manager. USM offers the following features:
  - **Data integrity:** To protect messages from being modified during transmission through the network.
  - **Data origin verification:** To authenticate the user who sent the message request.
  - **Message timeliness:** To protect against message delays or replays.
  - **Data confidentiality:** To protect the content of messages from being disclosed to unauthorized entities or individuals.
- **View-Based Access Control Model.** The view-based access control model (VACM) enables you to configure access rights to a specific subtree of the MIB based on various parameters, such as security level, security model, user name, and view type. It enables you to configure agents to provide different levels of access to the MIB to different managers.

Citrix ADC supports the following entities that enable you to implement the security features of SNMPv3:

- SNMP Engines
- SNMP Views
- SNMP Groups
- SNMP Users

These entities function together to implement the SNMPv3 security features. Views are created to allow access to subtrees of the MIB. Then, groups are created with the required security level and access to the defined views. Finally, users are created and assigned to the groups.

**Note:**

The view, group, and user configuration are synchronized and propagated to the secondary node in a high availability (HA) pair. However, the engine ID is neither propagated nor synchronized as it is unique to each Citrix ADC appliance.

To implement message authentication and access control, you need to do the following:

## Setting the engine ID

SNMP engines are service providers that reside in the SNMP agent. They provide services such as sending, receiving, and authenticating messages. SNMP engines are uniquely identified using engine IDs.

The Citrix ADC appliance has a unique engineID based on the MAC address of one of its interfaces. It is not necessary to override the engineID. However, if you want to change the engine ID, you can reset it.

### To set the engine ID by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `set snmp engineId <engineID>`
- `show snmp engineId`

### Example

```
> set snmp engineId 8000173f0300c095f80c68
```

### To set the engine ID by using GUI

Navigate to **System > SNMP > Users**, click **Configure Engine ID** and type an engine ID.

## Configure a view

SNMP views restrict user access to specific portions of the MIB. SNMP views are used to implement access control.

### To add an SNMP view by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp view <name> <subtree> -type ( included | excluded )`
- `show snmp view <name>`
- `rm snmp view <name> <subtree>`

Where,

**Name.** Name for the SNMPv3 view. It can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=),

colon (:), and underscore (\_) characters. You should choose a name that helps identify the SNMPv3 view.

**Subtree.** A particular branch (subtree) of the MIB tree that you want to associate with this SNMPv3 view. You must specify the subtree as an SNMP OID. This is an argument of maximum Length: 99.

**type.** Include or exclude the subtree, specified by the subtree parameter, in or from this view. This setting can be useful when you have included a subtree, such as A, in an SNMPv3 view and you want to exclude a specific subtree of A, such as B, from the SNMPv3 view. This is a mandatory argument. Possible values: included, excluded.

### Examples

```
add snmp view SNMPv3test 1.1.1.1 -type included
sh snmp view SNMPv3test
rm snmp view SNMPv3test 1.1.1.1
```

### To configure an SNMP view by using the GUI

Navigate to **System > SNMP > Views**, and create the SNMP view.

### Configure a group

SNMP groups are logical aggregations of SNMP users. They are used to implement access control and to define the security levels. You can configure an SNMP group to set access rights for users assigned to that group, thereby restricting the users to specific views.

You need to configure an SNMP group to set access rights for users assigned to that group.

### To add an SNMP group by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp group <name> <securityLevel> -readViewName <string>`
- `show snmp group <name> <securityLevel>`

Where,

**Name.** Name for the SNMPv3 group. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) characters. You should choose a name that helps identify the SNMPv3 group.

**securityLevel.** Security level required for communication between the Citrix ADC appliance and the SNMPv3 users who belong to the group. Specify one of the following options:

**noAuthNoPriv.** Require neither authentication nor encryption.

**authNoPriv.** Require authentication but no encryption.

**authPriv.** Require authentication and encryption. Note: If you specify authentication, you must specify an encryption algorithm when you assign an SNMPv3 user to the group. If you also specify encryption, you must assign both an authentication and an encryption algorithm for each group member. This is a mandatory argument. Possible values: noAuthNoPriv, authNoPriv, authPriv.

**readViewName.** Name of the configured SNMPv3 view that you want to bind to this SNMPv3 group. An SNMPv3 user bound to this group can access the subtrees that are bound to this SNMPv3 view as type INCLUDED, but cannot access the ones that are type EXCLUDED. If the Citrix ADC appliance has multiple SNMPv3 view entries with the same name, all such entries are associated with the SNMPv3 group. This is a mandatory argument. Maximum Length: 31

### To configure an SNMP group by using the GUI

Navigate to **System > SNMP > Groups**, and create the SNMP group.

### Configuring a user

SNMP users are the SNMP managers that the agents allow to access the MIBs. Each SNMP user is assigned to an SNMP group.

You need to configure users at the agent and assign each user to a group.

### To configure a user by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- `add snmp user <name> -group <string> [-authType ( MD5 | SHA ){ -authPasswd } [-privType ( DES | AES ){ -privPasswd } ]]`
- `show snmp user <name>`

Where,

authType is the authentication option available while configuring an user. There are two authentication types such as MD5 and SHA.

privType is the encryption option available while configuring an user. There are two types of encryption such as DES of key size 128 bit, and AES of key size 128 bit.

**Example**

```
1 > add snmp user edocs_user -group edocs_group
2 <!--NeedCopy-->
```

**To configure an SNMP user by using the GUI**

Navigate to **System > SNMP > Users**, and create the SNMP user.

**Configuring SNMP Alarms for rate limiting**

September 21, 2020

Citrix ADC appliances such as the Citrix ADC MPX 10500, 12500, and 15500 are rate limited. The maximum throughput (Mbps) and packets per second (PPS) are determined by the license purchased for the appliance. For rate-limited platforms, you can configure SNMP traps to send notifications when throughput and PPS approach their limits and when they return to normal.

Throughput and PPS are monitored every seven seconds. You can configure traps with high-threshold and normal-threshold values, which are expressed as a percentage of the licensed limits. The appliance then generates a trap when throughput or PPS exceeds the high threshold, and a second trap when the monitored parameter falls to the normal threshold. In addition to sending the traps to the configured destination device, the Citrix ADC logs the events associated with the traps in the `/var/log/ns.log` file as `EVENT ALERTSTARTED` and `EVENT ALERTENDED`.

Exceeding the throughput limit can result in packet loss. You can configure SNMP alarms to report packet loss.

For more information about SNMP alarms and traps, see “[Configuring the Citrix ADC to generate SNMP v1 and v2 Traps](#).”

This document includes the following details:

- Configuring an SNMP Alarm for Throughput or PPS
- Configuring SNMP Alarm for Dropped Packets

**Configuring an SNMP alarm for throughput or PPS**

To monitor both throughput and PPS, you must configure separate alarms and set threshold pps value in Mbps.

### To configure an SNMP alarm for the throughput rate by using the command line interface

At the command prompt, type the following commands to configure the SNMP alarm, set threshold value in Mbps and verify the configuration:

- `set snmp alarm PF-RL-RATE-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state ( **ENABLED** | **DISABLED** )] [-severity <severity>] [-logging ( **ENABLED** | **DISABLED** )]`
- `show snmp alarm PF-RL-RATE-THRESHOLD`

#### Example

```
1 > set snmp alarm PF-RL-RATE-THRESHOLD -thresholdValue 70 -normalValue
    50
2 <!--NeedCopy-->
```

### To configure an SNMP alarm for PPS by using the command line interface

At the command prompt, type the following commands to configure the SNMP alarm for PPS and verify the configuration:

- `set snmp alarm PF-RL-PPS-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state ( **ENABLED** | **DISABLED** )] [-severity <severity>] [-logging ( **ENABLED** | **DISABLED** )]`
- `show snmp alarm PF-RL-PPS-THRESHOLD`

#### Example

```
1 > set snmp alarm PF-RL-PPS-THRESHOLD -thresholdValue 70 -normalValue 50
2 <!--NeedCopy-->
```

### To configure an SNMP alarm for throughput or PPS by using the GUI

1. Navigate to **System > SNMP > Alarms**, and select **PF-RL-RATE-THRESHOLD** (for throughput rate) or **PF-RL-PPS-THRESHOLD** (for packets per second).
2. Set the alarm parameters and enable the selected SNMP alarm.

### Configuring SNMP alarm for dropped packets

You can configure an alarm for packets dropped as a result of exceeding the throughput limit and an alarm for packets dropped as a result of exceeding the PPS limit.

**To configure an SNMP alarm for packets dropped because of excessive throughput, by using the command line interface**

At the command prompt, type:

```
set snmp alarm PF-RL-RATE-PKTS-DROPPED [-state (ENABLED | DISABLED)] [-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

**To configure an SNMP alarm for packets dropped because of excessive PPS, by using the command line interface**

At the command prompt, type:

```
set snmp alarm PF-RL-PPS-PKTS-DROPPED [-state (ENABLED | DISABLED)] [-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

**To configure an SNMP alarm for dropped packets by using the GUI**

1. Navigate to **System > SNMP > Alarms**, and select **PF-RL-RATE-PKTS-DROPPED** (for packets dropped because of excessive throughput) or **PF-RL-PPS-PKTS-DROPPED** (for packets dropped because of excessive PPS).
2. Set the alarm parameters and enable the selected SNMP alarm.

**Configuring SNMP in FIPS mode**

September 21, 2020

FIPS mode requires Simple Network Management Protocol version 3 (SNMPv3) with the authentication and privacy (authPriv) option. SNMP version 1 and version 2 use a community string mechanism to provide secured access to management data. The community string is sent as clear text between an SNMP manager and an SNMP agent. This type of communication is unsecure, allowing intruders to access SNMP information on the network.

The SNMPv3 protocol uses the User-based Security Model (USM) and View-based Access Control Model (VACM) to authenticate and control management access to SNMP messaging data. SNMPv3 has three security levels: no authentication no privacy (noAuthNoPriv), authentication and no privacy (authNoPriv), and authentication and privacy (authPriv).

Enabling FIPS mode and restarting the Citrix ADC appliance removes the following SNMP configurations from the appliance:

1. Community configuration for SNMPv1 and SNMPv2 protocols.
2. SNMPv3 groups configured with the noAuthNoPriv or authNoPriv security-level option.

3. Traps configured for SNMPv1 or SNMPv2, or SNMPv3 with the noAuthNoPriv security-level option.

After restarting the appliance, configure SNMPv3 with the authPriv option. For more information about configuring authPriv option in SMNP v3, see [SNMPV3 topic](#)

**Note:**

Enabling FIPS mode and restarting your appliance blocks execution of the following SNMP trap and group commands:

```

1      1.  add snmp community <communityName> <permissions>
2
3      2.  add snmp trap <trapClass> <trapDestination> ... [-version: v1/
4          v2] [-td <positive_integer>] [-destPort <port>] [-
5          communityName <string>] [-srcIP <ip_addr|ipv6_addr>] [-severity
6          <severity>] [-allPartitions ( ENABLED | DISABLED )]
7
8      3.  add snmp group <name> <securityLevel : noAuthNoPriv/ authNoPriv
9          > -readViewName <string>
10
11     4.  bind snmp trap specific <TrapIp>-userName <v3 user name> -
12         securityLevel <noAuthNoPriv/ authNoPriv>
13
14     <!--NeedCopy-->
```

## Audit logging

September 21, 2020

Auditing is a methodical examination or review of a condition or situation. The Audit Logging feature enables you to log the Citrix ADC states and status information collected by various modules in the kernel and in the user-level daemons. For audit logging, you can use the SYSLOG protocol, the native NSLOG protocol, or both.

SYSLOG is a standard protocol for logging. It has two components: the SYSLOG auditing module, which runs on the Citrix ADC appliance, and the SYSLOG server, which can run on the underlying FreeBSD operating system (OS) of the Citrix ADC appliance or on a remote system. SYSLOG uses user data protocol (UDP) for data transfer.

Similarly, the native NSLOG protocol has two components: the NSLOG auditing module, which runs on the Citrix ADC appliance, and the NSLOG server, which can run on the underlying FreeBSD OS of the Citrix ADC appliance or on a remote system. NSLOG uses transmission control protocol (TCP) for data transfer.

When you run a SYSLOG or NSLOG server, it connects to the Citrix ADC appliance. The Citrix ADC appliance then starts sending all the log information to the SYSLOG or NSLOG server, and the server can filter the log entries before storing them in a log file. An NSLOG or SYSLOG server can receive log information from more than one Citrix ADC appliance, and a Citrix ADC appliance can send log information to more than one SYSLOG server or NSLOG server.

If multiple SYSLOG servers are configured, the Citrix ADC appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the Citrix ADC appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastPackets, and AuditlogHash.

**Note**

The Citrix ADC appliance can send audit log messages up to 16 KB to an external SYSLOG server.

The log information that a SYSLOG or NSLOG server collects from a Citrix ADC appliance is stored in a log file in the form of messages. These messages typically contain the following information:

- The IP address of a Citrix ADC appliance that generated the log message.
- A time stamp
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information

To configure audit logging, you first configure the audit modules on the Citrix ADC appliance. That involves creating audit policies and specifying the NSLOG server or SYSLOG server information. You then install and configure the SYSLOG or the NSLOG server on the underlying FreeBSD OS of the Citrix ADC appliance or on a remote system.

**Note:**

Because SYSLOG is an industry standard for logging program messages, and various vendors provide support, this documentation does not include SYSLOG server configuration information.

The NSLOG server has its own configuration file (auditlog.conf). You can customize logging on the NSLOG server system by making additional modifications to the configuration file (auditlog.conf).

## Configuring Citrix ADC appliance for audit logging

September 21, 2020

Auditing module allows logging of all states and status information from different modules so that an administrator can see event history in the chronological order. Main components of an Audit framework are 'audit action', 'audit policy'. 'Audit action' describes Audit Server configuration information whereas 'audit policy' links a bind entity to an 'audit action'. The audit policies use 'Classic Policy Engine'(CPE) framework to link 'audit action' to 'bind entities' or Progress Integration (PI) framework to link 'audit action' to 'system global bind entities'.

The policy frameworks differ from each other in the way the audit-log policies are bound to the global entities. Previously, the audit module supported only Classic expression but now it supports both Classic and Advanced policy expressions. Currently, the Advanced expression can bind audit-log policies only to System global entities.

**Note**

When you bind a policy to global entities, you must bind it to a system global entity of the same expression type. For example, you cannot bind a classic policy to an advanced global entity or bind an advanced policy to a classic global entity.

**Configuring audit-log policies in a Classic policy expression**

Configuring audit-logging in Classic policy consists of the following steps:

1. **Configuring an audit-log action.** You can configure an audit action for different servers and for different log levels. 'Audit action' describes Audit Server configuration information whereas 'audit policy' links a bind entity to an 'audit action'. By default, the SYSLOG, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data. When using TCP for SYSLOG, you can set the buffer limit on the Citrix ADC appliance to store the logs. After which the logs are sent to the SYSLOG server.
2. **Configuring audit-log policy.** You can either configure SYSLOG policies to log messages to a SYSLOG server or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule identifying the messages to be logged, and a SYSLOG or NS LOG action.
3. **Binding audit-log policies to global entities.** You must globally bind the audit log policies to global entities such SYSTEM, VPN, Citrix ADC AAA and so on. You can do it to enable logging of all Citrix ADC system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

Each of these steps is explained in the following sections.

**Configuring audit-log action**

To configure SYSLOG action in Advanced Policy infrastructure by using the command line interface.

**Note**

The Citrix ADC appliance allows you to configure only one SYSLOG action to SYSLOG server IP address and port. The appliance does not allow you to configure multiple SYSLOG actions to the same server IP address and port.

A syslog action contains a reference to a syslog server. It specifies which information to log and mentions how to log that information.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit syslogAction <name> <serverIP> [-serverPort <port>] -
    logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )] [-
    transport ( TCP | UDP )]`
2 - show audit syslogAction [<name>]
3
4 <!--NeedCopy-->
```

To configure NSLOG action in Advanced Policy infrastructure by using the command line interface

An ns log action contains a reference to an ns log server. It specifies which information to log and mentions how to log that information.

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add audit nslogAction <name> <serverIP> [-serverPort <port>] -
    logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )]
2 - show audit nslogAction [<name>]
3 <!--NeedCopy-->
```

**Configuring audit-log policies**

To configure audit-log Policies in Classic Policy infrastructure by using the command line interface

At the command prompt, type:

```
1 add audit syslogpolicy <name> <-rule> <action>
2 add audit nslogpolicy <name> < rule> <action>rm audit nslogpolicy <name>
  >show audit nslogpolicy [<name>]set audit nslogpolicy <name> [-rule
  <expression>] [-action <name>]
3 <!--NeedCopy-->
```

## Binding audit syslog policies to audit syslog global

To bind audit-log policy in Classic policy framework by using the command line interface

At the command prompt, type:

```
bind audit syslogGlobal <policyName> [-globalBindType <globalBindType>
unbind audit syslogGlobal <policyName>[-globalBindType <globalBindType>]
```

## Configuring audit-log policies using advanced policy expression

Configuring audit-logging in Advanced policy consists of the following steps:

1. **Configuring an audit-log action.** You can configure an audit action for different servers and for different log levels. 'Audit action' describes Audit Server configuration information whereas 'audit policy' links a bind entity to an 'audit action'. By default, the SYSLOG, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data. When using TCP for SYSLOG, you can set the buffer limit on the Citrix ADC appliance to store the logs. After which the logs are sent to the SYSLOG server.
2. **Configuring audit-log policy.** You can either configure SYSLOG policies to log messages to a SYSLOG server or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule identifying the messages to be logged, and a SYSLOG or NS LOG action.
3. **Binding audit-log policies to global entities.** You must globally bind the audit log policies to SYSTEM global entity to enable logging of all Citrix ADC system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

### Note

The Citrix ADC appliance evaluates all the policies that are bind to true.

## Configuring audit-log action

To configure syslog action in Advanced Policy infrastructure by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 add audit syslogAction <name> <serverIP> [-serverPort <port>] -
  logLevel <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )] [-
  transport ( TCP | UDP )]
2 show audit syslogAction [<name>]
3 <!--NeedCopy-->
```

To configure NSLOG action in Advanced Policy infrastructure by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel
  <logLevel> [-dateFormat ( MMDDYYYY | DDMMYYYY )]
2 show audit nslogAction [<name>]
3 <!--NeedCopy-->
```

### Configuring audit-log policies

To add a syslog audit action by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
  domainResolveRetry <integer>])) | -lbVserverName <string>))[-
  serverPort <port>] -logLevel <logLevel>[-dateFormat <dateFormat>] [-
  logFacility <logFacility>][-tcp ( NONE | ALL )] [-acl ( ENABLED |
  DISABLED )] [-timeZone ( GMT_TIME | LOCAL_TIME )][-
  userDefinedAuditlog ( YES | NO )] [-appflowExport ( ENABLED |
  DISABLED )] [-lsn ( ENABLED | DISABLED )][-alg ( ENABLED | DISABLED
  )] [-subscriberLog ( ENABLED | DISABLED )][-transport ( TCP | UDP )]
  [-tcpProfileName <string>][-maxLogDataSizeToHold
2 <!--NeedCopy-->
```

### Example

```
1 add audit syslogaction audit-action1 10.102.1.1 -loglevel INFORMATIONAL
  -dateFormat MMDDYYYY
2 add audit nslogAction nslog-action1 10.102.1.3 -serverport 520 -
  loglevel INFORMATIONAL -dateFormat MMDDYYYY
3 add audit syslogpolicy syslog-pol1 ns_true audit-action1
4 add audit nslogPolicy nslog-pol1 ns_true nslog-action1
5 bind system global nslog-pol1 -priority 20
6 <!--NeedCopy-->
```

To add a ns log audit action by using the command line interface

At the command prompt, type:

```
1 add audit nslogAction <name> (<serverIP> | (<serverDomainName>[-
  domainResolveRetry <integer>])) [-serverPort <port>] -logLevel
  <logLevel> ... [-dateFormat <dateFormat>][-logFacility <logFacility
  >] [-tcp ( NONE | ALL )][-acl ( ENABLED | DISABLED )] [-timeZone (
  GMT_TIME | LOCAL_TIME )][-userDefinedAuditlog ( YES | NO )][-
```

```

appflowExport ( ENABLED | DISABLED )] [-lsn ( ENABLED | DISABLED )
][[-alg ( ENABLED | DISABLED )] [-subscriberLog ( ENABLED | DISABLED
)]`
2 <!--NeedCopy-->

```

## Binding audit-log policies to global entities

To bind syslog audit-log policy in Advanced policy framework by using the command line interface

At the command prompt, type:

```

bind audit syslogGlobal <policyName> [-globalBindType <globalBindType
unbind audit syslogGlobal <policyName>[-globalBindType <globalBindType>]

```

## Configuring audit-log policy by using the GUI

1. Navigate to **Configuration > System > Auditing > Syslog**.

The screenshot shows the Citrix ADC GUI. On the left, the navigation menu is visible with 'System' and 'Auditing' highlighted. The main content area displays the 'Syslog Auditing' configuration page. At the top, there are tabs for 'Policies' (1) and 'Servers' (1). Below the tabs are buttons for 'Add', 'Edit', 'Delete', and 'Select Action'. A search bar is present with the text 'Click here to search or you can enter Key: Value format'. Below the search bar is a table with the following columns: Name, Server, Globally Bound?, Priority, Expression Type, and Expression. The table contains one row with the following values: test, test, x, -NA-, Classic Policy, and ns\_true.

| Name | Server | Globally Bound? | Priority | Expression Type | Expression |
|------|--------|-----------------|----------|-----------------|------------|
| test | test   | x               | -NA-     | Classic Policy  | ns_true    |

2. Select **Servers** tab.
3. Click **Add**.
4. In the **Create Auditing Server** page, populate the relevant fields, and click **Create**.
5. To add the policy, select the **Policies** tab, and click **Add**.
6. In the **Create Auditing Syslog Policy** page, populate the relevant fields, and click **Create**.

## ← Create Auditing Syslog Policy

Name\*  
best\_syslog\_policy\_ever ?

Auditing Type  
**SYSLOG**

Expression Type  
 Classic Policy  Advanced Policy

Server\*  
test ▼ Add Edit

Create Close

7. To bind the policy globally, select **Advanced Policy Global Bindings** from the drop-down list. Select the **best\_syslog\_policy\_ever** policy. Click **Select**.
8. From the drop-down list, select the bind point as **SYSTEM\_GLOBAL** and click **Bind**, and then click **Done**.

### Configuring policy-based logging

You can configure policy-based logging for rewrite and responder policies. Audit messages are then logged in a defined format when the rule in a policy evaluates to TRUE. To configure policy-based logging, you configure an audit-message action that uses default syntax expressions. To specify the format of the audit messages, and associate the action with a policy. The policy can be bound either globally or to a load balancing or content switching virtual server. You can use audit-message actions to log messages at various log levels, either in syslog format only or in both syslog and new nslog formats.

#### Prerequisites

- User Configurable Log Messages (userDefinedAuditlog) option is enabled for when configuring the audit action server to which you want to send the logs in a defined format.
- The related audit policy is bound to system global.

## Configuring an audit message action

You can configure audit message actions to log messages at various log levels. You can do it either in syslog format only or in both syslog and new nslog formats. Audit-message actions use expressions to specify the format of the audit messages.

### To create an audit message action by using the command line interface

At the command prompt, type:

```
1 add audit messageaction <name> <logLevel> <stringBuilderExpr> [-  
  logtoNewnslog (YES|NO)] [-bypassSafetyCheck (YES|NO)]  
2 <!--NeedCopy-->
```

```
1 add audit messageaction log-act1 CRITICAL '"Client:"+CLIENT.IP.SRC+"  
  accessed "+HTTP.REQ.URL' -bypassSafetyCheck YES  
2 <!--NeedCopy-->
```

### To configure an audit message action by using the GUI

Navigate to **System > Auditing > Message Actions**, and create the audit message action.

### Binding audit message action to a policy

After you have created an audit message action, you must bind it to a rewrite or responder policy. For more information about binding log message actions to a rewrite or responder policy, see [Rewrite](#) or [Responder](#).

## Configure Audit Server

You can configure a SYSLOG audit server on a Citrix ADC appliance.

### Configure SYSLOG through Citrix GUI

To configure the SYSLOG audit server, complete the following steps:

**Note:**

These instructions are applicable to a stand-alone Citrix ADC appliance.

1. Sign into Citrix ADC and navigate to **System > Auditing > Syslog**.
2. In Servers tab, click **Add**.
3. In the **Create Auditing Server** page, set the following parameters:

- a) Auditing Type. Name of the auditing server type, example SYSLOG.
  - b) Name. Provide a name to the SYSLOG type auditing server.
  - c) Server Type. Select a server type from the drop-down list.
  - d) IP Address. Provide an IP address for the SYSLOG server.
  - e) Port. Provide the server port number.
  - f) Log Levels. Select an audit log level which specifies the events to be logged.
  - g) Log Facility. Select a log facility that is assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the Citrix ADC itself, the VPN, or external.
  - h) Date format. Select the format in which the date must appear in the log message.
  - i) Time Zone. Select the time zone for date and timestamps in the log message.
  - j) TCP Logging. Select this option to log TCP messages globally.
  - k) ACL Logging. Select this option to log access control list messages.
  - l) User Configurable Log Messages. Select this option to log user configurable log message globally.
  - m) AppFlow Logging. Select this option to export log messages to AppFlow collectors.
  - n) Large Scale NAT Logging. Select this option to log lsn information.
  - o) ALG messaging Logging. Select this option to log ALG information.
  - p) Subscriber Logging. Select this option to log subscriber's session event information.
  - q) DNS. Select this option to log DNS related SYSLOG messages.
  - r) SSL interception. Select this option to log SSL Interception event information.
  - s) URL Filtering. Select this option to log URL filtering event information.
  - t) Content Inspection Logging. Select this option to log content inspection events for ICAP or IPS integration at the global level.
4. Net Profile. Select a network profile. The SNIP configured in the network profile is as source IP when sending log messages.
5. Transport Type. Select a transport type for sending audit log messages to a syslog server. Default type is UDP.
6. Transport Profile. Add a transport profile whose settings are to be applied to the audit server information to tune the TCP connection parameters.
7. Max Log Data Size to hold. Provide the maximum size of log data that can be held in NSB chain of server information.
8. Click **Create**.

For information about SYSLOG parameters, see [Audit SyslogParams](#) command reference page.

## Installing and configuring the NSLOG server

September 21, 2020

During installation, the NSLOG server executable file (auditserver) is installed along with other files. The auditserver executable file includes options for performing several actions on the NSLOG server, including running and stopping the NSLOG server. In addition, you use the auditserver executable to configure the NSLOG server with the IP addresses of the Citrix ADC appliances from which the NSLOG server will start collecting logs. Configuration settings are applied in the NSLOG server configuration file (auditlog.conf).

Then, you start the NSLOG server by executing the auditserver executable. The NSLOG server configuration is based on the settings in the configuration file. You can further customize logging on the NSLOG server system by making additional modifications to the NSLOG server configuration file (auditlog.conf).

**Attention:**

The version of the NSLOG server package must be the same as that of the Citrix ADC. For example, if the version of the Citrix ADC is 10.1 Build 125.9, the NSLOG server must also be of the same version.

The following table lists the operating systems on which the NSLOG server is supported.

| Operating system | Software requirements                                                                                      | Remarks                                              |
|------------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| Windows          | Windows XP Professional, Windows Server 2003, Windows 2000/NT, Windows Server 2008, Windows Server 2008 R2 |                                                      |
| Linux            | RedHat Linux 4 or later, SUSE Linux Enterprise 9.3 or later                                                |                                                      |
| FreeBSD          | FreeBSD 6.3 or later                                                                                       | For Citrix ADC 10.5, use only FreeBSD 8.4.           |
| Mac OS           | Mac OS 8.6 or later                                                                                        | Not supported on Citrix ADC 10.1 and later releases. |

The minimum hardware specifications for the platform running the NSLOG server are as follows:

- Processor- Intel x86 ~501 megahertz (MHz)
- RAM - 512 megabytes (MB)
- Controller - SCSI

## Installing NSLOG server on the Linux operating system

Log on to the Linux system as an administrator. Use the following procedure to install the NSLOG server executable files on the system.

### To install the NSLOG server package on a Linux operating system

1. At a Linux command prompt, type the following command to copy the NSauditserver.rpm file to a temporary directory:

```
cp <path_to_cd>/Utilities/auditserver/Linux/NSauditserver.rpm /tmp
```

2. Type the following command to install the NSauditserver.rpm file.

```
rpm -i NSauditserver.rpm
```

This command extracts the files and installs them in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

### To uninstall the NSLOG server package on a Linux operating system

1. At a command prompt, type the following command to uninstall the audit server logging feature:

```
rpm -e NSauditserver
```

2. For more information about the NSauditserver RPM file, use the following command:

```
rpm -qpi \*.rpm
```

3. To view the installed audit server files use the following command:

```
rpm -qpl *.rpm
```

\*.rpm: Specifies the file name.

## Installing NSLOG server on the FreeBSD operating system

Before you can install the NSLOG server, you have to copy the NSLOG package from the Citrix ADC product CD or download it from [www.citrix.com](http://www.citrix.com). The NSLOG package has the following name format:

```
AuditServer_<release number>-<build number>.zip
```

For example: `AuditServer_10.5-58.11.zip`

This package contains files for all supported platforms: Linux, Windows, and FreeBSD. On a FreeBSD operating system, install the NSLOG package that has the following name format:

`audserver_bsd-<release number>-<build number>.tgz`

For example: `audserver_bsd-10.5-58.11.tgz`

To download NSLOG package from [www.citrix.com](http://www.citrix.com):

1. In a web browser, go to [www.citrix.com](http://www.citrix.com).
2. In the menu bar, click **Log In**.
3. Enter your login credentials, and then click **Log In**.
4. In the menu bar, click **Downloads**.
5. From the **Select a product** list, select **Citrix ADC**.
6. On the **Citrix ADC** page, select the release for which you want to download the NSLOG package (for example, Release 10.5), and then select **Firmware**.
7. Under **Firmware**, select the Citrix ADC firmware for the build number for which you want to download the NSLOG package.
8. On the page that appears, scroll down, select **Audit Servers**, and click **Download File** next to the package that you want to download.

To install the NSLOG server package on a FreeBSD operating system

1. On the system to which you have downloaded the NSLOG package `AuditServer_<release number>-<build number>.zip` (for example, `AuditServer_9.3-51.5.zip`), extract the FreeBSD NSLOG server **package** `audserver_bsd-<release number>-<build number>.tgz` (for example, `audserver_bsd-9.3-51.5.tgz`) from the package.
2. Copy the FreeBSD NSLOG server package `audserver_bsd-<release number>-<build number>.tgz` (for example, `audserver_bsd-9.3-51.5.tgz`) to a directory on a system running FreeBSD OS.
3. At a command prompt for the directory into which the FreeBSD NSLOG server package was copied, run the following command to install the package:

```
pkg_add audserver_bsd-<release number>-<build number>.tgz
```

**Example:**

```
1 pkg_add audserver_bsd-9.3-51.5.tgz
2 <!--NeedCopy-->
```

The following directories are extracted:

- <root directory extracted from the FreeBSD NSLOG server **package** tgz file>Citrix ADCbin (for example, `/var/auditserver/netscaler/bin`)
- <root directory extracted from the FreeBSD NSLOG server **package** tgz file>netscaler/etc (for example, `/var/auditserver/netscaler/etc`)
- <root directory extracted from the FreeBSD NSLOG server **package** tgz file>\netscaler\samples (for example, `/var/auditserver/samples`)

4. At a command prompt, type the following command to verify that the package is installed:

```
pkg_info | grep NSaudserver
```

### **To uninstall the NSLOG server package on a FreeBSD operating system**

At a command prompt, type:

```
pkg_delete NSaudserver
```

### **Installing NSLOG Server Files on the Windows Operating System**

Before you can install the NSLOG server, you have to copy the NSLOG package from the Citrix ADC product CD or download it from [www.citrix.com](http://www.citrix.com). The NSLOG package has the following name format `AuditServer_<release number>-<build number>.zip` (for example, `AuditServer_9.3-51.5.zip`). This package contains NSLOG installation packages for all supported platforms.

### **To download NSLOG package from [www.Citrix.com](http://www.Citrix.com)**

1. In a web browser, go to [www.citrix.com](http://www.citrix.com).
2. In the menu bar, click Log In.
3. Enter your login credentials, and then click Log In.
4. In the menu bar, click Downloads.
5. Search to find the page that provides the appropriate release number and build.
6. On that page, under Audit Servers, click Download to download the NSLOG package, having the format `AuditServer_<release number>-<build number>.zip`, to your local system (for example, `AuditServer_9.3-51.5.zip`).

### **To install NSLOG server on a Windows operating system**

1. On the system, where you have downloaded the NSLOG package `AuditServer_<release number>-<build number>.zip` (for example, `AuditServer_9.3-51.5.zip`), extract `audserver_win-<release number>-<build number>.zip` (for example, `audserver_win-9.3-51.5.zip`) from the package.
2. Copy the extracted file `audserver_<release number>-<build number>.zip` (for example, `audserver_win-9.3-51.5.zip`) to a Windows system on which you want to install the NSLOG server.
3. Unzip the `audserver_<release number>-<build number>.zip` file (for example, `audserver_win-9.3-51.5.zip`).
4. The following directories are extracted:

- a) <root directory extracted from the Windows NSLOG server **package** zip file>\bin(for example, C:\audserver\_win-9.3-51.5\bin)
  - b) <root directory extracted from the Windows NSLOG server **package** zip file>\etc (for example, C:\audserver\_win-9.3-51.5\ etc)
  - c) <root directory extracted from the Windows NSLOG server **package** zip file >\samples (for example, C:\audserver\_win-9.3-51.5\ samples)
5. At a command prompt, run the following command from the <root directory extracted from the Windows NSLOG server **package** zip file>\bin path
- ```
audserver -install -f <directorypath>\auditlog.conf
```
- <directorypath>: Specifies the path to the configuration file ( auditlog.conf). By default, log.conf is under \<root directory extracted from Windows NSLOG server **package** zip file>\samples directory. But you can copy auditlog.conf to your desired directory.

### **To uninstall the NSLOG server on a Windows operating system**

At a command prompt, run the following from the <root directory extracted from Windows NSLOG server **package** zip file>\bin path:

```
audserver -remove
```

### **NSLOG Server Command Options**

For information about NSLOG server commands, see [Audit Server Options](#).

Run the audserver command from the directory in which the audit server executable is present:

- 'On Windows: \ns\bin'
- On Solaris and Linux:\usr\local\netscaler\bin

The audit server configuration files are present in the following directories:

- On Windows: \ns\etc
- On Linux: \usr\local\netscaler\etc

The audit server executable is started as ./auditserver in Linux and FreeBSD.

### **Adding the Citrix ADC Appliance IP Addresses on the NSLOG Server**

In the configuration file ( auditlog.conf), add the IP addresses of the Citrix ADC appliances whose events must be logged.

### **To add the IP addresses of the Citrix ADC appliance**

At a command prompt, type the following command:

```
audserver -addns -f <directorypath>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (auditlog.conf).

You are prompted to enter the information for the following parameters:

NSIP: Specifies the IP address of the Citrix ADC appliance, for example, 10.102.29.1.

Userid: Specifies the user name, for example, nsroot.

Password: Specifies the password, for example, nsroot.

If you add multiple Citrix ADC IP addresses (NSIP), and later you do not want to log all of the Citrix ADC appliance event details, you can delete the NSIPs manually by removing the NSIP statement at the end of the auditlog.conf file. For a high availability (HA) setup, you must add both primary and secondary Citrix ADC IP addresses to auditlog.conf by using the audserver command. Before adding the IP address, make sure the user name and password exist on the system.

### **Verifying the NSLOG Server Configuration File**

Check the configuration file (audit log.conf) for syntax correctness to enable logging to start and function correctly.

To verify configuration, at a command prompt, type the following command:

```
audserver -verify -f <directorypath>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (audit log.conf).

## **Running the NSLOG server**

September 21, 2020

### **To start audit server logging**

Type the following command at a command prompt:

```
audserver -start -f <directorypath>\auditlog.conf
```

<directorypath>: Specifies the path to the configuration file (audit log.conf).

## To stop audit server logging that starts as a background process in FreeBSD or Linux

Type the following command:

```
audserver -stop
```

## To stop audit server logging that starts as a service in Windows

Type the following command:

```
audserver -stopservice
```

## Customizing logging on the NSLOG server

September 21, 2020

You can customize logging on the NSLOG server by making additional modifications to the NSLOG server configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the server system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information from a Citrix ADC appliance or a set of Citrix ADC appliances.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

This document includes the following details:

- Creating Filters
- Specifying Log Properties

### Creating filters

You can use the default filter definition located in the configuration file (audit log.conf ), or you can modify the filter or create a new filter. You can create more than one log filter.

Note:

For consolidated logging, if a log transaction occurs for which there is no filter definition, the default filter is used (if it is enabled.) The only way you can configure consolidated logging of all the Citrix ADC appliances is by defining the default filter.

### To create a filter

At the command prompt, type the following command in the configuration file ( auditlog.conf):

```
1 filter <filterName> [IP <ip>] [NETMASK <mask>] ON | OFF]
2 <!--NeedCopy-->
```

filterName: Specify the name of the filter (maximum of 64 alphanumeric characters).

ip: Specify the IP addresses.

mask: Specify the subnet mask to be used on a subnet.

Specify ON to enable the filter to log transactions, or specify OFF to disable the filter. If no argument is specified, the filter is ON.

### Examples:

```
1 filter F1 IP 192.168.100.151 ON
2 <!--NeedCopy-->
```

To apply the filter F2 to IP addresses 192.250.100.1 to 192.250.100.254:

```
1 filter F2 IP 192.250.100.0 NETMASK 255.255.255.0 ON
2 <!--NeedCopy-->
```

filterName is a required parameter if you are defining a filter with other optional parameters, such as IP address, or the combination of IP address and Netmask.

### Specifying log properties

Log properties associated with the filter are applied to all the log entries present in the filter. The log property definition starts with the key word BEGIN and ends with END as illustrated in the following example:

```
1 BEGIN <filename>
2     logFilenameFormat ...
3     logDirectory ...
4     logInterval ...
5     logFileSizeLimit ....
6 END
7 <!--NeedCopy-->
```

Entries in the definition can include the following:

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:

- Static: A constant string that specifies the absolute path and the file name.
- Dynamic: An expression that includes the following format specifiers:
  - \* Date ({format}t)
  - \* creates file name with NSIP

**Example:**

```

1  LogFileNameFormat Ex%` {
2  `m%d%y }
3  t.log
4  <!--NeedCopy-->

```

This creates the first file name as Exmddy.log. New files are named: Exmddy.log.0, Exmddy.log.1, and so on. In the following example, the new files are created when the file size reaches 100MB.

**Example:**

```

1  LogInterval size
2  LogFileSize 100
3  LogFileNameFormat Ex%` {
4  `m%d%y }
5  t
6  <!--NeedCopy-->

```

**Caution**

The date format %t specified in the LogFileNameFormat parameter overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFileNameFormat parameter.

- **logDirectory** specifies the directory name format of the log file. The name of the file can be either of the following:
  - Static: Is a constant string that specifies the absolute path and file name.
  - Dynamic: Is an expression containing the following format specifiers:
    - \* Date ({format}t)
    - \* creates directory with NSIP

The directory separator depends on the operating system. In Windows, use the directory separator.

**Example:**

```

1  LogDirectory dir1\dir2\dir3
2  <!--NeedCopy-->

```

In the other operating systems (Linux, FreeBSD, etc.), use the directory separator.

- **LogInterval** specifies the interval at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour. Default value.
  - Daily: A file is created every day at midnight.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly : A file is created on the first day of the month at midnight.
  - None: A file is created only once, when audit server logging starts.
  - Size: A file is created only when the log file size limit is reached.

**Example:**

```
1 LogInterval Hourly
2 <!--NeedCopy-->
```

- **LogFileSizeLimit** specifies the maximum size (in MB) of the log file. A new file is created when the limit is reached.

**Note**

You can override the loginterval property by assigning size as its value.

The default LogFileSizeLimit is 10 MB.

**Example:**

```
1 LogFileSizeLimit 35
2 <!--NeedCopy-->
```

## SYSLOG Over TCP

September 21, 2020

Syslog is a standard for sending event notification messages. These messages can be stored locally or on an external log server. Syslog enables network administrators to consolidate log messages and derive insights from the collected data.

Syslog is originally designed to work over UDP, which can transmit a huge amount of data within the same network with minimal packet loss. However, telco operators prefer to transmit syslog data over TCP, because they need reliable, ordered data transmission between networks. For example, telco tracks user activities, and TCP provides retransmission in the event of network failure.

## How Syslog over TCP works

To understand how syslog over TCP works, consider two hypothetical cases:

Sam, a network administrator, wants to log significant events on an external syslog server.

XYZ Telecom, an ISP, has to transmit and store a significant amount of data on syslog servers to comply with government regulations.

In both cases, the log messages must be transmitted over a reliable channel and stored safely on an external syslog server. Unlike UDP, TCP establishes a connection, transmits messages securely, and retransmits (from sender to receiver) any data that is corrupted or lost because of network failure.

The Citrix ADC appliance sends log messages over UDP to the local syslog daemon, and sends log messages over TCP or UDP to external syslog servers.

## SNIP support for Syslog

When the audit-log module generates syslog messages, it uses a Citrix ADC IP (NSIP) address as the source address for sending the messages to an external syslog server. To configure a SNIP as the source address, you must make it part of the netProfile option and bind the netProfile to the syslog action.

### Note

TCP uses SNIP for sending monitoring probes to check the connectivity and then sends the logs over NSIP. Hence the syslog server must be reachable via SNIP. Net profiles can be used to redirect all the TCP syslog traffic through SNIP entirely.

**Use of a SNIP address is not supported in internal logging.**

## Fully qualified domain name support for audit Log

Previously, the audit-log module was configured with the destination IP address of the external syslog server to which the log messages are sent. Now, the audit-log server uses a fully qualified domain name (FQDN) instead of the destination IP address. The FQDN configuration resolves the configured domain name of the syslog server to the corresponding destination IP address for sending the log messages from the audit-log module. The name server must be properly configured to resolve the domain name and avoid domain based service issues.

### Note

When configuring an FQDN, server domain name configuration of the same Citrix ADC appliance in syslog action or nslog action is not supported.

## Configuring Syslog over TCP by using the Command Line Interface

To configure a Citrix ADC appliance to send syslog messages over TCP by using the command line interface

At the command prompt, type:

```
1      add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
      domainResolveRetry <integer>]) | -lbVserverName<string>))[-
      serverPort <port>] -logLevel <logLevel>[-dateFormat <dateFormat
      >] [-logFacility <logFacility>] [-tcp ( NONE | ALL )] [-acl (
      ENABLED | DISABLED )][-timeZone ( GMT_TIME | LOCAL_TIME )][-
      userDefinedAuditlog ( YES | NO )][-appflowExport ( ENABLED |
      DISABLED )] [-lsn ( ENABLED | DISABLED )][-alg ( ENABLED |
      DISABLED )] [-subscriberLog ( ENABLED | DISABLED )][-transport (
      TCP | UDP )] [-tcpProfileName <string>][-maxLogDataSizeToHold <
      positive_integer>][-dns ( ENABLED | DISABLED )] [-netProfile <
      string>]
2 <!--NeedCopy-->
```

```
1      add audit syslogaction audit-action1 10.102.1.1 -loglevel
      INFORMATIONAL -dateformat MMDDYYYY -transport TCP
2 <!--NeedCopy-->
```

## Adding SNIP IP address to net profile option by using the command line interface

To add a SNIP IP address to net profile by using the command line interface

At the command prompt, type:

```
1      add netProfile <name> [-td <positive_integer>] [-srcIP <string>][-
      srcippersistency ( ENABLED | DISABLED )][-overrideLsn ( ENABLED
      | DISABLED )]add syslogaction <name> <serverIP> -loglevel all
      - netprofile net1
2 <!--NeedCopy-->
```

```
1      add netprofile net1 - srcip 10.102.147.204`
2 <!--NeedCopy-->
```

Where, srcIP is the SNIP

## Adding a net profile in a syslog action by using the command line interface

To add a netProfile option in a syslog action by using the command line interface

At the command prompt, type:

```
1      add audit syslogaction <name> (<serverIP> | -lbVserverName <string
      >) -logLevel <logLevel>
2      -netProfile <string> ...
3
4 <!--NeedCopy-->
```

```
1      add syslogaction sys_act1 10.102.147.36 - loglevel all - netprofile
      net1
2 <!--NeedCopy-->
```

Where, -netprofile specifies the name of the configured net profile. The SNIP address is configured as part of the netProfile and this netProfile option is bound to the syslog action.

#### Note

You must always bind the netProfile option to the SYSLOGUDP or SYSLOGTCP services bound to the SYSLOGUDP or SYSLOGTCP load balancing virtual server, when an LB virtual server name is configured in syslog action.

### Configuring FQDN support by using the command line interface

To add a server domain name to a Syslog action by using the command line interface

At the command prompt, type:

```
1 add audit syslogAction <name> (<serverIP> | ((<serverDomainName>[-
  domainResolveRetry <integer>])) | -lbVserverName <string>)) -logLevel
  <logLevel> ...
2 set audit syslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>]-
  serverDomainName <string>] [-lbVserverName <string>]-
  domainResolveRetry <integer>] [-domainResolveNow]
3 <!--NeedCopy-->
```

To add a server domain name to a Nslog action by using the command line interface.

At the command prompt, type:

```
1      add audit nslogAction <name> (<serverIP> | (<serverDomainName>[-
      domainResolveRetry <integer>])) -logLevel <logLevel> ...
2      set audit nslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>][-
      serverDomainName <string>] [-domainResolveRetry <integer>][-
      domainResolveNow]
3 <!--NeedCopy-->
```

Where serverDomainName. Domain name of the log server. Is mutually exclusive with serverIP/ lb-VserverName.

DomainResolveRetry integer. Time (in seconds) that the Citrix ADC appliance waits, after a DNS resolution fails, before sending the next DNS query to resolve the domain name.

DomainResolveNow. Included if the DNS query has to be sent immediately to resolve the server's domain name.

### **Configuring Syslog over TCP by using the GUI**

To configure the Citrix ADC appliance to send Syslog messages over TCP by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select Transport Type as **TCP**.

### **Configuring a net profile for SNIP support by using the GUI**

To configure a net profile for SNIP support by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select a net profile from the list.

### **Configuring FQDN by using the GUI**

To configure FQDN by using the GUI

1. Navigate to **System > Auditing > Syslog** and select the **Servers** tab.
2. Click **Add** and select a Server Type and Server Domain Name from the list.

## **Load balancing SYSLOG servers**

September 21, 2020

The Citrix ADC appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the Citrix ADC appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
add service <name>(<IP> | <serverName>)<serviceType (SYSLOGTCP |  
SYSLOGUDP)> <port>
```

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

```
add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod  
<AUDITLOGHASH>]
```

3. Bind the service to the load balancing virtual server.

```
Bind lb vserver <name> <serviceName>
```

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogaction <name> <serverIP> [-lbVserverName <string>] [-logLevel  
<logLevel>]
```

5. Add a SYSLOG policy by specifying the rule and action.

```
add syslogpolicy <name> <rule> <action>
```

6. Bind the SYSLOG policy to the system global for the policy to take effect.

```
bind system global <policyName>
```

#### \*Load balancing of SYSLOG servers using the GUI

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

Navigate to **Traffic Management > Services**, click **Add** and select **SYSLOGTCP** or **SYSLOGUDP** as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

Navigate to **Traffic Management > Virtual Servers**, click **Add** and select **SYSLOGTCP** or **SYSLOGUDP** as protocol.

3. Bind the service to the load balancing virtual server to the service.

Bind the service to the load balancing virtual server.

Navigate to **Traffic Management > Virtual Servers**, select a virtual server and then select **AUDITLOGHASH** in the **Load Balancing Method**.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

Navigate to **System > Auditing**, click **Servers** and add a server by selecting **LB Vserver** option in **Servers**.

5. Add a SYSLOG policy by specifying the rule and action.

Navigate to **System > Syslog**, click **Policies** and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to **System > Syslog**, select a SYSLOG policy and click **Action**, and then click **Global Bindings** and bind the policy to system global.

**Example:**

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. AUDITLOGHASH method load balances the traffic based on input hash value from the audit agents. The agents are the modules which generate auditlog in a Citrix ADC appliance. For example, if an agent LSN wants to load balance auditlogs based on client IP address, LSN module generates the hash value based on clientIP and passes the hash value to auditlog module. The auditlog module sends the auditlog messages which have same hash value to the external syslog server.

The Citrix ADC appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
1 add service service1 192.0.2.10 SYSLOGUDP 514
2 add service service2 192.0.2.11 SYSLOGUDP 514
3 add service service3 192.0.2.11 SYSLOGUDP 514
4 add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
5 bind lb vserver lbvserver1 service1
6 bind lb vserver lbvserver1 service2
7 bind lb vserver lbvserver1 service3
8 add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
9 add syslogpolicy syspol1 ns_true sysaction1
10 bind system global syspol1
11 <!--NeedCopy-->
```

**Limitations:**

- The Citrix ADC appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

## Default settings for the log properties

September 21, 2020

The following is an example of the default filter with default settings for the log properties:

```

1 begin default
2   logInterval Hourly
3   logFileSizeLimit 10
4   logFilenameFormat auditlog%` {
5     `%y%m%d }
6   t.log
7 end default
8 <!--NeedCopy-->

```

Following are two examples of defining the default filters:

**Example 1:**

```

1 Filter f1 IP 192.168.10.1
2 <!--NeedCopy-->

```

This creates a log file for NSI 192.168.10.1 with the default values of the log in effect.

**Example 2:**

```

1 Filter f1 IP 192.168.10.1
2 begin f1
3   logFilenameFormat logfiles.log
4 end f1
5 <!--NeedCopy-->

```

This creates a log file for NSIP 192.168.10.1. Since the log file name format is specified, the default values of the other log properties are in effect.

## Sample configuration file (audit.conf)

September 21, 2020

Following is a sample configuration file:

```

1 #####
2 # This is the Auditserver configuration file
3 # Only the default filter is active
4 # Remove leading # to activate other filters
5 #####
6 MYIP <NSAuditserverIP>
7 MYPOR 3023
8 #   Filter filter_nsip  IP <Specify the Citrix ADC IP address to filter
   on > ON

```

```
 9 #   begin filter_nsip
10 #       logInterval      Hourly
11 #       logFileSizeLimit  10
12 #       logDirectory     logdir\%A\
13 #       logFilenameFormat nsip%\{\
14   \\%d%m%Y }
15   t.log
16 #   end filter_nsip
17 Filter default
18 begin default
19     logInterval      Hourly
20     logFileSizeLimit  10
21     logFilenameFormat auditlog%\{
22   \%y%m%d }
23   t.log
24 end default
25 <!--NeedCopy-->
```

## Web server logging

September 21, 2020

You can use the Web server logging feature to send logs of HTTP and HTTPS requests to a client system for storage and retrieval. This feature has two components:

- The Web log server, which runs on the Citrix ADC.
- The Citrix ADC Web Logging (NSWL) client, which runs on the client system.

When you run the Citrix ADC Web Logging (NSWL) client:

1. It connects to the Citrix ADC.
2. The Citrix ADC buffers the HTTP and HTTPS request log entries before sending them to the client.
3. The client can filter the entries before storing them.

To configure Web server logging, you first enable the Web logging feature on the Citrix ADC and configure the size of the buffer for temporarily storing the log entries. Then, you install NSWL on the client system. You then add the Citrix ADC IP address (NSIP) to the NSWL configuration file. You are now ready to start the NSWL client to begin logging. You can customize Web server logging by making additional modifications to the NSWL configuration file (log.conf).

## Configuring the Citrix ADC for web server logging

September 21, 2020

To configure the Citrix ADC for web server logging you are required to only enable the Web Server Logging feature. Optionally, you can perform the following configurations:

- Modify the size of the buffer (default size is 16 MB) that stores the logged information before it is sent to the Citrix ADC Web Logging (NSWL) client.
- Specify the custom HTTP headers that you want to export to the NSWL client. You can configure a maximum of two HTTP request and two HTTP response header names.

### To configure web server logging by using the command line interface

At the command prompt, perform the following operations:

- Enable the web server logging feature.

```
enable ns feature WL
```

- [Optional] Modify the buffer size for storing the logged information.

```
set ns weblogparam -bufferSizeMB <size>
```

**Note:**

To activate your modification, you must disable and then re-enable the Web server logging feature.

- [Optional] Specify the custom HTTP header names that you want to export.

```
set ns weblogparam [-customReqHdrs <string> ...] [-customRspHdrs <string> ...]
```

```
1 > enable ns feature WL
2 Done
3 > set ns weblogparam -bufferSizeMB 60
4 Done
5 > show ns weblogparam
6 Web Logging parameters:
7 Log buffer size: 60MB
8 Custom HTTP request headers: (none)
9 Custom HTTP response headers: (none)
10 Done
11 > set ns weblogparam -customReqHdrs req1 req2 -customRspHdrs res1
    res2
12 Done
```

```

13 > show ns weblogparam
14     Web Logging parameters:
15     Log buffer size: 60MB
16     Custom HTTP request headers: req1, req2
17     Custom HTTP response headers: res1, res2
18 Done
19 <!--NeedCopy-->

```

## To configure web server logging by using the GUI

1. Navigate to **System > Settings** and perform the following operations:
  - a) To enable the web server logging feature, click **Change Advanced Features** and select **Web Logging**.
  - b) To modify the buffer size, click **Change Global System Settings** and under **Web Logging**, enter the buffer size.
  - c) To specify the custom HTTP headers to be exported, click **Change Global System Settings** and under **Web Logging**, specify the header values.

## Installing the Citrix ADC web logging (NSWL) client

July 9, 2021

When you install NSWL, the client executable file (NSWL) is installed along with other files. The NSWL executable file provides a list of options that you can use. For details, see [Configuring the NSWL Client](#).

### Attention:

The version of the NSWL client must be the same as Citrix ADC. For example, if the version of the Citrix ADC is 10.1 Build 125.9, the NSWL client must also be of the same version. Also, the web logging (NSWL) client works on both 32 bit and on 64 bit server machines.

The following table lists the operating systems on which the NSWL client can be installed.

Operating system	Version	Hardware requirements	Remarks
Windows	Windows Server 2016 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	

Operating system	Version	Hardware requirements	Remarks
macOS	macOS 8.6 or later	Not supported on Citrix ADC 10.1 and later releases.	
Linux	Ubuntu, SUSE Linux, CentOS, Red Hat Enterprise Linux released in 2016 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	
Solaris	Solaris Sun OS 5.6 or later	Processor - UltraSPARC-III 400 MHz, RAM - 512 MB, Controller - SCSI	Not supported on Citrix ADC 10.5 and later releases.
FreeBSD	FreeBSD 6.3 or later	Processor - x86/amd64 CPU (1 GHz or higher), RAM - 4 GB (or higher)	For Citrix ADC 10.5, use only FreeBSD 8.4.
AIX	AIX 6.1	-	Not supported on Citrix ADC 10.5 and later releases.

If the NSWL client system cannot process the log transaction because of a CPU limitation, the Web log buffer overruns and the logging process reinitiates.

**Caution:**

Reinitiation of logging can result in loss of log transactions.

To temporarily solve an NSWL client system bottleneck caused by a CPU limitation, you can tune the Web server logging buffer size on the Citrix ADC appliance. To solve the problem, you need a client system that can handle the site's throughput.

### Download NSWL client

You can obtain the NSWL client package from either the Citrix ADC product CD or the Citrix downloads site. Within the package there are separate installation packages for each supported platform.

### To download the NSWL client from the Citrix website

1. Log on to Citrix by accessing the URL <https://www.citrix.com/downloads/citrix-adc/>.
2. Navigate to a particular Citrix ADC release version and look for its Firmware.
3. Click **Firmware** (for example, Citrix ADC Release (Feature Phase) 13.0 Build 52.24).

## Citrix ADC (NetScaler ADC)

[Subscribe to RSS notifications of new downloads](#)

Permanent fixes for CVE-2019-19781 ADC versions 13.0, 12.1, 12.0 and 11.1 are available now in this page:

These fixes also apply to Citrix ADC/Gateway Virtual Appliances (VPX) hosted on any of ESX, Hyper-V, KVM, XenServer, Azure, AWS, GCP or on a Citrix ADC Service Delivery Appliance (SDX).

It is necessary to upgrade all Citrix ADC/Gateway for instances running 13.0 (MPX or VPX) to build 13.0.47.24, for instances running 12.1 (MPX or VPX) to build 12.1.55.18, for instances running 12.0 (MPX or VPX) to build 12.0.63.13, for instances running 11.1 (MPX or VPX) to build 11.1.63.15 and for instances running 10.5 (MPX or VPX) to build 10.5.70.12 to install the security vulnerability fixes.

## Install NSWL client on Solaris

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_solaris-<release number>-<build number>.tar` file from the package.
2. Copy the extracted file to a Solaris system on which you want to install the NSWL client.
3. Extract the files from the tar file with the following command:

```
tar xvf nswl_solaris-9.3-51.5.tar
```

A directory Weblog is created in the temporary directory, and the files are extracted to the Weblog directory.

1. Install the package with the following command:

```
pkgadd -d
```

The list of available packages appears. In the following example, one Weblog package is shown:

```
1 NSweblog Citrix ADC Weblogging (SunOS,sparc)7.0
```

1. You are prompted to select the packages. Select the package number of the Weblog to be installed.

After you select the package number and press **Enter**, the files are extracted and installed in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

1. To check whether the NSWL package is installed, run the following command:

```
pkginfo | grep NSweblog
```

#### Note

To uninstall the NSWL package, run the following command:

```
pkgrm NSweblog
```

## Install NSWL client on Linux

### Important

The installation of an NSWL client on Linux replaces the configuration file. You must take a backup before installing it.

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_linux-<release number>-<build number>.rpm` file from the package.
2. Copy the extracted file to a system, running Linux OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
rpm -i nswl_linux-9.3-51.5.rpm
```

This command extracts the files and installs them in the following directories.

- /usr/local/netscaler/etc

- `/usr/local/netscaler/bin`
- `/usr/local/netscaler/samples`

**Note**

To uninstall the NSWL package, run the following command:

```
rpm -e NSweblog
```

**Note**

To get more information about the Weblog RPM file, run the following command:

```
rpm -qpi *.rpm
```

**Note**

To view the installed Web server logging files, run the following command:

```
rpm -qpl *.rpm
```

## Install NSWL client on FreeBSD

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_bsd-<release number>-<build number>.tgz` file from the package.
2. Copy the extracted file to a system, running FreeBSD OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
pkg_add nswl_bsd-9.3-51.5.tgz
```

This command extracts the files and installs them in the following directories.

```
1 - /usr/local/netscaler/etc
2 - /usr/local/netscaler/bin
3 - /usr/local/netscaler/samples
```

**Note**

To uninstall the NSWL package, run the following command:

```
pkg_delete NSweblog
```

1. To verify that the package is installed, run the following command:

```
pkg_info | grep NSweblog
```

## Install the NSWL client on Mac

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_macos-<release number>-<build number>.tgz` file from the package.
2. Copy the extracted file to a system, running macOS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
pkg_add nswl_macos-9.3-51.5.tgz
```

This command extracts the files and installs them in the following directories:

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

### Note

To uninstall the NSWL package, run the following command:

```
pkg_delete NSweblog
```

1. To verify that the package is installed, run the following command:

```
pkg_info | grep NSweblog
```

## Install NSWL client on Windows

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_win-<release number>-<build number>.zip` file from the package.
2. Copy the extracted file to a Windows system on which you want to install the NSWL client.
3. On the Windows system, unzip the file in a directory (referred as `<NSWL-HOME>`). The following directories are extracted: `/bin`, and `/etc`, and `/samples`.
4. At the command prompt, run the following command from the `<NSWL-HOME>\bin` directory:

```
nswl -install -f <directorypath>\log.conf
```

Where,

Directory path refers to the path of the configuration file (log.conf). By default, the file is in the `<NSWL-HOME>` and `/etc` directory. However, you can copy the configuration file to any other directory.

**Note**

To uninstall the NSWL client, at the command prompt, run the following command from the < NSWL-HOME>\bin directory:

```
> nswl -remove
```

**Install NSWL client on AIX system**

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the `nswl_aix-<release number>-<build number>.rpm` file from the package.
2. Copy the extracted file to a system, running AIX OS, on which you want to install the NSWL client.
3. To install the NSWL package, run the following command:

```
rpm -i nswl_aix-9.3-51.5.rpm
```

This command extracts the files and installs them in the following directories.

- `/usr/local/netscaler/etc`
- `/usr/local/netscaler/`
- `usr/local/netscaler/samples`

**Note**

To uninstall the NSWL package, run the following command:

```
rpm -e Weblog
```

**Note**

To get more information about the Weblog RPM file, run the following command:

```
rpm -qpi *.rpm
```

**Note**

To view the installed Web server logging files, run the following command:

```
rpm -qpl *.rpm
```

**Configure NSWL client**

September 21, 2020

After installing the NSWL client, you can configure the NSWL client using the `nswl` executable. These configurations are then stored in the NSWL client configuration file (`log.conf`).

**Note:**

You can further customize logging on the NSWL client system by making additional modifications to the NSWL configuration file (log.conf). For details, see [Customizing Logging on the NSWL Client System](#).

The following table describes the commands that you can use to configure the NSWL client.

NSWL command	Specifies
nswl -help	The available NSWL help options.
nswl -addns -f <path-to-configuration-file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the Citrix ADC appliance. Enter a valid user name and password.
nswl -verify -f <path-to-configuration-file>	Check for syntax or semantic errors in the configuration file.
nswl -start -f <path-to-configuration-file>	Start the NSWL client based on the settings in the configuration file. Note: For Solaris and Linux: To start Web server logging as a background process, type the ampersand sign (&) at the end of the command.
nswl -stop (Solaris and Linux only)	Stop the NSWL client if it was started as a background process; otherwise, use CTRL+C to stop Web server logging.
nswl -install -f <path-to-configuration-file> (Windows only)	Install the NSWL client as a service in Windows.
nswl -startservice (Windows only)	Start the NSWL client by using the settings in the configuration file specified in the nswl install option. You can also start NSWL client from Start > Control Panel > Services. Note: The NSWL log files will be created in C:\Windows\SysWOW64.
nswl -stopservice (Windows only)	Stops the NSWL client.
nswl -remove	Remove the NSWL client service from the registry.

Run the following commands from the directory in which the NSWL executable is located:

- **Windows:** `\ns\bin`
- **Solaris and Linux:** `\usr\local\netscaler\bin`

The Web server logging configuration files are located in the following directory path:

- **Windows:** `\ns\etc`
- **Solaris and Linux:** `\usr\local\netscaler\etc`

The NSWL executable is started as `.\nswl` in Linux and Solaris.

### Add the IP addresses of the Citrix ADC appliance

In the NSWL client configuration file (`log.conf`), add the Citrix ADC IP address (NSIP) from which the NSWL client will start collecting logs.

#### To add the NSIP address of the Citrix ADC appliance

1. At the client system command prompt, type:

```
nswl -addns -f < directorypath > \log.conf
```

< directorypath >: Specifies the path to the configuration file (`log.conf`).

2. At the next prompt, enter the following information:

- **NSIP:** Specify the IP address of the Citrix ADC appliance.
- **Username and Password:** Specify the `nsroot` user credentials of the Citrix ADC appliance.

#### Note:

If you add multiple Citrix ADC IP addresses (NSIP), and later you do not want to log all of Citrix ADC system log details, you can delete the NSIPs manually by removing the NSIP statement at the end of the `log.conf` file. During a failover setup, you must add both primary and secondary Citrix ADC IP addresses to the `log.conf` by using the command. Before adding the IP address, make sure the user name and password exist on the Citrix ADC appliances.

### Verify the NSWL configuration file

To make sure that logging works correctly, check the NSWL configuration file (`log.conf`) on the client system for syntax errors.

### **To verify the configuration in the NSWL configuration file**

At the client system command prompt, type:

```
nswl -verify -f <directorypath>\log.conf
```

< directorypath>: Specifies the path to the configuration file (log.conf).

### **Running the NSWL Client**

#### **To start Web server logging**

At the client system command prompt, type:

```
nswl -start -f <directorypath>\log.conf
```

<directorypath>: Specifies the path to the configuration file ( log.conf).

#### **To stop Web server logging started as a background process on the Solaris or Linux operating systems**

At the command prompt, type:

```
nswl -stop
```

#### **To stop Web server logging started as a service on the Windows operating system**

At the command prompt, type:

```
nswl -stopservice
```

## **Customize logging on the NSWL client system**

July 20, 2021

You can customize logging on the Citrix ADC Web Logging (NSWL) client system by making more modifications to the NSWL client configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the client system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information based on the host IP address, domain name, and host name of the Web servers.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

## Sample configuration file

Following is a sample configuration file:

```
1 #####
2 # This is the NSWL configuration file
3 # Only the default filter is active
4 # Remove leading # to activate other filters
5 #####
6 #####
7 # Default filter (default on)
8 # W3C Format logging, new file is created every hour or on reaching 10
9   MB file size,
10 # and the file name is Exyymmdd.log
11 #####
12 Filter default
13 begin default
14     logFormat           W3C
15     logInterval        Hourly
16     logFileSizeLimit   10
17     logFilenameFormat  Ex%` {
18     ` %y%m%d }
19     t.log
20 end default
21 #####
22 # Citrix ADC caches example
23 # CACHE_F filter covers all the transaction with HOST name www.
24   netscaler.com and the listed server ip's
25 #####
26 #Filter CACHE_F HOST www.netscaler.com IP 192.168.100.89 192.168.100.95

94  ##### END FILTER CONFIGURATION #####
95  <!--NeedCopy-->

```

## Creating filters

You can use the default filter definition in the configuration file (log.conf), or you can modify the filter or create a filter. You can create more than one log filter.

### Note

Consolidated logging, which logs transactions for which no filter is defined, uses the default filter if it is enabled. Consolidated logging of all servers can be done by defining only the default filter.

If the server hosts multiple websites and each website has its own domain name, and each domain is associated with a virtual server, you can configure Web server logging to create a separate log directory for each website. The following table displays the parameters for creating a filter.

Parameter	Specifies
filterName	Name of the filter. The filter name can include alphanumeric characters and cannot be longer than 59 characters. Filter names longer than 59 characters are truncated to 59 characters.
Host name	Host name of the server for which the transactions are being logged.

Parameter	Specifies
IP	IP address of the server for which transactions are to be logged (for example, if the server has multiple domains that have one IP address).
IP <code>ip 2...ip n</code> :	Multiple IP addresses (for example, if the server domain has multiple IP addresses).
ip6 IP	IPv6 address of the server for which transactions are to be logged.
IP <code>ip NETMASK mask</code>	IP addresses and netmask combination to be used on a subnet.
ON   OFF	Enable or disable the filter to log transactions. If no argument is selected, the filter is enabled (ON).

Table 1. Parameters for Creating a Filter

**To create a filter**

To create a filter, enter the following command in the log.conf file:

- `filter <filterName> <HOST name> | [IP<ip> ] | [IP<ip 2...ip n> ] | <IP ip NETMASK mask> [ON | OFF]`
- `filter <filterName> <HOST name> | [IP6 ip/<prefix length>] [ON | OFF]`

**To create a filter for a virtual server**

To create a filter for a virtual server, enter the following command in the log.conf file:

```
filter <filterName> <VirtualServer IP address>
```

**Example**

In the following example, you specify an IP address of 192.168.100.0 and netmask of 255.255.255.0. The filter applies to IP addresses 192.168.100.1 through 192.168.100.254.

```
1 Filter F1 HOST www.netscaler.com ON
2 Filter F2 HOST www.netscaler.com IP 192.168.100.151 ON
3 Filter F3 HOST www.netscaler.com IP 192.168.100.151 192.165.100.152 ON
4 Filter F4 IP 192.168.100.151
5 Filter F5 IP 192.168.100.151 HOST www.netscaler.com OFF
```

```

6 Filter F6 HOST www.netscaler.com HOST www.xyz.com HOST www.abcxyz.com
  IP 192.168.100.200 ON
7 Filter F7 IP 192.250.100.0 NETMASK 255.255.255.0
8 Filter F8 HOST www.xyz.com IP 192.250.100.0 NETMASK 255.255.255.0 OFF
9 For creating filters for servers having IPv6 addresses.
10 Filter F9 2002::8/112 ON
11 Filter F10 HOST www.abcd.com IP6 2002::8 ON
12
13 <!--NeedCopy-->

```

## Specifying log properties

Log properties are applied to all log entries associated with the filter. The log property definition begins with the keyword BEGIN and ends with END as illustrated in the following example:

```

1 BEGIN <filtername>
2   logFormat ...
3   logFilenameFormat ...
4   logInterval ...
5   logFileSize ....
6   logExclude ....
7   logTime ...
8   END
9 <!--NeedCopy-->

```

Entries in the definition can include the following:

- **LogFormat** specifies the Web server logging feature that supports NCSA, W3C Extended, and custom log file formats.

By default, the `logformat` property is `w3c`. To override, enter `custom` or `NCSA` in the configuration file, for example:

```

1     LogFormat NCSA
2 <!--NeedCopy-->

```

### Note

For the NCSA and custom log formats, local time is used to time stamp transactions and for file rotation.

- **LogInterval** specifies the intervals at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour.

- Daily: A file is created every day at midnight. Default value.
- Weekly: A file is created every Sunday at midnight.
- Monthly: A file is created on the first day of the month at midnight.
- None: A file is created only once, when Web server logging starts.</span>

**Example:**

```
1 LogInterval Daily
2 <!--NeedCopy-->
```

**LogFileSizeLimit** specifies the maximum size of the log file in MB. It can be used with any log interval (weekly, monthly, and so on.) A file is created when the maximum file size limit is reached or when the defined log interval time elapses.

To override this behavior, specify the size as the `loginterval` property so that a file is created only when the log file size limit is reached.

The default LogFileSizeLimit is 10 MB.

**Example:**

```
1 LogFileSizeLimit 35
2 <!--NeedCopy-->
```

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:

- Static: Specifies a constant string that contains the absolute path and file name.

Dynamic: Specifies an expression containing the following format:

- \* Server IP address
- \* Date (%{format}t)
- \* URL suffix (%x)
- \* Host name (%v)

**Example:**

```
1 LogFileNameFormat Ex%` {
2   `%m%d%y }
3   t.log
4 <!--NeedCopy-->
```

This command creates the first file name as Exmddyy.log, then every hour creates a file with the file name: Exmddyy.log.0, Exmddyy.log.1,..., Exmddyy.log.n.

**Example:**

```

1     LogInterval size
2     LogFileSize 100
3     LogFileNameFormat Ex%`{
4     `m%d%y }
5     t
6 <!--NeedCopy-->

```

**Caution**

The date format %t specified in the LogFileNameFormat command overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFileNameFormat.

- **LogExclude** prevents logging of transactions with the specified file name extensions.

**Example:**

```

1     LogExclude .html
2 <!--NeedCopy-->

```

This command creates a log file that excludes log transactions for \*.html files.

**LogTime** specifies log time as either GMT or LOCAL.

The defaults are:

- NCSA log file format: LOCAL
- W3C log file format: GMT.

**Understanding NCSA and W3C log formats**

The Citrix ADC supports the following standard log file formats:

- NCSA Common Log Format
- W3C Extended Log Format

**NCSA Common Log Format**

If the log file format is NCSA, the log file displays log information in the following format:

```

1 Client_IP_address -User_Name [Date:Time -TimeZone] "Method Object
   HTTP_version" HTTP_StatusCode BytesSent
2 <!--NeedCopy-->

```

To use the NCSA Common log format, enter NCSA in the LogFormat argument in the log.conf file.

The following table describes the NCSA Common log format.

Argument	Specifies
Client_IP_address	The IP address of the client computer.
User Name	The user name.
Date	The date of the transaction.
Time	The time when the transaction was completed.
Time Zone	The time zone (Greenwich Mean Time or local time).
Method	The request method (for example; GET, POST).
Object	The URL.
HTTP_version	The version of HTTP used by the client.
HTTP_StatusCode	The status code in the response.
Bytes Sent	The number of bytes sent from the server.

### W3C extended log format

An extended log file contains a sequence of lines containing ASCII characters terminated by either a Line Feed (LF) or the sequence Carriage Return Line Feed (CRLF.) Log file generators must follow the line termination convention for the platform on which they are run.

Log analyzers must accept either LF or CRLF form. Each line might contain either a directive or an entry. If you want to use the W3C Extended log format, enter W3C as the Log-Format argument in the log.conf file.

By default, the standard W3C log format is defined internally as the custom log format, shown as follows:

```

1  %` {
2  ` %Y-%m-%d%H:%M:%S }
3  t %a %u %S %A %p %m %U %q %s %j %J %T %H %+{
4  user-agent }
5  i %+{
6  cookie }
7  i %+{
8  referer }
9  i
10 <!--NeedCopy-->
```

You can also change the order or remove some fields in this W3C log format. For example:

```
1 logFormat W3C %` {
2   `%Y-%m-%d%H:%M:%S }
3   t %m %U
4 <!--NeedCopy-->
```

W3C log entries are created with the following format:

```
1 #Version: 1.0 #Fields: date time cs-method cs-uri #Date: 12-Jun-2001
   12:34 2001-06-12 12:34:23 GET /sports/football.html 2001-06-12
   12:34:30 GET /sports/football.html
2 <!--NeedCopy-->
```

## Entries

Entries consist of a sequence of fields relating to a single HTTP transaction. Fields are separated by white space. Citrix recommends the use of tab characters. If a field in a particular entry is not used, a dash (-) marks the omitted field.

## Directives

See the [Directives](#) table for the information about the logging process. Lines beginning with the pound sign (#) contain directives.

### Example:

The following sample log file shows the log entries in W3C Extended log format:

```
1 #Version: 1.0 #Fields: time cs-method cs-uri #Date: 12-Jan-1996
   00:00:00 00:34:23 GET /sports/football.html 12:21:16 GET /sports/
   football.html 12:45:52 GET /sports/football.html 12:57:34 GET /
   sports/football.html
2 <!--NeedCopy-->
```

## Fields

The Fields directive lists a sequence of field identifiers that specify the information recorded in each entry. Field identifiers might have one of the following forms:

- **identifier:** Relates to the transaction as a whole.
- **prefix-identifier:** Relates to information transfer between parties defined by the value prefix.
- **prefix (header):** Specifies the value of the HTTP header field header for transfer between parties defined by the value prefix. Fields specified in this manner always have the type.

The following table describes defined prefixes.

Prefix	Specifies
c	Client
s	Server
r	Remote
cs	Client to server
sc	Server to client
sr	Server to remote server (prefix used by proxies)
rs	Remote server to server (prefix used by proxies)
x	Application-specific identifier

**Examples:**

The following examples are defined identifiers that use prefixes:

**cs-method:** The method in the request sent by the client to the server.

**sc(Referer):** The [Referer](#) field in the reply.

**c-ip:** The IP address of the client.

**Identifiers**

The following table describes the W3C Extended log format identifiers that do not require a prefix.

Identifier	Description
date	The date on which the transaction was done.
time	The time when the transaction is done.
time-taken	The time taken (in seconds) for the transaction to complete.
bytes	The number of bytes transferred.
cached	Records whether a cache hit has occurred. A zero indicates a cache miss.

Table 5. W3C Extended Log Format Identifiers (No Prefix Required)

The following table describes the W3C Extended log format identifiers that require a prefix.

Identifier	Description
IP	The IP address and the port number.
DNS	The DNS name.
status	The status code.
comment	The comment returned with a status code.
method	The method.
url	The URL.
url-stem	The stem portion of the URL.
url-query	The query portion of the URL.

Table 6. W3C Extended Log Format Identifiers (Requires a Prefix)

The W3C Extended Log file format allows you to choose log fields. These fields are shown in the following table.

Field	Description
Date	The date on which the transaction is done.
Time	The time when the transaction is done.
Client IP	The IP address of the client.
User Name	The user name.
Service Name	The service name, which is always HTTP.
Server IP	The server IP address.
Server Port	The server port number
Method	The request method (for example; GET, POST).
Url Stem	The URL stem.
Url Query	The query portion of the URL.
HTTP Status	The status code in the response.
Bytes Sent	The number of bytes sent to the server (request size, including HTTP headers).
Bytes Received	The number of bytes received from the server (response size, including HTTP headers).

Field	Description
Time Taken	The time taken for a transaction to complete, in seconds.
Protocol Version	The version number of HTTP being used by the client.
User Agent	The User-Agent field in the HTTP protocol.
Cookie	The Cookie field of the HTTP protocol.
Referer	The <a href="#">Referer</a> field of the HTTP protocol.

Table 7. W3C Extended Log File Format (Allows Log Fields)

### Creating a custom log format

You can customize the display format of the log file data manually or by using the NSWL library. By using the custom log format, you can derive most of the log formats that Apache currently supports.

#### Creating a custom log format by using the NSWL library

Use one of the following NSWL libraries depending on whether the NSWL executable has been installed on a Windows or Solaris host computer:

- **Windows:** The `nswl.lib` library in the `\ns\bin` directory on the system manager host computer.
- **Solaris:** The `libnswl.a` library in `/usr/local/netscaler/bin`.

#### To create the custom log format by using the NSWL library

1. Add the following two C functions defined by the system in a C source file:

`ns_userDefFieldName()`: This function returns the string that must be added as a custom field name in the log record.

`ns_userDefFieldVal()`: This function implements the custom field value, then returns it as a string that must be added at the end of the log record.

2. Compile the file into an object file.
3. Link the object file with the NSWL library (and optionally, with third party libraries) to form a new NSWL executable.
4. Add a `%d` string at the end of the `logFormat` string in the configuration file (`log.conf`).

#### Example:

```

1 ##### # A new file is created every midnight or on reaching 20MB
   file size, # and the file name is /datadisk5/netscaler/log/NS<
   hostname>/Nsmdddy.log and create digital #signature field for each
   record. BEGIN CACHE_F logFormat custom "%a - "%{
2   user-agent }
3   i" [%d/%B/%Y %T -%g] "%x" %s %b%{
4   referrer }
5   i "%{
6   user-agent }
7   i" "%{
8   cookie }
9   i" %d " logInterval Daily logFileSizeLimit 20 logFilenameFormat /
   datadisk5/netscaler/log/%v/NS%` {
10  `%m%d%y }
11  t.log END CACHE_F
12  <!--NeedCopy-->

```

### Creating a Custom log format manually

To customize the format in which log file data must appear, specify a character string as the argument of the LogFormat log property definition. The following is an example where character strings are used to create a log format:

```

1 LogFormat Custom ""%a - "%{
2   user-agent }
3   i" [%d/%m/%Y]t %U %s %b %T"
4 <!--NeedCopy-->

```

- The string can contain the “c” type control characters \n and \t to represent new lines and tabs.
- Use the Esc key with literal quotes and backslashes.

The characteristics of the request are logged by placing % directives in the format string, which are replaced in the log file by the values.

If the %v (Host name) or %x (URL suffix) format specifier is present in a log file name format string, the following characters in the file name are replaced by an underscore symbol in the log configuration file name:

```

" * . / : < > ? \

```

Characters whose ASCII values lie in the range of 0-31 are replaced by the following:

```
%<ASCII value of character in hexadecimal>.
```

For example, the character with ASCII value 22 is replaced by %16.

**Caution**

If the %v format specifier is present in a log file name format string, a separate file is opened for each virtual host. To ensure continuous logging, the maximum number of files that a process can have open must be sufficiently large. See your operating system documentation for a procedure to change the number of files that can be opened.

**Creating Apache log formats**

You can derive from the custom logs most of the log formats that Apache currently supports. The custom log formats that match Apache log formats are:

NCSA/combined: LogFormat custom %h %l %u [%t] "%r" %s %B "%{referer}i" "%{user-agent}i"

NCSA/Common: LogFormat custom %h %l %u [%t] "%r" %s %B

Referer Log: LogFormat custom "%{referer}i" -> %U

User agent: LogFormat custom %{user-agent}i

Similarly, you can derive the other server log formats from the custom formats.

**Arguments for defining a custom log format**

See the [Custom log format](#) PDF table for more information about defining a custom log format.

**Note**

For instructions on how to export custom HTTP headers, see [Configuring the Citrix ADC for Web Server Logging](#)

For example, if you define the log format as %+{user-agent}i, and if the user agent value is Citrix ADC system Web Client, then the information is logged as Citrix ADC system+Web+Client. An alternative is to use double quotation marks. For example, "%{user-agent}i" logs it as "Citrix ADC system Web Client." Do not use the <Esc> key on strings from %.. .R, %.. .i and, %.. .o. This complies with the requirements of the Common Log Format. Clients can insert control characters into the log. Therefore, you must take care when working with raw log files.

**Time format definition**

See the [Time format definition](#) table to know about the format part of the %{format}t string described in the Custom Log Format table. Values within brackets ([ ]) show the range of values that appear. For example, [1,31] in the %d description in the following table shows %d ranges from 1 to 31.

#### Note

If you specify a conversion that does not correspond to any of the ones described in the preceding table, or to any of the modified conversion specifications listed in the next paragraph, the behavior is undefined and returns 0.

The difference between %U and %W (and also between modified conversions %OU and %OW) is the day considered to be the first day of the week. Week number 1 is the first week in January (starting with a Sunday for %U, or a Monday for %W). Week number 0 contains the days before the first Sunday or Monday in January for %U and %W.

## Displaying Server Logs

You can configure a Citrix ADC Web Logging (NSWL) feature to display server logs on the console or redirect server logs to a directory on the Citrix ADC appliance.

There are two ways to display logs on the console (standard output):

Option 1: Display all logs on the console.

Option 2: Display only selected logs on the console with filters with `log filename format` as STDOUT.

## Call Home

September 21, 2020

Appliances might sometimes fail to perform well because of software or hardware issues. In such cases, Citrix needs to collect data and perform issue resolution before a potential impact can occur at the customer site. By enabling Call Home on your Citrix ADC appliance, you can automate the error notification process. Not only you avoid calling Citrix support, raising a service request, and uploading system data before the support team can troubleshoot the issue, but support can identify and address an issue before it occurs. Call Home periodically monitors the appliance and automatically uploads data to the Citrix technical support server. In addition, the incoming Call Home data provide insights about Citrix ADC usage. Multiple teams within Citrix can use this data to better design, support, and implement Citrix ADC.

By default, Call Home is enabled on all platforms and all flavors of Citrix ADC (MPX, VPX, SDX). By having this feature enabled, you allow Citrix to collect Citrix ADC deployment and telemetry data for better implementation, and support service.

#### Note

You can also see the [Call Home FAQ](#) page for information pertaining to Call Home.

## Benefits

Call Home provides the following benefits.

- Monitor hardware and software error conditions. For more information, see Monitor critical error conditions section.
- Notify critical events that impact your network.
- Send performance data and system usage details to Citrix to:
  - Analyze and improve product quality.
  - Provide real-time troubleshooting information for proactive issue identification, and faster issue resolution.

## Platform support

Call Home feature is supported on all Citrix ADC platforms and all appliance models (MPX, VPX, and SDX).

- Citrix ADC MPX: All MPX models.
- Citrix ADC VPX: All VPX models, including VPX appliances that obtain their license from external or central licensing pools.
- Citrix ADC SDX: Monitors the disk drive and assigned SSL chips for any errors or failures. The VPX instances, however, do not have access to the Power Supply Unit (PSU) and therefore their status is not monitored. In an SDX platform, you can configure Call Home either directly on an individual instance or through the SVM.

## Prerequisites

To use Call Home, the Citrix ADC appliance must have the following:

- **Internet connection.** Call Home requires an internet connection for the Citrix ADC to connect to the Citrix support server for uploading a data archive.

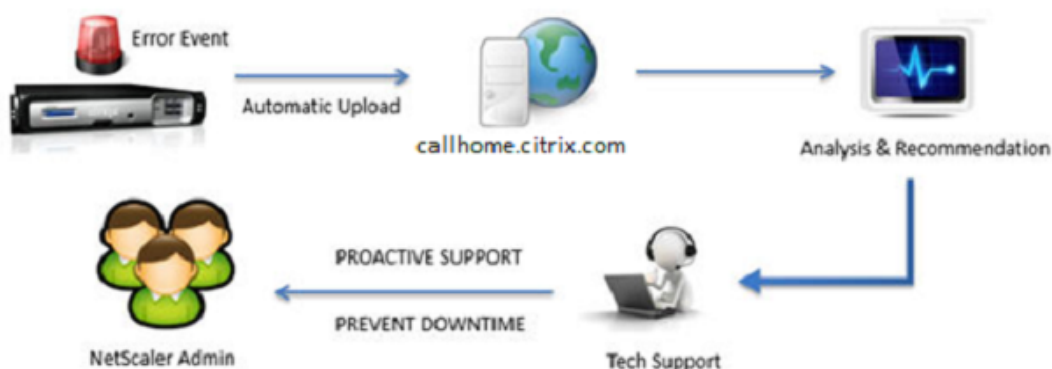

## How Call Home works

The following figure shows a basic workflow of Call Home in a Citrix ADC appliance deployed at a customer site.

### Step 1: Appliance Registration

### Step 2: Trigger Based Upload

The following are the workflow of a Call Home:

**1. Set up Internet Connectivity.** For Call Home to upload system data, your appliance must have an internet connectivity. If it does not, you can configure a proxy server configuration to provide internet connectivity. For more information, see Configuring Call Home section.

**2. Enable Call Home.** When upgrading your appliance to the latest software through either Citrix ADC command interface or GUI, Call Home is enabled by default and the system delays the registration process by 24 hours. During this period, you can choose to manually disable the feature, but Citrix recommends you to have it enabled.

#### Note

If you are upgrading your appliance from an older version that explicitly has Call Home disabled, the system still enables the feature by default and displays a notification message on your first login.

In addition, if you are doing any configuration changes for an internet connectivity, you must disable and enable Call Home. It enables Call Home to register with the Citrix Insight Services (CIS) server without any failure errors.

**3. Register the Citrix ADC appliance on the Citrix Support Server.** When Call Home registers the appliance with the Citrix Support server, the server checks the database for the validity of the appliance serial number. If the serial number is valid, the server registers the appliance for Call Home service and sends a successful registration response. Otherwise, the server sends back a registration failure

message. The basic system information is sent as a separate message. The data includes memory and CPU usage details along with the throughput numbers. The data is sent periodically as part of the heartbeat message every 7 days, by default. However, a value of less than 5 days is not recommended, because frequent uploads are not useful.

**4. Monitor critical error conditions.** Once registered, Call Home starts monitoring the appliance. The following table lists the conditions Call Home can monitor on the appliance.

Critical Error Condition	Description	Call Home Monitoring Interval	Corresponding SNMP Alarm Name
Compact flash drive errors	The compact flash drive on the appliance encountered read or write failures.	24 hours	COMPACT-FLASH-ERRORS
Hard disk drive errors	The hard drives on the appliance encountered read or write failures.	24 hours	HARD-DISK-DRIVE-ERRORS
Power supply unit failure	One of the power supply units on the Citrix ADC appliance has failed.	7 seconds	POWER-SUPPLY-FAILURE
SSL card failure	One of the SSL cards on the Citrix ADC appliance has failed.	7 seconds	SSL-CARD-FAILED
Warm restart	The appliance has warm restarted due to a failure of a system process.	After every restart of the Citrix ADC appliance.	WARM-RESTART-EVENT
Memory anomaly error	Memory utilization progressively increases above its normal limit and exceeds the threshold.	1 day	No SNMP alarm

Critical Error Condition	Description	Call Home Monitoring Interval	Corresponding SNMP Alarm Name
Rate limit packet drop	The throughput limits or packets-per-second (pps) limits is reached.	7 seconds	PF-RL-PPS-PKTS-DROPPED, PF-RL-RATE-PKTS-DROPPED

**5. Upload Call Home data.** If any one of the previous critical conditions is identified on the appliance, the Call Home feature automatically notifies the Citrix support. The support archives are uploaded to the Citrix support server. Also, you can configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever Call Home upload happens. The SNMP alert notifies the local administrator about the critical event.

#### Note

Call Home creates the Call Home tar file and uploads it to the Citrix tech support server for only the first occurrence of a particular error condition since the last reboot. If you want the appliance to send alerts each time a particular error condition occurs, configure the corresponding SNMP alarm for the error condition.

**6. Create Service Request.** Call Home automatically creates a service request for the critical hardware related events. The events are classified as; power supply failure, SSL card failure, hard disk drive errors, and compact flash errors. For other errors, after you review the System Logs, you can contact the Citrix support team to raise a service request for investigation.

## Configuring Call Home

To configure Call Home, verify the internet connectivity on the appliance and ensure a DNS name-server is configured. If there is no internet connection, configure a proxy server or service. Then, enable Call Home on the appliance and verify the registration status of the appliance with a Citrix support server. Once registered, Call Home can monitor and upload data. In addition, you can configure SNMP alarms to notify the administrator at the customer site.

To configure Call Home, you can use either the Citrix ADC command interface or the GUI to do the following tasks:

- Enable Call Home.
- Configure Call Home for optional proxy server parameters.
- Verify Call Home Registration Status.
- View errors and timestamp details.
- Configure SNMP Alarms.

## To configure Call Home by using the Citrix ADC command interface

The **Citrix ADC** command interface enables you to do the following:

### Enabling Call Home

At the command prompt, type:

```
enable ns feature callhome
```

### Configuring Call Home for optional proxy server parameters

Call Home enables you to configure the optional proxy server for internet connectivity. You can either configure a proxy server with IP address and port or configure a proxy authentication service with one-way or two-way authentication.

### To configure optional proxy server with IP address and port

At the command prompt, type:

```
set callhome -proxyMode ( YES | NO )[-IPAddress <ip_addr|ipv6_addr|*>] [-port <port |*>]
```

```
1 set callhome - proxyMode YES - IPAddress 10.102.167.33 - port 80
2 <!--NeedCopy-->
```

### Note

Call Home uses the proxy server only when you set the proxy-mode parameter to YES. If you set it to NO, the proxy functionality does not work, even if the IP address and port are configured. The port number must be for an HTTP service, not for an HTTPS service.

### To configure optional proxy authentication service

This mode provides two types of security authentication: one-way and two-way. To set up either type, you must configure an SSL service. For more information, see [Configuring an SSL Service](#) topic.

In one-way authentication, only the Citrix ADC appliance authenticates the proxy server. In two-way authentication, the Citrix ADC appliance authenticates the proxy server and the proxy server, in turn, authenticates the appliance.

### To configure proxy authentication service

At the command prompt, type:

```
set callhome -proxyMode ( YES | NO )[-proxyAuthService <string>]
```

```
1 set callhome - proxyMode YES - proxyAuthService callhome_proxy
2 <!--NeedCopy-->
```

### To configure one-way proxy server authentication

Do the following tasks to configure one-way proxy server authentication.

1. Create an SSL service.
2. Bind a CA certificate to the service.
3. Bind an HTTPS Monitor to the service.
4. Configure Call Home to use the SSL service.

To configure two-way proxy server authentication

Do the following tasks to configure two-way proxy server authentication.

1. Create an SSL service
2. Bind a CA certificate to the service.
3. Bind a Client Certificate.
4. Bind an HTTPS Monitor to the service.
5. Configure Call Home to use the SSL service.

Verifying Call Home Registration status

At the command prompt, type:

```
1 show callhome
2
3 show callhome
4
5 Registration with Citrix upload server SUCCESSFUL
6
7 Mode: Default
8
9 Contact email address: exampleadmin@example.com
10
11 Heartbeat Custom Interval (days): 7
12
13 Proxy Mode: Yes
14
15 Proxy IP Address:10.102.29.200
16
17 Proxy Authentication Service:
18
19 Proxy Port: 80
20
21 Trigger event State First
   occurrence Latest occurrence
22

	..		
30			
31	4) SSL card failure	N/A	N/
	A	N/A	
32			
33	5) Power supply unit failure	N/A	N/
	A	N/A	
34			
35	6) Rate limit packet drops	Enabled	..
	..		
36			
37	7) Memory anomaly	Enabled	..
	..		
38			
39	Done		
40	<!--NeedCopy-->		

**Note**

If the Call Home fails to register with CIS, the appliance displays an error message.

**Enabling SNMP Alarms**

The Citrix ADC appliance provides a set of error condition entities called *SNMP alarms*. When an error condition in an SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the SSL-CARD-FAILED alarm is enabled, a trap message is generated and sent to the trap listener. The trap message is sent whenever there is an SSL card failure on the appliance. For more information, see [SNMP](#).

At the command prompt, type:

```
enable snmp alarm <trapName>
```

```
show snmp alarm <trapName>
```

**To configure Call Home by using GUI**

To verify if the Call Home feature is enabled by default in the GUI

1. Navigate to **Configuration > System > Settings**.

2. In the **details** pane, click **Configure Advanced features** link.
3. In the **Configure Advanced Features** page, **Call Home** option must display as enabled.

To enable Call Home by using GUI

1. Navigate to **Configuration > System > Settings**.
2. In the **details** pane, click **Configure Advanced features** link and select **Callhome** option.

To configure Call Home for optional proxy mode authentication by using GUI

1. You can use any of the two ways to access the Call Home page:
  - a) Navigate to **System > System Information**.
  - b) Navigate to **System > Diagnostics**.
    - i. In the details pane, under **Technical Support Tools**, select **Call Home**.
2. On the **Configure Call Home** page, set the following parameters.

- a) **Mode**. Call Home mode of operation. Possible types: Default, Citrix Service Provider (CSP) deployment.

**Note**

This option is not user configurable. The mode is automatically determined and set based on the type of Citrix ADC deployment.

- b) **Email address**. Email address of the contact administrator at the customer site.
- c) **CallHome Heartbeats Interval (days)**. Monitoring interval (in days) between Call Home heartbeats. Minimum value=1 and Maximum value=7.
- d) **Enable Call Home**. Enable or disable the Call Home feature to view the status of appliance registration on the Citrix support server.
- e) **Proxy Mode**. If you do not have an internet connectivity, enable proxy mode and set the optional proxy parameters.
- f) **Proxy Server**. If you set the proxy mode by using a proxy server, specify the server IP address.
  - i. **Proxy Service**. If you set the proxy mode by using a proxy service, specify the service name.
  - ii. **IP Address**. IP address of the proxy server.
  - iii. **Port**. Port number of the proxy server.
  - iv. **Proxy Authentication SSL Service**. The name of the proxy service that provides proxy-mode authentication.

3. Click **OK** and **Done**.

To configure SSL service for proxy server authentication by using GUI

For information about configuring an SSL service by using the GUI, see [Configuring an SSL Service](#) topic.

To verify Call Home registration status by using the GUI

1. You can use any of the two ways to access the **Call Home** page:

- a) Navigate to **System > System Information**.
- b) Navigate to **System > Diagnostics**.
  - i. In the details pane, under **Technical Support Tools**, select **Call Home**.
2. In the **Configure Call Home** page, the **Registration with Citrix upload server** field shows the registration status.

To configure an SNMP alarm

1. Navigate to **System > SNMP > Alarms**.
2. In the details pane, select an alarm and configure its parameters.
3. Click **OK** and **Close**.

### **Citrix Service Provider (CSP) deployment support**

In a Citrix Service Provider (CSP) environment where Citrix ADC services are deployed on VPX instances, Call Home can monitor and track the license-specific information and securely send the information to Citrix Insight Services (CIS). CIS in turn sends the information to the License Usage Insights (LUI) portal for accounting purposes and for CSP customers to review their license usage. Currently, CSP environments support Citrix ADC services on VPX instances only, not on MPX or SDX appliances. The VPX instances can be deployed in either standalone or high availability mode.

## **Reporting tool**

April 1, 2021

Use the Citrix® Citrix ADC® Reporting tool to view Citrix ADC performance statistics data as reports. Statistics data are collected by the `nscollect` utility and are stored in a database. When you want to view certain performance data over a period, the Reporting tool pulls out specified data from the database and displays them in charts.

Reports are a collection of charts. The Reporting tool provides built-in reports in addition to the option to create custom reports. In a report, you can modify the charts and add new charts. You can also modify the operation of the data collection utility, `nscollect`, and stop or start its operation.

### **Using the reporting tool**

The Reporting tool is a web-based interface accessed from the Citrix® Citrix ADC® appliance. Use the Reporting tool to display the performance statistics data as reports containing graphs. In addition to using the built-in reports, you can create custom reports, which you can modify at any time. Reports can have between one and four charts. You can create up to 256 custom reports. You can create a custom report for any number of entities.

## To invoke the reporting tool

1. Use the Web browser of your choice to connect to the IP address of the Citrix ADC (for example, <http://10.102.29.170/>). The Web Logon screen appears.
2. In the User Name text box, type the user name assigned to the Citrix ADC.
3. In the Password text box, type the password.
4. In the Start in drop-down list box, select Reporting. Click Login.

The following screenshots show the report toolbar and the chart toolbar, which are frequently referenced in this documentation.

Figure 1. Report Toolbar

Figure 2. Chart Toolbar

## Working with reports

You can plot and monitor statistics for the various functional groups configured on the Citrix ADC over a specified time interval. Reports enable you to troubleshoot or analyze the behavior of your appliance. There are two types of reports: built-in reports and custom reports. Report content for built-in or custom reports can be viewed in a graphical format or a tabular format. The graphical view consists of line, area, and bar charts that can display up to 32 sets of data (counters). The tabular view displays the data in columns and rows. This view is useful for debugging error counters.

The default report that is displayed in the Reporting tool is CPU vs. Memory Usage and HTTP Requests Rate. You can change the default report view by displaying the report you want as your default view, and then clicking Default Report.

Reports can be generated for the last hour, last day, last week, last month, last year, or you can customize the duration.

You can do the following with reports:

- Toggle between a tabular view of data and a graphical view of data.
- Change the graphical display type, such as bar chart or line chart.
- Customize charts in a report.
- Export the chart as an Excel comma-separated value (CSV) file.
- View the charts in detail by zooming in, zooming out, or using a drag operation (scrolling).
- Set a report as the default report for viewing whenever you log on.
- Add or remove counters.

- Print reports.
- Refresh reports to view the latest performance data.

### Using built-in reports

The Reporting tool provides built-in reports for frequently viewed data. Built-in reports are available for the following functional groups: System, Network, SSL, Compression, Integrated Cache, Citrix ADC Gateway, and Citrix ADC Application Firewall. By default, the built-in reports are displayed for the last day. However, you can view the reports for the last hour, last week, last month, or last year.

#### Note:

You cannot save changes to built-in reports, but you can save a modified built-in report as a custom report.

### To display a built-in report

1. In the left pane of the Reporting tool, under Built-in Reports, expand a group (for example, SSL).
2. Click a report (for example, SSL > All back-end Ciphers).

### Creating and deleting reports

You can create your own custom reports and save them with user-defined names for reuse. You can plot different counters for different groups based on your requirements. You can create up to 256 custom reports.

You can either create a new report or save a built-in report as a custom report. By default, a newly created custom report contains one chart named System Overview, which displays the CPU Usage counter plotted for the last day. You can customize the interval and set the data source and time zone from the report toolbar.

### To create a custom report

1. In the **Reporting** tool, on the report toolbar, click **Create**, or if you want to create a new custom report based on an existing report, open the existing report, and then click **Save As**.
2. In **Report Name** box, type a name for the custom report.
3. Do one of the following:
  - To add the report to an existing folder, in Create in or Save in, click the down arrow to choose an existing folder, and then click **OK**.
  - To create a new folder to store the report, click the Click to add folder icon, in Folder Name, type the name of the folder, and in Create in, specify where you want the new folder to reside in the hierarchy, and then click **OK**.

**Note:**

You can create up to 128 folders.

### To delete a custom report

1. In the left pane of the Reporting tool, next to Custom Reports, click the Click to manage the custom reports icon.
2. Select the check box that corresponds with the report you want to delete, and then click Delete.

**Note:**

When you delete a folder, all the contents of that folder are deleted.

### Modifying the time interval

By default, built-in reports display data for the last day. However, if you want to change the time interval for a built-in report, you can save the report as a custom report. The new interval applies to all charts in the report. The following table describes the time-interval options.

### To modify the time interval

1. In the left pane of the Reporting tool, click a report.
2. On the report toolbar, click **Duration**, and then click a time interval.

### Setting the data Source and time zone

You can retrieve data from different data sources to display them in the reports. You can also define the time zone for the reports and apply the currently displayed report's time selection to all the reports, including the built-in reports.

### To set the data source and time zone

1. In the **Reporting tool**, on the report toolbar, click **Settings**.
2. In the **Settings** dialog box, in Data Source, select the data source from which you want to retrieve the counter information.
3. Do one or both of the following:
  - If you want the tool to remember the time period for which a chart is plotted, select the **Remember time selection for charts** check box.
  - If you want the reports to use the time settings of your Citrix ADC appliance, select the **Use Appliance's time zone** check box.

## Exporting and importing custom reports

You can share reports with other Citrix ADC administrators by exporting reports. You can also import reports.

### To export or import custom reports

1. In the left pane of the Reporting tool, next to Custom Reports, click the **Click to manage custom reports** icon.
2. Select the check box that corresponds with the report you want to export or import, and then click **Export** or **Import**.

**Note:**

When you export the file, it is exported in a .gz file format.

## Working with charts

Use charts to plot and monitor counters or groups of counters. You can include up to four charts in one report. In each chart, you can plot up to 32 counters. The charts can use different graphical formats (for example, area and bar). You can move the charts up or down within the report, customize the colors and visual display for each counter in a chart, and delete a chart when you do not want to monitor it.

In all report charts, the horizontal axis represents time and the vertical axis represents the value of the counter.

### Adding a chart

When you add a chart to a report, the System Overview chart appears with the CPU Usage counter plotted for the last one day.

**Note:**

If you add charts to a built-in report, and you want to retain the report, you must save the report as a custom report.

Use the following procedure to add a chart to a report.

### To add a chart to a report

1. In the left pane of the Reporting tool, click a report.
2. Under the chart where you want to add the new chart, click the Add icon.

## Modifying a chart

You can modify a chart by changing the functional group for which the statistics are displayed and by selecting different counters.

### To modify a chart

1. In the left pane of the Reporting tool, click a report.
2. Under the chart that you want to modify, click Counters.
3. In the dialog box that appears, in the Title box, type a name for the chart.
4. Next to the Plot chart for, do one of the following:
  - To plot counters for global counters, such as Integrated Cache and Compression, click System global statistics.
  - To plot entity counters for entity types, such as Load Balancing and GSLB, click System entities statistics.
5. In the Select group, click the desired entity.
6. Under Counters, in Available, click the counter name(s) that you want to plot, and then click the > button.
7. If you selected System entities statistics in step 4, on the Entities tab, under Available, click the entity instance name(s) you want to plot, and then click the > button.
8. Click OK.

### Viewing a chart

You can specify the graphical formats of the plotted counters in a chart. Charts can be viewed as line charts, spline charts, step-line charts, scatter charts, area charts, bar charts, stacked area charts, and stacked bar charts. You can also zoom in, zoom out, or scroll inside the plot area of a chart. You can zoom in or out for all data sources for 1 hour, 1 day, 1 week, 1 month, 1 year, and 3 years.

Other options for customizing the view of a chart include customizing the axes of the charts, changing the background and edge color of the plot area, customizing the color and size of the grids, and customizing the display of each data set (counter) in a chart.

Data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

Whenever you modify a built-in report, you need to save the report as a custom report to retain your changes.

### To change the graph type of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart you want to view, on the chart toolbar, click **Customize**.
3. On the **Chart** tab, under **Category**, click **Plot type**, and then click the graph type you want to display for the chart. If you want to display the graph is 3D, select the Use 3D check box.

#### To refocus a chart with detailed data

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Zoom In**, and do one or both of the following:
  - To refocus the chart to display data for a specific time window, drag the cursor from the start time to the end time. For example, you can view data for a one-hour period on a certain day.
  - To refocus the chart to display data for a data point, simply click once on the chart where you want to zoom in and get more detailed information.
3. Once you have the desired range of time for which you want to view detailed data, on the report toolbar, click Tabular View. Tabular view displays the data in numeric form in rows and columns.

#### To view numeric data for a graph

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click Tabular View. To return to the graphical view, click **Graphical View**.

**Note:** You can also view the numeric data in the graphical view by hovering your cursor over the notches in the gridlines.

#### To scroll through time in a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Scroll**, and then click inside the chart and drag the cursor in the direction for which you want to see data for a new time period. For example, if you want to view data in the past, drag to the left.

#### To change the background color and text color of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under **Category**, click one or more of the following:
  - To change the background color, click **Background Color**, and then select the options for color, transparency, and effects.

- To change the text color, click Text **Color**, and then select the options for color, transparency, and effects.

### To customize the axes of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under Category, click one or more of the following:
  - To change the scale of the left y-axis, click **Left Y-Axis**, and then select the scale you want.
  - To change the scale of the right y-axis, click **Right Y-Axis**, in a data set to plot, select the data set, and then select the scale you want.

Note:

The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

- To plot each data set in its own hidden y-axis, click **Multiple Axes**, and then click **Enable**.

### To change the background color, edge color, and gridlines for a plot area of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the plot area, click **Customize**.
3. On the **Plot Area** tab, under Category, click one or more of the following:
  - To change the background color and edge color of the chart, click **Background Color and Edge Color**, and then select the options for color, transparency, and effects.
  - To change the horizontal or vertical grids of the chart, click **Horizontal Grids** or **Vertical Grids**, and then select the options for displaying the grids, grid width, grid color, transparency, and effects.

### To change the color and graph type of a data set

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the display of the data set (counters), click **Customize**.
3. On the **Data Set** tab, in Select Data Set, select the data set (counter) for which you want to customize the graphical display.

Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and

Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

4. Under Category, do one of more of the following:
  - To change the background color, click **Color**, and then select the options for color, transparency, and effects.
  - To change the graph type, click **Plot type**, and then select the graph type you want to display for the data set. If you want to display the graph as 3D, select the Use 3D check box.

### Exporting chart data to excel

For further data analysis, you can export charts to Excel in a comma-separated value (CSV) format.

To export chart data to excel

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart with the data you want to export to Excel, click **Export**.

### Deleting a chart

If you do not want to use a chart, you can remove it from the report. You can permanently remove charts from custom reports only. If you delete a chart from a built-in report and want to retain the changes, you need to save the report as a custom report.

### To delete a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart that you want to delete, click the **Delete** icon.

### Examples

#### To display the trend report for CPU usage and memory usage for the last week

1. In the left pane of the Reporting tool, under Built-in Reports, expand System.
2. Click the report CPU vs. Memory Usage and HTTP Requests Rate.
3. In the right pane, on the report toolbar, click **Duration**, and then click **Last Week**.

**To compare the bytes received rate and the bytes transmitted rate between the two interfaces for the last week**

1. In the right pane, on the report toolbar, click Create.
2. In the **Report Name** box, type a name for the custom report (for example, Custom\_Interfaces), and then click **OK**. The report is created with the default System Overview chart, which displays the CPU Usage counter plotted for the last hour.
3. Under System Overview, on the chart toolbar, click Counters.
4. In the counter selection pane, in Title, type a name for the chart (for example, Interfaces bytes data).
5. In Plot chart for, click System entities statistics, and then in Select Group, select Interface.
6. On the **Entities** tab, click the interface names you want to plot (for example, 1/1 and 1/2), and then click the > button.
7. On the Counters tab, click Bytes received (Rate) and Bytes transmitted (Rate) and then click the > button.
8. Click **OK**.
9. On the report toolbar, click **Duration**, and then click **Last Week**.

**Stopping and starting the data collection utility**

The data collection utility, `nscollect`, runs automatically when you start the Citrix ADC. This utility retrieves the application performance data and stores it in the form of data sources on the ADC. You can create up to 32 data sources. The default data source is `/var/log/db/default`.

The data collection utility creates databases for global counters and entity-specific counters, and uses this data to generate reports. Global-counter databases are created at `/var/log/db/<DataSourceName>`. The entity-specific databases are created based on the entities configured on the Citrix ADC, and a separate folder is created for each entity type in `/var/log/db/<DataSourceName/EntityNameDB>`.

The `nscollect` retrieves data once every 5 minutes. It retains data in 5-minute granularity for one day, hourly for the last 30 days, and daily for three years.

You might have to stop and restart the data collection utility if data is not updated accurately or the reports display corrupted data.

**To stop `nscollect`**

At the command prompt, type:

```
/netScaler/nscollect stop
```

**To start `nscollect` on the current SSH session to the Citrix ADC:**

At the command prompt, type:

```
/netScaler/nscollect start
```

**To start nscollect on the local system:**

At the command prompt, type:

```
/netScaler/nscollect start &
```

## CloudBridge Connector

June 29, 2021

**Note:** The current Citrix ADC 1000V release does not support this feature.

The CloudBridge Connector feature of the Citrix ADC appliance connects enterprise datacenters to external clouds and hosting environments, making the cloud a secure extension of your enterprise network. Cloud-hosted applications appear as though they are running on one contiguous enterprise network. With Citrix CloudBridge Connector, you can augment your datacenters with the capacity and efficiency available from cloud providers.

The CloudBridge Connector enables you to move your applications to the cloud to reduce costs and increase reliability.

In addition to using CloudBridge Connector between a datacenter and a cloud, you can use it to connect two datacenters for a high-capacity secure and accelerated link.

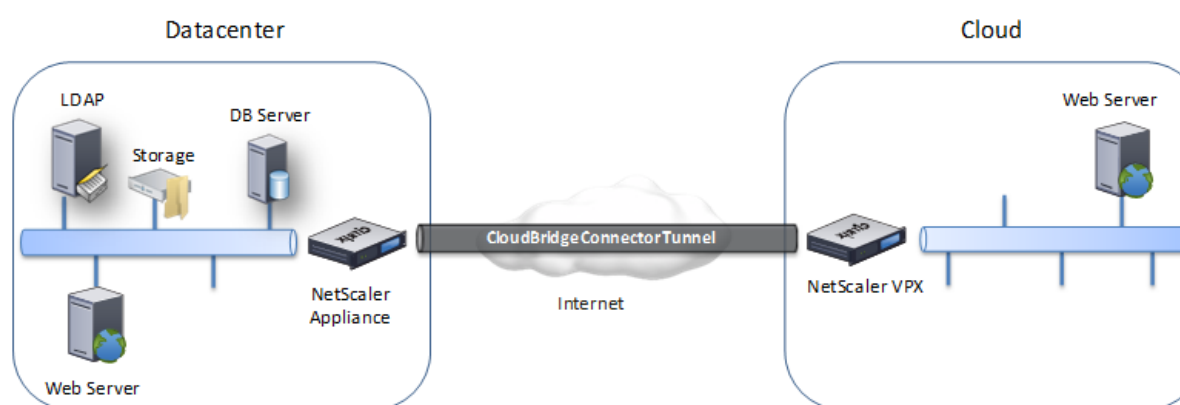

### Understanding CloudBridge Connector

To implement the Citrix CloudBridge Connector solution, you connect a datacenter to another datacenter or an external cloud by setting up a tunnel called the CloudBridge Connector tunnel.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between two Citrix ADC appliances, one in each datacenter.

To connect a datacenter to an external cloud (for example, Amazon AWS cloud), you set up a CloudBridge Connector tunnel between a Citrix ADC appliance in the datacenter and a virtual appliance (VPX) that resides in the Cloud. The remote end point can be a CloudBridge Connector or a Citrix ADC VPX with Premium license.

The following illustration shows a CloudBridge Connector tunnel set up between a datacenter and an

external cloud.

The appliances between which a CloudBridge Connector tunnel is set up are called the *end points* or *peers* of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel uses the following protocols:

- Generic Routing Encapsulation (GRE) protocol
- Open-standard IPsec Protocol suite, in transport mode

The GRE protocol provides a mechanism for encapsulating packets, from a wide variety of network protocols, to be forwarded over another protocol. GRE is used to:

- Connect networks running non-IP and non-routable protocols.
- Bridge across a wide area network (WAN).
- Create a transport tunnel for any type of traffic that needs to be sent unchanged across a different network.

The GRE protocol encapsulates packets by adding a GRE header and a GRE IP header to the packets.

The Internet Protocol security (IPsec) protocol suite secures communication between peers in the CloudBridge Connector tunnel.

In a CloudBridge Connector tunnel, IPsec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPsec uses the transport mode in which the GRE encapsulated packet is encrypted. The encryption is done by the Encapsulating Security Payload (ESP) protocol. The ESP protocol ensures the integrity of the packet by using a HMAC hash function, and ensures confidentiality by using an encryption algorithm. After the packet is encrypted and the HMAC is calculated, an ESP header is generated. The ESP

header is inserted after the GRE IP header and, an ESP trailer is inserted at the end of the encrypted payload.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version (IKE) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

- The two peers mutually authenticate with each other, using one of the following authentication methods:
  - **Pre-shared key authentication.** A text string called a pre-shared key is manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
  - **Digital certificates authentication.** The initiator (sender) peer signs message interchange data by using its private key, and the other receiver peer uses the sender's public key to verify the signature. Typically, the public key is exchanged in messages containing an X.509v3 certificate. This certificate provides a level of assurance that a peer's identity as represented in the certificate is associated with a particular public key.
- The peers then negotiate to reach agreement on:
  - An encryption algorithm.
  - Cryptographic keys for encrypting data in one peer and decrypting the data in the other.

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when two peers, CB1 and CB2, are communicating through a Connector tunnel, CB1 has two Security Associations. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets.

SAs expire after a specified length of time, which is called the *lifetime*. The two peers use the Internet Key Exchange (IKE) protocol (part of the IPSec protocol suite) to negotiate new cryptographic keys and establish new SAs. The purpose of the limited lifetime is to prevent attackers from cracking a key.

The following table lists some IPSec properties supported by a Citrix ADC appliance:

IPSec Properties	Types Supported
IKE Versions	V1, V2
IKE DH group	A Citrix ADC appliance supports only DH group 2 (1024 bits MODP algorithm) for both IKEv1 and IKEv2.
IKE Authentication Methods	Pre-shared key authentication, Digital certificates authentication
Encryption Algorithm	AES (128 bits), AES 256 (256 bits), 3DES

IPSec Properties	Types Supported
Hash Algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA384, HMAC SHA512, HMAC MD5

## Monitoring CloudBridge Connector tunnels

September 21, 2020

You can display the statistics for monitoring the performance of a CloudBridge Connector tunnel. To display CloudBridge Connector tunnel statistics on a Citrix ADC appliance, use the GUI or the Citrix ADC command line.

The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels on a Citrix ADC appliance.

Statistical counter	Specifies
Bytes Received	Total number of bytes received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Sent	Total number of bytes sent by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Received	Total number of packets received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Sent	Total number of packets sent by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Received Rate	Number of bytes per second received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels.

Bytes Sent Rate	Number of bytes per second sent by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels
Packets Received Rate	Number of bytes per second received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels
Packets Sent Rate	Number of bytes per second received by the Citrix ADC appliance through all the configured CloudBridge Connector tunnels

All these counters are reset to 0 when the Citrix ADC appliance is restarted. They do not increment during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key) phase on any configured CloudBridge Connector tunnel.
- IKE Security Association (SA) establishment phase on any configured CloudBridge Connector tunnel.

To display CloudBridge Connector tunnel statistics by using the Citrix ADC command line

At the command prompt, type:

- **stat ipsec counters**

To display CloudBridge Connector tunnel statistics by using the GUI

1. Access the GUI by using a web browser to connect to the IP address of the Citrix ADC appliance.
2. On the **Configuration** tab, navigate to **System > CloudBridge Connector**.
3. On the CloudBridge Connector page, click **Create/Monitor CloudBridge Connector**. The **IPSec Bytes** and **IPSec Packets** charts display the bytes received rate, bytes sent rate, packets received rate, and packets sent rate of all the CloudBridge Connector tunnels configured on the Citrix ADC appliance.

```

1 > stat ipsec counters

## Configuring a CloudBridge Connector tunnel between two datacenters

September 21, 2020

You can configure a CloudBridge Connector tunnel between two different datacenters to extend your network without reconfiguring it, and leverage the capabilities of the two datacenters. A CloudBridge Connector tunnel between the two geographically separated datacenters enables you to implement redundancy and safeguard your setup from failure. The CloudBridge Connector tunnel helps achieve optimal utilization of infrastructure and resources across datacenters. The applications available across the two datacenters appear as local to the user.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between a Citrix ADC appliance in one datacenter and a Citrix ADC appliance in the other datacenter.

As an illustration of CloudBridge Connector tunnel between datacenters, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance NS\_Appliance-1 in datacenter DC1 and Citrix ADC appliance NS\_Appliance-2 in datacenter DC2.

Both NS\_Appliance-1 and NS\_Appliance-2 function in L2 and L3 mode. They enable communication between private networks in datacenters DC1 and DC2. In L3 mode, NS\_Appliance-1 and NS\_Appliance-2 enable communication between client CL1 in datacenter DC1 and server S1 in the datacenter DC2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

Because client CL1 and server S1 are on different private networks, L3 mode is enabled on NS\_Appliance-1 and NS\_Appliance-2, and routes are updated as follows:

- CL1 has a route to NS\_Appliance-1 for reaching S1.
- NS\_Appliance-1 has a route to NS\_Appliance-2 for reaching S1.
- S1 has a route to NS\_Appliance-2 for reaching CL1.
- NS\_Appliance-2 has a route to NS\_Appliance-1 for reaching CL1.

The following table lists the settings on Citrix ADC appliance NS\_Appliance-1 in datacenter DC1.

The following table lists the settings on Citrix ADC appliance NS\_Appliance-2 in datacenter DC2.

Entity	Name	Details
The NSIP address		198.51.100.12
SNIP address		198.51.100.15
CloudBridge Connector tunnel	Cloud_Connector_DC1-DC2	1. Local endpoint IP address of the CloudBridge Connector tunnel: 198.51.100.15, 2. Remote endpoint IP address of the CloudBridge Connector tunnel: 203.0.113.133. GRE Tunnel Details Name = Cloud_Connector_DC1-DC2, IPSec Profile Details Name = Cloud_Connector_DC1-DC2, Encryption algorithm = AES, Hash algorithm = HMAC SHA1

### Points to consider for configuring CloudBridge Connector tunnel

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Deploy and set up a Citrix ADC appliance in each of the two datacenters.
2. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

## Configuration procedure

To set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in one datacenter and another Citrix ADC appliance that resides in the other datacenter, use the GUI or the command line interface of one of the Citrix ADC appliances.

When you use the GUI, the CloudBridge Connector tunnel configuration created on the first Citrix ADC appliance is automatically pushed to the other endpoint (the other Citrix ADC appliance) of the CloudBridge Connector tunnel. Therefore, you do not have to access the GUI of the other Citrix ADC appliance to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on each of the Citrix ADC appliances consists of the following entities:

- **IPSec profile**—An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **GRE tunnel**—An IP tunnel specifies the local IP address (a public SNIP address configured on the local Citrix ADC appliance), remote IP address (a public SNIP address configured on the remote Citrix ADC appliance), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the first datacenter and is destined to a server on the subnet in the second datacenter. If this packet matches the source and destination IP address range of the PBR entity on the Citrix ADC appliance in the first datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

- `add ipsec profile <name> [-ikeVersion ( V1 | V2 )] [-encAlgo ( AES | 3 DES )...] [-hashAlgo <hashAlgo\> ...] [-lifetime <positive_integer>] (-psk | (-publickey<string> -privatekey <string>-peerPublicKey <string>)) [-livenessCheckInterval <positive_intege>] [-replayWindowSize \< positive_integer>] [-ikeRetryInterval <positive_integer>] [-retransmissiontime <positive_integer>]`
- `show ipsec profile <name>`

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

- `add ipTunnel <name> <remote><remoteSubnetMask> <local> [-protocol <protocol>] [-ipsecProfileName <string>]`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

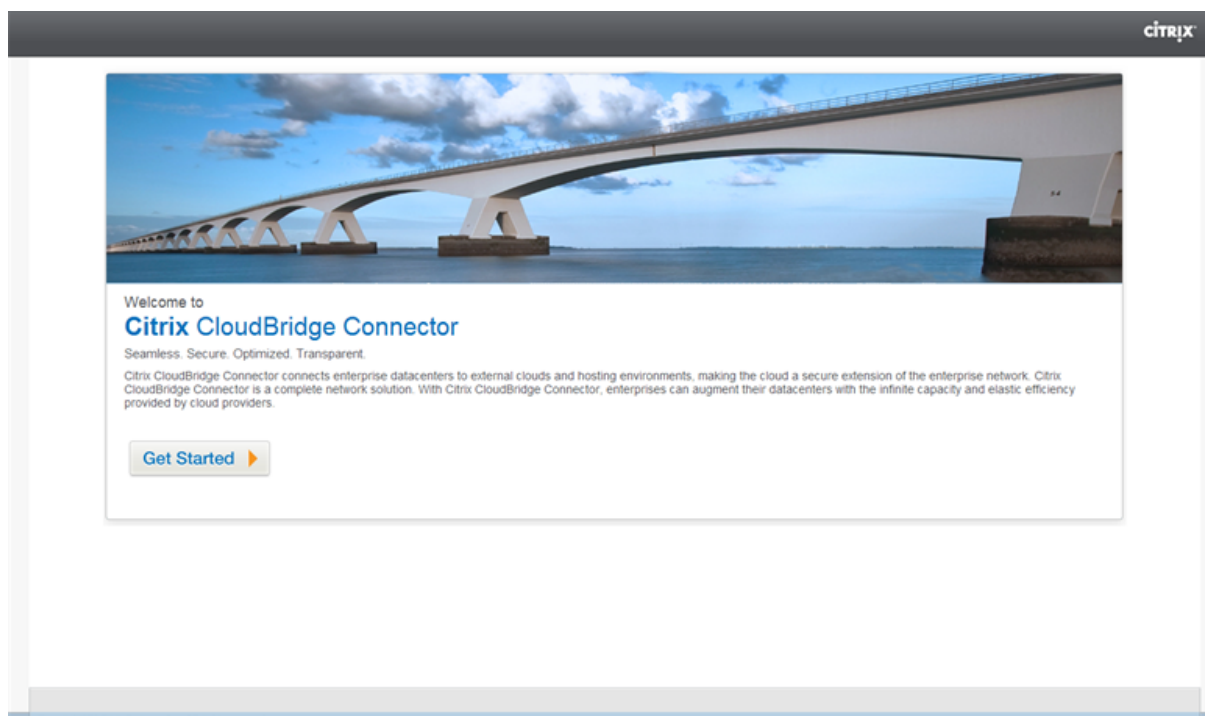

- `add ns pbr <pbr_name> ALLOW -srcIP = <local_subnet_range> -destIP = <remote_subnet_range> -ipTunnel <tunnel_name>`
- `apply ns pbrs`
- `show ns pbr <pbr_name>`

Example

```
1  add ipsec profile Cloud_Connector_DC1-DC2  -encAlgo AES  -
    hashAlgo HMAC_SHA1
2  Done
3  > add ipTunnel Cloud_Connector_DC1-DC2 203.0.113.133 255
    .255.255.255 198.51.100.15 -protocol GRE  -
    ipsecProfileName Cloud_Connector_DC1-DC2
4
5  Done
6  > add ns pbr PBR-DC1-DC2 ALLOW -srcIP 198.51.100.15 -destIP
    203.0.113.133 ipTunnel Cloud_Connector_DC1-DC2
7
8  Done
9  > apply ns pbrs
10
11 Done
12 <!--NeedCopy-->
```

To configure a CloudBridge Connector tunnel in a Citrix ADC appliance by using the GUI

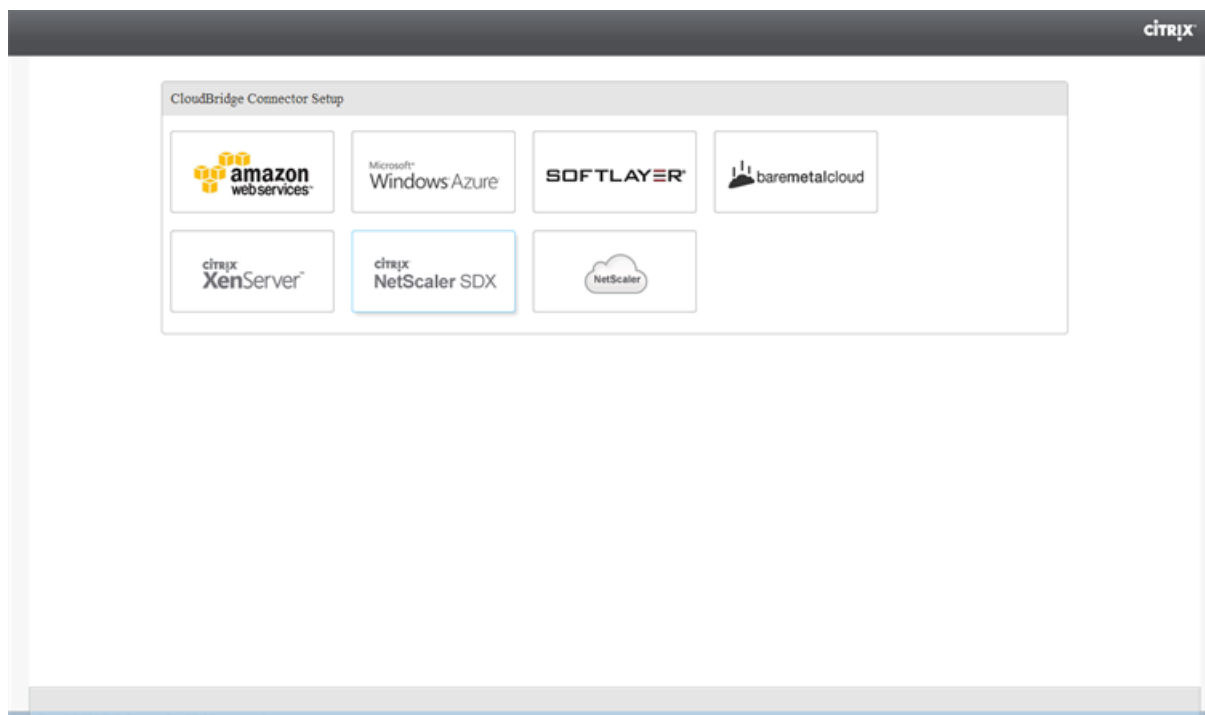

1. Type the NSIP address of a Citrix ADC appliance in the address line of a web browser.
2. Log on to the GUI of the Citrix ADC appliance by using your account credentials for the appliance.
3. Navigate to **System > CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.  
The first time you configure a CloudBridge Connector tunnel on the appliance, a **Welcome** screen appears.
5. On the **Welcome** screen click **Get Started**.

**Note:**

If you already have a CloudBridge Connector tunnel configured on the Citrix ADC appliance, the Welcome screen does not appear, so you do not click Get Started.

1. In the **CloudBridge Connector Setup** pane, click **Citrix ADC**.

1. In the Citrix ADC pane, provide your account credentials for the remote Citrix ADC appliance. Click **Continue**.
2. In the **CloudBridge Connector Setting** pane, set the following parameter:
  - **CloudBridge Connector Name**—Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.
3. Under **Local Setting**, set the following parameter:
  - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel.
4. Under **Remote Setting**, set the following parameter:
  - **Subnet IP**—IP address of the peer endpoint of the CloudBridge Connector tunnel.
5. Under **PBR Setting**, set the following parameters:
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Source IP Low** —Lowest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Source IP High**—Highest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Destination IP Low\***—Lowest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
  - **Destination IP High**—Highest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
6. (Optional) Under **Security Settings**, set the following IPSec protocol parameters for the Cloud-Bridge Connector tunnel:
  - **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
  - **Hash Algorithm**—Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
  - **Key**—Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
    - **Auto Generate Key**—Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.
    - **Specific Key**—Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.

- \* **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
- **Upload Certificates**—Authentication based on digital certificates.
  - \* **Public Key**—A local digital certificate to be used to authenticate the local Citrix ADC appliance to the peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
  - \* **Private Key**—Private key of the local digital certificate.
  - \* **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.

7. Click **Done**.

The new CloudBridge Connector tunnel configuration on both the Citrix ADC appliances appears on the Home tab of the respective GUI. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge Connectors pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

## Monitoring the CloudBridge Connector Tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## Configuring CloudBridge Connector between datacenter and AWS cloud

September 21, 2020

You can configure a CloudBridge Connector tunnel between a datacenter and AWS cloud to leverage the infrastructure and computing capabilities of the data center and the AWS cloud. With AWS, you can extend your network without initial capital investment or the cost of maintaining the extended network infrastructure. You can scale your infrastructure up or down, as required. For example, you can lease more server capabilities when the demand increases.

To connect a datacenter to AWS cloud, you set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in the datacenter and a Citrix ADC virtual appliance (VPX) that resides in AWS cloud.

As an illustration of a CloudBridge Connector tunnel between a datacenter and Amazon AWS cloud,

consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance NS\_Appliance-DC, in datacenter DC, and Citrix ADC virtual appliance (VPX) NS\_VPX\_Appliance-AWS.

Both NS\_Appliance-DC and NS\_VPX\_Appliance-AWS function in L3 mode. They enable communication between private networks in datacenter DC and the AWS cloud. NS\_Appliance-DC and NS\_VPX\_Appliance-AWS enable communication between client CL1 in datacenter DC and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

**Note:**

AWS does not support L2 mode, hence it is necessary to have only L3 mode enabled on both the endpoints.

For proper communication between CL1 and S1, L3 mode is enabled on NS\_Appliance-DC and NS\_VPX\_Appliance-AWS and routes are updated as such:

- CL1 have a route to NS\_Appliance-DC for reaching S1.
- NS\_Appliance-DC have a route to NS\_VPX\_Appliance-AWS for reaching S1.
- S1 should have a route to NS\_VPX\_Appliance-AWS for reaching CL1.
- NS\_VPX\_Appliance-AWS have a route to NS\_Appliance-DC for reaching CL1.

The following table lists the settings on Citrix ADC appliance NS\_Appliance-DC in datacenter DC.

Entity	Name	Details
The NSIP address		66.165.176.12
SNIP address		66.165.176.15

Entity	Name	Details
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	Local endpoint IP address of the CloudBridge Connector tunnel: 66.165.176.15, Remote endpoint IP address of the CloudBridge Connector tunnel: 168.63.252.133, GRE Tunnel Details - Name= CC_Tunnel_DC-AWS

The following table lists the settings on Citrix ADC VPX NS\_VPX\_Appliance-AWS on AWS cloud.

Entity	Name	Details
NSIP address		10.102.25.30
Public EIP address mapped to the NSIP address		168.63.252.131
SNIP address		10.102.29.30
Public EIP address mapped to the SNIP address		168.63.252.133
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	Local endpoint IP address of the CloudBridge Connector tunnel:168.63.252.133, Remote endpoint IP address of the CloudBridge Connector tunnel: 66.165.176.15; <b>GRE Tunnel Details</b> Name= CC_Tunnel_DC-AWS, IPsec Profile Details, Name= CC_Tunnel_DC-AWS, Encryption algorithm= AES, Hash algorithm= HMAC SHA1

## Prerequisites

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Install, configure, and launch an instance of Citrix ADC Virtual appliance (VPX) on AWS cloud. For more information, see [Deploy a Citrix ADC VPX instance on AWS](#).
2. Deploy and configure a Citrix ADC physical appliance, or provisioning and configuring a Citrix ADC virtual appliance (VPX) on a virtualization platform in the datacenter.
  - For instructions on installing Citrix ADC virtual appliances on XenServer, see [Install a Citrix ADC VPX instance on Citrix Hypervisor](#).
  - For instructions on installing Citrix ADC virtual appliances on VMware ESX or ESXi, see [Install a Citrix ADC VPX instance on VMware ESX](#).
  - For instructions on installing Citrix ADC virtual appliances on Microsoft Hyper-V, see [Install a Citrix ADC VPX instance on Microsoft Hyper-V server](#).
3. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

## Citrix ADC VPX license

After the initial instance launch, Citrix ADC VPX for AWS requires a license. If you are bringing your own license (BYOL), see the VPX Licensing Guide at: <http://support.citrix.com/article/CTX122426>.

You have to:

1. Use the licensing portal within Citrix website to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

## Configuration steps

To set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in a datacenter and a Citrix ADC virtual appliance (VPX) that resides on the AWS cloud, use the GUI of the Citrix ADC appliance.

When you use the GUI, the CloudBridge Connector tunnel configuration created on the Citrix ADC appliance, is automatically pushed to the other endpoint or peer (the Citrix ADC VPX on AWS) of the CloudBridge Connector tunnel. Therefore, you do not have to access the GUI (GUI) of the Citrix ADC VPX on AWS to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on both peers (the Citrix ADC appliance that resides in the datacenter and the Citrix ADC virtual appliance (VPX) that resides on the AWS cloud) consists of the following entities:

- **IPSec profile**—An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in both the peers of the CloudBridge Connector tunnel.
- **GRE tunnel**—An IP tunnel specifies a local IP address (a public SNIP address configured on the local peer), remote IP address (a public SNIP address configured on the remote peer), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the datacenter and is destined to a server on the subnet in the AWS cloud. If this packet matches the source and destination IP address range of the PBR entity on the Citrix ADC appliance in the datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

- `add ipsec profile <name> [-**ikeVersion** ( V1 | V2 )] [-**encAlgo** ( AES | 3DES )...] [-**hashAlgo** <hashAlgo> ...] [-**lifetime** <positive_integer>] (-**psk** | (-**publickey** <string> -**privatekey** <string> -**peerPublicKey** <string>)) [-**livenessCheckInterval** <positive_integer>] [-**replayWindowSize** <positive_integer>] [-**ikeRetryInterval** <positive_integer>] [-**retransmissiontime** <positive_integer>]`
- `**show ipsec profile** <name>`

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

- `add ipTunnel <name> <remote><remoteSubnetMask> <local> [-protocol <protocol>] [-ipsecProfileName <string>]`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

- `add ns pbr <pbr_name> ALLOW -srcIP = <local_subnet_range> -destIP = <remote_subnet_range> -ipTunnel <tunnel_name>`

- `apply ns pbrs`
- `show ns pbr <pbr_name>`

#### Example

```
1      > add ipsec profile CC_Tunnel_DC-AWS -encAlgo AES -hashAlgo
      HMAC_SHA1
2
3      Done
4      > add ipTunnel CC_Tunnel_DC-AWS 168.63.252.133 255.255.255.0
      66.165.176.15 - protocol GRE -ipsecProfileName CC_Tunnel_DC-AWS
5
6      Done
7      > add ns pbr PBR-DC-AWS ALLOW - srcIP 66.165.176.15 - destIP
      168.63.252.133 ipTunnel CC_Tunnel_DC-AWS
8
9      Done
10     > apply ns pbrs
11
12     Done
13 <!--NeedCopy-->
```

To configure a CloudBridge Connector tunnel in a Citrix ADC appliance by using the GUI

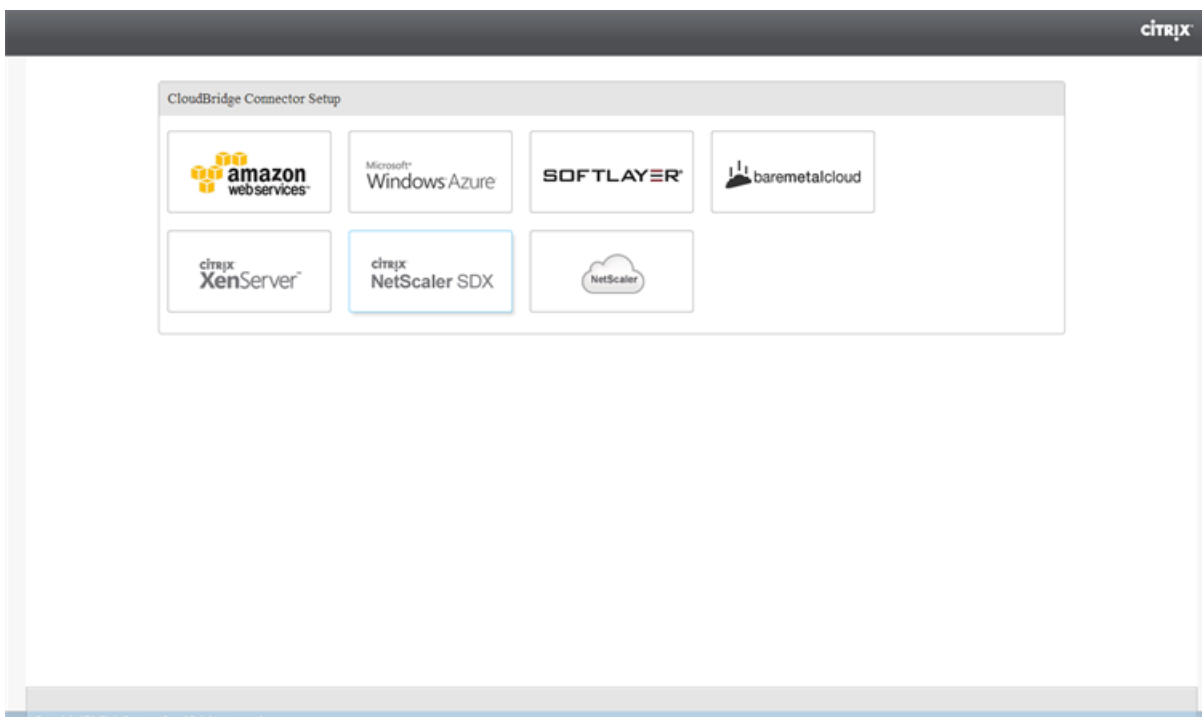

1. Type the NSIP address of a Citrix ADC appliance in the address line of a web browser.
2. Log on to the GUI of the Citrix ADC appliance by using your account credentials for the appliance.
3. Navigate to **System > CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
5. The first time you configure a CloudBridge Connector tunnel on the appliance, a **Welcome** screen appears.
6. On the **Welcome** screen click **Get Started**.

**Note:**

If you already have a CloudBridge Connector tunnel configured on the Citrix ADC appliance, the Welcome screen does not appear, so you do not click Get Started.

1. In the **CloudBridge Connector Setup** pane, click **amazon web services**

1. In the **Amazon** pane, provide your AWS account credentials: AWS Access Key ID and AWS Secret Access Key. You can obtain these access keys from the AWS GUI console. Click **Continue**.

**Note**

Earlier, the Setup wizard always connects to the same AWS region even when another region is selected. As a result, configuring CloudBridge Connector tunnel to a Citrix ADC VPX running on the selected AWS region used to fail. This issue has been fixed now.

1. In the **Citrix ADC** pane, select the NSIP address of the Citrix ADC virtual appliance running on AWS. Then, provide your account credentials for the Citrix ADC virtual appliance. Click **Continue**.
2. In the **CloudBridge Connector Setting** pane, set the following parameter:
  - **CloudBridge Connector Name**—Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.
3. Under **Local Setting**, set the following parameter:
  - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel. Must be a public IP address of type SNIP.
4. Under **Remote Setting**, set the following parameter:
  - **Subnet IP**—IP address of the CloudBridge Connector tunnel end point on the AWS side. Must be an IP address of type SNIP on the Citrix ADC VPX instance on AWS.
  - **NAT**—Public IP address (EIP) in AWS that is mapped to the SNIP configured on the Citrix ADC VPX instance on AWS.
5. Under **PBR Setting**, set the following parameters:
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Source IP Low**—Lowest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Source IP High**—Highest source IP address to match against the source IP address of an outgoing IPv4 packet.
  - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
  - **Destination IP Low**—Lowest destination IP address to match against the destination IP address of an outgoing IPv4 packet.
  - **Destination IP High**—Highest destination IP address to match against the destination IP address of an outgoing IPv4 packet.

6. (Optional) Under **Security Settings**, set the following IPSec protocol parameters for the CloudBridge Connector tunnel:

- **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
- **Hash Algorithm**—Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
- **Key**— Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
  - **Auto Generate Key**— Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.
  - **Specific Key**—Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
    - \* **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
  - **Upload Certificates**—Authentication based on digital certificates.
    - \* **Public Key**—A local digital certificate to be used to authenticate the local peer to the remote peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
    - \* **Private Key**—Private key of the local digital certificate.
    - \* **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.

7. Click **Done**.

The new CloudBridge Connector tunnel configuration on the Citrix ADC appliance in the datacenter appears on the Home tab of the GUI. The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC VPX appliance in the AWS cloud appears on the GUI. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and virtual private gateway on AWS

September 21, 2020

To connect a datacenter to Amazon Web Services (AWS), you can configure a CloudBridge Connector tunnel between a Citrix ADC appliance in the datacenter and a virtual private gateway on AWS. The Citrix ADC appliance and the virtual private gateway form the endpoints of the CloudBridge Connector tunnel and are called peers.

**Note:**

You can also set up a CloudBridge Connector tunnel between a Citrix ADC appliance in a datacenter and a Citrix ADC VPX instance (instead of a virtual private gateway) on AWS. For more information, see [Configuring CloudBridge Connector between Datacenter and AWS Cloud](#).

Virtual private gateways on AWS support the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings when you configure the Citrix ADC appliance for the CloudBridge Connector tunnel.

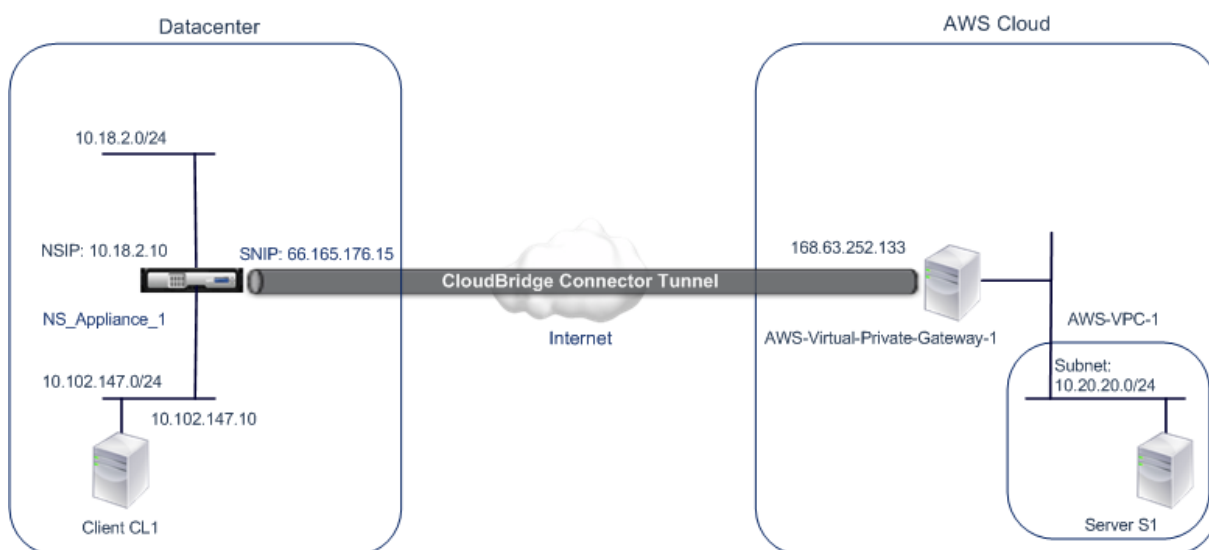

---

IPSec Properties	Setting
IPSec mode	Tunnel mode
IKE version	Version 1
IKE Authentication method	Pre-Shared Key
Encryption algorithm	AES
Hash algorithm	HMAC SHA1

---

### Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance NS\_Appliance-1 in a datacenter and virtual private gateway gateway AWS-Virtual-Private-Gateway-1 on AWS cloud.

NS\_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the AWS cloud through the CloudBridge Connector tunnel. As a router, NS\_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPsec profile entity named NS\_AWS\_IPSec\_Profile, a CloudBridge Connector tunnel entity named NS\_AWS\_Tunnel, and a policy based routing (PBR) entity named NS\_AWS\_Pbr.

The IPsec profile entity NS\_AWS\_IPSec\_Profile specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, and hash algorithm, to be used by the IPsec protocol in the CloudBridge Connector tunnel. NS\_AWS\_IPSec\_Profile is bound to IP tunnel entity NS\_AWS\_Tunnel.

CloudBridge Connector tunnel entity NS\_AWS\_Tunnel specifies the local IP address (a public IP—SNIP—address configured on the Citrix ADC appliance), the remote IP address (the IP address of the AWS-Virtual-Private-Gateway-1), and the protocol (IPsec) used to set up the CloudBridge Connector tunnel. NS\_AWS\_Tunnel is bound to policy based routing (PBR) entity NS\_AWS\_Pbr.

The PBR entity NS\_AWS\_Pbr specifies a set of conditions and a CloudBridge Connector tunnel entity (NS\_AWS\_Tunnel). The source IP address range and the destination IP address range are the conditions for NS\_AWS\_Pbr. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the AWS cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the AWS cloud matches the conditions in NS\_AWS\_Pbr. This packet is then considered for CloudBridge Connector processing and is sent across the CloudBridge Connector tunnel (NS\_AWS\_Tunnel) bound to the PBR entity.

The following table lists the settings used in this example.

IP address of the CloudBridge Connector tunnel end point (NS_Appliance-1) in the datacenter side	66.165.176.15
IP address of the CloudBridge Connector tunnel end point (AWS-Virtual-Private-Gateway-1) in the AWS	168.63.252.133
Datacenter Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.102.147.0/24
AWS Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.20.20.0/24

Settings on Amazon AWS

Customer Gateway	AWS-Customer-Gateway-1	Routing = Static, IP Address = Internet-routable CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side = 66.165.176.15
Virtual Private Gateway	AWS-Virtual-Private-Gateway-1	Associated VPC = AWS-VPC-1
VPN Connection	AWS-VPN-Connection-1	Customer Gateway = AWS-Customer-Gateway-1, Virtual Private Gateway= Virtual-Private-Gateway-1, Routing Options: Type = Static, Static IP Prefixes = Subnets on the Citrix ADC side = 10.102.147.0/24

**Settings on Citrix ADC appliance NS\_Appliance-1 in Datacenter-1:**

IP Tunnel = NS\_AWS\_Tunnel|

### **Points to consider for a CloudBridge Connector tunnel configuration**

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and AWS gateway, consider the following points:

1. AWS supports the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings when you configure the Citrix ADC appliance for the CloudBridge Connector tunnel.
  - IKE version = v1
  - Encryption algorithm = AES
  - Hash algorithm = HMAC SHA1
2. You must configure the firewall at the Citrix ADC end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
3. You must configure Amazon AWS before specifying the tunnel configuration on the Citrix ADC, because the public IP address of the AWS end (gateway) of the tunnel and the PSK are automatically generated when you set up the tunnel configuration in AWS. You need this information for specifying the tunnel configuration on the Citrix ADC appliance.
4. AWS gateway supports static routes and the BGP protocol for route updates. The Citrix ADC appliance does not support the BGP protocol in a CloudBridge Connector tunnel to AWS gateway. Therefore, appropriate static routes must be used on both sides of the CloudBridge Connector tunnel for proper routing of traffic through the tunnel.

### **Configuring Amazon AWS for the CloudBridge Connector tunnel**

To create a CloudBridge Connector tunnel configuration on Amazon AWS, use the Amazon AWS Management Console, which is a web based graphical interface for creating and managing resources on Amazon AWS.

Before you begin the CloudBridge Connector tunnel configuration on AWS cloud, make sure that:

- You have a user account for Amazon AWS cloud.
- You have a virtual private cloud whose networks you want to connect to the networks at the Citrix ADC side through the CloudBridge Connector tunnel.
- You are familiar with the Amazon AWS Management Console.

**Note:**

The procedures for configuring Amazon AWS for a CloudBridge Connector tunnel might change over time, depending on the Amazon AWS release cycle. Citrix recommends you refer [Amazon AWS documentation](#) for the latest procedures.

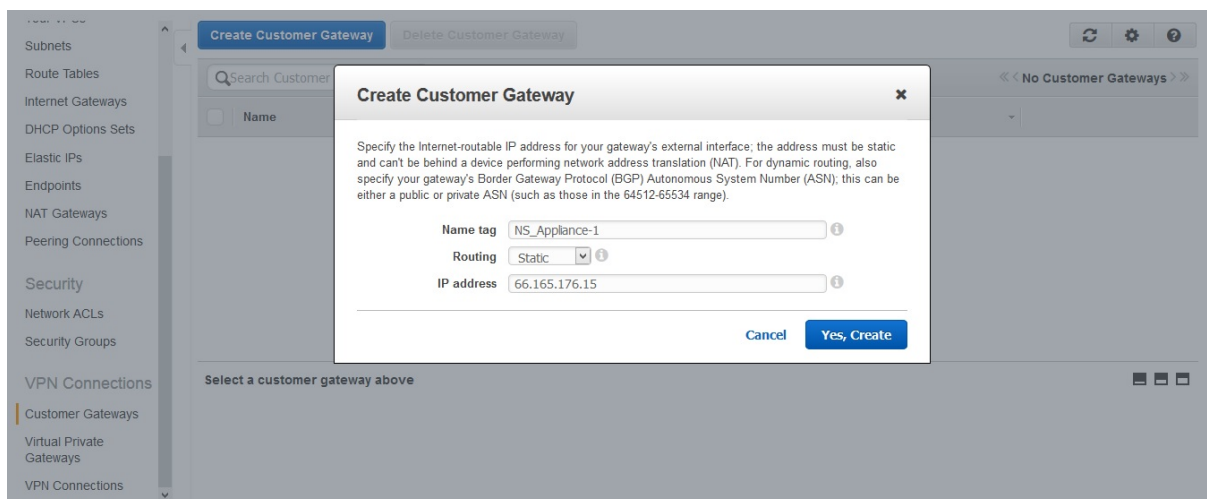

To configure a CloudBridge connector tunnel between a Citrix ADC and AWS gateway perform the following tasks on the AWS Management Console:

- **Create a Customer Gateway.** A customer gateway is an AWS entity that represents a CloudBridge Connector tunnel endpoint. For a CloudBridge Connector tunnel between a Citrix ADC appliance and AWS gateway, the customer gateway represents the Citrix ADC appliance on AWS. The customer gateway specifies a name, the type of routing (static or BGP) used in the tunnel, and the CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side. The IP address can be an Internet-routable Citrix ADC owned subnet IP (SNIP) address or, if the Citrix ADC appliance is behind a NAT device, an Internet-routable NAT IP address that represents the SNIP address.
- **Create a Virtual Private Gateway and attach it to a VPC.** A virtual private gateway is a CloudBridge Connector tunnel endpoint at the AWS side. When you create a virtual private gateway, you assigned it a name or allow AWS to assign the name. You then associate the virtual private gateway with a VPC. This association enables the subnets of the VPC to connect to the subnets at the Citrix ADC side through the CloudBridge Connector tunnel.
- **Create a VPN Connection.** A VPN connection specifies a customer gateway and a virtual private gateway between which a CloudBridge Connector tunnel is to be created. It also specifies an IP prefix for the networks at the Citrix ADC side. Only IP prefixes that are known to the virtual private gateway (through static route entry) can receive traffic from the VPC through the tunnel. Also, the virtual private gateway does not route any traffic not destined to the specified IP prefixes through the tunnel. After configuring a VPN connection, you might have to wait few minutes for it to be created.
- **Configure Routing Options.** For the VPC's network to reach the networks at the Citrix ADC side through the CloudBridge Connector tunnel, you must configure the VPC's routing table to include routes for the networks at the Citrix ADC side and point those routes to the virtual private gateway. You can include routes in a VPC's routing table in one of the following ways:
  - **Enable Route Propagation.** You can enable route propagation for your routing table, so that routes are automatically propagated to the table. The static IP prefixes that you specify for VPN configuration are propagated to the routing table after you've created the VPN connection.

- **Enter Static Routes Manually.** If you do not enable route propagation, you must manually enter the static routes for the networks at the Citrix ADC side.
- **Download Configuration.** After the CloudBridge Connector tunnel (VPN connection) configuration is created on AWS, download the configuration file of the VPN connection to your local system. You might need the information in the configuration file for configuring the CloudBridge Connector tunnel on the Citrix ADC appliance.

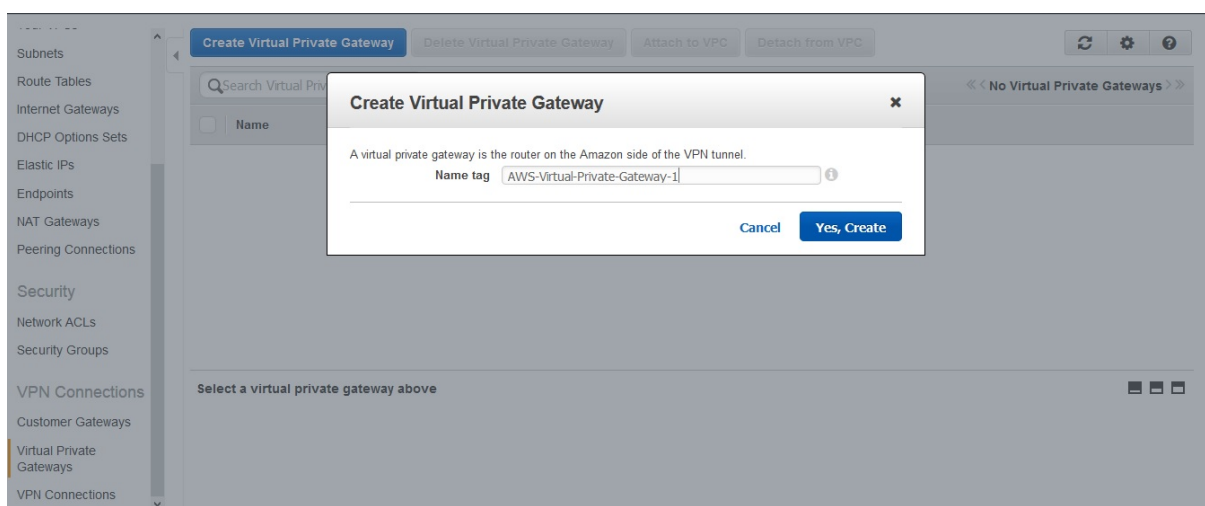

To create a customer gateway

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. Navigate to **VPN Connections > Customer Gateways** and click on **Create Customer Gateway**.
3. In the **Create Customer Gateway** dialog box, set the following parameters and then click **Yes, Create**:
  - **Name tag.** A name for the customer gateway.
  - **Routing list.** Type of routing between Citrix ADC appliance and AWS virtual private gateway for advertising routes to each other through the CloudBridge Connector tunnel. Select **Static Routing** from the **Routing list**. **Note:** The Citrix ADC appliance does not support the BGP protocol in a CloudBridge Connector tunnel to AWS gateway. Therefore, appropriate static routes must be used on both sides of the CloudBridge Connector tunnel for proper routing of traffic through the tunnel.
  - **IP Address.** Internet-routable CloudBridge Connector tunnel endpoint IP address on the Citrix ADC side. The IP address can be an Internet-routable Citrix ADC owned subnet IP (SNIP) address or, if the Citrix ADC appliance is behind a NAT device, an Internet-routable NAT IP address that represents the SNIP address.

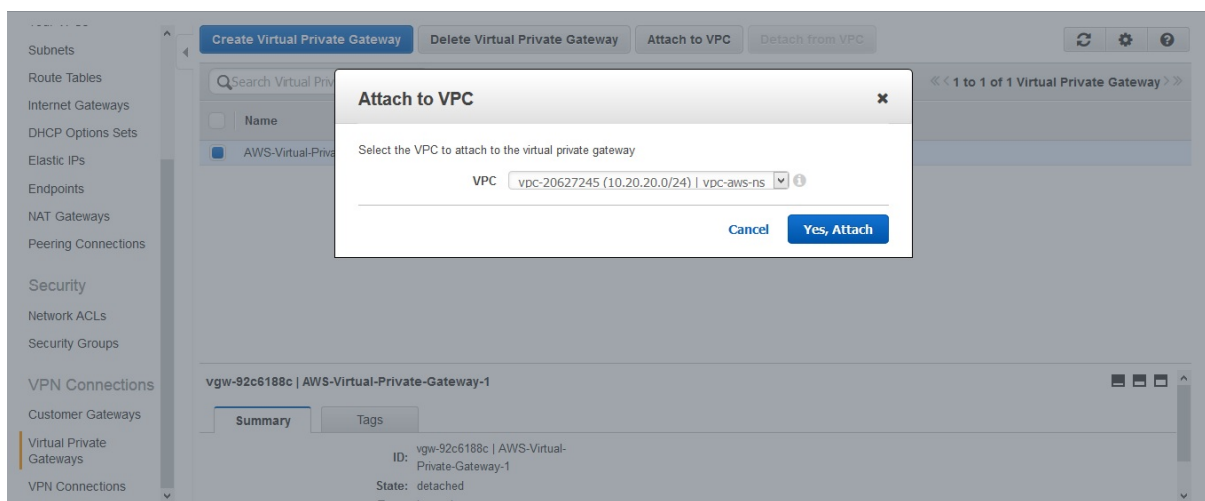

To create a virtual private gateway and attach it to a VPC

1. Navigate to **VPN Connections > Virtual Private Gateways**, and then click **Create Virtual Private Gateway**.
2. Enter a name for the virtual private gateway, and then click **Yes, Create**.

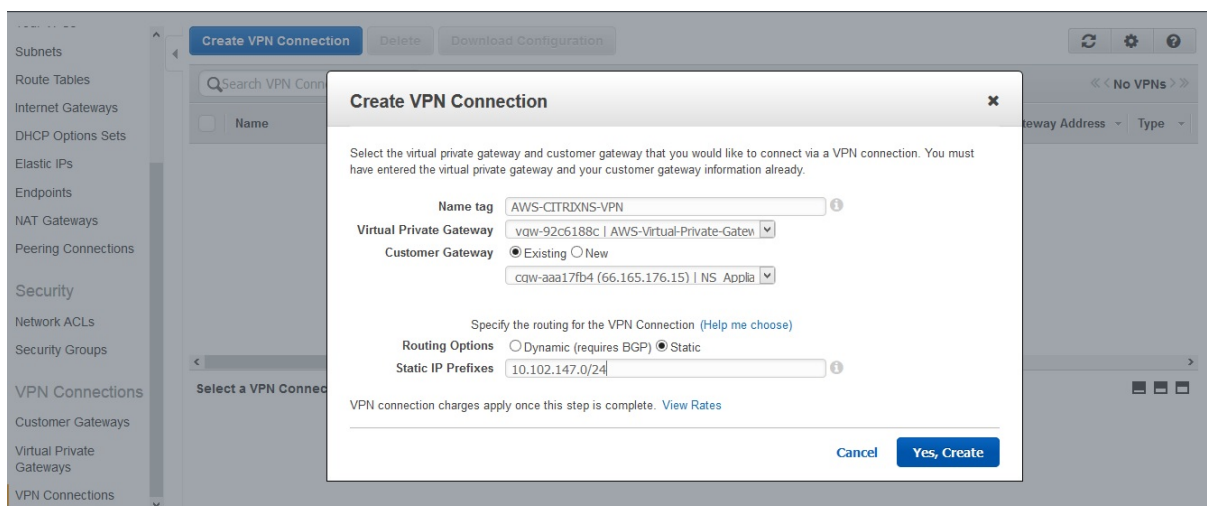

1. Select the virtual private gateway that you created, and then click Attach to VPC.
2. In the Attach to VPC dialog box, select your VPC from the list, and then choose Yes, Attach.

**To create a VPN connection:**

1. Navigate to VPN Connections > VPN Connections and then click Create VPN Connection.
2. In the Create VPN Connection dialog box set the following parameters and then choose Yes, Create:
  - **Name tag.** A name for the VPN connection.
  - **Virtual Private Gateway.** Select the virtual private gateway that you created earlier.
  - **Customer Gateway.** Select Existing. Then, from the drop down list, select the customer gateway that you created earlier.
  - **Routing Options.** Type of routing between the virtual private gateway and customer gateway (Citrix ADC appliance). Select Static. In the Static IP Prefixes field, specify the IP prefixes for the subnet on the Citrix ADC side, separated by commas.

### To enable route propagation:

1. Navigate to **Route Tables** and select the routing table that's associated with the subnet whose traffic is to traverse the CloudBridge Connector tunnel.

#### Note

By default, this is the main routing table for the VPC.

1. On the **Route Propagation** tab in the details pane, choose **Edit**, select the virtual private gateway, and then choose **Save**.

### To manually enter static routes:

1. Navigate to **Route Tables** and select your routing table.
2. On the **Routes** tab, click **Edit**.
3. In the **Destination** field, enter the static route used by your CloudBridge Connector tunnel (VPN connection).
4. Select the virtual private gateway ID from the **Target** list, and then click **Save**.

### To download the configuration file:

1. Navigate to **VPN Connection**, select a VPN connection, and then click **Download Configuration**.
2. In the **Download Configuration** dialog box, set the following parameters, and then click **Yes, Download**.
  - **Vendor.** Select **Generic**.
  - **Platform.** Select **Generic**.
  - **Software.** Select **Vendor Agnostic**.

## Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a virtual private gateway on AWS cloud, perform the following tasks on the Citrix ADC appliance.

You can use either the Citrix ADC command line or the GUI.

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm and PSK to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol and associate the IPsec profile with it.** An IP tunnel specifies the local IP address (a SNIP address configured on the Citrix ADC appliance), remote IP address (the public IP address of the virtual private gateway in AWS), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to traverse the tunnel, and set the destination IP address range to specify the AWS VPC subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet that originates from a client in the subnet on the Citrix ADC side and is destined to a server in the AWS cloud subnet, and matches the source and destination IP range of the PBR entity, is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the Citrix ADC command line

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -**ikeVersion** v1`
- `show ipsec profile** <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the Command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the Command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP** <subnet-range> -*ipTunnel <tunnelName>`
- `apply pbrs`

- `show pbr <pbrName>`

The following commands create all settings of Citrix ADC appliance NS\_Appliance-1 used in “Example of CloudBridge Connector Configuration and Data Flow.”

```
1 > add ipsec profile NS_AWS_IPSec_Profile -psk
    DkiMgMdcqbqYREEuIvxsBKkKw0Foyabcd -ikeVersion v1 - lifetime
    31536000
2 Done
3 > add iptunnel NS_AWS_Tunnel 168.63.252.133 255.255.255.255
    66.165.176.15 - protocol IPSEC - ipsecProfileName
    NS_AWS_IPSec_Profile
4
5 Done
6 > add pbr NS_AWS_Pbr -srcIP 10.102.147.0-10.102.147.255 - destIP
    10.20.0.0-10.20.255.255 - ipTunnel NS_AWS_Tunnel
7 Done
8
9 > apply pbrs
10
11 Done
12 <!--NeedCopy-->
```

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** dialog box, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version (select V1)
4. Select the **Pre-shared Key Authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** dialog box, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop down list, select Subnet IP).

- Local IP (All the configured IPs of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
  - Protocol
  - IPSec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** dialog box, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select IP Tunnel)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI.

The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

### **Monitoring the CloudBridge Connector tunnel**

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters.

For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

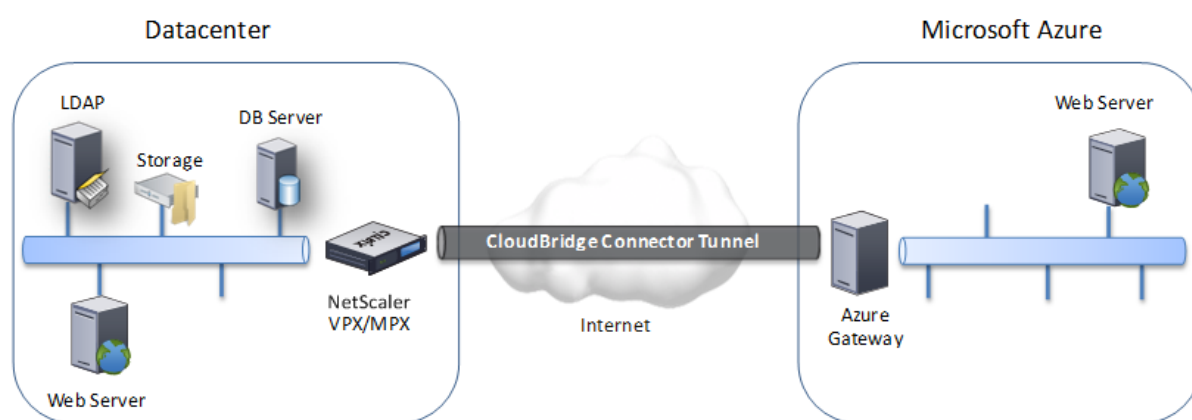

## **Configuring a CloudBridge Connector tunnel between a datacenter and Azure cloud**

September 21, 2020

The Citrix ADC appliance provides connectivity between your enterprise datacenters and the Microsoft cloud hosting provider, Azure, making Azure a seamless extension of the enterprise network. Citrix ADC encrypts the connection between the enterprise datacenter and Azure cloud so that all data transferred between the two is secure.

### How CloudBridge Connector tunnel works

To connect a datacenter to Azure cloud, you set up a CloudBridge Connector tunnel between a Citrix ADC appliance that resides in the datacenter and a gateway that resides in the Azure cloud. The Citrix ADC appliance in the datacenter and the gateway in Azure cloud are the end points of the CloudBridge Connector tunnel and are called peers of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel between a datacenter and Azure cloud uses the open-standard Internet Protocol security (IPSec) protocol suite, in tunnel mode, to secure communications between peers in the CloudBridge Connector tunnel. In a CloudBridge Connector tunnel, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the tunnel mode in which the complete IP packet is encrypted and then encapsulated. The encryption uses the Encapsulating Security Payload (ESP) protocol, which ensures the integrity of the packet by using a HMAC hash function and ensures confidentiality by using an encryption algorithm. The ESP protocol, after encrypting the payload and calculating the HMAC, generates an ESP header and inserts it before the encrypted IP packet. The ESP protocol also generates an ESP trailer and inserts it at the end of the packet.

The IPSec protocol then encapsulates the resulting packet by adding an IP header before the ESP header. In the IP header, the destination IP address is set to the IP address of the CloudBridge Connector peer.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version 1 (IKEv1) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

1. The two peers mutually authenticate with each other, using pre-shared key authentication, in which the peers exchange a text string called a pre-shared key (PSK). The pre-shared keys are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
2. The peers then negotiate to reach agreement on:
  - An encryption algorithm
  - Cryptographic keys for encrypting data on one peer and decrypting it on the other.

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when a CloudBridge Connector tunnel is set up between a Citrix ADC appliance in a datacenter and a gateway in an Azure cloud, both the datacenter appliance and the Azure gateway have two SAs. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets. SAs expire after a specified interval of time, which is called the lifetime.

### **Example of CloudBridge Connector tunnel configuration and data flow**

As an illustration of CloudBridge Connector Tunnel, consider an example in which a CloudBridge Connector tunnel is set up between Citrix ADC appliance CB\_Appliance-1 in a datacenter and gateway Azure\_Gateway-1 in Azure cloud.

CB\_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the Azure cloud through the CloudBridge Connector tunnel. As a router, CB\_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the Azure cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On CB\_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPSec profile entity named CB\_Azure\_IPSec\_Profile, a CloudBridge Connector tunnel entity named CB\_Azure\_Tunnel, and a policy based routing (PBR) entity named CB\_Azure\_Pbr.

The IPSec profile entity CB\_Azure\_IPSec\_Profile specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, and hash algorithm, to be used by the IPSec protocol in the CloudBridge Connector tunnel. CB\_Azure\_IPSec\_Profile is bound to IP tunnel entity CB\_Azure\_Tunnel.

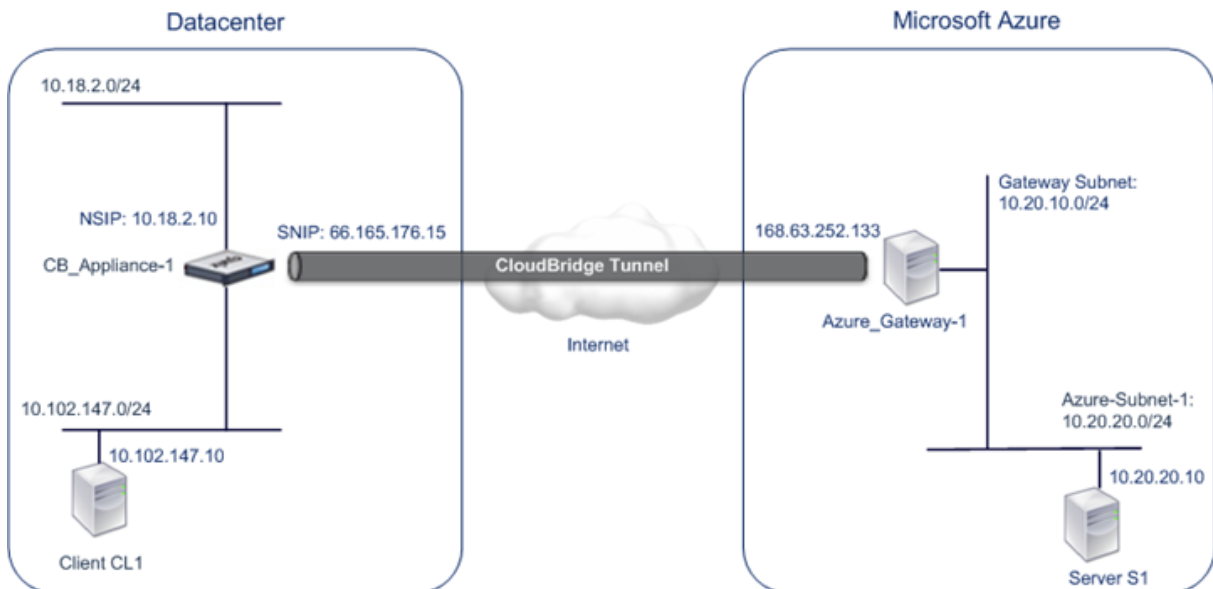

CloudBridge Connector tunnel entity CB\_Azure\_Tunnel specifies the local IP address (a public IP (SNIP) address configured on the Citrix ADC appliance), the remote IP address (the IP address of the Azure\_Gateway-1), and the protocol (IPSec) used to set up the CloudBridge Connector tunnel. CB\_Azure\_Tunnel is bound to the PBR entity CB\_Azure\_Pbr.

The PBR entity `CB_Azure_Pbr` specifies a set of conditions and a CloudBridge Connector tunnel entity (`CB_Azure_Tunnel`). The source IP address range and the destination IP address range are the conditions for `CB_Azure_Pbr`. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the Azure cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the Azure cloud matches the conditions in `CB_Azure_Pbr`. This packet is then considered for CloudBridge processing and is sent across the CloudBridge Connector tunnel (`CB_Azure_Tunnel`) bound to the PBR entity.

On Microsoft Azure, the CloudBridge Connector tunnel configuration includes a local network entity named `My-Datacenter-Network`, a virtual network entity named `Azure-Network-for-CloudBridge-Tunnel`, and a gateway named `Azure_Gateway-1`.

The local (local to Azure) network entity `My-Datacenter-Network` specifies the IP address of the Citrix ADC appliance on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network entity `Azure-Network-for-CloudBridge-Tunnel` defines a private subnet named `Azure-Subnet-1` in Azure. The traffic of the subnet traverses the CloudBridge Connector tunnel. The server `S1` is provisioned in this subnet.

The local network entity `My-Datacenter-Network` is associated with the virtual network entity `Azure-Network-for-CloudBridge-Tunnel`. This association defines the remote and local network details of the CloudBridge Connector tunnel configuration in Azure. Gateway `Azure_Gateway-1` was created for this association to become the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel.

For more information about the settings, refer to the [CloudBridge Connector Tunnel Settings](#) pdf.

## Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance in datacenter and Microsoft Azure, consider the following points:

1. The Citrix ADC appliance must have a public facing IPv4 address (type SNIP) to use as a tunnel end-point address for the CloudBridge Connector tunnel. Also, the Citrix ADC appliance should not be behind a NAT device.
2. Azure supports the following IPsec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPsec settings while configuring the Citrix ADC for the CloudBridge Connector tunnel.
  - IKE version = v1
  - Encryption algorithm = AES
  - Hash algorithm = HMAC SHA1
3. You must configure the firewall in the datacenter edge to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
4. IKE re-keying, which is renegotiation of new cryptographic keys between the CloudBridge Connector tunnel end points to establish new SAs, is not supported. When the Security Associations (SAs) expire, the tunnel goes into the DOWN state. Therefore, you must set a very large value for the lifetimes of SAs.
5. You must configure Microsoft Azure before specifying the tunnel configuration on the Citrix ADC, because the public IP address of the Azure end (gateway) of the tunnel, and the PSK, are automatically generated when you set up the tunnel configuration in Azure. You need this information for specifying the tunnel configuration on the Citrix ADC.

## Configuring the CloudBridge Connector tunnel

For setting up a CloudBridge Connector tunnel between your datacenter and Azure, you must install CloudBridge VPX/MPX in your datacenter, configure Microsoft Azure for the CloudBridge Connector tunnel, and then configure the Citrix ADC appliance in the data center for the CloudBridge Connector tunnel.

Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance in datacenter and Microsoft Azure consists of the following tasks:

1. **Setting up the Citrix ADC appliance in the datacenter.** This task involves deploying and configuring a Citrix ADC physical appliance (MPX), or provisioning and configuring a Citrix ADC virtual appliance (VPX) on a virtualization platform in the datacenter.
2. **Configuring Microsoft Azure for the CloudBridge Connector tunnel.** This task involves creating local network, virtual network, and gateway entities in Azure. The local network entity spec-

ifies the IP address of the CloudBridge Connector tunnel end point (the Citrix ADC appliance) on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network defines a network on Azure. Creating the virtual network includes defining a subnet whose traffic is to traverse the CloudBridge Connector tunnel to be formed. You then associate the local network with the virtual network. Finally, you create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel.

- 3. Configuring the Citrix ADC appliance in the datacenter for the CloudBridge Connector tunnel.** This task involves creating an IPSec profile, an IP tunnel entity, and a PBR entity in the Citrix ADC appliance in datacenter. The IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used in the CloudBridge Connector tunnel. The IP tunnel specifies the IP address of both the CloudBridge Connector tunnel end points (the Citrix ADC appliance in datacenter and the gateway in Azure) and the protocol to be used in the CloudBridge Connector tunnel. You then associate the IPSec profile entity with the IP tunnel entity. The PBR entity specifies the two subnets, in the datacenter and in the Azure cloud, that are to communicate with each other through the CloudBridge Connector tunnel. You then associate the IP tunnel entity with the PBR entity.

### **Configuring Microsoft Azure for the CloudBridge Connector tunnel**

To create a CloudBridge Connector tunnel configuration on Microsoft Azure, use the Microsoft Windows Azure Management Portal, which is a web based graphical interface for creating and managing resources on Microsoft Azure.

Before you begin the CloudBridge Connector tunnel configuration on Azure cloud, make sure that:

- You have a user account for Microsoft Azure.
- You have a conceptual understanding of Microsoft Azure.
- You are familiar with the Microsoft Windows Azure Management Portal.

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on Microsoft Azure by using the Microsoft Windows Azure Management Portal:

- **Create a local network entity.** Create a local network entity in Windows Azure for specifying the network details of the datacenter. A local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the Citrix ADC) on the datacenter side and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel.
- **Create a Virtual Network.** Create virtual network entity that defines a network on Azure. This task includes defining a private address space, where you provide a range of private addresses and subnets belonging to the range specified in the address space. The traffic of the subnets will traverse the CloudBridge Connector tunnel. You then associate a local network entity with the virtual network entity. This association lets Azure create a configuration for a CloudBridge Connector tunnel between the virtual network and the data center network. A gateway (to be

created) in Azure for this virtual network will be the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel. You then define a private subnet for the gateway to be created. This subnet belongs to the range specified in the address space in the virtual network entity.

- **Create a gateway in Windows Azure.** Create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel. Azure, from its pool of public IP addresses, assigns an IP address to the gateway created.
- **Gather the public IP address of the gateway and the pre-shared key.** For a CloudBridge Connector tunnel configuration on Azure, the public IP address of the gateway and the pre-shared Key (PSK) are automatically generated by Azure. Make a note of this information. You will need it for configuring the CloudBridge Connector tunnel on the Citrix ADC in datacenter.

**Note:**

The procedures for configuring Microsoft Azure for a CloudBridge Connector tunnel might change over time, depending on the Microsoft Azure release cycle. For the latest procedures, see the [Microsoft Azure documentation](#).

### Configuring the Citrix ADC Appliance in the datacenter for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on the Citrix ADC in the datacenter. You can use either the Citrix ADC command line or the GUI:

- **Create an IPSec profile.** An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel with IPSec protocol and associate the IPSec profile to it.** An IP tunnel specifies the local IP address (a public SNIP address configured on the Citrix ADC appliance), remote IP address (the public IP address of the gateway in Azure), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate the IP tunnel to it.** A PBR entity specifies a set of conditions and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range to specify the datacenter subnet whose traffic is to traverse the tunnel, and the destination IP address range to specify the Azure subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet originated from a client in the subnet on the datacenter and destined to a server in the subnet on the Azure cloud matches the source and destination IP range of the PBR entity. This packet is then considered for CloudBridge Connector tunnel processing and is sent across the CloudBridge Connector tunnel associated with the PBR entity.

The GUI combines all these tasks in a single wizard called the CloudBridge Connector wizard.

To create an IPSEC profile by using the Citrix ADC command line:

At the Command prompt, type:

```
add ipsec profile <name> -psk <string> -ikeVersion v1
```

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line:

At the Command prompt, type:

```
add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -  
ipsecProfileName <string>
```

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

```
add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> ipTunnel  
<tunnelName> apply pbrs
```

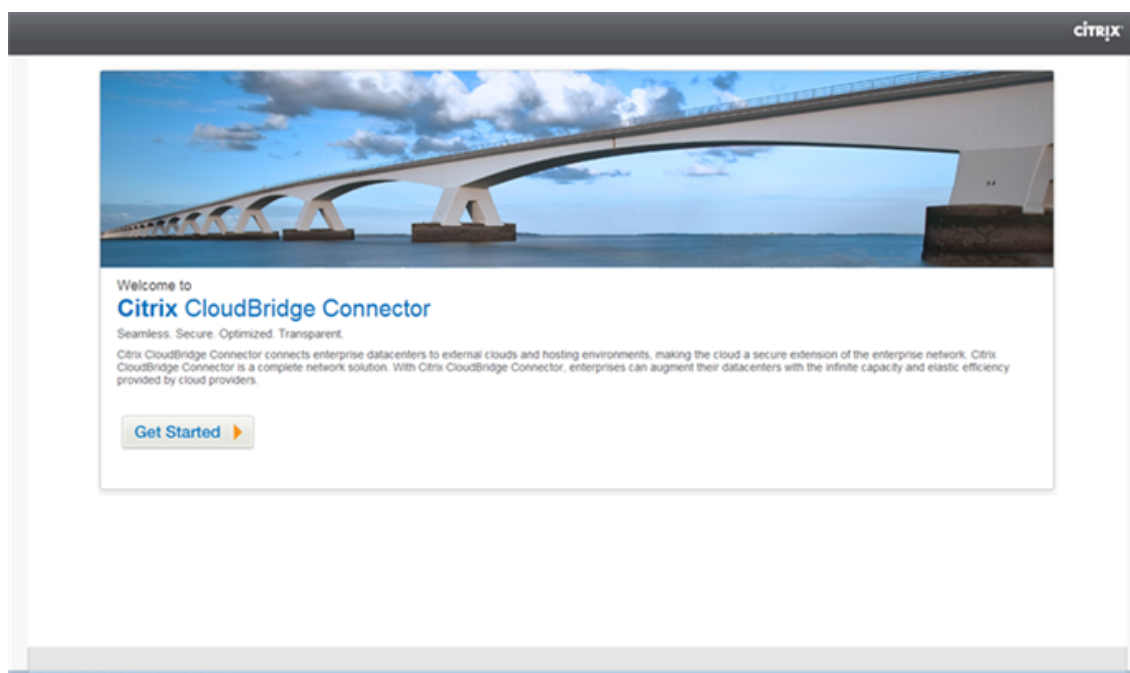

### Sample Configuration

The following commands create all settings of Citrix ADC appliance CB\_Appliance-1 used in “Example of CloudBridge Connector Configuration and Data Flow”.

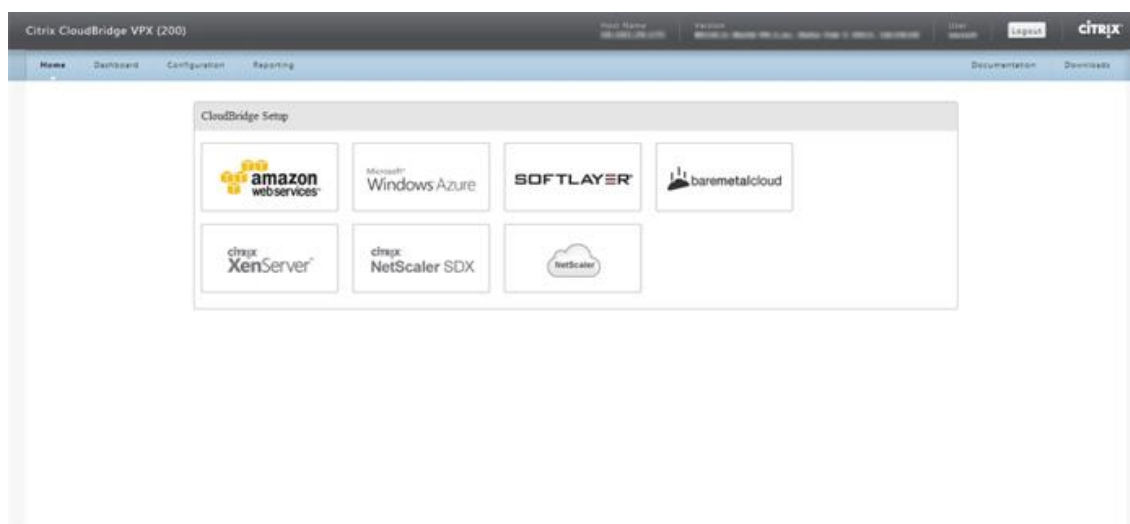

```
1 > add ipsec profile CB_Azure_IPSec_Profile -psk  
    DkiMgMdcbqvYREEuIvxsbKkW0F0yDiLM -ikeVersion v1 -lifetime 31536000  
2 Done  
3  
4 > add iptunnel CB_Azure_Tunnel 168.63.252.133 255.255.255.255  
    66.165.176.15 -protocol IPSEC - ipsecProfileName  
    CB_Azure_IPSec_Profile  
5 Done  
6  
7 > add pbr CB_Azure_Pbr -srcIP 10.102.147.0-10.102.147.255 - destIP  
    10.20.0.0-10.20.255.255 - ipTunnelCB_Azure_Tunnel  
8 Done  
9  
10 > apply pbrs  
11 Done  
12 <!--NeedCopy-->
```

To configure a CloudBridge Connector tunnel in a Citrix ADC appliance by using the GUI

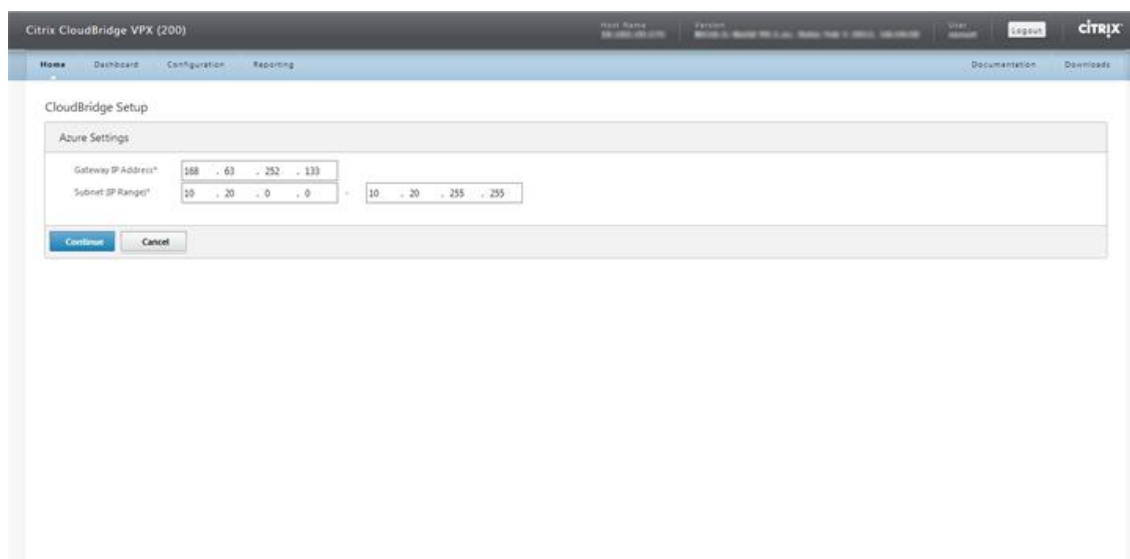

1. Access the GUI by using a web browser to connect to the IP address of the Citrix ADC appliance in the datacenter.
2. Navigate to **System > CloudBridge Connector**.
3. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.

4. Click **Get Started**.

**Note:** If you already have any CloudBridge Connector tunnel configured on the Citrix ADC appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

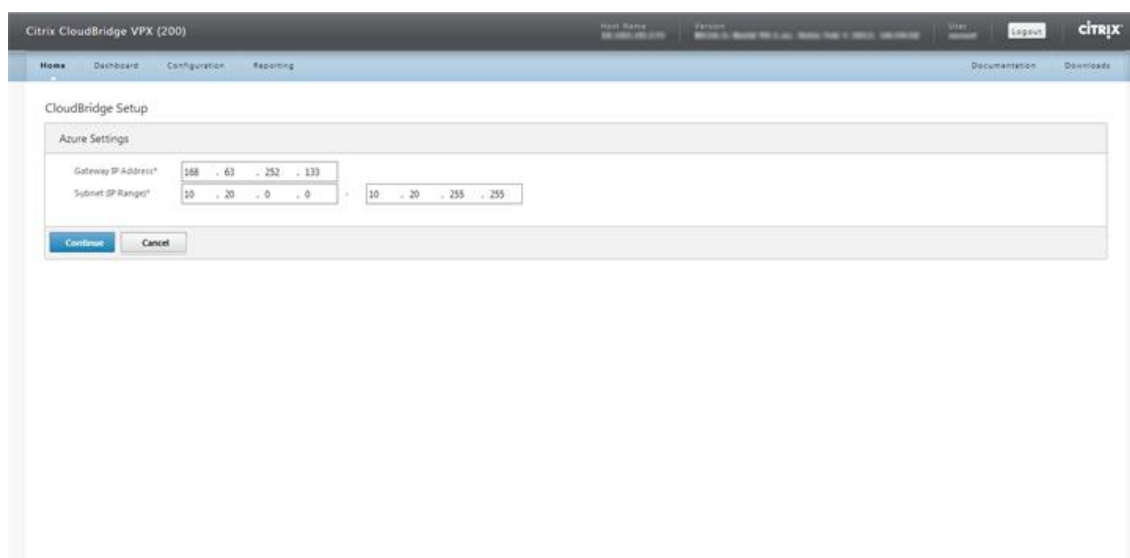

5. In the CloudBridge Setup pane, click **Microsoft Windows Azure**.

6. In the Azure Settings pane, in the **Gateway IP Address** field, type the IP address of the Azure gateway. The CloudBridge Connector tunnel is then set up between the Citrix ADC appliance and the gateway. In the **Subnet (IP Range)** text boxes, specify a subnet range (in Azure cloud), the traffic of which is to traverse the CloudBridge Connector tunnel. Click **Continue**.

The screenshot shows the Citrix CloudBridge VPX (200) configuration interface. The top navigation bar includes 'Home', 'Dashboard', 'Configuration', and 'Reporting'. The main content area is titled 'CloudBridge Setup' and contains an 'Azure Settings' section. This section has two input fields: 'Gateway IP Address\*' with the value '168 . 63 . 252 . 133' and 'Subnet IP Range\*' with the value '10 . 20 . 0 . 0' followed by a range indicator and '10 . 20 . 255 . 255'. Below these fields are 'Continue' and 'Cancel' buttons.

7. In the Citrix ADC Settings pane, from the **Local Subnet IP** drop-down list, select a publicly accessible SNIP address configured on the Citrix ADC appliance. In **Subnet (IP Range)** text boxes, specify a local subnet range, the traffic of which is to traverse the CloudBridge Connector tunnel. Click **Continue**.

This screenshot is identical to the one above, showing the 'CloudBridge Setup' configuration page with the 'Azure Settings' section. The 'Gateway IP Address\*' is '168 . 63 . 252 . 133' and the 'Subnet IP Range\*' is '10 . 20 . 0 . 0' to '10 . 20 . 255 . 255'. 'Continue' and 'Cancel' buttons are visible at the bottom.

8. In the **CloudBridge Setting** pane, in the CloudBridge Name text box, type a name for the CloudBridge that you want to create.

9. From the Encryption Algorithm and Hash Algorithm drop-down lists, select the AES and HMAC\_SHA1 algorithms, respectively. In the Pre Shared Security Key text box, type the security key.
10. Click **Done**.

## Monitoring the CloudBridge Connector tunnel

You can view statistics for monitoring the performance of a CloudBridge Connector tunnel between the Citrix ADC appliance in the datacenter and Microsoft Azure. To view CloudBridge Connector tunnel statistics on the Citrix ADC appliance, use GUI or Citrix ADC command line. To view CloudBridge Connector tunnel statistics in Microsoft Azure, use the Microsoft Windows Azure Management Portal.

### Displaying CloudBridge Connector tunnel Statistics in the Citrix ADC appliance

For information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see

[Monitoring CloudBridge Connector Tunnels.](#)

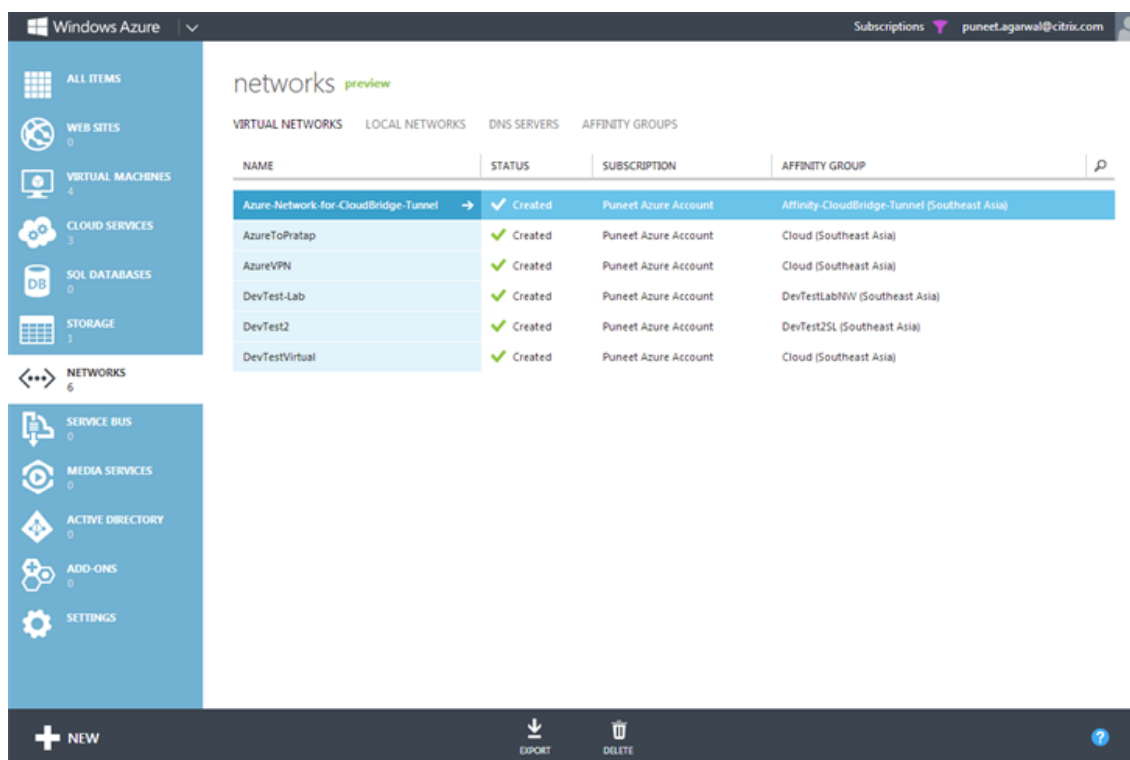

### Displaying CloudBridge Connector tunnel Statistics in Microsoft Azure

The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels in Microsoft Azure.

Statistical counter	Specifies
DATA IN	Total number of kilobytes received by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.
DATA OUT	Total number of kilobytes sent by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.

To display CloudBridge Connector tunnel statistics by using the Microsoft Windows Azure Management Portal

1. Log on to the [Windows Azure Management Portal](#) by using your Microsoft Azure account credentials.
2. In the left pane, click **NETWORKS**.
3. On the **Virtual Network** tab, in the Name column, select the virtual network entity associated with a CloudBridge Connector tunnel whose statistics you want to display.

4. On the **DASHBOARD** page of the virtual network, view the DATA IN and DATA OUT counters for the CloudBridge Connector tunnel.

## Configuring CloudBridge Connector tunnel between datacenter and softlayer enterprise cloud

September 21, 2020

The GUI includes a wizard that helps you to easily configure a CloudBridge Connector tunnel between a Citrix ADC appliance in a datacenter and Citrix ADC VPX instances on the SoftLayer enterprise cloud.

When you use the wizard of the Citrix ADC appliance in the datacenter, the CloudBridge Connector tunnel configuration created on the Citrix ADC appliance, is automatically pushed to the other endpoint or peer (the Citrix ADC VPX on SoftLayer) of the CloudBridge Connector tunnel.

Using the wizard of the Citrix ADC appliance in the datacenter, you perform the following steps to configure a CloudBridge Connector tunnel.

1. Connect to the Softlayer enterprise cloud by providing the user log on credentials.
2. Select the Citrix XenServer that is running the Citrix ADC VPX appliance.
3. Select the Citrix ADC VPX appliance.
4. Provide CloudBridge Connector tunnel parameters to:
  - Configure a GRE Tunnel.
  - Configure IPsec on the GRE tunnel.

- Create a netbridge, which is a logical representation of the CloudBridge connector, by specifying a name.
- Bind the GRE Tunnel to the netbridge.

### To configure a CloudBridge Connector tunnel by using the GUI

1. Log on to the GUI of the Citrix ADC appliance in the datacenter by using your account credentials for the appliance.
2. Navigate to **System > CloudBridge Connector** .
3. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge Connector**.
4. Click **Get Started**.

**Note:**

If you already have any CloudBridge Connector tunnel configured on the Citrix ADC appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

5. In the CloudBridge Connector Setup pane, click Softlayer, and then follow the instructions in the wizard.

### Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and Cisco IOS device

June 29, 2021

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco device to connect two datacenters or extend your network to a Cloud provider. The Citrix ADC appliance and the Cisco IOS device form the end points of the CloudBridge Connector tunnel and are called peers.

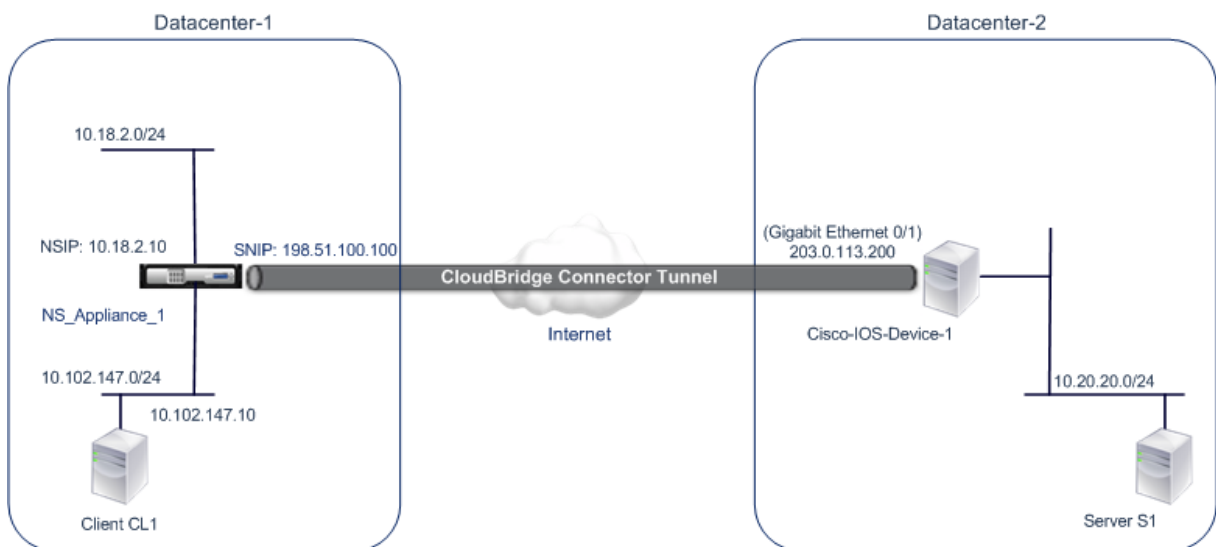

## Example of CloudBridge Connector tunnel configuration and data flow

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- Cisco IOS device Cisco-IOS-Device-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and Cisco-IOS-Device-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and Cisco-IOS-Device-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_Cisco\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_Cisco\_Tunnel, and policy based routing (PBR) entity NS\_Cisco\_Pbr.

For more information, refer to the [CloudBridge Connector tunnel between a Citrix ADC appliance and Cisco IOS device settings](#) pdf.

## Points to Consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco IOS device, consider the following points:

- The following IPsec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco IOS device.

IPSec Properties	Setting
IPSec mode	Tunnel mode
IKE version	Version 1
IKE DH group	DH group 2 (1024 bits MODP algorithm)
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES, 3DES
IKE hash algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA384, HMAC SHA512, HMAC MD5
ESP encryption algorithm	AES, 3DES
ESP hash algorithm	HMAC SHA1, HMAC SHA256, HMAC SHA256, HMAC SHA256, HMAC MD5

- You must specify the same IPSec settings on the Citrix ADC appliance and the Cisco IOS device at the two ends of the CloudBridge Connector.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another, and a common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore on the Cisco device, you must specify the same hash algorithm and same encryption algorithm for IKE (while creating IKE policy) and ESP (while creating IPSec transform set).
- You must configure the firewall at the Citrix ADC end and Cisco device end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

### Configuring the Cisco IOS device for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a Cisco IOS device, use the Cisco IOS command line interface, which is the primary user interface for configuring, monitoring, and maintaining Cisco devices.

Before you begin the CloudBridge Connector tunnel configuration on a Cisco IOS device, make sure that:

- You have a user account with administrator credentials on the Cisco IOS device.
- You are familiar with the Cisco IOS command line interface.
- The Cisco IOS device is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

**Note:**

The procedures for configuring CloudBridge Connector tunnel on a Cisco IOS device might change over time, depending on the Cisco release cycle. Citrix recommends that you follow the official Cisco product documentation for more information, see [Configuring IPsec VPN tunnels](#) topic.

**To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a Cisco IOS device, perform the following tasks on the Cisco device's IOS command line:**

- Create an IKE Policy.
- Configure a Pre-shared key for IKE authentication.
- Define a transform set and configure IPsec in tunnel mode.
- Create a crypto access List
- Create a crypto map
- Apply the crypto Map to an interface

The examples in the following procedures create settings in [Cisco IOS device Cisco-IOS-Device-1](#) mentioned in section “Example of CloudBridge Connector Configuration and Data Flow.”

**To create an IKE policy**, refer to the [IKE policy](#) pdf.

**To configure a pre-shared key by using the Cisco IOS command line:**

At the Cisco IOS device's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto isakmp identity address	Cisco-ios-device-1(config)# crypto isakmp identity address	Specify the ISAKMP identity (address) for the Cisco IOS device to use when communicating with the peer (Citrix ADC appliance) during IKE negotiations. This example specifies the address keyword, which uses IP address 203.0.113.200 (Gigabit Ethernet interface 0/1 of Cisco-IOS-Device-1) as the identity for the device.

Command	Example	Command Description
crypto isakmp key keystringaddress peer-address	Cisco-ios-device-1 (config)# crypto isakmp key examplepresharedkey address 198.51.100.100	Specify a pre-shared key for the IKE authentication. This example configures shared key examplepresharedkey to be used with the Citrix ADC appliance NS_Appliance-1 (198.51.100.100). The same pre-shared key must be configured on the Citrix ADC appliance for IKE authentication to be successful between the Cisco IOS device and the Citrix ADC appliance.

**To create a crypto access list by using the Cisco IOS command line:**

At the Cisco IOS device's command prompt, type the following command in global configuration mode, in the order shown:

Command	Example	Command Description
access-listaccess-list-number permit IPsource source-wildcard destination destination-wildcard	Cisco-ios-device-1(config)# access-list 111 permit ip 10.20.20.0 0.0.0.255 10.102.147.0 0.0.0.255	Specify conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example configures access list 111 to protect traffic from subnets 10.20.20.0/24 (at the Cisco-IOS-Device-1 side) and 10.102.147.0/24 (at the NS_Appliance-1 side).

**To define a transform and configure IPSec tunnel mode by using the Cisco IOS command line:**

At the Cisco IOS device's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description

--	--	--

		<pre>crypto ipsec transform-setname ESP_Authentication_Transform ESP_Encryption_Transform</pre> <p>Note: ESP_Authentication_Transform can take the following values: esp-sha-hmac, esp-sha256-hmac, esp-sha384-hmac, esp-sha512-hmac, esp-md5-hmac. ESP_Encryption_Transform can take the following values: esp-aes or esp-3des</p> <pre>Cisco-ios-device-1(config)# crypto ipsec transform-set NS-CISCO-TS esp-sha256-hmac esp-3des</pre> <p>Define a transform set and specify the ESP hash algorithm (for authentication) and the ESP encryption algorithm to be used during exchange of data between the CloudBridge Connector tunnel peers. This example defines transform set NS-CISCO-TS and specifies ESP authentication algorithm as esp-sha256-hmac, and ESP encryption algorithm as esp-3des.</p> <pre>mode tunnel</pre> <p>Cisco-ios-device-1 (config-crypto-trans)# mode tunnel</p> <p>Set IPsec in tunnel mode.</p> <pre>exit</pre> <p>Cisco-ios-device-1 (config-crypto-trans)# exit, Cisco-ios-device-1 (config)#</p> <p>Exit back to global configuration mode.</p>
--	--	--

### To create a crypto map by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto mapmap-name seq-num ipsec-isakmp	Cisco-ios-device-1 (config)# crypto map NS-CISCO-CM 2 ipsec-isakmp	Enter crypto map configuration mode, specify a sequence number for the crypto map, and configure the crypto map to use IKE to establish security associations (SAs). This example configures sequence number 2 and IKE for crypto map NS-CISCO-CM.
set peer ip-address	Cisco-ios-device-1 (config-crypto-map)# set peer 172.23.2.7	Specify the peer (Citrix ADC appliance) by its IP address. This example specifies 198.51.100.100, which is the CloudBridge Connector endpoint IP address on the Citrix ADC appliance.

Command	Example	Command Description
match address access-list-id	Cisco-ios-device-1 (config-crypto-map)# match address 111	Specify an extended access list. This access list specifies conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example specifies access list 111.
set transform-set transform-set-name	Cisco-ios-device-1 (config-crypto-map)# set transform-set NS-CISCO-TS	Specify which transform sets are allowed for this crypto map entry. This example specifies transform set NS-CISCO-TS.
exit	Cisco-ios-device-1 (config-crypto-map)# exit	
Cisco-ios-device-1 (config)#	Exit back to global configuration mode.	

### To apply a crypto map to an interface by using the Cisco IOS command line:

At the Cisco IOS device's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
interface interface-ID	Cisco-ios-device-1(config)# interface GigabitEthernet 0/1	Specify a physical interface to which to apply the crypto map and enter interface configuration mode. This example specifies Gigabit Ethernet interface 0/1 of the Cisco device Cisco-IOS-Device-1. IP address 203.0.113.200 is already set to this interface.

Command	Example	Command Description
crypto mapmap-name	Cisco-ios-device-1 (config-if)# crypto map NS-CISCO-CM	Apply the crypto map to the physical interface. This example applies crypto map NS-CISCO-CM.
exit	Cisco-ios-device-1 (config-if)# exit, Cisco-ios-device-1 (config)#	Exit back to global configuration mode.

### Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco IOS device, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- Create an IPsec profile.
- Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.
- Create a PBR rule and associate it with the IP tunnel.

#### To create an IPSEC profile by using the Citrix ADC command line:

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1`
- `show ipsec profile <name>`

#### To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line:

At the Command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `add ipTunnel <name>`

#### To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line:

At the Command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbrs <pbrName>`

The following commands create settings in Citrix ADC appliance NS\_Appliance-1 mentioned in section **Example of CloudBridge Connector Configuration and Data Flow**.

```
1 > add ipsec profile NS_Cisco_IPSec_Profile -psk
   examplepresharedkey -ikeVersion v1 - lifetime 315360 - encAlgo 3
   DES
2 Done
3 > add iptunnel NS_Cisco_Tunnel 203.0.113.200 255.255.255.255
   198.51.100.100 - protocol IPSEC - ipsecProfileName
   NS_Cisco_IPSec_Profile
4
5 Done
6 > add pbr NS_Cisco_Pbr -srcIP 10.102.147.0-10.102.147.255 - destIP
   10.20.0.0-10.20.255.255 - ipTunnel NS_Cisco_Tunnel
7
8 Done
9 > apply pbrs
10
11 Done
12 <!--NeedCopy-->
```

#### To create an IPSEC profile by using the GUI:

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** dialog box, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
4. Configure the **IPsec authentication** method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

#### To create an IP tunnel and bind the IPSEC profile to it by using the GUI:

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** dialog box, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop down list, select Subnet IP).
  - Local IP (All the configured IPs of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)

- Protocol
  - IPSec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** dialog box, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select IP Tunnel)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

#### **To apply a PBR by using the GUI:**

1. Navigate to **System > Network > PBRs**.
2. On the **PBRs** tab, select the **PBR**, in the **Action list**, select **Apply**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

### **Monitoring the CloudBridge Connector Tunnel**

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## **Configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and fortinet fortIGate appliance**

June 29, 2021

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Fortinet FortiGate appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the FortiGate appliance form the end points of the CloudBridge Connector tunnel and are called peers.

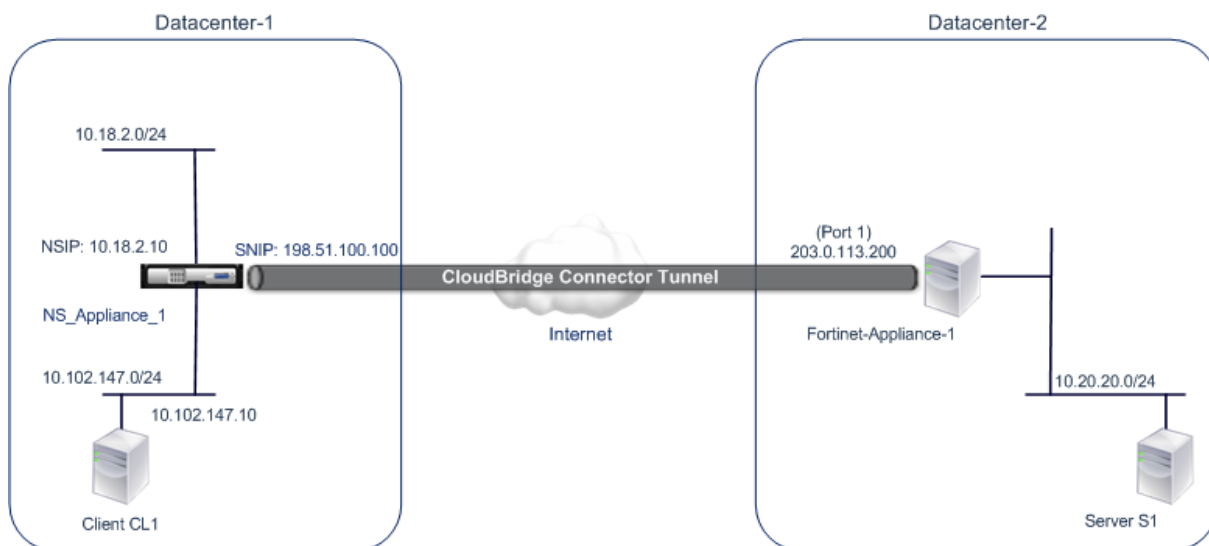

### Example of a CloudBridge Connector Tunnel Configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- FortiGate appliance FortiGate-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and FortiGate-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and FortiGate-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_Fortinet\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_Fortinet\_Tunnel, and policy based routing (PBR) entity NS\_Fortinet\_Pbr.

For more information, see [CloudBridge Connector tunnel configuration table pdf](#).

For information about Settings on Fortinet FortiGate-Appliance-1 in Datacenter-2, see [table](#).

## Points to consider for a CloudBridge Connector tunnel configuration

Before configuring a CloudBridge Connector tunnel between a Citrix ADC appliance and a FortiGate appliance, consider the following points:

- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a FortiGate appliance.

IPSec Properties	Settings
IPSec mode	Tunnel mode
IKE version	Version 1
IKE DH group	DH group 2 (1024 bits MODP algorithm)
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES
IKE hash algorithm	HMAC SHA1
ESP encryption algorithm	AES
ESP hash algorithm	HMAC SHA1

- You must specify the same IPSec settings on the Citrix ADC appliance and the FortiGate appliance at the two ends of the CloudBridge Connector.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore in the FortiGate appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).
- You must configure the firewall at the Citrix ADC end and FortiGate end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets
- FortiGate appliance supports two types of VPN tunnels: Policy-based and Route-based. Only policy-based VPN tunnel is supported between a FortiGate appliance and a Citrix ADC appliance.

## Configuring FortiGate appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a FortiGate appliance, use the Fortinet Web-based Manager, which is the primary user interface for configuring, monitoring, and maintaining FortiGate

appliances.

Before you begin the CloudBridge Connector tunnel configuration on a FortiGate appliance, make sure that:

- You have a user account with administrator credentials on the FortiGate appliance.
- You are familiar with the Fortinet Web-based Manager.
- The FortiGate appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

#### Note

The procedures for configuring CloudBridge Connector tunnel on a FortiGate appliance might change over time, depending on the Fortinet release cycle. Citrix recommends that you follow the official Fortinet product documentation for [Configuring IPsec VPN tunnels](#).

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a FortiGate appliance, perform the following tasks on the FortiGate appliance by using the Fortinet Web-based manager:

- **Enable Policy-based IPsec VPN feature.** Enable this feature for creating policy-based VPN tunnels on the FortiGate appliance. Only policy-based type of VPN tunnel is supported between a FortiGate appliance and a Citrix ADC appliance. A policy-based VPN tunnel configuration on a FortiGate appliance includes phase 1 settings, phase 2 settings, and an IPsec security policy.
- **Define phase 1 parameters.** Phase 1 parameters are used by the FortiGate appliance for IKE Authentication before forming a secure tunnel to the Citrix ADC appliance.
- **Define phase 2 parameters.** Phase 2 parameters are used by the FortiGate appliance for forming a secure tunnel to the Citrix ADC appliance by establishing IKE security associations (SA).
- **Specify private subnets.** Define the FortiGate-side and the Citrix ADC-side private subnets whose IP traffic is to be transported through the tunnel.
- **Define an IPsec security policy for the tunnel.** A security policy allow IP traffic to pass between interfaces on a FortiGate appliance. An IPsec security policy specifies the interface to the private subnet and the interface connecting the Citrix ADC appliance through the tunnel.

To enable Policy-based IPsec VPN feature by using the Fortinet Web-based Manager

1. Navigate to **System > Config > Features**.
2. On the **Feature Settings** page, select **Show More** and turn on **Policy-based IPsec VPN**.

To define phase 1 parameters by using the Fortinet Web-based Manager

1. Navigate to **VPN > IPsec > Auto Key (IKE)** and click **Create Phase1**.
2. On the **New Phase 1** page, set the following parameters:
  - Name: Enter a name for this phase 1 configuration.
  - Remote Gateway: Select *Static IP Address*.
  - Mode: Select *Main (ID Protection)*.

- Authentication Method: Select *Preshared Key*.
- Pre-Shared Key: Enter a pre-shared key. The same pre-shared key must be configured on the Citrix ADC appliance.
- Peer Options: Set the following IKE parameters for authenticating a Citrix ADC appliance.
  - IKE Version: Select *1*.
  - Mode Config: Clear this option if it is selected.
  - Local Gateway IP: Select *Main Interface IP*.
  - P1 Proposal: Select the encryption and authentication algorithms for IKE Authentication before forming a secure tunnel to the Citrix ADC appliance.
    - \* 1 - Encryption: Select *AES128*.
    - \* Authentication: Select *SHA1*.
    - \* Keylife: Enter an amount of time (in seconds) for the phase 1 key life.
    - \* DH Group: Select *2*.
  - X-Auth: Select *Disable*.
  - Deed Peer Detection: Select this option.

3. Click **OK**.

To specify private subnets by using the Fortinet Web-based Manager

1. Navigate to **Firewall Objects > Address > Addresses** and select **Create New**.
2. On the **New Address** page, set the following parameters:
  - Name: Enter a name for FortiGate-side subnet.
  - Type: Select *Subnet*.
  - Subnet / IP Range: Enter the address of the FortiGate-side subnet.
  - Interface: Select the local interface to this subnet.
3. Click **OK**.
4. Repeat steps 1-3 to specify the Citrix ADC-side subnet.

To define phase 2 parameters by using the Fortinet Web-based Manager

1. Navigate to **VPN > IPsec > Auto Key (IKE)** and click **Create Phase 2**.
2. On the **New Phase 2** page, set the following parameters:
  - Name: Enter a name for this phase 2 configuration.
  - Phase 1: Select the Phase 1 configuration from the drop-down list.
3. Click **Advanced** and set the following parameters:
  - P2 Proposal: Select the encryption and authentication algorithms for forming a secure tunnel to the Citrix ADC appliance.
    - 1 - Encryption: Select *AES128*.
    - Authentication: Select *SHA1*.
    - Enable replay detection: Select this option.
    - Enable perfect forward secrecy (PFS): Select this option.
    - DH Group: Select *2*.

- Keylife: Enter an amount of time (in seconds) for the phase 2 key life.
- Autokey Keep Alive: Select this option.
- Auto-negotiate: Select this option.
- Quick Mode Selector: Specify the FortiGate-side and the Citrix ADC-side private subnets whose traffic is to be traversed through the tunnel.
  - Source Address: Select the FortiGate-side subnet from the drop-down list.
  - Source Port: Enter 0.
  - Destination Address: Select the Citrix ADC-side subnet from the drop-down list.
  - Destination Port: Enter 0.
  - Protocol: Enter 0.

4. Click **OK**.

To define an IPSec security policy by using the Fortinet Web-based Manager

1. Navigate to **Policy > Policy > Policy** and click **Create New**.
2. On the **Edit Policy** page, set the following parameters:
  - Policy Type: Select *VPN*.
  - Policy Subtype: Select *IPSec*.
  - Local Interface: Select the local interface to the internal (private) network.
  - Local Protected Subnet: Select the FortiGate-side subnet from the drop-down list whose traffic is to be traversed through the tunnel.
  - Outgoing VPN Interface: Select the local interface to the external (public) network.
  - Remote Protected Subnet: Select the Citrix ADC-side subnet from the drop-down list whose traffic is to be traversed through the tunnel.
  - Schedule: Keep the default setting (*always*) unless changes are needed to meet specific requirements.
  - Service: Keep the default setting (*ANY*) unless changes are needed to meet your specific requirements.
  - VPN Tunnel: Select *Use Existing* and select the tunnel from the drop-down list.
  - Allow traffic to be initiated from the remote site: Select if traffic from the remote network will be allowed to initiate the tunnel.
3. Click **OK**.

## Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a FortiGate appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- **Create an IPSec profile.** An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPSec protocol in the CloudBridge Connector tunnel.

- **Create an IP tunnel that uses IPSec protocol, and associate the IPSec profile with it.** An IP tunnel specifies the local IP address (CloudBridge Connector tunnel end point IP address (of type SNIP) configured on the Citrix ADC appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the FortiGate appliance), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the FortiGate appliance side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecy ENABLE`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName** <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPSec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPSec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version

- Perfect Forward Secrecy (Enable this parameter)
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the Pre-shared key authentication method and set the Pre-Shared Key Exists parameter.
  5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select *IP Tunnel*)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI.

The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration.”

```
1 > add ipsec profile NS_Fortinet_IPSec_Profile -psk
   examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
   HMAC_SHA1 -lifetime 315360 -perfectForwardSecrecy ENABLE
2
3 Done
4 > add iptunnel NS_Fortinet_Tunnel 203.0.113.200 255.255.255.255
   198.51.100.100 -protocol IPSEC -ipsecProfileName
   NS_Fortinet_IPSec_Profile
5
6 Done
7 > add pbr NS_Fortinet_Pbr -srcIP 10.102.147.0-10.102.147.255 -
   destIP 10.20.0.0-10.20.255.255 -ipTunnel NS_Fortinet_Tunnel
8
9 Done
10 > apply pbrs
11
12 Done
13 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## CloudBridge Connector tunnel diagnostics and troubleshooting

September 21, 2020

If you have problems with a CloudBridge Connector tunnel configuration, make sure that all prerequisites were observed before the tunnel was set up. If they were, the problem might be with the tunnel end-point IP addresses, a NAT configuration, the way the tunnel was set up, or with the data traffic.

### Troubleshooting a CloudBridge Connector tunnel

If your CloudBridge Connector tunnel does not function properly, the issue could be with tunnel establishment or with the data traffic. If you are unsure which type of problem you have, look for an error message in the log file and see if the error message is in the list of tunnel-establishment issues. If you do not find your error message, check the list of possible issues related to data traffic.

### Issues Related to tunnel establishment

After the requirements for configuring the IPSec tunnel are met and the CloudBridge Connector tunnel is configured, if the status of the tunnel is not UP, look for debugging information in the `iked.log` file on one or both Citrix ADC appliances configured as the tunnel end points.

On either appliance, type the following command at the Citrix ADC shell prompt:

```
'cat /tmp/iked.debug                tee /var/iked.log'
```

The [Troubleshooting](#) pdf lists some common errors and their solutions.

### Issues related to data traffic

If the data in the CloudBridge Connector tunnel are not exchanged properly between the tunnel end points, do the following.

- For a CloudBridge Connector tunnel that uses GRE and IPSec protocols:
  - Make sure that L2 mode is enabled on both of the CloudBridge Connector tunnel end points. To enable L2 mode, type the following command at the Citrix ADC command line interface:  
`enable mode L2`
    - \* If one of the CloudBridge Connector tunnel end points is a CloudBridge virtual appliance (VPX) and is provisioned on a VMware ESXi hypervisor, make sure that Promiscuous mode is set to Accept for the vSwitch associated with the CloudBridge VPX appliance.
  - If a VLAN is extended through a CloudBridge Connector tunnel, verify one-to-one mapping on the extended VLAN entity on each of the tunnel end points
  - Make sure that the IP tunnel entity is bound to the correct netbridge entity in each of the tunnel end points.
  - Verify that the ARP entry for the peer CloudBridge Connector tunnel end point exists on the local tunnel end point, by typing the following command at the Citrix ADC command line interface:  
`'show arp'`
  - If the output shows an incomplete ARP entry, bidirectional traffic is not flowing through the tunnel. If bidirectional traffic is flowing, the ARP entry shows the name of tunnel interface for the devices on the other side of the tunnel.
  - Remove the IP tunnel entities from both tunnel end points and add them again with the same parameters, but with the IPSec profile set to NONE, so that the tunnel uses only the GRE protocol.

After verifying the following in the IP tunnel (that uses GRE protocol), configure the tunnel with IPSec parameters by specifying a valid IPSec profile to the respective IP tunnel entities on each of the tunnel end points.

Proper PING or TCP flow through the tunnel.

Proper flow of data traffic through the tunnel.

After the configured tunnel (that uses GRE and IPSec protocols) is in UP state, if the data traffic does not flow properly through the tunnel, and if a NAT device was deployed in front of any or both of the tunnel end points, analyze the ingress and egress packets on the NAT devices.

- If a Citrix ADC appliance is used as Router or Gateway.
  - Make sure that L3 mode is enabled on the Citrix ADC appliance. To enable L3 mode, run the following command in the CloudBridge command line.
  - enable mode L3
  - If subnets are bound to a netbridge entity, make sure that correct IP tunnel entity is also bound to the netbridge.
  - Run the following command in the Citrix ADC command line to see where the packets (Input and Output) are getting dropped:  
`stat ipsec counters`
  - Make sure that the correct routes are configured on both the tunnel end points.
  - If no NAT device is deployed in front of the Citrix ADC appliance, make sure that the firewalls are configured to allow any ESP (IP protocol number 50) packets and any UDP packets for port 4500.

If none of the above measures result in successful exchange of traffic between the tunnel end points, contact Citrix Technical Support.

### **Checklist before contacting Citrix technical Support**

For a speedy resolution, make sure that you have the following items ready before contacting Citrix Technical Support.

- Details of the deployment and network topology.
- Log file collected by typing the following command at the Citrix ADC shell prompt.  
`cat /tmp/iked.debug | tee /var/log/iked.log`
- Tech support bundle captured by typing the following command at the Citrix ADC command line.  
`show techsupport`
- Packet traces captured on both CloudBridge Connector tunnel end points. To start a packet trace, type the following command at the Citrix ADC command line.  
`start nstrace -size 0`

To stop packet trace, type the following command at the Citrix ADC command line.

```
stop nstrace
```

- Output of the following command typed at the Citrix ADC command prompt.

```
show arp
```

## CloudBridge Connector interoperability – StrongSwan

September 21, 2020

StrongSwan is an opensource IPSec implementation for Linux platforms. You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a StrongSwan appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the StrongSwan appliance form the end points of the CloudBridge Connector tunnel and are called peers.

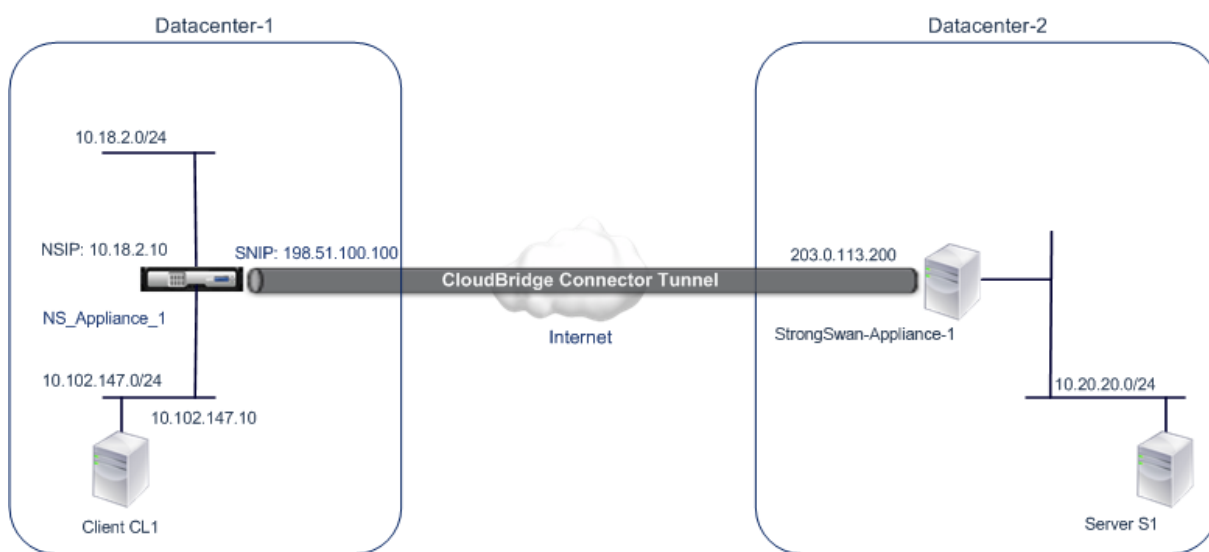

### Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- StrongSwan appliance StrongSwan-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and StrongSwan-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and StrongSwan-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPSec profile entity NS\_StrongSwan\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_StrongSwan\_Tunnel, and policy based routing (PBR) entity NS\_StrongSwan\_Pbr.

The following table lists the settings used in this example.

Main settings of the CloudBridge Connector tunnel setup

Entity	Details
IP address of the CloudBridge Connector tunnel end point (NS_Appliance-1) in Datacenter-1	198.51.100.100
IP address of the CloudBridge Connector tunnel end point (StrongSwan-Appliance-1) in Datacenter-2	203.0.113.200
Datacenter-1's subnet whose traffic is to be protected over the CloudBridge Connector tunnel	10.102.147.0/24
Datacenter-2's subnet whose traffic is to be protected over the CloudBridge Connector tunnel	10.20.20.0/24

Settings on Citrix ADC appliance NS\_Appliance-1 in Datacenter-1

SNIP1(for reference purposes only)	198.51.100.100	
IPSec profile	NS_StrongSwan_IPSec_Profile	IKE version: v1, Encryption algorithm: AES, Hash algorithm: HMAC_SHA1
<p>psk = examplepresharedkey          (Note: This is an example of a pre-share key, for illustration. Citrix does not recommend to use this string in your CloudBridge Connector configuration)</p>		
CloudBridge Connector tunnel	NS_StrongSwan_Tunnel	Remote IP = 203.0.113.200, Local IP= 198.51.100.100, Tunnel protocol = IPSEC, IPSec profile= NS_StrongSwan_IPSec_Profile
Policy based route	NS_StrongSwan_Pbr	Source IP range = Subnet in the Datacenter-1=10.102.147.0-10.102.147.255, Destination IP range =Subnet in Datacenter-2=10.20.20.0-10.20.20.255, IP Tunnel = NS_StrongSwan_Tunnel

### Points to consider for a CloudBridge Connector tunnel configuration

Before you begin configuring CloudBridge connector tunnel, make sure that:

- You have a basic knowledge about linux configurations.
- You have a basic Knowledge about IPSec protocol suite.
- The StrongSwan appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The Citrix ADC appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

- The following IPsec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a StrongSwan appliance.
  - IPsec mode: Tunnel mode
  - IKE version: Version 1
  - IKE authentication method: Pre-Shared Key
  - IKE encryption algorithm: AES
  - IKE hash algorithm: HMAC SHA1
  - ESP encryption algorithm: AES
  - ESP hash algorithm: HMAC SHA1
- You must specify the same IPsec settings on the Citrix ADC appliance and the StrongSwan appliance at the two ends of the CloudBridge Connector tunnel.
- Citrix ADC provides a common parameter (in IPsec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the StrongSwan appliance, you must specify the same hash algorithm and same encryption algorithm in IKE and ESP parameters in the IPsec.conf file.
- You must configure the firewall at the Citrix ADC end and StrongSwan end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

### **Configure StrongSwan for the CloudBridge Connector tunnel**

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a StrongSwan appliance, perform the following tasks on the StrongSwan appliance:

- **Specify IPsec connection information in ipsec.conf file.** ipsec.conf file defines all control and configuration information for IPsec connections in the strongSwan appliance.
- **Specify pre-shared key in ipsec.secrets file.** ipsec.secrets file defines secrets for IKE/IPsec authentication for IPsec connections in the strongSwan appliance.

The procedures for configuring IPsec VPN (CloudBridge Connector tunnel) on a StrongSwan appliance might change over time, depending on the StrongSwan release cycle. Citrix recommends that you follow the official StrongSwan documentation for [Configuring IPsec VPN tunnels](#).

Following sample excerpt of ipsec.conf file specifies IPsec information for setting up the IPsec VPN tunnel, described in Example of a CloudBridge Connector Configuration topic. For more information, see [CloudBridge Connector Configuration](#) pdf.

Following sample excerpt of ipsec.secrets file specifies the IKE authentication pre-shared key for setting up the IPsec VPN tunnel, described in Example of a CloudBridge Connector Configuration topic.

**/etc/ipsec.secrets** PSK 'examplepresaredkey' #pre-shared key for IPsec IKE authentication'

## Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a StrongSwan appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.** An IP tunnel specifies the local IP address (CloudBridge Connector tunnel endpoint IP address (of type SNIP) configured on the Citrix ADC appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the StrongSwan appliance), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the StrongSwan side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1`
- `show ipsec profile <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication method** and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the Add IP Tunnel page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop-down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select *IP Tunnel*)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration:

```
1 > add ipsec profile NS_StrongSwan_IPSec_Profile -psk
   examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
   HMAC_SHA1
2
3
4 Done
5
6 > add iptunnel NS_StrongSwan_Tunnel 203.0.113.200 255.255.255.255
   198.51.100.100 - protocol IPSEC - ipsecProfileName
   NS_StrongSwan_IPSec_Profile
7
8
9 Done
10
11 > add pbr NS_StrongSwan_Pbr -srcIP 10.102.147.0-10.102.147.255 -
   destIP 10.20.0.0-10.20.255.255 - ipTunnel NS_StrongSwan_Tunnel
12
13
14 Done
15
16 > apply pbrs
17
18
19 Done
20 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## CloudBridge Connector interoperability – F5 BIG-IP

September 21, 2020

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a F5 BIG-IP appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the F5 BIG-IP appliance form the end points of the CloudBridge Connector tunnel and are called peers.

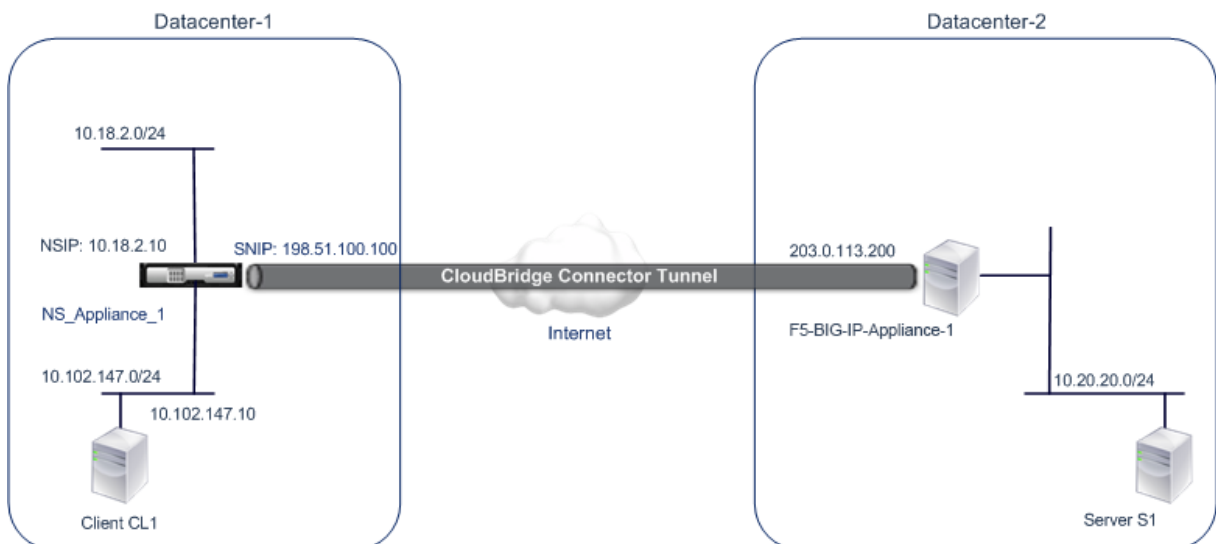

### Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following devices:

- Citrix ADC appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- F5 BIG-IP appliance F5-BIG-IP-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and F5-BIG-IP-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and F5-BIG-IP-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_F5-BIG-IP\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_F5-BIG-IP\_Tunnel, and policy based routing (PBR) entity NS\_F5-BIG-IP\_Pbr.

For more information, refer to [F5 big IP pdf](#).

## Points to consider for a CloudBridge Connector tunnel configuration

- The Citrix ADC appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The F5 BIG-IP appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.
- The following IPsec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and an F5 BIG-IP appliance.
  - IPsec mode: Tunnel mode
  - IKE version: Version 1
  - IKE authentication method: Pre-Shared Key
  - IKE encryption algorithm: AES
  - IKE hash algorithm: HMAC SHA1
  - ESP encryption algorithm: AES
  - ESP hash algorithm: HMAC SHA1
- You must specify the same IPsec settings on the Citrix ADC appliance and the F5 BIG-IP appliance at the two ends of the CloudBridge Connector tunnel.
- Citrix ADC provides a common parameter (in IPsec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the F5 BIG-IP appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).
- You must configure the firewall at the Citrix ADC end and F5 BIG-IP end to allow the following.
  - Any UDP packets for port 500
  - Any UDP packets for port 4500
  - Any ESP (IP protocol number 50) packets

## Configuring F5 BIG-IP for the CloudBridge Connector tunnel

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and an F5 BIG-IP appliance, perform the following tasks on the F5 BIG-IP appliance:

- **Create a forwarding virtual server for IPsec.** A forwarding virtual server intercepts IP traffic for the IPsec tunnel.
- **Create an IKE peer.** An IKE peer specifies the local and remote IPsec tunnel endpoints. It also specifies algorithms and credentials to be used for IPsec IKE phase 1.
- **Create a custom IPsec policy.** A policy specifies the IPsec protocol (ESP) and the mode (tunnel) to be used for forming the IPsec tunnel. It also specifies the algorithms and security parameters to be used for IKE IPsec phase 2.
- **Create a bidirectional IPsec traffic selector.** A traffic selector specifies the F5 BIG-IP side and Citrix ADC side subnets whose IP traffic is to be traversed through the IPsec tunnel.

The procedures for configuring IPsec VPN (CloudBridge Connector tunnel) on an F5 BIG-IP appliance might change over time, depending on the F5 release cycle. Citrix recommends that you follow the official F5 BIG-IP documentation for configuring IPsec VPN tunnels, at:

<https://f5.com>

To create a forwarding virtual server for IPsec by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Local Traffic > Virtual Servers**, and then click **Create**.
2. On **New Virtual Server List** screen, set the following parameters:
  - **Name**. Type a unique name for the virtual server.
  - **Type**. Select **Forwarding (IP)**.
  - **Destination Address**. Type a wildcard network address in CIDR format, for example, 0.0.0.0/0 for IPv4 to accept any traffic.
  - **Service Port**. Select **All Ports** from the list.
  - **Protocol list**. Select **All Protocols** from the list.
  - **VLAN and Tunnel Traffic**. Retain the default selection, **All VLANs and Tunnels**.
3. Click **Finished**.

To create a custom IPsec policy by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Network > IPsec > IPsec Policies**, and then click **Create**.
2. On the **New Policy** screen, set the following parameters:
  - **Name**. Type a unique name for the policy.
  - **IPsec Protocol**. Retain the default selection, ESP.
  - **Mode**. Select Tunnel. The screen refreshes to show additional related settings.
  - **Tunnel Local Address**. Type the local IPsec tunnel endpoint IP address (Configured on the F5 BIG-IP appliance).
  - **Tunnel Remote Address**. Type the remote IPsec tunnel endpoint IP address (Configured on the Citrix ADC appliance).
3. For the IKE Phase 2 parameters, retain the default values, or select the options that are appropriate for your deployment.
4. Click **Finished**.

To create a bidirectional IPsec traffic selector by using the F5 BIG-IP GUI

1. On the **Main** tab, click **Network > IPsec > Traffic Selectors**, and then click **Create**.
2. On the **New Traffic Selector** screen, set the following parameters:
  - **Name**. Type a unique name for the traffic selector.
  - **Order**. Retain the default value (**First**). This setting specifies the order in which the traffic selector appears on the Traffic Selector List screen.
3. From the **Configuration** list, select **Advanced**, and set the following parameters:
  - **Source IP Address**. Click **Host** or **Network**, and in **Address** field, type the address of the F5 BIG-IP side subnet whose traffic is to be protected over the IPsec tunnel.

- **Source Port.** Select \* **All Ports**.
  - **Destination IP Address.** Click **Host**, and in the **Address** field, type the address of the Citrix ADC side subnet whose traffic is to be protected over the IPsec tunnel.
  - **Destination Port.** Select \* **All Ports**.
  - **Protocol.** Select \* **All Protocols**.
  - **Direction.** Select **Both**.
  - **Action.** Select **Protect**. The **IPsec Policy Name** setting appears.
  - **IPsec Policy Name.** Select the name of the custom IPsec policy that you created.
4. Click **Finished**.

## Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a F5 BIG-IP appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC command line or the Citrix ADC graphical user interface (GUI):

- **Create an IPsec profile.** An IPsec profile entity specifies the IPsec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and authentication method to be used by the IPsec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.** An IP tunnel specifies the local IP address (CloudBridge Connector tunnel end point IP address (of type SNIP) configured on the Citrix ADC appliance), remote IP address (CloudBridge Connector tunnel endpoint IP address configured on the F5 BIG-IP appliance), protocol (IPsec) used to set up the CloudBridge Connector tunnel, and an IPsec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate it with the IP tunnel.** A PBR entity specifies a set of rules and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP address range are the conditions for the PBR entity. Set the source IP address range to specify the Citrix ADC-side subnet whose traffic is to be protected over the tunnel, and set the destination IP address range to specify the F5 BIG-IP side subnet whose traffic is to be protected over the tunnel.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecyENABLE`
- `show ipsec profile** <name>`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

At the command prompt, type:

- `add pbr <pbrName> ALLOW -srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>`
- `apply pbrs`
- `show pbr <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsecProfile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication method** and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.
2. On the **IPv4 Tunnels** tab, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select *Subnet IP*).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.

2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select *IP Tunnel*)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration.:

```
1 > add ipsec profile NS_F5-BIG-IP_IPSec_Profile -psk
   examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
   HMAC_SHA1 -lifetime 315360 -perfectForwardSecrecy ENABLE
2
3
4 Done
5
6 > add iptunnel NS_F5-BIG-IP_Tunnel 203.0.113.200 255.255.255.255
   198.51.100.100 -protocol IPSEC -ipsecProfileName NS_F5-BIG-
   IP_IPSec_Profile
7
8
9 Done
10
11 > add pbr NS_F5-BIG-IP_Pbr -srcIP 10.102.147.0-10.102.147.255 -
   destIP 10.20.0.0-10.20.255.255 -ipTunnel NS_F5-BIG-IP_Tunnel
12
13
14 Done
15
16 > apply pbrs
17
18
19 Done
```

## Monitoring the CloudBridge Connector tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## CloudBridge Connector interoperability – Cisco ASA

September 21, 2020

You can configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance to connect two datacenters or extend your network to a cloud provider. The Citrix ADC appliance and the Cisco ASA appliance form the end points of the CloudBridge Connector tunnel and are called peers.

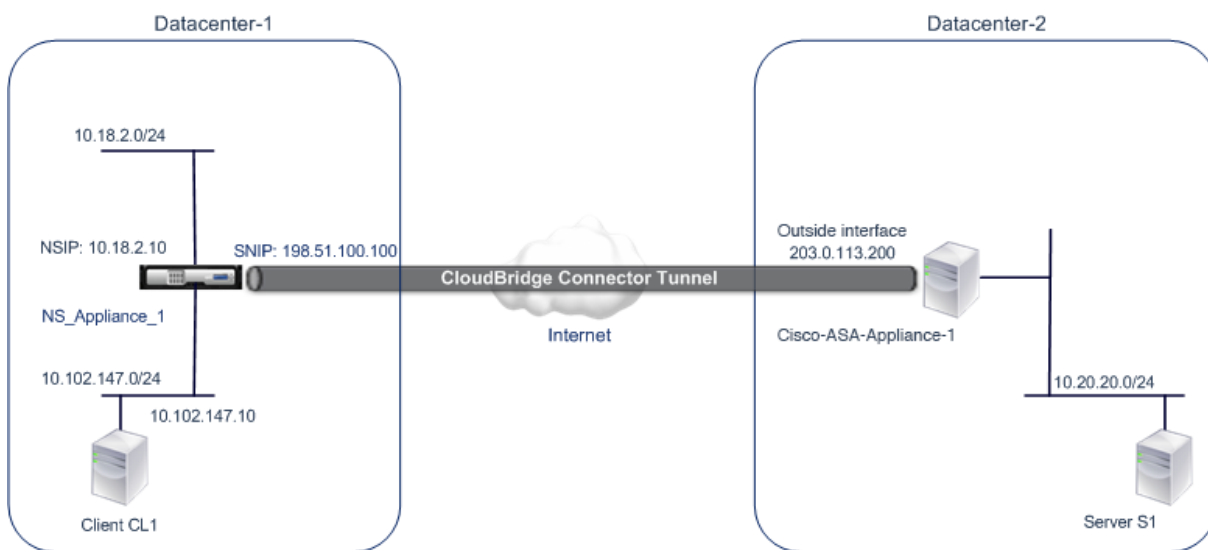

### Example of a CloudBridge Connector tunnel configuration

As an illustration of the traffic flow in a CloudBridge Connector tunnel, consider an example in which a CloudBridge Connector tunnel is set up between the following appliances:

- Citrix ADC appliance NS\_Appliance-1 in a datacenter designated as Datacenter-1
- Cisco ASA appliance Cisco-ASA-Appliance-1 in a datacenter designated as Datacenter-2

NS\_Appliance-1 and Cisco-ASA-Appliance-1 enable communication between private networks in Datacenter-1 and Datacenter-2 through the CloudBridge Connector tunnel. In the example, NS\_Appliance-1 and Cisco-ASA-Appliance-1 enable communication between client CL1 in Datacenter-1 and server S1 in Datacenter-2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On NS\_Appliance-1, the CloudBridge Connector tunnel configuration includes IPsec profile entity NS\_Cisco-ASA\_IPSec\_Profile, CloudBridge Connector tunnel entity NS\_Cisco-ASA\_Tunnel, and policy based routing (PBR) entity NS\_Cisco-ASA\_Pbr.

### Points to consider for a CloudBridge Connector tunnel configuration

Before you begin configuring CloudBridge connector tunnel, make sure that:

- The following IPSec settings are supported for a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance.

IPSec Properties	Settings
IPSec mode	Tunnel mode
IKE version	Version 1
IKE authentication method	Pre-Shared Key
IKE encryption algorithm	AES, 3DES
IKE hash algorithm	HMAC SHA1, HMAC MD5
ESP encryption algorithm	AES, 3DES
ESP hash algorithm	HMAC SHA1, HMAC MD5

- You must specify the same IPSec settings on the Citrix ADC appliance and the Cisco ASA appliance at the two ends of the CloudBridge Connector tunnel.
- Citrix ADC provides a common parameter (in IPSec profiles) for specifying an IKE hash algorithm and an ESP hash algorithm. It also provides another common parameter for specifying an IKE encryption algorithm and an ESP encryption algorithm. Therefore, in the Cisco ASA appliance, you must specify the same hash algorithm and same encryption algorithm in IKE (phase 1 configuration) and ESP (phase 2 configuration).
- You must configure the firewall at the Citrix ADC end and Cisco ASA end to allow the following.

- Any UDP packets for port 500
- Any UDP packets for port 4500
- Any ESP (IP protocol number 50) packets

## Configuring Cisco ASA for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel on a Cisco ASA appliance, use the Cisco ASA command line interface, which is the primary user interface for configuring, monitoring, and maintaining Cisco ASA appliances.

Before you begin the CloudBridge Connector tunnel configuration on a Cisco ASA appliance, make sure that:

- You have a user account with administrator credentials on the Cisco ASA appliance.
- You are familiar with the Cisco ASA command line interface.
- The Cisco ASA appliance is UP and running, is connected to the Internet, and is also connected to the private subnets whose traffic is to be protected over the CloudBridge Connector tunnel.

### Note

The procedures for configuring CloudBridge Connector tunnel on a Cisco ASA appliance might change over time, depending on the Cisco release cycle. Citrix recommends that you follow the official Cisco ASA product documentation for Configuring IPsec VPN tunnels, at:

- <http://www.cisco.com>

To configure a CloudBridge connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance, perform the following tasks on the Cisco ASA appliance's command line:

- **Create an IKE Policy.** An IKE policy defines a combination of security parameters to be used during the IKE negotiation (phase 1). For example, parameters such as hash algorithm, encryption algorithm, and authentication method to be used in the IKE negotiation are set in this task.
- **Enable IKE on the outside interface.** Enable IKE on the outside interface through which the tunnel traffic will flow to the tunnel peer.
- **Create a tunnel group.** A tunnel group specifies the type of tunnel and the pre-shared key. The tunnel type must be set to ipsec-l2l, which stands for IPsec LAN to LAN. A pre-shared key is a text string, which the peers of a CloudBridge Connector tunnel use to mutually authenticate with each other. The pre-shared keys are matched against each other for IKE authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on the Cisco ASA appliance and the Citrix ADC appliance.
- **Define a transform set.** A transform set defines a combination of security parameters (phase 2) to be used in the exchange of data over the CloudBridge Connector tunnel after the IKE negotiation is successful.

- **Create an access List.** Crypto access lists are used to define the subnets whose IP traffic will be protected over the CloudBridge tunnel. The source and destination parameters in the access list specify the Cisco appliance side and Citrix ADC side subnets that are to be protected over the CloudBridge Connector Tunnel. The access list must be set to permit. Any request packet that originates from an appliance in the Cisco appliance side subnet and is destined to an appliance in the Citrix ADC side subnet, and that matches the source and destination parameters of the access list, is sent across the CloudBridge Connector tunnel.
- **Create a crypto map.** Crypto maps define the IPSec parameters for security associations (SAs). They include the following: Crypto access list to identify the subnets whose traffic is to be protected over the CloudBridge tunnel, peer (Citrix ADC) identification by IP address, and transform set to match the peer security settings.
- **Apply the crypto Map to the outside interface.** In this task, you apply the crypto map to the outside interface through which the tunnel traffic will flow to the tunnel peer. Applying the crypto map to an interface instructs the Cisco ASA appliance to evaluate all interface traffic against the crypto map set and to use the specified policy during connection or security association negotiations.

The examples in the following procedures create settings of Cisco ASA appliance Cisco-ASA-Appliance-1 used in Example of CloudBridge Connector Configuration and Data Flow.

To create an IKE policy by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto ikev1 policy priority	Cisco-ASA-appliance-1(config)# crypto ikev1 policy 1	Enter IKE policy configuration mode and identify the policy to create. (Each policy is uniquely identified by the priority number you assign.) This example configures policy 1.

Command	Example	Command Description	
encryption (3des	aes)	Cisco-ASA-appliance-1 (config-ikev1-policy)# encryption 3des	Specify the encryption algorithm. This example configures the 3DES algorithm.
hash (sha	md5)	Cisco-ASA-appliance-1 (config-ikev1-policy)# hash sha	Specify the hash algorithm. This example configures SHA.
authenticationpre-share	Cisco-ASA-appliance-1 (config-ikev1-policy)# authentication pre-share	Specify the pre-share authentication method.	
group 2	Cisco-ASA-appliance-1 (config-ikev1-policy)# group 2	Specify 1024-bit Diffie-Hellman group identifier (2).	
lifetime seconds	Cisco-ASA-appliance-1 (config-ikev1-policy)# lifetime 28800	Specify the security association's lifetime in seconds. This example configures 28800 seconds, which is the default value of lifetime in a Citrix ADC appliance.	

To enable IKE on the outside interface by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, in the order shown:

Command	Example	Command Description
<code>crypto ikev1 enable outside</code>	Cisco-ASA-appliance-1(config)# <code>crypto ikev1 enable outside</code>	Enable IKEv1 on the interface through which the tunnel traffic flows to the tunnel peer. This example enables IKEv1 on the interface named outside.

To create a tunnel group by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode, as show in the attached pdf [Tunnel Group using Cisco ASA command line](#):

To create a crypto access list by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following command in global configuration mode, in the order shown:

Command	Example	Command Description
<code>access-list access-list-number permit IP source source-wildcard destination destination-wildcard</code>	Cisco-ASA-appliance-1(config)# <code>access-list 111 permit ip 10.20.20.0 0.0.0.255 10.102.14</code>	Specify conditions to determine the subnets whose IP traffic is to be protected over the CloudBridge Connector tunnel. This example configures access list 111 to protect traffic from subnets 10.20.20.0/24 (at the Cisco-ASA-Appliance-1 side) and 10.102.147.0/24 (at the NS_Appliance-1 side).

To define a transform set by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands, starting in global configuration mode. See [Transform set using ASA command line table pdf](#).

To create a crypto map by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto map map-name seq-num match address access-list-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 match address 111	Create a crypto map and specify an access list to it. This example configures crypto map NS-CISCO-CM with sequence number 1 and assigns access list 111 to NS-CISCO-CM.
crypto map map-name seq-num set peer ip-address	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 set peer 198.51.100.100	Specify the peer (Citrix ADC appliance) by its IP address. This example specifies 198.51.100.100, which is the tunnel endpoint IP address on the Citrix ADC appliance.
crypto map map-name seq-num set ikev1 transform-set transform-set-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM 1 set ikev1 transform-set NS-CISCO-TS	Specify which transform set is allowed for this crypto map entry. This example specifies transform set NS-CISCO-TS.

To apply a crypto map to an interface by using the Cisco ASA command line

At the Cisco ASA appliance's command prompt, type the following commands starting in global configuration mode, in the order shown:

Command	Example	Command Description
crypto map map-name interface interface-name	Cisco-ASA-appliance-1 (config)# crypto map NS-CISCO-CM interface outside	Apply the crypto map to the interface through which CloudBridge Connector tunnel traffic will flow. This example applies crypto map NS-CISCO-CM to interface outside.

### Configuring the Citrix ADC appliance for the CloudBridge Connector tunnel

To configure a CloudBridge Connector tunnel between a Citrix ADC appliance and a Cisco ASA appliance, perform the following tasks on the Citrix ADC appliance. You can use either the Citrix ADC com-

mand line or the Citrix ADC graphical user interface (GUI):

- Create an IPsec profile.
- Create an IP tunnel that uses IPsec protocol, and associate the IPsec profile with it.
- Create a PBR rule and associate it with the IP tunnel.

To create an IPSEC profile by using the Citrix ADC command line

At the command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1 -encAlgo AES -hashAlgo HMAC_SHA1 -perfectForwardSecrecy ENABLE`
- `show ipsec profile <name>`

\*\*To create an IPSEC tunnel and bind the IPSEC profile to it by using the Citrix ADC command line

\*\*At the command prompt, type:

- `add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC -ipsecProfileName <string>`
- `show ipTunnel <name>`

\*\*To create a PBR rule and bind the IPSEC tunnel to it by using the Citrix ADC command line

\*\*At the command prompt, type:

- `**add pbr** <pbrName> **ALLOW** -**srcIP** <subnet-range> -**destIP** <subnet-range>`
- `**ipTunnel** <tunnelName>`
- `**apply pbrs**`
- `**show pbr** <pbrName>`

To create an IPSEC profile by using the GUI

1. Navigate to **System > CloudBridge Connector > IPsec Profile**.
2. In the details pane, click **Add**.
3. In the **Add IPsec Profile** page, set the following parameters:
  - Name
  - Encryption Algorithm
  - Hash Algorithm
  - IKE Protocol Version
  - Perfect Forward Secrecy (Enable this parameter)
4. Configure the IPsec authentication method to be used by the two CloudBridge Connector tunnel peers to mutually authenticate: Select the **Pre-shared key authentication** method and set the **Pre-Shared Key Exists** parameter.
5. Click **Create**, and then click **Close**.

To create an IP tunnel and bind the IPSEC profile to it by using the GUI

1. Navigate to **System > CloudBridge Connector > IP Tunnels**.

2. On the **IPv4 Tunnels tab**, click **Add**.
3. In the **Add IP Tunnel** page, set the following parameters:
  - Name
  - Remote IP
  - Remote Mask
  - Local IP Type (In the Local IP Type drop-down list, select Subnet IP).
  - Local IP (All the configured IP addresses of the selected IP type are in the Local IP drop down list. Select the desired IP from the list.)
  - Protocol
  - IPsec Profile
4. Click **Create**, and then click **Close**.

To create a PBR rule and bind the IPSEC tunnel to it by using the GUI

1. Navigate to **System > Network > PBR**.
2. On the **PBR** tab, click **Add**.
3. In the **Create PBR** page, set the following parameters:
  - Name
  - Action
  - Next Hop Type (Select IP Tunnel)
  - IP Tunnel Name
  - Source IP Low
  - Source IP High
  - Destination IP Low
  - Destination IP High
4. Click **Create**, and then click **Close**.

The corresponding new CloudBridge Connector tunnel configuration on the Citrix ADC appliance appears in the GUI. The current status of the CloudBridge connector tunnel is shown in the Configured CloudBridge Connector pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

The following commands create settings of Citrix ADC appliance NS\_Appliance-1 in “Example of a CloudBridge Connector Configuration.”:

```
1 > add ipsec profile NS_Cisco-ASA_IPSec_Profile -psk
   examplepresharedkey -ikeVersion v1 -encAlgo AES -hashalgo
   HMAC_SHA1 -lifetime 315360 -perfectForwardSecrecy ENABLE
2
3 Done
4
5 > add iptunnel NS_Cisco-ASA_Tunnel 203.0.113.200 255.255.255.255
   198.51.100.100 -protocol IPSEC -ipsecProfileName NS_Cisco-
   ASA_IPSec_Profile
```

```
6
7
8 Done
9
10 > add pbr NS_Cisco-ASA_Pbr -srcIP 10.102.147.0-10.102.147.255 - destIP
      10.20.0.0-10.20.255.255 - ipTunnel NS_Cisco-ASA_Tunnel
11
12
13 Done
14
15 > apply pbrs
16
17 Done
18
19 <!--NeedCopy-->
```

## Monitoring the CloudBridge Connector Tunnel

You can monitor the performance of CloudBridge Connector tunnels on a Citrix ADC appliance by using CloudBridge Connector tunnel statistical counters. For more information about displaying CloudBridge Connector tunnel statistics on a Citrix ADC appliance, see [Monitoring CloudBridge Connector Tunnels](#).

## High Availability

September 21, 2020

A high availability (HA) deployment of two Citrix ADC appliances can provide uninterrupted operation in any transaction. With one appliance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

The secondary node monitors the primary by sending periodic messages (often called heartbeat messages or health checks) to determine whether the primary node is accepting connections. If a health check fails, the secondary node retries the connection for a specified period, after which it determines that the primary node is not functioning normally. The secondary node then takes over for the primary (a process called failover).

After a failover, all clients must reestablish their connections to the managed servers, but the session persistence rules are maintained as they were before the failover.

With Web server logging persistence enabled, no log data is lost due to the failover. For logging persistence to be enabled, the log server configuration must carry entries for both systems in the log.conf file.

The following figure shows a network configuration with an HA pair.

Figure 1. Citrix ADC Appliances in a High Availability Configuration

To configure HA, you might want to begin by creating a basic setup, with both nodes in the same subnet. You can then customize the intervals at which the nodes communicate health-check information, the process by which nodes maintain synchronization, and the propagation of commands from the primary to the secondary. You can configure fail-safe mode to prevent a situation in which neither node is primary. If your environment includes devices that do not accept Citrix ADC gratuitous ARP messages, you should configure virtual MAC addresses. When you are ready for a more complex configuration, you can configure HA nodes in different subnets.

To improve the reliability of your HA setup, you can configure route monitors and create redundant links. In some situations, such as when troubleshooting or performing maintenance tasks, you might want to force a node to fail over (assign primary status to the other node), or you might want to force the secondary node to stay secondary or the primary node to stay primary.

## Points to consider for a high availability setup

September 21, 2020

### Note

The following requirements for configuring systems in an HA setup:

- In an HA configuration, the primary and secondary Citrix ADC appliances should be of the same model. Different Citrix ADC models are not supported in an HA pair.
- In an HA setup, both nodes must run the same version of Citrix ADC, for example, nCore/nCore or classic/classic. If the nodes are running Citrix ADC classic and you want to migrate to Citrix ADCs nCore of the same Citrix ADC release, prop and sync are not supported during the migration process. Once migration is complete, prop and sync are auto-enabled. The same applies if you migrate from Citrix ADC nCore to Citrix ADC classic.
- Entries in the configuration file (ns.conf) on both the primary and the secondary system must match, with the following exceptions:
  - The primary and the secondary systems must each be configured with their own unique IP addresses (NSIPs.)
  - In an HA pair, the node ID and associated IP address of one node must point to the other node. For example, if you have nodes NS1 and NS2, you must configure NS1 with a unique node ID and the IP address of NS2, and you must configure NS2 with a unique node ID and the IP address of NS1.
- If you create a configuration file on either node by using a method that does not go directly through the GUI or the CLI (for example, importing SSL certificates, or changing to startup scripts), you must copy the configuration file to the other node or create an identical file on that node.
- Initially, all Citrix ADC appliances are configured with the same RPC node password. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. For security, you should change the default RPC node passwords.

One RPC node exists on each Citrix ADC. This node stores the password, which is checked against the password provided by the contacting system. To communicate with other systems, each Citrix ADC requires knowledge of those systems, including how to authenticate on those systems. RPC nodes maintain this information, which includes the IP addresses of the other systems, and the passwords they require for authentication.

RPC nodes are implicitly created when adding a node or adding a Global Server Load Balancing (GSLB) site. You cannot create or delete RPC nodes manually.

**Note:**

If the Citrix ADC appliances in a high availability setup are configured in one-arm mode, you must disable all system interfaces except the one connected to the switch or hub.

For an IPv6 HA configuration, the following considerations apply:

- You must install the IPv6PT license on both Citrix ADC appliances.
- After installing the IPv6PT license, enable the IPv6 feature by using the GUI or the command line interface.
- Both Citrix ADC appliances require a global NSIP IPv6 address. In addition, network entities (for example, switches and routers) between the two nodes must support IPv6.

## Configuring high availability

September 21, 2020

To set up a high availability configuration, you create two nodes, each of which defines the other's Citrix ADC IP (NSIP) address as a remote node. Begin by logging on to one of the two Citrix ADC appliances that you want to configure for high availability, and add a node. Specify the other appliance's Citrix ADC IP (NSIP) address as the address of the new node. Then, log on to the other appliance and add a node that has the NSIP address of the first appliance. An algorithm determines which node becomes primary and which becomes secondary.

**Note:**

The Citrix ADC GUI provides an option that avoids having to log on to the second appliance.

The following figure shows a simple HA setup, in which both nodes are in same subnet.

Figure 1. Two Citrix ADC Appliances Connected in a High Availability Configuration

## Adding a remote node

To add a remote Citrix ADC appliance as a node in a high availability setup, you specify a unique node ID and the appliance's NSIP. The maximum number of node IDs in an HA setup is 64. When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

### Note:

To ensure that each node in the high availability configuration has the same settings, you should synchronize your SSL certificates, startup scripts, and other configuration files with those on the primary node.

## To add a node by using the command line interface

At the command prompt, type:

- `add ha node <id> <IPAddress>`
- `show ha node`

Example

```
1 > add ha node 10 203.0.113.32
2 <!--NeedCopy-->
```

### To disable an HA monitor by using the command line interface

At the command prompt, type:

- `set interface <ifNum> [-haMonitor ( ON | OFF )]`
- `show interface <ifNum>`

Example

```
1 > set interface 1/3 -haMonitor OFF
2 Done
3 <!--NeedCopy-->
```

### To add a remote node by using the GUI

Navigate to **System > High Availability** and, on the **Nodes** tab, add a new remote node, or edit an existing node.

### Disabling or Enabling a Node

You can disable or enable only a secondary node. When you disable a secondary node, it stops sending heartbeat messages to the primary node, and therefore the primary node can no longer check the status of the secondary. When you enable a node, the node takes part in the high availability configuration.

### To disable or enable a node by using the command line interface

At the command prompt, type one of the following commands:

- `set ha node -hastatus DISABLED`
- `set ha node -hastatus ENABLED`

### To disable or enable a node by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. In the **High Availability Status** list, select **ENABLED (Actively Participate in HA)** or **DISABLED (Do not participate in HA)**.

## Removing a Node

If you remove a node, the nodes are no longer in high availability configuration.

### To remove a node by using the command line interface

At the command prompt, type:

```
rm ha node <id>
```

Example

```
1 > rm ha node 10
2   Done
3 <!--NeedCopy-->
```

### To remove a node by using the GUI

Navigate to **System > High Availability** and, on the **Nodes** tab, delete the node.

## Configuring the communication intervals

September 21, 2020

The hello interval is the interval at which the heartbeat messages are sent to the peer node. The dead interval is the time interval after which the peer node is marked DOWN if heartbeat packets are not received. The heartbeat messages are UDP packets sent to port 3003 of the other node in an HA pair. Dead interval must be set as a multiple of hello interval.

### To set the hello and dead intervals by using the command line interface

At the command prompt, type:

- `set HA node [-helloInterval <msecs>] [-deadInterval <secs>]`
- `show HA node <id>`

### To set the hello and dead intervals by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. Set the following parameters:
  - Hello Interval (msecs)
  - Dead Interval (secs)

## Configuring synchronization

September 21, 2020

Synchronization is a process of duplicating the configuration of the primary node on the secondary node. The purpose of synchronization is to ensure that there is no loss of configuration information between the primary and the secondary nodes, regardless of the number of failovers that occur. Synchronization uses port 3010.

Synchronization is triggered by either of the following circumstances:

- The secondary node in an HA setup comes up after a restart.
- The primary node becomes secondary after a failover.

Automatic synchronization is enabled by default. You can also force synchronization.

### Disabling or enabling synchronization

Automatic HA synchronization is enabled by default on each node in an HA pair. You can enable or disable it on either node.

#### To disable or enable automatic synchronization by using the command line interface

At the command prompt, type:

- `set HA node -haSync DISABLED`
- `set HA node -haSync ENABLED`

#### To disable or enable synchronization by using the GUI

1. Navigate to **System > High Availability**.
2. Under HA Synchronization, clear or select the Secondary node will fetch the configuration from Primary option.

### Forcing the secondary node to synchronize with the primary node

In addition to automatic synchronization, the Citrix ADC supports forced synchronization. You can force the synchronization from either the primary or the secondary node. When you force synchronization from the secondary node, it starts synchronizing its configuration with the primary node.

However, if synchronization is already in progress, forced synchronization fails and the system displays a warning. Forced synchronization also fails in any of the following circumstances:

- You force synchronization on a standalone system.

- The secondary node is disabled.
- HA synchronization is disabled on the secondary node.

### To force synchronization by using the command line interface

At the command prompt, type:

```
force HA sync
```

### To force synchronization by using the GUI

1. Navigate to System > High Availability.
2. On the **Nodes** tab, in the Action list, click **Force Synchronization**.

## Synchronizing configuration files in a high availability setup

September 21, 2020

In a high availability setup, all configuration files are synchronised automatically from the primary node to the secondary node at an interval of one minute. Synchronizing configuration files can be performed manually by using the command line interface or the GUI at either the primary or the secondary node.

Files located on the secondary that are specific to the secondary (not present on the primary) are not deleted during the synchronization.

### To synchronize files in a high availability setup by using the command line interface

At the command prompt, type:

```
sync HA files <mode>
```

Example

```
1 > sync HA files all
2 Done
3 <!--NeedCopy-->
```

```
1 > sync HA files ssl
2 Done
3 <!--NeedCopy-->
```

**Parameter descriptions (of the command listed in the CLI procedure)**

```
sync ha files <mode>
```

```
mode
```

Specify one of the following modes of synchronization.

- **all** - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, and Application Firewall XML objects.
- **bookmarks** - Synchronize all Access Gateway bookmarks.
- **ssl** - Synchronize all certificates, keys, and CRLs for the SSL feature.
- **htmlinjection** - Synchronize all scripts configured for the HTML injection feature.
- **imports** - Synchronize all XML objects (for example, WSDLs, schemas, error pages) configured for the application firewall.
- **misc** - Synchronize all license files and the rc.conf file.
- **all\_plus\_misc** - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, application firewall XML objects, licenses, and the rc.conf file.

**To synchronize files in a high availability setup by using the GUI**

Navigate to **System > Diagnostics** and, in the **Utilities** group, click **Start HA files synchronization**.

**Configuring command propagation**

September 21, 2020

In an HA setup, any command issued on the primary node propagates automatically to, and is executed on, the secondary before it is executed on the primary. If command propagation fails, or if command execution fails on the secondary, the primary node executes the command and logs an error. Command propagation uses port 3010.

In an HA pair configuration, command propagation is enabled by default on both the primary and secondary nodes. You can enable or disable command propagation on either node in an HA pair. If you disable command propagation on the primary node, commands are not propagated to the secondary node. If you disable command propagation on the secondary node, commands propagated from the primary are not executed on the secondary node.

**Note**

After reenabling propagation, remember to force synchronization.

If synchronization occurs while you are disabling propagation, any configuration-related changes that you make before the disabling of propagation takes effect are synchronized with the secondary node. This is also true for cases where propagation is disabled while synchronization is in progress.

### **To disable or enable command propagation by using the command line interface**

At the command prompt, type:

- set HA node -haProp DISABLED
- set HA node -haProp ENABLED

### **To disable or enable command propagation by using the GUI**

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. Clear or select the Primary node will propagate configuration to the Secondary option.

## **Restricting high availability synchronization traffic to a VLAN**

June 17, 2021

In a high availability (HA) deployment, traffic related to maintaining the HA configuration flows between the two HA nodes. This traffic is of the following types:

- Config synchronization
- Config propagation
- Connection mirroring
- Load balancing persistency config synchronization
- Persistent session synchronization
- Session state synchronization

Proper flow of this HA related traffic between the two nodes is critical for the functioning of the HA deployment. Typically, the HA related traffic is small in volume but can become very high during a failover. It becomes very high if stateful connection failover is enabled and the node that was primary before the failover was handling a large number of connections.

By default, the HA related traffic flows through the VLANs to which the NSIP address is bound. To accommodate a potential surge in this traffic, you can separate the HA related traffic from the management traffic and restrict its flow to a separate VLAN. This VLAN is called the HA SYNC VLAN.

## Points to consider before Configuring an HA SYNC VLAN

- The configuration of an HA SYNC VLAN is neither propagated nor synchronized. In other words, the HA SYNC VLAN is node specific and is configured independently on each node.
- HA SYNC VLAN configuration is removed when you clear the configuration in only FULL mode.
- HA MON must be set to OFF for interfaces that are part of the HA SYNC VLAN, to avoid a situation in which both nodes function as the primary node.
- Management interfaces (for example, 0/1 and 0/2) must not be part of the HA SYNC VLAN, so that HA related traffic does not flow through management interfaces.
- Citrix recommends disabling high availability heartbeat messages on management interfaces and enabling on HA SYNC VLAN interfaces. After meeting these recommendations, high availability heartbeat messages can also be enabled on data interfaces.

For more information on disabling high availability heartbeat messages on interfaces, see [Managing high availability heartbeat messages on a Citrix ADC appliance](#).

To configure an HA SYNC VLAN on a Citrix ADC node, specify a configured VLAN with the HA SYNC VLAN parameter of the local node entity.

### To configure an HA SYNC VLAN on a local node by using the command line:

At the command prompt, type:

- `set ha node -syncvlan <VLANID>`
- `show node`

### Parameter Description:

**syncvlan (Sync VLAN)** - VLAN on which HA related traffic is sent. This includes traffic for synchronization, propagation, connection mirroring, load balancing persistency, configuration synchronization, persistent session synchronization, and session state synchronization. However, HA heartbeats can use any interfaces.

### To configure an HA SYNC VLAN on a node by using the GUI:

1. Navigate to **System > High Availability**.
2. Set the **Sync VLAN** parameter while modifying the local node.

## Configuring fail-safe mode

September 21, 2020

In an HA configuration, fail-safe mode ensures that one node is always primary when both nodes fail the health check. This is to ensure that when a node is only partially available, backup methods are

enabled to handle traffic as best as possible. The HA fail-safe mode is configured independently on each node.

The following table shows some of the fail-safe cases. The NOT\_UP state means that the node failed the health check yet it is partially available. The UP state means that the node passed the health check.

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP(failed last)	NOT_UP (failed first)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
NOT_UP (failed first)	NOT_UP(failed last)	A (Secondary), B (Secondary)	A(Secondary), B(Primary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
UP	UP	A (Primary), B (Secondary)	A (Primary), B (Secondary)	If both nodes pass the health check, no change in behavior with fail-safe enabled.
UP	NOT_UP	A(Primary), B(Secondary)	A (Primary), B (Secondary)	If only the secondary node fails, no change in behavior with fail-safe enabled.

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP	UP	A(Secondary), B(Primary)	A(Secondary), B(Primary)	If only the primary fails, no change in behavior with fail-safe enabled.
NOT_UP	UP (STAYSEC- ONDARY)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If the secondary is configured as STAYSEC-ONDARY, the primary remains primary even if it fails.

### To enable fail-safe mode by using the command line interface

At the command prompt, type:

```
set HA node [-failSafe ( **ON** | **OFF** )]
```

Example

```
1 set ha node -failsafe ON
2 <!--NeedCopy-->
```

### To enable fail-safe mode by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the node.
2. Under **Fail-Safe Mode**, select the **Maintain one Primary** node even when both nodes are unhealthy option.

## Configuring Virtual MAC Addresses

September 21, 2020

A Virtual MAC address (VMAC) is a floating entity shared by the primary and the secondary nodes in an HA setup.

In an HA setup, the primary node owns all of the floating IP addresses, such as the MIPs, SNIPs, and VIPs. The primary node responds to Address Resolution Protocol (ARP) requests for these IP addresses with its own MAC address. As a result, the ARP table of an external device (for example, an upstream router) is updated with the floating IP address and the primary node's MAC address.

When a failover occurs, the secondary node takes over as the new primary node. It then uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it acquired from the primary. However, the MAC address that the new primary advertises is the MAC address of its own interface.

Some devices (notably a few routers) do not accept the GARP messages generated by the Citrix ADC appliance. As a result, some external devices retain the old IP to MAC mapping advertised by the old primary node. This can result in a site going down.

You can overcome this problem by configuring a Virtual MAC on both nodes of an HA pair. Both nodes then possess identical MAC addresses. Therefore, when failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

To create a Virtual MAC, you need to first create a Virtual Router ID (VRID) and bind it to an interface. (In an HA setup, you need to bind the VRID to the interfaces on both nodes.) Once the VRID is bound to an interface, the system generates a Virtual MAC with the VRID as the last octet.

This section includes the following details:

- [Configuring IPv4 Virtual MACs](#)
- [Configuring IPv6 Virtual MAC6s](#)

## Configuring IPv4 Virtual MACs

When you create a IPv4 Virtual MAC address and bind it to a interface, any IPv4 packet sent from the interface uses the Virtual MAC address that is bound to the interface. If there is no IPv4 Virtual MAC bound to an interface, the interface's physical MAC address is used.

The generic Virtual MAC is of the form `00:00:5e:00:01:<VRID>`. For example, if you create a VRID with a value of 60 and bind it to an interface, the resulting Virtual MAC is `00:00:5e:00:01:3c`, where `3c` is the hex representation of the VRID. You can create 255 VRIDs with values from 1 to 255.

## Creating or modifying an IPv4 Virtual MAC

You create an IPv4 virtual MAC by assigning it a virtual router ID. You can then you bind the Virtual MAC to an interface. You cannot bind multiple VRIDs to the same interface. To verify the Virtual MAC con-

figuration, you should display and examine the Virtual MACs and the interfaces bound to the Virtual MACs.

### To add a Virtual MAC by using the command line interface

At the command prompt, type:

- `add vrID`
- `bind vrid <id> -ifnum <interface_name>`
- `show vrID`

Example

```
1 > add vrID 100
2 Done
3 > bind vrid 100 -ifnum 1/1 1/2 1/3
4 Done
5 <!--NeedCopy-->
```

### To unbind interfaces from a Virtual MAC by using the command line interface

At the command prompt, type:

- `unbind vrid <id> -ifnum <interface_name>`
- `show vrID`

### To configure a Virtual MAC by using the GUI

Navigate to **System** > **Network** > **VMAC** and, on the **VMAC** tab, add a new Virtual MAC, or edit an existing Virtual MAC.

### Removing an IPv4 Virtual MAC

To remove an IPv4 virtual MAC, you delete its virtual router ID.

### To remove an IPv4 Virtual MAC by using the command line interface

At the command prompt, type:

```
rm vrid <id>
```

Example

```
1 rm vrid 100s
2 <!--NeedCopy-->
```

### To remove an IPv4 Virtual MAC by using the GUI

Navigate to **System > Network > VMAC** and, on the **VMAC** tab, delete the IPv4 Virtual MAC.

### Configuring IPv6 Virtual MAC6s

The Citrix ADC supports Virtual MAC6 for IPv6 packets. You can bind any interface to a Virtual MAC6, even if an IPv4 Virtual MAC is bound to the interface. Any IPv6 packet sent from the interface uses the Virtual MAC6 bound to that interface. If there is no Virtual MAC6 bound to an interface, an IPv6 packet uses the physical MAC.

### Creating or Modifying a Virtual MAC6

You create an IPv6 virtual MAC by assigning it an IPv6 virtual router ID. You can then you bind the Virtual MAC to an interface. You cannot bind multiple IPv6 VRIDs to an interface. To verify the Virtual MAC6 configuration, you should display and examine the Virtual MAC6s and the interfaces bound to the Virtual MAC6s.

### To add a Virtual MAC6 by using the command line interface

At the command prompt, type:

- `add vrID6 <id>`
- `bind vrID6 <id> -ifnum <interface_name>`
- `show vrID6`

Example

```
1 > add vrID6 100
2 Done
3 > bind vrID6 100 -ifnum 1/1 1/2 1/3
4 Done
5 <!--NeedCopy-->
```

### To unbind interfaces from a Virtual MAC6 by using the command line interface

At the command prompt, type:

- `unbind vrID6 <id> -ifnum <interface_name>`
- `show vrID6`

### To configure a Virtual MAC6 by using the GUI

Navigate to **System > Network > VMAC** and, on the **VMAC6** tab, add a new Virtual MAC6, or edit an existing Virtual MAC6.

### Removing a Virtual MAC6

To remove an IPv4 virtual MAC, you delete its virtual router ID.

### To remove a Virtual MAC6 by using the command line interface

At the command prompt, type:

```
rm vrid6 <id>
```

Example

```
1 rm vrid6 100s
2 <!--NeedCopy-->
```

### To remove a Virtual MAC6 by using the GUI

Navigate to **System > Network > VMAC** and, on the **VMAC6** tab, delete the virtual router ID.

## Configuring high availability nodes in different subnets

March 16, 2021

The following figure shows an HA deployment with the two systems located in different subnets:

Figure 1. High Availability over a Routed Network

In the figure, the systems NS1 and NS2 are connected to two separate routers, R3 and R4, on two different subnets. The Citrix ADC appliances exchange heartbeat packets through the routers. This configuration could be expanded to accommodate deployments involving any number of interfaces.

**Note:**

If you use static routing on your network, you must add static routes between all the systems to ensure that heartbeat packets are sent and received successfully. (If you use dynamic routing on your systems, static routes are unnecessary.)

If the nodes in an HA pair reside on two separate networks, the primary and secondary node must have independent network configurations. This means that nodes on different networks cannot share entities such as SNIPs, VLANs, and routes. This type of configuration, where the nodes in an HA pair have different configurable parameters, is known as Independent Network Configuration (INC) or Symmetric Network Configuration (SNC).

The following table summarizes the configurable entities and options for an INC, and shows how they must be set on each node.

NetScaler entities	Options
IPs (NSIP/SNIPs)	Node-specific. Active only on that node.
VIPs	Floating.

NetScaler entities	Options
VLANs	Node-specific. Active only on that node.
Routes	Node-specific. Active only on that node. Link load balancing routes are floating.
ACLs	Floating (Common). Active on both nodes.
Dynamic routing	Node-specific. Active only on that node. The secondary node should also run the routing protocols and peer with upstream routers.
L2 mode	Floating (Common). Active on both nodes.
L3 mode	Floating (Common). Active on both nodes.
Reverse NAT (RNAT)	RNAT configuration with the NAT IP address set to a virtual server IP address (VIP) because the VIP address is floating (common).

As in configuring HA nodes in the same subnet, to configure HA nodes in different subnets, you log on to each of the two Citrix ADC appliances and add a remote node representing the other appliance.

### Adding a Remote Node

When two nodes of an HA pair reside on different subnets, each node must have a different network configuration. Therefore, to configure two independent systems to function as an HA pair, you must specify INC mode during the configuration process.

When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

### To add a node by using the command line interface

At the command prompt, type:

- `add ha node <id> <IPAddress> -inc ENABLED`
- `show ha node`

Example

```

1 > add ha node 3 10.102.29.170 -inc ENABLED
2 Done
3 > add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
4 Done

```

```
5 <!--NeedCopy-->
```

### To disable an HA monitor by using the command line interface

At the command prompt, type:

- `set interface <ifNum> [-haMonitor ( **ON** | **OFF** )]`
- `show interface <ifNum>`

Example

```
1 > set interface 1/3 -haMonitor OFF
2 Done
3 <!--NeedCopy-->
```

### To add a remote node by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, add a new remote node.
2. Make sure to select the Turn off HA monitor on interfaces/channels that are down and Turn on INC (Independent Network Configuration) mode on self mode options.

### Removing a Node

If you remove a node, the nodes are no longer in high availability configuration.

### To remove a node by using the command line interface

At the command prompt, type:

```
rm ha node <id>
```

Example

```
1 > rm ha node 2
2 Done
3 <!--NeedCopy-->
```

### To remove a node by using the GUI

Navigate to **System > High Availability** and, on the **Nodes** tab, delete the node.

**Note:**

You can use the Network Visualizer to view the Citrix ADC appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks.

## Configuring route monitors

September 21, 2020

You can use route monitors to make the HA state dependent on the internal routing table, whether or not the table contains any dynamically learned or static routes. In an HA configuration, a route monitor on each node watches the internal routing table to make sure that a route entry for reaching a particular network is always present. If the route entry is not present, the state of the route monitor changes to DOWN.

When a Citrix ADC appliance has only static routes for reaching a network, and you want to create a route monitor for the network, you must enable monitored static routes (MSR) for the static routes. MSR removes unreachable static routes from the internal routing table. If MSR is disabled on static routes, an unreachable static route can remain in the internal routing table, defeating the purpose of having the route monitor.

Route Monitors are supported both in non-INC and INC mode.

Route Monitors in HA in non-INC mode	Route Monitors in HA in INC mode
Route monitors are propagated by nodes and exchanged during synchronization.	Route monitors are neither propagated by nodes nor exchanged during synchronization.
Route monitors are active only in the current primary node.	Route monitors are active on both the primary and the secondary node.
The Citrix ADC appliance always displays the state of a route monitor as UP irrespective of the whether the route entry is present or not in the internal routing table.	The Citrix ADC appliance displays the state of the route monitor as DOWN if the corresponding route entry is not present in the internal routing table.
A route monitor starts monitoring its route after 180 seconds in the following cases [This is done to allow dynamic routes to get learnt, which may take 180 secs]: reboot, failover, set route6 command for v6 routes, set route msr enable/disable command for v4 routes, adding a new route monitor.	-

Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

Consider an example of a non-INC mode HA setup in a two-arm topology that has Citrix ADC appliances NS1 and NS2 in the same subnet, with router R1 and switches SW1, SW2, and SW3.

Because R1 is the only router in this setup, you want the HA setup to failover whenever R1 is not reachable from the current primary node. You can configure a route monitor (say, RM1 and RM2, respectively) on each of the nodes to monitor the reachability of R1 from that node.

Figure 1.

With NS1 as the current primary node, the execution flow is as follows:

1. Route monitor RM1 on NS1 monitors NS1's internal routing table for the presence of a route entry for router R1. NS1 and NS2 exchange heartbeat messages through switch SW1 or SW3 at regular intervals.
2. If switch SW1 goes down, the routing protocol on NS1 detects that R1 is not reachable and therefore removes the route entry for R1 from the internal routing table. NS1 and NS2 exchange heartbeat messages through switch SW3 at regular intervals.

3. Detecting that the route entry for R1 is not present in the internal routing table, RM1 initiates a failover. If route to R1 is down from both NS1 and NS2, failover happens every 180 seconds till one of the appliances is able to reach R1 and restore the connectivity.

## Adding a route monitor to a high availability node

A single procedure creates a route monitor and binds it to an HA node.

### To add a route monitor by using the command line interface

At the command prompt, type:

- `bind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])`
- `show HA node`

Example

```
1 > bind HA node 0 -routeMonitor 10.102.71.0 255.255.255.0
2 Done
3 > bind HA node 0 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
4 Done
5 <!--NeedCopy-->
```

### To add a route monitor by using the GUI

Navigate to **System > High Availability** and, on the **Route Monitors** tab, click **Configure**.

## Removing route monitors

### To remove a route monitor by using the command line interface

At the command prompt, type:

- `unbind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])`
- `show ha node`

Example

```
1 unbind HA node 3 -routeMonitor 10.102.71.0 255.255.255.0
2 unbind HA node 3 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
3 <!--NeedCopy-->
```

## To remove a route monitor by using the GUI

Navigate to **System > High Availability** and, on the **Route Monitors** tab, delete the route monitor.

## Limiting failovers caused by route monitors in non-INC mode

September 21, 2020

In an HA configuration in non-INC mode, if route monitors fail on both nodes, failover happens every 180 seconds until one of the nodes is able to reach all of the routes monitored by the respective route monitors.

However, for a node, you can limit the number of failovers for a given interval by setting the Maximum Number of Flips and Maximum Flip Time parameters on the nodes. When either limit is reached, no more failovers occur, and the node is assigned as primary (but node state as NOT UP) even if any route monitor fails on that node. This combination of HA state as Primary and Node state as NOT UP is called Stick Primary state.

If the node is then able to reach all of the monitored routes, the next monitor failure triggers resetting of the Maximum Number of Flips and Maximum Flip Time parameters on the node and starting the time specified in the Maximum Flip Time parameter.

These parameters are set independently on each node and therefore are neither propagated nor synchronized.

- Parameters for limiting the number of failovers

### **Maximum Number of Flips (maxFlips)**

Maximum number of failovers allowed, within the Maximum Flip Time interval, for the node in HA in non INC mode, if the failovers are caused by route-monitor failure.

### **Maximum Flip Time ( maxFlipTime )**

Amount of time, in seconds, during which failovers resulting from route-monitor failure are allowed for the node in HA in non INC mode.

To limit the number of failovers by using the command line interface

At the command prompt, type:

- `set HA node [-maxFlips < positive_integer>] [-maxFlipTime <positive_integer >]`
- `show HA node [< id>]`

To limit the number of failovers by using the GUI

1. Navigate to **System > High Availability** and, on the **Nodes** tab, open the local node.

## 2. Set the following parameters:

- Maximum Number of Flips
- Maximum Flip Time

```
1 > set ha node -maxFlips 30 -maxFlipTime 60
2 Done
3 > sh ha node
4 1) Node ID: 0
5 IP: 10.102.169.82 (NS)
6 Node State: UP
7 Master State: Primary
8 Fail-Safe Mode: OFF
9 INC State: DISABLED
10 Sync State: ENABLED
11 Propagation: ENABLED
12 Enabled Interfaces : 1/1
13 Disabled Interfaces : None
14 HA MON ON Interfaces : 1/1
15 Interfaces on which heartbeats are not seen :None
16 Interfaces causing Partial Failure:None
17 SSL Card Status: NOT PRESENT
18 Hello Interval: 200 msec
19 Dead Interval: 3 secs
20 Node in this Master State for: 0:4:24:1 (days:hrs:min:sec)
21
22 2) Node ID: 1
23 IP: 10.102.169.81
24 Node State: UP
25 Master State: Secondary
26 Fail-Safe Mode: OFF
27 INC State: DISABLED
28 Sync State: SUCCESS
29 Propagation: ENABLED
30 Enabled Interfaces : 1/1
31 Disabled Interfaces : None
32 HA MON ON Interfaces : 1/1
33 Interfaces on which heartbeats are not seen : None
34 Interfaces causing Partial Failure: None
35 SSL Card Status: NOT PRESENT
36
37 Local node information:
38 Configured/Completed Flips: 30/0
39 Configured Flip Time: 60
40 Critical Interfaces: 1/1
```

```

41
42     Done
43 <!--NeedCopy-->

```

## SNMP Alarm for Sticky Primary State

Enable HA-STICKY-PRIMARY SNMP alarm in a node of a high availability set up if you want to be alerted of the node becoming sticky primary. When the node becomes sticky primary, it alerts by generating a trap message (stickyPrimary (1.3.6.1.4.1.5951.1.1.0.138)) and sends it to all the configured SNMP trap destinations. For more information about configuring SNMP alarms and trap destinations, see [configuring the Citrix ADC to Generate SNMPv1 and SNMPv2 Traps](#).

## Frequently Asked Questions

Consider an example of a high availability setup of two Citrix ADC appliances NS-1 and NS-2 in non-INC mode. Maximum numbers of flips and maximum flip time in both the nodes have been set with the same values.

The following table lists the settings used in this example:

Entity	Detail
IP address of NS-1	10.102.173.211
IP address of NS-2	10.102.173.212
Maximum number of flips	2
Maximum flip time	200

For information about the [maximum number of flips and maximum flip time settings](#), refer to the pdf.

## Configuring failover interface set

September 21, 2020

A Failover Interface Set (FIS) is a logical group of interfaces. In an HA configuration, using a FIS is a way to prevent failover by grouping interfaces so that, when one interface fails, other functioning interfaces are still available. A FIS can also be configured for the nodes of a Citrix ADC cluster.

HA MON interfaces that are not bound to an FIS are known as critical interfaces (CI) because if any of them fails, failover is triggered.

**Note:**

An FIS does not create an active and standby configuration. It also does not prevent bridging loops when connecting to links to the same VLAN.

**Note**

An FIS does not create an active and standby Interfaces or channels. It also does not prevent bridging loops when connecting to links to the same VLAN

## Creating or Modifying an FIS

### To add an FIS and bind interfaces to it by using the command line interface

At the command prompt, type:

- `add fis <name>`
- `bind fis \<name\> \<ifnum\> ...`
- `show fis \<name\>`

Example

```
1 > add fis fis1
2 Done
3 > bind fis fis1 1/3 1/5
4 Done
5 <!--NeedCopy-->
```

An unbound interface becomes a critical interface (CI) if it is enabled and HA MON is on.

### To unbind an interface from an FIS by using the command line interface

At the command prompt, type:

- `unbind fis \<name\> \<ifnum\> ...`
- `show fis \<name\>`

Example

```
1 > unbind fis fis1 1/3
2 Done
3 <!--NeedCopy-->
```

### To configure an FIS by using the GUI

Navigate to System > High Availability and, on the Failover Interface Set tab, add a new FIS, or edit an existing FIS.

## Removing an FIS

When the FIS is removed, its interfaces are marked as critical interfaces.

### To remove an FIS by using the command line interface

At the command prompt, type:

```
rm fis <name>
```

Example

```
1 > rm fis fis1
2   Done
3 <!--NeedCopy-->
```

### To remove an FIS by using the GUI

Navigate to **System > High Availability** and, on the **Failover Interface Set** tab, delete the FIS.

## Understanding the causes of failover

August 18, 2021

The following events can cause failover in an high availability configuration:

1. If the secondary node does not receive a heartbeat packet from the primary for a period of time that exceeds the dead interval set on the secondary. (See Note 1.)
2. The primary node experiences a hardware failure of its SSL card.
3. The primary node does not receive any heartbeat packets on its network interfaces for three seconds.
4. On the primary node, a network interface that is not part of a Failover Interface Set (FIS) or a Link Aggregation (LA) channel and has the HA Monitor (HAMON) enabled, fails. (See Note 2.)
5. On the primary node, all interfaces in an FIS fail. (See Note 2.)
6. On the primary node, an LA channel with HAMON enabled fails. (See Note 2.)
7. On the primary node, all interfaces fail (see Note 2). In this case, failover occurs regardless of the HAMON configuration.
8. On the primary node, all interfaces are manually disabled. In this case, failover occurs regardless of the HAMON configuration.
9. You force a failover by issuing the force failover command on either node.
10. A route monitor that is bound to the primary node goes DOWN.

**Note 1:**

For more information about setting the dead interval, see [Configuring the Communication Intervals](#). Possible causes for a node not receiving heartbeat packets from a peer node include:

- A network configuration problem prevents heartbeats from traversing the network between the HA nodes.
- The peer node experiences a hardware or software failure that causes it to freeze (hang), reboot, or otherwise stop processing and forwarding heartbeat packets.

**Note 2:**

In this case, fail means that the interface was enabled but goes to the DOWN state, as can be seen from the show interface command or from the GUI. Possible causes for an enabled interface to be in the DOWN state are LINK DOWN and TXSTALL.

## Forcing a node to fail over

June 29, 2021

You might want to force a failover if, for example, you need to replace or upgrade the primary node. You can force failover from either the primary or the secondary node. A forced failover is not propagated or synchronized. To view the synchronization status after a forced failover, you can view the status of the node.

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.

The Citrix ADC appliance displays a warning message if it detects a potential issue when you run the force failover command. The message includes the information that triggered the warning, and requests confirmation before proceeding.

You can force a failover on a primary node, secondary node, and when nodes are in listen mode.

- **Forcing Failover on the Primary Node.**

If you force failover on the primary node, the primary becomes the secondary and the secondary becomes the primary. Forced failover is possible only when the primary node can determine that the secondary node is UP.

If the secondary node is DOWN, the force failover command returns the following error message: “Operation not possible due to invalid peer state. Rectify and retry.”

If the secondary system is in the claiming state or inactive, it returns the following error message:

```
Operation not possible now. Please wait for the system to stabilize before retrying.
```

- **Forcing Failover on the Secondary Node.**

If you run the force failover command from the secondary node, the secondary node becomes primary and the primary node becomes secondary. A force failover can occur only if the secondary node's health is good and it is not configured to stay secondary.

If the secondary node cannot become the primary node, or if the secondary node was configured to stay secondary (using the STAYSECONDARY option), the node displays the following error message:

```
Operation not possible as my state is invalid. View the node for more information.
```

- **Forcing Failover When Nodes Are in Listen Mode.**

When the two nodes of an HA pair are running different versions of the system software, the node running the higher version switches to the listen mode. In this mode, neither command propagation nor synchronization works.

Before upgrading the system software on both nodes, test the new version on one of the nodes. To do this, you must force a failover on the system that has already been upgraded. The upgraded system then takes over as the primary node, but neither command propagation or synchronization occurs. Also, all connections must be re-established.

### **Important!**

If you force a failover when an HA synchronization operation is in progress, some active data sessions on the HA setup might be lost. So, wait for the HA synchronization operation to be completed before performing the force failover operation.

### **To force failover on a node by using the command line interface:**

At the command prompt, type:

```
force HA failover
```

### **To force failover on a node by using the GUI:**

Navigate to **System > High Availability** and, on the **Nodes** tab, select the node, in the Action list, select **Force Failover**.

## Forcing the secondary node to stay secondary

October 14, 2020

In an HA setup, the secondary node can be forced to stay secondary regardless of the state of the primary node.

For example, suppose the primary node needs to be upgraded and the process will take a few seconds. During the upgrade, the primary node may go down for a few seconds, but you do not want the secondary node to take over; you want it to remain the secondary node even if it detects a failure in the primary node.

When you force the secondary node to stay secondary, it will remain secondary even if the primary node goes down. Also, when you force the status of a node in an HA pair to stay secondary, it does not participate in HA state machine transitions. The status of the node is displayed as `STAYSECONDARY`.

Forcing the node to stay secondary works on both standalone and secondary nodes. On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node stops processing traffic and becomes the secondary node. The new node becomes the primary node.

### Note:

When you force a system to remain secondary, the forcing process is not propagated or synchronized. It affects only the node on which you run the command.

### To force the secondary node to stay secondary by using the command line interface

At the command prompt, type:

```
set ha node -hastatus STAYSECONDARY
```

### To force the secondary node to stay secondary by using the GUI

Navigate to **System > High Availability**, on the **Nodes** tab, open the local node, and select **STAY SECONDARY**.

## Forcing the primary node to stay primary

May 18, 2021

In an HA setup, you can force a healthy primary node to remain primary even after a failover. You can enable this option either on a primary node in an HA pair. This option allows the primary node to be in primary state as long as it is healthy.

On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node continues to function as the primary node, and the new node becomes the secondary node.

### To force the primary node to stay primary by using the command line interface

At the command prompt, type:

```
set ha node -hastatus STAYPRIMARY
```

### To force the primary node to stay primary by using the GUI

Navigate to **System > High Availability**, on the **Nodes** tab, open the local node, and select **STAY PRIMARY**.

## Understanding the high availability health check computation

September 21, 2020

The following table summarizes the factors examined in a health check computation:

- State of the failover interface sets
- State of the critical interfaces
- State of the route monitors

The following table summarizes the health check computation.

Failover interface sets	Critical interfaces	Route monitor	Condition
N	Y	N	If the system has any critical interfaces, all of those critical interfaces must be UP.
Y	Y	N	If the system has any failover interface sets, all of those failover interface sets must be UP.

Failover interface sets	Critical interfaces	Route monitor	Condition
Y	Y	Y	If the system has any route monitors configured, all monitored routes must be present in the failover interface set.

## High Availability FAQs

October 13, 2020

1. What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?

In an HA configuration, both nodes use the following ports to exchange HA related information:

- UDP Port 3003, to exchange heartbeat packets.
- Port 3010, for synchronization and command propagation.

2. What are the conditions that trigger config synchronization?

Synchronization is triggered by any of the following conditions:

- The incarnation number of the primary node, received by the secondary, does not match that of the secondary node.

Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node's configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number is not incremented for the following commands:

- a) All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
- b) All Interface related commands. For example, set interface and unset interface.
- c) All channel-related commands. For example, add channel, set channel, and bind channel.

- The secondary node comes up after a restart.
- The primary node becomes secondary after a failover.

3. What configurations are not synced or propagated in an HA configuration in INC or non-INC mode?

The following commands are neither propagated nor synced to the secondary node:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.

**Note:**

The following configurations are neither synced nor propagated only in HA in INC mode. Each node has its own:

- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations
- Net profiles

4. Does a configuration added to the secondary node get synchronized on the primary?

No, a configuration added to the secondary node is not synchronized to the primary.

5. What could be the reason for both nodes claiming to be the primary in an HA configuration?

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem could be with the network between the nodes.

6. Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

Different system-clock settings on the two nodes can cause the following issues:

- The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
- After a failover, you might have problems with any type of cookie based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
- Similar considerations apply to any time related decisions on the nodes.

7. What are the conditions for failure of the *force HA sync* command?

Forced synchronization fails in any of the following circumstances:

- You force synchronization when synchronization is already in progress.

- You force synchronization on a standalone Citrix ADC appliance.
- The secondary node is disabled.
- HA synchronization is disabled on the current secondary node.
- HA propagation is disabled on the current primary node and you force synchronization from the primary.

8. What are the conditions for failure of the *sync HA files* command?

Synchronizing configuration files fail in either of the following circumstances:

- On a standalone system.
- With the secondary node disabled.

9. In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the *force failover* command.

10. What are the conditions for failure of the force failover command?

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.
- The primary node is configured to remain primary.
- The state of the peer node is unknown.

11. What types of traffic flows between the nodes of a high availability set-up?

In a high availability set-up, traffic related to maintaining the high availability configuration flows between the two nodes. This traffic is of the following types:

- Config synchronization
- Config propagation
- Data connection mirroring (For features that have connection failover enabled. For more information see, [Connection failover](#).)
- Load balancing persistent session synchronization
- Session state synchronization
- Session state ICA sessions (If ICA session reliability is enabled. For more information, see [Session reliability](#).)

## Troubleshooting high availability issues

September 21, 2020

The most common high availability issues involve the high availability feature not working at all, or working only intermittently. Following are common high availability issues, and probable causes and resolutions.

- **Issue**

The inability of the Citrix ADC appliances to pair the Citrix ADC appliances in a high availability setup.

- **Cause**

- Network connectivity

- **Resolution**

- Verify that both the appliances are connected to the switch and the interfaces are enabled.

- **Cause**

- Mismatch in the Password for the default Administrator account

- **Resolution**

- Verify that the password on both the appliances is the same.

- **Cause**

- IP conflict

- **Resolution**

- Verify that both the appliances have unique Citrix ADC IP (NSIP) address. The appliances should not have the same NSIP address.

- **Cause**

- Node ID mismatch

- **Resolution**

- Verify that the Node ID Configuration on both the appliances is unique. The appliances should not have the same Node ID configuration. Additionally, you must assign value for a Node ID between 1 and 64.

- **Cause**

- Mismatch in the password of the RPC node

- **Resolution**

- Verify that both the nodes have the same RPC node password.

- **Cause**

- An administrator has disabled the remote node

- **Resolution**

- Enable the remote node.

- **Cause**

- The Firewall application has blocked the heartbeat packets

### **Resolution**

Verify that the UDP port 3003 is allowed.

- **Issue**

Both the appliances claim to be the primary appliance.

- **Cause**

Missing heartbeat packets between the appliances

- Resolution**

Verify that the UDP port 3003 is not blocked for communication between the appliances.

- **Issue**

The Citrix ADC appliance is not able to synchronize the configuration.

- **Cause**

A Firewall application is blocking the required port.

- Resolution**

Verify that the UDP port 3010 (or UDP port 3008 with secure synchronization) is not blocked for communication between the appliances.

- **Cause**

An administrator has disabled synchronization.

- Resolution**

Enable synchronization on the appliance that has the issue.

- **Cause**

Different Citrix ADC releases or builds are installed on appliances.

- Resolution**

Upgrade the appliances to the same Citrix ADC release or build.

- **Issue**

Command propagation fails between the appliances.

- **Cause**

A Firewall application is blocking the port.

- Resolution**

Verify that the UDP port 3011 (or UDP port 3009 with secure propagation) is not blocked for communication between the appliances.

- **Cause**

An administrator has disabled command propagation.

- Resolution**

Enable command propagation on the appliance that has the issue.

- **Cause**

Different Citrix ADC releases or builds are installed on appliances.

- Resolution**

Upgrade the appliances to the same Citrix ADC release or build.

- **Issue**

The Citrix ADC appliances in the high availability pair are unable to run the force failover process.

- **Cause**

- The Secondary node is disabled.

- Resolution**

- Enable the secondary node.

- **Cause**

- The Secondary node is configured to stay secondary.

- Resolution**

- Set the secondary high availability status of the secondary node to Enable from Stay Secondary.

- **Issue**

- The secondary appliance does not receive any traffic after the failover process.

- **Cause**

- The upstream router does not understand GARP messages of Citrix ADC appliance.

- Resolution**

- Configure Virtual MAC (VMAC) address on the secondary appliance.

## Managing high availability heartbeat messages on a Citrix ADC appliance

September 21, 2020

The two nodes in a high availability configuration send and receive heartbeat messages to and from each other on all interfaces that are enabled. The heartbeat messages flow regardless of the HA MON setting on these interfaces. If NSVLAN or both (NSVLAN and SYNC) are configured on an appliance, the heartbeat messages flow only through the enabled interfaces that are part of the NSVLAN and SYNCVLAN.

If a node does not receive the heartbeat messages on an enabled interface, it sends critical alerts to the specified Command Center and SNMP managers. These critical alerts give false alarms and draw unnecessary attention from the administrators for interfaces that are not configured as part of the connections to the peer node.

To resolve this issue, the HAHeartBeat option for interfaces and channels is used for enabling or disabling HA heartbeat-message flow on them.

To manage the high availability heartbeat messages on an interface by using the command line interface

At the command prompt, type:

- `set interface <ID> [-HAHeartBeat ( ON | OFF )]`

- `show interface <ID>`

To manage the high availability heartbeat messages on a channel by using the command line interface

At the command prompt, type:

- `set channel <ID> [-HAHeartBeat ( ON | OFF )]`
- `show channel <ID>`

To manage the high availability heartbeat messages for an interface by using the GUI

1. Navigate to **System > Network > Interfaces**.
2. Enable or disable the **HA Heart Beat** parameter.

To manage the high availability heartbeat messages on a channel by using the GUI

1. Navigate to **System > Network > Channels**.
2. Enable or disable the **HA Heart Beat** parameter.

## Remove and Replace a Citrix ADC in a High Availability Setup

September 21, 2020

This topic helps you to address RMA replacements. Also, this topic has instructions on how to backup configurations, upgrade or downgrade shipped software version, and setup of RPC password on ADC.

### Points to Consider

The following configurations are not synchronized or propagated in a high availability configuration in INC (Independent Network Configuration) or non-INC mode:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.
- All Interface HA Monitoring configuration commands.

The following configurations are not synced nor propagated in an HA configuration in INC mode (Independent Network Configuration):

- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors

- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations

## Instructions

Complete the following steps to replace a Citrix ADC in high availability setup:

- Remove an Active Citrix ADC secondary node
- Configure Replacement secondary node
- Verify and Update the Software Build on Replacement ADC
- Set Password on New secondary to Match primary
- Add Licenses to Replacement ADC
- Creating HA Pair between primary and New secondary node

## Remove an Active Secondary Node

1. Log on to both ADCs and run the following command to confirm which node is primary and which node is secondary:

```
1 show ha node
2 <!--NeedCopy-->
```

2. Log on to the primary ADC, backup the configurations on the primary node, and copy the files off of the ADC prior to the changes. These files are located under “/var/ns\_sys\_backup/” directory.

The steps are as follows:

- a) Save the ADC running configurations to memory:

```
1 save ns config
2 <!--NeedCopy-->
```

- b) Create the full backup file package:

```
1 create system backup -level full
2 <!--NeedCopy-->
```

- c) Create the basic backup file package:

```
1 create system backup -level basic
2 <!--NeedCopy-->
```

3. After all backup files have been generated, be sure to copy them off of the device before proceeding.

From a windows terminal, open a Command Prompt and copy the backup files off of the ADC and onto your local hard drive. This can be done using the following command:

```
1 pscp <username>@<NSIP>:<Target file source> <Target file
   destination>
2 <!--NeedCopy-->
```

Example:

```
1 pscp nsroot@10.125.245.78:/var/ns_sys_backup/backup_basic_10
   .125.245.78_2016_09_14_15_08.tgz c:\nsbackup\backup_basic_10
   .125.245.78_2016_09_14_15_08.tgz
2 <!--NeedCopy-->
```

When prompted, enter the password for the specified administrator account, then hit Enter. Repeat these steps until all backup bundles are copied to the local PC before proceeding.

4. SSH into the secondary ADC, and set the unit to the “STAYSECONDARY” status. This will force the unit to not attempt to assume the primary role in the event of a detected failure during the swap. Confirm that you are connected to the secondary ADC before executing this step

```
1 set ha node - haStatus <state>
2 set ha node - haStatus STAYSECONDARY
3 <!--NeedCopy-->
```

5. Once the secondary ADC’s **Node State** successfully displays STAYSECONDARY, switch to the primary ADC and delete the secondary node and run the following command:

```
1 save ns config
2 <!--NeedCopy-->
```

While logged into the primary ADC, run the following commands

- a) Run the following command to identify which numerical value represents the secondary HA node:

```
1 show ha node
2 <!--NeedCopy-->
```

- b) Run the following command to remove the secondary ADC from the primary HA pair;

```
1 rm ha node <node ID>
2 <!--NeedCopy-->
```

- c) Run the following command to save the configuration:

```
1 save ns config
2 <!--NeedCopy-->
```

- d) With the secondary ADC now removed, shutdown, disconnect, and remove the secondary ADC from the network.

**Note.** Be sure to label all connections before disconnecting.

### Configure Replacement Secondary Node

1. With the replacement ADC in place, power up the new device. DO NOT CONNECT the network connections at this point.
2. With boot-up complete, use the console port to connect to the ADC and configure the NSIP that you will use to connect to the unit.
3. When prompted, select **4**.

**Note.** In this example, we are using a different NSIP for the replacement ADC. If you wish to use the original secondary unit's IP, You may change it on the replacement before binding the new ADC to the primary HA unit.

4. The ADC should now be booted. Now connect the network interface that will be used for Management traffic, and confirm that the IP address is reachable from your network.

### Verify and Update the Software Build on Replacement ADC

Before syncing the new unit to the primary ADC, we need to ensure that both ADCs are running the same build.

1. To verify the version on ADC run the following command:

```
1 show version
2 <!--NeedCopy-->
```

2. While on the new secondary ADC, create a subfolder in **/var** to be used for the upgrade.
3. Go to [Citrix Downloads](#) and download the appropriate package that matches the build version running on the primary ADC.
4. Download and extract the .tgz file:

```
1 tar -xvzf "file.tgz"
2 <!--NeedCopy-->
```

5. Copy the extracted files to the secondary ADC. On your windows terminal, open a “Command Prompt” and navigate to the directory containing the extracted .tgz build package and run the following pscp command:

```
1 pscp <Target file source> <username>@<NSIP>:<Target file
  destination>
2 <!--NeedCopy-->
```

Example:

```
1 C:\inetpub>pscp c:\inetpub\build-12.1-47.14_nc.tgz nsroot@10
  .20.245.80:/var/NS_upg_12.1_47.14/build-12.1-47.14_nc.tgz
2 <!--NeedCopy-->
```

6. After the file has been transferred, return to the secondary ADC and upgrade. For detailed instructions, see [Upgrading a Citrix ADX Standalone Appliance](#).
7. Once the new secondary has rebooted, SSH back into the unit and confirm that the upgrade is successful and the build matches that of the primary.

### Set Password on Replacement Secondary Node to Match Primary

**Note:** If at this point you want to change the management IP (NSIP) address of the new secondary ADC, you may do so before moving forward.

Change the password on the new secondary ADC to match the password that is currently on the primary ADC.

1. Make that the default administrator (nsroot) account password is the same as the primary ADC. This is accomplished using the following command while logged in through SSH into the new secondary unit:

```
1 set system user <user> <password>
2 <!--NeedCopy-->
```

This command set/resets the password for the specified user.

2. SSH into the primary and new secondary ADC and confirm that passwords match.

### Add Licenses to Replacement Secondary Node

With the new ADC updated and ready for pairing, download and install the appropriate licensing for the replacement node.

1. Navigate to <https://www.citrix.com> to request and download licenses for the new replacement unit.

2. Once you have all appropriate licenses downloaded, SSH into the new secondary ADC and type the following command to see the current state of licensing:

```
1 show license
2 <!--NeedCopy-->
```

3. From the Windows terminal command prompt you must now upload the license files to the new secondary ADC using the following command:

**Note.** If you have multiple licenses, repeat this step until all licenses are uploaded.

```
1 pscp <Target file source> <username>@<NSIP>:<Target file
  destination>
2 <!--NeedCopy-->
```

Example:

```
1 C:\inetpub>pscp c:\inetpub\NS-VPX-3K-LIC-020030ad0024.lic
  nsroot@10.125.245.80:/nsconfig/license/NS-VPX-3K-LIC-020030
  ad0024.lic
2 <!--NeedCopy-->
```

4. SSH into the new secondary ADC and perform a warm reboot using the following command:

```
1 reboot -w
2 <!--NeedCopy-->
```

After the unit is restarted, SSH into the unit and run show license command once again. At this point, the licenses should be applied.

## Set up High Availability between primary and New Secondary Node

At this point, we are now ready to join the Citrix ADC units into a high availability pair. For more information, see [Configuring high availability](#).

## TCP optimization

September 21, 2020

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

## **Congestion Control Strategies**

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

### **Proportional Rate Recovery (PRR) algorithm**

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

### **TCP Fast Open (TFO)**

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a Citrix ADC appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the Citrix ADC appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

#### **How TFO works**

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the Citrix ADC appliance can include data in the SYN-ACK segment even though it has not received the final ACK segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the Citrix ADC appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client's IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.

3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The Citrix ADC appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

**Note:**

If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the Citrix ADC appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

**Note:** If the server acknowledges the event with only a SYN segment, the Citrix ADC appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

### Configuring TCP fast open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

**To enable or disable TFO by using the command line:**

At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

**Note:** The default value is DISABLED.

```
1 add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
```

```
2   set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3   unset tcpprofile <TCP Profile Name> - tcpFastOpen
4   Examples
5   add tcpprofile Profile1 - tcpFastOpen
6   Set tcpprofile Profile1 - tcpFastOpen Enabled
7   unset tcpprofile Profile1 - tcpFastOpen
8   <!--NeedCopy-->
```

### To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1   set tcpparam - tcpfastOpenCookieTimeout <Timeout Value>
2   Example
3   set tcpprofile - tcpfastOpenCookieTimeout 30secs
4   <!--NeedCopy-->
```

### To configure the TCP Fast Open by using the GUI

1. Navigate to **Configuration > System > Profiles** > and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **TCP Fast Open** checkbox.
3. Click **OK** and then **Done**.

### To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to **Configuration > System > Settings > Change TCP Parameters** and then **Configure TCP Parameters** page to set the TCP Fast Open Cookie timeout value.

## TCP Hystart

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

### Configuring TCP Hystart

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

### To configure Hystart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

```
1 add tcpprofile <profileName> -hystart ENABLED
2 set tcpprofile <profileName> -hystart ENABLED
3 unset tcpprofile <profileName> -hystart
4 <!--NeedCopy-->
```

#### Examples:

```
1 add tcpprofile profile1 -hystart ENABLED
2 set tcpprofile profile1 -hystart ENABLED
3 unset tcpprofile profile1 -hystart
4 <!--NeedCopy-->
```

To configure Hystart support by using the GUI

1. Navigate to **Configuration > System > Profiles >** and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

### TCP burst rate control

It is observed that TCP control mechanisms can lead to a bursty traffic flow on high speed mobile networks with a negative impact on the overall network efficiency. Due to mobile network conditions such as congestion or Layer-2 retransmission of data, TCP acknowledgements arrive clumped at the sender triggering a burst of transmission. These group of consecutive packets sent with a short inter-packet gaps it is called TCP packet burst. To overcome traffic burst, the Citrix ADC appliance uses a TCP Burst Rate Control technique. This technique evenly spaces data into the network for an entire round-trip-time so that the data is not sent into a burst. By using this burst rate control technique, you can achieve better throughput and lower packet drop rates.

#### How TCP burst rate control works

In a Citrix ADC appliance, this technique evenly spreads the transmission of a packets across the entire duration of the round-trip-time (RTT). This is achieved by using a TCP stack and network packet scheduler that identifies the various network conditions to output packets for ongoing TCP sessions in order to reduce the bursts.

At the sender, instead of transmitting packets immediately upon receipt of an acknowledgment, the sender can delay transmitting packets to spread them out at the rate defined by scheduler (Dynamic configuration) or by the TCP profile (Fixed configuration).

## Configuring TCP burst rate control

To use the TCP Burst Rate Control option in the relevant TCP profile and set the burst rate control parameters.

### To set TCP burst rate control by using the command line

At the command prompt, set one of the following TCP Burst Rate Control commands are configured in a new or existing profile.

**Note:** The default value is DISABLED.

```
1 add tcpProfile <TCP Profile Name> -burstRateControl Disabled | Dynamic
   | Fixed
2
3 set tcpProfile <TCP Profile Name> -burstRateControl Disabled | Dynamic
   | Fixed
4
5 unset tcpProfile <TCP Profile Name> -burstRateControl Disabled |
   Dynamic | Fixed
6 <!--NeedCopy-->
```

where,

Disabled – If the Burst rate control is disabled, then a Citrix ADC appliance does not perform burst management other than the maxBurst setting.

Fixed – If the TCP burst rate control is Fixed, the appliance uses the TCP Connection Payload Send Rate value mentioned in the TCP Profile.

Dynamic – If the Burst Rate Control is “Dynamic” the connection is being regulated based on various network conditions to reduce TCP bursts. This mode works only when the TCP connection is in END-POINT mode. When Dynamic Burst Rate control is enabled the maxBurst parameter of the TCP profile is not in effect.

```
1 add tcpProfile profile1 -burstRateControl Disabled
2
3 set tcpProfile profile1 -burstRateControl Dynamic
4
5 unset tcpProfile profile1 -burstRateControl Fixed
6 <!--NeedCopy-->
```

### To set TCP Burst Rate Control parameters by using the command line interface

At the command prompt, type:

```
1      set ns tcpprofile nstcp_default_profile - burstRateControl <type of
      burst rate control> - tcprate <TCP rate> -rateqmax <maximum
      bytes in queue>
2
3      T1300-10-2> show ns tcpprofile nstcp_default_profile
4          Name: nstcp_default_profile
5          Window Scaling status:  ENABLED
6          Window Scaling factor:  8
7          SACK status:  ENABLED
8          MSS: 1460
9          MaxBurst setting: 30 MSS
10         Initial cwnd setting: 16 MSS
11         TCP Delayed-ACK Timer: 100 millisec
12         Nagle's Algorithm:  DISABLED
13         Maximum out-of-order packets to queue: 15000
14         Immediate ACK on PUSH packet:  ENABLED
15         Maximum packets per MSS:  0
16         Maximum packets per retransmission: 1
17         TCP minimum RT0 in millisec: 1000
18         TCP Slow start increment: 1
19         TCP Buffer Size: 8000000 bytes
20         TCP Send Buffer Size: 8000000 bytes
21         TCP Syncookie:  ENABLED
22         Update Last activity on KA Probes:  ENABLED
23         TCP flavor:  BIC
24         TCP Dynamic Receive Buffering:  DISABLED
25         Keep-alive probes:  ENABLED
26         Connection idle time before starting keep-alive probes: 900
      seconds
27         Keep-alive probe interval: 75 seconds
28         Maximum keep-alive probes to be missed before dropping
      connection: 3
29         Establishing Client Connection:  AUTOMATIC
30         TCP Segmentation Offload:  AUTOMATIC
31         TCP Timestamp Option:  DISABLED
32         RST window attenuation (spoof protection):  ENABLED
33         Accept RST with last acknowledged sequence number:  ENABLED
34         SYN spoof protection:  ENABLED
35         TCP Explicit Congestion Notification:  DISABLED
36         Multipath TCP:  DISABLED
37         Multipath TCP drop data on pre-established subflow:
      DISABLED
38         Multipath TCP fastopen:  DISABLED
39         Multipath TCP session timeout:  0 seconds
```

```
40      DSACK: ENABLED
41      ACK Aggregation: DISABLED
42      FRTO: ENABLED
43      TCP Max CWND : 4000000 bytes
44      FACK: ENABLED
45      TCP Optimization mode: ENDPOINT
46      TCP Fastopen: DISABLED
47      HYSTART: DISABLED
48      TCP dupack threshold: 3
49      Burst Rate Control: Dynamic
50      TCP Rate: 0
51      TCP Rate Maximum Queue: 0
52 <!--NeedCopy-->
```

### To configure the TCP Burst Rate Control by using the GUI

1. Navigate to **Configuration > System > Profiles >** and then click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select **TCP Burst Control** option from the drop-down list:
  - a) BurstRateCntrl
  - b) CreditBytePrms
  - c) RateBytePerms
  - d) RateSchedulerQ
3. Click **OK** and then **Done**.

### Protection against wrapped sequence (PAWS) algorithm

If you enable the TCP timestamp option in the default TCP profile, the Citrix ADC appliance uses the Protection Against Wrapped Sequence (PAWS) algorithm to identify and reject old packets whose sequence numbers are within the current TCP connection's receive window because the sequence has "wrapped" (reached its maximum value and restarted from 0).

If network congestion delays a non-SYN data packet and you open a new connection before the packet arrives, sequence-number wrapping might cause the new connection to accept the packet as valid, leading to data corruption. But if the TCP timestamp option is enabled, the packet is discarded.

By default, the TCP timestamp option is disabled. If you enable it, the appliance compares the TCP timestamp (SEG.TSval) in a packet's header with the recent timestamp (Ts.recent) value. If SEG.TSval is equal to or greater than Ts.recent, the packet is processed. Otherwise, the appliance drops the packet and sends a corrective acknowledgement.

## How PAWS works

The PAWS algorithm processes all the incoming TCP packets of a synchronized connection as follows:

1. If  $SEG.TSval < Ts.recent$ : The incoming packet is not acceptable. PAWS sends an acknowledgment (as specified in RFC-793) and drops the packet. Note: Sending an ACK segment is necessary in order to retain TCP's mechanisms for detecting and recovering from half-open connections.
2. If packet is outside the window: PAWS rejects the packet, as in normal TCP processing.
3. If  $SEG.TSval > Ts.recent$ : PAWS accepts the packet and processes it.
4. If  $SEG.TSval \leq Last.ACK.sent$  (arriving segment satisfies): PAWS must copy  $SEG.TSval$  value to  $Ts.recent$  (is it copied to  $Ts.Recent$  field in the db?).
5. If packet is in sequence: PAWS accepts the packet.
6. If packet is not in sequence: The packet is treated as a normal in-window, out-of-sequence TCP segment. For example, it might be queued for later delivery.
7. If  $Ts.recent$  value is idle for more than 24 days: The validity of  $Ts.recent$  is checked if the PAWS timestamp check fails. If the  $Ts.recent$  value is found to be invalid, the segment is accepted and the PAWS rule updates  $Ts.recent$  with the  $TSval$  value from the new segment.

## To enable or disable TCP timestamp by using the command line interface

At the command prompt, type:

```
1 set nstcpprofile nstcp_default_profile -TimeStamp (ENABLED | DISABLED)
2 <!--NeedCopy-->
```

To enable or disable TCP timestamp by using the GUI

Navigate to **System > Profile > TCP Profile**, select the default TCP profile, click **Edit**, and select or clear the **TCP timestamp** check box.

## Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.

### Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server's traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

For information about using subscriber attributes to perform TCP optimization, see [Policy-based TCP Profile](#).

### **Configuring policy based TCP profile selection**

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your Citrix ADC ADC can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

### **Configuring using the command line interface**

#### **To enable AppQoE by using the command line interface**

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

- `enable ns feature appqoe`
- `show ns feature`

#### **To bind a TCP profile while creating an AppQoE action using the command line interface**

At the command prompt, type the following AppQoE action command with `tcpprofiletobind` option.

```
add appqoe action <name> [-priority <priority>] [-respondWith ( ACS | NS )
[<CustomFile>] [-altContentSvcName <string>] [-altContentPath <string>] [-
maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth <positive_integer
>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-
dosAction ( SimpleResponse |HICResponse )] [-tcpprofiletobind <string>]
show appqoe action
```

**To configure an AppQoE policy by using the command line interface**

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

**To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface**

At the command prompt, type:

```
bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <priority>
bind lb vserver <name> - policyName <appqoe_policy_name> -priority <priority>
>
bind cr vserver <name> -policyName <appqoe_policy_name> -priority <priority>
>
```

**Example**

```
1   add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle
    ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500
    -slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -
    sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spoofSynDrop
    ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack
    ENABLED -tcpmode ENDPOINT
2   add appqoe action appact1 -priority HIGH -tcpprofile tcp1
3   add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -
    action appact1
4   bind lb vserver lb2 -policyName apppol1 -priority 1 -
    gotoPriorityExpression END -type REQUEST
5   bind cs vserver cs1 -policyName apppol1 -priority 1 -
    gotoPriorityExpression END -type REQUEST
6   <!--NeedCopy-->
```

**Configuring policy based TCP profiling using the GUI**

To enable AppQoE by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

**To configure AppQoE policy by using the GUI**

1. Navigate to **App-Expert > AppQoE > Actions**.
2. In the details pane, do one of the following:
3. To create a new action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.
5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
  - a) Name—name
  - b) Action type—respondWith
  - c) Priority—priority
  - d) Policy Queue Depth—polqDepth
  - e) Queue Depth—priqDepth
  - f) DOS Action—dosAction
6. Click **Create**.

**To bind AppQoE policy by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:
  - a) Select a policy type as AppQoE from the drop-down list.
  - b) Select a traffic type from the drop-down list.
4. In the **Policy Binding** section, do the following:
  - a) Click **New** to create a new AppQoE policy.
  - b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

**SACK block generation**

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send

the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

**Note:** A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

### **Client renegeing**

A Citrix ADC appliance can handle client renegeing during SACK based recovery.

### **Memory checks for marking end\_point on PCB is not considering total available memory**

In a Citrix ADC appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

### **Unnecessary retransmissions due to missing SACK blocks**

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.

### **SNMP for number of connections bypassed optimization because of overload**

The following SNMP ids have been added to a Citrix ADC appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.131 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

### **Dynamic receive buffer**

To maximize TCP performance, a Citrix ADC appliance can now dynamically adjust the TCP receive buffer size.

## **Troubleshooting Citrix ADC**

September 21, 2020

This topic gives you some basic troubleshooting solutions needed to resolve issues that occur in your appliance. It gives you an understanding of NetScaler appliance, how it integrates with the network, and what issues you can expect in basic system features.

## How to record a packet trace on Citrix ADC

December 24, 2020

This troubleshooting article explains how an administrator can record a network packet trace using the Citrix ADC GUI.

### Points to remember

- Citrix recommends you to use the recent Wireshark version from the “automated build section” available in the following webpage: <http://www.wireshark.org/download/automated>.
- In Citrix ADC version 10.5 or later, to decrypt the capture and ensure ECC (Elliptic Curve Cryptography), Session Reuse, and DH parameters are disabled from the virtual server. It is done before the trace is captured.

### Record packet trace on NetScaler version 11.1

1. Navigate to **System > Diagnostics** page.
2. click the **Start new trace** link in the **Diagnostics** page, as shown in the following screenshot.

3. Update the packet size to 0 in the **Packet size** field.

## Start Trace

Packet Size

4. Click **Start** to start recording the network packet trace.
5. Click **Stop and Download** to stop recording the network packet trace after the test is complete.

## Stop Trace

### Stop Running NetScaler Packet Capture Tool

Trace State

RUNNING

Trace File Location

/var/nstrace/22May2016\_15\_56\_39

Packet Capturing In Progress 

**Stop and Download**

Close

6. Select the required file and click **Select** and click **Download**.

Download		Delete	Action
Name	Type		
 nstrace1.cap	File		

7. Open the network packet trace file with the Wireshark utility to display the content of the file.

## Record packet trace on NetScaler 10.5 appliance

1. Navigate to **System > Diagnostics** page.

2. Click the **Start new trace** link under **Technical Support Tools** as shown in the following screenshot.
3. Update the packet size to 0 in the **Packet Size** field.

The screenshot shows the 'Trace' configuration page. The 'Packet Size' field is a text input box containing the value '0'. Below it, there is a checkbox labeled 'Capture trace in .pcap format' which is currently unchecked.

**Note:** If appliance headers are not required then select Capture trace in .pcap format.

4. Click **Start** to start recording the network packet trace.
5. Click **OK** to stop recording the network packet trace after the test is complete.

An nstrace.cap file is generated, which contains the network packet trace.

6. Highlight the required file and click **Download**.

7. Specify a destination and save the packet trace.
8. Open the network packet trace file with the Wireshark utility to display the content of the file.

**Note:** Select Decrypted SSL packets (SSLPLAIN) to decrypt the packet trace without the private key.

#### Capturing Mode

- Packets buffered for transmission (TXB)
- Received packets before NIC pipelining (RX)
- Decrypted SSL packets (SSLPLAIN)
- Translated IPV6 packets
- Capture C2C message

### Capture SSL master keys

In the 11.0, 11.1 version and above there is an option to capture the session keys which is valid only for that particular session/nstrace, and this option can be used if you do not want to share the private key or use SSLPLAIN mode. For more information, see <https://support.citrix.com/article/CTX135889>.

### Export Session Keys without sharing Private key

In most of the scenarios the private key is not available or shared. In such scenarios we can suggest exporting the **SSL session** keys instead of the private key. Read, [How to Export and Use SSL Session Keys to Decrypt SSL Traces Without Sharing the SSL Private Key, see <https://support.citrix.com/article/CTX135889>.

### Filters

Also, it is always recommended to add IP based filters while taking traces. The process ensures that you capture only interested traffic which eases your troubleshooting. Adding filters will also decrease the load on the appliance while taking traces.

Filter Expression Expression Editor

Select
Select
Select
✕

Press Control+Space to start the expression and then type '.' to get the next set of options

Evaluate

Simple IP-based filters are enough to get the right captures. For more information about ns trace filters and examples, see [Citrix Documentation](#) page.

### Use case to capture a packet trace with virtual server IP filter (both front-end and back end)

Using a filter of the virtual server IP address and enabling the option “-link” in CLI or select the option “Trace filtered connection peer traffic” in GUI (available 10.1 and above), you can capture both the front end and back-end traffic for that particular IP address. With this option it is not recommended to mention a source IP or destination IP filter.

```

1 start nstrace -size 0 -filter "CONNECTION.IP.EQ(1.1.1.1)" -link ENABLED
2
3 show nstrace
4      State:  RUNNING           Scope:  LOCAL           TraceLocation
      :  "/var/nstrace/24Mar2017_16_00_19/..." Nf:  24
      Time:  3600              Size:  0
      Mode:  TXB NEW_RX
5      Traceformat:  NSCAP       PerNIC:  DISABLED       FileName:  24
      Mar2017_16_00_19 Filter:  "CONNECTION.IP.EQ(1.1.1.1)" Link:
      ENABLED              Merge:  ONSTOP          Doruntimecleanup
      :  ENABLED
6      TraceBuffers:  5000       SkipRPC:  DISABLED       Capsslkeys:
      DISABLED            InMemoryTrace:  DISABLED
7 <!--NeedCopy-->
    
```

Merge

ONSTOP

Trace filtered connection's peer traffic

Skip RPC

Do Runtime cleanup

Capture SSL Master keys

### Capturing cyclic traces

It is always challenging to troubleshoot an intermittent issue. Cyclic tracing is best suited for issues which are intermittent. The traces can be run over a span of few hours or days before the issue occurs.

Also, you can use a specific filter and evaluate the size of the trace files that are generated before you run it for a longer time.

Run the following command from the CLI:

```
1 start nstrace -nf 60 -time 30 -size 0
2 This particular trace will create 60 files each of them for 30 sec.
   This means the files will start getting overwritten after 60 trace
   files or 30 mins
3 Show nstrace à To check the status of the nstrace
4 Stop nstrace à To stop the nstrace.
5
6 <!--NeedCopy-->
```

## Best Practices

On a unit handling GB of traffic per second, capturing traffic is a very resource intensive process. The impact to resources is mainly in terms of the CPU and the disk space. Disk space impact can be reduced by using filtering expressions. However, the impact on the CPU remains and sometimes causes a slight increase as the appliance now needs to process packets according to the filter before capturing them.

The best practice about tracing is:

1. The duration for which the trace is run must be as limited as possible when you still ensure the packets of interest are captured.
2. Schedule the tracing activity to happen at a time when the number of users (and hence the traffic) is greatly reduced, such as during off hours.

## More resources

### Disable session reuse on virtual server from the GUI

Session reuse is disabled when you capture a trace to complete an SSL handshake in the trace. When it is enabled, you can capture a partial handshake in the trace. Ensure you enable the option after the trace collection.

Do not disable an SSL session reuse when the persistence method is `sslsession`, as it breaks the persistence for existing connections. For more information refer to <https://support.citrix.com/article/CTX121925>.

1. Open the virtual server and navigate to SSL Parameters.
2. Disable Enable Session Reuse if enabled.

#### **Disable session reuse on virtual server from the CLI**

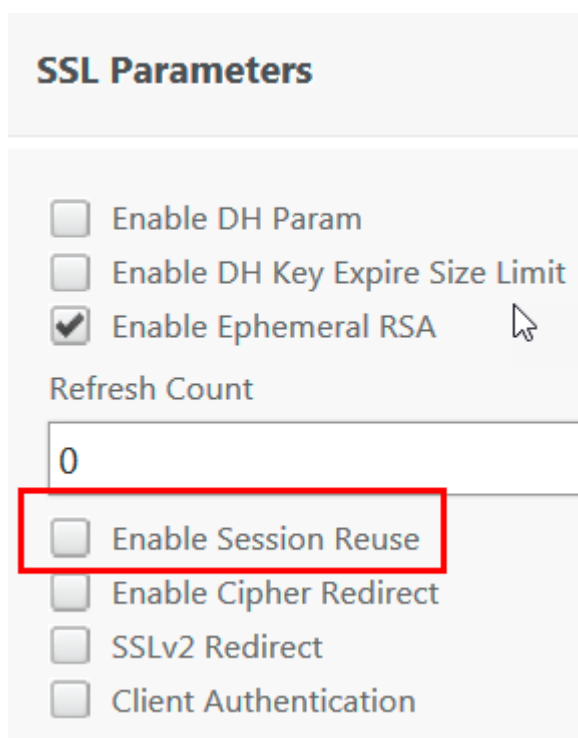

1. SSH to the appliance console.
2. Run the following command to disable DH Param from the virtual server:

```
set ssl vserver "vServer_Name"-sessReuse DISABLED
```

#### **Disable DH parameter on virtual server from the GUI**

Refer to <https://support.citrix.com/article/CTX213335>. To understand about DH Parameter.

1. Open the virtual server and navigate to SSL Parameters.
2. Disable DH Param if enabled.

**SSL Parameters**

- Enable DH Param
- Enable DH Key Expire Size Limit
- Enable Ephemeral RSA

Refresh Count

0

- Enable Session Reuse
- Enable Cipher Redirect
- SSLv2 Redirect
- Client Authentication

#### Disable DH parameter on virtual server from the CLI

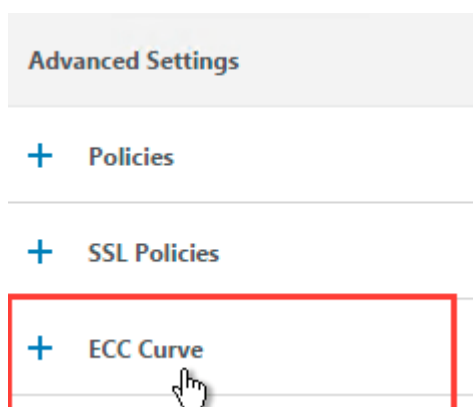

1. SSH to the appliance console.
2. Run the following command to disable DH Param from the virtual server:

```
set ssl vserver "vServer_Name"-dh DISABLED
```

#### Disable ECC curve on virtual server from the GUI

ECC curve is disabled to decrypt the captured SSL trace with private key. Do not disable the keys if the related SSL ciphers are used. For more information about the ECC curve, see <https://support.citrix.com/article/CTX205289>

1. Open the virtual server and navigate to ECC Curve.

2. If there is no ECC Curve bound to the virtual server then no other action is required.

3. If any ECC Curve is bound to the virtual server then click the ECC Curve and Unbind it from the virtual server.

### Disable ECC curve on virtual server from the CLI

1. SSH to the appliance console.
2. Run the following command for each ECC Curve bound to the virtual server:

```
unbind ssl vserver "vServer_Name"-eccCurveName "ECC_Curve_Name"
```

### How the Citrix ADC traces are decrypted

This section explains how to ensure that the Citrix ADC traces are decrypted.

#### Points to remember

You ensure that several configuration settings for SSL virtual server and ServiceGroups are done. It helps to make sure that traces are decrypted. Citrix also provides additional information on what is needed and how to take the traces. It helps in capturing relevant data.

#### Instructions to ensure Citrix ADC traces are decrypted

While taking a Citrix ADC trace, you must start determining what kind of traces you are taking. Also, you must be aware of all the components involved. Consider an example, a content switch might redirect

to a load balancing virtual server with a Service Group, or a Gateway virtual server. It might point the Session Profile to the load balancing virtual server, which uses a Service Group. Citrix recommends you to remove the load balancer to simplify troubleshooting. If that is not possible, you suspect the load balancer as part of the problem. You have three options (Gateway virtual server, load balance virtual server, and load balance Service Group) to modify and ensure traces are decrypted.

#### Note

The steps to decrypt the traces remain the same for content switching and other SSL virtual servers.

- **Gateway virtual server.** In Gateway virtual server, modify the SSL parameters as per the following:

- Disable DH param
- Disable DH Key Expire Size
- Disable Ephemeral RSA
- Disable Session Reuse
- Disable TLS 1.2, but ensure TLS 1.1 and 1.0 is enabled

SSL Parameters		Set these settings to disabled	
Enable DH Param	DISABLED	Clear Text Port	0
Enable DH Key Expire Size Limit	DISABLED	Enable Cipher Redirect	DISABLED
Enable Ephemeral RSA	DISABLED	Client Authentication	DISABLED
Enable Session Reuse	DISABLED	Send Close-Notify	YES
SSL Redirect	DISABLED	PUSH Encryption Trigger	Always
		SNI Enable	DISABLED
		SSLv2 Redirect	DISABLED
		SSLv2	DISABLED
		SSLv3	ENABLED
		TLSv1	ENABLED
		TLSv11	ENABLED
		TLSv12	DISABLED

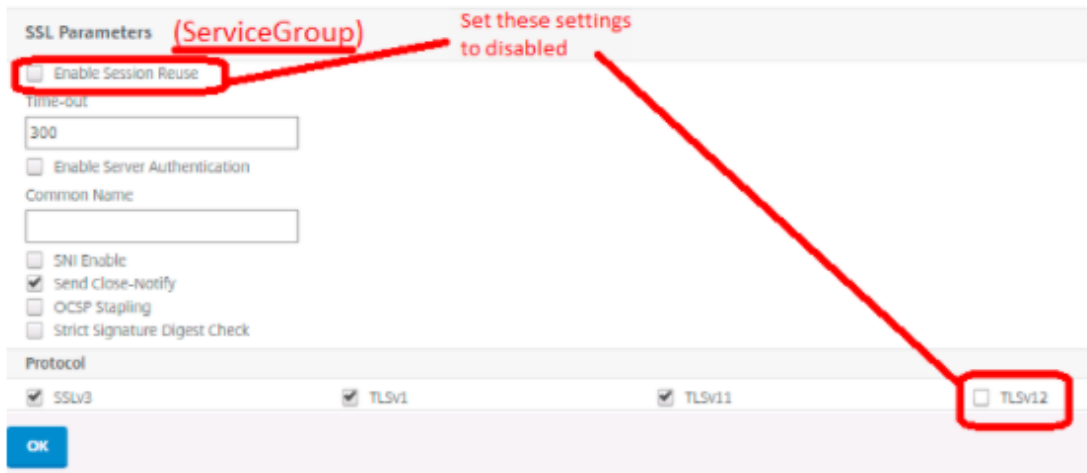

- **Load balancing SSL virtual server.** The settings in a load balancing SSL virtual server remains the same as the Gateway virtual server.

- Disable DH param
- Disable DH Key Expire Size
- Disable Ephemeral RSA
- Disable Session Reuse
- Disable TLS 1.2, but ensure TLS 1.1 and 1.0 is enabled

SSL Parameters		Set these settings to disabled	
Enable DH Param	DISABLED	Clear Text Port	0
Enable DH Key Expire Size Limit	DISABLED	Enable Cipher Redirect	DISABLED
Enable Ephemeral RSA	DISABLED	Client Authentication	DISABLED
Enable Session Reuse	DISABLED	Send Close-Notify	YES
SSL Redirect	DISABLED	PUSH Encryption Trigger	Always
		SNI Enable	DISABLED
		SSLv2 Redirect	DISABLED
		SSLv2	DISABLED
		SSLv3	ENABLED
		TLSv1	ENABLED
		TLSv11	ENABLED
		TLSv12	DISABLED

- Finally, adjust the Service Group.
  - Service Group SSL parameters (no SSL profile)

- \* Disable Session Reuse
- \* Disable TLS 1.2, but ensure TLS 1.1 and is enabled

**Note**

You repeat this step for each service if using individual services. Also, if using an SSL Profile, you have to adjust it, either for each Service or for the Service Group.

- Service Group SSL Profile or individual services
  - \* Disable DH param
  - \* Disable DH Key Expire Size
  - \* Disable Ephemeral Reuse
  - \* Disable session Reuse
  - \* Disable TLS 1.2, but ensure TLS 1.1 and 1.0 is enabled

- Ensure the following settings are done to set up the trace. Do not modify the rest of the settings.

- Packet Size: 0
  - File Size: 0
  - Trace Filtered connections peer traffic: Checked
  - Capture SSL Master Keys: Checked
  - Click Start. You receive a warning. Click OK.
  - You receive a notice that the trace is started.
- Open a new incognito browser window. It is for the SSL Client Hello, so it is not missed. If using a mobile device, close all the apps before beginning, it is important. If the beginning of the SSL handshake is not captured, the Citrix ADC cannot decrypt the traces. You ensure the trace is started before accessing a login webpage or opening any mobile app.
  - Login and duplicate the issue. Once the issue is duplicated, wait for 1-2 minutes. The waiting time might be because of an interruption or loading error or ICA timeout. It results in a RESET packet being sent and if you do not wait, you might miss the reset, which can contain valuable information.
  - You can stop the trace once the issue is replicated and have waited as recommended. Download both the `sslkeys` files (there can be more than 1) and the ns trace file.
  - Gather IPs of all relevant devices: Citrix ADC, Client, Gateway URL, back-end Server, VDA if ICA traffic, and StoreFront.
  - Now that you have the traces and IPs, generate a new Support file from the Citrix ADC. You can do it after taking the traces. It allows you to correlate logs and counters from the support file with events in the traces. It can be essential when troubleshooting the complex issues.

The following section describes the purpose and impact of the settings:

- **SSL Session Reuse.** It is a mechanism that speeds up the SSL transaction, which speeds up the client communication. The impact of disabling is that some clients using SSL Reuse might have to reconnect to the SSL Session. However, you cannot always decrypt when Session Reuse is enabled.
- **DH Parameters.** DH refers to Diffie-Hellman and ciphers which use DH often do not decrypt. It is better to disable DH parameters to ensure decryption.
- **Ephemeral RSA.** You disable Ephemeral RSA to prevent the Citrix ADC from trying to use ECC curve ciphers, which you cannot decrypt. Users reconnect if using the ECC Curves when disabled.
- **TLS 1.2.** It is not necessary to disable TLS 1.2. However, you tend to have fewer decryption issues when disabling TLS 1.2. Users have to reconnect if using TLS 1.2, when disabled.

## How to free space on /var directory for logging issues with a Citrix ADC appliance

June 17, 2021

The following article explains how an administrator can free the space from the `/var` directory of a Citrix ADC appliance. You can follow the steps when the Citrix GUI is not accessible.

When the amount of disk space is low in the `/var` directory of the appliance, you might not be able to sign in to the Citrix GUI. In this scenario, you can remove the old log files to create free space in the `/var` directory.

### Points to remember

- Ensure that you back up the files before removing the files from the appliance.

To free space in the `/var` directory of a Citrix ADC appliance, complete the following procedure:

1. Log on to the CLI of Citrix ADC by using SSH. For more information to complete this task, see the Citrix ADC documentation.
2. After you log on to Citrix ADC CLI, switch to the shell prompt using the following command.`shell`
3. Run the following command to see the availability of space on the Citrix ADC appliance.`df -h`
4. If the memory capacity of the `/var` directory is filled up to 90 percent, then you must delete few files from this directory.

- Run the following commands to view the contents of the `/var` directory:

```
cd /var
ls -l
```

The directories that are usually of interest are as follows:

- ```
1 /var/nstrace - This directory contains trace files.This is the
   most common reason for HDD being filled on the Citrix ADC. This
   is due to an nstrace being left running for indefinite amount
   of time. All traces that are not of interest can and should be
   deleted. To stop an nstrace, go back to the CLI and issue stop
   nstrace command.
2
3 /var/log - This directory contains system specific log files.
4
5 /var/nslog - This directory contains Citrix ADC log files.
6
```

```
7 /var/tmp/support - This directory contains technical support files
, also known as, support bundles. All files not of interest
should be deleted.
8
9 /var/core - Core dumps are stored in this directory. There will be
directories within this directory and they will be labeled
with numbers starting with 1. These files can be quite large in
size. Clear all files unless the core dumps are recent and
investigation is required.
10
11 /var/crash - Crash files, such as process crashes are stored in
this directory. Clear all files unless the crashes are recent
and investigation is required.
12
13 /var/nsinstall - Firmware is placed in this directory when
upgrading. Clear all files, except the firmware that is
currently being used.
```

- Verify if any of the directories are using more space:

```
1 du -hs *
2 44k    cache
3 2.0k   clusterd
4 2.0k   configdb
5 6.0k   core
6 989M   crash
7 4.0k   cron
8 2.0k   dev
9 6.0k   download
10 2.0k   gui
11 2.0k   install
12 2.0k   krb
13 2.0k   learnt_data
14 122M   log
15 366M   netscaler
16 14k    ns_gui
17 86k    ns_sys_backup
18 631M   nsinstall
19 883M   nslog
20 32k    nsproflog
21 2.0k   nssynclog
22 16k    nstemplates
23 36k    nstmp
24 4.5G   nstrace
25 8.1M   opt
```

```
26 6.0k  pubkey
27 52k   run
28 28M   safenet
29 72M   tmp
30 2.0k  vmtools
31 14k   vpn
```

- Delete the files which are not required:

```
1  rm -r nstrace/*
```

For more help on deleting files see FreeBSD man Pages.

- If the log or `nslog` directory is using more space, then run the following commands to open the log directory and view its contents:
- Delete the files which are not required.  

```
rm -r nstrace/*
```

For more help on deleting files see FreeBSD man Pages.
- If the log or `nslog` directory is using more space, then run the following commands to open the log directory and view its contents:

```
1  cd /var/log
2  ls -l
3  cd /var/nslog
4  ls -l
```

1. Ensure that all files are compressed. This is indicated by the `.tar.gz` file name extension.
2. If you are using Citrix ADM or Command Center, then verify the `/var/ns_system_backup` directory. Ensure that Citrix ADM or Command Center clears the backup files it creates.

### More resources

For information on any of the commands mentioned in the preceding procedure, see - <http://ss64.com/bash/>

## How to download core or crashed files from Citrix ADC appliance

October 6, 2020

This troubleshooting article explains how an administrator can download core or crash files from the Citrix ADC GUI.

## Download core or crash files from Citrix ADC appliance using SFTP client

To download the core or crash files from a NetScaler appliance, complete the following procedure:

1. Open WinSCP and log on to the NetScaler Management IP.
2. Navigate to the `/var/core/1` to download the files.

| /var/core/1      |           |                     |           |       |
|------------------|-----------|---------------------|-----------|-------|
| Name             | Size      | Changed             | Rights    | Owner |
| ..               |           | 15/05/2017 08:12:21 | rwxrwxr-x | root  |
| nscac64p-1177.gz | 12,428 KB | 25/07/2016 12:06:25 | rw-----   | root  |
| NSPPE-00-1055.gz | 12,651 KB | 25/07/2016 12:06:43 | rw-----   | root  |

### Note:

To download the latest crash or core file, you can also use the WinSCP tool through the command interface. The files can be located either in the core or crash directory.

## How to collect performance statistics and event logs

September 21, 2020

You can collect performance statistics of virtual servers and associated services from an archived `newslog` file present in the `/var/nslog` directory. The `newslog` files are interpreted by running `/netscaler/nsconmsg`.

### Collect performance statistics and event logs using the CLI

You can run the `nsconmsg` command from the Citrix ADC shell prompt to report events.

At the command prompt, type:

```
/netscaler/nsconmsg -K /var/nslog/newslog -d event
```

```

1 Displaying event information
2 NetScaler V20 Performance Data
3 NetScaler NS10.5: Build 57.7.nc, Date: May 14 2015, 07:35:21
4 rtime: Relative time between two records in milliseconds
5 seqno rtime event-message event-time
6 11648 16310 PPE-0 MonServiceBinding_10.104.20.110:443_(tcp-default)
7 <!--NeedCopy-->
```

**View the time span covered by a given “newslog” file**

At the command prompt, type:

```
/netscaler/nsconmsg -K /var/nslog/newslog -d setime
```

The current data is appended to the `/var/nslog/newslog` file. NetScaler archives the `newslog` file automatically every two days by default. To read the archived data, you must extract the archive as shown in the following example:

`cd /var/nslog` - Command to go to a particular directory from NetScaler Shell Prompt.

`tar xvfz newslog.100.tar.gz` - Command to extract the tar file.

`/netscaler/nsconmsg -K newslog.100 -d setime` - Command to check the time span covered by the particular file, in this example `newslog.100`.

`ls -l` Command checks all the logs file and time stamp associated with those files.

```
root@NETSCALER## cd /var/nslog
```

```
root@NETSCALER## ls -l
```

```
1 wheel 461544 Aug 7 2014 newslog.1.tar.gz
2 -rw-r--r-- 1 root wheel 191067 Aug 7 2014 newslog.10.tar.gz
3 -rw-r--r-- 1 root wheel 11144873 Apr 26 22:04 newslog.100.tar.gz
4 -rw-r--r-- 1 root wheel 11095053 Apr 28 22:04 newslog.101.tar.gz
5 -rw-r--r-- 1 root wheel 11114284 Apr 30 22:04 newslog.102.tar.gz
6 -rw-r--r-- 1 root wheel 11146418 May 2 22:04 newslog.103.tar.gz
7 -rw-r--r-- 1 root wheel 11104227 May 4 22:04 newslog.104.tar.gz
8 -rw-r--r-- 1 root wheel 11297419 May 6 22:04 newslog.105.tar.gz
9 -rw-r--r-- 1 root wheel 11081212 May 8 22:04 newslog.106.tar.gz
10 -rw-r--r-- 1 root wheel 11048542 May 10 22:04 newslog.107.tar.gz
11 -rw-r--r-- 1 root wheel 11101869 May 12 22:04 newslog.108.tar.gz
12 -rw-r--r-- 1 root wheel 11378787 May 14 22:04 newslog.109.tar.gz
13 -rw-r--r-- 1 root wheel 44989298 Apr 11 2014 newslog.11.gz
14 <!--NeedCopy-->
```

## Display the time span within a file

Use the `nsconmsg` command to only display a span of time within the given file, as shown in the following example:

```
/netscaler/nsconmsg -K /var/nslog/newslog -s time=22Mar2007:20:00 -T 7 -s
ConLb=2 -d oldconmsg
```

Where,

`s - time=22Mar2007:20:00:00` is start at March 22, 2007 at exactly 20:00.

`T 7` - Displays seven seconds of data

`s` is `ConLb=2` is a detail level for load balancing statistics.

`d` - Displays statistical information.

### Note:

From ADC release 12.1 you need add at the “time” seconds as well, that is: `22Mar2007:20:00:00`

The statistical information provided by the `-d oldconmsg` parameter is recorded every seven seconds. The following is a sample output.

```
1 VIP(10.128.58.149:80:UP:WEIGHTEDRR): Hits(38200495, 18/sec) Mbps(1.02)
   Pers(OFF) Err(0)
2 Pkt(186/sec, 610 bytes) actSvc(4) DefPol(NONE) override(0)
3 Conn: Clt(253, 1/sec, OE[252]) Svr(3)
4 S(10.128.49.40:80:UP) Hits(9443063, 4/sec, P[2602342, 0/sec]) ATr(5)
   Mbps(0.23) BWlmt(0 kbits) RspTime(112.58 ms)
5 Other: Pkt(36/sec, 712 bytes) Wt(10000) RHits(31555)
6 Conn: CSvr(42, 0/sec) MCSvr(20) OE(16) RP(11) SQ(0)
7 S(10.128.49.39:80:UP) Hits(9731048, 4/sec, P[2929279, 0/sec]) ATr(9)
   Mbps(0.27) BWlmt(0 kbits) RspTime(161.69 ms)
8 Other: Pkt(41/sec, 756 bytes) Wt(10000) RHits(31555)
9 Conn: CSvr(32, 0/sec) MCSvr(19) OE(13) RP(4) SQ(0)
10 S(10.128.49.38:80:UP) Hits(9341366, 5/sec, P[2700778, 0/sec]) ATr(4)
   Mbps(0.27) BWlmt(0 kbits) RspTime(120.50 ms)
11 Other: Pkt(42/sec, 720 bytes) Wt(10000) RHits(31556)
12 Conn: CSvr(37, 0/sec) MCSvr(19) OE(13) RP(9) SQ(0)
13 S(10.128.49.37:80:UP) Hits(9685018, 4/sec, P[2844418, 0/sec]) ATr(3)
   Mbps(0.23) BWlmt(0 kbits) RspTime(125.38 ms)
14 Other: Pkt(38/sec, 670 bytes) Wt(10000) RHits(31556)
15 Conn: CSvr(32, 0/sec) MCSvr(20) OE(10) RP(7) SQ(0)
16 <!--NeedCopy-->
```

**Note:**

The client connection counts of the individual services do not add up to the client connection count of the virtual server. The reason is because of session reuse between the Citrix ADC appliance and the back-end service.

**Virtual Server Output**

```
VIP(10.128.58.149:80:UP:WEIGHTEDRR): Hits(38200495, 18/sec)Mbps(1.02)Pers(OFF)Err(0)Pkt(186/sec, 610 bytes)actSvc(4)DefPol(NONE)override(0)Conn: Clt(253, 1/sec, OE[252])Svr(3)
```

The following list describes the virtual server statistics:

1. IP (IP address:port:state:Load balancing method). The IP address and port of the Virtual IP address as configured. The virtual server state or virtual IP address is UP, DOWN, or OUT OF SERVICE; Load balancing method configured for the Virtual IP address.
2. Hits (##). Number of requests that reached the virtual server.
3. Mbps (##). Total traffic Volume on the virtual server (Rx + Tx) converted into Mbits/s
4. Pers: Type of persistence configured.
5. Err (##). Number of times an error page was generated by the virtual server.
6. Pkt (##/sec, ## bytes): Volume of network traffic (as packets) passing through the virtual server and average packet size flowing through the virtual server.
7. actSvc(##). Number of active services that are bound to the virtual server.
8. DefPol (RR): Indicates whether the default load balancing method is active. Default load balancing method is used for some number of initial requests to smooth the behavior of the other methods.
9. Clt (##, ##/sec). Number of current client connections to the virtual server rate.
10. OE [##]. Number of server connections from the virtual server in open established state.
11. Svr (##). Number of current server connections from the virtual server.

In the preceding output, Svr(3) indicates the command collects the statistical sample. There are three active connections for the virtual server to the back-end server, even though there are four services in total. When a client establishes a connection with the virtual server, it is not necessary that the client sends or receives any traffic when the command collects the information. Therefore, it is common to see the Svr counter lower than the OE[] number. The Svr counter represents the number of active connections that are actively sending or receiving data. The Mapped IP address (MIP) or Subnet IP address (SNIP) is connected to the associated back-end server. And, the Citrix ADC tracks the virtual server connected to the back-end server and calculates the counter.

**Virtual service output**

```

1 S(10.128.49.40:80:UP) Hits(9443063, 4/sec, P[2602342, 0/sec]) ATr(5)
  Mbps(0.23) BWlmt(0 kbits) RspTime(112.58 ms)
2 Other: Pkt(36/sec, 712 bytes) Wt(10000) RHits(31555)
3 Conn: CSvr(42, 0/sec) MCSvr(20) OE(16) RP(11) SQ(0)
4 <!--NeedCopy-->

```

The following list describes the service statistics:

1. S (IP address:port:state): IP address, port, and state of the service such as, DOWN, UP, or OUT OF SERVICE.
2. Hits (#, P[#]): Number of requests directed to the service, Number of requests directed to the service due to configured server persistence.
3. ATr (#): Number of active connections to the service.

**Note:**

Active connections are ones which have the outstanding request to the service or currently have traffic activity.

1. Mbps (##.####). Total traffic Volume on the Service (Rx + Tx) converted into Mbits/s
2. BWlmt (## kbits): Defined bandwidth limit.
3. RspTime (## ms). Average response time of the service in milliseconds.
4. Pkt(##/sec, ##bytes). Traffic volume in terms of packets per second going to the service; Average size of the packets.
5. Wt (##). Weight index, used in load balancing algorithm.

**Note:**

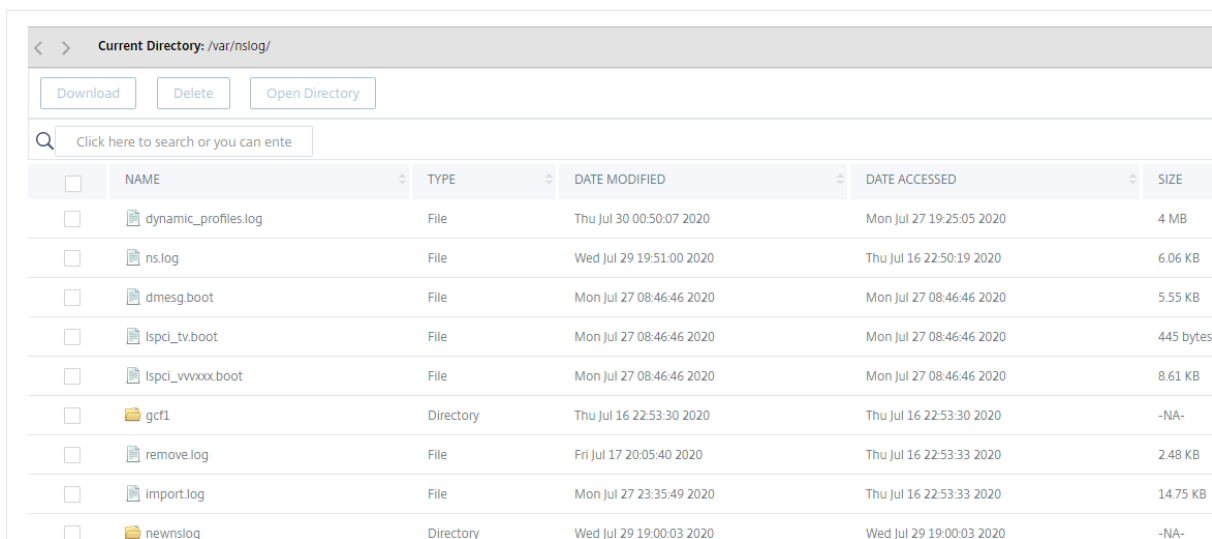

If you divide this value by 10,000, then you get the actual configured weight of the service.

1. RHits (#): Running requests counter used in Round Robin load balancing algorithm.
2. CSvr (#, #/sec): Number of connections to the service rate.
3. MCSvr (#): Maximum number of connections to the service.
4. OE (#): Number of connections to the service in the established state.
5. RP (#): Number of connections to the service, residing in the reuse pool.
6. SQ (#): Number of connections to the service, waiting in the surge queue.

### Collect performance statistics and event logs using the Citrix ADC GUI

1. Navigate to **System > Diagnostics > Maintenance > Delete/Download log files**.
2. Select a file and click **Download** to download the file.

## How to free space on a /flash directory in a Citrix ADC appliance

January 5, 2021

This troubleshooting article explains how an administrator can free space from the /flash directory of a Citrix ADC appliance.

### Procedure to free space in the /flash directory of a Citrix ADC appliance

1. Log on to the CLI of Citrix ADC by using SSH.
2. After you log on to the Citrix ADC CLI, switch to the shell prompt using the following command.`shell`.
3. Run the `df -h` command to see the availability of space on the Citrix ADC appliance.
4. If the capacity of the /flash directory is more than 90 percent or low, you must delete few files from this directory.
5. Run the following commands to view the contents of the /flash directory:

```
1 cd /flash
2 ls -l
```

6. You might find multiple files of various versions of the NetScaler software release. Ensure that the files present in this location are the ones applicable to the current version of the NetScaler software on your appliance. Run the following command to remove any other files from the appliance.

```
1 rm <filename>
```

#### Note

Remove only the older versions of the kernel. The /flash directory must contain the files that the current version or build of the NetScaler software release is using and the kernel.gz file. Citrix recommends not to remove these files from the /flash directory.

## Reference Material

September 21, 2020

Use this reference information to get an in-depth understanding of the following Citrix ADC components:

**Citrix ADC SNMP OIDs** - Details of the SNMP OIDs that can be used to obtain information from a Citrix ADC appliance.

**Citrix ADC Syslog Messages** - Details of the Syslog messages given by the Citrix ADC appliance.

**Citrix ADC CLI Commands** - Details of the commands that can be used to configure the Citrix ADC appliance through the CLI. You can also view the details of each command in the CLI, by entering the “man <ns-command-name>” command.

**API Reference** - Details of all operations that can be performed on the Citrix ADC appliance by using the REST API.

**Citrix ADC Advanced Policy Expressions** - Details of the expressions that can be used to define advanced policies.
