NetScaler 10.1

About the NetScaler 10.1 Release

Jan 01, 2014

NetScaler 10.1 releases are categorized into the following:

Main releases - Includes the first main NetScaler 10.1 build and subsequent builds which typically include minor changes and fixes to issues that existed in previous builds. In some instances, main releases might also include major enhancements.

Release naming format: NetScaler <ver> Build <major_ build>.<minor_build>.

Enhancement releases - Includes builds that provide major enhancements to a previously released NetScaler main release.

Release naming format: NetScaler <ver> Build <main_release><minor_build>.e.

For example, a release that adds an enhancement to NetScaler 10.1 Build 123.11 would be: NetScaler 10.1 Build 123.11xx.e.

> **Important**
>
> Unless explicitly specified, these enhancements are not available in main releases.

Main Releases

Aug 10, 2015

The release notes describe the changes or enhancements, fixed issues, and known issues in Build 133.9. The list of known issues is cumulative, that is, it includes issues that are newly found in this build and also issues from previous builds.

Fixed Issues - The issues addressed in Build 133.9.

Known Issues - The issues that exist in Build 133.9.

What's New in Previous 10.1 Builds - The enhancements and changes that were available in NetScaler 10.1 releases prior to Build 133.9. The build number provided below the issue description indicates the build in which this enhancement or change was provided.

Fixed Issues in Previous 10.1 Builds - The issues that were addressed in NetScaler 10.1 releases prior to Build 133.9. The build number provided below the issue description indicates the build in which this issue was addressed.

Note

- This build includes fixes for 7 issues that were known issues in the previous build of the NetScaler 10.1 release.
- The [# XXXXXX] labels under the issue descriptions are internal tracking IDs used by the NetScaler team.
- These release notes do not document security related fixes. For a list of security related fixes and advisories, see the Citrix security bulletin.

Fixed Issues

Oct 10, 2015

The issues addressed in Build 133.9.

AAA-TM | Acceleration | AppFlow | Application Firewall | Configuration Utility | DNS | GSLB | Load Balancing | NITRO API | NetScaler Gateway | NetScaler Insight Center | NetScaler SDX Appliance | Networking | Platform | SSL | System

---

- With LDAP authentication, users can experience authentication failures even when they provide valid credentials. This issue occurs when the authentication subsystem is low on memory after a large number of invalid authentication attempts.

  [#534280]

- The classic-policy expression used by the default acceleration policy fails to identify an Internet Explorer browser whose signature does not comply with the IE user-agent string standards.

  [#535130]

- The NetScaler appliance might fail if, while AppFlow for ICA is enabled, a network glitch disrupts the Citrix Receiver connection and Receiver attempts to reconnect.

  [#531017, 532712, 542000, 544421, 547598, 547984, 548297, 548749, 548771, 549044, 549370, 549511, 567534, 578548]

- The Citrix application firewall silently resets the connection when it receives a malformed or invalid request. With this fix, the application firewall logs such events.

  [#577742]

- If a large number of long standing sessions expire and are freed during application firewall processing, a tight-loop condition might occur, causing the NetScaler appliance to fail.

  [#550657]

- If, when processing a form for response-side security check inspection, the application firewall resets a connection, the partially parsed form is not freed. The result is a memory leak. With this fix, the memory allocated to the partially parsed forms is freed when a connection is reset.

  [#572637, 581520]

- When you update the application firewall signatures from the NetScaler command line, you must update the default signatures first, and then issue additional update commands to update each custom signatures file that is based on the

default signatures. If you do not update the default signatures first, a version mismatch error prevents updating of the custom signatures files.

For example, if you had two sets of custom signatures, named "custom_signatures" and "custom_signatures_2", that were based on copies of the default signatures file, you would update the signatures on your NetScaler ADC by issuing the following commands:

> update appfw signatures "*Default Signatures"

> update appfw signatures "custom_signatures"

> update appfw signatures "custom_signatures_2"

[#399596]

- During an application firewall security check inspection, a compressed response from the server might trigger a violation if the XML format check is enabled. With this fix, the Accept-Encoding request header is removed when the XML protections are enabled. If content compression is enabled on the server, the XML check inspection is bypassed when the server sends a compressed response.

  [#580273]

- If you specify the service type as DNS and select the DNS64 and ByPassAAA check boxes, and later navigate to some other service type (for example HTTP), the checkboxes are grayed out, because they do not apply to (for example) an HTTP service, but they are not cleared. That is, DNS64 and ByPassAAA are disabled but not set to the default value.

  [#538163]

- The system backup and restore functionality is not available on the Cisco NetScaler GUI.

  [#553373]

- Non-standard query packets are altered before they are forwarded to back-end servers, which causes the server to respond with a "FORMAT error" message.

  [#559064]

- Loading a new location file that has a coordinate outside the correct range (-90 to +90 latitude or -180 to +180 longitude) can cause the appliance to fail.

  Recommendation: After loading any location file, use the command, "show locationparameters" to get a summary of the coordinates loaded and any parsing errors. The specific problems are reported in /var/log/ns.log.

  [#550294]

- If the "Invalid argument error" message appears intermittently in nsmund.log, treat it as a false positive. The error

appears because a scenario was not handled correctly. However, if this message appears in the log every time a particular script runs, there is an issue with the arguments that are passed to the script.

[#568719]

- In a RADIUS load balancing setup, if Use Source IP (USIP) is configured on the RADIUS services, the server side connections are not reused, and requests are dropped.

  [#574120, 534888]

- In a RADIUS load balancing setup, requests might be dropped because the memory for the session entries is not freed until the idle timeout expires even though the transaction completed earlier.

  [#573155]

- If you configure cookie persistence and custom cookie on a virtual server, and later change the name or IP address of the virtual server, persistence is not honored.

  [#524079, 559022]

- If an SSL monitor is bound to a domain-based service that is configured with non-default SSL settings, the monitor might not show the service as UP.

  [#575171, 576012]

- In a high availability setup, if custom cookie persistence is configured on a virtual server, part of the secondary node's configuration might not be synchronized with the primary after a failover occurs.

  [#552799, 552607]

- If the load balancing (LB) feature is not licensed, and you try to enable an LB virtual server, an error message appears.

  [#466094, 534755]

- **Viewing the Statistics of Services and Service Groups that are Bound to a Load Balancing Virtual Server**

  You can now view the statistics of services and service groups that are bound to a load balancing virtual server by using the following URL:

  http://<netscaler-ip-address>/nitro/v1/stat/lbvserver/<name>?statbindings=yes

  You cannot view these details by using the "http://<netscaler-ip-address>/nitro/v1/stat/lbvserver/<name>" URL which only gives the statistics of the load balancing virtual server.

  [#241950, 244603, 523907, 534804, 538057]

- **Applicable only for Mac VPN clients**

  Chrome is phasing out NPAPI support. From Chrome version 42+ all NPAPI plugins will appear as if they are not installed. This will affect all existing customers. Affected customers will see a download prompt even though the VPN plugin is

installed.

Workaround: Google has announced that Chrome will stop supporting NPAPI completely in version 45.

Until then, you can enable NPAPI as follows:

1) In the Chrome URL bar, type:

Chrome://flags

2) Enable the "Enable NPAPI" option.

3) Restart Chrome.

For more information about NPAPI deprecation, see https://support.google.com/chrome/answer/6213033?hl=en

[#572447, 574353, 575609]

- In a double hop deployment, STA server status on hop 1 does not go down when double hop is disabled in hop2, and the user still launch ICA apps.

  [#539743]

- Internet access fails intermittently when connecting to a NetScaler Gateway with Split Tunnel On using a Windows machine.

  [#572709]

- NetScaler Gateway EPA and VPN plugins don't get triggered on latest chrome browser. Chrome browser shows download prompt even after installation.

  [#570493]

- NetScaler Gateway now supports Windows 10.

  [#579428]

- The RSA Pin change fails if RSA radius servers are load-balanced with the RADIUS type protocol service. The workaround is to change the load-balance protocol service type to UDP or ANY.

  [#534888, 528950, 542189]

- NetScaler appliance fails because of incorrect handling of HDX Insight's internal data structures. This may happen when HDX Insight skips parsing ICA data in certain error scenarios.

  [#559043, 553185, 585888, 588152]

- NetScaler appliance fails because of incorrect handling of HDX Insight's internal data structures. This may happen when HDX Insight skips parsing ICA data in certain error scenarios.

  [#551081, 580514, 589856]

- On an SDX appliance, the Management Service may lose connectivity. The issue is seen only with Management Service which is in the UP state for many days, minimum being 277 days.

  [#444854, 487984, 496194, 506802, 547064, 547571, 549842]

- If you have created channels on NetScaler SDX Appliance, the Management Service statistics process, svm_stat, may fail in some cases.

  [#570006]

- Upgrading XenServer on a NetScaler SDX appliance to Revision 1 of XenServer 6.1 causes a loss of information about memory and CPU settings assigned to the control domain. As a result, a subsequent attempt to upgrade to XenServer 6.5 fails.

  [#578680]

- A PBR6 rule might not get evaluated if you set the operator option to NEQ (!=) for source and destination IPv6 addresses.

  [#575906]

- In a high availability configuration, if you remove an ACL rule from the primary node and modify another ACL rule on the primary node, but you do not apply the ACLs on the primary node before forcing synchronization on the secondary node, the secondary node might become unresponsive.

  [#576810, 545920]

- An ACL6 rule might not get evaluated if you set the operator option to NEQ (!=) for source and destination IPv6 addresses.

  [#573516]

- An attempt to access the configuration utility might fail if the logon address is an IPv6 address.

  [#553588]

- If you have configured an INAT rule in which the private IP address is set to a virtual IP address, the rule is removed after you restart the NetScaler appliance.

  [#556632]

- TFTP monitor probes might fail with the error "Probe Timed out."

  [#578663]

- If the IPv6 routes change, the IPv6-Ipv6 tunnel's encapsulation IP addressess are not obtained based on the latest route information. As a result, the tunnels use old encapsulation IP addresses to encapsulate packets.

  [#564252]

- The MPX 25100T and MPX 25160T platforms are now supported in this release. For more information about these platforms, see http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-platforms-con/ns-hardware-25100T-25160T-ref.html.

  [#486703, 495591, 552218]

- You can now upgrade the Lights Out Management (LOM) firmware directly from the host, without configuring the LOM port on the network.

  [#430733, 542439]

- If you have a cluster setup of NetScaler MPX 8005/8015/8200/8400/8600/8800 appliances, time synchronization among the cluster nodes might fail.

  [#356564, 566811]

- If application data is received during an SSL renegotiation handshake, the appliance sends a RST flag.

  [#542034]

- In some cases, when client authentication is enabled, incorrect data form a client leads to a memory leak on the NetScaler appliance. If a large number of clients send incorrect data, the appliance fails.

  [#570754]

- In a NetScaler cluster setup, if you add a certificate-key pair with a subject name greater than 64 characters, and later add more certificate-key files, the addition fails with the "No such certificate file exists" error even though the certificate-key pair key file is present on all cluster nodes.

  [#554917]

- If you execute NTP commands, such as enable ntp sync and show ntp status, the NetScaler appliance might become unresponsive because of a memory leak.

  [#529787, 574866, 581849]

- NTP Version Update

  In NetScaler release 11, the NTP version has been updated from 4.2.6p3 to 4.2.8p2.

  If you upgrade your NetScaler appliance from any earlier release to release 11, the NTP configuration is automatically upgraded with additional security policies. For more information about configuring an NTP server, see http://docs.citrix.com/en-us/netscaler/11/system/basic-operations/configuring-clock-sychronization.html.

  [#440375, 440591]

- If you enable the snmp alarm SERVICEGROUP-MEMBER-MAXCLIENTS, varbinds such as svcGrpMemberName, svcGrpMemberEstablishedConn, alarmHighThreshold, svcGrpMemberFullName, and sysIpAddress might be missing from the alert.

[#578673]

Known Issues

Oct 10, 2015

The issues that exist in Build 133.9.

AAA-TM | AppFlow | Application Firewall | CloudBridge Connector | Cluster | Command Line Interface | Configuration Utility | Content Switching | Content Switching/Load Balancing | DNS | DataStream | GSLB | Graphical user Interface | High Availability | Integrated Caching | Load Balancing | NITRO API | NS-AAA | NS-Gateway | NetScaler 1000V | NetScaler Gateway | NetScaler Insight Center | NetScaler SDX Appliance | NetScaler VPX Appliance | Networking | Platform | Policies | Reporting | SSL | System | User Interface | Web Interface | XML API

- The NetScaler implementation of Kerberos does not fully implement the ktutil functionality. While this does not affect Kerberos authentication, it restricts some administrative tasks, such as the ability to merge keytab files.

  [#551091]

- Forms-based single sign-on does not work if the form is customized to include Javascript.

  [#565740]

- The NetScaler ADC AAA-TM user interface has a timeout of 20 seconds. If authentication through an external authentication server takes more than 20 seconds, the following message appears in the logs: "libaaa recv failed." This message does not indicate authentication failure or any other problem that affects users. It can safely be ignored.

  [#437454]

- The rule (expression) in a AAA-TM policy can be from one to 1434 characters in length. If you enter a longer rule, AAA-TM displays an "invalid rule" error.

  [#332831]

- When AAA-TM logs users off after their sessions time out, the traffic management session associated with the user is not terminated. If the number of abandoned traffic management sessions exceeds internal limits, the NetScaler ADC might become unresponsive.

  [#481876]

- In NetScaler 9.3 and previous versions, the NetScaler ADC used a SNIP address as the source IP address for authentication requests unless the administrator configured a static route to a different interface. In NetScaler 10.1 and subsequent versions, the ADC uses the NSIP address as the source for authentication requests even when a static route points to a different interface.

  To force the ADC to use a SNIP (not the NSIP) as the source IP address in version 10.1 or later, you can set up a load balancing virtual server with an authentication service, and then configure that load balancing virtual server to perform the authentication.

  [#457817]

- The AppFlow exporter might not export the correct information. Therefore, the client IP address shown on the NetScaler Insight Center dashboard might be incorrect.

  [#396892]

- AppFlow records generated by the NetScaler appliance cannot be seen on SPLUNK.

  [#327439]

- The following behavior is seen during a high availability failover on a NetScaler appliance that has active ICA session applications launched:

  --- The applications stop functioning, but are visible on the browser.

  --- The Citrix Receiver displays a dialog box, with a message stating that the connection is disconnected.

  --- When you click OK on the dialog box, the applications are not displayed anymore.

  --- If you launch any fresh applications without re-login, all the previously launched applications will resume with the previous status.

  [#388563, 438710, 488206]

- The timestamp in AppFlow records are not in NTP format.

  [#525568]

- If a user request triggers an application firewall policy that is bound to the APPFW_BYPASS profile, the application firewall might fail to generate an SNMP alarm.

  [#489691]

- If the user sends a request that contains the string "Javascript" without a non-alphanumeric delimeter, the Cross-Site Scripting check does not block the request. This is expected behavior. Without a delimiter, the keyword "Javascript" cannot trigger code execution and therefore poses no threat to the protected web application.

  [#457926, 506333]

- The auto-update operation restores the default SQL/XSS patterns in the signatures. If the user edits a signature to remove any of the SQL/XSS patterns, the removed patterns might reappear in the signature when it is auto-updated.

  [#455652]

- On a NetScaler ADC that has the application firewall enabled and the HTML SQL injection feature configured to block, when the ADC detects an SQL violation on a page with a web form, a second violation might be generated for the Form Action URL. This is expected behavior. To avoid unexpected blocks, when you configure a relaxation for a web form, be sure to include a relaxation for the Form Action URL as well.

  [#451014]

- A NetScaler ADC that has the application firewall feature enabled might reset the connection after a protected web server issues an HTTP 204 response.

  [#427798]

- When you enable the sessionless URL closure feature, you must also enable the URL closure feature. If you do not enable URL closure, the sessionless URL closure feature does not work.

  [#283780]

- If the server sends less data than the amount specified in the Content-length header, the NetScaler application firewall might send a 9845 response and reset the connection.

  [#506653]

- On a NetScaler ADC that has the application firewall enabled and the buffer overflow check configured to block, the following error message might appear in the logs: "Internal error: additional data generated after partial response <blocked>." This error message indicates that a partial response was sent before the remainder of the response was blocked.

  [#498912]

- The Perl script that parses and merges the application firewall signatures during schema version upgrade can cause Perl to crash on the NetScaler ADC. These crash files can fill up the space on the hard drive, preventing access to the Graphical User Interface.

  [#532248]

- A POST request with an attached word document is silently blocked by the application firewall for a customized application.

  [#530277]

- URL Transformation, SSL VPN, and CVPN features leverage the application firewall processing engine and enforce the content-length check of the built-in dummy application firewall profile. For some transactions, this check truncates the processed data.

  [#532338, 526029, 539487]

- On a NetScaler appliance that has standalone application firewall license, when you bind a classic application firewall policy to a load balancing virtual server, an error message is displayed in the graphical user interface. The binding operation is successful. The error message is harmless and can be safely ignored.

  [#522712]

- For some malformed requests, the NetScaler application firewall log messages might not include the client IP address.

  [#510006]

- In NetScaler 9.3, if there is a standalone application firewall license, the user is able to bind a classic application firewall policy to the load balancing virtual server. However, in NetScaler 10.1, the design is changed. If the load balancing feature is not licensed, binding a classic application firewall policy to the load balancing virtual server now results in an error message.

[#510509]

- The customer's application does not work when the application firewall is deployed to inspect the request for security check violations. When the application firewall forwards the request to the backend server, the server responds with a 403 HTTP error code, indicating that it cannot properly validate the CORBA session, and sends the page without the expected data in the form fields. The root cause is under investigation.

  Workaround: Turn off form field tagging and credit card checks.

  [#511254]

- During an upgrade of a NetScaler appliance from version 10.0 to version 10.1 (build 121.1 or subsequent), the default JSON content type is not automatically configured. The default JSON content type is configured when version 10.1 (build 121.1) is installed on new hardware or in a new VPX instance. To check whether your appliance or instance has the correct default setting, log onto the NetScaler command line and type the following command:

  show appfw JSONContentType

  If the default content type is configured, the command output is similar to the following example:

  > show appfw JSONContentType

  1) JSONContenttypevalue: "^application/json$" IsRegex: REGEX

  Done

  If it is not, the screen shows only the following:

  > show appfw JSONContentType

  Done

  To add the default content type to the configuration, after upgrading to 10.1 (121.1), log onto the NetScaler command line, and then type the following commands to configure the default content type and verify the configuration:

  add appfw JSONContentType ^application/json$ -isRegex REGEX

  show appfw JSONContentType

  [#430014]

- If the application firewall blocks a request because of a limiting policy, such as a maximum upload size limit on a web form, the blocking action is not logged. If a custom redirect page has been configured for that web page, the application firewall does not display it.

  [#466329]

- With TCP services reachable over a GRE tunnel (without IPSEC), one or both tunnel end points (NetScaler appliances) might become unresponsive while monitoring the services over the tunnel.

  [#508535]

- In a cluster setup, a command that is executed on the cluster configuration coordinator is propagated to the other cluster nodes. Therefore, a command that takes a long time to complete (such as "save ns config"), can take a little extra time to complete on all the cluster nodes. During this time, if you execute another command on the cluster (through another session), that command will fail because the previous command is not yet complete.

  [#551607, 495270, 562651]

- In a cluster setup, the "show ns trace" command displays the trace only of the cluster configuration coordinator node. It does not show the trace of the other cluster nodes.

  [#568518]

- During an upgrade from a NetScaler 10.1 build to a NetScaler 10.5 build, running the "show audit messages" command can cause the NetScaler appliance to fail.

  [#546038]

- The NetScaler command line interface exits abruptly upon executing the "show dns addRec -format old" command.

  [#512526, 527066, 545578]

- When you use the Net::SSH::Perl library, and execute a command where an argument has a @ character, the NetScaler gives an error message indicating that the argument does not exist.

  For example, if you use the @ character in the tacacsSecret parameter of the following command:

  > set authentication tacacsAction TACACS-0101 -tacacsSecret Sl4make5f0rd@enc5

  Workaround: Use one of the following alternate approaches to execute the command:

  - Use Net::SSH::Perl library and include double quotes around the command when calling $ssh->cmd().

  - Use the Net::Telnet library.

  - Use the Net::SSH::Expect library.

  [#346066]

- The "alias" command prepends an extraneous quote character. As a result, the command does not work as expected.

  [#531114]

- If you open the NetScaler ADC configuration utility on multiple browser tabs, and if you disable a feature on one of the tabs, the other tabs are not automatically refreshed.

  Workaround: Manually refresh the tabs.

  [#469755]

- The Upgrade Wizard sometimes does not display a message when the appliance is rebooting. However, the NetScaler appliance reboots and the upgrade is successful.

  Workaround: Reload the NetScaler GUI through the browser.

  [#557379, 585649]

- If you use a Chrome browser to access the NetScaler graphical user interface (GUI), the browser might display the Page Unresponsive error message.

  Workaround:

  If you are using a Windows computer, do the following:

  1. Right-click the shortcut icon that you use to open the Chrome browser, and select Properties from the pop-up menu.

  2. In the Google Chrome Properties dialog box, click the Shortcut tab and, in the Target field, append the following value: --disable-hang-monitor

  For example: "C:\\Program Files (x86)\\Google\\Chrome\\Application\\chrome.exe --disable-hang-monitor" http://www.google.com

  3. Close all instances of the Chrome browser, and restart the Chrome browser.

  If you are using a MAC computer, do the following:

  1. Open the terminal.

  2. Launch the Chrome browser from the terminal and append the --disable-hang-monitor value, as follows:

  open -a /Applications/Google\\ Chrome.app --args --disable-hang-monitor

  [#400073, 401262]

- If, when using the configuration utility to configure a NetScaler ADC, you press Alt+Tab to switch between programs, the current dialog box might disappear, hidden behind the main configuration utility screen. To reach the dialog box, press Alt+Tab a second time.

  [#374437]

- On the Reporting tab of the NetScaler GUI, if you have chosen to use the time zone settings of the NetScaler ADC, the System Overview graph does not reflect the time zone set on the NetScaler ADC. The values in the graph are for the GMT time zone.

  [#485314]

- The Traffic Management > Load Balancing > Set up NetScaler for XenApp/XenDesktop wizard displays an error if more than one service group is bound to the virtual server that is used for load balancing the XenApp/XenDesktop servers, or if more than one service is bound to the service group.

  [#414807]

- You cannot use the configuration utility to add signatures to an existing application firewall profile using the wizard, if the application firewall policy is not globally bound.

Workaround: Use the command line interface .

[#470941]

- The maximum length for creating a NetScaler ADC system user password (System > User Administration > Users) is 127. The GUI tooltip displays this value as 255, which is incorrect.

  [#499223, 561315]

- If you use the Google Chrome browser to access the NetScaler configuration utility, and the monitor resolution is low, you might not be able to use the mouse to scroll the screen.

  Workaround: Use the arrow keys on the keyboard to scroll the screen.

  [#389328]

- If you access the NetScaler configuration utility from the Start screen on a Windows 8 machine, the Java based configuration views are not displayed.

  Workaround: Switch to the Desktop screen to display Java based configuration views. Microsoft Windows 8 does not support plug-ins on the Start screen, and therefore Java cannot run on the Start screen. For more information, see http://www.java.com/en/download/faq/win8_faq.xml

  [#388534]

- In a high availability setup, if you run the "add ssl certkey" command on the primary node, and the certificate and key files are not present on the secondary node, the command fails?on the secondary node. However, the configuration utility does not display an error message.

  [#459703]

- When using the Traffic Management > Load Balancing > Set Up NetScaler for XenApp/XenDesktop wizard, Web Interface on NetScaler does not publish XenDesktop applications if the load balancing virtual server is configured to listen on two XenDesktop servers.

  [#414422]

- In certain cases, if the state of a load balancing virtual server changes, the NetScaler appliance might fail while changing the state of the associated content switching virtual server.

  [#522510, 528782, 538223, 552913]

- When you configure load balancing virtual servers in a content switched environment, the service types of primary and backup virtual servers must be the same. If you assign a backup virtual server with a service type of TCP to a load balancing virtual server with a service type of HTTP, any content switching action bound to the load balancing virtual server fails.

  [#399575]

- If DNS caching is enabled and the NetScaler ADC receives a query that is not cached, it forwards the query to the name server. It sends the response from the server to the client and also caches the records in the Answer, Authority, and Additional sections of the DNS response. The response from the server can have the AA bit set or unset.

  - If the AA bit is set and a query is received for a record that was cached and a part of the Authority or Additional section, the ADC responds to the query from its cache, with the AA bit unset and TTL decremented.

  - If a subsequent query is received for a record that is cached and was part of the Answer section, the ADC responds to the query from its cache, with the AA bit set and the original TTL.

  [#458244]

- If, while adding a DNS record (such as addrec and nsrec) from the GUI or by using the NITRO API, you specify the TTL value as 3600, the value of the minimum TTL of the SOA record is used instead.

  [#382478]

- A NetScaler client becomes unresponsive if:

  1. The NetScaler appliance receives the complete response to the client's query from the server.

  2. At the same time, the client sends an attention packet to the appliance.

  The client becomes unresponsive because the appliance closes the server-side connection but does not send the client a response to the attention packet.

  [#560401]

- In all releases of 10.0 and 10.1, the "show server" output does not include IP address and state information for GSLB services.

  This feature works in all builds of the 9.3 and 10.5 releases.

  [#499523]

- GSLB force sync option fails, if the following conditions are met:

  * The same load balancing (LB) monitor is bound to a GSLB service as well as other LB entities.

  * The server IP address already exists in the slave node under non-GSLB entity (the entity with same server IP address but with different server name) and the master node tries to synchronize the configuration.

  [#530638, 506432]

- If you do not specify the deployment details when you import the SharePoint AppExpert template, you cannot configure backend servers.

  [#511638]

- When upgrading HA nodes that have Web Interface on NetScaler (WIonNS) build 126.x, the updates made in the Webinterface.conf file are overwritten by the previous version of the file. This is due to the rolling upgrade of HA nodes or due to the file sync operation between HA nodes.

  To avoid this issue, use the following steps when upgrading the HA nodes:

  1. Before upgrading, run the "set ns param -internaluserlogin DISABLED" command.

  2. Upgrade the secondary HA node to NetScaler release 10.1 build 126.x.

  3. Force failover to make the upgraded node the primary node.

  4. Upgrade the other HA node to NetScaler release 10.1 build 126.x.

  5. Reenable the "internaluserlogin" parameter with the "set ns param -internaluserlogin ENABLED" command.

  6. Save the configurations.

  Note: Before upgrading synchronize files between the HA nodes by using the "sync ha files all" command.

  [#471294]

- In a NetScaler deployment that has integrated caching and SSL enabled, the NetScaler can crash in the following scenario:

  1. Client1 requests for an object that is not in cache.

  2. While the NetScaler fetches the object from the backend server, client2 (a slow client) sends a request for the same object.

  3. Client1 now decides to reset the connection.

  4. When available, NetScaler serves the object to the client2.

  However, since client2 is slow, large data is piled up on the NetScaler that needs to be forwarded to client2. When the NetScaler tries to send this large data to the client, the NetScaler can crash.

  [#486535]

- When a selector-based content group has been configured, the NetScaler ADC can fail when a policy associated with this content group is matched and the response status is "404 Not Found".

  [#440107, 440389]

- If a NetScaler appliance sending a DNSSEC negative response over UDP is not able to include the required records (for example, SOA, NSECs, and RRSIG records) in the Authority section, the appliance might send a truncated response in the wrong packet format.

  [#540965]

- The NetScaler ADC might fail or become unresponsive if the FTP virtual server name exceeds 32 characters and L2Conn is enabled on the virtual server.

  [#441776]

- If a DNS autoscale service group is bound to a virtual server, the "show lb vserver" command output displays one extra service bound to the virtual server.

  [#464952]

- When you load balance secure XenApp servers running SSL,using Netscaler load balancing servers, then Constrained Delegation between WebInterface and XenApp fails.

  [#535103]

- If the FQDN is not resolvable, you might notice high CPU utilization on the NetScaler ADC.

  [#455133]

- The appliance fails if non-reachable autoscale entities that are part of a service group later become reachable and, in the interim, the service group name has changed.

  [#583647]

- The session timeout value that is set for a particular user (using the "add/set system user -timeout <value>" command) is not used as the session timeout value for that user when logged on to a NITRO session in NetScaler 10.1 builds. The session timeout value for NITRO API can be specified at login time, otherwise a default value of 30 minutes is taken as the session timeout value.

  Note: In NetScaler 10.5 builds, the user session timeout value is by default used as the NITRO API session timeout value for that user.

  [#513938, 525094]

- Configuring singleton entities such as lbparam, sslparam, csparam, and vpathparam by using the "application/vnd.com.citrix.netscaler.<entityname>+json" content-type, results in error. For example, you get an error when setting the vPath parameter as follows:

  - URL: /nitro/v1/config/vpathparam

  - Method: PUT

  - Content-type: application/vnd.com.citrix.netscaler.vpathparam+json

  - Request payload: {"vpathparam":{"encapsulation":"enabled"}}

  - Response: {"errorcode": -1,"message": "Entityname is missing","severity": "ERROR"}

  Workaround: Use one of the following content types to resolve the issue:

  Option1: Using the "application/json" content type.

- URL: /nitro/v1/config/vpathparam

- Method: PUT

- Content-Type: application/json

- Cache-Control: no-cache

- Request payload: {"vpathparam":{"encapsulation":"enabled"}}

Option2: Using the URLEncoded content type.

- URL: /nitro/v1/config/

- Method: PUT

- Content-Type: application/x-www-form-urlencoded

- Cache-Control: no-cache

- Request payload: {"vpathparam":{"encapsulation":"enabled"}}

[#574321]

- The "set appfw" command cannot be executed on the Netscaler ADC if TACACS server is used for authorization. An error message -"Not authorized to execute this command" might be seen.

  [#519898]

- In a Double-Hop deployment, if a STA server on the first hop is DOWN, the ns.log file is filled with SSLVPN Message: "Sent IPv4 Socks connect reply to client. Connection Refused "

  [#559879]

- EULA should not be prompted when interface type is modified from Shared to Passthrough for a NetScaler-VSB provisioned on Nexus 1010/1110 platforms.

  [#471373]

- Log file gets congested with the messages reporting WI monitor services as UP, with no corresponding DOWN messages.

  [#562819]

- When running the NetScaler Gateway wizard, a prompt appears at the end to make the LDAP authentication policy the primary authentication type, even though the LDAP policy is selected as primary earlier in the wizard.

  [#427092]

- The pop-up messages for NetScaler Gateway Plug-in for Windows appear behind the active applications (such as browsers) on Windows 8.

  [#511757]

- A customer reported: with TACACS+?configured for AAA, and authorization disabled on the policy when the customer runs commands, they get a "Not Authorized" error.

  [#573836]

- The NetScaler counters, used to verify connected users, display a value that does not reflect actual connections.

  [#490991, 398874]

- During login, the client authenticates, but the kernel module did not compile.

  Cause and solution: The Linux NSGClient expects linux kernel headers to be installed. The user needs to install linux headers manually before installing NSGClient. The command would be,

  apt-get install linux-headers-`uname -r`

  [#545810]

- For windows, if the NetScaler VPN plugin is auto-upgraded from version 9.3 or older, and the Citrix receiver is running, after the auto-upgrade the home pages are displayed in two tabs.

  [#530310]

- If you apply the Citrix Receiver theme to the NetScaler Gateway logon page, the layout appears garbled on computers running Windows XP Service Pack 3 with Internet Explorer 7 browsers.

  [#346729]

- On an nCore appliances, when users attempt to access the subnet IP address through the VPN tunnel over HTTP, a 401 Access Denied error message appears. Connecting to the subnet IP address works if users make the attempt by using HTTPS.

  [#373991]

- If you configure NetScaler Gateway as a high availability pair and if there is a failover from the primary to the secondary appliance, the ICA connection to published apps that are already open on the user device is reestablished. If users attempt to open more applications from the Web Interface, the applications fail to open and user receive an error message

  [#384998]

- When users log on with the NetScaler Gateway Plug-in, when WiFi roaming occurs, intermittent ICMP requests time out and users cannot access network resources.

  [#392389]

- If Pre-authentication scan is configured on NetScaler and users launch NetScaler Gateway plugin when browser is already opened then users intermittently get redirected to "Internal error" page.

[#393357]

- If you configure an intranet IP address, when users log on by using clientless access and then open SharePoint 2007, when they try to open a folder with Windows Explorer, a blank page appears.

  [#376303, 394800]

- Installing and uninstalling the NetScaler Gateway Plug-in can take a long time. This is due to multiple entries of the Citrix Virtual Adapter in the registry.

  [#398693]

- Java Plug-in: Intranet Application fails to connect if AG VIP is running on non default port

  [#399405]

- The NetScaler Gateway Plug-in for Java does not compress network traffic even when compression is configured on the NetScaler Gateway.

  [#400050]

- If you configure Group Extraction, you cannot bind an LDAP authentication policy to the virtual server. However, if an LDAP authentication policy was bound to the virtual server before configuring Group Extraction, you can enable authentication on the virtual server.

  [#400171]

- If you configure a NetScaler Gateway virtual server, enable ICA proxy and enable the Use Source IP (USIP) mode globally, when users connect and use StoreFront to open an application, NetScaler Gateway uses the client IP address as the source IP address when contacting the STA server and the application fails to open. If you disable USIP mode, the same behavior occurs unless you restart the NetScaler Gateway appliance. To avoid the issue, you need to configure a service on NetScaler for the STA server and disable USIP on that service.

  [#411851]

- When you use the Set Up NetScaler for XenApp/XenDesktop wizard in NetScaler, apply optimization settings, and bind the cache policy globally, when users log on with the NetScaler Gateway Plug-in and open Citrix Receiver, the applications and desktops do not appear. The following message appears: There are no apps or desktops assigned to you at this time. Citrix recommends disabling the optimization settings.

  [#411152]

- If you configure the appliance with NetScaler Gateway and Application Firewall, logon attempts by unauthorized users appear in the logs. When an authorized user logs on and then attempts to access a network resource to which users are explicitly denied, the access attempt does not appear in the logs and users receive a 403 error.

  [#374890]

- When users connect, the DNS Service Location (SRV) records configured on NetScaler Gateway are not served.

  [#464518, 467420]

- To configure two-factor authentication with SAML authentication, you must configure the secondary authentication

policy in the primary cascade.

[#397625]

- Occasionally, the NetScaler shows, "Error: Not a privileged user", when attempting to reach ShareFile through the SAML method.

  [#555779]

- A NetScaler Gateway NSPPE crash happened under the following conditions:

  * wihome is configured with FQDN

  * wihome is removed immediately even before the DNS response for the same comes back

  [#542560, 566864]

- If you have configured a proxy server and you configure NetScaler Gateway to route traffic through the proxy server, when users log off from a clientless access session, a 403 error occurs.

  [#385318]

- The running configuration does not include group extraction policies bound to the NetScaler Gateway virtual server.

  [#368229]

- The URL rewrite label, which is set at the global level, overrides the rewrite label that is set at the virtual server level. The settings in the global level should not override the virtual server level settings.

  [#444715]

- In transparent mode, after you initiate a session and launch an application through Citrix Receiver (Enterprise edition) from a Windows 8 client, the session terminates and resumes when you launch subsequent applications. Consequently, HDX Insight reports include session termination records.

  [#399626]

- On the Dashboard > HDX Insight > Users page, the report for user sessions displays incorrect values. The left pane displays the average values for the entire session, but the right pane displays the values for the period selected from the drop-down list.

  [#397236]

- The time values on the graphs display overlapping values, mostly in the 5-minute-interval view.

  [#379876, 424686, 437964]

- In a graph that displays a very low number of data points, the time value displayed on the x-axis includes milliseconds. The value displayed for milliseconds has no significance.

  [#368967]

- On the Dashboard > Web Insight > Applications page, the values shown when you select "Response Time" from the

drop-down list can be incorrect.

[#394526]

- If an ICA session is initiated by launching XenDesktop, the user name is displayed along with the domain name "(user-id@domain-name)".

  [#385821]

- The following error message appears when NetScaler Insight Center installed on VMware ESX is powered on or off:

  The VMware Tools power-on script did not run successfully in this virtual machine. If you have configured a custom power-on script in this virtual machine, make sure that it contains no errors. You can also submit a support request to report this issue.

  [#414160]

- In some instances, the bar line on a graph appears outside the time points on the x-axis.

  [#446120]

- On the HDX Insight reports, a Y-axis value of 0 is sometimes shown at a location higher than the x axis.

  [#414214]

- When launching n instances of an application, the NetScaler appliance sends n-1 termination records for the application. Consequently, the HDX Insight node displays only a single instance of this application as active.

  [#386911]

- Upgrading NetScaler Insight Center on a VMware ESX server from build 118.7 or 119.7 to build 120.13 or later is not supported. However, upgrading from build 120.13 to later build is supported.

  Workaround: To upgrade to build 120.13 or later, perform a fresh installation. To retain your existing configurations, make sure that the IP address of the NetScaler appliance and the IP address of NetScaler Insight Center remain the same.

  [#424673]

- NetScaler Insight Center might not display reports under the following set of conditions:

  -NetScaler ADCs that are configured for Network Address Translation (NAT) are added to the NetScaler Insight Center inventory.

  -A NetScaler ADC and a NetScaler Insight Center virtual appliance are in different networks and are configured for NAT.

  [#441163]

- When you launch XenApp through Citrix Receiver (standard edition), the app launch duration is not calculated and is shown as zero.

  [#388096, 423109]

- In SDX systems, sometimes interface or channel binding to a VLAN fails. This happens only if the interface is down or one of the member interfaces of a channel is down.

  [#474438, 493664]

- On adding many VPX instances, you may hit the default cache memory limit which could result in unexpected behavior.

  Workaround: Increase the default cache memory limit.

  [#499311]

- Configuring of Enforced VLAN by providing VLAN number in the VLAN ID field is not supported on SDX Rome 1G port.

  Workaround: Use the Allowed VLAN feature which has the same functionality as Enforced VLAN.

  [#369650, 442942, 468381]

- On SDX systems, sometime while creating/deleting or modifying a LACP channel, TX stalls are seen on some of the member interfaces.

  [#476304]

- If there are no 0/x interfaces provisioned in a VPX and 10/x or 1/x interface is used for manageability purpose and the user creates a LACP channel on those interfaces (10/x or 1/x), then the VPX will become unreachable by Management Service and the channel configurations will not be propagated to the VPX.

  The best way to achieve the same is to create the required channel first and then provision the VPX with the LACP selected.

  [#506167]

- If you use the Management Service to bind a new interface to an LACP channel or unbind an existing interface, all the member interfaces of the LACP channel are reset. This forces an HA failover.

  [#434687]

- If you disable an interface of an LA channel configured on a NetScaler instance running on a NetScaler SDX appliance, the SDX appliance does not notify the peer device that the interface is disabled. Therefore, the peer device might send traffic to the disabled interface.

  Workaround: Disable the interface of the peer device so that it does not send traffic to the disabled interface of the SDX appliance.

  [#384909]

- On a NetScaler VPX instance running on a Linux-KVM platform, dynamic routing protocols OSPF and ISIS fail to run on the platforms MacVTap interfaces.

  Workaround: Enable promiscuous mode on these MacVTap interfaces, using either the Linux-KVM graphical interface (Virt-Manager) or the Linux-KVM command line interface (virsh).

  [#405164]

- A NetScaler VPX instance might fail to restart on a Linux-KVM virtualization platform using processors that do not support the constant_tsc CPU feature.

  [#405383, 360482]

- The NetScaler appliance does not create session entries for ICMPv6 packets that match a forwarding-session rule.

  [#399436]

- A large number of IPv6 client connections (more than 2 million) can degrade the performance of a NetScaler appliance.

  [#575126]

- In an active-active high availability configuration using Virtual Router Redundancy Protocol (VRRP) protocol, a ping to a virtual IP address (VIP) might fail from a node that is a backup node for this VIP address.

  [#485260]

- In a high availability configuration with the network firewall mode set to BASIC on the current secondary node, synchronization of configuration files from the primary to secondary node fails, regardless of whether you run the "sync HA files" command from the NetScaler command line or by using the Start HA files synchronization dialog box in the configuration utility.

  Workaround: Add the following extended ACL on each node of the HA configuration:

  > add acl <aclname> -srcIP <NSIP of the peer node> -protocol TCP -destport 22

  For example, for an HA configuration in which the primary node's NSIP address is 198.51.100.9 and the secondary node's NSIP address is 198.51.100.27, you would run the following commands:

  On the primary node:

  > add acl ACL-example -srcIP 198.51.100.27 -protocol TCP -destport 22

  On the secondary node:

  > add acl ACL-example -srcIP 198.51.100.9 -protocol TCP -destport 22

  [#371613]

- The NetScaler ADC might become unresponsive if you run the show route operation during a dynamic route addition or deletion process.

  [#323127]

- For an RNAT connection, the NetScaler appliance drops the first packet that the server sends to the client.

  [#543171]

- In an HA configuration in INC mode running the OSPF routing protocol, the secondary node drops all L3 traffic that has the destination that was advertised by the secondary node.

  [#318684]

- Live migration of a NetScaler virtual machine running on a Linux-KVM host is not supported.

  [#407185]

- A high number of nic_err_rx_crc errors has been attributed to improperly seated or faulty small form-factor pluggable (SFP) transceivers.

  Workaround: If experiencing nic_err_rx_crc errors, perform a manual diagnostic check to rule out problems with SFPs, cables, and connectivity with the partner device ports.

  [#494183]

- In rare conditions, a 10G interface might stop processing the traffic.

  Workaround: Reset the interface.

  [#519000, 519041]

- On the MPX 8200/8400/8600 and MPX 5550/5650 platforms, if a 1G data port is connected but disabled, the status of the peer port on the switch might be shown as UP after the MPX appliance restarts.

  [#385217]

- If you add an NTP time server by specifying the server name (host name), and the ns.conf file is very large, the result is a race condition in which the NTP daemon (NTPD) is started before host name services are ready.

  Workaround: Do one of the following:

  -Restart the NTP daemon after starting the NetScaler appliance.

  -Add the NTP server by specifying the IP address of the server instead of specifying the host name.

  [#573306]

- In rare conditions, Network Interface Cards (NIC) might become unresponsive and reset polling on these interfaces also might fail.

  [#535789]

- L2 mode is not supported on NetScaler VPX instances running on a Linux-KVM host.

  [#402113]

- VLAN tagging is not supported on a Netscaler VPX instance operating in MacVTap-Bridge, MacVTap-Private, MacVTap-VEPA, or MacVTap-Passthrough interface mode.

  [#402111]

- The memory usage statistic shown on the LCD display of a NetScaler appliance is the allocated memory. The NetScaler configuration utility displays the currently used memory. Therefore, the two values are different.

  [#334358, 576545]

- LACP is not supported on Netscaler VPX instances operating in Bridge, MacVTap-Bridge, MacVTap-Private, or MacVTap-VEPA interface mode.

  [#407184]

- You cannot use the configuration utility to define classic SSL policies. However, you can use the configuration utility to bind and unbind classic SSL policies.

  Workaround: Use the CLI to define classic SSL policies.

  Note: Citrix encourages the use of default syntax policies rather than classic policies.

  [#390584]

- Some IP based expressions might not work for IP addresses starting from octet 128 or greater (128.x.x.x - 254.x.x.x).

  The following expressions are not impacted:

  - EQ

  - IN_SUBNET

  - IS_IPV6

  - GET1

  - GET2

  - GET3

  - GET4

  - MATCHES

  - MATCHES_LOCATION

  - APPEND

  - TYPECAST_TEXT_T

  - TYPECAST_IPv6_ADDRESS_AT

  The following expressions do not work:

  - GT

  - GE

  - LT

  - LE

  - BETWEEN

- NE

- ADD

- SUB

- MUL

- DIV

- MOD

- NEG

- BITAND

- BITOR

- BITXOR

- BITNEG

- LSHIFT

- RSHIFT

- TYPECAST_TIME_AT

- TYPECAST_IP_ADDRESS_AT

- TYPECAST_DOUBLE_AT

- TYPECAST_UNSIGNED_LONG_AT

- WEEKDAY_STRING

- WEEKDAY_STRING_SHORT

- SIGNED8_STRING

- UNSIGNED8_STRING

- SIGNED16_STRING

- UNSIGNED16_STRING

- SIGNED32_STRING

[#534244]

- If a wildcard virtual server (** IP address and port values) that accepts both IPv4 and IPv6 packets uses a listen policy of CLIENT.IP.PROTOCOL.EQ(ICMP) to capture ICMP traffic, it also captures IPv6 packets in which the second byte of the source IPv6 address has a value of 01).

  Workaround: First use an expression that filters the IPv4 traffic, and then use an expression that reads the protocol value from the filtered IPv4 packets and checks for a protocol value of ICMP.

!CLIENT.IP.SRC.IS_IPV6 && CLIENT.IP.PROTOCOL.EQ(ICMP)

[#422967]

- After you import a custom data source, the charts for the counters under "System entities statistics" are inaccurate, because of issues in the third party charting engine.

  [#368982]

- If you disable SSLv3 on the "nskrpcs-127.0.0.1-3009" service, an "ERROR: Operation not permitted" message appears even though SSLv3 has been successfully disabled on the service.

  [#521569]

- If you update the certificate-key pair for a service group, the change is not reflected in the individual services that are bound to this service group. As a result, the old certificate-key pair continues to be used for negotiation in the SSL handshake.

  [#554925]

- An incoming SSL record that spans more than 256 TCP packets and contains TCP header options causes memory corruption in the Cavium command buffer structure. As a result, the NetScaler appliance fails.

  [#573904, 583295, 590222]

- In rare cases, the "update ssl certKey" command fails and, in spite of displaying a "Resource already exists" error message, creates a stale duplicate entry with the same certificate-key pair in the configuration file (ns.conf).

  [#519368]

- If a certificate has a validity of 100 years, Days to Expiration incorrectly appears as 0 in the NetScaler command line interface and the configuration utility.

  [#509608]

- If the format of a CRL is incorrect or the issuer of a CRL does not match the specified CA certificate, and you run the "show crl" command, an error message showing the CRL status as invalid appears.

  [#468198]

- In a cluster setup, if you include the "cipherdetails" option in the "show ssl service" or "show ssl vserver" command, an incorrect message appears. This is only a display issue.

  For example,

  > show ssl service svc1 -cipherDetails

  ERROR: No such resource [serviceName, svc1]

  [#402423]

- On a NetScaler MPX or SDX appliance, TLS protocol version 1.2 does not support a client certificate with an RSA 4096-bit key.

  [#343395]

- An SSL chip is disabled at the third reinitialization attempt. That is, the maximum reinitialization limit is 2. Earlier, this limit was 5.

  [#455821]

- When the management CPU is running at close to 100% of capacity, the aggregator might not be able to process some of the statistics requests from clients, such as requests from the configuration utility, the CLI, and SNMP. If the aggregator fails to respond within the timeout period, the client returns following error:

  Invalid response from the aggregator [Device not Configured]

  [#377618, 341460, 351127, 364015, 481575, 499259]

- FTP connections through a TCP wildcard virtual server on the NetScaler appliance might fail for one of the following reasons:

  - A mismatch in TCP parameters is preventing the appliance from reusing the probe connection.

  - The server is sending data before the client-side TCP connection is established.

  [#545858]

- When SPDY Protocol is enabled and SPDY Traffic is received on the NetScaler appliance, the TCP current clients counter goes to negative values and shows a very large value in the stat or the SNMP OID.

  [#551562, 551786, 568554]

- If a client on an IPV6 connection advertises an MSS value below 1360 (bytes), the NetScaler appliance responds with a MSS value below the (RFC) required minimum value of 1220 (bytes).

  [#556475]

- The NetScaler appliance displays cluster related logs even if it is not in a clustered configuration or does not have a cluster license.

  [#543429]

- The initial client connection on the NetScaler appliance might fail if a wildcard virtual server is configured and the useProxyPort option is disabled globally on the appliance.

  [#542776, 571357]

- You cannot generate a report from the imported log files.

  [#535527]

- In a cluster or HA setup, when you perform an operation that adds a new file (create/import SSL/APPFW), the files is

synchronized to the other nodes (non-CCO nodes in a cluster or the secondary appliance in an HA setup). This synchronization either happens either periodically or when manually executed. If an operation that uses this file is executed before the file is synchronized, the operation fails, because the required file is not available.

For example, if you import a certificate file, and then execute the "show cert key" command immediately, the command fails.

This issue is fixed by synchronizing the files across all the nodes automatically, after they are added.

[#535162, 288743, 389394, 470729, 562724]

- Load Balancing

  If all of the following conditions are present, they might lead to a situation in which CPU usage is significantly different among the packet engines (PEs):

  1. The maximum number of clients (maxclients) for a service is set to a value less than the number of PEs in the system.

  2. Connections to this service have a high degree of connection reuse, that is, multiple requests are sent on the same TCP connection.

  3. Requests for connections to this service cause a surge queue buildup.

  If the maxclient setting is less than the number of PEs, only some PEs can open connections. After the maxclient limit is reached, PEs that have open connections are not likely to close them, because they are using those connections to process the traffic generated by high connection reuse and the large surge queue. As a result, the other PEs might not be able to open new connections. They therefore have a lower level of CPU usage, because they cannot participate in processing the surge queue.

  This is expected behavior and usually does not cause any issues. However, if some of the PEs have near 100% CPU usage while the other PEs have relatively low CPU usage, you might want to limit the maximum requests per connection by using the "set service <name> -maxReq <positive_integer>" command, so that the PEs close connections that have delivered the specified number of requests. This evens out the CPU usage, because it allows the other PEs to open connections to the service.

  [#516606, 528242]

- The virtual IP (VIP) address of a load balancing virtual server cannot be changed if the LB virtual server and syslog server have same configuration (ip, port, service) and use the same server information. In such cases, if the syslog server's IP address is changed, the syslog server uses different server information and does not update the server information used by the LB virtual server. As a result, the LB virtual server displays an error message when you try to change its VIP address.

  [#522665]

- In deployments with large configurations (in the order of 2 MB), when the load on the management CPU is high, the execution of the "show ns runningConfig" command can take a large amount of time.

  Workaround: If you're executing the command manually, then there is no workaround. However, if you are using a script to fetch the the output of the "show ns runningConfig" command, and if the script has a timeout, then modify the script to increase timeout to 500 seconds. The command could be executed within that time period.

  [#449234, 457629]

- When using MPTCP, if a single SSL record is split into a large number (> 100) of small segments, an SSL buffer overrun causes the NetScaler appliance to crash.

  [#427126, 441982, 452885, 456645]

- HA SYNC takes longer than expected for NetScaler 1000V. For example, for synchronizing ns.conf file of 38.4 KB size, it takes 70-100 seconds.

  [#508410]

- Setting 'Request timeout' or 'Request timeout action' in HTTP Profiles can cause the NetScaler to fail in some situations.

  [#501100]

- Every Domain Based Service (DBS) on a NetScaler appliance is assigned two monitors. Therefore, the limit of 7500 monitors can result in a memory allocation failure when you add a new service to the appliance.

  [#523473]

- On a NetScaler 1000V instance, transmit congestion occurs on virtual interfaces in high traffic conditions.

  [#430154]

- If an LACP channel is bound to nine or more interfaces and is a member of a tagged VLAN, deleting the channel from a service VM can cause the NetScaler appliance to fail intermittently.

  [#524320]

- Configuration Utility

  If, while upgrading a NetScaler appliance, you change the RSS key type, the configuration utility does not display a warning message to restart the NetScaler appliance.

  [#542702]

- Configuration Utility

  A large configuration file puts a heavy load on the management CPU. The resulting delay in displaying the output of the "show ns runningconfig" command might exceed the timeout value.

  Workaround: If you are using a script to fetch the output for "show ns runningConfig" command, and the script has a placeholder for timeout value, modify the script to increase the timeout value to 500 seconds.

  [#475830, 449234]

- On a NetScaler ADC, if WIHome is configured to point to an IPv6 load balancing virtual server that points to the IPv6 StoreFront services, a user trying to log on receives a 500 Internal Server Error message.

  Workaround: Remove the IPv6 load balancing virtual server configuration and configure WIHome to point directly to

the StoreFront server URL.

[#397150]

- The following APIs are not available in version 10.1 or later:

  - bindservicegroup_state2

  - unsetnslimitidentifier_selectorname. Use unsetnslimitidentifier_selector instead.

  [#363145]

What's New in Previous 10.1 Builds

Oct 10, 2015

The enhancements and changes that were available in NetScaler 10.1 releases prior to Build 133.9. The build number provided below the issue description indicates the build in which this enhancement or change was provided.

AAA Application Traffic | AAA-TM | AppExpert | AppFlow | AppQoE | Application Firewall | Cache Redirection | Cloud Integration | Cluster | Configuration Utility | Content Switching | DNS | DNS64 | DataStream | Global Server Load Balancing | Load Balancing | Load Balancing and AAA-TM | Monitors | NITRO API | NetScaler Gateway | NetScaler Insight Center | NetScaler SDX Appliance | NetScaler VPX Appliance | Networking | Platform | Policies | SNMP | SSL | Statistics | Support for ECDHE Ciphers | System

---

- Smart Group Option for LDAP Authentication

  When configuring AAA for LDAP, you can now set the default authentication group attribute explicitly, instead of allowing AAA to set the Group attribute from information that it extracts from credentials. In complex organizations that have multiple domains, smart group support allows simpler and more fool-proof implementation of SSO.

  To configure the smart group option at the command line, type the following command:

  > set aaa ldapParams -defaultAuthenticationGroup <string>

  For <string>, substitute the group identifier that you want to use.

  To configure the smart group option by using the configuration utility, in the Create Authentication Server or Modify Authentication Server dialog box, fill in the Default Authentication Group text box.

  [From Build 112.15] [#357837]

- Extracting Group Credentials from a Third Authentication Server

  When performing two-factor authentication, the AAA feature now supports extraction of the group membership credential from a third authentication server. This function is supported by use of a third authentication chain that is invoked only if the first and second authentication attempts succeed.

  To enable extraction of group membership credentials from a third authentication server, create an LDAP policy with authentication disabled. Then, bind that policy to the authentication virtual server, with the -groupExtraction flag set, as shown below.

  bind authentication vserver <name> [-policy <string> [-priority <positive_integer>]

  [-groupExtraction]]

  If -groupExtraction is set, the policy is an LDAP policy, and the policy has authentication disabled, then the policy is added to the third authentication chain. Otherwise, the binding will fail.

For more information, see http://support.citrix.com/proddocs/topic/ns-security-10-1-map/ns-aaa-setup-policies-authntcn-tsk.html.

[From Build 112.15] [#308118, 305567]

- Two-Factor SAML Authentication

  AAA now supports two-factor SAML authentication. When a user requests a resource, AAA checks for SAML policies. If a SAML policy with two-factor authentication is present, AAA redirects the user to the specified third-party authentication server. Once the user has authenticated and obtained a valid assertion, AAA redirects the user to the secondary login page for the resource.

  To enable two-factor SAML authentication, type the following command at the NetScaler command line:

  > add authentication samlAction <name> -samlTwoFactor ON

  For more information, see http://support.citrix.com/proddocs/topic/ns-security-10-1-map/ns-aaa-setup-policies-auth-saml-tsk.html.

  [From Build 112.15] [#277562]

- KCD Support for Microsoft SQL Data Stream

  Kerberos Constrained Delegation (KCD) is now supported for the Microsoft SQL server and the MSSQL data stream.

  For more information, see http://support.citrix.com/proddocs/topic/ns-security-10-1-map/ns-aaa-kerberos-kcd-con.html.

  [From Build 112.15] [#307491, 243724]

- Cluster Support

  Support for AAA-TM has been added to the NetScaler cluster when operated in spotted VIP mode. AAA-TM authenticates users correctly. AAA-TM commands run correctly at the command line, and the configuration utility displays the AAA-TM node and screens.

  [From Build 112.15] [#317306]

- Kerberos SSO

  The AAA-TM Kerberos functionality now supports single sign-on (SSO) with all supported authentication mechanisms. The CAC (Smart Card) and SAML SSO mechanisms are supported in all cases, regardless of the authentication method that the client uses to log onto the NetScaler appliance. The HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms are also supported if the client uses either HTTP-Basic or Forms-Based authentication to log onto the NetScaler appliance.

  You can configure Kerberos SSO to work in one of two ways: by impersonation or by delegation. To configure Kerberos SSO by impersonation, you must have the user's password or client certificate. To configure impersonation using a client certificate, the user must also have a properly-configured version of the Citrix Receiver installed on his or her personal computer. To configure Kerberos SSO by delegation, you must have the delegated user's credentials in one of the following formats: the user's password, the keytab configuration that includes an encrypted password, or the client cert and the matching CA certificate.

To configure Kerberos SSO, first configure your NetScaler appliance to manage traffic to the web application servers that users will access through SSO. Next, configure AAA-TM for your preferred authentication method. Verify that the NetScaler appliance can communicate with your LDAP Active Directory (AD) server and your Kerberos server.

What you do next depends on whether you want to configure Kerberos SSO by Impersonation or by Delegation. Follow the instructions in the appropriate section below.

Configuring Kerberos SSO by Impersonation

To configure Kerberos SSO by Impersonation, enable integrated authentication on each web application server. After you have done this, create and configure the NetScaler KCD account that will impersonate users.

To create the KCD account for SSO by impersonation with a password

At the NetScaler command prompt, type the following command:

add aaa kcdaccount <accountname> -realmStr <realm>

For each variable, substitute the following values:

* accountname - The KCD account name.

* realm - The domain assigned to Kerberos SSO.

Example:

add aaa kcdAccount kcdaccount1 ?realmStr EXAMPLE.COM

To create the KCD account for SSO by impersonation with a client certificate

At the NetScaler command prompt, type the following command:

add aaa kcdAccount <accountname> ?cacert <cacert>

For each variable, substitute the following values:

* accountname - The KCD account name.

* cacert - The full path and name of the CA certificate file on the NetScaler appliance.

Example:

add aaa kcdAccount kcdaccount1 ?cacert <path to certificate>

Configuring Kerberos SSO by Delegation

To configure Kerberos SSO by Delegation, next create an account (the Kerberos Service Account, or KSA) on the AD server for the NetScaler appliance to use as the delegated user. Next, in the KSA account Properties dialog box, Delegation tab, enable the following options: "Trust this user for delegation to specified services only" and "Use any Authentication protocol." Finally, add the HTTP service and any other services that Kerberos SSO will manage to the services list, which is located on the Properties tab beneath the two settings.

After you configure the NetScaler account on AD, enable integrated authentication on each web application server. Finally, create and configure the NetScaler KCD account that will serve as the delegated user.

To create the KCD account for SSO by delegation with a password

At the NetScaler command prompt, type the following commands:

add aaa kcdaccount <accountname> ?delegatedUser root -kcdPassword <password> - realmStr <realm>

For each variable, substitute the following values:

* accountname - The KCD account name.

* password - The password for the KCD account.

* realm - The domain assigned to Kerberos SSO.

Example (UPN format):

add aaa kcdaccount kcdaccount1 ?delegatedUser root -kcdPassword passsword1 -realmStr EXAMPLE.COM

Example (SPN format):

add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM -delegatedUser "host/kcdvserver.example.com" -kcdPassword password1

To create the KCD account for SSO by delegation with a keytab file

First, on the AD server, use the ktpass utility to create the appropriate keytab file. Next, use the file transfer utility of your choice to copy the keytab file from the AD server to the NetScaler appliance, and put it in /nsconfig/krb under the filename kcdvserver.keytab.

Next, at the NetScaler command prompt, type the following command:

add aaa kcdaccount <accountname> ?keytab <keytab>

Example:

add aaa kcdaccount kcdaccount1 ?keytab kcdvserver.keytab

Finally, verify that the new KCD account has the proper keytab file and virtual server principle associated with it:

To verify the KCD account on the NetScaler appliance

sh kcdAccount <accountname>

To create the KCD account for SSO by delegation with a client cert

At the NetScaler command prompt, type the following commands:

add aaa kcdaccount <accountname> -realmStr <realm> ?delegatedUser <spnuser> -usercert <cert> -cacert <cacert>

For each variable, substitute the following values:

* accountname - The KCD account name.

* realm - The domain assigned to Kerberos SSO.

* spnuser - The username in SPN format.

* usercert - The full path and name of the user client certificate file on the NetScaler appliance.

* cacert - The full path and name of the CA certificate file on the NetScaler appliance.

Example:

add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM -delegatedUser "host/kcdvserver.example.com" -usercert /certs/usercert -cacert /cacerts/cacert

[From Build 121.10] [#361257]

- Support for Additional Public Endpoints

  AppExpert applications and the deployment files created from them now support two or more endpoints. However, when importing an AppExpert template file, if you do not include a deployment file, the AppExpert Template Wizard displays a screen on which you can configure a maximum of two public endpoints: one endpoint of type HTTP and one endpoint of type HTTPS. So, if you want more than two endpoints, you have to configure additional endpoints after you create the application. You can then export the application to obtain a deployment file that contains all the configured endpoints.

  For information about importing an AppExpert template, configuring public endpoints after importing an application, and exporting an AppExpert to a template file, see http://support.citrix.com/proddocs/topic/ns-main-appexpert-10-1-map/ns-aapexpert-apptemp-get-started-tsk.html.

  [From Build 112.15] [#259600]

- Configure a Persistency Group for Application Units

  You can now configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

  For more information about configuring a persistency group for the application units in an AppExpert application, see http://support.citrix.com/proddocs/topic/ns-main-appexpert-10-1-map/ns-appexpert-apptemp-config-pers-groups-for-app-units-tsk.html.

  [From Build 112.15] [#243716]

- Enhanced Target Support for RefineSearch Parameter in Rewrite

  The RefineSearch and Target parameters can now be used together in a single Rewrite action. The following types of search are supported:

  * TCP with regular expressions

  * HTTP with regular expressions

  * HTTP with XPath expressions

* HTTP body payload expressions

[From Build 112.15] [#245438, 243248, 247097]

- Service and Service Group Configurations Exported to Application Templates

  When you export an AppExpert application, all services and service groups that are part of the application configuration are exported to the deployment file. During import, the appliance compares the deployment file's contents with its own configuration, and manages conflicts in the following way:

  - If a service in the file has the same name and service type as a service on the appliance, the appliance does not import the service. It binds the existing service to all the application units created during import.

  - If a service in the file has the same name as a service on the appliance, but its service type is different, the appliance does not import the service. It displays a message indicating a protocol mismatch.

  - If a service in the file has the IP address and port combination of a service on the appliance, and both services use the same underlying transport protocol (for example, HTTP and SSL services both use TCP), the appliance does not import the service, even if their names are different. It displays a message indicating a port and service type conflict. If the IP address and port combination is same, but the name and underlying transport protocol are different, the appliance imports the service.

  - If a service group in the file has the same name and service type as a service group on the appliance, the appliance does not import the service group. It binds the existing service group to all application units created during import.

  - If a service group in the file has the same name as a service group on the appliance, but its service type is different, the appliance does not import the service group. It displays a message indicating a protocol mismatch.

  If a conflict is detected during import, the appliance ends the import process and rolls back any configuration changes that were made, preserving the configuration that was in place before the template was imported.

  [From Build 112.15] [#248273]

- AppExpert Template for Microsoft Outlook Web Access

  An AppExpert template has been created to help users configure the application firewall to protect a web server that runs Microsoft Outlook Web Access. The template and associated signatures file provide an appropriate default configuration for the application firewall when protecting OWA. The template is posted on the Citrix Community Web Site, and can be downloaded from within the configuration utility, in the main AppExpert pane, by clicking Download AppExpert Templates.

  To install the downloaded templates, first extract them from the archive to a temporary location on your local computer. The archive contains four files:

  * OWA_Template.xml?The actual template

  * OWA_signatures.xml?The associated signatures

  * OWA_deployment.xml?The deployment file

  * OWA_NS10_what is new.txt?A brief list of changes to the template since the previous version

  After you extract the template archive, in the AppExpert pane click Import AppExpert Template to run the AppExpert

wizard, and follow the instructions in the Wizard to install the template and create the OWA configuration.

For more information, see http://support.citrix.com/proddocs/topic/netscaler-10-1/ns-appexpert-con-10.html.

[From Build 112.15] [#246845]

- Configuring SourceIP for AppFlow Traffic

  You can now configure the source IP address (SNIP or MIP address), to be used for AppFlow traffic. When you add an Appflow collector by using the add appflow collector command, you can use the -netprofile option to associate a netprofile to which the source IP address is bound. By default, the Appflow exporter takes NSIP address as the source IP address if you do not specify the -netprofile option.

  > add appflow collector <col_name> -IPAddress <IP_addr> [-netprofile {netprofile_name}]

  [From Build 112.15] [#288343]

- Export Multiple Set-cookies in AppFlow Records

  The HTTP response can contain multiple values in the set-cookie header. This enhancement extends support to export all those values in the appflow record instead of just one value as was the case earlier.

  [From Build 112.15] [#329122]

- X-Forwarded-For HTTP Header Support

  AppFlow records can now log X-Forwarded-For HTTP header information. You can enable the logging with the "set appflow param -httpXForwardedFor ENABLED" command or by using the configuration utility.

  [From Build 112.15] [#311033]

- NetScaler Insight Center appliances now support exporting ICA AppFlow records from NetScaler appliances with enterprise licenses.

  [From Build 119.7] [#395659]

- Application-level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle queuing of all requests to a web site or application as one group before load balancing, instead of as separate streams after load balancing. The integrated features are:

  - HTTP Denial-of-Service Protection (HDOSP)

  - Priority Queuing

  - SureConnect

  By implementing these features at the virtual server level instead of the individual service level, the NetScaler appliance can maintain absolute priority of connections, prevent flushing of connection if a service transitions state, and detect

and divert unwanted or lower priority traffic during DDoS attacks or other periods of extremely high load without having to first expend CPU to load balance these unwanted connections and assign them to a service queue.

For more information about AppQoE and instructions on how to implement it, see http://support.citrix.com/proddocs/topic/ns-main-appexpert-10-1-map/ns-appqoe-wrapper-con.html.

[From Build 112.15] [#379091]

- HTML Cross-Site Scripting Check Might Transform Allowed Tags and Attributes

  If an application firewall profile has the HTML cross-site scripting check configured to transform unsafe HTML, in some situations the application firewall might transform all HTML tags, including allowed HTML tags and attributes.

  [From Build 112.15] [#369529]

- Application Firewall Improved Diagnostics and Tracking Tools for Troubleshooting

  The application firewall now generates log messages for system resets, packets dropped because of violations of RFC strict checks or malformed request/response header checks, or due to errors within the application firewall itself. These logs provide additional information for troubleshooting.

  [From Build 112.15] [#248186]

- Application Firewall Cluster Support

  Support for the application firewall has been added to the NetScaler cluster when operated in single node spotted VIP mode. Application firewall commands run correctly at the command line, and the configuration utility displays the application firewall node and screens. Users should keep in mind that session state sharing between nodes is disabled when using the application firewall on a cluster.

  [From Build 112.15] [#326635]

- Application Firewall Learning Support on Cluster

  Support for the application firewall learning feature has been added to the NetScaler cluster. The cluster controller node now aggregates learning data from all nodes in the cluster and stores the learned data in a temporary database file. It then provides the data set to each node in the cluster upon request, enabling the learning feature to operate on the complete set of requests and responses to a protected web server, application, or service.

  [From Build 112.15] [#327601, 315156, 318640]

- Application Firewall Performance Improvements

  A number of performance improvements have increased the performance of the application firewall overall by approximately 10%. These improvements include caching of frequently used objects, significant enhancements to processing of HTTP POST bodies, and more efficient Signatures string operations.

  [From Build 112.15] [#327608, 206010]

- Application Firewall Scan Tool Integration

  The Citrix NetScaler Application Firewall now supports signatures generated by the IBM AppScan, Trend Microsystems,

and WhiteHat vulnerability scanners. You can import WhiteHat WASC 1.0, WASC 2.0, and best practices signatures, IBM AppScan Standard and Enterprise signatures, and Trend Microsystems Vulnerability Scanner (TMVS) signatures into the application firewall. These signatures can either be added to existing signatures objects, or can be used to create new signatures objects. Once imported, the signatures can be used to protect web applications exactly like any other signatures.

Once imported, the signatures can be used to protect web applications exactly like any other signatures.

For more information, see http://support.citrix.com/proddocs/topic/ns-security-10-1-map/appfw-signatures-con.html and http://support.citrix.com/proddocs/topic/ns-security-10-1-map/appfw-signatures-updatingcenzic-tsk.html.

[From Build 112.15] [#317580]

- The Citrix NetScaler Application Firewall Signatures feature has received a number of enhancements. The Signatures feature now includes the following new and enhanced functions:

  - Automatic updates: You can configure automatic updates for the default application firewall signatures or any signatures object that you have created from a cloud-based service. This feature is disabled by default. You enable and configure it in the configuration utility Signatures pane by selecting the signatures that you want to update, then choosing Auto-Update Settings in the Action drop-down list. If signature updates are enabled, the NetScaler appliance checks the specified URL for updates at the designated interval, hourly by default. If it finds updated signatures, it downloads and installs them.

  - Manual per-signature updates: Manual per-signature updates--You can manually update the default application firewall signatures or any signatures object that you have created by using the command line or the configuration utility. To update signatures from the command line, use the following command: update appfw signatures <name> [-mergeDefault].

  For <name>, substitute the name of signatures object to update. If you want to merge updates with the default signatures, include the -mergeDefault parameter.

  To update signatures by using the configuration utility, in the Signatures pane select the signatures that you want to update, then select Merge from the Action drop-down list. In the Update Signatures Object dialog box, type in the path and name of the signatures update file or use the browse dialog to select it, and then click Update.

  - Signature patterns support for JSON payloads: The signatures feature now matches JSON in HTTP requests. You can create patterns that examine JSON payloads for patterns that might signify a security breach on your protected web server or application.

  - Signature patterns support for HTTP responses: The signatures feature now matches patterns in the HTTP response as well as the request. You can create patterns that examine HTTP response headers and bodies for patterns that might signify a security breach on your protected web server or application.

  The following new patterns apply specifically to responses:

  Credit cards

  Safe objects

  - Per-signature counters: Signature statistics are now maintained on a per-signature basis, allowing you to see exactly how many times a specific signature has matched a request or response.

For more information about enhanced Signatures features, see http://support.citrix.com/proddocs/topic/ns-security-10-1-map/appfw-signatures-con.html.

[From Build 112.15] [#318148]

- When configuring the Safe Commerce (credit card) check, you can now configure the application firewall to check the MIME/type of HTTP responses and skip responses that are not of the appropriate content type for Safe Commerce filtering. You can use this configuration option to prevent false positives.

  To enable MIME/type checking, at the NetScaler command line type the following command:

  bind appfw profile <name> -inspectResContentType <type>

  For <name>, substitute the name of the profile. For <type>, substitute a string that matches the MIME/type. For example, to check for and skip PDF content sent to the library profile, you would type the following:

  bind appfw profile library -inspectResContentType "text/PDF"

  To disable a MIME/type rule that you have previously enabled, use the unbind command:

  unbind appfw profile <name> -inspectResContentType <type>

  [From Build 119.7] [#236218, 213852]

- Cache Redirection Changes

  The following changes have been made in the cache redirection feature:

  * The cacheVserver parameter is no longer part of the add cr vserver command. To specify a cache server, you must use the bind cr vserver ?lbvserver <string> command.

  In the configuration utility, in the Create Virtual Server (Cache Redirection) and Configure Virtual Server (Cache Redirection) dialog boxes, the Cache Server list has been renamed to Default Cache Server and has been moved from the Advanced tab to the area above the tabs. Additionally, a hit counter has been added next to the list. The hit counter maintains a count of the number of hits received by the cache server.

  * In the Create Virtual Server (Cache Redirection) and Configure Virtual Server (Cache Redirection) dialog boxes, on the Policies tab, when you click the CSW button and then the Insert Policy button, the list that appears in the Policy Name column no longer includes a Default content switching policy.

  [From Build 112.15] [#319966, 325728, 330010]

- You can now bind compression and filter policies to a cache redirection virtual server by using the configuration utility.

  [From Build 112.15] [#330033]

- AutoScale: Automatically Scaling Your Application Fleet in a CloudPlatform Environment

  Issue ID 0311703: In an environment deployed and managed by using Citrix CloudPlatform, automatic scaling of an application fleet can be achieved by using the Citrix NetScaler appliance. CloudPlatform provides a feature called

AutoScale, as part of its elastic load balancing feature. A CloudPlatform user can use the AutoScale feature to specify thresholds for various conditions for automatically scaling the application fleet upward and downward. The scale up and scale down conditions can vary from simple use cases, such as a server's CPU usage, to complex use cases, such as a combination of a server's CPU usage and responsiveness. CloudPlatform, in turn, configures the NetScaler appliance to load balance traffic to the application virtual machines (VMs), monitor application thresholds and performance, and trigger scale up and scale down actions to add or remove VMs from the application fleet.

For more information about how AutoScale works on the NetScaler appliance, see http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-autoscale-automatic-scaling-in-cloudplatform-env-wrapper-con.html.

For answers to frequently asked questions, see http://support.citrix.com/proddocs/topic/ns-faq-map-10-1/ns-faq-autoscale-ref.html.

[From Build 112.15] [#311703, 326608]

- The NetScaler cluster now supports the rate limiting and action analytics feature.

  [From Build 112.15] [#341764]

- The NetScaler cluster now supports configuring of content switching actions.

  [From Build 112.15] [#317324]

- Removing a Cluster Node

  You can now remove a cluster node through a single-step procedure. You must log on to the cluster IP address and execute the "rm cluster node" command.

  For more information, see http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-cluster-remove-node-tsk.html.

  [From Build 112.15] [#291771]

- Partially Striped Configurations in a NetScaler Cluster

  You can now define some configurations to be active only on specific cluster nodes. For example, you can define a virtual server to be active on only three nodes of a 5-node cluster. Such a configuration is referred to as partially striped. To define a partially striped configuration, use a node group, which is a set of cluster nodes to which you can bind the following virtual servers (load balancing, content switching, cache redirection, and authentication).

  Note: An entity that is bound to a node group that includes all the cluster nodes is striped across the cluster. Similarly, an entity that is bound to a node group that includes only one node is spotted on that node.

  For more information, see http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-cluster-node-groups-con.html and http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-cluster-config-node-group-tsk.html.

  [From Build 112.15] [#335401]

- The NetScaler cluster now supports spillover based on bandwidth.

[From Build 112.15] [#346786]

- The NetScaler cluster now supports Branch Repeater load balancing.

  [From Build 112.15] [#283450]

- Viewing and Clearing Node-Specific Routing Information

  You can now retrieve node-specific routing configurations by specifying the node(s) in the owner-node argument as follows:

  > vtysh

  ns# owner-node 0 1

  ns(node-0 1)# show cluster state

  ns(node-0 1)# exit-owner-node

  Similarly, you can also clear node-specific routing configurations by specifying the node(s) in the owner-node argument as follows:

  > vtysh

  ns# owner-node 0 1

  ns(node-0 1)# clear config

  ns(node-0 1)# exit-owner-node

  [From Build 112.15] [#309178]

- The NetScaler cluster now supports the ISIS routing protocol.

  [From Build 112.15] [#274535]

- The NetScaler cluster now supports IP-IP Tunneling.

  [From Build 112.15] [#269113]

- Configuring priority for the configuration coordinator

  You can now configure the priority for a cluster node to be selected as a configuration coordinator. The node with the highest priority (lowest priority number) is made the configuration coordinator. If the current configuration coordinator goes down, the node with the next lowest priority number takes over as the configuration coordinator. If the priority is not set or if there are multiple nodes with the lowest priority number, the configuration coordinator is selected from one of the available nodes.

  You can set the node priority by using the priority parameter of the add cluster node command.

  [From Build 112.15] [#359806]

- In addition to the reorganization of the nodes within the navigation tree, some of the nodes are now grouped with the

configurations options in the details pane (the pane on the right side of the screen) of the configuration utility. For example, LDNS entries, which were a subnode of GSLB, are now with the global GSLB configuration items in the details pane.

The following embedded Java views have been moved to the Overview pages:

- Auto Detected Services Detail View

- FIPS Detail View

- Applications Detail View

- Access Gateway Applications Detail view

- Template Detail view

- GSLB LDNS entries Detail View

- Cache Objects

[From Build 112.15] [#381622]

- Features in the NetScaler configuration utility navigation tree have been reorganized to provide greater logical consistency and ease of navigation. The feature nodes are grouped under the following top-level nodes:

  - System: System and infrastructure features

  - AppExpert: Grouping of all Application, Policies, templates and Layer 7 features

  - Traffic Management: Core traffic management features such as load balancing, GSLB, content switching, cache redirection, SSL, and SSL offload

  - Optimization: Core optimization features such as caching and compression

  - Security: Security oriented features and functionalities

  For more information, see http://support.citrix.com/proddocs/topic/ns-rn-main-release-10-1-map/ns-rn-changes-gui-10-1-con.html.

  [From Build 112.15] [#360658]

- Global Setting for Using a Proxy Port

  You can now use the NetScaler user interface to configure the Use Proxy Port setting globally.

  For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-advancedsettings-useproxyport-tsk.html.

  [From Build 112.15] [#302646]

- The content switching feature now supports dynamic selection of a load balancing virtual server at the run time. This feature enables you to analyze the request and accordingly direct it to the correct load balancing virtual server. The target LB virtual server is determined at the run time by the expression defined in the action of the content switching

policy.

[From Build 112.15] [#248750]

- Rename a Content Switching Policy Label

  You can now rename a content switching policy label, even if the label is already referenced by existing policies. The new name is automatically incorporated into all configurations that include the old name.

  For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-cs-basicconfig-policy-labels-tsk.html.

  [From Build 112.15] [#312929]

- Enabling or Disabling the Recursion Available Flag

  An option Recursion Available is added for the load balancing virtual servers of type DNS and DNS TCP to control the RA (Recursion Available) flag in all the DNS responses from these virtual servers.

  [From Build 119.7] [#403114, 248936, 269857, 388338]

- The NetScaler DNS64 feature responds with a synthesized DNS AAAA record to an IPv6 client sending an AAAA request for an IPv4-only domain. The DNS64 feature is used with the NAT64 feature to enable seamless communication between IPv6-only clients and IPv4-only servers. DNS64 enables discovery of the IPv4 domain by the IPV6 only clients, and NAT64 enables communication between the clients and servers.

  For synthesizing an AAAA record, the NetScaler appliance fetches a DNS A record from a DNS server. The DNS64 prefix is a 96-bit IPv6 prefix configured on the NetScaler appliance. The NetScaler appliance synthesizes the AAAA record by concatenation of the DNS64 Prefix (96 bits) and the IPv4 address (32 bits).

  For more information on configuring DNS64, see http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-nw-ipaddrssng-DNS64-intro-con.html.

  [From Build 120.13] [#318404]

- Database Profiles

  You can now configure a database profile for virtual servers of type MSSQL and MYSQL. A database profile is a named collection of parameters that is configured once but applied to multiple virtual servers that require those particular parameter settings. After creating a database profile, you bind it to load balancing or content switching virtual servers. You can create as many profiles as you need.

  For more information, see http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-ac-config-db-profile-tsk.html.

  [From Build 112.15] [#343179]

- Transparent Mode for Logging MSSQL Transactions

You can configure the NetScaler appliance to operate transparently between MSSQL clients and servers, and to only log or analyze details of all client-server transactions. Transparent mode is designed so that the NetScaler appliance only forwards MSSQL requests to the server, and then relays the server's responses to the clients. As the requests and responses pass through the appliance, the appliance logs information gathered from them, as specified by the AppFlow configuration, or collects statistics, as specified by the Action Analytics configuration.

For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-dbproxy-usecase-log-mssql-transactions-transparent-mode-tsk.html.

[From Build 112.15] [#319464]

- Database Specific Load Balancing of Services

  You can now configure the Citrix NetScaler appliance to retrieve a list of databases that are active on a service and, for a given query, to load balance only the services on which the requested database is available. If the requested database is unavailable on a service, the appliance excludes the service from load balancing decisions until it becomes available. This behavior ensures uninterrupted service to clients.

  For more information about database specific load balancing, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-dbproxy-db-specific-lb-wrapper-con.html.

  [From Build 112.15] [#358254]

- Support for Microsoft SQL Server 2012

  The Citrix NetScaler appliance now supports Microsoft SQL Server 2012. To load balance SQL 2012 database servers, you must set the Server Version (mssqlServerVersion) parameter to 2012 on each of the load balancing and content switching virtual servers in the configuration.

  If you have configured availability groups for read-only routing, the appliance can handle the redirect packets with which the primary database server responds to clients who declare read-only application intent in their connection properties. However, when deployed to manage traffic associated with an availability group, the NetScaler appliance provides additional benefits. With the help of content switching policies, the appliance can differentiate between connections in which the ApplicationIntent connection property is set to ReadWrite and those in which the property is set to ReadOnly. A content switching virtual server can then forward all ReadWrite requests to a load balancing virtual server to which you have bound the primary database instance, and all ReadOnly requests to a load balancing virtual server to which you have bound the secondary database servers.

  In this configuration, ReadOnly requests are load balanced across all the secondary servers (unlike configurations involving a redirect response, in which only one secondary server is selected for serving ReadOnly requests). In this way, the appliance can optimally utilize all of the secondary database servers while eliminating redirect traffic from your network.

  [From Build 112.15] [#354723]

- Caching Stored Procedures and SQL Queries

  If connection multiplexing is disabled in a database profile, stored procedures and SQL batch queries are not cached, despite caching being enabled for the profile. With this enhancement, you can enable caching, if connection multiplexing is disabled, by setting the new "enableCachingConMuxOFF" parameter in the profile.

At the command prompt, type:

add dbProfile <name> ?conMultiplex DISABLED -enableCachingConMuxOFF ENABLED

or

set dbProfile <name> -enableCachingConMuxOFF ENABLED

In the configuration utility, select "Enable caching when connection multiplexing OFF".

[From Build 126.12] [#453973]

- View Site Persistence Cookies for GSLB Services

  If site persistence is configured for GSLB services, and the services are bound to a GSLB virtual server, the NetScaler appliance generates a site persistence cookie for each service. Unlike in earlier NetScaler releases, the NetScaler user interface now displays the site persistence cookies that the appliance generates.

  To view site persistence cookies by using the NetScaler command line

  At the NetScaler command prompt, type:

  show gslb vserver <name>

  To view site persistence cookies by using the NetScaler configuration utility

  1. In the navigation pane, expand GSLB, and then click Virtual Servers.

  2. In the details pane, select the virtual server for whose services you want to view site persistence cookies, and then click Open.

  3. In the Configure GSLB Virtual Server dialog box, on the Services tab, select the service whose site persistence cookie you want to view.

  The site persistence cookie is displayed below the table of services.

  [From Build 112.15] [#242446]

- Diameter Expression Support

  Expressions to retrieve AVPs from a Diameter request or response are now available. You can use these expressions for configuring the token load balancing method and for rule-based persistency.

  The expressions are of the form DIAMETER.REQ.AVP(<avpcode>). For example, to retrieve the Auth-Application-Id AVP (AVP code 258), you can use the expression: DIAMETER.REQ.AVP(258).

  Some important AVPs have aliases. For example, the Auth-Application_Id AVP has the alias AUTH_APPLICATION_ID. So, the expression to retrieve the Auth-Application_Id by using the alias is: DIAMETER.REQ.AUTH_APPLICATION_ID.

  [From Build 112.15] [#318377]

- Rate Statistics for Services Bound to a Load Balancing Virtual Server

  The stat lb vserver command and the Monitoring page for a load balancing virtual server now display the hit rate (Hits/s), request rate(Req/s), and response rate (Rsp/s) for bound services.

  [From Build 112.15] [#275029]

- Automatic State Transition Based on Percentage Health of Bound Services

  You can now configure a load balancing virtual server to automatically transition from the UP state to the DOWN state if the percentage of active services falls below a configured threshold. For example, if you bind 10 services to a load balancing virtual server and configure a threshold of 50% for that virtual server, it transitions from UP to DOWN if six or more services are DOWN. When the percentage health rises above the threshold value, the virtual server returns to the UP state. You can also enable an SNMP alarm called ENTITY-STATE if you want the NetScaler appliance to notify you when the percentage health of bound services causes a virtual server to change state.

  For instructions, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-advancedsettings-auto-state-transition-svc-health-tsk.html.

  [From Build 112.15] [#361659]

- Stateless Connection Failover Supported for IPv6

  You can now bind an IPv6 service to a load balancing virtual server with connection failover set to stateless.

  [From Build 112.15] [#276300]

- Configure Spillover Based on NetScaler Policies

  In earlier NetScaler releases, you can configure spillover by specifying only one of the following spillover methods along with a spillover threshold: CONNECTION, DYNAMICCONNECTION, BANDWIDTH, and HEALTH. Also, of a backup virtual server is not available when spillover occurs, the NetScaler appliance responds to clients with a TCP reset.

  In this release, you can also use a NetScaler rule, of your choice, to specify the conditions that should be met for spillover to occur. You specify the rule in a spillover policy. Configuring a spillover rule enables you to configure the NetScaler appliance for a wider range of spillover scenarios. For example, you can configure spillover on the basis of the virtual server's response time, or on the basis of the load on the virtual server.

  [From Build 112.15] [#257226]

- Monitor for Citrix StoreFront Stores

  You can now configure a user monitor for a Citrix Storefront store.

  For more information about monitoring a StoreFront store, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-monitors-builtin-ctx-storefront-stores-tsk.html.

  [From Build 112.15] [#366050]

- Ability to Specify a Name for a Persistence Cookie

  Unlike in earlier releases, for load balancing virtual servers and load balancing persistency groups for which the COOKIEINSERT persistence type is configured, you can specify a name for the persistency cookie. You specify a name

for the persistency cookie by setting the cookieName parameter. If you configure the COOKIEINSERT persistence type, but you do not specify the cookieName parameter, the NetScaler appliance inserts a cookie of the form <NSC_XXXX>= <serviceIP> <servicePort>, where <NSC_XXXX> is the virtual-server ID that is derived from the virtual server's name, <serviceIP> is the hexadecimal value of the IP address of the service, and <servicePort> is the hexadecimal value of the port of the service.

[From Build 112.15] [#289773, 232227, 289772, 302494]

- Counters for the Number of Active and Inactive Bound Services

  Issue ID 0275028: The stat lb vserver and stat gslb vserver commands, and the Monitoring pages for load balancing and global server load balancing virtual servers, now display a count of the number of bound services that are UP and DOWN. The counters are called actSvcs (total active services) and inactSvcs (total inactive services), respectively.

  [From Build 112.15] [#275028]

- View the Global Spillover Count by Using SNMP

  You can use the totSpilloverCount SNMP counter to retrieve a count of the number of times spillover has occurred on various load balancing and content switching virtual servers after the NetScaler appliance was last restarted. The SNMP OID is 1.3.6.1.4.1.5951.4.1.3.5.6.

  [From Build 112.15] [#229026]

- Support for Clearing a Specific Persistence Session

  Issue ID 0258312: You can specify a persistence parameter in the "clear lb persistentSessions" command to clear the persistence session associated with only that parameter. Following is the command synopsis for clearing the session associated with a specific persistence parameter:

  clear lb persistentSessions [<vServer> [-persistenceParam <string>]]

  where

  persistenceParam is the persistence parameter whose session you want to clear.

  For more information about clearing a specific persistence session, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-persistence-clearing-tsk.html.

  [From Build 112.15] [#258312]

- Ability to Configure VLAN Transparency

  You can now configure a load balancing virtual server to retain the client's VLAN identifier in packets that are to be forwarded to servers. The virtual server must be a wildcard virtual server of type ANY, and must be functioning in MAC mode.

  For instructions, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-advancedsettings-retain-vlan-tsk.html.

  [From Build 112.15] [#361552]

- Offload DNSSEC Operations to the NetScaler Appliance

For DNS zones for which your DNS servers are authoritative, you can offload DNSSEC operations to the NetScaler appliance. When a DNS server sends a response, the appliance signs the response on the fly before relaying it to the client. The appliance also caches the signed response. Apart from reducing the load on the DNS servers, offloading DNSSEC operations to the appliance gives you the following benefits:

-> You can sign records that the DNS servers generate programmatically. Such records cannot be signed by routine zone signing operations performed on the DNS servers.

-> You can serve signed responses to clients even if you have not implemented DNSSEC on your servers.

[From Build 112.15] [#249691]

- Support for Overriding Persistence for Overloaded Services

  When a service is loaded or is otherwise unavailable, service to clients is degraded. To work around this situation, you might have to configure the NetScaler appliance to temporarily forward to other services the requests that would otherwise be included in the persistence session that is associated with the overloaded service. In other words, you might have to override the persistence setting that is configured for the load balancing virtual server until the service returns to a state in which it can accept requests. You can achieve this functionality by binding a load monitor to the virtual server and setting the skippersistency parameter for the virtual server.

  For more information about overriding persistence for overloaded services, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-persistence-override-pers-overloaded-server-tsk.html.

  [From Build 112.15] [#258313]

- Increase in the Maximum Number of Persistence Sessions

  The maximum number of persistence sessions per core on an nCore NetScaler appliance has been raised from 150,000 to 1,000,000 (1 million). The maximum number of persistence sessions that can coexist on an nCore NetScaler appliance is equal to the product of the number of cores and the per-core limit. For example, if the appliance has 6 CPU cores, the maximum number of persistence sessions that can coexist on the appliance is 6,000,000 (6 * 1000000).

  For information about how to configure a limit for the number of persistence sessions that can coexist on the NetScaler appliance, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-persistence-config-limit-number-persist-sessions-tsk.html.

  [From Build 112.15] [#328498]

- Monitor for Accounting Information Delivery from a RADIUS Server

  You can now configure a monitor called a RADIUS accounting monitor to determine whether the Radius server used for Authentication, Authorization, and Accounting (AAA) is delivering accounting information as expected.

  For more information about monitoring accounting information delivery from a RADIUS server, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-1-map/ns-lb-monitors-builtin-radius-accnting-tsk.html.

  [From Build 112.15] [#348828]

- Dynamic Load Balancing of Repeater Appliances

You can now configure the NetScaler appliance for dynamic load balancing of Repeater appliances, by using the Dynamic Load Balancing wizard for Citrix Branch Repeater. In the wizard, you specify the datacenter Repeater IP addresses and the datacenter server subnets to which the NetScaler appliance or instance must forward the branch-office traffic. The wizard creates the required configuration.

[From Build 112.15] [#333238]

- Options for Branch IP Address in the Load Balancing wizard for Citrix Branch Repeater

  In the Static Load Balancing wizard for Citrix Branch Repeater, when specifying a branch whose traffic is to be accelerated, you can specify either the primary IP address or the accelerated pair A (apA) IP address of a Branch Repeater appliance.

  [From Build 112.15] [#275289]

- NetScaler and XenMobile Solution for Enterprise Mobility

  Citrix NetScaler deployed with XenMobile Mobile Device Management (MDM) provides the ability to scale, ensure high availability for apps, and maintain security.

  Use the XenMobile MDM Setup wizard on the NetScaler configuration utility to configure the following two deployment scenarios:

  * Load balance XenMobile Device Managers (MDM servers): In this scenario, the NetScaler appliance sits between the client and the XenMobile MDM servers to load balance encrypted data from mobile devices to the XDM servers.

  * Load balance MS Exchange servers with email filtering: In this scenario, the NetScaler appliance sits between the client and the XNC and CAS servers. All requests from the client devices go to the NetScaler appliance, which then communicates with the XNC to retrieve information about the device. Based on the response from the XNC, the NetScaler either forwards the request from a whitelisted device to the backend server, or drops the connection from a blacklisted device.

  [From Build 118.7] [#365382]

- Oracle Monitor Support

  You can now create a load balancing monitor for an Oracle DBMS server by using the new Oracle-ECV monitor type. This monitor supports the following data types:

  ORACLE_BINARY_DOUBLE = 101,

  ORACLE_BINARY_FLOAT = 100,

  ORACLE_CHAR = 96,

  ORACLE_DATE = 12,

  ORACLE_INTERVALDS = 183,

  ORACLE_INTERVALYM = 182,

  ORACLE_NUMBER1 = 2,

ORACLE_NUMBER2 = 6,

ORACLE_NVARCHAR2 = 1,

ORACLE_TIMESTAMP = 180,

ORACLE_TIMESTAMP_WITH_LOCAL_TIME_ZONE = 231

ORACLE_TIMESTAMP_WITH_TIME_ZONE = 181,

You can configure the monitor by using the NetScaler command line or the configuration utility. To create or configure an Oracle-ECV monitor at the NetScaler command line, type the appropriate command:

add lb monitor <monitorName> oracle-ecv [parameters...]

set lb monitor <monitorName> oracle-ecv [parameters...]

To create or configure an Oracle-ECV monitor by using the configuration utility, navigate to Traffic Management => Load Balancing => Monitors, and then click Add to create the monitor or select an existing monitor and then click Open to configure the monitor.

The new expressions that support the Oracle-ECV monitor are as follows:

ORACLE.RES.ATLEAST_ROWS_COUNT(n)

Determines whether the query response contains at least the specified

number of rows.

ORACLE.RES.ROW(i).NUM_ELEM(j).eq(n)

Determines whether the value located at the specified row and column

is equal to the specified number. You can substitute other valid

numeric operations for "eq".

ORACLE.RES.ROW(i).IS_NULL_ELEM(j)

Determines whether the value located at the specified row and column

is NULL.

ORACLE.RES.ROW(i).TEXT_ELEM(j).eq("pattern")

Determines whether the value located at the specified row and column

matches the specified pattern. You can substitute other valid

text operations for "eq".

[From Build 118.7] [#364085]

- Setting Up NetScaler for XenApp/XenDesktop

  The NetScaler now provides a wizard that simplifies the task of setting up a NetScaler appliance for a

XenApp/XenDesktop deployment. For more information, see Setting Up NetScaler for XenApp/XenDesktop.

[From Build 120.13] [#345912]

- You can now configure up to 8K (8192) service groups on a NetScaler appliance. The earlier limit was 4K (4096) service groups.

  [From Build 121.10] [#406355]

- Native Windows Authentication (Kerberos) for MSSQL Monitors

  Microsoft SQL monitors on the NetScaler appliance now support the Kerberos authentication protocol, and can therefore monitor load-balanced application servers in a Kerberos 5 environment that employs Kerberos Protocol Transition (KPT) and Kerberos Constrained Delegation (KCD).

  [From Build 112.15] [#329542]

- Starting with release 10.1 build 122.17, the script files for user monitors are in a new location.

  If you upgrade an MPX or VPX virtual appliance to release 10.1 build 122.17 or later, the changes are as follows:

  - A new directory named conflicts is created in /nsconfig/monitors/ and all the built-in scripts of the previous builds are moved to this directory.

  - All new built-in scripts are available in the /netscaler/monitors/ directory. All custom scripts are available in the /nsconfig/monitors/ directory.

  - You must save a new custom script in the /nsconfig/monitors/ directory.

  - After the upgrade is completed, if a custom script is created and saved in the /nsconfig/monitors/ directory, with the same name as that of a built-in script, the script in the /netscaler/monitors/ directory takes priority. That is, the custom script does not run.

  If you provision a virtual appliance with release 10.1 build 122.17 or later, the changes are as follows:

  - All built-in scripts are available in the /netscaler/monitors/ directory.

  - The /nsconfig/monitors/ directory is empty.

  - If you create a new custom script, you must save it in the /nsconfig/monitors/ directory.

  [From Build 122.17] [#447105]

- Unlicensed Feature Handling

  NITRO operations are now restricted to the features that are licensed on the NetScaler appliance.

  [From Build 112.15] [#328055]

- You can now view the virtual servers to which a specified service is bound. The REST URL for this is http://<nsip>/nitro/v1/config/svcbindings/svcname.

  [From Build 112.15] [#257279]

- Log Support

  All NITRO operations are now logged in the /var/nitro/nitro.log file on the appliance.

  [From Build 112.15] [#328051]

- Plug-in Icon Decoupling from Citrix Receiver

  The desktop client plug-ins icons can now be configured to operate independently from Native Citrix Receiver clients. Settings to manage Receiver integration with the NetScaler Gateway Plug-ins can be configured globally and within session policies.

  [From Build 129.22] [#406312]

- The HTML Injection feature is now available for Web Insight data collection on platinum licenses of NetScaler 10.0 appliances and on all licenses of NetScaler 10.1 appliances.

  [From Build 118.7] [#392732]

- On the Dashboard > HDX Insight > Users > <user name> page, the application and gateway reports display the active applications by default.

  [From Build 118.7] [#388409]

- NetScaler Insight Center supports clearing AppFlow configurations from a virtual server.

  [From Build 118.7] [#341904, 375905, 383246]

- NetScaler Insight Center supports sending syslog messages to an external syslog server.

  [From Build 118.7] [#381072]

- HDX Insight reports now include details about Client Side NS Latency, Server Side NS Latency and Host Delay.

  [From Build 119.7] [#400867]

- NetScaler Insight Center now saves the following:

  Granular data: Time to Purge

  7 sec data: 6 min

  5 min data: 65 min.

  Hourly data: 25 hrs.

Daily data: 8 days.

Weekly data: 5 weeks.

[From Build 121.10] [#404805]

- HDX Insight reports now include details about session reconnects, client-side retransmissions, and server-side retransmissions.

  [From Build 122.17] [#392016]

- All the metrics except bandwidth and hits display the average values.

  [From Build 122.17] [#409634]

- HDX Insight now provides a report about active sessions, grouped by server IP and gateway IP.

  [From Build 122.17] [#398322]

- The top-right corner of the page now displays a percentile icon, which you can click to display percentile values and the highest and lowest values for a selected metric.

  [From Build 122.17] [#418196]

- In this release you can select and show columns in the tables on the NetScaler Insight Center graphical user interface (GUI) and also rearrange them. The changes can also be made persistent to reflect these changes when the same user logs in the next time.

  [From Build 122.17] [#423207]

- HDX Insight reports now include details about CloudBridge in an ICA session path.

  [From Build 123.11] [#432702, 430583]

- You can now configure the ICA session timeout value for inactive sessions on the configuration tab of the NetScaler Insight Center.

  For details, see http://support.citrix.com/proddocs/topic/ni-10-5-map/ni-ica-session-timeout-tsk.html

  [From Build 123.11] [#431957]

- Configuring VLANs on Management Interfaces

  You can now configure a VLAN on the management interfaces, 0/1 and 0/2, while provisioning a NetScaler instance.

  [From Build 112.15] [#318609]

- Support for SNMPv3 Queries on the NetScaler SDX Appliance

  Simple Network Management Protocol Version 3 (SNMPv3) queries are now supported on the NetScaler SDX appliance. SNMPv3 enhances the basic architecture of SNMPv1 and SNMPv2 to incorporate administration and security capabilities, such as authentication, access control, data integrity check, data origin verification, message timeliness check, and data confidentiality.

For more information, see http://support.citrix.com/proddocs/topic/sdx-administration-10-1-map/sdx-ag-manage-mon-appliance-config-snmp-v3-con.html.

[From Build 112.15] [#328392]

- Support of Regular Expressions for Search Text Fields

  The Search text fields on the pagination views of the Management Service utility now support regular expressions.

  [From Build 112.15] [#309358, 312469]

- Changing the Hostname of the Appliance

  You can now change the hostname of the Management Service. On the Configuration tab, navigate to System > System Settings > Change Hostname, and enter a new hostname.

  [From Build 112.15] [#323534]

- Password Management on the NetScaler SDX Appliance

  If you log on to a NetScaler VPX instance and change the password for access to the instance, instead of changing the password from the Management Service, connectivity from the Management Service to the instance is lost. With this release, you can restore connectivity by creating a new profile from the Management Service, assigning it the same password that you specified on the NetScaler VPX instance, and then binding the new profile to the NetScaler VPX instance.

  [From Build 112.15] [#318968]

- Support for System Notifications

  You can now configure Syslog, mail, and SMS notifications on the SDX appliance.

  [From Build 112.15] [#291016]

- Restrict a VLAN to a Specific Virtual Interface

  The NetScaler SDX appliance administrator can enforce specific 802.1Q VLANs on the virtual interfaces associated with NetScaler instances. This capability is especially helpful in restricting the usage of 802.1Q VLANs by the instance administrators. If two instances belonging to two different companies are hosted on an SDX appliance, you can restrict the two companies from using the same VLAN ID, so that one company does not see the other company's traffic. If an instance administrator, while provisioning or modifying a VPX instance, tries to assign an interface to an 802.1Q VLAN, a validation is performed to verify that the VLAN ID specified is part of the allowed list.

  For more information, see http://support.citrix.com/proddocs/topic/sdx-administration-10-1-map/sdx-ag-prov-ns-instances-restrict-vlans-to-vfs-tsk.html.

  [From Build 112.15] [#323926]

- Audit Templates for NetScaler Instances

  You can create an audit template by copying the commands from an existing configuration file. You can later use this template to find any changes in the configuration of an instance and take corrective action if required.

[From Build 112.15] [#322404]

- Simplification of NetScaler SDX Licensing Process

  The process of allocating your licenses has been greatly simplified. The new licensing framework allows you to focus on getting maximum value from Citrix products.

  In the Management Service configuration utility (GUI), you can use your hardware serial number (HSN) or your license activation code (LAC) to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

  [From Build 112.15] [#323681, 331160]

- Display the Mapping of virtual interfaces on the VPX instance to the physical interfaces on the NetScaler SDX Appliance

  If you log on to the NetScaler virtual instance, the configuration utility and the command line interface display the mapping of the virtual interfaces on the instance to the physical interfaces on the appliance.

  For more information, see http://support.citrix.com/proddocs/topic/sdx-administration-10-1-map/sdx-ag-interface-naming-tsk.html.

  [From Build 112.15] [#261346, 335910]

- Cluster of NetScaler Instances Provisioned on NetScaler SDX Appliances

  You can now create a cluster of NetScaler instances that are provisioned on the NetScaler SDX appliance. The instances can be available on the same SDX appliance or on any SDX appliance within the same subnet.

  For more information, see http://support.citrix.com/proddocs/topic/sdx-administration-10-1-map/sdx-setup-cluster-tsk.html.

  [From Build 112.15] [#317258, 286049, 345509]

- Retrieving Tech Support tar file of Instances from Management Service Utility

  Now you can generate support tar archive for instances running on SDX through the Management Service utility.

  [From Build 112.15] [#240391]

- MAC-Address Assignment by System Administrator

  If, while you are provisioning a NetScaler instance on an SDX appliance, XenServer internally assigns a MAC address to a virtual interface associated with that instance, the same MAC address might be assigned to a virtual interface associated with another instance on the same appliance or on another appliance. To prevent assignment of duplicate MAC addresses, you can enforce unique MAC addresses.

  For more information, see http://support.citrix.com/proddocs/topic/sdx-administration-10-1-map/sdx-ag-config-svm-assign-mac-addr-to-interface-tsk.html.

  [From Build 112.15] [#325507]

- Provisioning Third-Party Instances on a NetScaler SDX Appliance

  You can now provision the following third-party virtual machines (instances):

BlueCat DNS/DHCP Server?Provides a DNS, DHCP, and IP Address Management software solution for enterprises.

[From Build 118.7] [#349549]

- Provisioning Third-Party Instances on a NetScaler SDX Appliance

  You can now provision the following third-party virtual machines (instances):

  * SECUREMATRIX(R) GSB?Provides a highly secure password system that eliminates the need to carry any token devices.

  * Websense(R) Protector?Allows enterprises to deploy a data loss prevention (DLP) solution to protect sensitive enterprise information.

  [From Build 118.7] [#329072]

- Upgrading the XenServer Software

  You must upgrade the NetScaler SDX appliance to XenServer version 6.1.0 to enable functionality of some features, such as LACP and third-party virtual machines. The process of upgrading the XenServer software involves uploading the build file of the target build to the Management Service, and then upgrading the XenServer software.

  [From Build 118.7] [#322368]

- Configure Link Aggregation from the Management Service

  You can now configure link aggregation from the Management Service at the time of provisioning a NetScaler instance, or later by modifying an instance. An aggregated link is also known as a channel. The interfaces that form part of a channel are not listed in the Network Settings view shown when you add or modify a NetScaler instance. Instead of the interfaces, the channels are listed.

  [From Build 118.7] [#257892]

- Upgrade Progress

  When you upgrade a NetScaler VPX instance on an SDX appliance, a new window, Upgrade Progress, shows the status of the upgrade operation, including any error messages. This feature is also available for SecureMatrixGSB and Websense Protector virtual machines.

  [From Build 120.13] [#346988]

- Multi-interface Support for BlueCat DNS/DHCP Server Virtual Machines

  Management Service now supports assigning interfaces explicitly for high availability and service along with the management for BlueCat DNS/DHCP Server virtual machines.

  [From Build 122.17] [#413839]

- 22040/22060/22080/22100/22120 Platform

  The SDX 22040/22060/22080/22100/22120 platform now supports NetScaler release 10.1 build 122.x.

  For more information, see Citrix NetScaler SDX 22040, SDX 22060, SDX 22080, SDX 22100, and SDX 22120.

  [From Build 122.17] [#353415]

- When system sends any e-mail notification, it will contain host name along with IP address as sender.

  [From Build 129.22] [#464856]

- You do not require a separate license file to set up a cluster on an SDX appliance. Clustering support will be provided with a valid SDX Platform License.

  [From Build 129.22] [#492668]

- Support for NetScaler VPX Virtual Appliance on XenServer 6.2

  The NetScaler VPX virtual appliance now supports XenServer version 6.2 only on a non-SDX appliance. On the NetScaler SDX appliance, only the XenServer versions available for download on www.citrix.com under NetScaler downloads are supported. XenServer 6.1.1 is the latest supported version on the NetScaler SDX appliance.

  [From Build 122.17] [#439509]

- NetScaler VPX Setup for the Linux KVM Platform

  The Citrix NetScaler VPX can now be hosted on Kernel-based Virtualization Machine (KVM). NetScaler VPX runs as a virtual appliance on Linux-KVM server. You can set up the NetScaler VPX on this platform either through the graphical Virtual Machine Manager (Virt-Manager) application or the vrish program.

  The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware. After you provision a NetScaler virtual appliance, you can add additional interfaces.

  For more information, see Installing NetScaler Virtual Appliances on Linux-KVM Platform.

  [From Build 123.11] [#344349]

- Block Fragmented Packets

  You can now configure the NetScaler appliance to drop any fragmented packets that it receives.

  This feature can be useful in the following cases:

  *To preventing security attacks based on fragmented packets

  *To accommodate a use case requiring that the NetScaler appliance accept no fragmented packets.

  To block any fragmented packet, enable the Dropipfragments (Drop IP Fragments) option in one of the following ways:

  *On the NetScaler command line, by running the set L3 param command.

  *In the configuration utility, by using the Configure Layer 3 Parameters dialog box (Network > Settings > Configure Layer 3 Parameters).

  [From Build 112.15] [#299298]

- IPv6 Protocol Compliance

  The appliance accepts all the ICMPv6 fragments of an ICMPv6 echo request that is destined to one of the NetScaler owned IPv6 address. The appliance also sends out all the ICMPv6 fragments of the corresponding ICMv6 echo response.

  [From Build 112.15] [#286580]

- Block Non-IP Packets

  You can configure the NetScaler appliance to drop any non-IP related packet that it receives. For example, you can drop ARP packets. This feature can be useful in the following cases:

  - To prevent security attacks based on non-IP traffic

  - To prevent very heavy non-IP traffic from affecting the performance of the appliance

  To block non-IP traffic, set the fwmode (Network firewall mode) parameter to FULL in one of the following ways:

  - On the NetScaler command line, by running the set ns config command.

  - In the configuration utility, by using the Configure Network firewall mode settings dialog box (System > Settings > Change Network firewall mode).

  [From Build 112.15] [#329548]

- Controlling the L2 Conn Behavior of Load Balancing Virtual Servers

  The set l4 parameter command has a new parameter, l2connMethod, for specifying the MAC address, channel number, and VLAN ID attributes for the L2 Conn option behavior in a virtual server

  [From Build 112.15] [#339846, 332695]

- TFTP Support

  The NetScaler appliance now supports communication between a client and a Trivial File Transfer Protocol (TFTP) server.

  TFTP is a simple form of file transfer protocol and is based on the UDP protocol. TFTP does not provide any security features and is generally used for automated transfer of configuration and boot files between devices in a private network. TFTP support on the NetScaler appliance is compliant with RFC 1350. A server listens on port 69 for any TFTP request.

  The following features are supported:

  Load balancing of TFTP servers?The NetScaler appliance can now load balance TFTP servers.

  INAT processing compliant to TFTP?When a request packet, with port 69 as the destination, received by the NetScaler appliance matches an INAT rule with TFTP option enabled, the appliance processes the request and the corresponding response as compliant with the TFTP protocol.

  RNAT processing compliant to TFTP?When a request packet generated by a server is destined to a TFTP server, and the packet matches an RNAT rule on the NetScaler appliance, the appliance's processing of the request and the corresponding response from the TFTP server is compliant with the TFTP protocol.

  [From Build 112.15] [#250958, 244142, 258928]

- Configure Traffic Domains

  Traffic domains are a way to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments within a NetScaler appliance. An application belonging to a specific traffic domain communicates with entities and processes traffic within that domain. The traffic belonging to one traffic domain cannot cross the boundary of another traffic domain.

  The main benefits of using traffic domains on the NetScaler appliance are the following:

  * Use of duplicate IP addresses in a Network?Traffic domains allow you to assign the same IP address or network address to multiple devices on a network, or multiple entities on a NetScaler appliance, as long as each of the duplicate address belongs to a different traffic domain.

  * Use of Duplicate entities on the NetScaler appliance?Traffic domains allow you to use duplicate NetScaler feature entities on the appliance. You can create entities with the same settings as long as each entity is assigned to a separate traffic domain.

  * Multitenancy?Using traffic domains, you can provide hosting services for multiple customers by isolating each customer's type of application traffic within a defined address space on the network.

  [From Build 112.15] [#319241, 318309]

- IPv6 Protocol Compliance

  The NetScaler appliance in L3 mode can now send out periodic Router Advertisement (RA) messages from its advertising interfaces. The appliance also sends RA messages in response to valid solicitations messages. The outgoing RA messages sent by the NetScaler appliance are compliant with RFC 4861 for Neighbor Discovery protocol for IP version 6 (IPv6). The NetScaler appliance can also send redirect messages to inform an originating host of a better router for reaching a specific destination.

  [From Build 112.15] [#286578]

- Powering off an Interface

  Now, when you disable an interface or an LA channel, the NetScaler appliance powers off the interface or interfaces of the LA channel and sends a link-down message to the peer device to notify that the interface(s) are disabled.

  [From Build 112.15] [#338863]

- Clearing all Dynamic Routing Configurations

  You can now at once clear all the routing configurations, which you created by using the VTYSH shell.

  For clearing all the dynamic routing configurations, you run the clear config command in the Exec mode of the VTYSH shell. After clearing the configuration, you must run the write command in the VTYSH shell to save the changes.

  [From Build 112.15] [#285913]

- ACL Action in the ACL Log Messages

  Each ACL log entry now includes a field that displays the action set for the ACL. This field tells you whether the packet that hit the ACL was passed onto the NetScaler appliance or was dropped.

The field takes one of the following values:

- ALLOW: A packet that matches the conditions specified in the ACL and is passed onto the NetScaler appliance.

- DENY: A packet that matches the conditions specified in the ACL and is dropped.

Following are two sample log entries:

19) 01/23/2013:18:48:53 GMT Informational 0-PPE-0 : ACL ACL_PKT_LOG 212 0 : Source 10.102.56.26

--> Destination 10.102.56.40 - Protocol ICMP -Type 8 - Code 0 -TimeStamp 92612208(ms) - Hitcount 5 -

Hit Rule ACL1 - Action ALLOW - Data 08 00 51 ac 7e 73 00 5c 19 c4 ff 50 19 6c 0a 00 08 09 0a 0b 0c 0d 0e

0f 10 11 12 13 14 15 16 17 18 19 1a 1b 1c 1d 1e 1f 20 21 22 23 24 25 26 27 28 29 2a 2b 2c 2d 2e 2f 30 31

32 33 34 35 36 37

20) 01/23/2013:18:48:58 GMT Informational 0-PPE-0 : ACL ACL_PKT_LOG 213 0 : Source 10.102.56.99

--> Destination 10.102.56.45 - Protocol ICMP -Type 8 - Code 0 -TimeStamp 92617209(ms) - Hitcount 6 -

Hit Rule ACL2 - Action DENY - Data 08 00 c6 a6 7e 73 00 61 1e c4 ff 50 9f 6c 0a 00 08 09 0a 0b 0c 0d 0e

0f 10 11 12 13 14 15 16 17 18 19 1a 1b 1c 1d 1e 1f 20 21 22 23 24 25 26 27 28 29 2a 2b 2c 2d 2e 2f 30 31

32 33 34 35 36 37

[From Build 112.15] [#290631]

- Configure Stateless NAT46 Translation

  The stateless NAT46 feature enables the communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance.

  A stateless NAT46 configuration on the NetScaler appliance has the following components:

  * IPv4-IPv6 INAT entry. An entry defining a 1:1 relationship between a public IPv4 address and an IPv6 address. In other words, a public IPv4 address on the appliance listens to connection requests on behalf of an IPv6 server.

  * NAT46 IPv6 prefix. A global IPv6 prefix of length 96 bits (128-32=96) configured on the appliance. During IPv4 packet to IPv6 packet translation, the appliance sets the source IP address of the translated IPv6 packet to a concatenation of the NAT46 IPv6 prefix [96 bits] and the IPv4 source address [32 bits] that was received in the request packet.

  [From Build 112.15] [#284926]

- IPv6 Protocol Compliance

  You can configure multiple link-local addresses as type SNIP6. A link-local SNIP6 address can be bound to only one VLAN, and a VLAN can have only one link-local SNIP6 address. Because NetScaler owned IP addresses are of type floating, the link-local SNIP6 address bound to a VLAN is associated with all the interfaces bound to the VLAN. Any Neighbor Discovery for IPv6 (ND6) traffic going out of the interface is sourced as the link-local address associated with the interface, as specified by RFC 4861.

  [From Build 112.15] [#286577]

- Stateful NAT64 Translation

  The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance.

  A stateful NAT64 configuration on the NetScaler appliance has the following components:

  * NAT64 rule: An entry consisting of an ACL6 rule and a netprofile, which consists of a pool of NetScaler owned SNIPs.

  * NAT64 IPv6 Prefix: A global IPv6 prefix of length 96 bits (128-32=96) configured on the appliance.

  When an IPv6 request packet received by the NetScaler appliance matches an ACL6 defined in a NAT64 rule and the destination IP of the packet matches the NAT64 IPv6 prefix, the NetScaler appliance considers the IPv6 packet for translation.

  The appliance translates this IPv6 packet to an IPv4 packet with a source IP address matching one of the IP address in the netprofile defined in the NAT64 rule, and a destination IP address consisting of the last 32 bits of the destination IPv6 address of the IPv6 request packet. The NetScaler appliance creates a session and forwards the packet to the IPv4 server. Subsequent responses from the IPv4 server and requests from the IPv6 client are translated accordingly by the appliance for the duration of the session.

  [From Build 112.15] [#316933]

- Set Interval for Generating ACL Log Messages

  You can now set the interval at which a log message is to be generated by the NetScaler appliance for a particular flow that matches an extended ACL configured on the appliance.

  To set the interval, set the AclLogTime (ACL Log Time) parameter in one of the following ways:

  *On the NetScaler command line, by running the set L3 param command.

  *In the configuration utility, by using the Configure Layer 3 Parameters dialog box (Network > Settings > Configure Layer 3 Parameters).

  [From Build 112.15] [#301716]

- The "show lacp" command does not display the lacp configurations. This issue is observed only in a cluster setup.

  [From Build 112.15] [#288450, 290635, 324248]

- Configuring Link Redundancy by using LACP channels

  Link Redundancy by using LACP channels enables the NetScaler appliance to logically create sub channels from a LACP channel where one of the sub channel is active and the remaining sub channels stay in standby mode. If the active sub channel fails or does not meet a minimum threshold throughput, one of the standby sub channel takes over and becomes active.

  The NetScaler appliance forms a sub channels from links that are part of the LACP channel and are connected to a particular device. For example, for a LACP channel with four interfaces on a NetScaler appliance, where two of the interface is connected to device A, and the other two interfaces are connected to device B, then the NetScaler appliance logically creates two sub channels, one sub channel with two links to device A, and the other sub channel with

the remaining two links to device B.

The lrMinThroughput parameter is introduced for configuring link redundancy for a LACP channel. This parameter specifies the minimum throughput threshold to be met by the active sub channel of a LACP channel. When the throughput of the active channel falls below the lrMinThroughput , link failover occurs and one of the standby sub channels becomes active.

For example, set channel la/1 -lrMinThroughput 2000

Link redundancy for a LACP channel is disabled, which is also the default setting, when you set the lrMinThroughput parameter of the LACP channel to zero or when you unset this parameter.

Note: In an HA configuration, if you want to configure throughput (throughput parameter) based HA failover and link redundancy (lrMinThroughput parameter) on a LACP channel, you must set a lesser or equal value to the throughput parameter as compared to the lrMinThroughput parameter.

For example, set channel la/1 throughput 2000 -lrMinThroughput 2000

HA failover does not occur if any of the sub channels meets the lrMinThroughput parameter value even when the total throughput of the LACP channel does not meet the throughput parameter value.

HA failover occurs only when the entire sub channels of the LACP channel does not meet the lrMinThroughput parameter value and the total throughput of the LACP channel does not meet the throughput parameter value.

For more information, see http://edocssand.citrix.com/proddocs/topic/ns-system-10-5-map/ns-nw-config-lr-lacp-tsk.html.

[From Build 120.13] [#346763]

- Now, the NetScaler appliance sends all ARP replies from the first interface (lexicographical order) of an LA channel.

  [From Build 129.22] [#486632]

- The MPX 22040/22060/22080/22100/22120 platform now supports NetScaler release 9.3 build 65.x.

  [From Build 121.10] [#311561]

- NetScaler MPX appliances now support Cisco QSFP+ cables (part number L45593-D178-C30).

  [From Build 122.17] [#427155]

- Increased Throughput on the NetScaler MPX 5650 Appliance

  The MPX 5650 appliance now delivers a throughput of 5Gbps.

  [From Build 123.11] [#428131, 432315]

- New NetScaler MPX Appliances

  Release 10.1-122.x supports the new MPX 8005 and MPX 8015 appliances.

  [From Build 123.11] [#421834, 428128]

- If an LCD hardware failure is detected on a NetScaler MPX appliance, the appliance restarts. With this enhancement, the LCD application gracefully exits without restarting the appliance.

  [From Build 123.11] [#430690]

- New NetScaler SDX Appliance

  Release 10.1-122.x supports the new SDX 8015 appliance.

  [From Build 123.11] [#429429, 432915]

- Support for ECDHE Ciphers

  The Citrix NetScaler MPX 11515/11520/11530/11540/11542 appliances support the ECDHE cipher group. On the SDX 11515/11520/11530/11540/11542 appliances, the cipher group is supported only if an SSL chip is assigned to a VPX instance. This group contains the following ciphers:

  - TLS1-ECDHE-RSA-RC4-SHA

  - TLS1-ECDHE-RSA-DES-CBC3-SHA

  - TLS1-ECDHE-RSA-AES128-SHA

  - TLS1-ECDHE-RSA-AES256-SHA

  The following ECC curves are supported:

  - P_256

  - P_384

  - P_224

  - P_521

  Note: ECC curves 224 and 521 are not supported with TLS1.2 protocol.

  [From Build 124.13] [#453765]

- The 10G ixgbe (ix) driver on the NetScaler appliance now supports the following Active Optical Cables (AOCs):

  - Finisar FCBG110SD1C03

  - Avago AFBR-7CAR03Z

  [From Build 125.9] [#419237]

- The SDX 24100/24150 and MPX 24100/24150 platforms are now supported in this release.

  [From Build 129.22] [#487831]

- The MPX 25100T and MPX 25160T platforms are now supported in this release. For more information about these platforms, see http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-platforms-con/ns-hardware-25100T-25160T-ref.html.

[From Build 132.8] [#486703, 495591, 552218]

- LDAP Referral Support

  AAA now supports LDAP referrals. If this feature is enabled, and the NetScaler appliance receives an LDAP_REFERRAL response to a request, AAA follows the referral to the active directory (AD) server contained in the referral and performs the update on that server, First, AAA looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the binddn credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

  LDAP referral support is disabled by default, and must be explicitly enabled for each ldapAction. This feature cannot be turned on globally. The system administrator must also make sure that the AD server accepts the same binddn credentials that are used with the referring (GC) server.

  To enable LDAP referrals, type the following commands at the NetScaler command line:

  set authentication ldapAction <name> -followReferrals ON

  set authentication ldapAction <name> -maxLDAPReferrals <integer>

  For <integer>, substitute the maximum level of referrals. By default, one referral level is allowed.

  For more information, see http://support.citrix.com/proddocs/topic/ns-security-10-1-map/ns-aaa-setup-policies-auth-ldap-tsk.html.

  [From Build 112.15] [#327591]

- HTTP Callouts

  HTTP callout responses can now be cached for a specified time duration.

  [From Build 112.15] [#233253, 241059]

- HTTP Callouts

  HTTP callouts now support IPv6 addresses.

  [From Build 112.15] [#215794]

- HTTP callouts can now generate HTTPS requests. When configuring the HTTP callout, you must set the "scheme" parameter of the "set policy httpCallout" command.

  [From Build 112.15] [#317392]

- Support for Hashing Text Strings

  You can now hash text strings by using the following algorithms: MD2, MD4, MD5, SHA1, SHA224, SHA256, SHA384, and SHA512. The method provided for this purpose is DIGEST(algorithm) and it can be used on text strings. For example, to hash the body of a HTTP request by using MD5 algorithm, the expression is: HTTP.REQ.BODY(1000).DIGEST(MD5)

  [From Build 112.15] [#236496, 246627]

- TCP Level Expressions

  You can now get the smoothed round trip time and the bandwidth of TCP connections for the client and server by using the following expressions:

  * CLIENT.TCP.SMOOTHRTT

  * CLIENT.TCP.BANDWIDTH

  * SERVER.TCP. SMOOTHRTT

  * SERVER.TCP.BANDWIDTH

  [From Build 112.15] [#236816]

- You can now specify an expression that produces a body of the HTTP callout. The expression must be specified in the -bodyExpr parameter of the "set httpCallout" command. A "Content-Length" header is automatically added with an appropriate value indicating that the request message contains a body. You can use the "unset httpCallout" command with the -bodyExpr parameter when you do not want to use the body expression for the HTTP callout.

  [From Build 112.15] [#340586]

- Get Information of RPC Request

  You can now get information about an RPC request by using the following expressions:

  * MSSQL.REQ.RPC.BODY?Returns the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value.

  * MSSQL.REQ.RPC.BODY(n)?Returns part of the body of the SQL request as a string in the form of parameters represented as "a=b" clauses separated by commas, where "a" is the RPC parameter name and "b" is its value. Parameters are returned from only the first "n" bytes of the request, skipping the SQL header. Only complete name-value pairs are returned.

  Both expressions return text data, on which any text operation can be performed.

  [From Build 112.15] [#320216]

- You can now get the ethertype by using an advanced policy expression.

  Examples:

  - CLIENT.ETHER.ETHERTYPE.EQ(IPv4)

  - SERVER.ETHER.ETHERTYPE.EQ(IPv6)

  [From Build 129.22] [#388879]

- The following SNMP counters for IPv6 are added in snmp group nsIp6StatsGroup:

  - ipv6TotRxPkts : IPv6 packets received

  - ipv6TotTxPkts:: IPv6 packets transmitted

- ipv6TotRxBytes: IPv6 bytes received

- ipv6TotTxBytes: IPv6 bytes transmitted

- ipv6FragTotRxPkts:IPv6 Fragments received

- ipv6FragRxPkts: IPv6 Fragments received

- ipv6FragTotPktsForward : IPv6 Fragments bridged

- ipv6FragTotPktsProcessNoReass : IPv6 Fragments processed without reassembly

- ipv6ErrHdr : IPv6 error hdr packets

- ipv6LandAttack: Land-attack packets received

- ipv6FragZeroLenPkt : Packets received with a fragment length of 0 bytes

- ipv6TotIcmpFragPkts : ICMPV6 fragmented packets

- ipv6TotLookupDone : IPV6 Neighbour Look ups.

- ipv6TotLookupFailed: IPV6 Neighbour Look ups failed

- ipv6TotStaticRoutes : IPV6 Static Routes

- ipv6TotDynamicRoutes : IPV6 Static Routes.

- ipv6TotNeigborDiscovered : IPV6 Total Neighbor Discovered.

- ipv6TotIpv6To4Conversions: IPV6 To IPV4 Conversions.

- ipv6TotIpv4To6Conversions : IPV4 To IPV6 Conversions.

- ipv6TotTcpConnection : IPV6 TCP Connections.

- ipv6TotNonTcpConnection : IPV6 Non TCP Connections.

[From Build 112.15] [#339095]

- The owner node for the SNMP engine can be set in a cluster. Use the ownerNode parameter of the set SNMP engineID command.

  [From Build 112.15] [#356223]

- A new SNMP OID, vsvrEstablishedConn (1.3.6.1.4.1.5951.4.1.3.1.1.71) is available for current client connections in the ESTABLISHED state at the vserver level.

  [From Build 126.12] [#418044]

- Support for TLS1.1 and TLS 1.2

  The SSL virtual server on the NetScaler appliance supports TLS1.1 and TLS1.2 protocol based clients. These protocols helps prevent Browser Exploit Against SSL/TLS (BEAST) attacks.

For more information about this protocol, see https://tools.ietf.org/html/rfc5246.

The following ciphers support the TLS1.1 and TLS1.2 protocol:

- SSL3-RC4-MD5

- SSL3-RC4-SHA

- SSL3-DES-CBC3-SHA

- TLS1-AES-256-CBC-SHA

- TLS1-AES-128-CBC-SHA

- SSL3-EDH-RSA-DES-CBC3-SHA

- TLS1-DHE-RSA-AES-256-CBC-SHA

- TLS1-DHE-RSA-AES-128-CBC-SHA

The following ciphers support the TLSv1.1 protocol:

- SSL3-DES-CBC-SHA

- SSL3-EDH-RSA-DES-CBC-SHA

- SSL3-ADH-RC4-MD5

- SSL3-ADH-DES-CBC-SHA

- SSL3-ADH-DES-CBC3-SHA

- TLS1-ADH-AES-128-CBC-SHA

- TLS1-ADH-AES-256-CBC-SHA

[From Build 112.15] [#271648, 205184, 258052, 258328, 262506, 315852]

- Configuring SSL Close-notify at the Entity Level

  Although the global sendCloseNotify parameter must be set to YES if any entity is to send an SSL close-notify, an entity no longer has to inherit this setting from the global settings. You can set the sendCloseNotify parameter at the entity (virtual server, service, or service group) level. This enhancement provides the flexibility to set this parameter for one entity and unset it for another entity. However, make sure that you set this parameter at the global level. Otherwise, the setting at the entity level does not apply.

  [From Build 112.15] [#257122]

- Support for SPDY in SSL

  The NPN extension is now supported on the NetScaler appliance.

  [From Build 112.15] [#284270, 329666, 329672]

- Add a Certificate Bundle

You can load a certificate bundle containing one server certificate, up to nine intermediate certificates, and optionally, a server key. Separate steps for loading and linking the certificates are no longer required.

[From Build 112.15] [#236585, 277630]

- Certificate Expiry Monitoring

  The certificate expiry monitoring option is now enabled by default, and the default expiry notification period is set to 30 days.

  [From Build 112.15] [#351522]

- Restrict the Root CA's distinguished names (DN) sent by the NetScaler Appliance

  As a part of the SSL handshake, in the Certificate Request message during client authentication, the server lists the distinguished names (DNs) of all the certificate authorities (CAs) bound to the server from which it will accept a client certificate. If you do not want the DN name of a specific CA certificate to be sent to the SSL client, set the skipCA flag. This setting indicates that the particular CA certificate's distinguished name should not be sent to the SSL client.

  [From Build 112.15] [#262041]

- Low Encryption Licenses for Russia

  A NetScaler MPX appliance for customers in Russia initially ships with a low encryption license. After proper authorization from the Russian agency, customers can upgrade to a Standard, Enterprise, or Platinum software edition, which enables high-encryption SSL performance on the appliance.

  [From Build 118.7] [#349674, 379439]

- As part of the SSL handshake with the server, the NetScaler appliance now sends a Client Hello message on the basis of the version (for example SSLv3 or TLS1.0) that is configured on the appliance. Earlier, it sent an SSLv2 compliant Client Hello message to the server.

  [From Build 123.11] [#378806, 204465, 406907]

- Setting the Limit for Disabled SSL Chips

  You can now set a limit to the number of disabled SSL chips after which the appliance restarts. At the command prompt, type:

  set ssl parameter ?cryptodevDisableLimit <positive_integer>

  A chip is marked disabled after the third failed reinitialization attempt.

  [From Build 125.9] [#376153]

- An SSL chip is disabled at the third reinitialization attempt. That is, the maximum reinitialization limit is 2. Earlier, this limit was 5.

  [From Build 125.9] [#455821]

- Display HSM Model Number

  The output of the "show fips" command now displays the HSM model number as shown below. This is especially helpful

if you are conducting an audit of the FIPS card in a NetScaler appliance and cannot open the appliance without voiding the warranty.

> sh fips

FIPS HSM Info:

HSM Label : NetScaler FIPS

Initialization : FIPS-140-2 Level-2

HSM Serial Number : 2.1G1037-IC000253

HSM State : 2

HSM Model : NITROX XL CN1620-NFBE

Hardware Version : 2.0-G

Firmware Version : 1.1

Firmware Release Date : Jun04,2010

Max FIPS Key Memory : 3996

Free FIPS Key Memory : 3994

Total SRAM Memory : 467348

Free SRAM Memory : 62580

Total Crypto Cores : 3

Enabled Crypto Cores : 3

Done

[From Build 129.22] [#385499]

- On all the NetScaler MPX platforms, DH cryptographic operation is now offloaded to the hardware, reducing the load on the CPU. If your deployment uses DH crypto operations heavily, you will notice a performance improvement.

  [From Build 131.11] [#490273, 378182, 404081]

- Clearing Statistical Counters

  You can now clear the counters that are displayed by the configuration utility's Dashboard and by stat commands in the NetScaler command-line interface. Clearing a counter resets it to zero, from which point it is incremented as the appliance processes traffic. You can clear the counters regardless of whether the NetScaler appliance is currently processing traffic. The ability to clear counters enables you to observe them over a specific period of time and troubleshoot the configuration.

  [From Build 112.15] [#241836, 189957, 192898, 228298]

- The Citrix NetScaler MPX 22040/22060/22080/22100/22120 appliances now support the ECDHE cipher group. This group contains the following ciphers:

  - TLS1-ECDHE-RSA-RC4-SHA

  - TLS1-ECDHE-RSA-DES-CBC3-SHA

  - TLS1-ECDHE-RSA-AES128-SHA

  - TLS1-ECDHE-RSA-AES256-SHA

  Because of its smaller key size, Elliptic Curve Cryptography (ECC) is especially useful in a mobile (wireless) environment and in an interactive voice response environment, where every millisecond is important. Smaller key sizes result in power, memory, bandwidth, and computational cost savings.

  The following ECC curves are supported:

  - P_256

  - P_384

  - P_224

  - P_521

  By default all four curves are bound to an SSL virtual server.

  For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-5-map/ns-ssl-config-ecdhe-ciphers-tsk.html

  [From Build 121.10] [#329257, 198673, 401256]

- Enabling CallHome Feature while Upgrading the NetScaler Appliance

  While upgrading the NetScaler appliance from an older release to release 10.1 or later, the NetScaler appliance prompts you to enable the CallHome feature in one of the following cases:

  - The CallHome feature is not supported in the older release.

  - The CallHome feature is disabled in the older release.

  [From Build 112.15] [#311617]

- Send Buffer Support for TCP Profiles

  You can now set the window that is advertised to the server by using the sendBuffsize parameter of the "set ns tcpProfile" command.

  [From Build 112.15] [#315625]

- User Name and Password Length Extended to 127 Characters

User names and passwords on the NetScaler appliance can now be up to 127 characters in length. Usernames and passwords can consist of upper-case and lower-case letters, digits, and the hyphen and underscore characters.

[From Build 112.15] [#325421]

- Public Key Authentication for Non-nsroot Users

  All NetScaler users can now access the NetScaler appliance by using public key authentication in SSH.

  [From Build 112.15] [#209190, 235961, 291483]

- New Parameters for Web Interface Site

  The following parameters are added for a web interface site:

  For the add wi site command:

  - welcomeMessage. Localized welcome message that appears on the welcome area of the login screen.

  - footerText. Localized text that appears in the footer area of all pages.

  - loginSysMessage. Localized text that appears at the bottom of the main content area of the login screen.

  - appWelcomeMessage. Localized text that appears at the top of the main content area of the applications screen.

  - preLoginButton. Localized text that appears as the name of the pre-login message confirmation button.

  - preLoginMessage. Localized text that appears on the pre-login message page.

  - preLoginTitle. Localized text that appears as the title of the pre-login message page.

  - showSearch. Enables the Search option on XenApp websites.

  - showRefresh. Provides the Refresh button on the applications screen.

  - wiUserInterfaceModes. Appearance of the login screen.

  ---- Simple - Only the login fields for the selected authentication method are displayed.

  ---- Advanced - Displays the navigation bar, which provides access to the prelogin messages and preferences screens.

  - userInterfaceLayouts. Specifies whether or not to use the compact user interface.

  - domainSelection. Domain names listed on the login screen for explicit authentication.

  For the bind wi site command:

  - farmName. Name for the logical representation of a XenApp or XenDesktop farm to be bound to the Web Interface site.

  - groups. Active Directory groups that are permitted to enumerate resources from server farms. Including a setting for this parameter activates the user roaming feature. A maximum of 512 user groups can be specified for each farm defined with the Farm<n> parameter. The groups must be comma separated.

  - recoveryFarm. Binded farm is set as a recovery farm.

[From Build 112.15] [#317793]

- SNMP statistics can be cleared by using the clearstats parameter of the stat snmp command.

  [From Build 112.15] [#362132]

- SPDY Support

  NetScaler appliances can now support SPDY. You have to enable SPDY in an HTTP profile and bind the profile to a virtual server. When SPDY is enabled, the virtual server functions as a SPDY gateway and converts SPDY requests from the clients into HTTP requests that it sends to the servers. It also converts the HTTP responses from the servers to SDPY responses that it sends to the clients. The servers do not have to support SPDY. You can enable SPDY in an HTTP profile by using the set ns httpprofile - SPDY enabled command or by using the configuration utility.

  Note: SSL is required for SPDY protocol to function.

  [From Build 112.15] [#329671]

- PHP Version Upgraded from 5.3.10 to 5.3.17

  The PHP version has been upgraded from 5.3.10 to 5.3.17 on the NetScaler appliance to resolve security vulnerabilities and stability issues with PHP.

  [From Build 112.15] [#333572]

- Multipath TCP Support

  NetScaler appliances now support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You have to enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

  For more information, see TCP Configurations.

  [From Build 119.7] [#320221, 307024]

- Custom HTTP Headers Support using Web Server Logging

  The NetScaler can now export values of custom HTTP headers to the NSWL client. You can configure up to a maximum of two HTTP request header names and two HTTP response header names.

  [From Build 119.7] [#329710]

- Call Home Proxy Mode Support

  Call Home can now upload your NetScaler appliance's data to the Citrix TaaS server through a proxy server.

  [From Build 119.7] [#311623]

- Backing Up and Restoring a NetScaler Appliance

  You can now back up the NetScaler appliance at any time and then use the backup to restore the same appliance to that state.

For more information, see Backing Up and Restoring the NetScaler Appliance.

[From Build 119.7] [#367021]

- New Subnet Mask Field for the SNIP Address in the First-time Setup Wizard

  The first-time setup wizard now has separate subnet mask fields for the NetScaler IP (NSIP) and subnet IP (SNIP) addresses.

  [From Build 120.13] [#413542]

- Before reusing a server connection in the reuse pool, the NetScaler appliance checks the connection's idletimeout and reusepool values, and closes the connection if either value is exceeded. The appliance also checks the reuse pool for idle connections, and closes them, more frequently than specified by the zombie timer interval.

  [From Build 122.17] [#365828, 365731]

Fixed Issues in Previous 10.1 Builds

Oct 10, 2015

The issues that were addressed in NetScaler 10.1 releases prior to Build 133.9. The build number provided below the issue description indicates the build in which this issue was addressed.

AAA-TM | AAA-TM/Content Switching | Action Analytics | AppFlow | Application Firewall | Cache Redirection | Citrix NetScaler 1000V | CloudBridge Connector | Cluster | Command Line Interface | Compression | Configuration Utility | Configuration utility | Content Switching | DNS | DataStream | Documentation | GSLB | Graphical User Interface | High Availability | ICA AppFlow | Integrated Caching | Load Balancing | Load Balancing/AAA-TM | Load Balancing/DNS | Load Balancing/MSSQL | Load Balancing/Responder | MPTCP | Monitoring | NITRO API | NetScaler Gateway | NetScaler Insight Center | NetScaler SDX Appliance | NetScaler VPX Appliance | Networking | Platform | Policies | Policies [#446507,#506761,#463284,#500444] | Policy | Rewrite | SNMP | SPDY | SSL | SureConnect | System | User Interface | WIonNS | Web Interface | XML

- During authentication, when AAA generated a URL redirect, it rewrote the query portions of URLs that contained Base64 strings into base 8 ASCII string equivalents instead of transmitting the original strings. This caused some redirects to fail, and introduced security issues into other redirects. This behavior has been changed, and AAA now transmits the unmodified query to the user. Users should be aware that the new approach might cause issues with different protected web applications.

  [From Build 118.7] [#390037, 242875, 246109, 247244, 358370]

- When Kerberos Constrained Delegation is configured with a content switching virtual server, the NetScaler appliance might hang or crash. The cause is a GET request with multiple authorization headers. (Only one authorization header is expected.)

  [From Build 118.7] [#372362, 381621, 401539]

- On a NetScaler appliance with AAA enabled and Kerberos Constrained Delegation single sign-on configured, after several single sign-on requests are successfully authenticated, the virtual server principle can unexpectedly become blank. When this happens, subsequent authentication requests fail.

  [From Build 118.7] [#387076, 390083]

- When importing a keytab while setting up a KCD account, AAA might fail to extract the SPN from the keytab, causing the import to fail.

  [From Build 119.7] [#387049]

- When AAA is configured by authentication profile on a NetScaler appliance that has content switching enabled, users can use the Microsoft Internet Explorer or Mozilla Firefox browsers to log on, but might not be permitted to access all resources that they should be able to access. Users who log on using the Google Chrome browser do not experience this problem. The underlying cause was that authentication level is checked only once per connection rather than at each request.

  [From Build 120.13] [#401000]

- On a NetScaler ADC that has AAA-TM enabled and Kerberos authentication configured, when you direct traffic through the ADC to a Microsoft SQL server, an error causes the ADC to restart.

  [From Build 123.11] [#436493]

- When AAA-TM is configured to use SAML authentication, the redirect URL that the SAML virtual server returns appends the string "%00", a text-based form of the null value, to the original redirect URL. Most browsers handle the appended string properly, but newer Apple iOS and some Apple MacOS browsers fail to load the web page because of this string.

  To work around this issue, you can create a Rewrite action and policy to strip off the "%00" string, and bind it to global. If you configure the gotoPriorityExpr for the policy to NEXT, and bind the policy with a priority of 1, it will run first, strip the null string from the end of all redirect URLs, and then continue policy evaluation with the next policy. This configuration should work without creating any problems with your existing policy evaluation flow.

  [From Build 124.13] [#441755]

- RFC822 Name-based Certificate Authentication

  AAA-TM now supports the use of RFC822 name-based (SAN) client certificates to authenticate users. SAN client certificates work in exactly the same way as other client certificates. To configure the NetScaler ADC to use SAN client certificate authentication, follow the client certificate authentication instructions in the AAA-TM documentation.

  [From Build 125.9] [#453125]

- When the NetScaler ADC is configured to use AAA with SAML authentication, and it receives a response from the IDP, it reformats the response in standard SAML format. (This process is sometimes called "canonicalizing" the response.) The ADC might not reformat SAML <samlp: response> namespace prefix tags correctly, because it expects <saml: assertion> format. In that case, digest verification fails.

  To work around this issue, you must remove the namespace prefixes definition, as described on the following web page:

  http://publib.boulder.ibm.com/infocenter/tivihelp/v2r1/index.jsp?topic=%2Fcom.ibm.tivoli.fim.doc_6226%2Fconfig%2Freference%2FCustomPropsKess.html

  [From Build 125.9] [#435529, 448986, 456574]

- AAA-TM now supports relative URLs as form Action URLs in forms-based SSO logon forms. You do not have to specify an absolute path to the web form when configuring forms-based SSO.

  [From Build 127.10] [#317157]

- When AAA is configured to authenticate users to a Microsoft Sharepoint 2013 server by using NTLM, the user might be prompted to retype his or her credentials even though the user entered those credentials correctly. After the user retypes the credentials, he or she is logged on successfully. The issue is that initially the NetScaler ADC sends an incorrect domain to Sharepoint.

  [From Build 129.22] [#476885]

- If the hostname that sends an incoming request does not match the domain configured on the authentication virtual server, the NetScaler ADC returns an HTTP 500 error. As a workaround, configure an authentication profile and include the hostname.

[From Build 129.22] [#488015]

- In forms-based single sign-on (SSO), if the designated response size is 0, the NetScaler ADC does not search for the complete response, as it normally would for responses with sizes above 0. It therefore fails to find the login form, and forms-based SSO authentication fails.

  [From Build 129.22] [#493308]

- The Authorization header received from the client with the user credentials for 401 based authentication for KCD was intentionally corrupted by the NetScaler ADC as "Ahoutrization" before forwarding it to the backend. To avoid the risk of decoding the user-supplied credentials by using simple base64decode, the ADC now removes the incoming authorization header containing user credentials, and inserts a new Authorization header with a Kerberos token before sending the payload to the backend application.

  [From Build 129.22] [#478374]

- The NetScaler ADC no longer sets the NSC_TMAA session cookie during a secure load balancing virtual server session.

  [From Build 129.22] [#474918, 502915]

- If a user name or password consists of UTF8 characters, basic authentication fails on the NetScaler ADC. With this fix, the ADC now passes the encoding type in the 401 challenge so that the incoming data is accurately encoded.

  [From Build 130.13] [#507386]

- The NetScaler ADC does not handle an authentication request if the incoming base64 decoded kerberos ticket is more than 10 kilobytes. This fix increases the buffer-size limit to accommodate tickets of up to 65 kilobytes.

  [From Build 130.13] [#505809, 507692]

- In a AAA-TM setup that has 401 authentication enabled on the load balancing virtual server, the NetScaler appliance can, in some cases, go down if it receives a malformed authorization header.

  [From Build 131.11] [#530792]

- The NetScaler appliance can fail if the logout of the AAA-TM session is initiated through a traffic policy. The configuration that can lead to this is of the form:

  > add tm trafficAction testAction1 -InitiateLogout ON

  > add tm trafficPolicy testPolicy1 <rule> testAction1

  [From Build 131.11] [#527651]

- The NetScaler appliance sometimes sends a 401 error message to a client that sent a valid authorization header.

  [From Build 132.8] [#532675]

- When you configure a content switching rule that is evaluated before the user authenticates with AAA-TM, and the rule is supposed to redirect users to a specific virtual server on the basis of the user name, the rule fails.

  [From Build 118.7] [#397673]

- The NetScaler crashes due to an issue in hash calculation and comparison of the action analytics records. The crash is observed when the NetScaler receives URLs that differ only in case.

  Examples:

  http://10.217.6.239/TesT/

  http://10.217.6.239/TEST/

  http://10.217.6.239/TEsT/

  http://10.217.6.239/TeST/

  Note post fix:

  Stream analytics record creation will be case sensitive. For example, WWW.GOOGLE.COM and www.google.com will result in two seperate records.

  If this is not desired, stream selector results should be converted to one case. Example:

  add stream selector sel1 HTTP.REQ.hostname.to_lower

  [From Build 130.13] [#406457]

- If you enable AppFlow from a NetScaler Insight Center virtual appliance while traffic is flowing through a monitored NetScaler appliance, NetScaler Insight Center disables and then re-enables the AppFlow feature for every virtual server on the NetScaler appliance. Doing that while traffic is flowing through the appliance puts some pointer out of sync. As a result, the appliance does not respond properly.

  [From Build 118.7] [#388650, 393917, 396149, 398276, 409840]

- A newly added HTTP header prevents parsing of the HTTP request.

  [From Build 121.10] [#418296]

- A Nitro call used by NetScaler Insight Center to fetch the license information from a NetScaler appliance affects the performance of the appliance.

  [From Build 122.17] [#430591]

- The NetScaler fails to respond if appflow logging is disabled on a VPN virtual server when ICA traffic flows through the NetScaler.

  [From Build 123.11] [#430960, 470262]

- If HTML Injection is enabled, the NetScaler ADC injects JavaScript into the response to obtain client-side page-load time and client-side page-render time details. The JavaScript triggers a special request that is intended only for the NetScaler ADC, but the NetScaler ADC creates an additional request by forwarding the request to the server.

  [From Build 126.12] [#441332, 357422, 401672]

- If a browser executes the JavaScript that is inserted into the response of the main page, it sends a special request intended for the NetScaler ADC. AppFlow records for this request must not be generated. While handling this behavior, the logic in one part of the code assumes that the AppFlow records must not be sent, but another part of the code assumes that the records must be sent. As a result, the NetScaler ADC fails to respond.

  [From Build 128.8] [#478480, 480535, 495201]

- If you enable Appflow for ICA on a NetScaler ADC, the NetScaler ADC might fail under certain conditions while parsing the ICA frames.

  [From Build 129.22] [#512321, 519402]

- If you have enabled AppFlow for ICA on a NetScaler ADC, the ADC crashes while processing CGP packets.

  [From Build 129.22] [#523088]

- NetScaler ADC might fail if you disable AppFlow or clear the AppFlow actions and policies when ICA traffic flows through the NetScaler ADC.

  [From Build 129.22] [#487686, 502208, 516910]

- The NetScaler ADC fails if AppFlow is enabled and it receives an ICA command longer than 2048 bytes.

  [From Build 129.22] [#504990, 508918]

- The HTML Injection JavaScript is incorrectly inserted into one of the JavaScript responses sent by the server, causing the page to fail to load.

  [From Build 131.11] [#472971]

- AppFlow should not export the records for internal connections, like the Kernel RPC. When it attempts to export records for such an internal connection, it leads to AppFlow failure.

  [From Build 132.8] [#547892, 531101]

- The application firewall now supports sessionless cookie proxying on NetScaler cluster configurations that do not use the spotted VIP feature.

  [From Build 118.7] [#351544]

- Application Firewall Signatures

  To improve performance, when the application firewall processes buffer overflow signatures it does not evaluate PCRE expressions unless the minLength parameter is set.

  [From Build 118.7] [#376437, 365941]

- Application Firewall Signatures

  If you configure an application firewall profile but do not bind any signatures to it, the NetScaler appliance becomes unresponsive or fails if a user sends a request with a JSON body to a web site protected by that profile.

[From Build 118.7] [#390804, 393588]

- Application Firewall Signatures

  You can now configure the JSON content types for your application firewall in the "Manage JSON Content Types" dialog box in the global settings. The dialog box is nearly identical to the "Manage XML Content Types" dialog box.

  [From Build 118.7] [#384103]

- The application firewall includes an extraneous line break in the hidden field that it adds to forms as part of the form field consistency check. This line break is not javascript-compliant and can cause issues with javascript-enhanced forms.

  [From Build 119.7] [#403027]

- Application firewall statistics are not supported for NetScaler classic policies. If you need to see numbers of policy hits and other statistics, you must use NetScaler default syntax policies.

  [From Build 120.13] [#303060]

- If the NetScaler appliance sends a large amount of input data to the application firewall in a short time, the appliance can become unresponsive or fail. The appliance now sends input data in batches limited to sizes that do not cause this problem.

  [From Build 121.10] [#416714]

- On a NetScaler appliance with both the application firewall and integrated caching enabled, a memory leak might occur. To work around this issue, disable integrated caching.

  [From Build 122.17] [#391317, 423289]

- On a NetScaler appliance with the application firewall enabled, web forms submitted with URL-encoded double-byte character (Chinese, Japanese, or Korean) inputs might generate a Form Field consistency check violation. The reason is that the application firewall counts bytes instead of characters when validating web form input, causing some double-byte input to exceed the form field maxlength attribute.

  [From Build 122.17] [#422639, 239207]

- On a NetScaler appliance with the application firewall enabled and configured, if a protected web site contains a multipart web form, a memory leak causes a small amount of memory to be consumed and not released each time the application firewall processes the web form. Repeated processing of requests and responses can gradually consume available memory.

  [From Build 122.17] [#422919, 423289]

- By default, the application firewall's SQL Injection signatures patterns and security checks do not prevent SQL injection attacks that use the percent (%) or underscore (_) characters. To work around this issue, add the percent and underscore characters to each signatures object as SQL special characters.

  [From Build 123.11] [#407347]

- If memory utilization is high on a NetScaler appliance that has the application firewall enabled and configured, URL redirect might fail, causing the appliance to crash. To work around this issue, reduce memory utilization by reducing session timeouts and disabling memory-intensive filtering rules.

[From Build 123.11] [#427717]

- The application firewall currently miscalculates memory limits on 12 GB, 2 vCPU NetScaler appliances. For example, when the appliance has 2 GB of memory available, the application firewall shows only 600 MB of available memory.

  [From Build 123.11] [#427857]

- On a NetScaler MPX5500 appliance that has the application firewall enabled, and has logging enabled for at least one signature or security check, when that logging action is triggered the appliance might hang or crash.

  [From Build 123.11] [#423861, 436918]

- If you use the single sign on (SSO) feature on your NetScaler ADC or NetScaler Gateway, it might become unresponsive or restart.

  [From Build 123.11] [#446304, 443080, 444746, 444810, 447206, 448814, 449393, 449396, 451162, 451860, 452078, 452427, 453146, 454416]

- The application firewall blocks XML requests that have empty bodies (zero content length), which causes autodiscover and other features that use such requests to fail. To work around this issue, you can disable the XML Format, XML Message Validation, XML Denial of Service, and Web Services Interoperability (WSI) security checks.

  [From Build 123.11] [#432276]

- When using CVPN or the application firewall credit card or safe object security checks, memory issues might cause the NetScaler ADC to become unresponsive or restart.

  [From Build 123.11] [#448961, 449223, 449851, 450070]

- On a NetScaler ADC HA pair configured to use the Citrix VPN, single sign-on, and the Application Firewall, a memory page issue might cause the primary ADC to reboot, failing over to the secondary ADC.

  [From Build 124.13] [#445552, 367086, 444810, 450052, 453111, 453165]

- On a NetScaler appliance or VPX that has the application firewall enabled and at least one profile that has the Safe Object security check enabled, the application firewall might generate an extremely large buffer file while checking responses for objects. The oversized buffer might cause performance problems or, in extreme cases, hang the system. To work around this issue, disable the Safe Object check.

  [From Build 124.13] [#444471]

- Apple iPhone and iPad users are unable to watch MP4 videos on web sites that are protected by the application firewall when either the form field consistency check or the credit card check is enabled, even if blocking is not enabled. The problem is specific to Apple iOS. Google Android smartphone or tablet users are able to watch MP4 content.

  To work around this issue, add the following expression to the policy that invokes the application firewall:

  "HTTP.REQ.URL.REGEX_MATCH(re#.mp4$#).NOT"

  For example, to exempt URLs that contain the string ".mp4" from the policy pol_media.example.com, which calls the profile prfl_media.example.com, you would type the following command:

  > add appfw policy pol_media-example.com "HTTP.REQ.URL.REGEX_MATCH(re#.mp4$#).NOT" prfl_media.example.com

[From Build 124.13] [#405434, 412329]

- Memory Caching Issue

  On a NetScaler ADC that has the application firewall enabled, and that has either limited available memory or a small memory cache configured, a memory page issue might cause the ADC to become unresponsive or reboot.

  [From Build 125.9] [#453111]

- Viewing Large PDF Files in Google Chrome Browser

  On a NetScaler ADC that has the application firewall enabled, when a Google Chrome user opens a large PDF file on a protected web server, the ADC might become unresponsive. The same file, if downloaded with Internet Explorer or Mozilla Firefox, causes no problems. The cause is a loop in a backup queue.

  [From Build 125.9] [#452846, 438094, 453768, 456263, 459327, 461608, 464502]

- High Level of Out of Memory Errors

  On a NetScaler ADC with limited CPU and memory, if the application firewall is enabled, out-of-memory errors might accumulate in the NetScaler log, causing rapid rotation of logfiles. To work around this issue, lower the session timeout from the default 900 seconds to 360 seconds or lower.

  [From Build 125.9] [#428852]

- Response-side Check Issue with Lotus Notes Webmail

  On a NetScaler ADC that has the application firewall enabled and an XML or Web 2.0 profile configured, if a response-side check (such as the Credit Card or Safe Object check) is enabled along with at least one XML-based check, Lotus Notes webmail does not load correctly. Specifically, the frame that should contain the user's inbox is blank.

  [From Build 125.9] [#448610]

- Web Form Processing Issue Causes ADC to Become Unresponsive

  On a NetScaler ADC that has the application firewall enabled and the Form Field Consistency check or Field Formats check enabled, a memory leak might cause the ADC to become unresponsive, requiring a manual restart. The underlying issue is a failure to process certain types of web form content properly. Appliances or VPX instances that have limited CPU and memory are especially likely to experience this issue.

  To work around this issue, disable entity decoding. You can disable this feature by logging onto the NetScaler command line and, at the prompt, typing the following command:

  set appfw settings -entityDecoding off

  [From Build 125.9] [#436100]

- Web-Based Content Not Loaded Correctly when XML Checks are Enabled

  On a NetScaler ADC that has the application firewall enabled and an XML or Web 2.0 profile configured, if any XML security checks are enabled, certain web content does not load correctly. To work around this issue, create a separate profile that has the application firewall disabled. Then, create an application firewall policy that assigns that profile to those web pages that are affected by this issue.

[From Build 125.9] [#450939]

- A user with a web proxy that allows the user to modify the HTTP header can on rare occasions bypass certain security checks when sending content that would normally be blocked. For example, a user might bypass the HTML and XML SQL injection checks when sending an SQL special symbol to a protected web application, as long as the special symbol is not combined with an SQL command. A user might also be able to send a modified cookie by intercepting and including all cookies that the application firewall sent to the user, including the NetScaler cookie. Finally, the user might be able to use a web form to upload a script and save that script as a different file type.

  It does not appear that this technique can be used to cause an actual security breach.

  [From Build 126.12] [#424879]

- After automatic update of the application firewall signature rules, custom signature rules with versions lower than the current signatures are automatically disabled.

  [From Build 126.12] [#457454]

- If an attacker includes an SQL special character that is not followed by an SQL keyword in web form data filtered by the application firewall, the application firewall does not block the request because it classifies a special character that does not include a keyword as a false positive.

  [From Build 126.12] [#443207, 355620]

- Any application firewall profile that has either the "AlwaysExceptFirstRequest" or the "AlwaysExceptStartURLs" option enabled cannot be viewed in the configuration utility. These options are available from the command line only. When upgrading to either the current 10.1 maintenance release or the 10.5 beta release of the NetScaler operating system from any previous release, any profile which had the "always" option enabled has that option changed to "AlwaysExceptStartURLs." Profiles that have the "if_present" or "OFF" options enabled are not affected.

  [From Build 127.10] [#472094]

- NetScaler ADCs that are configured as an HA pair with the application firewall enabled might become unresponsive or reboot when the application firewall is processing a large web form.

  [From Build 127.10] [#455284]

- A NetScaler ADC that is configured as an HA pair, and that has the application firewall feature enabled, might experience repeated failovers from the primary to the secondary node when processing HTML traffic with large tag attribute values.

  [From Build 127.10] [#456650, 313950]

- The application firewall parses multipart forms correctly according to the appropriate RFC.

  [From Build 129.22] [#479840, 472476, 482042]

- If you update default signatures on the primary NetScaler ADC in an HA pair, you cannot sync the updated signatures to the secondary ADC.

  Workaround: Export the updated signatures, and import them on the secondary ADC.

  [From Build 129.22] [#486231]

- The SQL wildcard characters (%, _, ^, []) were accidentally removed from the Citrix application firewall default signature object. This breaks the SQL wildcard functionality when the default signature file and its clones are used. This fix restores the wildcard characters in the default signature file. The application firewall detects them and flags the SQL Injection check violations.

  [From Build 129.22] [#513952]

- If you use the configuration utility to make changes to the HTML Cross-Site Scripting check, Allowed/Denied patterns, the application firewall becomes unresponsive after the first POST request it receives after you save your changes. (The Allowed/Denied patterns are accessed through the Modify Signature dialog box.) If you use the command line to make the same changes, no problems occur.

  [From Build 129.22] [#459031, 463351]

- If the application firewall receives a multipart POST request with a Content-Type header that contains a charset, it blocks that request as malformed.

  [From Build 129.22] [#464641]

- The NetScaler application firewall "Click to Rule" functionality is not working in the 51.x and the 52.x builds of release 10.5. With this fix, the user can successfully select the pertinent log message in the syslog viewer and deploy it as a relaxation rule.

  [From Build 129.22] [#503856]

- If a NetScaler ADC receives a request for an object that it cached before the application firewall configuration was modified to add any advanced security check protection, the ADC responds with HTTP Error 503 for subsequent requests to access this cached object, because the object does not contain the expected application firewall metadata. With this fix, the existing cached objects without the required metadata are considered stale and are flushed. The request is served from the origin server and the cache is updated with refreshed data.

  [From Build 130.13] [#473322, 466491]

- The NetScaler ADC might fail if a transaction is aborted before the application firewall completes processing the request.

  [From Build 130.13] [#481899]

- When a user attempts to upload a file to a server that is protected by the application firewall, the file upload fails. The underlying cause is that the application firewall included an invalid character in the MIME boundary when encoding the file.

  [From Build 130.13] [#472476, 418036]

- The application firewall PCI-DSS report does not contain information about the "SQLInjectionCheckSQLWildChars" parameter.

  [From Build 130.13] [#423150]

- If the NetScaler application firewall receives a request with percent-encoded space character, such as "login%20name" for a form field login name, the deployed learned rule containing the encoded character (%20) fails to work as relaxation rule. The security check violation is still triggered. Note that the browser converts the space to a "+" character. For such a

request, the corresponding learned rule with "login+name" for "login name" works as expected when deployed as a startURL relaxation rule.

Workaround: Edit the relaxation rule to replace "%20" with "\\s*" for requests with percent encoded space characters.

[From Build 130.13] [#315183]

- NetScaler Application Firewall Default Signature object now has rules that can be enabled to protect against Shellshock vulnerability (CVE-2014-6271, CVE-2014-7169) which could allow arbitrary code execution.

  [From Build 130.13] [#505272, 505039]

- If a response contains href links that include query parameters, the NetScaler application firewall triggers false positives for CSRF and form field consistency violations if these links are accessed. With this fix, if CSRF or Field Consistency checks are enabled, the URLs in the hrefs are added to the URL Closure table even if startURL Closure is not enabled.

  [From Build 130.13] [#488369]

- If CEF logging is turned on, only the format of application firewall log messages is expected to change, but the format of other logs is also affected, causing problem with their display. With this fix, turning on the application firewall CEF logging does not modify the format or display of other logs.

  [From Build 130.13] [#476206]

- The Application Firewall PCI-DSS report does not display signature bindings. The Profile Settings section of the report shows bound signatures as "Not Set".

  [From Build 130.13] [#443673]

- After an upgrade from a 9.3 build, the user interfaces display inaccurate information about classic policy bindings and inheritance. With this fix, both the configuration utility and the command line interface display the information accurately.

  [From Build 131.11] [#511480]

- The external syslog servers are not able to properly display the audit-log messages from the NetScaler application firewall, because the messages are longer than expected. With this fix, the messages are the correct length.

  [From Build 131.11] [#528170]

- A 64 bit memory leak in the application firewall module might lead to cache misses. The memory leak occurs when the cache is turned on and any of the advanced application firewall security checks are enabled. The application firewall memory leak is now fixed, and the fix resolves the interoperability issue with the cache module.

  [From Build 132.8] [#549466]

- During binding a signature to an application firewall profile, the NetScaler appliance might fail when it is under memory pressure.

  [From Build 132.8] [#559060]

- The Perl script that parses and merges the application firewall signatures during an update operation can cause Perl to crash on the NetScaler ADC. The crash files reduce the amount of space available on the hard drive.

[From Build 132.8] [#543372]

- The NetScaler ADC might fail if a request attempts to access uninitialized variable for an application firewall protected resource. This might be seen when the path ends with "/..".

  [From Build 132.8] [#517750, 530793]

- Enabling the NetScaler application firewall XML Format check might block the contents of a response when the user accesses an embedded link in some applications. The response might be truncated even when the XML format check is deployed in a non-block mode.

  [From Build 132.8] [#528902, 558724]

- When any form protection check is enabled and the default request content-type parameter of the application firewall profile is not configured, an incoming request without a content-type header is treated as a form, even if it is not a form. The transfer-encoding header gets deleted, and a content-length header gets added, but the request is forwarded to the server as a chunked request. The server is unable to process the chunked data and determines it to be a bad request. With this fix, the form analysis is carried out only when "multipart/form-data" or "application/x-www-form-urlencoded" content type is either specified in the request or set as the default request content type in the profile that is applied when the content-type is not specified in the request.

  [From Build 132.8] [#559348]

- The response for an XML GET request might be truncated if, in addition to any of the XML checks, the creditcard or safeobject checks are enabled for the application firewall profile.

  [From Build 132.8] [#539777]

- The NetScaler cache fails to respond to a request in which an absolute URL does not include a slash (/) after the host name.

  [From Build 119.7] [#401148, 408856, 441788]

- An invalid HTTP request received on a cache redirection virtual server configured on the NetScaler ADC is sent to the cache server. This results in errors and degraded performance.

  With the fix, invalid HTTP requests are redirected to the origin server instead of the cache server.

  [From Build 129.22] [#497866, 502366]

- When the cache redirection virtual server is configured as a forward proxy, if an ASYNC memory allocation failure happens, the NetScaler appliance might fail to respond while trying to access a page on the a server that is already configured as a service on the NetScaler.

  [From Build 130.13] [#486578, 491485, 502030, 519399]

- Applying multiple ACL rules causes excessive consumption of CPU cycles. As a result, the NetScaler ADC might become unresponsive.

  [From Build 130.13] [#502366, 505091, 514785]

- The NetScaler ADC fails if the cache redirection virtual server and the httpport parameter point to the same service. For example, the following configuration causes the ADC to fail:

  > set ns param -httpport 80

  > add cr vserver cr1 http * 80

  > set cr vserver cr1 -listenpoliciy "client.ip.src.eq(1.1.1.1)"

  Workarounds:

  Add a listen policy when you add the cache redirection virtual server. For example:

  set ns param -httpport 80

  > add cr vserver cr1 -td 0 HTTP * 80 -range 1 -cacheType TRANSPARENT -Listenpolicy "CLIENT.IP.DST.EQ(4.4.4.10)"

  OR:

  Unset the httpport parameter. For example:

  > unset ns param httpport

  > add cr vserver cr1 http * 80

  [From Build 131.11] [#509690]

- In a fully transparent CR deployment if a client sends two HTTP GET requests for the same connection, the first connection to the CACHE is closed when the second GET request is received. This happens because a specific flag is set to open new connection which forwards the second GET request to the cache. Since the first connection for the same 4 tuple is still open, NetScaler sends a reset signal.

  Fix: Do not set the flag to initiate the connection for the second GET request, since the previous connection already exists.

  [From Build 132.8] [#541395]

- NetScaler-VSB supporting 9 virtual NICs comes up with virtual NICs. This happens when there is an existing NetScaler-VSB (pre 10.5-52.x) on Nexus1110x that supports 7 virtual NICs.

  [From Build 129.22] [#499050]

- The Internet Key Exchange Daemon (IKED) might fail after the NetScaler ADC is restarted.

  [From Build 128.8] [#460193, 444265, 451886, 474654]

- Traffic latency might be greater than 100 milliseconds in a CloudBridge connector tunnel between two NetScaler appliances.

  [From Build 129.22] [#498541]

- Memory leaks might occur on NetScaler ADCs connected to a CloudBridge Connector tunnel when one of the ADCs sends monitor probes, through the tunnel, to a service that is bound to an HTTP or SSH load balancing virtual server.

  [From Build 129.22] [#512191, 513775]

- When the state of a CloudBridge connector tunnel is DOWN, there is a delay in displaying the related log messages (from the /tmp/iked.debug file) on the Create CloudBridge Connector page of the configuration utility.

  [From Build 130.13] [#440781]

- A newly added node cannot synchronize the cluster configuration, because it cannot establish a connection to the cluster configuration coordinator. This issue might arise if the configuration coordinator rpcNode password on the new node is not the same as that on the configuration coordinator.

  Workaround: Make sure the configuration coordinator rpcNode password on the newly added node is the same as that of the configuration coordinator. If not, use the "set ns rpcNode" command to update the password.

  [From Build 118.7] [#370814]

- In some cases, the MSR routes remain in DOWN state since probing ownership is incorrectly being distributed across the cluster. MSR in cluster needs spotted SNIPs and probing ownership must be with the local node alone.

  [From Build 126.12] [#455148]

- When upgrading a cluster node to NetScaler 10.5, from any build of NetScaler 10.1, make sure that the "syncookie" parameter is disabled on the TCP profiles. Otherwise, there can be disruption in traffic flow.

  [From Build 129.22] [#480071, 483171]

- From NetScaler 10.5 Build 52.x, the cluster feature is licensed with the Platinum and Enterprise licenses. In earlier releases, the cluster feature was licensed by a separate cluster license file.

  Note:

  - If you have configured a cluster in an earlier build, the cluster will work with the separate cluster license file. No changes are required.

  - When you configure a new cluster in Build 52.x and then downgrade to an earlier build, the cluster will not work as it now expects the separate cluster license file.

  [From Build 130.13] [#486259]

- NetScaler cluster nodes may send a large number of ARP requests if a large number of ARP entries are learned over a cluster LA interface.

  [From Build 132.8] [#519327, 542633]

- The "show ns runningConfig" command displays the current time instead of the time at which the configuration was last modified.

[From Build 121.10] [#379234]

- After a user logs on to a NetScaler appliance through the CLI, the "set cli mode -disabledFeatureAction NONE" command is automatically executed, and the following error message appears:

  ERROR: Not authorized to execute this command.

  [From Build 122.17] [#420596]

- A policy bound to a vpn vserver with "-type RESPONSE" gets lost after a reboot. That is, it is no longer bound after a reboot.

  [From Build 125.9] [#441505]

- When you run the command show techsupport to generate a tar of system configuration data, in certain scenarios, the NetScaler ADC might ignore to collect certain large files.

  [From Build 126.12] [#436772]

- The rbaOnResponse system parameter fails to work after you upgrade NetScaler ADC nCore or nCore VPX from version 9.3 to 10.x.

  [From Build 129.22] [#480639]

- NetScaler ADC fails to run the commands that have arguments accepting string values and starting with a hyphen (-).

  For example, NetScaler ADC fails to run the following command because the expected value is a string for uat argument that begins with a hyphen.

  bind policy patset ps_adi_any_robots_deny -uat -index 1

  [From Build 131.11] [#508618, 508815]

- The output of the "show cmp parameter" command incorrectly displays the label as "Disable External Cache" instead of "Enable External Cache".

  [From Build 126.12] [#456734]

- If you use the configuration utility to view a Responder action, the Responder Actions page is reloaded.

  [From Build 118.7] [#369583]

- You cannot configure a GSLB service for which a server is not configured on the NetScaler appliance. The configuration utility displays the message "Server must be specified".

  [From Build 118.7] [#360163]

- When search results do not fit onto one page, duplicate records might appear on the second and subsequent pages.

  [From Build 118.7] [#369900, 252063]

- On NetScaler appliances that run the cluster OS, user-defined control policies are not listed in the control flow and therefore do not appear in the Policy Manager. After these policies are bound to Global or an appropriate bind point, they are listed in the data flow.

  [From Build 118.7] [#387554]

- The pagination count on the page listing SSL policies that can be bound does not display the correct values.

  [From Build 119.7] [#372535]

- When a NetScaler session expires, a session expiry message appears in the graphical user interface, and the user has to manually enter the IP address or the domain name of the NetScaler appliance in the address bar to log back on.

  [From Build 120.13] [#361970, 387024, 397473, 400307]

- The Traffic Management > Load Balancing > Set up NetScaler for XenApp/XenDesktop wizard, displays an error if more than one service group is bound to the virtual server that is used for load balancing the XenApp/XenDesktop servers, or if more than one service is bound to the service group.

  [From Build 121.10] [#414807]

- When editing the "Xen Farm" settings in the "Traffic Management > Load balancing > Set Up NetScaler for XenApp/XenDesktop" wizard, load balancing configuration is lost if you switch from XenApp or XenDesktop to Both or from Both to XenApp or XenDesktop. This issue is observed only when Web Interface on NetScaler is the integration point.

  [From Build 121.10] [#414760]

- Unable to access ICA connections through the graphical user interface

  [From Build 121.10] [#420349, 414333, 430665]

- When using the "Traffic Management > Load balancing > Set Up NetScaler for XenApp/XenDesktop" wizard, if you configure XenDesktop and later edit the "Xen Farm" settings to have only XenApp, the XenDesktop bound to the Web Interface site of type Xenappservices in not modified. Therefore, published resources of both, XenApp and XenDesktop, are displayed when accessing the Web Interface site through Receivers.

  [From Build 121.10] [#413087]

- When using the "Traffic Management > Load Balancing > Set up NetScaler for XenApp/XenDesktop" wizard, the compression feature is not enabled on the appliance and for the service groups.

  Workaround: Enable compression on the appliance by using the "enable ns feature CMP" command. Also, enable compression for the service groups by using the "set servicegroup <name> -CMP on" command.

  [From Build 121.10] [#409605]

- When you click the "Edit" link to update the configurations specified in the "Traffic Management > Load balancing > Set Up NetScaler for XenApp/XenDesktop" wizard, an error is displayed when you try to apply the optimization settings.

  Workaround: Edit the XenFarm section (no actual changes required), click Continue and then apply the optimization settings.

[From Build 121.10] [#414361]

- If a SureConnect policy is bound to a virtual server and you upgrade the NetScaler appliance to version 10.1, build 120.13, the policy is not displayed when you navigate to "Traffic Management > Virtual Servers > <virtual server name>.

  [From Build 122.17] [#429652]

- When you use the configuration utility to add a new NetScaler IP address or subnet mask, the qwerty keyboard does not allow you to enter a value greater than 249 for the last octet.

  [From Build 122.17] [#431045]

- When you navigate to "System > Diagnostics" and, under "Utilities", click "TraceRoute" and "Run", the utility uses the default value for Packet Length(44) and displays the error message: Packet length must be greater than 47.

  [From Build 122.17] [#430094]

- The NetScaler configuration utility is not compatible with JRE version 7.45.

  [From Build 122.17] [#426594, 426069, 426185, 453470]

- When using the "Traffic Management > Load Balancing > Set Up NetScaler for XenApp/XenDesktop" wizard for the first time, if you cancel the operation, the configurations that you created are not cleared and you cannot access the wizard again.

  Workaround: Do not cancel the wizard during the first setup. If you want to change a configuration, go through the entire flow, click "Done", and then return to the wizard and click the "Edit" link to update the configuration that you want to change.

  [From Build 123.11] [#414431]

- In a cluster setup, globally bound DNS policies are listed multiple times in the "Bind/Unbind DNS Policy(s) to Global" dialog box.

  [From Build 123.11] [#323213, 388012]

- In the NetScaler configuration utility, virtual servers whose names begin with "APP_" or "app_" are not displayed.

  Workaround: Search for the virtual server names with the expressions "*" or "app" by using the search utility.

  [From Build 123.11] [#438216]

- When using the Traffic Management > Load Balancing > Set Up NetScaler for XenApp/XenDesktop wizard, Web Interface on NetScaler does not publish XenDesktop applications if the load balancing virtual server is configured to listen on two XenDesktop servers.

  [From Build 123.11] [#414422]

- If you navigate to "Traffic Management >Load Balancing > Virtual Servers" and click "SSL Settings" under the "SSL Parameter" tab on the "Create Virtual Server" dialogue box, the "Enable Cipher Redirect" check box is enabled by default.

  [From Build 123.11] [#419409]

- A large ns.conf file can make the configuration utility slow to respond. The large file also slows processing of the

following commands:

- show ns runningConfig

- save ns config

[From Build 123.11] [#405303]

- The comparison between the source IP address of the incoming packets and the configured NetScaler host-name address is unsuccessful because of an endian mismatch.

  [From Build 123.11] [#382199, 462580, 463712]

- If the Surge Protection feature is not licensed, you cannot use the configuration utility to modify the global system settings (System > Settings).

  [From Build 124.13] [#439603]

- If you create a monitor by using the graphical user interface and choose the default browse option to select the in-built monitor scripts from the /nsconfig/monitors folder, the folder does not display any scripts to choose..

  [From Build 125.9] [#447077, 460857]

- The configuration utility includes an option to enable Net Profile when you create a StoreFront monitor, but that option should not be enabled for a StoreFront monitor.

  [From Build 125.9] [#449229]

- If you use the configuration utility to create a NetScaler-owned IP address, and provide the OSPF LSA Type1 area value, the Type1 area value is not displayed when you click on the created IP address to view or edit the details.

  [From Build 125.9] [#443850]

- After you set the SSO Domain (single sign-on domain) value, the value is not displayed on the configuration utility when you navigate to Security > AAA Application Traffic > Settings > Change Global Settings.

  [From Build 125.9] [#446549]

- On a NetScaler SDX graphical user interface, an nsroot user cannot change the passwords of other configured user accounts.

  [From Build 126.12] [#460413]

- The System > Cluster > Manage Cluster screen allows a user to create a cluster without providing a Cluster IP address.

  [From Build 126.12] [#448851]

- In the Traffic Management > Load Balancing > Set Up NetScaler for XenApp/XenDesktop wizard, applying the application firewall policies through the Security settings creates an error condition.

  [From Build 127.10] [#403766]

- The Traffic Management > Load balancing > Set Up NetScaler for XenApp/XenDesktop wizard, displays a distorted view of the published resources when you apply the application firewall settings in the Security section.

[From Build 127.10] [#409057]

- For MPX and VPX Netscalers, you can edit ifalias from the Graphical User Interface properly. If you are using Cluster VPX, you can only edit ifalias using the command line interface and not the Graphical User Interface.

  [From Build 127.10] [#446373]

- The configuration utility might display the following error message when you create a monitor by navigating to Traffic Management > Load balancing > Monitors and click Add:

  Error creating view. Model must not be null

  [From Build 127.10] [#473832, 474471, 490291]

- The NetScaler Application Delivery Controller (ADC) and NetScaler Gateway are vulnerable to the arbitrary code execution in a SOAP interface, as described at http://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2014-7140.

  With this fix, the ADC and NetScaler Gateway do not allow a remote attacker to execute arbitrary code.

  [From Build 129.22] [#483340]

- If you bind a content switching policy to a content switching virtual server, an incorrect value appears in the Configure Virtual Server (Content Switching) dialog box. The error is on the CSW tab, in the Hits column under Policies.

  [From Build 129.22] [#475653]

- A NetScaler ADC displays a Java error if you access it by using an sshd connection.

  [From Build 129.22] [#451546]

- If you access the configuration utility through Internet Explorer 9 or 10 and rename a virtual server, a "No such resource" error message appears, even if the rename operation is successful.

  Workaround: Use the mouse to click the OK button instead of pressing the ENTER key on the keyboard.

  [From Build 129.22] [#374304, 377460]

- The configuration utility displays the "Resource already exists" error if you configure a content switching virtual server with the IP address 10.69.129.128 .

  [From Build 129.22] [#490142]

- If you bind a load balancing monitor to a load balancing service, the Configure Service dialog box displays an incorrect value for response time on the Monitor tab.

  [From Build 129.22] [#488748]

- If a connection from a client to a NetScaler ADC is closed without the client logging out, the session created for that connection remains active until the configured timeout period lapses. If this occurs frequently, after about the 20th occurrence the user might get a "Connection limit to CFE exceeded" error message.

  [From Build 130.13] [#511565]

- The configuration utility does not display SSL policies if you navigate to Traffic Management > SSL > Policies to create a

policy.

Workaround: Navigate to Traffic Management > SSL and, in the right pane, select SSL Policy Manager. Or click the refresh button on the top right corner to display the SSL policies.

[From Build 130.13] [#489884]

- If you have assigned an SSL chip to a VPX instance provisioned on an SDX appliance, you cannot enable or disable TLS1.1 and TLS1.2 protocol support on a virtual server by using the configuration utility.

  [From Build 130.13] [#496957]

- If a NetScaler connection from a client is closed without the client logging out, the session created for that connection remains active until the configured timeout period elapses. If this happens frequently, after about the 20th occurrence the user might get a "Connection limit to CFE exceeded" error message.

  [From Build 130.13] [#375277, 322602, 334465, 396405, 412455, 419503, 438382, 438534, 438796, 441853, 446387, 448361]

- If the number of interfaces that you created are more than eight, the Reporting tab in the configuration utility displays only eight interfaces to be monitored.

  [From Build 130.13] [#494804]

- If you create a GSLB service by using a server name with alphanumeric characters, the server name does not get converted to a server IP address, and the server IP address value is null. As a result, GSLB synchronization fails.

  [From Build 130.13] [#501644, 505641, 509379]

- The statistics of service group members do not appear correctly in the configuration utility.

  [From Build 131.11] [#521579, 508630, 519918, 521983]

- Load balancing virtual servers that are used by AppExpert applications are displayed in nodes other than the AppExpert node. For example, they are displayed in the Available Virtual Servers list in the "Create Persistency Group" dialog box (Load Balancing > Persistency Groups > Add) and in the Target Load Balancing Virtual Server list in the "Create Content Switching Action" dialog box (Content Switching > Actions > Add).

  [From Build 131.11] [#353015]

- The NetScaler configuration utility displays the following error message if a user with no shell access logs on to the NetScaler appliance: "Not authorized to execute this command".

  [From Build 131.11] [#524143]

- Although the default value of the sslv2redirect parameter is "Disabled," the configuration utility incorrectly shows this value as "Enabled" for a new SSL virtual server.

  [From Build 131.11] [#529177]

- The NetScaler configuration utility displays the following error message if a user with no shell access logs on to the NetScaler appliance: "Not authorized to execute this command".

  [From Build 131.11] [#522511, 517993]

- When you use the configuration utility to create a certificate, an error message appears even if the validity period specified is within the acceptable range.

  [From Build 131.11] [#420736, 536924]

- If you configure a command policy for a system user (System> User Administration > Users > <username> >Edit > Insert) by using the NetScaler configuration utility, the check-boxes do not function as expected on the Command Policies screen.

  [From Build 131.11] [#522654]

- NetScaler authentication fails if you use special characters such as & or ; in the password.

  [From Build 132.8] [#542557, 542644, 544420, 547508]

- If you specify the service type as DNS and select the DNS64 and ByPassAAA check boxes, and later navigate to some other service type (for example HTTP), the checkboxes are grayed out because they do not apply to an HTTP service but are not cleared. That is, DNS64 and ByPassAAA are disabled but not set to the default value.

  [From Build 132.8] [#538163]

- Java Runtime Environment (JRE) does not work on Internet Explorer version 10.

  Workaround: Press F12 and set the Document Mode and Browser mode to Internet Explorer 9.

  [From Build 132.8] [#482135]

- If a user with read-only permissions opens a monitor (Configuration > Traffic Management >Load Balancing> Monitors), the configuration utility displays the 'Not authorized to execute this command' error message.

  [From Build 130.13] [#512427]

- If a content switching virtual server with a large number of existing connections is removed, flushing all the PCBs takes time. If any traffic destined for the virtual server is received during this time, the appliance fails.

  [From Build 122.17] [#394856, 353736]

- In a cluster environment, if you run the bind cs vserver command with the argument type, the NetScaler appliance incorrectly reports a difference between the running configuration and the saved configuration.

  [From Build 123.11] [#411116]

- Rebinding a content switching policy to a content switching virtual server might result in memory corruption, which might cause the NetScaler appliance to fail.

  [From Build 123.11] [#432272, 409948, 467208]

- The NetScaler appliance fails in the following scenario:

  1. Create a content switching virtual server (CS1) and bind a policy (P1) to it.

2. Rename the virtual server (CS1) to CS2.

3. Create another content switching virtual server named CS1 and bind P1 to the new CS1.

4. Send traffic to virtual server CS1.

[From Build 125.9] [#428991]

- You must bind only a load balancing (LB) virtual server as the default or target LB virtual server to a content switching (CS) virtual server. Global server load balancing (GSLB), cache redirection (CR), virtual private network (VPN), and CS virtual servers must not be bound to a CS virtual sever as the default or target virtual server.

  [From Build 125.9] [#449261, 451077]

- If an HTTP content switching virtual server is bound to an SSL virtual server that has a backup SSL virtual server, the following error message appears:

  ERROR: The backup vserver of the target vserver is not compatible with the CS vserver.

  [From Build 125.9] [#445561]

- The output of the "stat cs vserver ?fullValues" command now displays the number of requests per second. In earlier builds, the output displayed the total number of requests.

  [From Build 127.10] [#460259]

- If an invalid HTTP request that spans multiple TCP segments is sent to a content switching virtual server, the NetScaler ADC might skip the load balancing decision and initiate a connection from the SNIP address to the content switching virtual server. This can cause the ADC to fail.

  To prevent this problem, the ADC closes the client connection when this situation arises.

  [From Build 130.13] [#501856]

- If you perform the following sequence of actions, the second command fails when the restart process runs the commands, because that process adds the gotopriorityexpression to the second binding:

  1. Bind a policy to a content switching virtual server and specify a gotopriorityexpression.

  2. Bind a filter or compression policy to another content switching virtual server without specifying a gotopriorityexpression.

  3. Save the configuration and restart the appliance.

  [From Build 131.11] [#523636, 532832, 533690]

- The NetScaler appliance, configured to function as DNS forwarder or DNS resolver, may becomes unresponsive whenever it receives UDP DNS truncated response from a name server.

  [From Build 120.13] [#401451, 406480, 409029]

- In DNSRewrite Policy, CLIENT.IP.SRC.MATCHES_LOCATION is an incorrect expression for a response from the DNS.

NetScaler does not recognize this expression and hence might crash.

[From Build 123.11] [#426093, 452776]

- NetScaler caches partial response in the following two conditions:

  1. When the response contains more number of resource records for same domain than the limit mentioned in documents. In such a condition, NetScaler caches response till the maximum limit.

  2. When the response contains invalid RDATA, for example, 0.0.0.0 in address record (A record). In such a condition, NetScaler caches resource record till the invalid resource record.

  In such conditions, when NetScaler received a query for the same domain, it replied with a partial response. Going forward, NetScaler will not cache partial response and in such conditions the queries are directed to the back end server.

  [From Build 123.11] [#385524]

- The NetScaler appliance might fail in the following set of circumstances:

  * On the appliance, you have configured DNSSEC offload and enabled NSEC record generation for a zone.

  * The appliance receives a DNS NODATA/NXDOMAIN query for that zone, over TCP, and the DNSSEC OK bit in the query is set.

  [From Build 124.13] [#376662]

- Statistics do not appear correctly for a DNS load balancing virtual server.

  [From Build 128.8] [#462862]

- CNAME Record Caching

  NetScaler ADC when deployed in a proxy mode does not always send the query for an address record to the back-end server. This happens when for an answer to a query for an address record, a partial CNAME chain is present in the cache. Under few conditions, ADC caches the partial CNAME record and serves the query from the cache.

  For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-5-map/ns-tmg-dns-caching-cname-record-con.html

  [From Build 128.8] [#422509]

- The DNS cache entries are not flushed if the DNS caching feature has been disabled for approximately 250 days.

  [From Build 129.22] [#471707]

- If a server sends a NODATA response that has CNAME record in the answer section and no records in the authoritative and additional sections, the response is marked for CNAME caching on the NetScaler ADC, because it is incorrectly assumed to be a referral response. As a result, the ADC sends a blank response to subsequent queries, of any query type, for the canonical name.

  [From Build 129.22] [#477552]

- When a NetScaler ADC is deployed as a DNS server with caching enabled, and "flush dns proxyRecords" is used when the ADC is serving a large volume of traffic and has a large number of records in its cache, the ADC might fail.

[From Build 129.22] [#484069]

- If the number of records in a DNS response for a domain exceeds the Netscaler ADC limit, or if one of the records in the response contains invalid data, the NetScaler ADC does not cache the response. As a result, DNS resolution using NetScaler nameserver entities fails.

  [From Build 130.13] [#437529]

- If a MySQL client sends a query larger than 16 MB, the query is split into multiple MySQL packets. Only the first MySQL packet in a query is forwarded to the server, and the remaining packets are accumulated on the appliance. After some time the window size is reduced to zero and the client cannot send any more packets to the appliance.

  [From Build 123.11] [#433383]

- A pluggable authentication request causes the handshake to fail. A NetScaler ADC does not support pluggable authentication requests. The flags that indicate pluggable authentication requests are now ignored and the request is processed.

  [From Build 124.13] [#441162]

- NTLM authentication is now supported on all Windows clients.

  [From Build 126.12] [#451036]

- Support for SQL Server High-Availability (HA) Group Deployment

  The NetScaler ADC now supports AlwaysOn Availability group deployment in database specific load balancing for MSSQL 2012.

  For more information, see http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-5-map/ns-dbproxy-db-specific-lb-for-mssql-2012-tsk.html

  [From Build 127.10] [#415485]

- If a service group is used to load balance MSSQL servers that require Kerberos Constrained Delegation, the NetScaler ADC fails to use the proper service port to fetch tickets.

  [From Build 129.22] [#479472, 501750]

- If you use SQL server driver for SQL Server 2000 SP1, the databases are not enumerated for Kerberos authentication on the NetScaler ADC, because the ADC does not process the SSPI packet correctly.

  [From Build 130.13] [#507709]

- The PDF format of NetScaler product documentation is no longer packaged with the NetScaler MPX, VPX, and SDX software. NetScaler product documentation is available in HTML format on the eDocs product library web site. You can generate a PDF for any topic from eDocs.

  To access NetScaler documentation on eDocs, see http://support.citrix.com/proddocs/topic/netscaler/ns-gen-netscaler-wrapper-con.html.

[From Build 118.7] [#395277]

- The configuration utility procedures in the NetScaler 10.1 documentation have not been updated to reflect the new top-level nodes.

  See http://support.citrix.com/proddocs/topic/ns-rn-main-release-10-1-map/ns-rn-changes-gui-10-1-con.html for information about the new node structure.

  [From Build 122.17] [#370607]

- On a NetScaler appliance that has both a monitor and a GSLB view bound to a GSLB service, occasionally the view binding is not visible from the command line and is not saved in ns.conf, even though the GSLB service is properly configured and UP.

  [From Build 118.7] [#394328, 406300]

- In a GSLB setup, if you perform auto synchronization and the configuration file in your local site contains the "add locationFile" command, the command is not synchronized to the remote location.

  [From Build 119.7] [#385305]

- When GSLB virtual server is configured with RTT or Static Proximity as load balancing method or SOURCEIPHASH as the persistence type, NetScaler may reboot because of invalid memory access.

  This issue is observed on the MPX 7500 appliance.

  [From Build 121.10] [#421837]

- If a configuration has a large number of GSLB services and the add location file command is used to add the location database, some of the services might not be assigned a location from the database.

  [From Build 121.10] [#408374]

- On a NetScaler appliance that has GSLB configured, if you remove custom location entries from the GSLB database, the appliance crashes.

  [From Build 123.11] [#413367]

- You can add a GSLB site IP address with a Traffic Domain setting, but this configuration is not supported, and the NetScaler fails. With this fix, you cannot add a GSLB site IP address with a Traffic Domain setting.

  [From Build 124.13] [#434660]

- GSLB static proximity stops working, if you remove the custom records after the database ideal times out. If you have not removed the custom records, then it starts to work when a new connection request is made.

  [From Build 127.10] [#465500]

- In rare cases, high management-CPU usage occurs and a large number of error messages appear in the log file. As a result, queries to the location database might fail, and the backup load balancing method is used for site load balancing.

  [From Build 129.22] [#453144, 455417]

- If you change the GSLB configuration while the GSLB feature is disabled, the NetScaler ADC might process some stale messages when you enable the feature. As a result, the ADC might dump core and restart.

  [From Build 130.13] [#485811]

- The NetScaler ADC fails if a VPN session action, a WI home page, or DBS services are configured with a domain name that at the same time is managed by a GSLB virtual server configured with static proximity or RTT load balancing methods.

  [From Build 131.11] [#433094, 469937, 517974]

- If you force synchronization of the GSLB configuration, the non-default settings on the RPC node are lost. As a result, the GSLB auto-sync functionality is lost.

  [From Build 131.11] [#497412]

- The show gslb service command now displays the following values related to the GSLB service:

  -Last State Change

  -Time since last state change

  -Client and Server idle timeout

  [From Build 131.11] [#498854]

- If the length of the domain name bound to a GSLB virtual server exceeds 31 characters, the domain name is displayed as HASHED STRING during an SNMP MIB Walk operation.

  [From Build 131.11] [#511878]

- All GSLB features except DNS views, auto sync, and static proximity are supported for IPV6.

  [From Build 131.11] [#519589]

- If the disablePrimaryOnDown parameter is configured on the primary GSLB virtual server, the primary GSLB virtual server remains in the DISABLED state even after its health state is UP. The backup GSLB virtual server continues to serve the traffic until HA failover, or until you manually enable the primary GSLB virtual server.

  [From Build 131.11] [#517961]

- A NetScaler appliance in a GSLB configuration might fail if the public IP address of a GSLB service is different on two GSLB sites and, on one of the sites, the public IP address for that service is the address of a load balancing virtual server.

  [From Build 131.11] [#505932]

- If a spillover policy is bound to a GSLB virtual server of type UDP, the show ns runningConfig command does not display the policy binding. The policy binding functions properly, but the configuration might be lost if a failover occurs or if the appliance is restarted.

  [From Build 132.8] [#528060]

- If you enable NTP synchronization on a NetScaler ADC, the ntpd service binds to port 3010. The binding causes resource conflicts, because the port was reserved for the nsnetsvc service.

  [From Build 130.13] [#502309, 503357]

- A user session is not terminated if the user logs out of NetScaler ADC by using the configuration utility. The session is terminated only after the session timeout is complete.

  [From Build 130.13] [#513132]

- On a NetScaler SDX appliance or NetScaler VPX instance, if you use the graphical user interface (GUI) to modify the high availability (HA) monitoring or any other property, the GUI displays the Operation not Permitted error message.

  [From Build 130.13] [#495067]

- In a high availability configuration, on a connection to an FTP virtual server with the stateful connection failover option enabled, if the FTP control connection is closed before the passive mode FTP data connection is opened, the secondary node might become unresponsive.

  [From Build 121.10] [#357841, 408502]

- The synchronization of files in an HA setup stops working after the nsinternal user is disabled.

  [From Build 122.17] [#420089, 409307, 425486]

- On the secondary node of a high availability (HA) configuration, if the HA propagation and HA synchronization options are disabled and Stay secondary is enabled, you cannot disable the Stay secondary option after upgrading the node.

  [From Build 124.13] [#416573]

- On a HA setup, even though the source IP is not explicitly set to *, the output of the "show ns rpcNode" commands shows the source IP as *. Therefore, when HA failover happens for the second time, the LB persistency session information is not propagated to the secondary node. This means that the information is not available when a forced failover is performed on the new primary node.

  The fix ensures that the NetScaler IP (NSIP) address of the local box is always set as the source IP address in a HA setup.

  [From Build 129.22] [#469857]

- In a high availability configuration, if the diff ns config command includes the -ignoreDeviceSpecific parameter, the command fails and does not display the difference in configurations between the two nodes.

  [From Build 131.11] [#524146, 526699]

- If the link between the primary and secondary appliance is very slow and there are a large number (millions) of sessions to be synchronized (because of, for example, load balancing persistence), the primary appliance quickly consumes all the NetScaler memory available for buffering. The lack of buffer space for other subsystems can result in various disruptions, such as failover.

  [From Build 131.11] [#519085, 525203, 533671, 534616, 537991, 539518, 541525]

- In a high availability configuration, if a NetScaler packet processing engine (NSPPE) fails on the primary node, both the

nodes might go into a warm reboot loop.

[From Build 132.8] [#479666, 507519, 541503]

- After an HA configuration is stabilized from a "spilt brain" condition (both nodes primary), connections are not immediately synchronized between the current primary and the current secondary node. This latency might result in an HA failover.

  Workaround: After the HA pair is stabilized, perform a forced synchronization, on either the primary or the secondary node.

  To perform a forced synchronization use the following command:

  force ha sync

  [From Build 132.8] [#537496]

- In a high availability configuration, with failSafe mode enabled on the secondary node, the node might briefly become primary when restarted.

  [From Build 132.8] [#534795]

- The NetScaler appliance fails while processing ICA traffic if you have disabled AppFlow logging on the VPN virtual server (set vpn vserver -appflowlog disable).

  [From Build 122.17] [#417274]

- When NetScaler Gateway is deployed in a double hop setup, the NetScaler fails while processing the packets.

  [From Build 123.11] [#429280, 449953, 463668]

- During an ICA handshake, the version-length value that Mac receiver sends in UNICODE format is parsed incorrectly.

  [From Build 123.11] [#432039]

- The NetScaler Insight Center dashboard displays incorrect Init Program and Client Version values for MAC or HTML receivers on different platforms.

  [From Build 123.11] [#433180]

- The NetScaler Gateway fails if AppFlow is enabled or disabled during ICA connections. The NetScaler Gateway might also fail if the NetScaler appliance receives an ICA parsing error.

  [From Build 123.11] [#430696]

- The HDX Insight console displays unnecessary ICA user-session information and console

  messages.

  [From Build 123.11] [#433511]

- On the NetScaler Insight Center dashboard, the source IP address displayed in the application launch records is incorrect.

[From Build 123.11] [#397109]

- The NetScaler ADC might fail if the EUEM channel data that is part of the ICA traffic flow is split across multiple frames in such a way that the first frame contains only 1 byte.

  [From Build 125.9] [#445959, 451775]

- With some WYSE clients, NetScaler ADC fails while processing the ICA connections if the ICA frame is fragmented across several CGP frames (more than three 3 frames).

  [From Build 125.9] [#445550]

- When appflow is enabled, Multi-Stream ICA connections do not work if an appflow policy is bound to a VPN virtual server and appflow logging is enabled on the VPN virtual server.

  [From Build 128.8] [#458122]

- Once the memory limit for a content group is reached, the memory of the resulting object flush is not handled properly. As a result, no objects are stored after the content groups memory limit is reached.

  [From Build 123.11] [#434877, 436298, 451148]

- The NetScaler appliance fails to respond when it receives multiple byte-range requests for the same objects at almost the same time and where the starting range of byte-range is greater than 1MB.

  [From Build 125.9] [#427598, 446526, 447867]

- When refreshing a cache object for a conditional GET to an expired object, the memory is deducted two times but is returned only once when the cache cell goes away. This causes the memory that is used for a content group to slowly increase and finally reach the maximum memory that a content group can use. The NetScaler appliance is therefore unable to cache objects for that content group.

  [From Build 125.9] [#436298]

- While revalidating cached objects, the integrated caching feature performs some incorrect accounting of the cache size. This causes the NetScaler appliance to crash.

  [From Build 127.10] [#466452, 469584, 469588, 470925]

- The output of the "stat cache -d" command displays an incorrect value for the utilized memory parameter.

  [From Build 128.8] [#427479, 463589, 482725, 502413]

- With integrated caching enabled, the NetScaler can crash when the evaluation of a callout 'result expression' (configured with the resultExpr parameter) results in a UNDEF condition.

  [From Build 129.22] [#488145]

- When you add a new server to an existing service group, the services in the group might be designated as DOWN even though monitoring probes succeed. To enable the services, unset the virtual server spillover method. They are then

correctly designated as UP.

[From Build 118.7] [#391273, 370416]

- Occasionally, when you create a new load balancing virtual server in the configuration utility, a series of error messages appear. The message indicates that the load balancing feature is not licensed, and you are unable to create the virtual server.

  Workaround: Use the NetScaler command line to create the virtual server.

  [From Build 118.7] [#387253]

- If a virtual server is UP because the service(s) are in Transition Out-Of-Service (TROFS) state, the clients do not respond due to requests being queued at the virtual server rather than at the services. Instead, the client must issue 503 or RST.

  [From Build 119.7] [#383402]

- If you change the load balancing group of a virtual server that has a large number of SSL sessions, the appliance might fail.

  [From Build 119.7] [#351870, 399978]

- If you unbind a load balancing (LB) monitor from its service, all the connections to the configured destination IP address (destip) and port (destport) of the LB monitor are closed. In a typical L3 direct server return (DSR) deployment, the destip address and destport of the LB monitor are actually the IP address and port of the virtual server. Therefore, in a typical L3 DSR deployment, if you unbind an LB monitor from its service, all the existing connections to the virtual server are closed. As a result, performance temporarily decreases. The same behavior occurs if you delete a service.

  [From Build 120.13] [#409028]

- In an interactive voice response (IVR) setup, the option selected by a user is not communicated to the server because the RTSP packet is corrupted. As a result, the user is repeatedly asked to select an option from the same list.

  [From Build 120.13] [#390545]

- Monitoring of StoreFront servers fails if they are part of a cluster and the StoreFront monitor is bound to the entire service group. The StoreFront monitor probe fails because individual members have different host names.

  Workaround: If the StoreFront servers are part of a cluster, Citrix recommends that you add them as individual services instead of as members of a service group.

  [From Build 120.13] [#398327]

- Oracle database monitor fills the console window with DONE and DEEP_FLD_LEN messages.

  This issue is observed on the MPX 9500 appliance.

  [From Build 121.10] [#417101]

- If a diameter packet is received by a diameter load balancing virtual server on which persistency is enabled, and that packet contains multiple full requests and a partial request, the NetScaler fails to recognize the partial request and sends it to the server. The result is an invalid packet being sent to the server, and the NetScaler sends a 5xxx message to the client.

[From Build 121.10] [#410711]

- If you run a custom health monitoring script that does not require an argument, the NetScaler appliance sends an incorrect timeout to the script. As a result, the script continues to run for longer than expected. After some time, the maximum limit for the number of scripts allowed on the appliance is reached and new scripts cannot be run.

  [From Build 121.10] [#409055]

- In a high availability setup, after you upgrade the secondary node and make it the new primary, the process of file synchronization from the new secondary (old primary) node to the new primary node overwrites some of the updated data on the new primary. Specifically, the new monitoring scripts delivered as part of the upgrade on the new primary node are overwritten. As a result, the monitoring scripts might fail.

  [From Build 122.17] [#417630]

- In some cases, if you configure a domain-based IPv6 service on the NetScaler appliance, the appliance might become unresponsive.

  [From Build 122.17] [#399446, 416718]

- The stat servicegroup command incorrectly displays the svrttfb (server-time-to-first-byte) value as zero.

  [From Build 122.17] [#424780]

- If the first octet of the IP address of a service has a value of 6 (6.x.x.x), and the service is bound to a virtual server that is configured for persistence, the NetScaler appliance fails when it tries to direct a request to that service.

  [From Build 122.17] [#393613, 427971, 456281]

- If a NetScaler appliance responds to a DNSSEC-enabled request from its cache, and this response is immediately followed by a response from the server to an earlier query that could not be addressed from the NetScaler cache, the appliance drops the response from the server instead of forwarding it. However, the memory associated with the response packet is not freed. As more such requests are received, the memory on the appliance is gradually exhausted.

  [From Build 122.17] [#412530]

- The NetScaler appliance might fail while processing an NX domain message if you have configured an autoscaling service group on the appliance.

  [From Build 123.11] [#402996, 405475, 407313]

- If you use NITRO to display the details of the load balancing monitors configured on a NetScaler appliance, the output for non-HTTP type monitors incorrectly displays a response code, user name, and password. These attributes are not applicable to non-HTTP type monitors.

  [From Build 123.11] [#410365]

- If you create a service of type SSL_BRIDGE and enable client IP address (CIP) on the service, the NetScaler appliance inserts an HTTP header with the client's IP address as its value. In an SSL_BRIDGE topology, you must not insert a header. With this fix, the appliance throws a warning and removes the CIP option for an SSL_BRIDGE service while saving the configuration.

  [From Build 123.11] [#438169]

- If you have configured an autoscaling service group on the NetScaler appliance, the states of some of these services are not updated, because command numbers are not updated. For example, a service state might appear as UP although the monitor has marked it as DOWN.

  [From Build 123.11] [#422821, 405467]

- If you bind a content switching (CS) policy to a CS virtual server, specify a load balancing (LB) virtual server as the target virtual server, and then view the LB virtual server details in the configuration utility, the CS virtual server bindings incorrectly appear in the cache redirection virtual server section. However, if you use the command line to view the details of the virtual server (show lb vserver), the details appear in the correct section.

  [From Build 123.11] [#406467]

- If you configure persistence on a virtual server that is configured for link load balancing, the NetScaler appliance might fail.

  [From Build 123.11] [#392542, 418698, 431925]

- The NetScaler appliance fails under the following sequence of events:

  1. An IPv6 domain based service and an IPv6 address based service are configured on the appliance.

  2. Both the services are bound to a load balancing virtual server.

  3. The domain based service is UP when the address based service enters the UP state.

  [From Build 123.11] [#429445]

- If you have configured a DNS auto-scaling service group and run the "show server <server name>" command to display the details of the server bound to this service group, the following incorrect entries appear:

  - an extra entity with an IP address 0.0.0.0

  - mode as POLICY

  - state as DOWN.

  [From Build 123.11] [#398274, 397588, 425221, 434329]

- If Edge mode is disabled, the state of the name-based service group member appears as UNKNOWN, even though the server represented by the service group member is reachable.

  [From Build 124.13] [#417872, 438960, 465030]

- In a high availability setup, if an autoscaling service group with more than 4000 members is removed, failover occurs.

  [From Build 124.13] [#407493]

- If you rename an autoscaling service group, the NetScaler appliance might fail.

  [From Build 124.13] [#421411]

- If you configure an HTTP_ECV monitor with a response string, and the response arrives in multiple packets, the NetScaler appliance might not parse the response correctly. As a result, a monitoring probe to the appliance fails and

services are marked DOWN.

[From Build 124.13] [#433324]

- If you add a new service group, the SOAP API query for the "show servicegroup" command might fail.

  [From Build 124.13] [#429538, 441186]

- If you have added a backup virtual server on release 9.x, the configuration is lost after you upgrade to release 10.1.

  [From Build 124.13] [#440406]

- If a NetScaler appliance receives a request for which a session does not already exist, the appliance creates a session and designates one of the packet engines (PEs) as the session owner. Subsequent requests that belong to that session might not always arrive at and be handled by the owner PE (for example, PE1). If such a request arrives at another PE (for example PE2), that PE (PE2) gets the information from the owner PE (PE1). Now, the cached session is present in PE2 and the owned session is present in PE1. Because of a timing issue, the information in PE1 is cleared before the cached entry in PE2. As a result, different session entries are created for the same client on PE1 and PE2 and source IP persistence might not work correctly.

  [From Build 124.13] [#420827, 434537]

- Support for Fallback to NTLM Authentication

  Currently AAA supports Kerberos authentication only with Datastream Windows Authentication. AAA does not support fallback to NTLM if Kerberos authentication fails.

  [From Build 125.9] [#382693]

- Using Canonical FQDN when Constructing Server SPN

  When performing Kerberos authentication or authorization, instead of accepting the hostname that the user provided in the request, AAA-TM now performs a DNS lookup on the hostname IP, and uses the canonical FQDN for that IP when constructing a server SPN.

  [From Build 125.9] [#441290]

- In direct server return mode, the NetScaler ADC does not send a RST flag to the client after the idle timeout has expired.

  [From Build 125.9] [#452648]

- The configuration for the NetScaler Web 2.0 Push feature is not saved in the configuration (ns.conf) file. As a result, if you run the "show running config" command, the push configuration is not shown.

  [From Build 125.9] [#451670]

- If a user tries to use a long URL (more than 1024 bytes) to access a protected resource for the first time (that is, without a valid cookie), the NetScaler ADC returns a 500 error.

  [From Build 126.12] [#456632]

- If you bind policies in one of the following orders of priority, and then run the "show running config" or the "save config" command, the command runs repeatedly:

* Syslog, nslog, syslog

* Nslog, syslog, nslog

[From Build 126.12] [#441973, 442098]

- When the primary virtual IP address is down and no backup is configured, spillover persistence fails to decrement the session allocation counter. This leads the NetScaler appliance to believe that sessions are alive and therefore reject new client requests.

  [From Build 126.12] [#454497]

- If you add a server with a name that contains an IP address and a string, and then use that server to add a service, the error message "service already exists" appears.

  [From Build 126.12] [#434925]

- In NetScaler deployments where a load balancing virtual server is deployed behind another virtual server, the count of the number of request bytes is inadvertently doubled.

  [From Build 126.12] [#369369, 252157, 438593]

- The NetScaler ADC does not set the mandatory flag in a Route-Record AVP. As a result, some diameter implementations might reject the AVP.

  [From Build 127.10] [#475980]

- In a deployment with multiple MAC-mode virtual servers, some changes in the configuration can result in a MAC-mode virtual server failing to serve traffic. Changes that can cause the problem include:

  - Disabling and enabling the interface through which the MAC of a service is learnt.

  - Removing virtual servers or clearing their configurations.

  - Changes caused by high availability failovers.

  [From Build 127.10] [#471938]

- The NetScaler ADC fails if requests requiring IP fragmentation are forwarded to a virtual server that is configured for sessionless load balancing in IP mode.

  [From Build 128.8] [#478949]

- If a client connection is in the CLOSE_WAIT state, the NetScaler ADC does not send PUSH notifications to the client. However, it reports success to the PUSH server.

  [From Build 129.22] [#489197]

- If you have configured the RADIUS PI expression CLIENT.UDP.RADIUS.ATTR_TYPE(<avp code>) for content switching, rule-based persistency, or the token load balancing method, and you typecast the result of this expression to an integer or IP address by using the expression TYPECAST_NUM_AT / TYPECAST_IP_ADDRESS_AT, the typecast operation fails.

  [From Build 129.22] [#482113]

- In a high availability setup, a failover might disconnect active connections even though stateful connection failover is enabled on the virtual servers.

  Workaround:

  Check the output of the "show rpcnode" command. If it shows an asterisk (*) for the SRCIP parameter, run the "set rpcnode <remote NSIP> -scrip <local NSIP>" command.

  [From Build 130.13] [#489400]

- If a load balancing virtual server on which persistence is configured is bound to a load balancing group that has no persistence setting, the NetScaler ADC does not change the virtual server's persistence setting. As a result, when traffic arrives at the virtual server, it tries to create a persistence session, but that session fails and the number of sessions increases.

  Workaround: Run the "set lb group ?persistenceType" command to reset the persistence on the virtual servers that are bound to the group.

  [From Build 130.13] [#497470]

- If a semantically incorrect command is entered while a domain based service is being resolved to a NetScaler-owned IP address, the NetScaler ADC displays the state of the service incorrectly.

  [From Build 130.13] [#502338]

- A very slow memory leak occurs on the secondary node in a high availability pair if all of the following conditions are met:

  a) The configuration is large (approximately 4MB).

  b) The configuration includes a large number of "bind lb group" commands.

  c) Configuration changes very frequently, resulting in frequent synchronization.

  [From Build 130.13] [#457639]

- You can now bind loopback members (for example 127.0.0.1) to service groups. Previously, you could bind loopback members to services only.

  [From Build 130.13] [#504209]

- Load Balancing

  The NetScaler ADC might fail after you rename a server that is bound to a service group. This problem does not occur if you assign a name to a server that was previously identified by its IP address.

  [From Build 131.11] [#443027]

- The NetScaler ADC might fail if a high idle timeout value is set on a TFTP load balancing virtual server and the ADC runs out of memory.

  [From Build 131.11] [#505543]

- Load Balancing

If your spillover policy contains the ACTIVETRANSACTIONS or the SURGECOUNT expression (for example, <expression>. ACTIVETRANSACTIONS.GT(<N>)), traffic might spill over to the virtual server bound to this policy even though the current value of the counter has not reached N. This is because these two expressions use an arbitrary number for comparison.

For example, spillover to a virtual server bound to the following policy might occur before the active transactions counter reaches a value of 10:

SYS.VSERVER("A').ACTIVETRANSACTION.GT(10) -action spillover

[From Build 131.11] [#516615]

- The SIP monitor probe has an invalid character in the VIA header. As a result, the probe fails and an incorrect service state might appear.

  [From Build 131.11] [#519644]

- Unsetting one of the load balancing virtual server parameters, such as redirect URL, backup virtual server, push virtual server, or authentication profile, incorrectly unsets the appflowLog parameter.

  [From Build 132.8] [#523239]

- A NetScaler appliance that has AAA-TM configured for authentication with a RADIUS Server might intermittently generate "HTTP/1.1 Internal Server Error 6" error messages.

  [From Build 118.7] [#391105, 457607]

- If you attempt to create a KCD service account on a NetScaler appliance or virtual appliance that has AAA-TM enabled and integrated caching disabled, a buffer overflow might load the appliance or cause it to fail.

  [From Build 119.7] [#402472, 397716, 403737, 404942, 465004, 474112]

- On a NetScaler appliance with AAA enabled and configured, a user whose account is bound to over 100 groups might be unable to execute NetScaler commands at the command line despite having the appropriate permissions to do so. To work around this issue, do not bind a single user account to more than 99 groups.

  [From Build 122.17] [#431206]

- On a NetScaler SDX with AAA and SAML enabled and configured, occasionally the NetScaler appliance crashes and generates a core dump during SAML authentication.

  [From Build 122.17] [#426421, 431795, 436267]

- On a NetScaler appliance that has the load balancing and AAA-TM features enabled, a request that contains an extraneous space in the URL might cause the appliance to crash. This issue occurs only with unauthenticated connections; the appliance processes the same request correctly over authenticated connections.

  [From Build 123.11] [#437407]

- On a NetScaler appliance that has the load balancing and AAA-TM features enabled, and that protects an application that uses 401 Basic authentication, if a client authenticates with a browser that does not support cookies, the

appliance might experience repeated crashes or (for HA setups) repeated failovers. The cause is that the appliance does not receive the expected traffic management cookie, fails to reconnect to the existing session, and instead creates a new sesson each time the client connects to a protected resource. If a large number of authentication requests is sent within a short period of time, the abandoned sessions do not expire quickly enough and can therefore consume available memory.

Workaround: You can either require clients to connect with browsers that support cookies, or reduce the session timeout to a very short interval so that sessions expire quickly.

[From Build 123.11] [#431917]

- If two NetScaler appliances in a high-availability configuration have TCPB mode enabled globally, and you create a DNS TCP service, the service might be successfully created on the primary NetScaler appliance but fail on the secondary appliance.

  [From Build 118.7] [#376173]

- On a NetScaler appliance or VPX virtual appliance that is configured for load balancing in an environment that includes a Microsoft SQL server database, if a client sends a large number of long queries to the MSSQL database, the appliance might become unresponsive or fail.

  [From Build 119.7] [#401118]

- On a NetScaler MPX15000 appliance that has the load balancing and responder features enabled, and has a load balancing policy that includes both the SYS.CHECK_LIMIT and HTTP.REQ.BODY statements, a complex cascade of events might cause the appliance to restart repeatedly. To work around this issue, you can either rewrite the configuration to separate the SYS.CHECK_LIMIT and HTTP.REQ.BODY statements into two separate policies, or operate the NetScaler appliance on a single core.

  [From Build 124.13] [#432790]

- MPTCP transactions of a TCP profile with Selective ACKnowledgement and window scaling might not respond.

  [From Build 120.13] [#401105]

- The NetScaler appliance might not respond when TCP buffering and MPTCP is enabled.

  [From Build 120.13] [#399938]

- The NetScaler appliance does not respond when using client IP insertion with MPTCP.

  [From Build 120.13] [#400888]

- Syncookie cannot be disabled on a TCP profile that has MPTCP enabled.

  [From Build 120.13] [#399708]

- The NetScaler appliances does not acknowledge the subflow FIN when it comes with the MPTCP DATA_FIN.

  [From Build 121.10] [#409426]

- While using MPTCP, the NetScaler appliance cannot adequately handle overlapping data sequence maps.

  [From Build 121.10] [#412833]

- While using MPTCP, the NetScaler appliance crashes when trying to free an already freed TCP session.

  [From Build 121.10] [#419184]

- The NetScaler appliance must not send MPTCP control signals such as DATA_FIN or FAST_CLOSE when the NetScaler has already sent a subflow FIN.

  [From Build 121.10] [#414182]

- MPTCP does not support IPv6 addresses.

  [From Build 121.10] [#401793]

- Virtual servers to which a listen policy is bound accept connections from the first subflow only.

  [From Build 122.17] [#400861]

- MPTCP does not support FTP data connections.

  [From Build 122.17] [#400819]

- With USIP enabled, MPTCP requests do not go through.

  [From Build 122.17] [#331338]

- Multiple spillover persistence sessions are created for a single MPTCP transaction.

  [From Build 122.17] [#400875]

- If you bind monitors to services, and then bind a DoS or SureConnect policy to one of those services, save the configuration, and restart the appliance, you lose information about monitors bound to any services created after the service to which you bound the policy was created. Also, if you run the "show ns runningConfig" command before restarting the appliance, the monitor binding information does not appear.

  [From Build 120.13] [#406391]

- A monitor of type CiTRIX-wi-EXTENDED fails if the script name and site path arguments are not explicitly set.

  Workaround:

  1. Create a monitor of type CiTRIX-wi-EXTENDED.

  2. Set the script name.

  3. Set the site path.

For example,

> add monitor wi-mon CiTRIX-wi-EXTENDED -userName administrator -password freebsd -domain xendt -sitePath "/Citrix/XenApp"

> set monitor wi-mon CiTRIX-wi-EXTENDED -scriptname "nswi.pl"

> set monitor wi-mon CiTRIX-wi-EXTENDED -sitePath "/Citrix/XenApp"

[From Build 121.10] [#383812]

- If you bind an FTP user monitor to an IPv6 service, the state of the service is shown as DOWN.

  [From Build 123.11] [#369946]

- Transparent monitors are now combined with the functionality of an ARP monitor. This avoids the need to bind a separate monitor to incorporate reachability as part of the health status. Without an ARP monitor, UP services could not transition to DOWN when the next hop failed.

  [From Build 124.13] [#301570]

- For a service that is bound to a service group, NITRO cannot obtain the state of the service monitor.

  [From Build 123.11] [#424553, 302231, 386570]

- When importing an AppExpert template that has back end services configured, the NetScaler ADC reports a protocol mismatch error even if other service parameters (service name, IP address and port) are not the same.

  [From Build 125.9] [#444986]

- When AppFlow is enabled on a NetScaler, the following query, which requests console messages from nsconmsg tool, results in httpd core dump due to large buffer length.

  http://<NSIP>/nitro/v1/config/clioutput?
  args=command:"shell+nsconmsg+%2DK+%2Fvar%2Fnslog%2Fnewnslog+%2Dd+consmsg"

  [From Build 130.13] [#507594]

- On a NetScaler appliance that has AAA configured with SSL certificate set to "optional" and at least one authentication policy, when Android users attempt to authenticate, the Android Receiver client generates the following error: "invalid server certificate". This error is caused by improper cookie handling by the Android Receiver client.

  [From Build 121.10] [#418200]

- Devices running Windows cannot connect if the NetScaler Gateway virtual server is configured with either TLS 1.1 or TLS 1.2 or both.

  [From Build 125.9] [#445485]

- When users log on, preauthenication might not synchronize between processes. When this occurs, NetScaler Gateway

fails.

[From Build 127.10] [#440623]

- If proxy settings are configured on the user device and the NetScaler Gateway URL is in the proxy bypass list, users cannot establish a VPN connection with the NetScaler Gateway Plug-in for Windows

  [From Build 127.10] [#456179, 462881, 466862]

- If you configure the Green Bubble theme and if users do not meet the domain requirements when changing their passwords, users do not receive an error message. Instead, the logon page appears. With this fix, the error message appears to users.

  [From Build 127.10] [#474027]

- If a configuration change occurs while being referred in the processing engine, NetScaler Gateway fails.

  [From Build 127.10] [#460997, 477547]

- If users connect to a domain-based server by using clientless access, NetScaler Gateway fails occasionally.

  [From Build 127.10] [#412237]

- When users log on with clientless access and then open the Access Interface, the order of files that appear in Personal File Shares differs from the order of files on the file share server.

  [From Build 128.8] [#461225]

- If you disable authentication on NetScaler Gateway, endpoint analysis scan can occasionally be bypassed.

  [From Build 128.8] [#470059]

- If the Domain Name Server (DNS) configuration is not available, users receive an "Internal error 500" message after successfully logging on to NetScaler Gateway.

  [From Build 128.8] [#464956, 470873, 471478, 474012]

- If you bind SAML and LDAP authentication polices to the virtual server for two-factor authentication, after authenticating with SAML which is primary authentication type the LDAP user name populates automatically. If the first logon attempt to LDAP fails, user names are case-sensitive and must be entered again exactly as it appears after SAML authentication. For example, if the user name is populated as JohnDoe@xyzz.com and the user types johndoe@xyzz.com during the subsequent attempt, log on fails.

  [From Build 128.8] [#463871]

- On a multi-core appliance, if session propagation to one core fails, NetScaler Gateway fails.

  [From Build 128.8] [#485042]

- Attempts to connect to the NetScaler Gateway from a Windows-based computer fails with the error 1008 when Transport Security Layer (TLS) block ciphers are configured and TLS 1.2 is enabled on NetScaler Gateway.

  [From Build 128.8] [#468145, 473867]

- When users upgrade the NetScaler Gateway Plug-in from Version 10.1.122.17 or later to the latest Version 10.1 Maintenance Release on a computer that includes an installation of Citrix Receiver, the automatic upgrade fails.

  [From Build 128.8] [#461279]

- If you configure load balancing virtual servers and the Secure Ticket Authority (STA) with the same fully qualified domain name (FQDN), attempts to bind the STA to the NetScaler Gateway virtual server fail.

  [From Build 128.8] [#374296]

- If the authentication server is extremely slow to respond, such as 15-30 seconds or more, this can cause delays with users logging on successfully, even if the amount of simultaneous connections is low.

  [From Build 129.22] [#489343]

- If user names contain a period (.) that have a common prefix before the period, NetScaler Gateway creates cache files based on the prefix. When this occurs, tickets for one user are sent to a different user.

  [From Build 129.22] [#494463]

- In a high availability deployment, if the NetScaler Gateway virtual server is missing on the secondary appliance, NetScaler Gateway fails during session propagation.

  [From Build 129.22] [#481889, 486176, 501408]

- The endpoint analysis scan fails when users log on by using Internet Explorer 11.

  [From Build 129.22] [#417481, 423915, 496637]

- Upgrading to Maintenance Build 122.11 changes the rewrite policy for HTTP.REQ.USER.NAME. This change retrieves the single sign-on name attribute instead of the server logon name.

  [From Build 129.22] [#495610]

- When there are a very large number of simultaneous user authentication requests and the authentication server is slow to respond, Netscaler Gateway can fail.

  [From Build 129.22] [#488182, 489345, 493939]

- When there are a very large number of simultaneous user authentication requests and the authentication server is slow to respond, Netscaler Gateway can fail.

  [From Build 129.22] [#484431, 488182]

- If Kerberos uses x.509 certificates (PKINIT) for single sign-on, NetScaler Gateway fails to obtain tickets if the Key Distribution Center (KDC) returns a realm referral. This can cause the NetScaler Gateway appliance to fail.

  [From Build 129.22] [#484245]

- If users connect to a web resource over Secure Browse and a proxy server resides behind NetScaler Gateway, single sign-on fails. Single sign-on is successful to either the web resource or the proxy server, but not both at the same time.

  [From Build 129.22] [#470013, 480556]

- If the maximum number of users is set to a number greater than 5 on a NetScaler Gateway virtual server, if you remove the Universal license, the virtual server configuration is also removed.

  [From Build 129.22] [#447452, 486009]

- If you configure SAML authentication with signed SAML assertions, if the user connection disconnects before the SAML response is normalized, NetScaler Gateway fails.

  [From Build 129.22] [#489609]

- In a high availability deployment, when users log on with SAML authentication, the secondary appliance fails over.

  [From Build 129.22] [#490075, 485042]

- If you configure endpoint analysis policies, if the session times out and users do not close the web browser, they cannot log on again.

  [From Build 129.22] [#459149]

- If users connect with the NetScaler Gateway Plug-in for Windows and then attempt to receive a call through a softphone, the call fails.

  [From Build 130.13] [#498679]

- When user connects to a multi-core NetScaler Gateway running out of memory during inter-core communication, NetScaler Gateway fails.

  [From Build 130.13] [#513385]

- When users connect from a web browser and enter their SAML credentials, NetScaler Gateway fails. This occurs when you configure pre-authentication policies and two-factor authentication policies with SAML and LDAP with SAML as the primary authentication type and having a higher priority.

  [From Build 130.13] [#506689]

- On nCore systems, when pre-authentication policies are configured or when an admin session timeout elapses, a core dump may occur when the NetScaler Gateway cleans up the session.

  [From Build 130.13] [#523321, 534178]

- When the Endpoint Analysis is configured, the users are redirected to index.html. Otherwise, a session is created for any arbitrary URL if the authentication is disabled on the NetScaler Gateway.

  [From Build 130.13] [#516257]

- In a double-hop DMZ deployment, if the Receiver connection closes and the connection to XenApp or XenDesktop is in progress, the appliance might fail.

  [From Build 130.13] [#508831]

- When pre-auth is configured on ncore systems, or when Session timeout kicks in, the NetScaler Gateway may fail while cleaning up the session.

  [From Build 130.13] [#528011, 527990]

- When users log on with the NetScaler Gateway Plug-in for Windows, attempts to access internal network resources fail from Windows Metro applications, such as Internet Explorer Metro Mode. This occurs when you configure address pools (intranet IP addresses).

  [From Build 130.13] [#505029]

- Responder or URL transform policies that are bound to the Content Switching virtual server are not applied to connection requests that come through NetScaler Gateway.

  [From Build 130.13] [#495867]

- When ActiveSync clients connect to NetScaler Gateway with "Basic authorization", Gateway fails if credentials in the basic authorization header are invalid.

  ActiveSync clients are supported only with AAA-TM servers on Netscaler.

  Note: This fix was provided in Build 120.x of NetScaler 10.1. However, it missed being included in the release notes of that build.

  [From Build 130.13] [#405138, 405517, 408689, 424539, 429017, 429477, 431645]

- Netscaler Gateway might fail on nCore systems if End Point Analysis is configured or if the configured Session Timeout kicks in.

  [From Build 130.13] [#527990]

- If users do not have administrative rights, the Endpoint Analysis Plug-in installation fails.

  [From Build 130.13] [#506686]

- When users log on with the NetScaler Gateway Plug-in, if the users TCP connection closes and the connection to the internal network through NetScaler Gateway is in progress, the appliance might fail.

  [From Build 130.13] [#500207, 508831]

- If ICA proxy is set to On and you configure authorization policies, when users attempt to connect, NetScaler Gateway modifies the host header to the FQDN of the Web Interface or StoreFront server. When this occurs, user log on fails with the message "Error: Not a priviledged user."

  [From Build 130.13] [#501369, 500311]

- The NetScaler Gateway appliance fails during the device certificate check if AppController is configured on the virtual server.

  [From Build 131.11] [#511805, 532549]

- The NetScaler GUI blocks the creation of a Session Action with a "forced time out" value greater than 255 (256 - 65535). The acceptable range for the "forced time-out" property was increased to 65535 at the back-end, but the GUI does not reflect the same.

  [From Build 131.11] [#535530]

- When a user logs on with the NetScaler Gateway Plug-in, if a Domain Name System (DNS) suffix is configured on the

user device, resolution fails. This occurs if a DNS server is not configured and all of the following are configured on the NetScaler Gateway appliance:

- Authoritative DNS

- DNS address record configured with the host name only

- DNS Suffix

[From Build 131.11] [#459311]

- If the NetScaler Gateway virtual server is behind a proxy server and its fully qualified domain name (FQDN) is not resolvable by the local DNS server, endpoint analysis fails and a "failed sending epaq" error message appears.

  [From Build 131.11] [#522700, 531535]

- In MPX devices, there can be a delay delivering UDP packets from the server to the client in full tunnel mode.

  [From Build 131.11] [#503811]

- Remote users who use the Windows full client/plugin to access Netscaler Gateway can encounter an issue if the Internet Explorer browser has "Automatic Configuration Script" settings configured for Proxy, and the automatic configuration script file is unreachable from the user device at the time of Gateway session establishment. In this scenario, the Windows plugin incorrectly connects to the Proxy server configured in the Manual Settings and fails to establish the session. The expected correct behavior in this situation would be to bypass the proxy and connect to NetScaler Gateway directly.

  Users are affected only if:

  1. They use Windows full client for establishing the gateway session

  AND

  2. They have both Automatic Configuration script and Manual configuration for Proxy in their Internet Explorer settings

  AND

  3. The configured Automatic Proxy script file happens to be unreachable from the user's device (for example the Automatic Proxy script file address is an internal address and not reachable remotely).

  [From Build 131.11] [#531520]

- In a high-availabiltity (HA) configuration, the secondary appliance may fail occasionally due to a duplicate free-attempt of a AAA context.

  [From Build 131.11] [#531956, 538937]

- Java Runtime Environment (JRE) version 7, update 51 or later, displays a security warning when NetScaler Gateway for Java is launched. In some cases, JRE blocks the launch.

  [From Build 131.11] [#491076, 535339]

- If existing AAA sessions exist on a Secondary Netscaler after failover with no associated vpn vservers, then the secondary Netscaler can fail during session sync from Primary.

[From Build 131.11] [#529205]

- If a user installs Microsoft Security Bulletin MS14-080 (KB3025390) for Internet Explorer 11, then uses the IE 11 browser to log on to a NetScaler Gateway virtual IP with endpoint analysis, either as pre-authentication or post-authentication check, the endpoint analysis fails and a Download or Skip Check button appears in the browser.

  [From Build 131.11] [#527757]

- The NetScaler appliance crashes under the following conditions:

  - An external service is added with the same IP address as wihome

  - There are existing AAA sessions

  - The IP address of this external service is changed and later removed

  The crash happens when a user logs in and launches an app. This is because the http request, which needs to be forwarded to Web Interface/Storefront, accesses the stale server information resulting in the crash.

  [From Build 132.8] [#529296, 540736]

- Memory is increasing gradually every week by some 1-2% . The Customer started observing this issue after upgrade to 10.1 126.12nc. A memory leak of MEM_SSLVPN module is suspected based on the observation.

  [From Build 132.8] [#512356]

- In order to fix this issue, we unbound the cache policy through the XA/XD wizard. The builds that implemented this fix will not bind to the cache policy in the configuration flow.

  But if the box is upgraded from an older build where the cache policy is bounded, it will continue and the removal of that policy is done manually.

  [From Build 132.8] [#545422, 550597]

- If the Authorization Group field (in NetScaler Gateway > Global Settings > Change global settings) is left empty, the NetScaler appliance throws the "String too short" error.

  [From Build 132.8] [#538804]

- The rba module crashes when rba users send incorrect remote addr data. Sanity checks for remote addrlen were added to prevent failure.

  [From Build 132.8] [#539286]

- OS X Yosemite users connecting to VPX NetScaler Gateway will not be able to access internal UDP or ICMP resources. This would not occur with the MPX NetScaler appliance.

  [From Build 132.8] [#538446]

- Applications that use UDP (User Datagram Protocol) or ICMP (Internet Control Message Protocol) on Mac OS X Yosemite (10.10) such as the ones using audio or video streaming, may be unreliable.

  [From Build 132.8] [#515013, 512064, 538446]

- If the HTTP CONNECT request is received on the existing connection to a NetScaler Gateway virtual server for a non-owner core before the session is fully authenticated and established, the NetScaler Gateway may fail.

  [From Build 132.8] [#534326]

- After the VPN tunnel is established, external websites fail to load intermittently under the following conditions:

  - If enable_vpn_dnstruncate_fix nsapimgr flag is set on NetScaler.

  - DNS servers on NetScaler are configured to send negative DNS response for external DNS query.

  - Split DNS is set to both

  [From Build 132.8] [#524028]

- HDX Insight

  The graph is not plotted for user applications. This issue is observed on navigating to "Dashboard > HDX Insight > Users > <username> > <SessionID> > Applications > More" button.

  [From Build 118.7] [#386543]

- HDX Insight

  In the Dashboard > HDX Insight > Applications page, the "Total Session Launch count" displays an incorrect number of sessions launched.

  [From Build 118.7] [#381522]

- Load balancing, content switching or VPN applications that have a space characters in the name cannot be enabled.

  [From Build 118.7] [#392515]

- Web Insight

  In Configuration > Inventory > Application List page, the value of number of applications displayed and total number of applications can be incorrect.

  [From Build 118.7] [#378044]

- NetScaler Insight Center appliance fails to respond.

  [From Build 118.7] [#377737, 369685]

- HDX Insight

  The graph is incorrectly plotted for user applications. This issue is observed on navigating to "Dashboard > HDX Insight > Users > <username> > <sessionID> > Applications > More > <application name>.

  [From Build 118.7] [#385895]

- The HDX Insight node appears even when all NetScaler appliances have only standard licenses. The node must be visible only when a minimum of one appliance has an enterprise or platinum license.

[From Build 118.7] [#391336]

- HDX Insight

  If you uncheck the ICA check-box and save, you will see Appflow enabled but no reports or data will show.

  [From Build 118.7] [#388453]

- HDX Insight

  The introduction displayed when you log in to a new NetScaler Insight Center appliance provides only Web Insight information. It does not provide information related to HDX Insight.

  [From Build 118.7] [#387257]

- HDX Insight

  The text that is displayed on clicking the orange icon besides a metric does not accurately describe the licensing issue.

  Workaround: Click the "Learn More" button to get more information on the issue.

  [From Build 118.7] [#388093]

- Web Insight

  The "Page analysis" button is misplaced and not functional on the Dashboard > Web Insight > URL page.

  [From Build 118.7] [#378652]

- HDX Insight

  You cannot enable Appflow on a VPN application for which you have specified an expression from the drop-down list.

  Workaround: The expression for the VPN application must be manually specified as TRUE.

  [From Build 118.7] [#391477]

- Web Insight

  In the Dashboard tab, in some instances, the breadcrumb navigation does not display any text for labels.

  [From Build 118.7] [#390581]

- The HDX Insight node is not displayed for Enterprise licenses of NetScaler appliances.

  [From Build 119.7] [#400665, 405611]

- During an ICA session, the NetScaler appliance fails to respond when you access it's invalid memory space.

  [From Build 119.7] [#405177]

- During an ICA session, the NetScaler appliance fails to respond due to a NULL pointer access.

  [From Build 119.7] [#403134, 403195, 404097, 405013, 408650]

- The load time and render time metrics are not displayed for standard or enterprise licenses of NetScaler appliances.

[From Build 119.7] [#400900]

- The help page on the Graphical User Interface (GUI) displays incorrect information for enabling data collection.

  Workaround: To view the details, click the help icon on the GUI and when the help page opens, click on the TOC tab and navigate to NetScaler Insight Center 10.1 > Enabling Data Collection.

  [From Build 119.7] [#400545]

- Unable to add the IP address in the inventory which contains the number 255 in any quadrant.

  [From Build 119.7] [#332854]

- During installation of a virtual NetScaler Insight Center on VMware ESX, NetScaler Insight allocates only 14 GB of space in the var directory, even though the OVF file specifies 120 GB.

  [From Build 120.13] [#408495, 410708]

- HDX Insight does not support XenApp versions earlier than 6.5.

  [From Build 120.13] [#414844]

- If the memory usage on the NetScaler Insight Center appliance reaches the maximum limit, the appliance fails to respond to further memory-allocation requests by other modules and becomes unresponsive.

  [From Build 120.13] [#402458]

- On the "Dashboard > Users" page, ICA RTT values displayed on the graph in the left panel do not match the values displayed below the graph, or there is a delay in the updating the values.

  [From Build 120.13] [#405818]

- In certain situations, the NetScaler appliance incorrectly interprets the compression buffer size negotiation between the client and the server, and enabling Appflow on the ICA connection causes the appliance to fail when the connection is used to launch an application or desktop. This problem most commonly occurs when a CloudBridge appliance or any WAN optimization device is placed between the client and the NetScaler appliance.

  [From Build 120.13] [#402959, 413016, 413657, 414382, 419571]

- On the Dashboard > HDX Insight > Users page, the report for user sessions displays incorrect values. The left pane displays the average values for the entire session, but, the right pane displays the values for the period selected from the drop-down list.

  [From Build 120.13] [#397236]

- If a CloudBridge appliance is placed between the client and a NetScaler appliance, and AppFlow is enabled for ICA traffic, the XenApp/XenDesktop applications fail to launch and the NetScaler appliance fails.

  [From Build 120.13] [#415812]

- The Active App count in the left pane of the User Details page is not updated instantly.

  Workaround: The correct value is displayed on the Application Details page.

[From Build 120.13] [#395022]

- In a mixed XenApp/XenDesktop server farm, if the XenApp and XenDesktop versions are older than 6.5 and 5.0 respectively, the applications fail to launch because the NetScaler appliance incorrectly parses the ICA packets.

  [From Build 120.13] [#411107]

- For an Active session, data is sent to the AppFlow collector even if the policy rule is changed to FALSE when the session is active.

  Workaround: Start the session again.

  [From Build 120.13] [#369664]

- NetScaler appliance may fail to respond when AppFlow is enabled on the NetScaler Insight Center and the user tries to access the XenApp/XenDesktop farm.

  [From Build 120.13] [#413016]

- In some situations, the NetScaler appliance fails after parsing ICA traffic incorrectly.

  [From Build 120.13] [#413657]

- If you have installed NetScaler Insight Center virtual appliance on ESX, then the console may display watchdog timeout errors or the Graphical User Interface (GUI) may freeze sometimes.

  [From Build 120.13] [#402727, 406388]

- When you enable HDX Insight on a VPN server and try to launch an application from the XenApp server, the NetScaler appliance might fail as it copies the data to an invalid memory location.

  [From Build 121.10] [#423840, 426203]

- NetScaler appliance might fail if AppFlow is enabled and the user tries to access a XenApp/Xendesktop farm under certain network conditions that result in split data packets.

  [From Build 121.10] [#414137, 410495]

- In some cases, NetScaler Insight Center reports incorrect values for XenApp launch count.

  [From Build 121.10] [#416889]

- On the "Dashboard > HDX Insight > Users" page, the report for a specific user does not display data for the Total Application Launch count.

  [From Build 122.17] [#398844]

- Even when Appflow is disabled for a virtual server, you can still clear the configurations on the NetScaler Insight Center by selecting the "Clear AppFlow Configurations" from the "Action" list.

  [From Build 122.17] [#399329]

- If the values for certain metrics are zero, the graphs display these values incorrectly.

  [From Build 122.17] [#403665]

- The "Total App Launch Count" is not displayed when you navigate to "Dashboard > HDX Insight > Gateways" and display the summary for a particular user.

  [From Build 122.17] [#394613]

- The WAN jitter and DC jitter values are not displayed in the NetScaler Insight Center reports.

  [From Build 123.11] [#412129]

- On the dashboard, the table that appears when you navigate to "HDX Insight > Gateways" might display a blank desktop name.

  [From Build 123.11] [#424610]

- NetScaler entity names are case insensitive, but NetScaler Insight Center expects the virtual server names or policy names to be case sensitive.

  [From Build 123.11] [#405849]

- In certain scenarios, if data sent from the XenApp server to the client receiver is delayed because of network congestion or increased network latency, the client re-transmits the ICA magic string, which causes the NetScaler Gateway to fail. This failure happens because the NetScaler Gateway was not expecting two packets containing the magic string.

  [From Build 123.11] [#437475, 441040, 454436, 456445, 459454, 459455, 465311]

- After the NetScaler upgrade or downgrade operation, NetScaler Insight Center does not report any data on the dashboard.

  [From Build 123.11] [#405936]

- On the "Dashboard > HDX Insight > Users" page, the line-graph plots might not add up to the summary shown to the left of the line graph for average bandwidth.

  [From Build 123.11] [#397258]

- In certain scenarios, if data sent from the XenApp server to the client receiver is delayed because of network congestion or increased network latency, the client re-transmits the ICA magic string, which causes the NetScaler Gateway to fail. This failure happens because the NetScaler Gateway was not expecting two packets containing the magic string.

  [From Build 123.11] [#439088]

- If you add a NetScaler appliance to a NetScaler Insight Center setup while ICA sessions are enabled, NetScaler Insight Center does not report the existing ICA sessions. It reports only the ICA sessions initiated after the appliance is added.

  [From Build 123.11] [#417415, 421148]

- The HDX Insight dashboard displays the host delay as server side server-side NetScaler delay.

  [From Build 123.11] [#439992]

- If you move columns and refresh the page, the column ordering is sometimes reset to default.

  [From Build 124.13] [#414155]

- After you enable appflow on some virtual servers, even though no error message appears, the Insight column does not display a check box indicating that the feature is enabled.

  Workaround: Refresh the screen. If appflow is enabled, the check box in the Insight column is selected.

  [From Build 124.13] [#346171, 333555]

- If a NetScaler ADC is deployed in transparent mode for HDX Insight, Citrix Receiver fails to launch the applications or desktops if the appflow policy is not bound to a global bind point.

  [From Build 126.12] [#452989]

- If a NetScaler ADC is deployed in transparent mode for HDX Insight, Citrix Receiver fails to launch the applications or desktops if use source IP (USIP) is enabled and use subnet IP (USNIP) is disabled.

  [From Build 126.12] [#451609]

- The report for desktop session count also includes the count of XenApp sessions, which are launched by the user.

  [From Build 126.12] [#409885]

- On the Dashboard > Web Insight > Applications page, the report for a specific application does not display the client type and client version details.

  [From Build 126.12] [#456449]

- On an HTTP virtual server, after you enable AppFlow by selecting the expression TRUE and the "HTML Injection" box, if you change the policy expression and disable HTML injection, the rewrite and responder policies are still bound to the load balancing virtual server.

  [From Build 126.12] [#401514]

- On the dashboard, HDX Insight reports do not display the active sessions and also displays an incorrect value for session launch count.

  [From Build 126.12] [#453764]

- On the dashboard, when you navigate to Web Insight > Devices > (device record) and click on HTTP Request Methods, HTTP Response Status, Operating Systems, or User Agents, and then from the bread crumb navigation click Application from the respective drop down list, the graph does not display any details.

  [From Build 127.10] [#450474]

- A memory corruption issue causes a NetScaler ADC with AppFlow for ICA enabled to fail.

  [From Build 128.8] [#459668]

- If you enable AppFlow for ICA traffic on a NetScaler ADC, the NetScaler ADC might fail because of an internal memory re-use and dependency issue.

  [From Build 128.8] [#482748]

- If you enable and then disable AppFlow on a NetScaler ADC, the ADC fails while sending the ICA AppFlow records.

[From Build 128.8] [#474159, 475853]

- A NetScaler ADC fails when it receives ICA traffic from metro receiver client.

  [From Build 129.22] [#475981, 477602, 482413, 485138]

- If you enable AppFlow for ICA traffic on a NetScaler ADC, and if there is a large number of sessions, the ADC might fail because of an internal memory re-use and dependency issue.

  [From Build 129.22] [#486792]

- A NetScaler ADC fails when it receives ICA traffic from metro receiver client.

  [From Build 129.22] [#482413, 492160]

- The NetScaler ADCs being monitored by NetScaler Insight Center might fail if, while ICA sessions are active, you enable AppFlow for ICA and then either clear the configuration or disable and re-enable AppFlow on NetScaler Insight Center.

  [From Build 130.13] [#505985, 507879, 507882]

- The NetScaler ADC might fail if you enable AppFlow for ICA and access XenApp or XenDesktop through the Windows Receiver client.

  [From Build 130.13] [#490680]

- You cannot install an SSL certificate on a NetScaler Insight Center virtual appliance.

  [From Build 131.11] [#541712]

- /var/mps/system_health directory is not created for Insight Center. Because of this the techsupport files are not created for Insight Center.

  Workaround: You can manually create the system_health directory after which the techsupport would work as intended.

  [From Build 132.8] [#494666]

- If the /var/mps/policy/mps_policy_backup.xml file is empty or corrupted, the appliance performs a core dump and the Management Service user interface is blank.

  [From Build 118.7] [#385037]

- If you create a static channel, you cannot use the Management Service to remove more than one member interface at a time from the channel.

  [From Build 119.7] [#400607]

- If you modify a NetScaler instance from the Management Service, binding 1/x and 10/x interfaces to an L2 VLAN fails.

  Workaround: Provision the NetScaler instance again.

  [From Build 119.7] [#400409]

- The SVM restore operation of NetScaler instances fail as the SVM shuts down the NetScaler instances that are still being provisioned.

  [From Build 120.13] [#405921]

- If you use the Management Service to delete a channel on which an L2 VLAN was created, the L2 VLAN setting on the NetScaler instance is not cleared. Therefore, the channel continues to be listed on the "VLAN Settings" page of NetScaler instance "Modify NetScaler Wizard".

  [From Build 120.13] [#399972]

- If, when provisioning or modifying a NetScaler instance, you configure an L2 VLAN on a channel that was created by using the Management Service, the configuration fails.

  [From Build 120.13] [#400502]

- After the SDX appliance restarts, NetScaler VPX instances on the appliance cannot send packets tagged with VLAN IDs through an LACP channel.

  [From Build 120.13] [#410416, 444395]

- SSL certificate installation on a NetScaler instance from the SDX Management Service fails during validation if the SSL certificate does not have an associated key file.

  [From Build 120.13] [#405115]

- When you display the running configuration of a NetScaler instance in the Service Management interface, the double quotation marks (") are replaced with HTML code (;quot&).

  [From Build 121.10] [#413123]

- The format of the APPFW CSRF TAG syslog message is not in the expected format. As a result, Command Center displays incorrect values, under AppFirewall Recent Logs, in some fields for this type of AppFirewall syslog message.

  [From Build 122.17] [#414851]

- The SNMP responses are not as specified by the RFC 4001.

  [From Build 122.17] [#420630]

- If a NetScaler instance is created with a Management VLAN using the 0/1 or 0/2 interface, the guest VMs fail to start after provisioning, because the guest VMs use the VLAN networks instead of physical network while assigning the interface.

  Workaround:

  1.Remove the NetScaler instances whose management ports are in tagged VLAN.

  2. Logon to the XenServer shell prompt and remove all the VLAN networks.

  [root@netscaler-sdx ~]# xe vlan-list

  uuid (RO) : bd0dc3b4-2f9f-4db4-0b2d-c1b891a8caf9

tagged-PIF (RO): 2b62ede6-de58-92b1-a2fa-46cd93dd8268

untagged-PIF (RO): 6ff1bd03-2acc-c035-1f7e-ad57952558d3tag (RO): 100

[root@netscaler-sdx ~]# xe vlan-destroy uuid=bd0dc3b4-2f9f-4db4-0b2d-c1b891a8caf9

3. Create the guest VM instances first, and then create the NetScaler instances.

[From Build 122.17] [#424588]

- If you create a channel on interfaces 0/1 and 0/2 by using the Management Service, and then provision a third-party instance and configure the management network for that instance on the newly created channel, the third-party instance is not reachable on the network.

  [From Build 122.17] [#400651]

- When viewing the built-in or custom reports on the Reporting tab on a NetScaler VPX instance running on the NetScaler SDX 17550/19550/20550/21550 platform, the following message appears: NO DATA TO CHART.

  [From Build 123.11] [#262505, 408110]

- A NetScaler SDX appliance intermittently stops processing traffic on interfaces that are part of an LACP link aggregation interface that is transmitting a small amount of traffic.

  [From Build 123.11] [#434738, 446641]

- Even after you configure a short message service (SMS) server, you do not receive an SMS message when an alert is generated.

  [From Build 123.11] [#430449]

- Deletion of a management channel from the Management Service might not always succeed.

  Workaround: Try deleting the management channel again from Management Service.

  [From Build 123.11] [#433054]

- If a management channel exists on a NetScaler instance, you cannot trace the route of a packet from the Management Service to a NetScaler instance.

  [From Build 123.11] [#431243]

- If you create an LACP channel with more than 8 member interfaces, or a static channel with more that 16 member interfaces, the following error message appears: "Channel Interface String Length: 185 is greater than maximum allowed length:128".

  [From Build 123.11] [#424630]

- Descriptors in the NetScaler SDX SNMP MIB file include underscore characters, which are invalid. Only alphanumeric characters are supported.

  [From Build 123.11] [#430097]

- If you apply a license after modifying the SVM host name, the license application might fail.

Workaround: Reboot the Management Service after changing the host name, and then try applying the license again.

[From Build 123.11] [#431463]

- If you specify secure-only access on a NetScaler instance, single sign-on to that instance from the Management Service user interface is not successful.

  [From Build 124.13] [#396252]

- After you create, modify or delete an LACP channel, one of the member interfaces might temporarily stop transmitting. The NetScaler instance might intermittently show the status of the member interfaces as Error-Disabled (in the command line) or DOWN (in the configuration utility).

  Workaround: Log on to the NetScaler instance and execute the following command on the interface that is shown as Error-disabled:

  "enable interface <interface_id> (eg. enable interface 1/1)"

  [From Build 124.13] [#370574, 431840, 442436]

- If you use the Management Service to bind a new interface to an LACP channel, the member interfaces of the channel are reset. As a result, the traffic is not evenly distributed among the interfaces in the channel.

  [From Build 124.13] [#399630]

- On NetScaler SDX appliance, the NetScaler instances do not start when the total number of interfaces and SSL cores is more than 26.

  [From Build 125.9] [#446985]

- If the administrative password for the Management Service contains an ampersand character (&), communication between Management Service and XenServer is affected, and errors occur during provisioning or modification of the instances.

  [From Build 125.9] [#447773]

- When you click on a NetScaler IP address in the SVM GUI, the NetScaler configuration utility opens without prompting for logon credentials. Log on is done through single sign on (SSO).

  [From Build 125.9] [#456884]

- On a NetScaler SDX appliance running Management Service version 10.1, build 119.7, manually initiated backup operations fail, and a User name missing error message appears.

  [From Build 125.9] [#445598]

- If appliance inventory is going on at the same time when channel is being created, then it may happen that channel is created on the VPX but it is not visible from the SVM.

  [From Build 126.12] [#449247]

- The local storage partition was configured as sda3 instead of sda4 in the disk configuration file for NSSDX-22000 and NSSDX-22000T systems. Installing the supplemental pack 100014 along with the latest release resolves the error in disk

configuration file.

[From Build 126.12] [#455601]

- Management service was showing wrong alert for power supply status with the message that "One of the two power supplies is not working."

  [From Build 126.12] [#460376, 457317]

- If you are using the NetScaler SDX 8015/ 8400/8600 10G platform, no interfaces are shown in the interface list when an LACP channel is being created.

  [From Build 126.12] [#460329]

- When an interface other than 0/1 and 0/2 is being used for management on a VPX and later if that interfaces is made part of a channel creation from SVM, then that channel will not be pushed to this VPX and manual steps will be required to achieve the same.

  A user can delete such channels (made out of data interfaces and used for VPX management) from SVM which will leave the VPX in unmanageable state.

  [From Build 127.10] [#456703]

- Configuring a wrong DNS IP address was slowing internal communication between Management Service and XenServer. With the current release, the DNS look up will be ignored for internal communication.

  [From Build 127.10] [#475099]

- The NSIP modify action from the Management Service results in inconsistent state if the "Save Config" command from the Management Service to VPX takes a long time to respond. This happens because the connection might time-out. The issue has been fixed by increasing the time-out values.

  [From Build 128.8] [#480581]

- Set operation on a channel may lead to channel MAC address becoming zero on a VPX running on an SDX appliance.

  Workaround: Use the set channel <Channel_id> -lamac <mac_address> command.

  [From Build 128.8] [#483430]

- If a management channel modify request is sent through Nitro and a data interface is added in the member interface list, then the request succeeds and makes management channel inconsistent.

  [From Build 128.8] [#481835]

- If a VPX is using an interface A and a channel is created on Management Service using interface A and interface B then this channel should also get added to the VPX. But if the Interface B is already shared to its maximum limit, that is no free VFs are left on interface B then that channel will not be added to the VPX.

  [From Build 128.8] [#436286]

- For a case under the following conditions, when:

  1. A VLAN is present on XenServer on management interfaces (normally ETH0 and ETH1 on most platforms)

2. A management channel created from Management Service is present on SDX, and

3. A VPX is using this management channel.

Then, If the management channel is deleted from Management Service, then post deletion the VPX may be seen with the VLAN present on its management interfaces.

[From Build 128.8] [#482603]

- Management Service gives an error when an SDX administrator tries to bind a management channel while provisioning or modifying a NetScaler instance.

  [From Build 128.8] [#463820, 480347]

- The backup of an SDX appliance was failing with an error "username missing". The root cause for this was that the migration from 9.3.x was failing because of duplicate database entries. Going forward, the Management Service will remove the duplicate database entries resulting in a successful migration.

  [From Build 128.8] [#480054]

- On creating a LACP channel, interface MAC address is altered and the new MAC address will be persistent even after the unbind operation.

  Workaround: On unbind, the interfaces might have same MAC addresses or MAC addresses will all be 0. In such a situation, it is recommended to reboot the VPX.

  [From Build 128.8] [#482122]

- After you unbind the interface from a channel, interface drops the packets sent to the individual interfaces.

  Workaround: In such a situation, it is recommended to reboot the VPX.

  [From Build 129.22] [#484194]

- If you create channels on SDX and use these channels in VPXs and then take a backup of the appliance to restore either the complete appliance or selected instances, then channels are not restored and instances may fail.

  [From Build 129.22] [#432899, 435206]

- In case of shared management of CPU in SDX, licenses fail to load on start-up sometimes if the management CPU is overloaded.

  [From Build 129.22] [#473681]

- The backup file contain more NetScaler instance than allowed instance in the license applied. Now instance restore for a single NetScaler fails with error message "License does not allow more than x NetScaler instance".

  Workaround: SDX appliance should have same license as in the backed up SDX appliance.

  Fix: For instance restore operation, licence validation is done against no of NetScaler selected for restore instead of validating against all NetScaler instance in the backup files

  [From Build 129.22] [#498440]

- On NetScaler SDX 8000 appliances, the Service Virtual Machine (SVM) might not detect the disk correctly, in which case it marks the status of the disk as down in system health monitoring. However, the provisioning of NetScaler VPX instances works as expected. This issue occurs in the following releases:

  - NetScaler 10.1 Build 129.11 or earlier

  - NetScaler 10.5 Build 52.11 or earlier

  [From Build 130.13] [#488794, 497445, 504308]

- Enhancement to add 'lspci -vvvxxx' logging at boot time information to SDX log. It uses logrotate to keep log data from the last 3 boots.

  [From Build 130.13] [#507009]

- The installation of supplemental pack 100015 fails on NSSDX-8200 10G platforms. The root cause of failure is that the install script treats a warning as an error and aborts the installation.

  [From Build 130.13] [#495614]

- The installation of supplemental pack 100015 fails on NetScaler SDX 8200 10G appliances.

  [From Build 130.13] [#502975]

- Restore operation fails when the backup file of newer version is restored in older Management Service version.

  [From Build 130.13] [#502428]

- The management interface of a SDX-8000/SDX8200/SDX-8400 appliance might loose connectivity if the interface is connected to a CAT switch.

  Workaround: Set the speed of the interface to 100 Mbps and disable auto-negotiation.

  [From Build 130.13] [#470002, 460650, 484387, 504145, 505053]

- In SDX NetScaler cluster, SDX management VLAN modifications are not allowed through cluster IP.

  [From Build 130.13] [#469680]

- In Management Service, the Tagall setting configured for channels under Management VLAN settings is not available on VPXs.

  [From Build 130.13] [#506128]

- If a new SSL certificate that requires a key is installed without the key, access to management service GUI is lost.

  [From Build 131.11] [#440208]

- The NetScaler SDX appliance fails if it receives SNMP requests before system initialization.

  [From Build 131.11] [#525871]

- Some of the NIC's may become unusable and may not be visible in Management Service on SDX220XX and SDX241XX platforms running with XenServer 6.1 Supplemental Pack 100016A.

[From Build 131.11] [#536844]

- When a NetSclaer VLAN with tagged option for channels is selected, the native VLAN also gets tagged inside the NetScaler VPX for the channel.

  [From Build 131.11] [#512624]

- When you provision the maximum possible number of VPX simultaneously from Management Service, the Xen Server does not provide the details of correct memory space available immediately. There is a lag in recovering the memory space. For this reason although the memory space is available, you may still get "Not enough memory available" error.

  [From Build 132.8] [#525616]

- In sparse traffic conditions on a NetScaler VPX virtual appliance installed on VMware ESX, some latency might occur in releases after 9.3 as compared to release 9.2. If this latency is not acceptable, you can change a setting on the appliance. At the shell prompt, type:

  sysctl netscaler.ns_vpx_halt_method=2

  Perform a warm reboot for the above change to take effect. To have the new setting automatically applied every time the virtual appliance starts, add the following command to the /nsconfig/nsbefore.sh file:

  sysctl netscaler.ns_vpx_halt_method=2

  [From Build 126.12] [#326388]

- For an IPv6 load balancing virtual server that belongs to a traffic domain, and for which the persistence is set as cookieinsert, the NetScaler appliance does not insert the correct cookie in its response.

  [From Build 118.7] [#359348]

- With Random source port selection for Active FTP enabled on the NetScaler appliance, when an FTP server initiates a connection from the standard TCP port number 20, the NetScaler appliance uses a random port instead of port 20 for the client side data connection.

  [From Build 119.7] [#402068]

- The NetScaler appliance might not send the received IPv6 fragments to the appropriate packet engine for processing, which might result in the NetScaler appliance becoming unresponsive.

  [From Build 119.7] [#402123]

- The Network Visualizer does not display the bound IP addresses of a configured VLAN.

  [From Build 119.7] [#366321]

- If the NetScaler appliance has redundant L2 connectivity with a switch, the NetScaler appliance might mark its link-local IPv6 addresses as duplicate during the DAD (Duplicate address detection)?process.

  [From Build 120.13] [#404861]

- When the conditions specified in an ACL rule include the != operator, the NetScaler appliance might not properly filter packets based on the ACL rule.

  [From Build 120.13] [#401303]

- When IP fragments are received on a load balancing virtual server on which the client timeout?parameter set to zero, the NetScaler appliance might dump core and then restart.

  [From Build 120.13] [#405190]

- The NetScaler appliance might restart if it receives a duplicate IPv6 fragment within a very short time after receiving the original fragment.

  [From Build 121.10] [#404849]

- After unbinding a netprofile from a NetScaler Gateway virtual server, the netprofile cannot be removed from the NetScaler appliance.

  [From Build 122.17] [#416941]

- The NetScaler appliance might become unresponsive when traffic from a TFTP server matches a RNAT rule configured on the appliance.

  [From Build 123.11] [#431652, 454475]

- If you have configured an extended ACL without specifying the optional parameter "source IP address", high CPU spikes might occur when you run the "apply ns acls" command either by using the configuration utility or the NetScaler command line.

  [From Build 123.11] [#424243, 430158, 438766]

- When you reset a member interface of a LACP channel, Tx stalls might increment continuously.

  [From Build 123.11] [#435697]

- If you have configured a TFTP load balancing virtual server with persistency option enabled, the NetScaler appliance might become unresponsive when the virtual server receives some traffic.

  [From Build 123.11] [#428819, 436289, 439158]

- If you have configured more than ten ICMP extended ACLs, high CPU spikes might occur when you run the "apply ns acls" command either by using the configuration utility or the NetScaler command line.

  [From Build 123.11] [#408693]

- For a load balancing configuration in which an IPv6 virtual server is used to load balance IPv6 servers, if the NetScaler appliance processes client's final ACK of the TCP handshake and the first data packets in the same IO cycle, the appliance may not forward the data packets to the server causing the connection to fail.

  [From Build 124.13] [#423856]

- On a NetScaler ADC configured for link load balancing with RNAT, access to external sites fails intermittently.

  [From Build 125.9] [#448738, 453558]

- In a High Availability configuration, if you set the maxFlips, maxFlipTime, or syncvlan parameter of the set HA node command, the NetScaler ADC adds a duplicate entry of the add HA node command to the running configuration.

  [From Build 125.9] [#449175]

- In a high availability configuration, you might lose your VLAN configuration if you upgrade the secondary node to build 125.x from builds: 122.17, 123.11,124.13.

  [From Build 126.12] [#469033, 467726]

- In a high availability configuration in INC mode, net profile and IPset commands propagate to the secondary node.

  [From Build 126.12] [#452434]

- If you have configured active FTP with random source port option enabled for an FTP virtual server, the NetScaler ADC might not handle data connections properly for this FTP server and (NetScaler) might become unresponsive.

  [From Build 127.10] [#477507]

- RNAT configuration might be lost in a NetScaler ADC after you restart it.

  [From Build 127.10] [#475466, 475462, 486447]

- The NetScaler appliance might consume excessive CPU cycles when processing ACL rules.

  [From Build 127.10] [#438557]

- In a high availability (HA) configuration, the secondary node might forward BOOTP and DHCP related traffic using a configured VMAC address instead of interface's MAC address.

  [From Build 127.10] [#457119]

- The NetScaler ADC might not remove the session information of an FTP connection from its memory while closing the connection. When the NetScaler ADC allocates the same memory block for a connection related to a UDP DNS service, the NetScaler ADC becomes unresponsive.

  [From Build 127.10] [#448316]

- The default speed for an LACP channel is set to NONE instead of AUTO.

  [From Build 128.8] [#414407, 485512]

- The NetScaler ADC might fail to evaluate listen policies, containing source or destination ipv6 address/subnet, for certain IPv6 addresses.

  [From Build 129.22] [#496564]

- With more than 1000 IP tunnels configured on a NetScaler ADC, the internal data structure for these IP tunnels might not be updated for some events. This changes the status of these IP tunnels to the DOWN state.

  [From Build 129.22] [#491473]

- In a high availability configuration, run-time information such as service states and load balancing persistence sessions might not propagate to the secondary.

[From Build 129.22] [#441062]

- For a link load balancing with RNAT configuration, the NetScaler ADC might use an incorrect subnet IP (SNIP) address to communicate to the external devices.

  [From Build 129.22] [#480621, 478048]

- The LACP channels of a NetScaler ADC might take around 7 minutes to become functional (UP state) after the NetScaler is restarted.

  [From Build 129.22] [#475622]

- In a high availability (HA) configuration, VMAC configuration might be lost when continuous HA failover happens.

  [From Build 129.22] [#477402]

- The NetScaler ADC might use a large amount of CPU cycles when it receives a burst of GRE traffic, which meets the following criteria:

  - The NetScaler ADC is not the GRE end point for this traffic.

  - The NetScaler ADC creates a NAT session information for this traffic.

  [From Build 129.22] [#480573]

- The NetScaler ADC drops IPv4 packets related to the following protocols:

  - IPv6 encapsulation (41)

  - Fragment Header for IPv6 (44)

  - ICMP for IPv6 (58)

  [From Build 129.22] [#490190]

- The CPU usage might be approximately 10% higher in NetScaler 10.5 version as compared to NetScaler 9.3 version.

  [From Build 129.22] [#432192]

- In a CloudBridge connector tunnel, IKED packets might get routed back to the same NetScaler ADC instead of the peer tunnel end point.

  [From Build 129.22] [#494875, 498447]

- In a transparent cache redirection deployment, when a request is destined to a MAC address (say MAC-A) and the response for the request is sent from another MAC address (say MAC-B), the NetScaler ADC sends further requests to MAC-B. If MAC-B stops handling the requests, the session might get hung.

  [From Build 129.22] [#460246]

- For a link load balancing with RNAT configuration in which persistence is enabled for the virtual server, the NetScaler ADC might become unresponsive when the virtual server receives traffic.

  [From Build 129.22] [#471651, 479882, 485831, 493232]

- On a NetScaler ADC, ND6 entries might get in INCOMPLETE state due to synchronization mismatch among different internal modules. As a result NetScaler fails to serve traffic for that IPV6 address.

  [From Build 129.22] [#480100, 483728]

- The NetScaler ADC might not update its bridge and ARP tables with the information received from GARP messages.

  [From Build 130.13] [#497277]

- For a load balancing server configured on a non-default traffic domain, modifying the IP address of the server also changes the name of the server.

  [From Build 130.13] [#496237]

- Old or stale OSPF LSAs might exist after a warm restart, or a restart after a power failure, resulting in a triple flip.

  [From Build 130.13] [#441005]

- With MAC based forwarding (MBF) enabled, the NetScaler ADC does not update Layer 2 information such as MAC address, interface ID, and VLAN ID, for a dynamic service even when the associated router is inactive. As a result, the router drops the packets destined to the IP address specified by the dynamic service.

  [From Build 130.13] [#490341]

- An Access Control List (ACL) rule specifying the TCP protocol and the Established option might not get evaluated if another ACL rule with a higher priority also specifies TCP.

  [From Build 130.13] [#510173]

- If you disable the TCP Proxy parameter while creating a Reverse Network Address Translation (RNAT) rule on a multi-core NetScaler ADC, the NAT operation fails.

  [From Build 130.13] [#508631, 509453]

- The NetScaler ADC might become unresponsive when ICMP error packets match a forwarding session rule.

  [From Build 130.13] [#502213, 512248]

- If you bind an interface with a unit number greater than 31 to a VLAN that is used as a Sync VLAN in an HA configuration, the Sync VLAN becomes unoperational.

  [From Build 131.11] [#507345]

- In an active-active configuration, services bound to the backup VIP addresses do not send monitor probes to the associated servers.

  [From Build 131.11] [#355965, 485260]

- Upon receiving Generic Routing Encapsulation (GRE) packets as IP fragments on a virtual server with protocol ANY, the NetScaler ADC fails and restarts. This occurs only when you do not explicitly configure a GRE tunnel on the NetScaler ADC.

  [From Build 131.11] [#522538]

- In a high availability (HA) configuration, ACL rules that are configured to block SSH related packets also block HA file synchronization that internally uses the SSH protocol.

  [From Build 131.11] [#438901]

- An ACL6 rule might not get evaluated for a series of TCP packets.

  [From Build 131.11] [#528554]

- An active FTP connection might get reset for no apparent reason, regardless of the state of the random source port.

  [From Build 132.8] [#507908]

- In an active-active configuration with the sendToMaster parameter enabled, the backup nodes might not forward packets to the master node.

  [From Build 132.8] [#554336]

- Blocking Traffic on Internal Ports

  The NetScaler appliance does not block traffic that matches an ACL rule if the traffic is destined to the appliance's NSIP address, or one of its SNIP addresses, and a port in the 3008-3011 range.

  This behavior is now specified by the default setting of the new Implicit ACL Allow (implicitACLAllow) parameter (of the L3 param command). You can disable this parameter if you want to block traffic to ports in the 3008-3011 range. An appliance in a high availability configuration makes an exception for its partner (primary or secondary) node. It does not block traffic from that node.

  To disable or enable this parameter by using the command line interface

  At the command prompt, type:

  > set l3param -implicitACLAllow [ENABLED | DISABLED]

  Note: The parameter implicitACLAllow is enabled by default.

  Example

  > set l3param -implicitACLAllow DISABLED

  Done

  [From Build 132.8] [#529317]

- The NetScaler hardware might sometimes report incorrect values for system health counters. The health counters are read over the SMBus, which is prone to reporting wrong or zero values.

  [From Build 118.7] [#373125]

- In certain cases, error messages on the console of an MPX 5550/5650 or MPX 8200/8400/8600 appliance continuously scroll if the physical registers are not correctly read.

  [From Build 118.7] [#360223, 363330, 368513, 374726, 376201, 383863, 385560, 387301, 388487, 392958, 396159,

417578, 426783, 456228]

- The NetScaler license is not processed if the configuration file (ns.conf) contains multiple instances of the host name, or if the host name in the ns.conf file is different from the host name in the rc.conf file. With this fix, if the ns.conf file contains multiple host names, only the name set by the "set ns hostname" command is used. Also, the host name in ns.conf no longer takes precedence over the host name in rc.conf.

  [From Build 120.13] [#409202]

- On the MPX 22040/22060/22080/22100/22120 appliance, if the 10G ports are not populated, the appliance takes about 20 minutes to finish the restart process.

  [From Build 123.11] [#432687]

- NetScaler does not display the correct daylight savings time for Israel.

  [From Build 123.11] [#428562]

- With recent versions of the ixgbe driver, the dmesg.boot file and the show interface command report that the FTLX1471D3BCV-I3 LR SFP+ port is unsupported. This issue occurs with the following releases and builds:

  - Release 10.1 starting build 112.15 or later

  - Release 10 build 74 or later

  - Release 9.3 build 62.4 or later

  - Release 9.3.e build 59.5003.e or later

  [From Build 123.11] [#410251]

- The MPX 11515/11520/11530/11540/11542 platform now supports NetScaler release 9.3 build 65.x.

  [From Build 124.13] [#395280]

- If you try to form a cluster of MPX 22040, MPX 22060, MPX 22080, MPX 22100, and MPX 22120 appliances, the appliance on which you issue the "join cluster" command performs a core dump and restarts. As a result, that appliance is not added to the cluster.

  [From Build 124.13] [#435200]

- The MPX 22040/22060/22080/22100/22120 platform now supports NetScaler release 9.3 build 65.x.

  [From Build 128.8] [#311561]

- For NetScaler platforms that have Small Form-factor Pluggable (SFP) transceivers, with part number FTLF8519P3BNL, the bootup log files show that the SFPs are unsupported, even though they are functioning properly. This issue occurs in the following releases:

  - NetScaler 9.3 Build 67.5 or earlier

  - NetScaler 10.1 Build 129.11 or earlier

  - NetScaler 10.5 Build 52.11 or earlier

[From Build 129.22] [#501834]

- NetScaler VPX instances running on Xen Server might consume a high percentage of CPU cycles while processing 1G traffic.

  [From Build 130.13] [#498929]

- On a NetScaler ADC that has a Small Form-factor Pluggable (SFP) interface with part number FTLF8519P2BNL, disabling this interface might not disable the interface of the peer device.

  [From Build 130.13] [#487169]

- NetScaler supports Multi-PE for Hyper-V.

  [From Build 130.13] [#484123]

- NetScaler VPX instances running on VMware ESXi lose network connectivity when you apply either of the following patches:

  - ESXi550-201410401-BG

  - ESXi510-201410401-BG

  Workaround: For more information, see http://support.citrix.com/article/CTX200278.

  [From Build 131.11] [#510673, 517241, 538267]

- On NetScaler MPX 22040/22060/22080/22100/22120 and ByteMobile T1200 appliances, SNMP based alarms are supported for only first two power supplies.

  [From Build 131.11] [#525360]

- The user interfaces (command line and configuration utility) of a NetScaler instance running on a SDX appliance do not display the actual state of the management ports.

  [From Build 131.11] [#251216, 302381]

- You can now upgrade the Lights Out Management (LOM) firmware directly from the host, without configuring the LOM port on the network.

  [From Build 131.11] [#430733, 542439]

- If an HTTP callout is configured with a virtual server that has a widcard port, the NetScaler appliance fails to respond the first time the callout is triggered.

  [From Build 119.7] [#391238]

- When a filter policy is globally bound to a NetScaler, application firewall or compression or authorization policies that are bound to a content switching virtual server are not saved in the running configuration. However, these bindings are displayed when you run the "show cs vserver" command.

  [From Build 122.17] [#410624]

- After upgrading to NetScaler 10.1, policies that were globally bound to the NetScaler are also being bound at a virtual server level.

  [From Build 122.17] [#429232]

- The NetScaler appliance might fail to respond in the event that a policy of the form HTTP.REQ.BODY(n).AFTER_STR(target-string) has a large value for "n" (for example, 40000) and when the appliance receives large requests in combination with requests with no content length.

  [From Build 123.11] [#417071, 423206]

- A memory leak in the XML_DECRYPT() policy function can consume all NetScaler memory, making it unavailable for other operations.

  [From Build 124.13] [#442807]

- The NetScaler appliance may fail to respond if it does not have sufficient memory during the execution of an XML_DECRYPT function in a policy expression.

  [From Build 124.13] [#414552, 429079]

- Error messages displayed during policy binding are shown as hexadecimal code instead of the corresponding warning message.

  [From Build 125.9] [#430148]

- After changing the time zone on a NetScaler appliance, you must restart the appliance so that policies referencing the LOCAL system use the new time zone instead of the old one. Otherwise, policies that should match do not, and policies that should not match do.

  [From Build 129.22] [#425465]

- The maximum value of the RelayState attribute that can be sent with the assertion that NetScaler sends is increased to 512 bytes. This applies to cases where the administrator configures a traffic policy to send assertion to a relying party.

  [From Build 129.22] [#473721]

- Using the "SYS.CHECK_LIMIT" expression in conjunction with any boolean expression can cause the NetScaler to crash.

  [From Build 129.22] [#493045]

- Rewrite policy bindings to virtual servers can be lost when you upgrade the NetScaler firmware to version 10.1.128.11. If the rewrite policy is bound to a load balancing virtual server, the policy bindings are not displayed as part of the server configuration, but they are saved when the user saves the configuration. If the rewrite policy is bound to a content switching virtual server, the policy bindings are lost when the user saves the configuration.

  [From Build 130.13] [#508510, 513724, 517150, 518535, 519945]

- The NetScaler appliance can crash or the data can get corrupted when the URL (or other string) satisfies the following criteria:

  - Length is more than 1300 bytes (800 bytes for HTML_XML_SAFE).

- Has at least one unsafe character.

- A significant initial part of the string does not need encoding (or some smaller initial part of the string does not need encoding and there are lots of characters needing encoding)

- One of the following functions is used on the string in the expression:

* HTTP_URL_SAFE - unsafe characters are not allowed. Safe characters are: a-z, A-Z, 0-9, "-", "_", ".", "!", "~", "*", "'", "(", ")", ";", ":", "@", "?", "=", "$", "%", "&", "+", ",", "/".

* HTTP_HEADER_SAFE - new line ('\\n') characters are unsafe.

* HTML_XML_SAFE - unsafe characters are '<', '>' and '&'.

* APPEND_QUERY_PARAMETER - same as HTTP_URL_SAFE

Workaround: As a workaround, remove uses of these functions from your expressions if strings can be long (or truncate the strings to 1300 bytes (800 bytes for HTML_XML_SAFE)). In a number of cases you can avoid using these functions if you concatenate the URL with some string constant to the left of it (for example "" + HTTP.REQ.URL) - if the input was encoded, so will be the result.

[From Build 130.13] [#506761, 519776]

- The default SSL virtual server configurations are disturbed, if HTTP callouts are configured on the NetScaler appliance.

  [From Build 132.8] [#551626]

- A NetScaler appliance that has a rewrite policy configured, becomes unresponsive, if all the following conditions are met:

  1. The rewrite action type is either "replace" or "insert_after".

  2. The HTTP response does not have the content-length header.

  3. The body of the HTTP response is split into multiple TCP packets with different TCP packets arriving with some time delay. This causes the policy rewrite engine to pause and resume the packet processing.

  4. The string specified in the rewrite action is present in the last packet of the HTTP response.

  [From Build 132.8] [#554460]

- Modifying the content with more than one callout results in incorrect computation of the content length. This issue is not observed if all the callouts use GET requests.

  [From Build 120.13] [#401455]

- On a NetScaler appliance with Rewrite enabled and configured, a newly-created Rewrite policy that is bound to a content-switching virtual server might not be saved either in the running configuration or in the saved configuration.

  [From Build 122.17] [#418252]

- A new SNMP alarm, vridStateChange, indicates the change of the state of a VRID from backup to master in an active-active configuration. The NetScaler appliance in which the state of a VRID changes to master sends a trap message for each VIP address bound to that VRID to the configured SNMP managers, indicating that the NetScaler appliance is currently serving traffic for a particular VIP address bound to that VRID. If no VIP addresses are bound to that VRID, the appliance does not send any trap messages.

  [From Build 118.7] [#246215]

- SNMPD fails to respond if it receives a packet with a NULL community string.

  [From Build 121.10] [#413733, 413871, 421055, 468830]

- Net-SNMP does not handle the endOfMibView condition properly if the value of max-repetition is set to zero. As a result, memory allocation failures, and the SNMP daemon fails to respond.

  [From Build 123.11] [#435520, 438590]

- The aggregateBWUseHigh and aggregateBWUseNormal SNMP traps are frequently generated even though the bandwidth is less than the set value for the alarm.

  [From Build 125.9] [#407594]

- The NetScaler appliance sometimes fails when a TCP connection is closed from a SPDY client while some streams are still active.

  [From Build 122.17] [#406948, 405903, 429211, 432515]

- Next Protocol Negotiation (NPN) TLS extension cannot be explicitly enabled or disabled. It is automatically enabled when SPDY is enabled on a HTTP profile, and disabled when SPDY is disabled.

  [From Build 127.10] [#460918, 474003]

- In some cases, parsing an incorrectly formatted client certificate might take more than a few seconds. The delay can trigger the monitoring logic to terminate the process and restart the appliance.

  [From Build 118.7] [#392683, 257157, 392686, 392996]

- An attempt to establish an HTTPS connection to a NetScaler FIPS appliance through a Chrome browser fails, because the browser sends a SPDY-NPN extension by default, and the NetScaler FIPS appliance does not support the NPN extension.

  Workaround: Disable SPDY in the Chrome browser.

  [From Build 119.7] [#400084]

- In the NetScaler configuration utility, the "FipsKey" parameter does not appear in the "Install certificate" dialog box. As a result, you cannot add a certificate-key pair on an MPX FIPS appliance by using the configuration utility.

  Workaround: Use the command line interface.

[From Build 119.7] [#400649]

- If any entity is added as part of user interactive process on command line for SSL Certificates and the operation is aborted in between using CTRL+C, then again carrying out the same operation causes the NetScaler command line to crash.

  [From Build 121.10] [#408393]

- If a malformed packet is received from a client, the NetScaler appliance closes the connection and releases the resources used for that connection to the common pool. In some cases, some of these resources are not cleaned before returning to the pool and a bad resource might be reused for a future request. In such cases, the SSL handshake for that future request fails.

  [From Build 122.17] [#423905, 418100, 430942]

- If a client sends a certain type of malformed message, which can make uninitialized resources available for subsequent handshakes, an SSL handshake that uses one of those resources causes a memory leak.

  [From Build 123.11] [#431919]

- If you create a certificate revocation list (CRL), enable refresh, and specify the method as HTTP or LDAP, CRL refresh does not happen.

  [From Build 123.11] [#434737]

- If you upgrade to this build, the number of SSL chips for which the status is shown as UP on an MPX 21550 platform with 36 chips is less than the actual number of chips that are UP. This is only a reporting issue.

  [From Build 123.11] [#235990]

- If the SSL handshake uses the TLSv1.1 or TLSv1.2 protocol and you have bound an RC4 cipher to the SSL virtual server, downloading a large file might take an unusually long time.

  [From Build 123.11] [#432375]

- On the NetScaler appliance, TLS protocol version 1.2 does not support ephemeral Diffie-Hellman cipher suites.

  [From Build 124.13] [#345883]

- If you add a certificate revocation list (CRL) with refresh enabled, the appliance might perform a core dump and restart.

  [From Build 125.9] [#436205, 411462, 436185]

- On a Nitrox-2 chip based platform, if you bind cipher groups, such as HIGH and AES, to your virtual server, the unsupported ECDHE cipher might also be bound. This cipher does not cause any problems. To remove it, you must unbind the cipher group.

  [From Build 126.12] [#437018]

- In a high availability setup, the force ha sync command appends the DEFAULT cipher group to the user-defined ciphers on the virtual server of the secondary node.

  [From Build 126.12] [#451698, 446674, 452080]

- If you use the configuration utility to configure FIPS appliances in a high availability setup, FIPS keys are not exported or imported between the nodes, because the option to enable secure information management (SIM) is not available.

  [From Build 127.10] [#459688, 446760]

- The version displayed in syslog is SSLv2.0 even though the session is negotiated using TLSv1.2.

  [From Build 128.8] [#474417, 474413]

- In rare cases, if the random number generated for the DH key exchange has a leading zero, DH negotiation fails because of a hardware limitation.

  [From Build 128.8] [#414388, 345883, 349858, 428257, 428259]

- On all the NetScaler MPX platforms, DH cryptographic operation is now offloaded to the hardware, reducing the load on the CPU. If your deployment uses DH crypto operations heavily, you will notice a performance improvement.

  [From Build 129.22] [#490273, 378182, 404081]

- If a spike in traffic occurs while the NetScaler ADC is doing a DH-based handshake, some packets might be dropped, because a DH handshake consumes a high number of CPU cycles.

  [From Build 129.22] [#484525]

- In a setup with a large number of virtual servers, if only a few virtual servers receive most of the traffic while the other virtual servers are idle, there might be a delay in cleaning up the sessions.

  [From Build 130.13] [#492087, 510038, 510483]

- If session reuse is enabled on the NetScaler and a network error occurs, the NetScaler attempts to clear the session information so that it is not reused for a subsequent session request from the same client. In rare cases, the NetScaler might fail during this cleanup process.

  [From Build 130.13] [#494093, 485932, 492191, 492797, 497321]

- On all NetScaler appliances except MPX 5500 and MPX 5550/5650/5750 appliances, if both the rate of new SSL connections and the percentage of SSL session reuse are high, SSL session buildup causes high usage of memory. If the result is a memory allocation failure, SSL traffic is dropped.

  [From Build 132.8] [#532136, 525686, 531207, 539902, 547350, 548697, 559753, 561598, 563485, 569063]

- If you run the "update ssl certkey" command to modify the certificate-key pair that is bound to a service group, a duplicate entry is seen for the same certificate key pair in the running configuration.

  [From Build 132.8] [#550138, 552436, 552701]

- SureConnect (SC) should be enabled on one entity. If you enable SC or configure SC policies on a load balancing virtual server, do not enable SC on any of the services or service groups that are bound to this virtual server. Doing so can result in configuration loss during reboot or lead to inconsistent configuration across an HA pair.

  [From Build 132.8] [#526782]

- When selective acknowledgement (SACK) and partial buffering are enabled on the appliance, acknowledgements with incorrect TCP checksum are forwarded to the server.

  [From Build 118.7] [#384153]

- The NetScaler appliance wrongly advertises TCP buffer size to the client side when dynamic windows management is enabled and the service-side buffer size is larger than 40k. This problem occurs when two different TCP profiles are bound to the virtual server (buffer size is 8k) and to the service (buffer size > 40k). It causes failure when the appliance is uploading files.

  [From Build 118.7] [#392293]

- SNMP returns incorrect values for the "ifOutOctets" and "ifInOctets" counters.

  [From Build 119.7] [#390257]

- If the SNMP service has the NSI_NS_SERVICE flag set, and you clear the configuration, the NetScaler appliance crashes.

  [From Build 119.7] [#404094]

- The SNMP module allocates memory for all OIDs in an SNMP request and queues them for further processing. With a large number of SNMP requests (each request with possibly hundreds of OIDs), the result can be a memory shortage that in turn leads to memory allocation failures.

  [From Build 119.7] [#394724, 411601]

- The NetScaler appliance dumps a core when you create a cluster or a high availability setup on an appliance that has a TFTP load balancing virtual server.

  Workaround: Make sure you delete existing TFTP load balancing virtual servers before creating the cluster or high availability setup.

  [From Build 119.7] [#395735, 401437, 406759, 407288]

- Stat-command output specified with the "fullValues" parameter is aligned incorrectly.

  [From Build 120.13] [#391632]

- When you try to add a second name-based SNMP manager, you get an error message that says an SNMP manger with that name already exists.

  [From Build 120.13] [#353546]

- If TCP buffering or caching is enabled on a NetScaler appliance receiving an ACK packet that has ACK_NO at the left edge of the SACK block, the packet engine enters a loop while processing the packet.

  [From Build 120.13] [#401111, 375425, 399769, 408267, 408648, 413721, 414273, 424726, 460731]

- Remote monitoring of a high capacity appliance, such as a NetScaler MPX 22000, might indicate a drop in performance even though performance remains robust. The apparent problem is the result of a pause in the stream of monitoring data, not an actual drop in throughput.

[From Build 120.13] [#407868]

- On a NetScaler MPX system, the SNMP count for the appliance's hardware memory and the show system memory display are incorrect. The amount of memory shown is larger than the actual amount.

  [From Build 120.13] [#391754]

- The NetScaler appliance might fail to respond if an ICMP error occurs when TCP buffering and integrated caching are enabled on the appliance.

  [From Build 120.13] [#402677, 406353, 408800, 411332, 412960, 426506, 441788]

- A session is not freed when port allocation fails. The session is getting matched and the NetScaler fails when it tries to access other linked sessions which are NULL.

  [From Build 120.13] [#407974, 421716]

- If, from a management computer, you run a command that forms a request size of more than 8000 bytes, the NetScaler ADC might not properly buffer this large request. As a result, the ADC terminates the connection to the management computer.

  [From Build 120.13] [#423610, 436854]

- The NetScaler appliance can crash when there are split ICA frames that span 2 CGP frames with other CGP packets in between.

  [From Build 121.10] [#411613, 414137, 436849, 444308]

- If changes are made in the nsconfig/resolv.conf file, the appliance fails to override the default DNS configurations.

  [From Build 121.10] [#412681]

- If you specify an invalid IPv4 address in a command that can accept either IPv4 or IPv6 address, the NetScaler shell exits automatically, because of to memory corruption.

  [From Build 121.10] [#415623, 247585, 327131, 384988]

- In an high availability setup, after a forced failover, the sync operation fails to sync the -establishClientConnection parameter setting.

  [From Build 121.10] [#216272, 220771]

- On a NetScaler appliance, an invalid HTTP range request results in a large amount of memory usage and the following error appears: "ERROR: Communication error with the packet engine."

  [From Build 121.10] [#401526]

- If TCP buffering or caching is enabled on a NetScaler appliance receiving an ACK packet that has ACK_NO at the left edge of the SACK block, the packet engine enters a loop while processing the packet.

  [From Build 121.10] [#375425]

- TCP buffering bypasses as the calculated 'usable system memory' is less than the configured threshold value.

[From Build 121.10] [#405532, 423815, 434383]

- The NetScaler appliance stops sending TCP DUP ACKs when it receives out of order packets. This might result in latency between the client and the appliance, or the appliance and the server, with reduced throughput for some traffic patterns.

  [From Build 122.17] [#417793, 421214, 421329, 423099]

- The NetScaler appliance does not forward the complete request to the server if the request requires more than one packet. As a result, the transaction fails.

  [From Build 122.17] [#420781]

- The NetScaler appliance intermittently resets TCP connections that originate from the NetScaler FreeBSD shell and are destined for NetScaler-owned IP addresses (for example, a SNIP or VIP address). The resets affect applications such as LDAP.

  [From Build 122.17] [#430176, 430185]

- When the NetScaler appliance receives invalid Selective Acknowledgment (SACK) blocks from the client, it attempts to send old data that has already been cleared. As a result, the appliance stops responding.

  [From Build 122.17] [#419553, 423433, 426506, 428155]

- When upgrading from release 9.3 to 10.1, the following SNMP alarms throw a time argument error: IP-CONFLICT, HA-LICENSE-MISMATCH, and HA-PROP-FAILURE. This issue occurs because, in version 10 and later, the "time" parameter is deprecated for these SNMP alarms.

  Note: The same error occurs if you try to set the time for one of these alarms.

  Workaround: Before upgrading to release 10.1, update the "ns.conf" file by removing the "time" parameter for these three alarms from the "set snmp alarm" command.

  [From Build 123.11] [#388481, 391618]

- On the "System > Diagnostics" page, when you select "Saved v/s running", the configuration utility displays a difference between the running and saved configurations, even if there is no difference.

  [From Build 123.11] [#388836, 388830, 388831, 411627, 416264, 430646, 430652]

- The "stat system -detail" command does not display the number of CPUs.

  [From Build 123.11] [#382647]

- The NetScaler appliance might fail to respond if an ICMP error causes the packet engine to enter a loop and thereby resulting in a pitboss process failure.

  [From Build 124.13] [#436798, 438765, 439849, 449803]

- When Call Home is enabled, duplicate SNMP traps are generated for power supply unit (PSU) failures.

  [From Build 124.13] [#435796]

- The MPTCP data_ack signal is not sent in the subflow in which the MP_FAIL signal is sent.

[From Build 124.13] [#397587]

- ISIS packets are dropped at the Nexus 1000V distributed virtual switch (DVS), which has no option to enable promiscuous mode. However, this issue is not observed when the virtual machines are connected through the ESX virtual switch with promiscuous mode ON.

  [From Build 124.13] [#430071]

- A signed short integer overflow can occur during packet processing. Subsequent packets are corrupted.

  [From Build 124.13] [#432728]

- If large number of small packets are sent through the packet processing pipeline, the packet engine enters a loop and restarts, causing a pitboss failure.

  [From Build 124.13] [#439579, 442723, 442749]

- When a client's MPTCP token is invalid in the C2C steered MP_CAPABLE final ACK, the packet is dropped silently without flushing out the RSS filter. This filter is never deleted. If the client reuses the same 4-tuple as the filter, the incoming packet may go into the steering loop between the PEs. This will lead to very high CPU utilization.

  [From Build 125.9] [#447623]

- When web server logging and audit logging are enabled on the NetScaler, the TCP current clients counter goes to negative values and shows a very large value in the stat or the SNMP OID.

  [From Build 126.12] [#335202, 248103, 341155, 404099]

- The NetScaler ADC forwards unprocessed packets to the load balancing virtual servers without selecting a service, because of an HTTP out-of-order packet processing issue. Instead of being dropped, these connections queue up at the virtual servers. The ADC fails to respond while processing these connections.

  [From Build 126.12] [#432612, 426784, 434780, 468253]

- The state of services for which NATPCB is allocated starts flapping because of NATPCB allocation failure.

  [From Build 126.12] [#453811, 470299]

- Memory leak found in shell '/bin/sh' while performing management CPU profiling in "nsproflog.sh" thereby causing swap zone issues.

  [From Build 126.12] [#462797, 441758, 446780, 455911, 457505, 459435, 468798, 476812, 495481]

- High CPU usage is observed when evaluating listen policy named expressions on a virtual server that picks up every packet.

  [From Build 126.12] [#450580]

- The NetScaler ADC might fail during an nstrace operation.

  [From Build 126.12] [#446300]

- The NetScaler appliance drops a connection if it receives 255 back-to-back old packets (re-transmissions). The limit is configurable and the default value has been increased.

[From Build 126.12] [#453108]

- If TCP buffering or caching is enabled on a NetScaler appliance receiving an ACK packet that has ACK_NO at the left edge of the SACK block, the packet engine enters a loop while processing the packet.

  [From Build 126.12] [#451285, 441843, 457850]

- With large number of configuration entries in the ns.conf file, the commands in the /nsconfig/rc.netscaler file might not be applied after the appliance is restarted.

  [From Build 126.12] [#396628, 402205]

- The "show ns runningConfig" command may produce partial output if invoked while another "show ns runningConfig" command, from the same or other admin session is in progress. **Workaround:** Re-execute the "show ns runningConfig" command to fetch the entire running configuration.

  [From Build 127.10] [#478895]

- When the NetScaler has application firewall disabled but SSO enabled, and if the NetScaler memory is less, all unused memory (appfw memory) is not recovered. This leads to an erroneous value for the "ActualInUse" memory counter.

  [From Build 127.10] [#450054, 450787, 453207, 453481, 459354]

- The NetScaler system backup tar file does not include the following files:

  - /nsconfig/ns.conf

  - /nsconfig/Zebos.conf

  - /nsconfig/rc.netscaler

  - /nsconfig/snmpd.conf

  - /var/log/wicmd.log

  - /nsconfig/nsbefore.sh

  - /nsconfig/nsafter.sh

  [From Build 127.10] [#455041, 478635, 484981]

- The NetScaler nstrace utility does not filter out all IPv6 packets when a IPv4 only filter is entered.

  [From Build 127.10] [#450398]

- The Monupload process monitors the power supply and sends a "show techsupport" bundle as soon as a power failure is observed. This behavior is now modified to upload the bundle only in case the power supply does not recover in a 1 minute.

  [From Build 128.8] [#452240]

- When different TCP profiles are bound to a virtual server and to the services that are bound to that virtual server, and one of the profiles has window scaling as ENABLED and the other has it as DISABLED, NetScaler sometimes considers that window scaling is ENABLED. The expectation in such a case is that NetScaler considers window scaling as

DISABLED.

[From Build 128.8] [#481442]

- Changes made to the time zone are not reflected till the NetScaler appliance is warm rebooted.

  [From Build 129.22] [#471100, 425465, 484159, 484187]

- With USIP mode enabled, when the client FIN comes along with the final ACK for the server response, the NetScaler TCP module does not acknowledge the FIN.

  [From Build 129.22] [#478356]

- A new HTTP profile option "rtspTunnel" allows RTSP over HTTP. The RTSP tunnel is detected by the presence of either one of the following

  - 'Accept: application/x-rtsp-tunnelled' request header

  - 'Content-Type: application/x-rtsp-tunnelled' response header

  Once the tunnel is detected, NetScaler stops HTTP tracking for that TCP connection and lets the RTSP flow go through. The "rtspTunnel" option is disabled by default.

  [From Build 129.22] [#480219]

- When the Call Home feature is disabled before the Call Home enable operation is successful, a second instance of the Call Home process starts to run. This results in high usage of the management CPU.

  [From Build 129.22] [#498232]

- The NetScaler intermittently fails to generate traps due to issues in propagating the alarm state to the SNMP daemon.

  [From Build 129.22] [#490192]

- If you change the IP address of a load balancing virtual server that shares the same server information (IP address, port and service) with an audit server and then clear the configurations, the NetScaler is expected to remove the virtual server, the audit server, and other NetScaler configurations. However, when you now add the virtual server with the original server details, the NetScaler throws an error message that says "resource already exists".

  Note: In a HA setup, this behavior is displayed even when you perform a force sync or a force failover operation.

  [From Build 129.22] [#484527]

- SNMP walk shows the operational status of a LA channel as DOWN even when it is in the PARTIAL-UP state.

  [From Build 129.22] [#477709]

- The nsnetsvc process size increases when the "stat" command is executed.

  [From Build 130.13] [#418028, 409722, 467187]

- When the Netscaler ADC hits congestion with HA or LACP packets or continuous congestion in a single-PE environment, it cannot recover and packet transmission stops. This is applicable to the management ports on NetScaler SDX appliances and to all ports on NetScaler VPX instances running on XenServer.

[From Build 130.13] [#532316, 532045, 533018, 534634, 534671, 537616]

- The NetScaler appliance can crash when a large HTTP request URL has a space in it and if the request is broken into multiple packets.

  [From Build 130.13] [#497321, 501856, 502116, 502902, 517374]

- When a HTTP profile is bound to a virtual server or service, the configurations of this profile are considered over the configurations of the global HTTP profile (nshttp_default_profile). However, when connection multiplexing is disabled globally and enabled on the virtual server or service, the global setting for connection multiplexing is being considered. This issue has now been fixed.

  [From Build 130.13] [#494013]

- The NetScaler randomly crashes when SPDY is enabled on a NetScaler deployment which has integrated caching or front end optimization enabled. This occurs due to some interaction issues.

  Workaround: Disable SDPY when integrated caching or front end optimization is enabled.

  [From Build 131.11] [#486257]

- If you enable the nstrace feature in TX mode with an advanced filter expression, the NetScaler appliance fails.

  [From Build 131.11] [#494911, 481032, 511763, 528309, 532708, 538507]

- If password based authentication is used to open an SSH session to a NetScaler appliance, the wrong remote IP address is sent to the NetScaler syslog records.

  [From Build 131.11] [#286861, 301935, 513312, 522183, 541332]

- The ns_monuploadd_err.pl script monitors the health of the NetScaler appliance by looking for errors recorded in the log files. The script decompresses the log files and does not remove the decompressed log files, which therefore consume disk space.

  [From Build 131.11] [#532042, 447664, 532587, 533164]

- A NetScaler ADC processing SPDY traffic on SPDY enabled virtual servers fails intermittently if an HTTP response body received with chunked transfer-encoding and the response header is modified by other NetScaler features.

  [From Build 131.11] [#519004, 528861]

- If a non-HTTP request is received on an HTTP virtual server, the transaction might fail.

  [From Build 131.11] [#504910]

- When upgrading the NetScaler software from release 9.3, without a cache license, to release 10.0 or later, with a cache license, you have to apply the cache configuration manually to enable the integrated caching feature.

  [From Build 131.11] [#451841, 332826, 346327, 361979, 465489, 485864]

- The save ns config command and the nsnetsvc process fail under low memory conditions.

  [From Build 131.11] [#488110, 496136]

- If you enable SPDY and the SPDY layer accumulates more than 8912 bytes of set-cookie values while processing a sever response, a buffer overrun causes the NetScaler appliance to fail.

  [From Build 131.11] [#524949]

- The NetScaler backup and restore functionality now creates a backup of each of the following configuration files: inetd.conf, ntp.conf, syslog.conf, newsyslog.conf, crontab, host.conf, hosts, ttys, sshd_config, httpd.conf, monitrc, rc.conf, ssh_config, localtime, issue, and issue.net.

  [From Build 131.11] [#506378]

- A NetScaler VPX virtual appliance with multiple packet engines fails if you enable the nstrace feature in TX mode with an advanced filter expression.

  [From Build 131.11] [#528309]

- If the NetScaler appliance uses the HTTP pipeline to parse an HTTP request, and the parsing process fragments the request packet, the appliance might not UNSET the NS_FINAL_DATA flag after receiving a fragment of the packet. In that case, the appliance will fails.

  [From Build 131.11] [#527320, 527211]

- During the execution of the "nstrace.sh" script (from shell) or the "start nstrace" command (from CLI), when the trace file is rolled over, some packets might not be available in the trace. The number of packets that will be dropped from the trace is directly proportional to the traffic rate.

  [From Build 132.8] [#480258, 494482, 523853]

- Enabling the AppFlow feature during a transaction causes the NetScaler appliance to fail.

  [From Build 132.8] [#547739, 527797, 531101]

- The output of the "show channel" command includes interfaces that have been unbound from the channel.

  [From Build 132.8] [#540998]

- If the NetScaler appliance receives a Websocket upgrade request, and an HTTP-body based policy is bound globally or to a virtual server, the appliance does not forward the request to server until a TCP FIN flag is received from the client.

  [From Build 132.8] [#536576, 549318]

- In a cluster setup, if the TCP profile parameter 'sendBuffsize' is unset the NetScaler appliance displays 0 bytes as the buffer size instead of 8190 bytes (default value).

  [From Build 132.8] [#552654]

- Multiple instances of the nstraceaggregator daemon can run at the same time. As a result the NetScaler appliance might fail and corrupt the captured files.

  [From Build 132.8] [#527119, 522584, 525657]

- A NetScaler appliance fails if it attempts to apply HTML injection to a server response that does not have a content type header.

[From Build 132.8] [#529493]

- The memory allocation API, malloc, returns a NULL value if it does not obtain memory for the nscollect utility. If the nscollect utility tries to dereference this NULL pointer, the result is a memory segmentation error.

  [From Build 131.11] [#528818, 529425]

- The NetScaler ADC generates SNMP clear alarm traps for successful cases of haVersionMismatch, haNoHeartbeats, haBadSecState, haSyncFailure, and haPropFailure error events in an HA configuration.

  [From Build 131.11] [#368832]

- The SNMP counter of type cntr32 has been changed to a gauge counter.

  [From Build 131.11] [#524080, 448724]

- In certain cases, an attempt to add or bind a load balancing virtual server, service, or service group can fail if the internal ID assigned to the virtual server, service or service group conflicts with the internal ID of an existing virtual server, service, or service group.

  Workaround: Try creating the virtual server, service, or service group again.

  [From Build 132.8] [#516162, 358664, 538009, 540912, 542248, 542721, 546566, 549368]

- The NetScaler appliance serves erroneous cache content if you use the XenApp/XenDesktop wizard's auto-configured cache policies.

  [From Build 132.8] [#426551, 545422]

- You can now optionally configure agCallbackURL from agURL. The agURL would represent the front end Access Gateway (AG) for the client. The agCallback is for communication between Web Interface (WI) and AG. Also, The agCallbackURL is an optional parameter. Use the following command to configure agCallbackURL:

  add wi site /Citrix/new http://agee.citrix.com http://sta.citrix.com -agCallbackUrl http://callback.citrix.com

  [From Build 131.11] [#508743]

- Upgrading a NetScaler ADC from release 10 to release 10.1 deletes a set of customized options of the add wi site command.

  [From Build 126.12] [#456120]

- In a high availability setup, if the failover operation is performed twice, a user trying to launch an application is unable to proceed after the AGESSO.jsp page appears. If the domain controller is configured for x number of logon retries, and the user refreshes the page x number of times, the account is locked.

  With this fix, the user is able to launch the application. However, if an application is launched immediately after failover, and the launch takes longer than usual (about 75 seconds), a session error page might appear, in which case the user has

to log on again.

[From Build 126.12] [#450811]

- Neither the CLI nor the configuration utility allows a user to configure a pre-login message of more than 255 characters.

  [From Build 126.12] [#458113]

- Users who access a Microsoft Sharepoint server through a NetScaler ADC that has the application firewall enabled are unable to open any document type that requires software that is not part of the browser, such as Microsoft Office files.

  [From Build 129.22] [#450232]

Enhancement Releases

Apr 08, 2014

This section describes the enhancements and known issues provided in the enhancement releases of the Citrix NetScaler and Citrix NetScaler SDX.

- Build 129.1105.e
- Build 127.1007.e
- Build 126.1203.e
- Build 124.1308.e
- Build 123.1100.e
- Build 122.1708.e
- Build 121.1013.e

Build 129.1105.e

Feb 13, 2014

Release version: Citrix NetScaler release 10.1.e build 129.1105.e

Replaces build: None

Release date: Oct 2014

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

Note:

- This release is based on Citrix NetScaler release 10.1 build 129.11. The release notes are available in the Build 129.22 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.1.e nCore.

Bug Fixes

May 07, 2014

Networking

- Issue ID 490341: With MAC based forwarding (MBF) option enabled, the NetScaler ADC does not update Layer 2 information such as MAC address, interface ID, and VLAN ID, for a dynamic service even when the associated router is inactive. As a result, the router drops the packets destined to the IP address specified by the dynamic service.

Build 127.1007.e

Feb 13, 2014

Release version: Citrix NetScaler release 10.1.e build 127.1007.e

Replaces build: None

Release date: Aug 2014

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

Note:

- This release is based on Citrix NetScaler release 10.1 build 127.10. The release notes are available in the Build 127.10 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.1.e nCore.

Bug Fixes

May 07, 2014

High Availability

- Issue ID 469857: On a HA setup, even though the source IP is not explicitly set to *, the output of the "show ns rpcNode" commands shows the source IP as *. Therefore, when HA failover happens for the second time, the LB persistency session information is not propagated to the secondary node. This means that the information is not available when a forced failover is performed on the new primary node.
  The fix ensures that the NetScaler IP (NSIP) address of the local box is always set as the source IP address in a HA setup.

NetScaler Gateway

- Issue ID 484245: If Kerberos uses x.509 certificates (PKINIT) for single sign-on, NetScaler Gateway fails to obtain tickets if the Key Distribution Center (KDC) returns a realm referral. This can cause the NetScaler Gateway appliance to fail.
- Issue ID 461279: When users upgrade the NetScaler Gateway Plug-in from Version 10.1.122.17 or later to the latest Version 10.1 Maintenance Release on a computer that includes an installation of Citrix Receiver, the automatic upgrade fails.
- Issue ID 463871: If you bind SAML and LDAP authentication polices to the virtual server for two-factor authentication, after authenticating with SAML which is primary authentication type the LDAP user name populates automatically. If the first logon attempt to LDAP fails, user names are case-sensitive and must be entered again exactly as it appears after SAML authentication. For example, if the user name is populated as JohnDoe@xyzz.com and the user types johndoe@xyzz.com during the subsequent attempt, log on fails.
- Issue IDs 481889, 486176: In a high availability deployment, if the NetScaler Gateway virtual server is missing on the secondary appliance, NetScaler Gateway fails during session propagation.

NetScaler SDX Appliance

- Issue ID 423917: DNS configuration is not included in backup files
  Workaround:Configure the DNS configuration through network settings option

Build 126.1203.e

Feb 13, 2014

Release version: Citrix NetScaler release 10.1.e build 126.1203.e

Replaces build: None

Release date: June 2014

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements

Note:

- This release is based on Citrix NetScaler release 10.1 build 126.12. The release notes are available in the Build 126.12 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.1.e nCore.

Enhancements

May 07, 2014

- Issue ID 437359: A parameter Source IP Persistency has been introduced in RNAT rules and Netprofiles:
  Source IP Persistency for RNAT Sessions

  The source IP persistency of a RNAT rule enables the NetScaler ADC to use the same NAT IP address for all RNAT sessions initiated from a particular server.

  Source IP Persistency for NetProfiles

  The source IP persistency of a netprofile associated with a virtual server or service enables the NetScaler ADC to use the same address, specified in the net profile, for all sessions initiated from a particular client.

Build 124.1308.e

Apr 08, 2014

Release version: Citrix NetScaler release 10.1.e build 124.1308.e

Replaces build: None

Release date: April 2014

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements

Note:

- This release is based on Citrix NetScaler release 10.1 build 124.13. The release notes are available in the Build 124.13 section on Citrix eDocs.
- The enhancement in this release apply to Citrix NetScaler 10.1.e nCore.

Enhancements

May 07, 2014

- ENH ID 0413833: You can now use Remote Integrated Service Engine (RISE) technology to integrate a NetScaler ADC and a Cisco Nexus 7000 Series switch. This combination offers layered network services, including robust application delivery capabilities that accelerate application performance for all users.
  With a RISE based implementation, the NetScaler functionality is available as a centralized resource that can be leveraged across the application infrastructure supported by the Cisco Nexus 7000 series switch. The key functionalities of the RISE architecture include:

  - Plug and play auto-provisioning
    RISE provides a plug and play auto-provisioning feature. When you directly connect the NetScaler ADC to the Cisco Nexus 7000 series switch, auto-discovery commences.

  - Discovery and bootstrapping
    The discovery and bootstrap mechanism enables the Cisco Nexus 7000 Series switch to communicate with the NetScaler ADC by exchanging information to set up a RISE channel, which transmits control and data packets.

  - Health Monitoring
    The NetScaler ADC uses its health monitoring feature to track and support server health by sending health probes to verify server responses.

  - Automatic Policy Based Routing (APBR)
    Automatic Policy Based Routing (APBR) automatically routes the return traffic from the servers to the NetScaler ADC, preserving the client IP addresses. The automatic policy based routes are defined on the Cisco Nexus 7000 series switch. When the return traffic from the server reaches the Cisco Nexus 7000 series switch, the APBR policies defined on the switch route the traffic to the NetScaler ADC, which in turn routes the traffic to the client.

- ENH ID 0436500: In a High Availability (HA) setup, stateful connection failover is now supported for load balancing virtual servers configured in TOS mode.
  With stateful connection failover enabled, the secondary appliance has information about the connections established before the failover and starts serving those already established connections after the failover.

  After HA failover, the client remains connected to the same physical server. The new primary appliance synchronizes the information with the new secondary appliance by using the SSF framework. During the transition period, the client and server may experience a brief disruption and retransmissions.

Build 123.1100.e

Mar 20, 2014

Release version: Citrix NetScaler release 10.1.e build 123.1100.e

Replaces build: None

Release date: March 2013

Release notes version: 2.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issue

Note:

- This release is based on Citrix NetScaler release 10.1 build 123.11. The release notes are available in the Build 123.11 section on Citrix eDocs.
- The enhancements and known issue in this release apply to Citrix NetScaler 10.1.e nCore™.

Enhancements

Mar 20, 2014

- ENH ID 0368447: This enhancement allows state information, in the form of variables, to be stored and used on NetScaler appliances . Variables can be of ulong, text, or map types. A map can have ulong and text type elements. And the map key is always text.

  Note:
  - Variables are not supported in a high availability setup.
  - Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) need to be deleted. Then the variable can be re-added with new settings, and the references (expressions and assignments) can be re-added.

  To use variables by using the command line interface

  1. Create a variable. Variables can be of singleton (ulong and text) and map type.
     //Declares a single valued 64-bit integer variable named my_counter. It is initialized to 0.
     ```
     add ns variable my_counter –type ulong
     ```
     //Declares a map named user_privilege_map that will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries. If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries . By default, an expression trying to get a value for a non-existent key will initialize an empty text value.
     ```
     add ns variable user_privilege_map -type map(text(15),text(10),10000)
     ```
  2. Specify the assignment for the variable. The assignment specifies the value or operation to be performed on that variable.
     //Defines an assignment named inc_my_counter that automatically adds one to the my_counter variable.
     ```
     add ns assignment inc_my_counter -var $my_counter -add 1
     ```
     //Defines an assignment named set_user_privilege that adds to the user_privilege_map variable an entry for the client's IP address with the value returned by the get_user_privilege HTTP callout. If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user_privilege_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.
     ```
     add ns assignment set_user_privilege -var $user_privilege_map[client.ip.src.typecast_text_t] -set sys.http.callout(get_user_privilege)
     ```
     //Defines an assignment named clear_user_privilege that clears the entry for the client's IP address in the user_privilege_map variable.
     ```
     add ns assignment clear_user_privilege -var $user_privilege_map[client.ip.src.typecast_text_t] -clear
     ```
  3. Configure the assignment as an action for a policy.
     //Configures the assignment set_user_privilege with a compression policy
     ```
     add cmp policy set_user_privilege_pol -rule $user_privilege_map.valueExists(client.ip.src.typecast_text_t).not -resAction set_user_privilege
     ```

  To use variables by using the configuration utility

  1. Navigate to AppExpert > NS Variables, to create the variables.
  2. Navigate to AppExpert > NS Assignments, to assign values to the variables.
  3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

For more information, see Variables.

Known Issue

Mar 12, 2014

- Issue ID 0419226: In the configuration utility, the online help for the content accelerator feature mentions a video that is not available.

Build 122.1708.e

Feb 13, 2014

Release version: Citrix NetScaler release 10.1.e build 122.1708.e

Replaces build: None

Release date: February 2014

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issue

Note:

- This release is based on Citrix NetScaler release 10.1 build 122.17. The release notes are available in the Build 122.17 section on Citrix eDocs.
- The enhancements and known issues in this release apply to Citrix NetScaler 10.1.e nCore.

Enhancements

Feb 13, 2014

Adaptive Threshold in NetScaler Insight Center

- ENH ID 0378995: The adaptive threshold functionality in NetScaler Insight Center dynamically sets the threshold value for the maximum number of hits on each URL. If the maximum number of hits on a URL is greater than the threshold value set for the URL, a syslog message is sent to an external syslog server. The threshold value can be set for daily or weekly interval.

  For more information, see Managing Threshold.

Provisioning Palo Alto VM-Series Instances on a NetScaler SDX Appliance

- ENH ID 0357214: Palo Alto Networks VM-Series on Citrix NetScaler SDX enables consolidation of best-in-class security and ADC capabilities on a single platform, for secure, reliable access to applications by businesses, business units, and service-provider customers. The combination of VM-Series on Citrix NetScaler SDX also provides a complete, validated, security and ADC solution for Citrix XenApp and XenDesktop deployments.

  You can provision, monitor, manage, and troubleshoot an instance from the Management Service.

  Note: The total number of instances that you can provision on an SDX appliance depends on the license installed on the appliance.
  Important: You must upgrade your XenServer version to version 6.1.0 and install the xs-netscaler-6.1.0-2.6.32.43-0.4.1.xs1.6.10.777.170770-100012 supplemental pack.
  For more information, see Palo Alto Networks VM-Series.

Known Issue

Mar 12, 2014

Configuration Utility

- Issue ID 0419226: In the configuration utility, the online help for the content accelerator feature mentions a video that is not available.

Build 121.1013.e

Dec 31, 2013

Release version: Citrix NetScaler release 10.1.e build 121.1013.e

Replaces build: None

Release date: December 2013

Release notes version: 1.0

Language supported: English (US)

Review the following sections:

- Enhancements
- Known Issue

Note:

- This release is based on Citrix NetScaler release 10.1 build 121.10. The release notes are available in the Build 121.10 section on Citrix eDocs.
- The enhancements and known issue in this release apply to Citrix NetScaler 10.1.e nCore™.

Enhancements

Jan 01, 2014

Authentication and Authorization Enhancements

- ENH ID 0399086: With this release, the following authentication and authorization capabilities are supported on NetScaler SDX appliance:

  - External authentication for RADIUS, TACACS, and LDAP servers.
  - Group extraction capability for LDAP and RADIUS authentication types.
  - Authentication and authorization for requests through SSH. However, the authorization of SSH users is limited to super-user privileges only.
  - Audit logs for RADIUS and TACACS servers. You need to enable the Accounting option for the servers in the Management Service.

  For more information, see Configuring Authentication and Authorization Settings.

User Name and Password Length Extended to 127 Characters

- ENH ID 0325421: User names and passwords on the NetScaler appliance can now be up to 127 characters in length. Usernames and passwords can consist of upper-case and lower-case letters, digits, and the hyphen and underscore characters.

Content Accelerator

- ENH ID 0400961: The NetScaler provides a feature called Content Accelerator, that can be used in a Citrix ByteMobile T1100 deployment, to store content on a Citrix ByteMobile T2100 appliance. For more information, see Content Accelerator.

Known Issue

Jan 01, 2014

Configuration Utility

- Issue ID 0419226: In the configuration utility, the online help for the content accelerator feature mentions a video that is not available.

Configuration Utility Changes

Jul 11, 2013

In release 10.1, the NetScaler configuration utility has a new look. The navigation tree is reorganized and grouped according to the major features of the NetScaler appliance. The action buttons have been moved to the top of the screen, and additional actions are now in a drop-down list. Some of the subnodes are also moved to the right pane of the configuration utility.

Note: In eDocs, only topics that have been updated or added in the current release reflect the interface changes. For other topics, see the "Node Mapping table" below to map the former top-level nodes to their new locations.

Navigation Tree Reorganization

The nodes in the configuration utility are grouped by feature area, in the same way that feature documentation is organized in eDocs. The top-level nodes in the navigation tree of the configuration utility are **System**, **AppExpert**, **Traffic Management**, **Optimization** and **Security**. The following table shows the new location of nodes that were formerly at the top-level.

Table 1. Node mapping table

Top-level nodes in the previous version of configuration utility	Location of the nodes in current configuration utility
Network	System > Network
Group	System > User Administration
Users	System > User Administration
Database Users	System > User Administration
command policies	System > User Administration
EdgeSight Monitoring	System > EdgeSight Monitoring
Network	System > Network

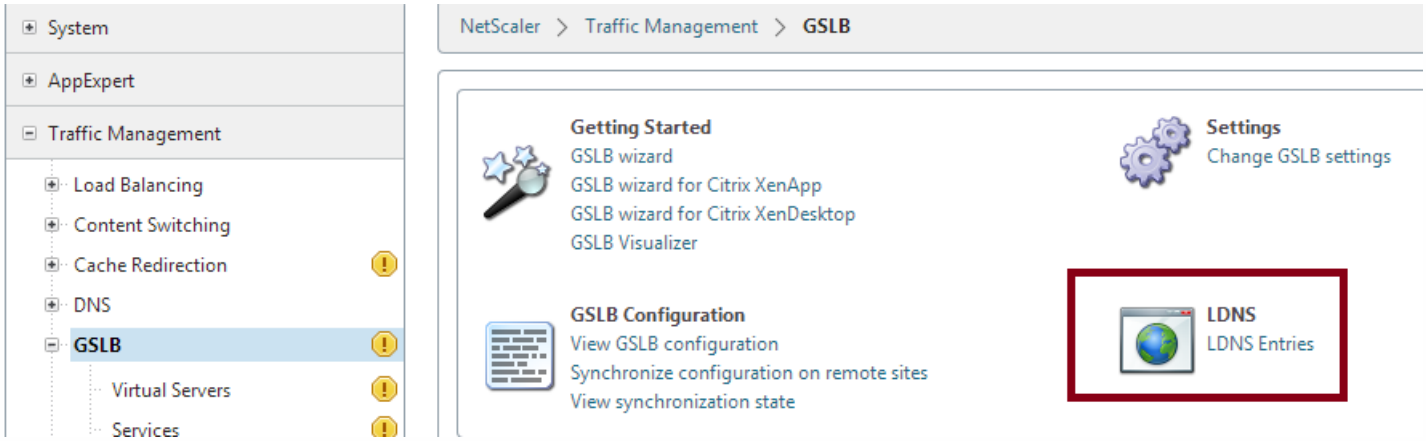
HTTP Compression	Optimization > HTTP Compression
Integrated Caching	Optimization > Integrated Caching
AAA-Application traffic	Security > AAA-Application traffic
Application Firewall	Security > Application Firewall
Protection features	Security > Protection features
Other changes	
GSLB > Location	AppExpert > Location

In addition to the reorganization of the nodes within the navigation tree, some of the nodes are now grouped along with the configurations options present in the right pane of the configuration utility. For example, LDNS Entries which was earlier present as a sub-node of GSLB, is now grouped along with the global GSLB configurations present in the details pane of the configuration utility.



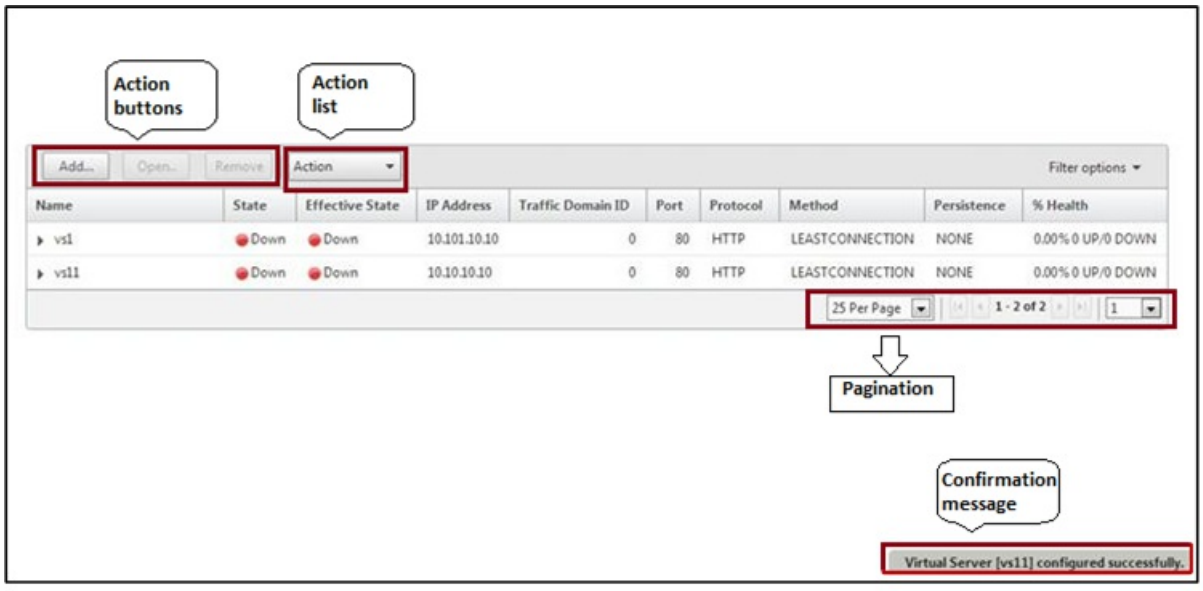
- Auto Detected Services, earlier present as a separate tab when you select Load Balancing > Services is now present as an option in the **Action** list when you select Load Balancing > Services.
- The option to view FIPS Configuration Summary is now present in the details pane, when you select **SSL**.
- The options to view the AppExpert applications, application templates, and the NetScaler Gateway Applications is present in the details pane, when you select **AppExpert**.
- The option to view cache objects is now present in the details pane, when you select **Integrated Caching**.

To locate any node in the new configuration utility, see the *Node mapping* table.

Other Changes

The following changes further enhance the usability of the configuration utility:

- The (Add, Open, and Remove) action buttons are now at the top of the details pane.
- The other action buttons (for example, Rename, Show Bindings, Policy Bindings, Statistics) have been replaced by Action list.
- The option for number of records to display per page has been moved to the bottom of the table that lists the entities.
- The confirmation message for any action that the user performs is displayed at the lower right corner of the configuration utility.
- A vertical scroll bar is provided in the right pane of the configuration utility for easy viewing.



NetScaler Licensing Overview

Aug 24, 2016

If you want to upgrade your software to 10.1, you can use your existing license. Contact your Citrix sales representative for new licenses if you are using the standard edition and want to upgrade to the enterprise or platinum edition, or if you are using the enterprise edition and want to upgrade to the platinum edition.

You can easily allocate your NetScaler licenses. In the NetScaler configuration utility (GUI), you can use your hardware serial number (HSN) or your license activation code (LAC) to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see "http://support.citrix.com/article/CTX131110".

Note:

- On a NetScaler MPX or SDX appliance, you can use the HSN or LAC to allocate your license or upload the license to the appliance from a local computer. On a NetScaler VPX appliance, you can only upload the license to the appliance from a local computer.
- You must purchase separate licenses for each appliance in a high availability (HA) pair. Make sure that the same type of licenses are installed on both the appliances. For example, if you purchase a platinum license for one appliance, you must purchase another platinum license for the other appliance.

This document includes the following information:

Prerequisites

Updated: 2014-06-24

To use the hardware serial number or license activation code to allocate your licenses:

- You must be able to access public domains through the appliance. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain, you must configure a NetScaler IP (NSIP) address, configure a mapped IP (MIP) address or a subnet IP (SNIP) address, and set up a DNS server.
- Your license must be linked to your hardware, or you must have a valid license activation code (LAC). Citrix sends your LAC by email when you purchase a license.

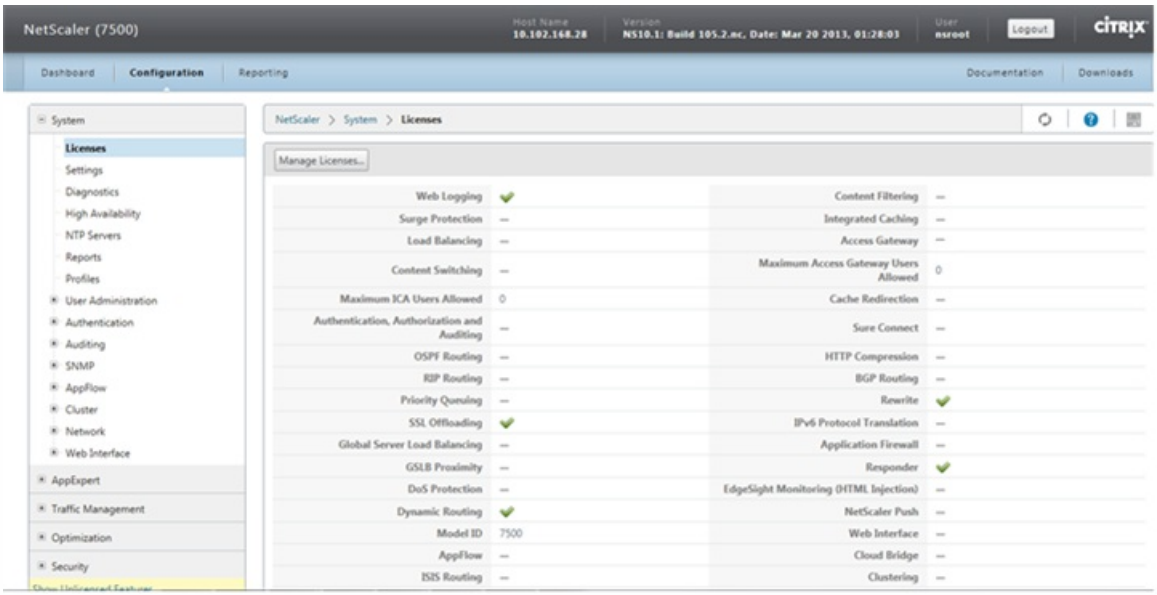
Allocating your License by using the Configuration Utility

Updated: 2014-02-11

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license activation code (LAC).

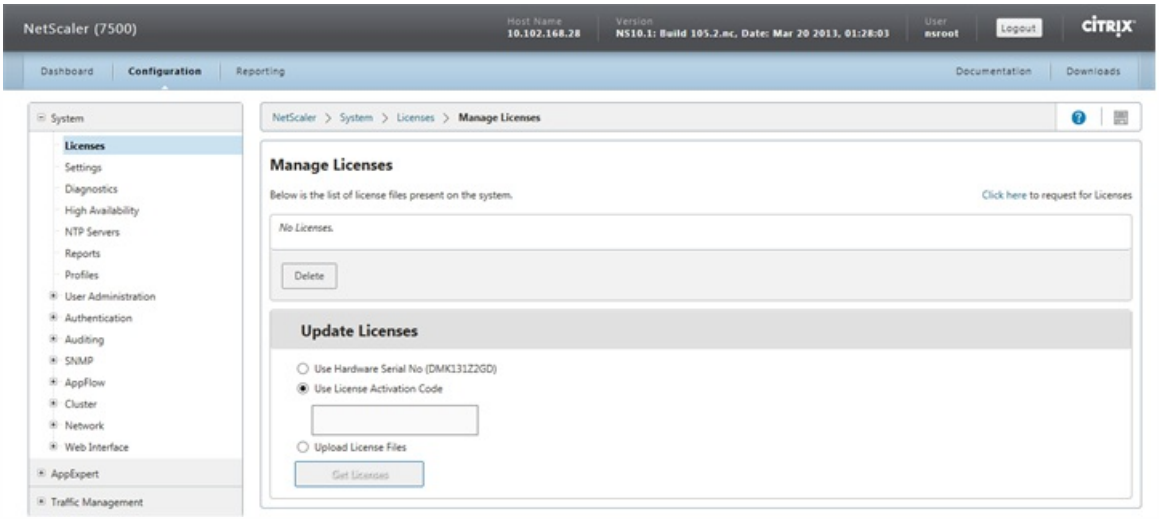
To allocate your license

1. In a web browser, type the IP address of the NetScaler (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System > Licenses.
4. In the details pane, click Manage Licenses.



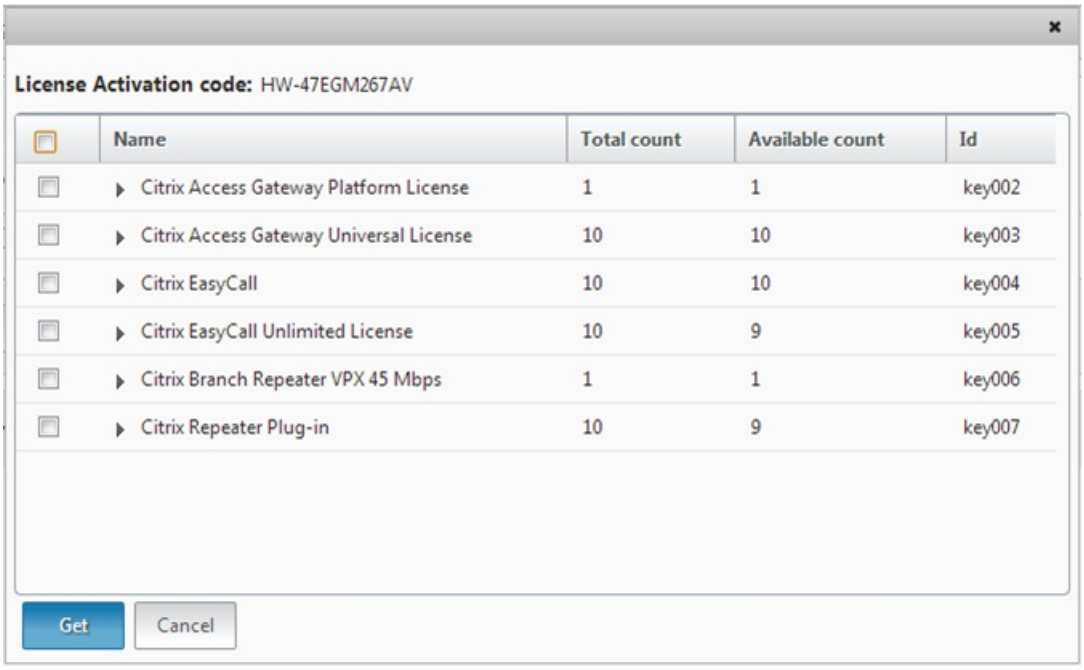
5. Click Update Licenses, and then select one of the following options:
   - **Use Hardware Serial Number**—The software internally fetches the serial number of your appliance and uses this number to display your license(s).

   - **Use License Activation Code**—Citrix emails the LAC for the license that you purchased. Enter the LAC in the text box.

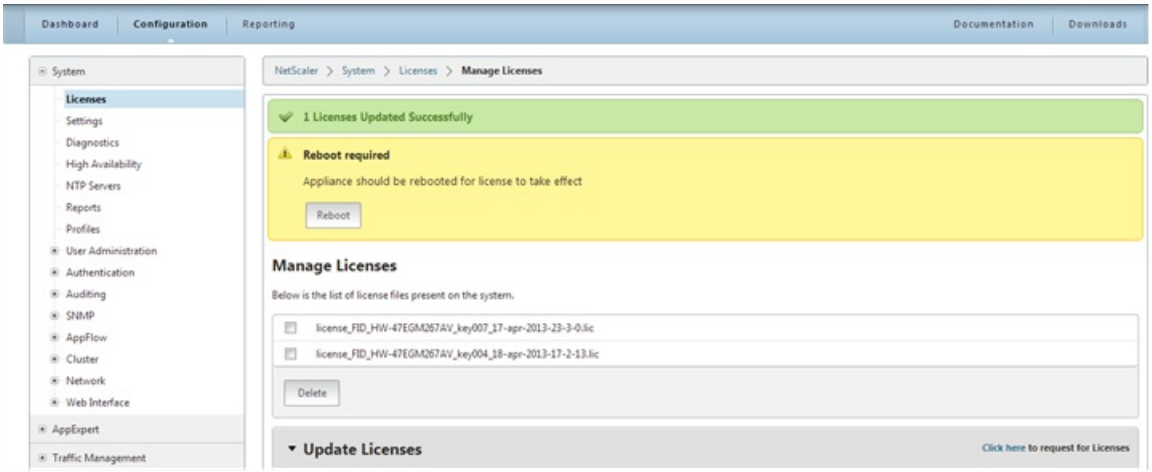


6. Click Get Licenses. Depending on the option that you selected, one of the following dialog boxes appears.
   - The following dialog box appears if you selected Hardware Serial Number.

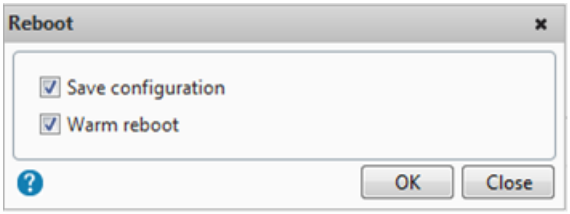
   - The following dialog box appears if you selected License Activation Code.



7. Select the license that you want to allocate, and then click Get.
8. Click Reboot for the license to take effect.



9. In the Reboot dialog box, click OK to proceed with the changes, or click Close to cancel the changes.



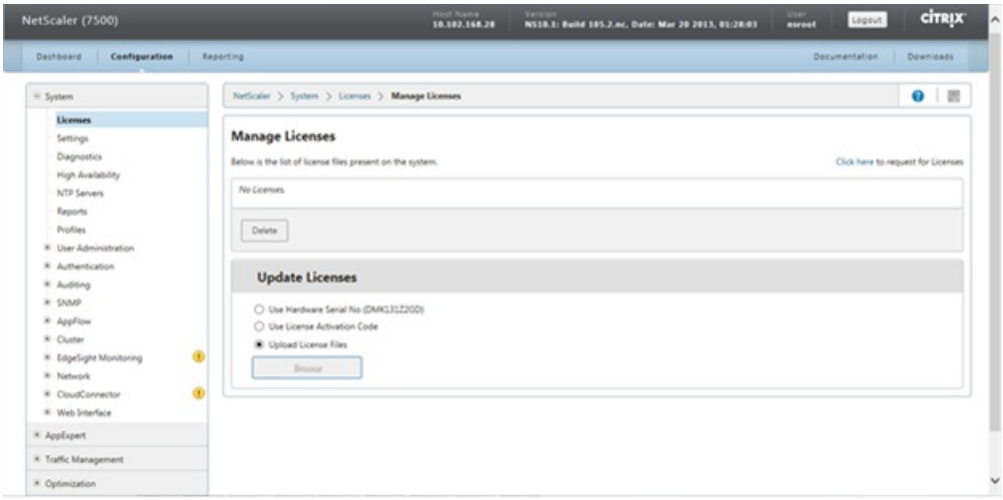
Installing the License

Updated: 2014-06-24

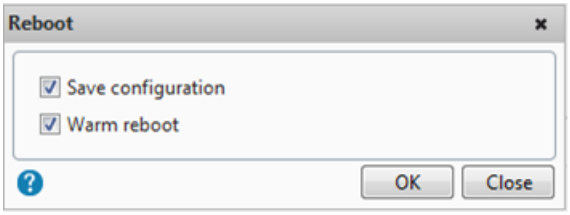
If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

To install a license file by using the configuration utility

1. In a web browser, type the IP address of the NetScaler (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System > Licenses .
4. In the details pane, click Manage Licenses.
5. Click Update Licenses, and then select **Upload License Files**.



6. Click Browse. Navigate to the location of the license files, select the license file, and then click Open.
7. Click Reboot to apply the license.
8. In the Reboot dialog box, click OK to proceed with the changes, or click Close to cancel the changes.



See also

To install the licenses by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy the new license file(s) to this directory.

Example

```
login: nsroot
Password: nsroot
Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
Done
> shell
Last login: Mon Aug  4 03:51:42 from 10.103.25.64
root@ns# mkdir /nsconfig/license
root@ns# cd /nsconfig/license
```

Copy the new license file(s) to this directory.

Note: The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the reboot -w command to warm reboot the system, or run the reboot command to reboot the system normally.

Verifying the Licensed Features

Updated: 2014-06-24

Before using a feature, make sure that your license supports the feature.

To verify the licensed features by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. At the command prompt, enter the sh ns license command to display the features supported by the license.

Example

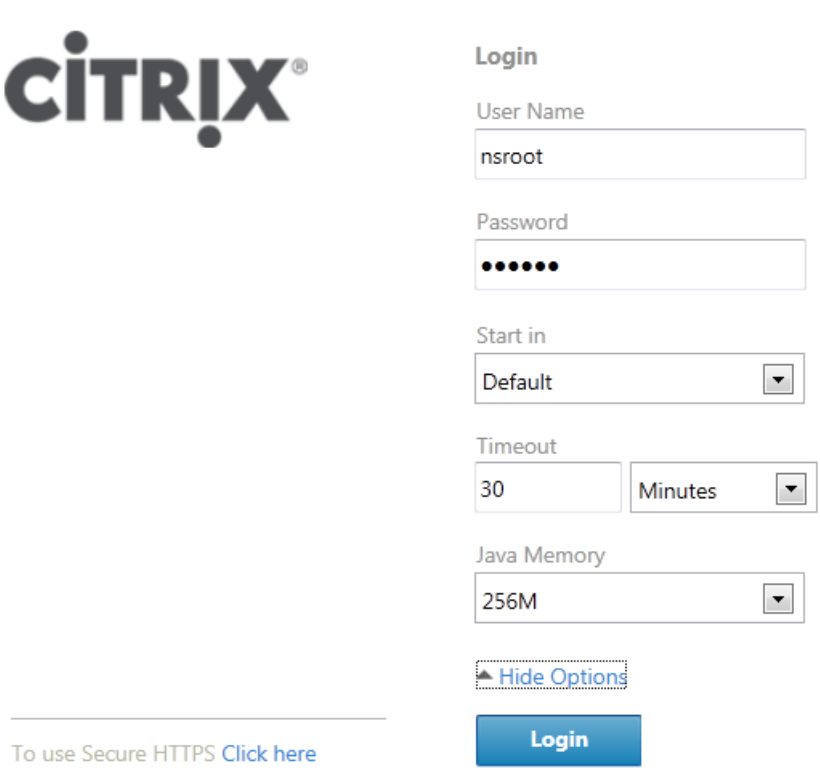
```
sh ns license
      License status:
                  Web Logging: YES
              Surge Protection: YES
                .......

                HTML Injection: YES
 Done
```

To verify the licensed features by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as http://192.168.100.1.
2. In User Name and Password, type the administrator credentials.
3. In Start in, select Configuration, and then click Login, as shown in the following figure.

Figure 1. Login Screen



4. In the navigation pane, expand System, and then click Licenses. You will see a green check mark next to the licensed features.

Enabling or Disabling a Feature

Updated: 2014-07-01

When you use the NetScaler appliance for the first time, you need to enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it will apply only after the feature is enabled.

To enable a feature by using the command line interface

At the NetScaler command prompt, type the following commands to enable a feature and verify the configuration:

- enable feature <FeatureName>
- show feature

Example

```
enable feature lb cs
done
 >show feature

      Feature                Acronym          Status
      -------                -------          ------
 1)   Web Logging             WL               OFF
 2)   Surge Protection         SP               ON
 3)   Load Balancing           LB               ON
 4)   Content Switching        CS               ON
 5)   Cache Redirection        CR               ON
```

```
.
.
.
24)  NetScaler Push          push          OFF
Done
```

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key is not available for a particular feature, the following error message appears for that feature:

```
ERROR: feature(s) not licensed
```

Note: To enable an optional feature, you need a feature-specific license. For example, if you have purchased and installed the Citrix NetScaler Enterprise Edition license and need to enable the Integrated Caching feature, you first need to purchase and install the AppCache license.

To disable a feature by using the command line interface

At the NetScaler command prompt, type the following commands to disable a feature and verify the configuration:

- disable feature <FeatureName>
- show feature

Example

The following example shows how to disable load balancing (LB).

```
> disable feature lb
Done
> show feature

     Feature              Acronym        Status
     -------              -------        ------
1)   Web Logging          WL             OFF
2)   Surge Protection     SP             ON
3)   Load Balancing       LB             OFF
4)   Content Switching    CS             ON
.
.
.
24)  NetScaler Push       push           OFF
Done
>
```

Upgrading or Downgrading the System Software

Jun 25, 2014

NetScaler 10.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Take a moment to read this document before you upgrade your software.

It is important to understand the licensing framework and types of licenses before you upgrade your software. A software edition upgrade may require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition.

Note: For upgrading or downgrading the nodes in a cluster setup, see "Upgrading or Downgrading the Cluster Software". Upgrading from release 10.1 build 121.10 or any earlier releases to release 10.1 build 122.17 and later involves some location changes of user monitor script files. For details, see Directory Locations of Script Files for User Monitors.

This document includes the following information:

- Upgrading to Release 10.1
- Upgrading to a Later Build within Release 10.1
- Downgrading from Release 10.1
- Downgrading to an Earlier Build within Release 10.1
- Auto Cleanup

Directory locations of script files for user monitors

Updated: 2014-06-24

In release 10.1 build 122.17, the script files for user monitors are at a new location. If you upgrade an appliance or virtual appliance to release 10.1 build 122.17 or later, the changes are as follows:

- A new directory named conflicts is created in /nsconfig/monitors/ and all the built-in scripts of the previous builds are moved to this directory.
- All new built-in scripts are available in the /netscaler/monitors/ directory. All custom scripts are available in the /nsconfig/monitors/ directory.
- You must save a new custom script in the /nsconfig/monitors/ directory.
- After the upgrade is completed, if a custom script is created and saved in the /nsconfig/monitors/ directory with the same name as that of a built-in script, the script in the /netscaler/monitors/ directory takes priority. That is, the custom script is not run.

If you provision a virtual appliance running release 10.1 build 122.17 or later, the changes are as follows:

- All built-in scripts are available in the /netscaler/monitors/ directory
- The directory /nsconfig/monitors/ is empty.
- If you create a new custom script, you must save it in the /nsconfig/monitors/ directory.

For more information about user monitors, see "Understanding User Monitors."

NetScaler Documentation

Apr 30, 2013

A complete set of NetScaler documentation is available on Citrix eDocs at http://support.citrix.com/proddocs/topic/netscaler/ns-gen-netscaler-wrapper-con.html.

You are encouraged to provide feedback and suggestions so that we can enhance the documentation.

Service and Support

Apr 30, 2013

Citrix® offers a variety of resources for support with your Citrix environment, including the following:

- The Knowledge Center is a self-service, Web-based technical support database that contains thousands of technical solutions, including access to the latest hotfixes, service packs, and security bulletins.
- Technical Support Programs for both software support and appliance maintenance are available at a variety of support levels.
- The Subscription Advantage program is a one-year membership that gives you an easy way to stay current with the latest product version upgrades and enhancements.
- Citrix Education provides official training and certification programs on virtually all Citrix products and technologies.

For more information about Citrix services and support, see the Citrix Systems Support Web site at http://www.citrix.com/lang/English/support.asp.

You can also participate in and follow technical discussions offered by the experts on various Citrix products at the following sites:

- http://community.citrix.com
- http://twitter.com/citrixsupport

FAQs

Feb 17, 2015

AppFlow

Jul 08, 2013

Which build of NetScaler supports AppFlow?

AppFlow is supported on NetScaler appliances running version 9.3 and above with nCore build.

What is the format used by AppFlow to transmit data?

AppFlow transmits information in the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information.

What do AppFlow records contain?

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response-status codes, server response time, and latency). IPFIX flow records are based on templates that must be sent before sending flow records.

After an upgrade to NetScaler Version 9.3 Build 48.6 Cl, why does an attempt to open a virtual server from the GUI result in the error message "The AppFlow feature is only available on Citrix Netscaler Ncore"

AppFlow is supported only on nCore appliances. When you open the virtual server configuration tab, clear the **AppFlow** checkbox.

What does the transaction ID in an AppFlow records contain?

A transaction ID is an unsigned 32-bit number identifying an application-level transaction. For HTTP, a transaction corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. A typical transaction has four uniflow records. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for the transaction.

What is an AppFlow action ?

An Appflow action is a set of collectors to which the flow records are sent if the associated AppFlow policy matches.

What commands can I run on the NetScaler appliance to verify that the AppFlow action is a hit?

The show appflow action. For example:

```
> show appflow action
1)    Name: aFL-act-collector-1
      Collectors: collector-1
      Hits: 0
      Action Reference Count: 2
2)    Name: apfl-act-collector-2-and-3
      Collectors: collector-2, collecter-3
      Hits: 0
      Action Reference Count: 1
3)    Name: apfl-act-collector-1-and-3
      Collectors: collector-1, collecter-3
      Hits: 0
      Action Reference Count: 1
```

What is an AppFlow collector?

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. You can remove unused collectors.

What NetScaler verison is required for using AppFlow?

Use NetScaler version 9.3.49.5 or higher, and remember that AppFlow is available in only the nCore builds.

What transport protocol does AppFlow use?

AppFlow uses UDP as the transport protocol.

What ports needs to be opened if I have a firewall in the network?

Port 4739. It is the default UDP port the AppFlow collector uses for listening on IPFIX messages. If the user changes the default port, that port should be opened on the firewall.

How can I change the default port AppFlow uses?

When you add an AppFlow collector by using the add appflowCollector command, you can specify the port to be used.

```
> add appflowCollector coll1 -IPAddress
10.102.29.251 -port 8000
 Done
```

What does setting clientTrafficOnly do?

NetScaler generates AppFlow records only for client-side traffic.

How many collectors can be configured at a time?

You can configure up to four AppFlow collectors at a time on the NetScaler appliance. Please note that the maximum number of collectors that can be configured on a NetScaler appliance is four.

AutoScale

Sep 18, 2013

What are the prerequisites for setting up AutoScale?

For prerequisites for setting up AutoScale, see "Prerequisites".

Can the CloudPlatform AutoScale feature be used without a NetScaler appliance?

No. The NetScaler appliance is currently required for the AutoScale feature to work. If the CloudPlatform administrator configures AutoScale in a network that does not include a NetScaler appliance, CloudPlatform throws an error.

What happens if the AutoScale feature is used with a NetScaler release that does not support AutoScale?

If the AutoScale feature is used with a NetScaler release that does not support AutoScale, the CloudPlatform user interface throws an error. CloudPlatform also writes a message to the log file, indicating that the configured NetScaler does not support AutoScale.

What versions of CloudPlatform and NetScaler should I use to implement AutoScale?

For information about NetScaler releases that support AutoScale, see Supported Environment.

In a load balancing rule, can manually provisioned virtual machine instances coexist with instances provisioned by the AutoScale feature?

No. The CloudPlatform virtual machine group in a load balancing rule can contain only manually provisioned instances or only instances provisioned by the AutoScale feature. They cannot coexist.

Is there a limit on the number of virtual machine instances to which we can scale up by using AutoScale?

Yes. The CloudPlatform administrator specifies the maximum number of members to which the configuration can scale up. When the limit is reached, virtual machines are not provisioned even if the scale-up condition is satisfied. The upper limit prevents uncontrolled spawning of VMs due to misconfiguration of the AutoScale feature or unexpected load conditions.

Are AutoScale events observable?

The events generated for deploying or destroying virtual machines are observable. These events are logged in the NetScaler logs (ns.log) and in the CloudPlatform logs (management-server.log). However, you cannot observe the metric values collected by NetScaler monitors.

What metrics can be used in AutoScale policies?

In an AutoScale policy, you can use any metric that is exposed through SNMP, or any NetScaler statistics associated with the load balancing virtual server used in the AutoScale configuration. For example, you can use metrics associated with CPU, memory, or disk usage, and NetScaler metrics such as throughput or response time.

What should a CloudPlatform administrator do before performing maintenance tasks on a CloudPlatform network in which AutoScale is configured?

The CloudPlatform administrator should disable the AutoScale configuration from the CloudPlatform user interface. Disabling the AutoScale configuration temporarily disables any scale-up or scale-down events. However, disabling AutoScale for an application, in CloudPlatform, does not affect the ability of the NetScaler appliance to serve traffic to existing virtual machines.

With AutoScale configured, are any configured VM limits enforced on the user account?

The NetScaler appliance works in the context of an AutoScale user account. Therefore, any limits that the CloudPlatform

administrator has imposed on the number of VMs that can be created by the account are automatically enforced when the NetScaler appliance attempts to create more VMs than are permitted.

Is AutoScale supported in a high availability (HA) NetScaler pair?

No. Currently, HA mode is not supported for AutoScale.

Call Home

Jun 14, 2016

What is the Call Home feature on a NetScaler appliance?

The Call Home feature registers your NetScaler appliance with the Citrix Technical Support server (TaaS) and monitors the appliance for common error conditions. If your appliance is successfully registered with TaaS server, Call Home automatically uploads system debug data to that server in the event that one of the conditions occurs. The appliance keeps a full log of all upload events. If you are unable to correct the problem after reviewing the appliance's log, you can contact the Citrix Technical Support team and open a service request. The team can analyze the uploaded system data and recommend possible solutions.

Which release of NetScaler Software supports Call Home?

Release 10 and later.

Does Call Home support monitoring of any error conditions in a NetScaler virtual appliance?

No. Call Home does not currently support monitoring of virtual appliances.

Which NetScaler hardware models support Call Home?

Any NetScaler MPX appliance running release 10 or later of the NetScaler software supports Call Home.

Do you need a separate license for Call Home?

No. The Call Home feature does not require a separate license. It is available with all NetScaler platform licenses.

Does Call Home support monitoring of cluster events or error conditions?

No. Call Home does not currently support monitoring of NetScaler clusters.

What error conditions does Call Home monitor in a NetScaler appliance?

Call Home supports monitoring of the following events in a NetScaler appliance:

- Compact flash drive errors
- Hard disk drive errors
- Power supply unit failure
- SSL card failure
- Warm restart

What mechanism does Call Home use to upload the Call Home tar file to TaaS?

Call Home uses the HTTPS protocol to upload the Call Home tar file.

Does Call Home support automatic Technical Support service request creation?

No. You have to contact the Citrix Technical Support team to open a service request.

What is the frequency of Call Home tar file uploads to TaaS?

Call Home creates the Call Home tar file and uploads it to the Citrix Technical Support server (TaaS) upon first occurrence of a particular error condition since the appliance was last started. That is, a reoccurrence of same error condition does not trigger another upload unless the appliance was rebooted after the previous occurrence.

Must I configure SNMP for Call Home to monitor error conditions?

No. Call Home creates and uploads a Call Home tar file for the first occurrence of a monitored error condition since the

appliance was last started. If you want to be alerted each time the error condition occurs, you can configure the corresponding SNMP alarm for the error condition.

Is the Call Home feature enabled by default on the appliance?

No, the Call Home feature is disabled, by default. You must first enable the feature to register the appliance for critical error conditions.

Clustering

Feb 04, 2016

Click here for clustering FAQs for NetScaler versions 11.0, 10.5, and 10.1.

Configuration Utility - Frequently Asked Questions

Sep 05, 2014

Q: I am using a MAC Safari browser to upgrade a NetScaler ADC. On the upgrade wizard, when I click the Browse button to choose the build file from the appliance, the dialog box does not show any files or folders. Also, when I navigate back to the root folder, the dialog box displays the top level folder, but I cannot browse it. What should I do?

A: On the Safari browser, click the Settings icon and navigate to Preferences > Security > Manage Website Settings > Java, and then change value of the When visiting other websites setting to Run in unsafe mode.

Q: After I upgraded the JRE on my appliance to version 7.51, the graphical user interface (GUI) applet does not load when I access the NetScaler configuration utility. The applet download stops at 1%, and Java generates a security error. What should I do?

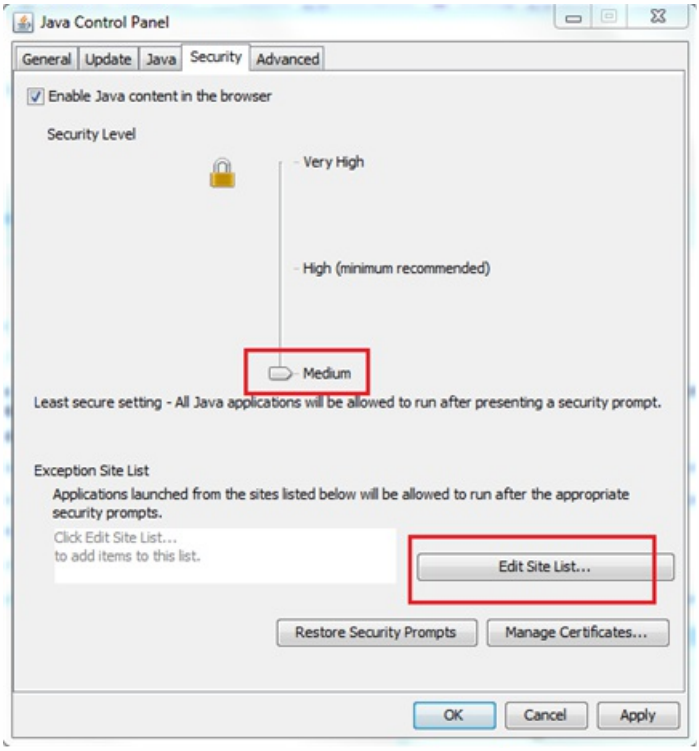
A: You can use the configuration utility with JRE 7.51 if, in the Java Control Panel, you lower the security level or add the NetScaler appliance's URL to the Exception Site List.

If using a Windows computer, navigate to Control Panel and click Java.

If using a MAC computer, navigate to System Preferences and click Java.

Then, in the Java Control Panel dialog box, do either of the following:

- Click the Security tab, and then set the Security Level to medium.
- Click the Security tab, click the Edit Site List button, and then add the URL of the NetScaler appliance in the Exception Site List box.
  Figure 1. Java Control Panel



Q: After I upgraded the JRE on my appliance to version 7.45, the graphical user interface (GUI) applet does not load when I access the NetScaler configuration utility. The applet download stops at 1%, and Java throws a security error. What should I do?

A: The NetScaler GUI is not compatible with JRE version 7.45. Citrix recommends using a JRE version earlier than 7.45 to access the configuration utility. If you have already upgraded to version 7.45 and do not want to downgrade, you can configure Java to not keep temporary files. However, you will have to download the JAR files every time you access the configuration utility.

To downgrade JRE 7.45 to an earlier version:

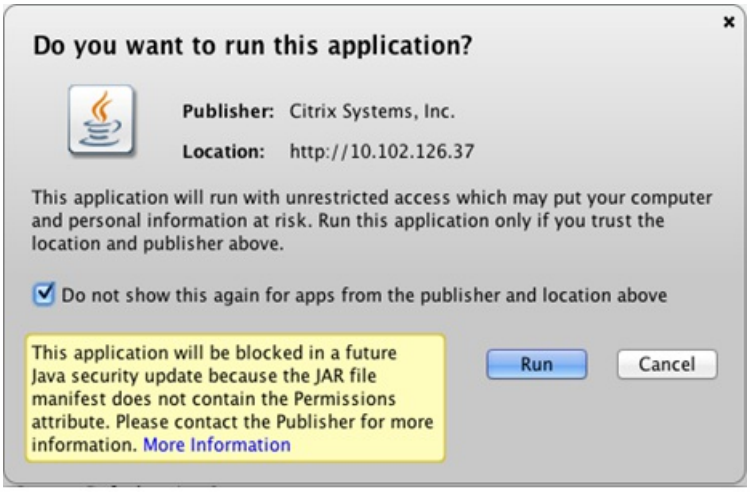
1. Uninstall JRE 7.45 by following the instructions at http://www.java.com/en/download/help/uninstall_java.xml.
2. Download an earlier version of JRE from the following location: http://www.oracle.com/technetwork/java/javase/archive-139210.html.

To continue using JRE 7.45:

If you are using a Windows system, navigate to Control Panel and click Java. The Java Control Panel opens.

If you are using a MAC system, navigate to System Preferences and click Java. The Java Control Panel opens.

1. Click the General tab.
2. Under Temporary Internet Files, click Settings.
3. Clear the Keep temporary files on my computer option.
4. Close the browser and re-launch the GUI.
5. Open the configuration utility and click Run and Allow, respectively, when the following warnings appear:



Note:

- The Jar files will not be cached and you will have to download the files every time you access the configuration utility.
- This problem is fixed in the following releases:
  - Release 9.3, build 65.x and later
  - Release 10.0, build 78.x and later
  - Release 10.1, build 122.x and later
  - Release 10.1.e, build 120.13xx.e

Q: What should I do before accessing the NetScaler configuration utility?

A: Before accessing a new version of the NetScaler software:

- Clear your browser cache.
- Make Sure that JavaScript, Java, and plug-ins are enabled in your browser. For help with enabling Java for your browser, see http://java.com/en/download/help/enable_browser.xml.
- Clear the "Temporary internet files" in the Java console.
- On the Java tab of the Java console, in Java Runtime Environment Settings, make sure that the latest version of JRE is present and is enabled.

Q: I am using HTTP to access the configuration utility. Which port should I open?

A: Open TCP port 3010 when using HTTP to access the configuration utility.

Q: I am using HTTPS to access the configuration utility. Which port should I open?

A: Open TCP port 3008 when using HTTPS to access the configuration utility.

Q: After entering the IP address of the NetScaler appliance in the address bar, I get the following error: "Java Applet could not be loaded". What should I do?

A: Verify that Java is installed properly. You can download Java from www.java.com. If you are using a MAC Safari browser, Java is disabled if it is not used for 35 days.

To enable Java plug-in in Safari, follow these steps:

1. In the Safari browser, choose Safari > Preferences or press Command-comma (⌘-,) on your keyboard.
2. Click Security, and then select Enable Java.

3. Close the Safari Preferences window.

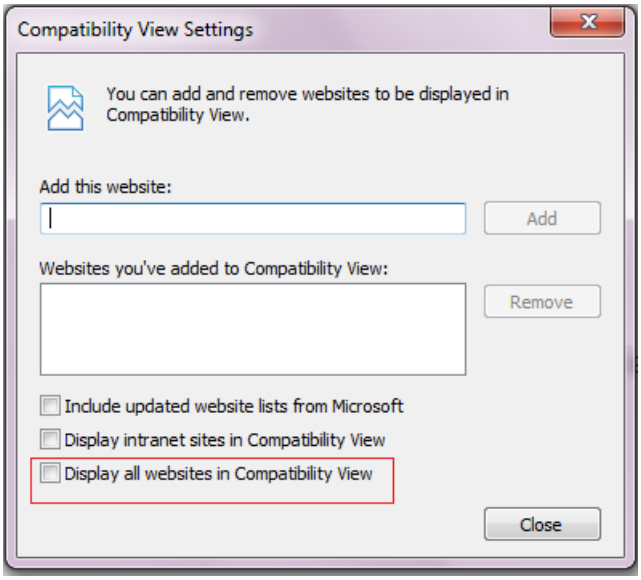
Q: With which browsers is the configuration utility compatible for different operating systems?

A: The following table lists the compatible browsers:

Operating System	Browser	Versions
Windows 7	Internet Explorer	8 and 9
	Mozilla Firefox	3.6.25 and above
	Chrome	15 and above
Windows 64 bit	Internet Explorer	8 and 9
	Chrome	15 and above
MAC OS	Mozilla Firefox	12 and above
	Safari	5.1.3

Q: When I access the NetScaler configuration utility by using Internet Explorer version 8 or 9, the browser displays only a grey bar at the top of the screen. What should I do?

A: The browser might be set in compatibility mode. To disable compatibility mode, go to **Tools** > **Compatibility View Settings** and clear the **Display all websites in Compatibility View** check box.



Q: Even after I disable compatibility mode in Internet Explorer version 8 or 9, the configuration utility does not appear. What should I do?

A: Make sure that the browser mode and document mode in the browser are set to the same version. To view the configuration, press F12. Set the values to either Internet Explorer 8 or Internet Explorer 9.

Q: When I access the NetScaler configuration utility by using Internet Explorer version 9, the utility displays the following error message: "You are not logged in. Please login." What should I do?

A: Make sure that the cookies are not blocked in your Interner Explorer settings. Go to **Tools** > **Internet Options**. Click the **Privacy** tab, and then under **Settings**, make sure that the slider is set to **Medium** or any lower value.

Q: I am using a MAC OS with JRE 1.7. After logging on to the configuration utility, I am not able to enter value in any of the text fields. What should I do?

A: Install Java 7, update 21 or higher.

Q: I am using a MAC OS. When I click outside a dialog window, the screen goes out of focus. Now, my browser looks disabled and hung. What should I do?

A: Click on the Java icon in the system dock, and in the JRE Security Warning window, click **Don't Block**. For details, see http://www.oracle.com/technetwork/java/javase/7u21-relnotes-1932873.html

Q: Is there any compatibility issue in using JRE version 7_11 with the latest version of browsers?

A: Yes. Internet Explorer 9 and Firefox 18.0.1 block Java on computers running JRE version 7_11. You have to manually activate Java in the browser or upgrade to a later version of JRE (JRE 7_13).

Content Switching

Aug 30, 2013

I have installed a non-NetScaler load balancing appliance on the network. However, I would like to use the content switching feature of the NetScaler appliance to direct the client requests to the load balancing appliance. Is it possible to use the Content switching feature of the NetScaler appliance with a non-NetScaler load balancing appliance?

Yes. You can use the Content switching feature of the NetScaler appliance with the load balancing feature of the NetScaler appliance or a non-NetScaler load balancing appliance. However, when using the non-NetScaler load balancing appliance, make sure that you create a load balancing virtual server on the NetScaler appliance and bind it to the non-NetScaler load balancing appliance as a service.

How is a Content switching virtual server different from a load balancing virtual server?

A Content switching virtual server is capable only of sending the client requests to other virtual servers. It does not communicate with the servers.

A Load balancing virtual server balances the client load among servers and communicates with the servers. It monitors server availability and can be used to apply different load balancing algorithms to distribute the traffic load.

Content switching is a method used to direct client requests for specific types of content to targeted servers by way of load balancing virtual servers. You can direct the client requests to the servers best suited to handle them. This result in reduced overheads to process the client requests on the servers.

I want to implement the Content switching feature of the NetScaler appliance to direct the client requests. What types of client request can I direct by using the Content switching feature?

You can direct only HTTP, HTTPS, FTP, TCP, Secure TCP, and RTSP client requests by using the Content switching feature. To direct HTTPS client requests, you must configure the SSL offload feature on the appliance.

I want to create Content switching rules on the NetScaler appliance. What are the various elements of the client request on which I can create a content switching rule?

You can create the content switching rules based on the following elements and their values in the client request:

- URL
- URL tokens
- HTTP version
- HTTP Headers
- Source IP address of the client
- Client version
- Destination TCP port

I understand that the content switching feature of the NetScaler appliance helps enhance the performance of the network. Is this correct?

Yes. You can direct the client requests you the servers best suited to handle them. The result is reduced overhead for processing the client requests on the servers.

Which feature of the NetScaler appliance should I configure on the NetScaler appliance to enhance the site manageability and response time to the client requests?

You can configure the content switching feature of the NetScaler appliance to enhance the site manageability and

response time to the client request. This feature enables you to create content groups within the same domain name and IP address. This approach is flexible, unlike the common approach of explicitly partitioning the content into different domain names and IP addresses, which are visible to the user.

Multiple partitions dividing a Web site into various domain names and IP addresses force the browser to create a separate connection for each domain it finds when rendering and fetching the content of a web page. These additional WAN connections degrade the response time for the web page.

I have hosted a web site on a web server farm. What advantages does the NetScaler content switching feature offer for this type of setup?

The content switching feature provides the following advantages on a NetScaler appliance in in a site that is based in a web server farm:

- Manage the site content by creating a content group within the same domain and IP address.
- Enhance the response time to client requests by using the content group within the same domain and IP address.
- Avoid the need for full content replication across domains.
- Enable application-specific content partitioning. For example, you can direct client requests to a server that handles only dynamic content or only static content, as appropriate for the request.
- Support multi-homing of multiple domains on the same server and use the same IP address.
- Reuse connections to the servers.

I want to implement the content switching feature on the NetScaler appliance. I want to direct the client requests to the various servers after evaluating the various parameters of each request. What approach should I follow to implement this setup when configuring the content switching feature?

You can use policy expressions to create policies for the content switching feature. An expression is a condition evaluated by comparing the qualifiers of the client request to an operand by using an operator. You can use the following parameters of the client request to create an expression:

- **Method**- HTTP request method.
- **URL**- URL in the HTTP header.
- **URL TOKENS**- Special tokens in the URL.
- **VERSION**- HTTP request version.
- **URL QUERY**- Contains the URL Query LEN, URL LEN, and HTTP header.
- **SOURCEIP**- IP address of the client.

Following is a complete list of the operators that you can use to create an expression:

- == (equals)
- != (not equals)
- EXISTS
- NOT EXISTS
- CONTAINS
- NOT CONTAINS
- GT (greater than)
- LT (less than)

You can also create various rules, which are logical aggregations of a set of expressions. You can combine multiple expressions to create rules. To combine expressions, you can use the && (AND) and || (OR) operators. You can also use parenthesis to create nested and complex rules.

I want to configure a rule based policy along with a URL based policy for the same content switching virtual

server. Is it possible to create both types of policies for the same content switching virtual server?

Yes. You can create both type of policies for the same content switching virtual server. However, be sure to assign priorities to set an appropriate precedence for the policies.

I want to create content switching policies that evaluate the domain name, along with a prefix and suffix of a URL, and direct the client requests accordingly. Which type of content switching policy should I create?

You can create a Domain and Exact URL policy. When this type of policy is evaluated, the NetScaler appliance selects a content group if the complete domain name and the URL in the client request match the ones configured. The client request must match the configured domain name and exactly match the prefix and suffix of the URL if they are configured.

I want to create content switching policies that evaluate the domain name, along with a partial prefix and suffix of URL, and direct the client requests accordingly. Which type of content switching policy should I create?

You can create a Domain and Wildcard URL policy for the content switching virtual server. When this type of policy is evaluated, the NetScaler appliance selects a content group if the request matches the complete domain name and partially matches the URL prefix.

What is a Wildcard URL policy?

You can use wildcards to evaluate partial URLs in client requests to the URL you have configured on the NetScaler appliance. You can use wildcards in the following types of URL-based policies:

- Prefix only. For example, the /sports/* expression matches all URLs available under the /sports URL. Similarly, the /sports* expression matches all URLs whose prefix is /sports .
- Suffix only. For example the /*.jsp expression matches all URLs with a file extension of jsp.
- Prefix and Suffix. For example, the /sports/*.jsp expression matches all URLs under the /sports/ URL that also have the jsp file extension. Similarly, the /sports*.jsp expression matches all URLs with a prefix of /sports* and a file extension of jsp.

What is a Domain and Rule policy?

When you create a Domain and Rule policy, the client request must match the complete domain and the rule configured on the NetScaler appliance.

What is the default precedence set for evaluating policies?

By default, the rule based policies are evaluated first.

If some of the content is the same for all client requests, what type of precedence should I use for evaluating policies?

If some of the content is same for all the users and different content should be served on the basis of client attributes, you can use URL-based precedence for policy evaluation.

What policy expression syntaxes are supported in content switching?

Content switching supports two types of policy expressions:

- **Classic Syntax-** Classic syntax in content switching starts with the keyword REQ and is more advanced than the default syntax. Classic policies cannot be bound to an action. Therefore, the target load balancing virtual server can be added only after binding the content switching virtual server.
- **Default Syntax:** Default syntax generally starts with key word HTTP and is easier to configure. A target load balancing virtual server action can be bound to a Default Syntax policy, and the policy can be used on multiple content switching virtual servers.

Can I bind a single content switching policy to multiple virtual servers?

Yes. You can bind a single content switching policy to multiple virtual servers by using policies with defined actions. Content switching policies that use an action can be bound to multiple content switching virtual servers because the target load balancing virtual server is no longer specified in the content switching policy. The ability to bind a single policy to multiple content switching virtual servers helps to further reduce the size of the content switching configuration.

For more information, see the following Knowledge Center articles and eDocs topics:

- "How to Bind the Same Content Switching Policy to Two Content Switching vServers on a NetScaler Appliance," at http://support.citrix.com/article/CTX122918 .
- "How to Bind the Same Advanced Policy to Multiple Content Switching Virtual Servers using Policy Labels," at http://support.citrix.com/article/CTX122736.
- "Configuring a Content Switching Action," at http://support.citrix.com/proddocs/topic/netscaler-traffic-management-10-map/ns-cs-basicconfig-config-cs-action-con.html

Can I create an action based policy using classic expressions?

No. As of now NetScaler does not support policies using classic syntax expressions with actions. The target load balancing virtual server should be added when binding the policy instead of defining it in an action.

High Availability

Sep 30, 2013

What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?

In an HA configuration, both nodes use the following ports to exchange HArelated information:

- UDP Port 3003, to exchange heartbeat packets
- Port 3010, for synchronization and command propagation

What configurations are not synced or propagated in an HA configuration in either INC or non-INC mode?

Configurations implemented with the following commands are neither propagated nor synced to the secondary node:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.

Note: For more information about HA Configuration in INC mode, see Configuring High Availability Nodes in Different Subnets.

What configurations are not synced or propagated in an HA configuration in INC mode?

The following configurations are neither synced nor propagated. Each node has its own.

- MIPs
- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations.

What are the conditions that trigger synchronization?

Synchronization is triggered by any of the following conditions:

- The incarnation number of the primary node, received by the secondary, does not match that of the secondary node. Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node's configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number is not incremented for the following commands:
  - All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
  - All Interface related commands. For example, set interface and unset interface.
  - All channel-related commands. For example, add channel, set channel, and bind channel.
- The secondary node comes up after a restart.
- The primary node becomes secondary after a failover.

Does a configuration added to the secondary node get synchronized on the primary?

No, a configuration added to the secondary node is not synchronized to the primary.

What could be the reason for both nodes claiming to be the primary in an HA configuration?

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem could be with the network between the nodes.

Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

Different system-clock settings on the two nodes can cause the following issues:

- The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
- After a failover, you might have problems with any type of cookie based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
- Similar considerations apply to any time related decisions on the nodes.

What are the conditions for failure of the *force HA sync* command?

Forced synchronization fails in any of the following circumstances:

- You force synchronization when synchronization is already in progress.
- The secondary node is disabled.
- HA synchronization is disabled on the current secondary node.
- HA propagation is disabled on the current primary node and you force synchronization from the primary.

What are the conditions for failure of the *sync HA files* command?

Synchronizing configuration files fail if the secondary node is disabled.

In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the *force failover* command.

What are the conditions for failure of the *force failover* command?

A forced failover fails in any of the following circumstances:

- The secondary node is disabled.
- The secondary node is configured to remain secondary.
- The primary node is configured to remain primary.
- The state of the peer node is unknown.

Hardware FAQs

Dec 04, 2014

Transceivers

Are transceivers shipped with the MPX 8005/8015/8200/8400/8600/8800 appliance?

No. Transceivers are available for purchase separately. Contact your Citrix sales representative to order transceivers for your appliance.

Are transceivers hot-swappable?

The 1G SFP transceiver is hot-swappable with release 9.3 build 47.5 or later on the following NetScaler appliances, which use the Intel e1k interface:

- MPX 7500/9500
- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

The 10G SFP+ transceiver is hot-swappable with release 9.3 build 57.5 or later on the following NetScaler appliances, which use the ixgbe (ix) interface:

- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 17500/19500/21500
- MPX 17550/19550/20550/21550
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

Why does the 10G SFP+ transceiver autonegotiate to 1G speed?

Autonegotiation is enabled by default on the 10G SFP+ ports into which you insert your 10G SFP+ transceiver. When a link is established between the port and the network, the speed is autonegotiated. For example, if you connect the port to a 1G network, the speed is autonegotiated to 1G.

Can I insert a 1G transceiver into a 10G slot?

The 10G slot supports copper 1G transceivers, which can operate at up to 1 Gbps in a 10 Gbps slot.

Note that you cannot insert a 10G transceiver into a 1G slot.

The following table shows the compatibility matrix of transceivers and ports available on the NetScaler appliance.

Ports	Transceivers		
	10G	1G Fiber	1G Copper

10G	Supported	Not Supported	Supported
1G Fiber	Not Supported	Supported	Not Supported
1G Copper	Not Supported	Not Supported	Supported

What is QSFP+?

QSFP+ stands for Quad Small Form-factor Pluggable, which is a small, hot-pluggable transceiver for connecting data devices. This transceiver is used for 40G interfaces.

QSFP+ to Four SFP+ Copper Breakout Cables—These cables connect to four SFP+ 10GE ports of a NetScaler appliance on one end and to a QSFP+ 40G port of a Cisco switch on the other end.

Support for 40G connectivity—NetScaler models that have at least four 10G SFP+ ports connect to Cisco 40G interfaces by aggregating four of the 10G SFP+ ports to form a 40G link aggregation channel. QSFP to Four port SFP+ Copper Breakout Cable **QSFP-4SFP10G-CU3M (reports as L45593-D178-C30)** is used.

Which NetScaler appliances support the QSFP-4SFP10G-CU3M (reports as L45593-D178-C30) Breakout Cable?

NetScaler appliances that have at least four 10G SFP+ ports support this cable. The following appliances have at least four 10G SFP+ ports:

- MPX 11500/13500/14500/16500/18500/20500
- MPX 17550/19550/20550/21550
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

QSFP-4SFP10G-CU3M breakout cable is supported by NetScaler release 9.3 build 65.8 or later, and release 10.1 build 122.17 or later.

Power Supplies

Is the power supply on the NetScaler MPX 5500 and MPX 5550/5650 appliances field replaceable?

No. The power supply on the NetScaler MPX 5500 and MPX 5550/5650 appliances is fixed.

Does the MPX 8005/8015/8200/8400/8600/8800 appliance ship with two power supplies?

No. The MPX 8005/8015/8200/8400/8600/8800 appliance supports dual power supplies but ships with one power supply. Contact your Citrix sales representative to order a second power supply.

How many power supplies are shipped with each platform?

The following table lists the number of power supplies shipped with each platform:

Platform	Number of Power Supplies shipped
MPX 5500	1
MPX 7500/9500	1 (You can order a second power supply.)

Platform	Number of Power Supplies shipped
MPX 9700/10500/12500/15500	2
MPX 15000/17000	1 (You can order a second power supply.)
MPX 11500/13500/14500/16500/18500/20500	2
MPX 17500/19500/21500	1 (You can order a second power supply.)
MPX 17550/19550/20550/21550	2

Are power supplies hot-swappable?

Yes. If the appliance has two power supplies, you can replace one power supply without shutting down the appliance, provided the other power supply is working.

Rack and Rail

Do you have different rail kits for 1U and 2U appliances?

No. All MPX and SDX appliances use the same rail kit. The kit contains two pairs of slide rails, of different lengths, for a 1U and a 2U appliance.

Which rail kit should I buy?

The appliance ships with the standard 4-post rail kit that fits racks from 28-38 inches.

The compact 4-post rail kit for racks from 23-33 inches, or the 2-post rail kit for 2-post racks, has to be purchased separately. Contact your Citrix sales representative to order the appropriate kit.

What are the maximum and the minimum lengths of the outer rack rails?

The length of a standard outer rack rail is from 28 to 38 inches. The length of a shorter outer rack rail is from 23 to 33 inches.

What is the space required between the front post and rear post of the rack?

Standard racks require 28–38 inches between the front and rear posts. Shorter racks require from 23 to 33 inches.

How far can an appliance extend from the front post of the rack?

The chassis can extend up to 1.25 inches from the front post for all NetScaler MPX and SDX appliances.

How much space is required for maintaining the front and rear area of an appliance?

Minimum clearance areas of 36 inches for the front area and 24 inches for the rear area are required for maintenance of all NetScaler MPX and SDX appliances.

Lights Out Management (LOM) Port

Which LOM features are supported on the NetScaler MPX Appliance?

The MPX 8005/8015/8200/8400/8600/8800, MPX 11500/13500/14500/16500/18500/20500, and MPX 17550/19550/20550/21550 have an Intelligent Platform Management Interface (IPMI), also known as the Lights out Management (LOM) port, on the front panel of the appliance. The following three LOM features are supported on those

platforms:

- Configuring the LOM port
- Power cycling the appliance
- Performing a core dump

Can the LOM interface be configured to accept only encrypted Virtual Network Computer (VNC) sessions on TCP port 5900?

Yes, customers who enable Transport Layer Security (TLS) on their LOM interface will have their VNC connections delivered over TLS as well.

For more information on LOM security guidelines, see Secure Deployment Guide for NetScaler MPX, VPX, and SDX Appliances.

Can the version of SSH used on the LOM interface be upgraded? Is there a patch available?

Individual components of the LOM cannot be upgraded independently. You must upgrade the entire LOM firmware as a package. The latest available LOM package can be found on the Citrix downloads website under LOM Firmware Upgrade.

Is it possible to add a third-party or self-signed SSL certificate to the LOM interface?

Yes, you can enable SSL on the latest binaries for third-party and self-signed SSL certificates, except on the 88XX models. On those models, the current LOM release does not support third-party certificates.

General

What is the recommended terminal emulator?

PuTTY.

Which platforms support Pay-As-You-Grow licenses?

The following platforms support Pay-As-You-Grow licenses:

- MPX 5550 to MPX 5650
- MPX 7500 to MPX 9500
- MPX 8005 to MPX 8015 to MPX 8200 to MPX 8400 to MPX 8600 to MPX 8800
- MPX 11500 to MPX 13500 to MPX 14500 to MPX 16500 to MPX 18500 to MPX 20500
- MPX 17500 to MPX 19500 to MPX 21500
- MPX 17550 to MPX 19550 to MPX 20550 to MPX 21550
- MPX 22040 to MPX 22060 to MPX 22080 to MPX 22100 to MPX 22120

Do you support direct attach cable (DAC)?

Yes, Citrix NetScaler appliances support a passive DAC in the following releases and builds:

- Release 9.3, build 63.4 and later
- Release 9.3.e, build 60.3007.e and later
- Release 10, build 74.2 and later
- Release 10.1, build 112.15 and later

Which port should I insert the DAC into?

DAC is inserted into the 10G port on the appliance.

Does the 1G port support DAC?

No. The DAC might fit into a 1G port but is not supported.

How can I order a DAC?

Contact your Citrix sales representative to order a DAC.

Can I mix DAC and fiber transceivers on the same appliance?

Yes. You can mix DAC and fiber transceivers on the same appliance. Each 10G port supports both options.

Can I mix SFP+ fiber and DAC in ports that are part of the same link aggregation channel (LAC)?

No. There must be symmetry between all elements in the same LAC.

Integrated Caching

Feb 28, 2014

Content Groups

How is a DEFAULT content group different from other content groups?

The behavior of the DEFAULT content group is exactly the same as any other group. The only attribute that makes the DEFAULT content group special is that if an object is being cached and no content group has been created, the object is cached in the DEFAULT group.

What is the 'cache-Control' option of the content group level?

You can send any cache-control header the browser. There is a content group level option, -cacheControl, which enables you to specify the cache-control header that you want to be inserted in the response to the browser.

What is the 'Minhit' option in content group level?

Minhit is an integer value specifying the minimum number of hits to a cache policy before the object is cached. This value is configurable at the content group level. Following is the syntax to configure this value from the command line interface.
add/set cache contentGroup <Content_Group_Name> [-minHits <Integer>]

What is the use of the expireAtLastByte option?

The expireAtLastByte option enables the integrated cache to expire the object as soon as it has been downloaded. Only requests that are outstanding requests at that time are served from cache. any new requests are sent to the server. This setting is useful when the object is frequently modified, as in the case of stock quotes. This expiry mechanism works along with the Flash Cache feature. To configure expireAtLastByte option, run the following command from the command line interface:

add cache contentGroup <Group_Name> –expireAtLastByte YES

Cache policy

What is a caching policy?

Policies determine which transactions are cacheable and which are not. Additionally, policies add or override the standard HTTP caching behavior. Policies determine an action, such as CACHE or NOCACHE, depending on the specific characteristics of the request or response. If a response matches policy rules, the object in the response is added to the content group configured in the policy. If you have not configured a content group, the object is added to the DEFAULT content group.

What is a policy hit?

A hit occurs when a request or response matches a cache policy.

What is a miss?

A miss occurs when a request or response does not match any cache policy. A miss can also occur if the request or response matches a cache policy but some override of RFC behavior prevents the object from being stored in the cache.

I have configured Integrated Caching feature of the NetScaler appliance. When adding the following policy, an error message appears. Is there any error in the command?

```
add cache policy image_caching -rule exp1 | ns_ext_not_jpeg –action cache
> ERROR: No such command
```

In the preceding command, the expression should be within the quotation marks. Without quotation marks, the operator is considered to be the pipe operator.

Memory Requirements

What are the commands that I can run on the NetScaler appliance to check the memory allocated to cache?

To display the memory allocated for cache in the NetScaler appliance, run any of the following commands from the command line interface:

- show cache parameter
  In the output, check the value of the Memory usage limit parameter. This is the maximum memory allocated for cache.
- show cache <Content_Group_Name>
  In the output, check the values of the Memory usage and Memory usage limit parameters indicating the memory used and allocated for the individual content group.

My NetScaler appliance has 2 GB of memory. Is there any recommended memory limit for cache?

For any model of the NetScaler appliance, you can allocate half of the memory to the cache. However, Citrix recommends allocating a little less than half of the memory, because of internal memory dependency. You can run the following command to allocate 1 GB of memory to cache:

```
set cache parameter -memLimit 1024
```

Is it possible to allocate memory for individual content groups?

Yes. Even though you allocate memory for the integrated cache globally by running the set cache parameter –memlimit<Integer>, you can allocate memory to individual content groups by running the set cache <Content_Group_Name> –memLimit <Integer> command. The maximum memory you can allocate to content groups (combined) cannot exceed the memory you have allocated to the integrated cache.

What is the dependency of memory between integrated cache and TCP buffer?

If the NetScaler appliance has 2 GB memory, then the appliance reserves approximately 800 to 900 MB of memory and remaining is allocated to FreeBSD operating system. Therefore, you can allocate up to 512 MB of memory to integrated cache and the rest is allocated to TCP buffer.

Does it affect the caching process if I do not allocate global memory to the integrated cache?

If you do not allocate memory to integrated cache, all requests are sent to the server. To make sure that you have allocated memory to the integrated cache, run the show cache parameter command. Actually no objects will be cached if global memory is 0, so this needs to be set first.

Verification commands

What are the options for displaying cache statistics?

You can use either of the following options to display the statistics for cache:

- stat cache
  To display the summary of the cache statistics.

- stat cache –detail
  To display the full details of the cache statistics.

What are the options for displaying the cached content?

To display the cached content, you can run the show cache object command.

What is the command that I can run to display the characteristics of an object stored in cache?

If the object stored in the cache is, for example, GET //10.102.12.16:80/index.html, you can display the details about the object by running the following command from the command line interface of the appliance:

```
show cache object -url '/index.html' -host 10.102.3.96 -port 80
```

Is it mandatory to specify the group name as a parameter to display the parameterized objects in cache?

Yes. It is mandatory to specify the group name as a parameter to display the parameterized objects in cache. For example, consider that you have added the following policies with the same rule:
add cache policy p2 -rule ns_url_path_cgibin -action CACHE –storeInGroup g1
add cache policy p1 -rule ns_url_path_cgibin -action CACHE -storeInGroup g2
In this case, for the multiple requests, if policy p1 is evaluated, its hit counter is incremented and the policy stores the object in the g1 group, which has hit parameters. Therefore, you have to run the following command to display the objects from the cache:

show cache object -url "/cgi-bin/setCookie.pl" -host 10.102.18.152 groupName g1

Similarly, for another set of multiple requests, if policy p2 is evaluated, its hit counter is incremented and the policy stores the object in the g2 group, which does not have hit parameters. Therefore, you have to run the following command to display the objects from the cache:

show cache object -url "/cgi-bin/setCookie2.pl" -host 10.102.18.152

I notice that there are some blank entries in the output of the nscachemgr command. What are those entries?

Consider the following sample output of the nscachemgr command. The blank entries in this output are highlighted in bold face for your reference:

```
root@ns# /netscaler/nscachemgr -a
//10.102.3.89:80/image8.gif
//10.102.3.97:80/staticdynamic.html
//10.102.3.97:80/
//10.102.3.89:80/image1.gif
//10.102.3.89:80/file5.html
//10.102.3.96:80/
//10.102.3.97:80/bg_logo_segue.gif
//10.102.3.89:80/file500.html
//10.102.3.92:80/
//10.102.3.96:80/cgi-bin/rfc/ccProxyReval.pl
Total URLs in IC = 10
```

The blank entries in the output are due to the default caching properties for GET / HTTP/1.1.

Flushing Objects

How can I flush a selective object from the cache?

You can identify an object uniquely by its complete URL. To flush such object, you can perform any of the following tasks:

- Flush cache
- Flush content group
- Flush the specific object

To flush the specific object, you have to specify the query parameters. You specify the invalParam parameter to flush the object. This parameter applies only to a query.

Does any change in the cache configuration trigger flushing of cache?

Yes. When you make any changes to the cache configuration, all the SET cache commands inherently flush the appropriate content groups.

I have updated the objects on the server. Do I need to flush the cached objects?

Yes. When you update objects on the server, you must flush the cached objects, or at least the relevant objects and content groups. The integrated cache is not affected by an update to the server. It continues to serve the cached objects until they expire.

Flash Cache

What is Flash Cache feature of the NetScaler appliance?

The phenomenon of Flash crowds occurs when a large number of clients access the same content. The result is a sudden surge in traffic toward the server. The Flash Cache feature enables the NetScaler appliance to improve performance in such situation by sending only one request to the server. All other requests are queued on the appliance and the single response is served to all of the requests. You can use either of the following commands to enable the Fast Cache feature:

- add cache contentGroup <Group_Name> -flashCache YES
- set cache contentGroup <Group_Name> -flashCache YES

What is the limit for Flash Cache clients?

The number of Flash Cache clients depends on the availability of resources on the NetScaler appliance.

Default Behaviour

Does the NetScaler appliance proactively receive objects upon expiry?

The NetScaler appliance never proactively receives objects on expiry. This is true even for the negative objects. The first access after expiry triggers a request to the server.

Does the integrated cache add clients to the queue for serving even before it starts receiving the response?

Yes. The integrated cache adds clients to the queue for serving even before it starts receiving the response.

What is the default value for the Verify cached object using parameter of the cache configuration?

HOSTNAME_AND_IP is the default value.

Does the NetScaler appliance create log entries in the log files?

Yes. The NetScaler appliance creates log entries in the log files.

Are compressed objects stored in the cache?

Yes. Compressed objects are stored in the cache.

Interoperability with other features

What happens to objects that are currently stored in cache and are being accessed though SSL VPN?

Objects stored in the cache and accessed regularly are served as cache hits when accessed through SSL VPN.

What happens to objects stored in the cache when accessed through SSL VPN and later accessed through a regular connection?

The objects stored through the SSL VPN access are served as a hit when accessed through the regular connection.

When using weblogging, how do I differentiate entries that indicate response served from cache from those served by the server?

For responses served from the integrated cache, the server log field contains the value IC. For responses served from a server, the server log field contains the value sent by the server. Following is a sample log entry for an integrated caching transaction:

"10.102.1.52 - "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 4.0; .NET CLR 1.0.3705)" "GET /" 200 0 "IC" 10.102.1.45"

Along with a client request, the response logged is the one sent to the client and not necessarily the one sent by the server.

Miscellaneous

What do you mean by configuring relexpiry and absexpiry?

By configuring relexpiry and absexpiry, it means that you are overriding the header irrespective of what appears in the header. You can configure different expiry setting and the content group level. With relexpiry, expiration of the header is based on the time at which the object was received by the NetScaler. With absexpiry, expiration is based on the time configured on the NetScaler. Relexpiry is configured in terms of seconds. Absexpiry is a time of day.

What do you mean by configuring weakpos and heuristic?

The weakpos and heuristic are like fall back values. If there is an expiry header, it is considered only if the last-modified header is present. The NetScaler appliance sets expiry on the basis of the last-modified header and the heuristic parameter. The heuristic expiry calculation determines the time to expiry by checking the last-modified header. Some percentage of the duration since the object was last modified is used as time to expiry. The heuristic of an object that remains unmodified for longer periods of time and is likely to have longer expiry periods. The –heurExpiryParam specifies what percentage value to use in this calculation. Otherwise, the appliance uses the weakpos value.

What should I consider before configuring dynamic caching?

If there is some parameter that is in name-value form and does not have the full URL query, or the appliance receives the parameter in a cookie header or POST body, consider configuring dynamic caching. To configure dynamic caching, you have to configure hitParams parameter.

How is hexadecimal encoding supported in the parameter names?

On the NetScaler appliance, the %HEXHEX encoding is supported in the parameter names. In the names that you specify for hitParams or invalParams, you can specify a name that contains %HEXHEX encoding in the names. For example, name, nam%65, and n%61m%65 are equivalent.

What is the process for selecting a hitParam parameter?

Consider the following excerpt of an HTTP header for a POST request:

```
How do we select a hitparam?
POST /data2html.asp?param1=value1&param2=&param3&param4=value4
HTTP/1.1
Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg,
application/vnd.ms-powerpoint, application/vnd.ms-excel,
application/msword, application/x-shockwave-flash, */*
Referer: http://10.102.3.97/forms.html
Accept-Language: en-us
Content-Type: application/x-www-form-urlencoded
Accept-Encoding: gzip, deflate
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)
Host: 10.102.3.97
Content-Length: 153
Connection: Keep-Alive
Cache-Control: no-cache
Cookie: ASPSESSIONIDQGQGGRNY=NNLLKDADEENOAFLCCDGFGDMO
S1=This+text+is+only+text%2C+not+more+and+not+less%2C+%0D%0Ajust+text+to+be+itself%2C+namely+%22Text%22+to+be+posted+as+text+%28what+else.
```

In the above request, you can use S1 and B1, highlighted in bold face for your reference, as hitParams depending on your requirements. Additionally, if you use -matchCookies YES in the ASPSESSIONIDQGQGGRNY content group, then you can also use these parameters as hitParams.

What happens to the queued clients if the response is not cacheable?

If the response is not cacheable, all of the clients in the queue receive the same response that the first client receives.

Can I enable the Poll every time (PET) and Flash Cache features on the same content group?

No. You cannot enable PET and Flash Cache on the same content group. The integrated cache does not perform AutoPET function on Flash Cache content groups. The PET feature ensures that the integrated cache does not serve a stored object without consulting the server. You can configure PET explicitly for a content group.

When are the log entries created for the queued clients?

The log entries are created for the queued clients soon after the appliance receives the response header. The log entries are created only if the response header does not make the object non-cacheable.

What is the meaning of the DNS, HOSTNAME, and HOSTNAME_AND_IP values of the Verify cached object using parameter of the cache configuration?

The meanings are as follows:

- set cache parameter -verifyUsing HOSTNAME
  This ignores the destination IP address.
- set cache parameter -verifyUsing HOSTNAME_AND_IP
  This matches the destination IP address.
- set cache parameter -verifyUsing DNS
  This uses the DNS server.

I have set weakNegRelExpiry to 600, which is 10 minutes. I noticed that 404 responses are not getting cached. What is the reason ?

This completely depends on your configuration. By default, 404 responses are cached for 10 minutes. If you want all 404 responses to be fetched form the server, specify–weakNegRelExpiry 0. You can fine tune the –weakNegRelExpiry to a desired value, such as higher or lower to get the 404 responses cached appropriately. If you have configured –absExpiry for positive responses, then it might not yield desired results.

When the user accesses the site by using the Mozilla Firefox browser, the updated content is served. However, when the user accesses the site by using the Microsoft Internet Explorer browser, stale content is served. What could be the reason?

The Microsoft Internet Explorer browser might be taking the content from its local cache instead of the NetScaler integrated cache. The reason could be that the Microsoft Internet Explorer browser is not respecting the expiry related header in the response.

To resolve this issue, you can disable the local cache of the Internet Explorer and clear the offline content. After clearing the offline content, the browser should display the updated content

What if Hits are zero?

Check to see if the server time and NS time are in sync. And the weakPosrelexpiry limit set should bear the time difference between NS and server as shown below

root@ns180# date

Tue May 15 18:53:52 IST 2012

Why are policies getting hits but nothing is being cached?

Verify that memory is allocated to the integrated cache and that the allocation is greater than zero.

Is it possible to zero the cache counters?

There is no command line or GUI option for setting the cache counters to zero, and flushing the cache does not do so either. Rebooting the box automatically sets these counters to zero.

Load Balancing

Feb 26, 2014

What are the various load balancing policies I can create on the NetScaler appliance?

You can create the following types of load balancing policies on the NetScaler appliance:

- Least Connections
- Round Robin
- Least response time
- Least bandwidth
- Least packets
- URL hashing
- Domain name hashing
- Source IP address hashing
- Destination IP address hashing
- Source IP - Destination IP hashing
- Token
- LRTM

Can I achieve the Web farm security by implementing load balancing using the NetScaler appliance?

Yes. You can achieve Web farm security by implementing load balancing using the NetScaler appliance. NetScaler appliance enables you to implement the following options of the load balancing feature:

- IP Address hiding: Enables you to install the actual servers to be on private IP address space for security reasons and for IP address conservation. This process is transparent to the end-user because the NetScaler appliance accepts requests on behalf of the server. While in the address hiding mode, the appliance completely isolates the two networks. Therefore, a client can access a service running on the private subnet, such as FTP or a Telnet server, through a different VIP on the appliance for that service.
- Port Mapping: Enables the actual TCP services to be hosted on non-standard ports for security reasons. This process is transparent to the end-user as the NetScaler appliance accepts requests on behalf of the server on the standard advertised IP address and port number.

What are various devices that I can use to load balance with a NetScaler appliance?

You can load balance following devices with a NetScaler appliance:

- Server farms
- Caches or Reverse Proxies
- Firewall devices
- Intrusion detection systems
- SSL offload devices
- Compression devices
- Content Inspection servers

Why should I implement the load balancing feature for the website?

You can implement the Load balancing feature for the website to take the following advantages:

- Reduce the response time: When you implement the load balancing feature for the website, one of the major benefits is the boost you can look forward to in load time. With two or more servers sharing the load of the web traffic, each of the servers runs less traffic load than a single server alone. This means there are more resources available to fulfill the client requests. This results in a faster website.

- Redundancy: Implementing the load balancing feature introduces a bit of redundancy. For example, if the website is balanced across three servers and one of them does not respond at all, the other two can keep running and the website visitors do not even notice any downtime. Any load balancing solution immediately stops sending traffic to the backend server that is not available.

Why do I need to disable the Mac Based Forwarding (MBF) option for Link Load Balancing (LLB)?

- If you enable the MBF option, the NetScaler appliance considers that the incoming traffic from the client and the outgoing traffic to the same client flow through the same upstream router. However, the LLB feature requires that the best path be chosen for the return traffic.
- Enabling the MBF option breaks this topology design by sending the outgoing traffic through the router that forwarded the incoming client traffic.

Load Balancing Methods

Feb 26, 2014

What are the various load balancing methods I can create on a NetScaler appliance?

You can create the following types of load balancing methods on a NetScaler appliance:

- Least Connections
- Round Robin
- Least response time
- Least bandwidth
- Least packets
- URL hashing
- Domain name hashing
- Source IP address hashing
- Destination IP address hashing
- Source IP - Destination IP hashing
- Token
- LRTM

What is the good practice I can follow when configuring the load balancing Virtual server on a NetScaler appliance?

The NetScaler appliance gives preference to the domain specified in the URL.

If domain appears in the URL as well as the HOST header, to what does the NetScaler appliance give preference in case of Domain Hashing?

The NetScaler appliance gives preference to the domain specified in the URL.

What health check for SMTP should I use?

You should use a TCP-ECV monitor with a send the QUIT string, which means "Ask the receiver to send a valid reply, and then close the transmission channel." You can leave the receive string blank, as it does not matter what the NetScaler appliance receive back. You can also use 250, which is a valid reply meaning "Requested mail action okay, completed".

You can use any of the following commands to use the TCP-ECV monitor to send the QUIT string:

- add monitor <name> TCP-ECV -send <string> -recv <string>
  add monitor smtp TCP-ECV –send “quit” –recv “”

- add monitor <name> TCP-ECV -send <string> -recv <string>
  add monitor smtp TCP-ECV –send “quit” –recv “250”

Why do I need to disable the Mac Based Forwarding (MBF) option for Link Load Balancing (LLB)?

If you enable the MBF option, the NetScaler appliance considers that the incoming traffic from the client and the outgoing traffic to the same client flow through the same upstream router. However, the LLB feature requires that the best path be chosen for the return traffic.

Enabling the MBF option breaks this topology design by sending the outgoing traffic through the router that forwarded the incoming client traffic.

The client is able to access the service directly. However, the client is not able to access the VIP address of

the NetScaler appliance. Have I made some incorrect configuration on the NetScaler appliance?

You might have enabled the Use Source IP (USIP) mode on the service bound to the virtual server on the NetScaler appliance. This mode forces the packets sent from the appliance to the backend server to contain the client IP as the source IP of the packet, whereas it should use the MIP. In this instance, probably the backend servers do not have a default route pointing to the appliance, which is preventing the server from sending the USIP packets back. However, it works when if you turn off the USIP mode for the services, as the servers can communicate with the MIP.

I want to configure the NetScaler appliance to support the persistence on a value. How can I achieve this configuration?

The issue with creating a rule for such a configuration is that there is nothing unique that you can use to persist. Therefore, you can create a wildcard rule or just match the jsession. In such cases, every request matches to any of the application servers. If each application server had a unique field in the jsession id, you can write a rule for persistence. Another option is to allow the NetScaler appliance to insert a cookie, such as jsessionID=<Value>.

Can I use the asterisk (*) wild card in the cookie, such as jsessionID=*, to represent a value the user has through the entire session?

No. The wildcard rule for persistence does not work with a dynamic session ID. In this case, all the users with a session ID persist to the server.

What are the various persistence types available on the NetScaler appliance?

The NetScaler appliance supports the following persistence types:

- Source IP
- Cookie insert
- SSL session ID
- URL passive
- Custom Server ID
- Rule
- DESTIP

Which counter is used in the Least Connection load balancing method?

When you configure the Least Connection load balancing method, the NetScaler appliance selects the server that has the least number of active transactions by using the Least Connection algorithm.

The Least Connection algorithm uses the Active Transactions (ATr) counter to implement the logic. You can run the following command from the shell prompt to display the details of the counter:

```
nsconmsg –s ConLb=2 –d oldconmsg
The following is the sample output of the command:
nsconmsg –s ConLb=2 –d oldconmsg
The following is the sample output of the command:
nsconmsg –s ConLb=2 –d oldconmsg
S(10.102.12.205:80:UP) Hits(2157, 0/sec, P[0, 0/sec]) ATr(0) Mbps(0.00) BWlmt(0
kbits) RspTime(0.00 ms)
Other: Pkt(1/sec, 0 bytes) Wt(10000) RHits(100)
Conn: CSvr(10, 0/sec) MCSvr(3) OE(1) RP(1) SQ(0)
```

The following is the list of counters used in the preceding output:

- ATr: Active Transactions. This is the number of active connections to the service.
- OE: Open Established. This is the number of connections to the service in the Established state.

- RP: Reuse Pool. This is the number of connections to the service stored in the reuse pool.
- SQ: Surge Queue. This is the number of connections to the service waiting in the surge queue

The Least Connection algorithm makes the following calculation before load balancing the requests:

- HTTP requests:
  ATr = OE – SQ - RP

  The ATr counter excludes the idle connections that are added to the reuse pool because these connections are reused to serve the new client requests.

- Non-HTTP Requests:
  ATr = OE – SQ

  The ATr counter includes all open connections because the idle connections are not added to the reuse pool.

What is a suitable deployment scenario for URL or Domain Hashing?

This form of load balancing method is more suitable for a cache environment where a cache serves a wide range of content from the Internet or the backend servers. By directing requests from a specific domain or URL to the cache that had previously served that domain, also known as hot cache, domain hashing makes sure a better resource utilization at the cache, higher cache-hit ratio, and faster request and response latency.

If domain appears in the URL as well as the HOST header, what does the NetScaler appliance give preference to in case of Domain Hashing?

The NetScaler appliance gives preference to the domain specified in the URL.

What happens if a NetScaler appliance cannot properly parse the HTTP request in case of URL Hashing?

If a NetScaler appliance cannot properly parse the HTTP request, such as if the request is in an unrecognized method or is a 0.9 HTTP request, the policy defaults to round-robin method for that request.

On a NetScaler appliance, what is considered as the Domain start and end for Domain Hashing?

On a NetScaler appliance, the Domain start is identified by the start of the domain string. The Domain end is the domain string without the port information.

On a NetScaler appliance, what is considered as the URL start and end for URL Hashing?

On a NetScaler appliance, the URL start is identified by the beginning of the /. The appliance skips the domain name and port. The URL end is the end of the GET sub-header.

What happens if a NetScaler appliance cannot parse the HTTP request properly in case of Domain Hashing?

If a NetScaler appliance cannot properly parse the HTTP request, such as if the request is in an unrecognized method or is a 0.9 HTTP request, or the request does not contain the host header, the policy defaults to round-robin method for that request.

If the actual URL length is smaller than the configured Hash length, how is hashing done in case of URL or Domain Hashing?

Hash function takes Minimum of hash length or actual URL or domain string length, whichever is smaller, for hash computation. The default value of hash length is 80 bytes, which is a user configurable parameter.

Is it possible configure the load balancing feature to make sure that the requests from the same subnet or requests to the same subnet are sent to the same server by using the Source IP, Destination IP, or Source IP

and Destination IP hashing method?

Yes. It possible configure the load balancing feature to make sure that the requests from the same subnet or requests to the same subnet are sent to the same server by using the Source IP, Destination IP, or Source IP and Destination IP hashing method.

By default, the NetScaler appliance uses the netmask 255.255.255.255. Therefore, the request is hashed for each Source IP, Destination IP, or Source IP and Destination IP addresses. You can use the -netmask <Netmask> option of either the add lb vserver or set lb vserver command to mask the Source IP, Destination IP, or Source IP and Destination IP addresses before calculating the hash value. This makes sure that all requests from the same subnet or requests to the same subnet are directed to the same server.

What is the deployment scenario I can use for the Source IP and Destination IP hashing method for load balancing?

You can use this load balancing method in IDS load balancing. The hashing is symmetric and yields the same value if the source IP and the destination IP addresses are reversed. This makes sure that all packets flowing from a specific client to the same destination are directed to the same IDS server.

What is the deployment scenario I can use for the Destination IP hashing method for load balancing?

This load balancing method is more appropriate when load balancing a transparent cache farm. This method is not recommended for the backend server and reverse proxy farm. This method is recommended in conjunction with cache redirection of transparent proxy farm.

Monitoring

Nov 07, 2016

Why should I configure a monitor?

Monitors help you in identifying the state of the service. In case a service is DOWN, monitor can identify it and the traffic is routed to alternative servers.

Can I bind multiple monitors to the same service?

Yes, you can bind multiple monitors to the same service. Each monitor evaluates the response to a different type of traffic.

I want to make some changes to built-in monitor. Can I do that?

No, you cannot customize the built-in monitors. You can only bind or unbind a built-in monitor to a service. Additionally, you cannot remove a built-in monitor.

I want to monitor SSL services. What monitors can I use?

You can use the following built-in monitors for an SSL service. You can also create your own monitors for SSL service.

- TCP
- HTTP
- TCP-ECV
- HTTP-ECV

I do not understand the difference between FTP monitor and FTP-EXTENDED monitors.

The FTP monitor checks the basic functionality. The FTP-EXTENDED monitor verifies whether the FTP server is able to transmit a file correctly.

I want to monitor the NetScaler Gateway. Is there a built-in monitor that I can use?

You can use the CITRIX-AG monitor for NetScaler Gateway.

What are custom monitors?

Custom monitors are based on the scripts that are included with the NetScaler operating system. Custom monitor can be of one of the following types:

- Inline monitor
- User monitor
- Load monitor

You can use the scripts provided with the NetScaler operating system or create your own scripts to monitor the services to which the monitors are bound.

Can I bind an inline monitor to Global Server Load Balancing (GSLB) remote or local service?

No, you cannot bind an inline monitor to GSLB remote or local service because these services represent the virtual servers rather than actual load balanced Web servers.

I have created a custom script for a user monitor, but I do not know where to add it.

You should add your script to /nsconfig/monitors directory.

Can I make changes to the scripts available in /nsconfig/monitors directory?

Yes, you can make changes to the scripts available in the /nsconfig/monitors directory and save it with a different name.

What happens when I remove all the monitors bound to the service?

When you remove all the monitors bound to the service, the default monitor is bound to the service. You cannot remove the default monitor bound to a service.

When should I use a reverse monitor? What purpose does it serve?

Reverse monitors are monitor that mark the service as DOWN when the probe criteria is met and marks the service as UP when criteria is not met.

Reverse monitors can be used in a situation when you want to use only one of the two available services. The reverse monitor marks the secondary service as DOWN as long as the primary service is UP. When primary service goes DOWN, it marks the secondary as UP. Reverse monitors monitor the server directly. These do not work as intended if you manually mark the service as DOWN.

What are the limitations for the Least Response Time Based on Monitoring load balancing method?

This load balancing method is not applicable to Global Server load balancing (GSLB) Virtual servers and session-less load balancing of type ANY. This load balancing is not advisable for HTTP and HTTPS type load balancing because there is LEASTRESPONSETIME load balancing, which considers live traffic to make decisions than the periodic monitoring probes.

What commands that I need to use to configure the Least Response Time Based on Monitoring load balancing method?

When you add services, make sure that appropriate monitors are bound to the service for LRTM to work. Later the load balancing method on the VIP must be set to LRTM. The following is a set of sample commands that you can run to configure LRTM on a NetScaler appliance:

```
add service svc1 10.102.4.66 ftp 21
add service svc2 10.102.4.67 ftp 21
add monitor con-ftp ftp –username nsroot –password <password>
bind monitor con-ftp svc1
bind monitor con-ftp svc2
add lb vserver ftp-vip ftp  10.1.1.1  21 –lbmethod LRTM
bind lb vserver ftp-vip svc1
bind lb vserver ftp-vip svc2
```

How frequently is the response time of a server measured?

The response time of the server is measured for every HTTP request.

Is the response time smoothed over a period?

The Least Response Time algorithm uses the average response time for the most recently completed 7-second polling interval. This provides some smoothing, but the algorithm does not strive for any greater complexity.

Is it possible to check the current response time value the NetScaler appliance is using for a server by using the command line interface?

Yes. You can display the real-time, time-to-first-byte (TTFB) response time metrics for all servers you have configured on a NetScaler appliance. You can display these on the Dashboard in either graphical or numeric values. Additionally, you can run the /etc/nsconmsg command to display these values from the command line interface. With the nsconmsg command, you can also display the historical values.

Is Average Response Time a good indicator for the server load?

The average response time might not be the most accurate form of estimating the server load because response time for

the dynamic content can be much higher than that of the static content, but on the assumption that the backend servers have replicated content, the average response time serves as a good approximation of the server load.

What health check for SMTP should I use?

You should use a TCP-ECV monitor with a send the QUIT string, which means "Ask the receiver to send a valid reply, and then close the transmission channel." You can leave the receive string blank, as it does not matter what the NetScaler appliance receive back. You can also use 250, which is a valid reply meaning "Requested mail action okay, completed".

You can use any of the following commands to use the TCP-ECV monitor to send the QUIT string:

- add monitor <name> TCP-ECV -send <string> -recv <string>
  add monitor smtp TCP-ECV –send "quit" –recv ""
- add monitor <name> TCP-ECV -send <string> -recv <string>
  add monitor smtp TCP-ECV –send "quit" –recv "250"

What is the difference between FTP monitor and FTP-EXTENDED monitors?

The FTP monitor checks the basic functionality. The FTP-EXTENDED monitor verifies whether the FTP server is able to transmit a file correctly.

For more information, see Monitors.

Persistence

Feb 26, 2014

I have configured Cookie Insert persistence on the NetScaler appliance. The users report that the connections work fine for some time, but then start getting disconnected. What best practice should I follow when configuring persistence?

By default, the time-out value for Cookie Insert persistence is 120 seconds. When you configure persistence for applications for which idle time cannot be determined, set the Cookie Insert persistence time-out value to 0. With this setting, the connection does not time out.

I have configured an HTTP virtual server on the NetScaler appliance. I need to make sure that a user always connects to the same server for the requested content, so I configured SourceIP persistence. Now, increasing the time-out value for persistence introduces latency. How can I increase the timeout value without affecting performance?

Consider using Cookie Insert persistence with the time-out value set to 0. This setting enables long-duration persistence settings, because the appliance does not specify a time for expiring the cookie.

The application server does not recognize cookies. Can I configure the NetScaler appliance to use Cookie Insert persistence?

On a NetScaler appliance, Cookie Insert persistence applies only to the client-side request, not to the application server. Additionally, when an application server does not set a cookie value, the response from the server does not contain any cookie value. However, the NetScaler appliance uses its cookie table to respond to the appropriate client.

I have configured Cookie Insert persistence on the NetScaler appliance. I works as expected when clients from the same time zone access the content. However, when a client from another time zone makes an attempt to connect, the connection is immediately timed out. What is the possible reason for this and how can I resolve this issue?

Time based Cookie Insert persistence works as expected when a client from the same time zone makes a connection. However, when the client machine and NetScaler appliance are in different time zones, the cookie is not valid. For example, when a client in EST time zone sends a cookie at 11:00 AM EST to a NetScaler appliance in the PST time zone, the appliance receives the cookie at 2:00 PM PST. As a result of the difference in time, the cookie is not valid, and the connection is immediately timed-out.
To resolve this issue, you can set the time-out value for Cookie Insert persistence to 0.

I have installed application servers, such as Oracle Weblogic server, that are load balanced by using a NetScaler appliance. To make sure that clients get persistent connections to these servers, I have configured SourceIP persistence. It works as expected when a connection is made from a computer. However, thin clients attempt a connection through a terminal server and, as a result, the appliance receives requests from multiple clients from the same IP address (the terminal server IP address). Therefore, the connections from all thin clients are directed to the same application server. Is it possible to configure persistency for requests from individual thin clients based on the client IP address?

No. The NetScaler appliance receives requests from the terminal server and the source IP address of the request remains the same. As a result, the appliance cannot distinguish among the requests received from the thin clients and provide persistence according to the requests from thin clients. To avoid this problem, you can configure Rule persistence based on some unique parameter value for each thin client.

I have multiple application servers load balanced through a NetScaler appliance. I have configured persistence along with monitors that monitor application servers every few seconds. If a server does not respond to a probe, the monitor marks the status of the server as DOWN. What happens to the client connections that are supposed to persist on the server that has just been marked as DOWN?

Regardless of persistence, the NetScaler appliance does not send traffic to a server that is marked as DOWN. The appliance overrides the persistence method and directs the traffic to another server that is available to receive the traffic according to the load balancing method configured on the appliance. The appliance renegotiates persistence for these connections.

I have configured a NetScaler appliance to load balance RDP connections. Even after configuring persistence for the RDP connections, users are connected to a different RDP server. Is there any method to make sure that the user is connected to the same server the next time?

No. This is an expected behavior. An RDP connection is a one-time connection. When a user disconnects an RDP connection and attempts to reconnect, the connection request is directed to an RDP server according to the load balancing method configured on the NetScaler appliance. The user might or might not get connected to the same server.

I have configured a NetScaler appliance to load balance application servers, such as Microsoft Exchange, with SourceIP persistency. The setup has a wireless network as a backup. When a user switches from the LAN to the wireless network, the connectivity to the applications is interrupted. For some applications, such as Microsoft Exchange, the user has to close the connection and reconnect to the application. Is there any solution for this issue?

No. This is an expected behavior. When you configure SourceIP persistence on the appliance, the persistence works according to the request from the source IP address. However, when you switch from LAN to the wireless network, the IP address of the client changes. As a result, persistence with the application server breaks.

I need to configure a NetScaler appliance to load balance HTTP application servers. For users connecting to these servers, I want to configure session-aware persistence. Which persistence method is recommended for this scenario?

Citrix recommends that you use the Cookie Insert persistence method for this scenario. When you configure this method, the session with the server persists until the client presents a valid cookie. To have the session persist for an indefinite length of time, set the cookie time-out value to 0, so that the cookie does not expire.

I have configured the NetScaler appliance to load balance Web Interface servers. When accessing the servers, the user receives the “State Error” error message. Additionally, when one of the Web Interface servers is shut down or not available, some of the users receive an error message. Are there any recommended settings that can resolve this issue?

Yes. Citrix recommends that you specify the Cookie Insert persistence method on the NetScaler appliance when load balancing Web Interface servers. Lack of persistence to the Web Interface servers can result in error messages when a user attempts to connect to the server.

I have configured multiple load balancing virtual servers for different functions of an application server. Is it possible to configure persistence with the same application server when a user accesses the server through any of the virtual servers?

Yes. You can create a persistency group with SourceIP persistence and bind the required virtual servers to the persistency group.

What is the data type of the CustomserverID parameter of the Custom Server ID persistence type?

Starting NetScaler release 10, the CustomserverID parameter is of alphanumeric data type. In the earlier releases, the parameter was of numeric data type.

What is the good practice I can follow when configuring the load balancing virtual server on a NetScaler appliance?

When configuring load balancing virtual servers, consider using Cookie Persistence option.

I want to configure the NetScaler appliance to support the persistence on a value. How can I achieve this configuration?

The issue with creating a rule for such a configuration is that there is nothing unique that you can use to persist. Therefore, you can create a wildcard rule or just match the jsession. In such cases, every request matches to any of the application servers. If each application server had a unique field in the jsession id, you can write a rule for persistence. Another option is to allow the NetScaler appliance to insert a cookie, such as jsessionID=<Value>.

Can I use the asterisk (*) wild card in the cookie, such as jsessionID=*, to represent a value the user has through the entire session?

No. The wildcard rule for persistence does not work with a dynamic session ID. In this case, all the users with a session ID persist to the server.

What are the various persistence types available on the NetScaler appliance?

The NetScaler appliance supports the following persistence types:

- Source IP
- Cookie insert
- SSL session ID
- URL passive
- Custom Server ID
- Rule
- DESTIP

See also:

To learn more about persistency groups, see Configuring Persistence Groups.

Protocols

Feb 26, 2014

What are the various protocols supported on the NetScaler appliance?

The NetScaler appliance supports the following protocols:

- HTTP
- FTP
- SSL
- SSL_BRIDGE
- SSL_TCP
- NNTP
- DNS
- DHCP Relay Agent (DHCPRA)
- Diameter
- MySQL
- MS SQL
- RADIUS
- RDP
- RTSP
- SIP

What is the difference among the SSL, SSL_BRIDGE, and SSL_TCP protocols?

The SSL, SSL_BRIDGE, and SSL_TCP protocols are used for the following tasks:

- SSL: The NetScaler appliance encrypts and decrypts data when using this protocol. It also has access to the underlying HTTP transaction.
- SSL_BRIDGE: The NetScaler appliance does not encrypt or decrypt any data when using this protocol. It does not have access to any HTTP data. The process of encryption and decryption is handled by the backend server.
- SSL_TCP: SSL_TCP implies TCP load balancing. When using this protocol, the NetScaler appliance encrypts and decrypts data but it does not have access to the underlying transaction.

How does the NetScaler appliance handle the load balancing of the HTTP or HTTPS traffic?

The HTTP or HTTPS load balancing is request based. If you have defined the service type as HTTP or HTTPS, the NetScaler appliance selects the server for every HTTP request independent of TCP connection. Therefore, different requests on the same client TCP connection can be Load Balanced to different servers on the backend.

How does the NetScaler appliance handle the load balancing of the TCP traffic?

The TCP load balancing is connection-based. If you have defined the service type as TCP, the NetScaler appliance selects the server for every new TCP connection. For each client connection, the appliance creates a connection to the backend server.

How does the NetScaler appliance handle the load balancing of the UDP traffic?

The UDP load balancing is time-based. If you have defined the service type as UDP, the NetScaler appliance selects the server for a UDP packet. After the server is selected, a session is created between the server and a client for a specific period of time. After the time expires, the session is deleted and new server selection is done for other packets even if the packets come from the same client.

Note: Session and load balancing are time based. Therefore, make sure that you specify the client timeout value. In case this value is set to 0, the appliance does not load balancing the same client requesting the same port.

How do I configure the TCP token based load balancing method?

You can set the additional properties of the VIP by using the set lb vserver command to configure TCP token based load balancing method. To configure this method with token received in the payload of the data packet at data offset 100 and length 2 bytes, run the following command:

set lb vserver <virtual servername> -lbmethod TOKEN –data_offset 100 –datalength 2

Note: The data offset and datalength are valid parameters only for TCP protocol.

How do I configure HTTP or HTTPS based token processing?

For HTTP protocol and token-based load balancing, a rule has to be maintained to check the string present in the URL. Depending on the string and token length, the token is extracted.

To create and configure an expression, use the add expression in the command. To define a rule, use the -rule <String> argument in the add lb vserver or set lb vserver commands. For example, the expression "URLQUERY contains token= -l 2" causes the NetScaler system to look for the token inside the URL query after matching the string token=, the length of the token is 2 bytes.

Service Groups

Feb 28, 2014

How can I evaluate the benefits of installing a NetScaler appliance on a network with respect to connection multiplexing?

Connection multiplexing is the method of reusing connections to avoid the overhead of establishing new TCP connections for data transfer when an established connection established is no longer in use. To evaluate the impact of a NetScaler appliance, you can run any of the following commands from the command line:

- stat service <Service_Name> detail
- stat servicegroup <Service_Group_Name> detail

The output of these commands displays the current client and server connections open on the appliance. The difference between the number of client connections and the number of server connections shows the extent to which the appliance reuses the same server connection for requests from multiple clients.

Is it possible to create a service group on the same port to which the application server listens?

Yes. If you create a service group on the same port to which the application server listens, the monitors for the services in the group mark the status of the services as DOWN if the port on the server is closed.

I have created a service group that takes care of the multiple servers. Is it possible to restrict internal access to some of the servers by using the same service group?

No. You cannot restrict internal access to some of the servers and provide external access to other servers by using the same service group. You can create another load balancing virtual server and bind the server targeted for internal access to this virtual server. The internal DNS server can resolve to this virtual server, and the external DNS server can resolve the other virtual server.

Alternatively, you can configure the content switching feature on the appliance. Depending on the client IP address of the request, you can switch traffic between the load balancing virtual servers that handle internal and external access to the servers.

Is it possible to identify IP address conflicts on a NetScaler appliance?

You can identify IP address conflicts from the Diagnostics page, which is available on the System node. On the Diagnostics page, click the View console messages link, and then click Run. The console messages display any IP address conflicts.

When the status of a service in a service group is marked as DOWN, the traffic of that service is diverted to other services. What happens to the traffic when the status of the service is later marked as UP?

When the service returns to the UP status, it handles new requests. However, the other services continue to handle all of their existing traffic until persistence expires.

I am installing a new NetScaler appliance. On this appliance, I would like to configure the same services as those on the existing appliance. Is it possible to export only the services configured on the existing appliance?

Yes. From the command line interface of the older appliance, open the ns.conf file, in the /nsconfig directory, and search to find the section that contains commands for services. Copy these commands to the ns.conf file on the new appliance.

Can I enable compression on a service group on which protocol ANY is enabled?

No. If you are using ANY as the protocol setting for a service group, the compression option is not available for the service

group. You need to select an appropriate protocol to enable compression.

Is it possible to create a secure load balancing virtual IP address that connects to a nonsecure service?

Yes. You can create a secure load balancing virtual IP address that can connect to a nonsecure service.

Can I bind a TCP service to a virtual server that uses the HTTPS protocol?

No. The underlying protocol of the service and the virtual server must be the same. For example, you can create an HTTPS virtual server to which you can bind an HTTP service. Similarly, you can create an SSL_TCP virtual server to which you can bind a TCP service.

I have a few service groups configured on the appliance. Each service group consists of multiple services. I want to direct a part of the traffic to one of the service groups. Is it possible to add weights to the service group to achieve this?

No. To direct a part of the traffic to a service group, you must add weights to each service in the service group.

For more information, see Configuring Services.

Migration

Oct 24, 2016

How is the rollback procedure performed on a NetScaler appliance?

The rollback procedure is similar to the basic upgrade procedure. Select the target build that you want to roll back to and perform the downgrade.
Before rolling back to a different release, Citrix recommends that you create a copy of your current configuration files. To downgrade from release 10.1, see Downgrading from Release 10.1 or to downgrade to an earlier build in 10.1, see Downgrading to an Earlier Build within Release 10.1 .

Can I upgrade a NetScaler appliance directly from release 9.3 to 10.1, or should I upgrade to 10.0 first and then to 10.1?

You can directly upgrade a NetScaler appliance regardless of the version or the build number.

Is the procedure for upgrading a NetScaler from classic to nCore different?

Yes. Only version 9.3 or earlier supports classic builds. For details, see Upgrading from a Classic to an nCore Release .

Does 10.0 support classic builds?

No. Release 10.0 supports only nCore builds. You must have a multi-processor Netscaler (MPX or higher) to upgrade to 10.0.

Can the primary appliance and secondary appliance have separate builds?

Recommended practice is to use the same version and build number on both the primary and the secondary appliance.

Can both the appliances in an High Availability (HA) pair be upgraded at the same time?

No. In an HA pair, first upgrade the secondary node and then upgrade the primary node. For details, refer Upgrading a High Availability Pair or Upgrading a NetScaler High Availability Pair to a Later Build.

Does Citrix support firmware upgrades in the amazon AWS cloud?

Yes.

Can I upgrade the NetScaler instance independently of the SDX version.

It is not required to upgrade the SDX version when the NetScaler appliance is upgraded. However, some features might not work.

Can I use the FTP server to upgrade the NetScaler appliance?

No. You must first download the firmware from the Citrix download site, save it on your local computer and then upgrade the appliance.

Is the procedure for upgrading the NetScaler appliance with GSLB configurations different from an upgrade of an appliance that is not involved in GSLB?

No. The upgrade procedure is similar to the basic upgrade procedure. The only difference is that you can upgrade the standalone or HA appliances on different sites in a phased manner.

SDX

Sep 04, 2013

What is SDX?

SDX is a true service delivery networking platform for enterprises and cloud datacenters. SDX features an advanced virtualization architecture that supports multiple NetScaler instances on a single hardware appliance.

When do I need SDX?

If you have multiple enterprise applications that have independent life cycle needs for L4–L7 networking services, or if you have a need to consolidate multiple underutilized load balancing appliances, you benefit from SDX.

What's unique about SDX?

SDX uniquely delivers key benefits from advancements in server hardware virtualization, hardware-assisted SSL acceleration, and the market-proven, award-winning NetScaler product line. The Management Service features an advanced control plane to unify provisioning, monitoring, and management in the most demanding multitenant environments, while providing full resource isolation for data separation and to meet service level agreement guarantees, such as availability, reliability, and performance.

How will I benefit from SDX?

SDX delivers isolated multitenancy with up to 40:1 consolidation. As a key pillar in Citrix's TriScale technology framework, SDX addresses the growing need to "scale in" within virtual data centers and cloud network infrastructures. The TriScale scale-in factor enables IT to provide the foundation for consolidating L4–L7 network services today, thereby simplifying the build-out of cloud based services down the line, in accordance with business requirements.

Will I need to go outside my normal procurement procedure to purchase SDX?

SDX is a fully contained networking appliance, designed for network deployment. SDX is not designed to be managed through standard hypervisor management tools such as XenCenter.

How do I purchase an SDX?

An SDX order has three basic product components: SDX appliance SKU, SDX support contract SKU, and Add-On Instance Packs. SKUs are also available for platform conversion (MPX-to-SDX) and platform upgrade (SDX-to-SDX). SDX today is available in Platinum Edition only.

Is there SDX-specific documentation?

Yes, please visit http://support.citrix.com/proddocs/topic/netscaler/sdx-ag-wrapper-con.html.

Do NetScaler editions apply to NetScaler SDX?

The editions do not apply from a packaging perspective. NetScaler SDX appliances and the instance 5-packs are priced the same regardless of the edition. However, when provisioning new instances, the administrator is free to deploy the Standard, Enterprise, or Platinum edition of the NetScaler software.

How much memory can I assign to each instance?

There is no maximum limit to the memory that can be assigned to each instance. Minimum memory required per instance is 2GB.

Can we migrate the existing configuration (ns.conf) from the MPX platform to SDX VPX instance?

Yes, but some configuration, such as RBA policies and SNMP community configuration, is deleted.

What NetScaler features do I get with SDX?

All NetScaler features are available on SDX.

Does SDX accelerate SSL in hardware like MPX does?

Yes. You can assign SSL cores to an instance during provisioning.

What changes to my network are required for me to deploy SDX?

SDX fits into your network environment through standard Ethernet interfaces. You must disable link aggregation control protocol (LACP) on any external switch ports connected to the appliance.

Is SDX interoperable with my routing and switching infrastructure?

Yes, although link aggregation control protocol (LACP) is currently not supported. However, SDX supports manual link aggregation.

Is SDX interoperable with my existing NetScaler deployment?

Yes, although standard VPX-to-MPX limitations apply. For example, high availability is supported only across homogeneous devices (you cannot pair a virtual device with a physical device), some configuration, such as RBA policies and SNMP configuration, is deleted, and license transfer is not supported.

Can I manage SDX from Command Center?

Yes. You can identify SDX appliances and provision and de-provision VPX instances by using Command Center.

How does SDX deliver multitenancy?

Each instance runs as a separate virtual machine with its own dedicated NetScaler kernel, CPU resources, memory resources, address space, and bandwidth allocation. Network I/O is done in a way that not only maintains aggregate system performance but also enables complete segregation of each tenant's data-plane and management-plane traffic.

Do I need to manage an SDX through XenCenter?

No. XenCenter is not supported. Use the Management Service to manage XenServer.

We are a VMware shop. We have no infrastructure available to support XenServer, do you have a VMware variant of SDX?

No additional XenServer infrastructure is necessary. SDX is a fully contained networking appliance with its own control plane, and the virtualization layer is transparent to the deployment.

Why is the system health monitoring page not showing any data?

You have to install the supplemental pack before you can use this feature. For installation instructions for the supplemental pack, see http://support.citrix.com/article/CTX132877.

How do I verify that the supplemental pack installation was successful?

After installation, a pop up window shows whether installation was successful or if there was an error.

Why is the VPX instance not reachable after interfaces on the appliance are modified?

When you provision a NetScaler VPX instance with L2VLAN configuration, physical interfaces on the SDX appliance are mapped to virtual interfaces on the VPX instance. If you remove an interface, you might change the mapping between the physical interfaces and VPX instances, and therefore you might lose connectivity to the VPX instance.
For example,

1. You provision a VPX instance, by using the Management Service, with interfaces 10/1, 10/2, 10/7, and tag VLAN 512 to interface 10/2. When you log on to that VPX instance, you see that interfaces 10/1, 10/2, and 10/3 are configured.
2. If you later modify the instance and remove interface 10/1, you lose connectivity to the instance, because interface 10/2 is renamed to 10/1 in the VPX instance.

Are IPv6 addresses supported on the NetScaler SDX appliance?

Yes. All NetScaler-supported IPv6 functionality is available on the SDX appliance.

Where are link parameters, such as speed and duplex, configured?

Link parameters are configured from the Management Service.

Should the appliance be restarted if the platform license is upgraded?

No. You do not need to restart the appliance for the new license to apply.

Do I need to restart the appliance to upgrade the device-level firmware?

Yes, this upgrade is handled through the Management Service and requires that the appliance be restarted. This is the only time that the SDX appliance needs a complete restart.

Do I need to restart the appliance when I upgrade it by using a Pay-As-You-Grow license?

No. Upgrading the appliance upgrades the platform license. Restart the Management Service but not the instances running on the SDX appliance. Once upgraded, the Management Service detects the higher throughput available for the instances. If you decide to increase the bandwidth limit for an instance, restart that instance after modifying the bandwidth limit.

What happens to production instances if I remove my platform license?

There is no change to the production instances. However, you cannot add new instances.

How can we readd a gadget to the Home page?

Click the << button in the top-right corner of the Home page. Then, type the name of the gadget, or press Enter for all gadgets. Click "Add to Dashboard".

Should member interfaces in manual link aggregation be part of same VLAN?

Yes. Member interfaces in manual link aggregation should be part of the same VLAN.

How many VLANs are supported per interface with VLAN filtering enabled? What happens if I configure more?

With VLAN filtering enabled, 10G interfaces support up to 63 VLANs, and 1G interfaces suppport up to 31 VLANs. This is a hard limit based on the number of the queues supported by the NIC. An error message appears if the limit is exceeded.

How many instances can be shared on a single NIC?

For a 10G interface, SDX supports up to 63 virtual functions per physical port, which translates to 63 instances per 10G NIC. For 1G interfaces, the maximum number of shared instances per NIC is 7.

Why is the XenServer password the same as the Management Service password?

The XenServer password and the Management Service password are the same to maintain administrative consistency.

Changing the XenServer password causes the internal communication between the Management Service and XenServer to fail.

If I have separate management networks, do I need to manually add these networks to the Management Service?

No. Communication is over an external device.

Why can't I modify the default administrator profile?

The default administrator profile enables multiple administrative roles to exist on the SDX. You cannot change the password of the nsroot administrator profile, but you can create a new administrator profile and make it the default profile.

Why does Core usage show 50% when I'm not passing any traffic through my NetScaler instance?

CPU core usage shows, from the hypervisor perspective, the CPU utilization of one physical CPU, which has two hyperthreads: one for the packet engine and one for the management CPU. For example, assume a single instance with one dedicated core. Even if you are not passing any traffic through your appliance, PE CPU utilization will be 100%, and average core utilization will be 50%.

Will restarting the Management Service interrupt my production instances?

No. Your production instances will continue to pass traffic without interruption while the Management Service restarts. The same applies when you upgrade the Management Service.

Can I configure the Management Service to send syslog?

Syslog through the Management Service is currently not supported.

Am I required to upgrade all VPX instances if I upgrade the Management Service?

No, instance life cycles can be managed independently of one other and of the life cycle of the Management Service.

If my Management Service and VPX instances are on different networks, how can I manage the VPX instance through HTTPS?

The same way as if they are on the same network.

If my Management Service and VPX instances are on different networks, how can I manage the VPX instance through the Management Service?

If the Management Service and the VPX instance are in different networks but the instance can be reached from Management Service, the Management Service shows the instance as UP. If an instance is UP, you can manage it from the Management Service. However, if communication between the two fails, the Management Service shows the instance as "Out of Service".

I forgot the IP address of my Management Service. What can I do?

Log on to XenServer, and then use the default IP address (169.254.0.10) to log on to the Management Service. At the shell prompt, type networkconfig to view or modify the IP address of the Management Service.

Can I specify VLANs on management interfaces?

VLANs on management interfaces are currently not supported.

How do I restart XenServer?

The only supported method for restarting XenServer is from the Management Service. It is equivalent to restarting the appliance.

How many instances can I provision on the SDX appliance? How much aggregate throughput can I expect?

This number is dependent on the hardware and the license that you purchased, as shown below:

- 11500, 13500, 14500, 16500, 18500, 20500—5 to 20 instances. Throughput ranges from 8 to 42 Gbps.
- 17500, 19500, 21500—5 to 20 instances. Throughput ranges from 20 to 50 Gbps.
- 17550, 19550, 20550, 21550—5 to 40 instances. Throughput ranges from 20 to 50 Gbps.
- 8400, 8600—2 to 5 instances. Throughput ranges from 4 to 6 Gbps.

Note: For more information, see the NetScaler datasheet at http://www.citrix.com/content/dam/citrix/en_us/documents/products/netscaler-data-sheet.pdf

Can I restrict functionality on the VPX instances?

Some functionality can be restricted by specifying the license (Standard, Enterprise, or Platinum) when you provision the instance.

How many SDX models are there, and how do they differ?

The NetScaler SDX appliance comes in the following variants:

- SDX 11500/13500/14500/16500/18500/20500—8 to 42 Gbps, maximum 20 instances, 8x1G ports, 4x10G ports.
- SDX 17500/19500/21500—20 to 50 Gbps, maximum 20 instances, 8x10G ports.
  Note: This platform is going EOS this year.
- SDX 17550/19550/20550/ 21550—20 to 50 Gbps, maximum 40 instances, 8x10G ports.
- SDX 8400/8600—4 to 6 Gbps, maximum 5 instances, (6x10/100/1000Base-T copper Ethernet ports + 6x1G SFP) and (6x10/100/1000Base-T copper Ethernet ports + 2x10G SFP+)

What is the minimum NetScaler software version required for SDX instances?

NetScaler VPX instances should run release 9.3 and later to be able to work on SDX.

How many physical interfaces will I need to use?

If you have a single management network, you'll need on an average 1 or 2 physical NICs per instance. For 2 or more management networks (multiple VLANs for NetScaler IP addresses), you'll need a dedicated separate physical NIC for each management VLAN trunk. You can share physical NICs among multiple instances with L2 separation. Therefore, depending on your topology, you can offset the management VLAN trunk count with multiple instances sharing a physical NIC.

Can I upgrade my MPX to an SDX? What about my MPX FIPS platform?

A non-FIPS MPX platform that supports the SDX architecture can be converted to a similar class of SDX platform. The MPX platform must have a platinum license to be eligible for this upgrade. This is a one way upgrade, and it wipes out the entire configuration on that MPX platform. For more information about this upgrade, see http://support.citrix.com/article/CTX129423.

How many SSL cards (cores) are supported on a NetScaler SDX appliance?

The number of SSL cards supported varies by the platform as follows:

- SDX 17500/19500/21500—16 cards.
- SDX 11500/13500/14500/16500/18500/20500—16 cards.
- SDX 17550/19550/20550/21550—36 cards.
- SDX 8400/8600—4 cards.

Note: Instances cannot share SSL cores. Any SSL cores that are allocated at the time of provisioning an instance are

dedicated to that instance.

Can I apply my VPX license to SDX?

No. NetScaler SDX and NetScaler VPX have different licensing models. One license cannot be used for the other.

Why are the hardware sensors not displayed on the NetScaler SDX 17500/19500/21500 appliance?

The NetScaler SDX 17500/19500/21500 is built on the MPX 17500/19500/21500 hardware platform. These appliance configurations do not support monitoring of hardware components.

When I upgraded my MPX to an SDX, the LCD panel went dark. Is that expected?

Yes, that is normal behavior. SDX does not support the LCD panel.

What are RX and TX errors on the NetScaler SDX appliance?

RX and TX errors include cyclic redundancy check (CRC) errors and small or runt packet errors.

What happens if a hardware component is removed from the SDX appliance?

If a hardware component is physically removed from the appliance, it no longer appears in the Management Service user interface.

Do I need to restart my appliance after I reconfigure VLAN filtering?

No. However, you need to restart the VPX instances that are affected by this change. The Management Service restarts the affected instances if you select "Reboot associated Instances" in the Enable/Disable VLAN Filter dialog box.

What is the NMI button for on the SDX appliance?

The NMI button is not operational on the SDX appliance.

SSL

Jun 16, 2014

HTTPS access to the NetScaler configuration utility fails on a VPX instance. How do I gain access?

A certificate-key pair is required for HTTPS access to the NetScaler configuration utility. On a NetScaler ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes and bind it to the internal service for HTTPS access to the configuration utility or update the ns-server-certificate to 1024 bytes. You can use HTTP access to the configuration utility or the NetScaler command line to install the certificate.

If I add a license to an MPX appliance, the certificate-key pair binding is lost. How do I resolve this problem?

If a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding. You must reinstall the certificate and bind it to the internal service

Citrix recommends that you install an appropriate license before starting the appliance.

What are the various steps involved in setting up a secure channel for an SSL transaction?

Setting up a secure channel for an SSL transaction involves the following steps:

1. The client sends an HTTPS request for a secure channel to the server.
2. After selecting the protocol and cipher, the server sends its certificate to the client.
3. The client checks the authenticity of the server certificate.
4. If any of the checks fail, the client displays the corresponding feedback.
5. If the checks pass or the client decides to continue even if a check fails, the client creates a temporary, disposable key called the *pre-master secret* and encrypts it by using the public key of the server certificate.
6. The server, upon receiving the pre-master secret, decrypts it by using the server's private key and generates the session keys. The client also generates the session keys from the pre-master secret. Thus both client and server now have a common session key, which is used for encryption and decryption of application data.

I understand that SSL is a CPU-intensive process. What is the CPU cost associated with the SSL process?

The following two stages are associated with the SSL process:

- The initial handshake and secure channel setup by using the public and private key technology.
- Bulk data encryption by using the asymmetric key technology.

Both of the preceding stages can affect server performance, and they require intensive CPU processing for of the following reasons:

1. The initial handshake involves public-private key cryptography, which is very CPU intensive because of large key sizes (1024bit, 2048bit, 4096bit).
2. Encryption/decryption of data is also computationally expensive, depending on the amount of data that needs to be encrypted or decrypted.

What are the various entities of an SSL configuration?

An SSL configuration has the following entities:

- Server certificate
- Certificate Authority (CA) certificate

- Cipher suite that specifies the protocols for the following tasks:
  - Initial key exchange
  - Server and client authentication
  - Bulk encryption algorithm
  - Message authentication
- Client authentication
- CRL
- SSL Certificate Key Generation Tool that enables you to create the following files:
  - Certificate request
  - Self signed certificate
  - RSA and DSA keys
  - DH parameters

I want to use the SSL offloading feature of the Citrix NetScaler appliance. What are the various options for receiving an SSL certificate?

You must receive an SSL certificate before you can configure the SSL setup on the Citrix NetScaler appliance. You can use any of the following methods to receive an SSL certificate:

- Request a certificate from an authorized CA.
- Use the existing server certificate.
- Create a certificate-key pair on the Citrix NetScaler appliance.
  Note: This is a test certificate signed by the test Root-CA generated by the NetScaler. Test certificates signed by this Root-CA are not accepted by browsers. The browser throws a warning message stating that the server's certificate cannot be authenticated.
- For anything other than test purposes, you must provide a valid CA certificate and CA key to sign the server certificate.

What are the minimum requirements for an SSL setup?

The minimum requirements for configuring an SSL setup are as follows:

- Obtain the certificates and keys.
- Create a load balancing SSL virtual server.
- Bind HTTP or SSL services to the SSL virtual server.
- Bind certificate-key pair to the SSL virtual server.

What are the limits for the various components of SSL?

SSL components have the following limits:

- Bit size of SSL certificates: 4096.
- Number of SSL certificates: Depends on the available memory on the appliance.
- Maximum linked intermediate CA SSL certificates: 9 per chain.
- CRL revocations: Depends on the available memory on the appliance.

What are the various steps involved in the end-to-end data encryption on a Citrix NetScaler appliance?

The steps involved in the server-side encryption process on a Citrix NetScaler appliance are as follows:

1. The client connects to the SSL VIP configured on the Citrix NetScaler appliance at the secure site.
2. After receiving the secure request, the appliance decrypts the request, applies layer 4-7 content switching techniques and load balancing policies, and selects the best available backend Web server for the request.
3. The Citrix NetScaler appliance creates an SSL session with the selected server.
4. After establishing the SSL session, the appliance encrypts the client request and sends it to the Web server by using the secure SSL session.
5. When the appliance receives the encrypted response from the server, it decrypts and re-encrypts the data, and sends the

data to the client by using the client side SSL session.

The multiplexing technique of the Citrix NetScaler appliance enables the appliance to reuse SSL sessions that have been established with the Web servers. Therefore, the appliance avoids the CPU intensive key exchange, known as *full handshake*. This process reduces the overall number of SSL sessions on the server and maintains end-to-end security.

Can I place the certificate and key files at any location? Is there any recommended location to store these files?

You can store the certificate and key files on the Citrix NetScaler appliance or a local computer. However, Citrix recommends that you store the certificate and key files in the /nsconfig/ssl directory of the Citrix NetScaler appliance. The /etc directory exists in the flash memory of the Citrix NetScaler appliance. This provides portability and facilitates backup and restoration of the certificate files on the appliance.
Note: Make sure that the certificate and the key files are stored in the same directory.

What is the maximum size of the certificate key supported on the Citrix NetScaler appliance?

A Citrix NetScaler appliance running a software release earlier than release 9.0 supports a maximum certificate key size of 2048 bits. Release 9.0 and later support a maximum certificate key size of 4096 bits. This limit is applicable to both RSA and DSA certificates.
An MPX appliance supports certificates from 512-bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A virtual appliance supports certificates from 512-bits up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 2048-bit certificate on the back end server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

What is the maximum size of the DH parameter supported on the Citrix NetScaler appliance?

The Citrix NetScaler appliance supports a DH parameter of maximum 2048 bits.

What is the maximum certificate-chain length, that is, the maximum number of certificates in a chain, supported on a Citrix NetScaler appliance?

A Citrix NetScaler appliance can send a maximum of 10 certificates in a chain when sending a server certificate message. A chain of the maximum length includes the server certificate and nine intermediate CA certificates.

What are the various certificate and key formats supported on the Citrix NetScaler appliance?

The Citrix NetScaler appliance supports the following certificate and key formats:

- Privacy Enhanced Mail (PEM)
- Distinguished Encoding Rule (DER)

Is there a limit for the number of certificates and keys that I can install on the Citrix NetScaler appliance?

No. The number of certificates and keys that can be installed is limited only by the available memory on the Citrix NetScaler appliance.

I have saved the certificate and key files on the local computer. I want to transfer these files to the Citrix NetScaler appliance by using the FTP protocol. Is there any preferred mode for transfering these files to the Citrix NetScaler appliance?

Yes. If using the FTP protocol, you should use binary mode to transfer the certificate and key files to the Citrix NetScaler appliance.
Note: By default, FTP is disabled. Citrix recommends using the SCP protocol for transferring certificate and key files. The configuration utility implicitly uses SCP to connect to the appliance.

What is the default directory path for the certificate and key?

The default directory path for the certificate and key is /nsconfig/ssl.

When adding a certificate and key pair, what happens if I do not specify an absolute path to the certificate and key files?

When adding a certificate and key pair, if you do not specify an absolute path to the certificate and key files, the Citrix NetScaler appliance searches the default directory, /nsconfig/ssl, for the specified files and attempts to load them to the kernel. For example, if the cert1024.pem and rsa1024.pem files are available in the /nsconfig/ssl directory of the appliance, both of the following commands are successful:

```
add ssl certKey cert1 -cert cert1204.pem -key rsa1024.pem

add ssl certKey cert1 -cert /nsconfig/ssl/cert1204.pem -key /nsconfig/ssl/rsa1024.pem
```

I have configured a high availability setup. I want to implement the SSL feature on the setup. How should I handle the certificate and key files in a high availability setup?

In a high availability setup, you must store the certificate and key files on both the primary and the secondary Citrix NetScaler appliance. The directory path for the certificate and key files must be the same on both appliances before you add an SSL certificate-key pair on the primary appliance.

What is a NULL-Cipher?

Ciphers with no encryption are known as NULL-Ciphers. For example, NULL-MD5 is a NULL-Cipher.

Are the NULL-Ciphers enabled by default for an SSL VIP or an SSL service?

No. NULL-Ciphers are not enabled by default for an SSL VIP or an SSL service.

What is the procedure to remove NULL-Ciphers?

To remove the NULL-Ciphers from an SSL VIP, run the following command:
bind ssl cipher <SSL_VIP> REM NULL

To remove the NULL-Ciphers from an SSL Service, run the following command:

```
bind ssl cipher <SSL_Service> REM NULL -service
```

What are the various cipher aliases supported on the Citrix NetScaler appliance?

The Citrix NetScaler appliance supports the following cipher aliases:

1. Alias Name: ALL
   Description: All NetScaler-supported ciphers, excluding NULL ciphers

2. Alias Name: DEFAULT
   Description: Default cipher list with encryption strength >= 128bit

3. Alias Name: kRSA
   Description: Ciphers with RSA key exchange algorithm
4. Alias Name: kEDH
   Description: Ciphers with Ephemeral-DH key exchange algorithm
5. Alias Name: DH
   Description: Ciphers with DH key exchange algorithm
6. Alias Name: EDH
   Description: Ciphers with DH key exchange algorithm and authentication algorithm
7. Alias Name: aRSA
   Description: Ciphers with RSA authentication algorithm
8. Alias Name: aDSS
   Description: Ciphers with DSS authentication algorithm
9. Alias Name: aNULL
   Description: Ciphers with NULL authentication algorithm
10. Alias Name: DSS
    Description: Ciphers with DSS authentication algorithm
11. Alias Name: DES
    Description: Ciphers with DES encryption algorithm
12. Alias Name: 3DES
    Description: Ciphers with 3DES encryption algorithm
13. Alias Name: RC4
    Description: Ciphers with RC4 encryption algorithm
14. Alias Name: RC2
    Description: Ciphers with RC2 encryption algorithm
15. Alias Name: eNULL
    Description: Ciphers with NULL encryption algorithm
16. Alias Name: MD5
    Description: Ciphers with MD5 message authentication code (MAC) algorithm
17. Alias Name: SHA1
    Description: Ciphers with SHA-1 MAC algorithm
18. Alias Name: SHA
    Description: Ciphers with SHA MAC algorithm
19. Alias Name: NULL
    Description: Ciphers with NULL encryption algorithm
20. Alias Name: RSA
    Description: Ciphers with RSA key exchange algorithm and authentication algorithm

21. Alias Name: ADH
    Description: Ciphers with DH key exchange algorithm, and NULL authentication algorithm
22. Alias Name: SSLv2
    Description: SSLv2 protocol ciphers
23. Alias Name: SSLv3
    Description: SSLv3 protocol ciphers
24. Alias Name: TLSv1
    Description: SSLv3/TLSv1 protocol ciphers
25. Alias Name: TLSv1_ONLY
    Description: TLSv1 protocol ciphers
26. Alias Name: EXP
    Description: Export ciphers
27. Alias Name: EXPORT
    Description: Export ciphers
28. Alias Name: EXPORT40
    Description: Export ciphers with 40-bit encryption
29. Alias Name: EXPORT56
    Description: Export ciphers with 56-bit encryption
30. Alias Name: LOW
    Description: Low strength ciphers (56-bit encryption)
31. Alias Name: MEDIUM
    Description: Medium strength ciphers (128-bit encryption)
32. Alias Name: HIGH
    Description: High strength ciphers (168-bit encryption)
33. Alias Name: AES
    Description: AES ciphers
34. Alias Name: FIPS
    Description: FIPS-approved ciphers
35. Alias Name: ECDHE
    Description: Elliptic Curve Ephemeral DH Ciphers

What is the command to display all the predefined ciphers of the Citrix NetScaler appliance?

To display all the predefined ciphers of the Citrix NetScaler appliance, at the NetScaler command line, type:
show ssl cipher

What is the command to display the details of an individual cipher of the Citrix NetScaler appliance?

To display the details of an individual cipher of the Citrix NetScaler appliance, at the NetScaler command line, type:
show ssl cipher <Cipher_Name/Cipher_Alias_Name/Cipher_Group_Name>

Example:

```
 > show cipher SSL3-RC4-SHA
 1) Cipher Name: SSL3-RC4-SHA
 Description: SSLv3 Kx=RSA Au=RSA Enc=RC4(128)
Mac=SHA1
 Done
```

What is the significance of adding the predefined ciphers of the Citrix NetScaler appliance?

Adding the predefined ciphers of the Citrix NetScaler appliance causes the NULL-Ciphers to get added to an SSL VIP or an SSL service.

Why do I need to bind the server certificate?

Binding the server certificates is the basic requirement for enabling the SSL configuration to process SSL transactions.
To bind the server certificate to an SSL VIP, at the NetScaler command line, type:

bind ssl vserver <vServerName> -certkeyName <cert_name>

To bind the server certificate to an SSL service, at the NetScaler command line, type:

bind ssl service <serviceName> -certkeyName <cert_name>

How many certificates can I bind to an SSL VIP or an SSL service?

On a NetScaler virtual appliance, you can bind a maximum of two certificates to an SSL VIP or an SSL service, one each of type RSA and type DSA. On a NetScaler MPX or MPX-FIPS appliance, if SNI is enabled, you can bind multiple server certificates of type RSA. If SNI is disabled, you can bind a maximum of one certificate of type RSA.
Note: DSA certificates are not supported on MPX or MPX-FIPS platforms.

Does SNI support Subject Alternative Name (SAN) certificates?

No. On a NetScaler appliance, SNI is not supported with a SAN extension certificate.

What happens if I unbind or overwrite a server certificate?

When you unbind or overwrite a server certificate, all the connections and SSL sessions created by using the existing certificate are terminated. When you overwrite an existing certificate, the following message appears:
ERROR:

Warning: Current certificate replaces the previous binding.

How do I install an intermediate certificate on Citrix NetScaler and link to a server certificate?

See the article at http://support.citrix.com/article/ctx114146 for information about installing an intermediate certificate.

Why am I am getting a "resource already exists" error when I try to install a certificate on the Citrix NetScaler?

See the article at http://support.citrix.com/article/CTX117284 for instructions for resolving the "resource already exists" error.

I want to create a server certificate on a Citrix NetScaler appliance to test and evaluate the product. What is the procedure to create a server certificate?

Perform the following procedure to create a test certificate.
Note: A certificate created with this procedure cannot be used to authenticate all the users and browsers. After using the certificate for testing, you should obtain a server certificate signed by an authorized Root CA.

To create a self-signed server certificate:

1. To create a Root CA certificate, at the NetScaler command line, type:
   create ssl rsakey /nsconfig/ssl/test-ca.key 1024

   create ssl certreq /nsconfig/ssl/test-ca.csr -keyfile /nsconfig/ssl/test-ca.key

   Enter the required information when prompted, and then type the following command:

   create ssl cert /nsconfig/ssl/test-ca.cer /nsconfig/ssl/test-ca.csr ROOT_CERT -keyfile /nsconfig/ssl/test-ca.key

2. Perform the following procedure to create a server certificate and sign it with the root CA certificate that you just created
   1. To create the request and the key, at the NetScaler command line, type:
      create ssl rsakey /nsconfig/ssl/test-server.key 1024

      create ssl certreq /nsconfig/ssl/test-server.csr -keyfile /nsconfig/ssl/test-server.key

   2. Enter the required information when prompted.
   3. To create a serial-number file, at the NetScaler command line, type:
      shell
      # echo '01' >
      /nsconfig/ssl/serial.txt
      # exit
3. To create a server certificate signed by the root CA certificate created in step 1, at the NetScaler command line, type:
   create ssl cert /nsconfig/ssl/test-server.cer /nsconfig/ssl/test-server.csr SRVR_CERT -CAcert /nsconfig/ssl/test-ca.cer -CAkey /nsconfig/ssl/test-ca.key -CAserial /nsconfig/ssl/serial.txt

4. To create a Citrix NetScaler certkey, which is the in-memory object that holds the server certificate information for SSL handshakes and bulk encryption, at the NetScaler command line, type:
   add ssl certkey test-certkey -cert /nsconfig/ssl/test-server.cer -key /nsconfig/ssl/test-server.key

5. To bind the certkey object to the SSL virtual server, at the NetScaler command line, type:
   bind ssl vserver <vServerName> -certkeyName <cert_name>

I have received a Citrix NetScaler appliance on which Citrix NetScaler software release 9.0 is installed. I have noticed an additional license file on the appliance. Is there any change in the licensing policy starting with Citrix NetScaler software release 9.0?

Yes. Starting with Citrix NetScaler software release 9.0, the appliance might not have a single license file. The number of license files depends on the Citrix NetScaler software release edition. For example, if you have installed the Enterprise edition, you might need additional license files for the full functionality of the various features. However, if you have installed the Platinum edition, the appliance has only one license file.

How do I export the certificate from Internet Information Service (IIS)?

There are many ways to do this, but by using the following method the appropriate certificate and private key for the Web site are exported. This procedure **must** be performed on the actual IIS server.

1. Open the Internet Information Services (IIS) Manager administration tool.
2. Expand the Web Sites node and locate the SSL-enabled Web site that you want to serve through the Citrix NetScaler.
3. Right-click this Web site and click Properties.
4. Click the Directory Security tab and, in the Secure Communications section of the window, select the View Certificate box.
5. Click the Details tab, and then click Copy to File.
6. On the Welcome to the Certificate Export Wizard page, click Next.
7. Select Yes, export the private key and click Next.

Note: The private key MUST be exported for SSL Offload to work on the Citrix NetScaler

8. Make sure that the Personal Information Exchange -PKCS #12 radio button is selected, and select *only* the Include all certificates in the certification path if possible check box. Click Next.
9. Enter a password and click Next.
10. Enter a file name and location, and then click Next. Give the file an extension of .PFX.
11. Click Finish.

How do I convert the PKCS#12 certificate and install it on the Citrix NetScaler?

1. Move the exported .PFX certificate file to a location from where it may be copied to the Citrix NetScaler (that is, to a machine that permits SSH access to the management interface of a Citrix NetScaler appliance). Copy the certificate to the appliance by using a secure copy utility such as SCP.
2. Access the BSD shell and convert the certificate (for example, cert.PFX) to .PEM format:
   root@ns# openssl pkcs12 -in cert.PFX -out cert.PEM
3. To make sure that the converted certificate is in correct x509 format, verify that the following command produces no error:
   root@ns# openssl x509 -in cert.PEM -text
4. Verify that the certificate file contains a private key. Begin by issuing the following command:
   root@ns# cat cert.PEM

   Verify that the output file includes an RSA PRIVATE KEY section.

   -----BEGIN RSA PRIVATE KEY-----
   Mkm^s9KMs9023pz/s...
   -----END RSA PRIVATE KEY-----
   The following is another example of an RSA PRIVATE KEY section:

   Bag Attributes
   1.3.6.1.4.1.311.17.2: <No Values>
   localKeyID: 01 00 00 00
   Microsoft CSP Name: Microsoft RSA SChannel Cryptographic
   Provider
   friendlyName:
   4b9cef4cc8c9b849ff5c662fd3e0ef7e_76267e3e-6183-4d45-886e-6e067297b38f

   Key Attributes
   X509v3 Key Usage: 10
   -----BEGIN RSA PRIVATE KEY-----
   Proc-Type: 4,ENCRYPTED
   DEK-Info: DES-EDE3-CBC,43E7ACA5F4423968
   pZJ2SfsSVqMbRRf6ug37Clua5gY0Wld4frPIxFXyJquUHr31dilW5ta3hbIaQ+Rg

   ... (more random characters)
   v8dMugeRplkaH2Uwt/mWBk4t71Yv7GeHmcmjafK8H8iW80ooPO3D/ENV8X4U/tIh

   5eU6ky3WYZ1BTy6thxxLIwAullynVXZEfINLxq1oX+ZYl6djgjE3qg==
   -----END RSA PRIVATE KEY-----
   The following is a SERVER CERTIFICATE section:

   Bag Attributes

localKeyID: 01 00 00 00
friendlyName: AG Certificate
subject=/C=AU/ST=NSW/L=Wanniassa/O=Dave Mother
Asiapacific/OU=Support/CN=davemother.food.lan
issuer=/DC=lan/DC=food/CN=hotdog
-----BEGIN CERTIFICATE-----
MIIFiTCCBHGgAwIBAgIKCGryDgAAAAAHzANBgkqhkiG9w0BAQUFADA8MRMwEQYK

... (more random characters) 5pLDWYVHhLkA1pSxvFjNJHRSIydWHc5ltGyKqIUcBezVaXyel94pNSUYx07NpPV/

MY2ovQyQZM8gGe3+lGFum0VHbv/y/gB9HhFesog=
-----END CERTIFICATE-----
The following is an INTERMEDIATE CA CERTIFICATE section:

Bag Attributes: <Empty Attributes>
subject=/DC=lan/DC=food/CN=hotdog
issuer=/DC=lan/DC=food/CN=hotdog
-----BEGIN CERTIFICATE-----
MIIESDCCAzCgAwIBAgIQah20fCRYTY9LRXYMIRaKGjANBgkqhkiG9w0BAQUFADA8

... (more random characters) Nt0nksawDnbKo86rQcNnY5xUs7c7pj2zxj/IOsgNHUp5W6dDI9pQoqFFaDk=

-----END CERTIFICATE-----
Further Intermediate CA certificates may follow, depending on the certification path of the exported certificate.

5. Open the .PEM file in a text editor
6. Locate the first line of the .PEM file and the first instance of the following line, and copy those two lines and all the lines between them:
   -----END CERTIFICATE-----

   Note: Make sure that last copied line is the first -----END CERTIFICATE----- line in the .PEM file.
7. Paste the copied lines into a new file. Call the new file something intuitive, such as cert-key.pem. This is the certificate-key pair for the server hosting the HTTPS service. This file should contain both the section labeled RSA PRIVATE KEY and the section labeled SERVER CERTIFICATE in the example above.
   Note: The certificate-key pair file contains the private key and must therefore be kept secure.
8. Locate any subsequent sections beginning with -----BEGIN CERTIFICATE----- and ending with ---END CERTIFICATE----, and copy each such section to a separate new file.
   These sections correspond to certificates of trusted CAs that have been included in the certification path. These sections should be copied and pasted into new individual files for these certificates. For example, the INTERMEDIATE CA CERTIFICATE section of the example above should be copied and pasted into a new file).

   For multiple intermediate CA certificates in the original file, create new files for each intermediate CA certificate in the order in which they appear in the file. Keep track (using appropriate filenames) of the order in which the certificates appear, as they need to be linked together in the correct order in a later step.

9. Copy the certificate-key file (cert-key.pem) and any additional CA certificate files into the /nsconfig/ssl directory on the Citrix NetScaler.
10. Exit the BSD shell and access the Citrix NetScaler prompt.
11. Follow the steps in "Install the certificate-key files on the appliance" to install the key/certificate once uploaded on the

device.

How do I convert the PKCS#7 certificate and install it on the NetScaler appliance?

You can use OpenSSL to convert a PKCS #7 Certificate to a format recognizable by the NetScaler appliance. The procedure is identical to the procedure for PKCS #12 certificates, except that you invoke OpenSSL with different parameters. The steps for converting PKCS #7 certificates are as follows:

1. Copy the certificate to the appliance by using a secure copy utility, such as SCP.
2. Convert the certificate (for example, cert.P7B) to PEM format:

   ```
   > openssl pkcs7 -inform DER -in cert.p7b -print_certs -text -out cert.pem
   ```

3. Follow steps 3 through 7 as described in the answer to Q32 for PKCS #12 certificates.

Note: Before loading the converted PKCS #7 certificate to the appliance, be sure to verify that it contains a private key, exactly as described in step 3 for the PKCS #12 procedure. PKCS #7 certificates, particularly those exported from IIS, do not typically contain a private key.

When I bind a cipher to a virtual server or service by using the bind cipher command, I see the error message "Command deprecated."

The command for binding a cipher to a virtual server or service has changed.

Use the bind ssl vserver <vsername> -ciphername <ciphername> command to bind an SSL cipher to an SSL virtual server.

Use the bind ssl service <serviceName> -ciphername <ciphername> command to bind an SSL cipher to an SSL service.

Note: New ciphers and cipher groups are added to the existing list and not replaced.

Why can't I create a new cipher group and bind ciphers to it by using the add cipher command?

The add cipher command functionality has changed in release 10. The command only creates a cipher group. To add ciphers to the group, use the bind cipher command.

How do I install the OpenSSL toolkit?

See the article at http://support.citrix.com/article/ctx106627.

How do I use OpenSSL to convert certificates between PEM and DER?

To use OpenSSL, you must have a working installation of the OpenSSL software and be able to execute Openssl from the command line.
x509 certificates and RSA keys can be stored in a number of different formats.

Two common formats are DER (a binary format used primarily by Java and Macintosh platforms) and PEM (a base64 representation of DER with header and footer information, which is used primarily by UNIX and Linux platforms). There is also an obsolete NET (Netscape server) format that was used by earlier versions of IIS (up to and including 4.0) and various other less common formats that are not covered in this article.

A key and the corresponding certificate, as well as the root and any intermediate certificates, can also be stored in a single PKCS#12 (.P12, .PFX) file.

Procedure

Use the Openssl command to convert between formats as follows:

1. To convert a certificate from PEM to DER:

x509 -in input.crt -inform PEM -out output.crt -outform DER

2. To convert a certificate from DER to PEM:

   x509 -in input.crt -inform DER -out output.crt -outform PEM

3. To convert a key from PEM to DER:

   rsa -in input.key -inform PEM -out output.key -outform DER

4. To convert a key from DER to PEM:

   rsa -in input.key -inform DER -out output.key -outform PEM

Note: If the key you are importing is encrypted with a supported symmetric cipher, you are prompted to enter the pass-phrase.
Note: To convert a key to or from the obsolete NET (Netscape server) format, substitute NET for PEM or DER as appropriate. The stored key is encrypted in a weak unsalted RC4 symmetric cipher, so a pass-phrase will be requested. A blank pass-phrase is acceptable.

What are the important numbers to remember?

1. Create Certificate Request:
   - Request File Name: Maximum 63 characters
   - Key File Name: Maximum 63 characters
   - PEM Passphrase (For Encrypted Key): Maximum 31 characters
   - Common Name: Maximum 63 characters
   - City: Maximum 127 characters
   - Organization Name: Maximum 63 characters
   - State/Province Name: Maximum 63 characters
   - Email Address: Maximum 39 Characters
   - Organization Unit: Maximum 63 characters
   - Challenge Password: Maximum 20 characters
   - Company Name: Maximum 127 characters
2. Create Certificate:
   - Certificate File Name: Maximum 63 characters
   - Certificate Request File Name: Maximum 63 characters
   - Key File Name: Maximum 63 characters
   - PEM Passphrase: Maximum 31 characters
   - Validity Period: Maximum 3650 days
   - CA Certificate File Name: Maximum 63 characters
   - CA Key File Name: Maximum 63 characters
   - PEM Passphrase: Maximum 31 characters
   - CA Serial Number File: Maximum 63 characters
3. Create and Install a Server Test Certificate:
   - Certificate File Name: Maximum 31 characters
   - Fully Qualified Domain Name: Maximum 63 characters
4. Create Diffie-Hellman (DH) key:
   - DH Filename (with path): Maximum 63 characters
   - DH Parameter Size: Maximum 2048 bits
5. Import PKCS12 key:

- Output File Name: Maximum 63 characters
- PKCS12 File Name: Maximum 63 characters
- Import Password: Maximum 31 characters
- PEM Passphrase: Maximum 31 characters
- Verify PEM Passphrase: Maximum 31 characters

6. Export PKCS12
   - PKCS12 File Name: Maximum 63 characters
   - Certificate File Name: Maximum 63 characters
   - Key File Name: Maximum 63 characters
   - Export Password: Maximum 31 characters
   - PEM Passphrase: Maximum 31 characters
7. CRL Management:
   - CA Certificate File Name: Maximum 63 characters
   - CA Key File Name: Maximum 63 characters
   - CA Key File Password: Maximum 31 characters
   - Index File Name: Maximum 63 characters
   - Certificate File Name: Maximum 63 characters
8. Create RSA Key:
   - Key Filename: Maximum 63 characters
   - Key Size: Maximum 4096 bits
   - PEM Passphrase: Maximum 31 characters
   - Verify Passphrase: Maximum 31 characters
9. Create DSA Key:
   - Key Filename: Maximum 63 characters
   - Key Size: Maximum 4096 bits
   - PEM Passphrase: Maximum 31 characters
   - Verify Passphrase: Maximum 31 characters
10. Change advanced SSL settings:
    - Maximum CRL memory size: Maximum 1024 Mbytes
    - Encryption trigger timeout (10 mS ticks): Maximum 200
    - Encryption trigger packet count: Maximum 50
    - OCSP cache size: Maximum 512 Mbytes
11. Install Certificate:
    - Certificate-Key pair Name: Maximum 31 characters
    - Certificate File Name: Maximum 63 characters
    - Private Key File Name: Maximum 63 characters
    - Password: Maximum 31 characters
    - Notification Period: Maximum 100
12. Create Cipher Group:
    - Cipher Group Name: Maximum 39 characters
13. Create CRL:
    - CRL Name: Maximum 31 characters
    - CRL File: Maximum 63 characters
    - URL: Maximum 127 characters
    - Base DN: Maximum 127 characters
    - Bind DN: Maximum 127 characters
    - Password: Maximum 31 characters
    - Day(s): Maximum 31

14. Create SSL Policy:
    - Name: Maximum 127 characters
15. Create SSL Action:
    - Name: Maximum 127 characters
16. Create OCSP Responder:
    - Name: Maximum 32 characters
    - URL: Maximum 128 characters
    - Batching Depth: Maximum 8
    - Batching Delay: Maximum 10000
    - Produced At Time Skew: Maximum 86400
    - Request Time-out: Maximum120000
17. Create Virtual Server:
    - Name: Maximum 127 characters
    - Redirect URL: Maximum 127 characters
    - Client Time-out: Maximum 31536000 secs
18. Create Service:
    - Name: Maximum 127 characters
    - Idle Time-out (secs):
      Client: Maximum 31536000

      Server: Maximum 31536000
19. Create Service Group:
    - Service Group Name: Maximum 127 characters
    - Server ID: Maximum 4294967295
    - Idle Time-out (secs):
      Client: Maximum value 31536000

      Server: Maximum 31536000
20. Create Monitor:
    - Name: Maximum 31 characters
21. Create Server:
    - Server Name: Maximum 127 characters
    - Domain Name: Maximum 255 characters
    - Resolve Retry: Maximum 20939 secs

Installing, Upgrading, and Downgrading

Aug 13, 2013

What is the use of the zebos.conf file available in a NetScaler release?

A NetScaler appliance uses Zebos as the routing suite. The zebos.conf file available in a NetScaler release is the configuration file for Zebos.

I want to change the SSH port (22) on the NetScaler appliance to some other port. Is it possible to change the SSH port on the appliance?

Yes. You can change the SSH port on the NetScaler appliance by editing the sshd_config file in the /nsconfig directory. If the file does not exist in the /nsconfig directory, copy it from the /etc directory.
In the sshd_config file, edit the entry for Port 22 to Port <Number>, where <Number> is the target port number. If you do not want to restart the appliance and make the changes effective, terminate the sshd process by using the kill command, and then restart the process.

The flash directory is missing from the NetScaler appliance. What procedure should I follow to mount the flash directory?

To mount the flash directory, do the following:

1. Start the NetScaler appliance in single-user mode.
   When the appliance starts, the following message appears:

   Hit [Enter] to boot immediately, or any other key for command prompt. Booting [kernel] in 10 seconds...”
   Hit space and you should see the following prompt:

   Type '?' for a list of commands, 'help' for more detailed help.

2. Enter the following command to start FreeBSD in single-user mode:
   boot –s

   After the appliance starts, the following message appears:

   Enter full pathname of shell or RETURN for /bin/sh:

3. Press Enter to display the # prompt.
4. Run the following command to mount the flash directory:
   mount /dev/ad0s1a /flash

   Note: If the preceding command displays an error message about permissions, run the following command to check the disk for consistency:
   fsck /dev/ad0s1a

   Run the mount command again to mount the flash directory.

5. Restart the appliance.
6. From the shell prompt, run the following command to verify that the flash directory is mounted:
   df -kh

I want to log on to the NetScaler appliance without entering the password. Is it possible to configure SSH on the appliance to allow that?

Yes. You can configure SSH on the NetScaler appliance to log on without a password. However, you must provide your user name. To configure SSH for logging in without a password, do the following:

1. Run the following command to generate the public and private keys:
   ```
   # ssh-keygen -t rsa
   ```
2. Run the following command to copy the id_rsa.pub file to the .ssh directory of the remote host that you want to log on to:
   ```
   # scp id_dsa.pub <user>@<remote_host>/.ssh/id_dsa.pub
   ```
3. Log on to the remote host.
4. Change to the .ssh directory.
5. Run the following commands to add the public key of the client to the known public keys:
   ```
   # cat id_dsa.pub >> authorized_keys2

   # chmod 640 authorized_keys2

   # rm id_dsa.pub
   ```

What is the procedure to reset the NetScaler appliance BIOS? Under what circumstances should I reset the BIOS?

To reset BIOS of the NetScaler appliance, complete the following procedure:

1. Connect to the appliance through the serial port.
2. Start the appliance and press Delete as soon as the boot-up process starts.
   Pressing Delete during the POST process displays the appliance's BIOS settings.
3. Activate the Exit page of the BIOS settings.
4. Select the Load Optimal Defaults option.
   The Load Optimal Settings message box appears.
5. Select OK.
6. Make the following changes to the BIOS settings on the various tabs:

Tab	Group	Component	Set to...
Advanced	SuperIO Configuration	Parallel Port Address	Disabled
	Floppy Configuration	Floppy A	Disabled
	Boot Settings Configuration	Quiet Boot	Disabled
		PS/2 Mouse Support	Disabled
		Parity Check	Enable
	Remote Access Configuration	Remote Access	COM1
		Serial Port Mode	9600 8'n'1

Tab	Group	Component	Set to...
Chipset		Hyper-threading	Disabled
PCI PnP		Allocate IRQ to PCIVGA	NO
		USB Function	Disabled
		Legacy USB Support	Disabled
Power		ACPI Aware OS	NO
		Power Management	Enabled

Note: The BIOS options differs by appliance model.

7. Activate the Exit page of the BIOS settings.
8. Select Save changes and Exit.
9. Select OK to confirm.
10. Verify that the appliance starts cleanly and the serial console displays output after the appliance starts.

You need to reset BIOS when the serial console does not respond. This usually happens after you upgrade the appliance and the serial console is disabled. However, you can still access the appliance by using the telnet or SSH utility.

I need to reset the NetScaler appliance to the factory defaults. What procedure should I follow?

To reset the NetScaler appliance to the factory defaults, you need to reset two environments: the NetScaler application environment and the base FreeBSD environment.

To reset the NetScaler application environment of the appliance to the factory defaults, do the following:

1. Make a backup of the appliance's /nsconfig/ns.conf.
2. Delete the /nsconfig/ns.conf file.
3. Restart the appliance.

To reset the FreeBSD environment of the appliance to the factory defaults, do the following:

1. Install a fresh NetScaler code image on the appliance. This overwrites a number of FreeBSD-level configuration files with default values.
2. Delete any users and groups that are added to the appliance, that is, all except the default users.
3. Delete the **/etc/resolv.conf** file.
4. Delete the entries that you have added to the **/etc/hosts** file.
5. If the **/etc/rc.netscaler** file exists, delete it.
6. Open the **/etc/nsperm_group_suser** file and make sure that all IOCTL entries are comment entries.
7. Open the **/etc/rc.conf** file and make sure that the **syslogd_enable=NO** entry is not changed to **syslogd_enable=YES**.
8. Open the **/etc/syslog.conf** file and make sure that there are no additional entries in the file.
9. Delete the contents of the **/var/nslog**, **/var/nstrace**, and **/var/crash** files.
10. If the **syslog** process is enabled on the appliance and the appliance creates log files locally, delete the contents of the log files listed in the **/etc/syslog.conf** file. The files are created in the /var/log directory. For example, if **syslog** process writes system events to the **/var/log/events** file, and sslvpn access events to the **/var/log/sslvpnevents** file, delete

these files.

The appliance displays a message similar to the "Jun 21 12:20:18 ns /flash/ns-10.0-47.15: [1/2]dc0: NIC hang condition #663: TX 10000/10000, RX 0, HF 0" message on the console. What is the meaning of this message?

The message consists of the following components (shown here as examples):

- #663: Number of times this condition has occurred on the appliance.
- TX 10000/10000: Number of packets that the appliance attempted to transmit, and number of packets transmitted. If both numbers are the same, as in this example, the NIC transmitted all the packets that the appliance attempted to transmit.
- RX 0: Number of packets received. In this example, no packet was received.
- HF0: Number of hardware issues reported by the NIC. In this example, the NIC did not report any hardware issue.

If the appliance does not receive any packets, it reports a hang condition, because on a network it is very unlikely not to receive any packets. However, if the appliance is plugged into quite interface, you can ignore this error message.

After I upgraded the NetScaler release on the appliance, the appliance still displays the earlier release/build. What could be the reason?

The appliance displays the software version number from the /flash/boot/loader.conf file. If the kernel entry for the current NetScaler release is missing from that file, the appliance displays the last NetScaler release version for which the entry was available.

To resolve this issue, do the following:

1. Verify that the kernel file exists in the /nsconfig directory.
2. Check the /flash/boot/loader.conf file for an entry for the kernel.
   (You can expect the entry for the kernel of the release/build that you just installed to be missing from the file.)
3. Open the loader.conf file in a text editor, such as the vi editor, and update the kernel entry for the new release/build.
4. Save and close the file.
5. Repeat step 2 through step 4 for the /flash/boot/loader.conf.local file.
6. Update the release/build entry in the ns.conf file.
7. Restart the appliance.

Since I upgraded the NetScaler release on the appliance, the LCD display on the front panel of the appliance displays the out of service message or does not display anything. How can I resolve this issue?

Run the following command from the appliance's shell prompt:
/netscaler/nslcd –k

I have upgraded the NetScaler release/build. However, after the upgrade process, the appliance fails to start. Can I downgrade the appliance's software to the previous release/build?

Yes. You can start the appliance with the kernel.old kernel file. When you restart the appliance, press the F1 key as soon as the appliance console displays the Press F1 message. Type kernel.old and press Enter.

After upgrading the NetScaler release on the appliance, I accidently deleted the kernel file from the /flash directory. As a result, I am not able to start the appliance. Is there a method for starting the appliance in this situation?

Yes. You can start the appliance by using the kernel.GENERIC kernel file, as follows:

1. When you restart the appliance, press the F1 key as soon as the appliance console displays the Press F1 message.
2. Type kernel.GENERIC and press Enter.
3. Login as the root user.

4. Reinstall the NetScaler release.
5. Restart the appliance.

I have received a NetScaler appliance with the latest NetScaler release installed on it. However, I want to downgrade the software release. Can I do so?

No. If you attempt to downgrade the software release, the appliance might not work as expected, because the ns.conf file of the later release might not be compatible with the earlier release, and the appliance might restore to the factory settings.

When downgrading the NetScaler release, I followed the instructions. However, the appliance displays the following message:

```
root@LBCOL03B# ./installns
installns version (10.0-47.7) kernel (ns-10.0-47.7.gz)
Note:
Installation may pause for up to 3 minutes while data is written to the flash.
Caution:
Do not interrupt the installation process.
Doing so may cause the system to become unusable.
Installation will proceed in 5 seconds, CTRL-C to abort
No Valid Netscaler Version Detected
root@LBCOL03B#
```

Am I doing something incorrectly?

This issue could be the result of incorrect version information in the ns.conf file. To resolve this issue, open the ns.conf file in a text editor, such as the vi editor. Update the release-specific entry in the ns.conf file to #NS<Release_No> Build <Build_No>. Here, <Release_No> is the NetScaler release number to which you want to downgrade the software, and the <Build_No> is the build number of the software release to which you want to downgrade the software.

After upgrading the appliance software to NetScaler release 10.0, I am not able to log on to the appliance, and the following message is appears:

```
login: nsroot
Password:
connect: No such file or directory
nsnet_connect: No such file or directory
Login incorrect
```

I tried to resolve this issue by using the password recovery procedure, but I was not successful. Have I done something incorrectly?

You cannot resolve this issue by using the password recovery procedure. NetScaler releases 8.0 and later use the new licensing system, based on the Imgrd daemon, which runs during the startup procedure. For this daemon to work properly, the host name of NetScaler appliance, which is set in the /nsconfig/rc.conf file, must be resolved by a name server to the NetScaler IP address. Alternately, you can create a hosts file in the /nsconfig directory and add the 127.0.0.1 <Host_Name> entry in file.

Additionally, make sure that you have copied the license files to the /nsconfig/license/ directory.

During an upgrade of a high availability pair, the following message appears repeatedly:

```
<auth.err> ns sshd[5035]: error: Invalid username or password
```

What could be the reason?

This error message appears when the appliances involved in the high availability pairing have either a different NetScaler release or a different builds of the same release installed. The appliances can have different version installed if you have upgraded or downgraded one appliance but not the other.

I want to change the netmask of the NetScaler IP address on a NetScaler appliance. Can I do so without causing an outage?

Changing the netmask of the NetScaler IP might result in a short outage. Make sure that you change the netmask on the secondary appliance, and then break the high availability pairing. Check the functionality of the appliance. If everything works as expected, rebuild the high availability pairing.

To change the netmask on the appliance, run the configns command from the CLI prompt, and then choose the second option in the menu.

I have configured a High Availability pair of NetScaler appliances. After upgrading the software release from a beta release to a final release, I noticed that some of the appliance configurations are missing. Can I retrieve the lost configurations?

You can use the following procedure to restore the configuration:

1. Log on to the command line interface of the primary appliance.
2. Run the following commands:

   save config

   shell

   #cp /nsconfig/ns.conf /nsconfig/ns.conf.bkup

   The ns.conf.bkup file is a backup for the running configuration.

3. Upgrade software of both the appliances to the final release.
4. Log on to the command line interface of the primary appliance.

Surge Protection

Jan 13, 2014

On the NetScaler appliance, I have configured the Surge Queue feature with a MaxClients value set on a service. After browsing a web page, is the user connection placed in the surge queue when a user opens the next page?

No. The connection is not placed in the surge queue, because the user accesses the same server. The persistence method configured for the virtual server ensures that the connection is maintained with the same server until the connection times out, at which point and server resource becomes available.

When a web browser sends multiple requests, is it possible for a request to be placed in surge queue?

No. Until the connection times out, making the server resource available for new connections, requests are not placed in the surge queue. If you make another request after the connection times out, a new connection is established and the request is put into the surge queue if the server resource is not available.

Can I specify a limit for the surge queue on the appliance?

No. You cannot limit the surge queue. The size of the surge queue depends on the available memory of the appliance.

What happens when the appliance has no memory available for the surge queue?

When the appliance approaches the memory limit, it triggers the memory recovery process. If still the appliance does not have enough memory, it stops accepting client connections.

What is the purpose of the MaxClient value?

The MaxClient value guards the server against network attacks by allowing only the specified number of client connections to the server. If this value is not set, the appliance passes all client connections to the server. As a result, the server might be slow in responding to a client request or might not respond at all.

NetScaler Solutions

Aug 23, 2013

NetScaler solutions simplify the task of setting up frequently deployed configurations. Check this space from time to time for additional solutions.

This document includes the following solutions:

- Setting Up NetScaler for XenApp/XenDesktop
- Integrating NetScaler ADCs with Cisco ACI
- RISE Integration: NetScaler ADC and Cisco Nexus 7000 Series Switch
- Web Interface

Setting Up NetScaler for XenApp/XenDesktop

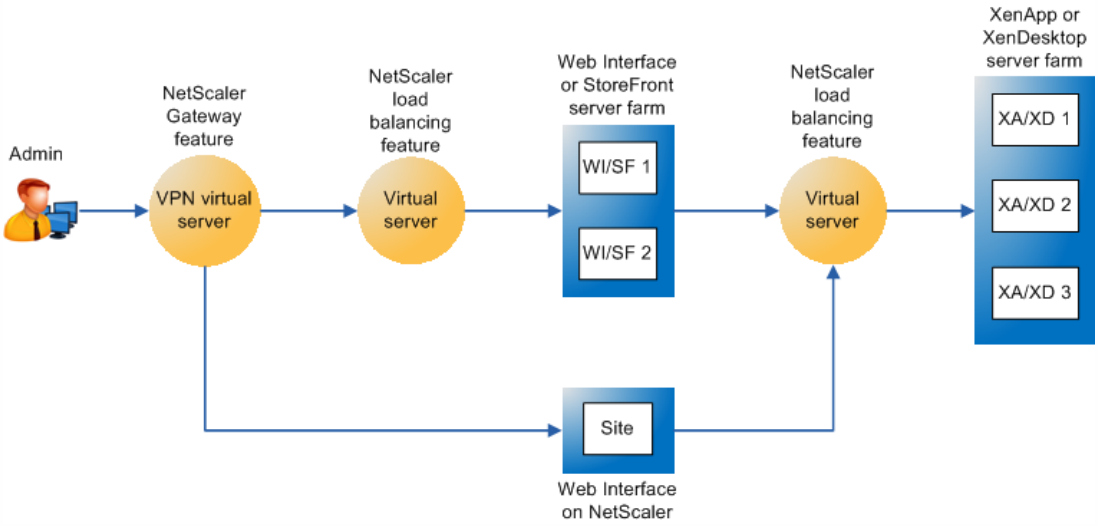
Dec 10, 2013

A NetScaler appliance can provide load balanced, secure remote access to your XenApp/XenDesktop applications. You can use the NetScaler load balancing feature to distribute traffic across the XenApp/XenDesktop servers, and the NetScaler Gateway feature to provide secure remote access to the servers. NetScaler can also accelerate and optimize the traffic flow and offer visibility features that are useful for XenApp/XenDesktop deployments.

The configurations that are required to be performed on the NetScaler are consolidated in a wizard that simplifies the deployment. You can also apply the following preset configurations:

- Optimization settings such as TCP profiles, compression, caching, and SSL quantum settings.
- Security settings such as application firewall profiles and policies.
- Visibility settings such as HDX Insight policies.

Figure 1. NetScaler Appliance in XenApp/XenDesktop Setup



The above figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.
- **NetScaler load balancing virtual server.** Load balances the traffic for the Web Interface or StoreFront servers. You can also deploy a load balancing virtual server in front of the XenApp/XenDesktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.
- **Web Interface or StoreFront or Web Interface on NetScaler.** Provides the interface through which you can access the applications.

  Note: Web Interface on NetScaler (WIonNS) is a customization of the Web Interface product, hosted on the NetScaler appliance.
- **XenApp/XenDesktop.** Provides the applications that your users want to access.

Prerequisites

Before using the wizard, make sure of the following:

- XenApp/XenDesktop servers are configured and available.
- Web Interface, StoreFront, or Web Interface on NetScaler servers are configured and available.
- You have a working knowledge of NetScaler Gateway, NetScaler, XenApp, XenDesktop, and StoreFront/Web Interface/Web Interface

on NetScaler. For more information, see "Citrix eDocs."

To set up the NetScaler for XenApp/XenDesktop by using the wizard

1. Log on to the NetScaler appliance and, on the Configuration tab, navigate to Traffic Management > Load Balancing.
2. In the details pane, under XenApp/XenDesktop, click Set Up NetScaler for XenApp/XenDesktop.
   Note: If the setup exists on the NetScaler, click the Edit link corresponding to each of the section that you want to modify.
3. Select the XenApp/XenDesktop deployment type.
   Note: The wizard supports only the single-hop deployment of XenApp/XenDesktop.
4. Select the product (StoreFront, Web Interface, or Web Interface on NetScaler) that in your deployment provides the interface for access to the XenApp/XenDesktop applications.
5. Set up secure remote access.
   1. In the NetScaler Gateway Settings section, specify the details for the VPN virtual server.
   2. In the Certificate section, choose an existing certificate or install a new certificate.
   3. In the Authentication Settings section, configure the primary authentication mechanism to be used and specify the server details. You can also configure secondary authentication to provide two-factor authentication.
      Note: While configuring the primary authentication mechanism, you can select the Load Balancing check box to distribute traffic among authentication servers. In the address field that appears, specify the IP address to assign to the load balancing virtual server.
6. Set up the interface used to access the applications. In the Web Interface, StoreFront, or Web Interface on NetScaler section, do the following:
   1. Specify the details of the server that provides the interface for accessing the applications.
   2. Select the Load Balancing check box to distribute load among the servers. In the address field that appears, specify the IP address to assign to the load balancing virtual server.
      Note: If Web Interface on NetScaler is selected in this wizard, but it is not installed on the NetScaler appliance, you are prompted to upload the TAR and JRE files. For more information, see "Installing the Web Interface."
7. Specify the XenApp/XenDesktop server(s) from which the applications are to be accessed. In the Xen Farm section, do the following:
   1. Provide details of the servers from which your users want to access applications.
   2. Select the Load Balancing check box to distribute load among the servers. In the address field that appears, specify the IP address to assign to the load balancing virtual server.
8. Configure optimization, security, and visibility on the NetScaler appliance.
   - In the Optimization section, click Apply. The following configurations are executed internally:

     TCP Profile

     > set vpn vserver ag_vsvr1 -tcpProfileName nstcp_default_XA_XD_profile
     > set servicegroup WI_servicegroup -tcpProfileName nstcp_default_XA_XD_profile
     > set servicegroup SF_servicegroup -tcpProfileName nstcp_default_XA_XD_profile
     > set servicegroup XA_Primary_Broker_servicegroup -tcpProfileName nstcp_default_XA_XD_profile
     > set servicegroup XA_Secondary_Broker_servicegroup -tcpProfileName nstcp_default_XA_XD_profile
     > set servicegroup XD_servicegroup -tcpProfileName nstcp_default_XA_XD_profile

     Compression

     > enable ns feature cmp
     > set servicegroup WI_servicegroup -cmp on
     > set servicegroup SF_servicegroup -cmp on
     > set servicegroup XA_Primary_Broker_servicegroup -cmp on
     > set servicegroup XA_Secondary_Broker_servicegroup -cmp on
     > set servicegroup XD_servicegroup -cmp on

     Caching

     > enable ns feature IC
     > add cache contentgroup cache_group_XA-XD
     > set cache parameter -memLimit 100
     > add cache policy cache_pol1 -rule TRUE -action CACHE -storeInGroup cache_group_XA-XD

> bind cache global XA_XD_10.102.87.108_cachepol -priority 10 -gotoPriorityExpression END -type REQ_DEFAULT

SSL quantum settings

> set ssl parameter -quantumSize 4 -sslTriggerTimeout 10 -encryptTriggerPktCount 10 -pushEncTriggerTimeout 10

- In the Security section, click Apply.

  Note: The security settings are not applicable for this release.
- In the Visibility section, click Apply. The following configurations are executed internally:

  > enable feature Appflow
  > set vpn vserver ag_vsvr1 -appflowLog ENABLED

  Note: Make sure that the appliance is added to the NetScaler Insight Center appliance.

9. Click Done to complete the configuration.

Integrating NetScaler ADCs with Cisco ACI

Apr 04, 2016

As businesses quickly move to make the datacenter more agile, the application centric automation and virtualization of both hardware and software infrastructure become increasingly important. Cisco Application Centric Infrastructure (ACI) supplies the critical link between business-based requirements for applications and the infrastructure that supports them. The Citrix NetScaler ADC connects infrastructure and applications and makes their configuration available to the Cisco Application Policy Infrastructure (APIC) through integration.

Citrix NetScaler and Cisco ACI enable datacenter and cloud administrators to holistically control L2-L7 network services in a unified manner, through seamless insertion and automation of best-in-class NetScaler services into next-generation datacenters built on Cisco's ACI Architectures. NetScaler leverages the Cisco Application Policy Infrastructure Controller (APIC) to programmatically automate network provisioning and control on the basis of application requirements and policies for both datacenter and enterprise environments.

Click here for more information on how to deploy NetScaler ADCs in Cisco ACI.

RISE Integration: NetScaler ADC and Cisco Nexus 7000 Series Switch

May 19, 2014

Application-delivery solutions that use service modules or switches have required complex configurations and changes in the networking stack. Cisco Remote Integrated Service Engine (RISE) technology can logically integrate a Citrix NetScaler application delivery controller (ADC) with a Cisco Nexus 7000 Series switch as a virtual service module. The integration eliminates the complexities and limitations of traditional inline and one-arm mode configurations. The NetScaler functionality is available as a centralized resource that can be leveraged across the application infrastructure supported by the Cisco Nexus 7000 series switch. The RISE integration provides a service module's streamlined deployment and simplified configuration and operation, and the complete NetScaler application-delivery capabilities that can accelerate application performance for all users.

An ADC deployed in an inline mode can create a bottleneck in the data center. Today, data-center traffic can handle traffic in the terms of terabytes per second, but the ADC capacity can scale up only to gigabytes per second range. The NetScaler ADC, with the new capability to integrate with Cisco Nexus 7000 switch using RISE, can be deployed in a one-arm mode and can provide ADC capabilities to data-center traffic with minimal configuration and maintenance overhead.

A one-arm mode deployment uses Source NAT (SNAT) and Policy Based Routing (PBR) to send only the necessary traffic through the ADC. With SNAT, the servers do not have visibility of client IP addresses. PBR resolves this issue, but it requires complex, manual configuration and is prone to errors. The Automatic Policy Based Routing (APBR) feature in RISE eliminates the need for Source NAT or manual PBR configuration in a one-arm mode design.

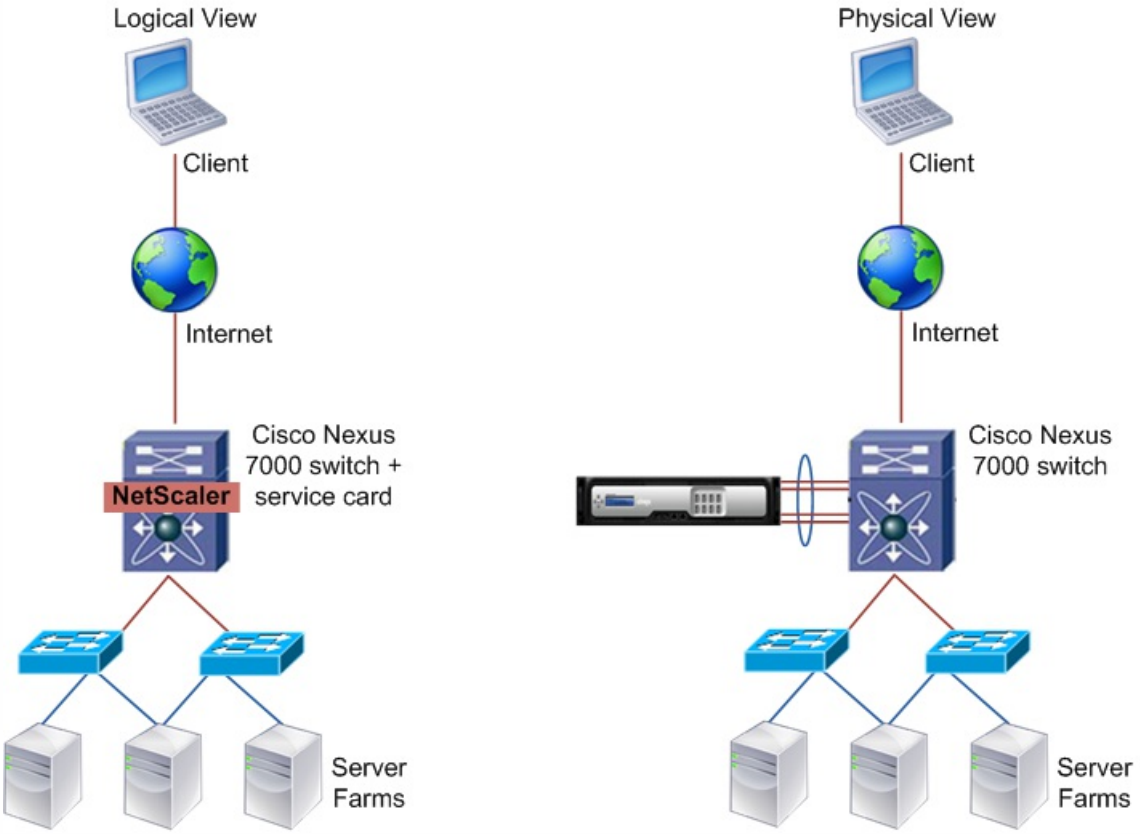
For more information about RISE functionality and other features, see Cisco Remote Integrated Service Engine for Citrix NetScaler Appliances and Cisco Nexus 7000 Series Switches Configuration Guide.

Understanding RISE

May 29, 2014

Cisco RISE technology logically integrates a Citrix NetScaler ADC with a Cisco Nexus 7000 Series switch as a virtual service module. After you connect the NetScaler ADC and the Cisco Nexus 7000 series switch, an initial handshake is performed and a control channel is established between the two devices to exchange port-channel information. The following figure shows the RISE deployment:

Figure 1. RISE Deployment



Because the NetScaler ADC appears to be a virtual module in the switch, client traffic that reaches the Cisco Nexus 7000 series switch is intelligently routed to the NetScaler ADC and then to the servers. The return traffic flows to the ADC through the Cisco switch, and then back to the client.

The interface or port-channel that connects the NetScaler ADC and Cisco Nexus 7000 series switch is a single trunk carrying both control and data VLANs. The control VLAN is used for all control channel communication, and the data VLAN is used for communicating data traffic.

For more information, see Cisco RISE Integration Overview.

This document includes the following:

- RISE Functionality
- RISE Network Topologies
- RISE Connection Modes

RISE Functionality

Updated: 2014-05-19

The feature integration that RISE enables between the NetScaler ADC and the Cisco Nexus 7000 Series switch provides the following functionalities:

- Plug and play auto-provisioning
  RISE provides a plug and play auto-provisioning feature. You can directly connect the NetScaler ADC to the Cisco Nexus 7000 series switch.

- Discovery and bootstrapping
  The discovery and bootstrap mechanism enables the Cisco Nexus 7000 Series switch to perform the initial setup of NetScaler automatically by exchanging information such as NSIP and VLANs to set up a RISE channel, which transmits control and data packets. For details, see Discovery and Bootstrap.

- Health Monitoring
  The NetScaler ADC uses its health monitoring feature to track and support server health by sending health probes to verify server responses. The Intelligent Services Control Manager (iSCM) on the Cisco Nexus 7000 Series switch and the Intelligent Services Control Client (iSCC) on the NetScaler ADC also periodically send heartbeat packets to each other. If a critical error occurs and health monitoring detects a service instance failure, or if the heartbeat is missed six times successively, the RISE channel becomes nonoperational. For details, see Health Monitoring.

- APBR
  Automatic Policy Based Routing (APBR) automatically routes the return traffic from the servers to the NetScaler ADC, preserving the client IP addresses. The automatic policy based routes are defined on the Cisco Nexus 7000 series switch. When the return traffic from the server reaches the Cisco Nexus 7000 series switch, the APBR policies defined on the switch route the traffic to the NetScaler ADC, which in turn routes the traffic to the client.

  Note:
  - APBR can function only if USIP is enabled on the NetScaler ADC.
  - APBR can be deployed in a VPC mode or a non-VPC mode. For more details on VPC mode, see Cisco VPC.

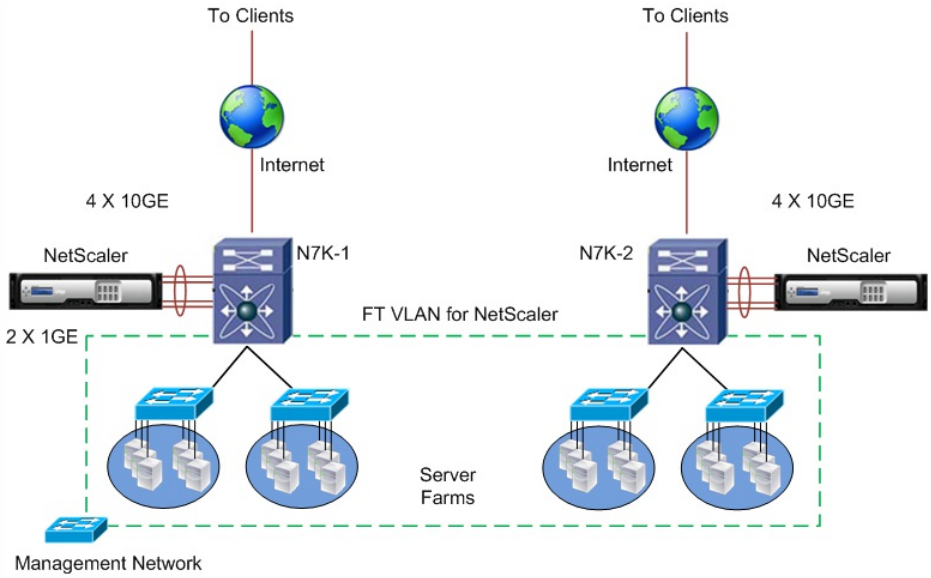
  For details on configuring APBR, see Configuring Auto Policy-Based Routing.

RISE Network Topologies

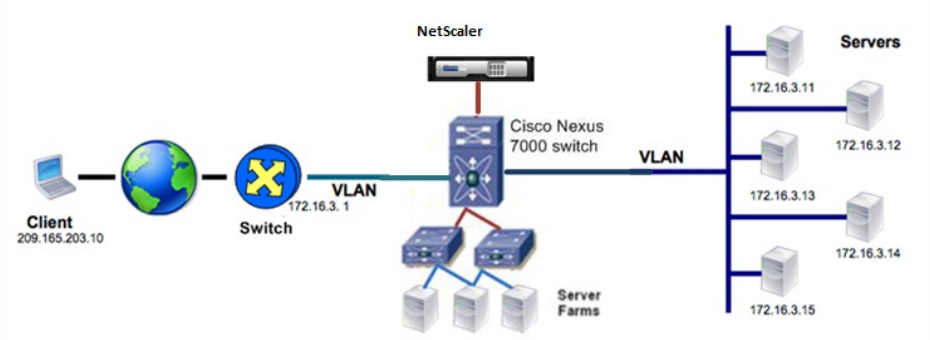
Updated: 2014-05-19

RISE can be deployed in any of the following modes:

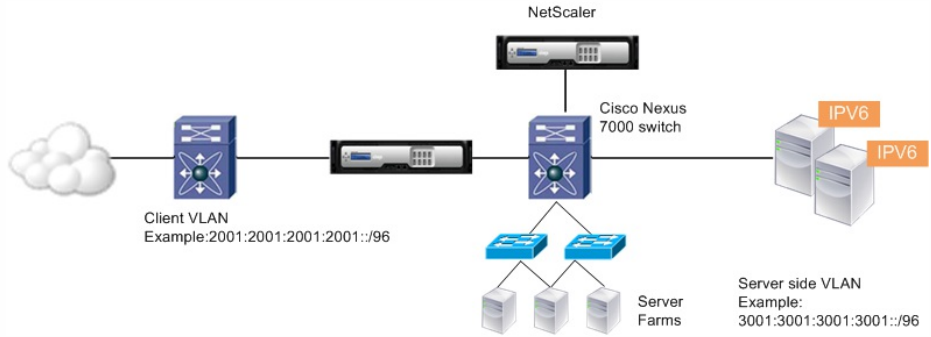
- One-Arm mode— The NetScaler ADC's ports are bundled as a port channel connected to the Cisco Nexus 7000 Series switch. In one-arm mode, the ADC is configured with a VLAN that handles both client and server requests.
  Figure 2. One-Arm Mode



- Bridged mode— In bridged mode, the NetScaler ADC bridges traffic between two VLANs in the same IP subnet. The VLAN facing the WAN is the client VLAN. The VLAN facing the data center is the server VLAN. A bridge group virtual interface (BVI) joins the two VLANs into one bridge group.
  Figure 3. Bridged Mode



- Routed mode—In routed mode, the NetScaler ADC is the next hop in the network, typically with the client-side VLAN and the server-side VLAN in different IP subnets or in different IP networks.
  Figure 4. Routed Mode



RISE Connection Modes

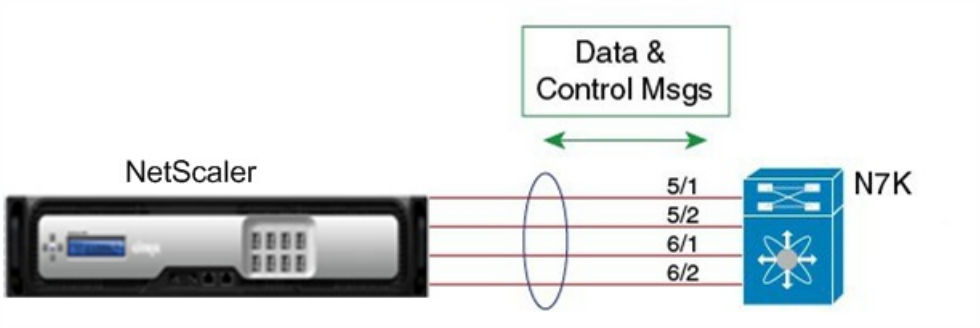
Updated: 2014-05-27

You can connect the Citrix NetScaler appliance to the Cisco Nexus 7000 Series switch in one of the following ways:

Direct Connect Mode for a Standalone Switch

In a direct mode deployment, the NetScaler ADC is attached to a single Nexus 7000 Series switch. The switch can be standalone device or a vPC peer.

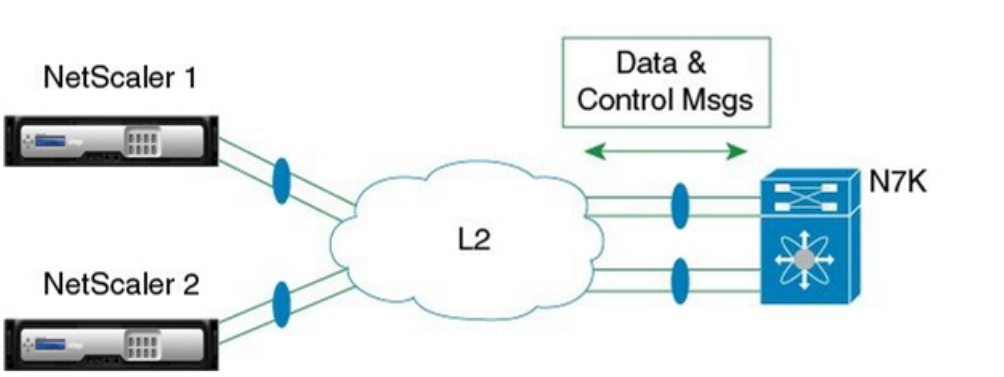
Figure 5. Direct Connect Mode



Indirect Connect Mode

In an indirect mode deployment, a virtual NetScaler ADC is connected to a Cisco Nexus 7000 Series switch through a switched layer 2 network.

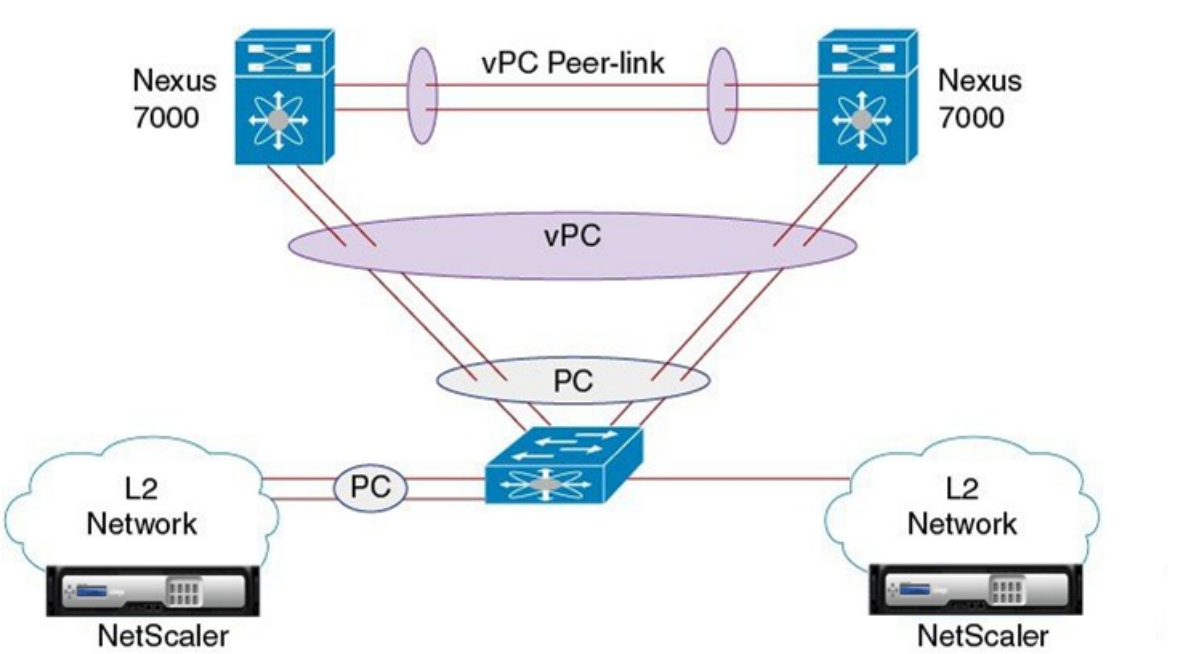
Figure 6. Indirect Connect Mode



Virtual Port Channel (vPC) Connect Mode

In a virtual port channel (vPC) direct mode deployment, the NetScaler ADC is attached to a single Nexus 7000 Series switch that is a vPC peer.

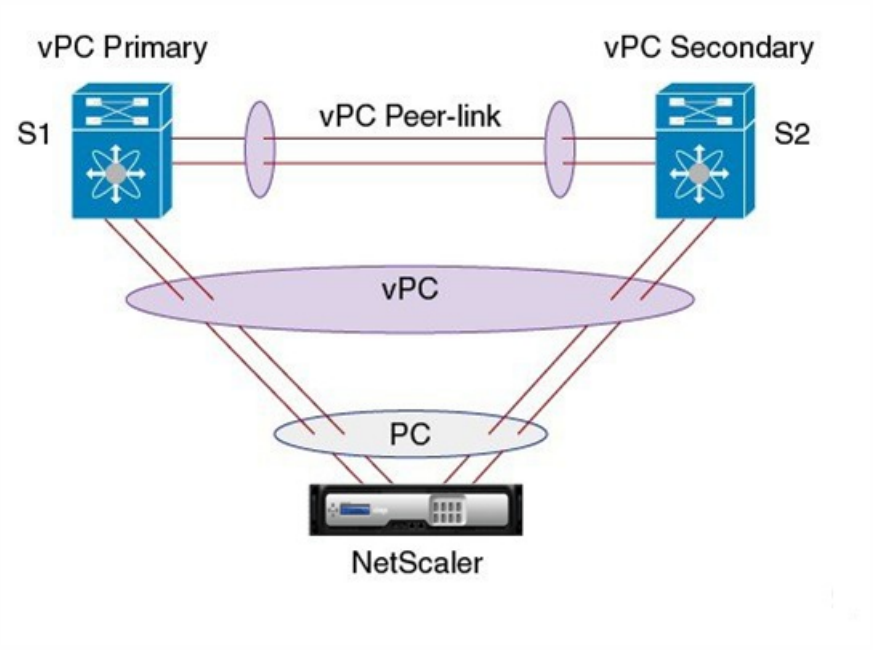
Figure 7. Virtual Port Channel (vPC) Connect Mode



vPC Indirect Connect Mode

In a vPC indirect mode deployment, the NetScaler ADC is indirectly attached to a Cisco Nexus vPC peer through a layer 2 network.

Figure 8. vPC Indirect Connect Mode

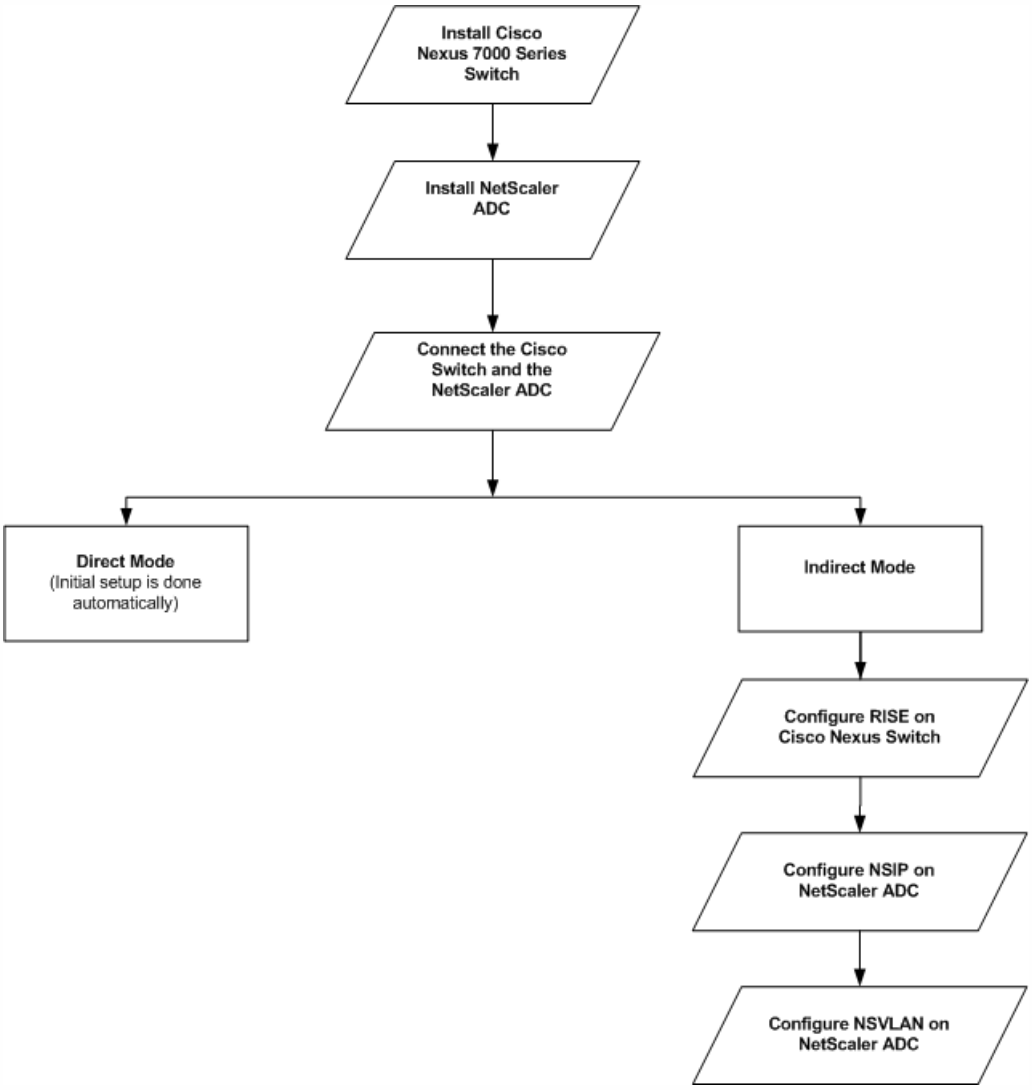


For more information on connection modes, see Connection Modes.

Getting Started with RISE

May 19, 2014

To begin using the RISE features, first install the Cisco Nexus 7000 series switch and the NetScaler ADC. Then, connect the NetScaler ADC to the Cisco Nexus 7000 switch either directly or indirectly. If you plan to connect the NetScaler ADC directly to the Cisco Nexus 7000 switch, the initial setup is done automatically by the auto-discovery feature. The following figure explains the flow of steps in the configuration of RISE.



This document includes the following:

- Installing the Cisco Nexus Switch and the NetScaler ADC
- Accessing the Cisco Nexus Switch and the NetScaler ADC
- Configuring RISE
- Configuring High Availability

Installing the Cisco Nexus Switch and the NetScaler ADC

Updated: 2014-05-26

You need to first install the Cisco Nexus 7000 series switch, and then install the NetScaler ADC.

Installing Cisco Nexus 7000 Series Switch

To install the Cisco Nexus 7000 Series Switch, see Installing Cisco Nexus 7000 Series Switch.

Installing NetScaler ADC

To install the NetScaler ADC, see Installing NetScaler ADC.

To install a virtual NetScaler ADC appliance, see Installing NetScaler Virtual Appliances on XenServer or Installing NetScaler Virtual Appliances on VMware ESX.

Accessing the Cisco Nexus Switch and the NetScaler ADC

Updated: 2014-05-26

After you have completed the installation process, you can access the Cisco Nexus Series 7000 switch through the command-line interface (CLI) and the Citrix NetScaler appliance through the graphical user interface (GUI) or the CLI. To perform administrative tasks and also, to configure RISE, you need to access the Cisco switch and the NetScaler ADC.

Accessing the Cisco Nexus Series 7000 Switch

After installing the Cisco Nexus 7000 series switch, you can access it using the command line interface. To access the Cisco Nexus 7000 Series Switch, see Accessing the Cisco Nexus 7000 series switch.

Accessing the NetScaler ADC

A NetScaler appliance has both a command line interface (CLI) and a graphical user interface (GUI). The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.
Note: If you are using the direct connect mode to connect the appliance to the Cisco Nexus switch, you are not required to access the Citrix Netscaler appliance to configure RISE. For direct connect mode, the IP address and VLAN for management are pushed from the Cisco Nexus switch as part of RISE simplified provisioning.
For information about the procedures to access through CLI and GUI, see Using the Command Line Interface and Using Graphical User Interface.

Configuring RISE

Updated: 2015-03-18

After you install the Cisco Nexus 7000 series switch and the NetScaler ADC, configure the appliance to work in direct mode, indirect mode, VPC direct mode, or VPC indirect mode.

Direct Mode

The NetScaler ADC which is directly connected to the switch is automatically configured for RISE mode and all of its ports are in operation mode. No configuration is required on the appliance in a direct mode deployment. For details on configuring RISE in direct mode, see Configuring RISE in Direct Mode.

Indirect Mode

For indirect mode deployment, configure RISE on Cisco Nexus switch, and then configure NSIP and NSVLAN on NetScaler

ADC.

- Configuring RISE on Cisco Nexus Switch
- Configuring NSIP on NetScaler ADC
- Configuring NSVLAN on NetScaler ADC

If the direct mode is disabled. all Layer 2 (L2) discovery messages are dropped and L2 RISE discovery does not take place. While, if the direct mode is enabled, the L2 discovery messages are parsed. If L2 RISE discovery messages are successfully parsed, the Indirect Mode is automatically enabled.

If indirect mode is disabled, NetScaler RISE daemon does not listen on TCP ports 8000 and 8001. As a result, RISE heartbeats stop and RISE profiles go down. While, if indirect mode is enabled, NetScaler RISE daemon starts listening on TCP ports 8000 and 8001. As a result, RISE heartbeats may be exchanged and RISE profiles may come up.

The default setting for RISE is direct attach mode as enabled and indirect mode as disabled. With these settings, the direct attach mode works. However, indirect mode will not work. If you want to deploy NetScaler in an indirect mode setting with N7K then use the following setting:

set rise param -indirectMode ENABLED

With active RISE profiles in direct mode, you must consider the followings points:

1. The set rise param -directMode DISABLED command displays a warning message; Warning: Disabling direct mode with one or more active RISE profile(s) on DIRECT ATTACH mode may cause corresponding RISE profile(s) to not come UP on reboot
2. The set rise param -indirectMode DISABLED displays a warning message; Warning: Disabling indirect mode will cause any active RISE profile(s) to go down

However, if the direct mode is enabled, and NetScaler starts receiving L2 RISE discovery messages, it automatically turns the indirect mode as enabled. Otherwise, RISE direct mode does not work.

With active RISE profiles in Indirect Attach mode, the set rise param -indirectMode DISABLED command displays a warning message; Warning: Disabling indirect mode will cause any active RISE profile(s) to go down leading to RISE profiles on Indirect Attach going down.

vPC Direct Mode

The NetScaler ADC which is directly connected to the switch is automatically configured for RISE mode and all of its ports are in operation mode. No configuration is required on the appliance in a direct mode deployment. For details on configuring RISE in direct mode, see Configuring RISE in vPC Direct Mode.

vPC Indirect Mode

In a vPC indirect mode deployment, the NetScaler ADC is indirectly attached to a Cisco Nexus vPC peer through a Layer 2 network.

- Configuring RISE on Cisco Nexus Switch
- Configuring NSIP on NetScaler ADC
- Configuring NSVLAN on NetScaler ADC

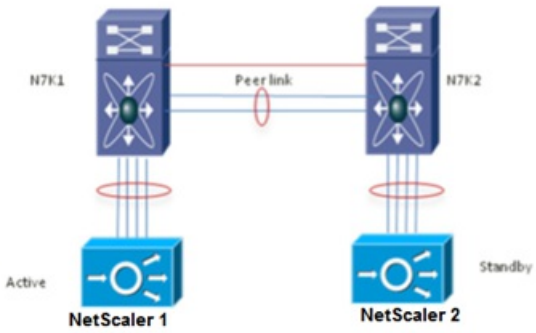
For details on configuring RISE in direct mode, see Configuring RISE in vPC Direct Mode.
For information on configuring RISE, see Configuring RISE.

Configuring High Availability

Updated: 2014-05-26

In a High Availability setup, the RISE deployment uses a maximum of two NetScaler ADCs. If one ADC becomes unavailable, the traffic flow is seamlessly switched to the other ADC.

Figure 1. High Availability



For information about high availability configuration, see High Availability.

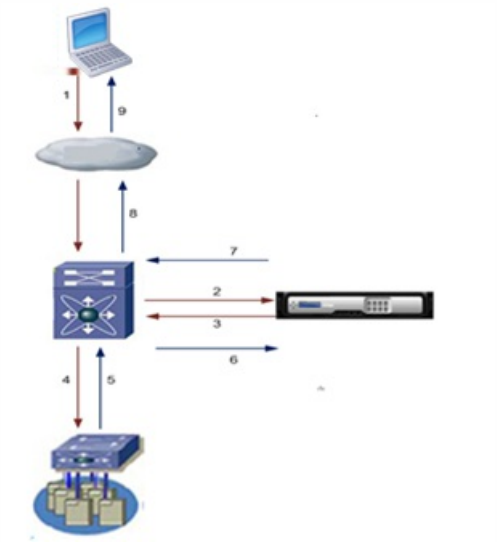
Use Case: Configuring Auto Policy-Based Routing

May 27, 2014

Auto Policy-Based Routing (APBR) automatically routes the return traffic from the servers to the NetScaler ADC, preserving the client IP addresses. The automatic policy based routes are defined on the Cisco Nexus 7000 series switch. When the return traffic from the server reaches the Cisco Nexus 7000 series switch, the APBR policies defined on the switch route the traffic to the NetScaler ADC, which in turn routes the traffic to the client.

To understand the need for APBR, first consider a NAT based scenario in which a packet flows from the client to the server and from the server back to the client.

Figure 1. Packet Flow



1. Client initiates the traffic to the virtual IP (VIP) address.
   SRC_IP= Client IP; DST_IP= VIP
2. The Cisco Nexus switch forwards the packet to the NetScaler ADC.
   SRC_IP= Client IP; DST_IP= VIP
3. The ADC performs source NAT and destination NAT (Network Address Translation), changes the source IP and destination IP addresses, and sends the packet to the Cisco Nexus switch.
   SRC_IP= NAT_IP; DST_IP= RS_IP
4. The Cisco Nexus switch receives the packet and forwards it to a server.
   SRC_IP= NAT_IP; DST_IP= RS_IP
5. The server processes the packet and forwards it to the Cisco Nexus 7000 series switch.
   SRC_IP= RS_IP IP; DST_IP= NAT_IP
6. The Cisco Nexus switch forwards the packet to the NetScaler ADC.
   SRC_IP= RS_IP IP; DST_IP= NAT_IP
7. The NetScaler ADC changes the source IP address and forwards the packet to the Cisco Nexus 7000 series switch.
   SRC_IP= VIP; DST_IP= Client_IP

8. The Cisco Nexus 7000 series switch forwards the packet to the client.
   SRC_IP= VIP; DST_IP= Client_IP

   The client receives the packet. However, the client IP address is not visible to the server.

Now, consider a scenario in which policy based routing (PBR) directs packet flow.

1. Client initiates the traffic to the virtual IP (VIP) address.
   SRC_IP= Client IP; DST_IP= VIP
2. The Cisco Nexus switch forwards the packet to the NetScaler ADC.
   SRC_IP= Client IP; DST_IP= VIP
3. The ADC performs destination NAT (Network Address Translation), changes the destination IP, and then sends the packet to the Cisco Nexus switch.
   SRC_IP= Client IP; DST_IP= RS_IP
4. The Cisco Nexus switch receives the packet and forwards it to a server.
   SRC_IP= Client IP; DST_IP= RS_IP
5. The server processes the packet and forwards it to the Cisco Nexus 7000 series switch.
   SRC_IP= RS_IP IP; DST_IP= Client IP
6. The Cisco Nexus switch forwards the packet to the NetScaler ADC.
   SRC_IP= RS_IP IP; DST_IP= Client IP
7. The NetScaler ADC changes the source IP address and forwards the packet to the Cisco Nexus 7000 series switch.
   SRC_IP= VIP; DST_IP= Client_IP
8. The Cisco Nexus 7000 series switch forwards the packet to the client.
   SRC_IP= VIP; DST_IP= Client_IP
9. The client receives the packet. The client IP address is visible to the server. However, PBR requires manual and complex configurations and is prone to errors.

To overcome these drawbacks, configure APBR rules on the RISE appliance. When APBR is configured, the packets flow as described in the following procedure:

1. Client initiates the traffic to the virtual IP (VIP) address.
   SRC_IP= Client IP; DST_IP= VIP
2. The Cisco Nexus switch forwards the packet to the NetScaler ADC.
   SRC_IP= Client IP; DST_IP= VIP
3. The ADC performs load balancing and changes the destination IP address to the appropriate server IP address and forwards the packet to the Cisco Nexus switch in an APBR message.
   SRC_IP= Client IP; DST_IP= RS_IP
4. The Cisco Nexus switch receives the packet and forwards it to a server by using a route map.
   SRC_IP= Client IP; DST_IP= RS_IP
5. The server processes the packet and forwards it to the Cisco Nexus 7000 series switch.
   SRC_IP= RS_IP IP; DST_IP= Client_IP

6. When the packet reaches the Nexus switch, the switch applies the APBR rules, sets the next hop IP address to that of the NetScaler ADC, and forwards the packet to the NetScaler ADC.
   SRC_IP= RS_IP IP; DST_IP= Client_IP

7. The NetScaler ADC changes the source IP address and forwards the packet to the Cisco Nexus 7000 series switch.
   SRC_IP= VIP; DST_IP= Client_IP

8. The Cisco Nexus 7000 series switch forwards the packet to the client.
   SRC_IP= VIP; DST_IP= Client_IP

9. The client receives the packet successfully.

Note: APBR rules are configured on the Cisco Nexus switch by the Citrix Netscaler appliance only if the Use Source IP (USIP) option is enabled in the services or service groups on the Citrix Netscaler appliance.
The APBR message control flow is explained below

1. After USIP is enabled in the services on Netscaler ADC, it publishes the IP address, port number and protocol details of the server to the Cisco Nexus 7000 series switch over the RISE control channel.
2. Using the IP address, port number and protocol details of the server, the Cisco Nexus 7000 series switch creates an APBR rule which consists of ACLs and route maps.
   Note:
   - For local servers, the switch creates ACLs and route maps.
   - For remote servers , the switch forwards the APBR messages to other Cisco Nexus 7000 series switches.
3. The RISE appliance then applies the APBR rules to the switch virtual interface on the Cisco Nexus 7000 series switch connected to server.

To configure the APBR functionality:

- Enable the feature on the Cisco Nexus switch
- Configure APBR on NetScaler ADC
  - Configure NSIP
  - Configure NSVLAN
  - Enable USIP option

For more information, see Configuring Auto Policy-Based Routing.

Web Interface

Aug 30, 2013

The Web Interface on Citrix NetScaler appliances is based on Java Server Pages (JSP) technology and provides access to Citrix XenApp and Citrix XenDesktop applications. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in.

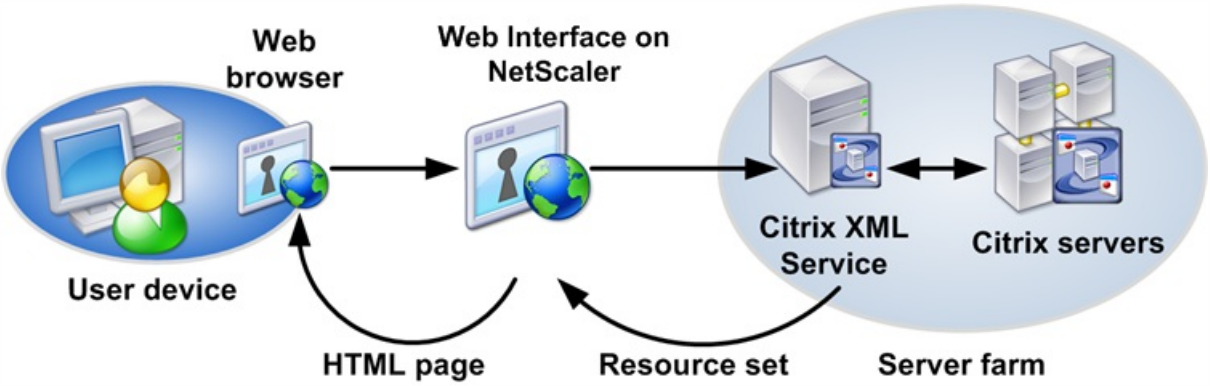
The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.35 on the NetScaler appliance. The Web Interface sites provide user access to the XenApp and XenDesktop resources, which include applications, content, and desktops.

The Web Interface installation includes installing the Web Interface tar file and JRE tar file on the NetScaler appliance. To configure the Web Interface, you create a Web Interface site and bind one or more XenApp or XenDesktop farms to it.

How Web Interface Works

The following figure illustrates a basic Web interface session.

Figure 1. *A Basic Web Interface Session*



Following is a typical set of interactions among a user device, a NetScaler running the Web interface, and a server farm.

1. A user authenticates to the Web interface through a Web browser or by using the XenApp plug-in.
2. The Web interface reads the user's credentials and forwards the information to the Citrix XML Service running on servers in the server farm.
3. The Citrix XML Service on the designated server retrieves from the servers a list of resources that the user can access. These resources constitute the user's resource set and are retrieved from the Independent Management Architecture (IMA) system.
4. The Citrix XML Service then returns the user's resource set to the Web interface running on the NetScaler.
5. The user clicks an icon that represents a resource on the HTML page.
6. The Web interface queries the Citrix XML Service for the least busy server.
7. The Citrix XML Service returns the address of this server to the Web interface.
8. The Web interface sends the connection information to the Web browser.
9. The Web browser initiates a session with the server.

Installing and Configuring the Web Interface

Sep 27, 2013

To configure the web interface, you create a web interface site and bind one or more XenApp or XenDesktop farms to it. You then configure the web interface to work behind an HTTP or an HTTPS virtual server or NetScaler Gateway.

- **Using an HTTP or an HTTPS virtual server**. You create an HTTP or an HTTPS virtual server on the NetScaler appliance and bind the web interface service, running on port 8080 of the NetScaler appliance, to the virtual server. Clients on the LAN use the virtual server IP address to access the web interface. When using this access method, the URL format for the web interface site is as follows:

  <HTTP or HTTPS>://<HTTP or HTTPS vserver IP address>:<vserver port number>/<web interface site path>

  The following access methods are available for clients accessing the web interface site when it is configured using an HTTP or an HTTPS virtual server:
  - **Direct**. Actual address of a XenApp or XenDesktop server is sent to the clients.
  - **Alternate**. Alternate address of a XenApp or XenDesktop server is sent to the clients.
  - **Translated**. Translated address, from the defined internal addresses to external addresses and ports mapping table, is sent to the clients from a specified network. When you use this option, you have to define internal address to external address and port mappings.
- **Using NetScaler Gateway**. You associate the web interface site with NetScaler Gateway. You associate the web interface site with NetScaler Gateway. Remote clients use the NetScaler Gateway URL to access the web interface site. With this access method, the URL format for the web interface site is as follows:

  HTTPS://<Access Gateway URL>/<web interface site path>

  The following access methods are available for clients accessing the web interface site when it is configured using an NetScaler Gateway:
  - **Gateway Direct**. Actual address of a XenApp or XenDesktop server is sent to NetScaler Gateway.
  - **Gateway Alternate**. Alternate address of a XenApp server is sent to NetScaler Gateway. You cannot use this mode to access XenDesktop servers.
  - **Gateway Translated**. Translated address, from the defined internal addresses to external addresses and ports mapping table, is sent to NetScaler Gateway. When you use this option, you have to define internal address to external address and port mappings.

Prerequisites

Updated: 2013-09-06

The following prerequisites are required before you begin installing and configuring the Web interface.

- XenApp or XenDesktop farms are set up and running in your environment. For more information about XenApp, see the XenApp documentation at http://edocs.citrix.com/. For more information about XenDesktop, see the XenDesktop farms documentation at http://edocs.citrix.com/.
- Conceptual knowledge of the Web interface. For more information about Web interface running on a server, see the Web interface documentation at http://edocs.citrix.com/.

Installing the Web Interface

To install the Web interface, you need to install the following files:

- **Web interface tar file**. The setup file for installing the Web interface on the NetScaler appliance. This tar file also includes Apache Tomcat Web server version 6.0.35. The file name has the following format: nswi-<version number>.tgz (for example, nswi-1.5.tgz).
- **JRE tar file**. The JRE tarball. You can use the Diablo Latte JRE version 1.6.0-7 for 64-bit FreeBSD 6.x/amd64 platform available on FreeBSD Foundation Web site at http://www.freebsdfoundation.org/java/java16. Alternatively, you can use OpenJDK6 package for FreeBSD 6.x/amd63. You can download openjdk6-b17_2.tbz from https://citrix.sharefile.com/d/c85aeefcc05643f8.

Note: On a high availability setup, when installing the web interface with tar files (web interface and JRE) that are already available on the appliance, ensure that the files are available in the same location on both the primary and secondary appliances; otherwise, the web interface will not be installed on the secondary appliance.
Copy the tar files to a local workstation or to the /var directory of the appliance.

These files install all the Web interface components and JRE on the hard drive and configure automatic startup of the Tomcat Web server with Web interface at appliance startup time. Both tar files are internally expanded in the /var/wi directory on the hard drive.

Note: After installing web interface on the appliance and before creating a web interface site, you must place the client plugin in the appliance by using the appropriate Upload Plugins utility provided on the web interface details pane.

To install the Web interface and JRE tar files by using the command line interface

At the command prompt, type:

install wi package -wi <URL> -jre <URL>

Examples

> install wi package -wi sftp://username:password@10.102.29.12/var/ nswi-1.5.tgz -jre <url> > install wi package -wi ftp://username:password@10.102.29.15/var/ nswi-

To install the Web interface and JRE tar files by using the configuration utility

1. Navigate to System > Web Interface and, in the Getting Started group, click Install Web Interface.
2. Specify the install path for web interface tar file and JRE tar file.

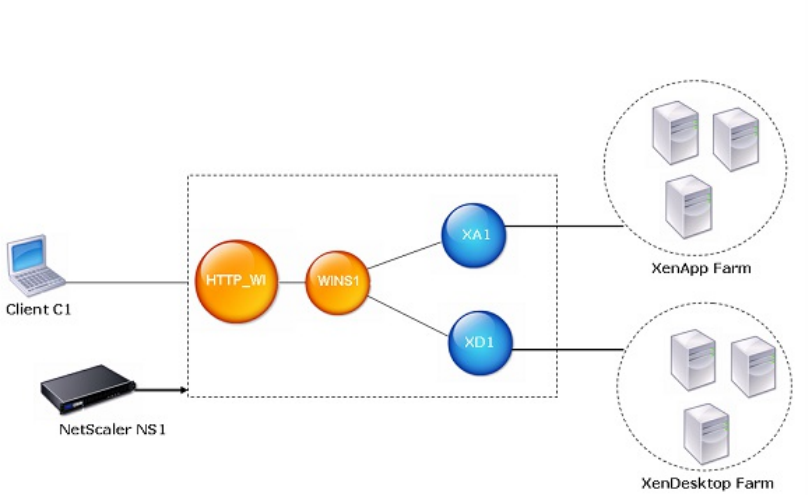
Configuring a Web Interface Site for LAN Users Using HTTP

Aug 08, 2014

In this scenario, user and the Web interface setup are on the same enterprise LAN. The enterprise has both a XenApp and a XenDesktop farm. Users access the Web interface by using an HTTP vserver. The Web interface exposes its own login page for authentication. The vserver IP address is used to access the Web interface.

The following figure illustrates the Web interface running on the NetScaler appliance NS1. A Web interface site WINS1 is created and a XenApp farm XA1 and a XenDesktop farm XD1 are bound to it. An HTTP vserver HTTP_WI is also created. Client C1 uses the IP address of the HTTP_WI vserver to access the WINS1 site.

Figure 1. A Web Interface Site Configured for LAN Users Using HTTP



To configure a Web interface site for LAN users using HTTP by using the configuration utility

1. Navigate to System > Web Interface, click Web Interface Wizard, and configure the web interface parameters.
2. In Default Access Methods, select the required access option and configure the access method parameters.
   Note: When you create the HTTP vserver by using the configuration utility, the configuration utility automatically creates a service, which logically represents the Web interface service running on the NetScaler appliance, and binds the service to the HTTP virtual server.
3. On Configure Access Methods page, create the access method for a client IP address or network.
   Note: Before you configure access method based on the client IP address, you must enable USIP mode on the web interface service to make the client's IP address available with the web interface.
4. On Configure Address Translations page, create the address translation for mapping between an Internal IP address and an external IP address.
   Note: The Configure Address Translations page appears on the wizard when you set the Translated access method for a Client's IP address or network.
5. On Configure XenApp/XenDesktop Farm page, create the XenApp or XenDesktop farm.
6. Verify the Web interface configuration by viewing the Details section at the bottom of the pane.
   To view the Web interface site, Navigate toSystem > Web Interface > Sites.

To configure a Web interface site for LAN users using HTTP by using the command line interface

1. Add a Web interface site. Set Direct or Alternate or Translated for the defaultAccessMethod parameter. At the command prompt, type: add wi site <sitePath> -siteType (XenAppWeb | XenAppServices) -publishedResourceType (Online | Offline | DualMode) -kioskMode (ON | OFF) -wiAuthenticationMethods (Explicit | Anonymous) -webSessionTimeout <positive_integer> -defaultAccessMethod <defaultAccessMethod> -loginTitle <string>

Example

```
> add wi site WINS1 -siteType XenAppWeb -publishedResourceType Online -kioskMode ON -defaultAccessMethod Direct
```

2. (Optional) Set an access method for a Client's IP address or network. At the command prompt, type:
   bind wi site <sitePath> -accessMethod <accessMethod> -clientIpAddress <ip_addr> -clientNetMask <netmask>

3. If you have set the Translated access method for a Client's IP address or network then provide Internal IP and external IP address mappings. At the command prompt, type:
   bind wi site <sitePath> -translationInternalIp <ip_addr> -translationInternalPort <port | *> -translationExternalIp <ip_addr> -translationExternalPort <port | *> [-accessType <accessType>]

4. Bind XenApp or XenDesktop farms to the Web interface site. At the command prompt, type:
   bind wi site <sitePath> <farmName> <xmlServerAddresses> -xmlPort <value> -transport (HTTP | HTTPS) -loadBalance (ON | OFF)

   Example

   ```
   > bind wi site WINS1 XA1 10.102.46.6 -xmlPort 80 -transport HTTP -LoadBalance OFF
   > bind wi site WINS1 XD1 10.102.46.50 -xmlPort 80 -transport HTTP -LoadBalance OFF
   ```

5. Create a service that is a logical representation of the Web interface service running on the NetScaler appliance. At the command prompt, type:
   add service <name> <IP address> <serviceType> <port>

   Example

   ```
   > add service WI_Loopback_Service 127.0.0.1 HTTP 8080
   ```

6. Add an HTTP vserver. At the command prompt, type:
   add lb vserver <virtualServerName> <protocol> <IPAddress> <port>

   Example

   ```
   > add lb vserver HTTP_WI HTTP 10.102.29.5 80
   ```

7. Bind the Web interface service to the HTTP vserver. At the command prompt, type:
   bind lb vserver <virtualServerName> <serviceName>

   Example

   ```
   > bind lb vserver HTTP_WI WI_Loopback_Service
   ```

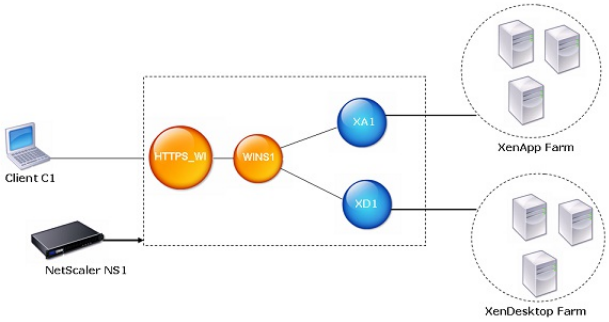
Configuring a Web Interface Site for LAN Users Using HTTPS

Aug 08, 2014

In this scenario, user accounts and the Web interface setup are on the same enterprise LAN. Users access the Web interface by using an SSL-based (HTTPS) vserver. The Web interface exposes its own login page for authentication. SSL offloading is done by this vserver on the NetScaler. The vserver IP address is used to access the Web interface instead of the NetScaler IP address (NSIP).

The following figure illustrates the Web interface running on the NetScaler appliance NS1. A Web interface site WINS1 is created and a XenApp farm XA1 and a XenDesktop farm XD1 are bound to it. An HTTPS vserver HTTPS_WI is also created. Client C1 uses the IP address of the HTTPS_WI vserver to access the WINS1 site.

Figure 1. A Web Interface Site Configured for LAN Users Using HTTPS



To configure a Web interface site for LAN users using HTTPS by using the configuration utility

1. Navigate toSystem > Web Interface, click Web Interface Wizard, and configure the web interface parameters.
2. In Default Access Methods, select the required access option and configure the access method parameters.
   Note: When you create the HTTPS vserver by using the configuration utility, the configuration utility automatically creates a service, which logically represents the Web interface service running on the NetScaler appliance, and binds the service to the HTTPS virtual server.
3. On Specify a server Certificate page, create or specify an existing SSL certificate–key pair. The SSL certificate–key pair is automatically bound to the HTTPS vserver.
4. On Configure Access Methods page, create the access method for a client IP address or network.
   Note: Before you configure access method based on the client IP address, you must enable USIP mode on the web interface service to make the client's IP address available with the web interface.
5. On Configure Address Translations page, create the address translation for mapping between an Internal IP address and an external IP address.
   Note: The Configure Address Translations page appears on the wizard when you set the Translated access method for a Client's IP address or network.
6. On the wizard's Configure XenApp/XenDesktop Farm page, create the XenApp or XenDesktop farm.
7. Verify the Web interface configuration by viewing the Details section at the bottom of the pane.
   To view the Web interface site, Navigate to System > Web Interface > Sites.

To configure a Web interface site for LAN users using HTTPS by using the command line

1. Add a Web interface site. Set Direct or Alternate or Translated for the defaultAccessMethod parameter. At the command prompt, type:
   add wi site <sitePath> -siteType (XenAppWeb | XenAppServices) -publishedResourceType (Online | Offline | DualMode) -kioskMode (ON | OFF) -wiAuthenticationMethods (Explicit | Anonymous) -webSessionTimeout <positive_integer> -defaultAccessMethod <defaultAccessMethod> -loginTitle <string>

   Example
   > add wi site WINS1 -siteType XenAppWeb -publishedResourceType Online -kioskMode ON -defaultAccessMethod Direct
2. (Optional) Set an access method for a Client's IP address or network. At the command prompt, type:
   bind wi site <sitePath> -accessMethod <accessMethod> -clientIpAddress <ip_addr> -clientNetMask <netmask>
3. If you have set the Translated access method for a Client's IP address or network then provide Internal IP and external IP address mappings. At the command prompt, type:
   bind wi site <sitePath> -translationInternalIp <ip_addr> -translationInternalPort <port | *> -translationExternalIp <ip_addr> -translationExternalPort <port | *> [-accessType <accessType>]
4. Bind XenApp or XenDesktop farms to the Web interface site. At the command prompt, type:
   bind wi site <sitePath> <farmName> <xmlServerAddresses> -xmlPort <value> -transport (HTTP | HTTPS) -loadBalance (ON | OFF)

   Example
   > bind wi site WINS1 XA1 10.102.46.6 -xmlPort 80 -transport HTTP -LoadBalance OFF
   > bind wi site WINS1 XD1 10.102.46.50 -xmlPort 80 -transport HTTP -LoadBalance OFF
5. Create a service that is a logical representation of the Web interface service running on the NetScaler appliance. At the command prompt, type:
   add service <name> <IPAddress> <serviceType> <port>

   Example
   > add service WI_Loopback_Service 127.0.0.1 HTTP 8080
6. Add an HTTPS vserver. At the command prompt, type:

add lb vserver <name>@ <protocol> <IPAddress> <port>

Example

```
> add lb vserver HTTPS_WI SSL 10.102.29.3 443
```

7. Bind the Web interface service to the HTTPS vserver. At the command prompt, type:
   bind lb vserver <name>@ <serviceName>

   Example

   ```
   > bind lb vserver HTTPS_WI WI_Loopback_Service
   ```

8. Create an SSL certificate key pair. At the command prompt, type:
   add ssl certkey <certificate-KeyPairName> -cert <certificateFileName> -key <privateKeyFileName>

   Example

   ```
   > add ssl certkey SSL-Certkey-1 -cert /nsconfig/ssl/test1.cer -key /nsconfig/ssl/test1
   ```

9. Bind the SSL certificate key pair to the HTTPS vserver. At the command prompt, type:
   bind ssl vserver <vserverName> -certkeyName <certificate- KeyPairName>

   Example

   ```
   > bind ssl vserver HTTPS_WI -certkeyName SSL-Certkey-1
   ```

10. Add a rewrite action. At the command prompt, type:
    add rewrite action <name> <type> <target> [<stringBuilderExpr>] [(-pattern <expression>]

    Example

    ```
    > add rewrite action Replace_HTTP_to_HTTPS INSERT_AFTER "HTTP.RES.HEADER(\"Location\").Value(0).Prefix(4)" "\"s\""
    ```

11. Create a rewrite policy and bind the rewrite action to it. At the command prompt, type:
    add rewrite policy <name> <rule> <action>

    Example

    ```
    > add rewrite policy rewrite_location "HTTP.RES.STATUS == 302 && HTTP.RES.HEADER(\"Location\").Value(0).startswith(\"http:\")" Replace_HTTP_to_HTTPS
    ```

12. Bind the rewrite policy to the HTTPS vserver. At the command prompt, type:
    bind lb vserver <VserverName> -policyname <rewritePolicyName> -priority <value> -type response

    Example

    ```
    > bind lb vserver HTTPS_WI -policyname rewrite_location -priority 10 -type response
    ```

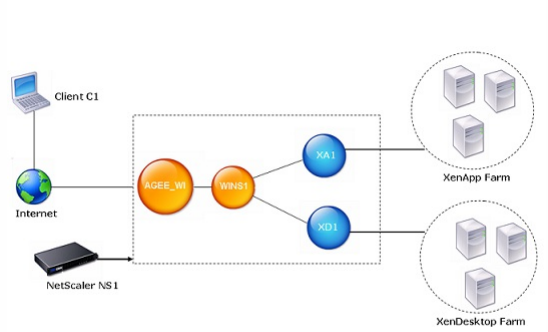
Configuring a Web Interface Site for Remote Users Using NetScaler Gateway

Aug 08, 2014

In this scenario, user accounts and the Web interface setup are on different networks. Users access a Web interface site by using the NetScaler Gateway URL. SmartAccess is automatically enabled.

The following figure illustrates the Web interface running on the NetScaler appliance NS1. A Web interface site WINS1 is created and a XenApp farm XA1 and a XenDesktop XD1 are bound to it. An NetScaler Gateway VPN vserver AGEE_WI is also configured. The client uses the NetScaler Gateway URL of the AGEE_WI to access the WINS1 site.

Figure 1. A Web Interface Site Configured for Remote Users Using NetScaler Gateway



To configure a Web interface site for remote users using NetScaler Gateway by using the configuration utility

1. Navigate to System > Web Interface, click Web Interface Wizard, and configure the web interface parameters.
2. In Default Access Methods, select the required access option and configure the access method parameters.
3. On Configure Access Methods page, create the access method for a client IP address or network.
   Note: Before you configure access method based on the client IP address, you must enable USIP mode on the web interface service to make the client's IP address available with the web interface.
4. On Configure Address Translations page, create the address translation for mapping between an Internal IP address and an external IP address.
   Note: The Configure Address Translations page appears on the wizard when you set the Translated access method for a Client's IP address or network.
5. On Configure XenApp/XenDesktop Farm page, create the XenApp or XenDesktop farm.
6. Verify the Web interface configuration by viewing the Details section at the bottom of the pane.
   To view the Web interface site, Navigate to System > Web Interface > Sites.

To configure a Web interface site for remote users using NetScaler Gateway by using the command line interface

1. Add a Web interface site. Set GatewayDirect or GatewayAlternate or GatewayTranslated for the defaultAccessMethod parameter. At the command prompt, type:
   add wi site <sitePath> <agURL> <staURL> -sessionReliability (ON | OFF) -useTwoTickets (ON | OFF) -secondSTAURL <string> -authenticationPoint (WebInterface | AccessGateway) -siteType (XenAppWeb | XenAppServices) -publishedResourceType (Online | Offline | DualMode) -kioskMode (ON | OFF)-wiAuthenticationMethods (Explicit | Anonymous) -webSessionTimeout <positive_integer> -defaultAccessMethod <defaultAccessMethod> -loginTitle <string>

   Example
   > add wi site WINS1 https://ag.mycompany.com http://ag.staserver.com -sessionReliability OFF -authenticationPoint AccessGateway -siteType XenAppWeb -publishedRes
2. (Optional) Set an access method for a Client's IP address or network. At the command prompt, type:
   bind wi site <sitePath> -accessMethod <accessMethod> -clientIpAddress <ip_addr> -clientNetMask <netmask>
3. If you have set the Translated access method for a Client's IP address or network then provide Internal IP and external IP address mappings. At the command prompt, type:
   bind wi site <sitePath> -translationInternalIp <ip_addr> -translationInternalPort <port | *> -translationExternalIp <ip_addr> -translationExternalPort <port | *> [-accessType <accessType>]
4. Bind XenApp or XenDesktop farms to the Web interface site. At the command prompt, type:
   bind wi site <sitePath> <farmName> <xmlServerAddresses> -xmlPort <value> -transport (HTTP | HTTPS) -loadBalance (ON | OFF)

   Example
   > bind wi site WINS1 XA1 10.102.46.6 -xmlPort 80 -transport HTTP -LoadBalance OFF
   > bind wi site WINS1 XD1 10.102.46.50 -xmlPort 80 -transport HTTP -LoadBalance OFF

Using Smart Card Authentication for Web Interface through NetScaler Gateway

Aug 08, 2014

The web interface on the NetScaler appliance supports single sign-on with a smart card through NetScaler Gateway. You log on to NetScaler Gateway by using a valid client certificate, either served from the local certificate store or from a smart card. After successful authentication, you are redirected to the web interface.

Requirements

- Make sure that you install the latest web interface tar file (nswi-1.5.tgz). This tar file provides support for smart card authentication.
- You must configure Delegation on the Active Directory. Follow the **Active Directory Configuration** section under **Procedure**, as described in the article at http://support.citrix.com/article/CTX124603.

To use smart card authentication for a web interface site through NetScaler Gateway by using the configuration utility

1. Navigate to System > Web Interface, click Web Interface Wizard, and configure the web interface parameters.
2. Select GatewayDirect as the Default Access Method.
3. Select Access Gateway as the Authentication Point.
4. Create theAccess Gateway Vserver. For more information, see "http://support.citrix.com/proddocs/topic/access-gateway-10/agee-config-settings-ag-wizard-tsk.html."
5. Click Settings to set the ICA mode, SSO, and WIhome and select SmartCard as the Access Gateway Authentication Method.
6. Click the SmartCard Settings link to configure certificate-based authentication on Access Gateway. You can skip these steps if certificate-based authentication is already configured on Access Gateway. In the Smart Card Settings wizard do the following:
    1. Specify the CA certificate. Install a CA certificate or use an already installed certificate for the NetScaler Gateway virtual server to authenticate the client certificate.
    2. Configure authentication policies. Create a certificate-based authentication policy and bind it to NetScaler Gateway vserver as follows:
        1. Click Insert Policy. In the Policy Name column, select New Policy.
        2. In the Create Authentication Policy dialog box, specify a name for the policy, select Authentication Type as CERT, and click New.
        3. In the Create Authentication Server dialog box, specify the server Name and the User Name Field and click Create.
        4. Bind the policy to the NetScaler Gateway Vserver with **ns_true** as expression and default priority.
    3. Configure SSL-based client authentication with Client Certificate set as Optional.
7. Continue with the wizard as described in "Configuring a Web Interface Site for Remote Users Using NetScaler Gateway."

To use smart card authentication for a web interface site through NetScaler Gateway by using the command line interface

At the command prompt, type:

add wi site <sitePath> <agURL> <staURL> -authenticationPoint AccessGateway -agAuthenticationMethod SmartCard -defaultAccessMethod GatewayDirect

Additionally, smart card support on web interface requires certificate-based authentication on the NetScaler GatewayAdditionally, smart card support on web interface requires certificate-based authentication on the Access Gateway. If you do not have certificate-based authentication already configured on the NetScaler Gateway vserver, do the following:

1. Configure an NetScaler Gateway vserver and bind the server and CA certificate to it.
   add vpn vserver <vpnvserver_name> SSL <AccessGateway_VIP> <port>

   bind ssl vserver <vpnvserver_name> -certkeyName <Server_Cert_Key_Pair>

   bind ssl vserver <vpnvserver_name> -certkeyName <Root_Cert_as_CKP> -CA

   set ssl vserver <vpnvserver_name> -clientAuth ENABLED -clientCert Optional

   add dns nameserver <dns_server_ip>

2. Configure a certificate-based authentication policy and bind itcertAction_name to the NetScaler Gateway vserver.
   add authentication certAction <certAction_name> -userNameField <string>

   add authentication certPolicy <certPolicy_name> <rule> <certAction_name>

   bind vpn vserver <vserver_name> -policy <certPolicy_name>

3. Configure the web interface site in ICA proxy mode through a session policy and then bind it to NetScaler Gateway vserver.
   add vpn sessionAction <sessionAction_name> -defaultAuthorizationAction ALLOW -SSO ON -wihome "<WI_URL>" -wiPortalMode NORMAL -icaproxy ON

   add vpn sessionPolicy <sessionPolicy_name> <rule> <sessionAction_name>

   bind vpn vserver <vpnvserver_name> -policyName <sessionPolicy_name>

   bind vpn vserver <vpnvserver_name> -staServer "<sta_server_url>"

Using the WebInterface.conf Dialog Box

Aug 08, 2014

The WebInterface.conf dialog box in the configuration utility displays the content of the webinterface.conf file for a Web Interface site.

You can do the following from this dialog box:

- Edit the WebInterface.conf file and save the changes.
- Search the file's content for instances of a text string.
- Easily save the WebInterface.conf file to your local computer.

To search a string in the webinterface.conf file by using the configuration utility

1. Navigate to System > Web Interface > Sites, select the web interface site, and click WebInterface.conf.
2. In the WebInterface.conf dialog box, use the following controls:
   - Find. Displays the following search options that you can use to find one or more instances of a text string in a configuration:
     - Look for. Provides a space for you to type the text string that you want to locate in the configuration. As you type the text, the first instance is displayed. If the word you are looking for is not in the file, the Look for text box will change color.
     - Next. Finds and highlights the next occurrence of the text string you typed in Look for.
     - Previous. Finds and highlights the previous occurrence of the text string you typed in Look for.
     - Mark All. Highlights all instances of the text string at one time you typed in Look for. Scroll to review each highlighted instance.

To save the content of the webinterface.conf to your local system by using the configuration utility

1. Navigate to System > Web Interface > Sites, click WebInterface.conf, and select Save output text to a file.

Using the config.xml Dialog Box

Aug 08, 2014

The Config.xml dialog box in the configuration utility displays the content of the config.xml file for a Web Interface site of site type XenApp/XenDesktop Services Site.

You can do the following from this dialog box:

- Edit the config.xml file and save the changes.
- Search the file's content for instances of a text string.
- Easily save the config.xml file to your local computer.

To search a string in the config.xml file by using the configuration utility

1. Navigate to System > Web Interface > Sites, select XenApp/XenDesktop services site, and click Config.xml.
2. In the Config.xml dialog box, use the following controls:
   - Find. Displays the following search options that you can use to find one or more instances of a text string in a configuration:
     - Look for. Provides a space for you to type the text string that you want to locate in the configuration. As you type the text, the first instance is displayed. If the word you are looking for is not in the file, the Look for text box will change color.
     - Next. Finds and highlights the next occurrence of the text string you typed in Look for.
     - Previous. Finds and highlights the previous occurrence of the text string you typed in Look for.
     - Mark All. Highlights all instances of the text string at one time you typed in Look for. Scroll to review each highlighted instance.

To save the content of the config.xml to the local system by using the configuration utility

1. Navigate to System > Web Interface > Sites, and select XenApp/XenDesktop Services Site.
2. Click Config.xml and select Save output text to a file.

Getting Started with Citrix NetScaler

Mar 15, 2012

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial set-up and basic configuration of the NetScaler, including the following topics.

Understanding the NetScaler

Updated: 2013-10-28

The Citrix NetScaler product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4–L7) network traffic for web applications. For example, a NetScaler bases load balancing decisions on individual HTTP requests instead of on long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The NetScaler feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.

Switching Features

Updated: 2013-09-06

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and Protection Features

Updated: 2013-10-28

NetScaler security and protection features protect web applications from Application Layer attacks. A NetScaler allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization Features

Updated: 2013-09-06

Optimization features offload resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. A NetScaler supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Understanding Policies and Expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the NetScaler what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When a NetScaler receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

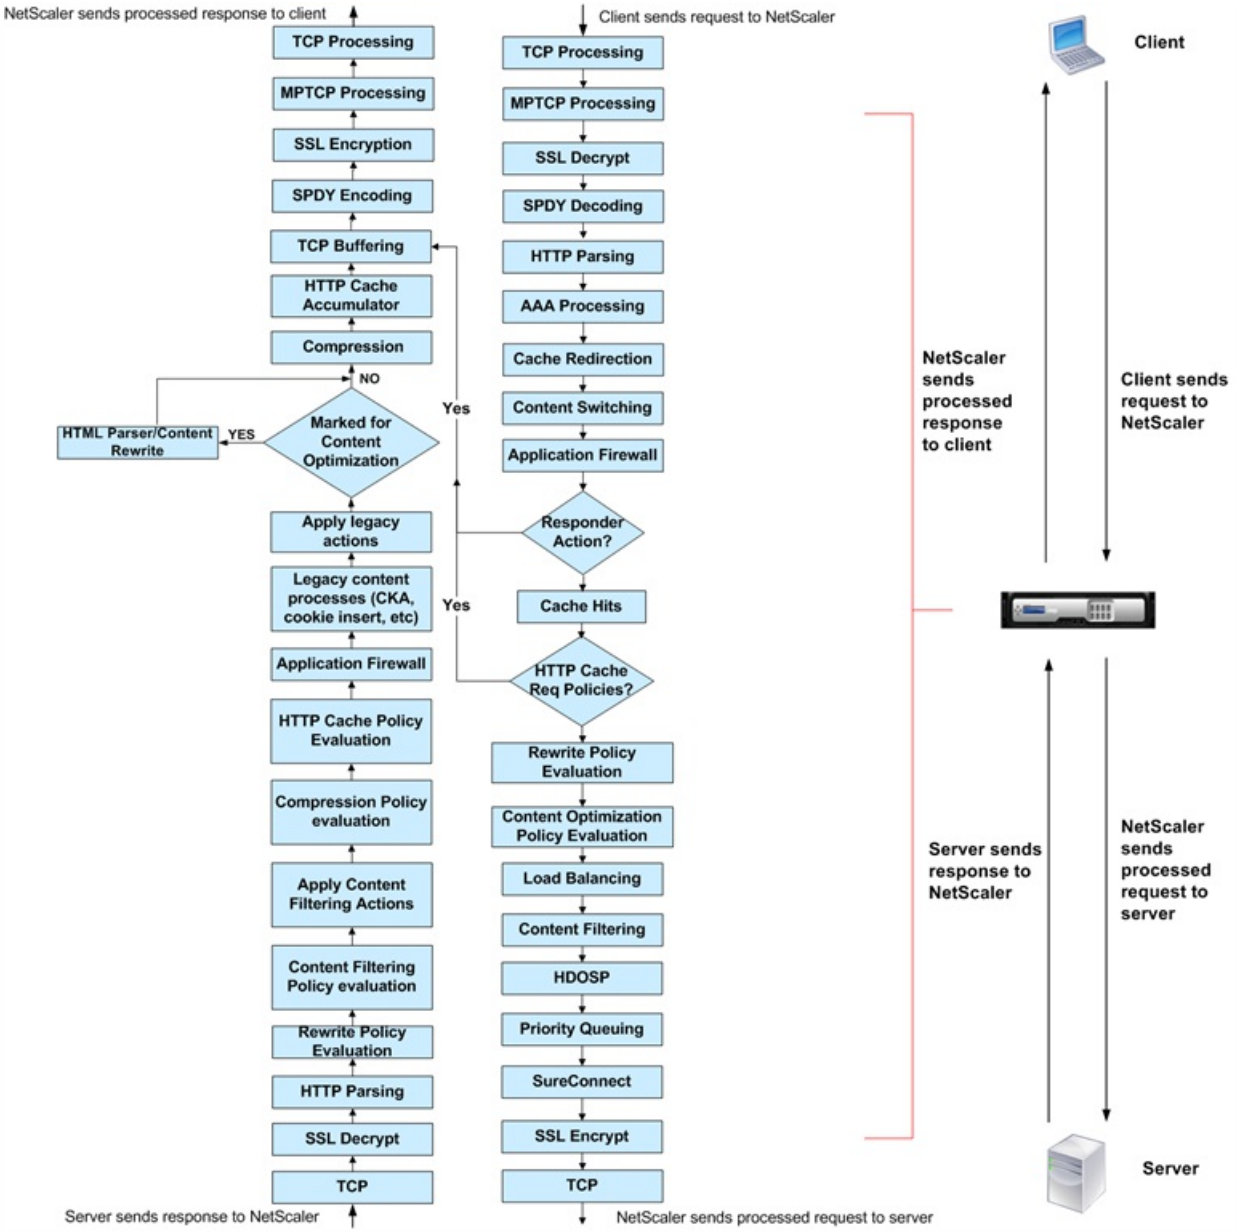
For all policy types except Rewrite policies, a NetScaler implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the NetScaler evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

Processing Order of Features

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

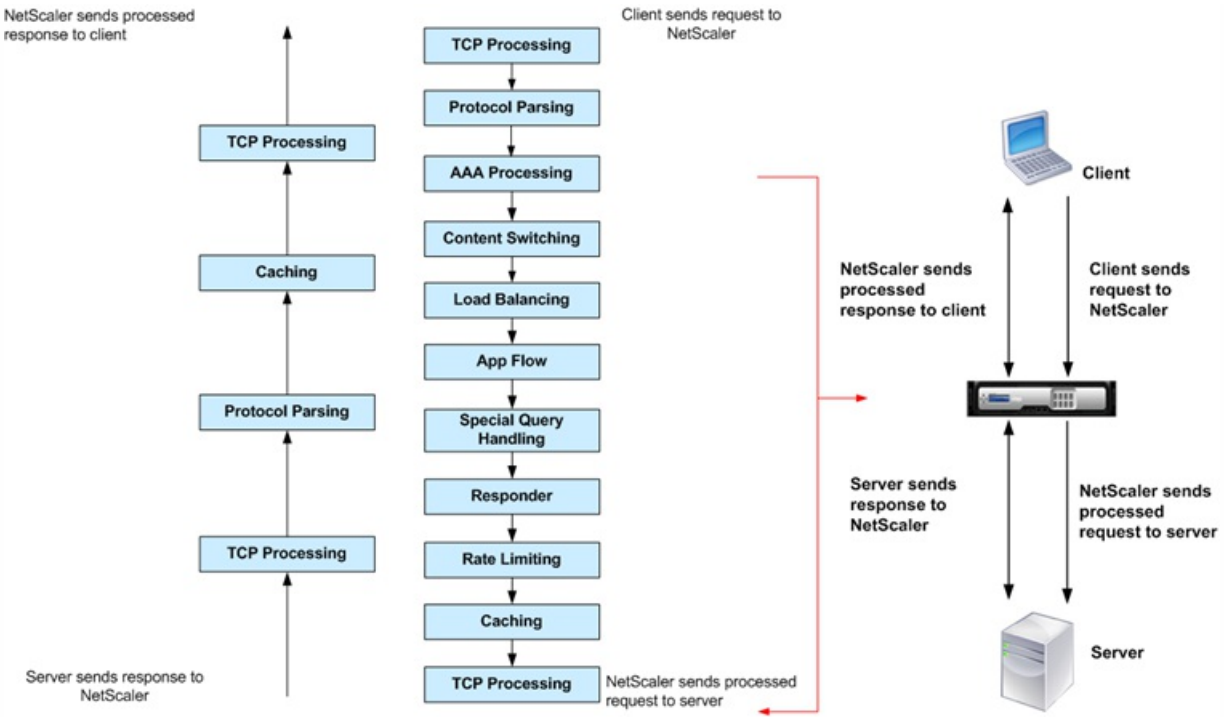
The following figure shows the L7 packet flow in the NetScaler.

Figure 1. L7 Packet Flow Diagram



The following figure shows the DataStream packet flow in the NetScaler. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see "DataStream."

Figure 2. DataStream Packet Flow Diagram



Where Does a NetScaler Appliance Fit in the Network?

Jun 24, 2013

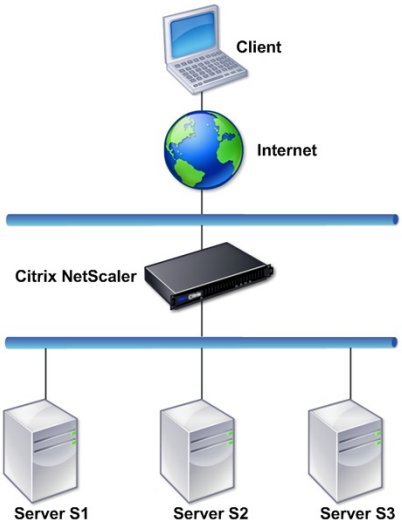
A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

Physical Deployment Modes

Updated: 2013-09-04

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment



In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see "Understanding Common Network Topologies."

Citrix NetScaler as an L2 Device

Updated: 2013-09-04

A NetScaler functioning as an L2 device is said to operate in L2 mode. In L2 mode, the NetScaler forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler.

For information about how the L2 and L3 modes interact, see "Configuring Modes of Packet Forwarding."

For information about configuring L2 mode, see "Enabling and Disabling Layer 2 Mode."

Citrix NetScaler as a Packet Forwarding Device

Updated: 2014-03-14

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for an appliance's MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see "Configuring Modes of Packet Forwarding."

For information about configuring the L3 mode, see "Enabling and Disabling Layer 3 Mode."

How a NetScaler Communicates with Clients and Servers

Aug 30, 2013

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-Owned IP Addresses

Updated: 2014-03-12

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

NetScaler IP (NSIP) address

The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

Mapped IP (MIP) address

A MIP address is used for server-side connections. It is not the IP address of the appliance. In most cases, when the appliance receives a packet, it replaces the source IP address with a MIP address before sending the packet to the server. With the servers abstracted from the clients, the appliance manages connections more efficiently.

Virtual server IP (VIP) address

A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.

Subnet IP (SNIP) address

A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

IP Set

An IP set is a set of IP addresses, which are configured on the appliance as SNIP . An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

Net Profile

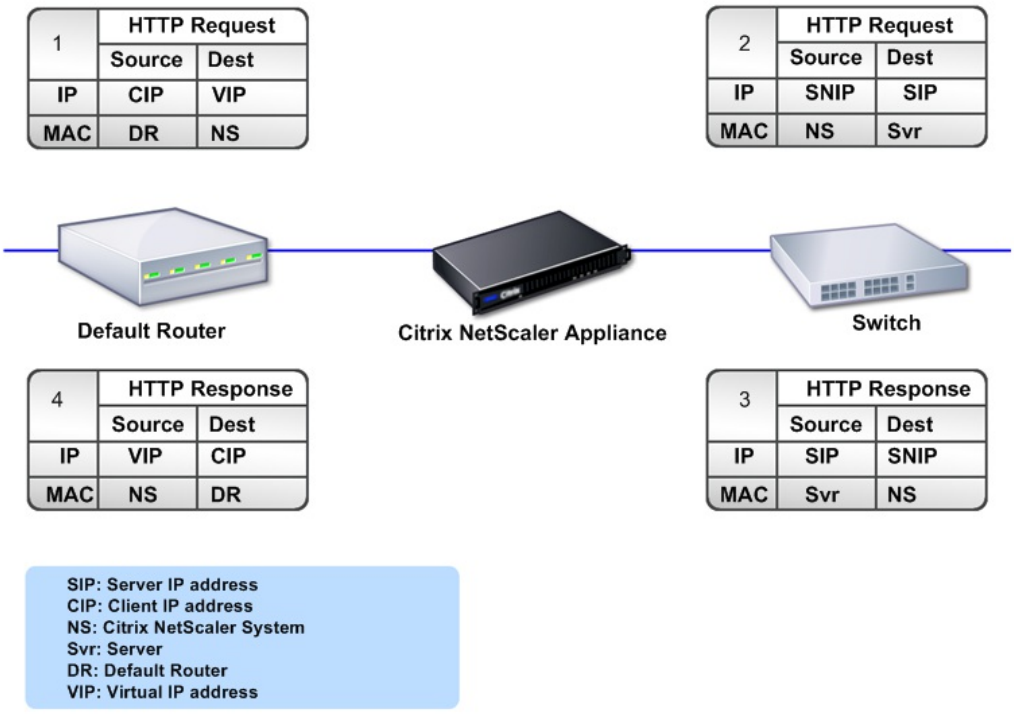
A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

How Traffic Flows Are Managed

Updated: 2014-03-12

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 1. Virtual Server Based Connections



In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

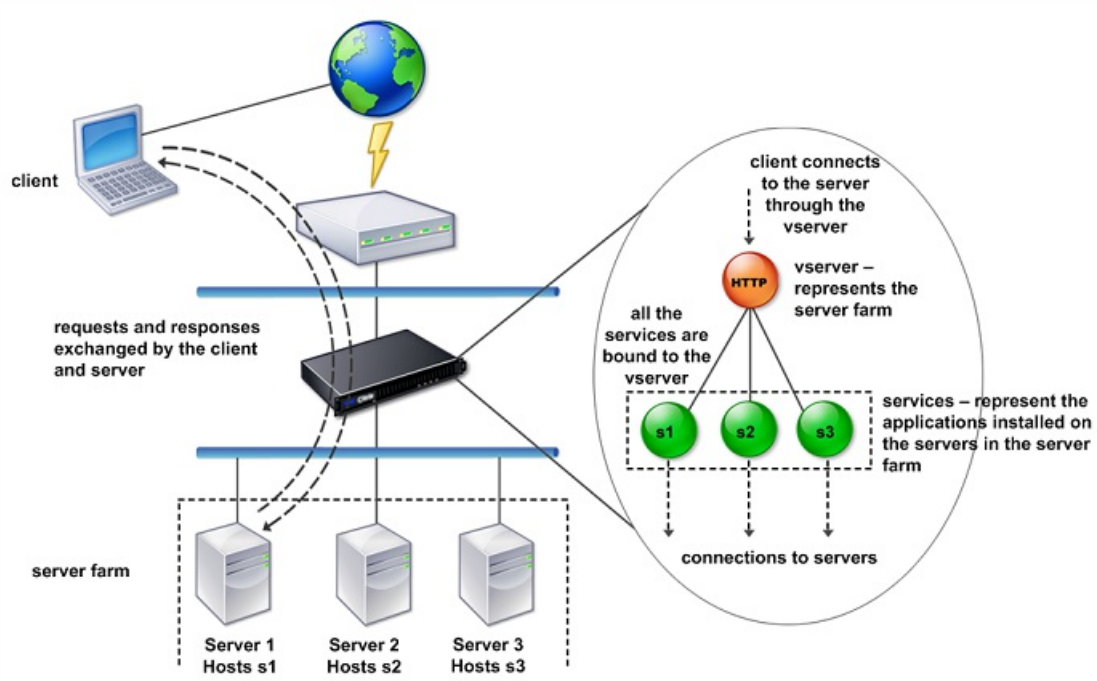
Traffic Management Building Blocks

Updated: 2013-06-24

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How Traffic Management Building Blocks Work



A Simple Load Balancing Configuration

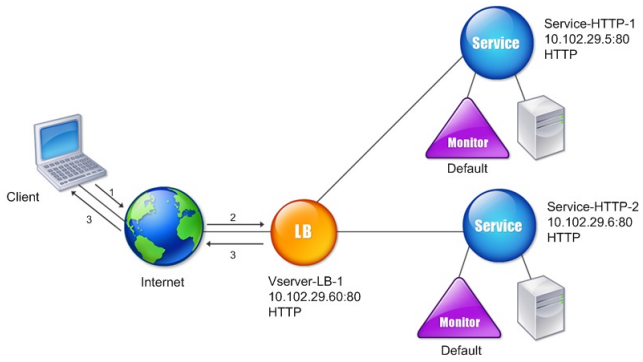
Updated: 2013-08-30

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to

connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load Balancing Virtual Server, Services, and Monitors



In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding Virtual Servers

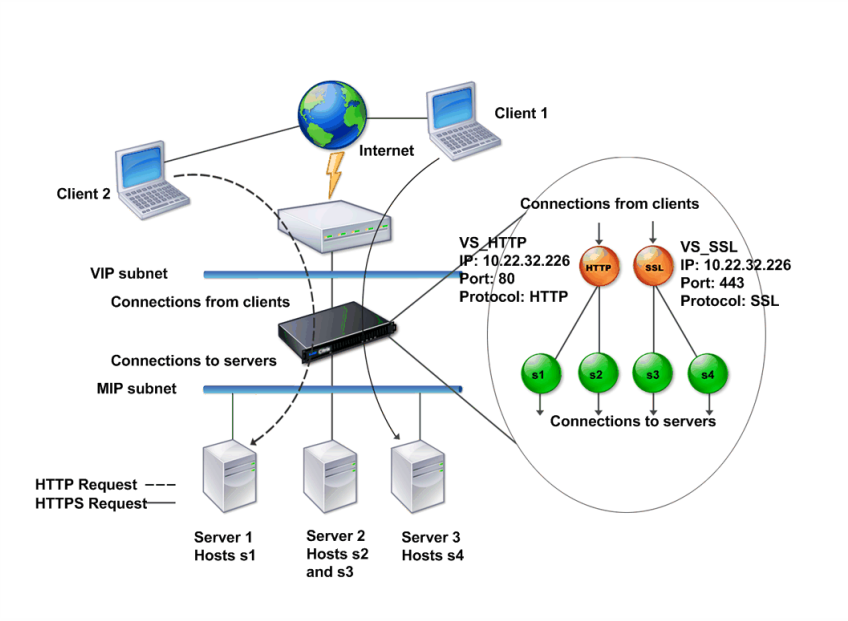
Updated: 2013-09-06

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol. The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address



The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

Load balancing virtual server

Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

Cache redirection virtual server

Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding Services

Updated: 2014-03-12

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the destination IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state. If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Introduction to the Citrix NetScaler Product Line

Sep 04, 2013

The Citrix NetScaler product line optimizes delivery of applications over the Internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

NetScaler appliances are available in a variety of hardware platforms that have a range of specifications, including multicore processors.

The NetScaler operating system is the base operating system for all NetScaler hardware platforms. The NetScaler operating system is available in three editions: Standard, Enterprise, and Platinum.

Citrix NetScaler Hardware Platforms

Updated: 2013-11-08

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications, including multicore processors. All hardware platforms support some combination of Fast Ethernet, Gigabit Ethernet, and 10 Gigabit Ethernet interfaces.

The following platforms are available for NetScaler .

- Citrix NetScaler MPX 5500
- Citrix NetScaler MPX 5550/5650
- Citrix NetScaler MPX 7500/9500
- Citrix NetScaler MPX 8200/8400/8600
- Citrix NetScaler MPX 9700/10500/12500/15500
- Citrix NetScaler MPX 11500/13500/14500/16500/18500/20500
- Citrix NetScaler MPX 15000
- Citrix NetScaler MPX 17000
- Citrix NetScaler MPX 17500/19500/21500
- Citrix NetScaler MPX 17550/19550/20550/21550
- Citrix NetScaler MPX 22040/22060/22080/22100/22120

For more information about the hardware platform specifications, see "Introduction to the Hardware Platforms."

The following tables list different editions of the NetScaler and the hardware platforms on which they are available.

Table 1. Product Editions and MPX Hardware Platforms

Hardware	MPX 5500	MPX 5550/5650	MPX 7500/9500	MPX 8200/8400/8600	MPX 15000	MPX 17000
Platinum Edition	Yes	Yes	Yes	Yes	Yes	Yes
Enterprise Edition	Yes	Yes	Yes	Yes	Yes	Yes
Standard Edition	Yes	Yes	Yes	Yes	Yes	Yes

Table 2. Product Editions and MPX Hardware Platforms (contd.)

Hardware	MPX 9700/10500/12500/15500	MPX 11500/13500/14500/16500/18500/20500	MPX 17500/19500/21500	MPX 17550/19550/20550/21550	MPX 22040/22060/22080/22100/22120
Platinum Edition	Yes	Yes	Yes	Yes	Yes
Enterprise Edition	Yes	Yes	Yes	Yes	Yes
Standard Edition	Yes	Yes	Yes	Yes	Yes

Citrix NetScaler Editions

Updated: 2013-09-04

The NetScaler operating system is available in Standard, Enterprise, and Platinum editions. The Enterprise and Standard editions have limited features available. Feature licenses are required for all editions.

For instructions on how to obtain and install licenses, see "http://support.citrix.com/article/ctx121062."

The Citrix NetScaler editions are described as follows:

- *— Citrix NetScaler, Standard Edition*
  . Provides small and medium enterprises with comprehensive Layer 4- Layer 7 (L4-L7) traffic management, enabling increased web application availability.
- *— Citrix NetScaler, Enterprise Edition*
  . Provides web application acceleration and advanced L4-L7 traffic management, enabling enterprises to increase web application performance and availability and reduce datacenter costs.
- *— Citrix NetScaler, Platinum Edition*
  . Provides a web application delivery solution that reduces data center costs and accelerates application performance, with end-to-end visibility of application performance, and provides advanced application security.

The following table summarizes the features supported by each edition in the Citrix NetScaler product line:

Table 3. Citrix NetScaler Application Delivery Product Line Features

Key Features	Platinum Edition	Enterprise Edition	Standard Edition
Application availability			
Layer 4 load balancing	Yes	Yes	Yes
Layer 7 content switching	Yes	Yes	Yes
AppExpert rate controls	Yes	Yes	Yes
IPv6 support	Yes	Yes	Yes
Global server load balancing (GSLB)	Yes	Yes	Optional
Dynamic routing protocols	Yes	Yes	No
Surge protection	Yes	Yes	No
Priority queuing	Yes	Yes	No
Application acceleration			
Client and server TCP optimizations	Yes	Yes	Yes
Citrix AppCompress for HTTP	Yes	Yes	Optional
Citrix AppCache	Yes	Optional	No
Citrix Branch Repeater client	Yes	No	No
Application security			
Layer 4 DoS defenses	Yes	Yes	Yes
Layer 7 content filtering	Yes	Yes	Yes
HTTP/URL Rewrite	Yes	Yes	Yes
NetScaler Gateway, EE SSL VPN	Yes	Yes	Yes
Layer 7 DoS Defenses	Yes	Yes	No
AAA security	Yes	Yes	No
Application firewall with XML security	Yes	Optional	No
Simple manageability			
AppExpert visual policy builder	Yes	Yes	Yes

Key Features	Platinum Edition	Enterprise Edition	Standard Edition
AppExpert service callouts	Yes	Yes	Yes
AppExpert templates	Yes	Yes	Yes
Role-based administration	Yes	Yes	Yes
Configuration wizards	Yes	Yes	Yes
Citrix Command Center	Yes	Yes	No
Citrix EdgeSight for NetScaler	Yes	Optional	No
Web 2.0 optimization			
Rich Internet application support	Yes	Yes	Yes
Advanced server offload	Yes	Yes	No
Lower total cost of ownership (TCO)			
TCP buffering	Yes	Yes	Yes
TCP multiplexing	Yes	Yes	Yes
SSL offload and acceleration	Yes	Yes	Yes
Cache redirection	Yes	Yes	No
Citrix EasyCall	Yes	No	No

Note: While we have taken care to ensure absolute accuracy when compiling this information, it might change. For the latest information, see Citrix Support at "http://www.citrix.com."

Supported Releases on NetScaler Hardware

Updated: 2014-06-30

The following table lists the earliest NetScaler builds for releases that are supported on the NetScaler MPX platforms.

Hardware	Software Release	Software Build #
MPX 5500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 5550/5650	10.5	All
	10.1	All
	10.0	71.6.nc and later
	9.3	59.5.nc and later
MPX 7500/9500	10.5	All
	10.1	All
	10.0	All

Hardware	Software Release	Software Build #
	9.3	All
MPX 8005/8015	10.5	All
	10.1	122.17.nc and later
	9.3	65.8.nc and later
MPX 8200/8400/8600	10.5	All
	10.1	All
	10.0	70.7.nc and later
	9.3	58.5.nc and later
MPX 9700/10500/12500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 9700/10500/12500 10G	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 15500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 15500 10G	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 11500/13500/14500/16500/18500/20500	10.5	All
	10.1	All
	10.0	All
	9.3	52.3.nc and later
MPX 11515/11520/11530/11540/11542	10.5	All
	10.1	123.11.nc and later

Hardware	Software Release	Software Build #
MPX 15000	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 17000	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 17500/19500/21500	10.5	All
	10.1	All
	10.0	All
	9.3	All
MPX 17550/19550/20550/21550	10.5	All
	10.1	All
	10.0	All
	9.3	53.5.nc and later
MPX 22040/22060/22080/22100/22120	10.5	51.10.nc and later
	10.1	123.11.nc and later
	9.3	65.8.nc and later
MPX 24100/24150	10.5	51.10.nc and later
	10.1	129.11.nc and later

Supported Browsers

Updated: 2014-06-24

To access the configuration utility and Dashboard, your workstation must have a supported web browser and version 1.6 or above of the Java applet plug-in installed.

Operating System	Browser	Versions
Windows 7	Internet Explorer	8, 9, and 10
	Mozilla Firefox	3.6.25 and above
	Google Chrome	15 and above
Windows 64 bit	Internet Explorer	8 and 9
	Google Chrome	15 and above

Operating System	Browser	Versions
Mac OS	Mozilla Firefox	12 and above
	Safari	5.1.3
	Google Chrome	15 and above

Software Requirements

Updated: 2013-07-11

Wireshark Versions for NetScaler Releases

The following table provides the Wireshark versions that you can use with different NetScaler releases and builds.

NetScaler Release	Build Number	Wireshark Version
10.1	Later than 95.2	1.9.1
10	Later than 69.3	1.8.4
9.3.e	Later than 57.5004.e	1.9.1
9.3.e	Up to 57.5004.e	1.8.4
9.3	Up to 60.3	1.8.4
9.2	Up to 57.2	1.8.4

Installing the NetScaler Hardware

Sep 04, 2013

Before installing a NetScaler appliance, review the pre-installation checklist. A NetScaler is typically mounted in a rack, and all models ship with rack-rail hardware. All models except the 7000 support small form factor pluggable SFP, XFP, or SFP+ transceivers. After mounting the appliance and installing the transceivers, connect the NetScaler to your network. Use a console cable to connect the NetScaler to a personal computer so that you can perform an initial configuration. After connecting everything else, connect the NetScaler to a power source.

This document includes the following:

Unpacking the Appliance

May 08, 2014

The hardware accessories for your particular appliance, such as cables, adapters, and rail kit, vary depending on the hardware platform you ordered. Unpack the box that contains your new appliance on a sturdy table with plenty of space and inspect the contents.

Use the following list to verify that you received everything that should have been included in the box.

- The appliance you ordered
- One RJ-45 to DB-9 adapter
- One 6 ft RJ-45/DB-9 cable
- The following list specifies the number of power cables included for each appliance model:
  - One power cable for the MPX 5500, MPX 5550/5650, MPX 7500/9500, and MPX 8005/8015/8200/8400/8600/8800 appliances
  - Two power cables for the MPX 15000, MPX 17000, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 14000, MPX 17500/19500/21500, and MPX 25100T/25160T appliances
  - Four power cables for the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 appliances
    Note: Make sure that a power outlet is available for each cable.

  Note: For Brazilian customers, Citrix does not ship a power cable. Use a cable that conforms to the **ABNT NBR 14136:2002** standard.
- One standard 4-post rail kit
  Note: If the kit that you received does not fit your rack, contact your Citrix sales representative to order the appropriate kit.

In addition to the items included in the box with your new appliance, you will need the following items to complete the installation and initial configuration process.

- Ethernet cables for each additional Ethernet port that you will connect to your network
- One available Ethernet port on your network switch or hub for each NetScaler Ethernet port you want to connect to your network
  Note: Transceiver modules are sold separately. Contact your Citrix sales representative to order transceiver modules for your appliance. Only transceivers supplied by Citrix are supported on the appliance.
- A computer to serve as a management workstation

Rack Mounting the Appliance

May 08, 2014

Most appliances can be installed in standard server racks that conform to EIA-310-D specification. The appliances ship with a set of rails, which you must install before you mount the appliance. The only tools that you need for installing an appliance are a Phillips screwdriver and a flathead screwdriver.

Caution: If you are installing the appliance as the only unit in the rack, mount it at the bottom. If the rack contains other units, make sure that the heaviest unit is at the bottom. If the rack has stabilizing devices available, install them before mounting the appliance.

The following table lists the different hardware platforms and the rack units required for each platform.

Table 1. ***Height Requirements For Each Platform***

Platform	**Number of rack units**
MPX 5500	One rack unit
MPX 5550/5650	One rack unit
MPX 7500/9500	One rack unit
MPX 8005/8015/8200/8400/8600/8800	One rack unit
MPX 9700/10500/12500/15500	Two rack units
MPX 14000	One rack unit
MPX 15000, MPX 17000	Two rack units
MPX 11500/13500/14500/16500/18500/20500	Two rack units
MPX 11515/11520/11530/11540/11542	Two rack units
MPX 17500/19500/21500	Two rack units
MPX 17550/19550/20550/21550	Two rack units
MPX 22040/22060/22080/22100/22120	Two rack units
MPX 24100/24150	Two rack units

MPX 25100T/25160T	Two rack units

Each appliance ships with a mounting rail kit that contains two rail assemblies, one for the left side and the other for the right side of the appliance, and screws to attach the rails. An assembly consists of an inner rail and a rack rail. The supplied rail kit is 28 inches long (38 inches extended). Contact your Citrix sales representative to order a 23-inch (33 inches extended) rail kit.
Note: The same rail kit is used for both square-hole and round-hole racks. See "Installing the Rail Assembly to the Rack" for specific instructions for threaded, round-hole racks.
To mount the appliance, you must first install the rails and then install the appliance in the rack.

Perform the following tasks to mount the appliance:
- Remove the inner rails from the rail assembly.
- Attach the inner rails to the appliance.
- Install the rack rails on the rack.
- Install the appliance in the rack.

The appliance is shipped with rack-rail hardware. This hardware consists of two inner rails that you attach to the appliance, one on each side, and a rack-rail assembly that you attach to the rack. The following figure illustrates the steps involved in mounting the Citrix NetScaler appliance to a rack.

To remove the inner rails from the rail assembly

1. Place the rail assembly on a flat surface.
2. Slide out the inner rail toward the front of the assembly.
3. Depress the latch until the inner rail comes all the way out of the rail assembly.
4. Repeat steps 1 through 3 to remove the second inner rail.

To attach the inner rails to the appliance

1. Position the right inner rail behind the handle on the right side of the appliance.
2. Align the holes on the rail with the corresponding holes on the side of the appliance.
3. Attach the rail to the appliance with the provided screws: 4 per side for a 1U appliance and 5 per side for a 2U appliance, as shown in the following figure.
   Figure 1. Attaching inner rails

4. Repeat steps 1 through 3 to install the left inner rail on the other side of the appliance.

To install the rack rails on the rack

1. If you have a round-hole, threaded rack, skip to step 3.
2. Install square nut retainers into the front post and back post of the rack as shown in the following figures. Before

inserting a screw, be sure to align the square nut with the correct hole for your 1U or 2U appliance. The three holes are not evenly spaced.

Figure 2. Installing Retainers into the Front Rack Posts

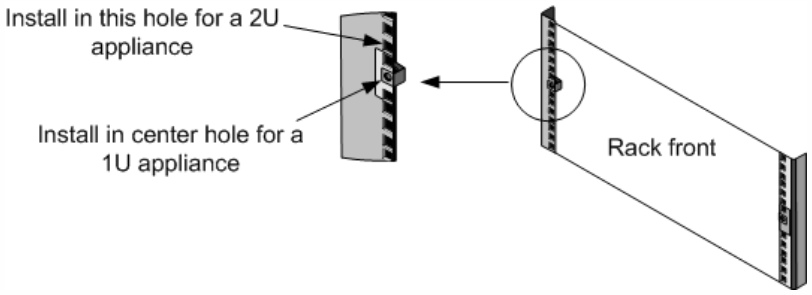


Figure 3. Installing Retainers into the Rear Rack Posts

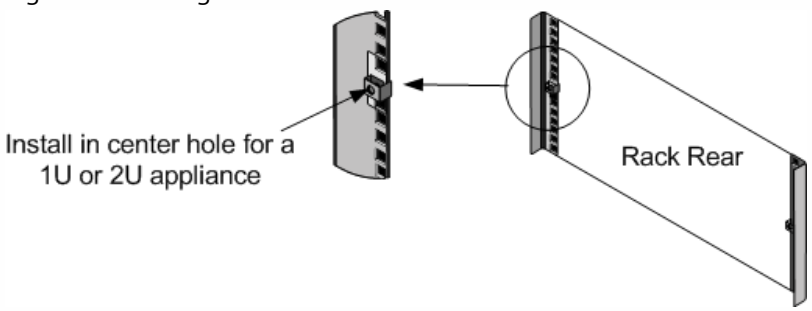
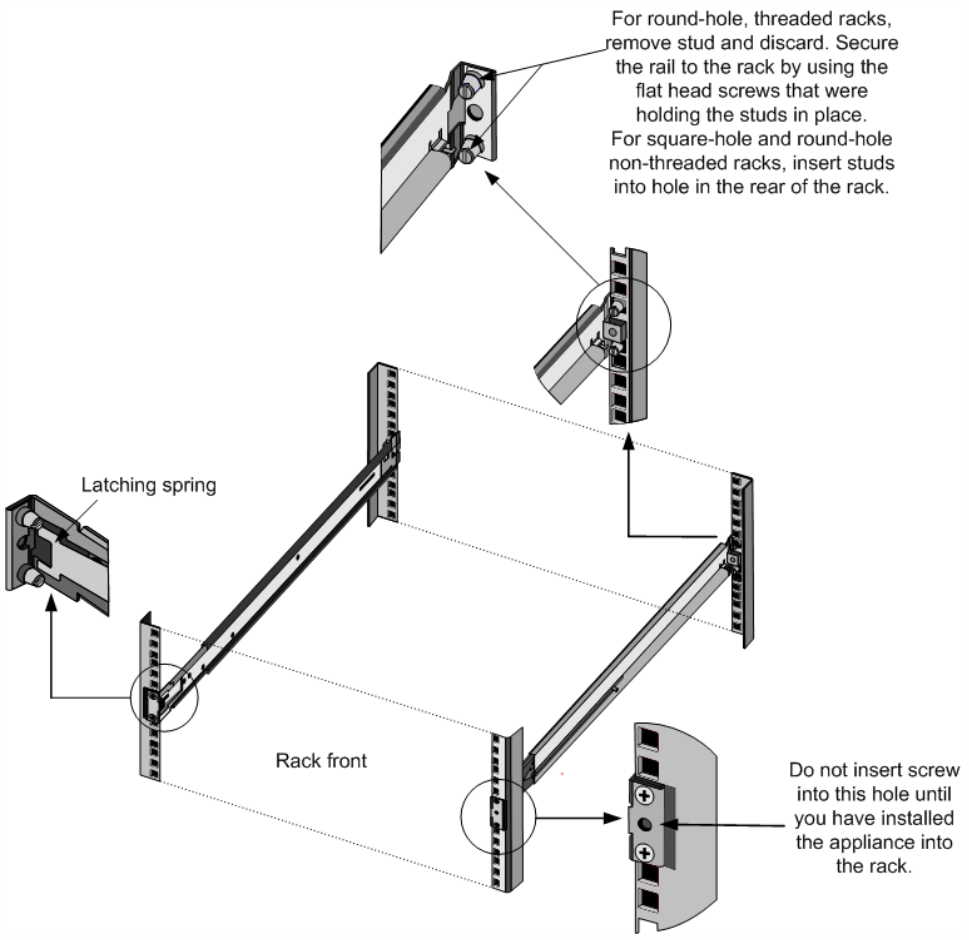


3. Install the adjustable rail assembly into the rack as shown in the following figures. Use a screw to lock the rear rail flange into the rack. With the screw securing the rail in place, you can optionally remove the latching spring.

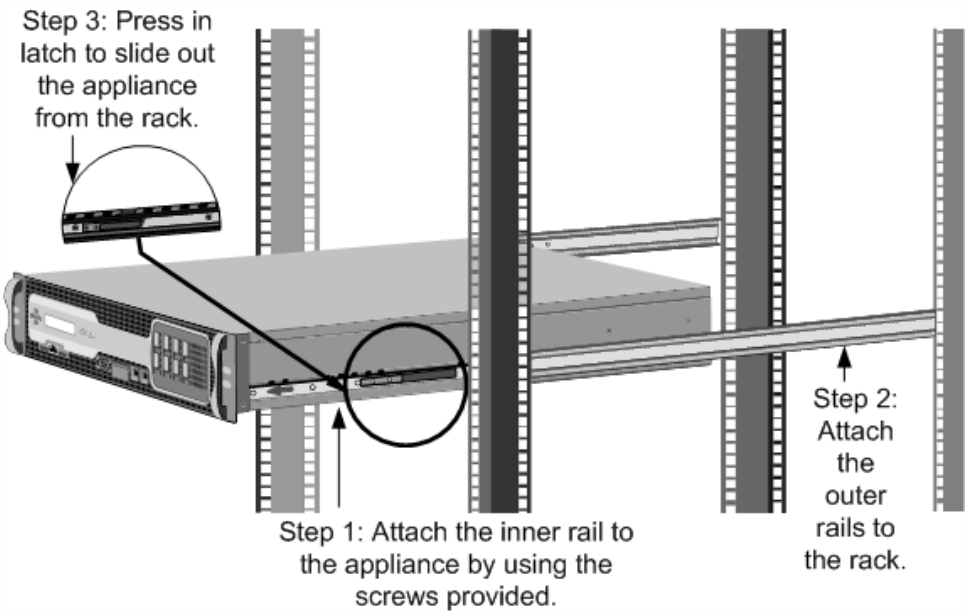
Figure 4. Installing the Rail Assembly to the Rack



To install the appliance in the rack

1. Align the inner rails, attached to the appliance, with the rack rails.
2. Slide the appliance into the rack rails, keeping the pressure even on both sides.
3. Verify that the appliance is locked in place by pulling it all the way out from the rack.

Figure 5. Rack Mounting the Appliance



Installing and Removing 1G SFP Transceivers

Mar 01, 2014

Note: This section applies to the MPX 8005/8015/8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 22040/22060/22080/22100/22120, and MPX 24100/24150 appliances.

A Small Form-Factor Pluggable (SFP) is a compact transceiver that can operate at speeds of up to 1 gigabit per second and is available in both copper and fiber types. Inserting a 1G SFP copper transceiver converts the 1G SFP port to a 1000BASE-T port. Inserting a 1G SFP fiber transceiver converts the 1G SFP port to a 1000BASE-X port. Auto-negotiation is enabled by default on the 1G SFP port into which you insert your 1G SFP transceiver. As soon as a link between the port and the network is established, the speed and mode are matched on both ends of the cable.

Note: The 1G SFP transceiver is hot-swappable from release 9.3 build 47.5 and later on the NetScaler appliances that use the e1k interface. The following platforms support 1G SPF transceivers:

- MPX 7500/9500
- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

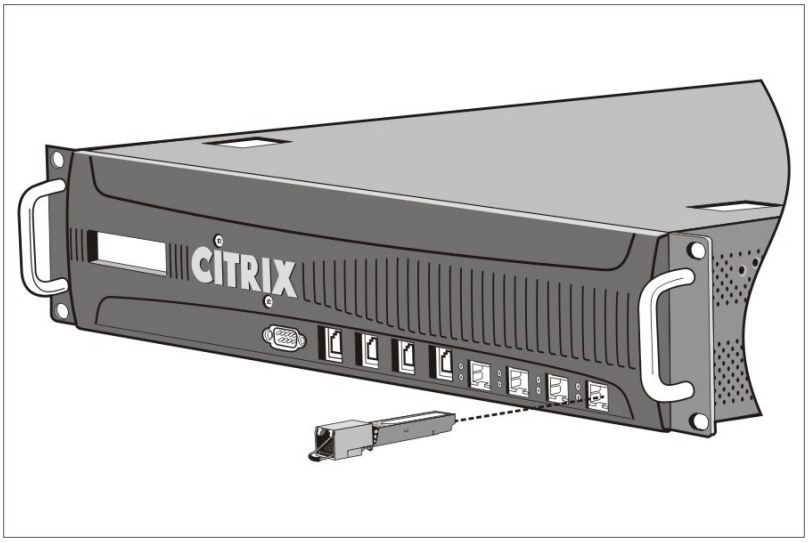
Caution: NetScaler appliances do not support 1G SFP transceivers from vendors other than Citrix Systems. Attempting to install third-party 1G SFP transceivers on your NetScaler appliance voids the warranty.

Insert 1G SFP transceivers into the 1G SFP ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the 1G SFP transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install a 1G SFP transceiver

1. Remove the 1G SFP transceiver carefully from its box.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Align the 1G SFP transceiver to the front of the 1G SFP transceiver port on the front panel of the appliance, as shown in the following figure.
   Note: The illustration in the following figures might not represent your actual appliance.
   Figure 1. Installing a 1G SFP transceiver



3. Hold the 1G SFP transceiver between your thumb and index finger and insert it into the 1G SFP transceiver port, pressing it in until you hear the transceiver snap into place.
4. Lock the transceiver.
5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.
6. If you are using a fiber 1G SFP transceiver, do not remove the dust caps attached to the transceiver and the cable until you are ready to insert the cable.

To remove a 1G SFP transceiver

1. Disconnect the cable from the 1G SFP transceiver. If you are using a fiber optic cable, replace the dust cap on the cable before putting it away.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Unlock the 1G SFP transceiver.
3. Hold the 1G SFP transceiver between your thumb and index finger and slowly pull it out of the port.
4. If you are removing a fiber 1G SFP transceiver, replace the dust cap before putting it away.
5. Put the 1G SFP transceiver into its original box or another appropriate container.

Accelerating Load Balanced Traffic by Using Compression

Aug 22, 2013

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

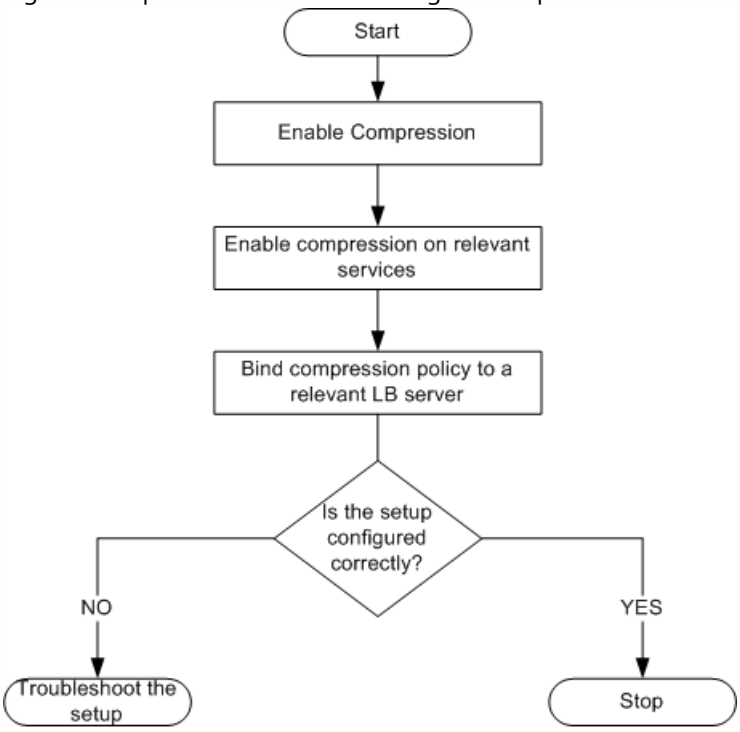
To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the polices to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

Compression Configuration Task Sequence

Updated: 2013-08-22

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression



Note: The steps in the above figure assume that load balancing has already been configured.

Enabling Compression

Updated: 2013-06-07

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the command line interface

At the command prompt, type the following commands to enable compression and verify the configuration:

- enable ns feature CMP
- show ns feature

Example

```
> enable ns feature CMP
Done
> show ns feature

     Feature                Acronym          Status
     -------                -------          ------
1)   Web Logging             WL               ON
2)   Surge Protection        SP               OFF
.
7)   Compression Control     CMP              ON
8)   Priority Queuing        PQ               OFF
.
Done
```

To enable compression by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

Configuring Services to Compress Data

Updated: 2013-08-22

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

To enable compression on a service by using the command line

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- set service <name> -CMP YES
- show service <name>

Example

```
> show service SVC_HTTP1
SVC_HTTP1 (10.102.29.18:80) - HTTP
State: UP
Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)
Time since last state change: 0 days, 03:03:37.200
Server Name: 10.102.29.18
Server ID : 0   Monitor Threshold : 0
Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
Use Source IP: NO
Client Keepalive(CKA): NO
Access Down Service: NO
TCP Buffering(TCPB): NO
HTTP Compression(CMP): YES
Idle timeout: Client: 180 sec   Server: 360 sec
Client IP: DISABLED
Cacheable: NO
SC: OFF
SP: OFF
Down state flush: ENABLED

1)      Monitor Name: tcp-default
State: DOWN     Weight: 1
Probes: 1095    Failed [Total: 1095 Current: 1095]
Last response: Failure - TCP syn sent, reset received.
Response Time: N/A
Done
```

To enable compression on a service by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the **Details** section at the bottom of the pane.

Binding a Compression Policy to a Virtual Server

Updated: 2013-09-04

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see "Configuring and Binding Policies with the Policy Manager."

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

- (bind | unbind) lb vserver <name> -policyName <string>
- show lb vserver <name>

Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp
Done
> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
State: UP
Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
Time since last state change: 19 days, 04:26:50.470
Effective State: UP
Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
Port Rewrite : DISABLED
No. of Bound Services :  1 (Total)      1 (Active)
Configured Method: LEASTCONNECTION
Current Method: Round Robin, Reason: Bound service's state changed to UP
Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED  Push VServer:
Push Multi Clients: NO
Push Label Rule:

Bound Service Groups:
1)      Group Name: Service-Group-1

1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP Weight:                 1

1)      Policy : ns_cmp_msapp Priority:0
Done
```

To bind or unbind a compression policy to a load balancing virtual server by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.

3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
   - To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.
   - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

Securing Load Balanced Traffic by Using SSL

Jan 31, 2011

The Citrix NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

This document includes the following:

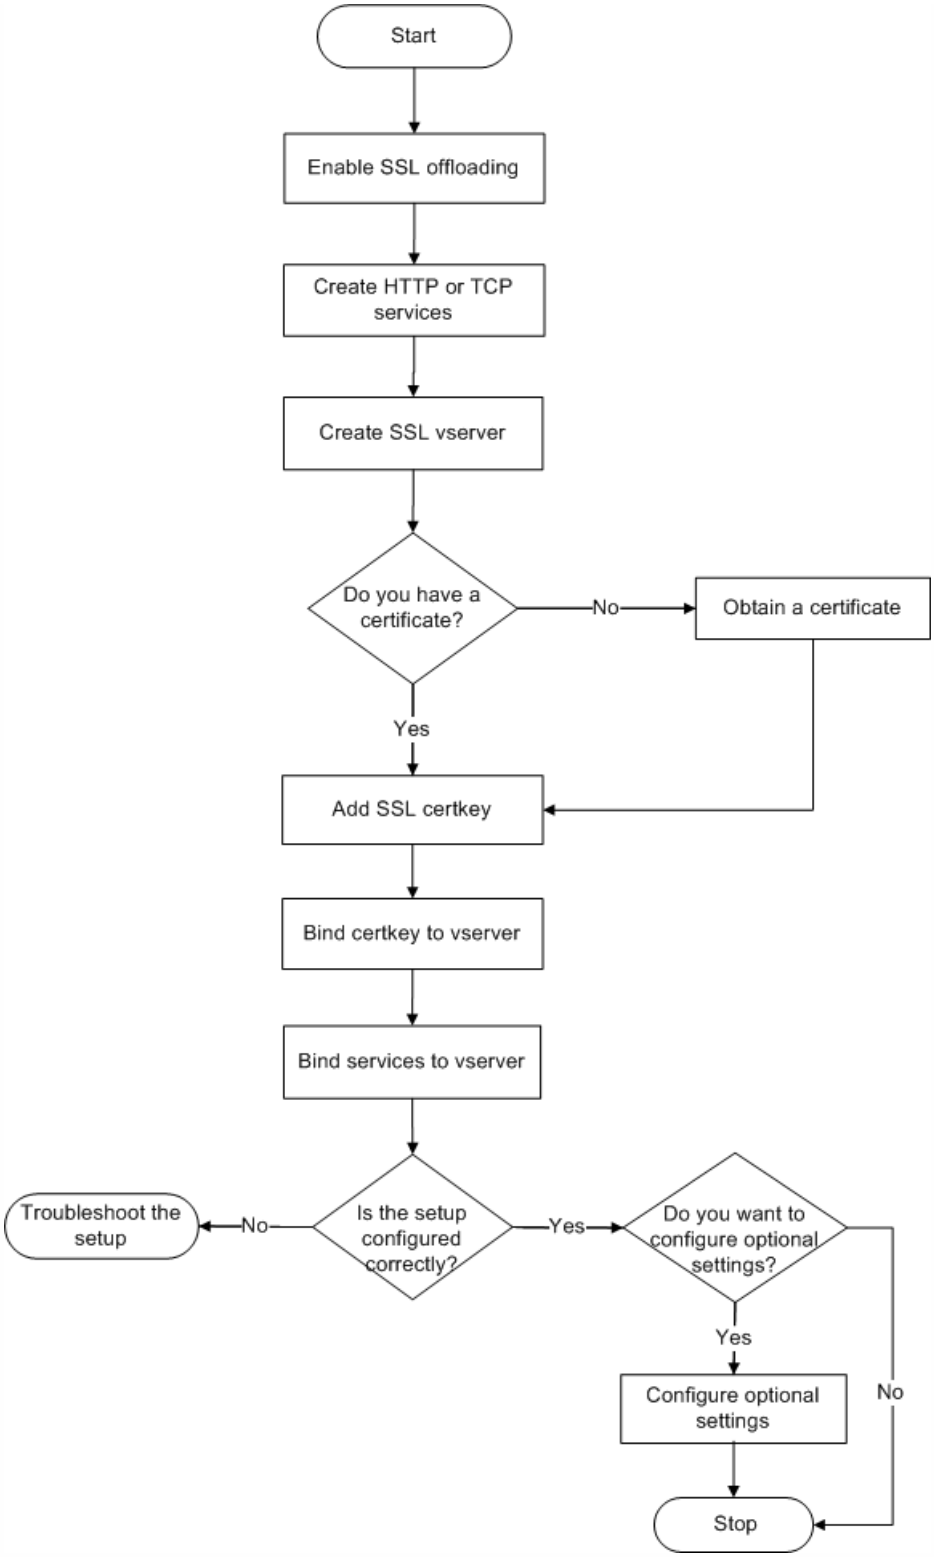
SSL Configuration Task Sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading



Enabling SSL Offload

Updated: 2013-06-05

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

To enable SSL by using the command line interface

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- enable ns feature SSL
- show ns feature

Example

```
> enable ns feature ssl
Done
> show ns feature
Feature Acronym Status
------- ------- ------
1) Web Logging WL ON
2) SurgeProtection SP OFF
3) Load Balancing LB ON . . .
 9) SSL Offloading SSL ON
10) Global Server Load Balancing GSLB ON . .
Done >
```

To enable SSL by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes.

Creating HTTP Services

Updated: 2013-08-23

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

To add an HTTP service by using the command line interface

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

- add service <name> (<IP> | <serverName>) <serviceType> <port>
- show service <name>

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80
 Done
> show service SVC_HTTP1
      SVC_HTTP1 (10.102.29.18:80) - HTTP
      State: UP
      Last state change was at Wed Jul 15 06:13:05 2009
```

```
        Time since last state change: 0 days, 00:00:15.350
        Server Name: 10.102.29.18
        Server ID : 0   Monitor Threshold : 0
        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
        Use Source IP: NO
        Client Keepalive(CKA): NO
        Access Down Service: NO
        TCP Buffering(TCPB): NO
        HTTP Compression(CMP): YES
        Idle timeout: Client: 180 sec   Server: 360 sec
        Client IP: DISABLED
        Cacheable: NO
        SC: OFF
        SP: OFF
        Down state flush: ENABLED

    1)    Monitor Name: tcp-default
              State: UP       Weight: 1
              Probes: 4       Failed [Total: 0 Current: 0]
              Last response: Success - TCP syn+ack received.
              Response Time: N/A
    Done
```

To add an HTTP service by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Services.
2. In details pane, click Add.
3. In the Create Service dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the Protocol list, select the type of the service (for example, HTTP).
5. Click Create, and then click Close. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

Adding an SSL-Based Virtual Server

Updated: 2013-06-05

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

To add an SSL-based virtual server by using the command line interface

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- add lb vserver <name> <serviceType> [<IPAddress> <port>]
- show lb vserver <name>

Example

```
> add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
Done
> show lb vserver vserver-SSL-1
vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS
State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (+176 ms)
Time since last state change: 0 days, 00:03:44.120
Effective State: DOWN Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
No. of Bound Services : 0 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule: Done
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

To add an SSL-based virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (SSL Offload) dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the Protocol list, select the type of the virtual server, for example, SSL.
5. Click Create, and then click Close.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Binding Services to the SSL Virtual Server

Updated: 2013-08-23

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see "SSL Offload and Acceleration."

To bind a service to a virtual server by using the command line interface

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- bind lb vserver <name> <serviceName>
- show lb vserver <name>

Example

```
> bind lb vserver vserver-SSL-1 SVC_HTTP1
Done
> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) - SSL Type:
ADDRESS State: DOWN[Certkey not bound]
Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)
Time since last state change: 0 days, 00:31:53.70
Effective State: DOWN Client Idle
Timeout: 180 sec
Down state flush: ENABLED Disable Primary Vserver On Down :
DISABLED No. of Bound Services : 1 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Vserver IP and
Port insertion: OFF Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule:

1) SVC_HTTP1 (10.102.29.18: 80) - HTTP
State: DOWN Weight: 1
Done
```

To bind a service to a virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. On the Services tab, in the Active column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click OK.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Adding a Certificate Key Pair

Updated: 2013-06-24

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.
Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

To add a certificate key pair by using the command line interface

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- add ssl certKey <certkeyName> -cert <string> [-key <string>]
- show sslcertkey <name>

Example

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
 Done
> show sslcertkey CertKey-SSL-1
   Name: CertKey-SSL-1 Status: Valid,
   Days to expiration:4811 Version: 3
   Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer: C=US,ST=California,L=San
   Jose,O=Citrix ANG,OU=NS Internal,CN=de fault
   Validity Not Before: Oct 6 06:52:07 2006 GMT Not After : Aug 17 21:26:47 2022 GMT
   Subject: C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS Internal,CN=d efault Public Key
   Algorithm: rsaEncryption Public Key
   size: 1024
 Done
```

To add a certificate key pair by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. In the details pane, click Add.
3. In the Install Certificate dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under Details, in Certificate File Name, click Browse (Appliance) to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.
5. Select the certificate you want to use, and then click Select.
6. In Private Key File Name, click Browse (Appliance) to locate the private key file. To use a private key present on the local system, select Local.
7. Select the key you want to use and click Select. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.
8. Click Install.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

Binding an SSL Certificate Key Pair to the Virtual Server

Updated: 2013-06-24

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

To bind an SSL certificate key pair to a virtual server by using the command line

interface

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- bind ssl vserver <vServerName> -certkeyName <string>
- show ssl vserver <name>

Example

```
 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
Done
> show ssl vserver Vserver-SSL-1

    Advanced SSL configuration for VServer Vserver-SSL-1:
    DH: DISABLED
    Ephemeral RSA: ENABLED Refresh Count: 0
    Session Reuse: ENABLED Timeout: 120 seconds
    Cipher Redirect: ENABLED
    SSLv2 Redirect: ENABLED
    ClearText Port: 0
    Client Auth: DISABLED
    SSL Redirect: DISABLED
    Non FIPS Ciphers: DISABLED
    SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate
1) Cipher Name: DEFAULT
  Description: Predefined Cipher Alias
Done
```

To bind an SSL certificate key pair to a virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the SSL Settings tab, under Available, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click Add.
4. Click OK.
5. Verify that the certificate key pair that you selected appears in the Configured area.

Configuring Support for Outlook Web Access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.
To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

Creating an SSL Action to Enable OWA Support

Updated: 2013-06-24

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

To create an SSL action to enable OWA support by using the command line interface

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- add ssl action <name> -OWASupport ENABLED
- show SSL action <name>

```
 > add ssl action Action-SSL-OWA -OWASupport enabled
Done
> show SSL action Action-SSL-OWA
  Name: Action-SSL-OWA
  Data Insertion Action: OWA
  Support: ENABLED
Done
```

To create an SSL action to enable OWA support by using the configuration utility

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, in the Name text box, type Action-SSL-OWA.
4. Under Outlook Web Access, select Enabled.
5. Click Create, and then click Close.
6. Verify that Action-SSL-OWA appears in the **SSL Actions** page.

Creating SSL Policies

Updated: 2013-09-04

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

To create an SSL policy by using the command line interface

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- add ssl policy <name> -rule <expression> -reqAction <string>
- show ssl policy <name>

Example

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
```

```
Done
> show ssl policy Policy-SSL-1
Name: Policy-SSL-1      Rule: ns_true
Action: Action-SSL-OWA  Hits: 0
Policy is bound to following entities
1)      PRIORITY : 0
Done
```

To create an SSL policy by using the configuration utility

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Add.
3. In the Create SSL Policy dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In Request Action, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see "Understanding Policies and Expressions."
5. In Named Expressions, choose the built-in general expression ns_true and click Add Expression. The expression ns_true now appears in the Expression text box.
6. Click Create, and then click Close.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

Binding the SSL Policy to an SSL Virtual Server

Updated: 2013-06-24

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

To bind an SSL policy to an SSL virtual server by using the command line interface

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

- bind ssl vserver <vServerName> -policyName <string>
- show ssl vserver <name>

Example

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
 Done
> show ssl vserver Vserver-SSL-1
      Advanced SSL configuration for VServer Vserver-SSL-1:
      DH: DISABLED
      Ephemeral RSA: ENABLED        Refresh Count: 0
      Session Reuse: ENABLED        Timeout: 120 seconds
      Cipher Redirect: ENABLED
```

```
        SSLv2 Redirect: ENABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

    1)    CertKey Name: CertKey-SSL-1 Server Certificate

    1)    Policy Name: Policy-SSL-1
                    Priority: 0
    1)    Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
     Done
    >
```

To bind an SSL policy to an SSL virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click Insert Policy, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click OK.

Features at a Glance

Sep 04, 2013

Citrix NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see "Processing Order of Features."

This document includes the following:

Application Switching and Traffic Management Features

Aug 30, 2016

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.
For more information, see "SSL Offload and Acceleration."

Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. A NetScaler does not compare incoming packets to disabled ACLs.
For more information, see "Access Control List."

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the NetScaler can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts. To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.
For more information, see "Load Balancing."

Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic, within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an addresses is not duplicated within the same domain.
For more information, see "Traffic Domains."

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances

the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler.

The NetScaler appliance supports the following types of network address translation:

INAT—In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the NetScaler replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

RNAT—In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

Stateless NAT46 Translation—Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

Stateful NAT64 Translation—The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see "Configuring Network Address Translation."

Multipath TCP Support

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.
For more information, see "MPTCP (Multi-Path TCP)."

Content Switching

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.
For more information, see "Content Switching."

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.
For more information, see "Global Server Load Balancing."

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.
For more information, see "Configuring Dynamic Routes."

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.
For more information, see " Link Load Balancing."

TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.
Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)— Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling— Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see "Configuring TCP Profiles."

Web Interface on NetScaler

Provides access to XenApp and XenDesktop resources, which include applications, content, and desktops. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in. The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance.
Note: Web Interface is supported only on NetScaler nCore releases.
For more information, see "Web Interface."

CloudBridge Connector

The Citrix NetScaler CloudBridge Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see "CloudBridge."

DataStream

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.
For more information, see "DataStream."

Application Acceleration Features

Sep 06, 2013

AppCompress

Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

For more information, see "Compression."

Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see "Cache Redirection."

AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see "Integrated Caching."

TCP Buffering

Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites.

For more information, see "TCP Buffering."

Application Security and Firewall Features

Oct 30, 2013

Denial of Service Attack (DoS) Defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see "HTTP Denial-of-Service Protection."

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.
This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see "Content Filtering."

Responder

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.
For more information, see "Responder."

Rewrite

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.
When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see "Rewrite."

Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.
For more information, see "Priority Queuing."

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.
For more information, see "Surge Protection."

NetScaler Gateway

NetScaler Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

For more information, see "NetScaler Gateway."

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.
For more information, see "Application Firewall."

Application Visibility Feature

Sep 04, 2013

NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.
HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird's eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.
For more information, see "EdgeSight Monitoring for NetScaler."

Enhanced Application Visibility Using AppFlow

The Citrix NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.
Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see "AppFlow."

Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed

by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see "Stream Analytics."

Cloud Integration Feature

Aug 23, 2013

AutoScale

All applications have specific usage patterns that comprise peaks and troughs. These load variations can be dynamic in nature and difficult to predict, given that they depend on several factors that are intrinsic to the use case. Cloud users have to constantly monitor the load on their application fleet and make sure that these variations have minimum impact on end users. During periods of peak usage, when the application fleet is overloaded and end users experience significant latency, they have to deploy additional application instances. During trough periods, the expanded fleet is underutilized. So they might have to remove additional instances or bear unnecessary cost overheads. In most cases, they have to perform these tasks manually.

If your organization uses Citrix CloudPlatform to deploy and manage the cloud environment, users can use the *AutoScale* feature in CloudPlatform, in conjunction with a Citrix NetScaler appliance, to automatically scale their applications as needed. The AutoScale feature is part of the elastic load balancing feature in CloudPlatform. A CloudPlatform user can use the AutoScale feature to specify thresholds for various conditions for automatically scaling the application fleet upward and downward. CloudPlatform, in turn, configures the NetScaler appliance (by using the NetScaler NITRO API) to load balance traffic to the application virtual machines (VMs), monitor application thresholds and performance, and trigger scale-up and scale-down actions to add or remove VMs to or from the application fleet.

As the NetScaler administrator, you do not have to perform any tasks for configuring AutoScale on the NetScaler appliance. However, you might have to be aware of certain prerequisites, and you might have to troubleshoot the configuration if issues arise in the AutoScale configuration. To troubleshoot the configuration, you have to be aware of how CloudPlatform works and what configuration CloudPlatform pushes to the NetScaler appliance. You also need a working knowledge of how to troubleshoot issues on a NetScaler appliance.

For more information about AutoScale, see "AutoScale: Automatic Scaling in the Citrix CloudPlatform Environment."

Getting Started with Citrix NetScaler VPX

Aug 13, 2014

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial setup and basic configuration of the NetScaler virtual appliance product, including the following topics.

Understanding the NetScaler

Updated: 2013-10-28

The Citrix NetScaler product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4–L7) network traffic for web applications. For example, a NetScaler bases load balancing decisions on individual HTTP requests instead of on long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The NetScaler feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.

Switching Features

Updated: 2013-09-06

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and Protection Features

Updated: 2013-10-28

NetScaler security and protection features protect web applications from Application Layer attacks. A NetScaler allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization Features

Updated: 2013-09-06

Optimization features offload resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. A NetScaler supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Understanding Policies and Expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the NetScaler what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When a NetScaler receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except Rewrite policies, a NetScaler implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the NetScaler evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

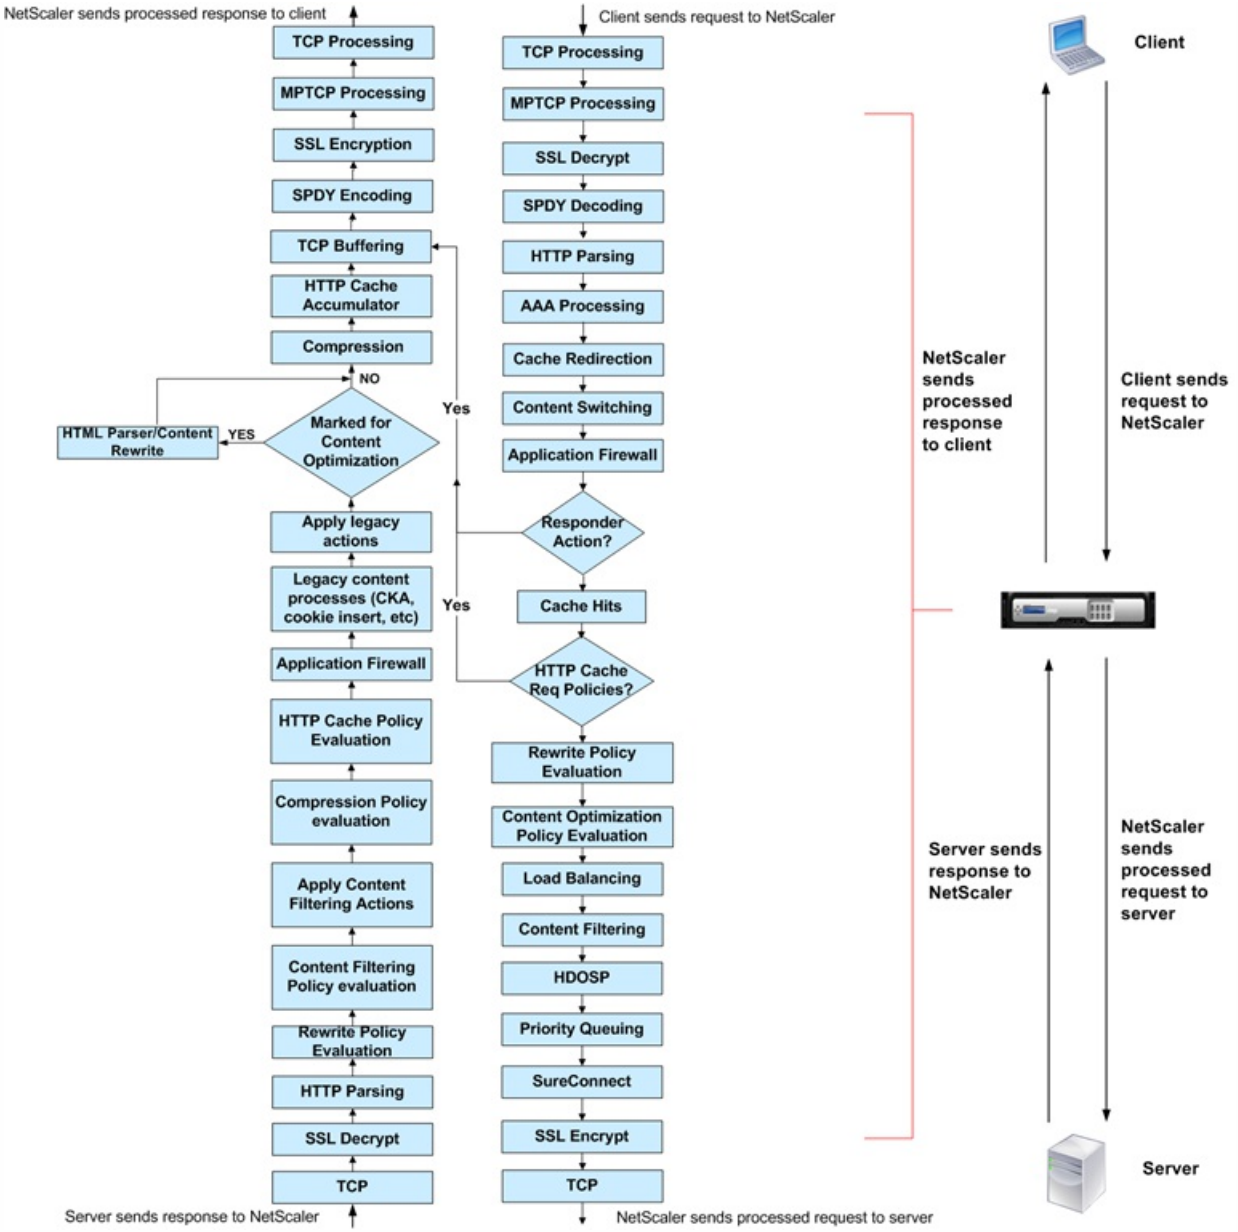
Processing Order of Features

Updated: 2013-08-22

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the L7 packet flow in the NetScaler.

Figure 1. L7 Packet Flow Diagram



The following figure shows the DataStream packet flow in the NetScaler. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see "DataStream."

Citrix NetScaler Virtual Appliance Overview

Oct 06, 2016

The NetScaler virtual appliance product is a virtual NetScaler appliance that can be hosted on Citrix XenServer®, VMware ESX or ESXi, Linux-KVM, and Microsoft Hyper-V virtualization platforms.

A NetScaler virtual appliance supports all the features of a physical NetScaler, except virtual MAC (vMAC) addresses, Layer 2 (L2) mode, and link aggregation control protocol (LACP). VLAN tagging is supported on the NetScaler virtual appliances hosted on the XenServer and on VMware ESX platforms.

For the VLAN tagging feature to work, do one of the following:

- On the Citrix XenServer, configure tagged VLANs on a port on the switch but do NOT configure any VLANs on the XenServer interface attached to that port. The VLAN tags are passed through to the virtual appliance and you can use the tagged VLAN configuration on the virtual appliance.
- On the VMware ESX, set the port group's VLAN ID to 4095 on the VSwitch of VMware ESX server. For more information about setting a VLAN ID on the VSwitch of VMware ESX server, see http://www.vmware.com/pdf/esx3_vlan_wp.pdf.

This overview covers only aspects that are unique to NetScaler virtual appliance.

Note: The terms *NetScaler*, *NetScaler appliance*, and *appliance* are used interchangeably with *NetScaler virtual appliance* unless stated otherwise.

NetScaler Virtual Appliance Setup for the XenServer Platform

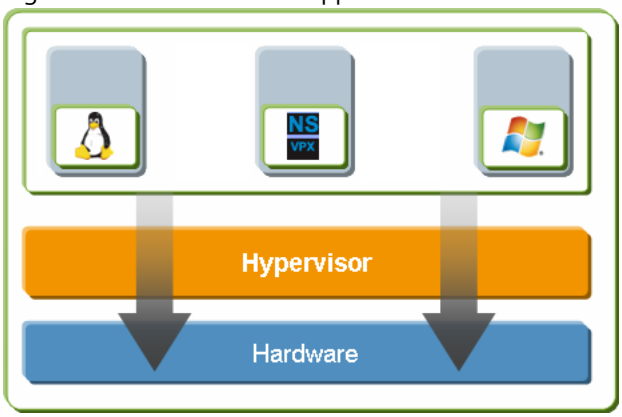
When you set up NetScaler virtual appliance on XenServer, you must use the XenCenter client to install the first NetScaler virtual appliance. Subsequent virtual appliances can be added by using either the XenCenter client or Citrix Command Center.

XenServer

The XenServer® product is a server virtualization platform that offers near bare-metal virtualization performance for virtualized server and client operating systems. XenServer uses the Xen® hypervisor to virtualize each server on which it is installed, enabling each server to host multiple virtual machines simultaneously.

The following figure shows the bare-metal solution architecture of NetScaler virtual appliance on XenServer.

Figure 1. NetScaler Virtual Appliance on XenServer



The bare-metal solution architecture has the following components:

Hardware or physical layer:

Physical hardware components including memory, CPU, network cards, and disk drives.

Xen hypervisor:

Thin layer of software that runs on top of the hardware. The Xen hypervisor gives each virtual machine a dedicated view of the hardware.

Virtual machine:

Operating system hosted on the hypervisor and appearing to the user as a separate physical computer. However, the machine shares physical resources with other virtual machines, and it is portable because the virtual machine is abstracted from physical hardware.

A NetScaler virtual machine, or *virtual appliance*, is installed on the Xen hypervisor and uses paravirtualized drivers to access storage and network resources. It appears to the users as an independent NetScaler appliance with its own network identity, user authorization and authentication capabilities, configuration, applications, and data. The paravirtualization technique enables the virtual machines and the hypervisor to work together to achieve high performance for I/O and for CPU and memory virtualization.

For more information about XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

XenCenter

XenCenter® is a graphical virtualization-management interface for XenServer®, enabling you to manage servers, resource pools, and shared storage, and to deploy, manage, and monitor virtual machines from your Windows desktop machine.

Use XenCenter to install NetScaler virtual appliance on XenServer.

For more information about XenCenter, see the XenServer documentation at http://support.citrix.com/product/xens/.

Command Center

Command Center is a management and monitoring solution for Citrix application networking products that include NetScaler, NetScaler virtual appliance, NetScaler Gateway Enterprise Edition, Citrix® Branch Repeater™, Branch Repeater VPX™, and Citrix Repeater™. Command Center enables network administrators and operations teams to manage, monitor, and troubleshoot the entire global application delivery infrastructure from a single, unified console.

This centralized management solution simplifies operations by providing administrators with enterprise-wide visibility and automating management tasks that need to be executed across multiple devices.

Command Center is available with Citrix NetScaler Enterprise and Platinum editions.

You can use Command Center to provision NetScaler virtual appliance on XenServer, and then you can manage and monitor the virtual appliances from Command Center.

Note: You must use the XenCenter client to manage XenServer. You cannot manage XenServer from Command Center.

NetScaler Virtual Appliance Setup for the VMware ESX Platform

The NetScaler virtual appliance setup for the VMware ESX platform requires a VMware ESX or ESXi server and the vSphere client.

VMware ESX and ESXi are virtualization products based on bare-metal architecture, offered by VMware, Inc. Citrix NetScaler virtual appliance can be hosted on a VMware ESX or ESXi server.

For more information about VMware ESX, see http://www.vmware.com/.

The vSphere client is a graphical interface for managing virtual machines on VMware ESX servers. You use the vSphere client to allocate resources on the ESX server to virtual appliances installed on the server or to deallocate resources. For example, you can allocate virtual network ports to a virtual appliance.

For more information about VMware vSphere client, see http://www.vmware.com/.

NetScaler Virtual Appliance Setup for the Microsoft Hyper-V Platform

Updated: 2014-08-07

The NetScaler virtual appliance setup for the Microsoft Hyper-V platform requires Windows Server 2008 R2 or 2012 with the Hyper-V role installed. Like all virtualization systems, Hyper-V enables you to create a virtualized computing environment that results in better utilization of your hardware resources.
Hyper-V is a type 1 hypervisor that comes preinstalled with Windows Server 2008 R2 or 2012. It needs to be enabled as a role on the Windows Server.

For more information about Hyper-V, see http://technet.microsoft.com/en-us/library/cc816638(WS.10).aspx.

NetScaler Virtual Appliance Setup for Linux-KVM Platform

Updated: 2014-03-07

The NetScaler® VPX™ is a virtual NetScaler appliance that can be hosted on a kernel based Virtualization Machine(KVM). The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. NetScaler VPX runs as a virtual appliance on Linux-KVM server. Like all virtualization systems, KVM enables you to create a virtualized computing environment that results in better utilization of your hardware resources.

Hypervisors Supported on a NetScaler Virtual Appliance

Updated: 2014-08-07

The following table lists the details, such as system ID (sysID) and whether support is available for multiple packet engines (multi-PE), for the different hypervisors supported on a NetScaler virtual appliance.

Table 1. Hypervisors Supported on a NetScaler Virtual Appliance

	VPX on XenServer	VPX on VMware ESX	VPX on Microsoft Hyper-V	VPX on generic KVM	VPX on Amazon Web Services
Hypervisor Version	6.0, 6.1, 6.2	4.1, 5.1, 5.5	2008, 2012	Linux - Fedora 16, Fedora 17, RHEL 6.4	N/A
SysID	450000	450010	450020	450070	450040
Multi-PE Supported	Yes	Yes	Yes	Yes	Yes
Clustering Supported	Yes	Yes	Yes	Yes	No

Licenses	**VPX on XenServer** VPX-10, VPX-200, VPX-1000, VPX-3000, VPX-8000	**VPX on VMware ESX** VPX-10, VPX-200, VPX-1000, VPX-3000, VPX-8000	**VPX on Microsoft Hyper-V** VPX-10, VPX-200, VPX-1000, VPX-3000, VPX-8000	**VPX on generic KVM** VPX-10, VPX-200, VPX-1000, VPX-3000, VPX-8000	**VPX on Amazon Web Services** VPX-10, VPX-200, VPX-1000, VPX-BYOL

Where Does a NetScaler Appliance Fit in the Network?

Jun 24, 2013

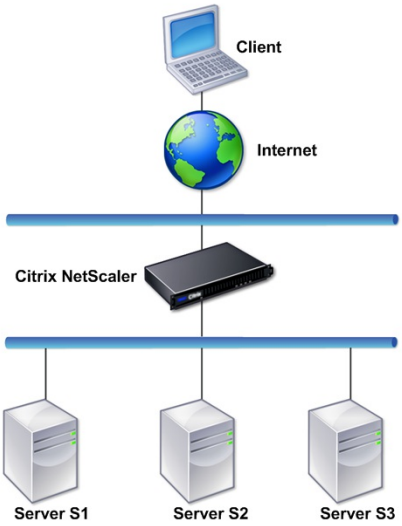
A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

Physical Deployment Modes

Updated: 2013-09-04

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment



In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see "Understanding Common Network Topologies."

Citrix NetScaler as an L2 Device

Updated: 2013-09-04

A NetScaler functioning as an L2 device is said to operate in L2 mode. In L2 mode, the NetScaler forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler.

For information about how the L2 and L3 modes interact, see "Configuring Modes of Packet Forwarding."

For information about configuring L2 mode, see "Enabling and Disabling Layer 2 Mode."

Citrix NetScaler as a Packet Forwarding Device

Updated: 2014-03-14

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for an appliance's MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see "Configuring Modes of Packet Forwarding."

For information about configuring the L3 mode, see "Enabling and Disabling Layer 3 Mode."

How a NetScaler Communicates with Clients and Servers

Aug 30, 2013

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-Owned IP Addresses

Updated: 2014-03-12

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

NetScaler IP (NSIP) address

The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

Mapped IP (MIP) address

A MIP address is used for server-side connections. It is not the IP address of the appliance. In most cases, when the appliance receives a packet, it replaces the source IP address with a MIP address before sending the packet to the server. With the servers abstracted from the clients, the appliance manages connections more efficiently.

Virtual server IP (VIP) address

A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.

Subnet IP (SNIP) address

A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

IP Set

An IP set is a set of IP addresses, which are configured on the appliance as SNIP . An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

Net Profile

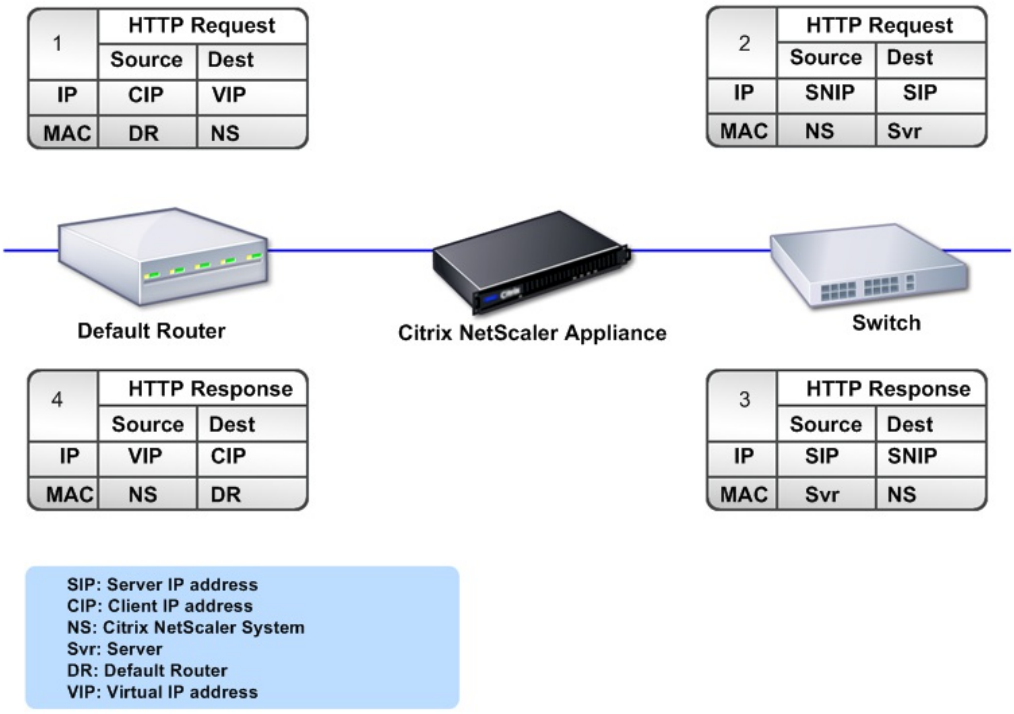
A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

How Traffic Flows Are Managed

Updated: 2014-03-12

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 1. Virtual Server Based Connections



In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

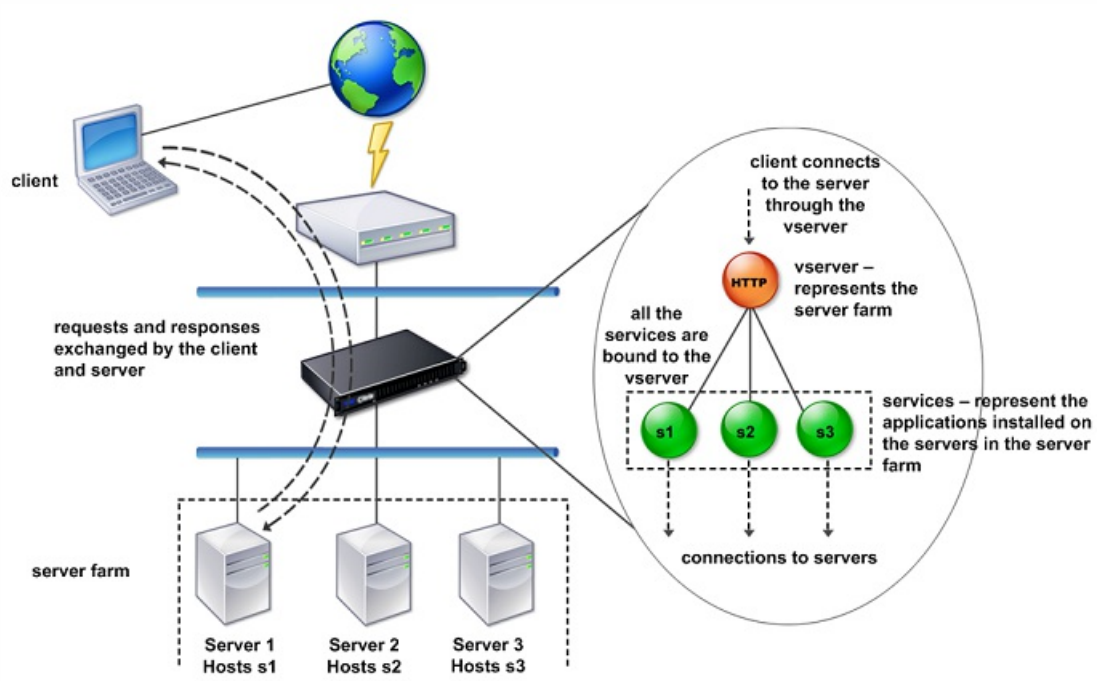
Traffic Management Building Blocks

Updated: 2013-06-24

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How Traffic Management Building Blocks Work



A Simple Load Balancing Configuration

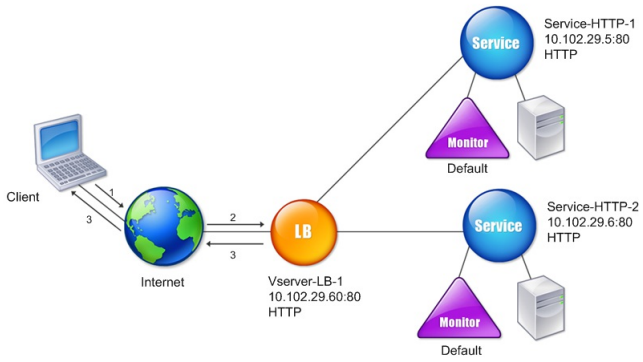
Updated: 2013-08-30

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to

connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load Balancing Virtual Server, Services, and Monitors



In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding Virtual Servers

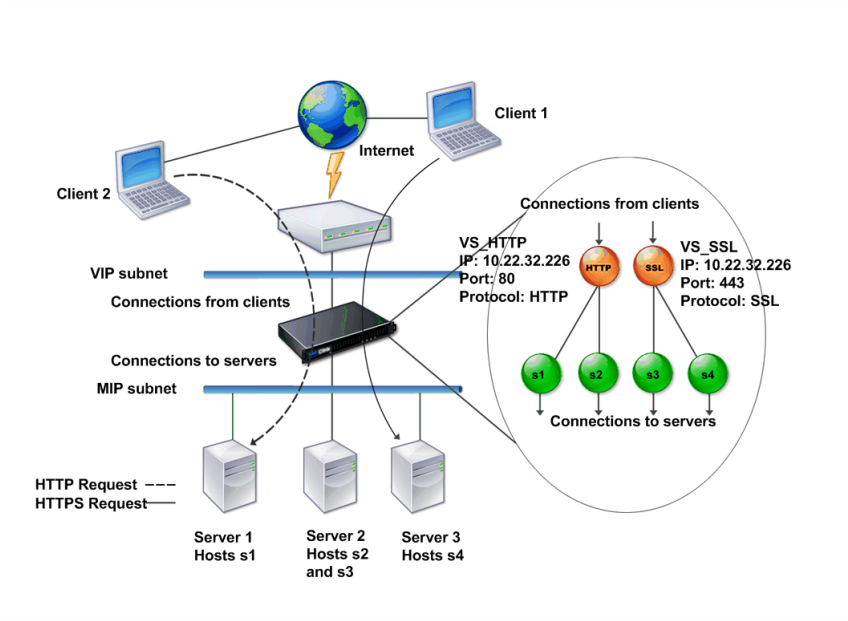
Updated: 2013-09-06

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol. The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address



The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

Load balancing virtual server

Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

Cache redirection virtual server

Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding Services

Updated: 2014-03-12

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the destination IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state. If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Installing NetScaler Virtual Appliances on XenServer

Aug 23, 2013

To install NetScaler virtual appliances on Citrix XenServer, you must first install XenServer on a machine with adequate system resources. To perform the NetScaler virtual appliance installation, you use Citrix XenCenter, which must be installed on a remote machine that can connect to the XenServer host through the network.

Note: After the initial configuration of the NetScaler appliance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

Prerequisites for Installing NetScaler Virtual Appliances on XenServer

Updated: 2013-08-23

Before you begin installing a virtual appliance, do the following:

- Install XenServer® version 5.6 or later on hardware that meets the minimum requirements.
- Install XenCenter® on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx122426.

XenServer Hardware Requirements

The following table describes the minimum hardware requirements for a XenServer platform running NetScaler.

Table 1. Minimum System Requirements for XenServer Running NetScaler nCore virtual appliance

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled Note: To run NetScaler virtual appliance, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. Consult your BIOS documentation for more details.
RAM	3 gigabytes (GB)
Disk space	Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space Note: XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for NetScaler virtual appliance and other virtual machines.
Network Interface Card (NIC)	One 1-Gbps NIC Recommended: Two 1-Gbps NICs

For information about installing XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

The following table lists the virtual computing resources that XenServer must provide for each NetScaler nCore virtual

appliance .

Table 2. Minimum Virtual Computing Resources Required for Running NetScaler ncore virtual appliance

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2
Virtual network interfaces	2

Note: For production use of NetScaler virtual appliance, Citrix recommends that CPU priority (in virtual machine properties) be set to the highest level, in order to improve scheduling behavior and network latency.

XenCenter System Requirements

XenCenter® is a Windows client application. It cannot run on the same machine as the XenServer® host. The following table describes the minimum system requirements.

Table 3. Minimum System Requirements for XenCenter Installation

Component	Requirement
Operating system	Windows 7, Windows XP, Windows Server 2003, or Windows Vista
.NET framework	Version 2.0 or later
CPU	750 megahertz (MHz) Recommended: 1 gigahertz (GHz) or faster
RAM	1 GB Recommended: 2 GB
Network Interface Card (NIC)	100 megabits per second (Mbps) or faster NIC

For information about installing XenCenter, see the XenServer documentation at http://support.citrix.com/product/xens/.

Installing NetScaler Virtual Appliances on XenServer by Using XenCenter

Updated: 2013-08-23

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial NetScaler virtual appliance (.xva image) on XenServer, you have the option to use Command Center to provision NetScaler virtual appliance. For more information, see the Command Center documentation.

To install NetScaler virtual appliances on XenServer by using XenCenter

1. Start XenCenter on your workstation.
2. On the Server menu, click Add.
3. In the Add New Server dialog box, in the Hostname text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the User Name and Password text boxes, type the administrator credentials, and then click Connect. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install NetScaler virtual appliance.
6. On the VM menu, click Import.
7. In the Import dialog box, in Import file name, browse to the location at which you saved the NetScaler virtual appliance .xva image file. Make sure that the Exported VM option is selected, and then click Next.
8. Select the XenServer on which you want to install the virtual appliance, and then click Next.
9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.
10. You can add, modify, or delete virtual network interfaces as required. When finished, click Next.
11. Click Finish to complete the import process.
    Note: To view the status of the import process, click the **Log** tab.
12. If you want to install another virtual appliance, repeat steps 5 through 11.

Installing NetScaler Virtual Appliances on VMware ESX

Aug 07, 2014

Important: You cannot install standard VMware Tools or upgrade the VMware Tools version available on a NetScaler virtual appliance. VMware Tools for a NetScaler virtual appliance are delivered as part of the NetScaler software release.
Before installing NetScaler virtual appliances on VMware ESX, make sure that VMware ESX Server is installed on a machine with adequate system resources. To install NetScaler virtual appliances on VMware ESXi version 4.0 or later, you use VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

After the installation, you can use vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX 4.0 or later release.

Note:
The VMware vSphere client shows the guest operating system as "Sun Solaris 10" for NetScaler virtual machine. This is by design because VMware ESXi does not recognize FreeBSD.

After the initial configuration of the NetScaler appliance, if you want to upgrade the appliance to the latest software release, see "Upgrading or Downgrading the System Software."

Prerequisites for Installing NetScaler Virtual Appliances on VMware

Updated: 2014-08-07

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX version 4.1 or later on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the NetScaler virtual appliance setup files.
- Label the physical network ports of VMware ESX.
- Obtain NetScaler license files. For more information about NetScaler virtual appliance licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx131110.

VMware ESX Hardware Requirements

The following table describes the minimum system requirements for VMware ESX servers running NetScaler ncore virtual appliance.

Table 1. Minimum System Requirements for VMware ESX Servers Running NetScaler nCore virtual appliance

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled Note: To run NetScaler virtual appliance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.
RAM	3 GB

Component	Requirement
Disk space	40 GB of disk space available
Network	One 1-Gbps NIC; Two 1-Gbps NICs recommended (The network interfaces must be Intel E1000.)

For information about installing VMware ESX, see http://www.vmware.com/.

The following table lists the virtual computing resources that the VMware ESX server must provide for each NetScaler ncore virtual appliance.

Table 2. Minimum Virtual Computing Resources Required for Running NetScaler ncore virtual appliance

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2 Important: Do not modify the system resources to create a virtual CPU (VCPU) in addition to the two CPUs already allotted to the virtual appliance.
Virtual network interfaces	1 Note: With ESX 4.0 or later, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded version to 7 or higher.
Disk space	20 GB Note: This is in addition to any disk requirements for the hypervisor.

Note: For production use of NetScaler virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX should also be reserved.

VMware vSphere Client System Requirements

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum System Requirements for VMware vSphere Client Installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the "vSphere Compatibility Matrixes" PDF file at http://kb.vmware.com/.
CPU	750 megahertz (MHz); 1 gigahertz (GHz) or faster recommended
RAM	1 GB; 2 GB recommended

Component	Requirement
Network Interface Card (NIC)	100 Mbps or faster NIC

OVF Tool 1.0 System Requirements

OVF Tool is a client application that can run on Windows and Linux systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 4. Minimum System Requirements for OVF Tool Installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the "OVF Tool User Guide" PDF file at http://kb.vmware.com/.
CPU	750 MHz minimum, 1 GHz or faster recommended.
RAM	1 GB Minimum, 2 GB recommended.
Network Interface Card (NIC)	100 Mbps or faster NIC

For information about installing OVF, search for the "OVF Tool User Guide" PDF file at http://kb.vmware.com/.

Downloading the NetScaler virtual appliance Setup Files

The NetScaler virtual appliance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from MyCitrix.com. You need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at http://www.mycitrix.com, click the New Users link, and follow the instructions to create a new My Citrix account.

Once logged on, navigate the following path from the My Citrix home page:

MyCitrix.com > Downloads > NetScaler > Virtual Appliances.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf)

Labeling the Physical Network Ports of VMware ESX

Before installing a NetScaler virtual appliance, label of all the interfaces that you plan to assign to virtual appliances, in a unique format. Citrix recommends the following format: NS_NIC_1_1, NS_NIC_1_2, and so on. In large deployments, labeling in a unique format helps in quickly identifying the interfaces that are allocated to the NetScaler virtual appliance

among other interfaces used by other virtual machines, such as Windows and Linux. Such labeling is especially important when different types of virtual machines share the same interfaces.

To label the physical network ports of VMware ESX server

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vSphere client, select the Configuration tab, and then click Networking.
3. At the top-right corner, click Add Networking.
4. In the Add Network Wizard, for **Connection Type**, select **Virtual Machine**, and then click Next.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that will map to interface 1/1 on the virtual appliances.
6. Enter NS_NIC_1_1 as the name of the vSwitch that will be associated with interface 1/1 of the virtual appliances.
7. Click Next to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, NS_NIC_1_2).

Installing NetScaler Virtual Appliances on VMware ESX 4.0 or Later

Updated: 2014-05-20

After you have installed and configured VMware ESX 4.0 or later, you can use the VMware vSphere client to install virtual appliances on the VMware ESX. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler virtual appliances on VMware ESX 4.0 or later by using VMware vSphere Client

1. Start the VMware vSphere client on your workstation.
2. In the IP address / Name text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the User Name and Password text boxes, type the administrator credentials, and then click Login.
4. On the File menu, click Deploy OVF Template.
5. In the Deploy OVF Template dialog box, in Deploy from file, browse to the location at which you saved the NetScaler virtual appliance setup files, select the .ovf file, and click Next.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click Next to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler virtual appliance. In the navigation pane, select the NetScaler virtual appliance that you have just installed and, from the right-click menu, select Power On. Click the Console tab to emulate a console port.
8. If you want to install another virtual appliance, repeat steps 4 through 6.

Installing Citrix NetScaler Virtual Appliances on Microsoft Hyper-V Servers

Feb 09, 2015

Note:

- The NetScaler virtual appliance is supported on Microsoft Hyper-V Server 2008 R2, Microsoft Hyper-V Server 2012 and 2012 R2.
- Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the NetScaler VPX virtual appliance hosted on the HyperV-2012 platform.

To install Citrix NetScaler virtual appliances on Microsoft Windows Server, you must first install Windows Server, with the Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the network interface cards (NICs) on the server that Hyper-V will use to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler virtual appliance installation.
NetScaler virtual appliance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler virtual appliance, you can configure the network adapters on virtual appliance, add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

Note:
After the initial configuration of the NetScaler appliance, if you want to upgrade the appliance to the latest software release, see "Upgrading or Downgrading the System Software."

Prerequisites for Installing NetScaler Virtual Appliance on Microsoft Servers

Updated: 2014-08-07

Before you begin installing a virtual appliance, do the following:

- Enable the Hyper-V role on Windows Servers . For more information, see http://technet.microsoft.com/en-us/library/ee344837(WS.10).aspx.
- Download the virtual appliance setup files.
- Obtain NetScaler virtual appliance license files. For more information about NetScaler virtual appliance licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx131110.

Microsoft Server Hardware Requirements

The following table describes the minimum system requirements for Microsoft Servers .

Table 1. Minimum System Requirements for Microsoft Servers

Component	Requirement
CPU	1.4 GHz 64-bit processor
RAM	3 GB

Component	Requirement
Disk Space	32 GB or greater

The following table lists the virtual computing resources for each NetScaler virtual appliance.

Table 2. Minimum Virtual Computing Resources Required for Running NetScaler Virtual Appliance

Component	Requirement
RAM	2 GB
Virtual CPU	2
Disk Space	20 GB
Virtual Network Interfaces	1

Downloading the NetScaler Virtual Appliance Setup Files

NetScaler virtual appliance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from MyCitrix.com. You will need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at http://www.mycitrix.com, click the New Users link, and follow the instructions to create a new My Citrix account.

To download the NetScaler virtual appliance setup files

1. In a Web browser, go to http://www.citrix.com/ and click My Citrix.
2. Type your user name and password.
3. Click Downloads.
4. In Search Downloads by Product, select NetScaler.
5. Under Virtual Appliances, click NetScaler VPX.
6. Copy the compressed file to your server.

Installing NetScaler Virtual Appliance on Microsoft Servers

Updated: 2014-08-07

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install NetScaler virtual appliance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).
Note: You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

To install NetScaler Virtual Appliance on Microsoft Server by using Hyper-V

Manager

1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.
2. In the navigation pane, under Hyper-V Manager, select the server on which you want to install NetScaler virtual appliance.
3. On the **Action** menu, click **Import Virtual Machine**.
4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the NetScaler virtual appliance software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.
   Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
5. Click **Import**.
6. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.
7. To install another virtual appliance, repeat steps 2 through 6.
   Important: Make sure that you extract the files to a different folder in step 4.

To configure virtual NICs on the NetScaler Virtual Appliance

1. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**.
2. In the **Settings for** <virtual appliance name> dialog box, click **Add Hardware** in the left pane.
3. In the right pane, from the list of devices, select **Network Adapter**.
4. Click **Add**.
5. Verify that **Network Adapter** (**not connected**) appears in the left pane.
6. Select the network adapter in the left pane.
7. In the right pane, from the **Network** drop-down list, select the virtual network to connect the adapter to.
8. To select the virtual network for additional network adapters that you want to use, repeat steps 6 and 7.
9. Click **Apply**, and then click **OK**.

To configure NetScaler Virtual Appliance

1. Right-click the virtual appliance that you previously installed, and then select **Start**.
2. Access the console by double-clicking the virtual appliance.
3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

Installing NetScaler Virtual Appliances on Linux-KVM Platform

Mar 09, 2015

To set up NetScaler VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virt-Manager) application. If you prefer the Linux-KVM command line, you can use the virsh program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a NetScaler virtual appliance, you can add additional interfaces.

Limitations and Usage Guidelines

General Recommendations

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the vnet interface associated with the NetScaler VM. Shut down the NetScaler VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the NetScaler VM. That is, do not use the **Force off** command.
- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
- The `.raw` file has to be unique for each of the NetScaler VPX instance provisioned.

Limitations

A NetScaler VPX setup on the Linux-KVM platform has the following limitations:

- VLAN tagging is not supported on Netscaler-VPX operating on MacVTap-Bridge, MacVTap-Private, MacVTap-VEPA, or MacVTap-Passthrough interface Mode.
- L2 mode is not supported on Netscaler VPX running on a Linux-KVM host.
- Interface parameter configurations, such as speed, duplex, and auto-negotiation are not supported
- Interface events, such as link UP and DOWN are not supported. Because these events are not reported, the following features are not supported:
  - Static link aggregation
  - Dynamic route advertisement for connected networks
  - Monitored static routes
  - Avoiding split brains in a high availability (HA) setup
  - Partial failure detection in an HA setup
- LACP is not supported on Netscaler VPX operating in Bridge, MacVTap-Bridge, MacVTap-Private, or MacVTap-VEPA interface mode.
- Live Migration of the Netscaler VPX running on KVM is not supported.
- When a VLAN tagged packet destined for a guest VM is received on an Intel IXGBE 10G interface of a KVM host running on Red Hat Enterprise Linux (RHEL) 6.4, the IXGBE driver of this distribution strips the VLAN tag before sending it to the

guest VM (in this case, NetScaler VPX). Because of this host behavior, a NetScaler VPX instance running on RHEL6.4 does not receive the intended VLAN tagged packets.

Prerequisites for Installing NetScaler VPX Virtual Appliances on Linux-KVM Platform

Sep 30, 2015

Hardware Requirements

The following table describes the minimum system requirements for Linux-KVM servers running NetScaler VPX.

Component	Requirement
CPU	• 64-bit x86 processors with the hardware virtualization features included in the AMD-V and Intel VT-X processors. To test whether your CPU supports Linux host, enter the following command at the host Linux shell prompt: **.egrep'^flags.*(vmx|svm)'/proc/cpuinfo** If the BIOS settings for the above extension are disabled, you must enable them in BIOS. • Provide at least 2 CPU cores to Host Linux. • There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.
Memory (RAM)	Minimum 4 GB for the host Linux kernel. Add additional memory as required by the VMs.
Hard Disk	Calculate the space for Host Linux kernel and VM requirements. A single NetScaler VPX VM requires 20 GB of disk space.

Software Requirements

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, Centos, and Fedora, have tested kernel versions and associated virtualization tools.

Guest VM Hardware Requirements

NetScaler VPX supports only IDE hard disk type. The Hard Disk Type has been configured in the XML file which is a part of the NetScaler package.

Networking Requirements

NetScaler VPX supports only virtIO para-virtualized network interfaces.

Source Interface and Modes

The source device type can be either Bridge or MacVTap. In case of MacVTap, four modes are possible - VEPA, Bridge,

Private and Pass-through.
The following tables list the types of interfaces that you can use and the supported traffic types.
For best performance by the NetScaler instance, make sure that the gro and lro capabilities are switched off on the source interfaces

Table 1. Interface Types

Interface Type	Considerations
Source: Bridge	• Linux Bridge. • Ebtables and iptables settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable IPtable services.
Source: MacVTap Mode : VEPA	• Better performance than a bridge. • Interfaces from the same lower device can be shared across the VMs. • Inter-VM communication using the same lower device is possible only if upstream or downstream switch supports VEPA mode.
Source: MacVTap Mode : Private	• Better performance than a bridge. • Interfaces from the same lower device can be shared across the VMs. • Inter-VM communication using the same lower device is not possible.
Source: MacVTap Mode : Bridge	• Better as compared to bridge. • Interfaces out of same lower device can be shared across the VMs. • Inter-VM communication using the same lower device is possible, if lower device link is UP.
Source: MacVTap Mode : Pass-through	• Better as compared to bridge. • Interfaces out of same lower device cannot be shared across the VMs. • Only one VM can use the lower device.

Table 2. Verified Traffic Types

Test Case	Bridge	MacVTap			
		VEPA	Private	Bridge	Pass-through
Untagged IPv4	S	S	S	S	S
Tagged IPv4	S	NS	NS	NS	NS

Test Case	Bridge	MacVTap			
		VEPA	Private	Bridge	Pass-through
IPv4 L3 Forwarding	S	S	S	S	S
IPv4 Endpoint Traffic	S	S	S	S	S
Broadcast/Multicast Traffic	S	S	S	S	S
Untagged IPv6	S	S	S	S	S
Tagged IPv6	S	NS	NS	NS	NS
IPv6 L3 Forwarding	S	S	S	S	S
IPv6 Endpoint Traffic	S	S	S	S	S

S - Supported.

NS - Not Supported.

Properties Of Source Interfaces

Make sure that you switch off the generic-receive-offload (gro) and large-receive-offload (lro) capabilities of the source interfaces. To switch off the gro and lro capabilities, run the following commands at the host Linux shell prompt.

ethtool -K eth6 gro off

ethool -K eth6 lro off

Example

```
[root@localhost ~]# ethtool -K eth6
  Offload parameters for eth6:
    rx-checksumming: on
    tx-checksumming: on
    scatter-gather: on
  tcp-segmentation-offload: on
  udp-fragmentation-offload: off
  generic-segmentation-offload: on
  generic-receive-offload: off
  large-receive-offload: off
  rx-vlan-offload: on
  tx-vlan-offload: on
  ntuple-filters: off
  receive-hashing: on
[root@localhost ~]#
```

Example

If the host Linux bridge is used as a source device, as in the following example, gro and lro capabilities must be switched

off on the vnet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```
[root@localhost ~]# brctl show eth6_br
bridge name     bridge id       STP enabled     interfaces
eth6_br         8000.00e0ed1861ae       no          eth6
                                        vnet0
                                        vnet2
[root@localhost ~]#
```

In the above example, the two virtual interfaces are derived from the eth6_br and are represented as vnet0 and vnet2. Run the following commands to switch off gro and lro capabilities on these interfaces.

```
ethtool –K vnet0 gro off
 ethtool –K vnet2 gro off
 ethtool –K vnet0 lro off
  ethtool –K vnet2 lro off
```

Module Required

For better network performance, make sure the vhost_net module is present in the Linux host. To check the existence of vhost_net module, run the following command on the Linux host :

```
lsmod | grep "vhost_net"
```

If vhost_net is not yet running, enter the following command to run it:

```
modprobe vhost_net
```

Provisioning the NetScaler Virtual Appliance by using OpenStack

Mar 10, 2015

You can provision a NetScaler vpx instance in an Openstack environment either by using the OpenStack command line interface or the OpenStack dashboard or GUI.

Provisioning a NetScaler instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance when it boots. This configuration drive can be used to pass networking configuration like management IP address, network mask, default gateway etc, which the instance can mount and access before you configure the network settings for the instance.

When OpenStack provisions a NetScaler instance, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string that indicates OpenStack. This string is 'OpenStack Foundation' and for Redhat Linux distributions, the string is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hyper-visor platform. The drive should have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the following information from the file name specified in the nova boot command. In the steps mentioned below, the file is referred as userdata:

- Management IP address
- Network mask
- Default gateway

Once the parameters are successfully read, they are populated in the NetScaler stack. This helps in managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16)

Provisioning the NetScaler Virtual Appliance by using OpenStack Using Command Line Interface

Updated: 2015-02-16

You can provision a NetScaler appliance in an OpenStack environment. Provisioning a NetScaler Virtual Appliance on OpenStack involves the following three steps:

1. Extracting the .raw file from the .ova file
2. Building an OpenStack image from the raw image
3. Provisioning a NetScaler instance

To provision a NetScaler instance in an OpenStack environment, complete the following steps:

1. Extract the .raw file from the .ova file.
   ```
   tar xvzf NetScaler1000V-KVM-10.5-49.3_nc.ova
   NetScaler1000V-KVM.xml
   NetScaler1000V-KVM-10.5-49.3_nc.raw
   checksum.txt
   ```
2. Build an OpenStack image using the .raw file extracted in step 1.
   ```
   glance image-create --name="NS-VPX-10-1-127-1 " --property hw_disk_bus=ide --is-public=true
   ```

--container-format=bare --disk-format=raw < NetScaler1000V-KVM-10.1-127.1_nc.raw

In the above command, NS-VPX-10-1-127-1 is the name of the OpenStack image that you want to create. NetScaler1000V-KVM-10.1-127.1_nc.raw is the raw file that was extracted from the ova file. The raw file is the input for creating the OpenStack image.

The following illustration provides a sample output for the glance image-create command.

```
+--------------------------+--------------------------------------+
| Property                 | Value                                |
+--------------------------+--------------------------------------+
| Property 'hw_disk_bus'   | ide                                  |
| checksum                 | 65b027c72d668abe9941716325731872     |
| container_format         | bare                                 |
| created_at               | 2014-06-12T06:15:50                  |
| deleted                  | False                                |
| deleted_at               | None                                 |
| disk_format              | raw                                  |
| id                       | 102d3621-c6b7-4823-bbf3-2ff47476cdc0 |
| is_public                | True                                 |
| min_disk                 | 0                                    |
| min_ram                  | 0                                    |
| name                     | NS-VPX-10-5-49-3                     |
| owner                    | e6f3a3cc7f764f639370060f1d121a88     |
| protected                | False                                |
| size                     | 21474836480                          |
| status                   | active                               |
| updated_at               | 2014-06-12T06:21:41                  |
| virtual_size             | None                                 |
+--------------------------+--------------------------------------+
```

3. After an OpenStack image is created, provision the NetScaler virtual appliance instance.

   nova boot --image NS-VPX-10-1-127-1 --config-drive=true --user-data ./userdata.txt --flavor m1.medium --nic net-id=b8c5acee-36b7-4517-af0e-80f8729aa82e vpx10_1_u

   In the above command, userdata.txt is the file which contains the details like, IP address, netmask, and default gateway for the NetScaler instance. The userdata file is a user customizable file. vpx10_1_u is the name of the virtual appliance that you want to provision.

   The following illustration gives a sample output of the nova boot command.

```
+--------------------------------------+------------------------------------------------------------+
| Property                             | Value                                                      |
+--------------------------------------+------------------------------------------------------------+
| OS-DCF:diskConfig                    | MANUAL                                                     |
| OS-EXT-AZ:availability_zone          | nova                                                       |
| OS-EXT-STS:power_state               | 0                                                          |
| OS-EXT-STS:task_state                | scheduling                                                 |
| OS-EXT-STS:vm_state                  | building                                                   |

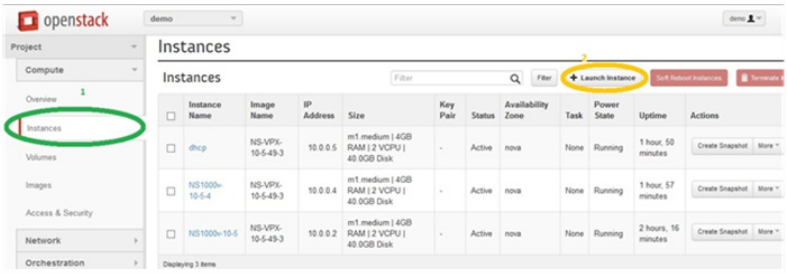
Provisioning the NetScaler Virtual Appliance by using OpenStack Dashboard

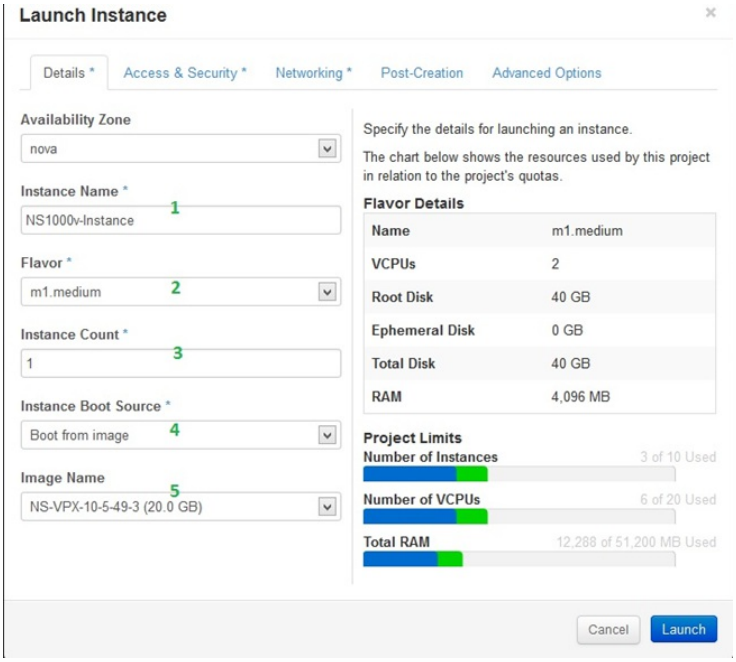
Updated: 2015-02-26

You can provisioning NetScaler in an OpenStack environment using the OpenStack dashboard.

1. Log in to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select Instances.
3. In the Instances panel, click Launch Instance to open the Instance Launching Wizard.



4. In the Launch Instance wizard, fill in the details, like:
    1. Instance Name
    2. Instance Flavor
    3. Instance Count
    4. Instance Boot Source
    5. Image Name



5. Click on the Post Creation tab in the wizard. In the Customization Script, add the content of the userdata file. The userdata file contains the IP address, Netmask and Gateway details of the NetScaler instance.
6. Click Launch.

Provisioning the NetScaler Virtual Appliance by using the Virtual Machine Manager

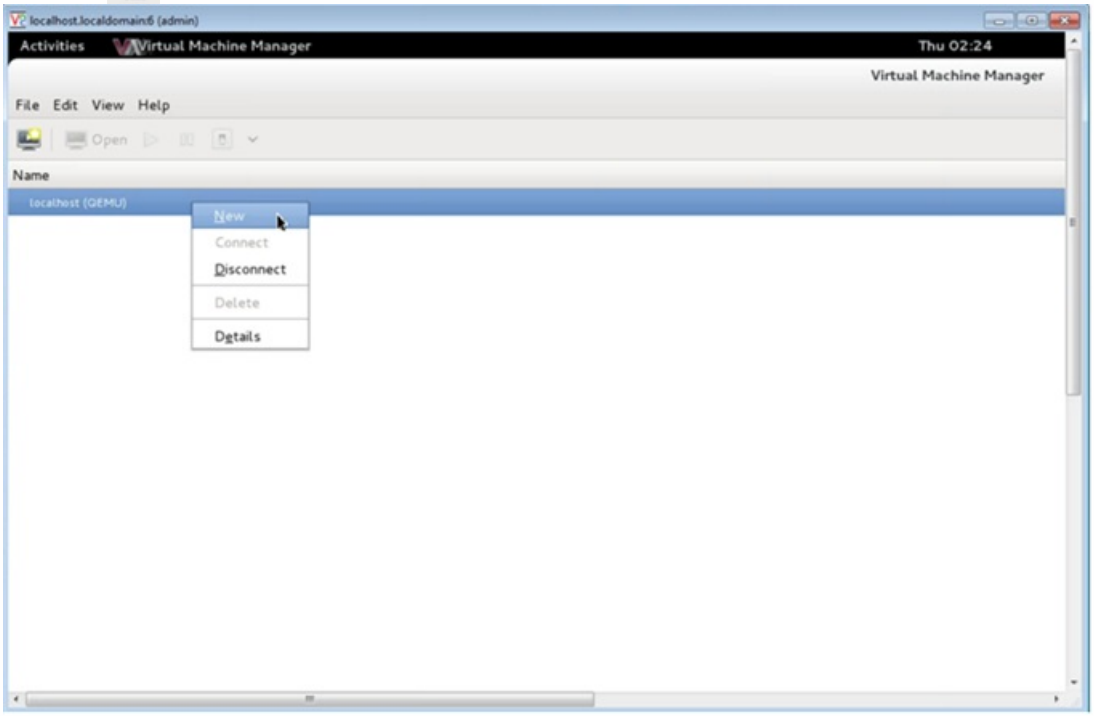
Mar 10, 2015

The Virtual Machine Manager is a desktop tool for managing VM Guests. It enables you to create new VM Guests and various types of storage, and manage virtual networks. You can access the graphical console of VM Guests with the built-in VNC viewer and view performance statistics, either locally or remotely.

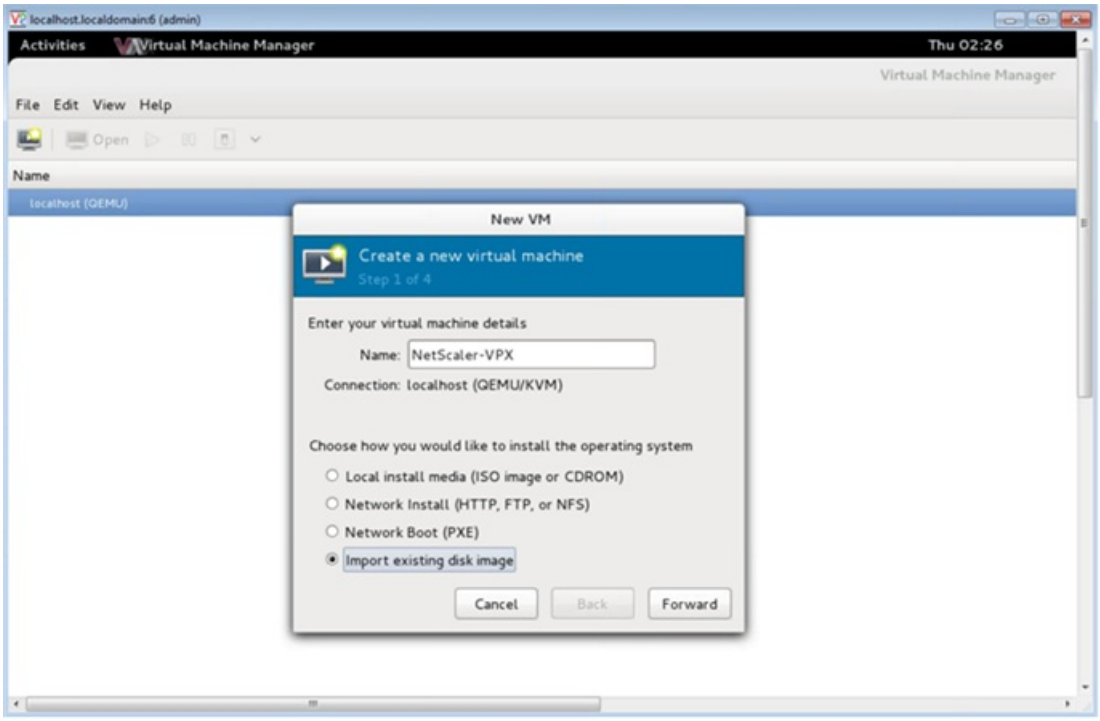
After installing your preferred Linux distribution, with KVM virtualization enabled, you can proceed with provisioning virtual machines.

To provision a NetScaler VPX by using Virtual Machine Manager

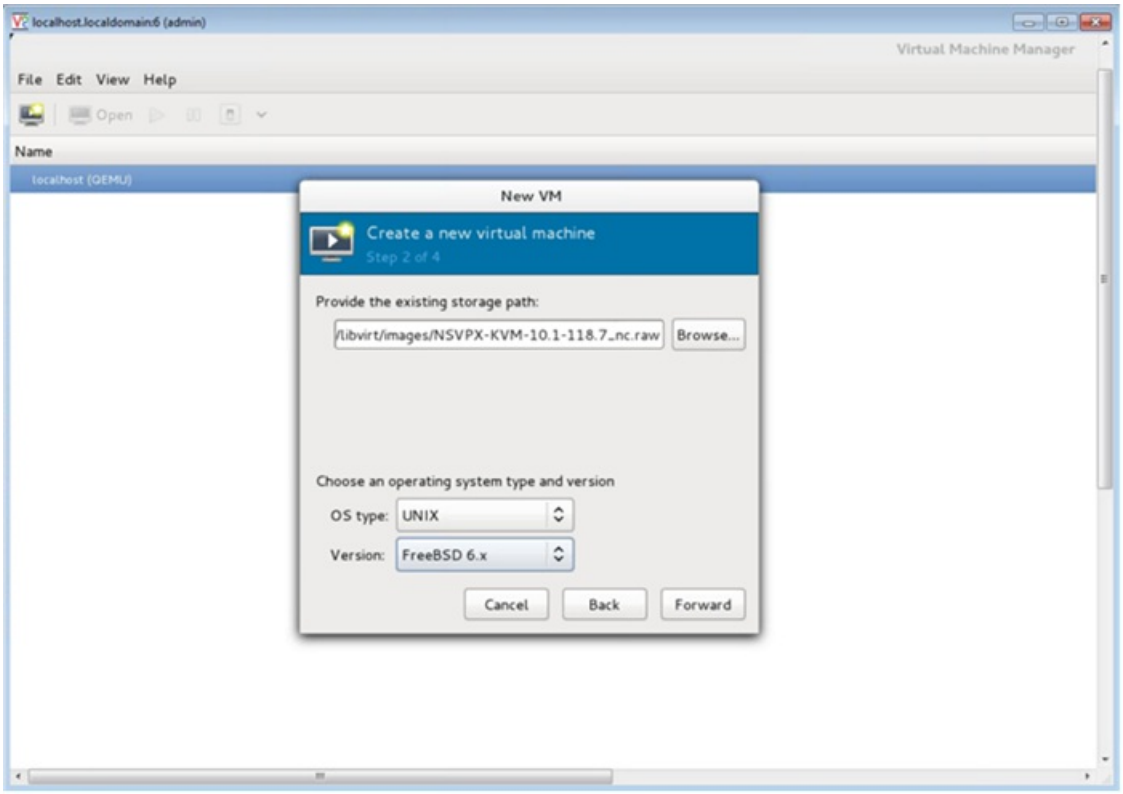
1. Open the Virtual Machine Manager (**Application** > **System Tools** > **Virtual Machine Manager**) and enter the logon credentials in the **Authenticate** window.
2. Click the  icon or right-click **localhost (QEMU)** to create a new NetScaler VPX instance.



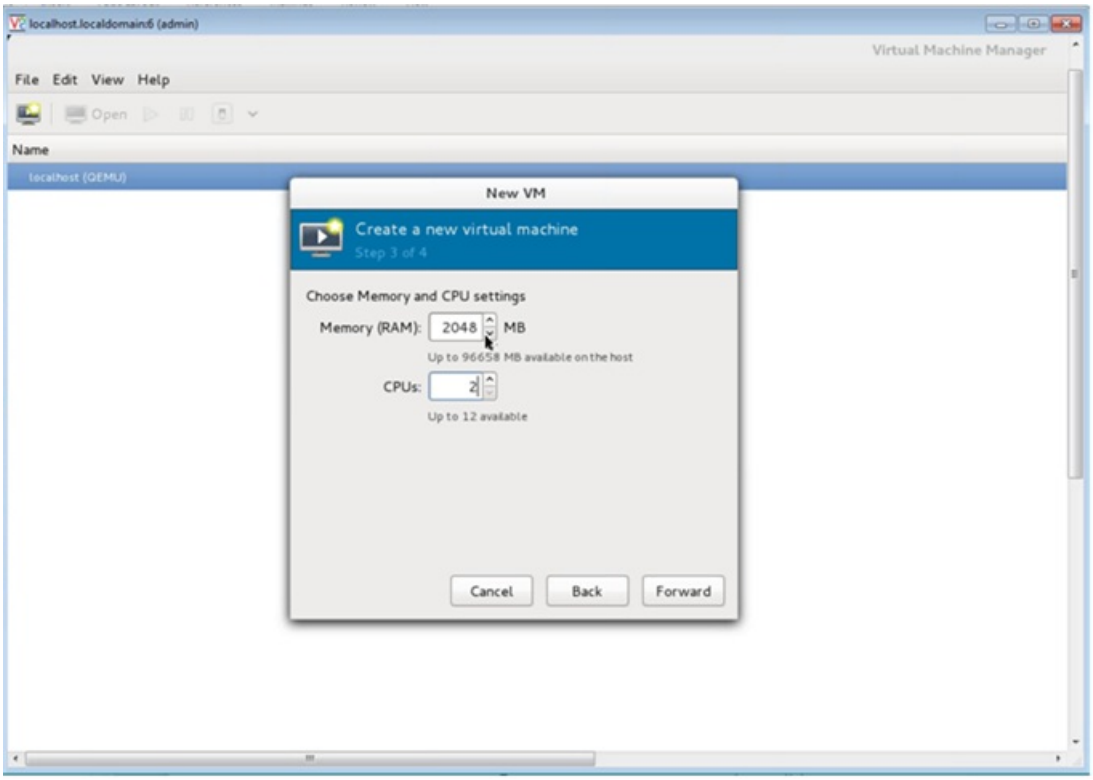
3. In the **Name** text box, enter a name for the new VM (for example, NetScaler-VPX).
4. In the **New VM** window, under "Choose how you would like to install the operating system," select **Import existing disk image**, and then and click **Forward**.



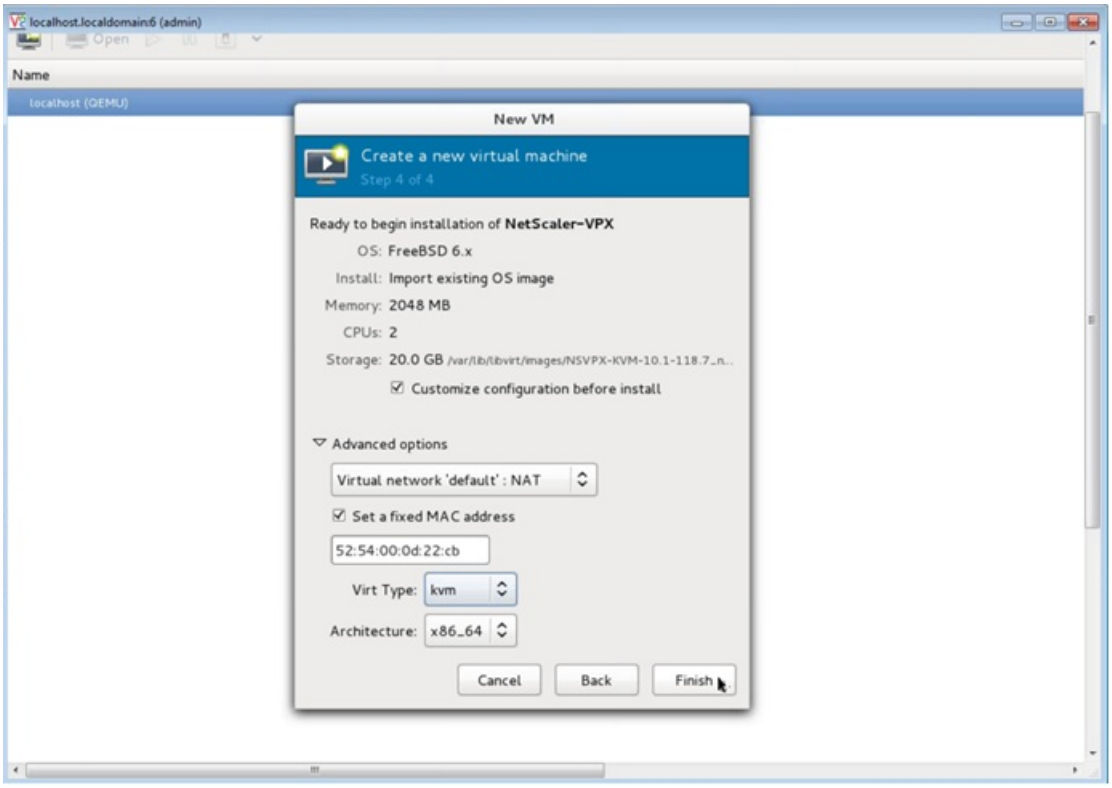
5. In the **Provide the existing storage path** field, navigate the path to the image. Choose the OS type as UNIX and Version as FreeBSD 6.x. Then, click **Forward**.



6. Under "Choose Memory and CPU settings," select the following settings, and then click **Forward**:
   - Memory (RAM)— 2048 MB
   - CPUs— 2

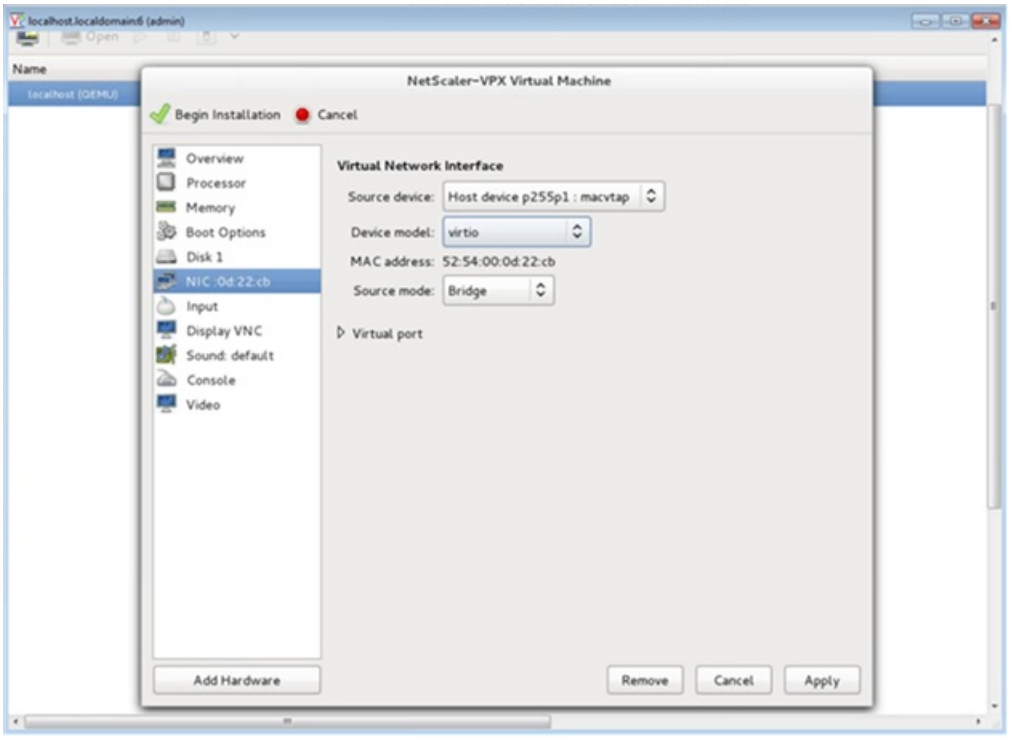


7. Select the **Customize configuration before install** check box. Optionally, under "Advanced options," you can you can customize the MAC address. Make sure the **Virt Type** selected is kvm and the Architecture selected is x86_64. Click **Finish**.



8. Select a NIC and provide the following configuration:
   - Source device— ethX macvtap or Bridge
   - Device model— virtio

- Source mode— Bridge



9. Click **Apply**, and then click **Begin Installation**. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces

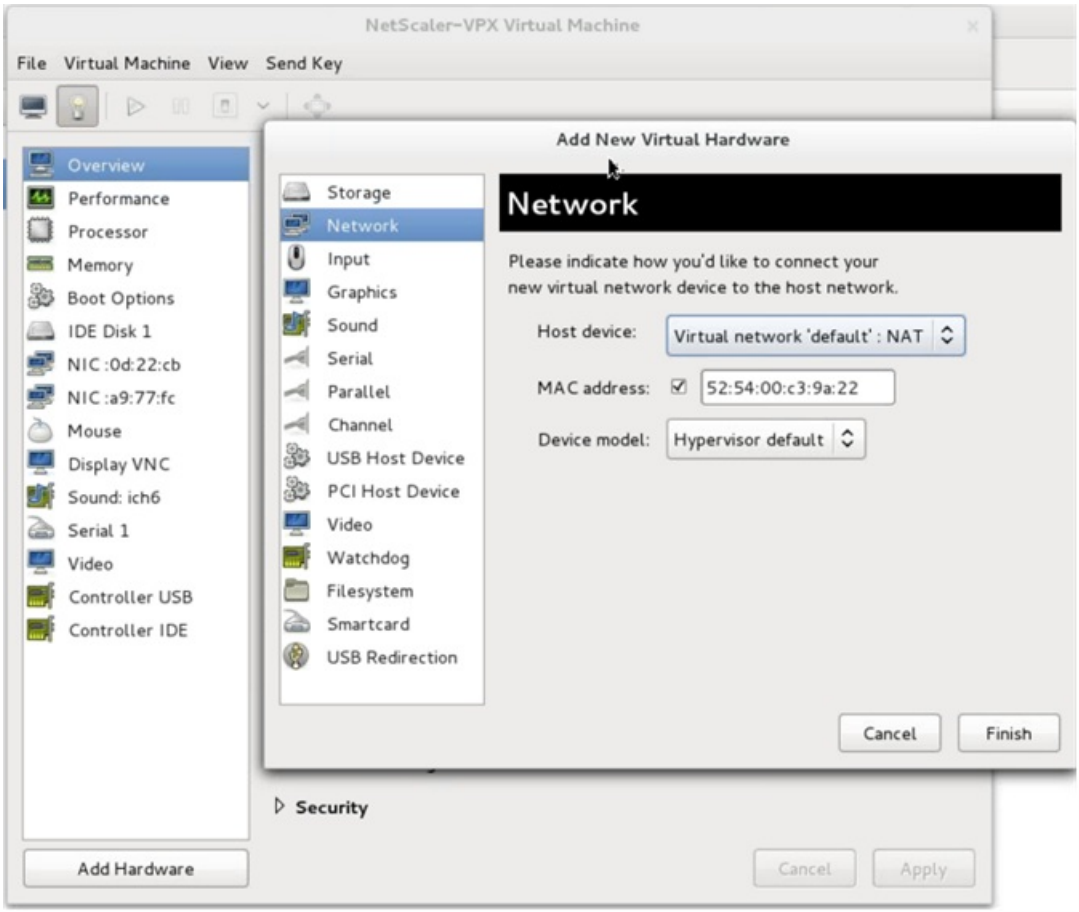
Adding Additional Interfaces to NetScaler VPX by using Virtual Machine Manager

Updated: 2015-03-11

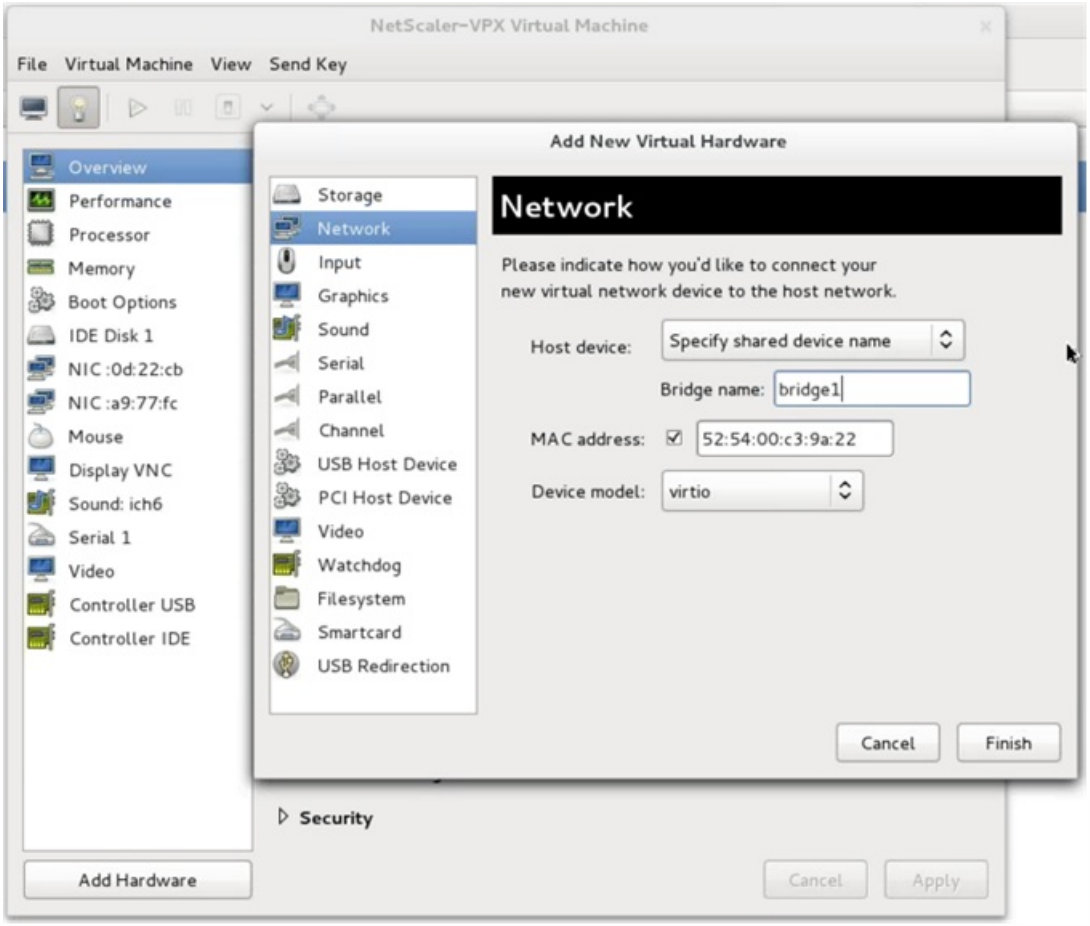
After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces

1. Shut down the NetScaler VPX instance running on the KVM.
2. Right-click the VPX instance and choose **Open** from the pop-up menu.
3. Click the  icon in the header to view the virtual hardware details.
4. Click **Add Hardware**. In the **Add New Virtual Hardware window**, select **Network** from the navigation menu.

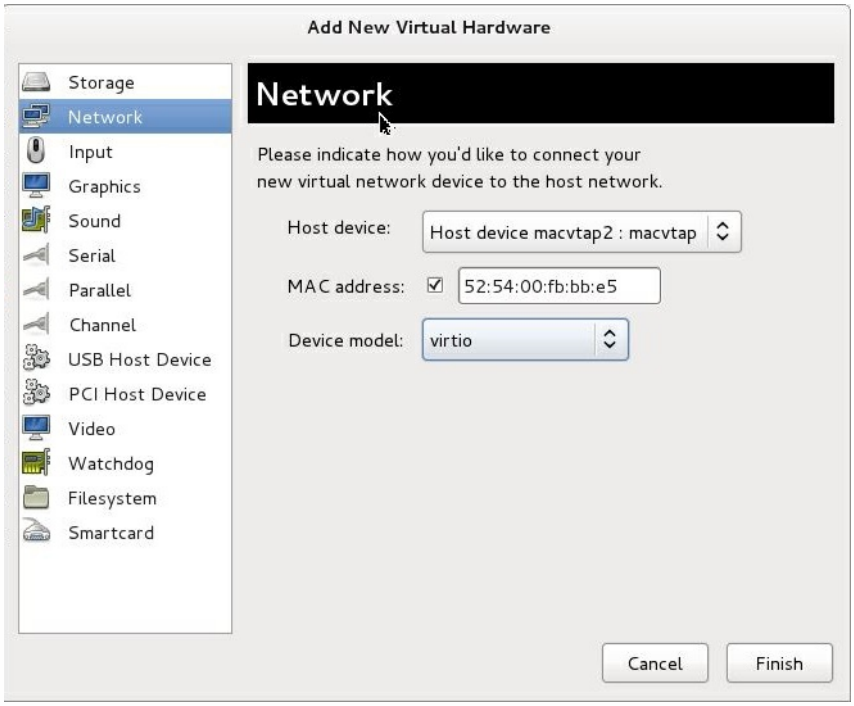


5. In **Host Device** field, select the physical interface type. The host device type can be either Bridge or MacVTap. In case of MacVTap, four modes possible are VEPA, Bridge, Private and Pass-through.
    1. For Bridge
        1. Host device— Select the "Specify shared device name" option.
        2. Provide the Bridge name that is configured in the KVM host.
           Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

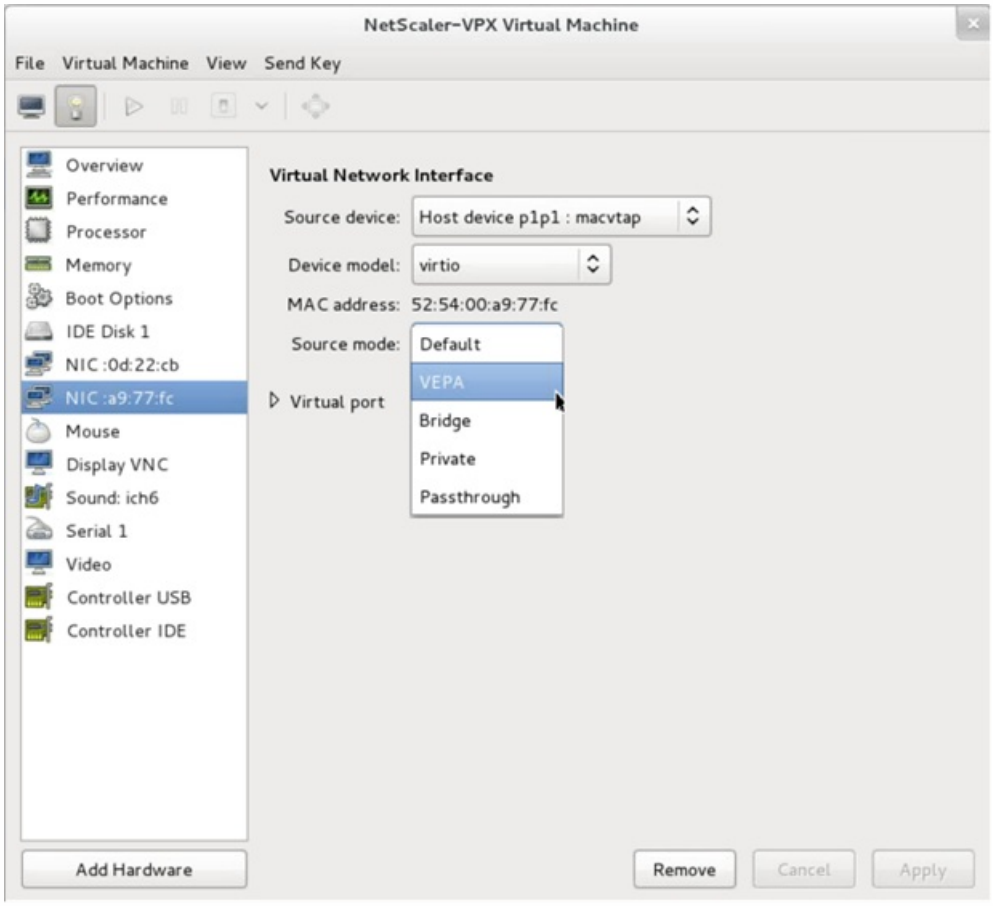


3. Device model—virtio.
4. Click Finish.

2. For MacVTap
   1. Host device—Select the physical interface from the menu.
   2. Device model—virtio.



3. Click Finish. You can view the newly added NIC in the navigation pane.



4. Select the newly added NIC and select the Source mode for this NIC. The available modes are VEPA, Bridge, Private, and Passthrough. For more details on the interface and modes, see Source Interface and Modes.
5. Click Apply.
6. Start the NetScaler VPX VM.

Provisioning the NetScaler Virtual Appliance by using the virsh Program

Mar 10, 2015

The virsh program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest's status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The virsh program is also useful for scripting VM Guest management operations.

To provision NetScaler VPX by using the virsh program

1. Use the tar command to untar the the NetScaler VPX package. The NSVPX-KVM-*_nc.tgz package contains following components:
   - The Domain XML file specifying VPX attributes [NSVPX-KVM-*_nc.xml]
   - Check sum of NS-VM Disk Image [Checksum.txt]
   - NS-VM Disk Image [NSVPX-KVM-*_nc.raw]

   Example:
   ```
   tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
   NSVPX-KVM-10.1-117_nc.xml
   NSVPX-KVM-10.1-117_nc.raw
   checksum.txt
   ```
2. Copy the NSVPX-KVM-*_nc.xml XML file to a file named <DomainName>-NSVPX-KVM-*_nc.xml. The <DomainName> is also the name of the virtual machine. Example:
   ```
   cp NSVPX-KVM-10.1-117_nc.xml NetScaler-VPX-NSVPX-KVM-10.1-117_nc.xml
   ```
3. Edit the <DomainName>-NSVPX-KVM-*_nc.xml file to specify the following parameters:
   - name— Specify the name.
   - mac— Specify the MAC address.
     Note: The domain name and the MAC address have to be unique.
   - sourcefile— Specify the absolute disk-image source path. The file path has to be absolute. In this example, the disk image is at the following location: /root/NSVPX-KVM-10.1-117_nc.raw.

   Example:
   ```
   <name>NetScaler-VPX</name>
         <mac address='52:54:00:29:74:b3'/>
         <source file='/root/NSVPX-KVM-10.1-117_nc.raw'/>
   ```
4. Edit the <DomainName>-NSVPX-KVM-*_nc.xml file to configure the networking details:
   - source dev— specify the interface.
   - mode— specify the mode. The default interface is **Macvtap Bridge**.

   Example: Mode: MacVTap Bridge Set target interface as ethx and mode as bridge Model type as virtio
   ```
    <interface type='direct'>
      <mac address='52:54:00:29:74:b3'/>
      <source dev='eth0' mode='bridge'/>
      <target dev='macvtap0'/>
      <model type='virtio'/>
      <alias name='net0'/>
      <address type='pci' domain='0x0000' bus='0x00' slot='0x03' function='0x0'/>
    </interface>
   ```

Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the <DomainName>-NSVPX-KVM-*_nc.xml file by using the following command: virsh define <DomainName>-NSVPX-KVM-*_nc.xml Example:
   virsh define NS-VPX-NSVPX-KVM-10.1-117_nc.xml
6. Start the VM by entering following command: virsh start [<DomainName> | <DomainUUID>] Example:
   virsh start NetScaler-VPX
7. Connect the Guest VM through the console virsh console [<DomainName> | <DomainUUID> |<DomainID>] Example:
   virsh console NetScaler-VPX

Adding Additional Interfaces to NetScaler VPX using virsh Program

Updated: 2015-03-09

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces

1. Shut down the NetScaler VPX instance running on the KVM.
2. Edit the <DomainName>-NSVPX-KVM-*_nc.xml file using the command: virsh edit [<DomainName> | <DomainUUID>]
3. In the <DomainName>-NSVPX-KVM-*_nc.xml file, append the following parameters:
   1. **For MacVTap**
      - Interface type— Specify the interface type as 'direct'.
      - Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
      - source dev— Specify the interface name.
      - mode— Specify the mode; the modes supported are - Bridge, VEPA, Private, and Pass-through
      - model type— Specify the model type as virtio

      Example:

      Mode: MacVTap Pass-through

      Set target interface as ethx, Mode as bridge, and model type as virtio

      ```
      <interface type='direct'>
          <mac address='52:54:00:29:74:b3'/>
          <source dev='eth1' mode='passthrough'/>
          <model type='virtio'/>
       </interface>
      ```

      Here eth1 is the physical interface attached to the VM.

   2. **For Bridge Mode**

      Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.
      - Interface type— Specify the interface type as 'bridge'.
      - Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
      - source bridge— Specify the bridge name.
      - model type— Specify the model type as virtio

      Example: Bridge Mode

      ```
      <interface type='bridge'>
      ```

```
    <mac address='52:54:00:2d:43:a4'/>
    <source bridge='br0'/>
    <model type='virtio'/>
</interface>
```

Managing the NetScaler Guest VMs

Sep 03, 2013

You can use the Virtual Machine Manager and the virsh program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).

Updated: 2013-09-04

Listing the VM Guests

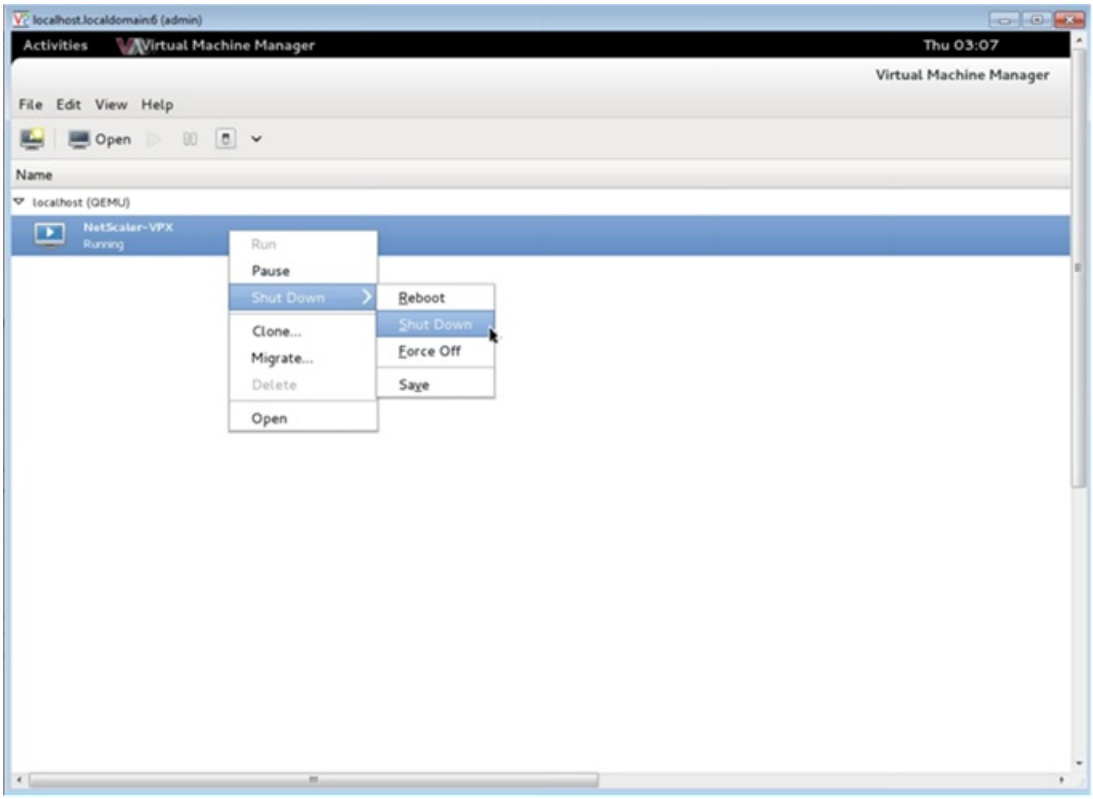
The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine's name, along with its status (Running, Paused, or Shutoff) displayed as icon.

Opening a Graphical Console

Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

Starting and Shutting Down a Guest

You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.



Rebooting a Guest

You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then

select Shut Down > Reboot from the pop-up menu.

Deleting a Guest

Deleting a VM Guest removes its XML configuration by default. You can also delete a guest's storage files. Doing so completely erases the guest.

1. In the Virtual Machine Manager, right-click the VM Guest entry.
2. Select Delete from the pop-up menu. A confirmation window opens.
   Note: The Delete option is enabled only when the VM Guest is shut down.
3. Click Delete.
4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

Updated: 2013-09-04

Listing the VM Guests and their current states

To use virsh to display information about the Guests

```
virsh list --all
```

The command output displays all domains with their states.

Example Output:

```
Id Name                 State
----------------------------------
 0 Domain-0             running
 1 Domain-1             paused
 2 Domain-2             inactive
 3 Domain-3             crashed
```

Opening a virsh Console

Connect the Guest VM through the console

```
virsh console [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh console NetScaler-VPX
```

Starting and Shutting Down a Guest

Guests can be started using the DomainName or Domain-UUID.

```
virsh start [<DomainName> | <DomainUUID>]
```

Example

```
virsh start NetScaler-VPX
```

To shut down a guest:

```
virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh shutdown NetScaler-VPX
```

Rebooting a Guest

```
virsh reboot [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

virsh reboot NetScaler-VPX

Deleting a Guest

To delete a Guest VM you need to shut-down the Guest and un-define the <DomainName>-NSVPX-KVM-*_nc.xml before you run the delete command.

virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
virsh undefine [<DomainName> | <DomainUUID>]

Example:

virsh shutdown NetScaler-VPX
virsh undefine NetScaler-VPX

Note: The delete command doesn't remove disk image file which needs to be removed manually.

Installing NetScaler VPX on AWS

Jan 29, 2014

You can now launch an instance of Citrix® NetScaler VPX within Amazon Web Services (AWS). NetScaler VPX is available as an Amazon Machine Image (AMI) in AWS marketplace. NetScaler VPX on AWS enables customers to leverage AWS Cloud computing capabilities and use NetScaler load balancing and traffic management features for their business needs. NetScaler on AWS supports all the traffic management features of a physical NetScaler appliance. NetScaler instances running in AWS can be deployed as standalone instances or in HA pairs.

Updated: 2014-05-13

AWS offers different types of web services, such as Amazon Simple Storage Services (S3), Amazon Elastic Cloud Compute (EC2), and Amazon Virtual Private Cloud (VPC). Amazon VPC allows you to run AWS resources (for example, EC2 instances) in a private, virtual network. Amazon EC2 instances are available as instance types that map to hardware archetypes on the basis of factors such as number of EC2 Compute Units (ECU), number of virtual cores, and memory size.

The NetScaler VPX AMI is packaged as an EC2 instance that is launched within an AWS VPC. The VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Currently, on Amazon AWS, VPX can be launched only within a VPC, because each VPX instance requires at least three IP addresses. (Although VPX on AWS can be implemented with one or two elastic network interfaces, Citrix recommends three network interfaces for a standard VPX on AWS installation.) AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances.

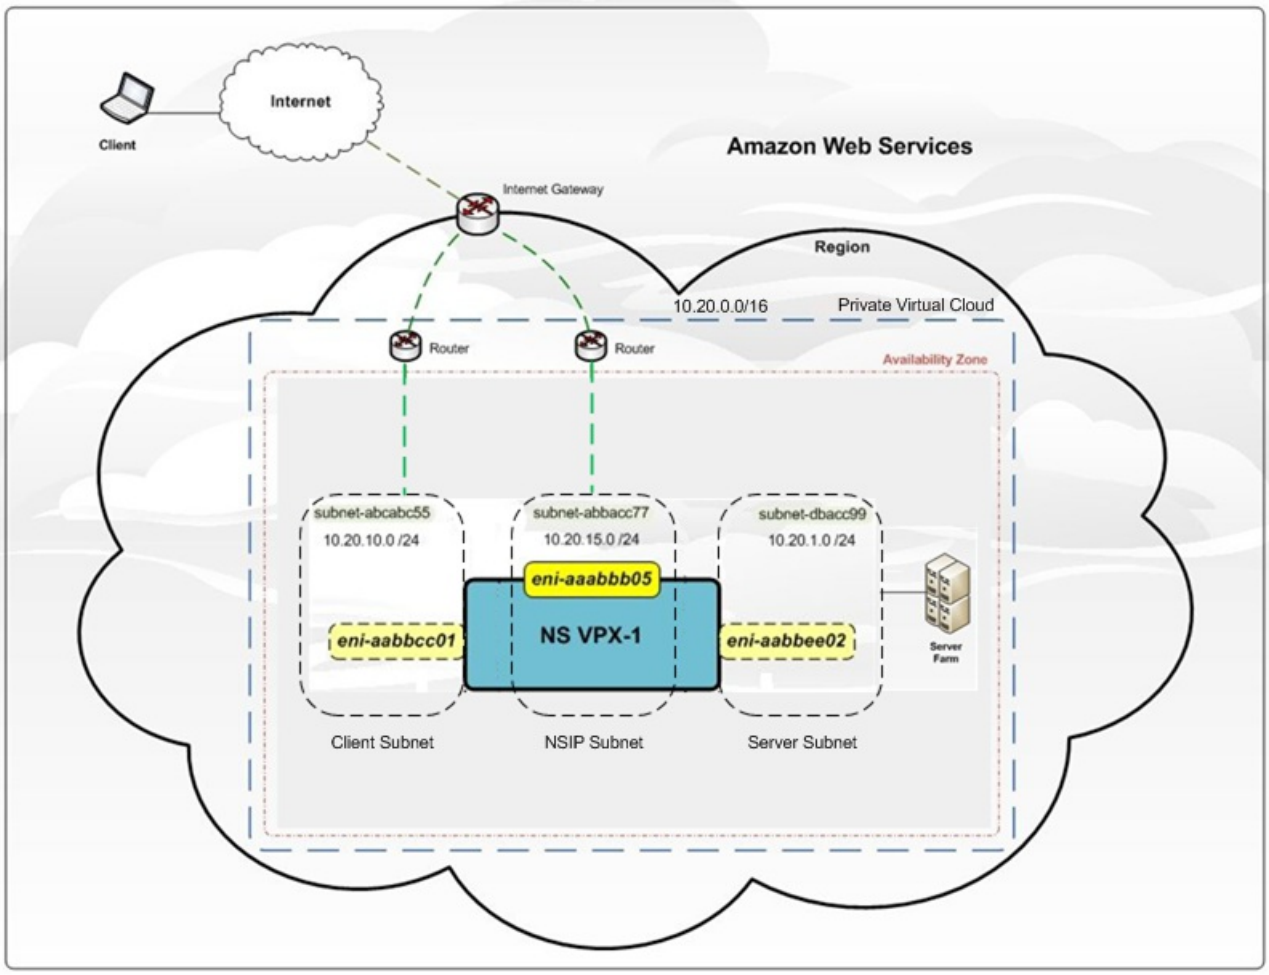
An Amazon VPC allows you to create and control a virtual networking environment, including your own IP address range, subnets, route tables, and network gateways.

Note: By default, you can create up to 5 VPC instances per AWS region for each AWS account. You can request higher VPC limits by submitting Amazon's request form (http://aws.amazon.com/contact-us/vpc-request/).

VPX on AWS Architecture

An EC2 instance of NetScaler VPX (AMI image) is launched within the AWS VPC. The following figure shows a typical VPX on AWS deployment.

Figure 1. VPX on AWS Architecture



The figure shows a simple topology of an AWS VPC with a NetScalerVPX deployment. The AWS VPC has:

1. A single Internet gateway to route traffic in and out of the VPC.
2. Network connectivity between the Internet gateway and the Internet.
3. Three subnets, one each for management, client, and server.
4. Network connectivity between the Internet gateway and the two subnets (management and client).
5. A single NetScaler VPX deployed within the VPC. The VPX instance has three Elastic Network Interfaces (ENIs), one attached to each subnet.

Supported EC2 instances

The NetScaler AMI can be launched on any of the following EC2 instance types:

- m3.large
- m3.xlarge
- m3.2xlarge

For more information about Amazon EC2 instances, see:
http://docs.amazonwebservices.com/AWSEC2/latest/UserGuide/instance-types.html

Updated: 2014-05-13

The following table lists the EC2 instance types and corresponding number of supported ENIs and number of private IP addresses per ENI.

Table 1. EC2 Support for ENIs and IP Addresses

Instance Name	Number of ENIs	Private IP Addresses per ENI
m3.large	3	10
m3.xlarge	4	15
m3.2xlarge	4	30

Limitations and Usage Guidelines

May 13, 2014

- The clustering feature is not supported for VPX.
- For HA to work as expected, associate a dedicated NATing device to management Interface or associate EIP to NSIP. For more information on NAT, in the AWS documentation, see NAT Instances.
- Data traffic and management traffic should be segregated by using ENIs belonging to different subnets.
- Only the NSIP address should be present on the management ENI.
- To send traffic to VIPs, you must enable MAC Based Forwarding (MBF) and Use Subnet IP (USNIP) modes on VPX.
- If a NAT instance is used for security instead of assigning an EIP to the NSIP, appropriate VPC level routing changes are required. For instructions on making VPC level routing changes, in the AWS documentation, see "Scenario 2: VPC with Public and Private Subnets."
- A VPX instance can be moved from one EC2 instance type to another (for example, from m3.large to an m3.xlarge).
- For storage options for VPX on AWS, Citrix recommends EBS, because it is durable and the data is available even after it is detached from instance.
- Dynamic addition of ENIs to VPX is not supported. You have to restart the VPX instance to apply the update. Citrix recommends you to stop the standalone or HA instance, attach the new ENI, and then restart the instance.
- You can assign multiple IP addresses to an ENI. The maximum number of IP addresses per ENI is determined by the EC2 instance type, see EC2 Support for ENIs and IP Addresses.
- Citrix recommends that you avoid using the enable and disable interface commands on NetScaler VPX interfaces.
- Due to Amazon AWS limitations, these features are not supported:
  - IPV6
  - Gratuitous ARP(GARP)
  - L2 mode
  - Tagged VLAN
  - Dynamic Routing
  - Virtual MAC (VMAC)

Launching the NetScaler VPX for AWS AMI

May 14, 2014

You can launch a Citrix NetScaler VPX AMI within an Amazon Web Services (AWS) Virtual Private Cloud (VPC) in one of two ways:

1. Using the Amazon GUI and CLI toolkit.
2. Using a Citrix authored CloudFormation template.
3. Using the Amazon 1-Click launch.

Note: The following are the default administrator credentials to access a NetScaler VPX instance:

- Username—nsroot
- Password—The default password for the nsroot account is set to the AWS instance-ID of the NetScaler VPX instance. For a high availability configuration between two NetScaler VPX instances, the nsroot password of the secondary node is set to that of the primary node after the HA configuration synchronization.

Updated: 2014-05-13

To launch a NetScaler VPX AMI within an Amazon Web Services (AWS) Virtual Private Cloud (VPC) by using the Amazon GUI and CLI toolkit, you need:

- An AWS account
- An AWS Virtual Private cloud (VPC)
- The AWS API toolkit (if creating a VPX instance with three or more ENIs).
- An IAM account

Creating an AWS Account

To launch a NetScaler VPX AMI in an Amazon Web Services (AWS) Virtual Private Cloud (VPC), you need an AWS account. You can create an AWS account for free at www.aws.amazon.com.

Creating an AWS Virtual Private Cloud (VPC)

Citrix recommends at least three IP addresses for a NetScaler instance. Currently, the only support that AWS provides for instances with multiple IP addresses is for instances within an AWS VPC.

To create an AWS VPC, first launch the AWS GUI console. For instructions for using the AWS GUI console, see http://docs.amazonwebservices.com/AmazonVPC/latest/GettingStartedGuide/GetStarted.html?r=2900.

To create an AWS VPC

1. Use the VPC with a Single Public Subnet Only option to create a new AWS VPC in an AWS availability zone.
2. Create additional subnets within the AWS VPC. Citrix recommends that you create at least three subnets, of the following types:
   - One subnet for NetScaler management traffic. You place the NetScaler management IP(NSIP) on this subnet.
   - One or more subnets for client-access (user-to-NetScaler) traffic, through which clients connect to one or more virtual IP (VIP) addresses assigned to NetScaler load balancing virtual servers.
   - One or more subnets for the server-access (NetScaler-to-server) traffic, through which your servers connect to NetScaler-owned subnet IP (SNIP) addresses.
     For more information about NetScaler load balancing and virtual servers, virtual IP addresses (VIPs), and subnet IP addresses (SNIPs), see: Getting Started with Citrix NetScaler.

   Note:
   - All subnets should be in the same availability zone.
   - You can launch a NetScaler AMI in an AWS VPC with a single subnet. In this configuration, the management traffic, client-side traffic, and server-side traffic all use the same subnet, and high availability (HA) cannot be configured.
   - You can launch the NetScaler AMI into an AWS VPC with two subnets. In this configuration, one subnet is used for management traffic, and the other subnet is used for both client-side and server-side traffic. This topology supports NetScaler HA.
3. Create an Internet gateway and attach it to the VPC instance.
4. Create routing tables for all traffic flowing into or out of the VPC. You need routes for access to the NSIP and to any client-facing VIP addresses. Traffic leaving the VPC must be routed through the Internet Gateway of the AWS VPC.
   Note:
   - Make sure that you associate management and client subnets with the routing table.
   - Add a default route to the routing table for the traffic flowing out of the VPC. Set the Destination to 0.0.0.0/0, and the Target as the Internet gateway address.
5. Create a security group and open the required ports.

Setting-up the AWS API Toolkit

The AWS GUI console does not allow you to launch instances with more than two ENIs. For a standard deployment, you have to create at least three ENIs for a VPC instance (though it is possible to launch a NetScaler AMI with one or two ENIs). To create three or more ENIs for a NetScaler instance, you must use the AWS CLI. To use the AWS CLI, you must install the AWS API toolkit.

The AWS API toolkit is available for download at http://aws.amazon.com/developertools/351/. To install the AWS API toolkit, complete the following tasks on a Windows or Linux machine:

1. Download the AWS API Toolkit.
2. Download X.509 certificate files and X.509 private key file.
3. Download the private key.
4. Convert the downloaded private key (.pem file) for SSH connectivity.
5. Configure the AWS API Toolkit environment on your Windows or Linux computer.

To download the AWS API toolkit

1. In a web browser, open the following website: http://aws.amazon.com/developertools/351/.

2. On the Amazon EC2 API Tools page, in the Download section, click Download the Amazon EC2 API Tools.
3. Save the file, ec2-api-tools.zip, to a local disk and use a file compression utility (for example, WinZip) to extract the files.

To download the X.509 certificate file and X.509 private key file

1. In your browser, open the following website: http://aws.amazon.com/.
2. Click My Account/Console, and then click Security Credentials.
3. On the Amazon Web Services Sign in page, use your Amazon account credentials to sign in.
4. On the Security Credentials page, in the Access Credentials section, on the X.509 Certificates tab, click Create a New Certificate.
5. In the X509 Certificate Created dialog box, Click Download Private Key File and save the private key file to a secure folder on your local drive.
6. Click Download X.509 Certificate and save the certificate to a secure folder on your local drive.
7. Click Close.

Note: The Private Key File can be downloaded only at the time of creating a certificate. However, you can download the certificate at any time after creating it.

To download private key for SSH connectivity

1. In your browser, open the following website: http://aws.amazon.com/ .
2. Click **My Account/Console.**
3. On the **Amazon Web Services Sign in** page, use your Amazon account credentials to sign in.
4. In the **Service** pane, in **Amazon Web Services**, click **EC2**.
5. In the **Navigation** section, in **Network and Security**, click **Key Pairs**.
6. In the **Key Pairs** pane, click **Create Key Pair**.
7. In the **Create Key Pair** dialog box, type the name for key pair and click **Create**.
8. Download the Key Pair to the local disk and click **Close**.

To convert the downloaded private key for SSH connectivity

For SSH connections from a management machine using Putty, you must convert the .pem file (Private Key) into .ppk file. The .ppk file is the private key for SSH connections to the NetScaler VPX instance hosted in the AWS environment. To convert the .pem file to a .ppk file, use the Putty application's PuttyGen utility. Make sure that the key pairs and certificate files are stored in an unshared and secured directory. After the conversion, you can use SSH to securely connect to the management address of the VPX on AWS instance.

To configure the AWS API Toolkit environment on a Windows machine

1. Move the certificate files to an unshared folder (for example, aws-ec2-api-tools).
2. Move the extracted AWS API toolkit folder to the unshared folder (for example, the aws-ec2-api-tools folder created in example in Step 1).
3. Create a batch file to configure the specific AWS environment in the unshared folder (aws-ec2-api-tools if you used the example in the preceding two steps). Following is an example of the batch file. The file location used in this example is C:\aws-vpc-config\ and the file name is set-aws-environment.bat.

```
rem Setup Amazon EC2 Command-Line Tools

set JAVA_HOME="C:\Program Files\Java\jre7\"

set EC2_HOME="C:\aws-ec2-api-tools\"

set PATH=%PATH%;%EC2_HOME%\bin
```

```
set EC2_PRIVATE_KEY=C:\aws-ec2-security-files\pk-3T6ACCLBEDGD3O3SMAM7YDI76VP5HXSU.pem

set EC2_CERT=C:\aws-ec2-security-files\cert-3T6ACCLBEDGD3O3SMAM7YDI76VP5HXSU.pem

set EC2_URL=https://<aws-region>.ec2.amazonaws.com
```

4. Open the command prompt and run the batch file. For the file in the above example, type:
   C:\aws-vpc-config> set-aws-environment.bat
5. Run the ec2ver command to verify that the AWS toolkit is installed properly. For example:
   C:\aws-vpc-config>ec2ver 1.5.6.1 2012-06-15

To configure the AWS API Toolkit on a Linux machine

1. Move the certificate files to an unshared folder (for example, aws-ec2-api-tools).
2. Move the extracted AWS API toolkit folder to the unshared folder (for example, the aws-ec2-api-tools folder created in example in Step 1).
3. Create a shell script to configure the specific AWS environment in the unshared folder (aws-ec2-api-tools if you used the example in the preceding two steps). Following is an example of the batch file. In this example, the file location used is C:\aws-vpc-config\ and the file name used is set-aws-environment.bat.

```
# Setup Amazon EC2 Command-Line Tools

export EC2_HOME=~/ec2-api-tools-1.5.6.0

export EC2_URL= https://us-east-1.ec2.amazonaws.com

export PATH=$EC2_HOME/bin:/usr/bin:$/usr/sbin:/usr/local/sbin:/sbin

export EC2_PRIVATE_KEY=~/pk-XOX3NS2UPZL6BGLFO7PM5OGLYBDPBUCB.pem

export EC2_CERT=~/cert-XOX3NS2UPZL6BGLFO7PM5OGLYBDPBUCB.pem

export JAVA_HOME=/usr

export PS1="AWS PROMPT >"
```

4. Run the ec2ver command to verify that the AWS toolkit is installed properly. For example:

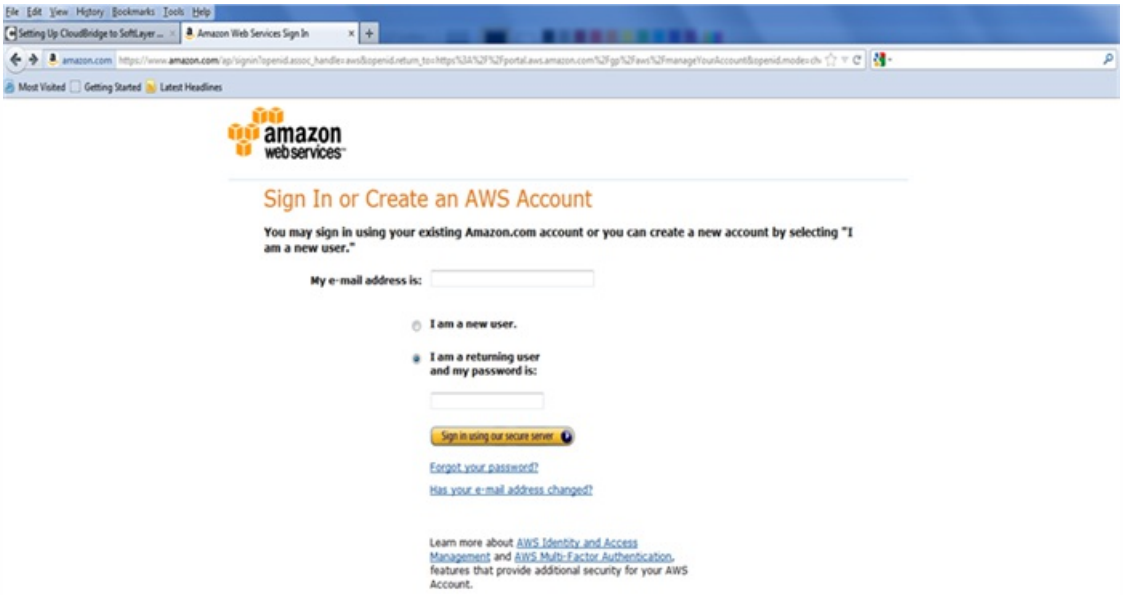
```
AWS PROMPT >ec2ver

1.5.6.1 2012-06-15
```

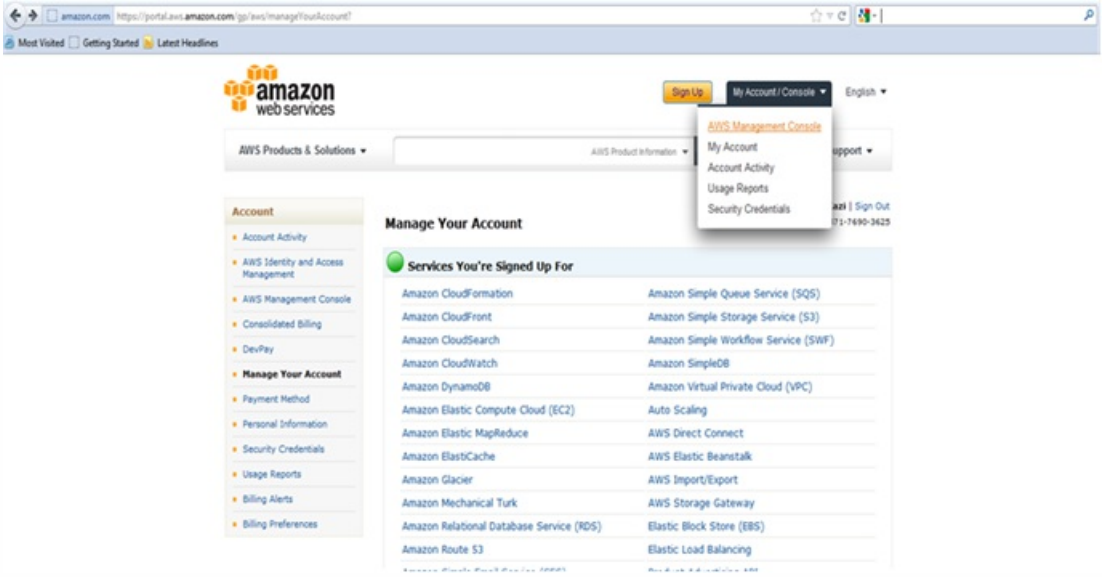
Creating an IAM Account

Before you launch the VPX AMI instance, you have to create a new IAM user account with the Access and Secret keys. The Access and Secret key credentials from the new IAM user are required for launching the NetScaler AMI instance. To create a new IAM user for NetScaler, complete the following steps.

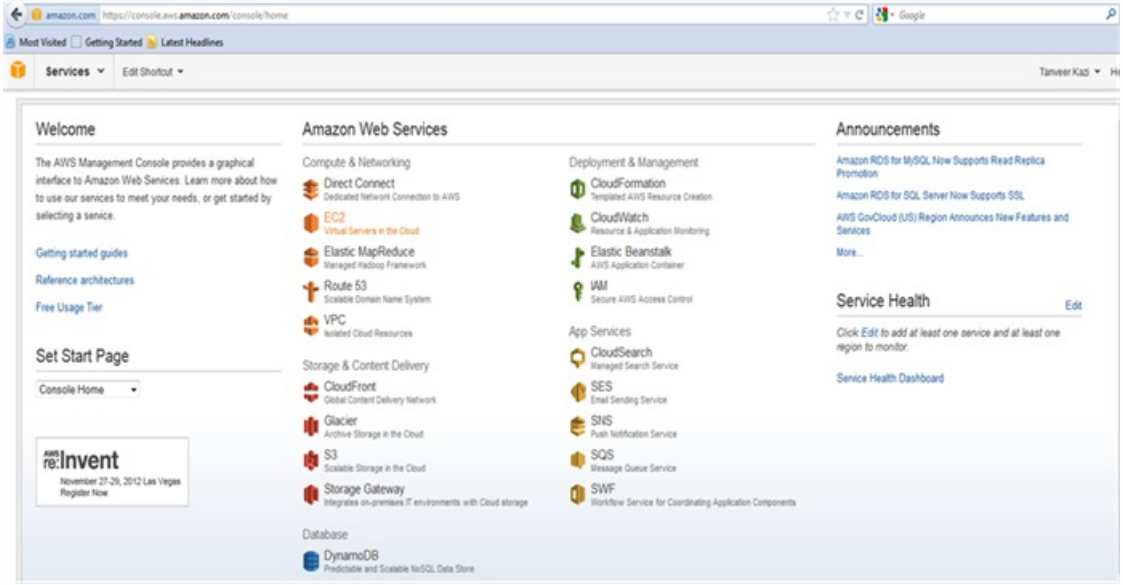
1. In a web browser, open the website at www.aws.amazon.com and log on with AWS credentials.



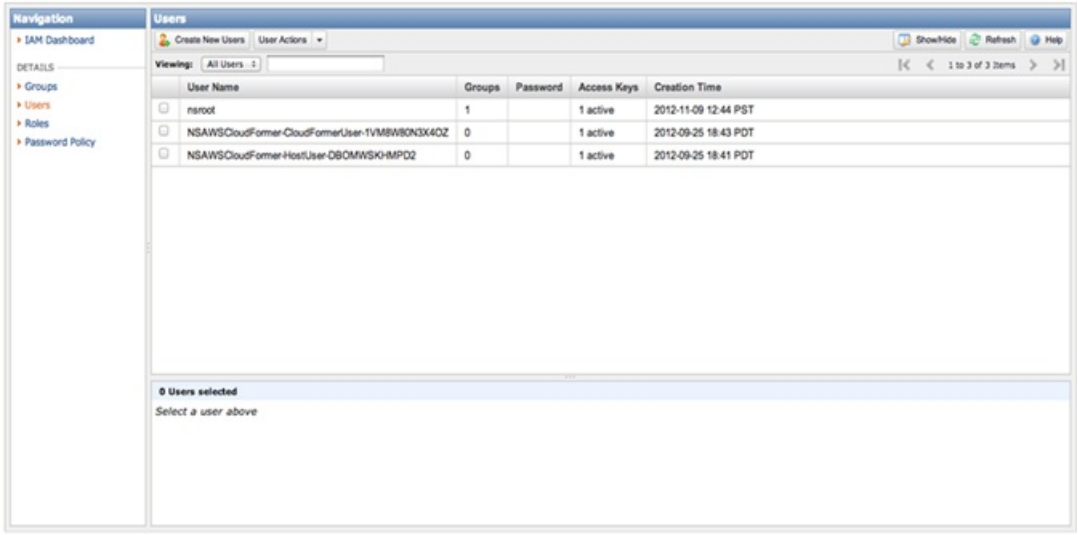
2. Click My Account/Console, and then click AWS Management Console.



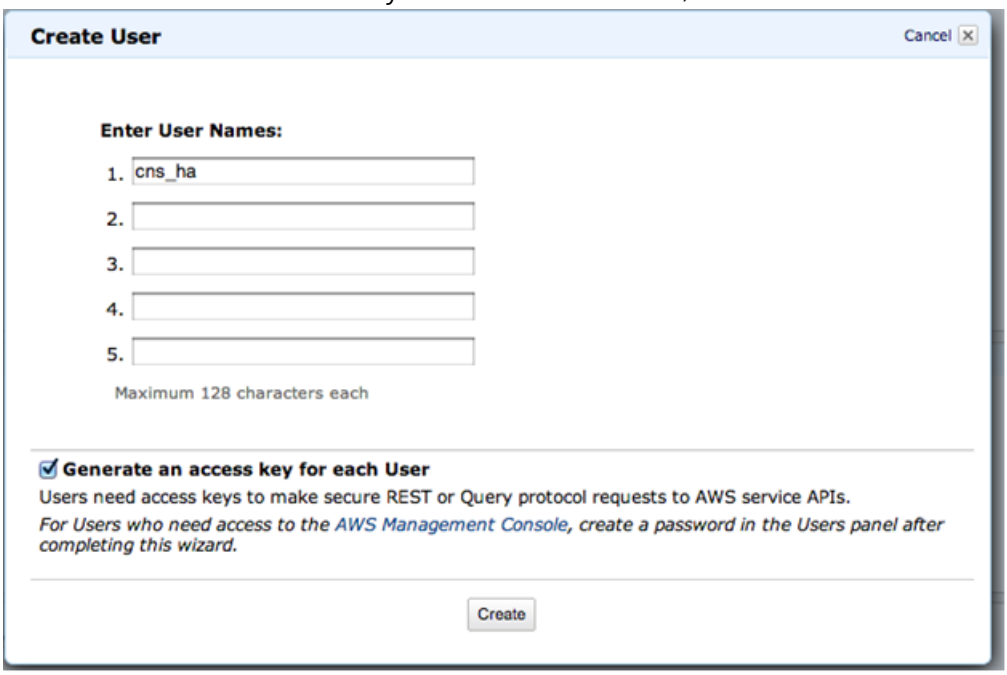
3. On the Amazon Web Services page, click IAM.



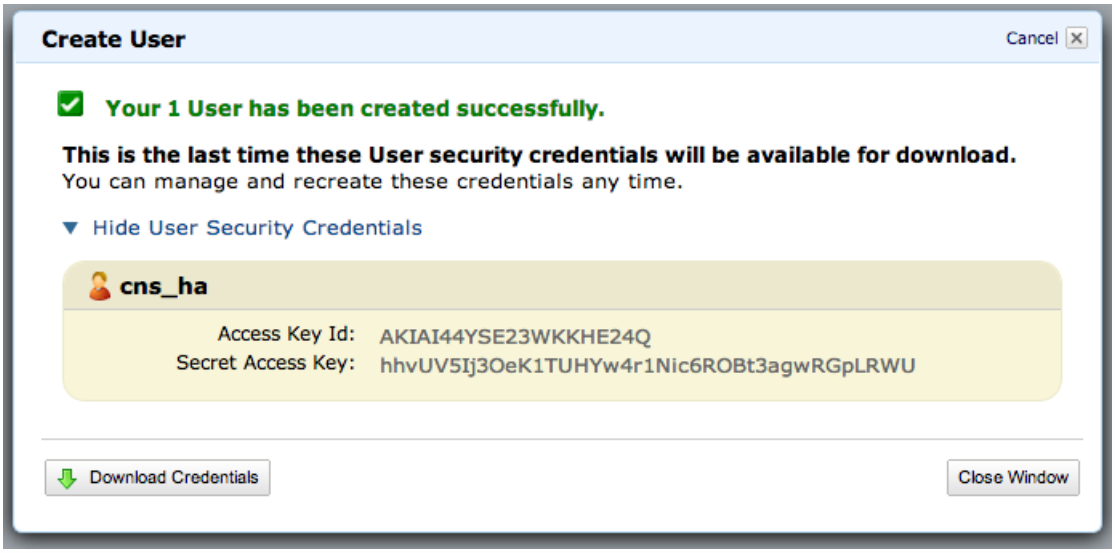
4. In the Navigation pane, click Users, and then click Create New Users.



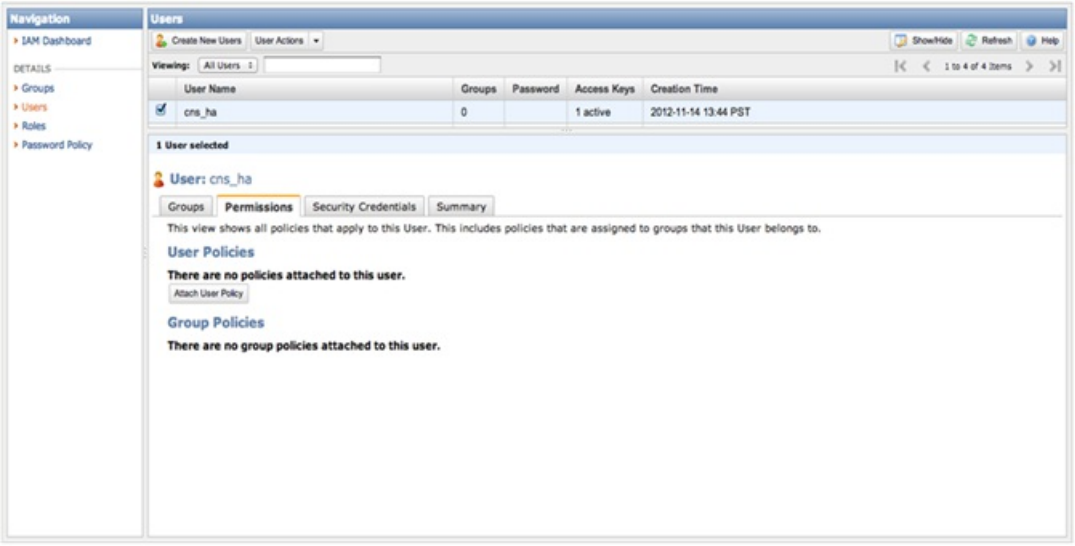
5. In the Create User dialog box, in one of the Enter User Names text boxes, type a user name (for example, cns_ha). Also select the Generate an access key for each User check box, and then click Create.



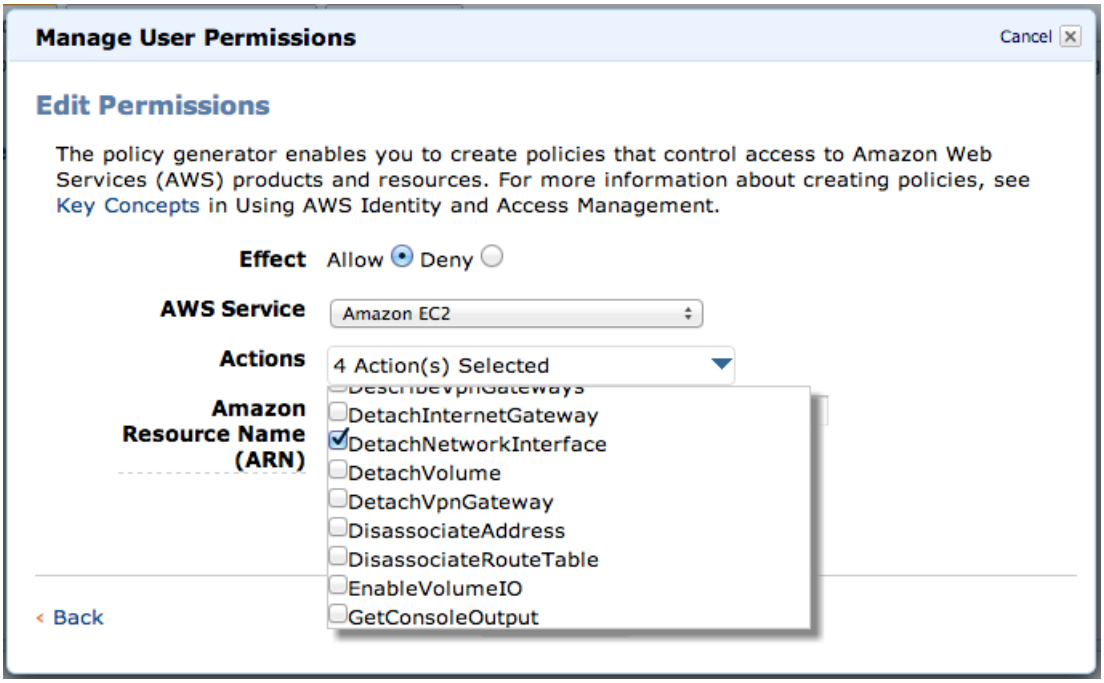
6. After a new IAM user is created, click Download Credentials to download the Access and Secret Keys to a safe location. These keys are required for launching NetScaler AMI. Click Close.
   Note: The Access Key ID and Secret Access Key values are used to create the key-pair file and to launch an instance.



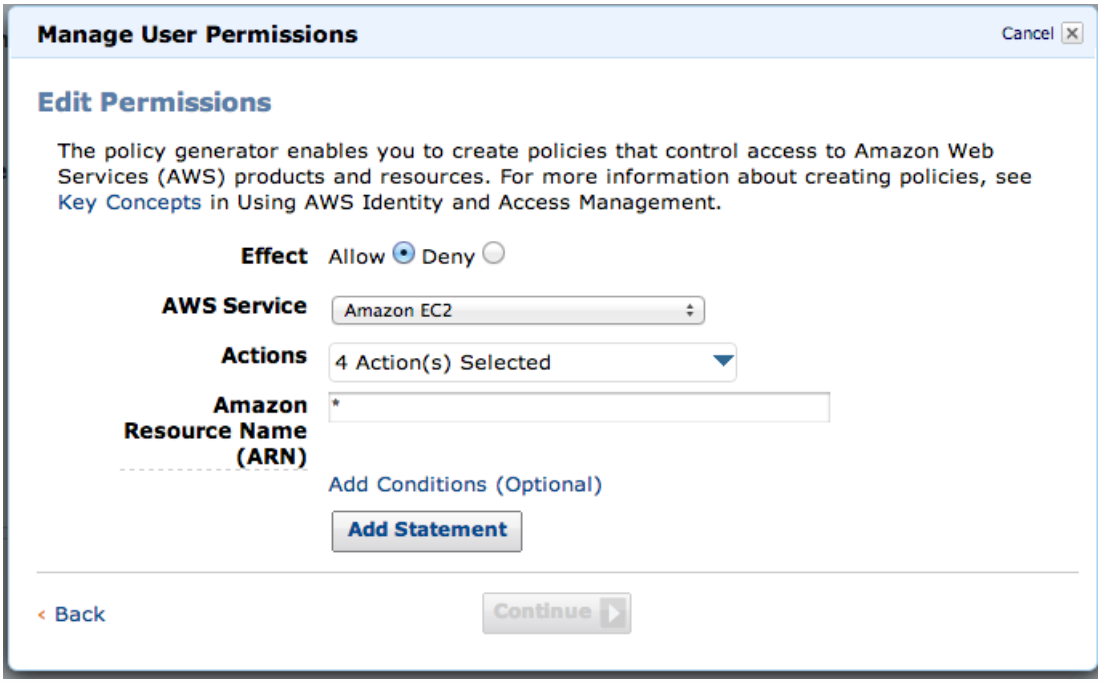
7. In the Users pane, select the newly created IAM user and click the Permissions tab. Then, click Attach User Policy to set policies for the user.



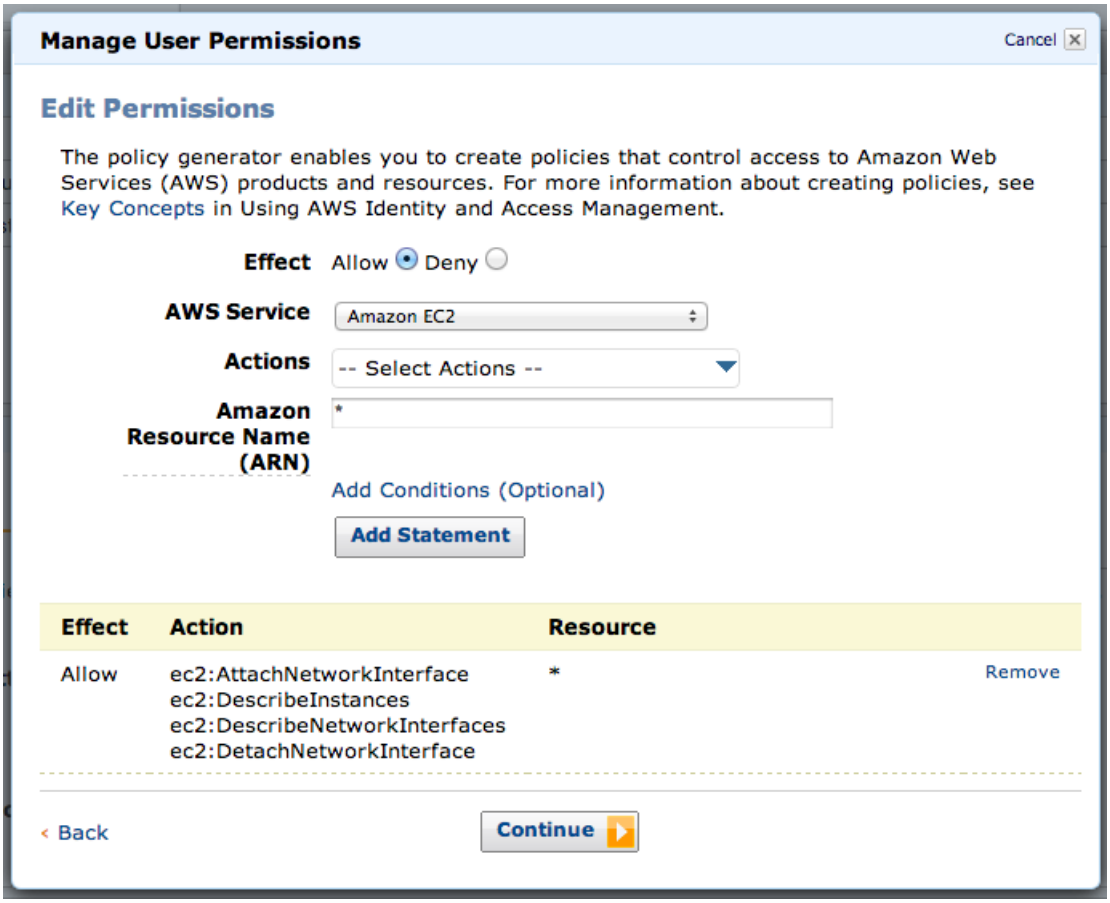
8. In the Manage User Permissions dialog box, next to Effect, select the Allow option. For AWS Service, select Amazon EC2. From the Actions drop-down list, select the following four actions:
   - AttachNetworkInterface
   - DescribeInstances
   - DescribeNetworkInterfaces
   - DetachNetworkInterface



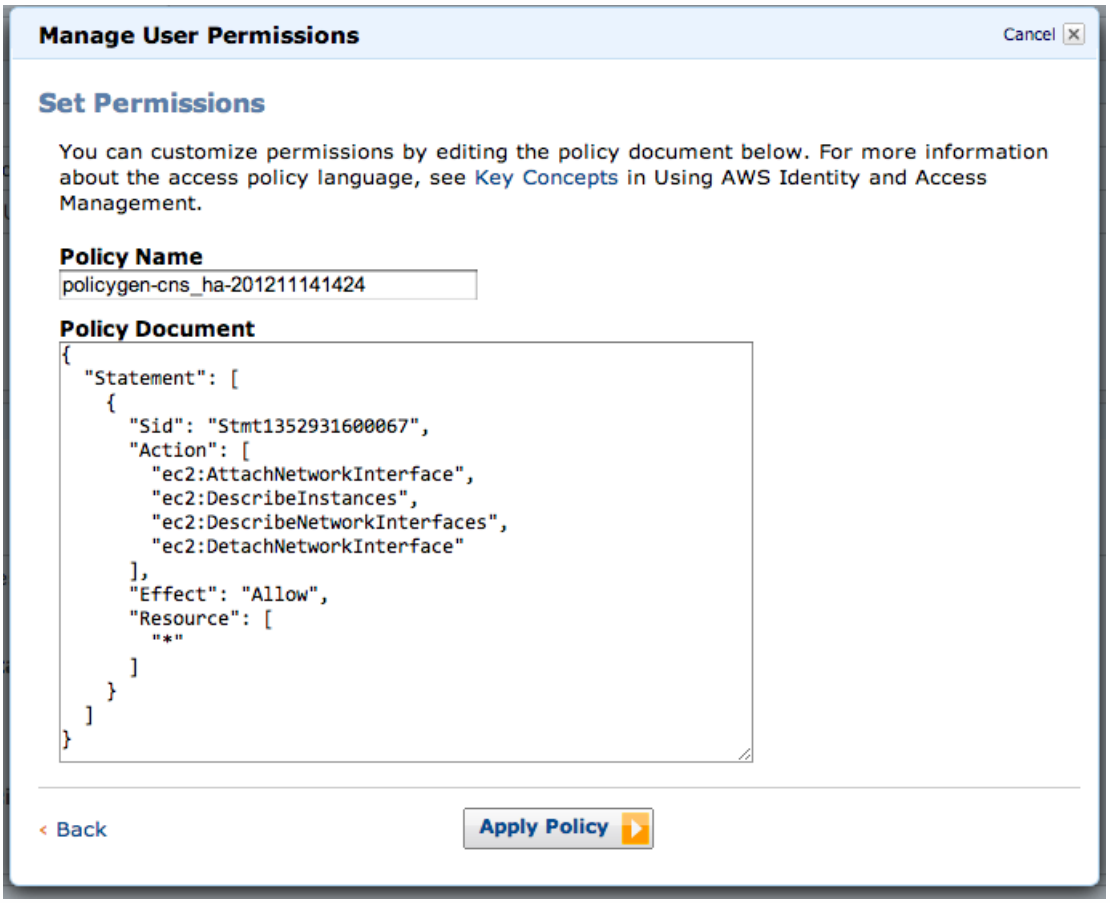
9. Click Add Statement.



10. Click Continue.



11. Click Apply Policy to set the new permissions for the selected user.



Launching the NetScaler AMI

Use the AWS CLI to launch the NetScaler AMI in an AWS VPC. Use the ec2-run-instances command. For information about the ec2-run-instances command, see http://docs.amazonwebservices.com/AWSEC2/latest/CommandLineReference/ApiReference-cmd-RunInstances.html.

Following are Windows and Linux examples of running the command to launch a single NetScaler instance. The EC2 instance type is m3.large. It is configured with the following entities:

- NetScaler AMI named ami-bd2986d4.
- Three ENIs (named NSIP, CLIENT-SIDE, and SERVER-SIDE) associated with the three subnets (15fa057e, 1547ba7e, and 1547ba7e) within the VPC.
- A single IP address for the NSIP ENI.
- Multiple private IP addresses (for multiple VIPs) on the CLIENT-SIDE ENI.
- Multiple private IPs (for multiple SNIPs) on the SERVER-SIDE ENI.

On a Windows platform:

C:\aws-vpc-config>ec2-run-instances ami-bd2986d4 -n 1 -t m1.large -k keyPairName -f access-secret-key-file -a :0:subnet-15fa057e:"NSIP":10.20.15.21 -a :1:subnet-1547ba7e:"CLIENT-SIDE":10.20.10.21::::"10.20.10.22,10.20.10.23,10.20.10.24,10.20.10.25,10.20.10.26,10.20.10.27,10.20.10.28,10.20.10.29,10.20.10.30" -a :2:subnet-cc47baa7:"SERVER-SIDE":10.20.1.21::::"10.20.1.22,10.20.1.23,10.20.1.24,10.20.1.25,10.20.1.26,10.20.1.27,10.20.1.28,10.20.1.29,10.20.1.30"
Note: The access-secret-key-file file contains the access and secret keys.

On a Linux platform:

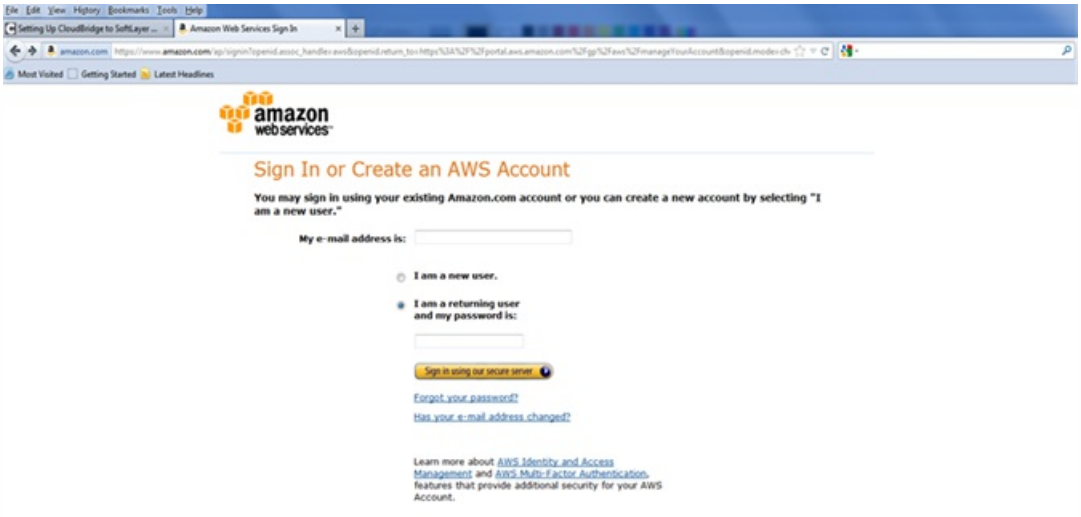
AWS PROMPT > ec2-run-instances ami-bd2986d4 -n 1 -t m1.large -k keyPairName -f access-secret-key-file -a :0:subnet-15fa057e:"NSIP":10.20.15.21 -a :1:subnet-1547ba7e:"CLIENT-SIDE":10.20.10.21::::10.20.10.22,10.20.10.23,10.20.10.24,10.20.10.25,10.20.10.26,10.20.10.27,10.20.10.28,10.20.10.29,10.20.10.30 -a :2:subnet-cc47baa7:"SERVER-SIDE":10.20.1.21::::10.20.1.22,10.20.1.23,10.20.1.24,10.20.1.25,10.20.1.26,10.20.1.27,10.20.1.28,10.20.1.29,10.20.1.30
Note: The access-secret-key-file file contains the access and secret keys.

The command returns the instance ID and the associated information. You can see the instance running within your AWS GUI Console.

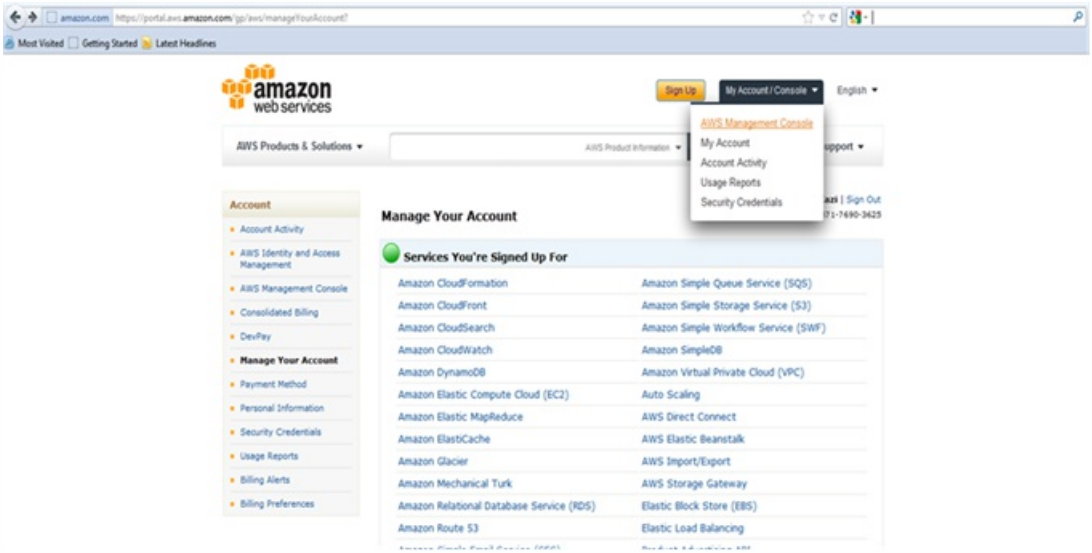
Note: Make sure that the environment variable EC2_URL points to the region where you want to launch the VPX instance.

To access the EC2 instance

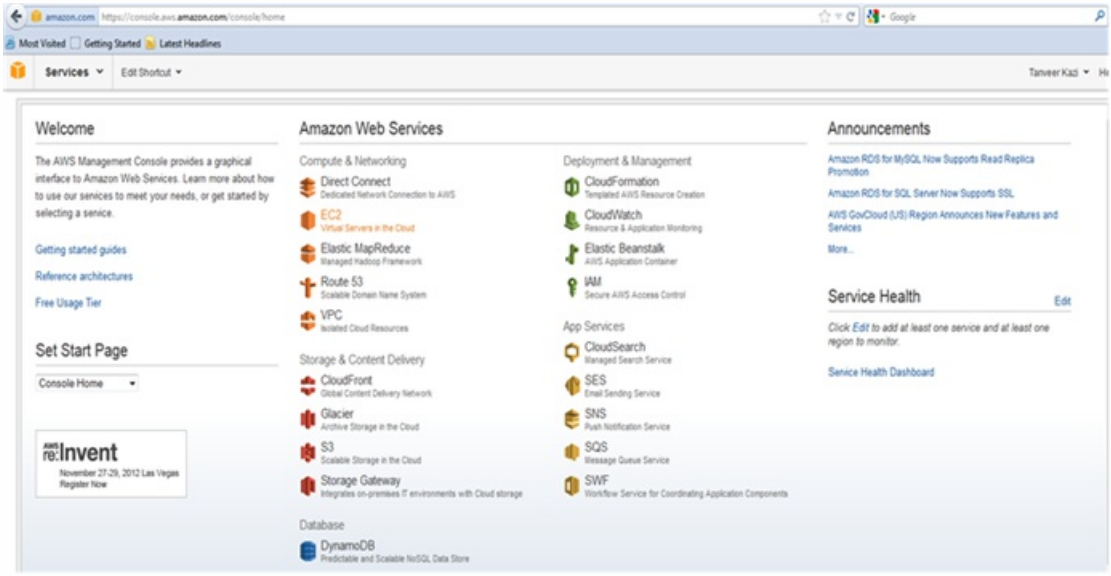
1. In a web browser, open the website at www.aws.amazon.com and log on with AWS credentials.



2. Click My Account/Console, and then click AWS Management Console.

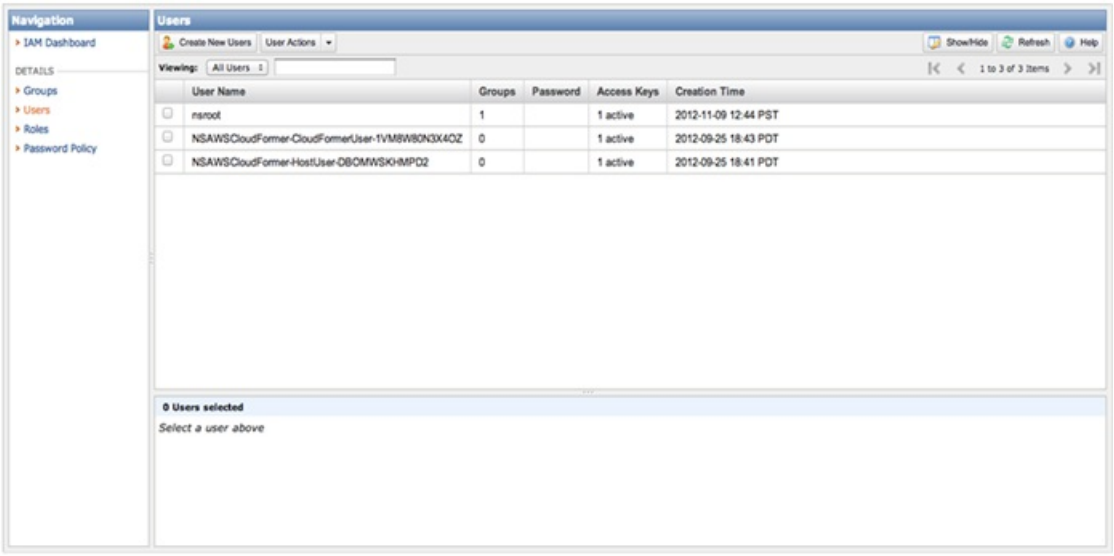


3. On the Amazon Web Services page, click EC2.



4. On the Amazon EC2 Console Dashboard page, in the Navigation pane, click Instances and verify that all of the NetScaler VPX instances are configured with the IP addresses that you specified when you used the ec2-run-instances command.

Note: The VPX instance or instances can take from five to ten minutes to start running.



The ec2-run-instances command does not allow associating AWS elastic IP with an ENI. To associate one or more EIPs with an ENI in the Navigation pane, in the NETWORK & SECURITY area, click Elastic IPs and associate EIPs with Private IP addresses for any of the VIPs that need to be externally routable.

You must also associate the instance ENIs with appropriate security groups. Go to the Network Interfaces section, right-click on the individual ENI, and select the Change Security Groups option. You can then associate a proper VPC security group.

Using the Citrix Cloud Formation Template to launch NetScaler VPX for AWS

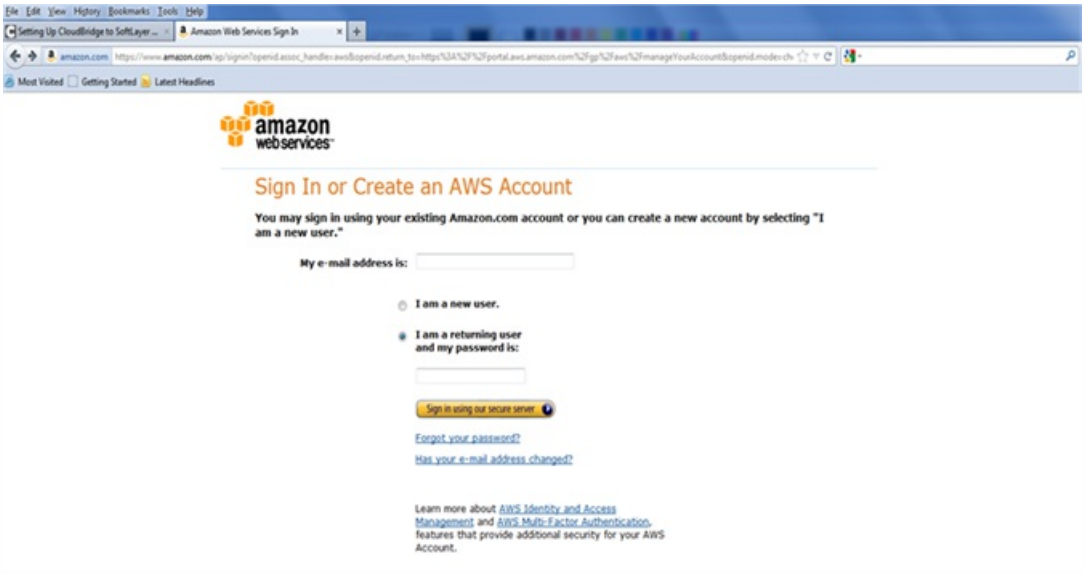
Citrix also provides a CloudFormation template that can be used to automate NetScaler instance launch. The tool requires an existing VPC environment. It launches a NetScaler instance with three ENIs. Therefore, to use the CloudFormation template, make sure that you have the following:

1. AWS account
2. AWS VPC
3. Three subnets within the VPC
4. A security group to use for the NetScaler instances ENIs

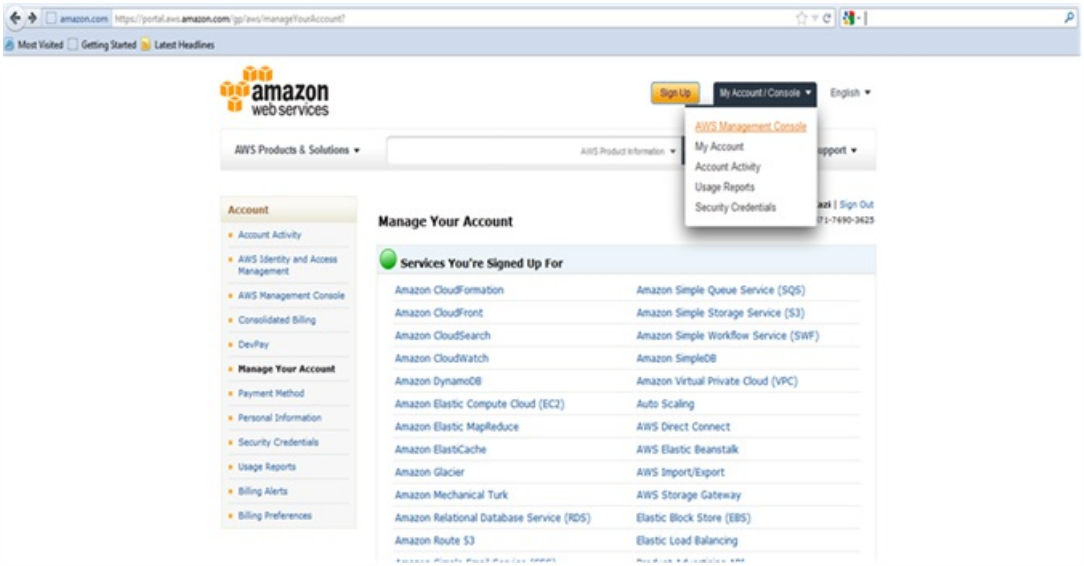
Refer to Creating an AWS Virtual Private Cloud (VPC) for information about how to configure subnets and security groups within a VPC. After configuring the required subnets and security groups, you can launch the NetScaler VPX AMI in AWS VPC. The CloudFormation tool provides functionality to launch a single NetScaler VPX instance or, to create a high availability environment, a pair of NetScaler VPX instances.

Launching a single NetScaler VPX instance in AWS

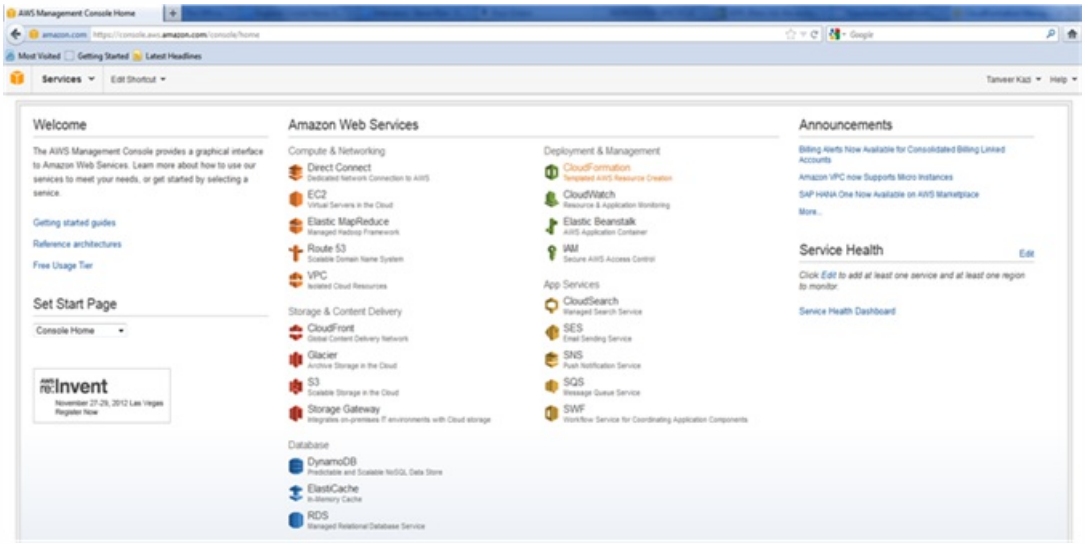
1. In a web browser, open the website at www.aws.amazon.comand log on with AWS credentials.



2. Click My Account/Console, and then click AWS Management Console.

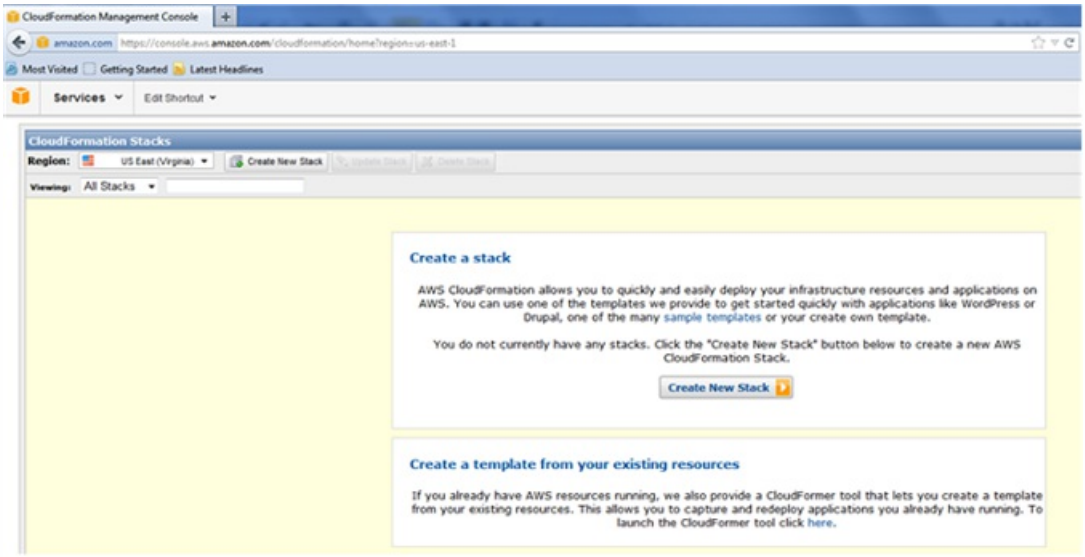


3. On the Amazon Web Services page, click Cloud Formation in the Deployment & Management section.



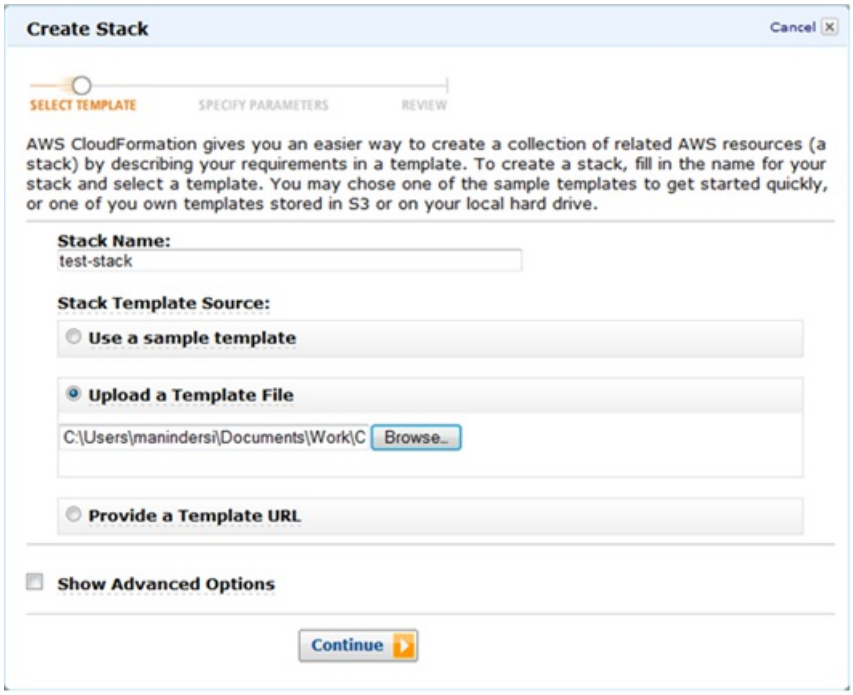
4. On the CloudFormation Stacks page, select the Region in which you plan to deploy the NetScaler VPX instance, and

then click Create New Stack.



5. In the Create Stack dialog box, specify a value for Stack Name, select the Upload a Template File option, and then click Browse. Select the template for a standalone NetScaler VPX from the local drive, and then click Continue.

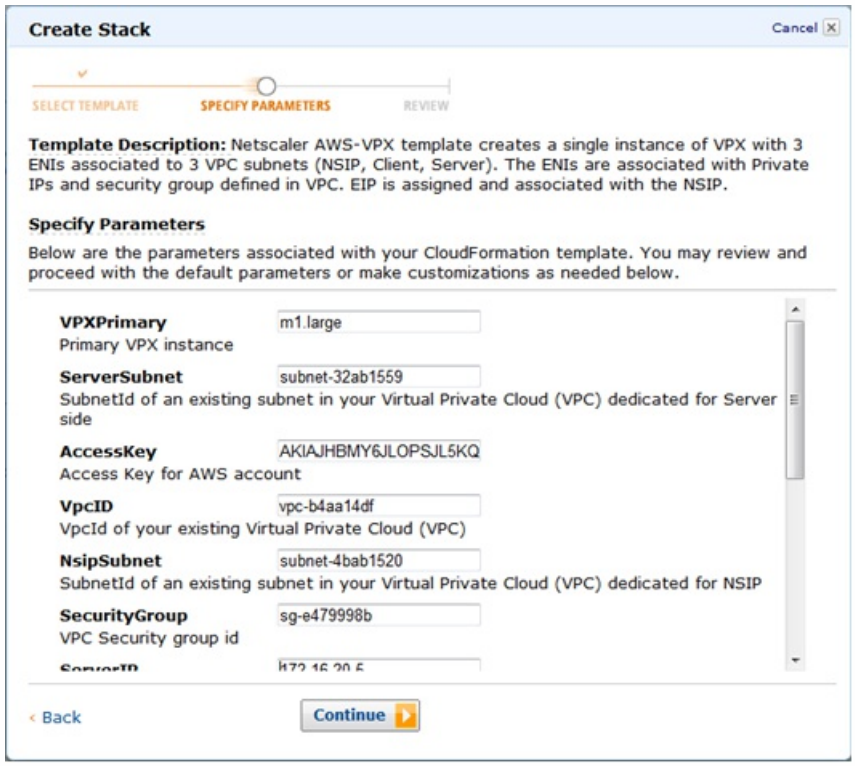
Note:



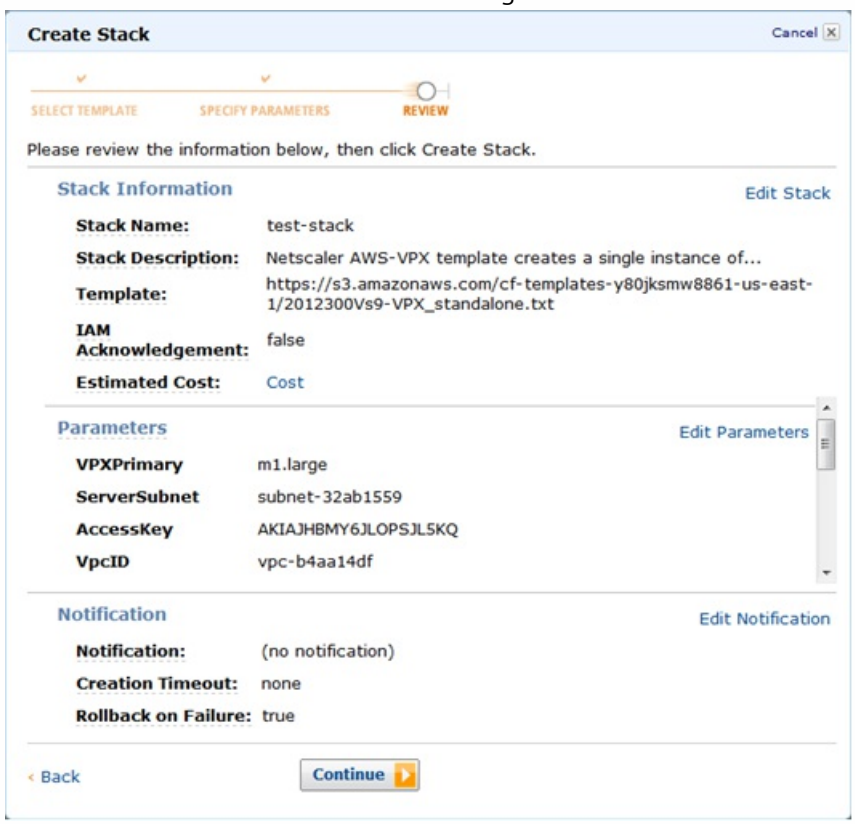
6. In the next pane, specify values for:
   - **VpcID** : An identifier to assign to the Virtual Private Cloud (VPC).
   - **NsipSubnet** : Subnet in which the NSIP is configured in the VPC
   - **ServerSubnet**: Subnet in which the server farm is configured in the VPC
   - **ClientSubnet**: SubnetId in which the client side is configured in the VPC
   - **SecurityGroup**: VPC Security group ID
   - **VPXPrimary**: Name of the primary VPX instance type
   - **AccessKey**: Access Key for IAM user account
   - **SecretKey**: Secret Key for IAM user account
   - **TenancyType**: Instance tenancy type, can be default or dedicated
   - **NsIP**: Private IP assigned to the NSIP ENI. The last octet of NSIP should be between 5 and 254.
   - **ServerIP**: Private IP assigned to the Server ENI. The last octet should be between 5 and 254.

- **ClientIP**: Private IP assigned to the Client ENI. The last octet should be between 5 and 254.
- **KeyName**: Name of an existing EC2 KeyPair to enable SSH access to the instances.

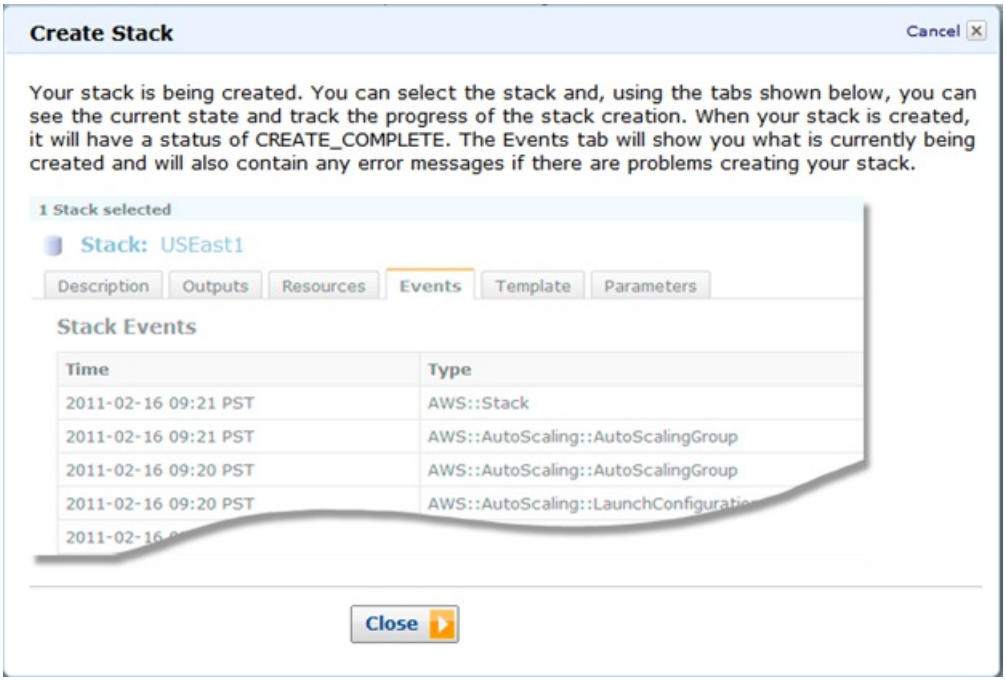
Note: Make sure that the VPC, subnets, security groups, routes and gateway associations are already configured.



7. Click Continue.
8. Review the values in the Create Stack dialog box.



9. Click Continue to create a Stack.



10. Click Close to close the Create Stack dialog box.
11. The new stack that you created appears on the CloudFormation Stacks page.

Note:

- Currently, the CloudFormation utility does not provide the functionality to add secondary IP addresses. Use the AWS console, after deploying a NetScaler VPX instance, to add the secondary IP addresses to the ENIs.
- The CloudFormation scripts for the standalone and HA pair VPX instances have the latest AMIs for the five supported regions. You have to update the scripts to synchronize with the latest AMIs.
- The script automatically selects the correct AMI for the region in which the VPX instance is being deployed.
- By default, all the ENIs are attached to one security group, use the AWS console to attach an ENI to a different security group.
- EIPs are automatically allocated and assigned to an instance. If the EIP limit exceeds the threshold for the region, the CloudFormation script fails and displays an error message.

Updated: 2015-01-29

1-Click helps you to launch an instance of NetScaler VPX on AWS, quickly as compared to other launching methods, with the default options. After the instance is launched on AWS, you can modify these options by using either the AWS CLI or the AWS GUI.

The default options include the following elastic network interfaces (ENIs) for the NetScaler instance:

- **Management Interface**—Associates a subnet for management related traffic. You add the NetScaler management IP (NSIP) address to this subnet.
- **Public Interface**—Associates a subnet for the client-access (user-to-NetScaler) traffic. You add one or more virtual IP (VIP) addresses on this subnet.
- **Private Interface**—Associates a subnet for server-access (NetScaler-to-server) traffic. You add subnet IP (SNIP) addresses on this subnet.

Before you begin launching an instance of NetScaler VPX on AWS, consider the following points :

- For security reasons, none of the elastic IP addresses are attached to the ENIs of the NetScaler VPX instance launched by using 1-Click. This means that the NetScaler VPX instance (including the management IP address) is not reachable from outside the AWS Virtual Private Cloud (VPC). If your VPC uses a Virtual Gateway or other method to provide a VPN access to the VPC, you can administer the instance by using the IP address of the network interface in the management subnet. If you do not have VPN access to your VPC, Citrix recommends that you set up a jump box instance within the VPC, and then use this as the source for accessing or managing other instances within the VPC. For instructions to create an SSH jump box, see https://s3.amazonaws.com/awsmp-usageinstructions/Creating_and_using_VPC.txt.
- Three default security policies are created. A policy each is attached to the management, public and private interfaces, respectively.
  - The security policy for the management interface allows traffic from a set of ports.
  - The security policies for the public and private interfaces block all the traffic to or from these interfaces. You can later modify these security groups to filter the desired traffic.
- High Availability configuration is not supported for a NetScaler VPX instance launched by using AWS 1-click.

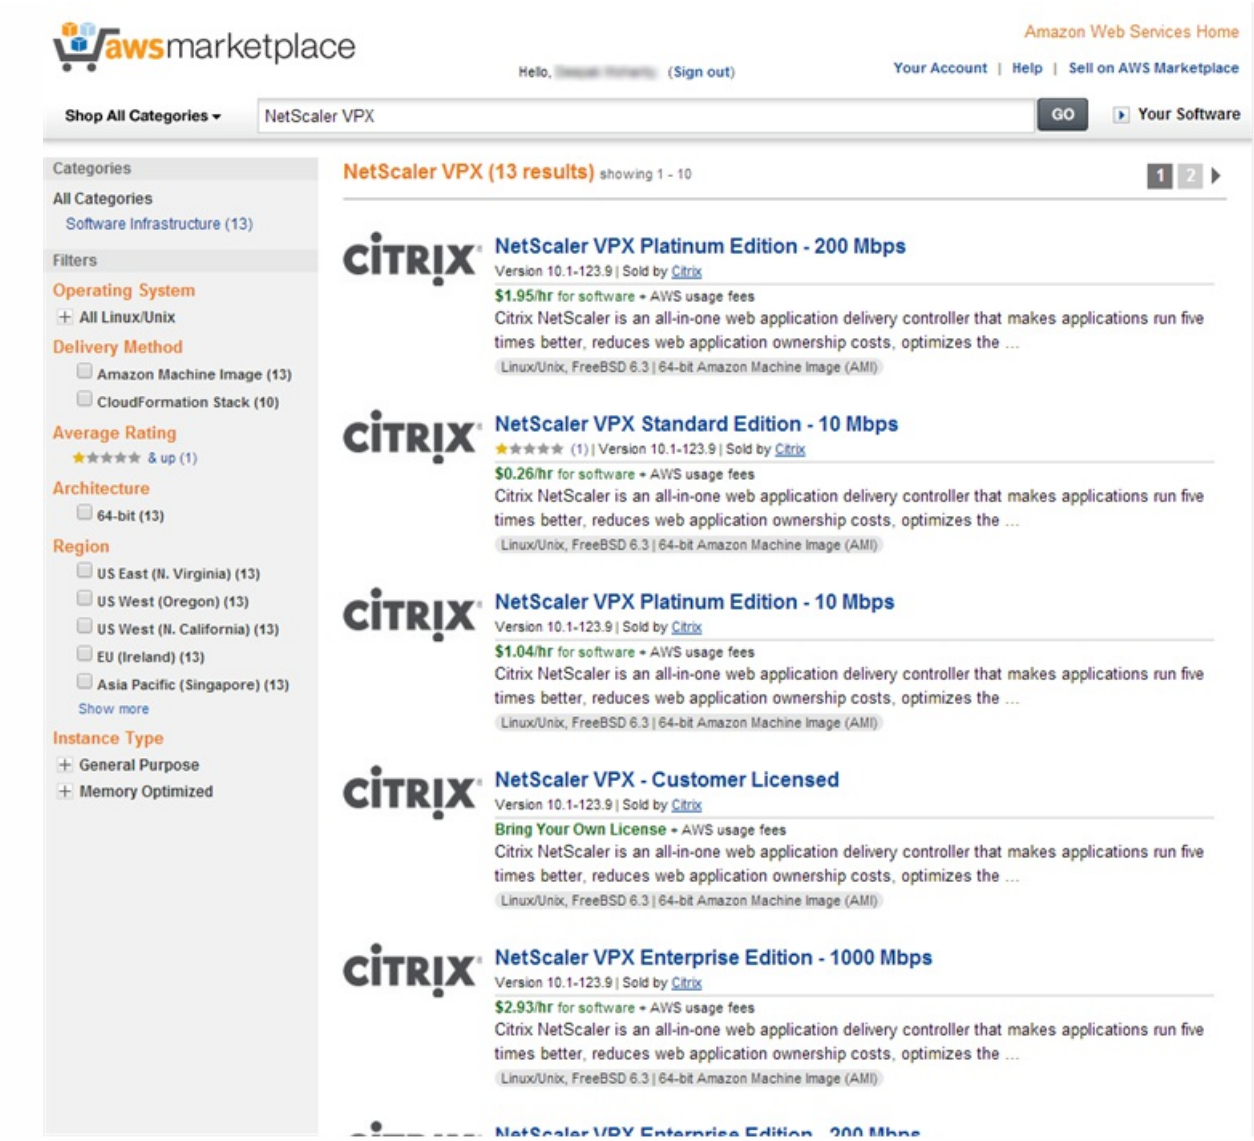
Before you begin launching an instance of NetScaler VPX on AWS, make sure that you have the following:

- An AWS account
- An AWS Virtual Private Cloud (VPC)
- Three subnets within the AWS VPC (one each for management interface, public interface, and private interface of the NetScaler instance)
- An IAM key pair

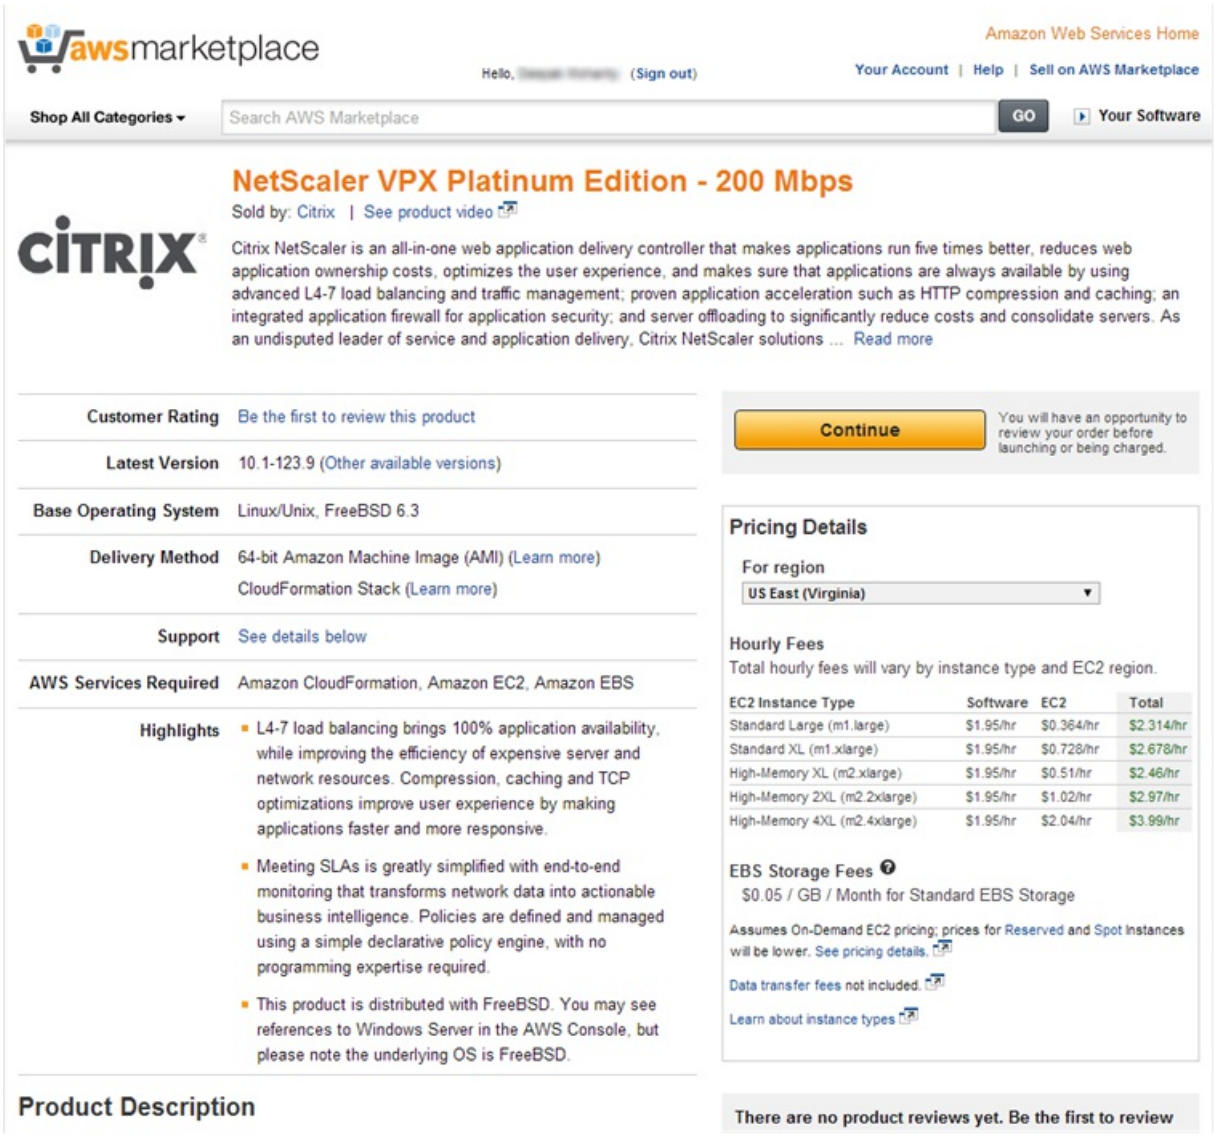
For information about creating an AWS account, a VPC, subnets in a VPC, and an IAM key pair, see Launching NetScaler VPX for AWS by Using the Amazon GUI and CLI toolkit.

To launch an instance of NetScaler VPX on AWS by using 1-Click

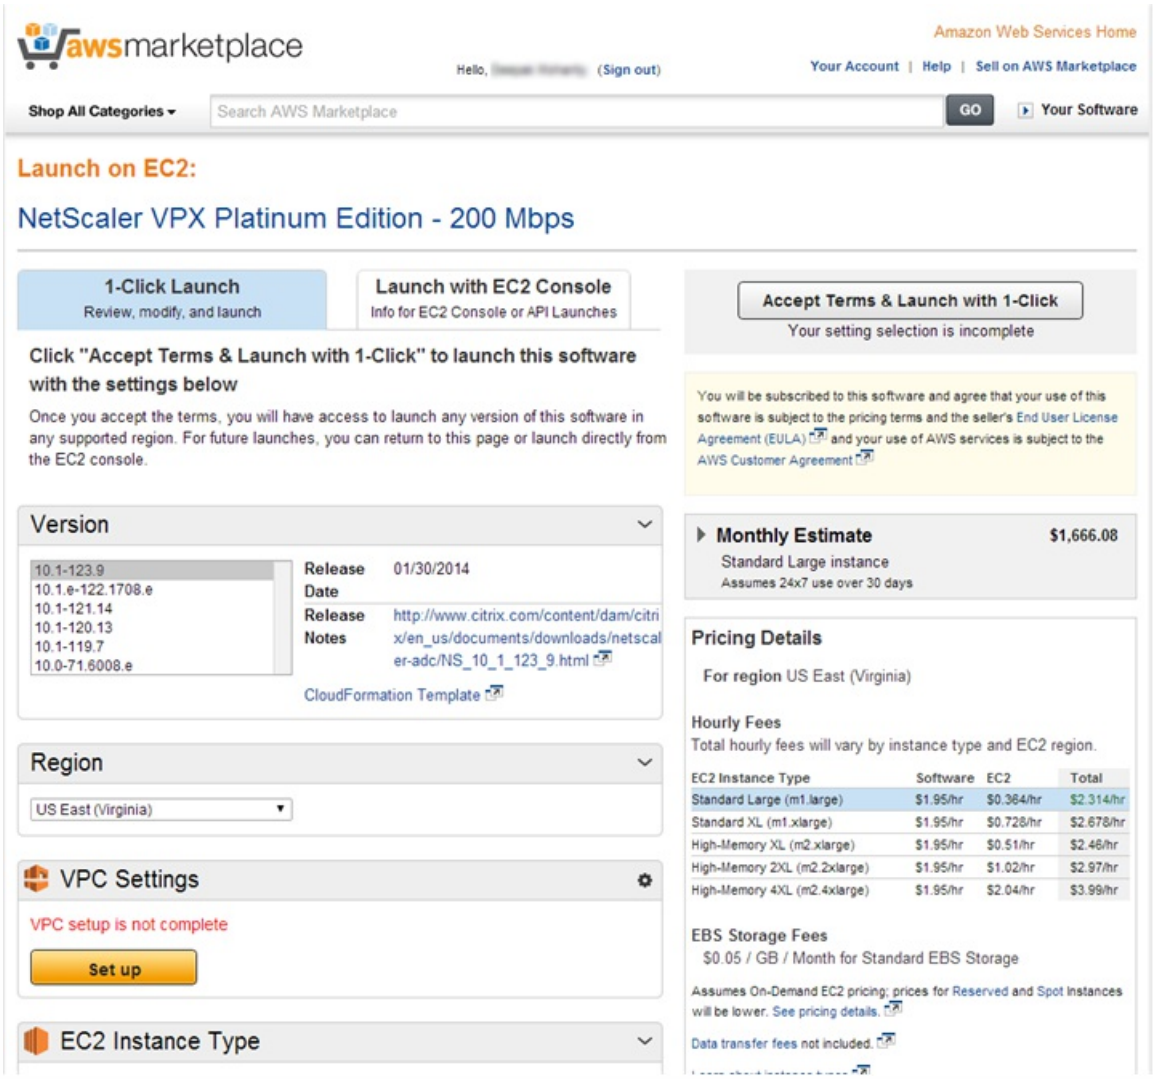
1. Log on to the AWS marketplace (https://aws.amazon.com/marketplace) by using your Amazon AWS credentials.
2. In the search field, type NetScaler VPX to search for the NetScaler AMI, and click Go.
3. On the search result page, click the desired Citrix NetScaler VPX offering.



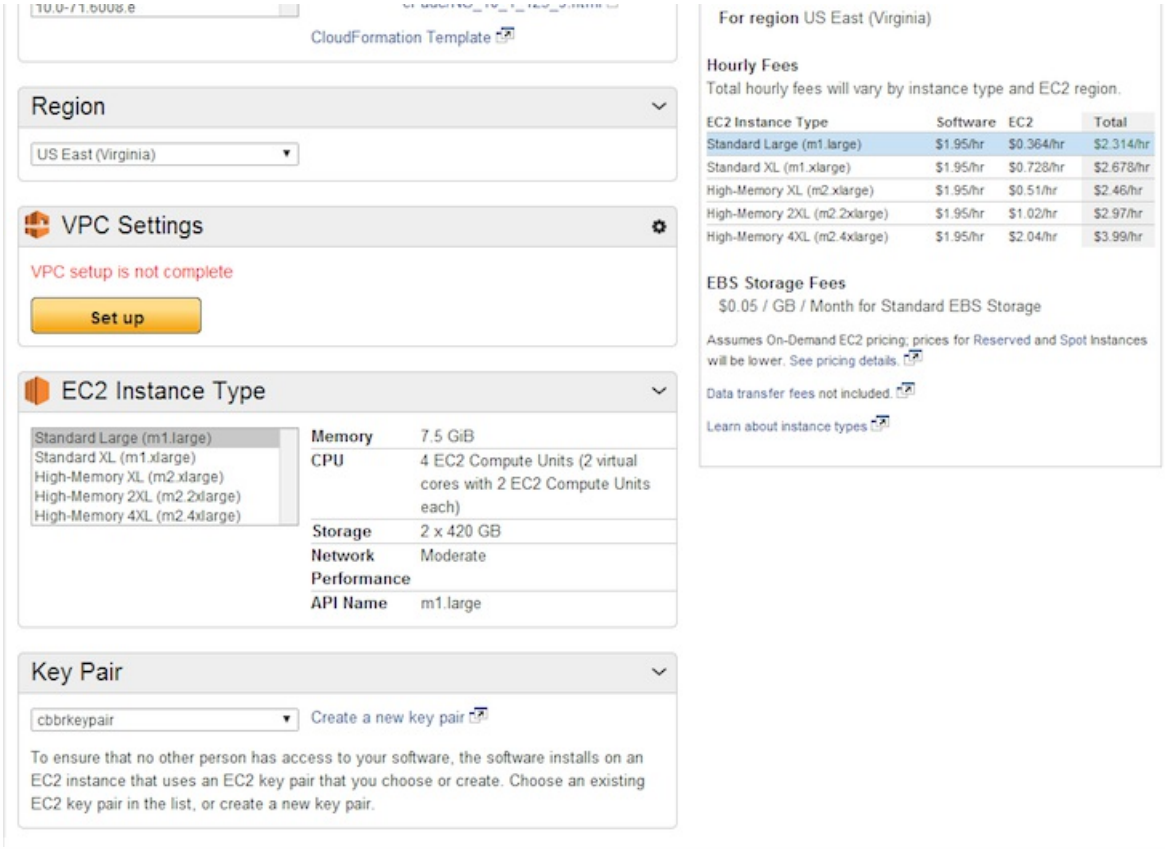
4. On the Citrix NetScaler VPX page, click Continue.



5. Click the 1-Click Launch tab. On the 1-Click Launch tab, specify values for the following fields:
   - Version
   - Region
   - EC2 Instance type
   - Key Pair

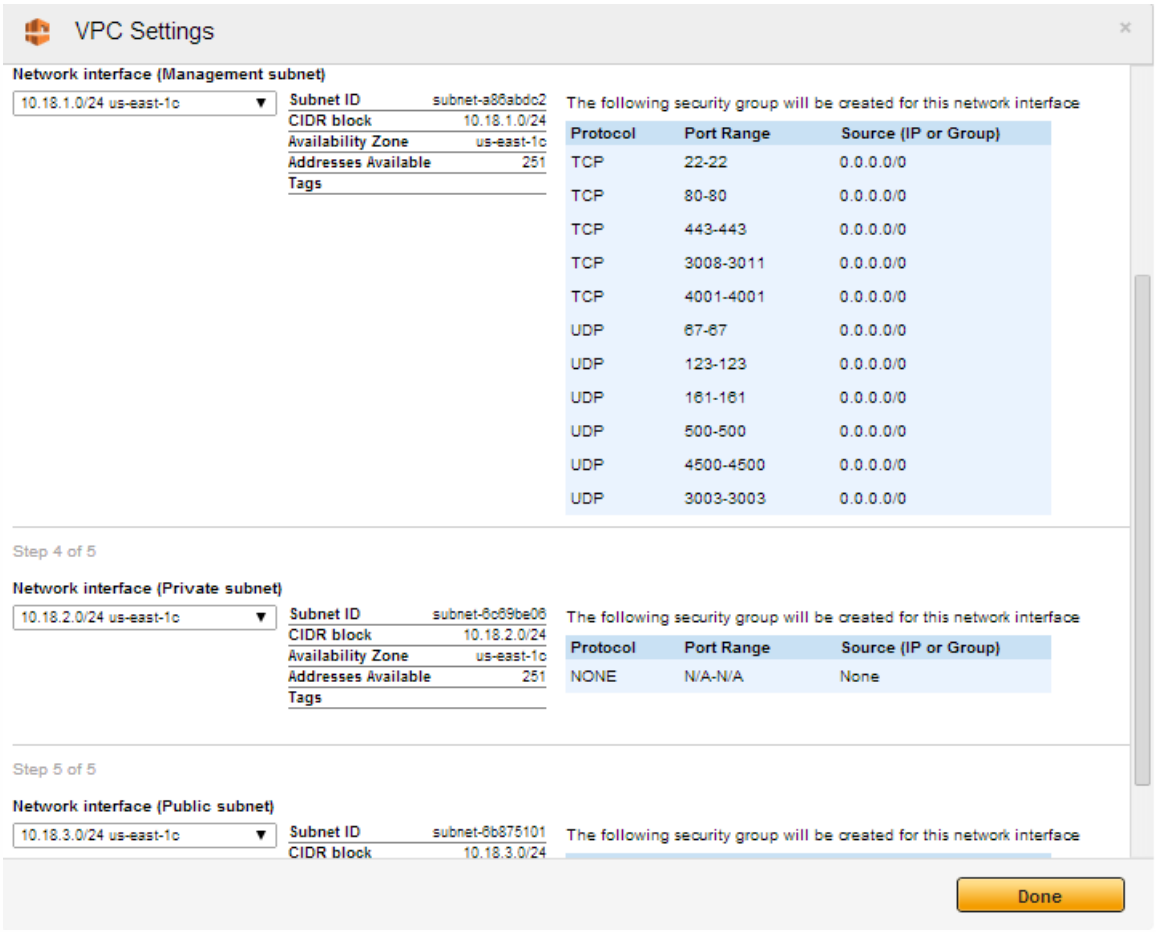


6. On the VPC Settings pane, click Setup.

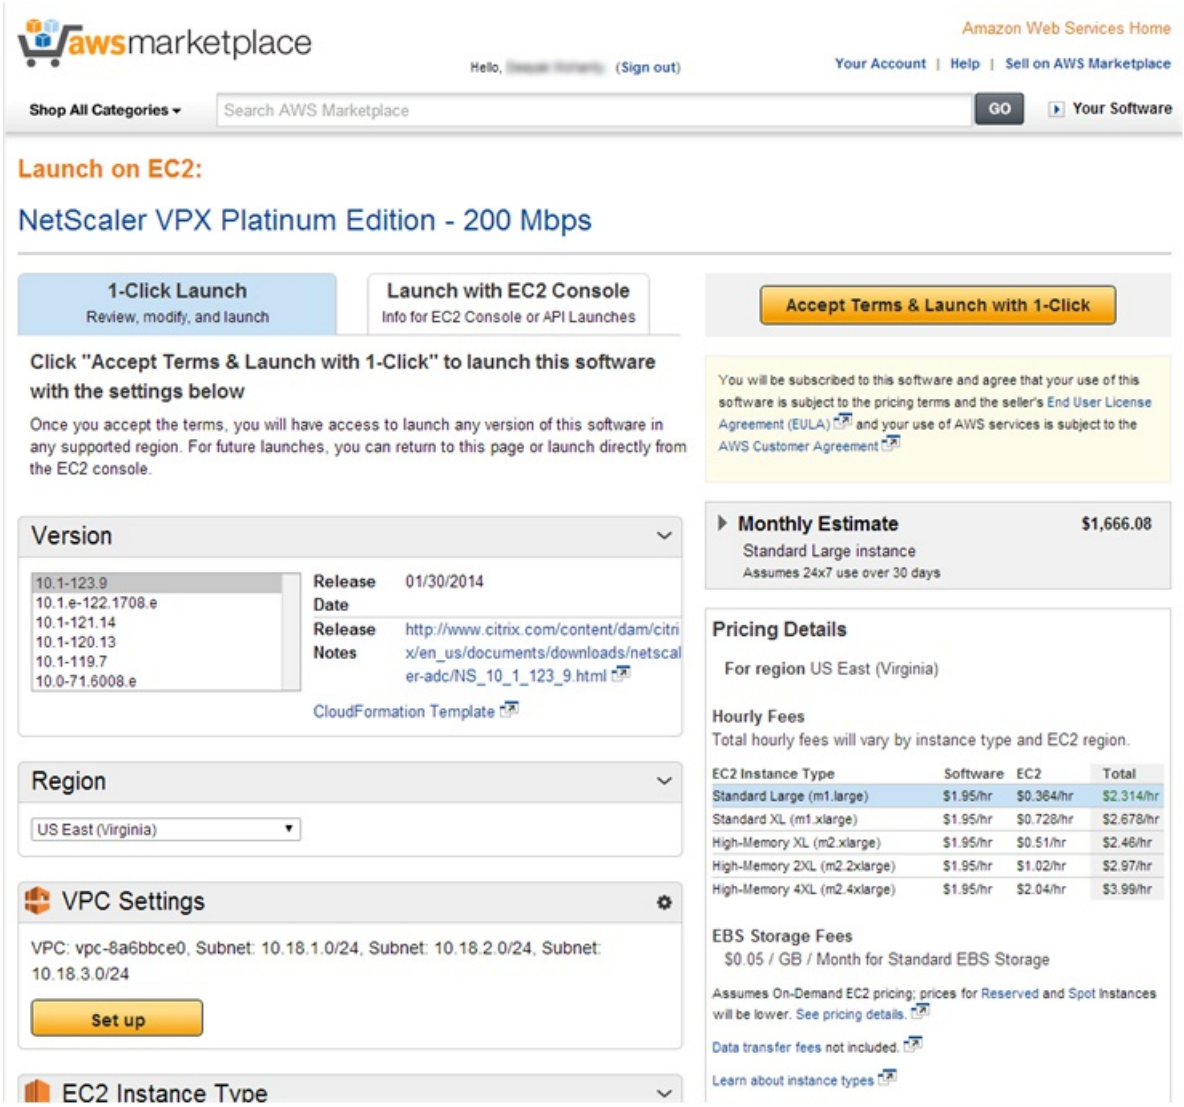


7. On the VPC Settings page, specify values for the following fields, and then click Done:
   - VPC
   - Network Interface (Management subnet)
   - Network Interface (Private subnet)
   - Network Interface (Public subnet)

   Note: You need to make sure that the subnets attached to these ENIs are different from each other. Attaching the same subnet to more than one ENI might cause routing issues.



8. Click Accept Terms & Launch with 1-Click.



After few minutes, the NetScaler instance is launched with three ENIs. You can now connect to the NSIP address (the IP address on the management ENI) of the instance by using the NetScaler CLI or NetScaler GUI and start configuring the NetScaler features, for example, load balancing.

Verifying the NetScaler VPX on AWS Installation

May 14, 2014

When the NetScaler instance is running, you can access the instance through the NetScaler GUI or the NetScaler CLI by connecting to the EIP associated with the management ENI (NSIP). For example, use the following addressing notation in a web browser:

http://<Elastic_IP> (unsecured access)

or

https://<Elastic_IP> (secured access)

Note:

- To access a NetScaler instance through SSH, provide the .pem file.
- You can use the AWS GUI console to manually add the private IP addresses for SNIPs on server subnets and VIPs on client subnets.
- If you want to access the NSIP from the Internet, you must assign an EIP to the NSIP address of each NetScaler instance. Also, make sure that the NSIP subnet is associated with a routing table that has a default route set to the Internet gateway.
- If you want VIP addresses to be accessible through the Internet, you must associate an EIP with each VIP address that is defined in the configuration.
- The following are the default administrator credentials to access a NetScaler VPX instance:
  - Username—nsroot
  - Password—The default password for the nsroot account is set to the AWS instance-ID of the NetScaler VPX instance. For a high availability configuration between two NetScaler VPX instances, the nsroot password of the secondary node is set to that of the primary node after the HA configuration synchronization.
- You can find the private key file from the AWS console. To view the private key file:
  1. Log on to the AWS marketplace (https://aws.amazon.com/marketplace) by using your Amazon AWS credentials.
  2. Click **Amazon Web Services Home**.
  3. Click **My Account/Console**, and then click **Security Credentials**.

Attaching Additional IP Addresses to an Instance

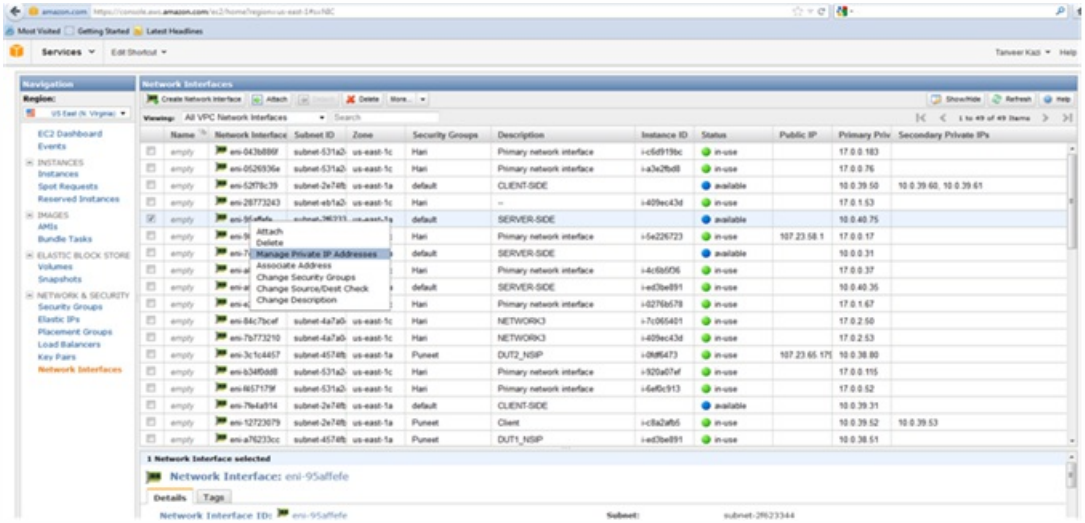
Aug 23, 2013

You can attach additional IP addresses to an instance as follows:

1. Add a secondary IP address to an ENI.
2. Associate an EIP with the secondary IP address that you created.

To add a secondary IP address to the ENI

1. In a web browser, open the website at www.aws.amazon.com and log on with AWS credentials.
2. Click My Account/Console, and then click AWS Management Console.
3. On the Amazon Web Services page, click EC2.
4. On the Amazon EC2 Console's Dashboard page, in the Navigation pane, in NETWORK & SECURITY, click Network Interfaces.
5. In the Network Interfaces pane, right-click the ENI attached to the subnet, and then select the Manage Private IP Addresses option from the pop-up menu.



6. In the Manage Private IP Addresses dialog box, click Assign a secondary private IP address and either let AWS automatically assign an IP address or type an IP address in the auto-assign text-field. Click Yes, Update.

Associating an EIP with the secondary IP

Complete the following steps to associate an EIP with a secondary IP address:

1. On the Amazon EC2 Console Dashboard page, in the Navigation pane, in NETWORK & SECURITY, click Elastic IPs.
2. In the Addresses pane, click Allocate New Address.
3. In the Allocate New Address dialog box, select VPC from the EIP used in drop-down list and click Yes, Allocate.
4. Select the newly allocated EIP, and click Associate Address.
5. In the Associate Address dialog box, select, from the **Instance** and the **Private IP address** drop-down lists, the instance and private address that you want to associate with the EIP. Then, click Yes, Associate.

Downloading a NetScaler VPX License

Jan 31, 2011

After the initial instance launch, NetScaler VPX for AWS requires a license. If you are bringing your own license (BYOL), see the *VPX Licensing Guide* at http://support.citrix.com/article/CTX122426

You have to:

1. Use the licensing portal within MyCitrix to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

Load Balancing Servers in different Availability Zones

Nov 27, 2012

A NetScaler instance can be used to load balance servers running in the same availability zone, or in:

- A different availability zone (AZ) in the same AWS VPC
- A different AWS region
- AWS EC2 in a VPC

To enable NetScaler to load balance servers running outside the AWS VPC that the NetScaler instance is in, configure the NetScaler to use EIPs to route traffic through the Internet gateway, as follows:

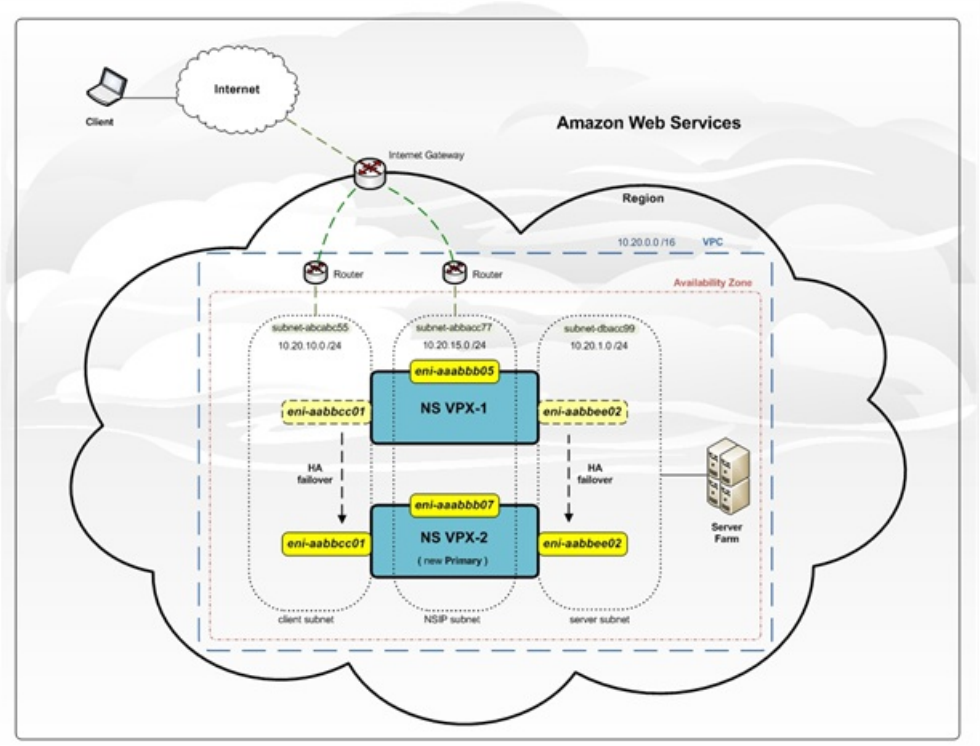
1. Configure a SNIP on the NetScaler by using the NetScaler CLI or the NetScaler GUI
2. Enable traffic to be routed out of the AZ, by creating a public facing subnet for the server-side traffic.
3. Add an Internet gateway route to the routing table, using the AWS GUI console.
4. Associate the routing table you just updated with the server-side subnet.
5. Associate an EIP with the server-side private IP address that is mapped to a NetScaler SNIP address.

High Availability

May 13, 2014

Two Citrix® NetScaler® VPX™ instances in AWS can be configured as a high availability (HA) pair. With one instance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

The following figure shows an example of the HA deployment architecture for NetScaler VPX on AWS.
Figure 1. NetScaler VPX on AWS - HA Deployment



To deploy HA for VPX on AWS, you must configure at least two ENIs on the primary instance and a single ENI on the secondary instance. On each instance, configure the NetScaler IP (NSIP) address (the management address) on the default ENI. On the primary instance, use the additional ENIs for client and server connections.

For instructions on obtaining access and secret keys, in the AWS documentation, see "How Do I Get Security Credentials?" and "Creating, Modifying, and Viewing User Access Keys (AWS Management Console)." For instructions to create an IAM user and set permissions, see "Creating an IAM Account."

Example format for a key file is:
ACCESS_KEY="AKIAJPBBBBBBBVA2PR2OHJNA"
SECRET_KEY="d75KxU7ukd44444NNNNtrrAOgynwBdJoSiooP"
Note: For HA failover to work:

1. The NSIP addresses for each NetScaler instance in an HA pair must be configured on the default ENI of the instance.
2. Both the primary and secondary instances must have EIPs associated with the NSIP or NAT configured to handle outgoing traffic in order to have access to the AWS API servers.
3. Client and server traffic (data-plane traffic) must not be configured on the default ENI.

4. Access and secret keys associated with the user's AWS Identity and Access Management (IAM) account. If the correct key information is not used when creating VPX instances, the HA deployment will fail. The access and secret keys are required for sending Query APIs to the AWS server.
5. Nameservers/DNS servers are configured at VPC level using DHCP options.

Notes on HA:

- Because Amazon does not allow any broadcast/multicast packets in AWS, HA is implemented by migrating data-plane ENIs from the primary to the secondary (new primary) VPX instance when the primary VPX instance fails.
- To deploy HA for VPX on AWS, you must configure at least two ENIs on the primary instance and a single ENI on the secondary instance.
- Because the default ENI cannot be moved to another VPX instance, you should not use the default ENI for data.
- The message AWSCONFIG IOCTL NSAPI_HOTPLUG_INTF success output 0 indicates that the two data ENI's have successfully attached to the secondary instance (the new primary).
- Failover might take up to 20 seconds due to the AWS detach/attach ENI mechanism.
- Upon failover, the failed instance always restarts.
- The secondary node always has one ENI interface (for management) and the primary node can have up to four ENIs.
- The heartbeat packets are received only on the management interface.
- The configuration file of the primary and secondary NetScaler appliances is synchronized, including the nsroot password. The nsroot password of the secondary node is set to that of the primary node after the HA configuration synchronization.
- **The AWS debug messages are available in the log file, /var/log/ns.log, on the VPX instance**.

To deploy HA for two VPX instances on AWS, you must create the primary NetScaler VPX instances with three ENIs and the secondary NetScaler VPX with a single ENI.

Following is an example of launching a primary VPX instance with three ENIs:

C:\aws-vpc-config>ec2-run-instances ami-bd2986d4 -n 1 -t m1.large -k keyPairName -f ./access-secret-key-file -a :0:subnet-15fa057e:"NSIP":10.20.15.21 -a :1:subnet-1547ba7e:"CLIENT-SIDE":10.20.10.21::::"10.20.10.22,10.20.10.23,10.20.10.24,10.20.10.25,10.20.10.26,10.20.10.27,10.20.10.28,10.20.10.29,10.20.10.30" -a :2:subnet-cc47baa7:"SERVER-SIDE":10.20.1.21::::"10.20.1.22,10.20.1.23,10.20.1.24,10.20.1.25,10.20.1.26,10.20.1.27,10.20.1.28,10.20.1.29,10.20.1.30"
Following is an example of launching a secondary VPX instance with a single ENI:

C:\aws-vpc-config>ec2-run-instances ami-bd2986d4 -n 1 -t m1.large -k keyPairName -f access-secret-key-file -a :0:subnet-15fa057e:"NSIP":10.20.15.31
Note: The access-secret-key-file argument contains the access and secret key. (You cannot change the access-secret-key-file associated with a VPC instance after it is created.)
After the two NetScaler instances are UP, configure the HA pairing on both the instances. You have to configure the instance with two or more ENIs before configuring HA on the instance with one ENI. Use the add HA node command, from within the NetScaler CLI, or from the NetScaler GUI. For example:

On the VPX instance with two or more ENIs:

add HA node 1 10.20.15.31

On the VPX instance with one ENI:

add HA node 1 10.20.15.21

After you enter add HA node commands, the two nodes form an HA pair, and configuration information is synchronized between the two VPX instances.

To remove HA from NetScaler VPX pair

You can remove HA configuration from the NetScaler VPX pair by using the remove ha node command. You have to remove the HA configuration from the secondary NetScaler VPX before removing the HA configuration from the primary NetScaler VPX.
For example, on the Secondary NetScaler VPX instance, at the NetScaler command line, type:

remove ha node

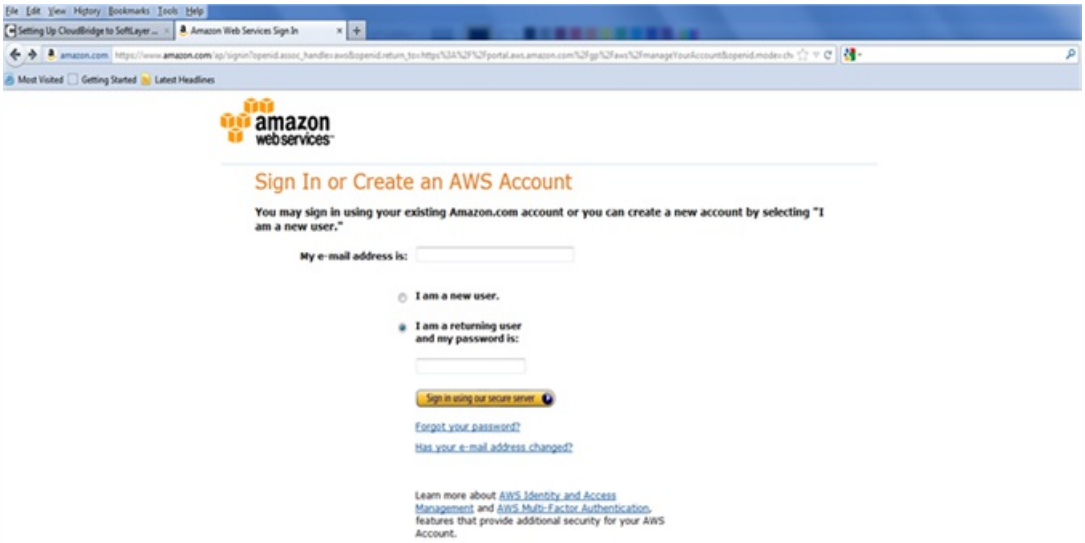
save config

On the Primary NetScaler VPX instance, at the NetScaler command line, type:

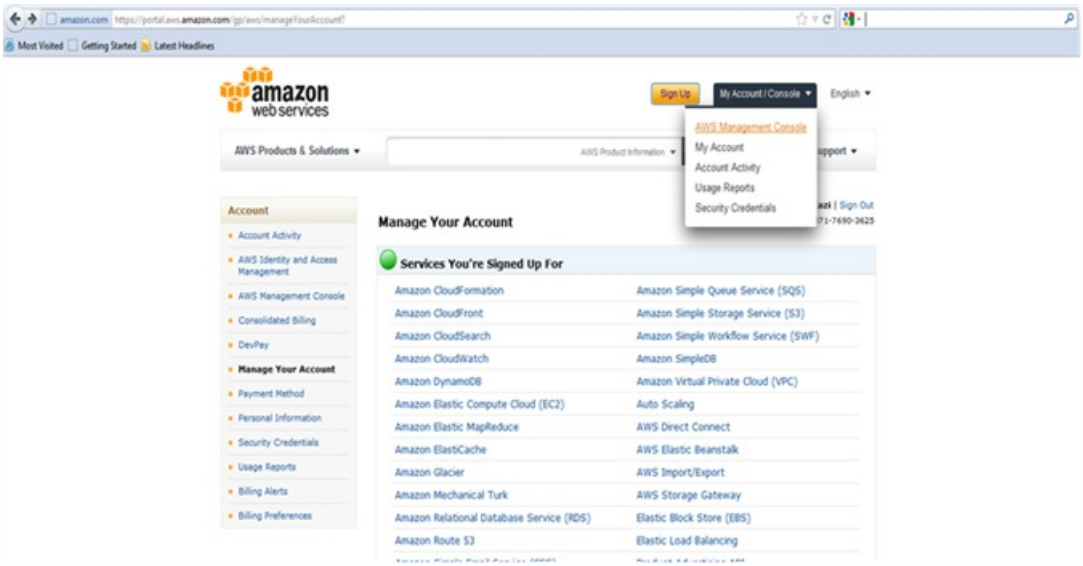
remove ha node

save config

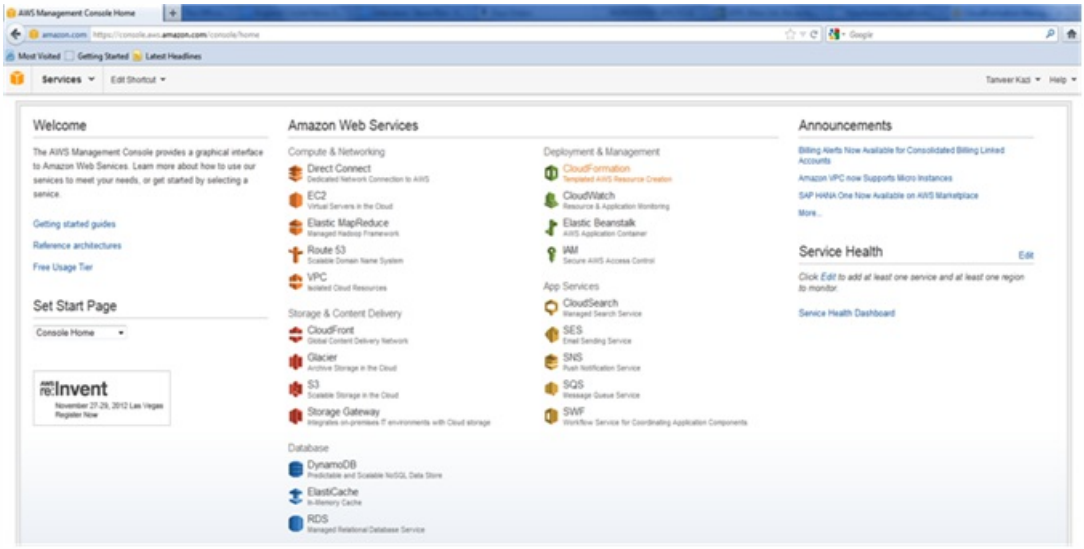
1. In a web browser, open the website at www.aws.amazon.com and log on with AWS credentials.



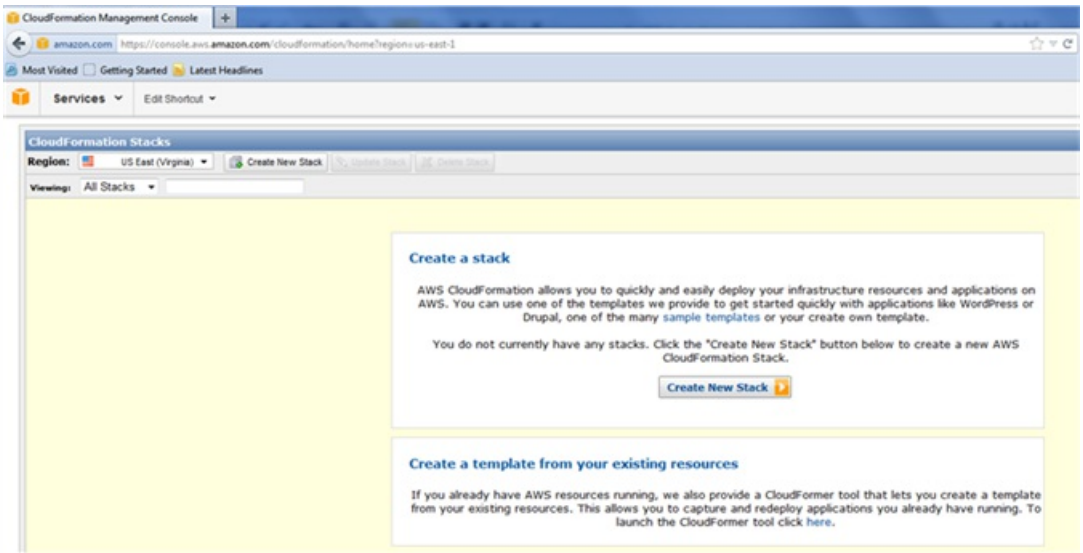
2. Click My Account/Console, and then click AWS Management Console.



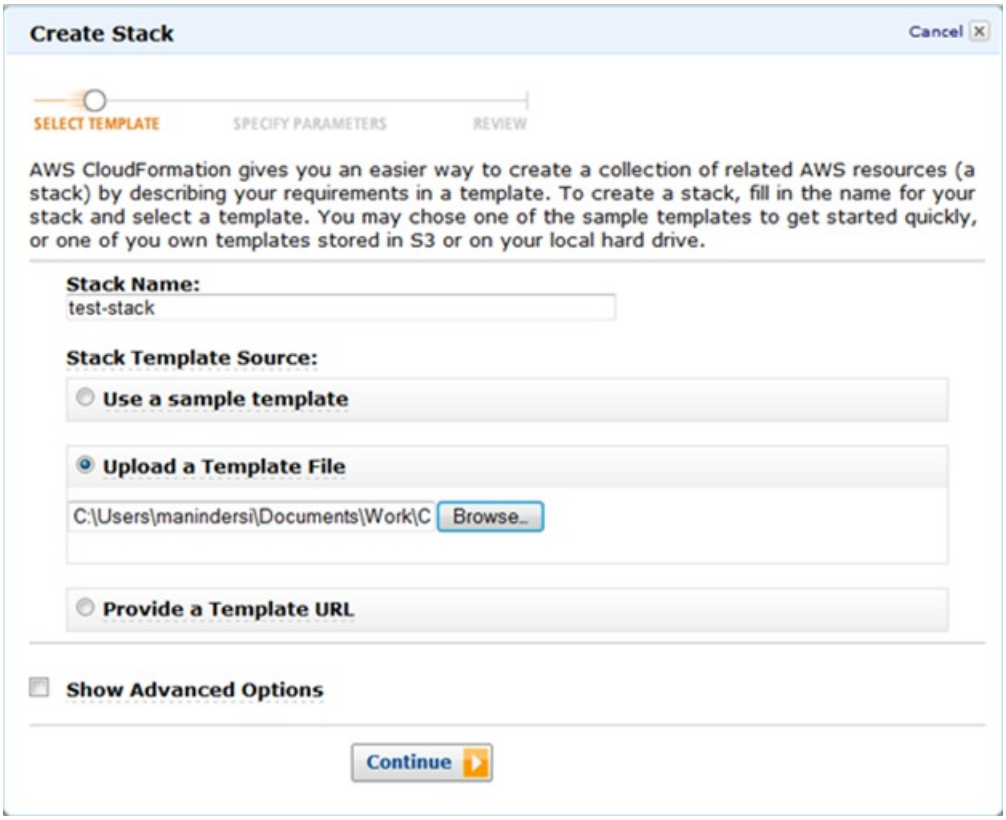
3. On the Amazon Web Services page, in the Deployment & Management section, click Cloud Formation.



4. On the CloudFormation Stacks page, select the Region in which you plan to deploy the NetScaler VPX instance, and then click Create New Stack.

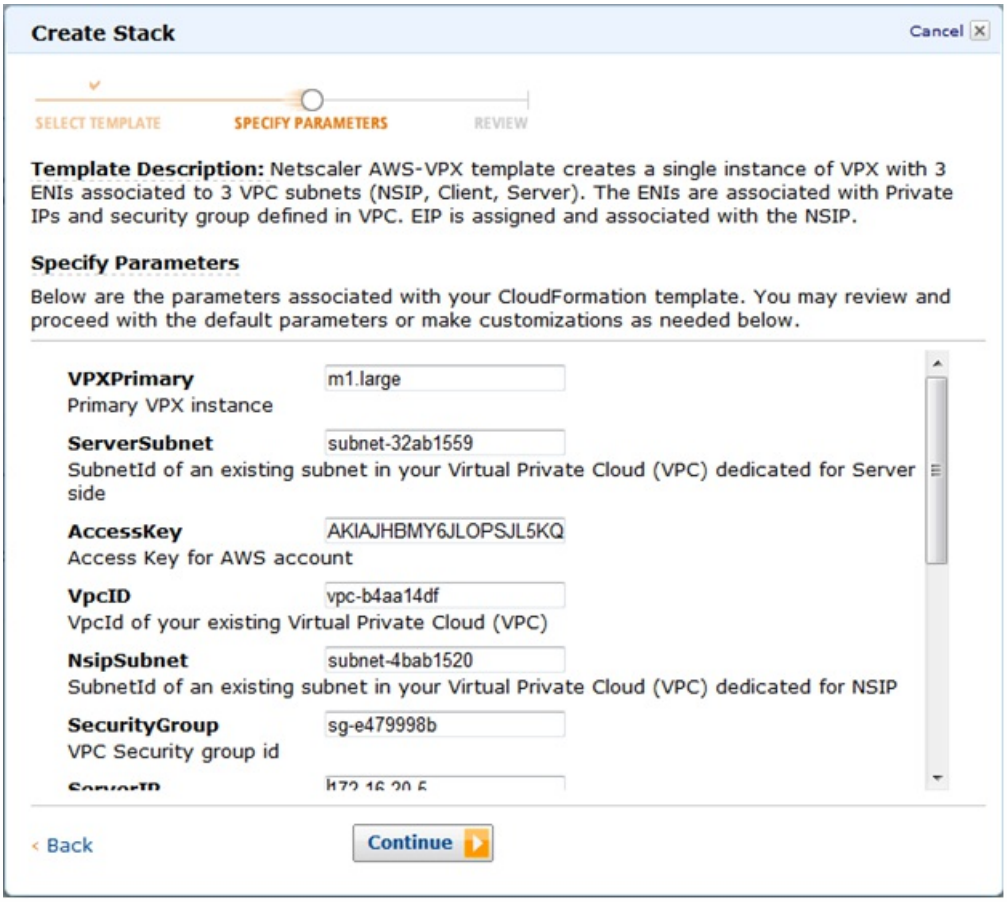


5. In the Create Stack dialog box, specify value for Stack Name, select the Upload a Template File option, and then click Browse. Select the template for HA NetScaler VPX from the local drive, and then click **Continue**.

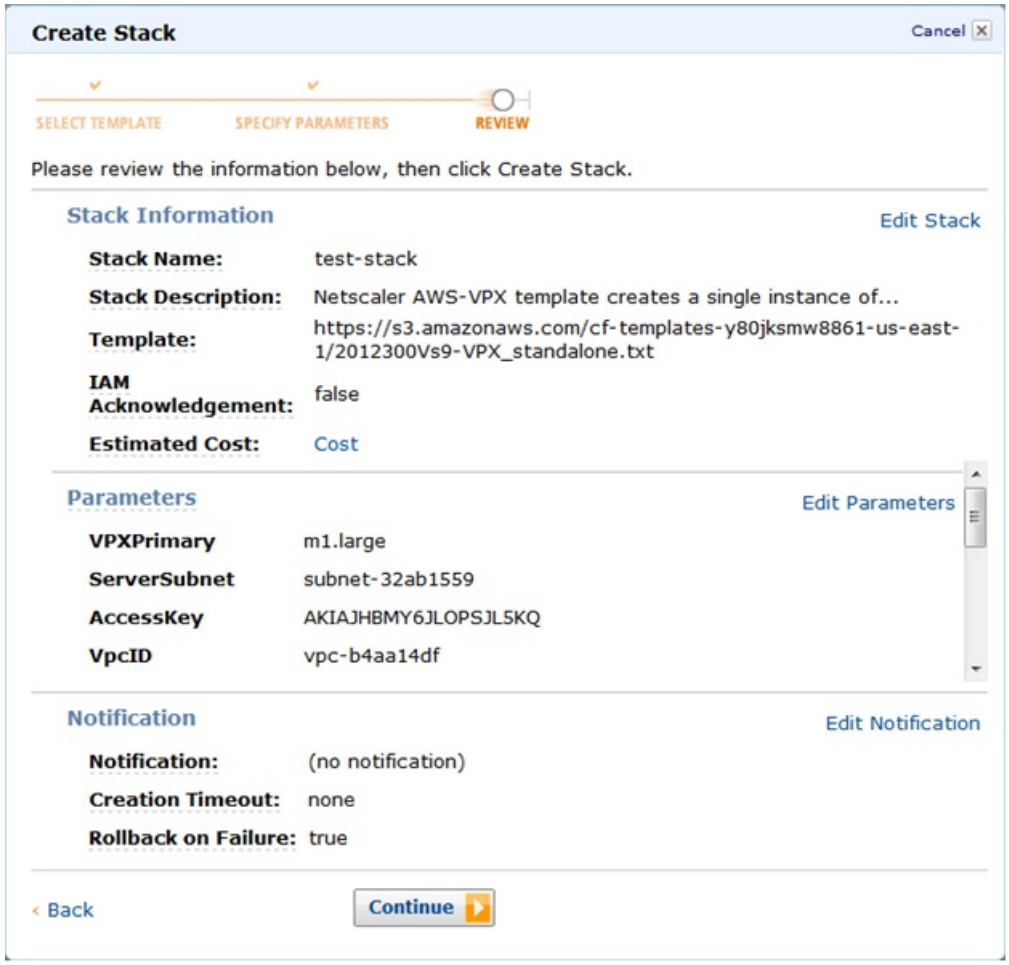


6. In the next pane, specify values for:
   - **VpcID**: An identifier to assign to the Virtual Private Cloud (VPC).
   - **NsipSubnet**: Subnet in which the NSIP is configured in VPC.
   - **ServerSubnet**: Subnet in which the server farm is configured in VPC.
   - **ClientSubnet**: SubnetId in which the client side is configured in VPC.
   - **SecurityGroup**: VPC Security group id.
   - **VPXPrimary**: Name of Primary VPX instance type.
   - **AccessKey**: Access Key for IAM user account.
   - **SecretKey**: Secret Key for IAM user account.
   - **TenancyType**: Instance tenancy type, can be default or dedicated.
   - **NsIP**: Private IP assigned to the NSIP ENI. The last octet of NSIP should be between 5 and 254.
   - **NsIPSec**: Private IP assigned to the NSIP ENI of Secondary. last octet has to be between 5 and 254.
   - **ServerIP**: Private IP assigned to the Server ENI. The last octet should be between 5 and 254.
   - **ClientIP**: Private IP assigned to the Client ENI. The last octet should be between 5 and 254.
   - **KeyName**: Name of an existing EC2 KeyPair to enable SSH access to the instances.

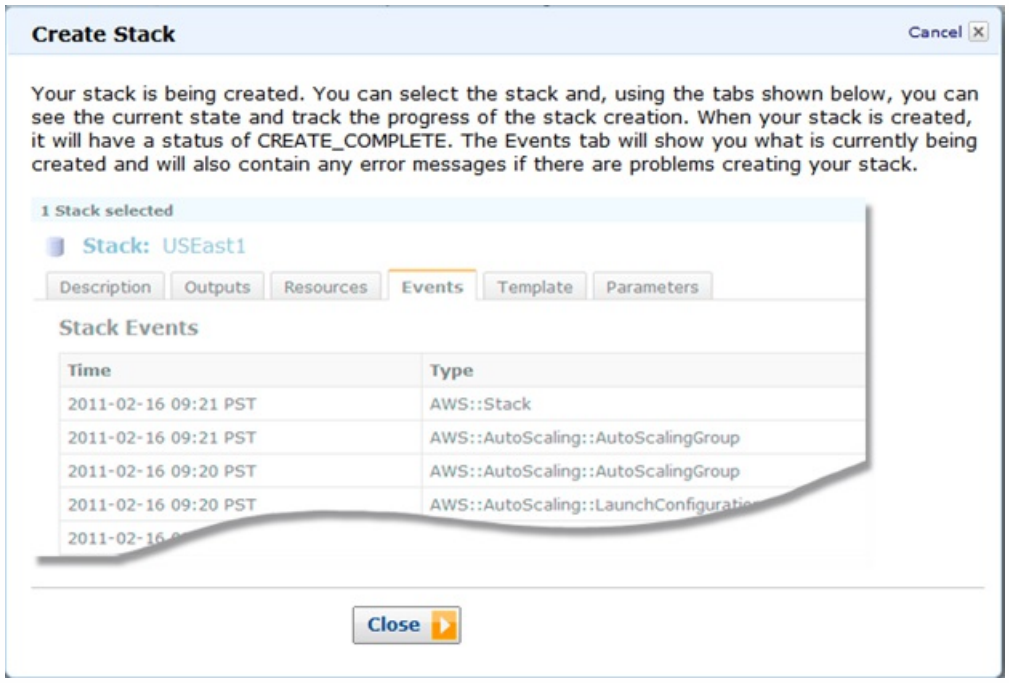
   Note: Make sure that the VPC, subnets, security groups, routes associations, gateway associations are already configured.



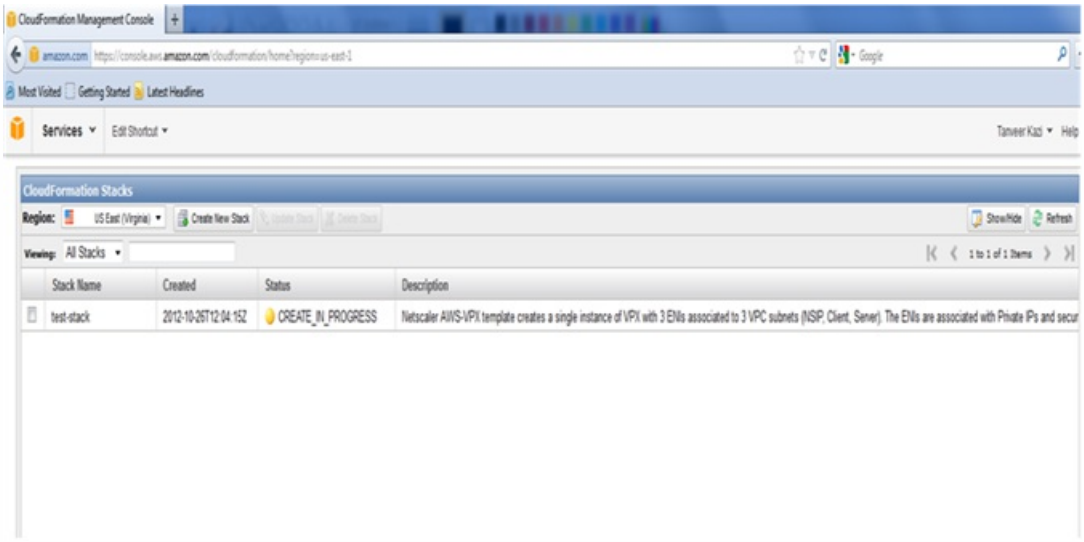
7. Click Continue.
8. Review the specified values in the Create Stack dialog box.



9. Click Continue to create a Stack.



10. Click Close to close the Create Stack dialog box.
11. The new stack that you created appears on the CloudFormation Stacks page.



Upgrading a NetScaler VPX instance on AWS

Apr 22, 2014

You can upgrade the EC2 instance type, throughput, software edition, and the system software of a NetScaler VPX running on AWS. For certain types of upgrades, Citrix recommends using the High Availability Configuration method to minimize downtime.

Note:

- NetScaler software release 10.1.e-124.1308.e or later for a NetScaler VPX AMI (including both utility license and customer license) does not support the M1 and M2 instance families.
- Because of changes in NetScaler instance support, downgrading from 10.1.e-124 or a later release to 10.1.123.x or an earlier release is not supported.
- Most of the upgrades do not require the launch of a new AMI, and the upgrade can be done on the current NetScaler AMI instance. If you do want to upgrade to a new NetScaler AMI instance, use the high availability configuration method.

Updated: 2014-04-22

If your NetScaler VPX instances are running release 10.1.e-124.1308.e or later, you can change the EC2 instance type from the AWS console as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

You can also use the above procedure to change the EC2 instance type for a release, earlier than 10.1.e-124.1308.e, unless you want to change the instance type to M3. In that case, you must first follow the standard NetScaler upgrade procedure, at Upgrading or Downgrading the System Software, to upgrade the NetScaler software to 10.1.e-124 or a later release, and then follow the above steps.

Updated: 2014-04-22

To upgrade the software edition (for example, to upgrade from standard to platinum edition) or throughput (for example, to upgrade from 200 mbps to 1000mbps), the method depends on the instance's license.

Using a customer license (Bring-Your-Own-License)

If you are using a customer license, you can purchase and download the new license from the Citrix Licensing portal (MyCitrix), and then install the license on the VPX instance. For more information about downloading and installing a license from the MyCitrix portal, see the VPX Licensing Guide.

Using a utility license (Utility license with hourly fee)

AWS does not support direct upgrades for fee-based instances. To upgrade the software edition or throughput of a fee based NetScaler VPX instance, launch a new AMI with the desired license and capacity and migrate the older instance configuration to the new instance. This can be achieved by using a NetScaler high availability configuration as described in "Upgrading to a New NetScaler AMI Instance by Using a NetScaler High Availability Configuration."

Updated: 2014-04-22

If you need to upgrade a NetScaler instance running 10.1.e-124.1308.e or a later release, follow the standard NetScaler upgrade procedure at Upgrading or Downgrading the System Software.

If you need to upgrade a NetScaler instance running a release older than 10.1.e-124.1308.e to 10.1.e-124.1308.e or a later release, first upgrade the system software, and then change the instance type to M3 as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

Updated: 2014-04-22

To use the high availability method of upgrading to a new NetScaler AMI instance, perform the following tasks:

- Create a new instance with the desired EC2 instance type, software edition, throughput, or software release from the AWS marketplace.
- Configure high availability between the old instance (to be upgraded) and the new instance. After high availability is configured between the old and the new instance, configuration from the old instance is synchronized to the new instance.
- Force an HA failover from the old instance to the new instance. As a result, the new instance becomes primary and starts receiving traffic.
- Stop, and reconfigure or remove the old instance from AWS.

Prerequisites and Points to Consider

- Make sure you understand how high availability works between two NetScaler VPX instances on AWS. For more information about high availability configuration between two NetScaler VPX instances on AWS, see High Availability.
- You must create the new instance in the same availability zone as the old instance, having the exact same security group and subnet.
- High availability setup requires access and secret keys associated with the user's AWS Identity and Access Management (IAM) account for both instances. If the correct key information is not used when creating VPX instances, the HA setup fails. For more information about creating an IAM account for a VPX instance, see Creating an IAM Account.
- You must use the EC2 console to create the new instance. You cannot use the AWS 1-click launch, because it does not accept the access and secret keys as the input.
- The new instance should have only one ENI interface.

To upgrade a NetScaler VPX Instance by using a high availability configuration

1. Configure high availability between the old and the new instance. To configure high availability between two NetScaler VPX instances, at the NetScaler command prompt of each intance, type:
   - add ha node <nodeID> <IPaddress of the node to be added>
   - save config

   Example

   At the NetScaler command prompt of the old instance, type:
   > add ha node 30 192.0.2.30
   Done

At the NetScaler command prompt of the new instance, type:

```
> add ha node 10 192.0.2.10
Done
```

Note the following:

- In the HA setup, the old instance is the primary node and the new instance is the secondary node.
- The NSIP IP address is not copied from the old instance to the new instance. Therefore, after the upgrade, your new instance has a different management IP address from the previous one.
- The nsroot account password of the new instance is set to that of the old instance after HA synchronization.

For more information about high availability configuration between two NetScaler VPX instances on AWS, see High Availability.

2. Force an HA failover. To force a failover in a high availability configuration, at the NetScaler command prompt of either of the instances, type:
   - force HA failover

   As the result of forcing a failover, the ENIs of the old instance are migrated to the new instance and traffic flows through the new instance (the new primary node). The old instance (the new secondary node) restarts.

   If the following warning message appears, type N to abort the operation:

   ```
   WARNING]:Force Failover may cause configuration loss, peer health not optimum. Reason(s):
   HA version mismatch
   HA heartbeats not seen on some interfaces
   Please confirm whether you want force-failover (Y/N)?
   ```

   The warning message appears because the system software of the two VPX instances is not HA compatible. As a result, the configuration of the old instance cannot be automatically synced to the new instance during a forced failover.

   Following is the workaround for this issue:

   1. At the NetScaler shell prompt of the old instance, type the following command to create a backup of the configuration file (ns.conf):
      - copy /nsconfig/ns.conf to /nsconfig/ns.conf.bkp
   2. Remove the following line from the backup configuration file (ns.conf.bkp):
      - set ns config -IPAddress <IP> -netmask <MASK>
        For example, set ns config -IPAddress 192.0.2.10 -netmask 255.255.255.0
   3. Copy the old instance's backup configuration file (ns.conf.bkp) to the /nsconfig directory of the the new instance.
   4. At the NetScaler shell prompt of the new instance, type the following command to load the old instance's configuration file (ns.conf.bkp) on the new instance:
      - batch -f /nsconfig/ns.conf.bkp
   5. Save the configuration on the new instance.
      - Save conifg
   6. At the NetScaler command prompt of either of the nodes, type the following command to force a failover, and then type Y for the warning message to confirm the force failover operation:
      - force ha failover

      Example

      ```
      > force ha failover

      WARNING]:Force Failover may cause configuration loss, peer health not optimum.
      ```

```
Reason(s):
HA version mismatch
HA heartbeats not seen on some interfaces
Please confirm whether you want force-failover (Y/N)? Y
```

3. Remove the HA configuration, so that the two instances are no longer in an HA configuration. First remove the HA configuration from the secondary node and then remove the HA configuration from the primary node.
   To remove an HA configuration between two NetScaler VPX instances, at the command prompt of each instance, type:

   - remove ha node <nodeID>
   - save config

   For more information about high availability configuration between two NetScaler instances on AWS, see High Availability.

   Example

   At the NetScaler command prompt of the old instance (new secondary node), type:

```
> remove ha node 30
  Done
> save config
  Done
```

   At the NetScaler command prompt of the new instance (new primary node), type:

```
> remove ha node 10
  Done
> save config
  Done
```

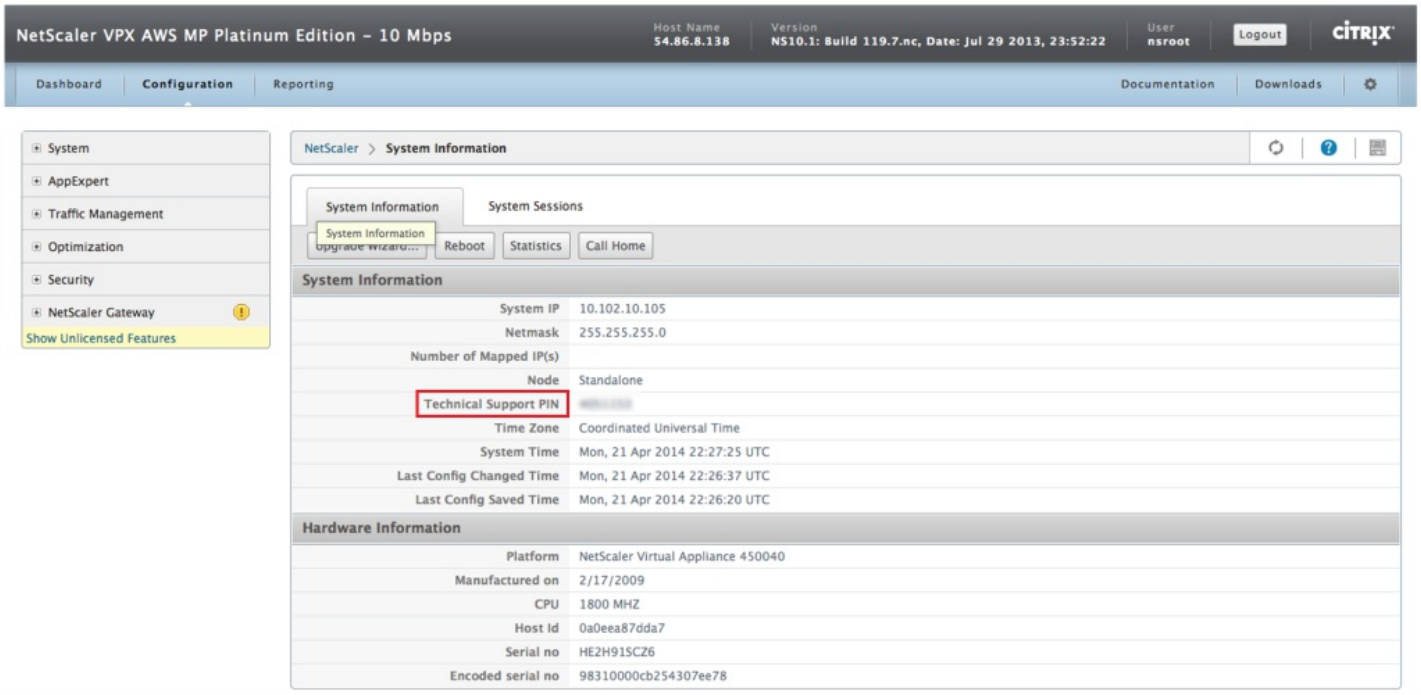
Troubleshooting the NetScaler VPX on AWS

Apr 28, 2014

Amazon does not provide console access to a NetScaler VPX virtual instance. To troubleshoot, you have to use the AWS GUI to view the activity log. You can debug only if the network is connected. To view an instance's system log, right-click the instance and select system log.

Citrix provides support for fee based NetScaler VPX instances (utility license with hourly fee) on AWS. To file a support case, find your AWS account number and support PIN code, and call Citrix support. You will also be asked for your name and email address. To find the support PIN, log on to the NetScaler configuration utility and navigate to the System page.

Here is an example of a system page showing the support PIN.



Configuring the Basic System Settings

Aug 23, 2013

After installing a Citrix NetScaler virtual appliance, you need to access it to configure the basic settings. Initially, you must access the NetScaler command line through the respective management application of the virtualization host (either Citrix XenCenter for Citrix XenServer or VMware vSphere client for VMware ESX) to specify a NetScaler IP (NSIP) address, subnet mask, and default gateway. The NSIP is the management address at which you can then access the NetScaler command line, through an SSH client, or access the configuration utility. You can use either of these access methods, or the console, to continue with basic configuration.

To access the configuration utility, type the NSIP into the address field of any browser (for example, http://<NSIP_address>). You need Java RunTime Environment (JRE) version 1.6 or later.

Updated: 2013-08-23

Your first task after installing a NetScaler virtual appliance on a virtualization host is to use the NetScaler virtual appliance console in the XenCenter client or vSphere client to configure the following initial settings.

Note: If you have installed a virtual appliance on XenServer by using Command Center, you do not have to configure these settings. Command Center implicitly configures the settings during installation. For more information about provisioning virtual appliance from Command Center, see the "Command Center" documentation.

NetScaler IP address (NSIP):

The IP address at which you access a NetScaler or a NetScaler virtual appliance for management purposes. A physical NetScaler or virtual appliance can have only one NSIP. You must specify this IP address when you configure the virtual appliance for the first time. You cannot remove an NSIP address.

Netmask:

The subnet mask associated with the NSIP address.

Default Gateway:

You must add a default gateway on the virtual appliance if you want access it through SSH or the configuration utility from an administrative workstation or laptop that is on a different network.

To configure the initial settings on the virtual appliance through the virtual appliance Console by using the management application

1. Connect to the XenServer or VMware ESX server on which the virtual appliance is installed by using XenCenter or vSphere client, respectively.
2. In the details pane, on the Console tab, log on to the virtual appliance by using the administrator credentials.
3. At the prompts, enter the NSIP address, subnet mask, and default gateway, and then save the configuration.

After you have set up an initial configuration through the NetScaler virtual appliance Console in the management application, you can use either the NetScaler command-line interface or the configuration utility to complete the configuration or to change the initial settings.

Updated: 2013-08-23

You can use the command line interface to set up the NSIP, Mapped IP (MIP), Subnet IP (SNIP), and hostname. You can also configure advanced network settings and change the time zone.

To complete initial configuration by using the command line interface

1. Use either the SSH client or the NetScaler virtual appliance Console in XenCenter to access the command line interface.
2. Log on to the virtual appliance, using the administrator credentials.
3. At the command prompt, type config ns to run the configuration script.
4. To complete the initial configuration, follow the prompts.

You have now completed the basic configuration of the virtual appliance. To continue the configuration process, choose one of the following options:

Citrix NetScaler Load Balancing Switch

If you are configuring the virtual appliance as a standard NetScaler load balancing switch with other licensed features, see "Traffic Management."

Citrix NetScaler Application Firewall

If you are configuring the virtual appliance as a standalone application firewall, see "Application Firewall."

For more information about the various features supported on the NetScaler virtual appliance, see Features at a Glance.

Updated: 2013-08-23

To use the Setup Wizard to set up the NetScaler virtual appliance, you must access the configuration utility from your Web browser. You can use the Setup Wizard to configure the NSIP, MIP, SNIP, hostname, and default gateway. You can also configure settings for a Web application by using an application template. You can also configure the appliance as a load balancer for Citrix XenDesktop or Citrix XenApp.

For information about application templates, see "AppExpert."

For information about the load balancing feature of a virtual appliance, see "Traffic Management."

To configure initial settings by using the configuration utility

1. In the address field of a Web browser, type: http://<NSIP address>
2. In User Name and Password, type the administrator credentials.
3. In Deployment Type, select NetScaler ADC.
4. In Start in, select Configuration, and then click Login.
5. In the Setup Wizard, click Next and follow the instructions.

You have now completed the basic configuration of the virtual appliance. To continue the configuration process, choose one of the following options:

Citrix NetScaler Load Balancing Switch

If you are configuring the virtual appliance as a standard NetScaler load balancing switch with other licensed features, see "Traffic Management."

Citrix NetScaler Application Firewall

If you are configuring the virtual appliance as a standalone application firewall, see "Application Firewall."

For more information about the various features supported on the NetScaler virtual appliance, see Features at a Glance.

Understanding Common Network Topologies

Sep 04, 2013

As described in "Physical Deployment Modes," you can deploy the Citrix NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

This document includes the following:

- Setting Up Common Two-Arm Topologies
- Setting Up Common One-Arm Topologies

Updated: 2013-06-24

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

Setting Up a Simple Two-Arm Multiple Subnet Topology

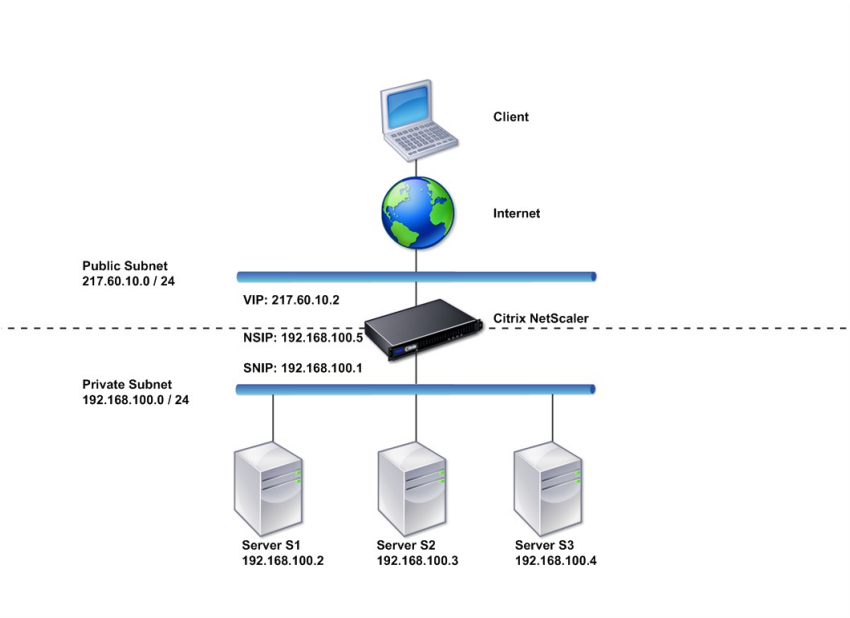
Updated: 2013-10-01

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler appliance in two-arm mode with multiple subnets

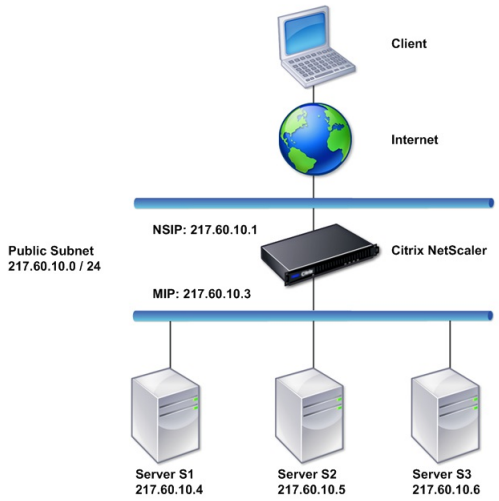
1. Configure the NSIP and default gateway, as described in "Configuring the NetScaler IP Address (NSIP)."
2. Configure the SNIP, as described in "Configuring Subnet IP Addresses."
3. Enable the USNIP option, as described in "To enable or disable USNIP mode."
4. Configure the virtual server and the services, as described in "Creating a Virtual Server" and "Configuring Services."
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

Setting Up a Simple Two-Arm Transparent Topology

Updated: 2013-09-16

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode



Task overview: To deploy a NetScaler in two-arm, transparent mode

1. Configure the NSIP, MIP, and default gateway, as described in "Configuring a NetScaler by Using the Command Line Interface."
2. Enable L2 mode, as described in "Enabling and Disabling Layer 2 Mode."
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

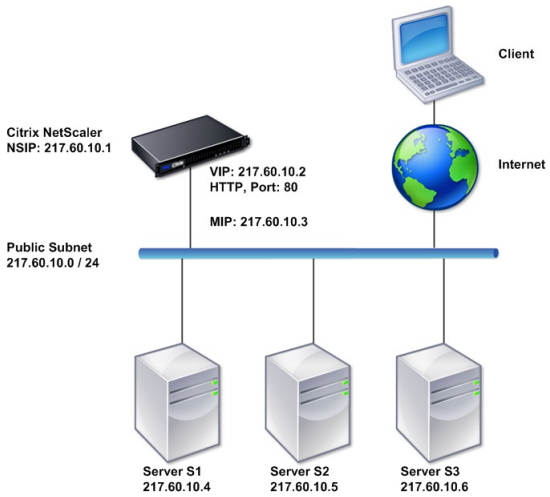
The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

Setting Up a Simple One-Arm Single Subnet Topology

Updated: 2013-08-23

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on a NetScaler, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet



Task overview: To deploy a NetScaler in one-arm mode with a single subnet

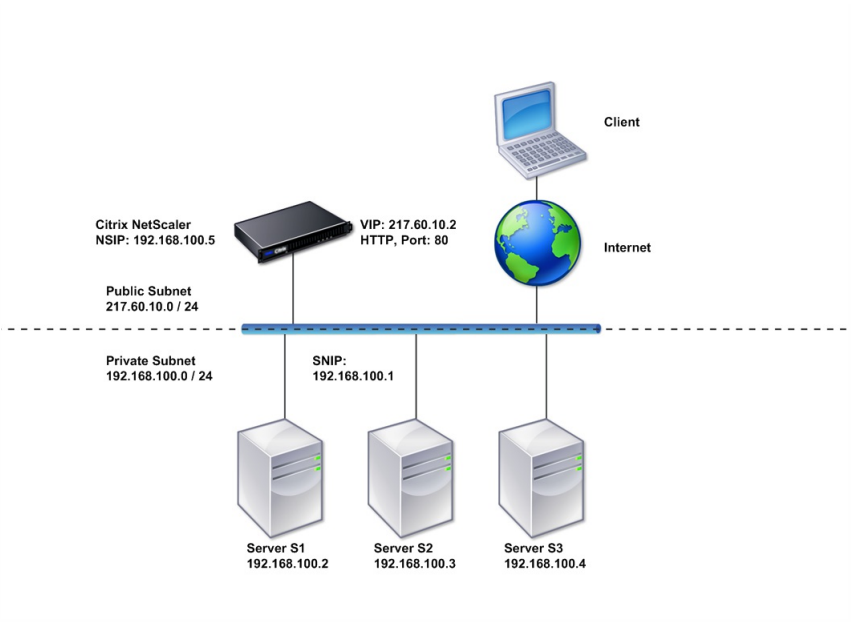
1. Configure the NSIP, MIP, and the default gateway, as described in "Configuring the NetScaler IP Address (NSIP)".
2. Configure the virtual server and the services, as described in "Creating a Virtual Server" and "Configuring Services".
3. Connect one of the network interfaces to the switch.

Setting Up a Simple One-Arm Multiple Subnet Topology

Updated: 2013-08-23

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler appliance in one-arm mode with multiple subnets

1. Configure the NSIP and the default gateway, as described in "Configuring the NetScaler IP Address (NSIP)".
2. Configure the SNIP and enable the USNIP option, as described in "Configuring Subnet IP Addresses".
3. Configure the virtual server and the services, as described in "Creating a Virtual Server" and "Configuring Services".
4. Connect one of the network interfaces to the switch.

Configuring System Management Settings

Sep 04, 2013

Once your initial configuration is in place, you can configure settings to define the behavior of the Citrix NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the NetScaler clock with a Network Time Protocol (NTP) server. The NetScaler can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

This document includes the following:

- Configuring System Settings
- Configuring Modes of Packet Forwarding
- Configuring Network Interfaces
- Configuring Clock Synchronization
- Configuring DNS
- Configuring SNMP
- Verifying the Configuration

Note: In addition to the tasks listed above, you can configure Syslog logging. For instructions, see "Audit Logging."

Configuring System Settings

Sep 04, 2013

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler configuration utility.

You can modify the types of HTTP parameters described in the following table.

Table 1. HTTP Parameters

Parameter Type	Specifies
HTTP Port Information	The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port. Note: If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.
Limits	The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set Max Connections to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set Max Requests to 0. Note: If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.
Client IP Insertion	Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a mapped IP address or a subnet IP address, the server identifies it as the client's IP address. Some applications need the client's IP address for logging purposes or to dynamically determine the content to be served by the web server. You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the

Parameter Type	Specifies
	inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).
Cookie Version	The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.
Requests/Responses	Options for handling certain types of requests, and enable/disable logging of HTTP error responses.
Server Header Insertion	Insert a server header in NetScaler-generated HTTP responses.

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Settings, click Change HTTP parameters.
3. In the Configure HTTP parameters dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click OK.

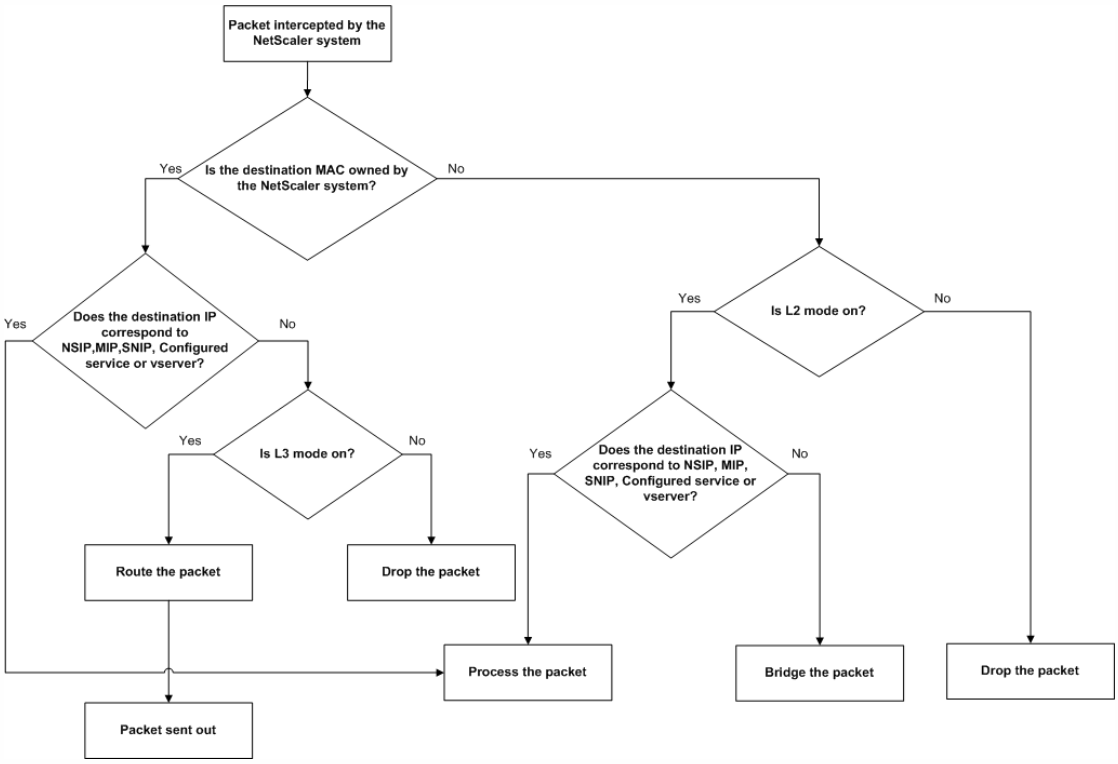
1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Settings, click Change global system settings.
3. Under FTP Port Range, in the Start Port and End Port text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click OK.

Configuring Modes of Packet Forwarding

Jun 24, 2013

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes



An appliance can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Updated: 2013-09-13

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent

bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

To enable or disable Layer 2 mode by using the command line interface

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

Examples

```
> enable ns mode l2
 Done
> show ns mode

    Mode              Acronym       Status
    -------           -------       ------
 1)  Fast Ramp          FR           ON
 2)  Layer 2 mode        L2           ON
 .
 .
 .
 Done
>

> disable ns mode l2
 Done
> show ns mode

    Mode              Acronym       Status
    -------           -------       ------
 1)  Fast Ramp          FR           ON
 2)  Layer 2 mode        L2           OFF
 .
 .
 .
 Done
>
```

To enable or disable Layer 2 mode by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 2 mode, select the Layer 2 Mode check box. To disable Layer 2 mode, clear the check box.

4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

Updated: 2013-09-13

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

To enable or disable Layer 3 mode by using the command line interface

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

Examples

```
> enable ns mode l3
 Done
> show ns mode

   Mode                 Acronym       Status
   -------              -------       ------
1) Fast Ramp              FR            ON
2) Layer 2 mode           L2            OFF
.
.
.
9) Layer 3 mode (ip forwarding)  L3          ON
.
.
.
 Done
>

> disable ns mode l3
 Done
> show ns mode

   Mode                 Acronym       Status
   -------              -------       ------
1) Fast Ramp              FR            ON
2) Layer 2 mode           L2            OFF
.
```

.
.
9) Layer 3 mode (ip forwarding) L3 OFF
.
.
.
Done
>

To enable or disable Layer 3 mode by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 3 mode, select the Layer 3 Mode (IP Forwarding) check box. To disable Layer 3 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

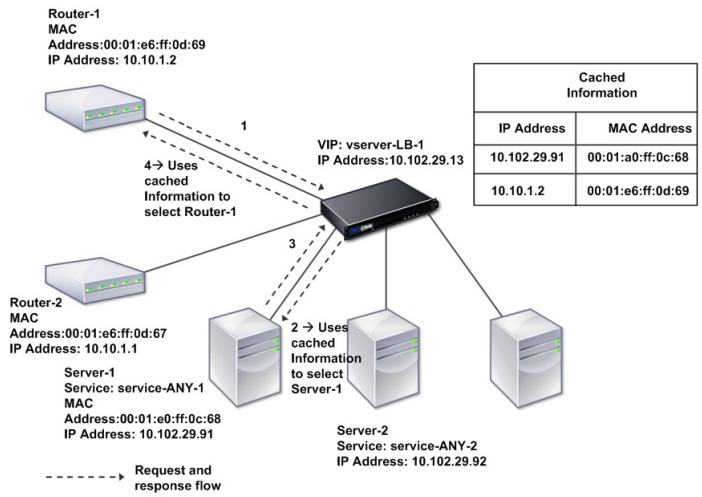
Updated: 2013-09-13

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

Figure 2. MAC-Based Forwarding Process



When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance's default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

To enable or disable MAC-based forwarding by using the command line interface

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode

Example

```
> enable ns mode mbf
 Done
> show ns mode

   Mode                Acronym        Status
   -------             -------        ------
1) Fast Ramp             FR             ON
2) Layer 2 mode          L2             OFF
.
.
.
6) MAC-based forwarding      MBF            ON
.
.
.
Done
>

> disable ns mode mbf
```

```
Done
> show ns mode

   Mode                Acronym        Status
   -------             -------        ------
1) Fast Ramp             FR             ON
2) Layer 2 mode           L2             OFF
.
.
.
6) MAC-based forwarding      MBF            OFF
.
.
.
Done
>
```

To enable or disable MAC-based forwarding by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features group, click Configure modes.
3. In the Configure Modes dialog box, to enable MAC-based forwarding mode, select the MAC Based Forwarding check box. To disable MAC-based forwarding mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

Configuring Network Interfaces

Aug 23, 2013

NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

The NetScaler supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The NetScaler (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs. A NetScaler supports the following types of VLANs.

Default VLAN

By default, the network interfaces on a NetScaler are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

Port-Based VLANs

A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

Tagged VLAN

A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the NetScaler and therefore must be done during initial network configuration.

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler and other connected devices. An aggregated link is also referred to as a channel.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see ""Configuring Link Aggregation by Using the Link Aggregation Control Protocol."

Configuring Clock Synchronization

Aug 23, 2013

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org.

1. Log on to the command line and enter the shell command.
2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:
   restrict localhost

   restrict 127.0.0.2

   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler.
3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.
4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.
5. Edit /nsconfig/rc.netscaler by adding the following entry: /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   Note: If the time difference between the NetScaler and the time server is more than 1000 sec, the ntpd service terminates with a message to the NetScaler log. To avoid this, you need to start ntpd with the -g option, which forcibly syncs the time. Add the following entry in /nsconfig/rc.netscaler:
   /usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

   If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the appliance and the time server by running the following command in the shell:

   ntpdate -q <IP address or domain name of the NTP server>
6. Reboot the appliance to enable clock synchronization.
   Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the rc.netscaler file in step 5) at the shell prompt:
   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ ntpd.log &

Configuring DNS

Sep 04, 2013

You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.

At the command prompt, type the following commands to add a name server and verify the configuration:

- add dns nameServer <IP>
- show dns nameServer <IP>

Example

```
> add dns nameServer 10.102.29.10
 Done
> show dns nameServer 10.102.29.10
1)      10.102.29.10  -  State: DOWN
 Done
>
```

1. Navigate to Traffic Management > DNS > Name Servers.
2. In the details pane, click Add.
3. In the Create Name Server dialog box, select IP Address.
4. In the IP Address text box, type the IP address of the name server (for example, 10.102.29.10). If you are adding an external name server, clear the Local check box.
5. Click Create, and then click Close.
6. Verify that the name server you added appears in the Name Servers pane.

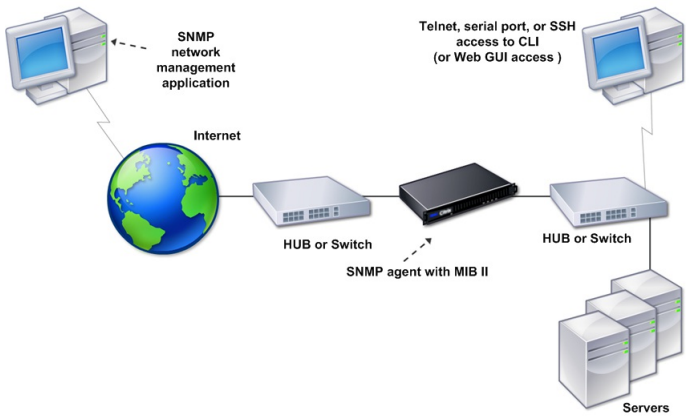
Configuring SNMP

May 14, 2012

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler that has SNMP enabled and configured.

Figure 1. SNMP on the NetScaler



The SNMP agent on a NetScaler supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the NetScaler) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler supports the following enterprise-specific MIBs:

A subset of standard MIB-2 groups

Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.

A system enterprise MIB

Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Updated: 2013-06-05

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks.

To add an SNMP manager by using the command line interface

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

- add snmp manager <IPAddress> ... [-netmask <netmask>]
- show snmp manager <IPAddress>

Example

```
> add snmp manager 10.102.29.5 -netmask 255.255.255.255
 Done
> show snmp manager 10.102.29.5
1)     10.102.29.5        255.255.255.255
 Done
>
```

To add an SNMP manager by using the configuration utility

1. In the navigation pane, expand System, expand SNMP, and then click Managers.
2. In the details pane, click Add.
3. In the Add SNMP Manager dialog box, in the IP Address text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click Create, and then click Close.
5. Verify that the SNMP manager you added appears in the Details section at the bottom of the pane.

Updated: 2013-09-13

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the command line interface

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- add snmp trap specific <IP>
- show snmp trap

Example

```
> add snmp trap specific 10.102.29.3
```

```
 Done
> show snmp trap
Type    DestinationIP   DestinationPort  Version  SourceIP     Min-Severity  Community
----    -------------   ---------------  -------  --------     ------------  ---------
generic  10.102.29.9    162          V2     NetScaler IP  N/A        public
generic  10.102.29.5    162          V2     NetScaler IP  N/A        public
generic  10.102.120.101  162          V2     NetScaler IP  N/A        public
.
.
.
specific 10.102.29.3    162          V2     NetScaler IP   -         public
 Done
>
```

To add an SNMP trap listener by using the configuration utility

1. In the navigation pane, expand System, expand SNMP, and then click Traps.
2. In the details pane, click Add.
3. In the Create SNMP Trap Destination dialog box, in the Destination IP Address text box, type the IP address (for example, 10.102.29.3).
4. Click Create and then click Close.
5. Verify that the SNMP trap you added appears in the Details section at the bottom of the pane.

Updated: 2013-09-13

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the command line interface

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

- set snmp alarm <trapName> [-state ENABLED | DISABLED]
- show snmp alarm <trapName>

Example

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
 Done
> show snmp alarm LOGIN-FAILURE
  Alarm        Alarm Threshold  Normal Threshold  Time  State    Severity   Logging
```

```
  -----         ---------------  ----------------  ----  --------  ---------  --------
 1) LOGIN-FAILURE  N/A           N/A           N/A   ENABLED   -       ENABLED
 Done
>
```

To set the severity of the alarm by using the command line interface

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- set snmp alarm <trapName> [-severity <severity>]
- show snmp alarm <trapName>

Example

```
> set snmp alarm LOGIN-FAILURE -severity Major
 Done
> show snmp alarm LOGIN-FAILURE
  Alarm         Alarm Threshold  Normal Threshold  Time  State    Severity   Logging
  -----         ---------------  ----------------  ----  --------  ---------  --------
 1) LOGIN-FAILURE  N/A           N/A           N/A   ENABLED   Major     ENABLED
 Done
>
```

To configure alarms by using the configuration utility

1. In the navigation pane, expand System, expand SNMP, and then click Alarms.
2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click Open.
3. In the Configure SNMP Alarm dialog box, to enable the alarm, select Enabled in the State drop-down list. To disable the alarm, select Disabled.
4. In the Severity drop-down list, select a severity option (for example, Major).
5. Click OK, and then click Close.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the Details section at the bottom of the pane.

Verifying the Configuration

Nov 08, 2013

After you finish configuring your system, complete the following checklists to verify your configuration.

Configuration Checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured mapped IP addresses is: _____
  - The expected number of simultaneous server connections is:
    [ ] 62,000 [ ] 124,000 [ ] Other_____

Topology Configuration Checklist

- The routes have been used to resolve servers on other subnets.

  The routes entered are:

  _____

- If the NetScaler is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the NetScaler resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

  _____

- If the NetScaler is placed behind an external load balancer, then the load balancing policy on the external load balancer is not "least connection."
  The load balancing policy configured on the external load balancer is:

  _____

- If the NetScaler is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.
  Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.
  The value configured for the session time-out is: _____

Server Configuration Checklist

- "Keep-alive" has been enabled on all the servers.
  The value configured for the keep-alive time-out is: _____

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler or upstream router.) The default gateway is:

  _____

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

  _____

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.
- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler.
  The MaxConn (maximum number of connections) value that has been set is:

  _____

- If a Netscape® Enterprise Server™ is used, the maximum requests per connection parameter is set on the NetScaler. The maximum requests per connection value that has been set is:

  _____

Software Features Configuration Checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler.)
  Reason for enabling or disabling:

  _____

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)
  Reason for enabling or disabling:

  _____

- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)
  Reason for enabling or disabling:

  _____

- Do the default settings of the surge protection feature need to be changed?
  Reason for changing or not changing:

  _____

Access Checklist

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall Checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load Balancing Traffic on a NetScaler Appliance

Jun 24, 2013

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A Citrix NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

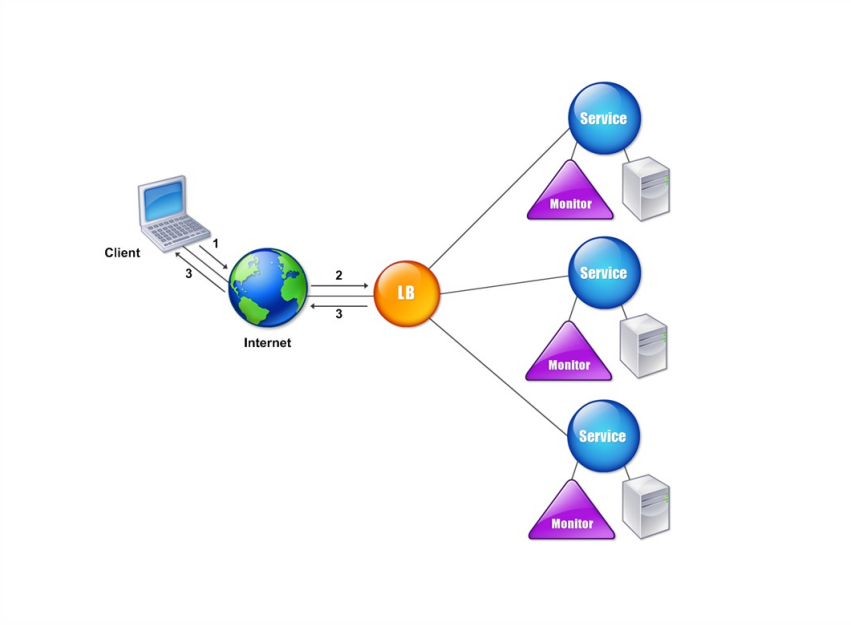
To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.

When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture



The entities function as follows:

- **Virtual server**. An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service**. A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object**. An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create

services by using the server object.

- **Monitor**. An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

Configuring Load Balancing

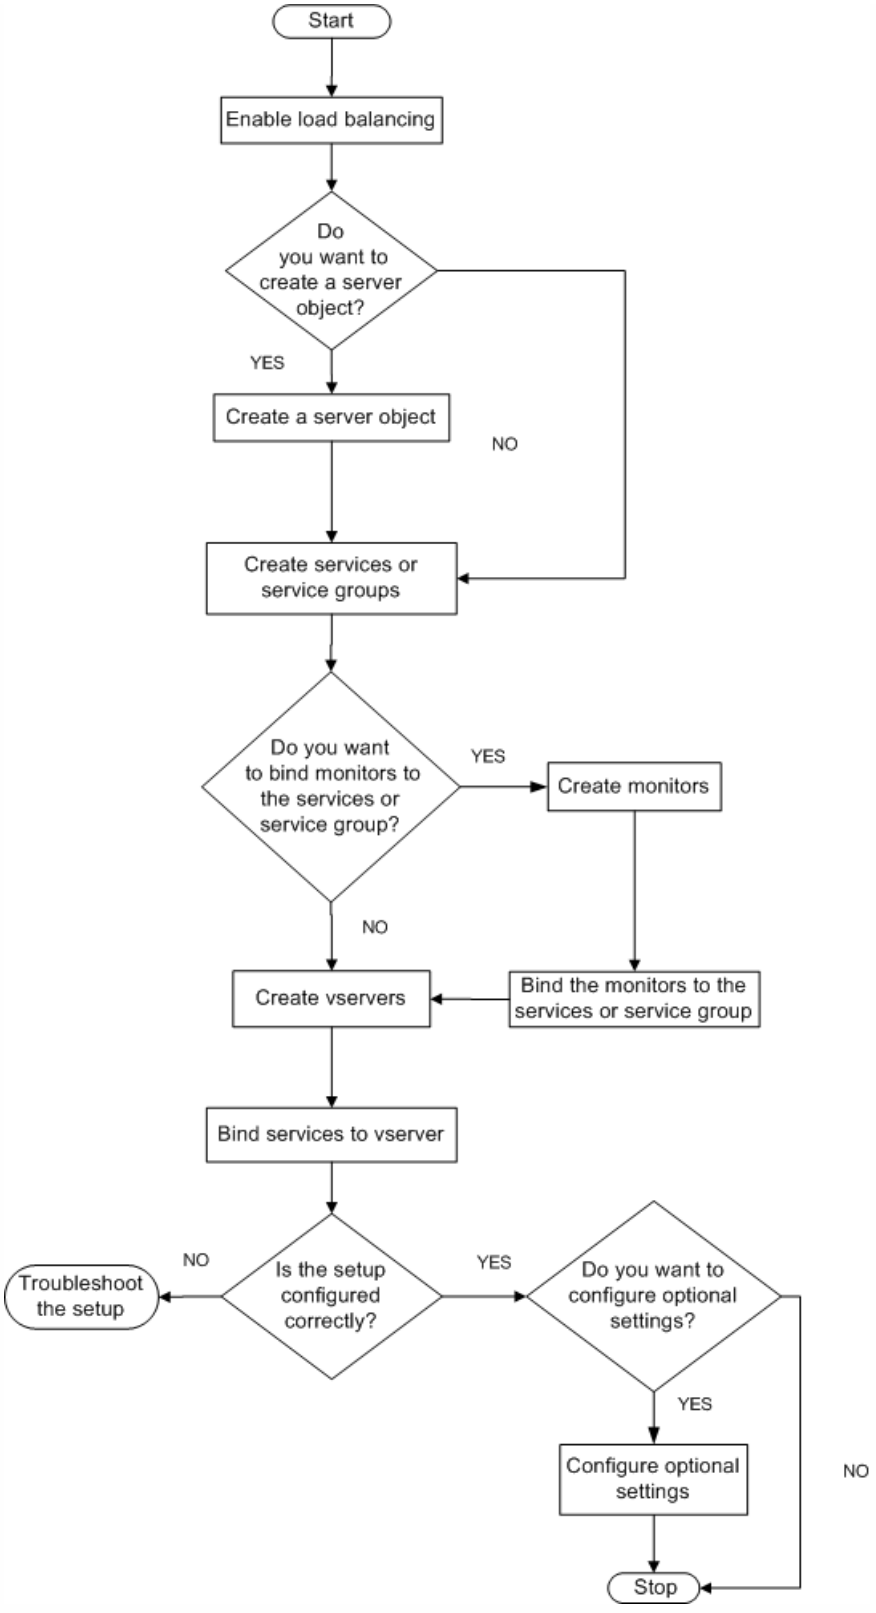
Jun 24, 2013

To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the NetScaler appliance binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the stat lb vserver <vserverName> command.
Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing



Updated: 2013-06-05

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the command line interface

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- enable feature lb
- show feature

Example

```
> enable feature lb
 Done
> show feature

   Feature             Acronym       Status
   -------             -------       ------
 1) Web Logging          WL            OFF
 2) Surge Protection     SP            OFF
 3) Load Balancing       LB            ON
 .
 .
 .
 9) SSL Offloading       SSL           ON
 .
 .
 .
Done
```

To enable load balancing by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click OK.
4. In the Enable/Disable Feature(s)? message, click Yes.

Updated: 2013-06-24

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the command line interface

At the command prompt, type the following commands to implement and verify the initial configuration:

- add service <name> <IPaddress> <serviceType> <port>
- add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]
- bind lb vserver <name> <serviceName>

- show service bindings <serviceName>
  Example

```
> add service service-HTTP-1 10.102.29.5 HTTP 80
 Done
> add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
 Done
> bind lb vserver vserver-LB-1 service-HTTP-1
 Done
> show service bindings service-HTTP-1
   service-HTTP-1 (10.102.29.5:80) - State : DOWN

      1)     vserver-LB-1 (10.102.29.60:80) - State : DOWN
 Done
```

To implement the initial load balancing configuration by using the configuration utility

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.

Choosing and Configuring Persistence Settings

Sep 04, 2013

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Table 1. Limitations on Number of Simultaneous Persistent Connections

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

Table 2. Persistence Types Available for Each Type of Virtual Server

Persistence TypeHeader 1	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom Server ID	YES	YES	NO	NO	NO
Rule	YES	YES	NO	NO	NO

Persistence Type	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
SRCIPDESTIP	N/A	N/A	YES	YES	N/A
Header 1					
DESTIP	N/A	N/A	YES	YES	N/A

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs.

Updated: 2013-08-23

When you enable persistence based on cookies, the NetScaler adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the NetScaler uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler inserts the cookie <NSC_XXXX>= <ServiceIP> <ServicePort>

where:

- <NSC_XXXX> is the virtual server ID that is derived from the virtual server name.
- <ServiceIP> is the hexadecimal value of the IP address of the service.
- <ServicePort> is the hexadecimal value of the port of the service.

The NetScaler encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.
By default, the NetScaler sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on a NetScaler, and the timeout value.
- If an HTTP cookie version 1 is used, the NetScaler inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.
If you set the timeout value to 0, the NetScaler does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can use the procedure in the following table to change the HTTP cookie version.

To change the HTTP cookie version by using the configuration utility

1. Navigate to System > Settings.
2. In the details pane, click Change HTTP Parameters.
3. In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see "Configuring Persistence Based on Cookies."

To configure persistence based on cookies by using the command line interface

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

- set lb vserver <name> -persistenceType COOKIEINSERT
- show lb vserver <name>

Example

```
> set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
 Done
> show lb vserver vserver-LB-1
   vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
   .
   .
   .
   Persistence: COOKIEINSERT (version 0)   Persistence Timeout: 2 min
   .
   .
   .
 Done
>
```

To configure persistence based on cookies by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Updated: 2013-08-23

The NetScaler can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the NetScaler extracts the server ID from the server response and embeds it in the URL query of the client request. The

server ID is an IP address and port specified as a hexadecimal number. The NetScaler extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see "Policy Configuration and Reference."

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL http://www.citrix.com/index.asp?&sid;=c0a864100050 is directed to the server with the IP address10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see "Load Balancing."

To configure persistence based on server IDs in URLs by using the command line interface

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

- set lb vserver <name> -persistenceType URLPASSIVE
- show lb vserver <name>

Example

```
> set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
 Done
> show lb vserver vserver-LB-1
   vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
    .
    .
    .
   Persistence: URLPASSIVE Persistence Timeout: 2 min
    .
    .
    .
 Done
>
```

To configure persistence based on server IDs in URLs by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.

3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configuring Features to Protect the Load Balancing Configuration

Jun 24, 2013

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Updated: 2013-06-24

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the command line interface

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:

- set lb vserver <name> -redirectURL <URL>
- show lb vserver <name>

Example

```
> set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
 Done
> show lb vserver vserver-LB-1
   vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
   State: DOWN
   Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)
   .
   .
   .
   Redirect URL: http://www.newdomain.com/mysite/maintenance
   .
   .
   .
 Done
>
```

To configure a virtual server to redirect client requests to a URL by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure URL redirection (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, http://www.newdomain.com/mysite/maintenance), and then click OK.
4. Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

Updated: 2013-06-24

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.

You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

To configure a backup virtual server by using the command line interface

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- set lb vserver <name> [-backupVserver <string>]
- show lb vserver <name>

Example

```
> set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
 Done
> show lb vserver vserver-LB-1
   vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
   State: DOWN
   Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
   .
   .
   .
   Backup: vserver-LB-2
   .
   .
```

.
Done
>

To set up a backup virtual server by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2, and then click OK.
4. Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.
   Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the Disable Primary When Down check box.

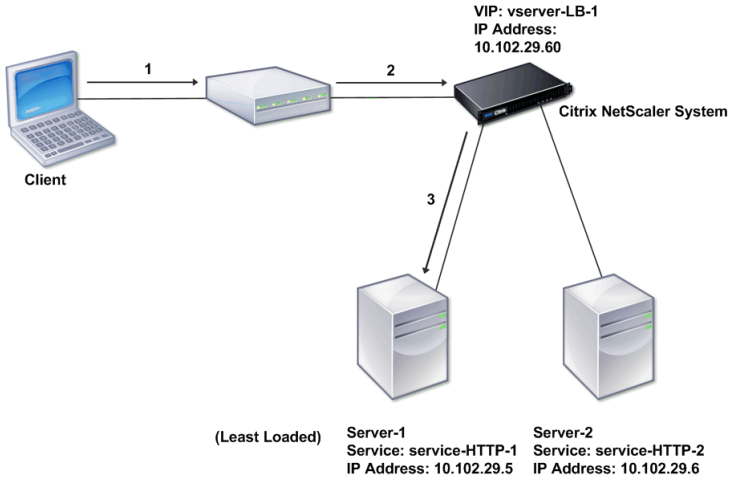
A Typical Load Balancing Scenario

Aug 23, 2013

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology



The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

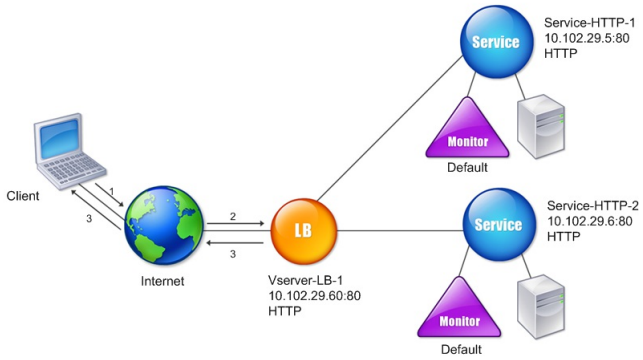
Table 1. LB Configuration Parameter Values

Entity Type	Required parameters and sample values			
	Name	**IP Address**	**Port**	**Protocol**
Virtual Server	vserver-LB-1	10.102.29.60	80	HTTP
Services	service-HTTP-1	10.102.29.5	8083	HTTP
	service-HTTP-2	10.102.29.6	80	HTTP
Monitors	Default	None	None	None

Entity Type	Required parameters and sample values			
	Name	IP Address	Port	Protocol

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model



The following tables list the commands used to configure this load balancing setup by using the command line interface.

Table 2. Initial Configuration Tasks

Task	Command
To enable load balancing	enable feature lb
To create a service named service-HTTP-1	add service service-HTTP-1 10.102.29.5 HTTP 80
To create a service named service-HTTP-2	add service service-HTTP-2 10.102.29.6 HTTP 80
To create a virtual server named vserver-LB-1	add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-1
To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-2

For more information about the initial configuration tasks, see "Enabling Load Balancing" and "Configuring Services and a Vserver."

Table 3. Verification Tasks

Task	Command
To view the properties of a virtual server named vserver-LB-1	show lb vserver vserver-LB-1
To view the statistics of a virtual server named vserver-LB-1	stat lb vserver vserver-LB-1
To view the properties of a service named service-HTTP-1	show service service-HTTP-1
To view the statistics of a service named service-HTTP-1	stat service service-HTTP-1
To view the bindings of a service named service-HTTP-1	show service bindings service-HTTP-1

Table 4. Customization Tasks

Task	Command
To configure persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
To configure URLPassive persistence on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
To set a backup virtual server on a virtual server named vserver-LB-1	set lb vserver vserver-LB-1 -backupVserver vserver-LB-2

For more information about configuring persistence, see "Choosing and Configuring Persistence Settings." For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see "Configuring Features to Protect the Load Balancing Configuration."

Accelerating Load Balanced Traffic by Using Compression

Aug 22, 2013

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

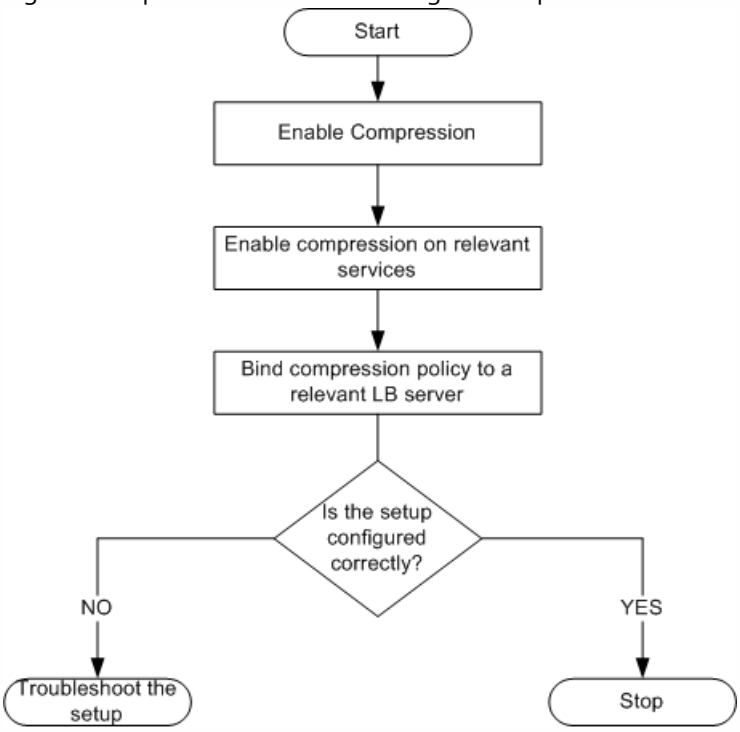
NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the polices to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

Updated: 2013-08-22

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression



Note: The steps in the above figure assume that load balancing has already been configured.

Updated: 2013-06-07

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the command line interface

At the command prompt, type the following commands to enable compression and verify the configuration:

- enable ns feature CMP
- show ns feature

Example

```
> enable ns feature CMP
Done
> show ns feature

     Feature                Acronym          Status
     -------                -------          ------
1)   Web Logging             WL               ON
2)   Surge Protection        SP               OFF
.
7)   Compression Control     CMP              ON
8)   Priority Queuing        PQ               OFF
.
Done
```

To enable compression by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

Updated: 2013-08-22

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

To enable compression on a service by using the command line

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- set service <name> -CMP YES
- show service <name>

Example

```
> show service SVC_HTTP1
SVC_HTTP1 (10.102.29.18:80) - HTTP
State: UP
Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)

Done
```

To enable compression on a service by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the **Details** section at the bottom of the pane.

Updated: 2013-09-04

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see "Configuring and Binding Policies with the Policy Manager."

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

- (bind | unbind) lb vserver <name> -policyName <string>
- show lb vserver <name>

Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp
Done
> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
State: UP
Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
Time since last state change: 19 days, 04:26:50.470
Effective State: UP
Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
Port Rewrite : DISABLED
No. of Bound Services :  1 (Total)      1 (Active)
Configured Method: LEASTCONNECTION
Current Method: Round Robin, Reason: Bound service's state changed to UP
Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED  Push VServer:
Push Multi Clients: NO
Push Label Rule:

Bound Service Groups:
1)      Group Name: Service-Group-1

1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP Weight:                 1

1)      Policy : ns_cmp_msapp Priority:0
Done
```

To bind or unbind a compression policy to a load balancing virtual server by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.

3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
   - To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.
   - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

Securing Load Balanced Traffic by Using SSL

Jan 31, 2011

The Citrix NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

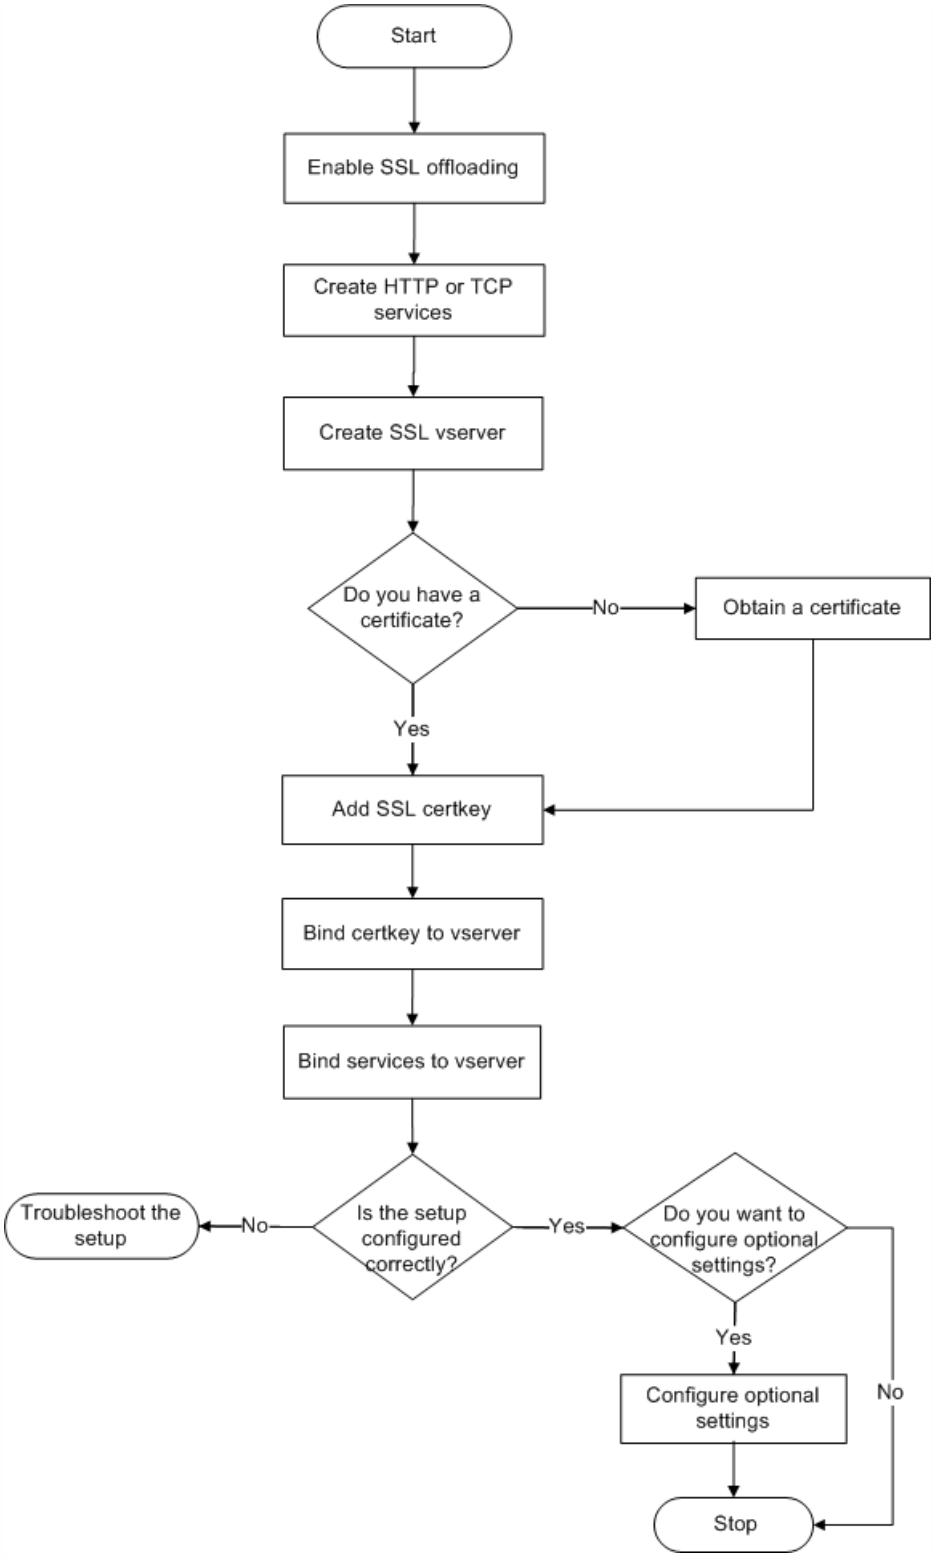
This document includes the following:

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading



Updated: 2013-06-05

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

To enable SSL by using the command line interface

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- enable ns feature SSL
- show ns feature

Example

```
> enable ns feature ssl
Done
> show ns feature
Feature Acronym Status
------- ------- ------
1) Web Logging WL ON
2) SurgeProtection SP OFF
3) Load Balancing LB ON . . .
 9) SSL Offloading SSL ON
10) Global Server Load Balancing GSLB ON . .
Done >
```

To enable SSL by using the configuration utility

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes.

Updated: 2013-08-23

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

To add an HTTP service by using the command line interface

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

- add service <name> (<IP> | <serverName>) <serviceType> <port>
- show service <name>

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80
 Done
> show service SVC_HTTP1
      SVC_HTTP1 (10.102.29.18:80) - HTTP
      State: UP
      Last state change was at Wed Jul 15 06:13:05 2009
```

```
        Time since last state change: 0 days, 00:00:15.350
        Server Name: 10.102.29.18
        Server ID : 0   Monitor Threshold : 0
        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
        Use Source IP: NO
        Client Keepalive(CKA): NO
        Access Down Service: NO
        TCP Buffering(TCPB): NO
        HTTP Compression(CMP): YES
        Idle timeout: Client: 180 sec   Server: 360 sec
        Client IP: DISABLED
        Cacheable: NO
        SC: OFF
        SP: OFF
        Down state flush: ENABLED

    1)    Monitor Name: tcp-default
              State: UP       Weight: 1
              Probes: 4       Failed [Total: 0 Current: 0]
              Last response: Success - TCP syn+ack received.
              Response Time: N/A
    Done
```

To add an HTTP service by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Services.
2. In details pane, click Add.
3. In the Create Service dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the Protocol list, select the type of the service (for example, HTTP).
5. Click Create, and then click Close. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

Updated: 2013-06-05

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

To add an SSL-based virtual server by using the command line interface

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- add lb vserver <name> <serviceType> [<IPAddress> <port>]
- show lb vserver <name>

Example

```
> add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
Done
> show lb vserver vserver-SSL-1
vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS
State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (+176 ms)
Time since last state change: 0 days, 00:03:44.120
Effective State: DOWN Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
No. of Bound Services : 0 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule: Done
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

To add an SSL-based virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (SSL Offload) dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the Protocol list, select the type of the virtual server, for example, SSL.
5. Click Create, and then click Close.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Updated: 2013-08-23

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see "SSL Offload and Acceleration."

To bind a service to a virtual server by using the command line interface

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- bind lb vserver <name> <serviceName>
- show lb vserver <name>

Example

```
> bind lb vserver vserver-SSL-1 SVC_HTTP1
Done
> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) - SSL Type:
ADDRESS State: DOWN[Certkey not bound]
Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)
Time since last state change: 0 days, 00:31:53.70
Effective State: DOWN Client Idle
Timeout: 180 sec
Down state flush: ENABLED Disable Primary Vserver On Down :
DISABLED No. of Bound Services : 1 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Vserver IP and
Port insertion: OFF Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule:

1) SVC_HTTP1 (10.102.29.18: 80) - HTTP
State: DOWN Weight: 1
Done
```

To bind a service to a virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. On the Services tab, in the Active column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click OK.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Updated: 2013-06-24

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.
Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

To add a certificate key pair by using the command line interface

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- add ssl certKey <certkeyName> -cert <string> [-key <string>]
- show sslcertkey <name>

Example

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
 Done
> show sslcertkey CertKey-SSL-1
   Name: CertKey-SSL-1 Status: Valid,
   Days to expiration:4811 Version: 3
   Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer: C=US,ST=California,L=San
   Jose,O=Citrix ANG,OU=NS Internal,CN=de fault
   Validity Not Before: Oct 6 06:52:07 2006 GMT Not After : Aug 17 21:26:47 2022 GMT
   Subject: C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS Internal,CN=d efault Public Key
   Algorithm: rsaEncryption Public Key
   size: 1024
 Done
```

To add a certificate key pair by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. In the details pane, click Add.
3. In the Install Certificate dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under Details, in Certificate File Name, click Browse (Appliance) to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.
5. Select the certificate you want to use, and then click Select.
6. In Private Key File Name, click Browse (Appliance) to locate the private key file. To use a private key present on the local system, select Local.
7. Select the key you want to use and click Select. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.
8. Click Install.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

Updated: 2013-06-24

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

To bind an SSL certificate key pair to a virtual server by using the command line

interface

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- bind ssl vserver <vServerName> -certkeyName <string>
- show ssl vserver <name>

Example

```
 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
Done
> show ssl vserver Vserver-SSL-1

    Advanced SSL configuration for VServer Vserver-SSL-1:
    DH: DISABLED
    Ephemeral RSA: ENABLED Refresh Count: 0
    Session Reuse: ENABLED Timeout: 120 seconds
    Cipher Redirect: ENABLED
    SSLv2 Redirect: ENABLED
    ClearText Port: 0
    Client Auth: DISABLED
    SSL Redirect: DISABLED
    Non FIPS Ciphers: DISABLED
    SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate
1) Cipher Name: DEFAULT
  Description: Predefined Cipher Alias
Done
```

To bind an SSL certificate key pair to a virtual server by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the SSL Settings tab, under Available, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click Add.
4. Click OK.
5. Verify that the certificate key pair that you selected appears in the Configured area.

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.
To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

Creating an SSL Action to Enable OWA Support

Updated: 2013-06-24

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- add ssl action <name> -OWASupport ENABLED
- show SSL action <name>

```
 > add ssl action Action-SSL-OWA -OWASupport enabled
Done
> show SSL action Action-SSL-OWA
  Name: Action-SSL-OWA
  Data Insertion Action: OWA
  Support: ENABLED
Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, in the Name text box, type Action-SSL-OWA.
4. Under Outlook Web Access, select Enabled.
5. Click Create, and then click Close.
6. Verify that Action-SSL-OWA appears in the **SSL Actions** page.

Creating SSL Policies

Updated: 2013-09-04

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- add ssl policy <name> -rule <expression> -reqAction <string>
- show ssl policy <name>

Example

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
```

```
Done
> show ssl policy Policy-SSL-1
Name: Policy-SSL-1      Rule: ns_true
Action: Action-SSL-OWA  Hits: 0
Policy is bound to following entities
1)      PRIORITY : 0
Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Add.
3. In the Create SSL Policy dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In Request Action, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see "Understanding Policies and Expressions."
5. In Named Expressions, choose the built-in general expression ns_true and click Add Expression. The expression ns_true now appears in the Expression text box.
6. Click Create, and then click Close.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

Binding the SSL Policy to an SSL Virtual Server

Updated: 2013-06-24

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

- bind ssl vserver <vServerName> -policyName <string>
- show ssl vserver <name>

Example

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
 Done
> show ssl vserver Vserver-SSL-1
        Advanced SSL configuration for VServer Vserver-SSL-1:
        DH: DISABLED
        Ephemeral RSA: ENABLED          Refresh Count: 0
        Session Reuse: ENABLED          Timeout: 120 seconds
        Cipher Redirect: ENABLED
```

```
        SSLv2 Redirect: ENABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

    1)    CertKey Name: CertKey-SSL-1 Server Certificate

    1)    Policy Name: Policy-SSL-1
                    Priority: 0
    1)    Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
     Done
    >
```

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click Insert Policy, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click OK.

Features at a Glance

Sep 04, 2013

Citrix NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see "Processing Order of Features."

This document includes the following:

Application Switching and Traffic Management Features

Aug 30, 2016

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.
For more information, see "SSL Offload and Acceleration."

Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. A NetScaler does not compare incoming packets to disabled ACLs.
For more information, see "Access Control List."

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the NetScaler can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts. To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.
For more information, see "Load Balancing."

Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic, within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an addresses is not duplicated within the same domain.
For more information, see "Traffic Domains."

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances

the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler.

The NetScaler appliance supports the following types of network address translation:

INAT—In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the NetScaler replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

RNAT—In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

Stateless NAT46 Translation—Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

Stateful NAT64 Translation—The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see "Configuring Network Address Translation."

Multipath TCP Support

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.
For more information, see "MPTCP (Multi-Path TCP)."

Content Switching

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.
For more information, see "Content Switching."

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.
For more information, see "Global Server Load Balancing."

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.
For more information, see "Configuring Dynamic Routes."

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.
For more information, see " Link Load Balancing."

TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.
Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)— Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling— Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see "Configuring TCP Profiles."

Web Interface on NetScaler

Provides access to XenApp and XenDesktop resources, which include applications, content, and desktops. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in. The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance.
Note: Web Interface is supported only on NetScaler nCore releases.
For more information, see "Web Interface."

CloudBridge Connector

The Citrix NetScaler CloudBridge Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see "CloudBridge."

DataStream

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.
For more information, see "DataStream."

Application Acceleration Features

Sep 06, 2013

AppCompress

Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

For more information, see "Compression."

Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see "Cache Redirection."

AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see "Integrated Caching."

TCP Buffering

Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites.

For more information, see "TCP Buffering."

Application Security and Firewall Features

Oct 30, 2013

Denial of Service Attack (DoS) Defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see "HTTP Denial-of-Service Protection."

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.
This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see "Content Filtering."

Responder

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.
For more information, see "Responder."

Rewrite

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.
When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see "Rewrite."

Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.
For more information, see "Priority Queuing."

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.
For more information, see "Surge Protection."

NetScaler Gateway

NetScaler Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

For more information, see "NetScaler Gateway."

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.
For more information, see "Application Firewall."

Application Visibility Feature

Sep 04, 2013

NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.
HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird's eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.
For more information, see "EdgeSight Monitoring for NetScaler."

Enhanced Application Visibility Using AppFlow

The Citrix NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.
Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see "AppFlow."

Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed

by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see "Stream Analytics."

Cloud Integration Feature

Aug 23, 2013

AutoScale

All applications have specific usage patterns that comprise peaks and troughs. These load variations can be dynamic in nature and difficult to predict, given that they depend on several factors that are intrinsic to the use case. Cloud users have to constantly monitor the load on their application fleet and make sure that these variations have minimum impact on end users. During periods of peak usage, when the application fleet is overloaded and end users experience significant latency, they have to deploy additional application instances. During trough periods, the expanded fleet is underutilized. So they might have to remove additional instances or bear unnecessary cost overheads. In most cases, they have to perform these tasks manually.

If your organization uses Citrix CloudPlatform to deploy and manage the cloud environment, users can use the *AutoScale* feature in CloudPlatform, in conjunction with a Citrix NetScaler appliance, to automatically scale their applications as needed. The AutoScale feature is part of the elastic load balancing feature in CloudPlatform. A CloudPlatform user can use the AutoScale feature to specify thresholds for various conditions for automatically scaling the application fleet upward and downward. CloudPlatform, in turn, configures the NetScaler appliance (by using the NetScaler NITRO API) to load balance traffic to the application virtual machines (VMs), monitor application thresholds and performance, and trigger scale-up and scale-down actions to add or remove VMs to or from the application fleet.

As the NetScaler administrator, you do not have to perform any tasks for configuring AutoScale on the NetScaler appliance. However, you might have to be aware of certain prerequisites, and you might have to troubleshoot the configuration if issues arise in the AutoScale configuration. To troubleshoot the configuration, you have to be aware of how CloudPlatform works and what configuration CloudPlatform pushes to the NetScaler appliance. You also need a working knowledge of how to troubleshoot issues on a NetScaler appliance.

For more information about AutoScale, see "AutoScale: Automatic Scaling in the Citrix CloudPlatform Environment."

Hardware Installation

Oct 25, 2013

The following sections describe the hardware installation and initial configuration for all NetScaler hardware platforms.

Introduction to the Hardware Platforms	Describes the NetScaler hardware platforms and provides detailed information about each platform and its components.
Preparing for Installation	Describes how to unpack the NetScaler appliance and prepare the site and rack for installing the appliance. Lists the cautions and warnings that you should review before you install the appliance.
Installing the Hardware	Describes the steps to install the rails, mount the hardware, connect the cables, and turn on the appliance.
Initial Configuration	Describes how to perform initial configuration of your NetScaler appliance and assign management and network IP addresses.
Lights Out Management Port of the NetScaler Appliance	Describes the different operations you can perform on your NetScaler appliance by using the Lights Out Management Port.

For information about NetScaler hardware and software compatibility and the supported upgrade and downgrade paths, see http://support.citrix.com/article/CTX113357.

Common Hardware Components

Apr 01, 2016

Each platform has front panel and back panel hardware components. The front panel has an LCD display and an RS232 serial console port. The number, type, and location of ports—copper Ethernet, copper and fiber 1G SFP, 10G SFP+, and XFP—vary by hardware platform. The back panel provides access to the fan and the field replaceable units (power supplies, CompactFlash card, and solid-state and hard-disk drives).

This document includes the follwing details:

- LCD Display and LED Status Indicators
- Ports

The LCD display on the front of every appliance displays messages about the current operating status of the appliance. These messages communicate whether your appliance has started properly and is operating normally. If the appliance is not operating normally, the LCD displays troubleshooting messages.

The LCD displays real-time statistics, diagnostic information, and active alerts. The dimensions of the LCD limit the display to two lines of 16 characters each, causing the displayed information to flow through a sequence of screens. Each screen shows information about a specific function.

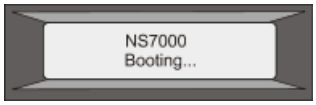
The LCD has a neon backlight. Normally, the backlight glows steadily. When there is an active alert, it blinks rapidly. If the alert information exceeds the LCD screen size, the backlight blinks at the beginning of each display screen. When the appliance shuts down, the backlight remains on for one minute and then automatically turns off.

There are nine types of display screens on the LCD display. The first two screens in the following list, the booting screen and the startup screen, appear when your appliance is starting up. The other screens, except the out-of-service screen, can appear while the appliance is operating. They show configuration information, alerts, HTTP information, network traffic information, CPU load information, and port information for your appliance.

Booting Screen.

The booting screen is displayed immediately after the appliance is turned on. The first line displays the hardware platform, as shown in the following figure.

Figure 1. LCD Booting Screen

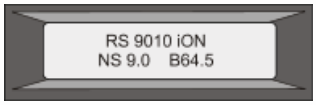


The newer MPX appliances display NSMPX followed by the platform number in the first line. For example, the MPX 7500/9500 appliances display NSMPX-7500. To view the model number, at the NetScaler command line, type show license. Scroll to the end of the command output to view the model number.

Startup Screen.

The startup screen is displayed for a few seconds after the appliance successfully begins operation. The first line displays the hardware platform, and the second line displays the software version and build number, as shown in the following figure.

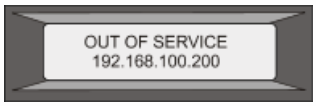
Figure 2. LCD Startup Screen



Out-of-Service Screen.

The out-of-service screen is displayed when the appliance has undergone a controlled shutdown, as shown in the following figure.

Figure 3. LCD Out-of-service Screen



Configuration Screen.

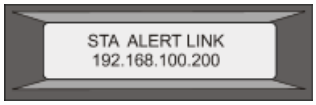
The first line displays the appliance status (STA, PRI, or SEC) and uptime. STA indicates that the appliance is in standalone mode, PRI indicates that the appliance is a primary node in a high availability (HA) pair, and SEC indicates that the appliance is a secondary node in an HA pair. Appliance uptime is displayed in HH:MM format. The second line displays the IP address of the appliance, as shown in the following figure.

Figure 4. LCD Configuration Screen

Alert Screen.

The first line displays the appliance status (STA, PRI, or SEC). STA indicates that the appliance is in standalone mode, PRI indicates that the appliance is a primary node in a high availability (HA) pair, and SEC indicates that the appliance is a secondary node in an HA pair. The second line displays the IP address of the appliance.

Figure 5. LCD Known Alert Screen



HTTP Statistics Screen.

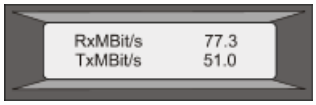
The first line displays the rate of HTTP GETS per second. The second line displays the rate of HTTP POSTS per second, as shown in the following figure.

Figure 6. LCD HTTP Statistics Screen

Network Traffic Statistics Screen.

The first line displays the rate at which data is received, in megabits per second. The second line displays the rate of data transmission, in megabits per second, as shown in the following figure.

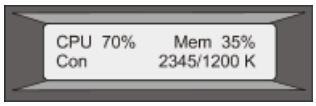
Figure 7. LCD Network Traffic Statistics Screen



CPU Load, Memory, and Connections Screen.

The first line displays CPU utilization and memory utilization as percentages. The second line displays the ratio of the

number of server connections to the number of client connections.
Note: If the number of server or client connections exceeds 99,999, the number is displayed in thousands, indicated by the letter K.
Figure 8. LCD CPU Load, Memory, and Connections Screen



Port Information Screen.

The S row displays port speed, flow control, and duplex information. The R row displays megabits received per second on the interface. The first port in each row is the management port.
Figure 9. Port Information for an 8-port Appliance

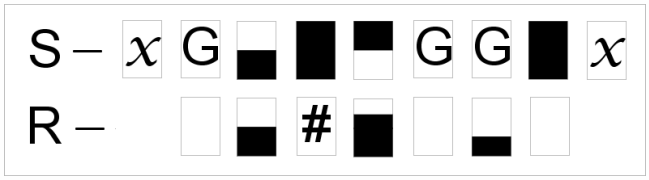


Figure 10. Port Information for a 10-port Appliance

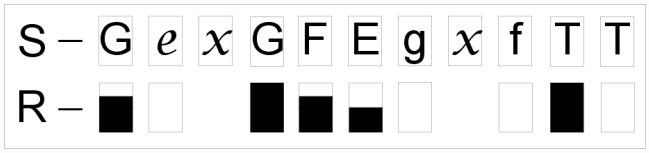

The following table defines the various abbreviations and symbols that appear in the S row of the port information screen.

Table 1. Port Abbreviations and Symbols for S Row

S row abbreviation/symbol	Indicates
E	A rate of 10 megabits per second, full duplex mode, and flow control OFF.
F	A rate of 100 megabits per second, full duplex mode, and flow control OFF.
G	A rate of 1 gigabit per second, full duplex mode, and flow control OFF.
T	A rate of 10 gigabits per second, full duplex mode, and flow control OFF.
	A disconnected port.

S row abbreviation/symbol	Indicates
x	Note: The R row does not display an abbreviation or symbol for a disconnected port.
	Receive flow control regardless of speed or duplex mode.
	Transmit flow control regardless of speed or duplex mode.
	Receive and transmit flow control regardless of speed or duplex mode.
e	A rate of 10 megabits per second, half duplex mode, and flow control OFF.
f	A rate of 100 megabits per second, half duplex mode, and flow control OFF.
g	A rate of 1 gigabit per second, half duplex mode, and flow control OFF.

The following table defines the various abbreviations and symbols that appear in the R row of the port information screen.

Table 2. Port Abbreviations and Symbols for R Row

R row abbreviation/symbol	Indicates
#	The port is disabled.
	Receive speed is about 10% of line speed.
	Receive speed is about 50% of line speed.

R row abbreviation/symbol	Indicates
	Receive speed is about 75% of line speed.
	Receive speed is about 100% of line speed.

On the appliance's back panel, system status LEDs indicate the overall status of the appliance. The following table describes the indicators of the system status LED.

Note: System status LEDs are available on only the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 appliances.

LED Color	LED Indicates
OFF	No power
Green	Appliance is receiving power
Red	Appliance has detected an error

On the appliance's back panel, power status LEDs indicate the status of each power supply. The following table describes the indicators of the power status LED.

LED Color	LED Indicates
OFF	No power
Green	Appliance is receiving power
Red	Power supply has detected an error

The port LEDs show whether a link is established and traffic is flowing through the port. The following table describes the LED indicators for each port. There are two LED indicators for each port type.

Note: This section applies to the MPX 5500, MPX 5550/5650, MPX 7500/9500, MPX 8005/8015/8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 17500/19500/21500, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 14020/14030/14040/14060/14080/14100, MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G, MPX 25100 40G, MPX 25160 40G, MPX 17550/19550/20550/21550, MPX 22040/22060/22080/22100/22120, MPX 24100/24150, MPX 25100T/25160T appliances.

Table 3. LED port-status indicators

Port Type	LED Location	LED Function	LED Color	LED Indicates
10G SFP+ (10 Gbps)	Top	Speed	Off	No connection.
			Solid blue	Traffic rate of 10 gigabits per second.
	Bottom	Link/ Activity	Off	No link.
			Solid green	Link is established but no traffic is passing through the port.
			Blinking green	Traffic is passing through the port.
1G SFP (1 Gbps)	Left	Link/ Activity	Off	No link.
			Solid green	Link is established but no traffic is passing through the port.
			Blinking green	Traffic is passing through the port.
	Right	Speed	Off	No connection.
			Yellow	Traffic rate of 1 gigabit per second.
Ethernet (RJ45)	Left	Speed	Off	No connection, or a traffic rate of 10 megabits per second (Mbps).
			Green	Traffic rate of 100 Mbps.
			Yellow	Traffic rate of 1 gigabit per second.
	Right	Link/ Activity	Off	No link.
			Solid green	Link is established but no traffic is passing through the port.
			Blinking green	Traffic is passing through the port.
Management	Left	Speed	Off	No connection, or a traffic rate of 10 megabits per

Port Type	LED Location	LED Function	LED Color	LED Indicates
(RJ45)			Green	second (Mbps). Traffic rate of 100 Mbps.
			Amber	Traffic rate of 1 gigabit per second.
	Right	Link/ Activity	Off	No link.
			Solid yellow	Link is established but no traffic is passing through the port.
			Blinking yellow	Traffic is passing through the port.

On each power supply, a bicolor LED indicator shows the condition of the power supply. The LEDs of the AC power supplies for MPX 15000 and 17000 appliances are different from the LEDs of the other appliances.

Table 4. LED Power Supply Indicators

Power Supply Type	LED Color	LED Indicates
AC	OFF	No power to any power supply.
	Flashing RED	No power to this power supply.
	Flashing GREEN	Power supply is in standby mode.
	GREEN	Power supply is functional.
	RED	Power supply failure.
DC	OFF	No power to any power supply.
	Flashing RED	No power to this power supply.
	Flashing BLUE	Power supply is in standby mode.
	BLUE	Power supply is functional.
	RED	Power supply failure.

Power Supply Type	LED Color	LED Indicates
MPX 15000 and 17000	OFF	Power supply is not plugged in to a power source. If the LED is off when the power supply is plugged in, the power supply has a malfunction.
	AMBER	Power supply has been plugged in for less than a few seconds. If the LED does not turn GREEN, the power supply has a malfunction.
	GREEN	Power supply is functioning properly.
	BLINKING	Power supply has a malfunction

Ports are used to connect the appliance to external devices. NetScaler appliances support RS232 serial ports, 10/100/1000Base-T copper Ethernet ports, 1-gigabit copper and fiber 1G SFP ports, and 10-gigabit fiber SFP+ ports. All NetScaler appliances have a combination of some or all of these ports. For details on the type and number of ports available on your appliance, see the section describing that platform.

RS232 Serial Port

The RS232 serial console port provides a connection between the appliance and a computer, allowing direct access to the appliance for initial configuration or troubleshooting.

All hardware platforms ship with an appropriate serial cable used to connect your computer to the appliance. For instructions on connecting your computer to the appliance, see "Installing the Hardware."

Copper Ethernet Ports

The copper Ethernet ports installed on many models of the appliance are standard RJ45 ports.

There are two types of copper Ethernet ports that may be installed on your appliance:

10/100BASE-T port

The 10/100BASE-T port has a maximum transmission speed of 100 megabits per second (Mbps). Most platforms have at least one 10/100BASE-T port.

10/100/1000BASE-T port

The 10/100/1000BASE-T port has a maximum transmission speed of 1 gigabit per second, ten times faster than the other type of copper Ethernet port. Most platforms have at least one 10/100/1000Base-T port.

To connect any of these ports to your network, you plug one end of a standard Ethernet cable into the port and plug the other end into the appropriate network connector.

Management Ports

Management ports are standard copper Ethernet ports (RJ45), which are used for direct access to the appliance for system administration functions.

1G SFP, 10G SFP+, and XFP Ports

A 1G SFP port can operate at a speed of 1 Gbps. It accepts either a copper 1G SFP transceiver, for operation as a copper Ethernet port, or a fiber 1G SFP transceiver for operation as a fiber optic port.

The 10G SFP+ and XFP ports are high-speed ports that can operate at speeds of up to 10 Gbps. You need a fiber optic cable to connect to a 10G SFP+ or XFP port. If the other end of the fiber optic cable is attached to a 1G SFP port, the 10G SFP+ port automatically negotiates to match the speed of the 1G SFP port.

Ports Compatibility

The 10G slot supports **copper** 1G transceivers, which can operate at up to 1 Gbps in a 10 Gbps slot.

Note: You cannot insert a copper 1G transceiver into a 10G slot in MPX 14060/14080-40G, and MPX 25100/25160-40G appliances.

Note: You cannot insert a fiber 1G transceiver into a 10G slot.
Note: You cannot insert a 10G transceiver into a 1G slot.
The following tables list the maximum distance specifications for NetScaler pluggable media (1G SFP, 10G SFP+, and XFP transceivers).
Note: The tables are categorized by 1G pluggable media and 10G pluggable media.
The 10G SFP+ modules are dual-speed capable and support both 1G and 10G, depending on the peer switch that the model connects to. These are listed in both tables.

Both tables have the following columns:

- SKU: Citrix maintains multiple SKUs for the same part.
- Description: The price list description of the part.
- Transmit Wavelength: The nominal transmit wavelength.
- Cable/Fiber Type: Fiber characteristics affect the maximum transmit distance achievable. This is especially true with 10G on multi-mode fiber (MMF), where various dispersion components become dominant. For more information, see http://www.thefoa.org/tech/ref/basic/fiber.html.
- Typical Reach: Maximum transmit distance.
- Products: Some chassis are available with different media options. Use the appropriate data sheet to confirm that your particular chassis type supports the media.

1G Pluggable Media

The following table lists the maximum distance specifications for 1G transceivers.

Table 5. Copper 1G SFP Distance Specifications

Note: Support for this cable is available in release 10.1 build 122.17 and later. Note: **To obtain these cables, contact Cisco partner representatives.**		

Field Replaceable Units

Apr 04, 2016

Citrix NetScaler field replaceable units (FRU) are NetScaler components that can be quickly and easily removed from the appliance and replaced by the user or a technician at the user's site. The FRUs in a NetScaler appliance can include a CompactFlash card, DC or AC power supplies, and solid-state or hard-disk drives, and a direct attach cable (DAC).

Note: The solid-state or hard-disk drive stores your configuration information, which has to be restored from a backup after replacing the unit.

This document includes the following details:

For appliances containing two power supplies, the second power supply acts as a backup. The MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 appliances can accommodate four power supplies, and require two power supplies for proper operation. The third and fourth power supplies act as backup.

The appliance ships with a standard power cord that plugs into the appliance's power supply and an NEMA 5-15 plug on the other end for connecting to the power outlet on the rack or in the wall.

For power-supply specifications, see "Hardware Platforms," which describes the various platforms and includes a table summarizing the hardware specifications.

Note: If you suspect that a power-supply fan is not working, please see the description of your platform. On some platforms, what appears to be the fan does not turn, and the actual fan turns only when necessary.

On each power supply, a bicolor LED indicator shows the condition of the power supply.

Electrical Safety Precautions for Power Supply Replacement

- Make sure that the appliance has a direct physical connection to earth ground during normal use. When installing or repairing an appliance, always connect the ground circuit first and disconnect it last.
- Always unplug any appliance before performing repairs or upgrades.
- Never touch a power supply when the power cord is plugged in. As long as the power cord is plugged in, line voltages are present in the power supply even if the power switch is turned off.

Replacing an AC Power Supply

Citrix NetScaler MPX platforms can accommodate two power supplies, except the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 platforms which can accommodate four power supplies. All NetScaler appliances function properly with a single power supply, except the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 platforms which need two power supplies for proper operation. The other power supplies serves as a backup. All power supplies must be of the same type (AC or DC).

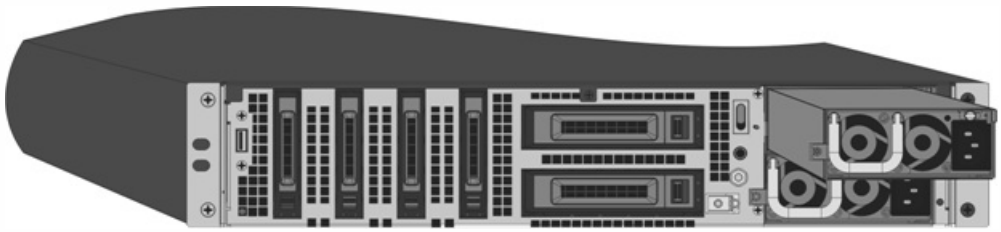
Note: If the appliance has only one power supply, you have to shut down the appliance before replacing the power supply.

If the appliance has two power supplies, you can replace one power supply without shutting down the appliance, provided the other power supply is working, and if the appliance has four power supplies, you can replace one or two power supplies without shutting down the appliance, provided the other two power supplies are working.

To install or replace an AC power supply on a Citrix NetScaler appliance

1. Align the semicircular handle perpendicular to the power supply. Loosen the thumbscrew and press the lever toward the handle and pull out the existing power supply, as shown in the following figure.
   Note: The illustration in the following figures might not represent the actual NetScaler appliance.
   Figure 1. Removing the Existing AC Power Supply

2. Carefully remove the new power supply from its box.
3. On the back of the appliance, align the power supply with the power supply slot.
4. Insert the power supply into the slot and press against the semicircular handle until you hear the power supply snap into place.
   Figure 2. Inserting the Replacement AC Power Supply



5. Connect the power supply to a power source. If connecting all power supplies, plug separate power cords into the power supplies and connect them to separate wall sockets.

Note: NetScaler appliances emit a high-pitched alert if one power supply fails or if you connect only one power cable to an appliance in which two power supplies are installed. To silence the alarm, press the small red button on the back panel of the appliance. The disable alarm button is functional only when the appliance has two power supplies.

Replacing a DC Power Supply

Citrix NetScaler MPX platforms can accommodate two power supplies, except the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 platforms which can accommodate four power supplies. All NetScaler appliances function properly with a single power supply, except the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 platforms which need two power supplies for proper operation. The other power supplies serves as a backup. All power supplies must be of the same type (AC or DC).

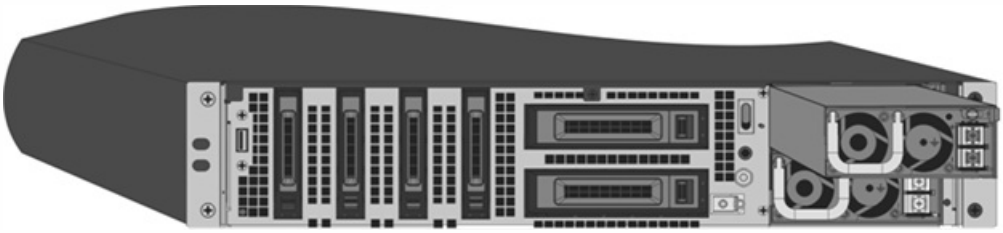
Note: If the appliance has only one power supply, you have to shut down the appliance before replacing the power supply. If the appliance has two power supplies, you can replace one power supply without shutting down the appliance, provided

the other power supply is working, and if the appliance has four power supplies, you can replace one or two power supplies without shutting down the appliance, provided the other two power supplies are working.

To install or replace a DC power supply on a Citrix NetScaler appliance

1. Loosen the thumbscrew and press the lever towards the handle and pull out the existing power supply, as shown in the following figure.
   Note: The illustration in the following figures might not represent the actual NetScaler appliance.
   Figure 3. Removing the Existing DC Power Supply

2. Carefully remove the new power supply from its box.
3. On the back of the appliance, align the power supply with the power supply slot.
4. Insert the power supply into the slot while pressing the lever towards the handle. Apply firm pressure to insert the power supply firmly into the slot.
   Figure 4. Inserting the Replacement DC Power Supply



5. When the power supply is completely inserted into its slot, release the lever.
6. Connect the power supply to a power source. If connecting all power supplies, plug separate power cords into the power supplies and connect them to separate wall sockets.

Note: NetScaler appliances emit a high-pitched alert if one power supply fails or if you connect only one power cable to an appliance in which two power supplies are installed. To silence the alarm, press the small red button on the back panel of the appliance. The disable alarm button is functional only when the appliance has two power supplies.

The NetScaler software is stored on either the solid-state drive or the CompactFlash card. The following MPX platforms store the NetScaler software on the CompactFlash card:

- Citrix NetScaler MPX 5500
- Citrix NetScaler MPX 7500 and MPX 9500
- Citrix NetScaler MPX 9700, MPX 10500, MPX 12500, and MPX 15500
- Citrix NetScaler MPX 15000
- Citrix NetScaler MPX 17000

Note: The CompactFlash card is mounted as /flash on the above platforms.
The CompactFlash card specifications vary by NetScaler hardware platform. A CompactFlash card from one platform does not necessarily work on a different platform.

Replacing a CompactFlash Card

Note: These instructions apply to the Citrix® NetScaler® MPX 5500, MPX 7500/9500, MPX 9700/10500/12500/15500, MPX 15000, and MPX 17000 appliances only.
Replacement CompactFlash cards contain a preinstalled version of the NetScaler software and a generic configuration file (ns.conf), but they do not contain SSL-related certificates and keys, or custom boot settings. Configuration files and customized settings must be restored from a backup storage location at the customer site, if available. The files to be restored might include:

- /flash/nsconfig/ns.conf: The current configuration file.
- /flash/nsconfig/ZebOS.conf: The ZebOS configuration file.
- /flash/nsconfig/license: The licenses for the NetScaler features.
- /flash/nsconfig/ssl: The SSL certificates and keys required for encrypting data to clients or to backend servers.
- /nsconfig/rc.netscaler: Customer-specific boot operations (optional).

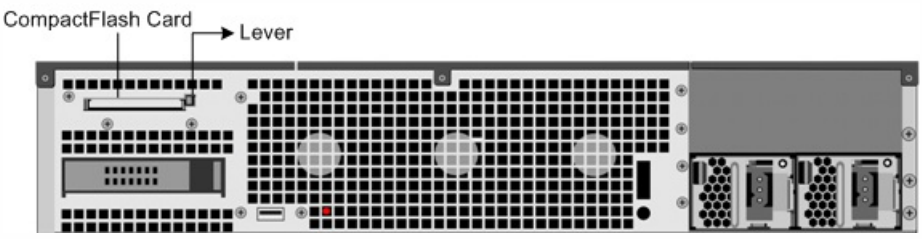
Note: Verify that the card you receive is the correct type for your NetScaler appliance.

To replace a CompactFlash card

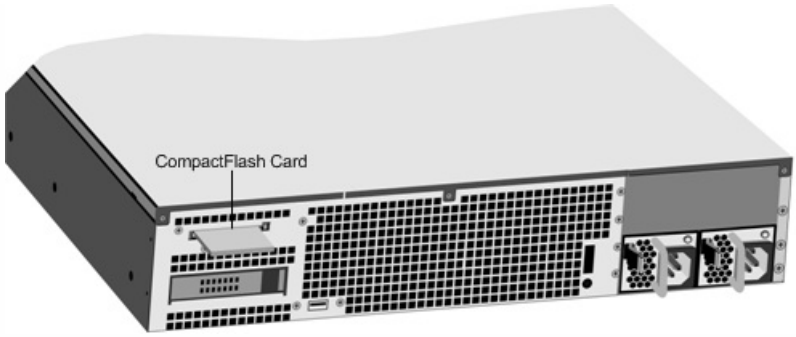
1. At the NetScaler command prompt, exit to the shell prompt. Type:
   shell

2. Shut down the NetScaler appliance by typing one of the following commands at the shell prompt.
   - On an MPX appliance, type:
     shutdown -p now
   - On a non-MPX appliance, type:
     shutdown

3. Locate the CompactFlash slot on the back panel of the appliance.
4. Disengage the CompactFlash by pushing the lever to the right of the CompactFlash slot. If necessary, use a pen or small screwdriver to push the lever in fully. Pull the existing flash card out of the slot.
   Note: The illustration in the following figures might not represent the actual NetScaler appliance.
   Figure 5. Removing the Existing CompactFlash Card



5. Insert the new flash card received from Citrix.
   Important: When you insert the card, make sure that the arrow on top of the card is pointing toward the CompactFlash slot. Position the connector grid on the edge of the CompactFlash card to meet the matching connector pins inside the CompactFlash slot.
   Figure 6. Inserting the Replacement CompactFlash Card



6. Turn on the NetScaler appliance.
   When the appliance starts, it no longer has the previous working configuration. Therefore, the appliance is reachable only through the default IP address of 192.168.100.1/16, or through the console port.
7. Perform the initial configuration of the appliance, as described in "Initial Configuration." Log on to the default IP address by using a web browser, or connect to the serial console by using a console cable, to perform the initial configuration.
8. Upload a platform license and any optional feature licenses, including universal licenses, to the NetScaler appliance. For more information, see the licensing chapter of the "Getting Started with Citrix NetScaler."
9. Once the correct NetScaler software version is loaded, you can restore the working configuration. Copy a previous version of the ns.conf file to the /nsconfig directory by using an SCP utility or by pasting the previous configuration into the /nsconfig/ns.conf file from the NetScaler command prompt. To load the new ns.conf file, restart the NetScaler appliance by entering the reboot command at the NetScaler command prompt.

A solid-state drive (SSD) is a high-performance device that stores data in solid-state flash memory. The MPX solid-state drives contain the boot loader configuration file, configuration file (ns.conf), licenses, and for some models, the NetScaler software and the user data.
The NetScaler software is stored on either the SSD or the CompactFlash card. The following MPX platforms store the NetScaler software on the SSD. The SSD is mounted as /flash.

- Citrix NetScaler MPX 5550 and MPX 5650
- Citrix NetScaler MPX 8005, MPX 8015, MPX 8200, MPX 8400, MPX 8600, and MPX 8800
- Citrix NetScaler MPX 11500, MPX 13500, MPX 14500, MPX 16500, MPX 18500, and MPX 20500
- Citrix NetScaler MPX 11515, MPX 11520, MPX 11530, MPX 11540, and MPX 11542
- Citrix NetScaler MPX 14020/14030/14040/14060/14080/14100
- Citrix NetScaler MPX 17500, MPX 19500, and MPX 21500
- Citrix NetScaler MPX 17550, MPX 19550, MPX 20550, and MPX 21550
- Citrix NetScaler MPX 22040, MPX 22060, MPX 22080, MPX 22100, and MPX 22120
- Citrix NetScaler MPX 24100 and MPX 24150
- Citrix NetScaler MPX 25100T and MPX 25160T
- MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G
- MPX 25100 40G, MPX 25160 40G

Note: On the MPX 5550/5650 and MPX 8005/8015/8200/8400/8600/8800 appliances, both /flash and /var are mounted from different partitions of the same SSD drive.

Replacing a Solid-State Drive

Note: These instructions apply to the Citrix NetScaler MPX 5550/5650, MPX 8005/8015/8200/8400/8600/8800, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 14020/14030/14040/14060/14080/14100, MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G, MPX 25100 40G, MPX 25160 40G, MPX 17500/19500/21500, MPX 17550/19550/20550/21550, MPX 22040/22060/22080/22100/22120, MPX 24100/24150, and MPX 25100T/25160T appliances.
Replacement solid-state drives (SSDs) contain a pre-installed version of the NetScaler software and a generic configuration file (ns.conf), but they do not contain SSL-related certificates and keys, or custom boot settings. Configuration files and customized settings must be restored to a replacement drive from a backup storage location at the customer site, if available. The files to be restored might include:

- /flash/nsconfig/ns.conf: The current configuration file.
- /flash/nsconfig/ZebOS.conf: The ZebOS configuration file.
- /flash/nsconfig/license: The licenses for the NetScaler features.
- /flash/nsconfig/ssl: The SSL certificates and keys required for encrypting data to clients or to backend servers.

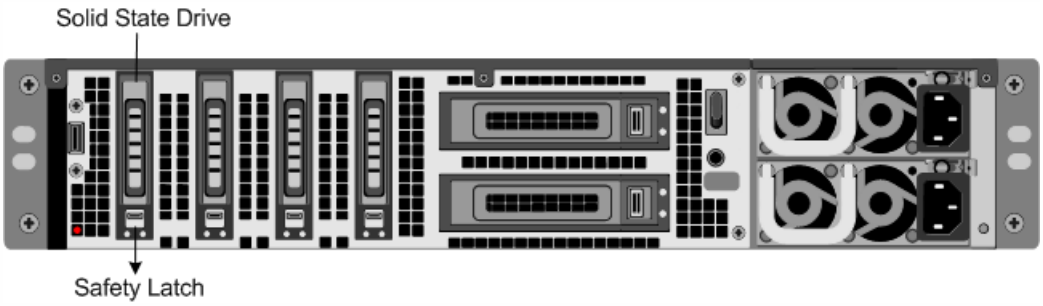
- /nsconfig/rc.netscaler: Customer-specific boot operations (optional).

To replace a solid-state drive

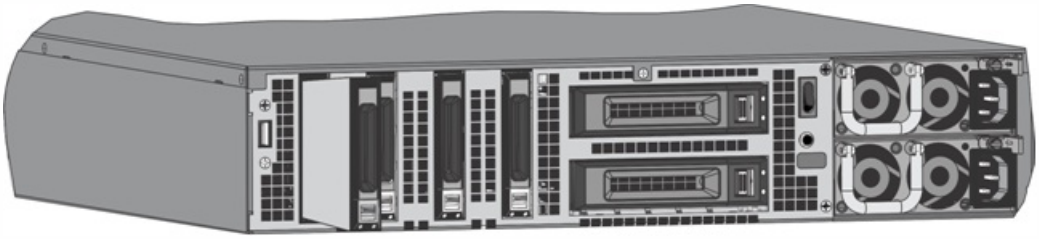
1. At the NetScaler command prompt, exit to the shell prompt. Type:
   shell

2. Shut down the NetScaler appliance by typing the following command at the shell prompt:
   shutdown –p now

3. Locate the SSD on the back panel of the appliance. Push the safety latch of the drive cover to the right or down, depending on the platform, while pulling out on the drive handle to disengage. Pull out the faulty drive.
   Note: The illustration in the following figures might not represent the actual NetScaler appliance.
   Figure 7. Removing the Existing Solid-State Drive



4. Verify that the replacement SSD is the correct type for the platform.
5. Pick up the new SSD, open the drive handle fully to the left or up, and insert the drive into the slot as far as possible. To seat the drive, close the handle flush with the rear of the appliance so that the drive locks securely into the slot.
   Important: When you insert the drive, make sure that the Citrix product label is at the top if the drive is inserted horizontally or at the right if the drive is inserted vertically.
   Figure 8. Inserting the Replacement Solid-State Drive



6. Turn on the NetScaler appliance. When the appliance starts, it no longer has the previous working configuration. Therefore, the appliance is reachable only through the default IP address of 192.168.100.1/16, or through the console port.
7. Perform the initial configuration of the appliance, as described in "Initial Configuration." Log on to the default IP address by using a web browser, or connect to the serial console by using a console cable, to perform the initial configuration.
8. Upload a platform license and any optional feature licenses, including universal licenses, to the NetScaler appliance. For more information, see the licensing chapter of the "Getting Started with Citrix NetScaler."
9. Once the correct NetScaler software version is loaded, you can restore the working configuration. Copy a previous version of the ns.conf file to the /nsconfig directory by using an SCP utility or by pasting the previous configuration into the /nsconfig/ns.conf file from the NetScaler command prompt. To load the new ns.conf file, you must restart the NetScaler appliance by entering the reboot command at the NetScaler command prompt.

A hard disk drive (HDD) stores logs and other data files. Files stored on the HDD include the newnslog files, dmesg and messages files, and any core/crash files. The HDD comes in various capacities, depending on the Citrix NetScaler platform. Hard drives are used for storing files required at runtime. An HDD is mounted as /var.

The following MPX platforms support HDD:

- Citrix NetScaler MPX 9700, MPX 10500, MPX 12500, and MPX 15500
- Citrix NetScaler MPX 11500, MPX 13500, MPX 14500, MPX 16500, MPX 18500, and MPX 20500

- Citrix NetScaler MPX 11515, MPX 11520, MPX 11530, MPX 11540, and MPX 11542
- Citrix NetScaler MPX 15000
- Citrix NetScaler MPX 17000
- Citrix NetScaler MPX 17500, MPX 19500, and MPX 21500
- Citrix NetScaler MPX 17550, MPX 19550, MPX 20550, and MPX 21550
- Citrix NetScaler MPX 22040, MPX 22060, MPX 22080, MPX 22100, and MPX 22120
- Citrix NetScaler MPX 24100 and MPX 24150

Replacing a Hard Disk Drive

A hard disk drive (HDD) stores log files and other user files. Collection of new log files begins upon boot-up with the new HDD. Product documentation can be downloaded from "MyCitrix.com" and reinstalled to the /var/netscaler/doc location.

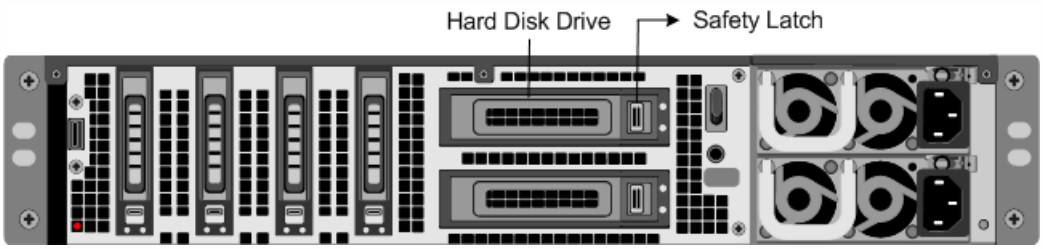
To install a hard disk drive

1. At the NetScaler command prompt, exit to the shell prompt. Type:
   shell

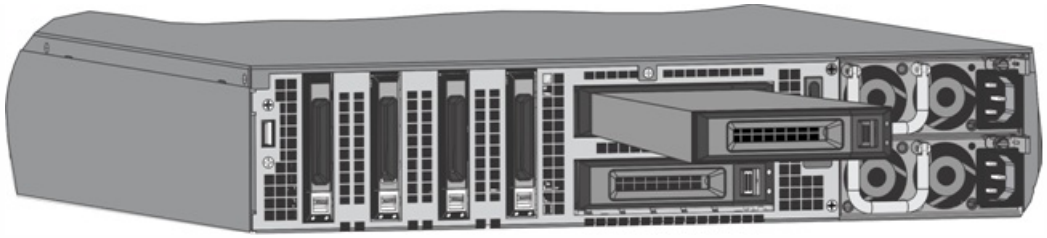
2. Shut down the NetScaler appliance by typing one of the following commands at the shell prompt.
   - On an MPX appliance, type:
     shutdown –p now

   - On a non-MPX appliance, type:
     shutdown

3. Locate the hard disk drive on the back panel of the appliance.
4. Verify that the replacement hard disk drive is the correct type for the NetScaler platform.
5. Disengage the hard disk drive by pushing the safety latch of the drive cover to the right or down, depending on the platform, while pulling out on the drive handle to disengage. Pull out the faulty drive.
   Note: The illustration in the following figures might not represent the actual NetScaler appliance.
   Figure 9. Removing the Existing Hard Disk Drive



6. Pick up the new disk drive, open the drive handle fully to the left, and insert the new drive into the slot as far as possible. To seat the drive, close the handle flush with the rear of the appliance so that the hard drive locks securely into the slot.
   Important: When you insert the drive, make sure that the Citrix product label is at the top.
   Figure 10. Inserting the Replacement Hard Disk Drive



7. Turn on the NetScaler appliance. The appliance starts the NetScaler software and reads the configuration file from the CompactFlash card.

A direct attach cable (DAC) assembly is a high performance integrated duplex data link for bi-directional communication. The cable is compliant with the IPF MSA (SFF-8432) for mechanical form factor and SFP+ MSA for direct attach cables. The cable, which can be up to 5 meters long, is data-rate agnostic. Supporting speeds in excess of 10 Gbps, it is a cost-effective alternative to optical links (SFP+ transceivers and fiber optic cables.) The transceiver with DAC is hot-swappable. You can insert and remove the transceiver with the attached cable without shutting down the appliance. The Citrix NetScaler appliance supports only passive DAC.

Important:

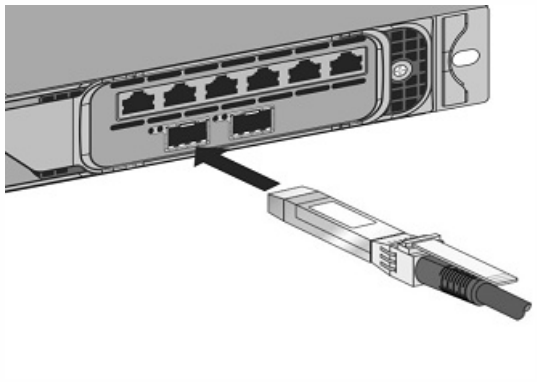
- DAC is supported only on 10G ports. Do not insert a DAC into a 1G port.
- Do not attempt to unplug the integrated copper cable from the transceiver and insert a fiber cable into the transceiver.

Installing a Direct Attach Cable

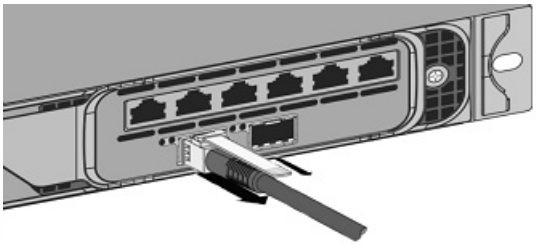
Note: The illustrations in the following figures are only for reference and might not represent the actual NetScaler appliance.

To install or remove a direct attach cable

1. To install the DAC, slide it into the 10G port on the appliance, as shown in the following figure. You will hear a click when the DAC properly fits into the port.
   Figure 11. Inserting a DAC into the 10G port



2. To remove the DAC, pull the tab on the top of the DAC, and then pull the DAC out of the port, as shown in the following figure.
   Figure 12. Removing a DAC from the 10G port



Hardware Platforms

Oct 07, 2013

The various NetScaler hardware platforms offer a wide range of features, communication ports, and processing capacities. All the MPX platforms have multicore processors.

The NetScaler hardware platforms range from the single processor MPX 5500 platform to the high-capacity, MPX 22040/22060/22080/22100/22120 hardware platform. The various NetScaler hardware platforms are similar in that they use the same types of components, but different models provide different hardware capabilities. All NetScaler hardware platforms support the NetScaler software.

Some of the hardware platforms are available as dedicated application firewall appliances or secure application access appliances.

For information on the software releases supported on the NetScaler hardware platforms, see Supported Releases on NetScaler Hardware.

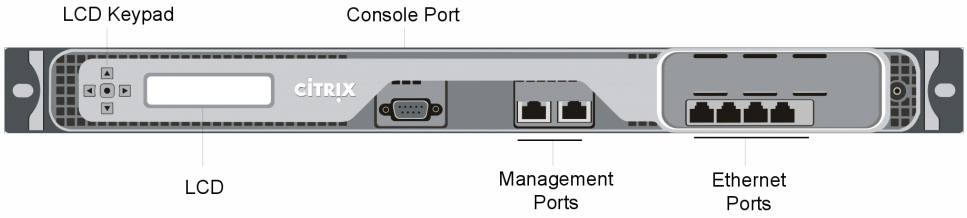
Citrix NetScaler MPX 5500

Sep 04, 2013

The Citrix NetScaler MPX 5500 is a 1U appliance, with 1 dual-core processor, and 4 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 5500.

Figure 1. Citrix NetScaler MPX 5500, front panel



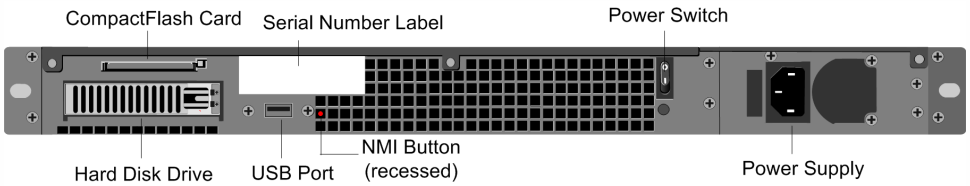
The MPX 5500 has the following ports:

- RS232 serial console port.
- Two 10/100/1000Base-T copper Ethernet management ports, numbered 0/1 and 0/2 from left to right. You can use these ports to connect directly to the appliance for system administration functions.
- Four 10/100/1000Base-T copper Ethernet ports numbered 1/1, 1/2, 1/3, and 1/4 from left to right.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of the MPX 5500.

Figure 2. Citrix NetScaler MPX 5500, back panel



The following components are visible on the back panel of the MPX 5500:

- Four GB removable CompactFlash card that is used to store the NetScaler software.
- Power switch, which turns off power to the MPX 5500, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Removable hard-disk drive (HDD) that is used to store user data. Appliances shipped before February, 2012 store user data on a HDD. In appliances shipped after February, 2012, a solid-state drive replaces the HDD. Both types of drive have the same functionality and support the same software releases.
- USB port (reserved for a future release).
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Power supply rated at 300 watts, 110-220 volts. The power-supply fan is designed to turn on only when the internal temperature of the power supply reaches a certain value. You cannot see the fan turning on the back panel. What you can see is the fixed part of the fan that holds the spinning motor.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

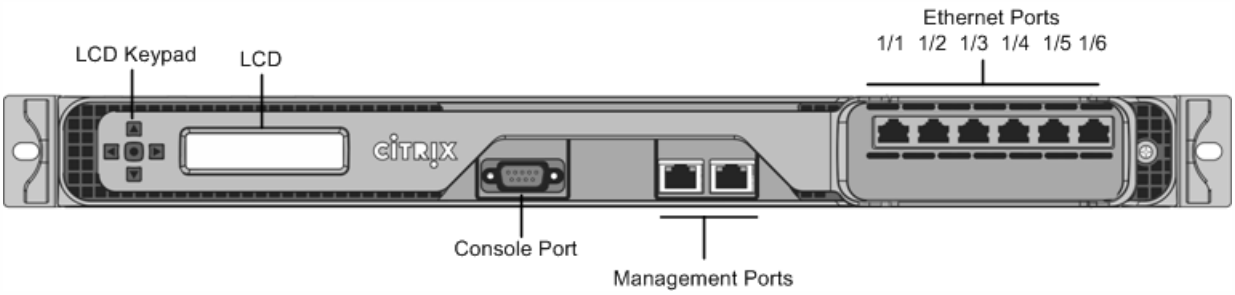
Citrix NetScaler MPX 5550 and MPX 5650

Sep 04, 2013

The Citrix NetScaler models MPX 5550 and MPX 5650 are 1U appliances. Each model has one quad-core processor and 8 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 5550/5650 appliance.

Figure 1. Citrix NetScaler MPX 5550/5650, front panel

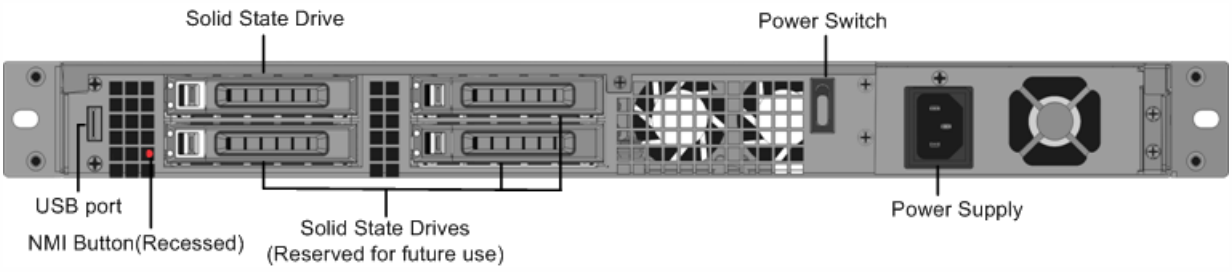


Depending on the model, the appliance has the following ports:

- RS232 serial console port.
- Two 10/100/1000Base-T copper Ethernet management ports (RJ45), numbered 0/1 and 0/2 from left to right. The management port is used to connect directly to the appliance for system administration functions.
- Six 10/100/1000Base-T copper Ethernet ports numbered 1/1, 1/2, 1/3, 1/4, 1/5, and 1/6 from left to right.

The following figure shows the back panel of the MPX 5550/5650 appliance.

Figure 2. Citrix NetScaler MPX 5550/5650 appliance, back panel



The following components are visible on the back panel of the MPX 5550/5650 appliance:

- 160 GB removable solid-state drive, which is used to store the NetScaler software and the user data.
- Power switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- USB port (reserved for a future release).
- Non-maskable interrupt (NMI) button, which is used at the request of Technical Support to produce a NetScaler core dump. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Single power supply, rated at 300 watts, 110-220 volts.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

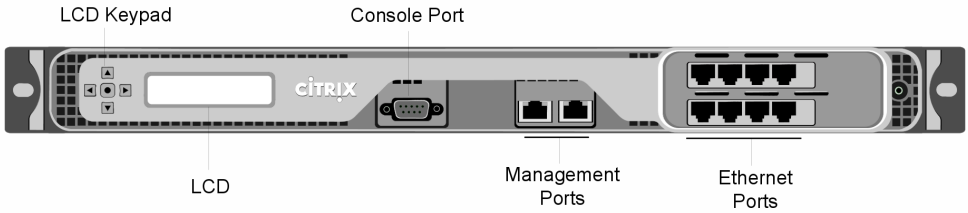
Citrix NetScaler MPX 7500 and MPX 9500

Sep 04, 2013

The Citrix NetScaler MPX 7500/9500 are 1U appliances, each with 1 quad-core processor, and 8 gigabytes (GB) of memory. The MPX 7500/9500 appliances are available in two port configurations: 8x10/100/1000Base-T copper Ethernet ports and 4x1G SFP + 4x10/100/1000Base-T copper Ethernet ports.

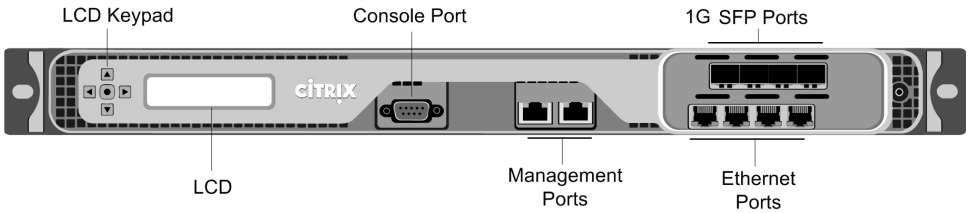
The following figure shows the front panel of the MPX 7500/9500 (8x10/100/1000Base-T copper Ethernet ports) appliances.

Figure 1. Citrix NetScaler MPX 7500/9500 (8x10/100/1000Base-T copper Ethernet ports), front panel



The following figure shows the front panel of the MPX 7500/9500 (4x1G SFP + 4x10/100/1000Base-T copper Ethernet ports) appliances.

Figure 2. Citrix NetScaler MPX 7500/9500 (4x1G SFP + 4x10/100/1000Base-T copper Ethernet ports), front panel

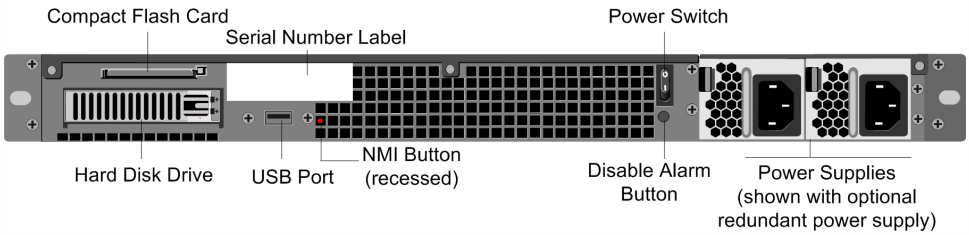


Depending on the model, the appliance has the following ports:

- RS232 serial console port.
- Two 10/100/1000Base-T copper Ethernet management ports, numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports
  - MPX 7500/9500 (8x10/100/1000Base-T copper Ethernet ports). Eight 10/100/1000Base-T copper Ethernet ports numbered 1/1, 1/2, 1/3, and 1/4 on the top row from left to right, and 1/5, 1/6, 1/7, and 1/8 on the bottom row from left to right.
  - MPX 7500/9500 (4x1G SFP + 4x10/100/1000Base-T copper Ethernet ports). Four 1-gigabit copper or fiber 1G SFP ports numbered 1/1, 1/2, 1/3, and 1/4 on the top row from left to right, and four 10/100/1000BASE-T copper Ethernet ports (RJ45) numbered 1/5, 1/6, 1/7, and 1/8 on the bottom row from left to right.

The following figure shows the back panel of the MPX 7500/9500 appliance.

Figure 3. Citrix NetScaler MPX 7500/9500, back panel



The following components are visible on the back panel of the MPX 7500/9500:

- Four-gigabyte removable CompactFlash card that is used to store the NetScaler software.
- Power switch, which turns off power to the MPX 7500/9500, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Removable hard-disk drive (HDD) that is used to store user data. Appliances shipped before February, 2012 store user data on a HDD. In appliances shipped after February, 2012, a solid-state drive replaces the HDD. Both types of drive have the same functionality and support the same software releases.
- USB port (reserved for a future release).
- Non-maskable interrupt (NMI) button that is used at the request of Technical Support and produces a core dump on the appliance. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Disable alarm button. This button is functional only when the appliance has two power supplies.
  Press this button to stop the power alarm from sounding when you have plugged the MPX 7500/9500 into only one power outlet or when one power supply is malfunctioning and you want to continue operating the MPX 7500/9500 until it is repaired.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

Citrix NetScaler MPX 8005,MPX 8015,MPX 8200, MPX 8400, MPX 8600, and MPX 8800

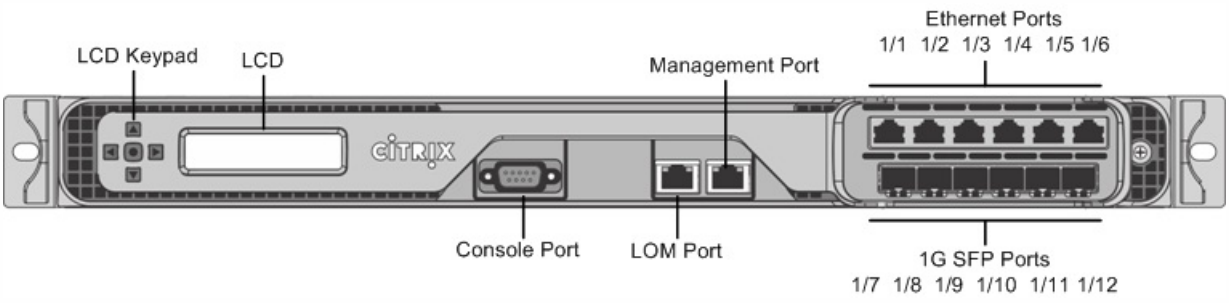
Jan 21, 2014

The Citrix NetScaler models MPX 8005, MPX 8015, MPX 8200, MPX 8400, MPX 8600, and MPX 8800 are 1U appliances. Each model has one quad-core processor and 32 gigabytes (GB) of memory. The MPX 8005/8015/8200/8400/8600/8800 appliances are available in two port configurations:

- Six 10/100/1000Base-T copper Ethernet ports and six 1G SFP ports (6x10/100/1000Base-T copper Ethernet ports + 6x1G SFP)
- Six 10/100/1000Base-T copper Ethernet ports and two 10G SFP+ ports (6x10/100/1000Base-T copper Ethernet ports + 2x10G SFP+)

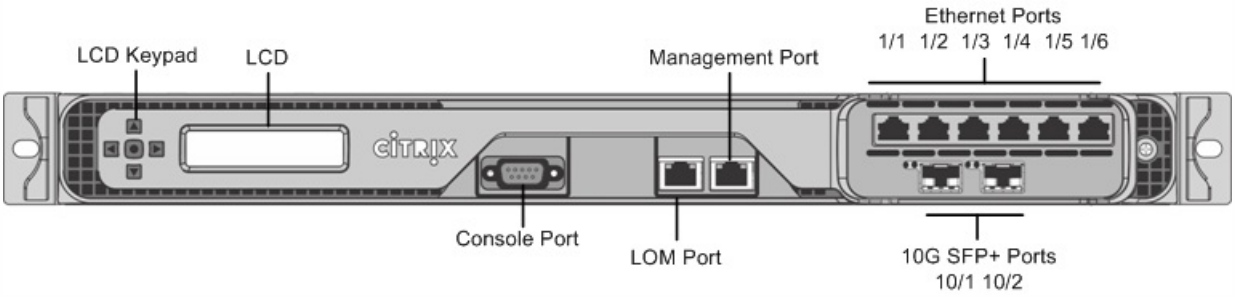
The following figure shows the front panel of the MPX 8005/8015/8200/8400/8600/8800 (6x10/100/1000Base-T copper Ethernet ports + 6x1G SFP) appliance.

Figure 1. Citrix NetScaler MPX 8005/8015/8200/8400/8600/8800 (6x10/100/1000Base-T copper Ethernet ports + 6x1G SFP), front panel



The following figure shows the front panel of the MPX 8005/8015/8200/8400/8600/8800 (6x10/100/1000Base-T copper Ethernet ports + 2x10G SFP+) appliance.

Figure 2. Citrix NetScaler MPX 8005/8015/8200/8400/8600/8800 (6x10/100/1000Base-T copper Ethernet ports + 2x10G SFP+), front panel



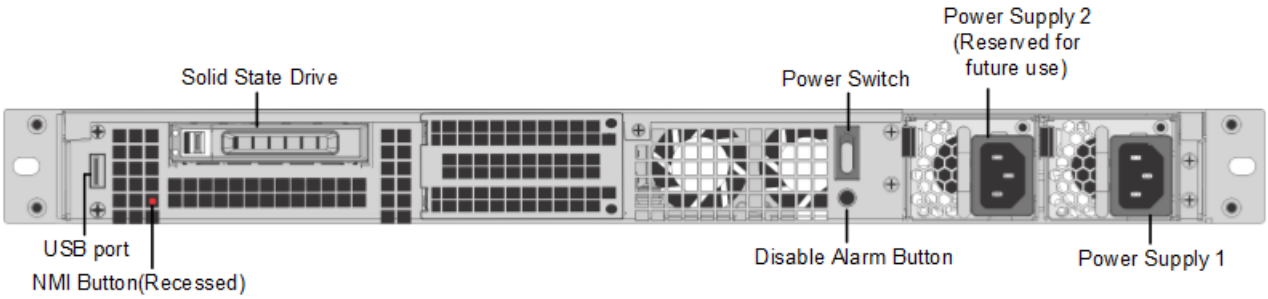
Depending on the model, the appliance has the following ports:

- RS232 serial console port.
- One 10/100Base-T copper Ethernet Port (RJ45), also called LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.

- One 10/100/1000Base-T copper Ethernet management port (RJ45), numbered 0/1. The management port is used to connect directly to the appliance for system administration functions.
- Network Ports
  - MPX 8005/8015/8200/8400/8600/8800 (6x10/100/1000Base-T copper Ethernet ports + 6x1G SFP). Six 10/100/1000BASE-T copper Ethernet ports (RJ45) numbered 1/1, 1/2, 1/3, 1/4, 1/5, and 1/6 on the top row from left to right, and six 1-gigabit copper or fiber 1G SFP ports numbered 1/7, 1/8, 1/9, 1/10, 1/11, and 1/12 on the bottom row from left to right.
  - MPX 8005/8015/8200/8400/8600/8800 (6x10/100/1000Base-T copper Ethernet ports + 2x10G SFP+). Six 10/100/1000BASE-T copper Ethernet ports (RJ45) numbered 1/1, 1/2, 1/3, 1/4, 1/5, and 1/6 on the top row from left to right and two 10-gigabit SFP+ ports numbered 10/1 and 10/2 on the bottom row from left to right.

The following figure shows the back panel of the MPX 8005/8015/8200/8400/8600/8800 appliance.

Figure 3. Citrix NetScaler MPX 8005/8015/8200/8400/8600/8800 appliance, back panel



The following components are visible on the back panel of the MPX 8005/8015/8200/8400/8600/8800 appliance:

- One 256 GB removable solid-state drive, which is used to store the NetScaler software and the user data.

  Note: Earlier MPX 8005/8015/8200/8400/8600/8800 appliances had three additional SSD slots for future use. Current NetScaler MPX 8005/8015/8200/8400/8600/8800 appliances do not have any additional SSD slots for future use.

- Power switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- USB port (reserved for a future release).
- Non-maskable interrupt (NMI) button, which is used at the request of Technical Support to produce a NetScaler core dump. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Disable alarm button, which is nonfunctional. This button is functional only if you install a second power supply. Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet, or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Single power supply, rated at 450 watts, 110-220 volts.

  Note: The MPX 8005/8015/8200/8400/8600/8800 appliance supports dual power supplies, but ships with one power supply. Contact your Citrix sales representative to order a second power supply.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

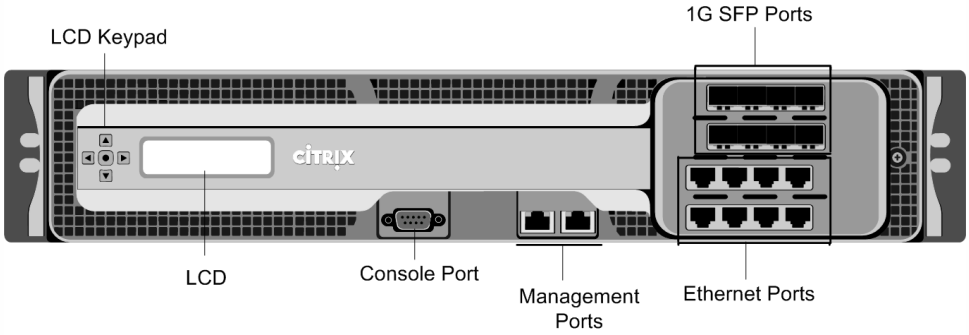
Citrix NetScaler MPX 9700, MPX 10500, MPX 12500, and MPX 15500

Sep 04, 2013

The Citrix NetScaler MPX 9700/10500/12500/15500 are 2U appliances, each with 2 quad-core processors, and 16 gigabytes (GB) of memory. All these appliances are also available in a 10G model and a FIPS model.

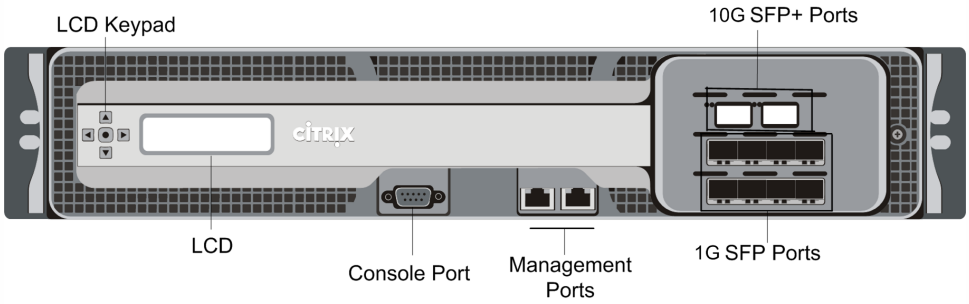
The following figure shows the front panel of the MPX 9700/10500/12500/15500.

Figure 1. Citrix NetScaler MPX 9700/10500/12500/15500, front panel



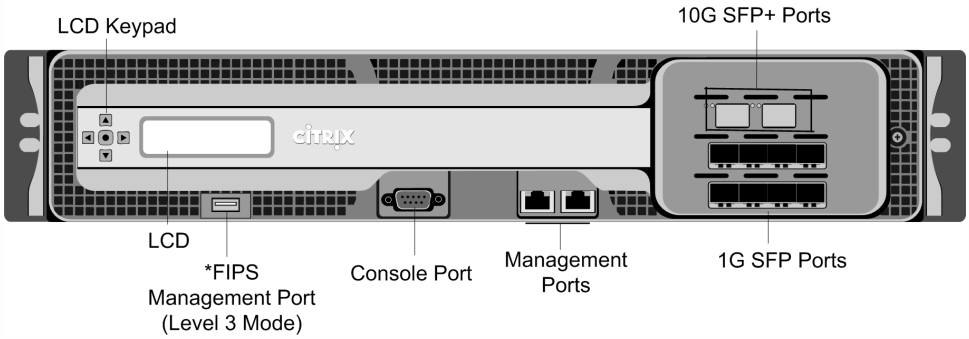
The following figure shows the front panel of the MPX 9700/10500/12500/15500 10G.

Figure 2. Citrix NetScaler MPX 9700/10500/12500/15500 10G, front panel



The following figure shows the front panel of the MPX 9700/10500/12500/15500 FIPS.

Figure 3. Citrix NetScaler MPX 9700/10500/12500/15500 FIPS, front panel



*The FIPS Management Port (Level 3 Mode) is reserved for a future release.

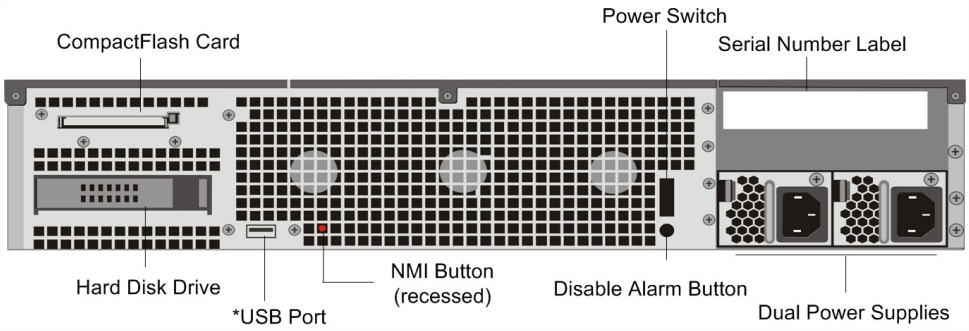
Caution: Do not insert a USB device into the FIPS Management Port. This will cause the FIPS card to fail.

Depending on the model, the appliance has the following ports:

- FIPS Management Port (reserved for a future release).
- RS232 serial Console Port.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports
  - MPX 9700/10500/12500/15500. Eight copper or fiber 1G SFP ports numbered 1/1, 1/2, 1/3, and 1/4 on the first row from left to right, and 1/5, 1/6, 1/7, and 1/8 on the second row from left to right. Eight 10/100/1000BASE-T copper Ethernet Ports (RJ45) numbered 1/9, 1/10, 1/11, and 1/12 on the third row from left to right, and 1/13, 1/14, 1/15, and 1/16 on the fourth row from left to right.
  - MPX 9700/10500/12500/15500 10G and MPX 9700/10500/12500/15000 FIPS. Two 10G SFP+ Ports numbered 10/1 and 10/2 on the top row, eight 1-gigabit copper or fiber 1G SFP Ports numbered 1/1, 1/2, 1/3, and 1/4 on the middle row from left to right, and 1/5, 1/6, 1/7, and 1/8 on the bottom row from left to right.

Important: The 10-gigabit ports on this appliance are labeled 10/1 and 10/2.
The following figure shows the back panel of the MPX 9700/10500/12500/15500 appliances, including the 10G model and FIPS model.

Figure 4. Citrix NetScaler MPX 9700/10500/12500/15500, MPX 9700/10500/12500/15500 FIPS, and MPX 9700/10500/12500/15500 10G, back panel



*The USB Port is reserved for a future release.

The following components are visible on the back panel of the MPX 9700/10500/12500/15500, including the 10G model and FIPS model:

- Four GB removable CompactFlash Card that is used to store the NetScaler software.
- Power Switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Removable Hard Disk Drive that is used to store user data.
- USB Port (reserved for a future release).
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Disable Alarm Button. This button is functional only when the appliance has two power supplies.
  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual Power Supplies, each rated at 450 watts, 110-220 volts.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the

Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

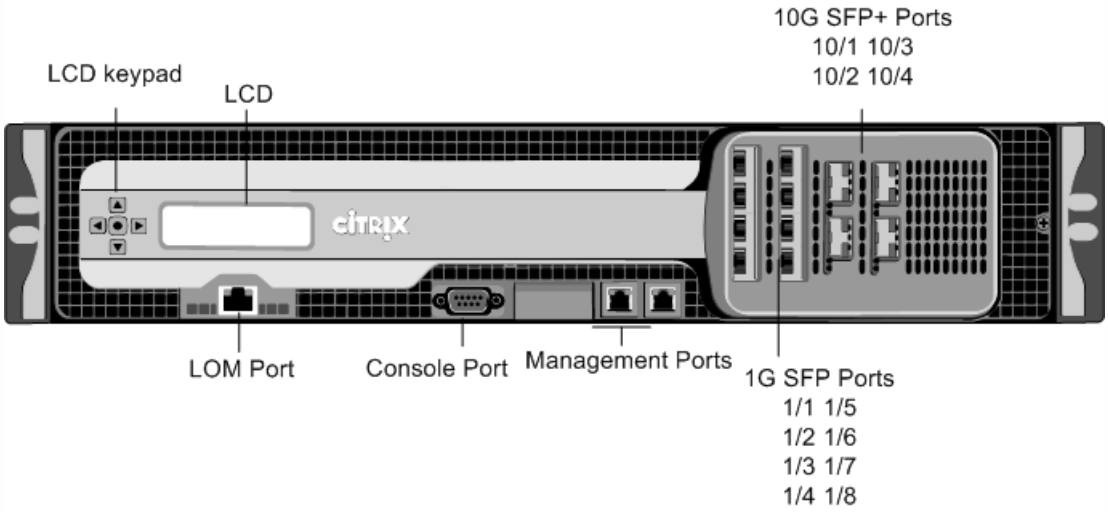
Citrix NetScaler MPX 11500,MPX 13500,MPX 14500,MPX 16500,MPX 18500, andMPX 20500

Oct 25, 2013

The Citrix NetScaler models MPX 11500/13500/14500/16500/18500/20500 are 2U appliances. Each model has two 6-core processors for a total of 12 physical cores (24 cores with hyper-threading), and 48 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 11500/13500/14500/16500/18500/20500 appliance.

Figure 1. Citrix NetScaler MPX 11500/13500/14500/16500/18500/20500 appliance, front panel

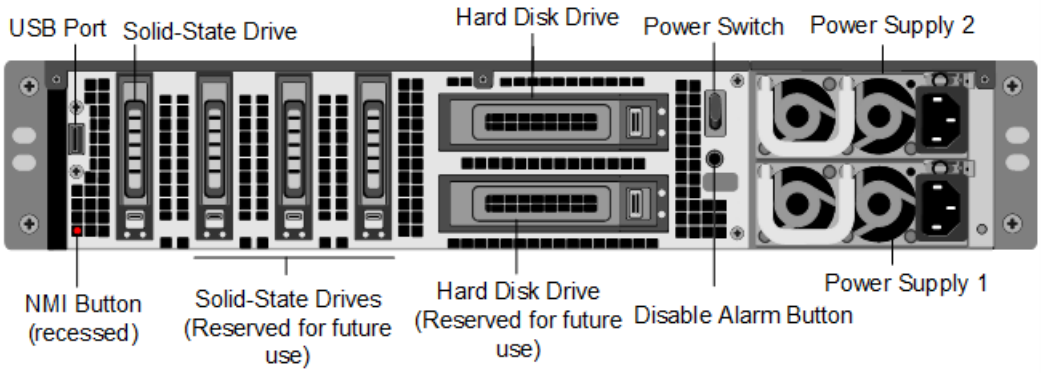


The MPX 11500/13500/14500/16500/18500/20500 appliances have the following ports:

- 10/100Base-T copper Ethernet Port (RJ45), also called LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
  Note: The LEDs on the LOM port are not operational by design.
- RS232 serial console port.
- Two 10/100/1000Base-T copper Ethernet management ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Eight 1G SFP ports numbered 1/1, 1/2, 1/3, 1/4 from top to bottom in the first column, and 1/5, 1/6, 1/7, and 1/8 from top to bottom in the second column.
- Four 10G SFP+ ports numbered 10/1 and 10/2 from top to bottom in the first column, and 10/3 and 10/4 from top to bottom in the second column.

The following figure shows the back panel of the MPX 11500/13500/14500/16500/18500/20500 appliance.

Figure 2. Citrix NetScaler MPX 11500/13500/14500/16500/18500/20500 appliance, back panel



The following components are visible on the back panel of the MPX 11500/13500/14500/16500/18500/20500 appliance:

- 160 GB removable solid-state drive that is used to store the NetScaler software.
- USB port (reserved for a future release).
- Power switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Two removable hard-disk drives that are used to store user data.
- Disable alarm button. This button is functional only when the appliance has two power supplies.
  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual power supplies, each rated at 650 watts, 110-220 volts.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

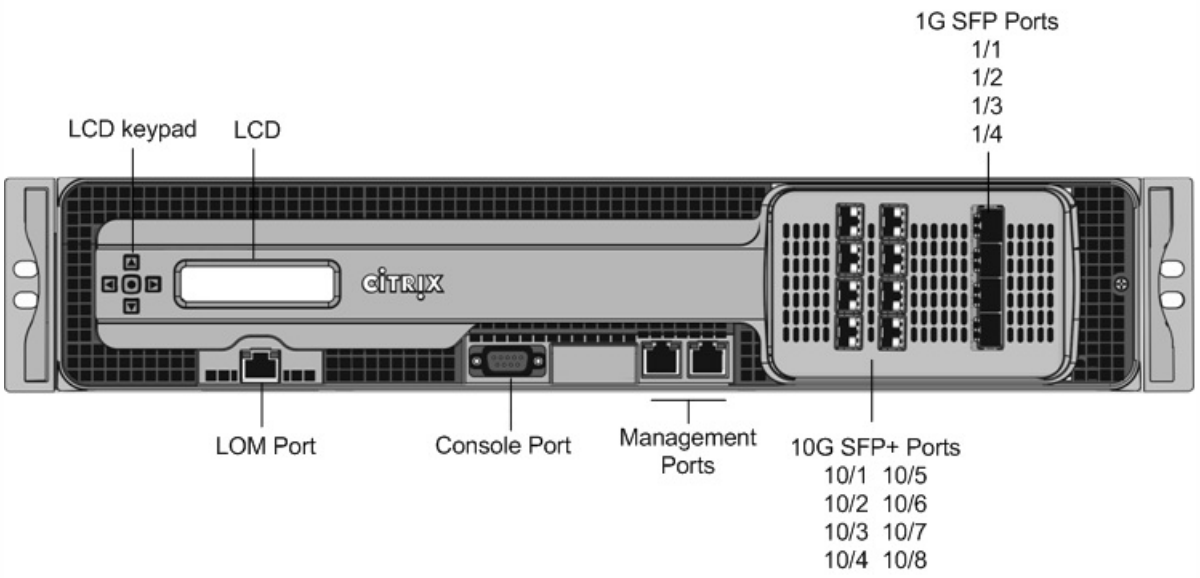
For information about performing initial configuration of your appliance, see "Initial Configuration."

Citrix NetScaler MPX 11515, MPX 11520, MPX 11530, MPX 11540, and MPX 11542

Mar 14, 2014

The Citrix NetScaler models MPX 11515/11520/11530/11540/11542 are 2U appliances. Each model has two 6-core processors for a total of 12 physical cores (24 cores with hyper-threading), and 48 gigabytes (GB) of memory.
The following figure shows the front panel of the MPX 11515/11520/11530/11540/11542 appliance.

Figure 1. Citrix NetScaler MPX 11515/11520/11530/11540/11542 appliance, front panel

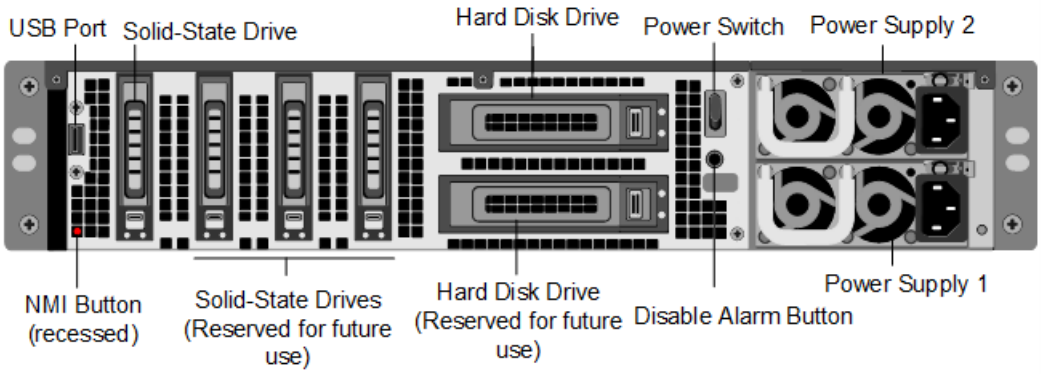


The MPX 11515/11520/11530/11540/11542 appliances have the following ports:

- RS232 serial console port.
- 10/100Base-T copper Ethernet Port (RJ45), also called LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
  Note: The LEDs on the LOM port are not operational by design.
- Two 10/100/1000Base-T copper Ethernet management ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Eight 10G SFP+ ports and four copper or fiber 1G SFP ports.

The following figure shows the back panel of the MPX 11515/11520/11530/11540/11542 appliance.

Figure 2. Citrix NetScaler MPX11515/11520/11530/11540/11542 appliance, back panel



The following components are visible on the back panel of the MPX 11515/11520/11530/11540/11542 appliance:

- 256 GB removable solid-state drive that is used to store the NetScaler software.
- USB port (reserved for a future release).
- Power switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Two removable hard-disk drives that are used to store user data.
- Disable alarm button. This button is functional only when the appliance has two power supplies.
  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual power supplies, each rated at 650 watts, 110-220 volts.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

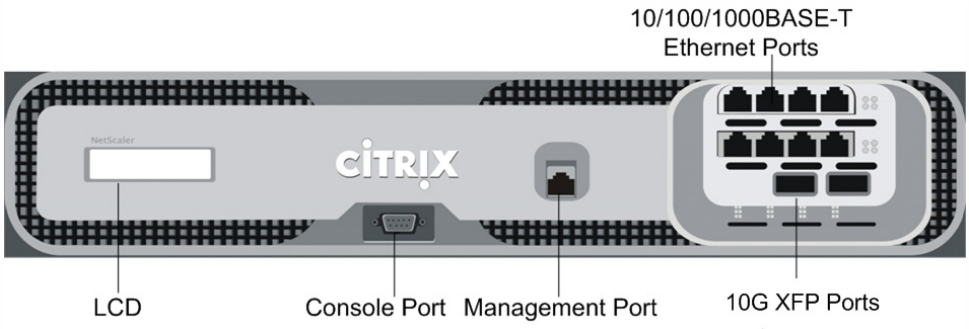
Citrix NetScaler MPX 15000

Sep 04, 2013

The Citrix NetScaler MPX 15000 appliance is a 2U appliance, with 2 dual-core processors, and 16 GB of memory. The MPX 15000 is a high-capacity hardware platform intended for heavy use in enterprise and service provider environments. The following figure shows the front panel of the MPX 15000 appliance.

Figure 1. Citrix NetScaler MPX 15000 appliance, front panel



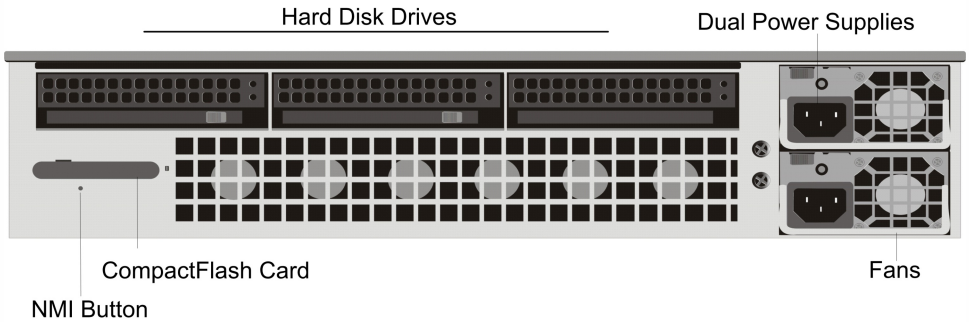
The appliance has the following ports:

- RS232 serial console port.
- 10/100/1000BASE-T copper Ethernet management port, numbered 0/1.
- Two XFP (10-Gigabit Small Form-Factor Pluggable) fiber optic ports, numbered from left to right 1/1 and 1/2.
- Eight 10/100/1000BASE-T copper Ethernet ports, numbered from upper left to bottom right 1/3, 1/4, 1/5, 1/6, 1/7, 1/8, 1/9, and 1/10.

When facing the bezel, the upper LEDs to the left of each port represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number and will always be either 0 or 1. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.
The following figure shows the back panel of the MPX 15000 appliance.

Figure 2. Citrix NetScaler MPX 15000 appliance, back panel



The following components are visible on the back panel of the MPX 15000 appliance:

- Removable hard-disk drive that is used to store user data.
- Dual power supplies, each rated at 500 watts, 110-220 volts.
  You plug separate power cords into the power supplies and connect them to separate wall sockets. The MPX 15000 functions properly with a single power supply; the extra power supply serves as a backup.

- Non-maskable interrupt (NMI) button, which signals the MPX 15000 to perform an orderly shutdown after saving all files. You must use a pen, pencil, or other pointed object to press this button, which is located inside a small hole to prevent it from being pressed accidentally.
- Removable CompactFlash card that is used to store the NetScaler software.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

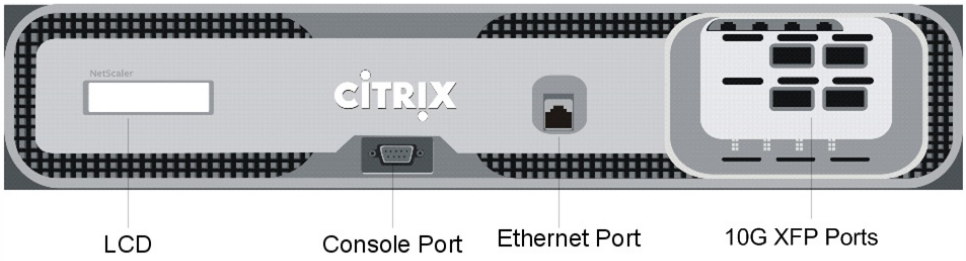
Citrix NetScaler MPX 17000

Sep 04, 2013

The Citrix NetScaler MPX 17000 appliance is a 2U appliance, with 2 quad-core processors, and 32 GB of memory. The MPX 17000 is a high-capacity hardware platform intended for any high traffic, intensive processing data center environment. There are two MPX 17000 models: the four network-port model and the ten network-port model.

The following figure shows the front panel of the MPX 17000, four network-port model.

Figure 1. Citrix NetScaler MPX 17000 four network-port model, front panel



Depending on the model, the appliance has the following ports:

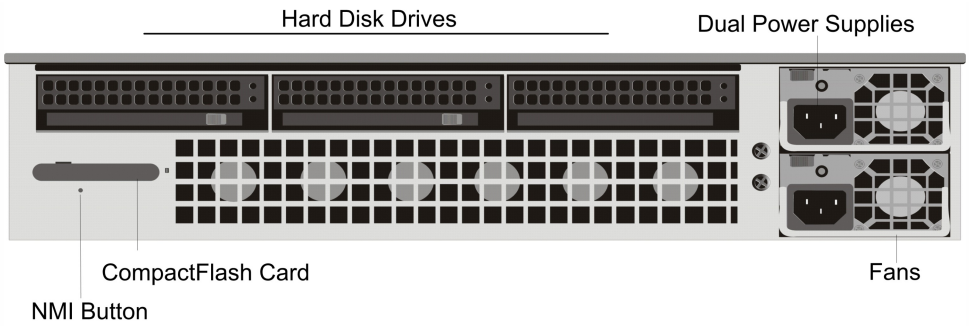
- RS232 serial console port.
- 10/100/1000BASE-T copper Ethernet management port, numbered 0/1.
- Network Ports
  - MPX 17000 four network-port model. Four XFP (10-Gigabit Small Form-Factor Pluggable) ports, numbered from upper left to bottom right 1/1, 1/2, 1/3, and 1/4.
  - MPX 17000 ten network-port model. Two XFP ports, numbered from left to right 1/1 and 1/2 and eight 10/100/1000BASE-T Ethernet ports, numbered from upper left to bottom right 1/3, 1/4, 1/5, 1/6, 1/7, 1/8, 1/9 and 1/10.

  Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number and will always be either 0 or 1. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

When facing the bezel, the upper LEDs to the left of each port represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

The following figure shows the back panel of the MPX 17000 appliance.

Figure 2. Citrix NetScaler MPX 17000 appliance, back panel



The following components are visible on the back of the MPX 17000 appliance:

- Removable hard-disk drive that is used to store user data.
- Dual power supplies, each rated at 500 watts, 110-220 volts.
  You plug separate power cords into the power supplies and connect them to separate wall sockets. The MPX 17000 functions properly with a single power supply; the extra power supply serves as a backup.
- Non-maskable interrupt (NMI) button, which signals the MPX 17000 to perform an orderly shutdown after saving all files. You must use a pen, pencil, or other pointed object to press this button, which is located inside a small hole to prevent it from being pressed accidentally.
- Removable CompactFlash card that is used to store the NetScaler software.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

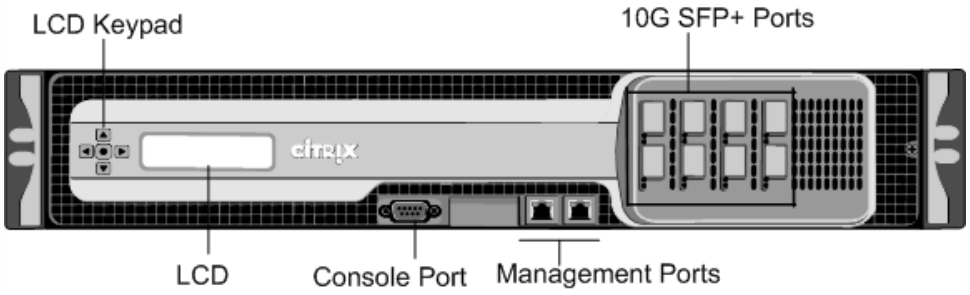
Citrix NetScaler MPX 17500, MPX 19500, and MPX 21500

Oct 25, 2013

The Citrix NetScaler models MPX 17500/19500/21500 are 2U appliances. Each model has two 6-core processors and 48 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 17500/19500/21500 appliance.

Figure 1. Citrix NetScaler MPX 17500/19500/21500 appliance, front panel

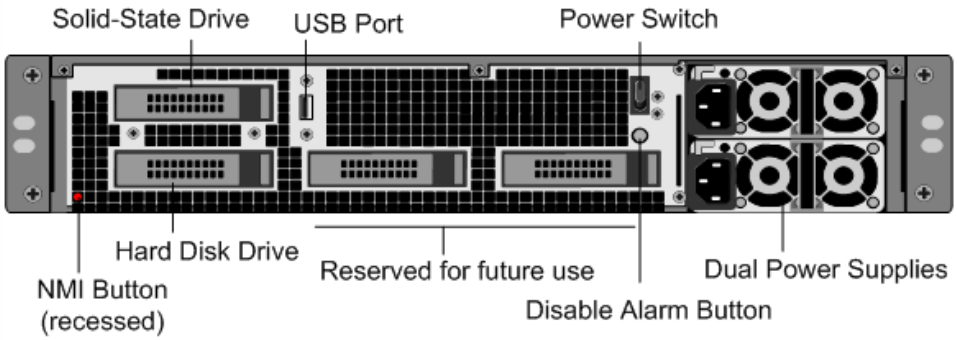


The MPX 17500/19500/21500 appliances have the following ports:

- RS232 serial console port.
- Two 10/100/1000Base-T copper Ethernet management ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Eight 10G SFP+ ports numbered 10/1, 10/2, 10/3, and 10/4 on the top row from left to right, and 10/5, 10/6, 10/7, and 10/8 on the bottom row from left to right.

The following figure shows the back panel of the MPX 17500/19500/21500 appliance.

Figure 2. Citrix NetScaler MPX 17500/19500/21500 appliance, back panel



The following components are visible on the back panel of the MPX 17500/19500/21500 appliance:

- 160 GB removable solid-state drive that is used to store the NetScaler software.
- USB port (reserved for a future release).
- Power switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent

unintentional activation.

- Removable hard-disk drive that stores user data.
- Disable alarm button. This button is functional only when the appliance has two power supplies.
  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual power supplies, each rated at 650 watts, 110-220 volts.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

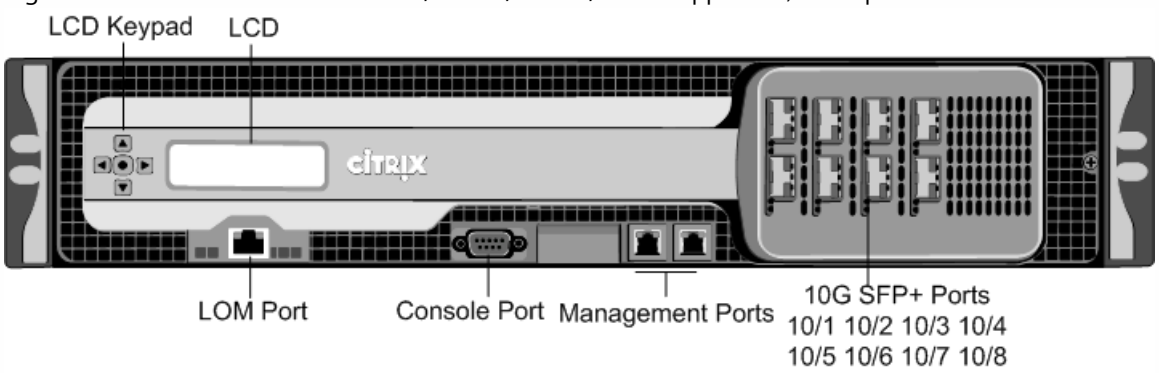
Citrix NetScaler MPX 17550, MPX 19550, MPX 20550, and MPX 21550

Oct 25, 2013

The Citrix NetScaler models MPX 17550, MPX 19550, MPX 20550, and MPX 21550 are 2U appliances. Each model has two 6-core processors for a total of 12 physical cores (24 cores with hyper-threading), and 96 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 17550/19550/20550/21550 appliance.

Figure 1. Citrix NetScaler MPX 17550/19550/20550/21550 appliance, front panel

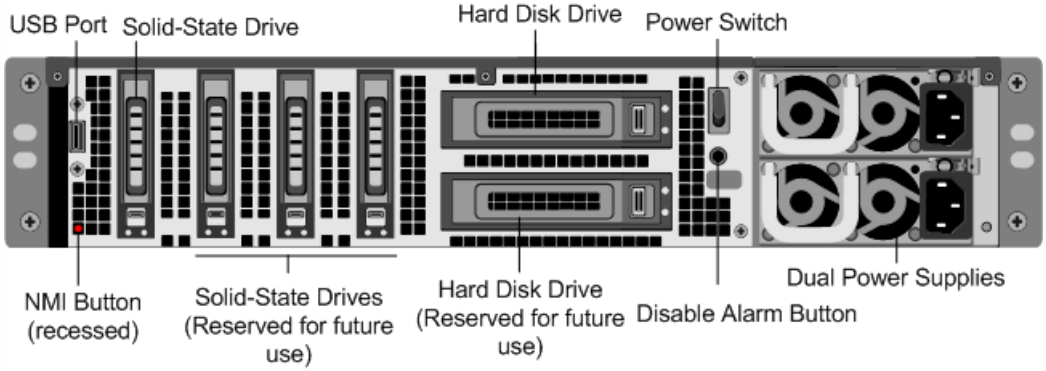


The MPX 17550/19550/20550/21550 appliance has the following ports:

- 10/100Base-T copper Ethernet Port (RJ45), also called LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
  Note: The LEDs on the LOM port are not operational by design.
- RS232 serial console port.
- Two 10/100/1000Base-T copper Ethernet management ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Eight 10G SFP+ ports numbered 10/1, 10/2, 10/3, and 10/4 on the top row from left to right, and 10/5, 10/6, 10/7, and 10/8 on the bottom row from left to right.

The following figure shows the back panel of the MPX 17550/19550/20550/21550 appliance.

Figure 2. Citrix NetScaler MPX 17550/19550/20550/21550 appliance, back panel



The following components are visible on the back panel of the MPX 17550/19550/20550/21550 appliance:

- 160 GB removable solid-state drive that is used to store the NetScaler software.
- USB port (reserved for a future release).

- Power switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Two removable hard-disk drives that store user data.
- Disable alarm button. This button is functional only when the appliance has two power supplies.
  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual power supplies, each rated at 850 watts, 110-220 volts.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

Citrix NetScaler MPX 22040, MPX 22060, MPX 22080, MPX 22100, and MPX 22120

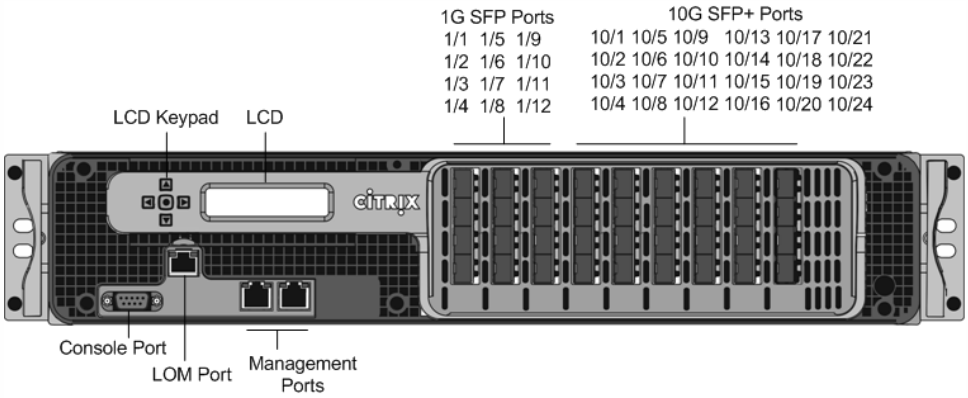
Oct 25, 2013

The Citrix NetScaler MPX 22040/22060/22080/22100/22120 are 2U appliances. Each model has two 8-core processors and 256 gigabytes (GB) of memory. The MPX 22040/22060/22080/22100/22120 appliances are available in two port configurations:

- Twelve 1G SFP ports and twenty-four 10G SFP+ ports (12x1G SFP + 24x10G SFP+)
- Twenty-four 10G SFP+ ports (24x10G SFP+)

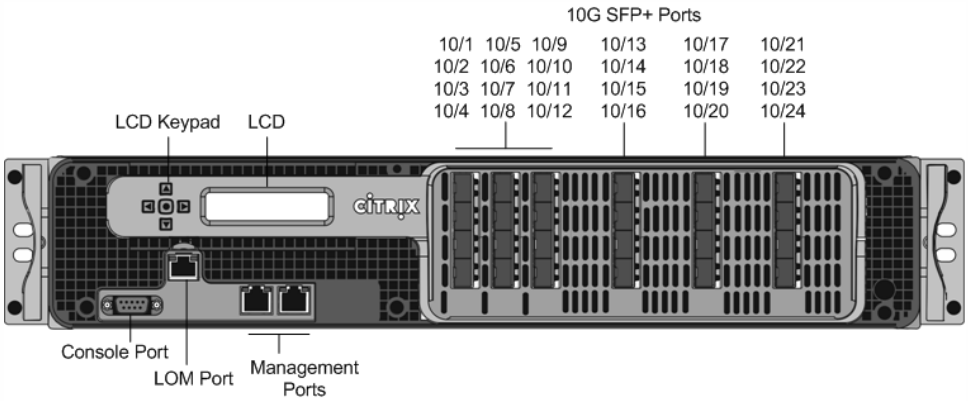
The following figure shows the front panel of the MPX 22040/22060/22080/22100/22120 (12x1G SFP + 24x10G SFP+) appliance.

Figure 1. Citrix NetScaler MPX 22040/22060/22080/22100/22120 (12x1G SFP + 24x10G SFP+), front panel



The following figure shows the front panel of the MPX 22040/22060/22080/22100/22120 (24x10G SFP+) appliance.

Figure 2. Citrix NetScaler MPX 22040/22060/22080/22100/22120 (24x10G SFP+), front panel



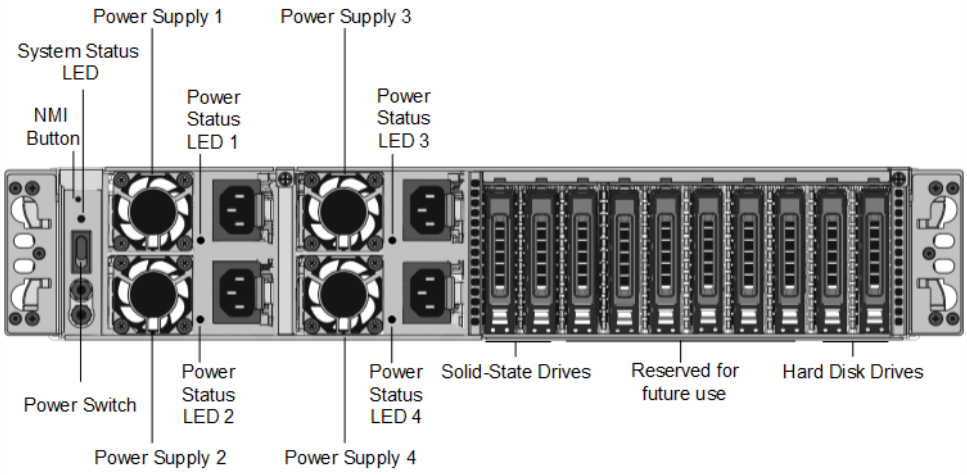
Depending on the model, the appliance has the following ports:

- RS232 serial Console Port.
- 10/100Base-T copper Ethernet Port (RJ45), also called the LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.

- Network Ports
  - MPX 22040/22060/22080/22100/22120 (12x1G SFP + 24x10G SFP+). Twelve copper or fiber 1G SFP ports and twenty-four 10G SFP+ ports.
  - MPX 22040/22060/22080/22100/22120 (24x10G SFP+). Twenty-four 10G SFP+ ports.

The following figure shows the back panel of the MPX 22040/22060/22080/22100/22120 appliances.

Figure 3. Citrix NetScaler MPX 22040/22060/22080/22100/22120, back panel



The following components are visible on the back panel of the MPX 22040/22060/22080/22100/22120 appliance:

- Non-maskable interrupt (NMI) Button, used at the request of Technical Support to initiate a core dump. To press this red button, which is recessed to prevent unintentional activation, use a pen, pencil, or other pointed object. The NMI Button is also available remotely over the network in the LOM GUI, in the Remote Control menu.
- System status LED, which indicates the status of the appliance, as described in http://support.citrix.com/proddocs/topic/netscaler-hrdwre-installation-10-5/ns-hardware-common-components-ref.html.

  Note: On an MPX 22040/22060/22080/22100/22120 appliance running LOM firmware version 3.22, the system status LED indicates an error (continuously glows RED) even though the appliance is functioning properly.
- Four power supplies, each rated at 750 watts, 100-240 volts. A minimum of two power supplies are required for proper operation. The extra power supplies act as backup. Each power supply has an LED that indicates the status of the power supply, as described in http://support.citrix.com/proddocs/topic/netscaler-hrdwre-installation-10-5/ns-hardware-common-components-ref.html.
- Power switch, which turns off power to the appliance. Press the switch for less than two seconds to turn off the power.
- Two 256 GB removable solid-state drives. The leftmost solid-state drive stores the NetScaler software. The other solid-state drive stores user data.
- Two 1TB removable hard disk drives that are used to store user data.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

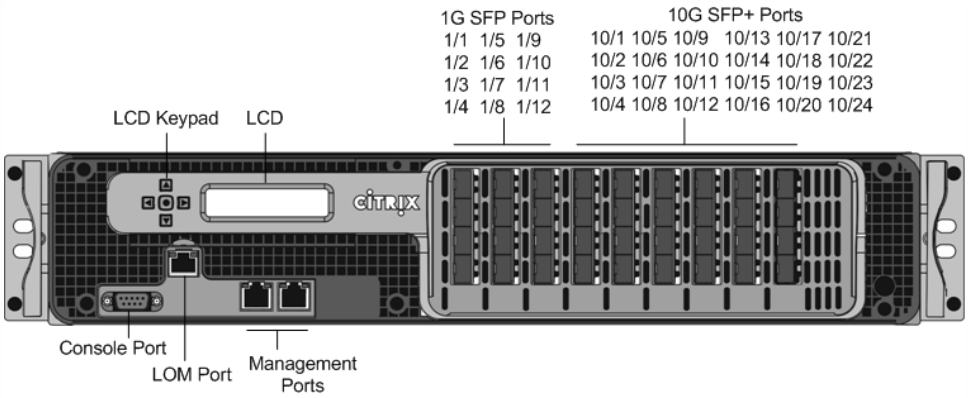
Citrix NetScaler MPX 24100 and MPX 24150

Oct 25, 2013

The Citrix NetScaler MPX 24100/24150 are 2U appliances. Each model has two 8-core processors and 256 gigabytes (GB) of memory. The MPX 24100/24150 appliances are available in the twelve 1G SFP ports and twenty-four 10G SFP+ ports (12x1G SFP + 24x10G SFP+) configuration.

The following figure shows the front panel of the MPX 24100/24150 (12x1G SFP + 24x10G SFP+) appliance.

Figure 1. Citrix NetScaler MPX 24100/24150 (12x1G SFP + 24x10G SFP+), front panel

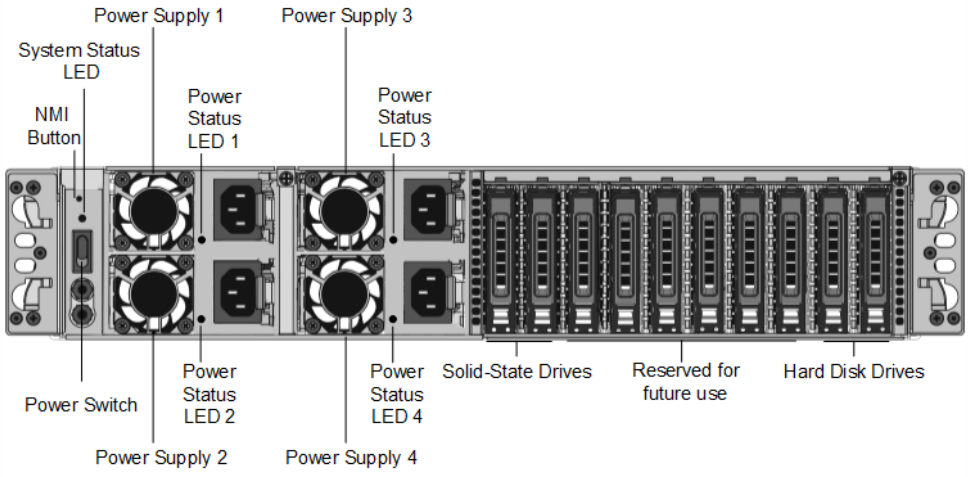


Depending on the model, the appliance has the following ports:

- RS232 serial Console Port.
- 10/100Base-T copper Ethernet Port (RJ45), also called the LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports
  - MPX 24100/24150 (12x1G SFP + 24x10G SFP+). Twelve copper or fiber 1G SFP ports and twenty-four 10G SFP+ ports.

The following figure shows the back panel of the MPX 24100/24150 appliances.

Figure 2. Citrix NetScaler MPX 24100/24150, back panel



The following components are visible on the back panel of the MPX 24100/24150 appliance:

- Non-maskable interrupt (NMI) Button, used at the request of Technical Support to initiate a core dump. To press this red button, which is recessed to prevent unintentional activation, use a pen, pencil, or other pointed object. The NMI Button is also available remotely over the network in the LOM GUI, in the Remote Control menu.
- System status LED, which indicates the status of the appliance, as described in http://support.citrix.com/proddocs/topic/netscaler-hrdwre-installation-10-5/ns-hardware-common-components-ref.html.

  Note: On an MPX 24100/24150 appliance running LOM firmware version 3.22, the system status LED indicates an error (continuously glows RED) even though the appliance is functioning properly.
- Four power supplies, each rated at 750 watts, 100-240 volts. A minimum of two power supplies are required for proper operation. The extra power supplies act as backup. Each power supply has an LED that indicates the status of the power supply, as described in http://support.citrix.com/proddocs/topic/netscaler-hrdwre-installation-10-5/ns-hardware-common-components-ref.html.
- Power switch, which turns off power to the appliance. Press the switch for less than two seconds to turn off the power.
- Two 128 GB removable solid-state drives.
- One 500 GB removable hard disk drive that is used to store user data.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

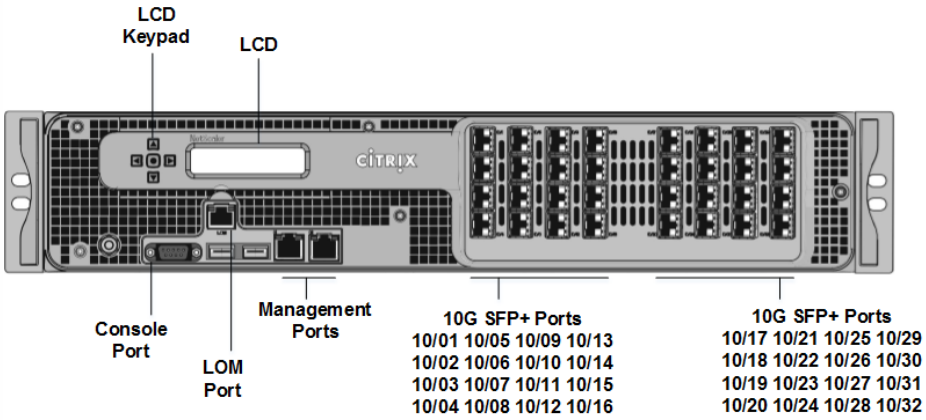
Citrix NetScaler MPX 25100T and MPX 25160T

Oct 25, 2013

The Citrix NetScaler MPX 25100T and 25160T are 2U appliances. Each model has two 10-core processors and 128 gigabytes (GB) of memory. The MPX 25100T/25160T appliances are available in the thirty-two 10G SFP+ ports (32x10G SFP+) configuration.

Note: The MPX 25000T appliances are not RAID (redundant array of independent disks) devices.
The following figure shows the front panel of the MPX 25100T/25160T (32x10G SFP+) appliance.

Figure 1. Citrix NetScaler MPX 25100T/25160T (32x10G SFP+), front panel

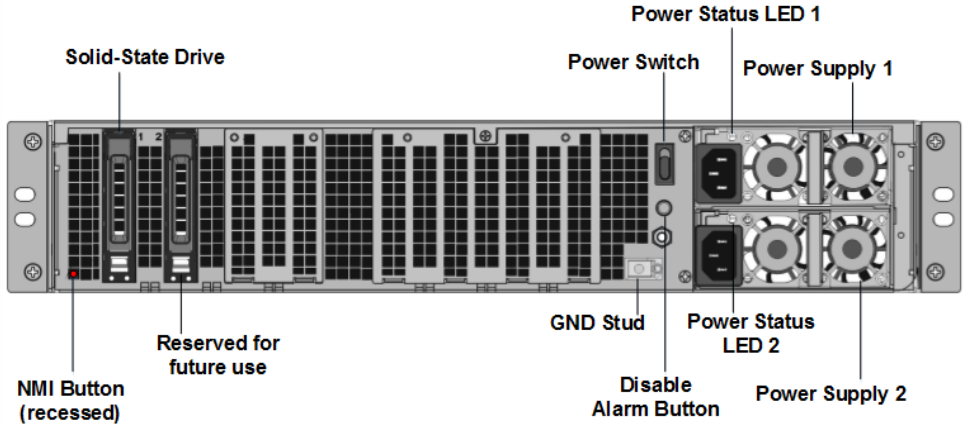


Depending on the model, the appliance has the following ports:

- RS232 serial Console Port.
- 10/100Base-T copper Ethernet Port (RJ45), also called the LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports, thirty-two 10G SFP+ ports (32x10G SFP+).
  Note: The 10G SFP+ ports on these appliances support copper 1G SFP transceivers.

The following figure shows the back panel of the MPX 25100T/25160T appliance.

Figure 2. Citrix NetScaler MPX 25100T/25160T, back panel



The following components are visible on the back panel of the MPX 25100T/25160T appliance:

- One 300 GB removable solid-state drive.
- Power switch, which turns power to the appliance on or off. Press the switch for less than two seconds to turn off the power.
- Two power supplies, each rated at 1000 watts, 100-240 volts. Each power supply has an LED that indicates the status of the power supply, as described in http://support.citrix.com/proddocs/topic/netscaler-hrdwre-installation-10-1/ns-hardware-common-components-ref.html.
- Disable alarm button, which is functional only when the appliance has two power supplies.

  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet, or when one power supply is malfunctioning, and you want to continue operating the appliance until it is repaired.

- Non-maskable interrupt (NMI) Button, used at the request of Technical Support to initiate a core dump. To press this red button, which is recessed to prevent unintentional activation, use a pen, pencil, or other pointed object. The NMI Button is also available remotely over the network in the LOM GUI, in the Remote Control menu. For more information on the Lights Out Management Port of the appliance, see http://support.citrix.com/proddocs/topic/netscaler-hrdwre-installation-10-1/ns-hardware-lom-intro-wrapper-con.html.

For information about installing the rails, rack mounting the hardware, and connecting the cables, see "Installing the Hardware."

For information about performing initial configuration of your appliance, see "Initial Configuration."

Citrix NetScaler MPX 14020, MPX 14030, MPX 14040, MPX 14060, MPX 14080, and MPX 14100

Nov 09, 2015

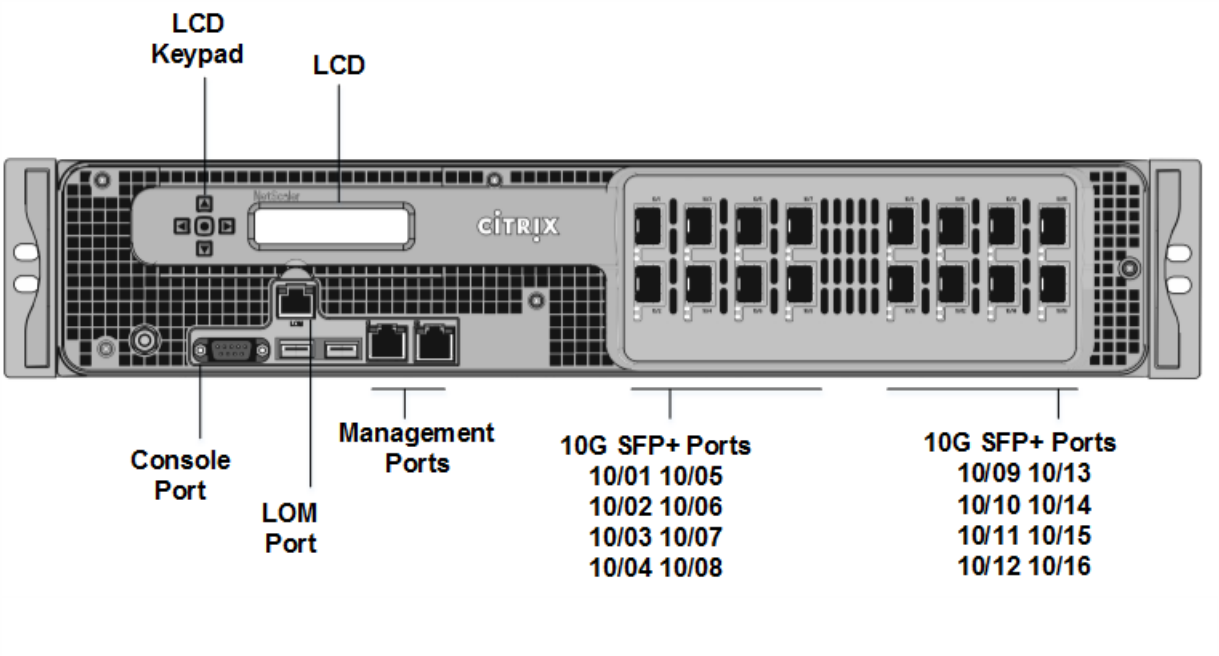
The Citrix NetScaler MPX 14020/14030/14040/14060/14080/14100 are 2U appliances. Each model has two 6-core processors and 64 gigabytes (GB) of memory and sixteen 10G SFP+ ports (16x10G SFP+).

The NetScaler MPX 14020/14030/14040/14060/14080/14100 appliances are shipped with NetScaler release 10.1 Build 133.13 and the LOM version is 4.07.

For information on the software releases supported on the NetScaler hardware platforms, see http://docs.citrix.com/en-us/netscaler/11/getting-started-with-netscaler/product-line.html.

The following figure shows the front panel of the MPX 14020/14030/14040/14060/14080 (16x10G SFP+) appliance.

Figure 1. Citrix NetScaler MPX 14020/14030/14040/14060/14080/14100 (16x10G SFP+), front panel



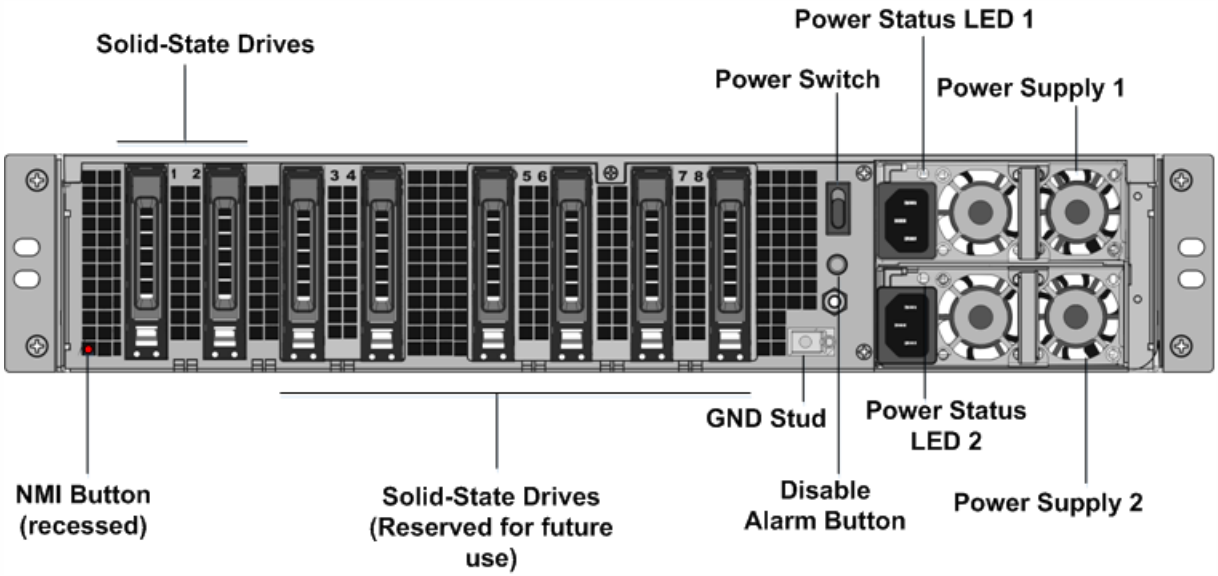
The NetScaler MPX 14020/14030/14040/14060/14080/14100 appliances have the following ports:

- RS232 serial Console Port.
- 10/100Base-T copper Ethernet Port (RJ45), also called the LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1and 0/2 from left to right. These ports are used to connect directly to the appliancefor system administration functions.
- Network Ports, sixteen 10G SFP+ ports (16x10G SFP+).

Note: The 10G SFP+ ports on these appliances support copper 1G SFP transceivers.

The following figure shows the back panel of the MPX 14020/14030/14040/14060/14080/ 14100 appliance.

Figure 2. Citrix NetScaler MPX 14020/14030/14040/14060/14080/14100, back panel



The following components are visible on the back panel of the MPX 14020/14030/14040/14060/14080/14100 appliance:

- Two 240 GB removable solid-state drives (SSDs).

These appliances are redundant array of independent disks (RAID) devices. In a RAID configuration, the same data is stored on multiple drives to improve performance, increase storage capacity, lower the risk of data loss, and provide fault tolerance.

The two SSDs store the same data. If one fails and you replace it, the new SSD mirrors the other one.

- Power switch, which turns power to the appliance on or off. Press the switch for lessthan two seconds to turn off the power.
- Two power supplies, each rated at 1000 watts, 100-240 volts. Each power supply has an LED that indicates the status of the power supply, as described in http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-common-components-ref.html.
- Disable alarm button, which is functional only when the appliance has two powersupplies.

Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet, or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.

- Non-maskable interrupt (NMI) Button, used at the request of Technical Support toinitiate a core dump. To press this red button, which is recessed to preventunintentional activation, use a pen, pencil, or other pointed object. The NMI Buttonis also available remotely over the network in the LOM GUI, in the Remote Controlmenu. For more information about the lights out management port of the appliance, see http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-lom-intro-wrapper-con.html.

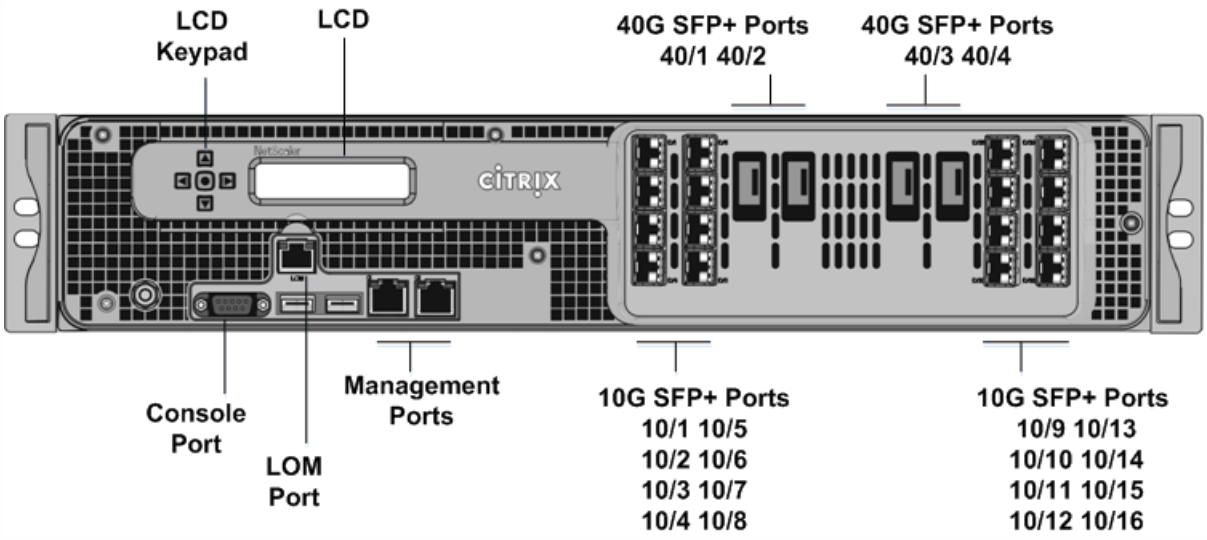
Citrix NetScaler MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G

Mar 24, 2016

The Citrix NetScaler MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G are 2U appliances. Each model has two 6-core processors, 64 gigabytes (GB) of memory, four 40G QSFP+ ports, and sixteen 10G SFP+ ports (4x40G QSFP+ + 16x10G SFP+).

The following figure shows the front panel of the MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G (4x40G QSFP+ + 16x10G SFP+) appliance.

Figure 1. Citrix NetScaler MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G (4x40G QSFP+ + 16x10G SFP+), front panel



The NetScaler MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G appliances have the following ports:

- RS232 serial Console Port.
- 10/100Base-T copper Ethernet Port (RJ45), also called the LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports, four 40G QSFP+ ports and sixteen 10G SFP+ ports (4x40G QSFP+ + 16x10G SFP+).

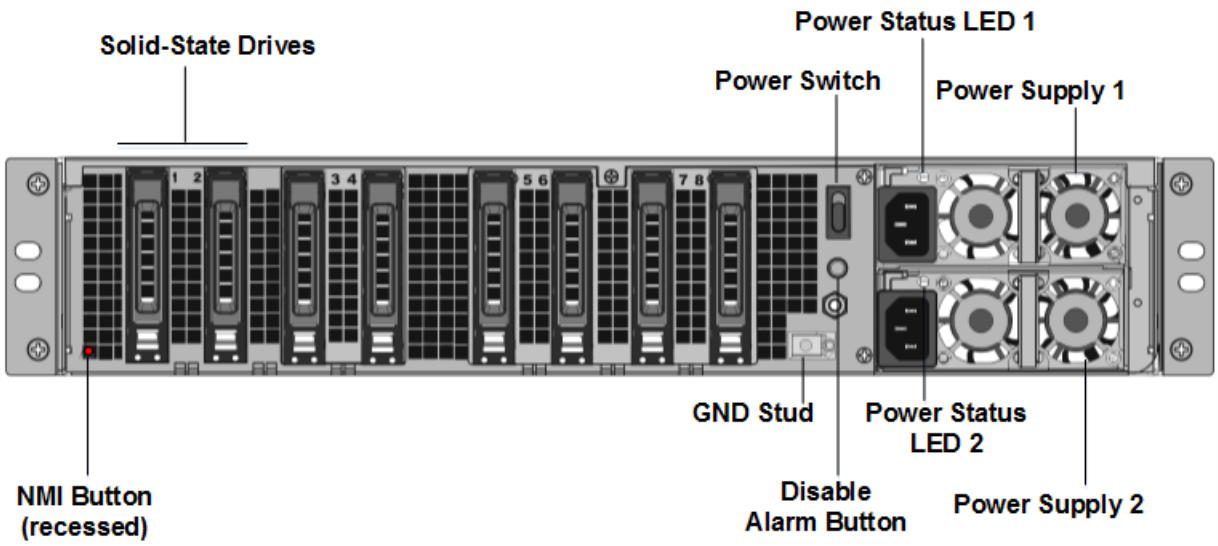
  Note the following points regarding the network ports on 14000-40G appliances:

  * 10G ports do not support 1G copper or 1G fiber transceivers.

  * 40G ports do not support 10G and 1G transceivers.

The following figure shows the back panel of the MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G appliance.

Figure 2. Citrix NetScaler MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G, back panel



The following components are visible on the back panel of the MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G

appliance:

- Two 240 GB removable solid-state drives (SSDs).

  These appliances are redundant array of independent disks (RAID) devices. In a RAID configuration, the same data is stored on multiple drives to improve performance, increase storage capacity, lower the risk of data loss, and provide fault tolerance.

  The two SSDs store the same data. If one fails and you replace it, the new SSD mirrors the other one.

- Power switch, which turns power to the appliance on or off. Press the switch for lessthan two seconds to turn off the power.
- Two power supplies, each rated at 1000 watts, 100-240 volts. Each power supply has an LED that indicates the status of the power supply, as described in http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-common-components-ref.html.
- Disable alarm button, which is functional only when the appliance has two powersupplies.
- Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet, or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Non-maskable interrupt (NMI) Button, used at the request of Technical Support toinitiate a core dump. To press this red button, which is recessed to preventunintentional activation, use a pen, pencil, or other pointed object. The NMI Buttonis also available remotely over the network in the LOM GUI, in the Remote Controlmenu. For more information about the lights out management port of the appliance, see http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-lom-intro-wrapper-con.html.

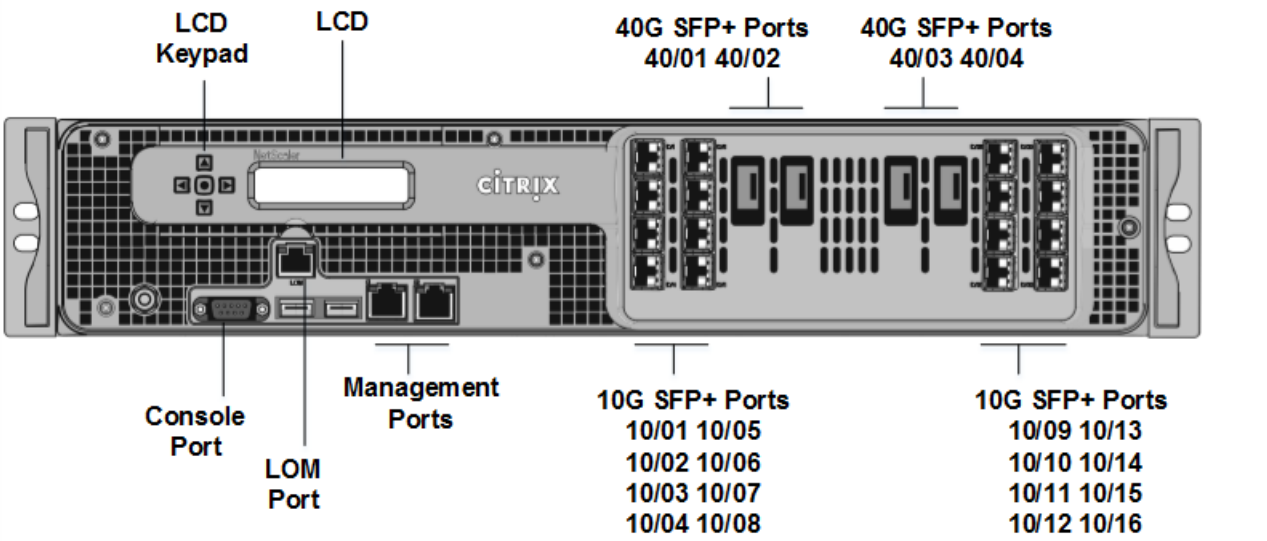
Citrix NetScaler MPX 25100 40G, MPX 25160 40G

Mar 24, 2016

The Citrix NetScaler MPX 25100 40G, MPX 25160 40G are 2U appliances. Each model has two 10-core processors, 256 gigabytes (GB) of memory, four 40G QSFP+ ports, and sixteen 10G SFP+ ports (4x40G QSFP+ + 16x10G SFP+).

The following figure shows the front panel of the MPX 25100 40G, MPX 25160 40G (4x40G QSFP+ + 16x10G SFP+) appliance.

Figure 1. Citrix NetScaler MPX 25100 40G, MPX 25160 40G (4x40G QSFP+ + 16x10G SFP+), front panel



The NetScaler MPX 25100 40G, MPX 25160 40G appliances have the following ports:

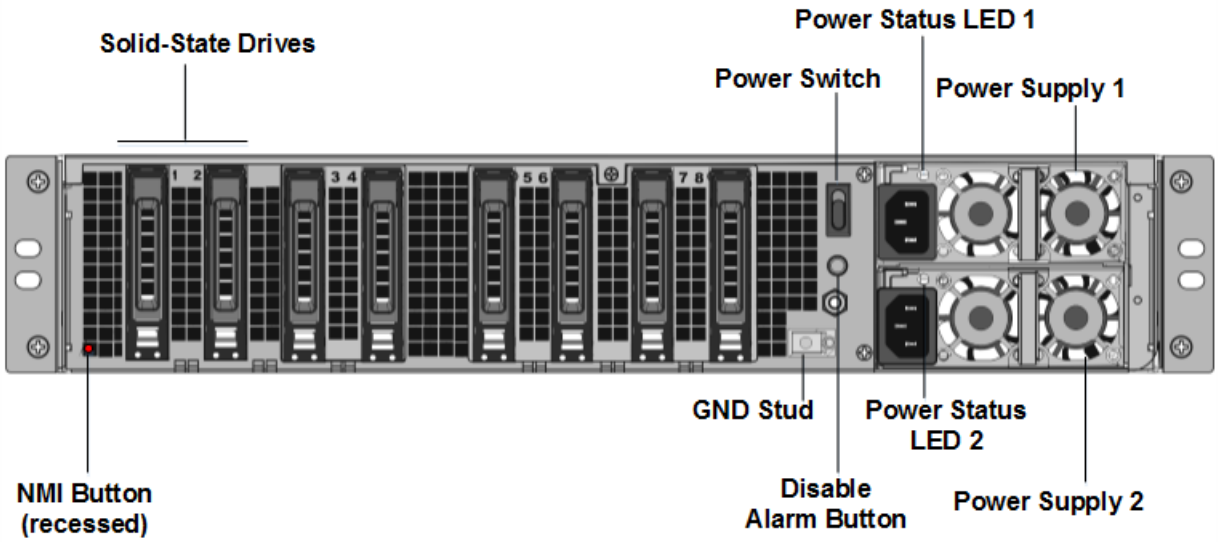
- RS232 serial Console Port.
- 10/100Base-T copper Ethernet Port (RJ45), also called the LOM port. You can use this port to remotely monitor and manage the appliance independently of the NetScaler software.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports, four 40G QSFP+ ports and sixteen 10G SFP+ ports (4x40G QSFP+ + 16x10G SFP+).

  Note the following points regarding the network ports on 25000-40G appliances:

  - 10G ports do not support 1G copper or 1G fiber transceivers.
  - 40G ports do not support 10G and 1G transceivers.

The following figure shows the back panel of the MPX 25100 40G, MPX 25160 40G appliance.

Figure 2. Citrix NetScaler MPX 25100 40G, MPX 25160 40G, back panel



The following components are visible on the back panel of the MPX 25100 40G, MPX 25160 40G

appliance:

- Two 300 GB removable solid-state drives.

  These appliances are redundant array of independent disks (RAID) devices. In a RAID configuration, the same data is stored on multiple drives to improve performance, increase storage capacity, lower the risk of data loss, and provide fault tolerance.

- Power switch, which turns power to the appliance on or off. Press the switch for less than two seconds to turn off the power.
- Two power supplies, each rated at 1000 watts, 100-240 volts. Each power supply has an LED that indicates the status of the power supply, as described in http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-common-components-ref.html.
- Disable alarm button, which is functional only when the appliance has two powersupplies.

  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet, or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.

- Non-maskable interrupt (NMI) Button, used at the request of Technical Support toinitiate a core dump. To press this red button, which is recessed to preventunintentional activation, use a pen, pencil, or other pointed object. The NMI Buttonis also available remotely over the network in the LOM GUI, in the Remote Control menu. For more information about lights out management port of the appliance, see http://docs.citrix.com/en-us/netscaler/10-1/ns-gen-hardware-wrapper-10-con/ns-hardware-lom-intro-wrapper-con.html.

Application Firewall Platforms

Oct 23, 2013

For information about the Application Firewall platforms, see Citrix NetScaler Application Firewall.

Summary of Hardware Specifications

Apr 01, 2016

The following tables summarize the specifications of the hardware platforms.

Table 1. MPX Platform Summary

	MPX 5500	MPX 5550/MPX 5650	MPX 7500/MPX 9500	MPX 15000
Processors	1 dual-core	1 quad-core	1 dual-core	2 quad-core
Memory	4 GB	8 GB	8 GB	16 GB
Ports - 1G	4x10/100/1000Base-T copper Ethernet ports	6x10/100/1000Base-T copper Ethernet ports	8x10/100/1000Base-T copper Ethernet ports model: 8x10/100/1000Base-T copper Ethernet ports 4x1G SFP + 4x10/100/1000Base-T copper Ethernet ports model: 4xcopper/fiber 1G SFP ports, 4x10/100/1000Base-T copper Ethernet ports	8x10/100/1000Base-T copper Ethernet ports
Ports - 10G	NA	NA	NA	NA
Number of Power Supplies	1	1	1 with second optional	2
AC Power Supply input voltage, frequency, & current	100–240 VAC 50–60 Hz 3–1.5 A	100–240 VAC 50–60 Hz 2.5 A	100–240 VAC 50–60 Hz 3–1.5 A	100–240 VAC 47–63 Hz
Maximum Power Consumption	260 W	300 W	260 W	700 W

Heat Dissipation	887 BTU per hour	630 BTU per hour	887 BTU per hour	
Weight	22 lbs 9.98 kg	32 lbs 14.5 kg	23 lbs with one power supply 10.43 kg with one power supply	52 lbs 23.58 kg

Hardware Health Attributes

Jan 21, 2014

Operating ranges for NetScaler hardware platforms vary for different attributes. You can use the stat system -detail command to display the current values of the attributes.

You can also query SNMP OIDs to monitor the attributes of the appliance. For more information about SNMP OIDs, see "SNMP OID Reference."

The following table lists the health attributes and their recommended value ranges.

	SNMP Alarm Support	Recommended Range

Preparing for Installation

Apr 04, 2016

Before you install your new appliance, carefully unpack your appliance and make sure that all parts were delivered. Once you are satisfied that your appliance has been delivered to your expectations, verify that the location where the appliance will be installed meets temperature and power requirements and that the server cabinet or floor-to-ceiling cabinet is securely bolted to the floor and has sufficient airflow.

Only trained and qualified personnel should install, maintain, or replace the appliance, and efforts should be taken to ensure that all cautions and warnings are followed.

This document includes the following information:

The hardware accessories for your particular appliance, such as cables, adapters, and rail kit, vary depending on the hardware platform you ordered. Unpack the box that contains your new appliance on a sturdy table with plenty of space and inspect the contents.

Use the following list to verify that you received everything that should have been included in the box.

- The appliance you ordered
- One RJ-45 to DB-9 adapter
- One 6 ft RJ-45/DB-9 cable
- The following list specifies the number of power cables included for each appliance model:
  - One power cable for the MPX 5500, MPX 5550/5650, MPX 7500/9500, and MPX 8005/8015/8200/8400/8600/8800 appliances
  - Two power cables for the MPX 15000, MPX 17000, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 14000, MPX 17500/19500/21500, MPX 25100T/25160T, MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G, MPX 25100 40G, MPX 25160 40G appliances
  - Four power cables for the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 appliances
    Note: Make sure that a power outlet is available for each cable.

  Note: For Brazilian customers, Citrix does not ship a power cable. Use a cable that conforms to the **ABNT NBR 14136:2002** standard.
- One standard 4-post rail kit
  Note: If the kit that you received does not fit your rack, contact your Citrix sales representative to order the appropriate kit.

In addition to the items included in the box with your new appliance, you will need the following items to complete the installation and initial configuration process.

- Ethernet cables for each additional Ethernet port that you will connect to your network
- One available Ethernet port on your network switch or hub for each NetScaler Ethernet port you want to connect to your network
  Note: Transceiver modules are sold separately. Contact your Citrix sales representative to order transceiver modules for your appliance. Only transceivers supplied by Citrix are supported on the appliance.
- A computer to serve as a management workstation

There are specific site and rack requirements for the NetScaler appliance. You must make sure that adequate environmental control and power density are available. Racks must be bolted to the ground, have sufficient airflow, and have adequate power and network connections. Preparing the site and rack are important steps in the installation process and help ensure a smooth installation.

Site Requirements

The appliance should be installed in a server room or server cabinet with the following features:

Environment control

An air conditioner, preferably a dedicated computer room air conditioner (CRAC), capable of maintaining the cabinet or server room at a temperature of no more than 27 degrees C/80.6 degrees F at altitudes of up to 2100 m/7000 ft, or 18 degrees C/64.4 degrees F at higher altitudes, a humidity level no greater than 45 percent, and a dust-free environment.

Power density

Wiring capable of handling at least 4,000 watts per rack unit in addition to power needs for the CRAC.

Rack Requirements

The rack on which you install your appliance should meet the following criteria:

Rack characteristics

Racks should be either integrated into a purpose-designed server cabinet or be the floor-to-ceiling type, bolted down at both top and bottom to ensure stability. If you have a cabinet, it should be installed perpendicular to a load-bearing wall for stability and sufficient airflow. If you have a server room, your racks should be installed in rows spaced at least 1 meter/3 feet apart for sufficient airflow. Your rack must allow your IT personnel unfettered access to the front and back of each server and to all power and network connections.

Power connections

At minimum, two standard power outlets per unit.

Network connections

At minimum, four Ethernet connections per rack unit.

Space requirements

One empty rack unit for the Citrix NetScaler MPX 5500, MPX 5550/5650, MPX 7500/9500, and MPX 8005/8015/8200/8400/8600/8800, MPX 14000, and two consecutive empty rack units for all other appliance models.

Note: You can order the following rail kits separately.

- Compact 4-post rail kit, which fits racks of 23 to 33 inches.
- 2-post rail kit, which fits 2-post racks.

Electrical Safety Precautions

Caution: During installation or maintenance procedures, wear a grounding wrist strap to avoid ESD damage to the electronics of the appliance. Use a conductive wrist strap attached to a good earth ground or to the appliance. You can attach it to the connector beside the ESD symbol on the back.
Follow basic electrical safety precautions to protect yourself from harm and the appliance from damage.

- Be aware of the location of the emergency power off (EPO) switch, so that you can quickly remove power to the appliance if an electrical accident occurs.
- Remove all jewelry and other metal objects that might come into contact with power sources or wires before installing or repairing the appliance. When you touch both a live power source or wire and ground, any metal objects can heat up rapidly and may cause burns, set clothing on fire, or fuse the metal object to an exposed terminal.
- Use a regulating, uninterruptible power supply (UPS) to protect the appliance from power surges and voltage spikes, and to keep the appliance operating in case of power failure.
- Never stack the appliance on top of any other server or electronic equipment.
- All appliances are designed to be installed on power systems that use TN earthing. Do not install your device on a power

system that uses either TT or IT earthing.

- Make sure that the appliance has a direct physical connection to the earth during normal use. When installing or repairing an appliance, always make sure that the ground circuit is connected first and disconnected last.
- Make sure that a fuse or circuit breaker no larger than 120 VAC, 15 A U.S. (240 VAC, 16 A international) is used on all current-carrying conductors on the power system to which your appliances are connected.
- Do not work alone when working with high voltage components.
- Always disconnect the appliance from power before removing or installing any component. When disconnecting power, first shut down the appliance, and then unplug the power cords of all the power supply units connected to the appliance. As long as the power cord is plugged in, line voltages can be present in the power supply, even when the power switch is OFF.
- Do not use mats designed to decrease static electrical discharge as protection from electrical shock. Instead, use rubber mats that have been specifically designed as electrical insulators.
- Make sure that the power source can handle the appliance's maximum power consumption rating with no danger of an overload. Always unplug any appliance before performing repairs or upgrades.
- Do not overload the wiring in your server cabinet or on your server room rack.
- During thunderstorms, or anticipated thunderstorms, avoid performing any hardware repairs or upgrades until the danger of lightning has passed.
- When you dispose of an old appliance or any components, follow any local and national laws on disposal of electronic waste.
- To prevent possible explosions, replace expired batteries with the same model or a manufacturer-recommended substitute and follow the manufacturer's instructions for battery replacement.
- Never remove a power supply cover or any sealed part that has the following label:

Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no user-serviceable parts inside these components. If you suspect a problem with one of these parts, contact Citrix Technical Support.

Appliance Precautions

- Determine the placement of each component in the rack before you install the rails.
- Install the heaviest appliance first, at the bottom of the rack, and then work upward. Distribute the load on the rack evenly. An unbalanced rack is hazardous.
- Allow the power supply units and hard drives to cool before touching them.
- Install the equipment near an electrical outlet for easy access.
- Mount equipment in a rack with sufficient airflow for safe operation.
- For a closed or multiple-unit rack assembly, the ambient operating temperature of the rack environment might be greater than the ambient temperature of the room. Therefore, consider the lowest and highest operating temperatures of the equipment when making a decision about where to install the appliance in the rack.

Rack Precautions

- Make sure that the leveling jacks on the bottom of the rack are fully extended to the floor, with the full weight of the rack resting on them.
- For a single-rack installation, attach a stabilizer to the rack.
- For a multiple-rack installation, couple (attach) the racks together.
- Always make sure that the rack is stable before extending a component from the rack.

- Extend only one component at a time. Extending two or more simultaneously might cause the rack to become unstable.
- The handles on the left and right of the front panel of the appliance should be used only for extending the appliance out of the rack. Do not use these handles for mounting the appliance on the rack. Use the rack-rail hardware, described later, instead.

Installing the Hardware

Apr 04, 2016

After you have determined that the location where you will install your appliance meets the environmental standards and the server rack is in place according to the instructions, you are ready to install the hardware. After you mount the appliance, you are ready to connect it to the network, to a power source, and to the console terminal that you will use for initial configuration. To complete the installation, you turn on the appliance. Be sure to observe the cautions and warnings listed with the installation instructions.

This document includes the following details:

Most appliances can be installed in standard server racks that conform to EIA-310-D specification. The appliances ship with a set of rails, which you must install before you mount the appliance. The only tools that you need for installing an appliance are a Phillips screwdriver and a flathead screwdriver.

Caution: If you are installing the appliance as the only unit in the rack, mount it at the bottom. If the rack contains other units, make sure that the heaviest unit is at the bottom. If the rack has stabilizing devices available, install them before mounting the appliance.
The following table lists the different hardware platforms and the rack units required for each platform.

Table 1. Height Requirements For Each Platform

Platform	**Number of rack units**
MPX 5500	One rack unit
MPX 5550/5650	One rack unit
MPX 7500/9500	One rack unit
MPX 8005/8015/8200/8400/8600/8800	One rack unit
MPX 9700/10500/12500/15500	Two rack units
MPX 14020/14030/14040/ 14060/14080/14100	Two rack units

MPX 15000, MPX 17000	Two rack units
MPX 11500/13500/14500/16500/18500/20500	Two rack units
MPX 11515/11520/11530/11540/11542	Two rack units
MPX 17500/19500/21500	Two rack units
MPX 17550/19550/20550/21550	Two rack units
MPX 22040/22060/22080/22100/22120	Two rack units
MPX 24100/24150	Two rack units
MPX 25100T/25160T	Two rack units
MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G	Two rack units
MPX 25100 40G, MPX 25160 40G	Two rack units

Each appliance ships with a mounting rail kit that contains two rail assemblies, one for the left side and the other for the right side of the appliance, and screws to attach the rails. An assembly consists of an inner rail and a rack rail. The supplied rail kit is 28 inches long (38 inches extended). Contact your Citrix sales representative to order a 23-inch (33 inches extended) rail kit.
Note: The same rail kit is used for both square-hole and round-hole racks. See "Installing the Rail Assembly to the Rack" for specific instructions for threaded, round-hole racks.
To mount the appliance, you must first install the rails and then install the appliance in the rack.

Perform the following tasks to mount the appliance:
- Remove the inner rails from the rail assembly.
- Attach the inner rails to the appliance.
- Install the rack rails on the rack.
- Install the appliance in the rack.

The appliance is shipped with rack-rail hardware. This hardware consists of two inner rails that you attach to the appliance, one on each side, and a rack-rail assembly that you attach to the rack. The following figure illustrates the steps involved in mounting the Citrix NetScaler appliance to a rack.

To remove the inner rails from the rail assembly

1. Place the rail assembly on a flat surface.

2. Slide out the inner rail toward the front of the assembly.
3. Depress the latch until the inner rail comes all the way out of the rail assembly.
4. Repeat steps 1 through 3 to remove the second inner rail.

To attach the inner rails to the appliance

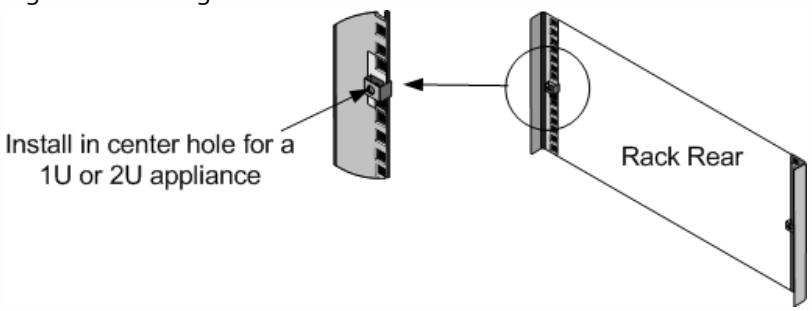
1. Position the right inner rail behind the handle on the right side of the appliance.
2. Align the holes on the rail with the corresponding holes on the side of the appliance.
3. Attach the rail to the appliance with the provided screws: 4 per side for a 1U appliance and 5 per side for a 2U appliance, as shown in the following figure.
   Figure 1. Attaching inner rails

4. Repeat steps 1 through 3 to install the left inner rail on the other side of the appliance.

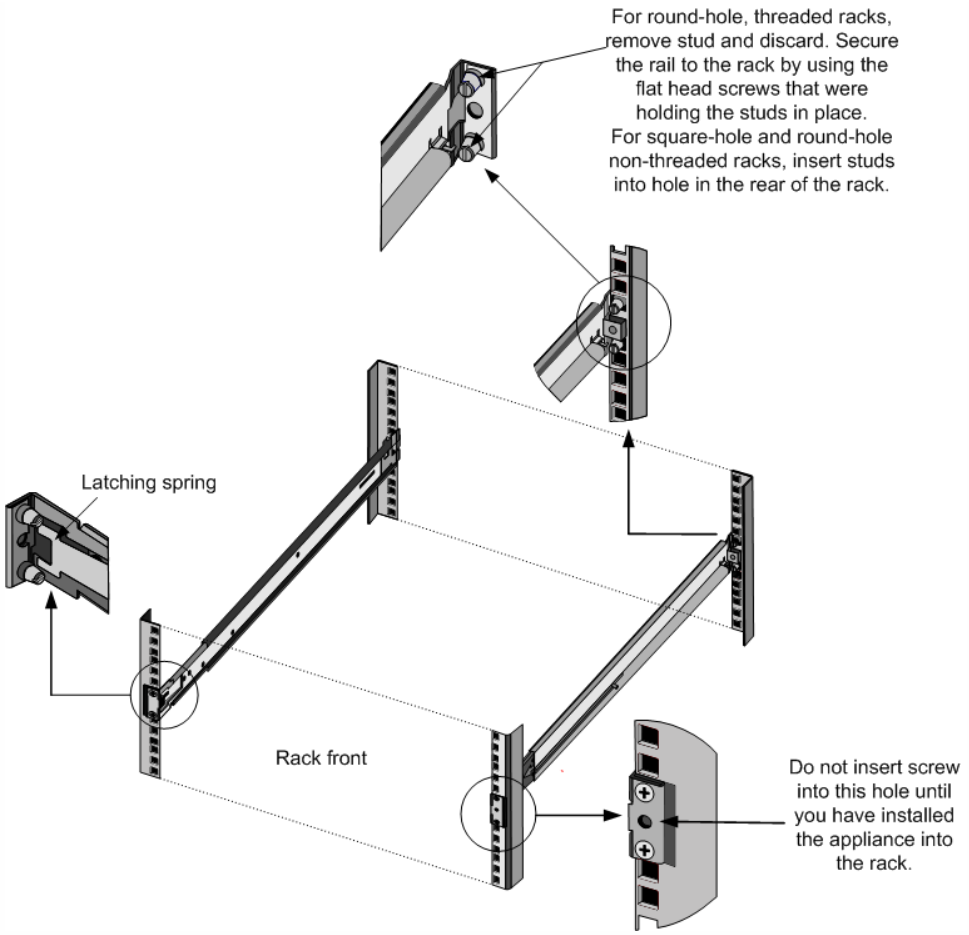
To install the rack rails on the rack

1. If you have a round-hole, threaded rack, skip to step 3.
2. Install square nut retainers into the front post and back post of the rack as shown in the following figures. Before inserting a screw, be sure to align the square nut with the correct hole for your 1U or 2U appliance. The three holes are not evenly spaced.
   Figure 2. Installing Retainers into the Front Rack Posts

   Figure 3. Installing Retainers into the Rear Rack Posts



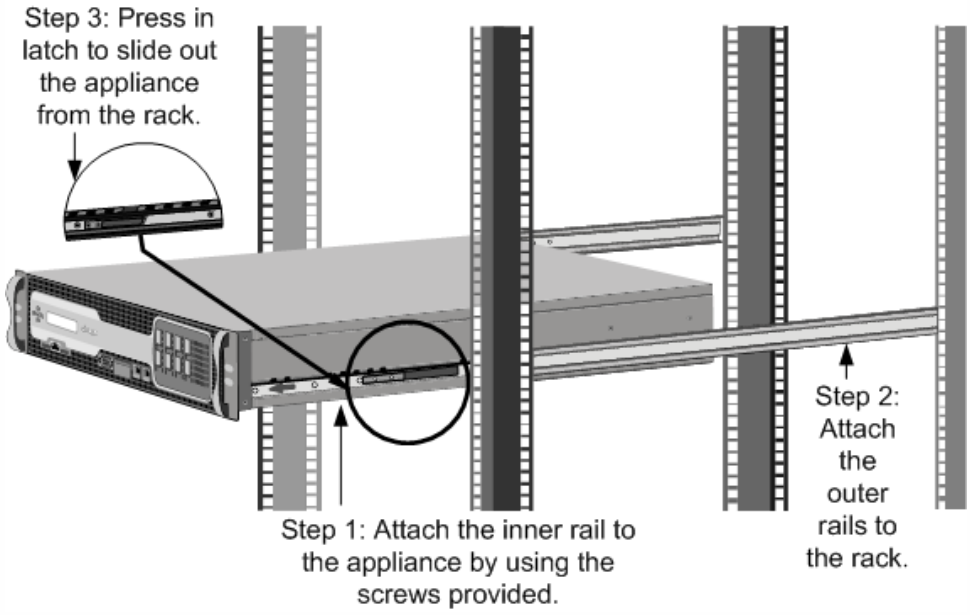
3. Install the adjustable rail assembly into the rack as shown in the following figures. Use a screw to lock the rear rail flange into the rack. With the screw securing the rail in place, you can optionally remove the latching spring.
   Figure 4. Installing the Rail Assembly to the Rack



To install the appliance in the rack

1. Align the inner rails, attached to the appliance, with the rack rails.
2. Slide the appliance into the rack rails, keeping the pressure even on both sides.
3. Verify that the appliance is locked in place by pulling it all the way out from the rack.

Figure 5. Rack Mounting the Appliance



Note: This section applies to the MPX 8005/8015/8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 22040/22060/22080/22100/22120, and MPX 24100/24150 appliances.

A Small Form-Factor Pluggable (SFP) is a compact transceiver that can operate at speeds of up to 1 gigabit per second and is available in both copper and fiber types. Inserting a 1G SFP copper transceiver converts the 1G SFP port to a 1000BASE-T port. Inserting a 1G SFP fiber transceiver converts the 1G SFP port to a 1000BASE-X port. Auto-negotiation is enabled by default on the 1G SFP port into which you insert your 1G SFP transceiver. As soon as a link between the port and the network is established, the speed and mode are matched on both ends of the cable.

Note: The 1G SFP transceiver is hot-swappable from release 9.3 build 47.5 and later on the NetScaler appliances that use the e1k interface. The following platforms support 1G SPF transceivers:

- MPX 7500/9500
- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

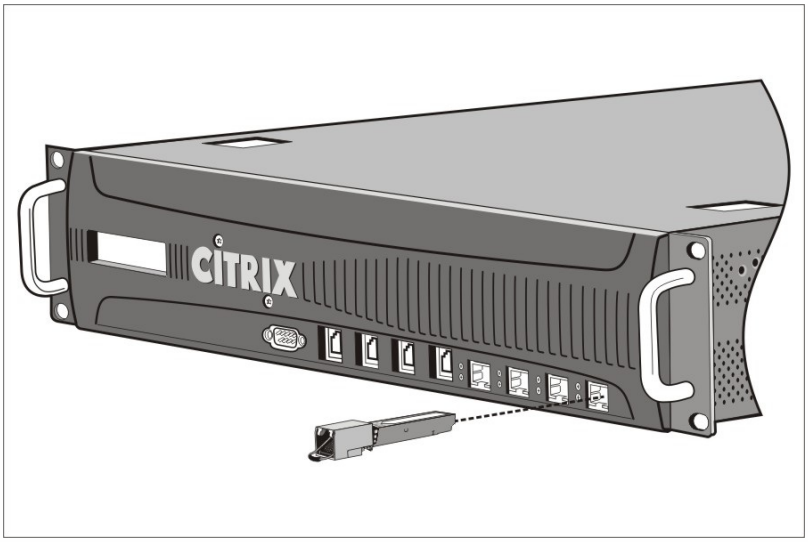
Caution: NetScaler appliances do not support 1G SFP transceivers from vendors other than Citrix Systems. Attempting to install third-party 1G SFP transceivers on your NetScaler appliance voids the warranty.

Insert 1G SFP transceivers into the 1G SFP ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the 1G SFP transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install a 1G SFP transceiver

1. Remove the 1G SFP transceiver carefully from its box.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Align the 1G SFP transceiver to the front of the 1G SFP transceiver port on the front panel of the appliance, as shown in the following figure.
   Note: The illustration in the following figures might not represent your actual appliance.
   Figure 6. Installing a 1G SFP transceiver



3. Hold the 1G SFP transceiver between your thumb and index finger and insert it into the 1G SFP transceiver port, pressing it in until you hear the transceiver snap into place.
4. Lock the transceiver.
5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.
6. If you are using a fiber 1G SFP transceiver, do not remove the dust caps attached to the transceiver and the cable until you are ready to insert the cable.

To remove a 1G SFP transceiver

1. Disconnect the cable from the 1G SFP transceiver. If you are using a fiber optic cable, replace the dust cap on the cable before putting it away.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Unlock the 1G SFP transceiver.
3. Hold the 1G SFP transceiver between your thumb and index finger and slowly pull it out of the port.
4. If you are removing a fiber 1G SFP transceiver, replace the dust cap before putting it away.
5. Put the 1G SFP transceiver into its original box or another appropriate container.

Note: This section applies to the MPX 8005/8015/8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 15000, MPX 17000, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 14020/14030/14040/14060/14080/14100,MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G, MPX 25100 40G, MPX 25160 40G, MPX 17500/19500/21500, MPX 17550/19550/20550/21550, MPX 22040/22060/22080/22100/22120, MPX 24100/24150, and MPX 25100T/25160T appliances.
A 10-Gigabit Small Form-Factor Pluggable (XFP or SFP+) is a compact optical transceiver that can operate at speeds of up to 10 gigabits per second. The MPX 15000 and MPX 17000 appliances use XFP transceivers and the MPX 8005/8015/8200/8400/8600/8800, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 14020/14030/14040/14060/14080/14100, MPX 17500/19500/21500, MPX 17550/19550/20550/21550, MPX 22040/22060/22080/22100/22120, MPX 24100/24150, MPX 25100T/25160T, MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G, MPX 25100 40G, MPX 25160 40G appliances use 10G SFP+ transceivers. Autonegotiation is enabled by default on the XFP/10G SFP+ ports into which you insert your XFP/10G SFP+ transceiver. As soon as a link between the port and the network is established, the mode is matched on both ends of the cable and for 10G SFP+ transceivers, the speed is also autonegotiated.

Note: An XFP transceiver is **not hot-swappable** on the NetScaler appliances. You must restart a NetScaler appliance after you insert an XFP transceiver.

However, the 10G SFP+ transceiver is hot-swappable from release 9.3 build 57.5 and later on the NetScaler appliances that use the ixgbe (ix) interface. The following platforms support 10G SPF+ transceivers:

- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500 10G and 10G FIPS
- MPX 11500/13500/14500/16500/18500/20500
- MPX 11515/11520/11530/11540/11542

- MPX 14020/14030/14040/14060/14080/14100
- MPX 17500/19500/21500
- MPX 17550/19550/20550/21550
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150
- MPX 25100T/25160T
- MPX 14020 40G, MPX 14040 40G, MPX 14060 40G, MPX 14080 40G
- MPX 25100 40G, MPX 25160 40G

The following platforms support XFP transceivers:

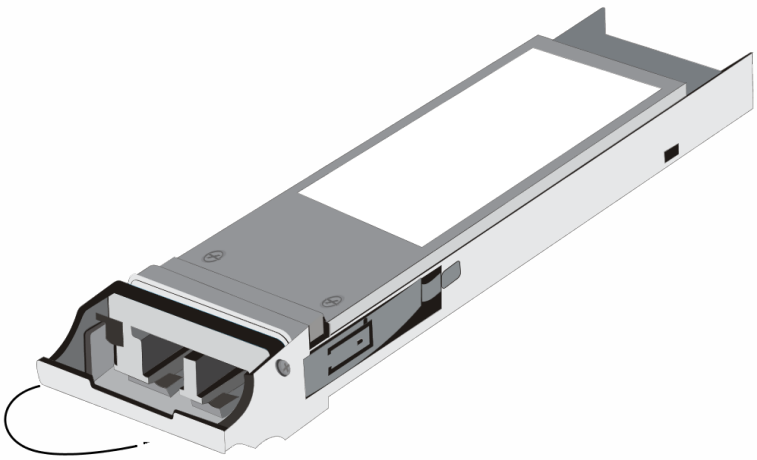
- MPX 15000
- MPX 17000

Caution: NetScaler appliances do not support XFP/10G SFP+ transceivers provided by vendors other than Citrix Systems. Attempting to install third-party XFP/10G SFP+ transceivers on your NetScaler appliance voids the warranty.
Insert the XFP/10G SFP+ transceivers into the XFP/10G SFP+ ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install an XFP/10G SFP+ transceiver

1. Remove the XFP/10G SFP+ transceiver carefully from its box.
   Danger: Do not look directly into fiber optic transceivers and cables. They emit laser beams that can damage your eyes.
2. Align the XFP/10G SFP+ transceiver to the front of the XFP/10G SFP+ transceiver port on the front panel of the appliance.
3. Hold the XFP/10G SFP+ transceiver between your thumb and index finger and insert it into the XFP/10G SFP+ transceiver port, pressing it in until you hear the transceiver snap into place.
4. Move the locking hinge to the DOWN position as shown in the following figure.
   Figure 7. Locking an XFP transceiver



5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.
6. Do not remove the dust caps attached to the transceiver and cable until you are ready to insert the cable.

To remove an XFP/10G SFP+ transceiver

1. Disconnect the cable from the XFP/10G SFP+ transceiver. Replace the dust cap on the cable before putting it away.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Unlock the XFP/10G SFP+ transceiver by moving the locking hinge to the UP position.
3. Hold the XFP/10G SFP+ transceiver between your thumb and index finger and slowly pull it out of the port.
4. Replace the dust cap on the transceiver before putting it away.
5. Put the XFP/10G SFP+ transceiver into its original box or another appropriate container.

> ## Note
>
> This section applies to the MPX/SDX 14020 40G, MPX/SDX 14040 40G, MPX/SDX 14060 40G, MPX/SDX 14080 40G and MPX/SDX 25100 40G, MPX/SDX 25160 40G appliances.

A Quad Small Form-Factor Pluggable (QSFP+) SR4 transceiver is a compact optical transceiver that can operate at speeds of up to 40 gigabits per second. It is hot-swappable on the NetScaler appliances and is available in the maximum link length of 100 meters. Auto-negotiation is enabled by default on the 40G QSFP+ ports into which you insert your 40G QSFP+ SR4 transceiver. As soon as a link between the port and the network is established, the mode is matched on both ends of the cable, and the link speed is auto-negotiated.

> ## Warning
>
> NetScaler appliances do not support 40G QSFP+ SR4 transceivers from vendors other than Citrix Systems. Attempting to install third-party 40G QSFP+ transceivers on your NetScaler appliance voids the warranty.

Insert 40G QSFP+ SR4 transceivers into the 40G QSFP+ ports on the front panel of the appliance. Follow the removal procedure carefully to avoid damaging the 40G QSFP+ SR4 transceiver or the appliance. Also note that frequent installation and removal of transceivers shortens their life span.

> ## Warning
>
> Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install a 40G QSFP+ SR4 transceiver

1. Remove the 40G QSFP+ SR4 transceiver carefully from its box.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Align the 40G QSFP+ SR4 transceiver to the front of the 40G QSFP+ transceiver port on the front panel of the appliance.
3. Hold the 40G QSFP+ SR4 transceiver between your thumb and index finger and insert it into the 40G QSFP+ transceiver port, pressing it in until you hear the transceiver snap into place.

4. Lock the transceiver.
5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.

To remove a 40G QSFP+ SR4 transceiver

1. Disconnect the cable from the 40G QSFP+ SR4 transceiver. If you are using a fiber optic cable, replace the dust cap on the cable before putting it away.
   Danger: Do not look directly into fiber optic transceivers or cables. They emit laser beams that can damage your eyes.
2. Unlock the 40G QSFP+ SR4 transceiver.
3. Hold the 40G QSFP+ SR4 transceiver between your thumb and index finger and slowly pull it out of the port.
4. If you are removing a fiber 40G QSFP+ SR4 transceiver, replace the dust cap before putting it away.

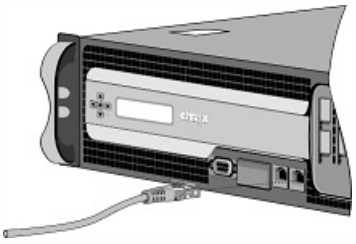
When the appliance is securely mounted on the rack, you are ready to connect the cables. Ethernet cables and the optional console cable are connected first. Connect the power cable last.

Danger: Before installing or repairing the appliance, remove all jewelry and other metal objects that might come in contact with power sources or wires. When you touch both a live power source or wire and ground, any metal objects can heat up rapidly and cause burns, set clothing on fire, or fuse the metal object to an exposed terminal.

Connecting the Ethernet Cables

Ethernet cables connect your appliance to the network. The type of cable you need depends on the type of port used to connect to the network. Use a category 5e or category 6 Ethernet cable with a standard RJ-45 connector on a 10/100/1000BASE-T port or 1G SFP copper transceiver. Use a fiber optic cable with an LC duplex connector with a 1G SFP fiber transceiver, 10G SFP+, or XFP transceiver. The type of connector at the other end of the fiber optic cable depends on the port of the device that you are connecting to.

1. Insert the RJ-45 connector on one end of your Ethernet cable into an appropriate port on the front panel of the appliance, as shown in the following figure.
   Figure 8. Inserting an Ethernet cable



2. Insert the RJ-45 connector on the other end into the target device, such as a router or switch.
3. Verify that the LED glows amber when the connection is established.

1. Remove the dust caps from the transceiver and cable.
2. Insert the LC connector on one end of the fiber optic cable into the appropriate port on the front panel of the appliance.
3. Insert the connector on the other end into the target device, such as a router or switch.

4. Verify that the LED glows amber when the connection is established.

Connecting the Console Cable

You can use the console cable to connect your appliance to a computer or terminal, from which you can configure the appliance. Alternatively, you can use a computer connected to the network. Before connecting the console cable, configure the computer or terminal to support VT100 terminal emulation, 9600 baud, 8 data bits, 1 stop bit, parity, and flow control set to NONE. Then connect one end of the console cable to the RS232 serial port on the appliance and the other end to the computer or terminal.

1. Insert the DB-9 connector at the end of the cable into the console port that is located on the front panel of the appliance, as shown in the following figure.
   Figure 9. Inserting a console cable

   Note: To use a cable with an RJ-45 converter, insert the optional converter provided into the console port and attach the cable to it.
2. Insert the RJ-45 connector at the other end of the cable into the serial port of the computer or terminal.

Connecting the Power Cable

An MPX 5500, MPX 5550/5650, MPX 7500/9500, MPX 8005/8015/8200/8400/8600/8800 appliance has one power cable. All the other appliances come with two power cables, but they can also operate if only one power cable is connected, except the MPX 22040/22060/22080/22100/22120 and MPX 24100/24150 platforms which come with four power cables and require two power cables for proper operation. A separate ground cable is not required, because the three-prong plug provides grounding.

1. Connect one end of the power cable to the power outlet on the back panel of the appliance, next to the power supply, as shown in the following figure.
   Figure 10. Inserting a power cable

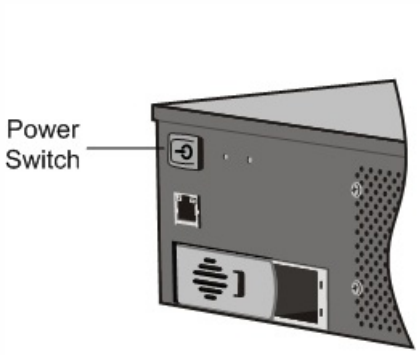
2. Connect the other end of the power cable to a standard 110V/220V power outlet.
3. If a second power supply is provided, repeat steps 1 and 2 to connect the second power supply.
   Note: The MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliance emit a high-pitched alert if one power supply fails or if you connect only one power cable to the appliance. To silence the alarm,

you can press the small red button located on the back panel of the appliance.

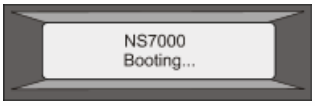
After you have installed the appliance in a rack and connected the cables, verify that the power cable is properly connected. If you have installed a second power supply, make sure the second cable is connected to an outlet for a different circuit than the first. After verifying the connections, you are ready to switch on the appliance.

To switch on the appliance

1. Verify that the appliance is connected through a console or Ethernet port. This will ensure that you can configure the appliance after it is switched on.
2. Press the ON/OFF toggle power switch on the back panel of the appliance.
   Figure 11. Power switch on back panel



3. Verify that the LCD on the front panel is backlit and the start message appears, as shown in the following figure.
   Figure 12. LCD startup screen



Caution: Be aware of the location of the emergency power off (EPO) switch, so that if an electrical accident occurs you can quickly remove power from the appliance.

Initial Configuration

Jan 31, 2011

After you have installed your appliance in a rack, you are ready to perform the initial configuration. Once initial configuration is complete, refer to the specific configuration guides for the features you will be using.

Initial configuration is the same for the multifunction Citrix NetScaler, the dedicated NetScaler Gateway Enterprise Edition, and the dedicated Citrix NetScaler Application Firewall appliances. You can use any of the following interfaces for initial configuration of your appliance:

- First-time use wizard—If you use a web browser to connect to the appliance, you are prompted to enter the network configuration and licensing information, if it is not already specified.
- LCD keypad—You can specify the network settings, but you must use a different interface to upload your licenses.
- Serial console—After connecting to the serial console, you can use the NetScaler command line to specify the network settings and upload your licenses,
- Dynamic Host Configuration Protocol (DHCP)—If you want to configure a new appliance from a remote network, or if you want to install multiple NetScaler appliances and then configure them without using the console port, you can use DHCP to assign each new appliance an IP address at which you can access the appliance for remote configuration.

For initial configuration, use nsroot as both the administrative user name and the password. For subsequent access, use the password assigned during initial configuration.

After you complete the initial configuration of the appliance, you can configure secure access to your appliance. As a result, you are no longer prompted for a password when logging on. This is especially helpful in environments for which you would otherwise have to keep track of a large number of passwords.

This document includes the following details:

To configure a NetScaler appliance (or NetScaler virtual appliance) for the first time, you need an administrative computer configured on the same network as the appliance.

Note: Unless stated otherwise, the term "NetScaler appliance" refers to either a physical or a virtual appliance.
You must assign a NetScaler IP (NSIP) address as the management IP address of your NetScaler appliance, a subnet mask (Netmask), a subnet IP (SNIP) address to which your servers can connect, and a subnet mask (Subnet IP Address Netmask). If you assign a host name, you will be able to access the appliance by specifying its name instead of its NSIP address. Also, assign a time zone.

The wizard automatically appears if any of the following conditions are met:

- The appliance is configured with the default IP address (192.168.100.1).
- A subnet IP address or a mapped IP address is not configured.
- Licenses are not present on the appliance.

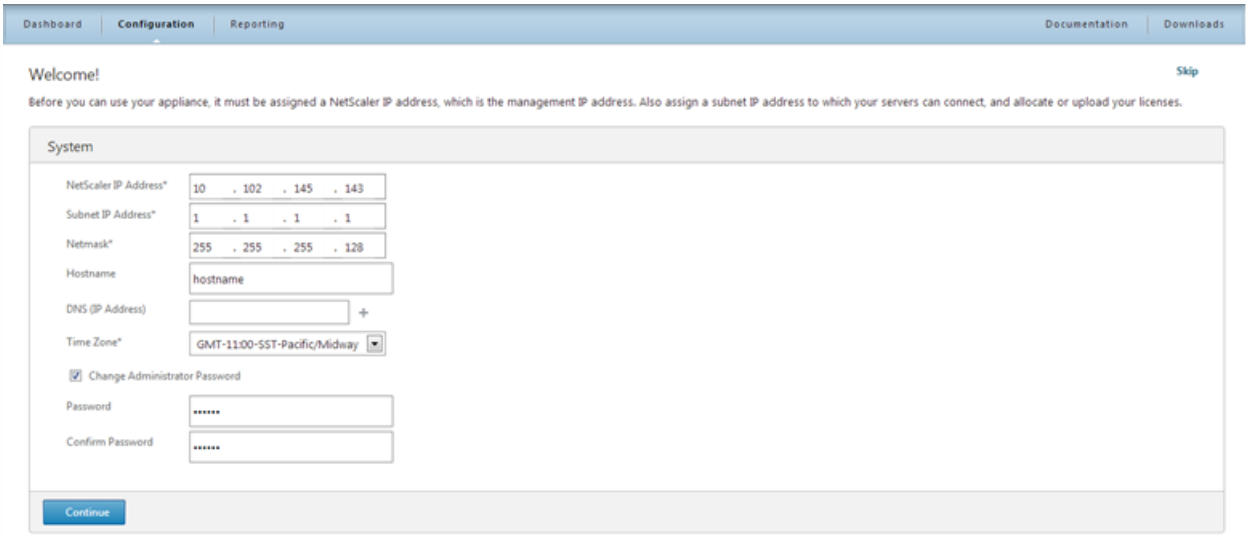
To perform first-time configuration of your appliance

1. In a web browser, type: http://192.168.100.1
   Note: The NetScaler software is preconfigured with a default IP address.
2. In User Name and Password, type the administrator credentials. You can obtain the initial user name and password from your sales representative or from Citrix Customer Service. In Deployment Type, select NetScaler ADC. The following screen appears.

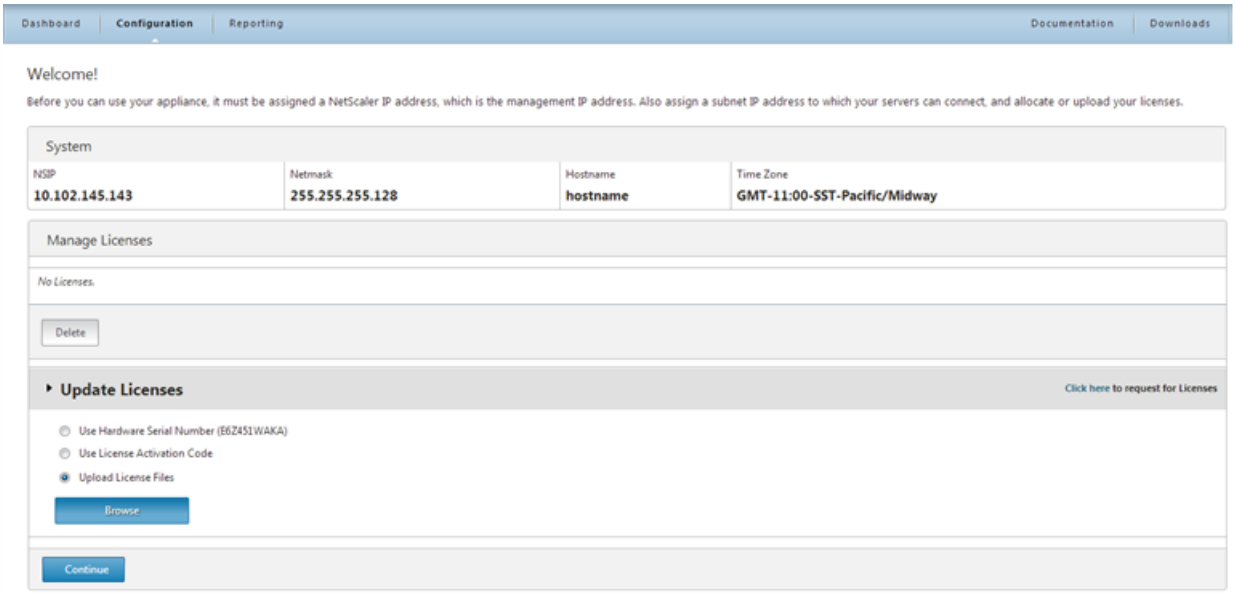
   Enter values for NSIP, SNIP, Netmask, host name, DNSIP and Time Zone. Citrix recommends that you change the administrator password.

   Upload or allocate licenses. Click Add New License and follow the prompts on the screen.

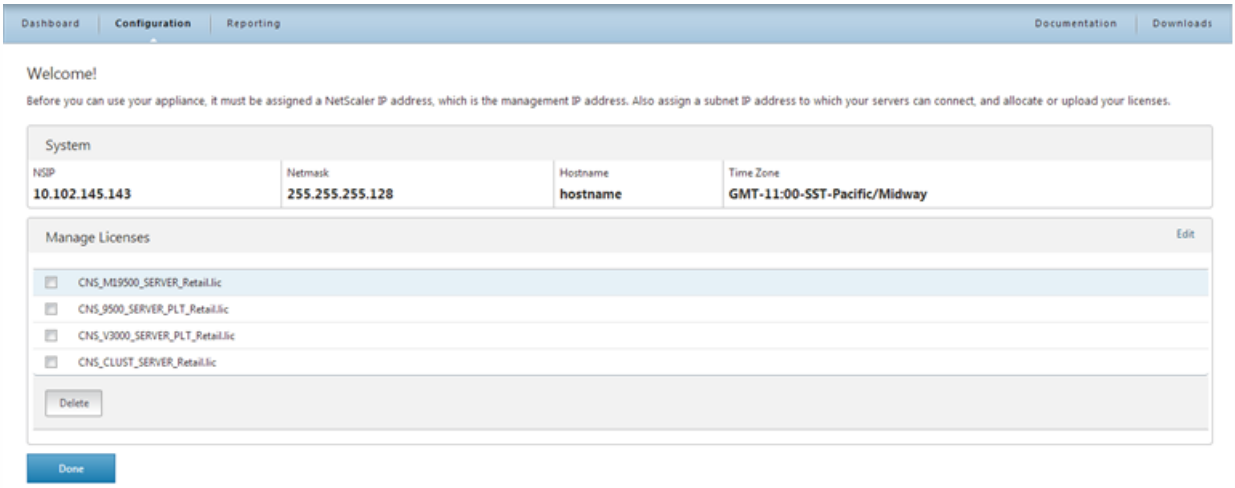
3. Click Continue, as shown in the following screenshot.



4. If you have downloaded your licenses from the licensing portal to your local computer, select Upload License Files, and then click Browse. Navigate to the location of the license files, select the license file, and then click Open.

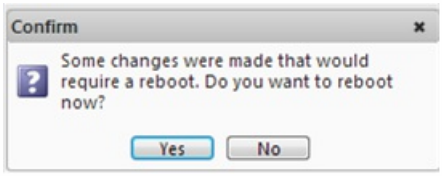


5. If you have not downloaded your licenses to your local computer, click Continue, and then click Done.



The next time you log on to the appliance, you will be prompted to allocate licenses.

6. When prompted, select Reboot.



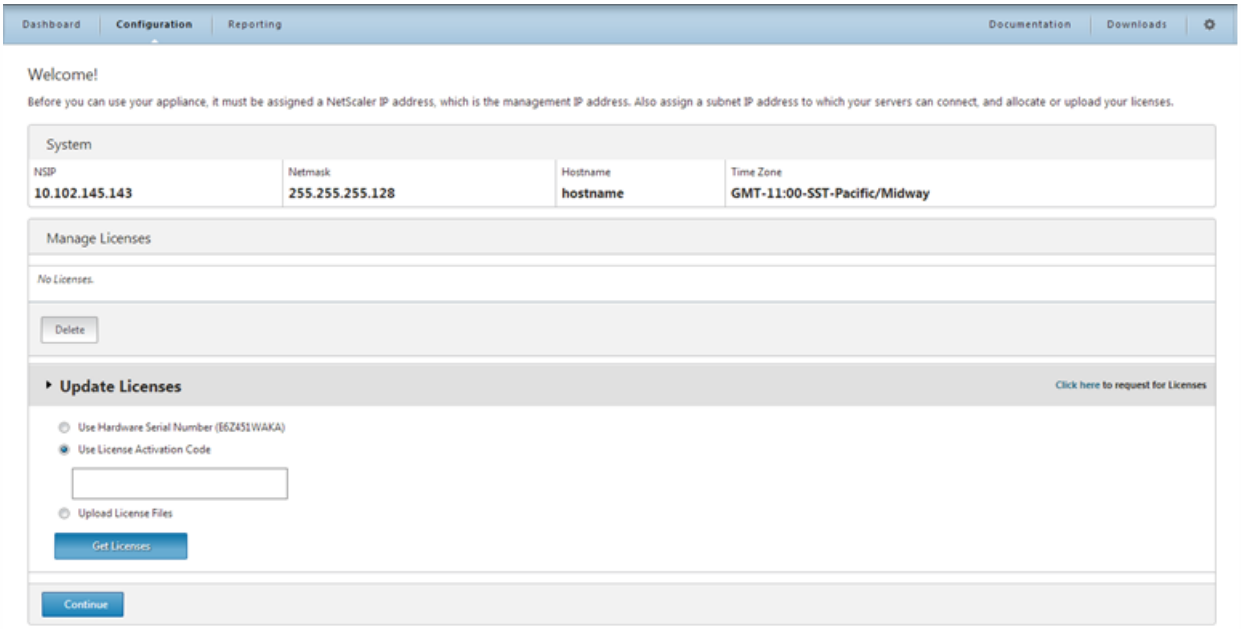
To allocate licenses

If you did not upload any licenses when you performed first-time configuration of your appliance, you are prompted to allocate licenses the next time you log on to the appliance. Log on and allocate the licenses as follows:

1. In a web browser, type the NSIP address of the appliance.
2. In User Name and Password, type the administrator credentials.
3. The following screen appears (Sample values shown.)

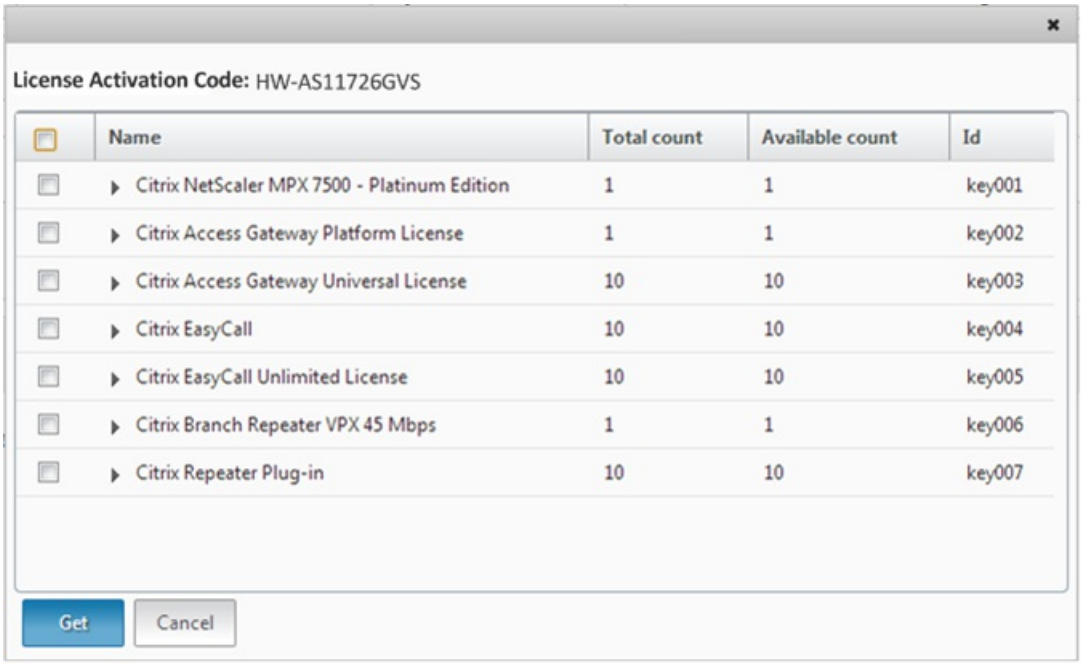
4. Click Continue, and then select one of the following options:
   - **Use Hardware Serial Number**—The software internally fetches the serial number of your appliance and uses this number to display your license(s).

   - **Use License Activation Code**—Citrix emails the LAC for the license that you purchased. Enter the LAC in the text box.

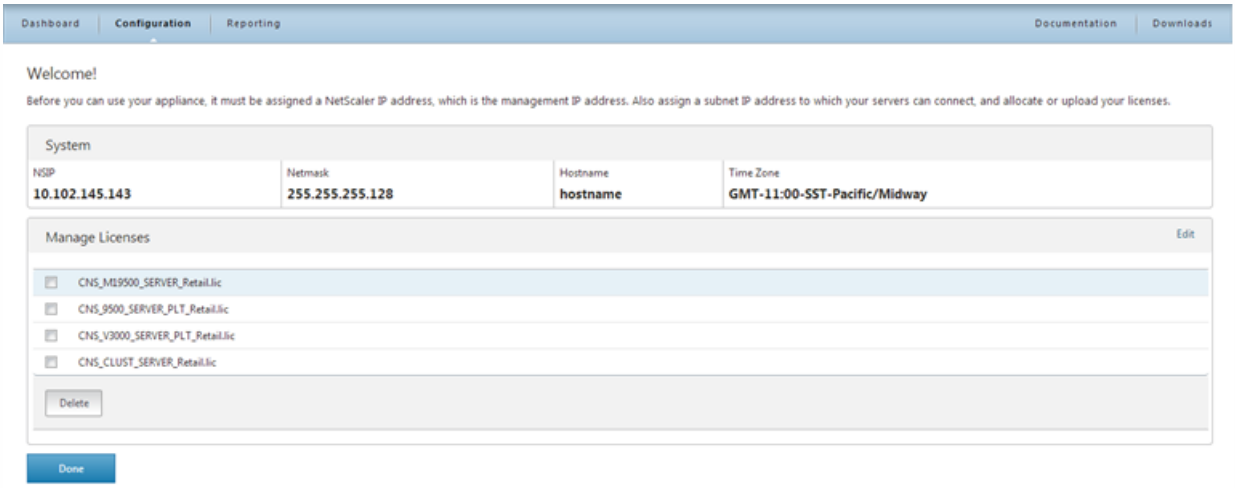


5. Click Get Licenses. Depending on the option that you selected one of the following dialog boxes appears.
   - The following dialog box appears if you selected Hardware Serial Number.

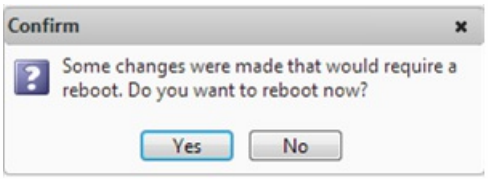
   - The following dialog box appears if you selected Use License Activation Code.



6. Select the license that you want to allocate, and then click Get.
7. Click Continue, and then click Done.



8. When prompted to reboot, select Yes.



When you first install the appliance, you can configure the initial settings by using the LCD keypad on the front panel of the appliance. The keypad interacts with the LCD display module, which is also on the front panel of these appliances.

Note: You can use the LCD keypad for initial configuration on a new appliance with the default configuration. The configuration file (ns.conf) should contain the following command and default values.
set ns config -IPAddress 192.168.100.1 -netmask 255.255.0.0

The functions of the different keys are explained in the following table.

Table 1. LCD Key Functions

Key	Function
<	Moves the cursor one digit to the left.
>	Moves the cursor one digit to the right.
^	Increments the digit under the cursor.
v	Decrements the digit under the cursor.
.	Processes the information, or terminates the configuration, if none of the values are changed. This key is also known as the ENTER key.

To perform the initial configuration by using the LCD keypad press the "<" key.

You are prompted to enter the subnet mask, NetScaler IP address (NSIP), and gateway in that order respectively. The subnet mask is associated with both the NSIP and default gateway IP address. The NSIP is the IPv4 address of the NetScaler appliance. The default gateway is the IPv4 address for the router, which will handle external IP traffic that the NetScaler cannot otherwise route. The NSIP and the default gateway should be on the same subnet.

If you enter a valid value for the subnet mask, such as 255.255.255.224, you are prompted to enter the IP address. Similarly, if you enter a valid value for the IP address, you are prompted to enter the gateway address. If the value you entered is invalid, the following error message appears for three seconds, where xxx.xxx.xxx.xxx is the IP address you entered, followed by a request to re-enter the value.

Invalid addr!
xxx.xxx.xxx.xxx
If you press the ENTER (.) key without changing any of the digits, the software interprets this as a user exit request. The following message will be displayed for three seconds.

Exiting menu...
xxx.xxx.xxx.xxx
If all the values entered are valid, when you press the ENTER key, the following message appears.

Values accepted,
Rebooting...
The subnet mask, NSIP, and gateway values are saved in the configuration file.

Note: For information about deploying a high availability (HA) pair, see "http://support.citrix.com/proddocs/topic/ns-system-10-1-map/ns-nw-ha-cnfgrng-ha-con.html."

When you first install the appliance, you can configure the initial settings by using the serial console. With the serial console, you can change the system IP address, create a subnet or mapped IP address, configure advanced network settings, and change the time zone.

Note: To locate the serial console port on your appliance, see "RS232 Serial Console Port" in "Ports."

To configure initial settings by using a serial console

1. Connect the console cable into your appliance. For more information, see "Connecting the Console Cable" in "Connecting the Cables."
2. Run the vt100 terminal emulation program of your choice on your computer to connect to the appliance and configure the following settings: 9600 baud, 8 data bits, 1 stop bit, parity, and flow control set to NONE.
3. Press ENTER. The terminal screen displays the Logon prompt.
   Note: You might have to press ENTER two or three times, depending on which terminal program you are using.
4. Log on to the appliance with the administrator credentials. Your sales representative or Citrix Customer Service can provide you with the administrator credentials.
5. At the prompt, type config ns to run the NetScaler configuration script.
6. To complete the initial configuration of your appliance, follow the prompts.
   Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.
   You can replace steps 5 and 6 with the following NetScaler commands. At the NetScaler command prompt, type:

   set ns config -ipaddress<IPAddress> -netmask<subnetMask>

   add ns ip<IPAddress> <subnetMask> -type<type>

   add route<network> <netmask> <gateway>

   set system user <userName> -password

   save ns config

   reboot

   Example

   ```
   set ns config -ipaddress 10.102.29.60 -netmask 255.255.255.0
   add ns ip 10.102.29.61 255.255.255.0 -type snip
   add route 0.0.0.0 0.0.0.0 10.102.29.1
   set system user nsroot -password
   Enter password: *****
   Confirm password: *****
   save ns config
   reboot
   ```

   You have now completed initial configuration of your appliance. To continue configuring the appliance, choose one of the following options:

   Citrix NetScaler.

   If you are configuring your appliance as a standard NetScaler with other licensed features, see "Load Balancing."

   Citrix NetScaler Application Firewall.

   If you are configuring your appliance as a standalone application firewall, see "Application Firewall."

   NetScaler Gateway.

   If you are configuring your appliance as an NetScaler Gateway, see "NetScaler Gateway 10.1."

Note: For information about deploying a high availability (HA) pair, see "Configuring High Availability."

Note: The terms NetScaler, NetScaler appliance, and appliance are used interchangeably.
For initial configuration of a NetScaler appliance, Dynamic Host Configuration Protocol (DHCP) can eliminate dependency on the console by providing a subnet IP (SNIP) address at which you can access the appliance to configure it remotely. You can also use DHCP after initial configuration if, for example, you want to move a NetScaler to a different subnet.

To use DHCP, you must first specify the NetScaler vendor class identifier on a DHCP server. Optionally, you can also specify the pool of IP addresses from which your NetScaler appliance can acquire an IP address. If a pool is not specified, the address is acquired from the general pool.

A new NetScaler appliance does not have a configuration file. When you connect an appliance without a configuration file to the network, its DHCP client automatically polls the DHCP server for an IP address. If you have specified the NetScaler vendor class identifier on the DHCP server, the server returns an address. You can also enable the DHCP client on a previously configured appliance.

Prerequisites

To use DHCP, you must:

1. Note the system ID (sysid) on the serial number sticker on the back panel of the appliance. On an older appliance, the system ID may not be available. In this case, use the MAC address instead of the system ID.
2. Set up a DHCP server and configure it with the NetScaler vendor class identifier.

To configure a Linux/UNIX DHCP server for the NetScaler appliance

1. Specify "citrix-NS" as the vendor class identifier for the NetScaler appliance by adding the following configuration to the server's dhcpd.conf file. The subclass declaration must be inside the subnet declaration.

```
option space auto;
 option auto.key code 1 = text;

class "citrix-1" {
 match option vendor-class-identifier;
}

subclass "citrix-1" "citrix-NS"{
vendor-option-space auto;
option auto.key "citrix-NS";
```

   Note: The location of the dhcpd.conf file can be different in different versions and flavors of the Linux/UNIX-based operating system (for example, in FreeBSD 6.3 the file is present in the /etc/ folder). For the location, see the dhcpd man page of the DHCP server.
2. If you do not want NetScaler appliances to use IP addresses from the general pool, specify a pool of addresses for the appliance. You must include this pool declaration inside the subnet declaration. For example, adding the following configuration to the dhcpd.conf file specifies a pool of IP addresses ranging from 192.168.2.120 to 192.168.2.127.

```
pool {
allow members of "citrix-1";
range 192.168.2.120 192.168.2.127;
option subnet-mask 255.255.255.0;
```

}

3. Terminate the DHCP process and restart it to reflect the change to the configuration file. At the shell prompt, type:
   killall dhcpd

   dhcpd&

```
option space auto;
option auto.key code 1 = text;

class "citrix-1" {
    match option vendor-class-identifier;
}

subnet 192.168.2.0 netmask 255.255.255.0 {
option routers10.217.242.1;
option domain-name"jeffbr.local";
option domain-name-servers8.8.8.8;
default-lease-time 21600;
max-lease-time 43200;
subclass "citrix-1" "citrix-NS" {
vendor-option-space auto;
option auto.key "citrix-NS";
}
pool {
allow members of "citrix-1";
range 192.168.2.120 192.168.2.127;
option subnet-mask 255.255.255.0;
}
}
```

Implementing an Initial NetScaler Configuration from a Remote Computer

When a new NetScaler appliance (or any appliance that does not have a configuration file) starts, it automatically polls the DHCP server for an IP address and provides the DHCP server with its sysid. The DHCP server selects one IP address from its pool and assigns it as a subnet IP (SNIP) address to the appliance. The DHCP server includes the sysid of the appliance and the IP address that it assigns to the appliance in the server's dhcpd.leases file. To find the IP address currently assigned to your appliance, look in the dhcpd.leases file for the last entry with the sysid of your appliance in the uid or client-hostname field. Verify that the binding state in this entry is active. If the binding state is not active but free, the IP address is not yet associated with the appliance.

You can use this address to connect to the appliance and remotely configure the initial settings. For example, you can change the IP address, subnet mask, and gateway settings that were fetched from the DHCP server. After completing the initial configuration, you can manually return the DHCP IP address to the server pool. Alternatively, restarting the appliance automatically releases the DHCP IP address back to the server pool.

You can find out the SNIP address assigned to the appliance from the NetScaler console or from the DHCP server.

At the console prompt, type:

```
> sh dhcpParams
DHCP Client on next reboot is ON
DHCP Client Current State: Active
DHCP Client Default route save: OFF
DHCP acquired IP:192.168.2.127
DHCP acquired Netmask:255.255.255.0
DHCP acquired Gateway:192.168.2.1
Done
```

Look in the dhcpd.leases file for the last entry with the sysid of your appliance in the uid or client-hostname field.

Example: The following entry in a DHCP server's dhcpd.leases file verifies the binding state of the appliance whose sysid is 45eae1a8157e89b9314f.

```
lease 192.168.2.127 {
  starts 3 2013/08/19 00:40:37;
  ends 3 2013/08/19 06:40:37;
  cltt 3 2013/08/19 00:40:37;
  binding state active;
  next binding state free;
  hardware ethernet 00:d0:68:11:f4:d6;
  uid "45eae1a8157e89b9314f";
  client-hostname "45eae1a8157e89b9314f";
```

In the above example, the binding state is ACTIVE and the IP address assigned to the appliance is 192.168.2.127.

The following table describes DHCP-related CLI commands that you might want to use when configuring a new NetScaler appliance.

Table 2. NetScaler CLI commands for using DHCP with a new NetScaler Appliance

Task	At the NetScaler command prompt, type:
To verify the DHCP fetched details, such as IP address, subnet mask, and gateway on the appliance	> sh dhcpParams
To release the DHCP IP address and return it to the IP address pool on the DHCP server when the NetScaler configuration is complete	> release dhcpIP

Using DHCP When a Configuration File is Present

If you need to move a NetScaler appliance to a different subnet, such as from a testing environment to a production environment, you can use DHCP to access an appliance that already has a configuration file. Before moving the appliance,

enable its DHCP client and save the configuration. As a result, when the appliance restarts, it automatically polls the DHCP server for an IP address. If you did not enable the DHCP client and save the configuration before shutting down the appliance, you will need to connect to the appliance through the console and dynamically run the DHCP client on the appliance. The DHCP server will then provide an IP address, a gateway, and a subnet mask. You can use the IP address to access the appliance and configure the other settings remotely.

If the DHCP client is enabled in the configuration file, you should disable it and then save the configuration file. If the DHCP client is enabled, the appliance will poll the DHCP server again for an IP address when it restarts.

The following table lists the NetScaler CLI commands associated with each task.

Table 3. NetScaler CLI commands for using DHCP with a previously configured NetScaler Appliance

Task	At the NetScaler command prompt, type:
To dynamically run the DHCP client to fetch an IP address from the DHCP server	> set dhcpParams dhcpClient on
To configure the DHCP client to run when the appliance restarts	> set dhcpParams dhcpClient on > save config
To prevent the DHCP client from running when the appliance restarts	> set dhcpParams dhcpClient off > save config Note: This is required only if the ON setting was saved.
To save the DHCP acquired route so that it is available when the appliance restarts	> set dhcpParams -dhcpclient on -saveroute on > save config
To prevent saving the DHCP acquired route (default behavior)	> set dhcpParams -dhcpclient on -saveroute off > save config Note: This is required only if the ON setting was saved.

If you administer a large number of NetScaler appliances, storing and looking up passwords for logging on to individual appliances can be cumbersome. To avoid being prompted for passwords, you can set up secure shell access with public key encryption on each appliance.

NetScaler features can also use SSH key based authentication for internal communication when the internal user is

disabled (by using the set ns param -internaluserlogin disabled command). In such cases, the key name must be set as "ns_comm_key".

To set up access using SSH keys, you must generate the public-private key pair on a client and copy the public key to the remote NetScaler appliance.

To generate the keys and connect to a remote NetScaler by using SSH keys

1. On a client (Linux client or a NetScaler) change directory to /root/.ssh.
   cd /root/.ssh
2. Generate the public-private key pair.
   ssh-keygen -t <key_type> -f <optional_key_file_name>

   Example: To create an RSA key with default file name.
   ssh-keygen -t rsa
3. Press ENTER when prompted for a file name for the key pair.
   Note:
   - If you update the default file name for the key pair, use the new name instead of the default name in the rest of this procedure.
   - If you want to disable internal user login, use "ns_comm_key" as the file name for the public-private key pair.
4. Press ENTER two times when prompted for a passphrase.
   Note: If the client is a NetScaler appliance, move the private key file to a persistent location such as sub-directories of the /flash and /var directories.
5. Log on to the remote NetScaler appliance from the client by using a file transfer protocol, and perform the following:
   1. Change directory to /nsconfig/ssh. At the prompt, type:
      cd /nsconfig/ssh
   2. Use the binary transfer mode to copy the public key to this directory.
      bin
      put id_rsa.pub
6. Open a connection to the remote NetScaler appliance by using an SSH client, such as PuTTY, and perform the following:
   1. Log on to the remote appliance using the administrator credentials.
   2. Go to the NetScaler shell.
      > shell
   3. At the shell prompt, change the directory to /nsconfig/ssh.
      root@ns# cd /nsconfig/ssh
   4. Append the public key to the authorized_keys file. At the shell prompt, type:
      root@ns# cat id_rsa.pub >> authorized_keys
      Note: If the authorized_keys file does not exist at the appliance, you need to first create the file and then append the contents.
   5. Change the permission of the /flash, nsconfig, and ssh directories to 755.
      root@ns# chmod 755 /flash
      root@ns# chmod 755 /flash/nsconfig
      root@ns# chmod 755 /flash/nsconfig/ssh
   6. Change the permission of the authorized_keys file to 744.
      root@ns# chmod 744 authorized_keys
   7. Optionally, remove the public key.
      root@ns# rm id_rsa.pub

7. On the client, verify that you can connect to the remote NetScaler appliance by using SSH, without entering the password.
   If using the default file name for the public-private key pair.
   ssh <user_name>@<NetScalerIPAddress>
   If using "ns_comm_key" (when internal user is disabled) for the public-private key pair.
   ssh –i /nsconfig/ssh/ns_comm_key <user_name>@<NetScalerIPAddress>
   If using any other name for the public-private key pair.
   ssh –i <path_to_client_private_key> <user_name>@<NetScalerIPAddress>

The default user account is the administrative account, which provides complete access to all features of the Citrix NetScaler appliance. Therefore, to preserve security, the administrative account should be used only when necessary, and only individuals whose duties require full access should know the password for the administrative account. The default administrative username and password are nsroot and nsroot, respectively. Citrix recommends changing the administrative password frequently.

To change the administrative password by using the configuration utility

1. Log on to the appliance by using the administrative credentials.
2. On the Configuration tab, in the navigation pane, expand System, and then click Users.
3. In the Users pane, click the default user account (nsroot), and then click Change Password.
4. In the Change Password dialog box, in Password and Confirm Password, type the password of your choice.
5. Click OK.

To change the administrative password by using the command line interface

At the command prompt, type:

set system user <userName> -password

Example:

```
set system user nsroot -password
Enter password: *****
Confirm password: *****
Done
```

Lights Out Management Port of the NetScaler MPX Appliance

Dec 17, 2015

The MPX 8005/8015/8200/8400/8600/8800, MPX 11500/13500/14500/16500/18500/20500, MPX 17550/19550/20550/21550, MPX 22040/22060/22080/22100/22120, MPX 24100/24150, and MPX 25100T/25160T appliances have an Intelligent Platform Management Interface (IPMI), also known as the Lights Out Management (LOM) port, on the front panel of the appliance. You can use the LOM port to remotely monitor and manage the appliance, independently of the NetScaler software.

By connecting the LOM port to a dedicated channel that is separate from the data channel, you can make sure that connectivity to the appliance is maintained even if the data network is down. You thereby eliminate the data cable and data network as a single point of failure.

You can access the LOM port through a browser and use the graphical user interface (GUI) for most tasks. All tasks can be performed through the NetScaler shell.

You can use either the GUI or a shell for the following tasks:

- Configuring the network settings
- Health monitoring
- Power control operations
- Factory reset

Different Citrix appliances support different shells:

- For FreeBSD based NetScaler MPX appliances, use the bash nsroot shell (also known as NS Shell).
- For Linux based appliances, use the Linux bash root shell.

Note: The terms LOM and Baseboard Management Controller (BMC) are used interchangeably.
Caution: LOM firmware versions are platform specific. Upgrading to a LOM firmware version other than one shown for your platform in the LOM Support Matrix, below, results in the LOM becoming unusable.
The LOM Support Matrix shows the LOM firmware versions shipped with the various platforms, along with the recommended versions, and the earliest NetScaler software versions that support both the shipped and the recommended LOM firmware versions. The latest available LOM package can be found on the Citrix downloads website under LOM Firmware Upgrade.

Hardware	Ships With Version	Recommended Version	Minimum NetScaler Version to avoid PS failure issues
MPX 8005/8015/8200/8400/8600/8800	2.04/2.07/3.02/3.10/3.11	3.11	9.3_65.x, 10.1_123.x, 10.5
MPX 11500/13500/14500/16500/18500/20500	2.52/3.02/3.33/3.39	3.39	9.3_65.x, 10.1_123.x, 10.5
MPX 11515/11520/11530/11540/11542	2.52/3.02/3.33/3.39	3.39	9.3_65.x, 10.1_123.x, 10.5

Hardware	Ships With Version	Recommended Version	Minimum NetScaler Version to avoid PS failure issues
MPX 17550/19550/20550/21550	2.52/3.02/3.33/3.39	3.39	9.3_65.x, 10.1_123.x, 10.5
MPX 22040/22060/22080/22100/22120	2.63/3.22	3.22	9.3_65.x, 10.1_123.x, 10.5
MPX 24100/24150	2.63/3.22	3.22	9.3_65.x, 10.1_123.x, 10.5

Configuring the Network Settings on the LOM Port

Jan 31, 2011

The default IP address for initial access to the LOM port is 192.168.1.3. Change the default credentials and IP address the first time you log on. All LOM GUI operations require you to connect to the appliance by typing the LOM IP address in a web browser and then entering the administrator credentials. Alternatively, you can access LOM functionality through the command line by using the *ipmitool* utility. Using the ipmitool utility remotely, you can determine the LOM firmware version number, perform warm and cold restarts, configure LOM network settings, monitor the health of the appliance, and perform power control operations. The utility is available for download at http://ipmitool.sourceforge.net/. The ipmitool utility is also included in NetScaler MPX and CloudBridge/SDX (dom0) appliances for initial LOM port network configuration. When using the shell, you can choose to use DHCP or static IP settings for initial network configuration. After configuring the network settings, you can use the ipmitool commands over the network. For example, the BMC firmware revision command would need the same username, password, and IP address that is used to access the BMC/LOM GUI port.

For initial configuration, connect the network port on your laptop or workstation directly to the LOM port with a crossover cable, or to a switch in the same local subnet(192.168.1.x) as the LOM port. Assign a network-reachable IP address and change the default credentials. After saving the new settings, the LOM restarts and the changes take effect. After the restart, you must use the new address to access to the LOM.

If you make a mistake that results in losing network connectivity at both the old and new IP addresses, you must use the local shell method to recover.

See the Secure Deployment Guide for best practices for managing administrative credentials and configuring your network for a secure LOM deployment.

Note: On all MPX platforms, except MPX 22040/22060/22080/22100/22120 and MPX 24100/24150, the LEDs on the LOM port are nonoperational by design.
Tip: For first-time setup in a network, to facilitate troubleshooting, make sure that a laptop/PC is connected directly to the LOM port. If you can ping and access the LOM GUI at the default IP address (192.168.1.3) by using static addressing on the laptop/PC, but remote access does not work, take a closer look at network firewall settings and access control list (ACL) policies of all network devices along the network path.
Tip: If some LOM GUI features work but others do not, (for example, normal NetScaler console output is visible in the NetScaler console window in the LOM GUI, but typing in the console does not work), try the above method to isolate the cause to the specific BMC protocol being blocked by the network.
Tip: Some LOM GUI features, such as the NetScaler console, require the latest Java security updates on the laptop/PC. Make sure that the latest Java updates are installed on your laptop/PC.

1. In a web browser, type http://192.168.1.3 and enter the default user credentials.
   Note: The NetScaler LOM port is preconfigured with IP address 192.168.1.3 and subnet mask 255.255.255.0.
2. On the Configuration tab, click Network and type new values for the following parameters:
   - IP Address—IP address of the LOM port
   - Subnet Mask—Subnet mask used to define the subnet of the LOM port
   - Default Gateway—IP address of the router that connects the LOM port to the network
3. Click Save.
4. If you want to change the user credentials, navigate to Configuration > Users, select the user, click Modify User, and change the credentials.

1. Configure the IP addressing mode:
   - To use DHCP, at the shell prompt, type:
     ipmitool lan set 1 ipsrc dhcp

     No further IP-level configuration is required.

   - To use static addressing, at the shell prompt, type:
     1. **ipmitool lan set 1 ipsrc static**
     2. **ipmitool lan set 1 ipaddr <LOM IP address>**
     3. **ipmitool lan set 1 netmask <netmask IP address>**
     4. **ipmitool lan set 1 defgw ipaddr <default gateway IP address>**

     The BMC reboots to apply the changes. Pings to the BMC should succeed after approximately 60 seconds.

2. Optionally, to configure Ethernet VLAN ID and priority, at the NetScaler shell prompt type:
   - **ipmitool lan set 1 vlan id <off|<ID>>**
   - **ipmitool lan set 1 vlan priority <priority>**

   You can either disable or enable the VLAN. Set the VLAN ID to a value from 1 to 4094, and the VLAN priority to a value from 0 to 7. After the network settings have been correctly applied, you can access the ipmitool remotely from a physically separate machine over the network. For remote access, enter the BMC username, BMC password, and the BMC IP address. For example, to run the "ipmitool mc info" command, at the shell prompt on a remote machine, type:

   ipmitool –U <username> –P <password> –H <bmc IP address> mc info

There are two NetScaler MIBs: the NetScaler software management MIB and the NetScaler IPMI LOM hardware management MIB. The software management MIB is primarily used for monitoring the application software and the application software's utilization of hardware resources, such as CPU % and memory %. It provides a high level view of the appliance and is therefore suitable for the application monitoring function carried out by an application group within an organization. The LOM MIB is used for monitoring the hardware health and therefore provides a lower level view of the appliance, more applicable to the network monitoring function carried out by a network monitoring group.

The LOM SNMP traps in the LOM MIB report hardware failures. The NetScaler SNMP traps in the NetScaler MIB report software failures and hardware load issues.

The NetScaler MIB has a very small subset of hardware sensors. It does not cover any BIOS level failures, because the BIOS checks the hardware primarily during boot time , before the NetScaler software starts. If the BIOS detects a failure, it does not load the boot loader. If the boot loader does not load, the operating system does not load, and therefore theNetScaler SNMP software service responsible for sending the traps does not load.

The NetScaler Software Management MIB issues a warning under the following conditions only:

1. If the failure is gradual enough for the main CPU to issue an SNMP alert. An electrical failure close to the CPU, such as a failed electrical capacitor, occurs too quickly for the CPU to issue an alert.
2. If the failure happens after the BIOS, Operating System, and SNMP service have started and normal boot-up has been successful.
3. If the failure happens while the operating system and other system software is in a stable enough state for the SNMP software service to run.

Whenever the NetScaler MIB is unable to report these warnings, because of hardware or software failure, the LOM MIB monitors and reports the warnings. The LOM microcontroller operates independently of the NetScaler software. To monitor the hardware and software of the NetScaler appliance, you must use both the NetScaler MIB and the LOM MIB.

The NetScaler IPMI LOM hardware management MIB SNMP firmware runs on the BMC microcontroller chip. The BMC chip CPU sends a warning in the case of a hardware failure, regardless of whether any of the above conditions occurs. For example, if the BIOS halts the system during boot-up because of a memory DIMM failure, the BMC chip uses the BIOS POST code snooping mechanism to detect the failure, and sends a bad DIMM SNMP alert.

You can log on to the LOM port to view the health information about the appliance. All system sensor information, such as system temperature, CPU temperature, and status of fans and power supplies, appears on the sensor readings page. The Event Log records time stamps of routine events such as a power cycle, in addition to recording hardware-failure events. If SNMP traps are enabled, these events can be sent to your SNMP Network Monitoring software. For more information about how to set up an SNMP alert, see Configuring SNMP Alerts.

To obtain health monitoring information

1. In the Menu bar, click System Health.
2. Under Options, click Sensor Readings.

Download the IPMI SNMP management information base (MIB) for your LOM firmware version, and import it into the SNMP monitoring software.

For a sample configuration, see http://www.net-snmp.org/tutorial/tutorial-5/commands/snmptrap.html. For the exact steps of this procedure specific to your environment, contact your SNMP network monitoring software provider.

You can configure SNMP alerts on the LOM. Optionally, you can configure an alert to send emails.

To configure the alerts, you can use the LOM GUI or the NetScaler Shell.

To configure SNMP alerts on the LOM by using the GUI

1. Download the IPMI View utility from **ftp://ftp.supermicro.com/utility/IPMIView/** and install it on your computer. You will use this utility to test the configuration. For more information, see the section about configuring the alert settings in the IPMI View User Guide at http://supermicro.com.
2. Open the IPMI View utility.
3. In the LOM GUI, navigate to Configuration > Alerts, click Alert No 1, and then click Modify.
4. Select the severity level of the events for which to generate alerts.
5. Set Destination IP to the IP address at which you installed the IPMI View utility.
6. Optionally, to receive alerts by email, specify an email address. To avoid receiving email for routine alerts, specify a severity higher than Informational.
7. Click Save.
8. The LOM should start sending alerts to the IPMI View utility within in a minute or two. After the IPMI View utility starts receiving alerts from the LOM, reconfigure the destination IP address to point to your SNMP Network Management Software, such as HP OpenView.

Setting up SNMP Alerts on the LOM by Using the NetScaler Shell

To customize your filter and policy settings, see the IPMI Specification 2.0 rev. 1.1 documentation.

The latest IPMI specifications are available from the IPMI section of the Intel website:

http://www.intel.com/content/www/us/en/servers/ipmi/ipmi-specifications.html

Usually, customization in the SNMP Network Management Software is the preferred method, because it can be done one time at a central location. Therefore, the settings below send all events for all sensors to the SNMP network management software. These are very low traffic events and therefore should not result in any significant network usage.

To set up SNMP filters

The following commands set up SNMP to allow all events:

ipmitool raw 4 0x12 0x6 0x10 0x80 1 1 0 0xff 0xff 0xff 0xff 0xff 0xff 0xff 0 0xff 0 0 0xff 0 0 0xff 0

To set up a policy list

The following command creates a policy list for all sensors and events:

ipmitool raw 4 0x12 9 0x10 0x18 0x11 0x81

To setting up the destination address for SNMP events

The following command sets up a destination IP address for an SNMP event:

ipmitool lan alert set 1 1 ipaddr <x.x.x.x>

Where, <x.x.x.x> is the IP address to which the SNMP event should be sent.

To specify an SNMP community string name

At the prompt, type:

ipmitool lan set 1 snmp <community string>

Installing a Certificate and Key on the LOM GUI

Jan 31, 2011

Citrix recommends using HTTPS to access the LOM GUI. To use HTTPS, you must replace the default SSL certificate with one from a trusted certificate authority and upload a private key to the LOM GUI.

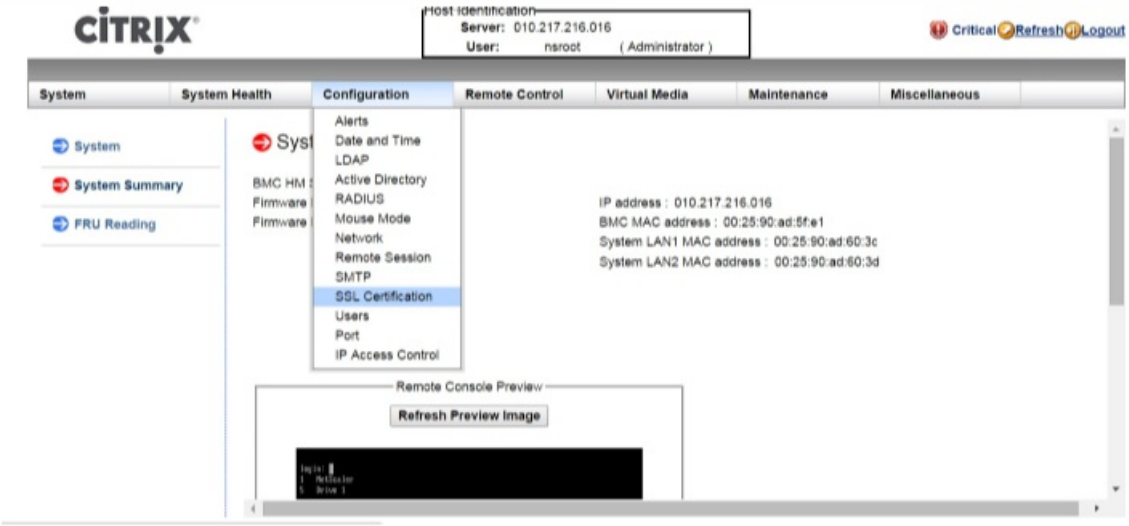
To encrypt SNMP alerts, setup an SSL certificate and private key. In the GUI, navigate to **Configuration** > **SSL Certification** and apply the SSL certificate and private key. See the NetScaler Secure Deployment Guide for more information about how to securely deploy the LOM in your network. To enable encryption and learn the security measures for LOM, see http://support.citrix.com/article/CTX129514.

If you make a mistake, you must restore the BMC to the factory defaults to erase the certificate and key. Use the following shell command:

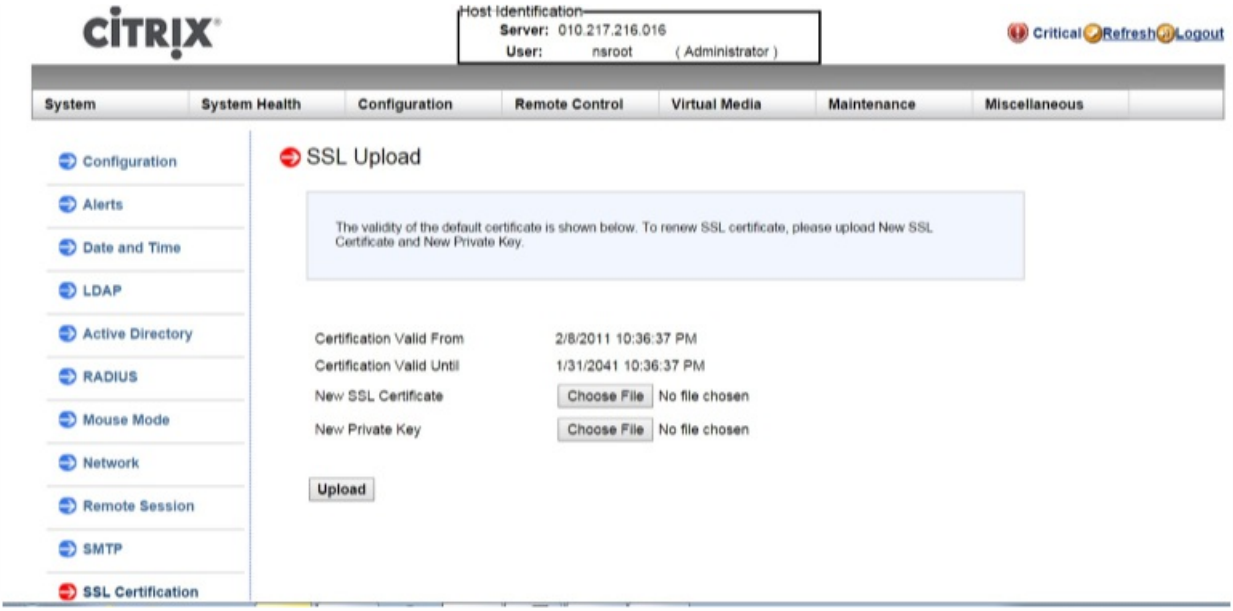
ipmitool raw 0x30 0x41 0x1

Note: The certificate file must contain only the certificate. The certificate and key must not be in the same file. Make sure that the certificate contains only the certificate and that the key file contains only the key.

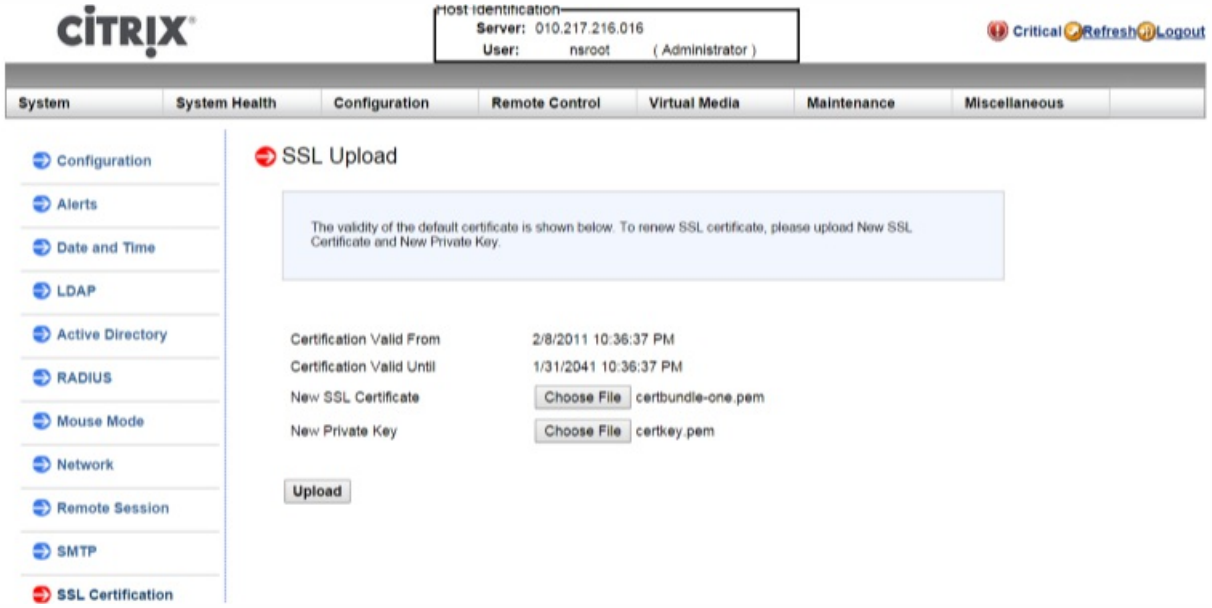
1. Navigate to Configuration > SSL Certification.



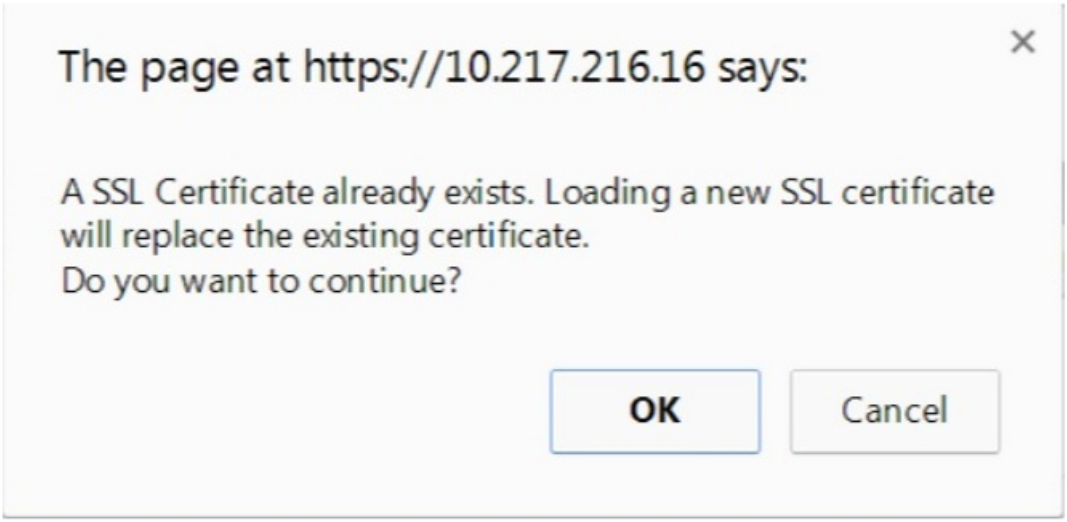
2. In the right pane, click the Choose File buttons to select a new SSL certificate and a new private key.



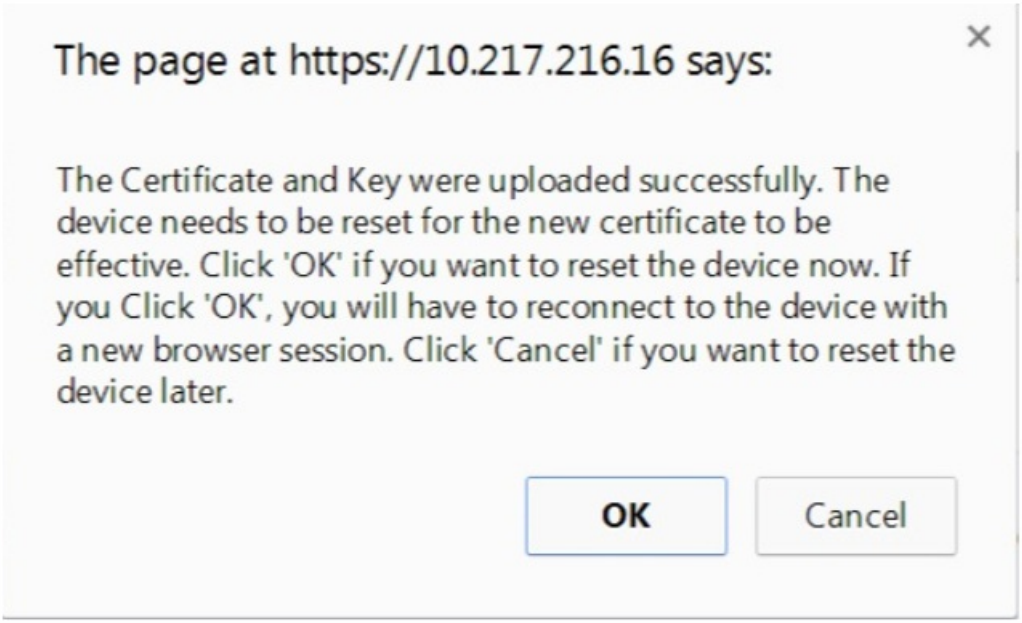
3. To verify that you have selected the correct certificate and private key, check the file names of the certificate and key, which appear next to the Choose File buttons.



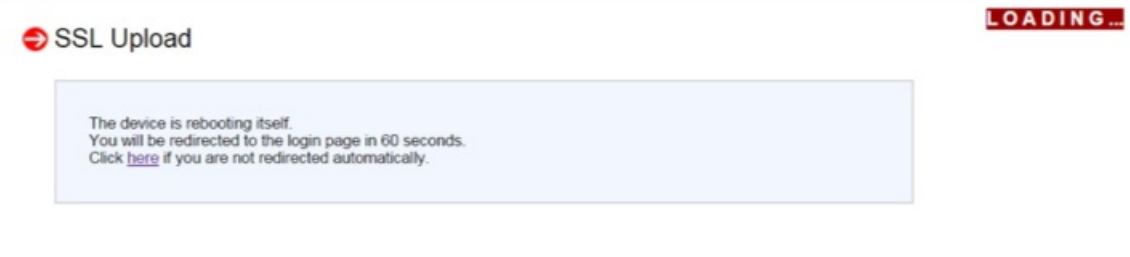
4. Click Upload. A message informs you that uploading a new SSL certificate replaces the existing (default) certificate.
5. Click OK.



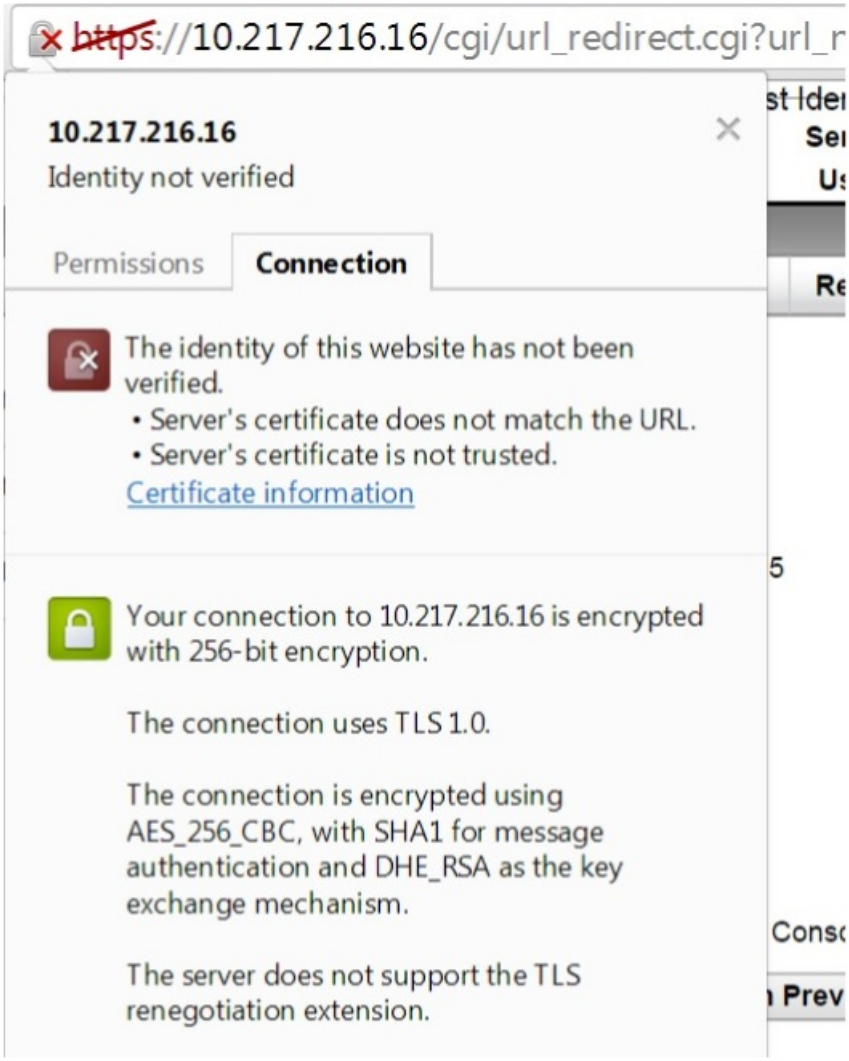
6. When a message informs you that the certificate and key have been uploaded successfully, click OK to reset the device.



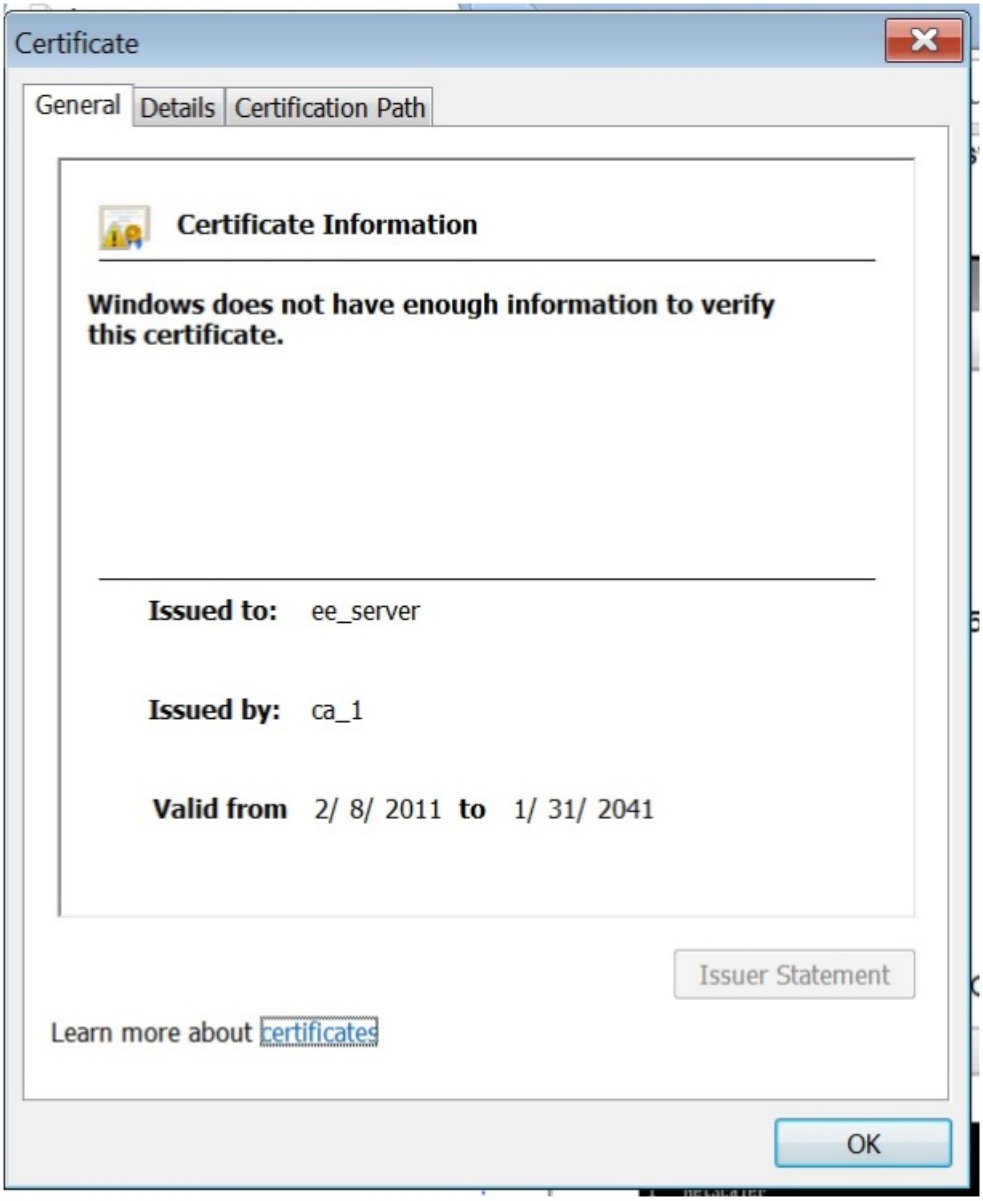
The reset takes approximately 60 seconds. You are then redirected to the logon page.



7. Log on to the LOM GUI by using your default credentials.
   Note: If the certificate or key are invalid, the BMC reboots, tries the new settings, and reverts to using the previous settings.
8. In the address bar, click the lock icon to display the connection tab, as shown on the screen below.



9. Click Certificate information to display details about the certificate that you just uploaded.



Note: For the best practices for LOM and NetScaler security, see http://support.citrix.com/article/CTX129514.

Obtaining the MAC Address, Serial Number, and Host Properties of the Appliance

Jan 31, 2011

A Media Access Control address (MAC address) is a unique identifier assigned to network interfaces for communication on the physical network segment. The serial number is on the back panel of the appliance. If you do not have easy access to the back panel, you can get the appliance's serial number by logging on to the LOM port. You can also retrieve the parameter settings assigned to the IP addresses configured on the appliance, such as the state of ARP, ICMP, telnet, secure shell access, and dynamic routing.

1. In the Menu bar, click Remote Control.
2. Under Options, click Console Redirection.
3. Click Launch Console, and then click Yes.
4. Type the administrator credentials.
5. Type show interface <management_interface_id> to display the MAC address.
6. Type show hardware to display the serial number of the appliance.
7. Type sh nsip to display the host properties of the appliance.

At the shell prompt, type:

ipmitool lan print

Example

```
Set in Progress         : Set Complete
Auth Type Support       : MD2 MD5 OEM
Auth Type Enable        : Callback : MD2 MD5 OEM
                        : User     : MD2 MD5 OEM
                        : Operator : MD2 MD5 OEM
                        : Admin    : MD2 MD5 OEM
                        : OEM      :

                       :    O=OEM
```

Performing Power Control Operations by using the LOM Port

Jan 31, 2011

Through the LOM port, you can remotely perform power control operations, such as graceful shutdown and restart, power cycling the appliance, and restarting the BMC microcontroller. A cold restart takes longer than a warm restart. In a cold restart, you switch off power to the appliance and then switch it back on.

1. In the Menu bar, click Remote Control.
2. Under Options, click Power Control, and then select one of the following options:
   - **Reset System**—Gracefully restart the appliance. All operations on the appliance are stopped, no new connections to the client or server are accepted, and all existing connections are closed before the appliance restarts. This is similar to a warm restart, such as by entering the reboot command. The BMC does not reboot itself during this operation.
   - **Power Off System – Immediate**—Disconnect power to the appliance immediately, without gracefully shutting down the appliance. The BMC continues to operate normally in this mode to allow the user to remotely power on the appliance. This is the same as pushing the power button until the unit powers off.
   - **Power Off System – Orderly Shutdown**—Gracefully shut down the appliance, and then disconnect power to the appliance. Has the same effect as pressing the power button on the back panel of the appliance for less than four seconds. All operations on the appliance are stopped, no new connections to the client or server are accepted, and all existing connections are closed before the appliance shuts down. The BMC continues to operate normally in this mode to allow the user to remotely power on the appliance. This is the same as entering the shutdown command in the appliance shell.
   - **Power On System**—Turn on the appliance. The BMC does not reboot itself during this operation. This is the same as pushing the power button.
   - **Power Cycle System**—Turn off the appliance, and then turn it back on. The BMC does not reboot itself during this operation. This is the same as pushing the power button until the unit powers off, and then pushing the power button to power on the unit.
3. Click Perform Action.

A warm restart, cold restart, or a power cycle of the appliance, using the power button, does not include power cycling the BMC. The BMC runs on standby power directly from the power supply. Therefore, the BMC is not affected by any state of the power button on the appliance. The only way to power cycle the BMC is to remove all power cords from the appliance for 60 seconds.

When performing either a warm or cold restart of the BMC microcontroller, you cannot communicate with the LOM port. Both actions restart the BMC but not the main CPU. To perform a warm restart of LOM from the appliance, type:

ipmitool mc reset warm

To perform a warm restart remotely from another computer on the network, type:

ipmitool –U <bmc_gui_username> –P <bmc_gui_password> –H <bmc IP address> mc reset warm

To perform a cold restart of the LOM from the appliance, type:

ipmitool mc reset cold

To perform a warm restart remotely from another computer on the network, type:

ipmitool –U <bmc_gui_username> –P <bmc_gui_password> –H <bmc IP address> mc reset cold

If the appliance fails or becomes unresponsive, you can remotely perform a core dump. This procedure has the same effect as pressing the NMI button on the back panel of the appliance.

To perform a core dump by using the GUI

1. In the Menu bar, click Remote Control.
2. Under Options, click NMI, and then click Initiate NMI.

To perform a core dump remotely from another computer on the network by using the shell

At the shell prompt, type:

ipmitool -U <bmc_gui_username> -P <bmc_gui_password> -H <bmc IP address> chassis power diag

Restoring the BMC Configuration to Factory Defaults

Jan 31, 2011

You can restore the BMC to its factory-default settings, including deleting the SSL Certificate and SSL key.

1. Navigate to Maintenance > Factory Default.
2. Click Restore.

At the shell prompt, type:

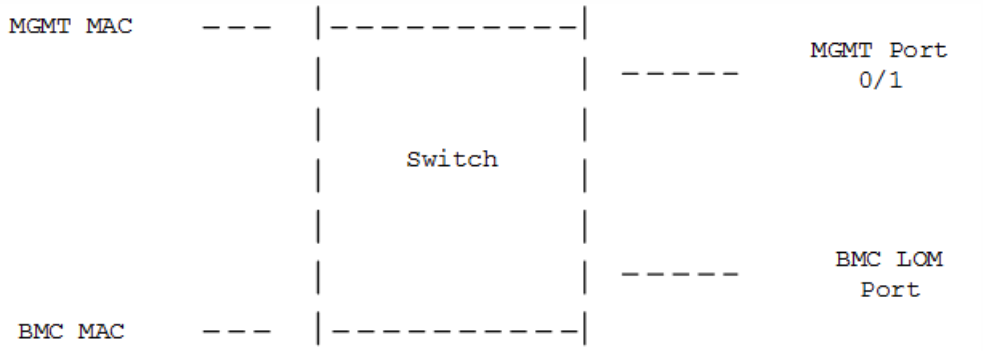
ipmitool raw 0x30 0x41 0x1

Specifying the Port for IPMI BMC Failover

Jan 31, 2011

With LOM firmware version 3.x or later, the default mode for failover between the dedicated LOM port and the shared LOM/management port is to fail over to the active port. By default, no user configuration is needed other than selecting the port to which to connect the cable. The motherboard has an Ethernet switch between the management MAC and the management port, and between the LOM MAC and the LOM port. The following figure shows the Ethernet switch.

Figure 1. Ethernet Switch



You can set this switch to direct LOM traffic through the dedicated LOM port or through the shared management port. A dedicated LOM port removes the management port as a single point of failure, while a shared LOM/management port reduces the cabling costs.

Using the BIOS POST Code to Detect Errors

Jan 31, 2011

You can read the BIOS POST code by using the LOM GUI or the shell. To interpret the BIOS Beep codes, see https://www.ami.com/support/doc/AMI_Aptio_4.x_Status_Codes_PUB.pdf.

Navigate to Miscellaneous > BIOS Post Snooping.

At the prompt, type:

ipmitool raw 0x30 0x2a

Migrating the Configuration of an Existing NetScaler Appliance to Another NetScaler Appliance

Jan 08, 2014

If you are migrating to a new appliance, you must make some changes to the configuration (ns.conf file) of the old appliance before you copy the configuration to the new appliance.

Note: The following procedure does not apply to NetScaler FIPS appliances.

1. On the old appliance, create a backup copy of the configuration file (ns.conf).
2. Use a vi editor to edit the configuration file that you backed up. For example, you might want to change the user name, host name, and password.
   Note: You must remove all interface-related configuration, such as set interface, bind vlan, add channel, bind channel, and set channel.
3. Shut down the old appliance.
4. Perform initial configuration on the new appliance. Connect to the serial console, and at the command prompt type **config ns** to run the NetScaler configuration script. Enter parameter values, such as NetScaler IP address and subnet mask. For information about performing initial configuration by using the configuration utility (GUI) or the LCD keypad, see Initial Configuration.
5. Restart the new appliance.
6. Add a route on the new appliance. At the command prompt, type: add route <network> <netmask> <gateway>
7. Copy the edited configuration file to the new appliance.
8. Copy other relevant files, such as bookmarks, SSL certificates, and CRLs, to the new appliance. Return your feature license(s) to the Citrix licensing portal and reallocate it on the new appliance. For more info about returning your licenses, see http://support.citrix.com/article/CTX131110.
   Note: The platform license is different for a new appliance.
9. Restart the new appliance.
10. Add interface-related configuration specific to your new appliance, switch, and router, and save the configuration.

If you have a high-availability setup, you must perform the above procedure on both the nodes.

Troubleshooting

Feb 28, 2014

NetScaler MPX 8005/8015/8200/8400/8600/8800, MPX 11500/13500/14500/16500/18500/20500, MPX 11515/11520/11530/11540/11542, MPX 17550/19550/20550/21550, MPX 22040/22060/22080/22100/22120, MPX 24100/24150, and MPX 25100T/25160T appliances support LOM. Depending on the state of the LOM configuration, start with one of the steps in the following procedure. (To configure the LOM port, see Lights Out Management Port of the NetScaler Appliance).

1. If the LOM port is configured and known to have been working previously, use the LOM credentials to log on to the LOM GUI, and then do the following:
   1. Navigate to **Remote Control** > **Console Redirection**, and then click **Launch Console**.
   2. On the Java iKVM Viewer screen, check the VGA console window for boot errors, such as bad or missing boot media (boot drive/Compact Flash card), and reseat any unconnected boot media. If the appliance boots up, try to log on and run the show techsupport command from the NetScaler command line. Complete the Check Network Interfaces steps listed below to find a working interface on which to transfer the support bundle file.
   3. Navigate to System Health > Sensor Readings to check the status of the hardware components (for example, CPU temperature, system temperature, and power supply status). You might need to scroll down. Green indicates that the hardware component is functioning properly. Red indicates that it has failed. Contact Citrix Support if you observe red indicators.
   4. Navigate to Miscellaneous > Post Snooping and check for BIOS POST initialization codes. If the value of Post Snooping is "00" or "AC," and the AC power supply LED light is green, the BIOS booted up normally. If not, check the Java iKVM Viewer screen to see if the appliance stopped responding during BIOS POST initialization. Perform substeps a through f of Step 2 to recover the appliance. If these steps fail, contact Citrix Support.
2. If the LOM port is configured and the LOM GUI is not accessible, try pinging the LOM IP address. The baseboard management controller (BMC, also known as LOM) runs on standby power, so even if the appliance is powered off by pressing the power button, the BMC is still working. If you are unable to ping the LOM IP address, connect to the COM1 console port through a serial cable (the serial cable can be connected to a network serial terminal/console server for remote access), or try pinging the NetScaler IP address. On the appliance, do the following:
   1. Verify that the appliance is receiving power.
   2. If the appliance is not receiving power, change the power cable and connect the cable to another socket.
   3. Verify that the power supply is properly seated in power supply slot.
   4. Remove all AC power supply cords for 30 seconds to completely remove power from the appliance.
   5. Reinsert the AC power supply cords and check the LEDs indicating the status of the AC power supplies. If a power-supply LED is not green, troubleshoot the power supply.
   6. Try pinging the LOM IP again. If successful, go to Step 1.
3. If the appliance does not support the LOM port or the LOM port is not configured, do the following:
   1. Connect the serial console cable to the appliance.
   2. Perform the substeps a through e of Step 2.
   3. On the serial console port window, check for any boot failure errors, such as bad or missing boot media (boot drive/Compact Flash card), and reseat any unconnected boot media. If the appliance boots up, try to log on and run the show techsupport command from the NetScaler command line. Complete the Check Network Interfaces steps listed below to find a working interface on which to transfer the support bundle file.

Check Network Interfaces.

1. If management interface 0/1 is not operational, use the Java iKVM Viewer, as described in Step 1.b, to set up management interface 0/2, and connect a network cable to port 0/2. Use the serial console port for appliances that do not support the LOM port.
2. Make sure that the LED port status indicators are green for all interfaces. For more information about LED port status indicators, see "LED Port-Status Indicators" in Ports.
3. Verify that the SFP/SFP+/XFP transceivers are supported by Citrix.

Hardware FAQs

Dec 04, 2014

Are transceivers shipped with the MPX 8005/8015/8200/8400/8600/8800 appliance?

No. Transceivers are available for purchase separately. Contact your Citrix sales representative to order transceivers for your appliance.

Are transceivers hot-swappable?

The 1G SFP transceiver is hot-swappable with release 9.3 build 47.5 or later on the following NetScaler appliances, which use the Intel e1k interface:

- MPX 7500/9500
- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150

The 10G SFP+ transceiver is hot-swappable with release 9.3 build 57.5 or later on the following NetScaler appliances, which use the ixgbe (ix) interface:

- MPX 8005/8015/8200/8400/8600/8800
- MPX 9700/10500/12500/15500
- MPX 11500/13500/14500/16500/18500/20500
- MPX 17500/19500/21500
- MPX 17550/19550/20550/21550
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150
- MPX 25100T/25160T

Why does the 10G SFP+ transceiver autonegotiate to 1G speed?

Autonegotiation is enabled by default on the 10G SFP+ ports into which you insert your 10G SFP+ transceiver. When a link is established between the port and the network, the speed is autonegotiated. For example, if you connect the port to a 1G network, the speed is autonegotiated to 1G.

Can I insert a 1G transceiver into a 10G slot?

The 10G slot supports copper 1G transceivers, which can operate at up to 1 Gbps in a 10 Gbps slot.

Note that you cannot insert a 10G transceiver into a 1G slot.

The following table shows the compatibility matrix of transceivers and ports available on the NetScaler appliance.

Ports	Transceivers		
	10G	1G Fiber	1G Copper

10G	Supported	Not Supported	Supported
1G Fiber	Not Supported	Supported	Not Supported
1G Copper	Not Supported	Not Supported	Supported

What is QSFP+?

QSFP+ stands for Quad Small Form-factor Pluggable, which is a small, hot-pluggable transceiver for connecting data devices. This transceiver is used for 40G interfaces.

QSFP+ to Four SFP+ Copper Breakout Cables—These cables connect to four SFP+ 10GE ports of a NetScaler appliance on one end and to a QSFP+ 40G port of a Cisco switch on the other end.

Support for 40G connectivity—NetScaler models that have at least four 10G SFP+ ports connect to Cisco 40G interfaces by aggregating four of the 10G SFP+ ports to form a 40G link aggregation channel. QSFP to Four port SFP+ Copper Breakout Cable **QSFP-4SFP10G-CU3M (reports as L45593-D178-C30)** is used.

Which NetScaler appliances support the QSFP-4SFP10G-CU3M (reports as L45593-D178-C30) Breakout Cable?

NetScaler appliances that have at least four 10G SFP+ ports support this cable. The following appliances have at least four 10G SFP+ ports:

- MPX 11500/13500/14500/16500/18500/20500
- MPX 17550/19550/20550/21550
- MPX 11515/11520/11530/11540/11542
- MPX 22040/22060/22080/22100/22120
- MPX 24100/24150
- MPX 25100T/25160T

QSFP-4SFP10G-CU3M breakout cable is supported by NetScaler release 9.3 build 65.8 or later, and release 10.1 build 122.17 or later.

Is the power supply on the NetScaler MPX 5500 and MPX 5550/5650 appliances field replaceable?

No. The power supply on the NetScaler MPX 5500 and MPX 5550/5650 appliances is fixed.

Does the MPX 8005/8015/8200/8400/8600/8800 appliance ship with two power supplies?

No. The MPX 8005/8015/8200/8400/8600/8800 appliance supports dual power supplies but ships with one power supply. Contact your Citrix sales representative to order a second power supply.

How many power supplies are shipped with each platform?

The following table lists the number of power supplies shipped with each platform:

Platform	Number of Power Supplies shipped
MPX 5500	1

Platform	Number of Power Supplies shipped
MPX 7500/9500	1 (You can order a second power supply.)
MPX 9700/10500/12500/15500	2
MPX 15000/17000	1 (You can order a second power supply.)
MPX 11500/13500/14500/16500/18500/20500	2
MPX 17500/19500/21500	1 (You can order a second power supply.)
MPX 17550/19550/20550/21550	2

Are power supplies hot-swappable?

Yes. If the appliance has two power supplies, you can replace one power supply without shutting down the appliance, provided the other power supply is working.

Do you have different rail kits for 1U and 2U appliances?

No. All MPX and SDX appliances use the same rail kit. The kit contains two pairs of slide rails, of different lengths, for a 1U and a 2U appliance.

Which rail kit should I buy?

The appliance ships with the standard 4-post rail kit that fits racks from 28-38 inches.

The compact 4-post rail kit for racks from 23-33 inches, or the 2-post rail kit for 2-post racks, has to be purchased separately. Contact your Citrix sales representative to order the appropriate kit.

What are the maximum and the minimum lengths of the outer rack rails?

The length of a standard outer rack rail is from 28 to 38 inches. The length of a shorter outer rack rail is from 23 to 33 inches.

What is the space required between the front post and rear post of the rack?

Standard racks require 28–38 inches between the front and rear posts. Shorter racks require from 23 to 33 inches.

How far can an appliance extend from the front post of the rack?

The chassis can extend up to 1.25 inches from the front post for all NetScaler MPX and SDX appliances.

How much space is required for maintaining the front and rear area of an appliance?

Minimum clearance areas of 36 inches for the front area and 24 inches for the rear area are required for maintenance of all NetScaler MPX and SDX appliances.

Which LOM features are supported on the NetScaler MPX Appliance?

The MPX 8005/8015/8200/8400/8600/8800, MPX 11500/13500/14500/16500/18500/20500, and MPX

17550/19550/20550/21550 have an Intelligent Platform Management Interface (IPMI), also known as the Lights out Management (LOM) port, on the front panel of the appliance. The following three LOM features are supported on those platforms:

- Configuring the LOM port
- Power cycling the appliance
- Performing a core dump

Can the LOM interface be configured to accept only encrypted Virtual Network Computer (VNC) sessions on TCP port 5900?

Yes, customers who enable Transport Layer Security (TLS) on their LOM interface will have their VNC connections delivered over TLS as well.

For more information on LOM security guidelines, see Secure Deployment Guide for NetScaler MPX, VPX, and SDX Appliances.

Can the version of SSH used on the LOM interface be upgraded? Is there a patch available?

Individual components of the LOM cannot be upgraded independently. You must upgrade the entire LOM firmware as a package. The latest available LOM package can be found on the Citrix downloads website under LOM Firmware Upgrade.

Is it possible to add a third-party or self-signed SSL certificate to the LOM interface?

Yes, you can enable SSL on the latest binaries for third-party and self-signed SSL certificates, except on the 88XX models. On those models, the current LOM release does not support third-party certificates.

What is the recommended terminal emulator?

PuTTY.

Which platforms support Pay-As-You-Grow licenses?

The following platforms support Pay-As-You-Grow licenses:

- MPX 5550 to MPX 5650
- MPX 7500 to MPX 9500
- MPX 8005 to MPX 8015 to MPX 8200 to MPX 8400 to MPX 8600 to MPX 8800
- MPX 11500 to MPX 13500 to MPX 14500 to MPX 16500 to MPX 18500 to MPX 20500
- MPX 17500 to MPX 19500 to MPX 21500
- MPX 17550 to MPX 19550 to MPX 20550 to MPX 21550
- MPX 22040 to MPX 22060 to MPX 22080 to MPX 22100 to MPX 22120

Do you support direct attach cable (DAC)?

Yes, Citrix NetScaler appliances support a passive DAC in the following releases and builds:

- Release 9.3, build 63.4 and later
- Release 9.3.e, build 60.3007.e and later
- Release 10, build 74.2 and later
- Release 10.1, build 112.15 and later

Which port should I insert the DAC into?

DAC is inserted into the 10G port on the appliance.

Does the 1G port support DAC?

No. The DAC might fit into a 1G port but is not supported.

How can I order a DAC?

Contact your Citrix sales representative to order a DAC.

Can I mix DAC and fiber transceivers on the same appliance?

Yes. You can mix DAC and fiber transceivers on the same appliance. Each 10G port supports both options.

Can I mix SFP+ fiber and DAC in ports that are part of the same link aggregation channel (LAC)?

No. There must be symmetry between all elements in the same LAC.

Licensing, Upgrading, and Downgrading

Mar 17, 2012

The following topics describe the migration instructions for setting up a new version of a NetScaler with a list of all new and deprecated commands, parameters, and SNMP OIDs.

This document includes the following information:

- Changes in Release 10.1
- New and Deprecated Commands, Parameters, and SNMP OIDs
- NetScaler Licensing Overview
- NetScaler Gateway Universal License
- Upgrading or Downgrading the System Software
- Troubleshooting

- **Networking**
  Issue ID 0305772: The Use Source IP (USIP) parameter in an INAT rule is now disabled by default. In earlier releases, the USIP parameter was enabled by default.

Welcome to the NetScaler 10.1 system software release. There are new commands, parameters, and SNMP OIDs in this release. Some commands, parameters, and SNMP OIDs will be deprecated in this release. For complete descriptions of the new commands and parameters, see "Command Reference". For complete descriptions of the SNMP OIDs, see *— Citrix NetScaler SNMP OID Reference Guide* at "http://support.citrix.com/article/CTX137665".

New Commands

The following table lists all the new commands in release 10.1.

Table 1. New Commands

Command Group	Command
AAA	add aaa kcdAccount rm aaa kcdAccount set aaa kcdAccount show aaa kcdAccount count aaa kcdAccount
Authorization	rename authorization policy rename authorization policylabel

Command Group	Command
Cluster	add cluster nodegroup show cluster nodegroup set cluster nodegroup unset cluster nodegroup bind cluster nodegroup unbind cluster nodegroup rm cluster nodegroup
Content Optimization	show co policy bind co global unbind co global
Content Switching	rename cs policy rename cs policylabel
DB	add db dbProfile rm db dbProfile set db dbProfile unset db dbProfile show db dbProfile
Network	add nat64 set nat64 set rsskeytype show rsskeytype set L4Param show L4Param add trafficdomain bind trafficdomain unbind trafficdomain

Command Group	Command
	show trafficdomain rm trafficdomain
NetScaler	clear ns stats
QOS	show qos stats
Traffic Management	add tm samlSSOProfile rm tm samlSSOProfile set tm samlSSOProfile
VPN	add vpn samlSSOProfile rm vpn samlSSOProfile set vpn samlSSOProfile

New Parameters

The following table lists all the new parameters in release 10.1.

Table 2. New Parameters

Command Group	Command
Basic	add service [-td] add serviceGroup [-td]
AAA	set aaa ldapParams [-defaultAuthenticationGroup] add aaa kcdAccount [-kcdAccount] [-keytab] [-principle] rm aaa kcdAccount [-kcdAccount] set aaa kcdAccount [-kcdAccount] [-keytab] [-principle] unset aaa kcdAccount [-kcdAccount] show aaa kcdAccount [-kcdAccount] count aaa kcdAccount [-kcdAccount]
Application Firewall	import appfw customSettings [-merge] [-sha1] update appfw customSettings [-mergeDefault]

Command Group	Command
	set appfw settings [-signatureAutoUpdate] import appfw signatures [-merge] [-sha1] update appfw signatures [-mergeDefault]
Authentication	add authentication radiusAction [-defaultAuthenticationGroup] set authentication radiusAction [-defaultAuthenticationGroup] add authentication ldapAction [-defaultAuthenticationGroup] set authentication ldapAction [-defaultAuthenticationGroup] add authentication tacacsAction [-defaultAuthenticationGroup] set authentication tacacsAction [-defaultAuthenticationGroup] add authentication negotiateAction [-defaultAuthenticationGroup] set authentication negotiateAction [-defaultAuthenticationGroup] add authentication samlAction [-defaultAuthenticationGroup] set authentication samlAction [-defaultAuthenticationGroup] add authentication vserver [-td] [-ownerNode] set authentication vserver [-ngname] add authentication authnProfile [-Authentication] [-authnVsName] [-AuthenticationHost] [-AuthenticationDomain] [-AuthenticationLevel] set authentication authnProfile [-Authentication] [-authnVsName] [-AuthenticationHost] [-AuthenticationDomain] [-AuthenticationLevel]
Authorization	rename authorization policy [-name] [-newName] rename authorization policylabel [-labelName] [-newName]
Cache	add cache contentGroup [-persist] set cache contentGroup [-persist] flush cache contentGroup [-force] flush cache object [-force]
Cluster	add cluster node [-priority] set cluster node [-priority]

Command Group	Command
	unset cluster node [-priority]
Content Optimization	bind co global [-policyName] unbind co global [-policyName]
Cache Redirection	add cr vserver [-td] set cr vserver [-ngname] bind cr vserver [-lbvserver] unbind cr vserver [-lbvserver]
Content Switching	add cs policy [-logAction] set cs policy [-logAction] unset cs policy [-logAction] rename cs policy [-policyName] [-newName] rename cs policylabel [-labelName] [-newName] add cs vserver [-td] [-soBackupAction] [-dbProfileName] [-oracleServerVersion] set cs vserver [-soBackupAction] [-dbProfileName] [-oracleServerVersion] unset cs vserver [-dbProfileName] [-authnProfile] add cs action [-targetVserverExpr] set cs action [-targetVserverExpr]
DB	add db dbProfile [-name] [-interpretQuery] [-stickiness] [-kcdAccount] rm db dbProfile [-name] set db dbProfile [-name] [-interpretQuery] [-stickiness] [-kcdAccount] unset db dbProfile [-name] [-interpretQuery] [-stickiness] [-kcdAccount] show db dbProfile [-name]
Global Server Load Balancing	add gslb vserver [-soBackupAction] set gslb vserver [-soBackupAction] bind gslb vserver [-policyName] unbind gslb vserver [-policyName]

Command Group	Command
HA	set HA node [-maxFlips] [-maxFlipTime] [-syncvlan]
Network	add ipsec profile [-ikeVersion] set ipsec parameter [-ikeVersion] unset ipsec parameter [-ikeVersion] add arp [-td] rm arp [-td] add route [-td] rm route [-td] set route [-td] unset route [-td] add vlan [-sdxVlan] set vlan [-sdxVlan] add route6 [-td] rm route6 [-td] set route6 [-td] unset route6 [-td] add nd6 [-td] rm nd6 [-td] add inat [-td] add inat -mode STATELESS [-tftp (ENABLED | DISABLED)] set inat -mode STATELESS [-tftp (ENABLED | DISABLED)] set inatparam [-nat46IgnoreTOS (YES | NO)] [-nat46ZeroCheckSum (ENABLED | DISABLED)] [-nat46v6Mtu <positive_integer>][-nat46FragHeader (ENABLED | DISABLED)] add netProfile [-td] clear rnat [-td] set lacp [-ownerNode] show lacp [-ownerNode] rm lacp [-ownerNode]

Command Group	Command
	set ipv6 [-routerRedirection] [-doDAD] set inatparam [-nat46v6Prefix]
Load Balancing	add lb monitor [-storename] [-storefrontacctservice] [-hostName] [-kcdAccount] set lb monitor [-storename] [-storefrontacctservice] [-hostName] [-kcdAccount] add lb vserver [-soBackupAction] [-dbProfileName] [-oracleServerVersion] [-minAutoscaleMembers] [-maxAutoscaleMembers] [-skippersistency] [-td] set lb vserver [-soBackupAction] [-dbProfileName] [-oracleServerVersion] [-minAutoscaleMembers] [-maxAutoscaleMembers] [-skippersistency] unset lb vserver [-dbProfileName] [-skippersistency] [-minAutoscaleMembers] [-maxAutoscaleMembers] [-authnProfile] clear lb persistentSessions [-persistenceParameter]
NetScaler	set ns limitIdentifier [-ngname] add ns acl [-td] add ns acl6 [-td] set ns config -nwfwmode <nwfwmode> add ns ip6 [-td] rm ns ip6 [-td] add ns ip [-td] rm ns ip [-td] add ns simpleacl [-td] add ns simpleacl6 [-td] add ns pbr [-td] [-ipTunnel] set ns pbr [-ipTunnel] unset ns pbr [-ipTunnel] add ns tcpProfile [-sendBuffsize] set ns tcpProfile [-sendBuffsize] unset ns tcpProfile [-sendBuffsize] add ns httpProfile [-spdy]

Command Group	Command
	set ns httpProfile [-spdy] unset ns httpProfile [-spdy]
	set ns param [-useproxyport] [-internaluserlogin] add ns pbr6 [-td]
Policy	set policy httpCallout [-scheme] [-cacheForSecs] unset policy httpCallout [-cacheForSecs]
SNMP	set snmp engineId [-ownerNode] unset snmp engineId [-ownerNode] show snmp engineId [-ownerNode] rm snmp engineId [-ownerNode]
Stream	add stream selector [-builtin] add stream identifier [-ngname] [-builtin] set stream identifier [-ngname] [-builtin]
Traffic Management	add tm sessionAction [-kcdAccount] [-homePage] set tm sessionAction [-kcdAccount] [-homePage] add tm samlSSOProfile [-name] [-samlSigningCertName] [-assertionConsumerServiceURL] [-relaystateRule] [-sendPassword] [-samlIssuerName] rm tm samlSSOProfile [-name] set tm samlSSOProfile [-name] [-samlSigningCertName] [-assertionConsumerServiceURL] [-sendPassword] [-samlIssuerName] [-relaystateRule] show tm samlSSOProfile [-name] add tm trafficAction [-kcdAccount] [-samlSSOProfile] set tm trafficAction [-kcdAccount] [-samlSSOProfile] set tm sessionParameter [-kcdAccount] [-homePage] unset tm sessionParameter [-kcdAccount] [-homePage]
Utility	traceroute6 [-T] traceroute [-T]

Command Group	Command
	ping6 [-T] ping [-T]
VPN	add vpn vserver [-netProfile] [-ownerNode] set vpn vserver [-netProfile] bind vpn vserver [-appController] [-sharefile] unbind vpn vserver [-appController] [-sharefile] add vpn trafficAction [-kcdAccount] [-samlSSOProfile] set vpn trafficAction [-kcdAccount] [-samlSSOProfile] add vpn samlSSOProfile [-name] [-samlSigningCertName] [-assertionConsumerServiceURL] [-relaystateRule] [-sendPassword] [-samlIssuerName] rm vpn samlSSOProfile [-name] set vpn samlSSOProfile [-name] [-samlSigningCertName] [-assertionConsumerServiceURL] [-sendPassword] [-samlIssuerName] [-relaystateRule] show vpn samlSSOProfile [-name] add vpn sessionAction [-kcdAccount] set vpn sessionAction [-kcdAccount] bind vpn global [-appController] [-sharefile] unbind vpn global [-appController] [-sharefile] set vpn parameter [-mdxTokenTimeout] [-UITHEME] [-kcdAccount] unset vpn parameter [-mdxTokenTimeout] [-UITHEME] [-kcdAccount]
Web Interface	add wi site [-appWelcomeMessage] [-welcomeMessage] [-footerText] [-loginSysMessage] [-preLoginButton] [-preLoginMessage] [-preLoginTitle] [-domainSelection] [-userInterfaceBranding] [-ShowSearch] [-ShowRefresh] [-wiUserInterfaceModes] [-UserInterfaceLayouts] set wi site [-appWelcomeMessage] [-welcomeMessage] [-footerText] [-loginSysMessage] [-preLoginButton] [-preLoginMessage] [-preLoginTitle] [-domainSelection] [-userInterfaceBranding] [-ShowSearch] [-ShowRefresh] [-wiUserInterfaceModes] [-UserInterfaceLayouts]

Deprecated Parameters

The following parameters are deprecated in release 10.1.

- add cr vserver -cacheVserver
- set cr vserver -cacheVserver
- unset cr vserver -cacheVserver
- set system collectionparam -communityName

New SNMP OIDs

The following table lists the new SNMP OIDs in release 10.1.

OID		Description
ACL		
aclTotCount	1.3.6.1.4.1.5951.4.1.1.22.1.21	Total number of ACL rules configured
acl6TotPktsNAT64	1.3.6.1.4.1.5951.4.1.1.22.4.27	Packets matching a NAT64 ACL6, resulting in a NAT64 translation
acl6TotCount	1.3.6.1.4.1.5951.4.1.1.22.4.28	Total number of ACL6 rules configured
SPDY		
spdy2TotStreams	1.3.6.1.4.1.5951.4.1.1.48.72	Total number of requests received over SPDY
Cache		
cacheNumObjSavedOnDisk	1.3.6.1.4.1.5951.4.1.1.49.77	Cached responses currently saved on disk. Includes responses fully saved to disk, and expired or flushed but not yet removed
cacheNumMBSavedOnDisk	1.3.6.1.4.1.5951.4.1.1.49.78	Size (MB) of cached responses currently saved on disk. Includes responses fully saved to disk, and expired or flushed but not yet removed
cacheNumMBReadFromDisk	1.3.6.1.4.1.5951.4.1.1.49.79	Total Number of bytes read from disk since last reboot
cacheNumMBWrittenToDisk	1.3.6.1.4.1.5951.4.1.1.49.80	Total Number of MB written to disk since last reboot
SSL-VPN		
iPv6tov4FindIPv6MapErr	1.3.6.1.4.1.5951.4.1.1.66.44	Number of IPv6toIPv4 find IPv6 mapping errors
iPv6toV4MapInsertErr	1.3.6.1.4.1.5951.4.1.1.66.45	Number of Ipv6 to Ipv4 mapping Insert Errors
parseIPv6AddressErr	1.3.6.1.4.1.5951.4.1.1.66.46	Errors in parsing for Ipv6 address from address string
AAA		

OID		Description
aaaCurTMSessions	1.3.6.1.4.1.5951.4.1.1.67.11	Count of current AAATM sessions
aaaTotTMSessions	1.3.6.1.4.1.5951.4.1.1.67.12	Count of all AAATM sessions
INAT Sessions		
nsInatGlobalStats	1.3.6.1.4.1.5951.4.1.1.74.1	This provides statistics related to all INAT sessions
nat46TotTcp46	1.3.6.1.4.1.5951.4.1.1.74.1.1	Total TCP packets translated (V4->v6)
nat46TotUdp46	1.3.6.1.4.1.5951.4.1.1.74.1.2	Total UDP packets translated (V4->v6)
nat46TotIcmp46	1.3.6.1.4.1.5951.4.1.1.74.1.3	Total ICMP packets translated (V4->v6)
nat46TotDrop46	1.3.6.1.4.1.5951.4.1.1.74.1.4	Total IPV4 packets dropped
nat46TotTcp64	1.3.6.1.4.1.5951.4.1.1.74.1.5	Total TCP packets translated (V6->v4)
nat46TotUdp64	1.3.6.1.4.1.5951.4.1.1.74.1.6	Total UDP packets translated (V6->v4)
nat46TotIcmp64	1.3.6.1.4.1.5951.4.1.1.74.1.7	Total ICMP packets translated (V6->v4)
nat46TotDrop64	1.3.6.1.4.1.5951.4.1.1.74.1.8	Total IPV6 packets dropped
nsInatPerNat46StatsTable	1.3.6.1.4.1.5951.4.1.1.74.2	This provides statistics related to per nat46 rule
nsInatPerNat46StatsEntry	1.3.6.1.4.1.5951.4.1.1.74.2.1	
inatname	1.3.6.1.4.1.5951.4.1.1.74.2.1.1	The name of the INAT
inatNat46Tcp46	1.3.6.1.4.1.5951.4.1.1.74.2.1.2	TCP packets translated (V4->v6)
inatNat46Udp46	1.3.6.1.4.1.5951.4.1.1.74.2.1.3	UDP packets translated (V4->v6)
inatNat46Icmp46	1.3.6.1.4.1.5951.4.1.1.74.2.1.4	ICMP packets translated (V4->v6)
inatNat46Drop46	1.3.6.1.4.1.5951.4.1.1.74.2.1.5	IPV4 packets dropped

OID		Description
inatNat46Tcp64	1.3.6.1.4.1.5951.4.1.1.74.2.1.6	TCP packets translated (V6->v4)
inatNat46Udp64	1.3.6.1.4.1.5951.4.1.1.74.2.1.7	UDP packets translated (V6->v4)
inatNat46Icmp64	1.3.6.1.4.1.5951.4.1.1.74.2.1.8	ICMP packets translated (V6->v4)
inatNat46Drop64	1.3.6.1.4.1.5951.4.1.1.74.2.1.9	IPV6 packets dropped
nsInatPerNatStatsTable	1.3.6.1.4.1.5951.4.1.1.74.3	This provides statistics related to per inat session
nsInatPerNatStatsEntry	1.3.6.1.4.1.5951.4.1.1.74.3.1	
inat44name	1.3.6.1.4.1.5951.4.1.1.74.3.1.1	The name of the INAT
inatTotHits	1.3.6.1.4.1.5951.4.1.1.74.3.1.2	INAT total sessions
inatCurSessions	1.3.6.1.4.1.5951.4.1.1.74.3.1.3	INAT current sessions
inatTotReceiveBytes	1.3.6.1.4.1.5951.4.1.1.74.3.1.4	INAT total Received Bytes
inatTotSentBytes	1.3.6.1.4.1.5951.4.1.1.74.3.1.5	INAT total Sent Bytes
inatTotpktreceived	1.3.6.1.4.1.5951.4.1.1.74.3.1.6	INAT total Packets Received
inatTotpktsent	1.3.6.1.4.1.5951.4.1.1.74.3.1.7	INAT total Packets Sent
NAT64		
nsNat64GlobalStats	1.3.6.1.4.1.5951.4.1.1.75.1	This provides statistics related to all NAT64 sessions
nat64TotUdpSessions	1.3.6.1.4.1.5951.4.1.1.75.1.1	Total number of UDP sessions created by NAT64
nat64TotTcpSessions	1.3.6.1.4.1.5951.4.1.1.75.1.2	Total number of TCP sessions created by NAT64
nat64TotSessions	1.3.6.1.4.1.5951.4.1.1.75.1.3	Total number of sessions created by NAT64
nat64TotIcmpSessions	1.3.6.1.4.1.5951.4.1.1.75.1.4	Total number of ICMP sessions created by NAT64
IPv6		

OID		Description
nsIp6StatsGroup	1.3.6.1.4.1.5951.4.1.1.76	This provides information about IPv6 related statistics in the NetScaler product
ipv6TotRxPkts	1.3.6.1.4.1.5951.4.1.1.76.1	IPv6 packets received
ipv6TotTxPkts	1.3.6.1.4.1.5951.4.1.1.76.2	IPv6 packets transmitted
ipv6TotRxBytes	1.3.6.1.4.1.5951.4.1.1.76.3	Bytes of IPv6 data received
ipv6TotTxBytes	1.3.6.1.4.1.5951.4.1.1.76.4	Bytes of IPv6 data transmitted
ipv6FragTotRxPkts	1.3.6.1.4.1.5951.4.1.1.76.5	IPv6 fragments received
ipv6FragTotPktsForward	1.3.6.1.4.1.5951.4.1.1.76.6	IPv6 fragments forwarded to the client or server without reassembly
ipv6FragTotPktsProcessNoReass	1.3.6.1.4.1.5951.4.1.1.76.7	IPv6 fragments processed without reassembly
ipv6ErrHdr	1.3.6.1.4.1.5951.4.1.1.76.8	Packets received that contain an error in one or more components of the IPv6 header
ipv6LandAttack	1.3.6.1.4.1.5951.4.1.1.76.9	Land-attack packets received. The source and destination addresses are the same. If not dropped, these packets can lock up the appliance
ipv6FragZeroLenPkt	1.3.6.1.4.1.5951.4.1.1.76.10	Packets received with a fragment length of 0 bytes
ipv6TotIcmpFragPkts	1.3.6.1.4.1.5951.4.1.1.76.11	Number of ICMPV6 fragmented packets
ipv6TotLookupDone	1.3.6.1.4.1.5951.4.1.1.76.12	Total number of nd6 lookup done
ipv6TotLookupFailed	1.3.6.1.4.1.5951.4.1.1.76.13	Total number of nd6 lookup failed
ipv6TotStaticRoutes	1.3.6.1.4.1.5951.4.1.1.76.14	Total number of static ipv6 routes
ipv6TotDynamicRoutes	1.3.6.1.4.1.5951.4.1.1.76.15	Total number of dynamic ipv6 routes
ipv6TotNeigborDiscovered	1.3.6.1.4.1.5951.4.1.1.76.16	Total number of nd6 entries both dynamic and static
ipv6TotIpv6To4Conversions	1.3.6.1.4.1.5951.4.1.1.76.17	Total number of ipv6 to v4 conversion done

OID		Description
ipv6TotIpv4To6Conversions	1.3.6.1.4.1.5951.4.1.1.76.18	Total number of ipv4 to v6 conversion done
ipv6TotTcpConnection	1.3.6.1.4.1.5951.4.1.1.76.19	TCP connections over IPv6
ipv6TotNonTcpConnection	1.3.6.1.4.1.5951.4.1.1.76.20	Non TCP connections over IPv6
Traffic Domain		
nsTdInetAddressTable	1.3.6.1.4.1.5951.4.1.1.77	This table contains information about the non-default Td IP Addresses configured on the NetScaler
nsTdInetAddressEntry	1.3.6.1.4.1.5951.4.1.1.77.1	
nsTdInetId	1.3.6.1.4.1.5951.4.1.1.77.1.1	This represents a traffic domain ID
nsTdInetAddressType	1.3.6.1.4.1.5951.4.1.1.77.1.2	The address type of nsTdInetAddress
nsTdInetAddress	1.3.6.1.4.1.5951.4.1.1.77.1.3	This represents an IPv4/v6 address configured on the NetScaler
nsTdInetMaskLength	1.3.6.1.4.1.5951.4.1.1.77.1.4	This represents netmask length
nsTdInetType	1.3.6.1.4.1.5951.4.1.1.77.1.5	This represents the IP address type
nsTdInetMode	1.3.6.1.4.1.5951.4.1.1.77.1.6	This represents the IP address mode
nsTdInetFreePorts	1.3.6.1.4.1.5951.4.1.1.77.1.7	This represents the number of unused ports free on this IP
nsTdInetVlan	1.3.6.1.4.1.5951.4.1.1.77.1.8	The vlan to which this ip address is bound
nsTdInetBridgeGroup	1.3.6.1.4.1.5951.4.1.1.77.1.9	The bridge group to which this ip address is bound
svcTdId	1.3.6.1.4.1.5951.4.1.2.1.1.57	Traffic Domain ID of this service
serverTdId	1.3.6.1.4.1.5951.4.1.2.2.1.8	Traffic Domain ID of this server
svcGrpMemberTdId	1.3.6.1.4.1.5951.4.1.2.7.1.37	Traffic Domain ID of this service group member
svcgrpTdId	1.3.6.1.4.1.5951.4.1.2.11.1.5	Traffic Domain ID of this service group

OID		Description
vsvrTdId	1.3.6.1.4.1.5951.4.1.3.1.1.69	Traffic Domain of the vserver
Load Balancing		
curConfigLbVservers	1.3.6.1.4.1.5951.4.1.3.5.4	Total number of LB vservers configured on the NetScaler
curConfigGslbVservers	1.3.6.1.4.1.5951.4.1.3.5.5	Total number of GSLB vservers configured on the NetScaler
totSpilloverCount	1.3.6.1.4.1.5951.4.1.3.5.6	Total count of spillovers
SNMP Trap		
qosdVersion	1.3.6.1.4.1.5951.4.1.10.2.39	This counter tells the QOSD version
brVersion	1.3.6.1.4.1.5951.4.1.10.2.40	This counter tells the BR version

NetScaler Licensing Overview

Aug 24, 2016

If you want to upgrade your software to 10.1, you can use your existing license. Contact your Citrix sales representative for new licenses if you are using the standard edition and want to upgrade to the enterprise or platinum edition, or if you are using the enterprise edition and want to upgrade to the platinum edition.

You can easily allocate your NetScaler licenses. In the NetScaler configuration utility (GUI), you can use your hardware serial number (HSN) or your license activation code (LAC) to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see "http://support.citrix.com/article/CTX131110".

Note:

- On a NetScaler MPX or SDX appliance, you can use the HSN or LAC to allocate your license or upload the license to the appliance from a local computer. On a NetScaler VPX appliance, you can only upload the license to the appliance from a local computer.
- You must purchase separate licenses for each appliance in a high availability (HA) pair. Make sure that the same type of licenses are installed on both the appliances. For example, if you purchase a platinum license for one appliance, you must purchase another platinum license for the other appliance.

This document includes the following information:

Updated: 2014-06-24

To use the hardware serial number or license activation code to allocate your licenses:

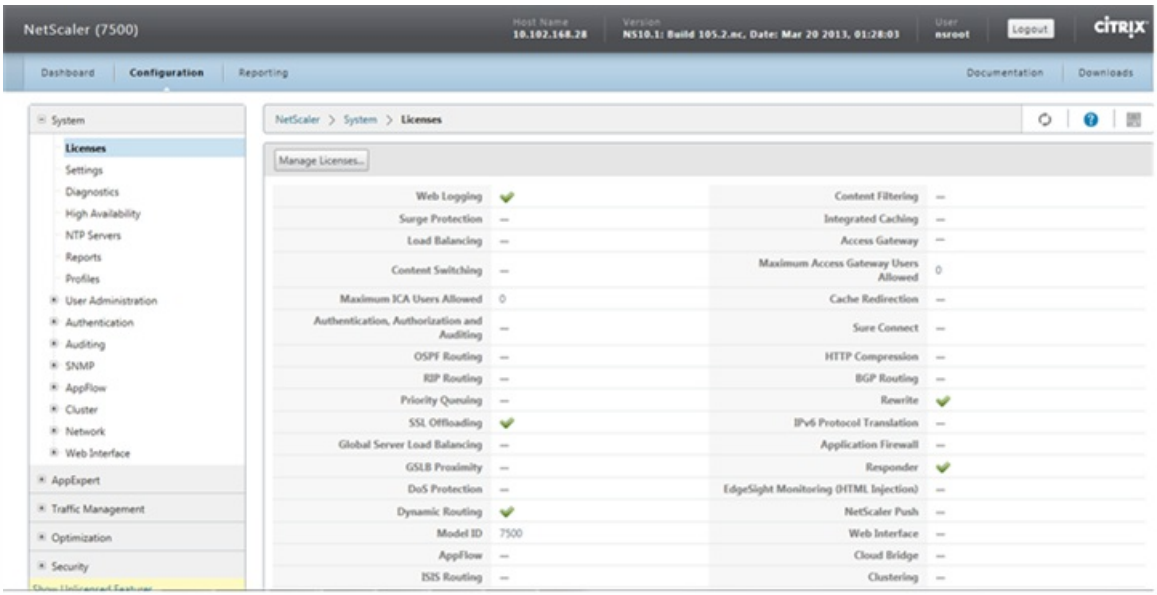
- You must be able to access public domains through the appliance. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain, you must configure a NetScaler IP (NSIP) address, configure a mapped IP (MIP) address or a subnet IP (SNIP) address, and set up a DNS server.
- Your license must be linked to your hardware, or you must have a valid license activation code (LAC). Citrix sends your LAC by email when you purchase a license.

Updated: 2014-02-11

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license activation code (LAC).

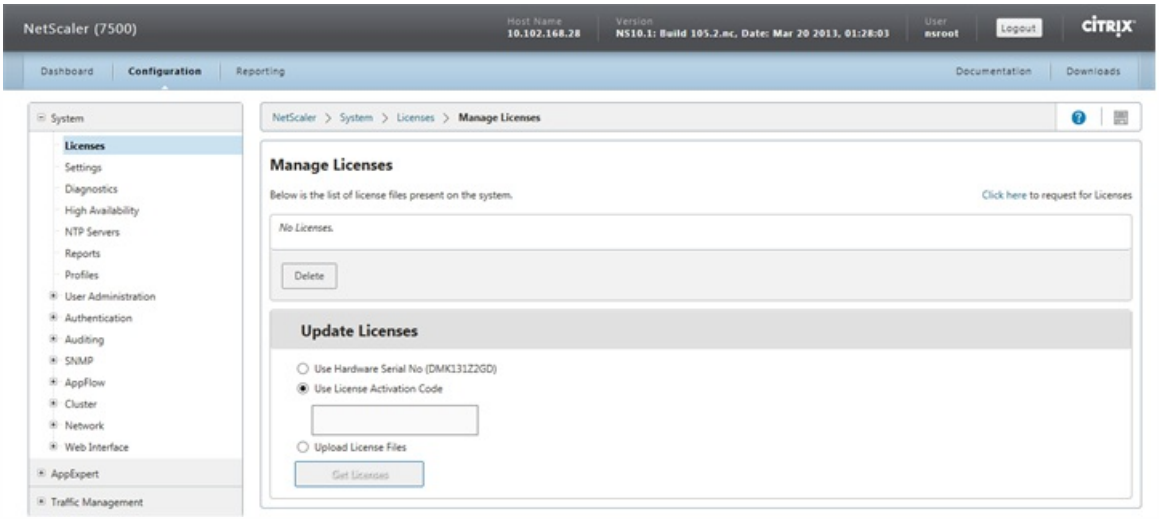
To allocate your license

1. In a web browser, type the IP address of the NetScaler (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System > Licenses.
4. In the details pane, click Manage Licenses.



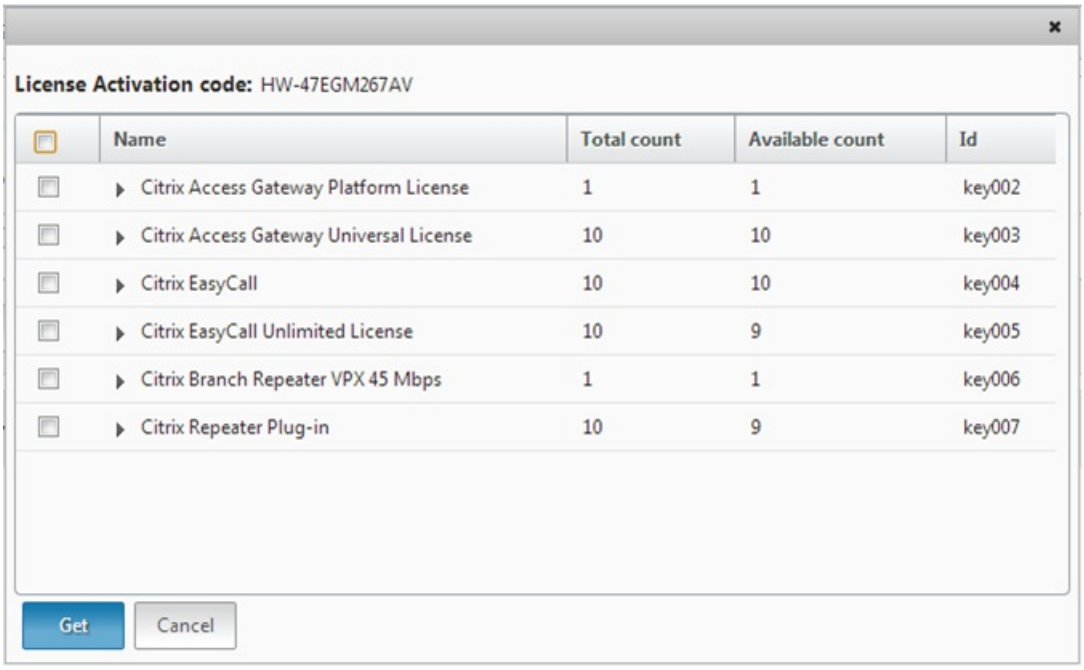
5. Click Update Licenses, and then select one of the following options:
   - **Use Hardware Serial Number**—The software internally fetches the serial number of your appliance and uses this number to display your license(s).

   - **Use License Activation Code**—Citrix emails the LAC for the license that you purchased. Enter the LAC in the text box.

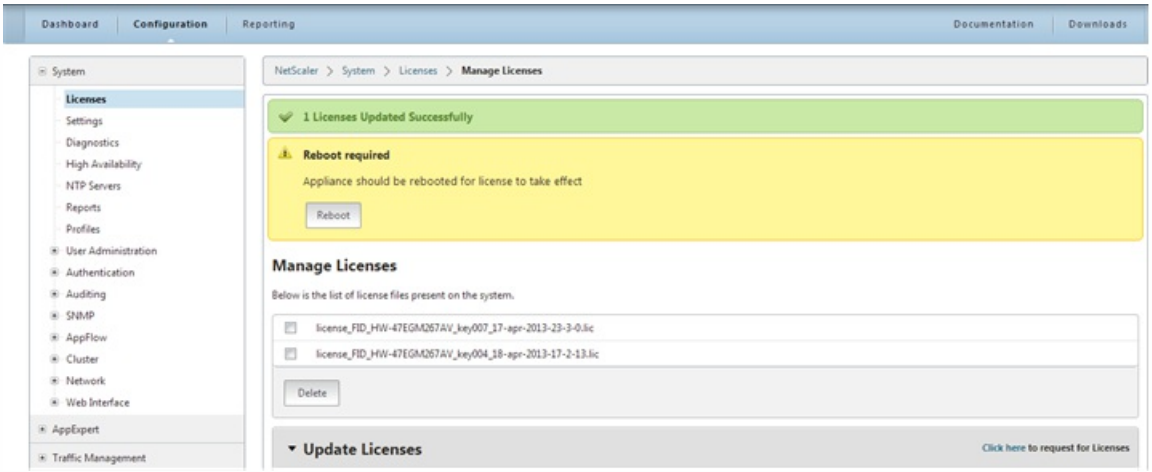


6. Click Get Licenses. Depending on the option that you selected, one of the following dialog boxes appears.
   - The following dialog box appears if you selected Hardware Serial Number.

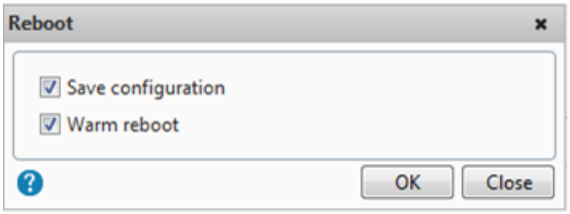
   - The following dialog box appears if you selected License Activation Code.



7. Select the license that you want to allocate, and then click Get.
8. Click Reboot for the license to take effect.



9. In the Reboot dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

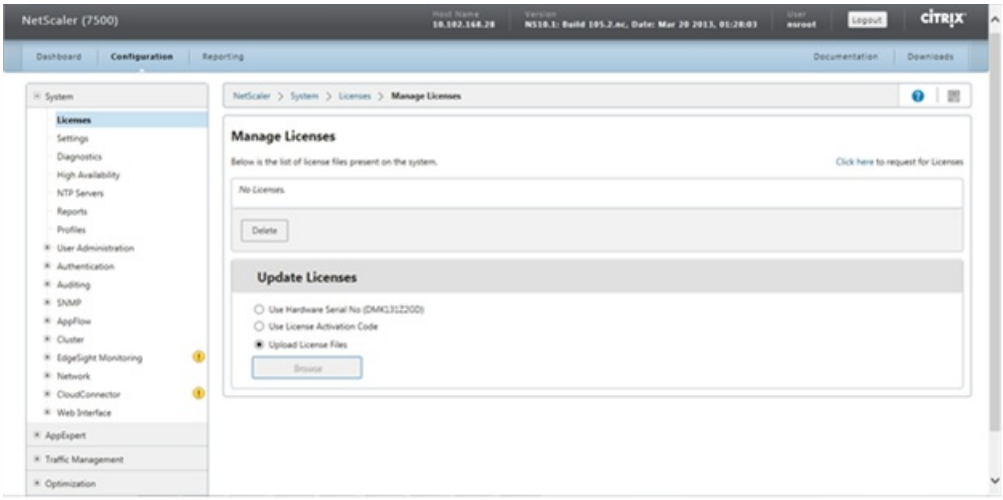


Updated: 2014-06-24

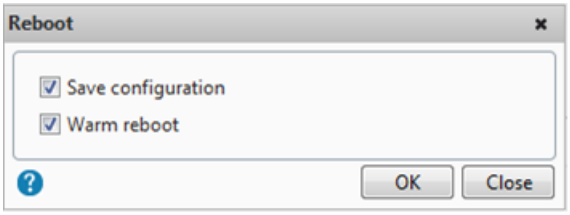
If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

To install a license file by using the configuration utility

1. In a web browser, type the IP address of the NetScaler (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System > Licenses .
4. In the details pane, click Manage Licenses.
5. Click Update Licenses, and then select **Upload License Files**.



6. Click Browse. Navigate to the location of the license files, select the license file, and then click Open.
7. Click Reboot to apply the license.
8. In the Reboot dialog box, click OK to proceed with the changes, or click Close to cancel the changes.



See also

To install the licenses by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy the new license file(s) to this directory.

Example

```
login: nsroot
Password: nsroot
Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
Done
> shell
Last login: Mon Aug  4 03:51:42 from 10.103.25.64
root@ns# mkdir /nsconfig/license
root@ns# cd /nsconfig/license
```

Copy the new license file(s) to this directory.

Note: The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the reboot -w command to warm reboot the system, or run the reboot command to reboot the system normally.

Updated: 2014-06-24

Before using a feature, make sure that your license supports the feature.

To verify the licensed features by using the command line interface

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. At the command prompt, enter the sh ns license command to display the features supported by the license.

Example

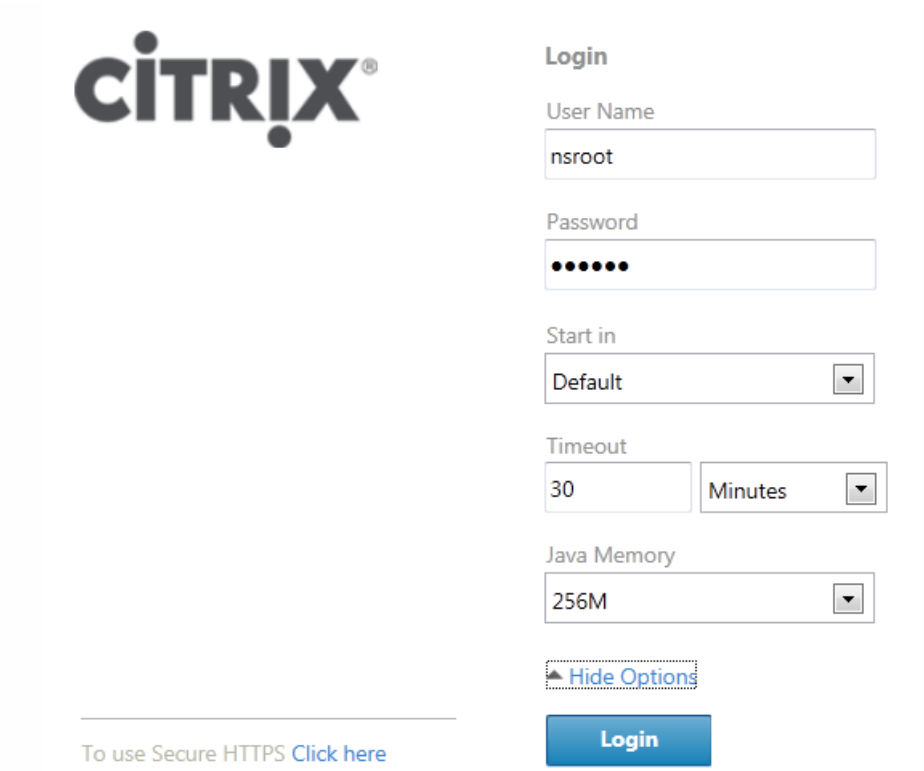
```
sh ns license
        License status:
                    Web Logging: YES
                Surge Protection: YES
                  .......

                  HTML Injection: YES
 Done
```

To verify the licensed features by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as http://192.168.100.1.
2. In User Name and Password, type the administrator credentials.
3. In Start in, select Configuration, and then click Login, as shown in the following figure.

Figure 1. Login Screen



4. In the navigation pane, expand System, and then click Licenses. You will see a green check mark next to the licensed features.

Updated: 2014-07-01

When you use the NetScaler appliance for the first time, you need to enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it will apply only after the feature is enabled.

To enable a feature by using the command line interface

At the NetScaler command prompt, type the following commands to enable a feature and verify the configuration:

- enable feature <FeatureName>
- show feature

Example

```
enable feature lb cs
done
 >show feature

      Feature                Acronym          Status
      -------                -------          ------
 1)   Web Logging             WL               OFF
 2)   Surge Protection        SP               ON
 3)   Load Balancing          LB               ON
 4)   Content Switching       CS               ON
 5)   Cache Redirection       CR               ON
```

```
.
.
.
24)  NetScaler Push          push          OFF
Done
```

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key is not available for a particular feature, the following error message appears for that feature:

```
ERROR: feature(s) not licensed
```

Note: To enable an optional feature, you need a feature-specific license. For example, if you have purchased and installed the Citrix NetScaler Enterprise Edition license and need to enable the Integrated Caching feature, you first need to purchase and install the AppCache license.

To disable a feature by using the command line interface

At the NetScaler command prompt, type the following commands to disable a feature and verify the configuration:

- disable feature <FeatureName>
- show feature

Example

The following example shows how to disable load balancing (LB).

```
> disable feature lb
Done
> show feature

     Feature              Acronym        Status
     -------              -------        ------
1)   Web Logging          WL             OFF
2)   Surge Protection     SP             ON
3)   Load Balancing       LB             OFF
4)   Content Switching    CS             ON
.
.
.
24)  NetScaler Push       push           OFF
Done
>
```

Licensing

Jul 25, 2013

Before you can deploy Citrix NetScaler Gateway to support user connections, the appliance must be properly licensed.

Important: Citrix recommends that you retain a local copy of all license files you receive. When you save a backup copy of the configuration file, all uploaded licenses files are included in the backup. If you need to reinstall NetScaler Gateway appliance software and do not have a backup of the configuration, you will need the original license files.
Before installing licenses on NetScaler Gateway, set the host name of the appliance and then restart NetScaler Gateway. You use the Setup Wizard to configure the host name. When you generate the Universal license for NetScaler Gateway, the host name is used in the license.

Upgrading or Downgrading the System Software

Jun 25, 2014

NetScaler 10.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Take a moment to read this document before you upgrade your software.

It is important to understand the licensing framework and types of licenses before you upgrade your software. A software edition upgrade may require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition.

Note: For upgrading or downgrading the nodes in a cluster setup, see "Upgrading or Downgrading the Cluster Software". Upgrading from release 10.1 build 121.10 or any earlier releases to release 10.1 build 122.17 and later involves some location changes of user monitor script files. For details, see Directory Locations of Script Files for User Monitors.

This document includes the following information:

- Upgrading to Release 10.1
- Upgrading to a Later Build within Release 10.1
- Downgrading from Release 10.1
- Downgrading to an Earlier Build within Release 10.1
- Auto Cleanup

Updated: 2014-06-24

In release 10.1 build 122.17, the script files for user monitors are at a new location. If you upgrade an appliance or virtual appliance to release 10.1 build 122.17 or later, the changes are as follows:

- A new directory named conflicts is created in /nsconfig/monitors/ and all the built-in scripts of the previous builds are moved to this directory.
- All new built-in scripts are available in the /netscaler/monitors/ directory. All custom scripts are available in the /nsconfig/monitors/ directory.
- You must save a new custom script in the /nsconfig/monitors/ directory.
- After the upgrade is completed, if a custom script is created and saved in the /nsconfig/monitors/ directory with the same name as that of a built-in script, the script in the /netscaler/monitors/ directory takes priority. That is, the custom script is not run.

If you provision a virtual appliance running release 10.1 build 122.17 or later, the changes are as follows:

- All built-in scripts are available in the /netscaler/monitors/ directory
- The directory /nsconfig/monitors/ is empty.
- If you create a new custom script, you must save it in the /nsconfig/monitors/ directory.

For more information about user monitors, see "Understanding User Monitors."

Upgrading to Release 10.1

Dec 30, 2015

You can use the configuration utility to upgrade most older releases to 10.1. For others, you must use the command line interface. You follow the same basic procedure to upgrade either a standalone appliance or each appliance in a high availability pair, although additional considerations apply to upgrading a high availability pair.

This document includes the following information:

- Upgrading a Standalone NetScaler
- Upgrading a High Availability Pair

Updated: 2014-12-10

Before upgrading the system software, make sure that you have the required licenses. For more information, see "NetScaler Licensing Overview." You do not need a new license for the following upgrades:

- 8.x to 9.x
- 8.x or 9.x to 10.x
- 8.x, 9.x, or 10.x to 10.y

Note: When upgrading from release 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, or 10, you have the option to use the configuration utility or the command line interface. Citrix recommends to perform the upgrade by using the command line interface. When using the upgrade wizard in the configuration utility to upgrade from release 8.0, do not use the Device option to upload your software.

In the following procedure, <release> and <releasenumber> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

To upgrade a standalone NetScaler appliance running release 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, or 10 by using the command line interface

1. Use an SSH client, such as PuTTy, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials. Save the running configuration. At the prompt, type:save config
3. Create a copy of the ns.conf file. At the shell prompt, type:
   1. cd /nsconfig
   2. cp ns.conf ns.conf.NS<currentreleasenumber><currentbuildnumber>

   You should backup the configuration file to another computer.
4. (Optional) If you have modified some of the following files in the /etc directory, and copied them to /nsconfig to maintain persistency, any updates that are pushed to the /etc directory during the upgrade might be lost:
   - ttys
   - resolv.conf
   - sshd_config
   - host.conf
   - newsyslog.conf
   - host.conf

- httpd.conf
- rc.conf
- syslog.conf
- crontab
- monitrc

To avoid losing these updates, create a /var/nsconfig_backup directory, and move the customized files to this directory. That is, move any files that you modified in /etc directory and copied to /nsconfig by running the following command:

cp /nsconfig/<filename> /var/nsconfig_backup

Example:
cp /nsconfig/syslog.conf /var/nsconfig_backup

5. Create a location for the installation package. At the shell prompt type
   1. cd/var/nsinstall
   2. mkdir <releasenumber>nsinstall
   3. cd <releasenumber>nsinstall
   4. mkdir build_<targetbuildnumber>
   5. cd build_<targetbuildnumber>
6. Download or copy the installation package (build-<release>-<targetbuildnumber>_nc.tgz) to the directory that you created for it. To download the installation package from the Citrix Web site, do the following:
   1. Go to MyCitrix.com, log on with your credentials, and click Downloads.
   2. In Select a Product, select NetScaler ADC.
   3. Under Firmware, click the release and build number to download.
   4. Click Get Firmware.

   Note: Documentation is not available as part of the build in NetScaler release 10.1, build 118.7 or later. See Citrix NetScaler for the documentation.
7. Extract the contents of the installation package. Example:
   tar –xvzf build_10.1-49.3_nc.tgz
8. Run the installns script to install the new version of the system software. The script updates the /etc directory. Example:
   ./installns
   Note:
   To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

   Warning: When upgrading to the NetScaler nCore build, the installation script prompts you to delete the /var directory if the swap partition is smaller than 32 gigabytes (GB). If this prompt appears, type N, save any important files located in /var to a backup location, and then re-run the installation script.
   If the free space available on the flash drive is insufficient to install the new build, the appliance prompts you to initiate a cleanup of the flash drive. For more information, see "Auto Cleanup".
9. When prompted, restart the NetScaler.
10. (Optional) If you performed step 4, do the following:
    1. Manually compare the files in /var/nsconfig_backup and /etc and make appropriate changes in /etc.
    2. To maintain persistency, move the updated files in /etc to /nsconfig.
    3. Restart the appliance to put the changes into effect.

login: nsroot

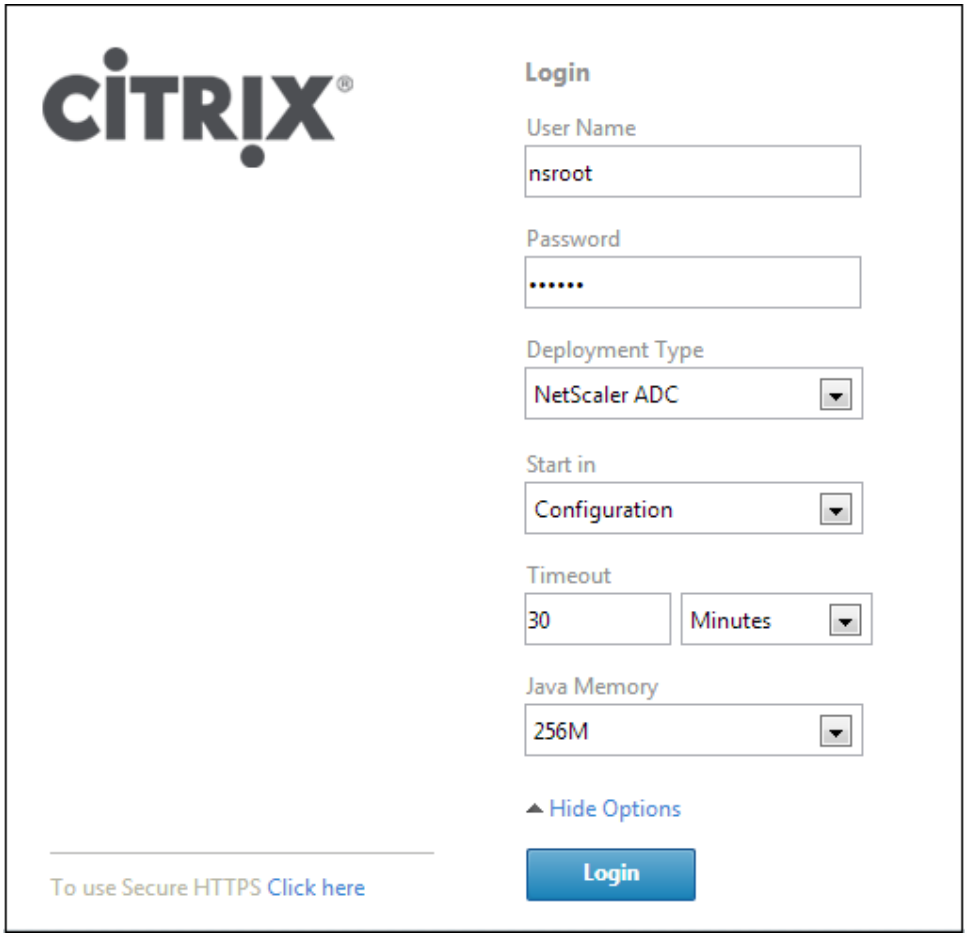
```
Password: nsroot
Last login: Mon Apr  19 03:37:27 2008 from 10.102.29.9
Done
> save config
> shell
Last login: Mon Apr  10 03:51:42 from 10.103.25.64
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 10_1nsinstall
root@NSnnn# mkdir build_110
root@NSnnn# cd build_110
root@NSnnn# ftp ... get  build-10.1-110_nc.tgz
root@NSnnn# tar xzvf build-10.1-110_nc.tgz
root@NSnnn# ./installns
installns version (10.1-110) kernel (ns-10.1-110_nc.gz)
...
...
...
Copying ns-10.1-110_n.gz to /flash/ns-10.1-110_nc.gz ...

...
Installation has completed.

Reboot NOW? [Y/N] Y
```

To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, or 10 by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as http://10.102.29.50.
2. In User Name and Password, type the administrator credentials.
3. In Deployment Type, select NetScaler ADC.
4. In Start in, select Configuration, and then click Login, as shown in the following figure.



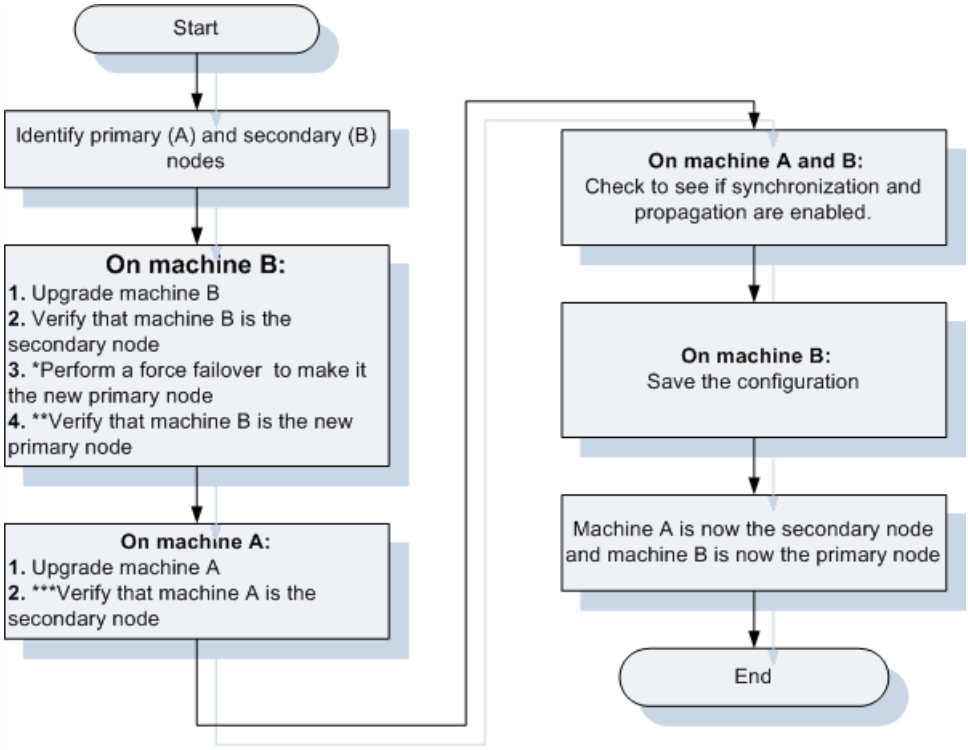
5. In the configuration utility, in the navigation pane, click System.
6. In the System Overview page, click Upgrade Wizard.
7. Follow the instructions to upgrade the software.
8. When prompted, select Reboot.
   Note: After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Updated: 2015-04-1

To upgrade the system software on NetScaler units in a high availability (HA) pair, first upgrade the secondary node, and then the primary node.
Note: If the two nodes in an HA configuration are running different NetScaler software releases, the following information does not get synchronized on the primary and secondary nodes:

- States of the services
- Connection failover sessions
- Persistence sessions

Figure 1. Upgrading a High Availability Pair



*After upgrading machine B, it becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. After you test that machine B properly functions as the new primary node, proceed with upgrading the former primary node (machine A).

**After machine B is upgraded successfully, both synchronization and propagation are automatically disabled until you upgrade machine A.

***After both the nodes are upgraded successfully, synchronization and propagation are automatically enabled.

In the following procedure, machine A is the primary node and machine B is the secondary node before the upgrade.

To upgrade NetScaler units in a high availability pair running release 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, or 10 by using the command line interface

On machine B (original secondary node)

1. Follow the procedure for upgrading a standalone node as described in "Upgrading a Standalone NetScaler Appliance". The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.
2. After the appliance restarts, log on with the administrator credentials and enter the show ha node command to verify that the appliance is a secondary node.
3. Test the new build by entering the force failover command on the secondary node (machine B). At the command prompt type force failover.
   When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding.
4. Enter the show ha node command to verify that machine B is the new primary node.
   Example

```
login: nsroot
Password: nsroot
Last login: Mon Mar  26 08:37:26 2008 from 10.102.29.9
Done
show ha node
        2 nodes:
1)      Node ID:      0
        IP:       10.0.4.2
        Node State: UP
        Master State: Primary
        ...
        Sync State: AUTO DISABLED
        Propagation: AUTO DISABLED
        ...
Done
```

Note: After machine B is upgraded successfully, both synchronization and propagation are automatically disabled until you upgrade machine A.

On machine A (original primary node)

5. Follow the procedure for upgrading a standalone node as described in "Upgrading a Standalone NetScaler Appliance." The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.
6. After the appliance restarts, log on by using the administrator credentials, and enter the show ha node command to verify that the appliance is a secondary node and that synchronization is disabled.
   Note: After both nodes are upgraded successfully, synchronization and propagation are automatically enabled.
   On machine A and machine B
7. After successfully upgrading both the nodes, run the show ha node command to verify that synchronization and propagation are enabled on the primary node and synchronization is successful and propagation is enabled on the secondary node.
   Example

   On Primary node (Machine B)

```
show ha node
        Node ID:      0
        IP:   10.0.4.2
        Node State: UP
        Master State: Primary
...
...
        INC State: DISABLED
        Sync State: ENABLED
        Propagation: ENABLED
        Enabled Interfaces : 1/1
        Disabled Interfaces : None
        HA MON ON Interfaces : 1/1
...
```

...
Local node information
Critical Interfaces: 1/1
Done

On Secondary node (Machine A)
Show ha node
Node ID: 0
IP: 10.0.4.11
Node State: UP
Master State: Secondary
..
..
INC State: DISABLED
Sync State: SUCCESS
Propagation: ENABLED
Enabled Interfaces : 1/1
Disabled Interfaces : None
HA MON ON Interfaces : 1/1
. . .
. . .
Local node information:
Critical Interfaces: 1/1
Done
On machine B (new primary node)

8. Enter the save ns config command to save the configuration.

Machine B (original secondary node) is now the primary node and machine A (original primary node) is now the secondary node.

Note: You can enter the force failover command again to make machine A (original primary node) as the primary node and machine B (original secondary node) as the secondary node.

To upgrade NetScaler units in a high availability pair running release 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, or 10 by using the configuration utility

1. Log on to the secondary node and perform the upgrade as described in "To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, 9.2, or 9.3 by using the configuration utility.
   Note: Before upgrading the primary node (machine A), you have the option to test the new release by entering the force failover command at the command line interface on the secondary node (machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command at the command line interface on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A).
2. Log on to the primary node and perform the upgrade as described in "To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, 9.2, or 9.3 by using the configuration utility".

Upgrading to a Later Build within Release 10.1

Oct 30, 2015

To upgrade from an earlier 10.1 build to a later 10.1 build on a standalone NetScaler appliance or a high availability pair, you can use the configuration utility or the command line interface. You use the same basic procedure to upgrade either a standalone appliance or each appliance in a high availability pair, although additional considerations apply to upgrading a high availability pair.

This document includes the following information:

- Upgrading a Standalone NetScaler Appliance to a Later Build
- Upgrading a NetScaler High Availability Pair to a Later Build

Upgrading a Standalone NetScaler Appliance to a Later Build

Updated: 2014-06-13

In the following procedure, <targetbuildnumber> is the build number that you are upgrading to within the 10.1 release. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

To upgrade a standalone NetScaler appliance running release 10.1 to a later build by using the command line interface

1. Use an SSH client, such as PuTTy, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials, and save the running configuration. At the prompt, type:
   save ns config
3. Create a copy of the ns.conf file. At the shell prompt, type:
   1. cd /nsconfig
   2. cp ns.conf ns.conf.NS<releasenumber><currentbuildnumber>

   You should backup the configuration file to another computer.
4. (Optional) If you have modified any of the following files in the /etc directory, and copied them to /nsconfig to maintain persistency, any updates that are pushed to the /etc directory during the upgrade might be lost:
   - ttys
   - resolv.conf
   - sshd_config
   - host.conf
   - newsyslog.conf
   - host.conf
   - httpd.conf
   - rc.conf
   - syslog.conf
   - crontab
   - monitrc

   To avoid losing these updates, create a /var/nsconfig_backup directory, and move the customized files to this directory. That is, move any files that you modified in /etc directory and copied to /nsconfig, by running the following command:

   cp /nsconfig/<filename> /var/nsconfig_backup

   Example:

cp /nsconfig/syslog.conf /var/nsconfig_backup

5. Create a location for the installation package. At the shell prompt, type:
   1. cd/var/nsinstall
   2. mkdir <releasenumber>nsinstall
   3. cd <releasenumber>nsinstall
   4. mkdir build_<targetbuildnumber>
   5. cd build_<targetbuildnumber>
6. Download or copy the installation package (build-10.1-<targetbuildnumber>_nc.tgz) to the directory that you created for it. To download the installation package from the Citrix Web site, do the following:
   1. Go to MyCitrix.com, log on with your credentials, and click Downloads.
   2. In the Select a Product, select NetScaler ADC.
   3. Under Firmware, click the release and build number to download.
   4. Click Get Firmware.

   Note: Documentation is not available as part of build in NetScaler release 10.1, build 118.7, or later. See Citrix NetScaler for the documentation.
7. Extract the contents of the installation package. Example:
   tar –xvzf build_10.1-121.10_nc.tgz
8. Run the installns script to install the new version of the system software. The script updates the /etc directory.
   Note:
   To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

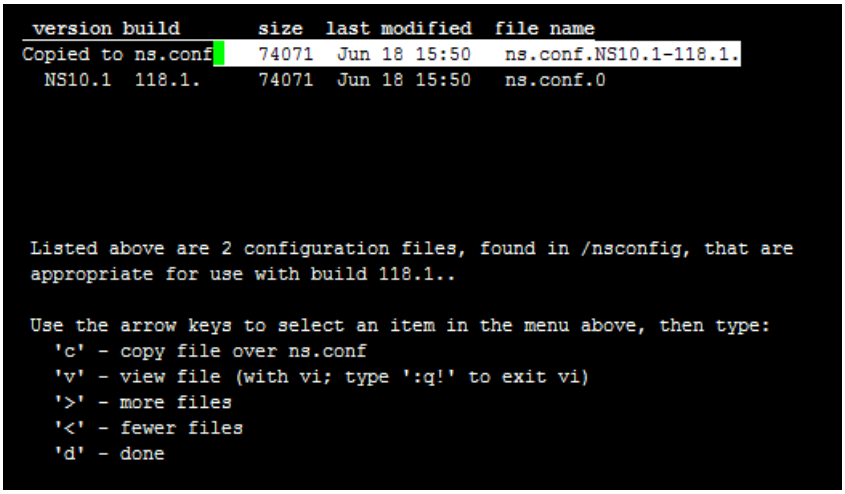
   During the upgrade, you are prompted for an option to load a different configuration, as shown in the following figure.

   Figure 1. Upgrade menu to load a different configuration

   If you do not want to load a different configuration and continue with the upgrade, typ N. wish to load a different configuration file, then type Y. If the configuration file for the build that you are upgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

   If you want to load a different configuration file, type Y. If the configuration file for the build to which you are upgrading exists in the appliance, you are prompted to load that configuration, as shown in the following figure.

   Figure 2. Upgrade menu if configuration file exists



9. When prompted, restart the appliance.
10. (Optional) If you performed step 4, do the following:
    1. Manually compare the files in /var/nsconfig_backup and /etc and make appropriate changes in /etc.
    2. To maintain persistency, move the updated files in /etc to /nsconfig.
    3. Restart the appliance to put the changes into effect.

Example

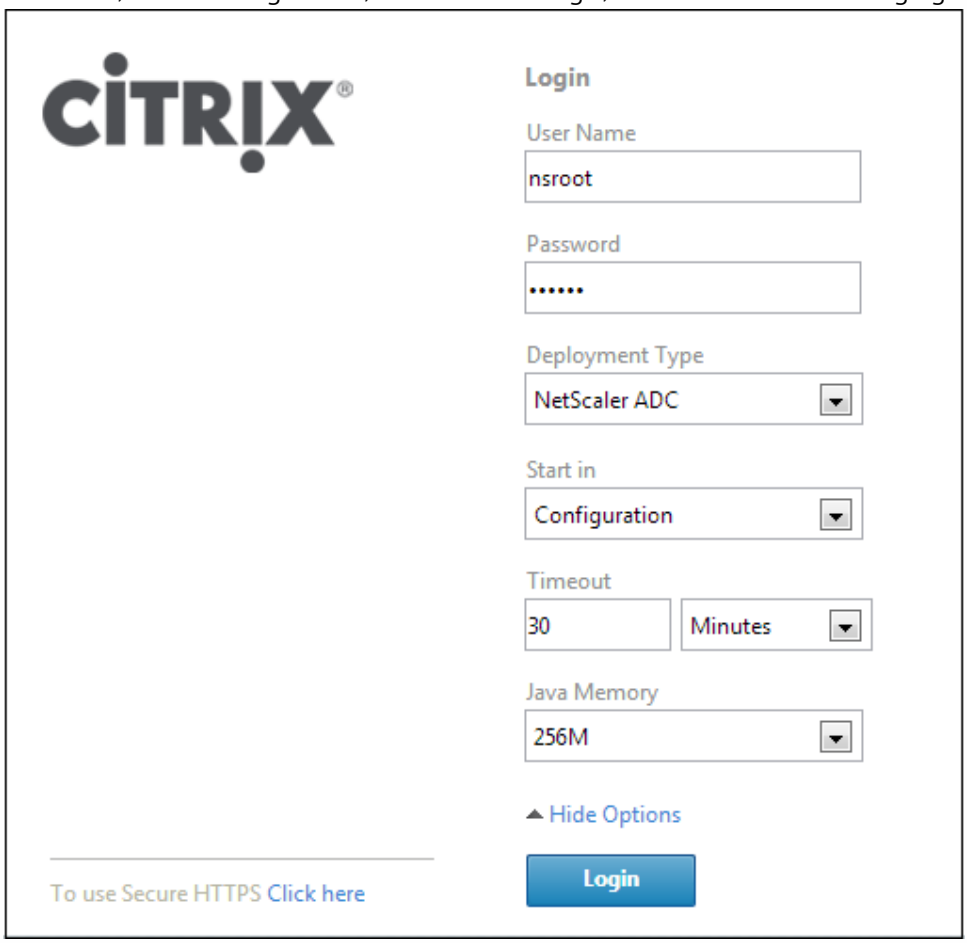
```
login: nsroot
Password:
Last login: Thu Aug  9 12:12:54 2012 from 10.144.7.22
Done
> save ns config
> shell
Last login: Mon Aug  9 03:51:42 from 10.103.25.64
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 10.1nsinstall
root@NSnnn# mkdir build_118.7
root@NSnnn# cd build_118.7
root@NSnnn# ftp ... get build-10.1-118.7_nc.tgz
root@NSnnn# tar  build-10.1-118.7_nc.tgz
root@NSnnn# ./installns
installns version (10.1-118.7) kernel (ns-10.1-118.7_nc.gz)
The Netscaler version 10.1-118.7 checksum file is located on
http://www.mycitrix.com under Support > Downloads > Citrix NetScaler.
Select the Release 10.1-118.7 link to view the MD5 checksum file for build 10.1-118.7.

There may be a pause of up to 3 minutes while data is written to the flash.
Do not interrupt the installation process once it has begun....
...
...
Copying ns-10.1-118.7_nc.gz to /flash/ns-10.1-118.7_nc.gz ...
...
Installation has completed.
```

Reboot NOW? [Y/N] Y

To upgrade a standalone NetScaler running release 10.1 to a later build by using the configuration utility

1. In a web browser, type the IP address of the NetScaler, such as http://10.102.29.50.
2. In User Name and Password, type the administrator credentials.
3. In Deployment Type, select NetScaler ADC.
4. In Start in, select Configuration, and then click Login, as shown in the following figure.

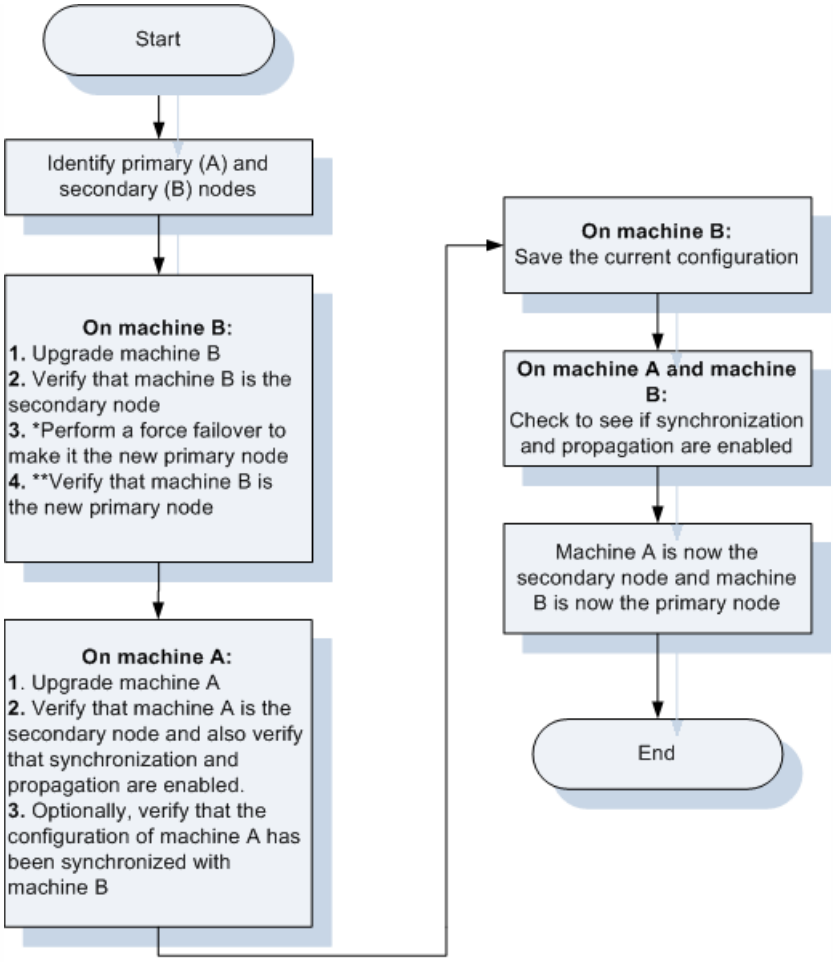


5. In the configuration utility, in the navigation pane, click System.
6. In the System Overview page, click Upgrade Wizard.
7. Follow the instructions to upgrade the software.
8. When prompted, select Reboot.
   Note: After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrading a NetScaler High Availability Pair to a Later Build

Updated: 2014-12-10

To upgrade the system software on NetScaler appliances in a high availability (HA) pair, upgrade the secondary node first, and then upgrade the primary node.
Warning: In certain cases, after you upgrade one of the nodes in an HA pair, synchronization and propagation are automatically disabled until you upgrade the other node. To determine whether synchronization and propagation are disabled, at the command line interface, type: show ha node
Figure 3. Upgrading a NetScaler High Availability Pair to a Later Build



*After upgrading machine B, it becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. After you test that machine B properly functions as the new primary node, proceed with upgrading the former primary node (machine A).

**After machine B is upgraded successfully, both synchronization and propagation are automatically disabled until you upgrade machine A.

In the following procedure, machine A is the original primary and machine B is the original secondary node, and <targetbuildnumber> is the build number that you are upgrading to within the 10.1 release.

To upgrade a NetScaler high availability pair to a later build by using the command line interface

On machine B (original secondary node)

1. Follow the procedure for upgrading a standalone node as described in "Upgrading a Standalone NetScaler Appliance to a Later Build". The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.
2. After the NetScaler restarts, log on by using the administrator credentials and enter the show ha node command to verify that the appliance is a secondary node.
3. Test the new build by entering the force failover command on the secondary node (machine B). At the command prompt type force failover.
   When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact

Citrix Customer Service before proceeding.

4. Enter the show ha node command to verify that machine B is the new primary node.
   On machine A (original primary node)

5. Follow the procedure for upgrading a standalone node as described in "Upgrading a Standalone NetScaler Appliance to a Later Build." The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.
6. After the appliance restarts, log on by using the administrator credentials and enter the show ha node command to verify that the appliance is a secondary node and that synchronization and propagation are enabled. Optionally, enter the show ns runningconfig command on both the nodes and compare the result to verify that the configuration of machine A has been synchronized with that of machine B.
   On machine B (new primary node)

7. Enter the save ns config command to save the current configuration.
   On machine A and machine B

8. After successfully upgrading both the nodes, run the show ha node command to verify that synchronization and propagation are enabled.
   Example

```
show ha node
        Node ID:      0
        IP:   10.0.4.2
        Node State: UP
        Master State: Primary
...
...
        INC State: DISABLED
        Sync State: ENABLED
        Propagation: ENABLED
        Enabled Interfaces : 1/1
        Disabled Interfaces : None
        HA MON ON Interfaces : 1/1
...
...
        Local node information
        Critical Interfaces: 1/1
Done

Show ha node
        Node ID:      0
        IP:   10.0.4.11
        Node State: UP
        Master State: Secondary
        ..
       ..
```

```
        INC State: DISABLED
        Sync State: SUCCESS
        Propagation: ENABLED
        Enabled Interfaces : 1/1
        Disabled Interfaces : None
        HA MON ON Interfaces : 1/1
        . . .
        . . .
        Local node information:
        Critical Interfaces: 1/1
Done
```

Machine B (original secondary node) is now the primary node and machine A (original primary node) is now the secondary node.

Downgrading from Release 10.1

Jun 09, 2014

You can downgrade to any release on a standalone NetScaler or a high availability pair by using the command line interface.

Caution: Loss in configuration may occur when downgrading. You should compare the configurations before and after the downgrade, and then manually reenter any missing entries.

This procedure provides steps to downgrade from release 10.1 to an earlier release. For downgrading to an earlier build within release 10.1, see "Downgrading to an Earlier Build within Release 10.1".

Note: Downgrading using the configuration utility is not supported.

This document includes the following information:

- Downgrading a Standalone NetScaler
- Downgrading a High Availability Pair

Downgrading a Standalone NetScaler

Updated: 2015-01-09

In the following procedure, <release> and <releasenumber> represent the release version you are downgrading to, and <targetbuildnumber> represents the build number that you are downgrading to. Refer to the table below for specific values.

Table 1. Release Version Values

Release Version	<release>	<releasenumber>
10	10	10
9.3	9.3	9.3
9.2	9.2	9.2
9.1	9.1	9.1
8.1	rhodes	8.1
8.0	andes	8.0
7.0	sierra	7.0

To downgrade a standalone NetScaler

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

save config

3. Create a copy of the ns.conf file. At the shell prompt, type:
   1. cd /nsconfig
   2. cp ns.conf ns.conf.NS10.1<currentbuildnumber>

   You should backup a copy of the configuration file on another computer.
4. Copy the <releasenumber> configuration file (ns.conf.NS<releasenumber>) to ns.conf. At the shell prompt, type:

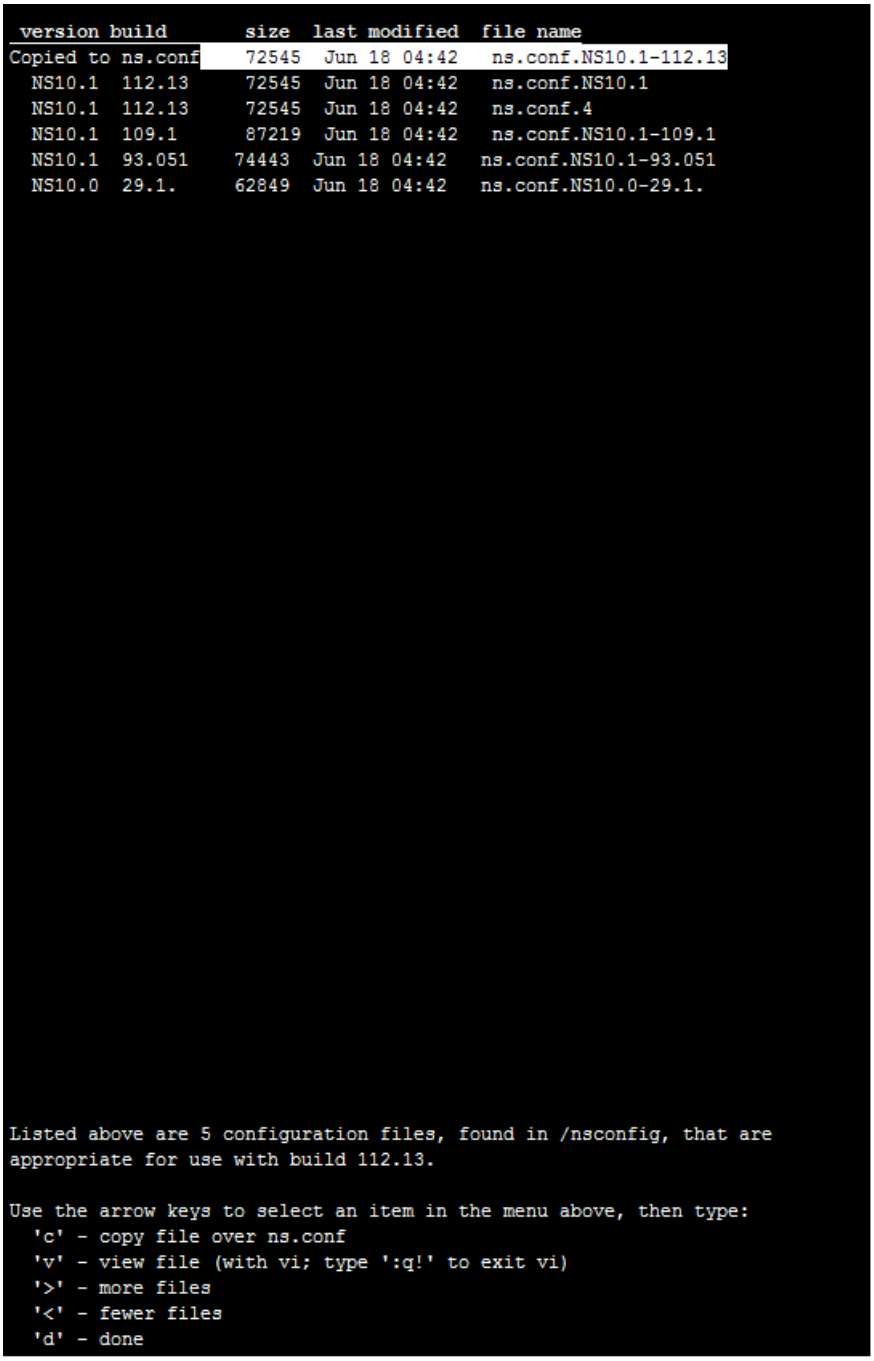
   cp **ns.conf.NS**<releasenumber> **ns.conf**

   Note: ns.conf.NS<releasenumber> is the backup configuration file that is automatically created when the system software is upgraded from release version <releasenumber> to the current release version. There may be some loss in configuration when downgrading. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

   Important: If routing is enabled, perform step 5. Otherwise, skip to step 6.
5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:
   1. cd **/nsconfig**
   2. cp **ZebOS.conf ZebOS.conf.NS**10.1
   3. cp ZebOS.conf.NS<targetreleasenumber> ZebOS.conf
6. Change directory to /var/nsinstall/<releasenumber>nsinstall, or create one if it does not exist.
7. Change directory to build_<targetbuildnumber>, or create one if it does not exist.
8. Download or copy the installation package (build-<release>-<targetbuildnumber>.tgz) and the documentation bundle (ns-<releasenumber>-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.
9. Run the installns script to install the new version of the system software. The script updates the /etc directory.

   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

   Figure 1. Downgrade menu if configuration file exists



If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see "Auto Cleanup".

10. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot
Last login: Tue Mar  27 01:38:25 2008 from 10.102.29.9
Done
> save config
> shell
Last login: Tue Mar  27 02:07:06 from 10.103.25.64
```

```
root@NSnnn# cp ns.conf.NS10 ns.conf
root@NSnnn# cd /var/nsinstall
root@NSnnn# mkdir 10nsinstall
root@NSnnn# cd 10nsinstall
root@NSnnn# mkdir build_55
root@NSnnn# cd build_55
root@NSnnn# ftp ... get build-10.0-55_nc.tgz
root@NSnnn# get ns-10-55-doc.tgz
root@NSnnn# tar xzvf build-10.0-55_nc.tgz
root@NSnnn# ./installns
installns version (10.0-55) kernel (ns-10.0-55.gz)
...
...
...
Copying ns-10.0-55.gz to /flash/ns-10.0-55_nc.gz ...
Changing /flash/boot/loader.conf for ns-10.0-55 ...
Installing documentation...

Installation has completed.

Reboot NOW? [Y/N] Y
```

Downgrading a High Availability Pair

Updated: 2013-08-21

To downgrade the system software on NetScaler units in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see "Downgrading a Standalone NetScaler".

Downgrading to an Earlier Build within Release 10.1

Jan 29, 2014

You can downgrade from a later 10.1 build to an earlier 10.1 build on a standalone NetScaler or a high availability pair. This procedure must be performed by using the command line interface.

Warning: Loss in configuration may occur when downgrading. You should compare the configurations before and after the downgrade, and then manually readd any missing entries.

This document includes the following information:

- Downgrading a Standalone NetScaler to an Earlier Build
- Downgrading a NetScaler High Availability Pair to an Earlier Build

Downgrading a Standalone NetScaler to an Earlier Build

Updated: 2014-01-29

In the procedure below, <targetbuildnumber> is the build number that you are downgrading to within the same release.

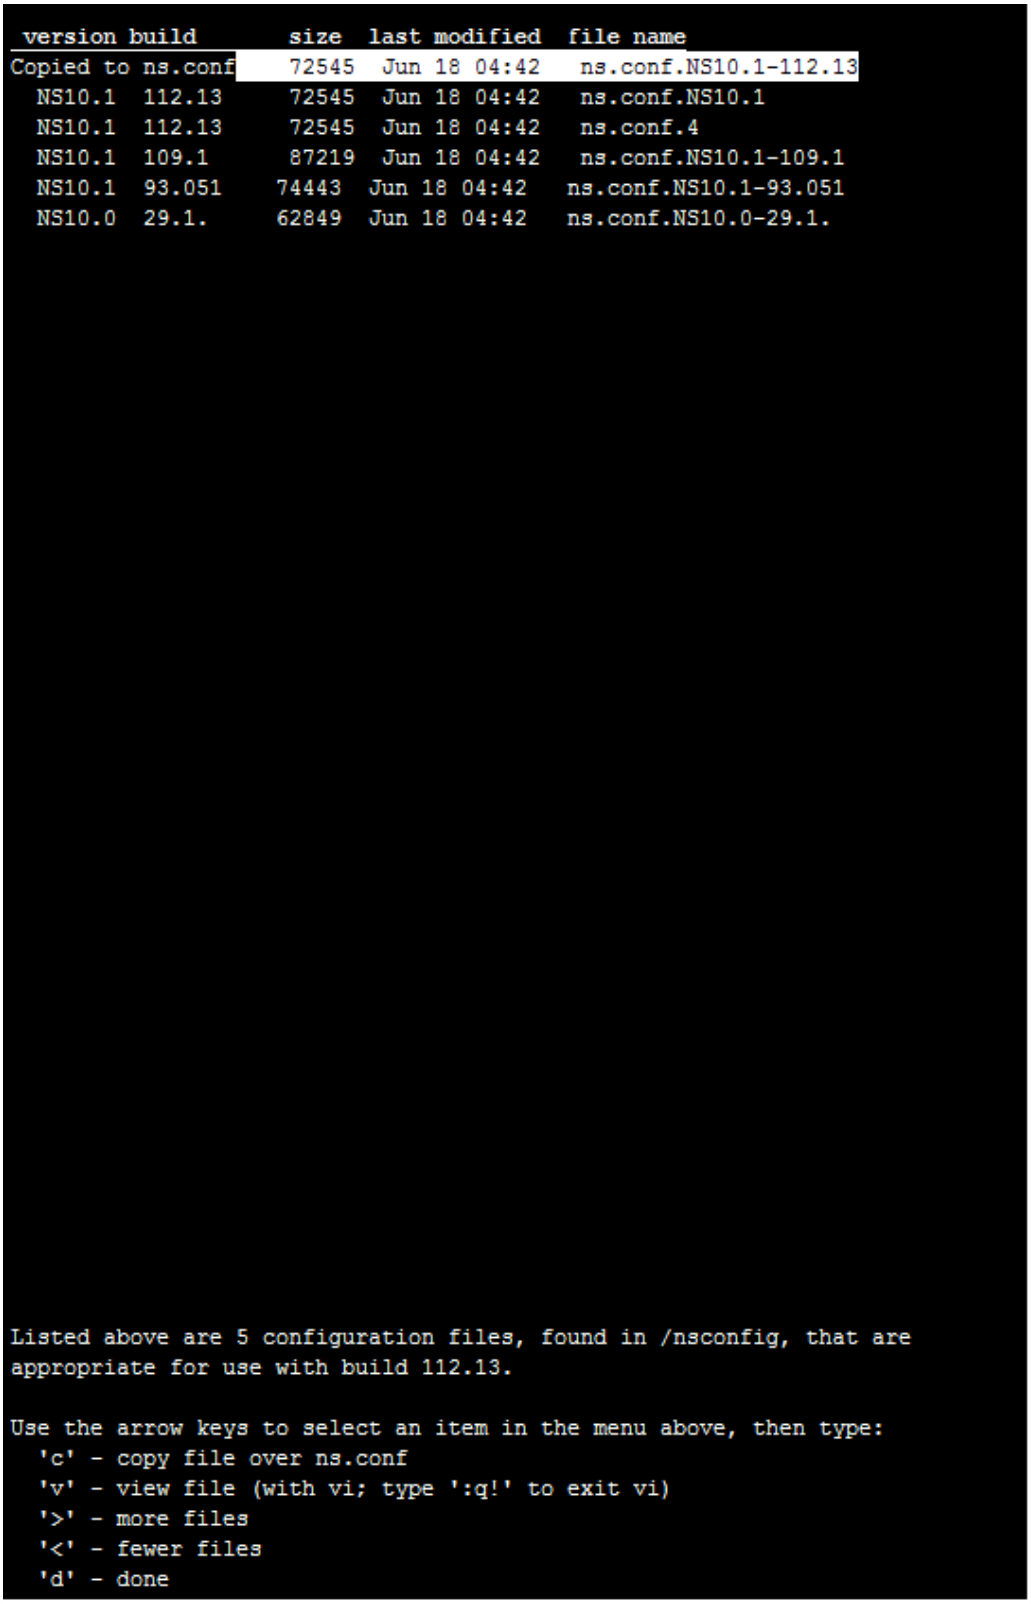
To downgrade a standalone NetScaler to an earlier build

1. Use an SSH client, such as PuTTy, to open an SSH connection to the appliance.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save ns config

   Caution: If ns.conf.NS10.1-<targetbuildnumber> does not exist, loss in configuration may occur when downgrading to an earlier build. The errors and warnings appear only on the console. Please watch the console closely for these errors and warnings. After the appliance restarts, compare the saved configuration with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.
3. Change directory to /var/nsinstall/10.1nsinstall.
4. Change directory to build_<targetbuildnumber>, or create one if it does not exist.
5. Download or copy the installation package (build-10.1-<targetbuildnumber>_nc.tgz) and the documentation bundle (ns-9.2-<targetbuildnumber>.e-doc.tgz) to this directory and extract the contents of the installation package.
   Note: Documentation is not included in this NetScaler build. It is available, only till the NetScaler release 10.1, build 113.x and later.
6. Run the installns script to install the old version of the system software. The script updates the /etc directory.
   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

   Figure 1. Downgrade menu if configuration file exists



7. When prompted, restart the NetScaler.

Example

login: nsroot
Password: nsroot

```
Last login: Sun May  5 08:38:25 2013 from 10.102.29.4
Done
> save ns config
> shell
Last login: Sun Aug  5 09:07:06 from 10.103.25.64
root@NSnnn# cp ns.conf.NS10.1-112.13 ns.conf
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 10.1nsinstall
root@NSnnn# cd build_112_13
root@NSnnn# ftp ... get build-10.1-112.13_nc.tgz
root@NSnnn# tar xzvf build-10.1-112.13_nc.tgz
root@NSnnn# ./installns
installns version (10.1-112.13) kernel (ns-10.1-112.13.gz)
...
...
...
Copying ns-10.1-112.13_nc.gz to /flash/ns-10.1-112.13_nc.gz ...
Changing /flash/boot/loader.conf for ns-10.1-112.13 ...

Installation has completed.

Reboot NOW? [Y/N] Y
```

Downgrading a NetScaler High Availability Pair to an Earlier Build

Updated: 2014-01-29

To downgrade the system software on NetScaler units in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see "Downgrading a Standalone NetScaler to an Earlier Build".

Note: In an HA setup, both nodes must run NetScaler nCore or NetScaler classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, propagation and synchronization are not supported during the migration process. Once migration is complete, you have to manually enable propagation and synchronization. The same applies if you migrate from NetScaler nCore to NetScaler classic.

Auto Cleanup

Jul 01, 2014

The cleanup procedure has been simplified in the later versions of release 7.0 (build 48 and later) and in releases 8.0, 8.1, 9.0, 9.1, 9.2, 9.3, 10, and 10.1. You no longer have to manually delete build files from the flash drive. During the installation process, if the free space on the flash drive is found to be insufficient, the NetScaler prompts you to initiate the cleanup process.

Note: To automatically clean up the flash, run the installns script with the -c option.
When downgrading to release 7.0, the prompt looks like this:

```
Installation path for kernel will be /flash
Size of kernel ns-7.0-21.7.gz is 58003.323 kilobytes
Available space on /flash/ filesystem is 25075 kilobytes
Available space on /flash/ filesystem is insufficient to install ns-7.0-21.7.gz
Do you want Auto Cleanup [Y/N] ?
```

When upgrading to release 8.1, the prompt looks like this:

```
Installation path for kernel is /flash
Size of kernel ns-8.1-32.2.gz is 61062.235 kilobytes
Available space on /flash/ filesystem is 59108 kilobytes
Available space on /flash/ filesystem is insufficient to install ns-8.1-32.2.gz
Do you want installns to free space by archiving older releases? [Y/ N]
```

To initiate the cleanup process, press Y. Messages similar to the following appear:

```
Archiving older releases ...
  Creating the archive directory /var/nsbackup/ns_2007_2_16_1_6_26 ...
  Move //flash//ns-6.1-97.4.m.gz /var/nsbackup/ ns_2007_2_16_1_6_26ns-6.1-97.4.m.gz ...
  Move //flash//ns-8.1-32.2.gz /var/nsbackup/ns_2007_2_16_1_6_26ns-8.1-32.2.gz ...
Archive operation completed, free space is 156452, required space is 61062.235
```

The installation process automatically continues after successful completion of the cleanup.

Troubleshooting

Aug 13, 2013

If the appliance does not work as expected after you complete the installation, upgrade, or downgrade process, the first thing to do is to check for the most common causes of the problem.

This document includes the following information:

- Resources for Troubleshooting
- Troubleshooting Issues Related to the Installation, Upgrade, and Downgrade processes

Resources for Troubleshooting

Updated: 2013-08-13

For best results, use the following resources to troubleshoot an issue related to installing, upgrading, or downgrading a NetScaler appliance:

- The configuration files from the appliance. In case of a High Availability pair, the configuration files from both appliances.
- The following files from the appliance(s):
  - The relevant newnslog files.
  - The ns.log file.
  - The messages file.
- A network topology diagram.

Troubleshooting Issues Related to the Installation, Upgrade, and Downgrade processes

Updated: 2013-11-22

Following are the most common installation, upgrade, and downgrade issues, and tips for resolving them:

- **Issue**
  The NetScaler appliance is not accessible after the software downgrade

  Cause

  During the software downgrade process, if the configuration file of the existing release and build does not match the configuration file of the earlier release and build, the appliance cannot load the configuration, and the default IP address is assigned to the appliance.

  Resolution

  - Verify that the appliance is accessible from the console.
  - Verify the NSIP address and the routes on the appliance.
    - If the IP address has changed to the default 192.168.100.1 IP address, change the IP address as required.
    - Verify that the appliance is accessible.
- **Issue**
  Configuration of the appliance is lost after you upgrade the software across multiple releases.

  Cause

  Some migration commands are built in for upgrading to the next release. Such commands might not be available across releases.

Resolution

- Verify the path of the upgrade process. Citrix recommends upgrading by one release at a time. For example, if the softer needs to be upgraded from NetScaler release 9.2 to NetScaler release 10.1, the following is the recommended path for the upgrade:
  - NetScaler release 9.2 to NetScaler release 9.3
  - NetScaler release 9.3 to NetScaler release 10
  - NetScaler release 10 to NetScaler release 10.1
- Verify that the appliance has appropriate license files.
- Verifying the configuration at each step of the upgrade process can give you pointers to the issue.

- **Issue**
  During an upgrade, if I run the command for synchronizing, the following message appears:

  Command failed on the secondary node but succeeded on the primary node.

  Resolution

  Do not run any dependent commands (set /unset /bind /unbind) when High Availability (HA) synchronization is in progress.

- **Issue**
  During an upgrade process, traffic does not pass through the new primary node when you run the force failover command.

  Resolution
  - Check for problems with the network topology and the switch configurations.
  - Run the set L2param -garpreply ENABLED command to enable the GARP reply.
  - Try using VMAC if not already used.
  - Run the sendarp –a command from the primary node.
- **Issue**
  In an HA pair, after you run the force HA failover command the devices keep rebooting. The secondary device does not come up after an upgrade.

  Resolution

  Check to see if the /var directory is full. If so, remove the old installation files. Run the df –h command to show the available disk space.

- **Issue**
  After upgrading an HA pair, one of the nodes is listed as state UNKNOWN.

  Resolution
  - Check to see if both nodes are running the same build. If the builds are not same and HA nodes have a version mismatch, some of the fields are shown as UNKNOWN when you run the show ha node command.
  - Check to see if the secondary appliance is reachable.
- **Issue**
  After you upgrade the NetScaler appliance, the interface shows most of the load balancing virtual servers and services are DOWN.

  Resolution

Verify that the SNIP address is active on the secondary appliance. Also, type the show service command to see if the service is running.

- **Issue**
  After performing an upgrade, all virtual servers are down on the secondary appliance.

  Resolution

  Enable the HA state and HA synchronization by running the following commands:
  - set node hastate enable
  - set node hasync enable

  Disabling HA is not recommended.
- **Issue**
  After performing a downgrade, the NetScaler appliance does not boot up properly.

  Resolution

  Check to see if the correct license has been installed.

- **Issue**
  In an HA pair, some features do not get synchronized after an upgrade is performed.

  Resolution

  Run the sync ha file misc command to synchronize the configurations files from the primary node to secondary node.

- **Issue**
  During reboot, the following error message appears:

  `One or more commands in ns.conf failed`What should I do?

  Resolution

  Make sure that no command in the ns.conf file exceeds the 255 byte limit. In commands that create policies that are too long for the 255-byte limit, you can use pattern sets to shorten the policies.

  Example:
  `add cs policy p11 -rule 'HTTP.REQ.URL.ENDSWITH_ANY("ctx_file_extensions")'`
  `Done`
  ctx_file_extensions is a default patset that covers a large number of extensions. In addition to the default pattern sets, you can create user-defined pattern sets. Add a patset by running the following command:
  `add patset <name>`
  Note: Patsets are supported only in release 9.3 or later.
- **Issue**
  When upgrading a NetScaler VPX appliance, I am told to free up space in /var. What files do I remove?

  Resolution

  Remove the old installation files from /var/tmp/ directory. Also remove unwanted files from /flash.

- **Issue**
  There is no connectivity to the graphical user interface (GUI) when you run the force HA failover command on the

secondary appliance.

Resolution

Log on to the secondary appliance using the command line interface and enable the access to GUI by running the set ns ip <IP> -gui enabled command.

- **Issue**
  After performing an upgrade, and when I click on any link on the GUI that has to load a java applet (Upgrade Wizard or license Wizard), the following error message appears: **GUI version does not match with the kernel version. Please close this instance, clear java plug-in cache and reopen**.

  Resolution

  - Log on to the NetScaler appliance using the GUI.
  - Navigate to NetScaler Gateway > Global Settings.
  - Click Change Global Settings under Settings.
  - In the details pane, under Client Experience, select Default from the UI theme list.
  - Click OK.

Note: These troubleshooting steps also apply to issues with configuration loss when downgrading the software across multiple releases.
For any other issue, see the release notes, Knowledge Center articles, and FAQs.

System

Sep 05, 2013

The following topics provide information of the NetScaler system.

Administration	Manages and monitors the NetScaler appliance by using built-in features such as authentication and authorization, SNMP management, audit logging, web server logging, NTP management, and Reporting tool.
AppFlow	Provides information about the reporting capabilities of AppFlow feature of the NetScaler.
AutoScale	Describes how users of Citrix CloudPlatform can use the AutoScale feature on the NetScaler appliance to enable automatic scaling of their applications.
CloudBridge Connector	Provides help in reducing the cost of moving your applications to the cloud, reduce the risk of application failure, and increase network efficiency in your cloud environment.
Clustering	A setup of multiple nCore NetScaler appliances that ensure high availability, high throughput, and scalability of a deployment of NetScaler appliances.
EdgeSight Monitoring for NetScaler	Monitors the end-user experience with web applications that are served in a NetScaler environment.
Flex Tenancy	A methodology that allows you to tune a group of NetScaler virtual appliance instances to the unique characteristics and needs of individual applications in a complex Web 2.0 setup.
High Availability	A setup of two NetScaler appliances that ensure the high availability of NetScaler appliances.
Web Interface	Provides access to Citrix XenApp and Citrix XenDesktop applications.

Basic Operations

Jun 02, 2015

Any changes you make to the configuration of a NetScaler appliance are not saved automatically. You have to save the settings manually. When an appliance is restarted, it loads the latest saved configuration.

This document includes the following details:

- Viewing and Saving Configurations
- Clearing the NetScaler Configuration

Viewing and Saving Configurations

Configurations are stored in the /nsconfig/ns.conf directory. For configurations to be available across sessions, you must save the configuration after every configuration change.

To view the running configuration by using the command line interface

At the command prompt, type:

show ns runningConfig

To view the running configuration by using the configuration utility

- Navigate to System > Diagnostics and, in the View Configuration group, click Running Configuration.

To find the difference between two configuration files by using the command line interface

At the command prompt, type:

diff ns config <configfile1> <configfile2>

To find the difference between two configuration files by using the configuration utility

- Navigate to System > Diagnostics and, in the View Configuration group, click Configuration difference.

To save configurations by using the command line interface

At the command prompt, type:

save ns config

To save configurations by using the configuration utility

On the Configuration tab, in the top-right corner, click the Save icon.

To view the saved configurations by using the command line interface

At the command prompt, type:

show ns ns.conf

To view the saved configurations by using the configuration utility

Navigate to System > Diagnostics and, in the View Configuration group, click Saved Configuration.

Clearing the NetScaler Configuration

You have the following three options for clearing the NetScaler configuration.

Basic level. Clearing your configuration at the basic level clears all settings except the following:

- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions
- Feature and mode settings
- Default administrator password (nsroot)

Extended level. Clearing your configuration at the extended level clears all settings except the following:

- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions

Feature and mode settings revert to their default values.

Full level. Clearing your configuration at the full level returns all settings to their factory default values. However, the NSIP and default gateway are not changed, because changing them could cause the appliance to lose network connectivity.

To clear the configuration by using the command line interface

At the command prompt, type:

clear ns config -force <level>

Example: To forcefully clear the basic configurations on an appliance.

```
clear ns config -force basic
```

To clear the configuration by using the configuration utility

- Navigate to System > Diagnostics and, in the Maintenance group, click Clear Configuration and select the configuration level to be cleared from the appliance.

Configuring Clock Synchronization

Jun 02, 2015

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network.

You can configure clock synchronization on your appliance by adding NTP server entries to the ntp.conf file from either the configuration utility or the command line interface, or by manually modifying the ntp.conf file and then starting the NTP daemon (NTPD). The clock synchronization configuration does not change if the appliance is restarted, upgraded, or downgraded. However, the configuration does not get propagated to the secondary NetScaler in a high availability setup.

Note: If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site, http://www.ntp.org, under Public Time Servers List. Before configuring your NetScaler to use a public NTP server, be sure to read the Rules of Engagement page (link included on all Public Time Servers pages).
This document includes the following details:

- Setting Up Clock Synchronization
- Starting the NTP Daemon
- Configuring Clock Synchronization Manually

Setting Up Clock Synchronization

Updated: 2014-08-18

To configure clock synchronization, you must add NTP servers and then enable NTP synchronization.

To add an NTP server by using the command line interface

At the command prompt, type the following commands to add an NTP server and verify the configuration:

- add ntp server (<serverIP> | <serverName>) [-minpoll <positive_integer>] [-maxpoll <positive_integer>]
- show ntp server

Example

```
> add ntp server 10.102.29.30 -minpoll 6 -maxpoll 11
```

To configure an NTP server by using the configuration utility

Navigate to System > NTP Servers, and create the NTP server.

Starting the NTP Daemon

Updated: 2014-08-08

When you enable NTP synchronization, the NetScaler starts the NTP daemon and uses the NTP server entries in the ntp.conf file to synchronize its local time setting. If you do not want to synchronize the appliance time with the other servers in the network, you can disable NTP synchronization, which stops the NTP daemon (NTPD).

To enable NTP synchronization by using the command line interface

At the command prompt, type one of the following commands:

enable ntp sync

To enable NTP synchronization by using the configuration utility

Navigate to System > NTP Servers, click Action and select NTP Synchronization.

Configuring Clock Synchronization Manually

Updated: 2013-08-23

You can configure clock synchronization manually by logging on to the NetScaler and editing the ntp.conf file.

To enable clock synchronization on your NetScaler by modifying the ntp.conf file

1. Log on to the command line interface.
2. Switch to the shell prompt.
3. Copy the /etc/ntp.conf file to /nsconfig/ntp.conf, unless the /nsconfig directory already contains an ntp.conf file.
4. Check the /nsconfig/ntp.conf file for the following entries and, if they are present, remove them:
   restrict localhost

   restrict 127.0.0.2

5. Add the IP address for the desired NTP server to the /nsconfig/ntp.conf file, beneath the file's server and restrict entries.
   Note: For security reasons, there should be a corresponding restrict entry for each server entry.
6. If the /nsconfig directory does not contain a file named rc.netscaler, create the file.
7. Add the following entry to /nsconfig/rc.netscaler: /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   This process runs every time the NetScaler is restarted.

8. Reboot the NetScaler to enable clock synchronization.
   Note:
   If you want to start the time synchronization process without restarting the NetScaler, run the following command from the shell prompt:

   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

Viewing the System Date and Time

Aug 08, 2014

To change the system date and time, you must use the shell interface to the underlying FreeBSD OS. However, to view the system date and time, you can use the command line interface or the configuration utility.

To view the system date and time by using the command line interface

At the command prompt, type:

```
show ns config
```

To view the system date and time by using the configuration utility

Navigate to System and select the System Information tab to view the system date.

Backing up and Restoring the NetScaler Appliance

Sep 15, 2015

You can back up the current state of a NetScaler appliance, and later use the backed up files to restore the appliance to the same state. You must use this feature before performing an upgrade or for precautionary reasons. A backup of a stable system enables you to restore the system to a stable point in the event that it becomes unstable.

Points to remember

- You cannot use the backup file taken from one appliance to restore a different appliance.
- You can back up and restore appliances in an HA setup, but make sure that you restore to the same appliance from which the backup file was created. For example, if the backup was taken from the primary appliance of the HA pair, when restoring make sure that the appliance you are restoring is the same appliance, even if it is no longer the primary appliance.
- You cannot perform the backup and restore operation on a NetScaler cluster.

This document includes the following details:

Backing up a NetScaler Appliance

Updated: 2015-03-11

Depending on the type of data to be backed up and the frequency at which you will create a backup, you can take a basic backup or a full backup.

- **Basic backup.** Backs up only configuration files. You might want to perform this type of backup frequently, because the files it backs up change constantly. The files that are backed up are:

Directory	Sub-Directory or Files
/nsconfig/	• ns.conf • ZebOS.conf • rc.netscaler • snmpd.conf • nsbefore.sh • nsafter.sh • inetd.conf • ntp.conf • syslog.conf • newsyslog.conf • crontab • host.conf • hosts • ttys • sshd_config • httpd.conf

Directory	Sub-Directory or Files
	• monitrc • rc.conf • ssh_config • localtime • issue • issue.net
/var/	• download/* • log/wicmd.log • wi/tomcat/webapps/* • wi/tomcat/logs/* • wi/tomcat/conf/catalina/localhost/* • nslw.bin/etc/krb.conf • nslw.bin/etc/krb.keytab • netscaler/locdb/* • lib/likewise/db/* • vpn/bookmark/* • netscaler/crl • nstemplates/* • learnt_data/*
/netscaler/	• custom.html • vsr.htm

- **Full backup.** In addition to the files that are backed up by a basic backup, a full backup backs up some less frequently updated files. The files that are backed up when using the full backup option are:

Directory	Sub-Directory or Files
/nsconfig/	• ssl/* • license/* • fips/*
/var/	• netscaler/ssl/* • wi/java_home/jre/lib/security/cacerts/* • wi/java_home/lib/security/cacerts/*

The backup is stored as a compressed TAR file in the /var/ns_sys_backup/ directory. To avoid issues due to non-availability of disk space, you can store a maximum of 50 backup files in this directory. You can use the rm system backup command to delete existing backup files so that you can create more backups.

Note:

- While the backup operation is in progress, do not execute commands that affect the configuration.
- If a file that is required to be backed up is not available, the operation skips that file.

To backup the NetScaler by using the NetScaler command line interface

At the command prompt, do the following:

1. Save the NetScaler configurations.
   save ns config

2. Create the backup file.
   create system backup [<fileName>] -level <basic ¦ full> -comment <string>

   Note: If the file name is not specified, the appliance creates a TAR file with the following naming convention: backup_<level>_<nsip_address>_<date-timestamp>.tgz.
   Example: To backup the full appliance using the default naming convention for the backup file.
   ```
   > create system backup -level full
   ```
3. Verify that the backup file was created.
   show system backup

   You can view properties of a specific backup file by using the fileName parameter.

To backup the NetScaler by using the configuration utility

Navigate to System > Backup and Restore, click Backup and then specify the details of the backup.

Restoring the NetScaler Appliance

When you restore the appliance from a backup file, the restore operation untars the backup file into the /var/ns_sys_backup/ directory. Once the untar operation is complete, the files are copied to their respective directories.

Attention: The restore operation does not succeed if the backup file is renamed or if the contents of the file are modified.

To restore the NetScaler by using the command line interface

At the command prompt, do the following:

1. Obtain a list of the backup files available on the appliance.
   show system backup

2. Restore the appliance by specifying one of the backup files.
   restore system backup <filename>

   Example: To restore by using a full backup of an appliance.
   ```
   > restore system backup backup_full_<nsip_address>_<date-timestamp>.tgz
   ```
3. Reboot the appliance.
   reboot

To restore the NetScaler by using the configuration utility

Navigate to System > Backup and Restore, right-click the backup file to be restored and click Restore.

Restarting or Shutting down the Appliance

Sep 16, 2014

The NetScaler appliance can be remotely restarted or shut down from the available user interfaces. When a standalone NetScaler appliance is restarted or shut down, the unsaved configurations (configurations performed since the last save ns config command was issued) are lost.

In a high availability setup, when the primary appliance is rebooted/shut down, the secondary appliance takes over and becomes the primary. The unsaved configurations from the old primary are available on the new primary appliance.

You can also restart the appliance by only rebooting the NetScaler software and not rebooting the underlying operating system. This is called a warm reboot. For example, when you add a new license or change the NetScaler IP address, you can warm reboot the NetScaler appliance for these changes to take place.

Note: Warm reboot can be performed only on nCore appliances.

To restart the NetScaler by using the command line interface

At the command prompt, type:

reboot [-warm]

To restart the NetScaler by using the configuration utility

1. In the configuration utility, click Reboot on the home page of the Configuration tab.
2. When prompted to reboot, select Save configuration to make sure that you do not lose any configurations.
   Note: You can perform a warm reboot by selecting Warm reboot.

To shut down the NetScaler by using the command line interface

At the command prompt, type:

- shutdown –p now: Shuts down the software and switches off the NetScaler. To restart NetScaler MPX, press the AC power switch. To Restart NetScaler VPX , restart the VPX instance.
- shutdown –h now: Shuts down the software and leaves the NetScaler switched on. Press any key to restart the NetScaler. This command does not switch off the NetScaler. Therefore, do not switch off the AC power or remove the AC power cables.

Note: The appliance cannot be shut down from the configuration utility.

Authentication and Authorization

Mar 17, 2014

To configure NetScaler authentication and authorization, you must first define the users who have access to the NetScaler appliance, and then you can organize these users into groups. After configuring users and groups, you need to configure command policies to define types of access, and assign the policies to users and/or groups.

You must log on as an administrator to configure users, groups, and command policies. The default NetScaler administrator user name is *nsroot*. After logging on as the default administrator, you should change the password for the nsroot account. Once you have changed the password, no user can access the NetScaler appliance until you create an account for that user. If you forget the administrator password after changing it from the default, you can reset it to nsroot.

Configuring Users, User Groups, and Command Policies

Oct 06, 2016

You must define your users by configuring accounts for them. To simplify the management of user accounts, you can organize them into groups. You can create command policies, or use built-in command policies, to regulate user access to commands.

You can also customize the command-line prompt for a user. Prompts can be defined in a user's configuration, in a user-group configuration, and in the global system configuration settings. The prompt displayed for a given user is determined by the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user's group.
3. Display the prompt as defined in the system global configuration settings.

You can specify a timeout value for inactive CLI sessions for a system user. If a user's CLI session is idle for a time that exceeds the timeout value, the NetScaler appliance terminates the connection. The timeout can be defined in a user's configuration, in a user-group configuration, and in the global system configuration settings. The timeout for inactive CLI sessions for a user is determined by the following order of precedence:

1. Timeout value as defined in the user's configuration.
2. Timeout value as defined in the group configuration for the user's group.
3. Timeout value as defined in the global system configuration settings.

This document includes the following details:

- Configuring User Accounts
- Configuring User Groups
- Configuring Command Policies

Configuring User Accounts

Updated: 2014-08-07

To configure user accounts, you simply specify user names and passwords. You can change passwords and remove user accounts at any time.

To create a user account by using the command line interface

At the command prompt, type the following commands to create a user account and verify the configuration:

- add system user <userName> [-promptString <string>] [-timeout <secs>]
- show system user <userName>

Example

```
> add system user johnd -promptString user-%u-at-%T

Enter password:
Confirm password:
```

To configure a user account by using the configuration utility

Navigate to System > User Administration > Users, and create the user.

Configuring User Groups

Updated: 2014-08-07

After configuring a user group, you can easily grant the same access rights to everyone in the group. To configure a group, you create the group and bind users to the group. You can bind each user account to more than one group. Binding user accounts to multiple groups might allow more flexibility when applying command policies.

To create a user group by using the command line interface

At the command prompt, type the following commands to create a user group and verify the configuration:

- add system group <groupName> [-promptString <string>] [-timeout <secs>]
- show system group <groupName>

Example

```
> add system group Managers -promptString Group-Managers-at-%h
```

To bind a user to a group by using the command line interface

At the command prompt, type the following commands to bind a user account to a group and verify the configuration:

- bind system group <groupName> -userName <userName>
- show system group <groupName>

Example

```
> bind system group Managers -userName user1
```

To configure a user group by using the configuration utility

Navigate to System > User Administration > Groups, and create the user group.

Note: To add members to the group, in the Members section, click Add. Select users from the Available list and add them to the Configured list.

Configuring Command Policies

Command policies regulate which commands, command groups, virtual servers, and other entities that users and user groups are permitted to use.

The appliance provides a set of built-in command policies, and you can configure custom policies. To apply the policies, you bind them to users and/or groups.

Here are the key points to keep in mind when defining and applying command policies.

- You cannot create global command policies. Command policies must be bound directly to the users and groups on the appliance.
- Users or groups with no associated command policies are subject to the default (DENY-ALL) command policy, and are therefore unable to execute any configuration commands until the proper command policies are bound to their accounts.
- All users inherit the policies of the groups to which they belong.
- You must assign a priority to a command policy when you bind it to a user account or group account. This enables the

appliance to determine which policy has priority when two or more conflicting policies apply to the same user or group.

- The following commands are available by default to any user and are unaffected by any command you specify: help, show cli attribute, set cli prompt, clear cli prompt, show cli prompt, alias, unalias, history, quit, exit, whoami, config, set cli mode, unset cli mode, and show cli mode.

Built-in Command Policies

Updated: 2015-06-15

The following table describes the built-in policies.

Table 1. Built-in Command Policies

Policy name	Allows
read-only	Read-only access to all show commands except show ns runningConfig, show ns ns.conf, and the show commands for the NetScaler command group.
operator	Read-only access and access to commands to enable and disable services and servers.
network	Full access, except to the set and unset SSL commands, show ns ns.conf, show ns runningConfig, and show gslb runningConfig commands.
sysadmin	[From NetScaler 11 onwards] A sysadmin is lower than a superuser is terms of access allowed on the appliance. A sysadmin user can perform all NetScaler operations with the following exceptions: no access to the NetScaler shell, cannot perform user configurations, cannot perform partition configurations, and some other configurations as stated in the sysadmin command policy.
superuser	Full access. Same privileges as the nsroot user.

Creating Custom Command Policies

Updated: 2015-06-15

Regular expression support is offered for users with the resources to maintain more customized expressions, and for those deployments that require the flexibility that regular expressions offer. For most users, the built-in command policies are sufficient. Users who need additional levels of control but are unfamiliar with regular expressions may want to use only simple expressions, such as those in the examples provided in this section, to maintain policy readability.

When you use a regular expression to create a command policy, keep the following in mind.

- When you use regular expressions to define commands that will be affected by a command policy, you must enclose the commands in double quotation marks. For example, to create a command policy that includes all commands that begin with show, type:
  "^show .*$"

  To create a command policy that includes all commands that begin with rm, type:

"^rm .*$"

- Regular expressions used in command policies are not case sensitive.

The following table lists examples of regular expressions:

Table 2. Examples of Regular Expressions for Command Policies

Command specification	Matches these commands
"^rm\s+.*$"	All remove actions, because all remove actions begin with the rm string, followed by a space and additional parameters such as command groups, command object types, and arguments.
"^show\s+.*$"	All show commands, because all show actions begin with the show string, followed by a space and additional parameters such as command groups, command object types, and arguments.
"^shell$"	The shell command alone, but not combined with any additional parameters such as command groups, command object types, and arguments.
"^add\s+vserver\s+.*$"	All create virtual server actions, which consist of the add vserver command followed by a space and additional parameters such as command groups, command object types, and arguments.
"^add\s+(lb\s+vserver)\s+.*"	All create lb virtual server actions, which consist of the add lb vserver command followed by a space and additional parameters such as command groups, command object types, and arguments.

The following table shows the command specifications for each of the built-in command policies.

Table 3. Expressions Used in the Built-in Command Policies

Policy name	Command specification regular expression
read-only	(^man.*)|(^show\s+(?!system)(?!configstatus)(?!ns ns\.conf)(?!ns savedconfig)(?!ns runningConfig)(?!gslb runningConfig)(?!audit messages)(?!techsupport).*)|(^stat.*)
operator	(^man.*)|(^show\s+(?!system)(?!configstatus)(?!ns ns\.conf)(?!ns savedconfig)(?!ns runningConfig)(?!gslb runningConfig)(?!audit messages)(?!techsupport).*)|(^stat.*)|(^(enable|disable) (server|service).*)
network	^(?!clear ns config.*)(?!scp.*)(?!set ssl fips)(?!reset ssl fips)(?!diff ns config)(?!shell)(?!reboot)(?!batch)\S+\s+(?!system)(?!configstatus)(?!ns ns\.conf)(?!ns savedconfig)(?!ns runningConfig)(?!gslb runningConfig)(?!techsupport).*
sysadmin	[From NetScaler 11 onwards] ^(?!shell)(?!sftp)(?!scp)(?!batch)(?!source)(?!.*superuser)(?!.*nsroot)(?!show\s+system\s+(user|cmdPolicy))(?!(set|add|rm|create|export|kill)\s+system)(?!(unbind|bind)\s+system\s+(user|group))(?!diff\s+ns\s+config)(?!\S+\s+ns\s+partition).*

Policy name	Command specification regular expression
superuser	.*

To create a command policy by using the command line interface

At the command prompt, type the following commands to create a command policy and verify the configuration:

- add system cmdPolicy <policyname> <action> <cmdspec>
- show system cmdPolicy <policyName>

Example

```
> add system cmdPolicy read_all ALLOW (^show\s+(!system)(!ns ns.conf)(!ns runningConfig).*)|(^stat.*)
```

To configure a command policy by using the configuration utility

Navigate to System > User Administration > Command Policies, and create the command policy.

Binding Command Policies to Users and Groups

Updated: 2014-08-07

Once you have defined your command policies, you must bind them to the appropriate user accounts and groups. When you bind a policy, you must assign it a priority so that the appliance can determine which command policy to follow when two or more applicable command policies are in conflict.

Command policies are evaluated in the following order:

- Command policies bound directly to users and the corresponding groups are evaluated according to priority number. A command policy with a lower priority number is evaluated before one with a higher priority number. Therefore, any privileges the lower-numbered command policy explicitly grants or denies are not overridden by a higher-numbered command policy.
- When two command policies, one bound to a user account and other to a group, have the same priority number, the command policy bound directly to the user account is evaluated first.

To bind command policies to a user by using the command line interface

At the command prompt, type the following commands to bind a command policy to a user and verify the configuration:

- bind system user <userName> -policyName <policyName> <priority>
- show system user <userName>

Example

```
> bind system user user1 -policyName read_all 1
```

To bind command policies to a user by using the configuration utility

Navigate to System > User Administration > Users, select the user and bind command policies.
Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

To bind command policies to a group by using the command line interface

At the command prompt, type the following commands to bind a command policy to a group, and verify the configuration:

- bind system group <groupName> -policyName <policyName> <priority>
- show system group <groupName>

Example

```
> bind system group Managers -policyName read_all 1
```

To bind command policies to a group by using the configuration utility

Navigate to System > User Administration > Groups, select the group, and bind command policies.
Optionally, you can modify the default priority to ensure that the policy is evaluated in the proper order.

Resetting the Default Administrator (nsroot) Password

Nov 24, 2014

The nsroot account provides complete access to all features of the appliance. Therefore, to preserve security, the nsroot account should be used only when necessary, and only individuals whose duties require full access should know the password for the nsroot account. Frequently changing the nsroot password is advisable. If you lose the password, you can reset it to the default and then change it.

To reset the nsroot password, you must boot the appliance into single user mode, mount the file systems in read/write mode, and remove the set NetScaler user nsroot entry from the ns.conf file. You can then reboot, log on with the default password, and choose a new password.

To reset the nsroot password

1. Connect a computer to the console port of the NetScaler ADC and log on.
   Note: You cannot log on by using SSH to perform this procedure; you must connect directly to the appliance.
2. Reboot the NetScaler ADC.
3. Press CTRL+C when the following message appears:
   `Press [Ctrl-C] for command prompt, or any other key to boot immediately.`

   `Booting [kernel] in # seconds.`
4. Run the following command to start the NetScaler in a single user mode:
   `boot -s`

   Note: If boot -s does not work, then try reboot -- -s and appliance will reboot in single user mode.
   After the appliance boots, it displays the following message:

   `Enter full path name of shell or RETURN for /bin/sh:`
5. Press ENTER key to display the # prompt, and type the following commands to mount the file systems:
   1. Run the following command to check the disk consistency:
      `fsck /dev/ad0s1a`

      Note: Your flash drive will have a specific device name depending on your NetScaler; hence, you have to replace ad0s1a in the preceding command with the appropriate device name.
   2. Run the following command to display the mounted partitions:
      `df`

      If the flash partition is not listed, you need to mount it manually.
   3. Run the following command to mount the flash drive:
      `mount /dev/ad0s1a /flash`
6. Run the following command to change to the nsconfig directory:
   `cd /flash/nsconfig`
7. Run the following commands to rewrite the **ns.conf** file and remove the set of system commands defaulting to the nsroot user:
   1. Run the following command to create a new configuration file that does not have commands defaulting to the

nsroot user:
grep –v “set system user nsroot” ns.conf > new.conf

2. Run the following command to make a backup of the existing configuration file:
   mv ns.conf old.ns.conf

3. Run the following command to rename the new.conf file to ns.conf:
   mv new.conf ns.conf

8. Run the following command to reboot the NetScaler:
   reboot

9. Log on using the default nsroot user credentials.
10. Run the following command to reset the nsroot user password:
    set system user nsroot <New_Password>

Example of a User Scenario

Sep 06, 2013

The following example shows how to create a complete set of user accounts, groups, and command policies and bind each policy to the appropriate groups and users. The company, Example Manufacturing, Inc., has three users who can access the NetScaler appliance:

- **John Doe.** The IT manager. John needs to be able to see all parts of the NetScaler configuration but does not need to modify anything.
- **Maria Ramiez.** The lead IT administrator. Maria needs to be able to see and modify all parts of the NetScaler configuration except for NetScaler commands (which local policy dictates must be performed while logged on as nsroot).
- **Michael Baldrock.** The IT administrator in charge of load balancing. Michael needs to be able to see all parts of the NetScaler configuration, but needs to modify only the load balancing functions.

The following table shows the breakdown of network information, user account names, group names, and command policies for the sample company.

Table 1. Sample Values for Creating Entities

Field	Value	Note
NetScaler host name	ns01.example.net	N/A
User accounts	johnd, mariar, and michaelb	John Doe, IT manager, Maria Ramirez, IT administrator and Michael Baldrock, IT administrator.
Groups	Managers and SysOps	All managers and all IT administrators.
Command Policies	read_all, modify_lb, and modify_all	Allow complete read-only access, Allow modify access to load balancing, and Allow complete modify access.

The following description walks you through the process of creating a complete set of user accounts, groups, and command policies on the NetScaler appliance named ns01.example.net.

The description includes procedures for binding the appropriate user accounts and groups to one another, and binding appropriate command policies to the user accounts and groups.

This example illustrates how you can use prioritization to grant precise access and privileges to each user in the IT department.

The example assumes that initial installation and configuration have already been performed on the NetScaler.

Configuration steps

1. Use the procedure described in "Configuring User Accounts" to create user accounts **johnd**, **mariar**, and **michaelb**.
2. Use the procedure described in "Configuring User Groups" to create user groups **Managers** and **SysOps**, and then bind the users **mariar** and **michaelb** to the **SysOps** group and the user **johnd** to the **Managers** group.

3. Use the procedure described in "Creating Custom Command Policies" to create the following command policies:
   - **read_all** with action **Allow** and command spec "(^show\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*)|(^stat.*)"
   - **modify_lb** with action as **Allow** and the command spec "^set\s+lb\s+.*$"
   - **modify_all** with action as **Allow** and the command spec **"^\S+\s+(?!system).*"**
4. Use the procedure described in "Binding Command Policies to Users and Groups" to bind the **read_all** command policy to the **SysOps** group, with priority value **1**.
5. Use the procedure described in "Binding Command Policies to Users and Groups" to bind the **modify_lb** command policy to user **michaelb**, with priority value **5**.

The configuration you just created results in the following:

- John Doe, the IT manager, has read-only access to the entire NetScaler configuration, but he cannot make modifications.
- Maria Ramirez, the IT lead, has near-complete access to all areas of the NetScaler configuration, having to log on only to perform NetScaler-level commands.
- Michael Baldrock, the IT administrator responsible for load balancing, has read-only access to the NetScaler configuration, and can modify the configuration options for load balancing.

The set of command policies that applies to a specific user is a combination of command policies applied directly to the user's account and command policies applied to the group(s) of which the user is a member.

Each time a user enters a command, the operating system searches the command policies for that user until it finds a policy with an ALLOW or DENY action that matches the command. When it finds a match, the operating system stops its command policy search and allows or denies access to the command.

If the operating system finds no matching command policy, it denies the user access to the command, in accordance with the NetScaler appliance's default deny policy.

Note: When placing a user into multiple groups, take care not to cause unintended user command restrictions or privileges. To avoid these conflicts, when organizing your users in groups, bear in mind the NetScaler command policy search procedure and policy ordering rules.

Configuring External User Authentication

Jun 01, 2015

External user authentication is the process of authenticating the users of the Citrix NetScaler appliance by using an external authentication server. The NetScaler supports LDAP, RADIUS, and TACACS+ authentication servers. To configure external user authentication, you must create authentication policies. You can configure one or many authentication policies, depending on your authentication needs. An authentication policy consists of an expression and an action. Authentication policies use NetScaler classic expressions, which are described in detail in "Policy Configuration and Reference."

After creating an authentication policy, you bind it to the system global entity and assign a priority to it. You can create simple server configurations by binding a single authentication policy to the system global entity. Or, you can configure a cascade of authentication servers by binding multiple policies to the system global entity. If no authentication policies are bound to the system, users are authenticated by the onboard system.

This document includes the following details:

- Configuring LDAP Authentication
- Configuring RADIUS Authentication
- Configuring TACACS+ Authentication
- Binding the Authentication Policies to the System Global Entity

Configuring LDAP Authentication

Updated: 2014-12-29

You can configure the NetScaler appliance to authenticate user access with one or more LDAP servers. LDAP authorization requires identical group names in Active Directory, on the LDAP server, and on the appliance. The characters and case must also be the same.

By default, LDAP authentication is secured by using SSL/TLS protocol. There are two types of secure LDAP connections. In the first type, the LDAP server accepts the SSL/TLS connection on a port separate from the port used to accept clear LDAP connections. After users establish the SSL/TLS connection, LDAP traffic can be sent over the connection. The second type allows both unsecure and secure LDAP connections and is handled by a single port on the server. In this scenario, to create a secure connection, the client first establishes a clear LDAP connection. Then the LDAP command StartTLS is sent to the server over the connection. If the LDAP server supports StartTLS, the connection is converted to a secure LDAP connection by using TLS.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections
- 636 for secure LDAP connections
- 3268 for Microsoft unsecure LDAP connections
- 3269 for Microsoft secure LDAP connections

LDAP connections that use the StartTLS command use port number 389. If port numbers 389 or 3268 are configured on the appliance, it tries to use StartTLS to make the connection. If any other port number is used, connection attempts use SSL/TLS. If StartTLS or SSL/TLS cannot be used, the connection fails.

When configuring the LDAP server, the case of the alphabetic characters must match that on the server and on the appliance. If the root directory of the LDAP server is specified, all of the subdirectories are also searched to find the user attribute. In large directories, this can affect performance. For this reason, Citrix recommends that you use a specific organizational unit (OU).

The following table lists examples of user attribute fields for LDAP servers.

Table 1. User Attribute Fields for LDAP Servers

LDAP server	User attribute	Case sensitive?
Microsoft Active Directory	Server sAMAccountName	No
Novell eDirectory	cn	Yes
IBM Directory Server	uid	Yes
Lotus Domino	CN	Yes
Sun ONE directory (formerly iPlanet)	uid or cn	Yes

The following table lists examples of the base distinguished name (DN).

Table 2. Examples of Base Distinguished Name

LDAP server	Base DN
Microsoft Active Directory	DC=citrix, DC=local
Novell eDirectory	dc=citrix, dc=net
IBM Directory Server	cn=users
Lotus Domino	OU=City, O=Citrix, C=US

LDAP server	Base DN
Sun ONE directory (formerly iPlanet)	ou=People, dc=citrix, dc=com

The following table lists examples of the bind distinguished name (DN).

Table 3. Examples of Bind Distinguished Name

LDAP server	Bind DN
Microsoft Active Directory	CN=Administrator, CN=Users, DC=citrix, DC=local
Novell eDirectory	cn=admin, dc=citrix, dc=net
IBM Directory Server	LDAP_dn
Lotus Domino	CN=Notes Administrator, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	uid=admin, ou=Administrators, ou=TopologyManagement, o=NetscapeRoot

To configure LDAP authentication by using the command line interface

At the command prompt, do the following:

1. Create an LDAP action.
   add authentication ldapAction <name> {-serverIP <ip_addr|ipv6_addr|*> | {-serverName <string>}} >] [-authTimeout <positive_integer>] [-ldapBase <string>] [-ldapBindDn <string>] {-ldapBindDnPassword } [-ldapLoginName <string>] [-groupAttrName <string>] [-subAttributeName <string>]

   Example:
   add authentication ldapAction ldap70 -serverIP <IP> -authTimeout 30 -ldapBase "CN=xxxxx,DC=xxxx,DC=xxx" -ldapBindDn "CN=xxxxx,CN=xxxxx,DC=xxxx,DC=xxx" -ld
2. Create an LDAP policy.
   add authentication ldapPolicy <name> <rule> [<reqAction>]

   Example:
   add authentication ldappolicy ldap_pol ns_true ldap70
3. Bind the LDAP policy to the following bind points at which the policy will be evaluated.
   - **System Global**: bind system global <policyName> [-priority <positive_integer>]
   - **VPN Global**: bind vpn global <policyName> [-priority <positive_integer>]
   - **Authentication Server**: bind authentication vserver <name> [-policy <string> [-priority <positive_integer>]
   - **VPN Server**: bind vpn vserver <name> [-policy <string> [-priority <positive_integer>]

To configure LDAP authentication by using the configuration utility

Navigate to System > Authentication > LDAP, and create the LDAP authentication policy.

Determining attributes in the LDAP directory

If you need help determining your LDAP directory attributes, you can easily look them up with the free LDAP browser from Softerra.

You can download the LDAP browser from the Softerra LDAP Administrator Web site at http://www.ldapbrowser.com. After the browser is installed, set the following attributes:

- The host name or IP address of your LDAP server.
- The port of your LDAP server. The default is 389.
- The base DN field can be left blank.
- The information provided by the LDAP browser can help you determine the base DN needed for the Authentication tab.
- The Anonymous Bind check determines whether the LDAP server requires user credentials for the browser to connect to it. If the LDAP server requires credentials, leave the check box cleared.

After completing the settings, the LDAP browser displays the profile name in the left pane and connects to the LDAP server.

Configuring RADIUS Authentication

Updated: 2014-08-08

You can configure the NetScaler appliance to authenticate user access with one or more RADIUS servers. If you are using RSA SecurID, SafeWord, or Gemalto Protiva products, use a RADIUS server.

Your configuration might require using a network access server IP address (NAS IP) or a network access server identifier (NAS ID). When configuring the appliance to use a RADIUS authentication server, use the following guidelines:

- If you enable use of the NAS IP, the appliance sends its configured IP address to the RADIUS server, rather than the source IP address used in establishing the RADIUS connection.
- If you configure the NAS ID, the appliance sends the identifier to the RADIUS server. If you do not configure the NAS ID, the appliance sends its host name to the RADIUS server.
- When the NAS IP is enabled, the appliance ignores any NAS ID that was configured by using the NAS IP to communicate with the RADIUS server.

To configure RADIUS authentication by using the configuration utility

Navigate to System > Authentication > Radius, and create the RADIUS authentication policy.

Choosing RADIUS authentication protocols

The NetScaler appliance supports implementations of RADIUS that are configured to use any of several protocols for user authentication, including:

- Password Authentication Protocol
- Challenge-Handshake Authentication Protocol (CHAP)

- Microsoft Challenge-Handshake Authentication Protocol (MS-CHAP Version 1 and Version 2)

If your deployment of the appliance is configured to use RADIUS authentication and your RADIUS server is configured to use Password Authentication Protocol, you can strengthen user authentication by assigning a strong shared secret to the RADIUS server. Strong RADIUS shared secrets consist of random sequences of uppercase and lowercase letters, numbers, and punctuation, and are at least 22 characters long. If possible, use a random character generation program to determine RADIUS shared secrets.

To further protect RADIUS traffic, assign a different shared secret to each appliance or virtual server. When you define clients on the RADIUS server, you can also assign a separate shared secret to each client. If you do this, you must configure separately each policy that uses RADIUS authentication.

Shared secrets are configured on the appliance when a RADIUS policy is created.

Configuring IP address extraction

You can configure the appliance to extract the IP address from a RADIUS server. When a user authenticates with the RADIUS server, the server returns a framed IP address that is assigned to the user. The following are attributes for IP address extraction:
- Allows a remote RADIUS server to supply an IP address from the internal network for a user logged on to the appliance.
- Allows configuration for any RADIUS attribute using the type ipaddress, including those that are vendor encoded.

When configuring the RADIUS server for IP address extraction, you configure the vendor identifier and the attribute type.

The vendor identifier enables the RADIUS server to assign an IP address to the client from a pool of IP addresses that are configured on the RADIUS server. The vendor ID and attributes are used to make the association between the RADIUS client and the RADIUS server. The vendor ID is the attribute in the RADIUS response that provides the IP address of the internal network. A value of zero indicates that the attribute is not vendor encoded. The attribute type is the remote IP address attribute in a RADIUS response. The minimum value is one and the maximum value is 255.

A common configuration is to extract the RADIUS attribute *framed IP address*. The vendor ID is set to zero or is not specified. The attribute type is set to eight.

To configure IP address extraction by using the configuration utility

1. Navigate to System > Authentication > Radius, and select a policy.
2. Modify the server parameters and set relevant values in Group Vendor Identifier and Group Attribute Type fields.

Configuring TACACS+ Authentication

Updated: 2014-08-07

You can configure a TACACS+ server for authentication. Similar to RADIUS authentication, TACACS+ uses a secret key, an IP address, and the port number. The default port number is 49. To configure the appliance to use a TACACS+ server, provide the server IP address and the TACACS+ secret. The port needs to be specified only when the server port number in use is something other than the default port number of 49.

To configure TACACS+ authentication by using the configuration utility

Navigate to System > Authentication > TACACS, and create the TACACS authentication policy.
After the TACACS+ server settings are configured on the appliance, bind the policy to the system global entity. For more information about binding authentication policies globally, see "Binding the Authentication Policies to the System Global Entity."

Binding the Authentication Policies to the System Global Entity

Updated: 2014-12-30

When the authentication policies are configured, bind the policies to the system global entity.

To bind an authentication policy to system global using the command line interface

At the command line prompt, do the following:

bind system global <policyName> [-priority <positive_integer>]

Example:
```
bind system global ldappol1 -priority 10
```

To bind an authentication policy to system global using the configuration utility

1. Navigate to System > Authentication, and select the required authentication type.
2. On the Policies tab, click Action > Global Bindings.
3. Click Insert Policy and under Policy Name, select the policy and click OK.

TCP Configurations

Nov 05, 2015

TCP configurations for a NetScaler appliance can be specified in an entity called a TCP profile, which is a collection of TCP settings. The TCP profile can then be associated with services or virtual servers that want to use these TCP configurations.

A default TCP profile can be configured to set the TCP configurations that will be applied by default, globally to all services and virtual servers.

Note: When a TCP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence.
The NetScaler appliance also provides other approaches for configuring TCP. Read on for more information.

The NetScaler appliance supports the following TCP capabilities:

- Congestion control using New-Reno, and TCP Westwood algorithms.
- Window scaling to increase the TCP receive window size beyond its maximum value of 65,535 bytes.
  Note: Before configuring window scaling, make sure that:
  - You do not set a high value for the scale factor, because this could have adverse effects on the appliance and the network.
  - You do not configure window scaling unless you clearly know why you want to change the window size.
  - Both hosts in the TCP connection send a window scale option during connection establishment. If only one side of a connection sets this option, window scaling is not used for the connection.
  - Each connection for same session is an independent window scaling session. For example, when a client's request and the server's response flow through the appliance, it is possible to have window scaling between the client and the appliance without window scaling between the appliance and the server.
- TCP maximum congestion window size that is user configurable. The default value is 8190 bytes.
- Selective acknowledgment (SACK), using which the data receiver (either a NetScaler appliance or a client) notifies the sender about all the segments that have been received successfully.
- Forward acknowledgment (FACK) avoids TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either a NetScaler ADC or a client) control the amount of data injected into the network during retransmission timeouts.
- TCP connection multiplexing enables reuse of existing TCP connections. The NetScaler appliance stores established TCP connections to the reuse pool. Whenever a client request is received, appliance checks for an available connection in the reuse pool and serves the new client if the connection is available. If it is unavailable, the appliance creates a new connection for the client request and stores the connection to the reuse pool.
  NetScaler supports connection multiplexing for HTTP, SSL, and DataStream connection types.
- Dynamic receive buffering allows the receive buffer to be adjusted dynamically based on memory and network conditions.
- MPTCP connections between client and NetScaler. MPTCP connections are not supported between NetScaler and the backend server.
  The NetScaler implementation of MPTCP is RFC 6824 compliant.

  Note:
  - For MPTCP to work, both sides of the connection (client and server) must support it. If you use the NetScaler appliance as an MPTCP gateway for your servers, the servers do not have to support MPTCP.
  - The NetScaler appliance does not initiate subflows (MP_JOIN's). The appliance expects the client to initiate subflows.
- TCP keep-alive to monitor the TCP connections to verify if the peers are up.
- Extracting TCP/IP path overlay and inserting client-IP HTTP header. Data transport through overlay networks often uses connection termination or Network Address Translation (NAT), in which the IP address of the source client is lost. To avoid this, the Netscaler appliance extracts the TCP/IP path overlay option and inserts the source client's IP address into the HTTP header. With the IP address in the header, the web server can identify the source client that made the connection. The extracted data is valid for lifetime of the TCP connection and therefore, this prevents the next hop host from having to interpret the option again. This option is applicable only for web services that have the client-IP insertion option enabled.

Additionally, NetScaler provides configuration support for the following:

- Synchronizing cookie for TCP handshake with clients. Disabling this capability prevents SYN attack protection on the NetScaler appliance.
- Learning MSS to enable MSS learning for all the virtual servers configured on the appliance.

This document includes the following details:

Setting Global TCP Parameters

Updated: 2014-08-08

The NetScaler appliance allows you to specify values for TCP parameters that are applicable to all NetScaler services and virtual servers. This can be done using:

- Default TCP profile
- Global TCP command
- TCP buffering feature

Note: The recvBuffSize parameter of the set ns tcpParam command is deprecated from release 9.2 onwards. In later releases, set the buffer size by using the bufferSize parameter of the set ns tcpProfile command. If you upgrade to a release where the recvBuffSize parameter is deprecated, the bufferSize parameter is set to its default value.

Default TCP profile

A TCP profile, named as **nstcp_default_profile**, is used to specify TCP configurations that will used if no TCP configurations are provided at the service or virtual server level.

Note:
- Not all TCP parameters can be configured through the default TCP profile. Some settings have to be performed by using the global TCP command (see section below).
- The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default TCP profile

- Using the command line interface, at the command prompt enter:

  set ns tcpProfile nstcp_default_profile ...

- On the configuration utility, navigate to System > Profiles, click TCP Profiles and update nstcp_default_profile.

Global TCP command

Another approach you can use to configure global TCP parameters is the global TCP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using a TCP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default TCP profile.

For example, if the SACK parameter is updated using this approach, the value is reflected in the SACK parameter of the default TCP profile (nstcp_default_profile).

Note: Citrix recommends that you use this approach only for TCP parameters that are not available in the default TCP profile.
To configure the global TCP command

- Using the command line interface, at the command prompt enter:

  set ns tcpParam ...

- On the configuration utility, navigate to System > Settings, click Change TCP parameters and update the required TCP parameters.

TCP buffering feature

NetScaler provides a feature called TCP buffering that you can use to specify the TCP buffer size. The feature can be enabled globally or at service level.

Note: The buffer size can also be configured in the default TCP profile. If the buffer size has different values in the TCP buffering feature and the default TCP profile, the greater value is applied.
To configure the TCP buffering feature globally

- At the command prompt enter:

  enable ns mode TCPB

  set ns tcpbufParam -size <positiveInteger> -memLimit <positiveInteger>

- On the configuration utility, navigate to System > Settings, click Configure Modes and select TCP Buffering.
  And, navigate to System > Settings, click Change TCP parameters and specify the values for Buffer size and Memory usage limit.

Setting Service or Virtual Server Specific TCP Parameters

Updated: 2014-08-08

Using TCP profiles, you can specify TCP parameters for services and virtual servers. You must define a TCP profile (or use a built-in TCP profile) and associate the profile with the appropriate service and virtual server.

Note:
- You can also modify the TCP parameters of default profiles as per your requirements. For more information on built-in TCP profiles, see Built-in TCP Profiles.

- You can specify the TCP buffer size at service level using the parameters specified by the TCP buffering feature. For more information, see TCP buffering feature.

To specify service or virtual server level TCP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the TCP profile.
   set ns tcpProfile <profile-name>...
2. Bind the TCP profile to the service or virtual server.
   To bind the TCP profile to the service:

   set service <name> ....

   Example:
   `> set service service1 -tcpProfileName profile1`
   To bind the TCP profile to the virtual server:

   set lb vserver <name> ....

   Example:
   `> set lb vserver lbvserver1 -tcpProfileName profile1`

To specify service or virtual server level TCP configurations by using the configuration utility

At the configuration utility, perform the following:

1. Configure the TCP profile.
   Navigate to System > Profiles > TCP Profiles, and create the TCP profile.
2. Bind the TCP profile to the service or virtual server.
   Navigate to Traffic Management > Load Balancing > Services/Virtual Servers, and create the TCP profile, which should be bound to the service or virtual server.

Built-in TCP Profiles

Updated: 2014-04-07

For convenience of configuration, the NetScaler provides some built-in TCP profiles. Review the built-in profiles listed below and select a profile and use it as it is or modify it to meet your requirements. You can bind these profiles to your required services or virtual servers.

Table 1. Built-in TCP Profiles

Built-in profile	Description
nstcp_default_profile	Represents the default global TCP settings on the appliance.
nstcp_default_tcp_lan	Useful for back-end server connections, where these servers reside on the same LAN as the appliance.
nstcp_default_tcp_lan_thin_stream	Similar to the nstcp_default_tcp_lan profile; however, the settings are tuned to small size packet flows.
nstcp_default_tcp_interactive_stream	Similar to the nstcp_default_tcp_lan profile; however, it has a reduced delayed ACK timer and ACK on PUSH packet settings.
nstcp_default_tcp_lfp	Useful for long fat pipe networks (WAN) on the client side. Long fat pipe networks have long delay, high bandwidth lines with minimal packet drops.
nstcp_default_tcp_lfp_thin_stream	Similar to the nstcp_default_tcp_lfp profile; however, the settings are tuned for small size packet flows.
nstcp_default_tcp_lnp	Useful for long narrow pipe networks (WAN) on the client side. Long narrow pipe networks have considerable packet loss once in a while.

Built-in profile	Description
nstcp_default_tcp_lnp_thin_stream	Similar to the nstcp_default_tcp_lnp profile; however, the settings are tuned for small size packet flows.
nstcp_internal_apps	Useful for internal applications on the appliance (for example, GSLB sitesyncing). This contains tuned window scaling and SACK options for the desired applications. This profile should not be bound to applications other than internal applications.
nstcp_default_Mobile_profile	Useful for mobile devices.
nstcp_default_XA_XD_profile	Useful for a XenApp or XenDesktop deployment.

Sample TCP Configurations

Updated: 2015-04-28

Sample command line interface examples for configuring the following:

- Selective ACKnowledgment (SACK)
- Window Scaling (WS)
- Maximum Segment Size (MSS)
- NetScaler to learn the MSS of a virtual server
- TCP keep-alive
- Buffer size - using TCP profile
- Buffer size - using TCP buffering feature
- MPTCP
- Congestion control
- Dynamic receive buffering

Selective ACKnowledgment (SACK)

Enable SACK on the required TCP profile.

```
> set ns tcpProfile profile1 -SACK ENABLED
 Done
> set lb vserver lbvserver1 -tcpProfileName profile1
 Done
```

Window Scaling (WS)

Enable window scaling and set the window scaling factor on the required TCP profile.

```
> set ns tcpProfile profile1 –WS ENABLED –WSVal 9
 Done
> set lb vserver lbvserver1 -tcpProfileName profile1
 Done
```

Maximum Segment Size (MSS)

Update the MSS related configurations.

```
> set ns tcpProfile profile1 –mss 1460 - maxPktPerMss 512
 Done
> set lb vserver lbvserver1 -tcpProfileName profile1
 Done
```

NetScaler to learn the MSS of a virtual server

Enable the NetScaler to learn the VSS and update other related configurations.

```
> set ns tcpParam -learnVsvrMSS ENABLED –mssLearnInterval 180 -mssLearnDelay 3600
 Done
```

TCP keep-alive

Enable TCP keep-alive and update other related configurations.

```
> set ns tcpProfile profile1 –KA ENABLED –KaprobeUpdateLastactivity ENABLED -KAconnIdleTime 900 -KAmaxProbes 3 -KaprobeInterval 75
```

```
 Done
> set lb vserver lbvserver1 -tcpProfileName profile1
 Done
```

Buffer size - using TCP profile

Specify the buffer size.

```
> set ns tcpProfile profile1 –bufferSize 8190
 Done
> set lb vserver lbvserver1 -tcpProfileName profile1
 Done
```

Buffer size - using TCP buffering feature

Enable the TCP buffering feature (globally or for a service) and then specify the buffer size and the memory limit.

```
> enable ns feature TCPB
 Done
> set ns tcpbufParam -size 64 -memLimit 64
 Done
```

MPTCP

Enable MPTCP and then set the optional MPTCP configurations.

```
> set ns tcpProfile profile1 -mptcp ENABLED
 Done
> set ns tcpparam -mptcpConCloseOnPassiveSF ENABLED -mptcpChecksum ENABLED -mptcpSFtimeout 0 -mptcpSFReplaceTimeout 10
-mptcpMaxSF 4 -mptcpMaxPendingSF 4 -mptcpPendingJoinThreshold 0 -mptcpRTOsToSwitchSF 2 -mptcpUseBackupOnDSS ENABLED
 Done
```

Congestion control

Set the required TCP congestion control algorithm.

```
> set ns tcpProfile profile1 -flavor Westwood
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

Dynamic receive buffering

Enable dynamic receive buffering on the required TCP profile.

```
> set ns tcpProfile profile1 -dynamicReceiveBuffering ENABLED
Done
> set lb vserver lbvserver1 -tcpProfileName profile1
Done
```

HTTP Configurations

Jun 03, 2015

HTTP configurations for a NetScaler appliance can be specified in an entity called an HTTP profile, which is a collection of HTTP settings. The HTTP profile can then be associated with services or virtual servers that want to use these HTTP configurations.

A default HTTP profile can be configured to set the HTTP configurations that will be applied by default, globally to all services and virtual servers.

Note: When a HTTP parameter has different values for service, virtual server, and globally, the value of the most-specific entity (the service) is given the highest precedence.
The NetScaler appliance also provides other approaches for configuring HTTP. Read on for more information.

The NetScaler supports the following HTTP capabilities:

- WebSocket protocol which allows browsers and other clients to create a bi-directional, full duplex TCP connection to the servers. The NetScaler implementation of WebSocket is RFC 6455 complaint.
- SPDY (Speedy). For more information, see SPDY.

This document includes the following details:

- Setting Global HTTP Parameters
- Setting Service or Virtual Server Specific HTTP Parameters
- Built-in HTTP Profiles
- Sample HTTP Configurations

Setting Global HTTP Parameters

Updated: 2014-08-06

The NetScaler appliance allows you to specify values for HTTP parameters that are applicable to all NetScaler services and virtual servers. This can be done using:

- Default HTTP profile
- Global HTTP command

Default HTTP profile

A HTTP profile, named as **nshttp_default_profile**, is used to specify HTTP configurations that will be used if no HTTP configurations are provided at the service or virtual server level.

Note:

- Not all HTTP parameters can be configured through the default HTTP profile. Some settings have to be performed by using the global HTTP command (see section below).
- The default profile does not have to be explicitly bound to a service or virtual server.

To configure the default HTTP profile

- Using the command line interface, at the command prompt enter:

  set ns httpProfile nshttp_default_profile ...

- On the configuration utility, navigate to System > Profiles, click HTTP Profiles and update nshttp_default_profile.

Global HTTP command

Another approach you can use to configure global HTTP parameters is the global HTTP command. In addition to some unique parameters, this command duplicates some parameters that can be set by using a HTTP profile. Any update made to these duplicate parameters is reflected in the corresponding parameter in the default HTTP profile.

For example, if the maxReusePool parameter is updated using this approach, the value is reflected in the maxReusePool parameter of the default HTTP profile (nshttp_default_profile).

Note: Citrix recommends that you use this approach only for HTTP parameters that are not available in the default HTTP profile.
To configure the global HTTP command

- Using the command line interface, at the command prompt enter:

  set ns httpParam ...

- On the configuration utility, navigate to System > Settings, click Change HTTP parameters and update the required HTTP parameters.

Setting Service or Virtual Server Specific HTTP Parameters

Updated: 2014-08-07

Using HTTP profiles, you can specify HTTP parameters for services and virtual servers. You must define a HTTP profile (or use a built-in HTTP profile) and associate the profile with the appropriate service and virtual server.

Note: You can also modify the HTTP parameters of default profiles as per your requirements. For more information on built-in HTTP profiles, see Built-in HTTP Profiles.

To specify service or virtual server level HTTP configurations by using the command line interface

At the command prompt, perform the following:

1. Configure the HTTP profile.
   set ns httpProfile <profile-name>...

2. Bind the HTTP profile to the service or virtual server.
   To bind the HTTP profile to the service:

   set service <name> .....

   Example:
   ```
   > set service service1 -httpProfileName profile1
   ```
   To bind the HTTP profile to the virtual server:

   set lb vserver <name> .....

   Example:
   ```
   > set lb vserver lbvserver1 -httpProfileName profile1
   ```

To specify service or virtual server level HTTP configurations by using the configuration utility

At the configuration utility, perform the following:

1. Configure the HTTP profile.
   Navigate to System > Profiles > HTTP Profiles, and create the HTTP profile.

2. Bind the HTTP profile to the service or virtual server.
   Navigate to Traffic Management > Load Balancing > Services/Virtual Servers, and create the HTTP profile, which should be bound to the service/virtual server.

Built-in HTTP Profiles

Updated: 2014-04-25

For convenience of configuration, the NetScaler provides some built-in HTTP profiles. Review the profiles listed below and use it as it is or modify it to meet your requirements. You can bind these profiles to the required services or virtual servers.

Table 1. Built-in HTTP Profiles

Built-in profile	Description
nshttp_default_profile	Represents the default global HTTP settings on the appliance.
nshttp_default_strict_validation	Settings for deployments that require strict validation of HTTP requests and responses.

Sample HTTP Configurations

Updated: 2014-04-25

Sample command line interface examples to configure the following:

- HTTP band statistics
- WebSocket connections

HTTP band statistics

Specify the band size for HTTP requests and responses.

```
> set protocol httpBand reqBandSize 300 respBandSize 2048
Done
> show protocol httpband -type REQUEST
```

WebSocket connections

Enable webSocket on the required HTTP profile.

```
> set ns httpProfile http_profile1 -webSocket ENABLED
Done
```

```
> set lb vserver lbvserver1 -httpProfileName profile1
Done
```

SNMP

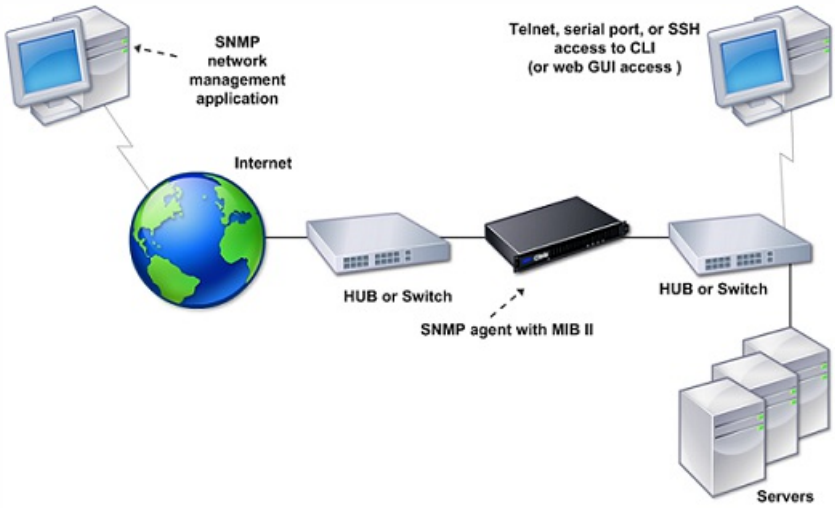
Jun 01, 2015

You can use Simple Network Management Protocol (SNMP) to configure the SNMP agent on the Citrix NetScaler appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the NetScaler. The traps are then sent to a remote device called a *trap listener*, which signals the abnormal condition on the NetScaler appliance. Or, you can query the SNMP agent for System-specific information from a remote device called an *SNMP manager*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The SNMP agent on the NetScaler can generate traps compliant with SNMPv1, SNMPv2, and SNMPv3. For querying, the SNMP agent supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3).

The following figure illustrates a network with a NetScaler that has SNMP enabled and configured. In the figure, each SNMP network management application uses SNMP to communicate with the SNMP agent on the NetScaler. The SNMP agent searches its management information base (MIB) to collect the data requested by the SNMP Manager and provides the information to the application.

Figure 1. *NetScaler Supporting SNMP*



Importing MIB Files to the SNMP Manager and Trap Listener

To monitor a NetScaler appliance, you must download the MIB object definition files. The MIB files include the following:

- MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- NetScaler-specific configuration and statistics.

You can obtain the MIB object definition files from the /netscaler/snmp directory or from the Downloads tab of the NetScaler GUI.

If the SNMP management application is other than WhatsUpGold, download the following files to the SNMP management application:

- NS-MIB-smiv1.mib. Used by SNMPv1 managers and trap listeners.

- NS-MIB-smiv2.mib. Used by SNMPv2 and SNMPv3 managers and SNMPv2 trap listeners.

If the SNMP management application is WhatsUpGold, download the following files to the SNMP management application:

- mib.txt
- traps.txt

Configuring the NetScaler to Generate SNMP Traps

Jun 01, 2015

You can configure the NetScaler appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the appliance. The traps are sent to a remote device called a *trap listener*. This helps administrators monitor the appliance and respond promptly to any issues.

The NetScaler appliance provides a set of condition entities called *SNMP alarms*. When the condition in any SNMP alarm is met, the appliance generates SNMP trap messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the appliance.

To configure the NetScaler appliance to generate traps, you need to enable and configure alarms. Then, you specify trap listeners to which the appliance will send the generated trap messages.

This document includes the following details:

- Enabling an SNMP Alarm
- Configuring Alarms
- Configuring SNMPv1 or SNMPv2 Traps
- Enabling Unconditional SNMP Trap Logging

Enabling an SNMP Alarm

Updated: 2014-08-08

The NetScaler appliance generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the appliance generates corresponding trap messages when some events occur. Some alarms are enabled by default.

To enable an SNMP alarm by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- enable snmp alarm <trapName>
- show snmp alarm <trapName>

To enable an SNMP alarm by using the configuration utility

1. Navigate to System > SNMP > Alarms, and select the alarm.
2. Click Actions and select Enable.

Configuring Alarms

Updated: 2014-08-06

The NetScaler appliance provides a set of condition entities called *SNMP alarms*. When the condition set for an SNMP alarm is met, the appliance generates SNMP traps messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a

login failure on the appliance.

You can assign an SNMP alarm with a severity level. When you do this, the corresponding trap messages are assigned that severity level.

The following are the severity levels, defined on the appliance, in decreasing order of severity.

- Critical
- Major
- Minor
- Warning
- Informational

For example, if you set a warning severity level for the SNMP alarm named LOGIN-FAILURE, the trap messages generated when there is a login failure will be assigned with the warning severity level.

You can also configure an SNMP alarm to log the corresponding trap messages generated whenever the condition on that alarm is met.

To configure an SNMP alarm by using the command line interface

At the command prompt, type the following commands to configure an SNMP alarm and verify the configuration:

- set snmp alarm <trapName> [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-time <secs>] [-state (ENABLED | DISABLED)] [-severity <severity>] [-logging (ENABLED | DISABLED)]
- show snmp alarm <trapName>

To configure SNMP alarms by using the configuration utility

Navigate to System > SNMP > Alarms, select an alarm and configure the alarm parameters.

Configuring SNMPv1 or SNMPv2 Traps

Updated: 2014-08-06

After configuring the alarms, you need to specify the trap listener to which the appliance sends the trap messages. Apart from specifying parameters such as IP or IPv6 address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

You can also configure the appliance to send SNMP trap messages with a source IP address other than the NetScaler IP (NSIP or NSIP6) address to a particular trap listener. For a trap listener that has an IPv4 address, you can set the source IP to either a mapped IP (MIP) address or a subnet IP (SNIP) address configured on the appliance. For a trap listener that has an IPv6 address, you can set the source IP to subnet IPv6 (SNIP6) address configured on the appliance.

You can also configure the appliance to send trap messages to a trap listener on the basis of a severity level. For example, if you set the severity level as Minor for a trap listener, all trap messages of the severity level equal to or greater than Minor (Minor, Major, and Critical) are sent to the trap listener.

If you have defined a community string for the trap listener, you must also specify a community string for each trap that is to be sent to the listener. A trap listener for which a community string has been defined accepts only trap messages that

include a community string matching the community string defined in the trap listener. Other trap messages are dropped.

To add an SNMP trap by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp trap <trapClass> <trapDestination> -version (V1 | V2) -destPort <port> -communityName <string> -srcIP <ip_addr> -severity <severity>
- show snmp trap

Example

```
> add snmp trap specific 10.102.29.3 -version V2 -destPort 80 -communityName com1 -severity Major
```

To configure SNMP Traps by using the configuration utility

Navigate to System > SNMP > Traps, and create the SNMP trap.

Enabling Unconditional SNMP Trap Logging

Updated: 2014-08-08

By default, the NetScaler appliance logs any SNMP trap messages (for SNMP alarms in which logging is enabled) when at least one trap listener is specified on the appliance. However, you can specify that SNMP trap messages be logged even when no trap listeners are configured.

To enable unconditional SNMP trap logging by using the command line interface

At the command prompt, type the following commands to configure unconditional SNMP trap logging and verify the configuration:

- set snmp option -snmpTrapLogging (ENABLED | DISABLED)
- show snmp option

To enable unconditional SNMP trap logging by using the configuration utility

Navigate to System > SNMP, click Change SNMP Options and select SNMP Trap Logging.

Configuring the NetScaler for SNMP v1 and v2 Queries

Jun 01, 2015

You can query the NetScaler SNMP agent for system-specific information from a remote device called *SNMP managers*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The following types of SNMP v1 and v2 queries are supported by the SNMP agent:

- GET
- GET NEXT
- ALL
- GET BULK

You can create strings called community strings and associate each of these to query types. You can associate one or more community strings to each query type. Community string are passwords and used to authenticate SNMP queries from SNMP managers.

For example, if you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the NetScaler appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

This document includes the following details:

Updated: 2014-08-06

You must configure the NetScaler appliance to allow the appropriate SNMP managers to query it. You must also provide the SNMP manager with the required NetScaler-specific information. You can add up to a maximum of 100 SNMP managers or networks.

For an IPv4 SNMP manager you can specify a host name instead of the manager's IP address. If you do so, you must add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host-name based SNMP managers.

Note: The appliance does not support use of host names for SNMP managers that have IPv6 addresses. You must specify the IPv6 address.
If you do not configure at least one SNMP manager, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds only to SNMP queries from those specific IP addresses.

If you remove an SNMP manager from the configuration, that manager can no longer query the appliance.

To add SNMP managers by specifying IP addresses by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp manager <IPAddress> ... [-netmask <netmask>]
- show snmp manager

```
> add snmp manager 10.102.29.10 10.102.29.15 10.102.29.30
```

To add an SNMP manager by specifying its host name by using the command line interface

Important: If you specify the SNMP manager's host name instead of its IP address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see "Adding a Name Server."
At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp manager <IPAddress> [-domainResolveRetry **<integer>]**
- show snmp manager

```
> add nameserver 10.103.128.15

> add snmp manager engwiki.eng.example.net –domainResolveRetry 10
```

To add an SNMP manager by using the configuration utility

1. Navigate to System > SNMP > Managers, and create the SNMP manager.
   Important: If you specify the SNMP manager's host name instead of its IPv4 address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see "Adding a Name Server."
   Note: The appliance does not support host names for SNMP managers that have IPv6 addresses.

Updated: 2014-08-06

You can create strings called community strings and associate them with the following SNMP query types on the appliance:

- GET
- GET NEXT
- ALL
- GET BULK

You can associate one or more community strings to each query types. For example, when you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

If you do not associate any community string to a query type then the SNMP agent responds to all SNMP queries of that type.

To specify an SNMP community by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp community <communityName> <permissions>
- show snmp community

```
> add snmp community com all
```

To configure an SNMP community string by using the configuration utility

Navigate to System > SNMP > Community, and create the SNMP community.

Configuring the NetScaler for SNMPv3 Queries

Jun 01, 2015

Simple Network Management Protocol Version 3 (SNMPv3) is based on the basic structure and architecture of SNMPv1 and SNMPv2. However, SNMPv3 enhances the basic architecture to incorporate administration and security capabilities, such as authentication, access control, data integrity check, data origin verification, message timeliness check, and data confidentiality.

To implement message level security and access control, SNMPv3 introduces the user-based security model (USM) and the view-based access control model (VACM).

- **User-Based Security Model.** The user-based security model (USM) provides message-level security. It enables you to configure users and security parameters for the SNMP agent and the SNMP manager. USM offers the following features:
  - **Data integrity:** To protect messages from being modified during transmission through the network.
  - **Data origin verification:** To authenticate the user who sent the message request.
  - **Message timeliness:** To protect against message delays or replays.
  - **Data confidentiality:** To protect the content of messages from being disclosed to unauthorized entities or individuals.
- **View-Based Access Control Model.** The view-based access control model (VACM) enables you to configure access rights to a specific subtree of the MIB based on various parameters, such as security level, security model, user name, and view type. It enables you to configure agents to provide different levels of access to the MIB to different managers.

The Citrix NetScaler supports the following entities that enable you to implement the security features of SNMPv3:

- SNMP Engines
- SNMP Views
- SNMP Groups
- SNMP Users

These entities function together to implement the SNMPv3 security features. Views are created to allow access to subtrees of the MIB. Then, groups are created with the required security level and access to the defined views. Finally, users are created and assigned to the groups.

Note: The view, group, and user configuration are synchronized and propagated to the secondary node in a high availability (HA) pair. However, the engine ID is neither propagated nor synchronized as it is unique to each NetScaler appliance.
To implement message authentication and access control, you need to:

- Set the Engine ID
- Configure Views
- Configure Groups
- Configure Users

This document includes the following details:

- Setting the Engine ID
- Configuring a View
- Configuring a Group
- Configuring a User

Updated: 2014-08-06

SNMP engines are service providers that reside in the SNMP agent. They provide services such as sending, receiving, and authenticating messages. SNMP engines are uniquely identified using engine IDs.

The NetScaler appliance has a unique engineID based on the MAC address of one of its interfaces. It is not necessary to override the engineID. However, if you want to change the engine ID, you can reset it.

To set the engine ID by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- set snmp engineId <engineID>
- show snmp engineId

```
> set snmp engineId 8000173f0300c095f80c68
```

To set the engine ID by using configuration utility

Navigate to System > SNMP > Users, click Configure Engine ID and type an engine ID.

Updated: 2014-08-06

SNMP views restrict user access to specific portions of the MIB. SNMP views are used to implement access control.

To add an SNMP view by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp view <name> <subtree> -type (included | excluded)
- show snmp view <name>

```
> add snmp view View1 -type included
```

To configure an SNMP view by using the configuration utility

Navigate to System > SNMP > Views, and create the SNMP view.

Updated: 2014-08-06

SNMP groups are logical aggregations of SNMP users. They are used to implement access control and to define the security levels. You can configure an SNMP group to set access rights for users assigned to that group, thereby restricting the users to specific views.

You need to configure an SNMP group to set access rights for users assigned to that group.

To add an SNMP group by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp group <name> <securityLevel> -readViewName <string>
- show snmp group <name> <securityLevel>

```
> add snmp group edocs_group2 authPriv -readViewName edocs_read_view
```

To configure an SNMP group by using the configuration utility

Navigate to System > SNMP > Groups, and create the SNMP group.

Updated: 2014-08-06

SNMP users are the SNMP managers that the agents allow to access the MIBs. Each SNMP user is assigned to an SNMP group.

You need to configure users at the agent and assign each user to a group.

To configure a user by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp user <name> -group <string> [-authType (MD5 | SHA) {-authPasswd } [-privType (DES | AES) {-privPasswd }]]
- show snmp user <name>

```
> add snmp user edocs_user -group edocs_group
```

To configure an SNMP user by using the configuration utility

Navigate to System > SNMP > Users, and create the SNMP user.

Configuring SNMP Alarms for Rate Limiting

Jun 01, 2015

Citrix NetScaler appliances such as the NetScaler MPX 10500, 12500, and 15500 are rate limited. The maximum throughput (Mbps) and packets per second (PPS) are determined by the license purchased for the appliance. For rate-limited platforms, you can configure SNMP traps to send notifications when throughput and PPS approach their limits and when they return to normal.

Throughput and PPS are monitored every seven seconds. You can configure traps with high-threshold and normal-threshold values, which are expressed as a percentage of the licensed limits. The appliance then generates a trap when throughput or PPS exceeds the high threshold, and a second trap when the monitored parameter falls to the normal threshold. In addition to sending the traps to the configured destination device, the NetScaler logs the events associated with the traps in the /var/log/ns.log file as EVENT ALERTSTARTED and EVENT ALERTENDED.

Exceeding the throughput limit can result in packet loss. You can configure SNMP alarms to report packet loss.

For more information about SNMP alarms and traps, see "Configuring the NetScaler to generate SNMP v1 and v2 Traps."

This document includes the following details:

- Configuring an SNMP Alarm for Throughput or PPS
- Configuring SNMP Alarm for Dropped Packets

Updated: 2014-08-12

To monitor both throughput and PPS, you must configure separate alarms.

To configure an SNMP alarm for the throughput rate by using the command line interface

At the command prompt, type the following commands to configure the SNMP alarm and verify the configuration:

- set snmp alarm PF-RL-RATE-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state (**ENABLED** | **DISABLED**)] [-severity <severity>] [-logging (**ENABLED** | **DISABLED**)]
- show snmp alarm PF-RL-RATE-THRESHOLD

```
> set snmp alarm PF-RL-RATE-THRESHOLD -thresholdValue 70 -normalValue 50
```

To configure an SNMP alarm for PPS by using the command line interface

At the command prompt, type the following commands to configure the SNMP alarm for PPS and verify the configuration:

- set snmp alarm PF-RL-PPS-THRESHOLD [-thresholdValue <positive_integer> [-normalValue <positive_integer>]] [-state (**ENABLED** | **DISABLED**)] [-severity <severity>] [-logging (**ENABLED** | **DISABLED**)]
- show snmp alarm PF-RL-PPS-THRESHOLD

```
> set snmp alarm PF-RL-PPS-THRESHOLD -thresholdValue 70 -normalValue 50
```

To configure an SNMP alarm for throughput or PPS by using the configuration

utility

1. Navigate to System > SNMP > Alarms, and select PF-RL-RATE-THRESHOLD (for throughput rate) or PF-RL-PPS-THRESHOLD (for packets per second).
2. Set the alarm parameters and enable the selected SNMP alarm.

Updated: 2014-08-12

You can configure an alarm for packets dropped as a result of exceeding the throughput limit and an alarm for packets dropped as a result of exceeding the PPS limit.

To configure an SNMP alarm for packets dropped because of excessive throughput, by using the command line interface

At the command prompt, type:
set snmp alarm PF-RL-RATE-PKTS-DROPPED [-state (**ENABLED** | **DISABLED**)] [-severity <severity>] [-logging (**ENABLED** | **DISABLED**)]

To configure an SNMP alarm for packets dropped because of excessive PPS, by using the command line interface

At the command prompt, type:
set snmp alarm PF-RL-PPS-PKTS-DROPPED [-state (**ENABLED** | **DISABLED**)] [-severity <severity>] [-logging (**ENABLED** | **DISABLED**)]

To configure an SNMP alarm for dropped packets by using the configuration utility

1. Navigate to System > SNMP > Alarms, and select PF-RL-RATE-PKTS-DROPPED (for packets dropped because of excessive throughput) or PF-RL-PPS-PKTS-DROPPED (for packets dropped because of excessive PPS).
2. Set the alarm parameters and enable the selected SNMP alarm.

Audit Logging

Jun 03, 2015

Auditing is a methodical examination or review of a condition or situation. The Audit Logging feature enables you to log the NetScaler states and status information collected by various modules in the kernel and in the user-level daemons. For audit logging, you can use the SYSLOG protocol, the native NSLOG protocol, or both.

SYSLOG is a standard protocol for logging. It has two components: the SYSLOG auditing module, which runs on the NetScaler appliance, and the SYSLOG server, which can run on the underlying FreeBSD operating system (OS) of the NetScaler appliance or on a remote system. SYSLOG uses user data protocol (UDP) for data transfer.

Similarly, the native NSLOG protocol has two components— the NSLOG auditing module, which runs on the NetScaler appliance, and the NSLOG server, which can run on the underlying FreeBSD OS of the NetScaler appliance or on a remote system. NSLOG uses transmission control protocol (TCP) for data transfer.

When you run a SYSLOG or NSLOG server, it connects to the NetScaler appliance. The NetScaler appliance then starts sending all the log information to the SYSLOG or NSLOG server, and the server can filter the log entries before storing them in a log file. An NSLOG or SYSLOG server can receive log information from more than one NetScaler appliance, and a NetScaler appliance can send log information to more than one SYSLOG server or NSLOG server.

The log information that a SYSLOG or NSLOG server collects from a NetScaler appliance is stored in a log file in the form of messages. These messages typically contain the following information:

- The IP address of a NetScaler appliance that generated the log message
- A time stamp
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information

To configure audit logging, you first configure the audit modules on the NetScaler appliance. That involves creating audit policies and specifying the NSLOG server or SYSLOG server information. You then install and configure the SYSLOG or the NSLOG server on the underlying FreeBSD OS of the NetScaler appliance or on a remote system.

Note: Because SYSLOG is an industry standard for logging program messages, and various vendors provide support, this documentation does not include SYSLOG server configuration information.
The NSLOG server has its own configuration file (auditlog.conf). You can customize logging on the NSLOG server system by making additional modifications to the configuration file (auditlog.conf).

Configuring the NetScaler Appliance for Audit Logging

Jun 01, 2015

On the NetScaler appliance, you configure SYSLOG and/or NSLOG policies. Each policy includes a rule, which is an expression identifying the messages to be logged, and a SYSLOG or NSLOG (depending on the type of policy) action. The action specifies the server to which to send the log message, the level of the messages to be logged, and the data format of the logged messages. You can bind the policies globally or to individual virtual servers.

The appliance logs the following information related to TCP connections:

- Source port
- Destination port
- Source IP
- Destination IP
- Number of bytes transmitted and received
- Time period for which the connection is open

Note:

- You can enable TCP logging on individual load balancing virtual servers. You must bind the audit log policy to a specific load balancing virtual server that you want to log.
- When using the NetScaler as the audit log server, by default, the ns.log file is rotated (new file is created) when the file size reaches 100K and the last 25 copies of the ns.log are archived and compressed with gzip. To accommodate more archived files after 25 files, the oldest archive is deleted. You can modify the 100K limit or the 25 file limit by updating the following entry in the /etc/newsyslog.conf file:
  `/var/log/ns.log 600 25 100 * Z`
  where, 25 is the number of archived files to be maintained and 100K is the size of the ns.log file after which the file will be archived.

This document includes the following details:

- Configuring Audit Servers
- Configuring Audit Policies
- Binding the Audit Policies Globally
- Configuring Policy-Based Logging

Updated: 2015-06-03

You can configure audit server actions for different servers and for different log levels.

To configure a SYSLOG server action by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)]
- show audit syslogAction [<name>]

```
> add audit syslogaction audit-action1 10.102.1.1 -loglevel INFORMATIONAL -dateformat MMDDYYYY
```

To configure an NSLOG server action by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)]
- show audit nslogAction [<name>]

```
> add audit nslogAction nslog-action1 10.102.1.3 -serverport 520 -loglevel INFORMATIONAL -dateFormat MMDDYYYY
```

To configure an auditing server action by using the configuration utility

Navigate to System > Auditing > Syslog or Nslog, click Servers tab and create the auditing server.

Updated: 2015-04-29

Configure SYSLOG policies to log messages to a SYSLOG server, and/or NSLOG policy to log messages to an NSLOG server. Each policy includes a rule identifying the messages to be logged, and a SYSLOG or NS LOG (depending on the type of policy) action.

To configure a SYSLOG policy by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add audit syslogPolicy <name> <rule> <action>
- show audit syslogPolicy [<name>]

```
> add audit syslogpolicy syslog-pol1 ns_true audit-action1
```

To configure an NSLOG policy by using the command line interface

At the command prompt, type the following commands to set the parameters and verify the configuration:

- add audit nslogPolicy <name> <rule> <action>
- show audit nslogPolicy [<name>]

```
> add audit nslogPolicy nslog-pol1 ns_true nslog-action1
```

To configure an audit server policy by using the configuration utility

Navigate to System > Auditing > Syslog or Nslog, click Policies tab and create the auditing policy.

Updated: 2015-06-02

You must globally bind the audit log policies to enable logging of all NetScaler system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

To configure a SYSLOG policy by using the command line interface

At the command prompt, type:

- bind system global [<policyName> [-priority <positive_integer>]]
- show system global

```
> bind system global nslog-pol1 -priority 20
```

To globally bind the audit policy by using the configuration utility

1. Navigate to System > Auditing > Syslog or Nslog.
2. On Policies tab, click Action, and select Global Bindings to bind the audit global policies.

Updated: 2014-08-07

You can configure policy-based logging for rewrite and responder policies. Audit messages are then logged in a defined format when the rule in a policy evaluates to TRUE. To configure policy-based logging, you configure an audit-message action that uses default syntax expressions to specify the format of the audit messages, and associate the action with a policy. The policy can be bound either globally or to a load balancing or content switching virtual server. You can use audit-message actions to log messages at various log levels, either in syslog format only or in both syslog and newnslog formats.

Pre Requisites

- User Configurable Log Messages (userDefinedAuditlog) option is enabled for when configuring the audit action server to which you want to send the logs in a defined format. For more information about enabling policy-based logging on an audit action server, see "Binding the Audit Policies Globally."
- The related audit policy is bound to system global. For more information about binding audit policies to system global, see "Binding the Audit Policies Globally."

Configuring an Audit Message Action

You can configure audit message actions to log messages at various log levels, either in syslog format only or in both syslog and newnslog formats. Audit-message actions use expressions to specify the format of the audit messages.

At the command prompt, type:

add audit messageaction <name> <logLevel> <stringBuilderExpr> [-logtoNewnslog (YES | NO)] [-bypassSafetyCheck (YES | NO)]

Example

```
> add audit messageaction log-act1 CRITICAL '"Client:"+CLIENT.IP.SRC+" accessed "+HTTP.REQ.URL' -bypassSafetyCheck YES
```

Navigate to System > Auditing > Message Actions, and create the audit message action.

Binding Audit Message Action to a Policy

After you have created an audit message action, you must bind it to a rewrite or responder policy. For more information about binding log message actions to a rewrite or responder policy, see "Rewrite" or "Responder".

Installing and Configuring the NSLOG Server

Jul 23, 2015

During installation, the NSLOG server executable file (auditserver) is installed along with other files. The auditserver executable file includes options for performing several actions on the NSLOG server, including running and stopping the NSLOG server. In addition, you use the auditserver executable to configure the NSLOG server with the IP addresses of the NetScaler appliances from which the NSLOG server will start collecting logs. Configuration settings are applied in the NSLOG server configuration file (auditlog.conf).

Then, you start the NSLOG server by executing the auditserver executable. The NSLOG server configuration is based on the settings in the configuration file. You can further customize logging on the NSLOG server system by making additional modifications to the NSLOG server configuration file (auditlog.conf).

Attention: The version of the NSLOG server package must be the same as that of the NetScaler. For example, if the version of the NetScaler is 10.1 Build 125.9, the NSLOG server must also be of the same version.
The following table lists the operating systems on which the NSLOG server is supported.

Table 1. Supported Platforms for the NSLOG Server

Operating system	Software requirements	Remarks
Windows	• Windows XP Professional • Windows Server 2003 • Windows 2000/NT • Windows Server 2008 • Windows Server 2008 R2	
Linux	• RedHat Linux 4 or later • SUSE Linux Enterprise 9.3 or later	
FreeBSD	FreeBSD 6.3 or later	For NetScaler 10.5, use only FreeBSD 8.4.
Mac OS	Mac OS 8.6 or later	Not supported on NetScaler 10.1 and later releases.

The minimum hardware specifications for the platform running the NSLOG server are as follows:

- Processor- Intel x86 ~501 megahertz (MHz)
- RAM - 512 megabytes (MB)
- Controller - SCSI

This document includes the following details:

- Installing NSLOG Server on the Linux Operating System
- Installing NSLOG Server on the FreeBSD Operating System
- Installing NSLOG Server Files on the Windows Operating System
- NSLOG Server Command Options
- Adding the NetScaler Appliance IP Addresses on the NSLOG Server
- Verifying the NSLOG Server Configuration File

Updated: 2013-06-20

Log on to the Linux system as an administrator. Use the following procedure to install the NSLOG server executable files on the system.

To install the NSLOG server package on a Linux operating system

1. At a Linux command prompt, type the following command to copy the NSauditserver.rpm file to a temporary directory:
   cp <path_to_cd>/Utilities/auditserver/Linux/NSauditserver.rpm /tmp
2. Type the following command to install the NSauditserver.rpm file:
   rpm -i NSauditserver.rpm

   This command extracts the files and installs them in the following directories:

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

To uninstall the NSLOG server package on a Linux operating system

1. At a command prompt, type the following command to uninstall the audit server logging feature:
   rpm -e NSauditserver
2. For more information about the NSauditserver RPM file, use the following command:
   rpm -qpi *.rpm
3. To view the installed audit server files use the following command:
   rpm -qpl *.rpm

   *.rpm: Specifies the file name.

Before you can install the NSLOG server, you have to copy the NSLOG package from the NetScaler product CD or download it from www.citrix.com. The NSLOG package has the following name format:

AuditServer_<release number>-<build number>.zip

For example: AuditServer_10.1-132.8.zip

This package contains files for all supported platforms: Linux, Windows, and FreeBSD. On a FreeBSD operating system, install the NSLOG package that has the following name format:

audserver_bsd-<release number>-<build number>.tgz

For example: audserver_bsd-10.1-132.8.tgz

To download NSLOG package from www.citrix.com

1. In a web browser, go to www.citrix.com.
2. In the menu bar, click **Log In**.
3. Enter your login credentials, and then click **Log In**.
4. In the menu bar, click **Downloads**.
5. From the **Select a product** list, select **NetScaler ADC**.
6. On the **NetScaler ADC** page, select the release for which you want to download the NSLOG package (for example, Release 10.1), and then select **Firmware**.
7. Under **Firmware**, select the NetScaler firmware for the build number for which you want to download the NSLOG package.
8. On the page that appears, scroll down, select **Audit Servers**, and click **Download File** next to the package that you want to download.

To install the NSLOG server package on a FreeBSD operating system

1. On the system to which you have downloaded the NSLOG package **AuditServer_<release number>-<build number>.zip** (for example, **AuditServer_9.3-51.5.zip**), extract the FreeBSD NSLOG server package **audserver_bsd-<release number>-<build number>.tgz** (for example, **audserver_bsd-9.3-51.5.tgz**) from the package.
2. Copy the FreeBSD NSLOG server package **audserver_bsd-<release number>-<build number>.tgz** (for example, **audserver_bsd-9.3-51.5.tgz**) to a directory on a system running FreeBSD OS.
3. At a command prompt for the directory into which the FreeBSD NSLOG server package was copied, run the following command to install the package:
   pkg_add audserver_bsd-<release number>-<build number>.tgz

   Example
   pkg_add audserver_bsd-9.3-51.5.tgz
   The following directories are extracted:

   - <root directory extracted from the FreeBSD NSLOG server package tgz file>\netscaler\bin (for example, /var/auditserver/netscaler/bin)
   - <root directory extracted from the FreeBSD NSLOG server package tgz file>\netscaler\etc (for example, /var/auditserver/netscaler/etc)
   - <root directory extracted from the FreeBSD NSLOG server package tgz file>\netscaler\samples (for example, /var/auditserver/samples)
4. At a command prompt, type the following command to verify that the package is installed:
   pkg_info | grep NSaudserver

To uninstall the NSLOG server package on a FreeBSD operating system

At a command prompt, type:

pkg_delete NSaudserver

Updated: 2013-06-20

Before you can install the NSLOG server, you have to copy the NSLOG package from the NetScaler product CD or download it from www.citrix.com. The NSLOG package has the following name format AuditServer _<release number>-<build number>.zip (for example, AuditServer_9.3-51.5.zip). This package contains NSLOG installation packages for all supported platforms.

To download NSLOG package from www.Citrix.com

1. In a web browser, go to www.citrix.com.
2. In the menu bar, click Log In.
3. Enter your login credentials, and then click Log In.
4. In the menu bar, click Downloads.
5. Search to find the page that provides the appropriate release number and build.
6. On that page, under Audit Servers, click Download to download the NSLOG package, having the format AuditServer_<release number>-<build number>.zip , to your local system (for example, AuditServer_9.3-51.5.zip).

To install NSLOG server on a Windows operating system

1. On the system, where you have downloaded the NSLOG package AuditServer_<release number>-<build number>.zip (for example, AuditServer_9.3-51.5.zip), extract audserver_win-<release number>-<build number>.zip (for example, audserver_win-9.3-51.5.zip) from the package.
2. Copy the extracted file audserver_<release number>-<build number>.zip (for example, audserver_win-9.3-51.5.zip) to a Windows system on which you want to install the NSLOG server.
3. Unzip the audserver_<release number>-<build number>.zip file (for example, audserver_win-9.3-51.5.zip).
4. The following directories are extracted:
   1. <root directory extracted from the Windows NSLOG server package zip file>\bin (for example, C:\audserver_win-9.3-51.5\bin)
   2. <root directory extracted from the Windows NSLOG server package zip file>\etc (for example, C:\audserver_win-9.3-51.5\ etc)
   3. < root directory extracted from the Windows NSLOG server package zip file >\samples (for example, C:\audserver_win-9.3-51.5\ samples)
5. At a command prompt, run the following command from the <root directory extracted from the Windows NSLOG server package zip file>\bin path:
   audserver -install -f <directorypath>\auditlog.conf

   <directorypath>: Specifies the path to the configuration file (auditlog.conf). By default, log.conf is under <root directory extracted from Windows NSLOG server package zip file>\samples directory. But you can copy auditlog.conf to your desired directory.

To uninstall the NSLOG server on a Windows operating system

At a command prompt, run the following from the <root directory extracted from Windows NSLOG server package zip file>\bin path:

audserver -remove

Updated: 2013-06-20

The following table describes the commands that you can use to configure audit server options.

Table 2. Audit Server Options

Audit server commands	Specifies
audserver -help	The available Audit Server options.
audserver -addns -f <path to configuration file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the NetScaler appliance. Enter the valid user name and password.
audserver -verify -f <path to configuration file>	Check for syntax or semantic errors in the configuration file (for example, auditlog.conf).
audserver -start -f <path to configuration file>	Start audit server logging based on the settings in the configuration file (auditlog.conf). Linux only: To start the audit server as a background process, type the ampersand sign (&) at the end of the command.
audserver -stop (Linux only)	Stops audit server logging when audit server is started as a background process. Alternatively, use the Ctrl+C key to stop audit server logging.
audserver -install -f <path to configuration file> (Windows only)	Installs the audit server logging client as a service on Windows.
audserver -startservice (Windows Only)	Start the audit server logging service, when you enter this command at a command prompt. You can also start audit server logging from Start > Control Panel > Services. Note: Audit server logging starts by using the configuration settings in the configuration file, for example, auditlog.conf file specified in the audit server install option.
audserver -stopservice (Windows Only)	Stop audit server logging.
audserver -remove	Removes the audit server logging service from the registry.

Audit server commands	Specifies
Run the audserver command	from the directory in which the audit server executable is present:

- On Windows: \ns\bin
- On Solaris and Linux: \usr\local\netscaler\bin

The audit server configuration files are present in the following directories:

- On Windows: \ns\etc
- On Linux: \usr\local\netscaler\etc

The audit server executable is started as ./auditserver in Linux and FreeBSD.

In the configuration file (auditlog.conf), add the IP addresses of the NetScaler appliances whose events must be logged.

To add the IP addresses of the NetScaler appliance

At a command prompt, type the following command:

audserver -addns -f <directorypath>\auditlog.conf

<directorypath>: Specifies the path to the configuration file (auditlog.conf).

You are prompted to enter the information for the following parameters:

NSIP: Specifies the IP address of the NetScaler appliance, for example, 10.102.29.1.

Userid: Specifies the user name, for example, nsroot.

Password: Specifies the password, for example, nsroot.

If you add multiple NetScaler IP addresses (NSIP), and later you do not want to log all of the NetScaler appliance event details, you can delete the NSIPs manually by removing the NSIP statement at the end of the auditlog.conf file. For a high availability (HA) setup, you must add both primary and secondary NetScaler IP addresses to auditlog.conf by using the audserver command. Before adding the IP address, make sure the user name and password exist on the system.

Check the configuration file (audit log.conf) for syntax correctness to enable logging to start and function correctly.

To verify configuration, at a command prompt, type the following command:

audserver -verify -f <directorypath>\auditlog.conf

<directorypath>: Specifies the path to the configuration file (audit log.conf).

Running the NSLOG Server

Jun 20, 2013

Type the following command at a command prompt:

audserver -start -f <directorypath>\auditlog.conf
<directorypath>: Specifies the path to the configuration file (audit log.conf).

Type the following command:

audserver -stop

Type the following command:

audserver -stopservice

Customizing Logging on the NSLOG Server

Jun 01, 2015

You can customize logging on the NSLOG server by making additional modifications to the NSLOG server configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the server system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information from a NetScaler appliance or a set of NetScaler appliances.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

This document includes the following details:

Updated: 2013-11-14

You can use the default filter definition located in the configuration file (audit log.conf), or you can modify the filter or create a new filter. You can create more than one log filter.

Note: For consolidated logging, if a log transaction occurs for which there is no filter definition, the default filter is used (if it is enabled.) The only way you can configure consolidated logging of all the NetScaler appliances is by defining the default filter.

To create a filter

At the command prompt, type the following command in the configuration file (auditlog.conf) :

filter <filterName> [IP <ip>] [NETMASK <mask>] [ON | OFF]

<filterName>: Specify the name of the filter (maximum of 64 alphanumeric characters).

<ip>: Specify the IP addresses.

<mask>: Specify the subnet mask to be used on a subnet.

Specify ON to enable the filter to log transactions, or specify OFF to disable the filter. If no argument is specified, the filter is ON

filter F1 IP 192.168.100.151 ON

To apply the filter F2 to IP addresses 192.250.100.1 to 192.250.100.254:

filter F2 IP 192.250.100.0 NETMASK 255.255.255.0 ON

filterName is a required parameter if you are defining a filter with other optional parameters, such as IP address, or the combination of IP address and Netmask.

Updated: 2013-11-13

Log properties associated with the filter are applied to all the log entries present in the filter. The log property definition starts with the key word BEGIN and ends with END as illustrated in the following example:

```
BEGIN <filtername>
 logFilenameFormat ...
 logDirectory ...
 logInterval ...
 logFileSizeLimit ....
END
```

Entries in the definition can include the following:

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: A constant string that specifies the absolute path and the file name.
  - Dynamic: An expression that includes the following format specifiers:
    - Date (%{format}t)
    - % creates file name with NSIP

  Example

  ```
  LogFileNameFormat Ex%{%m%d%y}t.log
  ```

  This creates the first file name as Exmmddyy.log. New files are named: Exmmddyy.log.0, Exmmddyy.log.1, and so on. In the following example, the new files are crated when the file size reaches 100MB.

  Example

  ```
  LogInterval size
  LogFileSize 100
  LogFileNameFormat Ex%{%m%d%y}t
  ```

  Caution: The date format %t specified in the LogFilenameFormat parameter overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFilenameFormat parameter.
- **logDirectory** specifies the directory name format of the log file. The name of the file can be either of the following:
  - Static: Is a constant string that specifies the absolute path and file name.
  - Dynamic: Is an expression containing the following format specifiers:
    - Date (%{format}t)
    - % creates directory with NSIP

  The directory separator depends on the operating system. In Windows, use the directory separator \.

  Example:

  ```
  LogDirectory dir1\dir2\dir3
  ```

  In the other operating systems (Linux, FreeBsd, etc.), use the directory separator /.

- **LogInterval** specifies the interval at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour. Default value.
  - Daily: A file is created very day at midnight.
  - Weekly: A file is created every Sunday at midnight.

- Monthly : A file is created on the first day of the month at midnight.
- None: A file is created only once, when audit server logging starts.
- Size: A file is created only when the log file size limit is reached.

Example

```
LogInterval Hourly
```

- **LogFileSizeLimit** specifies the maximum size (in MB) of the log file. A new file is created when the limit is reached.

  Note that you can override the loginterval property by assigning size as its value.

  The default LogFileSizeLimit is 10 MB.

  Example

  ```
  LogFileSizeLimit 35
  ```

Default Settings for the Log Properties

Mar 28, 2012

The following is an example of the default filter with default settings for the log properties:

```
begin default
 logInterval Hourly
 logFileSizeLimit 10
 logFilenameFormat auditlog%{%y%m%d}t.log
 end default
```

Following are two examples of defining the default filters:

Example 1

```
Filter f1 IP 192.168.10.1
```

This creates a log file for NSI 192.168.10.1 with the default values of the log in effect.

Example 2

```
Filter f1 IP 192.168.10.1
begin f1
 logFilenameFormat logfiles.log
end f1
```

This creates a log file for NSIP 192.168.10.1. Since the log file name format is specified, the default values of the other log properties are in effect.

Sample Configuration File (audit.conf)

Mar 28, 2012

Following is a sample configuration file:

```
################################
# This is the Auditserver configuration file
# Only the default filter is active
# Remove leading # to activate other filters
################################
MYIP <NSAuditserverIP>
MYPORT 3023
# Filter filter_nsip  IP <Specify the NetScaler IP address to filter on > ON
# begin filter_nsip
#  logInterval   Hourly
#  logFileSizeLimit  10
#  logDirectory   logdir\%A\
#  logFilenameFormat  nsip%{%d%m%Y}t.log
# end filter_nsip
Filter default
begin default
 logInterval   Hourly
 logFileSizeLimit  10
 logFilenameFormat  auditlog%{%y%m%d}t.log
end default
```

Web Server Logging

Jun 25, 2014

You can use the Web server logging feature to send logs of HTTP and HTTPS requests to a client system for storage and retrieval. This feature has two components:

- The Web log server, which runs on the NetScaler.
- The NetScaler Web Logging (NSWL) client, which runs on the client system.

When you run the NetScaler Web Logging (NSWL) client:

1. It connects to the NetScaler.
2. The NetScaler buffers the HTTP and HTTPS request log entries before sending them to the client.
3. The client can filter the entries before storing them.

To configure Web server logging, you first enable the Web logging feature on the NetScaler and configure the size of the buffer for temporarily storing the log entries. Then, you install NSWL on the client system. You then add the NetScaler IP address (NSIP) to the NSWL configuration file. You are now ready to start the NSWL client to begin logging. You can customize Web server logging by making additional modifications to the NSWL configuration file (log.conf).

Configuring the NetScaler for Web Server Logging

Aug 07, 2014

To configure the NetScaler for web server logging you are required to only enable the Web Server Logging feature. Optionally, you can perform the following configurations:

- Modify the size of the buffer (default size is 16 MB) that stores the logged information before it is sent to the NetScaler Web Logging (NSWL) client.
- Specify the custom HTTP headers that you want to export to the NSWL client. You can configure a maximum of two HTTP request and two HTTP response header names.

At the command prompt, perform the following operations:

- Enable the web server logging feature.
  enable ns feature WL
- [Optional] Modify the buffer size for storing the logged information.
  set ns weblogparam -bufferSizeMB <size>

  Note: To activate your modification, you must disable and then re-enable the Web server logging feature.
- [Optional] Specify the custom HTTP header names that you want to export.
  set ns weblogparam [-customReqHdrs <string> ...] [-customRspHdrs <string> ...]

  Example
  > set ns weblogparam -customReqHdrs Accept-Encoding X-Forwarded -customRspHdrs Content-Encoding ETag

Navigate to System > Settings and perform the following operations:

- To enable the web server logging feature, click Change Advanced Features and select Web Logging.
- To modify the buffer size, click Change Global System Settings and under Web Logging, enter the buffer size.
- To specify the custom HTTP headers to be exported, click Change Global System Settings and under Web Logging, specify the header values.

Installing the NetScaler Web Logging (NSWL) Client

Jun 01, 2015

During installation, the NSWL client executable file (nswl) is installed along with other files. The nswl executable file provides a list of options that you can use. For details, see Configuring the NSWL Client.

Attention: The version of the NSWL client must be the same as that of the NetScaler. For example, if the version of the NetScaler is 10.1 Build 125.9, the NSWL client must also be of the same version.
The following table lists the operating systems on which the NSWL client can be installed.

Table 1. Supported Platforms for the NSWL Client with hardware requirements

Operating system	Version	Hardware requirements	Remarks
Windows	• Windows XP Professional • Windows Server 2003 • Windows 2000/NT • Windows Server 2008 • Windows Server 2008 R2	Processor - Intel x86 ~501 MHz RAM - 512 MB Controller - SCSI	
Mac OS	Mac OS 8.6 or later	-	Not supported on NetScaler 10.1 and later releases.
Linux	• RedHat Linux 4 or later • SUSE Linux Enterprise 9.3 or later	Processor - Intel x86 ~501 MHz RAM - 512 MB Controller - SCSI	
Solaris	Solaris Sun OS 5.6 or later	Processor - UltraSPARC-IIi 400 MHz RAM - 512 MB Controller - SCSI	Not supported on NetScaler 10.5 and later releases.
FreeBSD	FreeBSD 6.3 or later	Processor - Intel x86 ~501 MHz RAM - 512 MB Controller - SCSI	For NetScaler 10.5, use only FreeBSD 8.4.

Operating system	Version	Hardware requirements	Remarks
AIX	AIX 6.1	-	Not supported on NetScaler 10.5 and later releases.

If the NSWL client system cannot process the log transaction because of a CPU limitation, the Web log buffer overruns and the logging process reinitiates.

Caution: Reinitiation of logging can result in loss of log transactions.
To temporarily solve a NSWL client system bottleneck caused by a CPU limitation, you can tune the Web server logging buffer size on the NetScaler appliance. To solve the problem, you need a client system that can handle the site's throughput.

This document includes the following details:

- Downloading the NSWL Client
- Installing the NSWL Client on a Solaris System
- Installing the NSWL Client on a Linux System
- Installing the NSWL Client on a FreeBSD System
- Installing the NSWL Client on a Mac System
- Installing the NSWL Client on a Windows System
- Installing the NSWL Client on a AIX System

Updated: 2014-06-25

You can obtain the NSWL client package from either the NetScaler product CD or the Citrix downloads site. Within the package there are separate installation packages for each supported platforms.

To download the NSWL client package from the Citrix site

1. Open the URL: https://www.citrix.com/downloads.html.
2. Log in to the site using your credentials.
3. Open the page for the required release number and build.
4. In the page, under Weblog Clients, click Download. The package has the name format as follows: Weblog-<release number>-<build number>.zip.

Updated: 2014-06-25

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_solaris-<release number>-<build number>.tar file from the package.
2. Copy the extracted file to a Solaris system on which you want to install the NSWL client.
3. Extract the files from the tar file with the following command:
   `tar xvf nswl_solaris-9.3-51.5.tar`
   A directory NSweblog is created in the temporary directory, and the files are extracted to the NSweblog directory.
4. Install the package with the following command:
   `pkgadd -d`

The list of available packages appears. In the following example, one NSweblog package is shown:

```
1 NSweblog NetScaler Weblogging (SunOS,sparc) 7.0
```

5. You are prompted to select the packages. Select the package number of the NSweblog to be installed.
   After you select the package number and press Enter, the files are extracted and installed in the following directories:
   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples
6. To check whether the NSWL package is installed, execute the following command:
   `pkginfo | grep NSweblog`
   Note: To uninstall the NSWL package, execute the following command:
   `pkgrm NSweblog`

Updated: 2014-06-25

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_linux-<release number>-<build number>.rpm file from the package.
2. Copy the extracted file to a system, running Linux OS, on which you want to install the NSWL client.
3. To install the NSWL package, execute the following command:
   `rpm -i nswl_linux-9.3-51.5.rpm`
   This command extracts the files and installs them in the following directories.
   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples
   Note: To uninstall the NSWL package, execute the following command:
   `rpm -e NSweblog`
   Note: To get more information about the NSweblog RPM file, execute the following command:
   `rpm -qpi *.rpm`
   Note: To view the installed Web server logging files, execute the following command:
   `rpm -qpl *.rpm`

Updated: 2014-06-25

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_bsd-<release number>-<build number>.tgz file from the package.
2. Copy the extracted file to a system, running FreeBSD OS, on which you want to install the NSWL client.
3. To install the NSWL package, execute the following command:
   `pkg_add nswl_bsd-9.3-51.5.tgz`
   This command extracts the files and installs them in the following directories.
   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples
   Note: To uninstall the NSWL package, execute the following command:
   `pkg_delete NSweblog`

4. To verify that the package is installed, execute the following command:
   pkg_info | grep NSweblog

Updated: 2014-06-25

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_macos-<release number>-<build number>.tgz file from the package.
2. Copy the extracted file to a system, running Mac OS, on which you want to install the NSWL client.
3. To install the NSWL package, execute the following command:
   pkg_add nswl_macos-9.3-51.5.tgz
   This command extracts the files and installs them in the following directories:
   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples
   Note: To uninstall the NSWL package, execute the following command:
   pkg_delete NSweblog
4. To verify that the package is installed, execute the following command:
   pkg_info | grep NSweblog

Updated: 2014-09-18

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_win-<release number>-<build number>.zip file from the package.
2. Copy the extracted file to a Windows system on which you want to install the NSWL client.
3. On the Windows system, unzip the file in a directory (referred as <NSWL-HOME>). The following directories are extracted: bin, etc, and samples.
4. At the command prompt, run the following command from the <NSWL-HOME>\bin directory:
   nswl -install -f <directorypath>\log.conf
   where,

   <directorypath> refers to the path of the configuration file (log.conf). By default, the file is in the <NSWL-HOME>\etc directory. However, you can copy the configuration file to any other directory.

   Note: To uninstall the NSWL client, at the command prompt, run the following command from the <NSWL-HOME>\bin directory:
   > nswl -remove

Updated: 2014-06-25

To install the NSWL client, perform the following operations on the system where you downloaded the package.

1. Extract the nswl_aix-<release number>-<build number>.rpm file from the package.
2. Copy the extracted file to a system, running AIX OS, on which you want to install the NSWL client.
3. To install the NSWL package, execute the following command:

```
rpm -i nswl_aix-9.3-51.5.rpm
```

This command extracts the files and installs them in the following directories.

- /usr/local/netscaler/etc
- /usr/local/netscaler/bin
- /usr/local/netscaler/samples

Note: To uninstall the NSWL package, execute the following command:

```
rpm -e NSweblog
```

Note: To get more information about the NSweblog RPM file, execute the following command:

```
rpm -qpi *.rpm
```

Note: To view the installed Web server logging files, execute the following command:

```
rpm -qpl *.rpm
```

Configuring the NSWL Client

Jun 01, 2015

After installing the NSWL client, you can configure the NSWL client using the nswl executable. These configurations are then stored in the NSWL client configuration file (log.conf).

Note: You can further customize logging on the NSWL client system by making additional modifications to the NSWL configuration file (log.conf). For details, see Customizing Logging on the NSWL Client System.
The following table describes the commands that you can use to configure the NSWL client.

NSWL command	Specifies
nswl -help	The available NSWL help options.
nswl -addns -f <path-to-configuration-file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the NetScaler appliance. Enter a valid user name and password.
nswl -verify -f <path-to-configuration-file>	Check for syntax or semantic errors in the configuration file.
nswl -start -f <path-to-configuration-file>	Start the NSWL client based on the settings in the configuration file. Note: For Solaris and Linux: To start Web server logging as a background process, type the ampersand sign (&) at the end of the command.
nswl -stop (Solaris and Linux only)	Stop the NSWL client if it was started as a background process; otherwise, use CTRL+C to stop Web server logging.
nswl -install -f <path-to-configuration-file> (Windows only)	Install the NSWL client as a service in Windows.
nswl -startservice (Windows only)	Start the NSWL client by using the settings in the configuration file specified in the nswl install option. You can also start NSWL client from Start > Control Panel > Services.
nswl -stopservice (Windows only)	Stops the NSWL client.
nswl -remove	Remove the NSWL client service from the registry.

Run the following commands from the directory in which the NSWL executable is located:

- Windows: \ns\bin
- Solaris and Linux: \usr\local\netscaler\bin

The Web server logging configuration files are located in the following directory path:

- Windows: \ns\etc
- Solaris and Linux: \usr\local\netscaler\etc

The NSWL executable is started as .\nswl in Linux and Solaris.

This document includes the following details:

- Adding the IP Addresses of the NetScaler Appliance
- Verifying the NSWL Configuration File
- Running the NSWL Client

Updated: 2013-07-17

In the NSWL client configuration file (log.conf), add the NetScaler IP address (NSIP) from which the NSWL client will start collecting logs.

To add the NSIP address of the NetScaler appliance

1. At the client system command prompt, type:

   nswl -addns -f < directorypath > \log.conf

   < directorypath >: Specifies the path to the configuration file (log.conf).

2. At the next prompt, enter the following information:

   - **NSIP**: Specify the IP address of the NetScaler appliance.
   - Username and Password: Specify the nsroot user credentials of the NetScaler appliance.

Note: If you add multiple NetScaler IP addresses (NSIP), and later you do not want to log all of NetScaler system log details, you can delete the NSIPs manually by removing the NSIP statement at the end of the log.conf file. During a failover setup, you must add both primary and secondary NetScaler IP addresses to the log.conf by using the command. Before adding the IP address, make sure the user name and password exist on the NetScaler appliances.

Updated: 2013-06-20

To make sure that logging works correctly, check the NSWL configuration file (log.conf) on the client system for syntax errors.

To verify the configuration in the NSWL configuration file

At the client system command prompt, type:

nswl -verify -f <directorypath>\log.conf

< directorypath >: Specifies the path to the configuration file (log.conf).

Updated: 2013-06-20

To start Web server logging

At the client system command prompt, type:

nswl -start -f <directorypath>\log.conf

<directorypath>: Specifies the path to the configuration file (log.conf).

To stop Web server logging started as a background process on the Solaris or Linux operating systems

At the command prompt, type:

nswl -stop

To stop Web server logging started as a service on the Windows operating system

At the command prompt, type:

nswl -stopservice

Customizing Logging on the NSWL Client System

Jun 01, 2015

You can customize logging on the NSWL client system by making additional modifications to the NSWL client configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the client system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information based on the host IP address, domain name, and host name of the Web servers.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

This document includes the following details:

Following is a sample configuration file:

```
##########
# This is the NSWL configuration file
# Only the default filter is active
# Remove leading # to activate other filters
##########
##########
# Default filter (default on)
# W3C Format logging, new file is created every hour or on reaching 10MB file size,
# and the file name is Exyymmdd.log
##########
Filter default
begin default
      logFormat            W3C
      logInterval          Hourly
      logFileSizeLimit      10
      logFilenameFormat     Ex%{%y%m%d}t.log
end default

#       logInterval           Daily
#       logFileSizeLimit      10
logFilenameFormat /ns/prod/vhost/%v/Ex%{%m%d%y}t
#end VHOST_F

########## END FILTER CONFIGURATION ##########
```

Updated: 2014-01-06

You can use the default filter definition located in the configuration file (log.conf), or you can modify the filter or create a new filter. You can create more than one log filter.

Note: Consolidated logging, which logs transactions for which no filter is defined, uses the default filter if it is enabled. Consolidated logging of all servers can be done by defining only the default filter.
If the server hosts multiple Web sites and each Web site has its own domain name, and each domain is associated with a virtual server, you can configure Web server logging to create a separate log directory for each Web site. The following table displays the parameters for creating a filter.

Table 1. Parameters for Creating a Filter

Parameter	Specifies
filterName	Name of the filter. The filter name can include alphanumeric characters and cannot be longer than 59 characters. Filter names longer than 59 characters are truncated to 59 characters.

Parameter	Specifies
HOST name	Host name of the server for which the transactions are being logged.
IP ip	IP address of the server for which transactions are to be logged (for example, if the server has multiple domains that have one IP address).
IP ip 2...ip n:	Multiple IP addresses (for example, if the server domain has multiple IP addresses).
ip6 ip	IPv6 address of the server for which transactions are to be logged.
IP ip NETMASK mask	IP addresses and netmask combination to be used on a subnet.
ON | OFF	Enable or disable the filter to log transactions. If no argument is selected, the filter is enabled (ON).

To create a filter

To create a filter, enter the following command in the log.conf file:

- filter <filterName> <HOST name> | [IP<ip>] | [IP<ip 2...ip n>] | <IP ip NETMASK mask> [ON | OFF]
- filter <filterName> <HOST name> | [IP6 ip/<prefix length>] [ON | OFF]

To create a filter for a virtual server

To create a filter for a virtual server, enter the following command in the log.conf file:

filter <filterName> <VirtualServer IP address>

Example

In the following example, you specify an IP address of 192.168.100.0 and netmask of 255.255.255.0. The filter applies to IP addresses 192.168.100.1 through 192.168.100.254.

```
Filter F1 HOST www.netscaler.com ON
Filter F2 HOST www.netscaler.com IP 192.168.100.151 ON
Filter F3 HOST www.netscaler.com IP 192.168.100.151 192.165.100.152 ON
Filter F4 IP 192.168.100.151
Filter F5 IP 192.168.100.151 HOST www.netscaler.com OFF
Filter F6 HOST www.netscaler.com HOST www.xyz.com HOST www.abcxyz.com IP 192.168.100.200 ON
Filter F7 IP 192.250.100.0 NETMASK 255.255.255.0
Filter F8 HOST www.xyz.com IP 192.250.100.0 NETMASK 255.255.255.0 OFF
For creating filters for servers having IPv6 addresses.
Filter F9 2002::8/112 ON
Filter F10 HOST www.abcd.com IP6 2002::8 ON
```

Log properties are applied to all log entries associated with the filter. The log property definition begins with the keyword BEGIN and ends with END as illustrated in the following example:

```
BEGIN <filtername>
 logFormat ...
 logFilenameFormat ...
 logInterval ...
 logFileSize ....
 logExclude ....
 logTime ....
 END
```

Entries in the definition can include the following:

- **LogFormat** specifies the Web server logging feature that supports NCSA, W3C Extended, and custom log file formats.

  By default, the logformat property is w3c. To override, enter custom or NCSA in the configuration file, for example:

```
LogFormat NCSA
```

Note: For the NCSA and custom log formats, local time is used to time stamp transactions and for file rotation.

- **LogInterval** specifies the intervals at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour.
  - Daily: A file is created every day at midnight. Default value.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly: A file is created on the first day of the month at midnight.
  - None: A file is created only once, when Web server logging starts.

  Example

  ```
  LogInterval Daily
  ```
- **LogFileSizeLimit** specifies the maximum size of the log file in MB. It can be used with any log interval (weekly, monthly, and so on.) A file is created when the maximum file size limit is reached or when the defined log interval time elapses.

  To override this behavior, specify the size as the loginterval property so that a file is created only when the log file size limit is reached.

  The default LogFileSizeLimit is 10 MB.

  Example

  ```
  LogFileSizeLimit 35
  ```
- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: Specifies a constant string that contains the absolute path and file name.
  - Dynamic: Specifies an expression containing the following format:
    - Server IP address (%A)
    - Date (%{format}t)
    - URL suffix (%x)
    - Host name (%v)

  Example

  ```
  LogFileNameFormat Ex%{%m%d%y}t.log
  ```
  This command creates the first file name as Exmmddyy.log, then every hour creates a file with file name: Exmmddyy.log.0, Exmmddyy.log.1,..., Exmmddyy.log.n.

  Example

  ```
  LogInterval size
  LogFileSize 100
  LogFileNameFormat Ex%{%m%d%y}t
  ```
  Caution: The date format %t specified in the LogFilenameFormat command overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFilenameFormat.
- **LogExclude** prevents logging of transactions with the specified file extensions.

  Example

  ```
  LogExclude .html
  ```
  This command creates a log file that excludes log transactions for *.html files.
- **LogTime** specifies log time as either GMT or LOCAL.

  The defaults are:
  - NCSA log file format: LOCAL
  - W3C log file format: GMT.

Updated: 2013-09-30

The NetScaler supports the following standard log file formats:

- NCSA Common Log Format
- W3C Extended Log Format

NCSA Common Log Format

If the log file format is NCSA, the log file displays log information in the following format:

```
Client_IP_address -User_Name [Date:Time -TimeZone] "Method Object HTTP_version"
HTTP_StatusCode BytesSent
```

To use the NCSA Common log format, enter NCSA in the LogFormat argument in the log.conf file.

The following table describes the NCSA Common log format.

Table 2. NCSA Common Log Format

Argument	Specifies
Client _IP_address	The IP address of the client computer.
User Name	The user name.
Date	The date of the transaction.
Time	The time when the transaction was completed.
Time Zone	The time zone (Greenwich Mean Time or local time).
Method	The request method (for example; GET, POST).
Object	The URL.
HTTP_version	The version of HTTP used by the client.
HTTP_StatusCode	The status code in the response.
Bytes Sent	The number of bytes sent from the server.

W3C Extended Log Format

An extended log file contains a sequence of lines containing ASCII characters terminated by either a Line Feed (LF) or the sequence Carriage Return Line Feed (CRLF.) Log file generators must follow the line termination convention for the platform on which they are run.

Log analyzers must accept either LF or CRLF form. Each line may contain either a directive or an entry. If you want to use the W3C Extended log format, enter W3C as the Log-Format argument in the log.conf file.

By default, the standard W3C log format is defined internally as the custom log format, shown as follows:

```
%{%Y-%m-%d%H:%M:%S}t %a %u %S %A %p %m %U %q %s %j %J %T %H %+{user-agent}i %+{cookie} i%+{referer}i
```

For a description of the meaning of this each custom format, see "Appendix A: Arguments for Defining a Custom Log Format." You can also change the order or remove some fields in this W3C log format. For example:

```
logFormat W3C %{%Y-%m-%d%H:%M:%S}t %m %U
```

W3C log entries are created with the following format:

```
#Version: 1.0
#Fields: date time cs-method cs-uri
#Date: 12-Jun-2001 12:34
2001-06-12 12:34:23 GET /sports/football.html
2001-06-12 12:34:30 GET /sports/football.html
```

Entries

Entries consist of a sequence of fields relating to a single HTTP transaction. Fields are separated by white space; Citrix recommends the use of tab characters. If a field in a particular entry is not used, a dash (-) marks the omitted field.

Directives

Directives record information about the logging process. Lines beginning with the pound sign (#) contain directives.

The following table describes the directives.

Table 3. Directive Descriptions

Directive	Description
Version: <integer>.<integer>	Displays the version of the extended log file format used. This document defines version 1.0.
Fields: [<specifier>...]	Identifies the fields recorded in the log.
Software: <string>	Identifies the software that generated the log.
Start-Date: <date> <time>	Displays the date and time at which the log was started.
End-Date: <date> <time>	Displays the date and time at which logging finished.
Date: <date> <time>	Displays the date and time when the entry was added.
Remark: <text>	Displays comments. Analysis tools ignore data recorded in this field.

Note: The Version and Fields directives are required. They precede all other entries in the log file.

Example

The following sample log file shows the log entries in W3C Extended log format:

```
#Version: 1.0
#Fields: time cs-method cs-uri
#Date: 12-Jan-1996 00:00:00
00:34:23 GET /sports/football.html
12:21:16 GET /sports/football.html
12:45:52 GET /sports/football.html
12:57:34 GET /sports/football.html
```

Fields

The Fields directive lists a sequence of field identifiers that specify the information recorded in each entry. Field identifiers may have one of the following forms:

- **identifier:** Relates to the transaction as a whole.
- **prefix-identifier:** Relates to information transfer between parties defined by the value prefix.
- **prefix (header):** Specifies the value of the HTTP header field header for transfer between parties defined by the value prefix. Fields specified in this manner always have the type <string>.

The following table describes defined prefixes.

Table 4. Prefix Descriptions

Prefix	Specifies
c	Client
s	Server
r	Remote
cs	Client to server

Prefix	Specifies
sc	Server to client
sr	Server to remote server (prefix used by proxies)
rs	Remote server to server (prefix used by proxies)
x	Application-specific identifier

Examples

The following examples are defined identifiers that use prefixes:

cs-method: The method in the request sent by the client to the server.

sc(Referer): The Referer field in the reply.

c-ip: The IP address of the client.

Identifiers

The following table describes the W3C Extended log format identifiers that do not require a prefix.

Table 5. W3C Extended Log Format Identifiers (No Prefix Required)

Identifier	Description
date	The date on which the transaction was done.
time	The time when the transaction is done.
time-taken	The time taken (in seconds) for the transaction to complete.
bytes	The number of bytes transferred.
cached	Records whether a cache hit has occurred. A zero indicates a cache miss.

The following table describes the W3C Extended log format identifiers that require a prefix.

Table 6. W3C Extended Log Format Identifiers (Requires a Prefix)

Identifier	Description
IP	The IP address and the port number.
dns	The DNS name.
status	The status code.
comment	The comment returned with status code.
method	The method.
url	The URL.
url-stem	The stem portion of the URL.

Identifier	Description
cs-uri-query	The query portion of the URL.

The W3C Extended Log file format allows you to choose log fields. These fields are shown in the following table.

Table 7. W3C Extended Log File Format (Allows Log Fields)

Field	Description
Date	The date on which the transaction is done.
Time	The time when the transaction is done.
Client IP	The IP address of the client.
User Name	The user name.
Service Name	The service name, which is always HTTP.
Server IP	The server IP address.
Server Port	The server port number
Method	The request method (for example; GET, POST).
Url Stem	The URL stem.
Url Query	The query portion of the URL.
Http Status	The status code in the response.
Bytes Sent	The number of bytes sent to the server (request size, including HTTP headers).
Bytes Received	The number of bytes received from the server (response size, including HTTP headers).
Time Taken	The time taken for transaction to complete, in seconds.
Protocol Version	The version number of HTTP being used by the client.
User Agent	The User-Agent field in the HTTP protocol.
Cookie	The Cookie field of the HTTP protocol.
Referer	The Referer field of the HTTP protocol.

Updated: 2013-09-30

You can customize the display format of the log file data manually or by using the NSWL library. By using the custom log format, you can derive most of the log formats that Apache currently supports.

Creating a Custom Log Format by Using the NSWL Library

Use one of the following NSWL libraries depending on whether the NSWL executable has been installed on a Windows or Solaris host computer:

- **Windows:** The nswl.lib library located in \ns\bin directory on the system manager host computer.
- **Solaris:** The libnswl.a library located in /usr/local/netscaler/bin.

1. Add the following two C functions defined by the system in a C source file:
   ns_userDefFieldName() : This function returns the string that must be added as a custom field name in the log record.

   ns_userDefFieldVal() : This function implements the custom field value, then returns it as a string that must be added at the end of the log record.
2. Compile the file into an object file.
3. Link the object file with the NSWL library (and optionally, with third party libraries) to form a new NSWL executable.
4. Add a %d string at the end of the logFormat string in the configuration file (log.conf).

Example

```
##########
# A new file is created every midnight or on reaching 20MB file size,
# and the file name is /datadisk5/netscaler/log/NS<hostname>/Nsmmddyy.log and create digital
#signature field for each record.
BEGIN CACHE_F
 logFormat  custom "%a - "%{user-agent}i" [%d/%B/%Y %T -%g] "%x" %s %b%{referrer}i "%{user-agent}i" "%{cookie}i" %d "
 logInterval  Daily
 logFileSizeLimit  20
 logFilenameFormat  /datadisk5/netscaler/log/%v/NS%{%m%d%y}t.log
END CACHE_F
```

Creating a Custom Log Format Manually

To customize the format in which log file data should appear, specify a character string as the argument of the LogFormat log property definition. For more information, see "Appendix A: Arguments for Defining a Custom Log Format." The following is an example where character strings are used to create a log format:

```
 LogFormat Custom ""%a - "%{user-agent}i" %[%d/%m/%Y]t %U %s %b %T"
```

- The string can contain the “c” type control characters \n and \t to represent new lines and tabs.
- Use the <Esc> key with literal quotes and backslashes.

The characteristics of the request are logged by placing % directives in the format string, which are replaced in the log file by the values.

If the %v (Host name) or %x (URL suffix) format specifier is present in a log file name format string, the following characters in the file name are replaced by an underscore symbol in the log configuration file name:

" * . / : < > ? \ |

Characters whose ASCII values lie in the range of 0-31 are replaced by the following:

%<ASCII value of character in hexadecimal>.

For example, the character with ASCII value 22 is replaced by %16.

Caution: If the %v format specifier is present in a log file name format string, a separate file is opened for each virtual host. To ensure continuous logging, the maximum number of files that a process can have open should be sufficiently large. See your operating system documentation for a procedure to change the number of files that can be opened.

Creating Apache Log Formats

You can derive from the custom logs most of the log formats that Apache currently supports. The custom log formats that match Apache log formats are:

NCSA/combined: LogFormat custom %h %l %u [%t] "%r" %s %B "%{referer}i" "%{user-agent}i"

NCSA/Common: LogFormat custom %h %l %u [%t] "%r" %s %B

Referer Log: LogFormat custom "%{referer}i" -> %U

Useragent: LogFormat custom %{user-agent}i

Similarly, you can derive the other server log formats from the custom formats.

Updated: 2015-04-02

The following table describes the data that you can use as the Log Format argument string:

Table 8. Custom Log Format

Argument	Specifies
%a	Remote IPv4 address.
%A	Local IPv4 address.
%a6	Remote IPv6 address.
%A6	Local IPv6 address.
%B	Bytes sent, excluding the HTTP headers (response size).
%b	Bytes received, excluding the HTTP headers (request size).
%d	User-defined field.
%e1	Value of the first custom HTTP request header.
%e2	Value of the second custom HTTP request header.
%E1	Value of the first custom HTTP response header.
%E2	Value of the second custom HTTP response header.
Note: For instructions on how to export custom HTTP headers, see "Configuring the NetScaler for Web Server Logging."	
%g	Greenwich Mean Time offset (for example, -0800 for Pacific Standard Time).
%h	Remote host.
%H	Request protocol.
%{Foobar}i	Contents of the Foobar: header line(s) in the request sent to the server. The system supports the User-Agent, Referer and cookie headers. The + after the % in this format informs the logging client to use the + as a word separator.
%j	Bytes received, including headers (request size)
%J	Bytes sent, including headers (response size)
%l	Remote log name (from identd, if supplied).
%m	Request method.
%M	Time taken to serve the request (in microseconds)
%	Contents of Foobar: header line(s) in the reply. USER-AGENT, Referer, and cookie headers (including set cookie headers) are supported.

Argument	Specifies
{Foobar}o	
%p	Canonical port of the server serving the request.
%q	Query string (prefixed with a question mark (?) if a query string exists).
%r	First line of the request.
%s	Requests that were redirected internally, this is the status of the original request.
%t	Time, in common log format (standard English time format).
%{format}t	Time, in the form given by format, must be in the strftime(3) format. For format descriptions, see "Appendix B: Time Format Definition."
%T	Time taken to serve the request, in seconds.
%u	Remote user (from auth; may be bogus if return status (%s) is 401).
%U	URL path requested.
%v	Canonical name of the server serving the request.
%V	Virtual server IPv4 address in the system, if load balancing, content switching, and/or cache redirection is used.
%V6	Virtual server IPv6 address in the system, if load balancing, content switching, and/or cache redirection is used.

For example, if you define the log format as %+{user-agent}i, and if the user agent value is Citrix NetScaler system Web Client, then the information is logged as NetScaler system+Web+Client. An alternative is to use double quotation marks. For example, "%{user-agent}i" logs it as "Citrix NetScaler system Web Client." Do not use the <Esc> key on strings from %.. .r, %. . .i and, %. . .o. This complies with the requirements of the Common Log Format. Note that clients can insert control characters into the log. Therefore, you should take care when working with raw log files.

Updated: 2015-04-28

The following table lists the characters that you can enter as the format part of the %{format}t string described in the Custom Log Format table of "Arguments for Defining a Custom Log Format." Values within brackets ([ ]) show the range of values that appear. For example, [1,31] in the %d description in the following table shows %d ranges from 1 to 31.

Table 9. Time Format Definition

Argument	Specifies
%%	The same as %.
%a	The abbreviated name of the week day for the locale.
%A	The full name of the week day for the locale.
%b	The abbreviated name of the month for the locale.
%B	The full name of the month for the locale.
%C	The century number (the year divided by 100 and truncated to an integer as a decimal number [1,99]); single digits are preceded by a 0.

Argument	Specifies
%d	The day of month [1,31]; single digits are preceded by 0.
%e	The day of month [1,31]; single digits are preceded by a blank.
%h	The abbreviated name of the month for the locale.
%H	The hour (24-hour clock) [0,23]; single digits are preceded by a 0.
%I	The hour (12-hour clock) [1,12]; single digits are preceded by a 0.
%j	The number of the day in the year [1,366]; single digits are preceded by 0.
%k	The hour (24-hour clock) [0,23]; single digits are preceded by a blank.
%l	The hour (12-hour clock) [1,12]; single digits are preceded by a blank.
%m	The number of the month in the year [1,12]; single digits are preceded by a 0.
%M	The minute [00,59]; leading 0 is permitted but not required.
%n	Inserts a new line.
%p	The equivalent of either a.m. or p.m. for the locale.
%r	The appropriate time representation in 12-hour clock format with %p.
%S	The seconds [00,61]; the range of values is [00,61] rather than [00,59] to allow for the occasional leap second and for the double leap second.
%t	Inserts a tab.
%u	The day of the week as a decimal number [1,7]. 1 represents Sunday, 2 represents Tuesday and so on.
%U	The number of the week in the year as a decimal number [00,53], with Sunday as the first day of week 1.
%w	The day of the week as a decimal number [0,6]. 0 represents Sunday.
%W	Specifies the number of the week in the year as a decimal number [00,53]. Monday is the first day of week 1.
%y	The number of the year within the century [00,99]. For example, 5 would be the fifth year of that century.
%Y	The year, including the century (for example, 1993).

Note: If you specify a conversion that does not correspond to any of the ones described in the preceding table, or to any of the modified conversion specifications listed in the next paragraph, the behavior is undefined and returns 0.
The difference between %U and %W (and also between modified conversions %OU and %OW) is the day considered to be the first day of the week. Week number 1 is the first week in January (starting with a Sunday for %U, or a Monday for %W). Week number 0 contains the days before the first Sunday or Monday in January for %U and %W.

Configuring Call Home

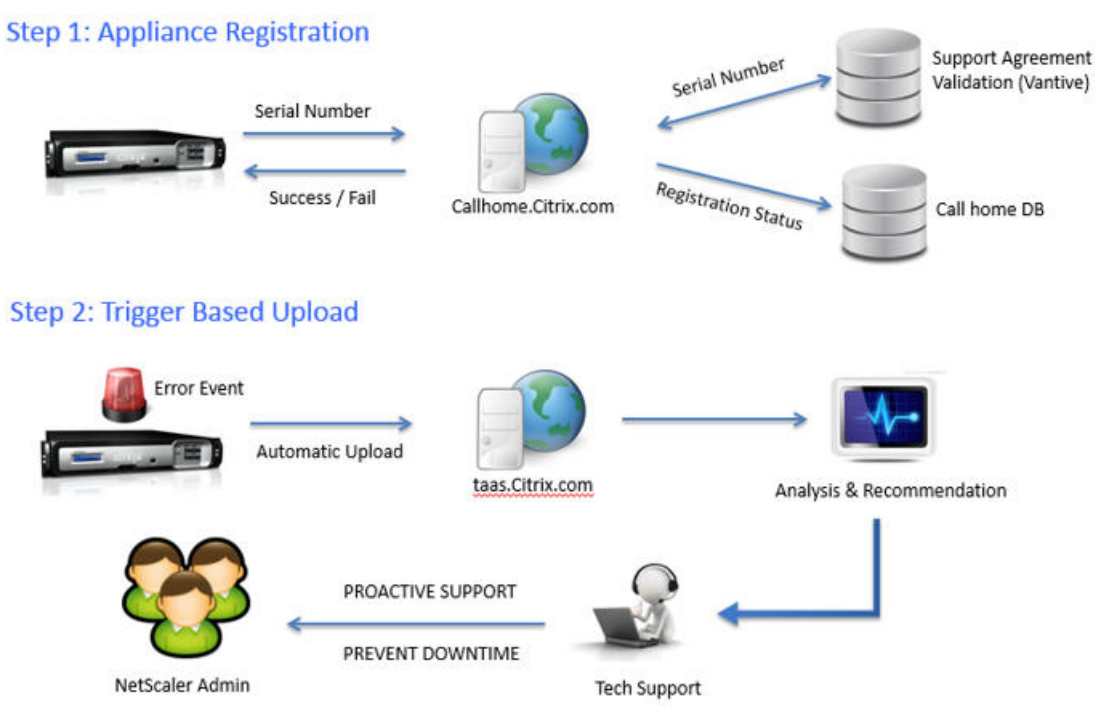
Jun 14, 2016

The Call Home feature monitors your NetScaler appliance for critical error conditions. Call Home registers your appliance with the Citrix Technical Support server. If your appliance is successfully registered with the Support server, Call Home automatically uploads system data to that server in the event that one of the conditions occurs. The NetScaler Appliance keeps a full log of all upload events. If you are unable to correct the problem after reviewing the appliance's log, you can contact the Citrix Technical Support team and open a service request. The team can analyze the uploaded system data and recommend possible solutions.

The Call Home feature is supported on all three platforms of NetScaler ADC.

- In NetScaler MPX, Call Home feature is supported on all MPX models.
- In NetScaler SDX, Call Home feature is supported on all VPX instances running on a SDX box 002E

Following is a typical set up for Call Home.



The process flow for using Call Home can be categorized as follows:

- Registration of the NetScaler appliance to the Citrix Technical Support server.
- Uploading of the appliance's data to the Citrix Technical Support server. The support server has the following URL: https://callhome.citrix.com/.
- Opening a Technical Support case (Optional).

By default, the Citrix Call Home service is disabled on the appliance. You must first enable the service to register the appliance for critical error conditions.

Registration of the NetScaler appliance. The appliance has to be registered to the Citrix Technical Support server before Call Home can upload the system data to the server when predefined error conditions occur on the appliance. Enabling the Call Home feature on the NetScaler appliance initiates the registration process. The process flow is as follows:

1. The Call Home process sends the following details to the Citrix Technical Support server:

- Hardware serial number is shared for NetScaler MPX and SDX models
- License serial number is shared for NetScaler VPX models.

2. The server checks its database for an active technical support service contract for the appliance.
3. If there is an active technical support service contract, the support server registers the NetScaler appliance for Call Home and sends a successful-registration response to the appliance stating that the feature is successfully enabled. If there is no active technical support service contract, the server sends a registration-failure response to the NetScaler appliance.

The following table lists the error conditions that Call Home currently monitors on a NetScaler Appliance:

Table 1. List of error conditions monitored by Call Home

Error Condition	Indicates	Call Home Monitoring Interval	Corresponding SNMP Alarm Name
Compact flash drive errors	The compact flash drive on the appliance that encountered read or write errors.	24 hours	COMPACT-FLASH-ERRORS
Hard disk drive errors	The hard drives on the appliance that encountered read or write errors.	24 hours	HARD-DISK-DRIVE-ERRORS
Power supply unit failure	One of the power supply units on the NetScaler appliance has failed.	7 seconds	POWER-SUPPLY-FAILURE
SSL card failure	One of the SSL cards on the NetScaler appliance has failed.	7 seconds	SSL-CARD-FAILED
Warm restart	The appliance has warm restarted due to a failure of a system process.	After every restart of the NetScaler appliance.	WARM-RESTART-EVENT

Note: The Call Home feature do not monitor the power supply unit (PSU) status for VPX models and VPX instances.

Uploading of appliance's data to the Support server. An error condition triggers the following sequence of events:

1. The Call Home process checks the registration status. If the status indicates successful registration, the process advances to the next step.
2. The Call Home process runs a showtech support script that collects all of the system related data in a tar file. The data in the tar file includes configurations, logs, and statistics. Call Home locally saves the tar file at /var/tmp/support/callhome.
3. Call Home uploads a copy of the tar file to the Citrix Technical Support server. The Appliance logs the uploading of the tar file in a log file named *callhome.log* located at /var/log. You can also configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever Call Home uploads happen.
4. If the SNMP alarm related to the error condition is enabled, the SNMP agent on the appliance generates an SNMP trap message and sends it to all of the configured SNMP trap destinations. For more information about configuring SNMP alarms and trap destinations, see "Configuring the NetScaler to Generate SNMPv1 and SNMPv2 Traps."

Note: Call Home creates the Call Home tar file and uploads it to the CITRIX tech support server for only the first occurrence of a particular error condition since the appliance was last restarted. If you want the NetScaler appliance to send you alerts each time a particular error condition occurs, configure the corresponding SNMP alarm for the error condition.

The Call Home tar file has the following name format:

collector_callhome_<NSIP of the appliance>_<P for Primary or standalone, or S for Secondary>_<date>_<hours, in 24 hr format, according to the local time zone>_<minutes>.tar.gz. For example, collector_callhome_10.105.13.100_P_2Feb2012_20_30.tar.gz.

Opening a Technical Support Service Request . After you review the logs and SNMP trap messages for Call Home upload events, you have the option of contacting the Citrix Technical Support team and opening a service request. For more information about contacting the team and opening a service request, see http://support.citrix.com/article/CTX132307.

The Support team can then analyze the system data in the uploaded Call Home tar files and sends recommendations for possible solutions to the administrator's email address.

Before you begin configuring Call Home, do the following:

- Make sure that the NetScaler appliance is connected to the Interne or to a proxy server that has internet connectivity.
- Make sure that you have an active Citrix Technical Support service contract for the appliance.

Configuring Call Home on the NetScaler appliance consists of the following tasks:

1. **Enable the Call Home feature**. When you enable the Call Home feature, the Call Home process registers the appliance with the Citrix Technical Support server. The registration takes some time to complete. During that time, the appliance displays the status as IN PROGRESS. When the registration is complete, the appliance displays the status as SUCCESSFUL.
   Note: While upgrading the NetScaler appliance from an older release to release 10.1 or later, the NetScaler appliance prompts you to enable the Call Home feature, if:
   - The Call Home feature is not supported in the older release.
   - The Call Home feature is disabled in the older release.
2. **(Optional) Specify the administrator's email address**. The Call Home process sends the email address to the Support server, where it is stored for future correspondence regarding Call Home uploads.
3. **(Optional) Specify Proxy server settings**. Netscaler appliance needs internet connectivity to upload the collector archive to the Citrix Technical Support server. If the appliance does not have internet connectivity, then a proxy server (having internet connectivity) can be configured to upload the data.
4. **(Optional) Enable the CALLHOME-UPLOAD-EVENT SNMP alarm**. The SNMP agent on the NetScaler appliance generates a trap message and sends to all the configured SNMP trap destinations. The message includes the status of uploading of the Call Home tar file by the Call Home process. For more information about configuring SNMP alarms and trap destinations, see "Configuring the NetScaler to Generate SNMPv1 and SNMPv2 Traps."
5. **(Optional) Enable all of the corresponding SNMP alarms**. Call Home creates and uploads a Call Home tar file for the first occurrence of a monitored error condition since the appliance was last restarted. If you want to be alerted of these error conditions, you can configure the corresponding SNMP alarm. Table 1 lists all the corresponding SNMP alarms. For more information about configuring SNMP alarms and trap destinations, see "Configuring the NetScaler to Generate SNMPv1 and SNMPv2 Traps."

At the command prompt, type any of the following:

- enable ns feature ch
- enable ns feature callhome

At the command prompt, type:
show callhome
Example

```
> enable ns feature ch
Done

> show callhome
 Callhome feature: ENABLED
 Registration with Citrix upload server IN PROGRESS

 E-mail address configured:
 Proxy mode:NO   Ipaddress:     Port:0

 Trigger event              State     First occurrence   Latest occurrence
 -------------              -----     ----------------   -----------------
 1) Compact flash errors       Enabled   ..              ..
 2) Hard disk drive errors     Enabled   ..              ..
 3) Power supply unit failure   Enabled   ..              ..
 4) SSL card failure           Enabled   ..              ..
 5) Warm restart               Enabled   N/A             ..
 Done

 > show callhome
 Callhome feature: ENABLED
 Registration with Citrix upload server SUCCESSFUL

 E-mail address configured:
 Proxy mode:NO   Ipaddress:     Port:0

 Trigger event              State     First occurrence   Latest occurrence
 -------------              -----     ----------------   -----------------
 1) Compact flash errors       Enabled    ..              ..
 2) Hard disk drive errors     Enabled    ..              ..
 3) Power supply unit failure   Enabled    ..              ..
 4) SSL card failure           Enabled    ..              ..
 5) Warm restart               Enabled    N/A             ..
 Done
```

To specify the administrator's email address and proxy server settings by using the command line interface

At the command prompt, type:

- set callhome -emailAddress <string>
- set callhome -proxyMode (YES | NO) [-IPAddress <ip_addr|ipv6_addr|*>] [-port <port|*>]
- show callhome

Example

```
> set callhome -emailAddress exampleadmin@example.com
Done

> set callhome –proxyMode Yes –IPAddress 10.102.167.33 –port 80
Done

> show callhome
 E-mail address configured: exampleadmin@example.com
 Proxy mode:YES   Ipaddress: 10.102.167.33      Port:80

 Trigger event              State     First occurrence   Latest occurrence
 -------------              -----     ----------------   -----------------
 1) Compact flash errors      Enabled   ..                 ..
 2) Hard disk drive errors    Enabled   ..                 ..
 3) Power supply unit failure  Enabled   ..                 ..
 4) SSL card failure          Enabled   ..                 ..
 5) Warm restart              Enabled   N/A                ..
 Done
```

At the command prompt, type:

- set callhome -ipAddress <ipaddress> -port <port> -proxyMode [yes | no]
- show callhome
  Note: Proxy mode is enabled only when the -proxymode parameter is set to YES. If it is set to NO, the proxy functionality does not work, even if the IP address and port are configured. The port number should be for an HTTP service on the proxy server, not for an HTTPS service.

Example

```
> set callhome ipAddress 10.0.0.1 -port 80 -proxyMode yes
Done
```

Navigate to System > Settings, click Configure Advanced Features and select the Call Home option.

Navigation to System > Diagnostics and, in the Technical Support Tools group, select Call Home option to view the status of registration.

Navigation to System > Diagnostics and, in the Technical Support Tools group, select Call Home option to specify the administrator's email address.

Navigation to System > Diagnostics and, in the Technical Support Tools group, select Call Home option to specify the proxy server's IP address and the port number.

Reporting Tool

Jun 01, 2015

Use the Citrix® NetScaler® Reporting tool to view NetScaler performance statistics data as reports. Statistics data are collected by the nscollect utility and are stored in a database. When you want to view certain performance data over a period of time, the Reporting tool pulls out specified data from the database and displays them in charts.

Reports are a collection of charts. The Reporting tool provides built-in reports as well as the option to create custom reports. In a report, you can modify the charts and add new charts. You can also modify the operation of the data collection utility, nscollect, and stop or start its operation.

This document includes the following details:

- Using the Reporting Tool
- Working with Reports
- Working with Charts
- Examples
- Stopping and Starting the Data Collection Utility

The Reporting tool is a Web-based interface accessed from the Citrix® NetScaler® appliance. Use the Reporting tool to display the performance statistics data as reports containing graphs. In addition to using the built-in reports, you can create custom reports, which you can modify at any time. Reports can have between one and four charts. You can create up to 256 custom reports.

To invoke the Reporting tool

1. Use the Web browser of your choice to connect to the IP address of the NetScaler (for example, http://10.102.29.170/). The Web Logon screen appears.
2. In the User Name text box, type the user name assigned to the NetScaler.
3. In the Password text box, type the password.
4. In the Start in drop-down box, select Reporting.
5. Click Login.

The following screen shots show the report toolbar and the chart toolbar, which are frequently referenced in this documentation.

Figure 1. *Report Toolbar*

Figure 2. *Chart Toolbar*

Updated: 2013-09-27

You can plot and monitor statistics for the various functional groups configured on the NetScaler over a specified time interval. Reports enable you to troubleshoot or analyze the behavior of your appliance. There are two types of reports: built-in reports and custom reports. Report content for built-in or custom reports can be viewed in a graphical format or a

tabular format. The graphical view consists of line, area, and bar charts that can display up to 32 sets of data (counters). The tabular view displays the data in columns and rows. This view is useful for debugging error counters.

The default report that is displayed in the Reporting tool is CPU vs. Memory Usage and HTTP Requests Rate. You can change the default report view by displaying the report you want as your default view, and then clicking Default Report.

Reports can be generated for the last hour, last day, last week, last month, last year, or you can customize the duration.

You can do the following with reports:

- Toggle between a tabular view of data and a graphical view of data.
- Change the graphical display type, such as bar chart or line chart.
- Customize charts in a report.
- Export the chart as an Excel comma-separated value (CSV) file.
- View the charts in detail by zooming in, zooming out, or using a drag-and-drop operation (scrolling).
- Set a report as the default report for viewing whenever you log on.
- Add or remove counters.
- Print reports.
- Refresh reports to view the latest performance data.

Using Built-in Reports

The Reporting tool provides built-in reports for frequently viewed data. Built-in reports are available for the following functional groups: System, Network, SSL, Compression, Integrated Cache, NetScaler Gateway, and Citrix NetScaler Application Firewall. By default, the built-in reports are displayed for the last day. However, you can view the reports for the last hour, last week, last month, or last year.

Note: You cannot save changes to built-in reports, but you can save a modified built-in report as a custom report.

1. In the left pane of the Reporting tool, under Built-in Reports, expand a group (for example, SSL).
2. Click a report (for example, SSL > All Backend Ciphers).

Creating and Deleting Reports

You can create your own custom reports and save them with user-defined names for reuse. You can plot different counters for different groups based on your requirements. You can create up to 256 custom reports.

You can either create a new report or save a built-in report as a custom report. By default, a newly created custom report contains one chart named System Overview, which displays the CPU Usage counter plotted for the last day. You can customize the interval and set the data source and time zone from the report toolbar. Within a report, you can use the chart toolbars to add, modify, or delete charts, as described in "Working with Charts."

By default, newly created custom reports contain one chart named System Overview that displays a CPU Usage counter plotted for the last day.

1. In the Reporting tool, on the report toolbar, click Create, or if you want to create a new custom report based on an existing report, open the existing report, and then click Save As.
2. In Report Name box, type a name for the custom report.
3. Do one of the following:

- To add the report to an existing folder, in Create in or Save in, click the down arrow to choose an existing folder, and then click OK.
- To create a new folder to store the report, click the Click to add folder icon, in Folder Name, type the name of the folder, and in Create in, specify where you want the new folder to reside in the hierarchy, and then click OK.

Note: You can create up to 128 folders.

1. In the left pane of the Reporting tool, next to Custom Reports, click the Click to manage custom reports icon.
2. Select the check box that corresponds with the report you want to delete, and then click Delete.

Note: When you delete a folder, all the contents of that folder are deleted.

Modifying the Time Interval

By default, built-in reports display data for the last day. However, if you want to change the time interval for a built-in report, you can save the report as a custom report. The new interval applies to all charts in the report. The following table describes the time-interval options.

Table 1. Time Intervals

Time interval	Displays
Last Hour	Statistics data collected for the last hour.
Last Day	Statistics data collected for the last day (24 hours).
Last Week	Statistics data collected for the last week (7 days).
Last Month	Statistics data collected for the last month (31 days).
Last Year	Statistics data collected for the last year (365 days).
Custom	Statistics data collected for a time period that you are prompted to specify.

1. In the left pane of the Reporting tool, click a report.
2. On the report toolbar, click Duration, and then click a time interval.

Setting the Data Source and Time Zone

You can retrieve data from different data sources to display them in the reports. You can also define the time zone for the reports and apply the currently displayed report's time selection to all the reports, including the built-in reports.

1. In the Reporting tool, on the report toolbar, click Settings.
2. In the Settings dialog box, in Data Source, select the data source from which you want to retrieve the counter information.
3. Do one or both of the following:
   - If you want the tool to remember the time period for which a chart is plotted, select the Remember time selection for charts check box.
   - If you want the reports to use the time settings of your NetScaler appliance, select the Use Appliance's time zone check box.

Exporting and Importing Custom Reports

You can share reports with other NetScaler administrators by exporting reports. You can also import reports.

1. In the left pane of the Reporting tool, next to Custom Reports, click the Click to manage custom reports icon.
2. Select the check box that corresponds with the report you want to export or import, and then click Export or Import.
   Note: When you export the file, it is exported in a .gz file format.

Updated: 2013-09-06

Use charts to plot and monitor counters or groups of counters. You can include up to four charts in one report. In each chart, you can plot up to 32 counters. The charts can use different graphical formats (for example, area and bar). You can move the charts up or down within the report, customize the colors and visual display for each counter in a chart, and delete a chart when you do not want to monitor it.

In all report charts, the horizontal axis represents time and the vertical axis represents the value of the counter.

Adding a Chart

When you add a chart to a report, the System Overview chart appears with the CPU Usage counter plotted for the last one day. To plot a different group of statistics or select a different counter, see "Modifying a Chart."

Note: If you add charts to a built-in report, and you want to retain the report, you must save the report as a custom report. Use the following procedure to add a chart to a report.

1. In the left pane of the Reporting tool, click a report.
2. Under the chart where you want to add the new chart, click the Add icon.

Modifying a Chart

You can modify a chart by changing the functional group for which the statistics are displayed and by selecting different counters.

1. In the left pane of the Reporting tool, click a report.
2. Under the chart that you want to modify, click Counters.
3. In the dialog box that appears, in the Title box, type a name for the chart.
4. Next to Plot chart for, do one of the following:
   - To plot counters for global counters, such as Integrated Cache and Compression, click System global statistics.
   - To plot entity counters for entity types, such as Load Balancing and GSLB, click System entities statistics.
5. In Select group, click the desired entity.
6. Under Counters, in Available, click the counter name(s) that you want to plot, and then click the > button.
7. If you selected System entities statistics in step 4, on the Entities tab, under Available, click the entity instance name(s) you want to plot, and then click the > button.
8. Click OK.

Viewing a Chart

You can specify the graphical formats of the plotted counters in a chart. Charts can be viewed as line charts, spline charts, step-line charts, scatter charts, area charts, bar charts, stacked area charts, and stacked bar charts. You can also zoom in, zoom out, or scroll inside the plot area of a chart. You can zoom in or out for all data sources for 1 hour, 1 day, 1 week, 1 month, 1 year, and 3 years.

Other options for customizing the view of a chart include customizing the axes of the charts, changing the background and edge color of the plot area, customizing the color and size of the grids, and customizing the display of each data set (counter) in a chart.

Data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.

Whenever you modify a built-in report, you need to save the report as a custom report to retain your changes.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart you want to view, on the chart toolbar, click Customize.
3. On the Chart tab, under Category, click Plot type, and then click the graph type you want to display for the chart. If you want to display the graph is 3D, select the Use 3D check box.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click Zoom In, and do one or both of the following:
   - To refocus the chart to display data for a specific time window, drag and drop the cursor from the start time to the end time. For example, you can view data for a one-hour period on a certain day.
   - To refocus the chart to display data for a data point, simply click once on chart where you want to zoom in and get more detailed information.
3. Once you have the desired range of time for which you want to view detailed data, on the report toolbar, click Tabular

View. Tabular view displays the data in numeric form in rows and columns.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click Tabular View. To return to the graphical view, click Graphical View.
   Note: You can also view the numeric data in the graphical view by hovering your cursor over the notches in the gridlines.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click Scroll, and then click inside the chart and drag the cursor in the direction for which you want to see data for a new time period. For example, if you want to view data in the past, click and drag to the left.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click Customize.
3. On the Chart tab, under Category, click one or more of the following:
   - To change the background color, click Background Color, and then select the options for color, transparency, and effects.
   - To change the text color, click Text Color, and then select the options for color, transparency, and effects.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click Customize.
3. On the Chart tab, under Category, click one or more of the following:
   - To change the scale of the left y-axis, click Left Y-Axis, and then select the scale you want.
   - To change the scale of the right y-axis, click Right Y-Axis, in Data set to plot, select the date set, and then select the scale you want.
     Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.
   - To plot each data set in its own hidden y-axis, click Multiple Axes, and then click Enable.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the plot area, click Customize.
3. On the Plot Area tab, under Category, click one or more of the following:
   - To change the background color and edge color of the chart, click Background Color and Edge Color, and then select the options for color, transparency, and effects.
   - To change the horizontal or vertical grids of the chart, click Horizontal Grids or Vertical Grids, and then select the options for displaying the grids, grid width, grid color, transparency, and effects.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the display of the data set (counters), click Customize.

3. On the Data Set tab, in Select Data Set, select the data set (counter) for which you want to customize the graphical display.
   Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if CPU usage and Memory usage are displayed in first and second order at the bottom of the chart, CPU usage is equal to Data Set 1 and Memory usage is equal to Data Set 2.
4. Under Category, do one of more of the following:
   - To change the background color, click Color, and then select the options for color, transparency, and effects.
   - To change the graph type, click Plot type, and then select the graph type you want to display for the data set. If you want to display the graph as 3D, select the Use 3D check box.

For further data analysis, you can export charts to Excel in a comma-separated value (CSV) format.

To export chart data to Excel

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart with the data you want to export to Excel, click Export.

Deleting a Chart

If you do not want to use a chart, you can remove it from the report. You can permanently remove charts from custom reports only. If you delete a chart from a built-in report and want to retain the changes, you need to save the report as a custom report.

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart that you want to delete, click the Delete icon.

To display the trend report for CPU usage and memory usage for the last week

1. In the left pane of the Reporting tool, under Built-in Reports, expand System.
2. Click the report CPU vs. Memory Usage and HTTP Requests Rate.
3. In the right pane, on the report toolbar, click Duration, and then click Last Week.

To compare the bytes received rate and the bytes transmitted rate between two interfaces for the last week

1. In the right pane, on the report toolbar, click Create.
2. In the Report Name box, type a name for the custom report (for example, Custom_Interfaces), and then click OK. The report is created with the default System Overview chart, which displays the CPU Usage counter plotted for the last hour.
3. Under System Overview, on the chart toolbar, click Counters.
4. In the counter selection pane, in Title, type a name for the chart (for example, Interfaces bytes data).
5. In Plot chart for, click System entities statistics, and then in Select Group, select Interface.
6. On the Entities tab, click the interface name(s) you want to plot (for example, 1/1 and 1/2), and then click the > button.
7. On the Counters tab, click Bytes received (Rate) and Bytes transmitted (Rate) and then click the > button.

8. Click OK.
9. On the report toolbar, click Duration, and then click Last Week.

Updated: 2014-09-24

The data collection utility, nscollect, runs automatically when you start the NetScaler ADC. This utility retrieves the application performance data and stores it in the form of data sources on the ADC. You can create up to 32 data sources. The default data source is /var/log/db/default.

The data collection utility creates databases for global counters and entity-specific counters, and uses this data to generate reports. Global-counter databases are created at /var/log/db/<DataSourceName> . The entity-specific databases are created based on the entities configured on the NetScaler, and a separate folder is created for each entity type in /var/log/db/<DataSourceName/EntityNameDB>.

Nscollect retrieves data once every 5 minutes. It retains data in 5-minute granularity for one day, hourly for the last 30 days, and daily for three years.

You might have to stop and restart the data collection utility if data is not updated accurately or the reports display corrupted data.

To stop nscollect

At the command prompt, type:
/netscaler/nscollect stop

To start nscollect on the local system

At the command prompt, type:
/netscaler/nscollect start

AppFlow

May 29, 2015

The Citrix NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. It also collects web page performance data and database information. AppFlow transmits the information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information, web page performance data, and database information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

AppFlow use actions and policies to send records for a selected flow to specific set of collectors. An AppFlow action specifies which set of collectors will receive the AppFlow records. Policies, which are based on Advanced expressions can be configured to select flows for which flow records will be sent to the collectors specified by the associated AppFlow action.

To limit the types of flows, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Note: This feature is supported only on NetScaler nCore builds.
This topic includes the following details:

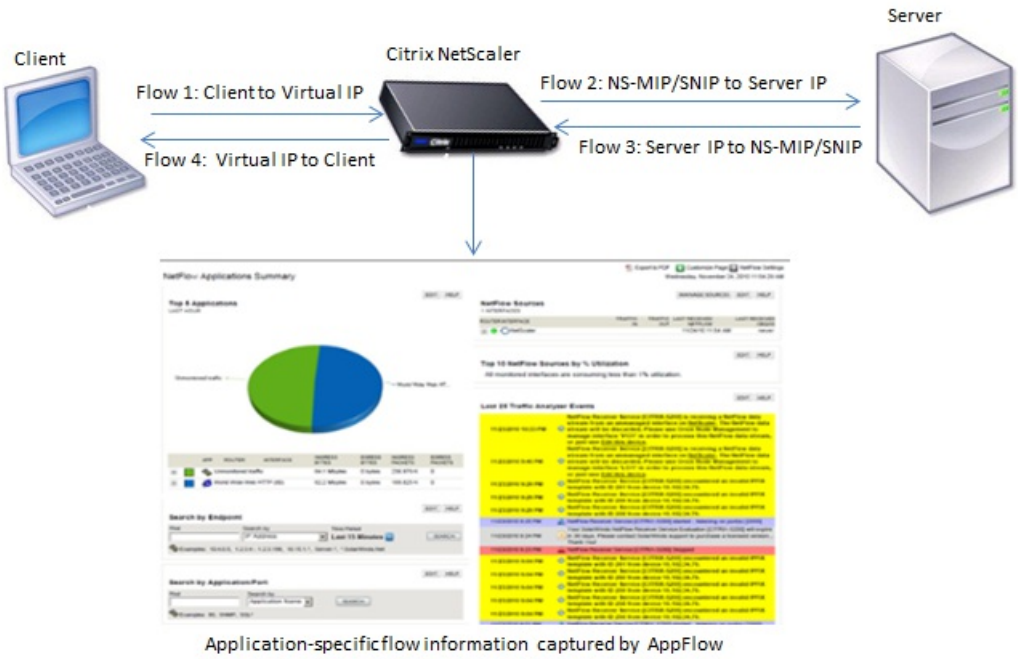
- How AppFlow Works
- Configuring the AppFlow Feature
- Exporting Performance Data of Web Pages to AppFlow Collector

Updated: 2015-05-28

In the most common deployment scenario, inbound traffic flows to a Virtual IP address (VIP) on the NetScaler appliance and is load balanced to a server. Outbound traffic flows from the server to a mapped or subnet IP address on the NetScaler and from the VIP to the client. A flow is a unidirectional collection of IP packets identified by the following five tuples: sourceIP, sourcePort, destIP, destPort, and protocol.

The following figure describes how the AppFlow feature works.

Figure 1. NetScaler Flow Sequence



Application-specific flow information captured by AppFlow

As shown in the figure, the network flow identifiers for each leg of a transaction depend on the direction of the traffic.

The different flows that form a flow record are:

Flow1: <Client-IP, Client-Port, VIP-IP, VIP-port, Protocol>

Flow2: <NS-MIP/SNIP, NS-port, Server-IP, Server-Port, Protocol>

Flow3: <Server-IP, Server-Port, NS-MIP/SNIP, NS-Port, Protocol>

Flow4: <VIP-IP, VIP-port, Client-IP, Client-Port, Protocol>

To help the collector link all four flows in a transaction, AppFlow adds a custom transactionID element to each flow. For application-level content switching, such as HTTP, it is possible for a single client TCP connection to be load balanced to different backend TCP connections for each request. AppFlow provides a set of records for each transaction.

This topic includes the following details:

- Flow Records
- Templates

Flow Records

Updated: 2013-08-20

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response status codes, server response time, and latency), web page performance data (such as page load time, page render time, and time spent on the page), and database information (such as database protocol, database response status and database response size). IPFIX flow records are based on templates that need to be sent before sending flow records.

Templates

AppFlow defines a set of templates, one for each type of flow. Each template contains a set of standard Information Elements (IEs) and Enterprise-specific Information Elements (EIEs). IPFIX templates define the order and sizes of the Information Elements (IE) in the flow record. The templates are sent to the collectors at regular intervals, as described in RFC 5101.

A template can include the following EIEs:

transactionID

An unsigned 32-bit number identifying an application-level transaction. For HTTP, this corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. In the most common case, there are four uniflow records that correspond to this transaction. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there may be only two flow records for this transaction.

connectionID

An unsigned 32-bit number identifying a layer-4 connection (TCP or UDP). The NetScaler flows are usually bidirectional, with two separate flow records for each direction of the flow. This information element can be used to link the two flows. For the NetScaler, connectionID is an identifier for the connection data structure to track the progress of a connection. In an HTTP transaction, for instance, a given connectionID may have multiple transactionID elements corresponding to multiple requests that were made on that connection.

tcpRTT

The round trip time, in milliseconds, as measured on the TCP connection. This can be used as a metric to determine the client or server latency on the network.

httpRequestMethod

An 8-bit number indicating the HTTP method used in the transaction. An options template with the number-to-method mapping is sent along with the template.

httpRequestSize

An unsigned 32-bit number indicating the request payload size.

httpRequestURL

The HTTP URL requested by the client.

httpUserAgent

The source of incoming requests to the Web server.

httpResponseStatus

An unsigned 32-bit number indicating the response status code.

httpResponseSize

An unsigned 32-bit number indicating the response size.

httpResponseTimeToFirstByte

An unsigned 32-bit number indicating the time taken to receive the first byte of the response.

httpResponseTimeToLastByte

An unsigned 32-bit number indicating the time taken to receive the last byte of the response.

flowFlags

An unsigned 64-bit flag used to indicate different flow conditions.

clientInteractionStartTime

Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and stylesheets.

clientInteractionEndTime

Time at which the browser received the last byte of response to load all the objects of the page such as images, scripts, and stylesheets.

clientRenderStartTime

Time at which the browser starts to render the page.

clientRenderEndTime

Time at which browser finished rendering the entire page, including the embedded objects.

dbProtocolName

An unsigned 8-bit number indicating the database protocol. Valid values are 1 for MS SQL and 2 for MySQL.

dbReqType

An unsigned 8-bit number indicating the database request method used in the transaction. For MS SQL, valid values are 1 is for QUERY, 2 is for TRANSACTION, and 3 is for RPC. For valid values for MySQL, see the MySQL documentation.

dbReqString

Indicates the database request string without the header.

dbRespStatus

An unsigned 64-bit number indicating the status of the database response received from the web server.

dbRespLength

An unsigned 64-bit number indicating the response size.

dbRespStatString

The response status string received from the web server.

Configuring the AppFlow Feature

May 28, 2015

You configure AppFlow in the same manner as most other policy-based features. First, you enable the AppFlow feature. Then you specify the collectors to which the flow records are sent. After that, you define actions, which are sets of configured collectors. Then you configure one or more policies and associate an action to each policy. The policy tells the NetScaler appliance to select requests the flow records of which are sent to the associated action. Finally, you bind each policy either globally or to specific vservers to put it into effect.

You can further set AppFlow parameters to specify the template refresh interval and to enable the exporting of httpURL, httpCookie, and httpReferer information. On each collector, you must specify the NetScaler IP address as the address of the exporter.
Note: For information about configuring the NetScaler as an exporter on the collector, see the documentation for the specific collector.
The configuration utility provides tools that help users define the policies and actions that determine exactly how the NetScaler appliance export records for a particular flow to a set of collectors(action.) The command line interface provides a corresponding set of CLI-based commands for experienced users who prefer a command line.

This topic includes the following details:

Updated: 2014-08-07

To be able to use the AppFlow feature, you must first enable it.

Note: AppFlow can be enabled only on nCore NetScaler appliances.

To enable the AppFlow feature by using the command line interface

At the command prompt, type one of the following commands:

enable ns feature AppFlow

To enable the AppFlow feature by using the configuration utility

Navigate to System > Settings, click Configure Advanced Features and select the AppFlow option.

Updated: 2014-08-07

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify

at least one collector. You can specify up to four. However, you cannot export the same data to multiple collectors. You can remove unused collectors. By default, the collector listens to IPFIX messages on UDP port 4739. You can change the default port, when configuring the collector. Similarly, by default, NSIP is used as the source IP for appflow traffic. You can change this default source IP to a SNIP or MIP address when configuring a collector.

To specify a collector by using the command line interface

At the command prompt, type the following commands to add a collector and verify the configuration:

- add appflow collector <name> -IPAddress <ipaddress> -port <port_number> -netprofile <netprofile_name>
- show appflow collector <name>

```
> add appflow collector col1 -IPaddress 10.102.29.251 -port 8000 -netprofile n2
```

To specify a collector by using the configuration utility

Navigate to System > AppFlow > Collectors, and create the AppFlow collector.

Updated: 2014-08-07

An AppFlow action is a set collectors, to which the flow records are sent if the associated AppFlow policy matches.

To configure an AppFlow action by using the command line interface

At the command prompt, type the following commands to configure an Appflow action and verify the configuration:

- add appflow action <name> --collectors <string> ... [-comment <string>]
- show appflow action

```
> add appflow action apfl-act-collector-1-and-3 -collectors collector-1 collecter-3
```

To configure an AppFlow action by using the configuration utility

Navigate to System > AppFlow > Actions, and create the AppFlow action.

Updated: 2014-08-07

After you configure an AppFlow action, you must next configure an AppFlow policy. An AppFlow policy is based on a rule, which consists of one or more expressions.

Note: For creating and managing AppFlow policies, the configuration utility provides assistance that is not available at the command line interface.

To configure an AppFlow policy by using the command line interface

At the command prompt, type the following command to add an AppFlow policy and verify the configuration:

- add appflow policy <name> <rule> <action>
- show appflow policy <name>

```
> add appflow policy apfl-pol-tcp-dsprt client.TCP.DSTPORT.EQ(22) apfl-act-collector-1-and-3
```

To configure an AppFlow policy by using the configuration utility

Navigate to System > AppFlow > Policies, and create the AppFlow policy.

To add an expression by using the Add Expression dialog box

1. In the Add Expression dialog box, in the first list box choose the first term for your expression.
   HTTP

   The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.

   SYS

   The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

   CLIENT

   The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

   When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
2. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
3. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

Updated: 2014-08-07

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to the traffic related to that virtual server.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add additional policies at any time without having to change the priority of an existing policy.

To globally bind an AppFlow policy by using the command line interface

At the command prompt, type the following command to globally bind an AppFlow policy and verify the configuration:

- bind appflow global <policyName> <priority> [<gotoPriorityExpression [-type <type>] [-invoke (<labelType> <labelName>)]
- show appflow global

bind appflow global af_policy_lb1_10.102.71.190 1 NEXT -type REQ_OVERRIDE -invoke vserver google

To bind an AppFlow policy to a specific virtual server by using the command line interface

At the command prompt, type the following command to bind an appflow policy to a specific virtual server and verify the configuration:
bind lb vserver <name> -policyname <policy_name> -priority <priority>

bind lb vserver google -policyname af_policy_google_10.102.19.179 -priority 251

To globally bind an AppFlow policy by using the configuration utility

Navigate to System > AppFlow, click AppFlow policy Manager and select the relevant Bind Point (Default Global) and Connection Type, and then bind the AppFlow policy.

To bind an AppFlow policy to a specific virtual server by using the configuration utility

Navigate to Traffic Management > Load Balancing > Virtual Servers, select the virtual server, and click Policies, and bind the AppFlow policy.

Updated: 2014-08-12

If you want to monitor only the traffic through certain virtual servers, enable AppFlow specifically for those virtual servers. You can enable AppFlow for load balancing, content switching, cache redirection, SSL VPN, GSLB, and authentication virtual servers.

To enable AppFlow for a virtual server by using the command line interface

At the command prompt, type:

set cs vserver <name> <protocol> <IPAddress> <port> -appflowLog ENABLED

> set cs vserver Vserver-CS-1 HTTP 10.102.29.161 80 -appflowLog ENABLED

To enable AppFlow for a virtual server by using the configuration utility

Navigate to Traffic Management > Content Switching > Virtual Servers, select the virtual server, and enable AppFlow Logging option.

Updated: 2014-08-07

You can enable AppFlow for services that are to be bound to the load balancing virtual servers.

To enable AppFlow for a service by using the command line interface

At the command prompt, type:

set service <name> -appflowLog ENABLED

```
set service ser -appflowLog ENABLED
```

To enable AppFlow for a service by using the configuration utility

Navigate to Traffic Management > Load Balancing > Services, select the service, and enable AppFlow Logging option.

Updated: 2014-08-08

You can set AppFlow parameters to customize the exporting of data to the collectors.

To set the AppFlow Parameters by using the command line interface

At the command prompt, type the following commands to set the AppFlow parameters and verify the settings:

- set appflow param [-templateRefresh <secs>] [-appnameRefresh <secs>] [-flowRecordInterval <secs>] [-udpPmtu <positive_integer>] [-httpUrl (**ENABLED** | **DISABLED**)] [-httpCookie (**ENABLED** | **DISABLED**)] [-httpReferer (**ENABLED** | **DISABLED**)] [-httpMethod (**ENABLED** | **DISABLED**)] [-httpHost (**ENABLED** | **DISABLED**)] [-httpUserAgent (**ENABLED** | **DISABLED**)] [-httpXForwardedFor (**ENABLED** | **DISABLED**)][-clientTrafficOnly (**YES** | **NO**)]
- show appflow Param

```
> set appflow Param -templateRefresh 240 -udpPmtu 128 -httpUrl enabled
```

To set the AppFlow parameters by using the configuration utility

Navigate to System > AppFlow, click Change AppFlow Settings, and specify relevant AppFlow parameters.

Updated: 2013-08-20

The following example illustrates the procedure for configuring AppFlow for DataStream using the command line interface.

```
> enable feature appflow
> add db user sa password freebsd
> add lbvserver lb0 MSSQL 10.102.147.97 1433 -appflowLog ENABLED
> add service sv0 10.103.24.132 MSSQL 1433 -appflowLog ENABLED
> bind lbvserver lb0 sv0
> add appflow collector col0 -IPAddress 10.102.147.90
> add appflow action act0 -collectors col0
> add appflow policy pol0 "mssql.req.query.text.contains(\"select\")" act0
> bind lbvserver lb0 -policyName pol0 -priority 10
```

When the Netscaler appliance receives a database request, the appliance evaluates the request against a configured policy. If a match is found, the details are sent to the AppFlow collector configured in the policy.

Exporting Performance Data of Web Pages to AppFlow Collector

May 28, 2015

The EdgeSight Monitoring application provides web page monitoring data with which you can monitor the performance of various Web applications served in a Netscaler environment. You can now export this data to AppFlow collectors to get an in-depth analysis of the web page applications. AppFlow, which is based on IPFIX standard, provides more specific information about web application performance than does EdgeSight monitoring alone.

You can configure both load balancing and content switching virtual servers to export EdgeSight Monitoring data to AppFlow collectors. Before configuring a virtual server for AppFlow export, associate an Appflow action with the EdgeSight Monitoring responder policy.

The following web page performance data is exported to AppFlow:

- **Page Load Time**. Elapsed time, in milliseconds, from when the browser starts to receive the first byte of a response until the user starts to interact with the page. At this stage, all the page content might not be loaded.
- **Page Render Time**.Elapsed time, in milliseconds, from when the browser receives the first byte of response until either all page content has been rendered or the page load action has timed out.
- **Time Spent on the Page**. Time spent by users on a page. Represents the period of time from one page request to the next one.

AppFlow transmits the performance data by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. The AppFlow templates use the following enterprise-specific Information Elements (EIEs) to export the information:

- **Client Load End Time**. Time at which the browser received the last byte of a response to load all the objects of the page such as images, scripts, and stylesheets.
- **Client Load Start Time**.Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and stylesheets.
- **Client Render End Time**. Time at which browser finished rendering the entire page, including the embedded objects.
- **Client Render Start Time**. Time at which the browser started rendering the page.

This topic includes the following details:

- Prerequisites for Exporting Performance Data of Web Pages to AppFlow Collectors
- Associating an AppFlow Action with the EdgeSight Monitoring Responder Policy

Updated: 2013-09-13

Before associating the AppFlow action with the AppFlow policy, verify that the following prerequisites have been met:

- The AppFlow feature has been enabled and configured. For instructions, see "Configuring the AppFlow feature".
- The Responder feature has been enabled. For instructions, see "Enabling a Responder Feature".
- The EdgeSight Monitoring feature has been enabled. For instructions, see "Enabling an Application for EdgeSight Monitoring."
- EdgeSight Monitoring has been enabled on the load balancing or content switching virtual servers bound to the services of applications for which you want to collect the performance data. For instructions, see "Enabling an Application for

EdgeSight Monitoring."

Updated: 2013-10-31

To export the web page performance data to the AppFlow collector, you must associate an AppFlow action with the EdgeSight Monitoring responder policy. An AppFlow action specifies which set of collectors receive the traffic.

To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the command line interface

At the command prompt, type:

set responder policy <name> -appflowAction <action_Name>

```
set responder policy pol -appflowAction actn
```

To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the configuration utility

1. Navigate to AppExpert > Responder > Policies.
2. In the details pane, select an EdgeSight Monitoring responder policy, and then click **Open**.
3. In the **Configure Responder Policy** dialog box, in the **AppFlow Action** drop-down list, select the AppFlow action associated with the collectors to which you want to send the web-page performance data.
4. Click **OK**.

Configuring a Virtual Server to Export EdgeSight Statistics to Appflow Collectors

To export EdgeSight statistics information from a virtual server to the AppFlow collector, you must associate an AppFlow action with the virtual server.

1. Navigate to Traffic Management > Load Balancing > Virtual Servers or Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, select a virtual server, or multiple virtual servers, and then click Enable EdgeSight Monitoring.
3. In the Enable EdgeSight Monitoring dialog box, select the Export EdgeSight statistics to Appflow check box.
4. From the Appflow Action drop-down list, select the AppFlow action. The AppFlow action defines the list of AppFlow collectors to which it exports EdgeSight Monitoring statistics. If you have selected multiple load balancing virtual servers, the same AppFlow Action will be associated with the responder policies bound to them. You can later change the AppFlow Action configured for each of the selected Load Balancing virtual server individually, if required.
5. Click OK.

AutoScale

Aug 26, 2013

Efficient hosting of applications in a cloud requires continuous optimization of application availability. To meet increasing demand, you have to scale network resources upward. When demand subsides, you need to scale down to avoid the unnecessary cost of idle resources. To minimize the cost of running the application by deploying only as many instances as are necessary during any given period of time, you have to constantly monitor traffic. However, monitoring traffic manually is not a feasible option. For the application environment to be able to scale up or down rapidly, you need to automate the processes of monitoring traffic and of scaling resources up and down whenever necessary.

If your organization uses Citrix CloudPlatform to deploy and manage the cloud environment, a Citrix NetScaler appliance can automatically scale users' applications as needed. The CloudPlatform elastic load balancing feature includes a feature called *AutoScale*. A CloudPlatform user can use the AutoScale feature to specify thresholds for various conditions for automatically scaling the application fleet upward and downward. The scale-up and scale-down conditions can vary from simple use cases, such as a server's CPU usage, to complex use cases, such as a combination of a server's CPU usage and responsiveness. CloudPlatform, in turn, configures the NetScaler appliance to load balance traffic to the application virtual machines (VMs), monitor application thresholds and performance, and trigger scale-up and scale-down actions to add or remove VMs to or from the application fleet.

The CloudPlatform user performs all AutoScale configuration tasks by using the CloudPlatform user interface or APIs. The CloudPlatform user:

1. Creates a load balancing rule, with the necessary load balancing algorithm and stickiness.
2. Configures AutoScale parameters by specifying the application instance template, the minimum number of instances to maintain, the maximum number of instances permitted, scale-up and scale-down policies, and other information necessary for the functioning of the feature.
3. Submits the configuration.

For information about configuring a load balancing rule and AutoScale, see *Citrix CloudPlatform 3.0.5 (powered by Apache CloudStack) Administrator's Guide*, at http://support.citrix.com/article/CTX134823.

When the CloudPlatform user completes the AutoScale configuration, CloudPlatform uses the NetScaler NITRO API to push all the necessary configuration commands to the NetScaler appliance. As the NetScaler administrator, you do not have to perform any tasks for configuring AutoScale on the NetScaler appliance. However, you might have to be aware of certain prerequisites, and you might have to troubleshoot the configuration if issues arise in the AutoScale configuration. To troubleshoot the configuration, you have to be aware of how CloudPlatform works and what configuration CloudPlatform pushes to the NetScaler appliance. You also need a working knowledge of how to troubleshoot issues on a NetScaler appliance.

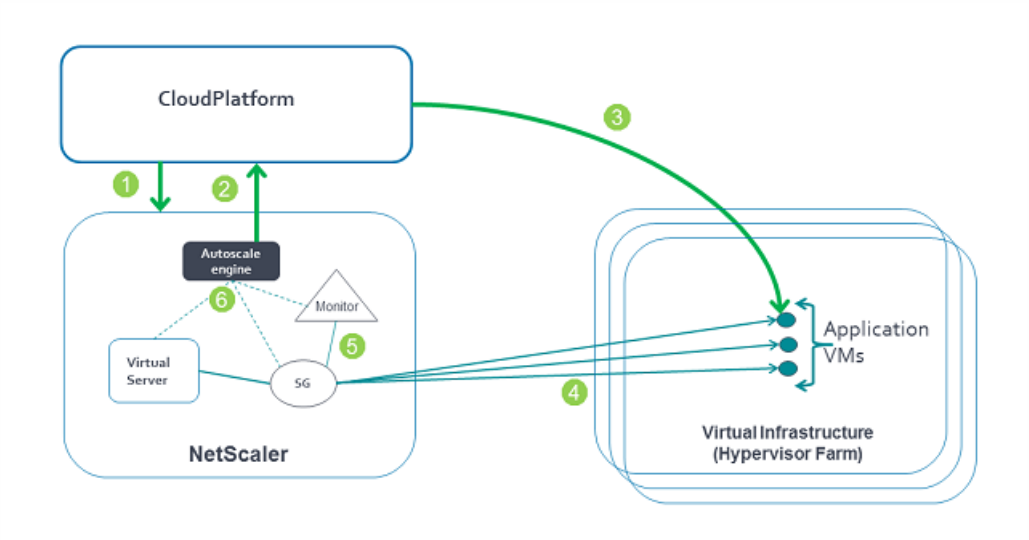
How AutoScale Works

Sep 06, 2013

When the CloudPlatform user completes the AutoScale configuration, CloudPlatform uses the NetScaler NITRO API to create an AutoScale-related configuration on the NetScaler appliance. For information about the configuration commands that CloudPlatform uses to configure the NetScaler appliance, see "NetScaler Configuration Details."

The following diagram shows the sequence of operations, beginning with CloudPlatform pushing the AutoScale configuration to the NetScaler appliance. The events are numbered in the order in which they occur, and are described below.

Figure 1. AutoScale Architecture



When the CloudPlatform user submits the AutoScale configuration, the following events occur:

1. CloudPlatform uses the NetScaler NITRO API to push the AutoScale configuration to the NetScaler appliance, creating AutoScale-related entities on the appliance. The entities include a load balancing virtual server, a service group, and monitors.
2. The AutoScale engine on the NetScaler appliance sends API requests to CloudPlatform to initially deploy the minimum number of virtual machines required.
3. CloudPlatform provisions the minimum number of instances (VMs) on the hypervisors (virtualization hosts) that it manages.
4. The NetScaler appliance discovers the IP addresses assigned by CloudPlatform to the newly created VMs and binds them, as services, to the service group representing them. The NetScaler appliance can then load balance traffic to the VMs.
5. NetScaler monitors bound to the service group start monitoring the load by collecting SNMP metrics from the instances.
6. The AutoScale engine on the NetScaler appliance monitors the metrics collected from the VMs and triggers scale-up and scale-down events whenever the metrics breach the configured threshold for the specified period. As part of the scale-up trigger, the NetScaler AutoScale engine sends an API request to CloudPlatform to deploy a new VM. After the virtual machine is deployed, the AutoScale engine binds the service representing the VM (IP address and port) to the service group and, after the configured quiet time, starts forwarding load balanced traffic to the new virtual machine. Likewise, as part of the scale-down trigger, the NetScaler AutoScale engine selects a VM, stops forwarding new requests to that

instance, and waits for the configured quiet time (to allow for the processing of current requests to complete) before it sends an API request to CloudPlatform to destroy the chosen instance.

In this way, the NetScaler appliance monitors the application and triggers scale-up and scale-down events on the basis of application load and/or performance.

Supported Environment

Sep 30, 2013

AutoScale is supported in the following environment:

- Citrix CloudPlatform 3.0.5.
- Citrix NetScaler MPX/SDX/virtual appliance running Citrix NetScaler release 10.e and later.
- SNMP v1/v2.

Prerequisites

Sep 06, 2013

Before you set up AutoScale, do the following:

- Make sure that CloudPlatform is reachable from the NetScaler appliance. You can do so by logging on to the NetScaler appliance and sending ping requests to the CloudPlatform server's IP address.
- Make sure that the network service offering used in CloudPlatform includes the NetScaler appliance as an external load balancing device.
- Use a CloudPlatform and NetScaler release that supports AutoScale. For information about NetScaler releases that support AutoScale, see "Supported Environment."

If you have to troubleshoot an AutoScale setup, you also have to know the prerequisites for setting up AutoScale in CloudPlatform. See the "Prerequisites" section of "Configuring AutoScale" in the *Citrix CloudPlatform 3.0.5 (powered by Apache CloudStack) Administrator's Guide*, at http://support.citrix.com/article/CTX134823.

NetScaler Configuration Details

Mar 19, 2012

The following table describes the AutoScale configuration commands that are used by Citrix CloudPlatform to configure a NetScaler appliance.

Table 1. NetScaler Configuration for AutoScale

AutoScale configuration command(s)	Description
add lb vserver Cloud-VirtualServer-192.0.2.116-22 TCP 192.0.2.116 22 -persistenceType NONE -lbMethod ROUNDROBIN -cltTimeout 9000 -minAutoscaleMembers 2 -maxAutoscaleMembers 5	Creates a load balancing virtual server to evenly distribute the load on the application instances (ROUND-ROBIN method). The virtual server also specifies the limits for the number of instances to which the application can scale up or down (maxAutoscaleMembers and minAutoscaleMembers, respectively).
add serviceGroup Clouda35a6b6b76614006b97476e841b80f79 TCP -maxClient 0 -maxReq 0 -cip DISABLED -usip NO -useproxyport YES -cltTimeout 9000 -svrTimeout 9000 -CKA NO -TCPB NO -CMP NO -autoScale POLICY -memberPort 22 bind lb vserver Cloud-VirtualServer-192.0.2.116-22 Clouda35a6b6b76614006b97476e841b80f79	Creates an AutoScale service group for the application instances, with the service group's autoScale parameter set to POLICY. Also specifies the port on which the service group members must receive traffic. The second command binds the service group to the load balancing virtual server.
add server autoscale-internal_server_Clouda35a6b6b76614006b97476e841b80f79 autoscale-internal_server_Clouda35a6b6b76614006b97476e841b80f79 bind serviceGroup Clouda35a6b6b76614006b97476e841b80f79 autoscale-internal_server_Clouda35a6b6b76614006b97476e841b80f79 22	Creates a server entry to represent the application instances. Binds the server entry to the service group.
add lb metricTable Cloud-MTbl-192.0.2.116-22 bind lb metricTable Cloud-MTbl-192.0.2.116-22 Linux_User_CPU_-_percentage 1.3.6.1.4.1.2021.11.9.0 add lb monitor Cloud-Mon-192.0.2.116-22 LOAD -interval 24 -destPort 161 -snmpCommunity public -metricTable Cloud-MTbl-192.0.2.116-22	Configures a new SNMP monitor to retrieve the specified metrics.

AutoScale configuration command(s)	Description
bind lb monitor Cloud-Mon-192.0.2.116-22 -metric Linux_User_CPU_-_percentage -metricThreshold 2147483647 bind serviceGroup Clouda35a6b6b76614006b97476e841b80f79 -monitorName Cloud-Mon-192.0.2.116-22 -passive	
add autoscale profile Cloud-AutoScale-Profile-192.0.2.116-22 -type CLOUDSTACK -url "http://10.102.31.107:8080/client/api" -apiKey t0fEWPtk_ncQYbofjAm1jjlgGTR7UNZrkZ3sdEpLREBNzBPLSNpNz8qNSbc439xNtYnEYdWn_MsUC_CUazaIKg -sharedSecret -PrE5h3DP7swHAN12TGBlX-xSTRLHzob91l6O0VO1FMxvE1UOl7uoD6_Z0bkkLaVtK5Y10oBkTzgbTwp3u5lCQ	Creates an AutoScale profile to specify the details required by NetScaler for making API requests to CloudPlatform (URL, API key, and shared secret).
add autoscale action Cloud-AutoScale-ScaleUpAction-192.0.2.116-22 -type SCALE_UP -profileName Cloud-AutoScale-Profile-192.0.2.116-22 -parameters "command=deployVirtualMachine&zoneid=2ab23590-78cb-4106-8d85-4412a2f2435f&serviceofferingid=b9503e47-0d8f-4c89-a88d-04d8b17fe8e9&templateid=1a4a5084-208c-47a8-9c16-d582550cf759&displayname=AutoScale-LB-lb&networkids=a3c97129-b729-4c72-994f-7b918f20ce4d&lbruleid=f96b7f3b-19ec-4123-891c-604f05b032b3" -quietTime 90 -vServer Cloud-VirtualServer-192.0.2.116-22	Creates a scale-up action, which enables the NetScaler appliance to add virtual machines (instances) to the application fleet.
add autoscale action Cloud-AutoScale-ScaleDownAction-192.0.2.116-22 -type SCALE_DOWN -profileName Cloud-AutoScale-Profile-192.0.2.116-22 -parameters "command=destroyVirtualMachine&lbruleid=f96b7f3b-19ec-4123-891c-604f05b032b3" -vmDestroyGracePeriod 30 -quietTime 90 -vServer Cloud-VirtualServer-192.0.2.116-22	Creates a scale-down action, which enables the NetScaler appliance to remove virtual machines (instances) from the application fleet.
add autoscale policy Cloud-AutoScale-Policy-Min-192.0.2.116-22 -rule "SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").ACTIVESERVICES.LT(SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").MINAUTOSCALEMEMBERS)" -action Cloud-AutoScale-ScaleUpAction-192.0.2.116-22	Creates an AutoScale policy to initially create the specified minimum number of VMs and, later, to ensure that the number of VMs in the fleet does not fall below the required minimum.
add autoscale policy Cloud-AutoScale-Policy-Max-192.0.2.116-22 -rule "SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").ACTIVESERVICES.GT(SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").MAXAUTOSCALEMEMBERS)" -action Cloud-AutoScale-ScaleDownAction-192.0.2.116-22	Creates an AutoScale policy to prevent the number of VMs in the fleet from exceeding the specified maximum.
add autoscale policy Cloud-AutoScale-Policy-192.0.2.116-22-35 -rule "SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").ACTIVESERVICES.LT(SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").MAXAUTOSCALEMEMBERS) && (SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").SNMP_TABLE(0).AVERAGE_VALUE.GT(90))" -action Cloud-AutoScale-ScaleUpAction-192.0.2.116-22	Creates an AutoScale policy to evaluate the metrics that are collected and trigger a scale-up action when the metric value breaches the threshold specified for the scale-up policy.

AutoScale configuration command(s)	Description
add autoscale policy Cloud-AutoScale-Policy-192.0.2.116-22-36 -rule "SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").ACTIVESERVICES.GT(SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").MINAUTOSCALEMEMBERS) && (SYS.VSERVER(\"Cloud-VirtualServer-192.0.2.116-22\").SNMP_TABLE(0).AVERAGE_VALUE.LT(30))" -action Cloud-AutoScale-ScaleDownAction-192.0.2.116-22	Creates an AutoScale policy to evaluate the collected metrics and trigger a scale-down action when the metric value breaches the threshold specified by the scale-down policy.
add ns timer Cloud-AutoScale-Timer-192.0.2.116-22 -interval 30 bind ns timer Cloud-AutoScale-Timer-192.0.2.116-22 -policyName Cloud-AutoScale-Policy-Min-192.0.2.116-22 -priority 1 -gotoPriorityExpression END -sampleSize 1 -threshold 1 bind ns timer Cloud-AutoScale-Timer-192.0.2.116-22 -policyName Cloud-AutoScale-Policy-Max-192.0.2.116-22 -priority 2 -gotoPriorityExpression END -sampleSize 1 -threshold 1 bind ns timer Cloud-AutoScale-Timer-192.0.2.116-22 -policyName Cloud-AutoScale-Policy-192.0.2.116-22-35 -priority 3 -gotoPriorityExpression END -sampleSize 2 -threshold 2 bind ns timer Cloud-AutoScale-Timer-192.0.2.116-22 -policyName Cloud-AutoScale-Policy-192.0.2.116-22-36 -priority 4 -gotoPriorityExpression END -sampleSize 2 -threshold 2	Creates a timer that enables evaluation of the AutoScale policies at the configured sampling intervals.

Troubleshooting

Sep 06, 2013

Before you attempt to resolve an AutoScale issue, make sure that the prerequisites have been adhered to, on both the CloudPlatform server and the NetScaler appliance, as described in "Prerequisites." If that does not resolve the issue, your problem could be one of the following.

- Recommend that the CloudPlatform user deploy one VM manually in the network before configuring AutoScale. Ask the user to remove the AutoScale configuration from the NetScaler appliance or the load balancer from the network, manually deploy one VM (preferably using the template created for the AutoScale configuration), and then create the AutoScale configuration.
- Verify that the CloudPlatform user has configured the VM template in such a way that the VMs that are created from the template can accept traffic without manual intervention. If a provisioned VM cannot accept traffic automatically, the metric remains above the threshold, and the AutoScale configuration continues to provision additional VMs, as designed. To remedy the issue, disable AutoScale from CloudPlatform, fix the template, and then enable AutoScale.
- Verify that the CloudPlatform user has not exceeded the limit for the number of VMs imposed by the user's account.
- Verify that the CloudPlatform server is up and is reachable from the NetScaler appliance.
- Verify that the CloudPlatform log file, management-server.log, has reported the successful creation of the AutoScale configuration in CloudPlatform.
- Verify that the scale-up policy that is responsible for initial scale up (the policy name is prefixed with Cloud-AutoScale-Policy-Min) is receiving hits.

- Verify that the CloudPlatform user has configured the VM template in such a way that the VMs that are created from the template can accept traffic without manual intervention. If a provisioned VM cannot accept traffic automatically, the metric remains above the threshold, and the AutoScale configuration continues to provision additional VMs, as designed. To remedy the issue, disable AutoScale from CloudPlatform, fix the template, and then enable AutoScale.
- Verify that the quiet time that the CloudPlatform user has configured in the AutoScale configuration is sufficient to ensure even traffic distribution to all the VMs, including the new VM. If the quiet time is too low, and traffic distribution has not stabilized, the metrics might remain above the threshold, and additional VMs might be spawned.

- Verify that the CloudPlatform user has installed an SNMP agent in the VM template, and that the SNMP agent is up and running on every VM.
- Verify that the CloudPlatform user has not exceeded the limit for the number of VMs imposed by the user's account.
- Verify that the CloudPlatform user has correctly configured the SNMP parameters to collect metrics from the VM (for example, the community string and the port).
- Verify that the scale-up or scale-down policy is receiving hits.
- Verify that the CloudPlatform server is up, and that the CloudPlatform server is reachable from the NetScaler appliance.

- Verify that the user has configured the templates in such a way that the VMs created from the templates can start serving traffic without any manual intervention.
- Verify that the service is running on the VMs, on the configured member port.
- Send a ping request to the gateway (virtual router), from the VM that is not accepting traffic.

- The VMs might not be deleted immediately after the AutoScale configuration is deleted. Wait for about 5 minutes after you have deleted the AutoScale configuration, and then check again.
- If the destruction of VMs has not commenced after 5 minutes, you might have to delete the VMs manually.

Clustering

May 25, 2015

A NetScaler cluster is a group of nCore appliances working together as a single system image. Each appliance of the cluster is called a node. The cluster can include as few as 2 or as many as 32 NetScaler nCore hardware or virtual appliances as nodes.

The client traffic is distributed between the nodes to provide high availability, high throughput, and scalability.

To create a cluster, you must add the appliances as cluster nodes, set up communication between the nodes, set up links to the client and server networks, configure the appliances, and configure the distribution of client and server traffic.

NetScaler Feature-level Support in a Cluster

Jun 15, 2015

The following table lists the features that are not supported in the NetScaler 10 release and also states the support for the feature in subsequent NetScaler releases.

Note:

- Unless stated otherwise in this table, all NetScaler features are supported in a cluster.
- The entry "Node-level" in the table indicates that the feature is supported only on individual cluster nodes.

NetScaler Feature	10	10.1	10.5	11
SSL (classic policies) Note: SSL - advanced policies are supported from NetScaler 10 onwards.	No	No	No	No
SSL FIPS	No	No	No	No
SSL Certificate Bundle	No	No	No	No
Content switching actions Note: The content switching feature is supported from NetScaler 10 onwards.	No	Yes	Yes	Yes
Policy-based logging for content switching policies	No	Yes	Yes	Yes
Rate limiting	No	Yes	Yes	Yes
Action analytics	No	Yes	Yes	Yes
Branch Repeater load balancing	No	Yes	Yes	Yes
GSLB	No	No	Yes	Yes
RTSP	No	No	No	No
DNSSEC	No	No	No	No
DNS64	No	No	No	No
FTP	No	No	No	Yes

NetScaler Feature	10	10.1	10.5	11
TFTP	No	No	No	No
Connection mirroring	No	No	No	No
Integrated caching	Node-Level	Node-level	Node-level	Node-level
Large shared cache	No	Node-level	Node-level	Node-level
Application firewall	No	No	Node-level	Node-level
HTTP Denial-of-Service Protection (HDOSP)	Node-level	Node-level	Node-level	Node-level
Priority queuing (PQ)	Node-level	Node-level	Node-level	Node-level
Sure connect (SC)	Node-level	Node-level	Node-level	Node-level
AppQoE	NA	Node-level	Yes	Yes
Surge protection	Node-level	Node-level	Node-level	Node-level
MPTCP	No	No	Yes	Yes
MSR	Yes	Yes	Yes	Yes Note: Not supported in a L3 cluster.
IS-IS (IPv4 and IPv6)	No	Yes	Yes	Yes
IP-IP tunneling	No	Yes	Yes	Yes
Link load balancing	No	No	Yes	Yes
FIS (Failover Interface Set)	No	No	Yes	Yes
Link redundancy (LR)	No	No	Yes	Yes
NAT46	No	No	No	No

NetScaler Feature	10	10.1	10.5	11
NAT64	No	No	No	No
v6 ReadyLogo	No	No	No	No
Traffic domains	No	No	Yes	Yes
Route monitor	No	No	No	No
GRE tunneling (CB)	No	No	No	No
Layer 2 mode	No	No	Yes	Yes
Net profiles	No	No	Yes	Yes
HTTPS callout	No	Yes	Yes	Yes
AAA-TM	No	Node-level	Node-level	Node-level
AppFlow	No	Node-level	Node-level	Node-level
Insight	No	No	No	No
HDX Insight	No	No	No	No
VMAC/VRRP	No	No	Yes	Yes
NetScaler Push	No	No	No	No
Stateful Connection Failover	No	No	No	No
Graceful Shutdown	No	No	No	No
DBS AutoScale	No	No	No	No
DSR using TOS	No	No	No	No
Finer Startup-RR Control	Node-level	Node-level	Node-level	Node-level

NetScaler Feature	10	10.1	10.5	11
XML XSM	No	No	No	No
DHCP RA	No	No	No	No
Bridge Group	No	No	Yes Note: Supported from NetScaler 10.5 Build 52.1115.e onwards.	Yes
Network Bridge	No	No	No	No
Web Interface on NetScaler (WIonNS)	No	No	No	No
EdgeSight Monitoring	No	No	No	No
Metrics tables - Local	No	No	No	No
DNS Caching	Node-level	Node-level	Node-level	Node-level
Call Home	Node-level	Node-level	Node-level	Node-level
NetScaler Gateway or SSL VPN	No	No	Node-level	Node-level
CloudBridge Connector	No	No	No	No

Prerequisites for Cluster Nodes

Jan 28, 2016

NetScaler appliances that are to be added to a cluster must satisfy the following criteria:

- A NetScaler cluster can only include NetScaler nCore appliances. Clustering of NetScaler Classic appliances is not supported.
- All appliances must have the same software version and build.
- All appliances must be of the same platform type. This means that a cluster must have either all hardware appliances (MPX) or virtual appliances (VPX) or SDX NetScaler instances.

  Note:
  - For a cluster of hardware appliances (MPX), all appliances must be of the same model type.
  - For a cluster of virtual appliances (VPX), the appliances must be deployed on the following hypervisors: XenServer, Hyper-V, VMware ESX, and KVM.
  - Clustering of SDX NetScaler instances is supported in NetScaler 10.1 and later releases. To create a cluster of SDX NetScaler instances, see "Setting up a Cluster of NetScaler Instances".
- All appliances must be on the same network.
- All appliances must have the same licenses. Also, depending on the NetScaler version, there are some additional aspects to address:
  - For releases prior to NetScaler 10.5 Build 52.x:
    - A separate cluster license file is required. This file must be copied to the /nsconfig/license/ directory of the configuration coordinator.
    - Because of the separate cluster license file, the cluster feature is available irrespective of the NetScaler license.
  - For releases after NetScaler 10.5 Build 52.x:
    - No separate cluster license is required.
    - Cluster is licensed with the Enterprise and Platinum licenses. Cluster is not available for Standard license.
- Be initially configured and connected to a common client-side and server-side network.

Note: For a cluster of virtual appliances, that has large configurations, it is recommended to use 6 GB RAM for each node of the cluster.

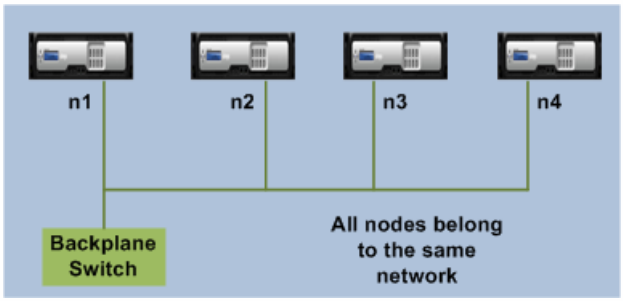
Cluster Overview

Jun 15, 2015

A NetScaler cluster is formed by grouping NetScaler appliances together. Based on the network location of the NetScaler appliances that you intend adding to the cluster, you must be aware of the following cluster setups:

Note: Unless specified otherwise, cluster features and configurations are the same for L2 and L3 clusters.

- **L2 cluster:** In this cluster deployment, all cluster nodes belong to the same network.



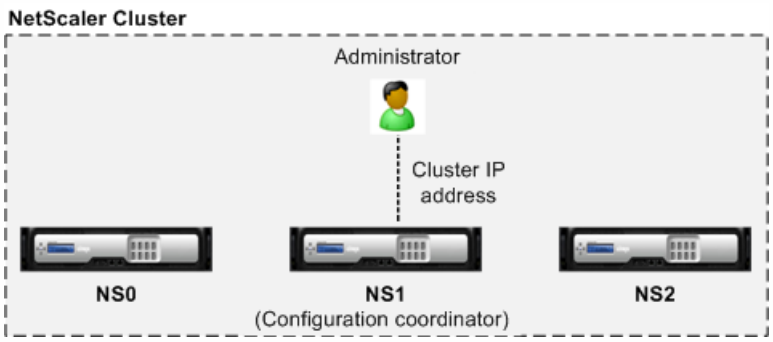
- **L3 cluster:** In this cluster deployment, cluster nodes can belong to different networks.

  Note: Not yet supported. Likely to be supported in future NetScaler versions.

Synchronization Across Cluster Nodes

May 25, 2015

All configurations on a NetScaler cluster are performed on the cluster IP address, which is the management address of the cluster. This cluster IP address is owned by a cluster node that is referred to as the cluster configuration coordinator as shown in the following figure:



The configurations that are available on the configuration coordinator are automatically propagated to the other cluster nodes and therefore all cluster nodes have the same configurations.

Note:

- NetScaler allows only a few configurations to be performed on individual cluster nodes through their NetScaler IP (NSIP) address. These configurations are not propagated across the other cluster nodes. For more information, see "Operations Supported on Individual Cluster Nodes".
- The following commands when executed on the cluster IP address are not propagated to other cluster nodes:
  - shutdown: Shuts down only the configuration coordinator.
  - reboot: Reboots only the configuration coordinator.
  - rm cluster instance: Removes the cluster instance from the node that you are executing the command on.
- If the NetScaler cluster is configured to use a quorum (quorum is mandatory for versions prior to NetScaler 10.5), a command is propagated to the other cluster nodes only when a majority of the nodes are in synch. If a majority of the nodes are not in synch or are in the process of synchronizing, the new commands cannot be accepted and therefore command propagation is temporarily halted.

When a node is added to a cluster, the configurations and the files (SSL certificates, licenses, DNS, and so on) that are available on the cluster configuration coordinator are synchronized to the newly added cluster node. When an existing cluster node, that was intentionally disabled or that had failed, is once again added, the cluster compares the configurations available on the node with the configurations available on the configuration coordinator. If there is a mismatch in configurations, the node is synchronized by using one of the following:

- **Full synchronization.** If the difference between configurations exceeds 255 commands, all the configurations of the configuration coordinator are applied to the node that is rejoining the cluster. The node remains operationally unavailable for the duration of the synchronization.
- **Incremental Synchronization.** If the difference between configurations is less than or equal to 255 commands, only the configurations that are not available are applied to the node that is rejoining the cluster. The operational state of the node remains unaffected.

Note: You can also manually synchronize the configurations and files. For more information, see "Synchronizing Cluster

Configurations" and "Synchronizing Cluster Files".

Striped, Partially Striped, and Spotted Configurations

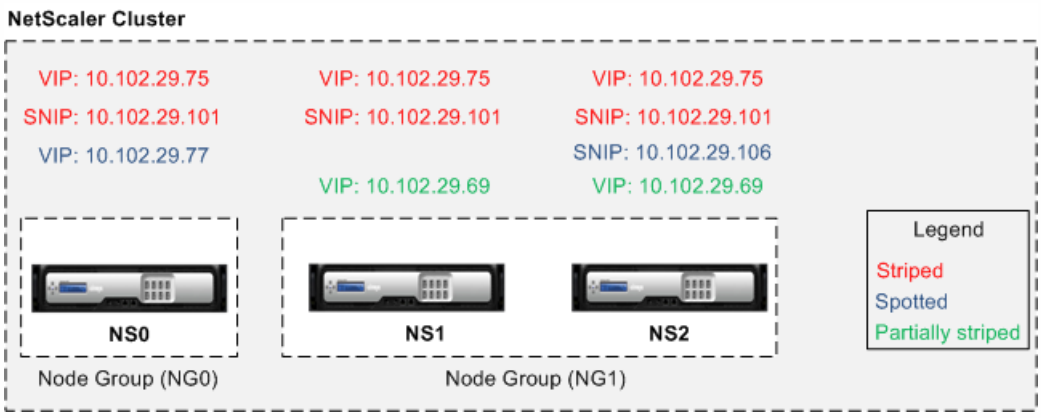
May 25, 2015

By virtue of command propagation, all nodes in a cluster have the same configurations. However, you may want some configurations to be available only on certain cluster nodes. While you cannot restrict the nodes on which the configurations are available, you can specify the nodes on which the configurations are active.

For example, you can define a SNIP address to be active on only one node, or define a SNIP address to be active on all nodes, or define a VIP address to be active on only one node, or define a VIP address to be active on all nodes, or define a VIP address to be active only on two nodes of a 3-node cluster.

Depending on the number of nodes the configurations are active on, cluster configurations are referred to as striped, partially striped, or spotted configurations.

Figure 1. Three-node cluster with striped, partially striped, and spotted configurations



The following table provides more details on the types of configurations:

Configuration Type	Active on...	Applicable to...	Configurations...
Striped configuration	All the cluster nodes	All entities	No specific configuration required to make an entity striped. By default, all entities defined on a cluster IP address are striped on all the cluster nodes.
Partially striped configuration	A subset of cluster nodes	Refer "Node Groups"	Bind the entities that you want to be partially striped, to a node group. The configuration will be active only on the cluster nodes that belong to the node group.
Spotted configuration	Single cluster node	• SNIP address • SNMP Engine ID • Hostname of cluster	A spotted configuration can be defined using one of two approaches. • **SNIP address.** When creating the SNIP address, specify the node on which you want the SNIP address to be active, as the owner node. **Example:**

Configuration Type	Active on...	Applicable to...	Configurations...
		nodes • Entities that can be bound to a node group	add ns ip 10.102.29.106 255.255.255.0 -type SNIP -ownerNode 2 (assuming node NS2 ID is 2) Note: You cannot change the ownership of a spotted SNIP address at run time. To change the ownership, you must first delete the SNIP address and add it again by specifying the new owner. • **Entities that can be bound to a node group.** By binding the entity to a single-member node group.

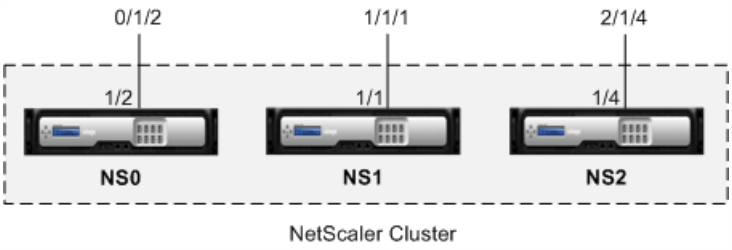
Note: Citrix recommends that you use spotted SNIP addresses. You can use striped SNIP addresses only if there is a shortage of IP addresses. The use of striped IP addresses can result in ARP flux issues.

Communication in a Cluster Setup

May 25, 2015

The interfaces of NetScaler appliances that are added to a cluster, are prefixed with a node ID. This helps identify the cluster node to which the interface belongs. Therefore, the interface identifier c/u, where c is the controller number and u is the unit number, now becomes n/c/u, where n is the node ID. For example, in the following figure, interface 1/2 of node n1 is represented as 0/1/2, interface 1/1 of node n2 is represented as 1/1/1, and interface 1/4 of node n3 is represented as 2/1/4.

Figure 1. Interface naming convention in a cluster



Server communication

The cluster communicates with the server through the physical connections between the cluster node and the server-side connecting device. The logical grouping of these physical connections is called the server data plane.

Client communication

The cluster communicates with the client through the physical connections between the cluster node and the client-side connecting device. The logical grouping of these physical connections is called the client data plane.

Inter-node communication

The cluster nodes communicate with each other by using the cluster backplane. The backplane is a set of connections in which one interface of each node is connected to a common switch, which is called the cluster backplane switch. Each node of the cluster uses a special MAC address to communicate with other nodes through the backplane.

The following figures shows the communication interfaces in L2 clusters and L3 clusters.

Figure 2. Cluster communication interfaces - L2 cluster

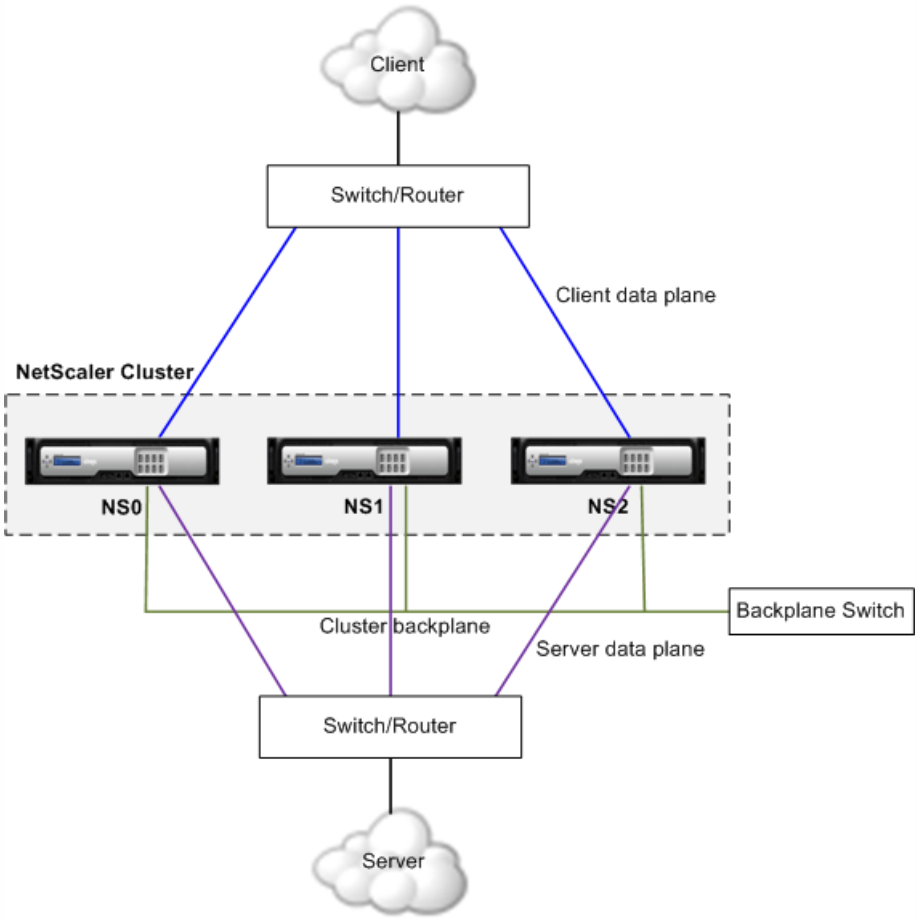


Figure 3. Cluster communication interfaces - L3 cluster

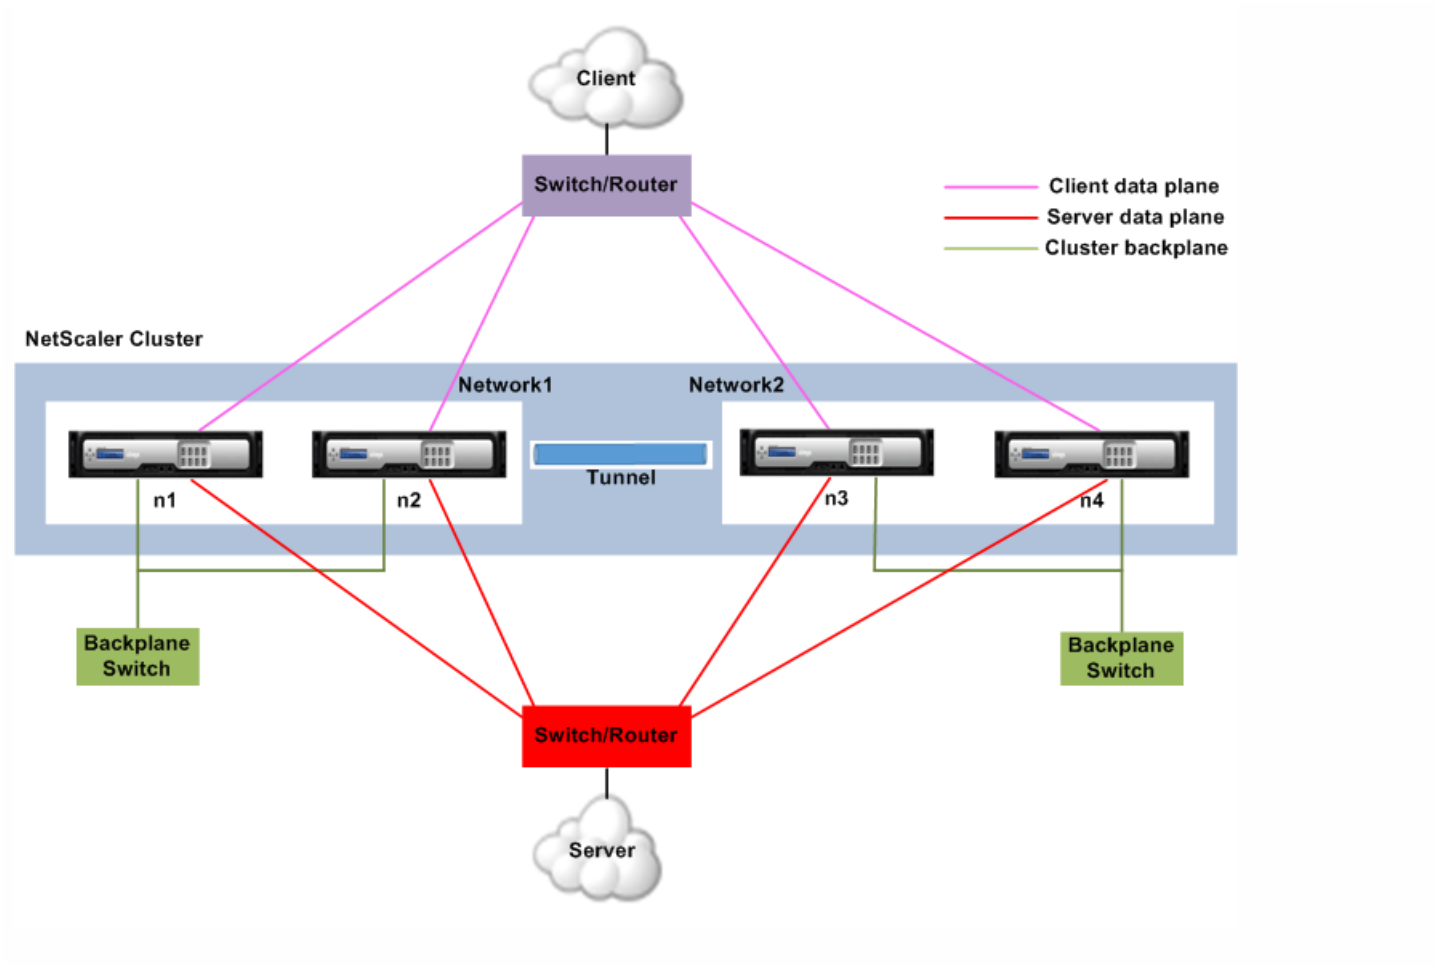


Traffic Distribution in a Cluster Setup

May 25, 2015

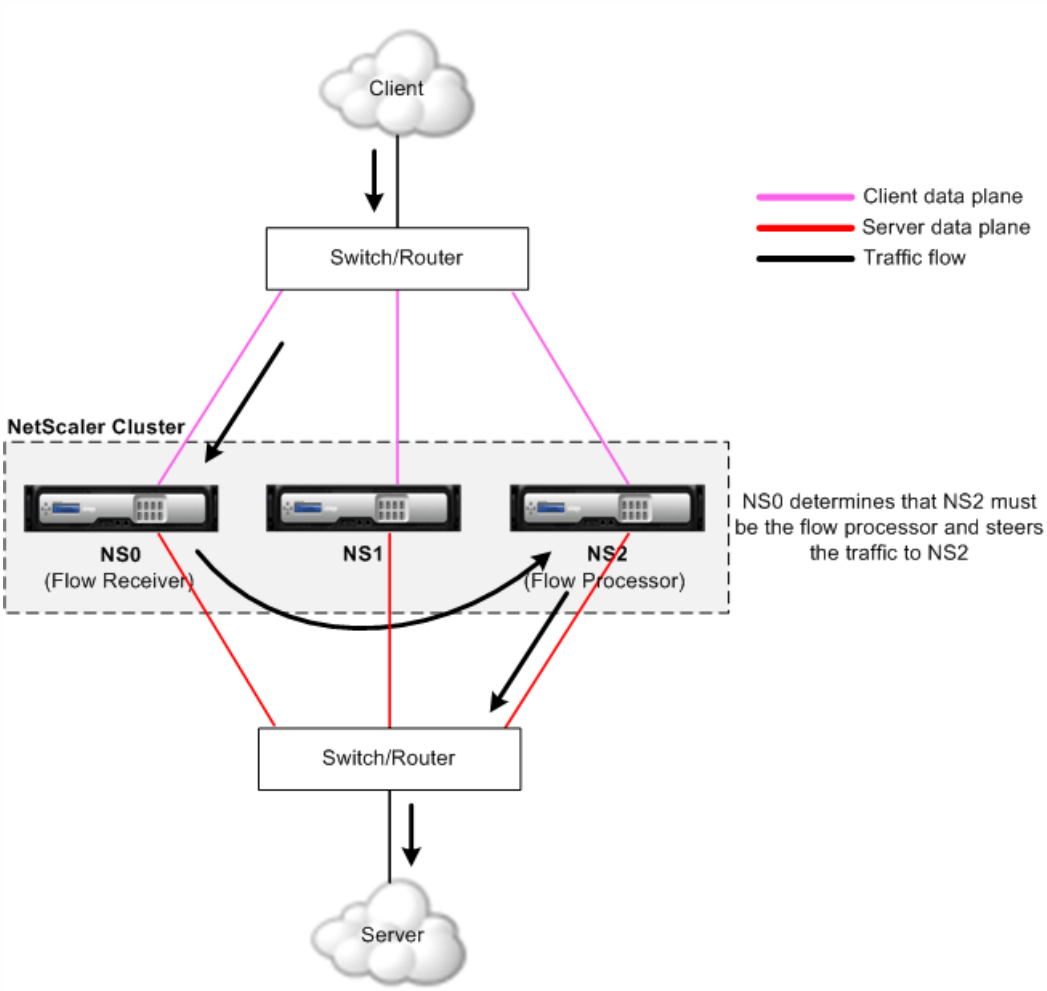
In a cluster setup, external networks view the collection of NetScaler appliances as a single entity. So, the cluster must select a single node that must receive the traffic. The cluster does this selection by using Equal Cost Multiple Path (ECMP) or cluster link aggregation traffic distribution mechanism. The selected node is called the flow receiver.

The flow receiver gets the traffic and then, using internal cluster logic determines the node that must process the traffic. This node is called the flow processor. The flow receiver steers the traffic to the flow processor over the backplane.

Note:

- The flow receiver and flow processor must be nodes capable of serving traffic.

Figure 1. Traffic distribution in a cluster



The above figure shows a client request flowing through the cluster. The client sends a request to a virtual IP (VIP) address. A traffic distribution mechanism configured on the client data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the node that must process the traffic, and steers the request to that node (unless the flow receiver selects itself as the flow processor).

The flow processor establishes a connection with the server. The server processes the request and sends the response to the subnet IP (SNIP) address that sent the request to the server.

- If the SNIP address is a striped or partially striped IP address, the traffic distribution mechanism configured on the server data plane selects one of the cluster nodes as the flow receiver. The flow receiver receives the traffic, determines the flow processor, and steers the request to the flow processor through the cluster backplane.
- If the SNIP address is a spotted IP address, the node that owns the SNIP address receives the response from the server.

In an asymmetric cluster topology (all cluster nodes are not connected to the external switch), you must use linksets either exclusively or combined with ECMP or cluster link aggregation. For more information, see "Using Linksets".

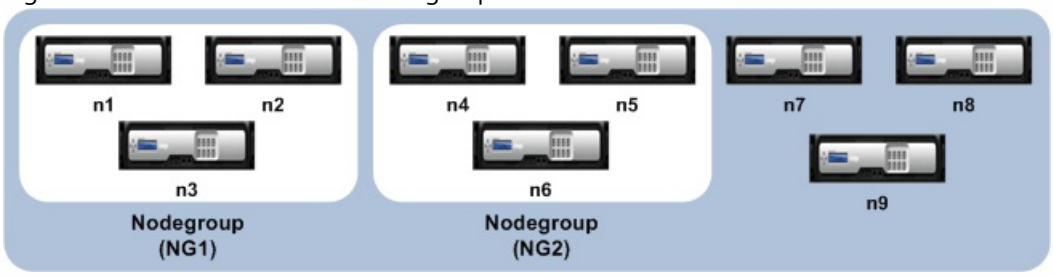
Cluster Nodegroups

May 25, 2015

Note: Nodegroups are supported from NetScaler 10.1 onwards.

As the name indicates, a cluster nodegroup is a group of cluster nodes.

Figure 1. NetScaler cluster with nodegroups



The above figure shows a cluster which has nodegroups NG1 and NG2 that include 3 cluster nodes each. The cluster also has 3 nodes that are not part of any nodegroup.

A nodegroup can be configured for the following:

- To define spotted and partially striped configurations. For more information, see "Nodegroups for Spotted and Partially-Striped Configurations".
- To configure redundancy of nodegroups. For more information, see "Configuring Redundancy for Nodegroups".
  Note: Supported from NetScaler 10.5 Build 52.1115.e onwards.

Note: The above functions of a nodegroup are mutually exclusive. This means that a nodegroup can provide only one of the above mentioned functionality.

Cluster and Node States

Jun 04, 2014

For a cluster to be functional, a majority of the nodes (n/2 + 1) must be online and be able to serve traffic by satisfying the following criteria:

- Admin state must be ACTIVE
- Operational state must be ACTIVE
- Health status must be UP

The following table describes the states of a cluster.

Type	Description
Admin	An admin state is configured when you add the node to the cluster. It indicates the purpose of the node, which can be in one of the following states: • **Active.** Nodes in this state serve traffic if they are operationally active and healthy. • **Passive.** Nodes in this state do not serve traffic but are in sync with the cluster. This is the default state of a cluster node. • **Spare.** Nodes in this state do not serve traffic but are in sync with the cluster. Spare nodes act as backup nodes for the cluster. If one of the nodes in the ACTIVE admin state becomes unavailable, a spare node becomes operationally active and starts serving traffic. Note: Whether the spare node remains operationally active depends on the preemption parameter of the add cluster instance command. If preemption is disabled, the spare node continues to serve traffic even if a node in ACTIVE admin state comes back online. If preemption is enabled, when a node in ACTIVE admin state comes back online, it preempts the spare node and starts serving traffic. The spare node goes back to inactive state.
Operational	When a node is part of a cluster, its operational state can change to ACTIVE, INACTIVE, or UNKNOWN. There are a number of reasons for a node being in INACTIVE or UNKNOWN state. Review the ns.log file or error counters to help determine the exact reason. Note: Passive nodes are always operationally INACTIVE. Spare nodes are ACTIVE only when they are serving traffic. Else, they are operationally INACTIVE.
Health	Depending on its health, a node can either be UP or NOT UP. To view the reasons for a node being in NOT UP state, run the show cluster node command for that node.

Routing in a Cluster

Apr 12, 2013

Routing in a cluster works in much the same way as routing in a standalone system. A few points to note:

- Routing runs only on spotted SNIP addresses and NSIP addresses.
- All routing configurations must be performed from the cluster IP address and the configurations are propagated to the other cluster nodes.
- Node-specific routing configurations must be performed by using the owner-node argument as follows:

```
!
interface vlan97
!
router ospf
 owner-node 0
  ospf router-id 97.131.0.1
 exit-owner-node
 owner-node 1
  ospf router-id 97.131.0.2
 exit-owner-node
 owner-node 2
  ospf router-id 97.131.0.3
 exit-owner-node
 redistribute kernel
 network 97.0.0.0/8 area 0
!
```

- Retrieve node-specific routing configurations by specifying the node(s) in the owner-node argument as follows:

```
> vtysh
ns# owner-node 0 1
ns(node-0 1)# show cluster state
ns(node-0 1)# exit-owner-node
```

- Clear node-specific routing configurations by specifying the node(s) in the owner-node argument as follows:

```
> vtysh
ns# owner-node 0 1
ns(node-0 1)# clear config
ns(node-0 1)# exit-owner-node
```

- Routing protocol daemons can run and adjacencies can be formed on active and inactive nodes of a cluster.
- Only active nodes advertise host routes to VIP addresses.
- Active and inactive nodes can learn dynamic routes and install them into the routing table.
- Routes learnt on a node are propagated to other nodes in the cluster only if route propagation is configured. This is mostly needed in asymmetric topologies where the unconnected nodes may not be able to form adjacencies.

  ```
  ns(config)# ns route-install propagate
  ```

  Note: Make sure that route propagation is not configured in a symmetric cluster topology as it can result in making the node unavailable to the cluster.

Setting up a NetScaler Cluster

Jun 15, 2015

NetScaler appliances that you want to add to the cluster must satisfy the criteria specified in "Prerequisites for Cluster Nodes". Before actually setting up a cluster, you must be aware of cluster basics. For information, see "Cluster Overview".

Forming a cluster requires you to set up inter-node communication, create the cluster (by adding the first NetScaler appliance), and then add the other cluster nodes. Each of these steps is explained with relevant details in subsequent topics.

Setting up Inter-Node Communication

Feb 04, 2016

The nodes in a cluster communicate with each other through the cluster backplane.

1. Identify the network interface that you want to use for the backplane.
2. Connect an Ethernet or optical cable from the selected network interface to the cluster backplane switch.

For example, to use interface 1/2 as the backplane interface for node 4, connect a cable from the 1/2 interface of node 4 to the backplane switch.

Important points to note when setting up the cluster backplane

- Do not use the appliance's management interface (0/1) as the backplane interface.
- Backlane interfaces must not be used for the client or server data planes.
- Configure a link aggregate (LA) channel to optimize the throughput of the cluster backplane.
- Citrix recommends that you dedicate a separate switch for the backplane, so that large amounts of traffic can be handled seamlessly.
- Backplane interfaces of all nodes of a cluster must be connected to the same switch and bound to the same L2 VLAN.
- If you have multiple clusters with the same cluster instance ID, make sure that the backplane interfaces of each cluster are bound to a different VLAN.
- The backplane interface is always monitored, regardless of the HA monitoring settings of that interface.
- The state of MAC spoofing on the different virtualization platforms can affect the steering mechanism on the cluster backplane. Therefore, make sure the appropriate state is configured:
  - XenServer - Disable MAC spoofing
  - HyperV - Enable MAC spoofing
  - ESX - Enable MAC spoofing (also make sure "Forged Transmits" is enabled)
- The Maximum Transmission Unit (MTU) for interfaces of the backplane switch must be greater than or equal to 1512 bytes, if features like MBF, L2 policies, ACLs, routing in CLAG deployments are configured. The MTU on the cluster backplane is automatically updated.

Creating a NetScaler Cluster

Apr 03, 2015

To create a cluster, start by taking one of the NetScaler appliances that you want to add to the cluster. On this node, you must create the cluster instance and define the cluster IP address. This node is the first cluster node and is called the cluster configuration coordinator. All configurations that are performed on the cluster IP address are stored on this node and then propagated to the other cluster nodes.

The responsibility of configuration coordination in a cluster is not fixed to a specific node. It can change over time depending on the following factors:

- The priority of the node. The node with the highest priority (lowest priority number) is made the configuration coordinator. Therefore, if a node with a priority number lower than that of the existing configuration coordinator is added, the new node takes over as the configuration coordinator.
  Note: Node priority can be configured from NetScaler 10.1 onwards.
- If the current configuration coordinator goes down. The node with the next lowest priority number takes over as the configuration coordinator. If the priority is not set or if there are multiple nodes with the lowest priority number, the configuration coordinator is selected from one of the available nodes.

Note: The configurations of the appliance (including SNIP addresses and VLANs) are cleared by implicitly executing the clear ns config extended command. However, the default VLAN and NSVLAN are not cleared from the appliance. Therefore, if you want the NSVLAN on the cluster, make sure it is created before the appliance is added to the cluster.

1. Log on to an appliance (for example, appliance with NSIP address 10.102.29.60) that you want to add to the cluster.
2. Add a cluster instance.
   add cluster instance <clId>

   Note:
   - The cluster instance ID must be unique within a LAN.
3. Add the NetScaler appliance to the cluster.
   add cluster node <nodeId> <IPAddress> -state <state> -backplane <interface_name>

   Example

   Adding a node for an L2 cluster (all cluster nodes are in the same network).

   ```
   > add cluster node 0 10.102.29.60 -state PASSIVE -backplane 0/1/1
   ```
4. Add the cluster IP address (for example, 10.102.29.61) on this node.
   add ns ip <IPAddress> <netmask> -type clip

   Example
   ```
   > add ns ip 10.102.29.61 255.255.255.255 -type clip
   ```
5. Enable the cluster instance.
   enable cluster instance <clId>

6. Save the configuration.
   save ns config

7. Warm reboot the appliance.

reboot -warm

Verify the cluster configurations by using the show cluster instance command. Verify that the output of the command displays the NSIP address of the appliance as a node of the cluster.

1. Log on to an appliance (for example, an appliance with NSIP address 10.102.29.60) that you intend to add to the cluster.
2. Navigate to System > Cluster.
3. In the details pane, click the Manage Cluster link.
4. In the Cluster Configuration dialog box, set the parameters required to create a cluster. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click Create.
6. In the Configure cluster instance dialog box, make sure that the Enable cluster instance check box is selected.
7. In the Cluster Nodes pane, select the node and click Open.
8. In the Configure Cluster Node dialog box, set the State.
9. Click OK, and then click Save.
10. Warm reboot the appliance.

Adding a Node to the Cluster

Apr 03, 2015

You can seamlessly scale the size of a cluster to include a maximum of 32 nodes. When a NetScaler appliance is added to the cluster, the configurations from that appliance are cleared and cluster configurations are synchronized on this node. There can be an intermittent drop in traffic while the synchronization is in progress.

Note:

- The licenses of the appliance are checked against the licenses available on the configuration coordinator. The appliance is added if the licenses match.
- If you use the NetScaler CLI to add a node, the new node does not become a functional part of the cluster until it is explicitly joined to the cluster. Therefore, after adding the node, log on to that node and join the node to the cluster. Alternatively, you can add the node from the command line and use the configuration utility to join the node to the cluster. If you use the configuration utility, you need only log on to the cluster IP address and add the node. The newly added node is automatically joined to the cluster.

Important: Before you add a NetScaler appliance to a cluster:

- Set up the backplane interface for the node.
- If you want the NSVLAN on the cluster, make sure that the NSVLAN is created on the appliance before it is added to the cluster.
- Citrix recommends that you add the node as a passive node. Then, after joining the node to the cluster, complete the node specific configuration from the cluster IP address. Run the force cluster sync command if the cluster has only spotted IP addresses, has L3 VLAN binding, or has static routes.
- When an appliance with a preconfigured link aggregate (LA) channel is added to a cluster, the LA channel continues to exist in the cluster environment. The LA channel is renamed from LA/x to nodeId/LA/x, where LA/x is the LA channel identifier.

To add a node to the cluster by using the command line interface

1. Log on to the cluster IP address and, at the command prompt, do the following:
   1. Add the appliance (for example, 10.102.29.70) to the cluster.
      add cluster node <nodeId> <IPAddress> -state <state> -backplane <interface_name>

      Example

      ```
      > add cluster node 1 10.102.29.70 -state PASSIVE -backplane 1/1/1
      ```
   2. Save the configuration.
      save ns config

2. Log on to the newly added node (for example, 10.102.29.70) and do the following:
   1. Join the node to the cluster.
      join cluster -clip <ip_addr> -password <password>

      Example

      ```
      > join cluster -clip 10.102.29.61 -password nsroot
      ```
   2. Save the configuration.
      save ns config

   3. Warm reboot the appliance.

```
reboot -warm
```

To add a node to the cluster by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster > Nodes.
3. In the details pane, click Add to add the new node (for example, 10.102.29.70).
4. In the Create Cluster Node dialog box, configure the new node. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click Create. When prompted to perform a warm reboot, click Yes.

To join a previously added node to the cluster by using the configuration utility

If you have used the command line to add a node to the cluster, but have not joined the node to the cluster, you can use the following procedure.

Note: When a node joins the cluster, it takes over its share of traffic from the cluster and hence an existing connection can get terminated.

1. Log on to the node that you want to join to the cluster (for example, 10.102.29.70).
2. Navigate to System > Cluster.
3. In the details pane, under Get Started, click the Join Cluster link.
4. In the Join to existing cluster dialog box, set the cluster IP address and the nsroot password of the configuration coordinator. For a description of a parameter, hover the mouse cursor over the corresponding text box.
5. Click OK.

Viewing the Details of a Cluster

Feb 13, 2015

You can view the details of the cluster instance and the cluster nodes by logging on to the cluster IP address.

To view details of a cluster instance by using the command line interface

Log on to the cluster IP address and, at the command prompt, type:

show cluster instance <clId>

Note: When executed from the NSIP address of a cluster node that is not the configuration coordinator, this command displays the status of the cluster on this node.

To view details of a cluster node by using the command line interface

Log on to the cluster IP address and, at the command prompt, type:

show cluster node <nodeId>

To view details of a cluster instance by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster.
3. In the details pane, under Get Started, click the Manage Cluster link to view the details of the cluster.

To view details of a cluster node by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster > Nodes.
3. In the details pane, click the node for which you want to view the details.

Distributing Traffic Across Cluster Nodes

Feb 13, 2015

After you have created the NetScaler cluster and performed the required configurations, you must deploy Equal Cost Multiple Path (ECMP) or cluster Link Aggregation (LA) on the client data plane (for client traffic) or server data plane (for server traffic). These mechanisms distribute external traffic across the cluster nodes.

Using Equal Cost Multiple Path (ECMP)

Feb 13, 2015

With the Equal Cost Multiple Path (ECMP) mechanism, the router has equal-cost routes to VIP addresses with the next hops as the active nodes of the cluster. The router uses a stateless hash-based mechanism to distribute traffic across the routes.

Note: Routes are limited to the maximum number of ECMP routes supported by the upstream router.
To use ECMP, you must first enable the required routing protocol (OSPF, RIP, BGP, or ISIS) on the cluster IP address. You must bind the interfaces and the spotted IP address (with dynamic routing enabled) to a VLAN. Configure the selected routing protocol and redistribute the kernel routes on the ZebOS by using the vtysh shell.

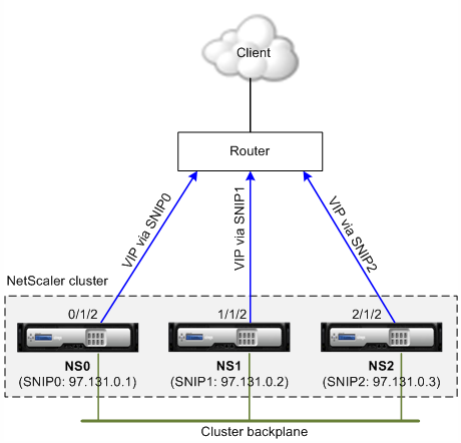
You must perform similar configurations on the cluster IP address and on the external connecting device.

Note:

- All routing configurations must be done through the cluster IP address. No configurations must be performed on individual cluster nodes.
- Make sure that the licenses on the cluster support dynamic routing, otherwise ECMP does not work.
- ECMP is not supported for wildcard virtual servers since RHI needs a VIP address to advertise to a router and wildcard virtual servers do not have associated VIP addresses.

You must have detailed knowledge of routing protocols to use ECMP. For more information, see "Configuring Dynamic Routes. For more information on routing in a cluster, see "Routing in a Cluster".

Figure 1. ECMP topology



As seen in the above figure, the ECMP router can reach the VIP address via SNIP0, SNIP1, or SNIP2.

To configure ECMP on the cluster by using the command line interface

1. Log on to the cluster IP address.
2. Enable the routing protocol.
   enable ns feature <feature>

   Example: To enable the OSPF routing protocol.
   `> enable ns feature ospf`
3. Add a VLAN.
   add vlan <id>

   Example
   `> add vlan 97`
4. Bind the interfaces of the cluster nodes to the VLAN.
   bind vlan <id> -ifnum <interface_name>

   Example
   `> bind vlan 97 -ifnum 0/1/2 1/1/2 2/1/2`
5. Add a spotted SNIP address for each node and enable dynamic routing on it.
   add ns ip <SNIP> <netmask> -ownerNode <positive_integer> -dynamicRouting ENABLED

   Example
   `> add ns ip 97.131.0.1 255.0.0.0 -ownerNode 0 -dynamicRouting ENABLED -type SNIP > add ns ip 97.131.0.2 255.0.0.0 -ownerNode 1 -dynamicRouting ENABLED -type SI`
6. Bind one of the spotted SNIP addresses to the VLAN. When you bind one spotted SNIP address to a VLAN, all other spotted SNIP addresses defined on the cluster in that subnet are automatically bound to the VLAN.
   bind vlan <id> -IPAddress <SNIP> <netmask>

   Example
   `> bind vlan 97 -ipAddress 97.131.0.1 255.0.0.0`
   Note: You can use NSIP addresses of the cluster nodes instead of adding SNIP addresses. If so, you do not have to perform steps 3 - 6.
7. Configure the routing protocol on ZebOS using vtysh shell.
   Example: To configure OSPF routing protocol on node IDs 0, 1, and 2.

   `> vtysh ! interface vlan97 ! router ospf owner-node 0 ospf router-id 97.131.0.1 exit-owner-node owner-node 1 ospf router-id 97.131.0.2 exit-owner-node owne`
   Note: For VIP addresses to be advertised, RHI setting must done by using the vserverRHILevel parameter as follows:
   add ns ip <IPAddress> <netmask> -type VIP -vserverRHILevel <vserverRHILevel>

For OSPF specific RHI settings, there are additional settings that can be done as follows:

add ns ip <IPAddress> <netmask> -type VIP -ospfLSAType (TYPE1 | TYPE5) -ospfArea <positive_integer>

Use the add ns ip6 command to perform the above commands on IPv6 addresses.

8. Configure ECMP on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.
   //For OSPF (IPv4 addresses) Global config: Configure terminal feature ospf Interface config: Configure terminal interface Vlan10 no shutdown ip address 97.131

Use Case: ECMP with BGP Routing

Aug 06, 2013

To configure ECMP with BGP routing protocol, perform the following steps:

1. Log on to the cluster IP address.
2. Enable BGP routing protocol.
   ```
   > enable ns feature bgp
   ```
3. Add VLAN and bind the required interfaces.
   ```
   > add vlan 985
   > bind vlan 985 -ifnum 0/0/1 1/0/1
   ```
4. Add the spotted IP address and bind them to the VLAN.
   ```
   > add ns ip 10.100.26.14 255.255.255.0 -ownerNode 1 -dynamicRouting ENABLED
   > add ns ip 10.100.26.15 255.255.255.0 -ownerNode 2 -dynamicRouting ENABLED
   > bind vlan 985 -ipAddress 10.100.26.10 255.255.255.0
   ```
5. Configure BGP routing protocol on ZebOS using vtysh shell.
   ```
   > vtysh
   conf t
   router bgp 65535
   neighbor 10.100.26.1 remote-as  65535
   ```
6. Configure BGP on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.
   ```
   router bgp 65535
   no synchronization
   bgp log-neighbor-changes
   neighbor 10.100.26.14 remote-as 65535
   neighbor 10.100.26.15 remote-as 65535
     no auto-summary
   dont-capability-negotiate
   dont-capability-negotiate
   no dynamic-capability
   ```

Using Cluster Link Aggregation

Feb 08, 2016

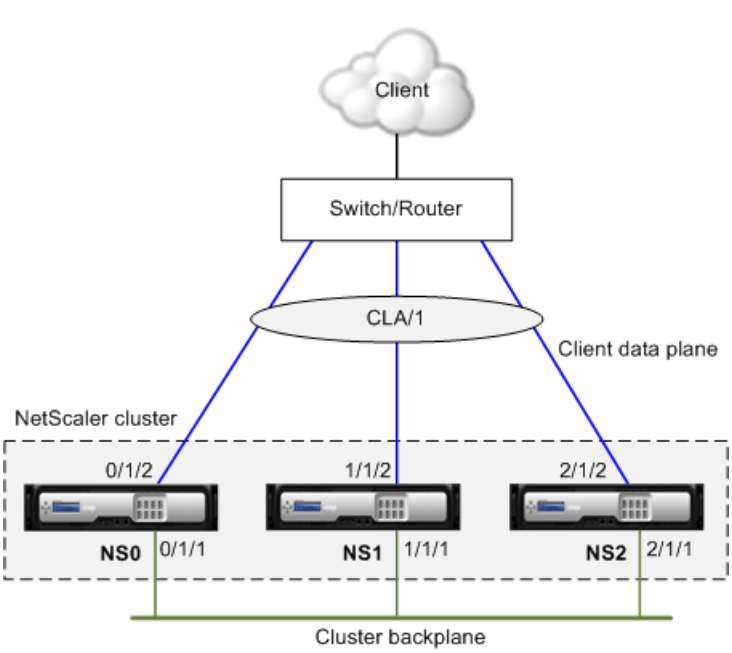
Cluster link aggregation, as the name suggests, is a group of interfaces of cluster nodes. It is an extension of NetScaler link aggregation. The only difference is that, while link aggregation requires the interfaces to be from the same device, in cluster link aggregation, the interfaces are from different nodes of the cluster.

Note: Cluster link aggregation is supported only for a cluster of hardware (MPX) NetScaler appliances.
For more information about link aggregation, see "Configuring Link Aggregation".

Cluster link aggregation can be either static or dynamic.

For example, consider a three-node cluster where all three nodes are connected to the upstream switch. A cluster LA channel (CLA/1) is formed by binding interfaces 0/1/2, 1/1/2, and 2/1/2.

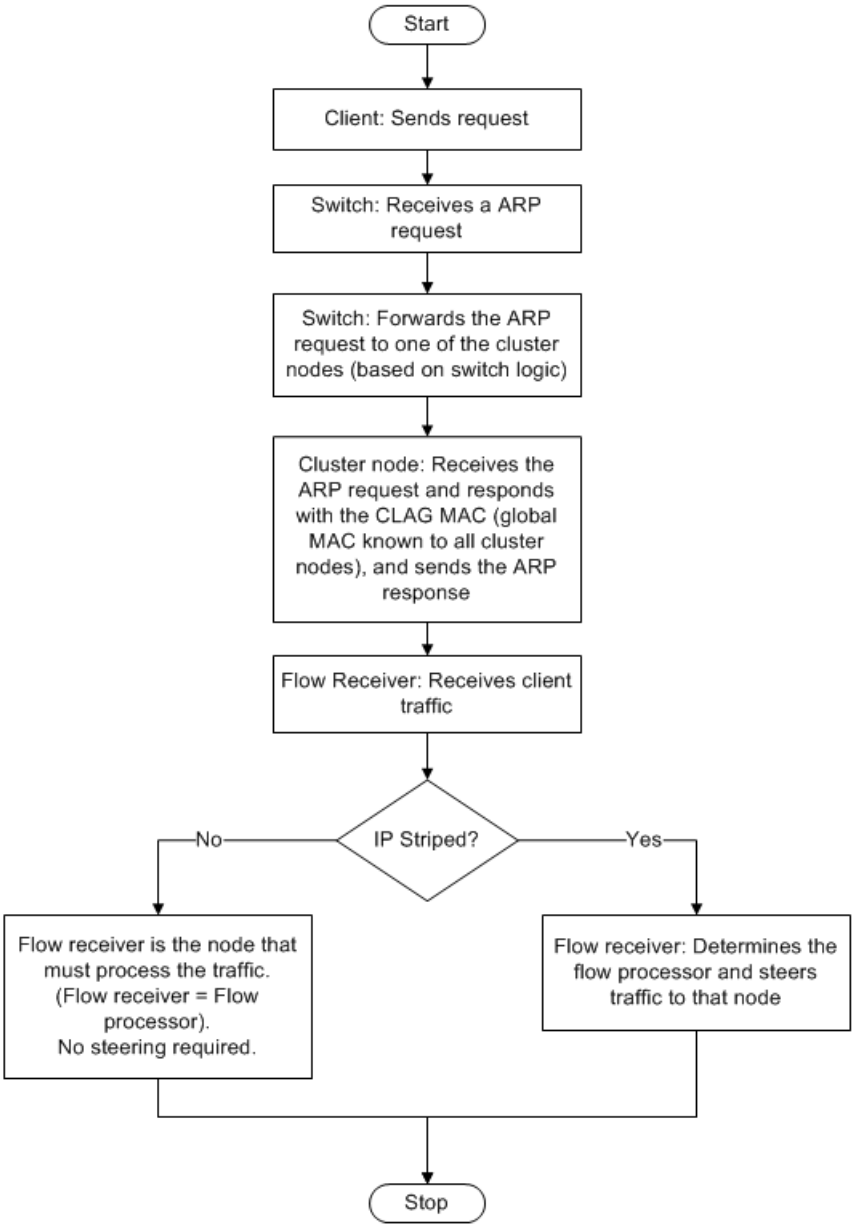
Figure 1. Cluster Link Aggregation topology



A cluster LA channel has the following attributes:

- Each channel has a unique MAC agreed upon by cluster nodes.
- The channel can bind both local and remote nodes' interfaces.
- A maximum of four cluster LA channels are supported in a cluster.
- Backplane interfaces cannot be part of a cluster LA channel.
- When an interface is bound to a cluster LA channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to one channel only.
- Management access to a cluster node, must not be configured on a cluster LA channel (for example, CLA/1) or its member interfaces. This is because when the node is INACTIVE, the corresponding cluster LA interface is marked as power down and therefore looses management access.

Figure 2. Traffic distribution flow using cluster LA



Static Cluster Link Aggregation

Feb 13, 2015

You must configure a static cluster LA channel on the cluster IP address and on the external connecting device. If possible, configure the upstream switch to distribute traffic based on IP address or port instead of MAC address.

For more information about configuring a static LA channel, see "Configuring Link Aggregation Manually".

To configure a static cluster LA channel by using the command line interface

1. Log on to the cluster IP address.
   Note: Make sure that you configure the cluster LA channel on the cluster IP address before configuring link aggregation on the external switch. Otherwise, the switch will forward traffic to the cluster even though the cluster LA channel is not configured. This can lead to loss of traffic.
2. Create a cluster LA channel.
   add channel <id> -speed <speed>

   Example
   > add channel CLA/1 -speed 1000
   Note: You must not specify the speed as AUTO. Rather, you must explicitly specify the speed as 10, 100, 1000, or 10000. Only interfaces that have the speed matching the <speed> attribute in the cluster LA channel are added to the active distribution list.
3. Bind the required interfaces to the cluster LA channel. Make sure that the interfaces are not used for the cluster backplane.
   bind channel <id> <ifnum>

   Example
   > bind channel CLA/1 0/1/2 1/1/2 2/1/2
4. Verify the configurations.
   show channel <id>

   Example
   > show channel CLA/1
   Note: You can bind the cluster LA channel to a VLAN by using the bind vlan command. The interfaces of the channel are automatically bound to the VLAN.
5. Configure static LA on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1). Similar configurations must be performed on other switches.
   Global config:
   Configure terminal

   Interface level config:

   ```
   interface Ethernet2/47
     switchport
     switchport access vlan 10
     channel-group 7 mode on
     no shutdown
   ```

```
interface Ethernet2/48
  switchport
  switchport access vlan 10
  channel-group 7 mode on
  no shutdown
```

Dynamic Cluster Link Aggregation

Apr 29, 2015

Dynamic cluster LA channel uses Link Aggregation Control Protocol (LACP). For more information about configuring a dynamic LA channel, see "Configuring Link Aggregation by Using the Link Aggregation Control Protocol".

You must perform similar configurations on the cluster IP address and on the external connecting device. If possible, configure the upstream switch to distribute traffic based on IP address or port instead of MAC address.

Points to remember:

- Enable LACP (by specifying the LACP mode as either ACTIVE or PASSIVE).

  Note: Make sure the LACP mode is not set as PASSIVE on both the NetScaler cluster and the external connecting device.
- Specify the same LACP key on each interface that you want to be the part of the channel. For creating a cluster LA channel, the LACP key can have a value from 5 through 8. For example, if you set the LACP key on interfaces 0/1/2, 1/1/2, and 2/1/2 to 5, CLA/1 is created. The interfaces 0/1/2, 1/1/2, and 2/1/2 are automatically bound to CLA/1. Similarly, if you set the LACP key to 6, CLA/2 channel is created.
- Specify the LAG type as Cluster.

To configure a dynamic cluster LA channel by using the command line interface

On the cluster IP address, for each interface that you want to add to the cluster LA channel, type:

set interface <id> -lacpMode <lacpMode> -lacpKey <positive_integer> -lagType CLUSTER

Example: To configure a cluster LA channel CLA/1 of 3 interfaces.

```
> set interface 0/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
> set interface 1/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
> set interface 2/1/2 -lacpMode active -lacpKey 5 -lagType Cluster
```

Note: Optionally, you can enable Link Redundancy in a Cluster with LACP.

Similarly, configure dynamic LA on the external switch. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1). Similar configurations must be performed on other switches.

```
Global config:
Configure terminal
feature lacp
Interface level config:

interface Ethernet2/47
   switchport
   switchport access vlan 10
   channel-group 7 mode active
   no shutdown

interface Ethernet2/48
   switchport
```

```
switchport access vlan 10
channel-group 7 mode active
no shutdown
```

Using Linksets

Feb 27, 2015

Linksets must be used when some cluster nodes are not physically connected to the external network. In such a cluster topology, the unconnected cluster nodes use the interfaces specified in the linkset to communicate with the external network through the cluster backplane. Linksets are typically used in scenarios when the connecting devices have insufficient ports to connect the cluster nodes.

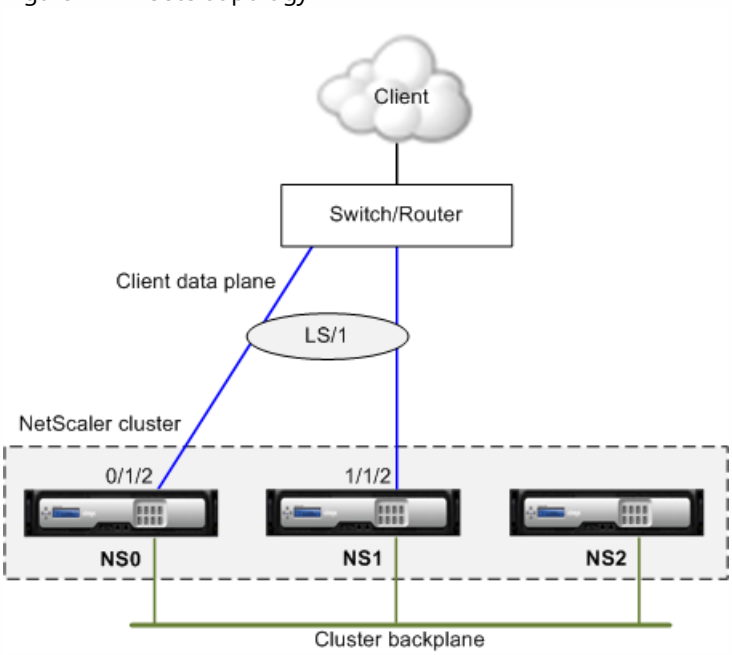
Note: Linksets are a mandatory configuration in the following scenarios:

- For deployments that require MAC-Based Forwarding (MBF).
- To improve manageability of ACL and L2 policies involving interfaces. You must define a linkset of the interfaces and add ACL and L2 policies based on linksets.

Linksets must be configured only through the cluster IP address.

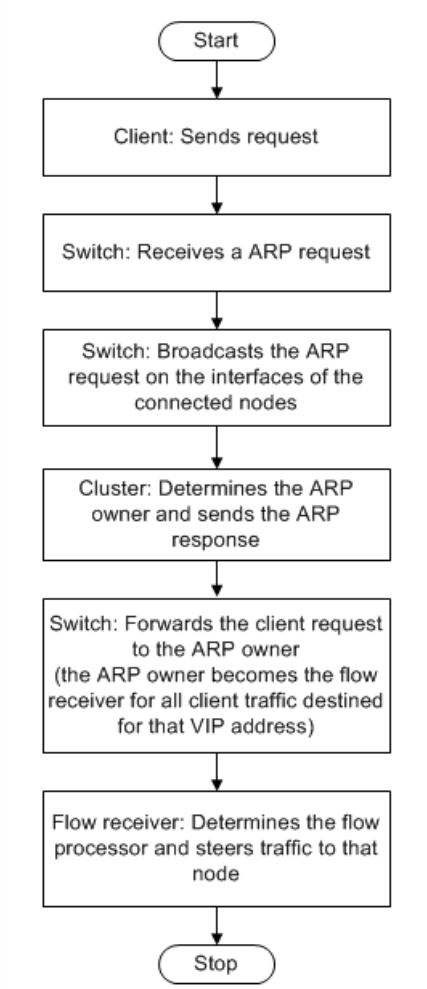
For example, consider a three node cluster where the upstream switch has only two ports available. Using linksets, you can connect two nodes to the switch and leave the third node unconnected. In the following figure, a linkset (LS/1) is formed by binding the interfaces 0/1/2 and 1/1/2. NS2 is the unconnected node of the cluster.

Figure 1. Linksets topology



The linkset informs NS2 that it can use interfaces 0/1/2 and 1/1/2 to communicate with the network devices. All traffic to and from NS2 is now routed through interfaces 0/1/2 or 1/1/2.

Figure 2. Traffic distribution flow using linksets



To configure a linkset by using the command line interface

1. Log on to the cluster IP address.
2. Create a linkset.
   add linkset <id>

   Example
   > add linkset LS/1
3. Bind the required interfaces to the linkset. Make sure the interfaces are not used for the cluster backplane.
   bind linkset <id> -ifnum <interface_name> ...

   Example
   > bind linkset LS/1 -ifnum 0/1/2 1/1/2
4. Verify the linkset configurations.
   show linkset <id>

   Example
   > show linkset LS/1
   Note: You can bind the linkset to a VLAN by using the bind vlan command. The interfaces of the linkset are automatically bound to the VLAN.

To configure a linkset by using the configuration utility

1. Log on to the cluster IP address.

2. Navigate to System > Network > Linksets.
3. In the details pane, click Add.
4. In the Create Linkset dialog box:
    1. Specify the name of the linkset by setting the Linkset parameter.
    2. Specify the Interfaces to be added to the linkset and click Add. Repeat this step for each interface you want to add to the linkset.
5. Click Create, and then click Close.

Managing the NetScaler Cluster

Nov 17, 2014

After you have created a cluster and configured the required traffic distribution mechanism, the cluster is able to serve traffic. During the lifetime of the cluster, you can perform cluster tasks such as configuring nodegroups, disabling nodes of a cluster, discovering NetScaler appliances, viewing statistics, synchronizing cluster configurations, cluster files, and the time across the nodes, and upgrading or downgrading the software of cluster nodes.

Nodegroups for Spotted and Partially-Striped Configurations

May 25, 2015

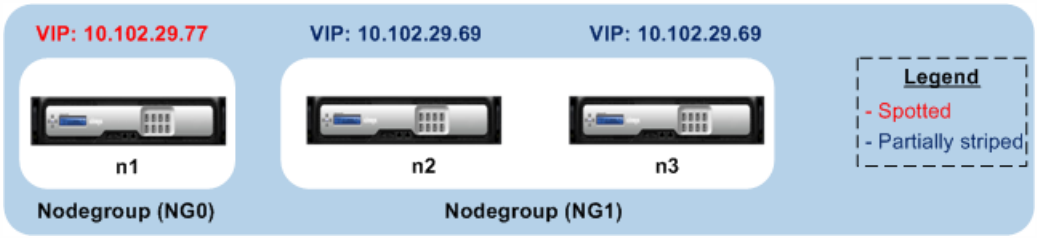
By virtue of the default cluster behavior, all configurations performed on the cluster IP address are available on all nodes of the cluster. However, there might be cases where you need some configurations to be available only on specific cluster nodes.

You can achieve this requirement by defining a nodegroup that includes the specific cluster nodes, and then binding the configuration to that nodegroup. This ensures that the configuration is active only on those cluster nodes. These configurations are called partially-striped or spotted (if active only one a single node). For more information, see Striped, Partially Striped, and Spotted Configurations.

For example, consider a cluster with three nodes. You create a nodegroup NG0 that includes node n1 and another nodegroup NG1 that includes n2 and n3. Bind load balancing virtual servers .77 to NG0 and load balancing virtual server .69 to NG1.

This means that virtual server .77 will be active only on n1 and consequently only n1 will receive traffic that is directed to .77. Similarly, virtual server .69 will be active only on nodes n2 and n3 and consequently only n2 and n3 will receive traffic that is directed to .69.

Figure 1. NetScaler cluster with nodegroups configured for spotted and partial-striped configurations



The entities or configurations that you can bind to a nodegroup are:

- Load balancing, content switching, cache redirection, authentication (AAA) virtual servers
  Note: FTP load balancing virtual servers cannot be bound to nodegroups.
- VPN virtual server (Supported from NetScaler 10.5 Build 50.10 onwards)
- Global Server Load Balancing (GSLB) sites and other GSLB entities (Supported from NetScaler 10.5 Build 52.11 onwards)
- Limit identifiers and stream identifiers

Behavior of Nodegroups

Mar 18, 2015

Due to the interoperability of nodegroups with different NetScaler features and entities, there are some behavioral aspects to be noted. Nodes in a nodegroup can also be backed up. Read on for more information.

General behavior of a cluster nodegroup

- A nodegroup that has entities bound to it cannot be removed.
- A cluster node that belongs to a nodegroup with entities bound to it, cannot be removed.
- A cluster instance that has nodegroups with entities bound to it, cannot be removed.
- You cannot add an entity that has a dependency on another entity that is not part of the nodegroup. If you need to do so, first remove the dependency. Then, add both the entities to the nodegroup and reassociate the entities.
  Examples:
  - Assume you have a virtual server, VS1, whose backup is virtual server VS2. To add VS1 to a nodegroup, first make sure that VS2 is removed as the backup server of VS1. Then, bind each server individually to the nodegroup, and then configure VS2 as the backup for VS1.
  - Assume you have a content switching virtual server, CSVS1, whose target load balancing virtual server is LBVS1. To add CSVS1 to a nodegroup, first remove LBVS1 as the target. Then, bind each server individually to the nodegroup, and then configure LBVS1 as the target.
  - Assume you have a load balancing virtual server, LBVS1, that has a policy which invokes another load balancing virtual server, LBVS2. To add either one of the virtual servers, first remove the association. Then, bind each server individually to the nodegroup, and then reassociate the virtual servers.
- You cannot bind an entity to a nodegroup that has no nodes and that has the `strict` option enabled. Consequently, you cannot unbind the last node of a nodegroup that has entities bound to it and that has the `strict` option enabled
- The `strict` option cannot be modified for a nodegroup that has no nodes but has entities bound to it.

Backing up Nodes in a Nodegroup

By default, a nodegroup is designed to provide back up nodes for members of a nodegroup. If a nodegroup member goes down, a cluster node that is not a member of the nodegroup dynamically replaces the failed node. This node is called the replacement node.

Note: For a single-member nodegroup, a backup node is automatically preselected when an entity is bound to the nodegroup.
When the original member of the nodegroup comes up, the replacement node, by default, is replaced by the original member node.

From NetScaler 10.5 Build 50.10 onwards, however, the NetScaler allows you to change this replacement behavior. When you enable the sticky option, the replacement node is retained even after the original member node comes up. The original node takes over only when the replacement node goes down.

You can also disable the backup functionality. To do this, you must enable the strict option. In this scenario, when a nodegroup member goes down, no other cluster node is picked up as a backup node. The original node continues being part of the nodegroup when it comes up. This option ensures that entities bound to a nodegroup are active only on nodegroup members.

Note: The strict and sticky option can be set only when creating a nodegroup.

Configuring Nodegroups for Spotted and Partially-Striped Configurations

Mar 31, 2015

To configure a nodegroup for spotted and partially-striped configurations you must first create a nodegroup and then bind the required nodes to the nodegroup. You must then associate the required entities to that nodegroup. The entities that are bound to the nodegroup will be:

- Spotted - If bound to a nodegroup that has a single node.
- Partially striped - If bound to a nodegroup that has more than one node.

Some points to remember:

- GSLB is supported on a cluster only when GSLB sites are bound to nodegroups that have a single cluster node. For more information, see Setting Up GSLB in a Cluster.
- NetScaler Gateway is supported on a cluster only when the VPN virtual servers are bound to nodegroups that have a single cluster node. The sticky option must be enabled on the nodegroup.
- Application firewall is supported on a cluster only when application firewall profiles are associated with virtual servers that are bound to nodegroups that have a single cluster node. You are not allowed to do the following:
  - Bind application firewall profiles to striped or partially striped virtual servers.
  - Bind the policy to a global bind point or to user-defined policy labels.
  - Unbind, from a nodegroup, a virtual server that has application firewall profiles.

Check NetScaler Features Supported in a Cluster to see the NetScaler versions from which GSLB, NetScaler Gateway, and application firewall are supported in a cluster.

To configure a nodegroup by using the command line interface

1. Log on to the cluster IP address.
2. Create a nodegroup. Type:
   add cluster nodegroup <name> -strict (**YES** | **NO**)

   Example
   ```
   > add cluster nodegroup NG0 -strict YES
   ```
3. Bind the required nodes to the nodegroup. Type the following command for each member of the nodegroup:
   bind cluster nodegroup <name> -node <nodeId>

   Example: To bind nodes with IDs 1, 5, and 6.
   ```
   > bind cluster nodegroup NG0 -node 1
   > bind cluster nodegroup NG0 -node 5
   > bind cluster nodegroup NG0 -node 6
   ```
4. Bind the entity to the nodegroup. Type the following command once for every entity that you want to bind:
   bind cluster nodegroup <name> (-vServer <string> | -identifierName <string> | -gslbSite <string> -service <string>)

   Note: The gslbSite and service parameters are available from NetScaler 10.5 onwards.
   Example: To bind virtual servers VS1 and VS2 and rate limit identifier named identifier1.
   ```
   > bind cluster nodegroup NG0 -vServer VS1
   > bind cluster nodegroup NG0 -vServer VS2
   > bind cluster nodegroup NG0 -identifierName identifier1
   ```

5. Verify the configurations by viewing the details of the nodegroup. Type:
   show cluster nodegroup <name>

   Example
   ```
   > show cluster nodegroup NG0
   ```

To configure a nodegroup by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster > Node Groups.
3. In the details pane, click Add.
4. In the Create Node Group dialog box, configure the nodegroup:
   1. Under Cluster Nodes, click the Add button.
      - The Available list displays the nodes that you can bind to the nodegroup and the Configured list displays the nodes that are bound to the nodegroup.
      - Click the + sign in the Available list to bind the node. Similarly, click the - sign in the Configured list to unbind the node.
   2. Under Virtual Servers, select the tab corresponding to the type of virtual server that you want to bind to the nodegroup. Click the Add button.
      - The Available list displays the virtual servers that you can bind to the nodegroup and the Configured list displays the virtual servers that are bound to the nodegroup.
      - Click the + sign in the Available list to bind the virtual server. Similarly, click the - sign in the Configured list to unbind the virtual server.

Configuring Redundancy for Nodegroups

Mar 18, 2015

Note: Supported from NetScaler 10.5 Build 52.1115.e onwards.

Nodegroups can be configured such that when one nodegroup goes down, another nodegroup can take over and process traffic. For example, when a nodegroup NG1 goes down, NG2 takes over.

Note: This functionality can be used to configure datacenter redundancy where each nodegroup is configured as a datacenter.

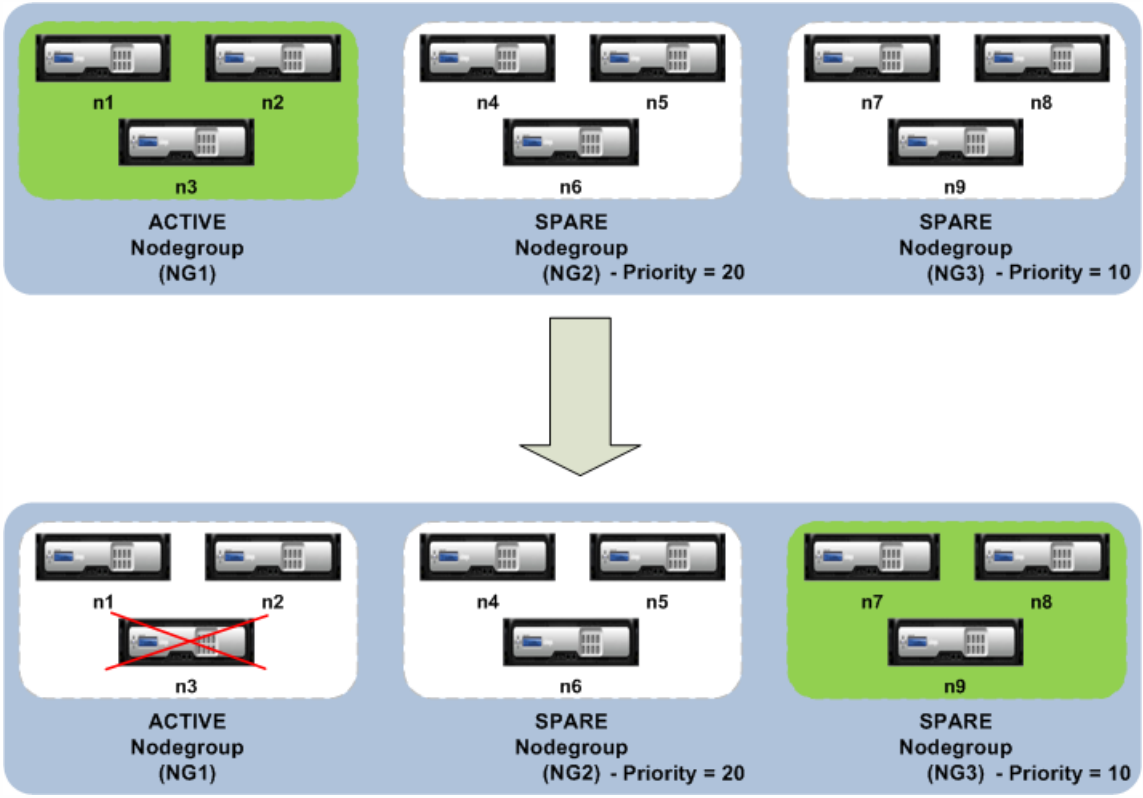
To achieve this use case, cluster nodes must be logically grouped into nodegroups, where some nodegroups must be configured as ACTIVE and others as SPARE. The active nodegroup with the highest priority (that is, the lowest priority number) is made operationally active and therefore serves traffic. When a node from this operationally active nodegroup goes down, the node count of this nodegroup is compared with the node count of the other active nodegroups in order of their priority. If a nodegroup has a higher or equal node count, that nodegroup is made operationally active. Else, the spare nodegroups are checked.

Note:

- Only one state-specific nodegroup can be active at a given point in time.
- A cluster node inherits the state of the nodegroup. So, if a node with "SPARE" state is added to nodegroup with state as "ACTIVE", the node automatically behaves as an active node.
- The preemption parameter that is defined for the cluster instance decides whether the initial active nodegroup will take control when the it comes up again.

The following figure shows a nodegroup setup that has nodegroup redundancy defined. NG1 is initially the active nodegroup. When it loses one of the nodes, the spare nodegroup (NG3) with the highest priority starts serving traffic.

Figure 1. NetScaler cluster with nodegroup redundancy configured



Configuring redundancy for nodegroups

1. Log on to the cluster IP address.
2. Create the active nodegroup and bind the required cluster nodes.
   add cluster nodegroup NG1 -state ACTIVE

   bind cluster nodegroup NG1 -node n1

   bind cluster nodegroup NG1 -node n2

   bind cluster nodegroup NG1 -node n3

3. Create the spare nodegroup and bind the requisite nodes.
   add cluster nodegroup NG2 -state SPARE -priority 20

   bind cluster nodegroup NG2 -node n4

   bind cluster nodegroup NG2 -node n5

   bind cluster nodegroup NG2 -node n6

4. Create another spare nodegroup and bind the requisite nodes.
   add cluster nodegroup NG3 -state SPARE -priority 10

   bind cluster nodegroup NG3 -node n7

   bind cluster nodegroup NG3 -node n8

   bind cluster nodegroup NG3 -node n9

Synchronizing Cluster Configurations

Feb 13, 2015

NetScaler configurations that are available on the configuration coordinator are synchronized to the other nodes of the cluster when:

- A node joins the cluster
- A node rejoins the cluster
- A new command is executed through the cluster IP address.

Additionally, you can forcefully synchronize the configurations that are available on the configuration coordinator (full synchronization) to a specific cluster node. Make sure you synchronize one cluster node at a time, otherwise the cluster can get affected.

To synchronize cluster configurations by using the command line interface

At the command prompt of the appliance on which you want to synchronize the configurations, type:

force cluster sync

To synchronize cluster configurations by using the configuration utility

1. Log on to the appliance on which you want to synchronize the configurations.
2. Navigate to System > Cluster.
3. In the details pane, under Utilities, click Force cluster sync.
4. Click OK.

Synchronizing Time Across Cluster Nodes

Mar 31, 2015

The cluster uses Precision Time Protocol (PTP) to synchronize the time across cluster nodes. PTP uses multicast packets to synchronize the time. If there are some issues in time synchronization, you must disable PTP and configure Network Time Protocol (NTP) on the cluster.

To enable/disable PTP by using the command line interface

At the command prompt of the cluster IP address, type:

set ptp -state disable

To enable/disable PTP by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster.
3. In the details pane, under Utilities, click Configure PTP Settings.
4. In the Enable/Disable PTP dialog box, select whether you want to enable or disable PTP.
5. Click OK.

Synchronizing Cluster Files

Feb 13, 2015

The files available on the configuration coordinator are called cluster files. These files are automatically synchronized on the other cluster nodes when the node is added to the cluster and periodically, during the lifetime of the cluster. Additionally, you can manually synchronize the cluster files.

The directories and files from the configuration coordinator that are synchronized are:

- /nsconfig/ssl/
- /var/netscaler/ssl/
- /var/vpn/bookmark/
- /nsconfig/dns/
- /nsconfig/htmlinjection/
- /netscaler/htmlinjection/ens/
- /nsconfig/monitors/
- /nsconfig/nstemplates/
- /nsconfig/ssh/
- /nsconfig/rc.netscaler
- /nsconfig/resolv.conf
- /nsconfig/inetd.conf
- /nsconfig/syslog.conf
- /nsconfig/snmpd.conf
- /nsconfig/ntp.conf
- /nsconfig/httpd.conf
- /nsconfig/sshd_config
- /nsconfig/hosts
- /nsconfig/enckey
- /var/nslw.bin/etc/krb5.conf
- /var/nslw.bin/etc/krb5.keytab
- /var/lib/likewise/db/
- /var/download/
- /var/wi/tomcat/webapps/
- /var/wi/tomcat/conf/Catalina/localhost/
- /var/wi/java_home/lib/security/cacerts
- /var/wi/java_home/jre/lib/security/cacerts
- /nsconfig/license/
- /nsconfig/rc.conf

To synchronize cluster files by using the command line interface

At the command prompt of the cluster IP address, type:

sync cluster files <mode>

To synchronize cluster files by using the configuration utility

1. Log on to the cluster IP address.

2. Navigate to System > Cluster.
3. In the details pane, under Utilities, click Synchronize cluster files.
4. In the Synchronize cluster files dialog box, select the files to be synchronized in the Mode drop-down box.
5. Click OK.

Viewing the Statistics of a Cluster

Feb 13, 2015

You can view the statistics of a cluster instance and cluster nodes to evaluate the performance or to troubleshoot the operation of the cluster.

To view the statistics of a cluster instance by using the command line interface

At the command prompt of the cluster IP address, type:

stat cluster instance <clId>

To view the statistics of a cluster node by using the command line interface

At the command prompt of the cluster IP address, type:

stat cluster node <nodeid>

Note: When executed from the cluster IP address, this command displays the cluster level statistics. However, when executed from the NSIP address of a cluster node, the command displays node level statistics.

To view the statistics of a cluster instance by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster.
3. In the details pane, in the center of the page, click Statistics.

To view the statistics of a cluster node by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster > Nodes.
3. In the details pane, select a node and click Statistics to view the statistics of the node. To view the statistics of all the nodes, click Statistics without selecting a specific node.

Discovering NetScaler Appliances

Feb 13, 2015

You can discover NetScaler appliances present in the same subnet as the NSIP address of the configuration coordinator. The discovered appliances can then be added to the cluster.

Note: This operation is available only through the configuration utility.

To discover appliances by using the configuration utility

1. Log on to the cluster IP address.
2. Navigate to System > Cluster > Nodes.
3. In the details pane, at the bottom of the page, click Discover NetScalers.
4. In the Discover NetScalers dialog box, set the following parameters:
   - IP address range - Specify the range of IP addresses within which you want to discover appliances. For example, you can search for all NSIP addresses between 10.102.29.4 to 10.102.29.15 by specifying this option as 10.102.29.4 - 15.
   - Backplane interface - Specify the interfaces to be used as the backplane interface. This is an optional parameter. If you do not specify this parameter, you must update it after the node is added to the cluster.
5. Click OK.
6. Select the appliances that you want to add to the cluster.
7. Click OK.

Disabling a Cluster Node

Feb 27, 2015

You can temporarily remove a node from a cluster by disabling the cluster instance on that node. A disabled node is not synchronized with the cluster configurations. When the node is enabled again, the cluster configurations are automatically synchronized on it. For more information, see Cluster Synchronization.

A disabled node cannot serve traffic and all existing connections on this node are terminated.

Note: If the configurations of a disabled non-configuration coordinator node are modified (through the NSIP address of the node), the configurations are not automatically synchronized on that node. You must manually synchronize the configurations as described in Synchronizing Cluster Configurations.

To disable a cluster node by using the command line interface

At the command prompt of the node that you want to disable, type:

disable cluster instance <clId>

Note: To disable the cluster, run the disable cluster instance command on the cluster IP address.

To disable a cluster node by using the configuration utility

1. On the node that you want to disable, navigate to System > Cluster, and click Manage Cluster.
2. In the Configure cluster instance dialog box, unselect the Enable cluster instance check box.
   Note: To disable the cluster instance on all the nodes, perform the above procedure on the cluster IP address.

Removing a Cluster Node

Feb 27, 2015

When a node is removed from the cluster, the cluster configurations are cleared from the node (by internally executing the clear ns config -extended command). The SNIP addresses and all VLAN configurations (except the default VLAN and NSVLAN) are also cleared from the appliance.

Note:

- If the deleted node was the cluster configuration coordinator, another node is automatically selected as the cluster configuration coordinator, and the cluster IP address is assigned to that node. All the current cluster IP address sessions will be invalid and you will have to start a new session.
- To delete the whole cluster, you must remove each node individually. When you remove the last node, the cluster IP address(es) are deleted.
- When an active node is removed, the traffic serving capability of the cluster is reduced by one node. Existing connections on this node are terminated.

For NetScaler 10.1 and later versions

Log on to the cluster IP address and at the command prompt, type:

rm cluster node <nodeId>

Note: If the cluster IP address is unreachable from the node, execute the rm cluster instance command on the NSIP address of that node itself.

For NetScaler 10

1. Log on to the node that you want to remove from the cluster and remove the reference to the cluster instance.
   rm cluster instance <clId>

   save ns config

2. Log on to the cluster IP address and remove the node from which you removed the cluster instance.
   rm cluster node <nodeId>

   save ns config

   Make sure you do not run the rm cluster node command from the local node as this results in inconsistent configurations between the configuration coordinator and the node.

On the cluster IP address, navigate to System > Cluster > Nodes, select the node you want to remove and click Remove.

Removing a Node from a Cluster Deployed Using Cluster Link Aggregation

Feb 13, 2015

To remove a node from a cluster that uses cluster link aggregation as the traffic distribution mechanism, you must make sure that the node is made passive so that it does not receive any traffic and then, on the upstream switch, remove the corresponding interface from the channel.

For detailed information on cluster link aggregation, see Using Cluster Link Aggregation.

1. Log on to the cluster IP address.
2. Set the state of the cluster node that you want to remove to PASSIVE.
   set cluster node <nodeId> -state PASSIVE
3. On the upstream switch, remove the corresponding interface from the channel by using switch-specific commands.
   Note: You do not have to manually remove the nodes interface on the cluster link aggregation channel. It is automatically removed when the node is deleted in the next step.
4. Remove the node from the cluster.
   rm cluster node <nodeId>

Cluster Setup and Usage Scenarios

Mar 31, 2015

This section aims at explaining some scenarios in which the NetScaler cluster can be setup and also how it can be configured for different features and network topologies. These are just some scenarios that we have documented. Provide feedback if you want some other scenarios to be included.

Creating a Two-Node Cluster

Feb 17, 2015

A two-node cluster is an exception to the rule that a cluster is functional only when a minimum of (n/2 +1) nodes, where n is the number of cluster nodes, are able to serve traffic. If that formula were applied to a two-node cluster, the cluster would fail if one node went down (n/2 +1=2).

A two-node cluster is functional even if only one node is able to serve traffic.

Creating a two node cluster is the same as creating any other cluster. You must add one node as the configuration coordinator and the other node as the other cluster node.

Note: Incremental configuration synchronization is not supported in a two-node cluster. Only full synchronization is supported.

Migrating an HA Setup to a Cluster Setup

Feb 17, 2015

An existing high availability (HA) setup can be migrated to a cluster setup by first removing the appliances from the HA setup and then creating the NetScaler cluster. This approach will result in a downtime for the application.

Consider an HA setup with appliances NS0 (10.102.97.131) and NS1 (10.102.97.132). NS0 is the primary and NS1 is the secondary appliance of the HA setup.

1. Log on to each HA node and remove it from the HA setup.
   rm HA node <id>

   Example
   rm HA node 1
2. Go to the shell on one of the HA nodes and copy the ns.conf file to another .conf file (for example, ns_backup.conf).
3. On both the nodes, identify the network interfaces to be used for the cluster backplane. Make sure to configure the backplane switch appropriately.
4. Create the cluster on one of the appliances (for example, 10.102.97.131).
   ```
   //On the NSIP address of the first appliance
   add cluster instance 1
   add cluster node 0 10.102.97.131 -state ACTIVE -backplane 0/1/1
   add ns ip 10.102.97.133 255.255.255.255 -type CLIP
   enable cluster instance 1
   save ns config
   reboot -warm
   ```
5. Add the other appliance to the cluster.
   ```
   //On the cluster IP address
   add cluster node 1 10.102.97.132 -state ACTIVE -backplane 1/1/1

   //On the NSIP address of the appliance
   join cluster -clip 10.102.97.133 -password nsroot
   save ns config
   reboot -warm
   ```
6. After the two nodes are up and active, log on to the cluster IP address and modify the backed-up configuration file as follows:
   1. Remove the features that are not supported on a cluster. For the list of unsupported features, see NetScaler Features Supported by a Cluster. This is an optional step. If you do not perform this step, the execution of unsupported commands will fail.
   2. Remove the configurations that have interfaces, or update the interface names from the c/u convention to the n/c/u convention.
      Example

      ```
      add vlan 10 -ifnum 0/1
      ```

      should be changed to

add vlan 10 -ifnum 0/0/1 1/0/1

3. The backup configuration file can have SNIP addresses or MIP addresses. These addresses are striped on all the cluster nodes. It is recommended that you add spotted IP addresses for each node.
   Example

   add ns ip 1.1.1.1 255.255.255.0 -ownerNode 0
   add ns ip 1.1.1.2 255.255.255.0 -ownerNode 1
4. Update the hostname to specify the owner node.
   Example

   set ns hostname ns0 -ownerNode 0
   set ns hostname ns1 -ownerNode 1
5. Change all other relevant networking configuration that depend on spotted IPs. For example, L3 VLAN, RNAT configuration which uses SNIPs as NATIP, INAT rules that refers to SNIPs/MIPs).

7. Apply configurations from the backup configuration file to the configuration coordinator through the cluster IP address.
   batch -fileName <input_filename>

   Example
   batch -f ns_backup.conf
8. Configure appropriate client traffic distribution mechanism (ECMP, cluster LA or linksets).
9. Save the configuration.
   save ns config

The appliances of the HA setup are migrated to a cluster setup.

Migrating an HA Setup to a Cluster Setup without Downtime

Feb 17, 2015

An existing high availability (HA) setup can be migrated to a cluster setup by first removing the secondary appliance from the HA setup and using that appliance to create a single-node cluster. Then, after the cluster becomes operational and serves traffic, the primary appliance of the HA setup is added to the cluster. This approach will not result in a downtime for the application.

Consider an HA setup with appliances NS0 (10.102.97.131) and NS1 (10.102.97.132). NS0 is the primary and NS1 is the secondary appliance of the HA setup.

1. Go to the shell on one of the HA nodes and copy the ns.conf file to another .conf file (for example, ns_backup.conf).
   Note: Make sure HA pair is stable with respect to configurations.
2. Log on to the secondary appliance NS1 and clear all the configurations. This removes the secondary appliance from the HA setup and makes it a standalone appliance.
   ```
   clear ns config full
   ```
   Note:
   - The configurations are cleared to make sure that NS1 does not start owning the VIPs once it becomes a standalone appliance.
   - At this stage, NS0 is still active and continues to serve traffic.
3. Create a cluster on appliance NS1 and configure it as a PASSIVE node.
   ```
   //On the NSIP address of node NS1
   add cluster instance 1
   add cluster node 0 10.102.97.131 -state PASSIVE -backplane 0/1/1
   add ns ip 10.102.97.133 255.255.255.255 -type CLIP
   enable cluster instance 1
   save ns config
   reboot -warm
   ```
4. Modify the backed-up configuration file.
   1. Remove the features that are not supported on a cluster. For the list of unsupported features, see NetScaler Features Supported by a Cluster. This is an optional step. If you do not perform this step, the execution of unsupported commands will fail.
   2. Remove the configurations that have interfaces, or update the interface names from the c/u convention to the n/c/u convention.
      Example

      ```
      add vlan 10 -ifnum 0/1
      ```

      should be changed to

      ```
      add vlan 10 -ifnum 0/0/1 1/0/1
      ```
   3. The backup configuration file can have SNIP addresses or MIP addresses. These addresses are striped on all the

cluster nodes. It is recommended that you add spotted IP addresses for each node.

Example

```
add ns ip 1.1.1.1 255.255.255.0 -ownerNode 0
add ns ip 1.1.1.2 255.255.255.0 -ownerNode 1
```

4. Update the hostname to specify the owner node.

Example

```
set ns hostname ns0 -ownerNode 0
set ns hostname ns1 -ownerNode 1
```

5. Change all other relevant networking configuration that depend on spotted IPs. For example, L3 VLAN, RNAT configuration which uses SNIPs as NATIP, INAT rules that refers to SNIPs/MIPs).

5. On the cluster, do the following:
   1. Make the topological changes to the cluster by connecting the cluster backplane, the cluster link aggregation channel, and so on.
   2. Apply configurations from the backup configuration file to the configuration coordinator through the cluster IP address.
      ```
      batch -f ns_backup.conf
      ```
   3. Configure external traffic distribution mechanisms like ECMP or cluster link aggregation.
6. Switch-over the traffic from the HA setup to the single-node cluster setup.
   1. Disable all interfaces on the primary appliance NS0.
      ```
      disable interface <interface id>
      ```
   2. Configure the cluster node as an ACTIVE node.
      ```
      set cluster node 0 -state ACTIVE
      ```

   Note: There can be a small amount (in the order of seconds) of downtime between disabling the interfaces and making the cluster node active.
7. On the primary appliance NS0, do the following:
   1. Clear all the configurations.
      ```
      clear ns config full
      ```
   2. Enable all the interfaces.
      ```
      enable interface <interface id>
      ```
   3. Add the appliance to the cluster.
      ```
      //On the cluster IP address (in this sample, 10.102.97.133)
      add cluster node 1 10.102.97.132 -state PASSIVE -backplane 1/1/1

      //On the NSIP address of the appliance
      join cluster -clip 10.102.97.133 -password nsroot
      save ns config
      reboot -warm
      ```
   4. Perform the required topological and configuration changes.
   5. Configure NS0 as an ACTIVE node.
      ```
      set cluster node 1 -state ACTIVE
      ```

The appliances of the HA setup are migrated to a cluster setup without any downtime for the application.

Using Cache Redirection in a Cluster

Feb 17, 2015

Cache redirection in a cluster works in the same way as it does on a standalone NetScaler appliance. The only difference is that the configurations are done on the cluster IP address. For more information on cache redirection, see "Cache Redirection."

Points to remember when using cache redirection in transparent mode on a cluster:

- Before configuring cache redirection, make sure that you have connected all nodes to the external switch and that you have linksets configured. Otherwise, client requests will be dropped.
- When MAC mode is enabled on a load balancing virtual server, make sure MBF mode is enabled on the cluster by using the enable ns mode MBF command. Otherwise, the requests are sent to origin server directly instead of being sent to the cache server.

Using L2 Mode in a Cluster Setup

Oct 08, 2014

Note: Supported from NetScaler 10.5 and later releases.

To use L2 mode in a cluster setup, you must make sure of the following:

- Spotted IP addresses must be available on all the nodes as required.
- Linksets must be used to communicate with the external network.
- Asymmetric topologies or asymmetric cluster LA groups are not supported.
- Cluster LA group is recommended.
- Traffic is distributed between the cluster nodes only for deployments where services exist.

Using Cluster LA Channel with Linksets

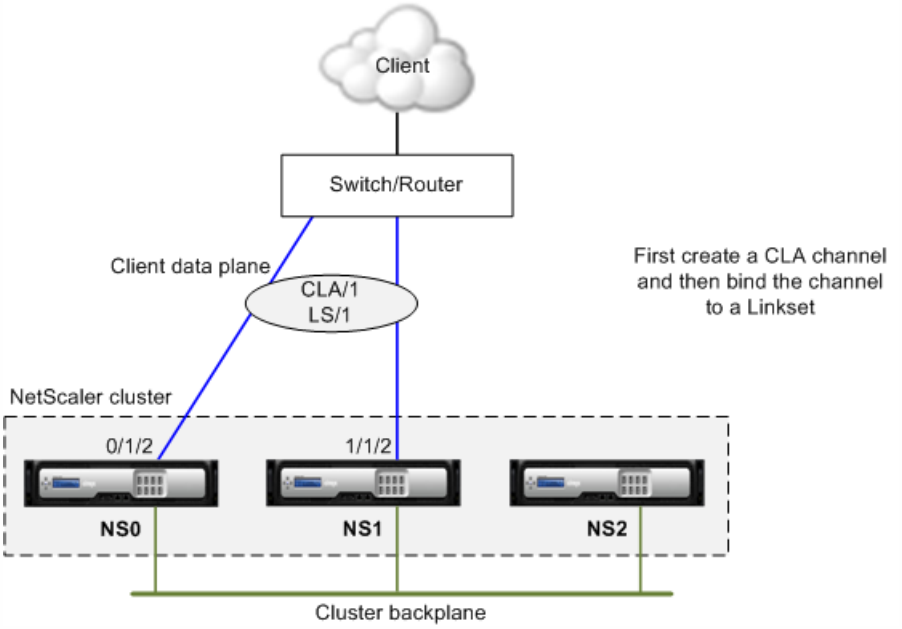
Feb 17, 2015

In an asymmetric cluster topology, some cluster nodes are not connected to the upstream network. In such a case, you must use linksets. To optimize the performance, you can bind the interfaces that are connected to the switch as a cluster LA channel and then bind the channel to a linkset.

To understand how a combination of cluster LA channel and linksets can be used, consider a three-node cluster for which the upstream switch has only two ports available. You can connect two of the cluster nodes to the switch and leave the other node unconnected.

Note: Similarly, you can also use a combination of ECMP and linksets in an asymmetric topology.

Figure 1. Linksets and cluster LA channel topology

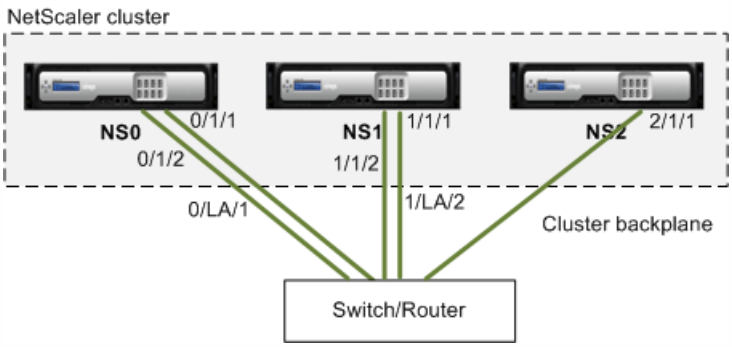


1. Log on to the cluster IP address.
2. Bind the connected interfaces to a cluster LA channel.
   ```
   add channel CLA/1 –ifnum 0/1/2 1/1/2
   ```
3. Bind the cluster LA channel to the linkset.
   ```
   add linkset LS/1 -ifnum CLA/1
   ```

Backplane on LA Channel

Feb 17, 2015

In this deployment, LA channels are used for the cluster backplane.



NS0 - nodeId: 0, NSIP: 10.102.29.60

NS1 - nodeId: 1, NSIP: 10.102.29.70

NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with the backplane interfaces as LA channels

1. Create a cluster of nodes NS0, NS1, and NS2.
   1. Log on to the first node that you want to add to the cluster and do the following:
      ```
      create cluster instance 1
      add cluster node 0 10.102.29.60 -state ACTIVE
      enable cluster instance 1
      add ns ip 10.102.29.61 255.255.255.255 -type CLIP
      save ns config
      reboot -warm
      ```
   2. Log on to the cluster IP address and do the following:
      ```
      add cluster node 1 10.102.29.70 -state ACTIVE
      add cluster node 2 10.102.29.80 -state ACTIVE
      ```
   3. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.
      ```
      join cluster -clip 10.102.29.61 -password nsroot
      save ns config
      reboot -warm
      ```

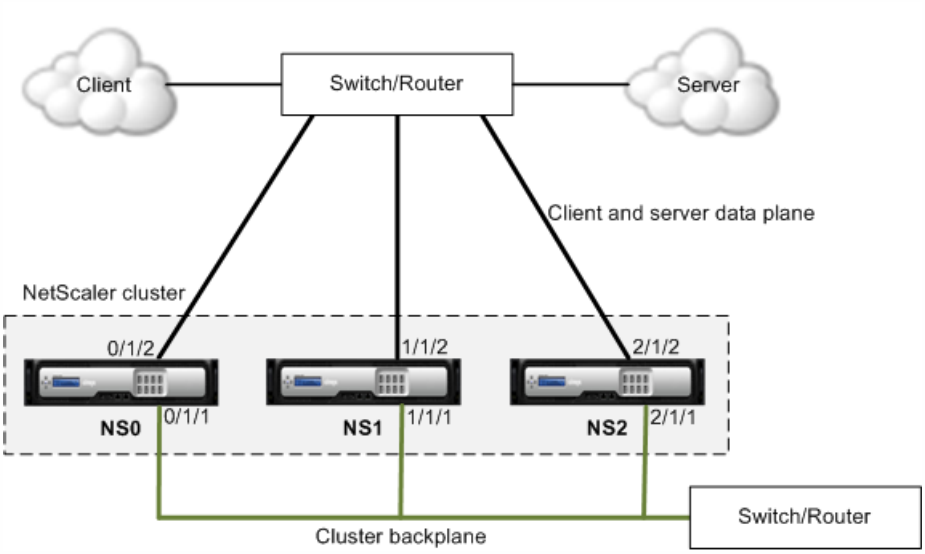
   As seen in the above commands the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

2. Log on to the cluster IP address and do the following:
   1. Create the LA channels for nodes NS0 and NS1.
      ```
      add channel 0/LA/1 -ifnum 0/1/1 0/1/2
      add channel 1/LA/2 -ifnum 1/1/1 1/1/2
      ```
   2. Configure the backplane for the cluster nodes.
      ```
      set cluster node 0 -backplane 0/LA/1
      set cluster node 1 -backplane 1/LA/2
      set cluster node 2 -backplane 2/1/1
      ```

Common Interfaces for Client and Server and Dedicated Interfaces for Backplane

Feb 17, 2015

This is a one-arm deployment of the NetScaler cluster. In this deployment, the client and server networks use the same interfaces to communicate with the cluster. The cluster backplane uses dedicated interfaces for inter-node communication.



NS0 - nodeId: 0, NSIP: 10.102.29.60

NS1 - nodeId: 1, NSIP: 10.102.29.70

NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with a common interface for the client and server and a different interface for the cluster backplane

1. Create a cluster of nodes NS0, NS1, and NS2.
    1. Log on to the first node that you want to add to the cluster and do the following:
       ```
       create cluster instance 1
       add cluster node 0 10.102.29.60 -state ACTIVE -backplane 0/1/1
       enable cluster instance 1
       add ns ip 10.102.29.61 255.255.255.255 -type CLIP
       save ns config
       reboot -warm
       ```
    2. Log on to the cluster IP address and do the following:
       ```
       add cluster node 1 10.102.29.70 -state ACTIVE -backplane 1/1/1
       add cluster node 2 10.102.29.80 -state ACTIVE -backplane 2/1/1
       ```
    3. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.
       ```
       join cluster -clip 10.102.29.61 -password nsroot
       save ns config
       ```

```
reboot -warm
```

As seen in the above commands the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

2. On the cluster IP address, create VLANs for the backplane interfaces and for the client and server interfaces.

```
//For the backplane interfaces
add vlan 10
bind vlan 10 0/1/1 1/1/1 2/1/1

//For the interfaces that are connected to the client and server networks.
add vlan 20
bind vlan 20 0/1/2 1/1/2 2/1/2
```

3. On the switch, create VLANs for the interfaces corresponding to the backplane interfaces and the client and server interfaces. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

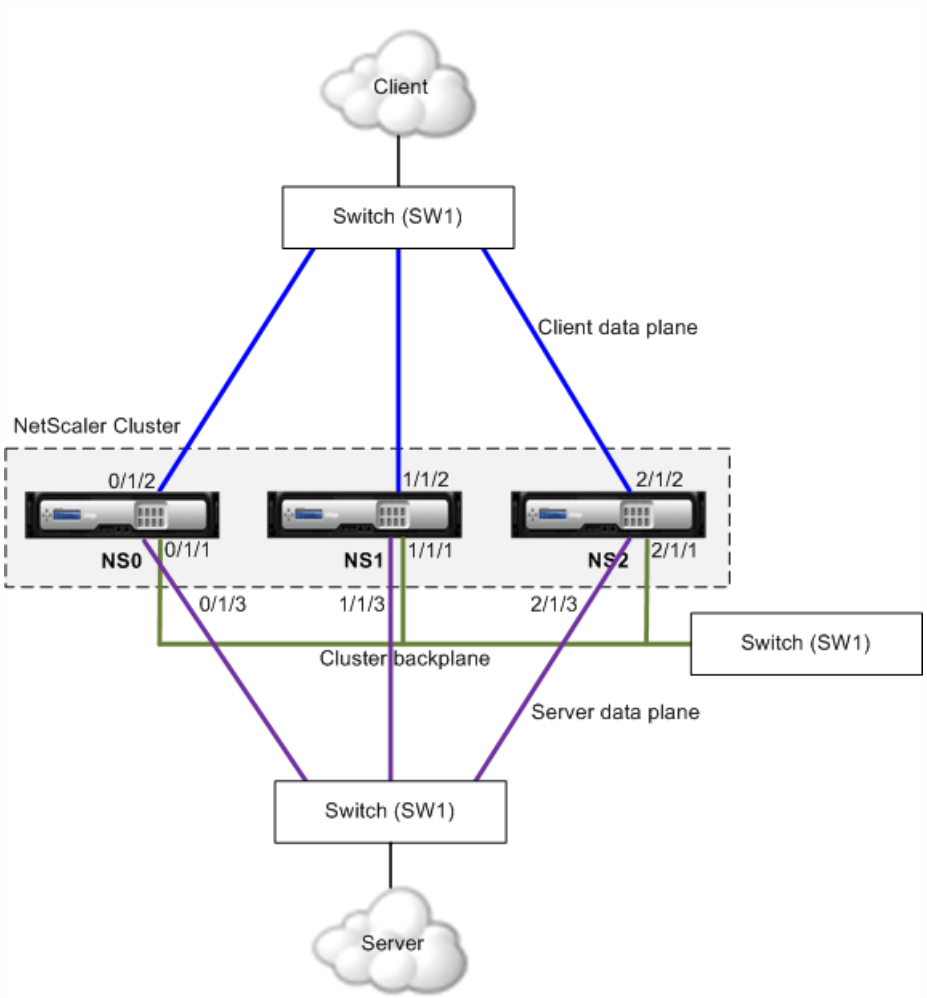
```
//For the backplane interfaces. Repeat for each interface...
interface Ethernet2/47
switchport access vlan 100
switchport mode access
end

//For the interfaces connected to the client and server networks. Repeat for each interface...
interface Ethernet2/47
switchport access vlan 200
switchport mode access
end
```

Common Switch for Client, Server, and Backplane

Feb 17, 2015

In this deployment, the client, server, and backplane use dedicated interfaces on the same switch to communicate with the NetScaler cluster.



NS0 - nodeId: 0, NSIP: 10.102.29.60

NS1 - nodeId: 1, NSIP: 10.102.29.70

NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with a common switch for the client, server, and backplane

1. Create a cluster of nodes NS0, NS1, and NS2.
   1. Log on to the first node that you want to add to the cluster and do the following:

      ```
      create cluster instance 1
      add cluster node 0 10.102.29.60 -state ACTIVE -backplane 0/1/1
      enable cluster instance 1
      add ns ip 10.102.29.61 255.255.255.255 -type CLIP
      save ns config
      ```

reboot -warm

2. Log on to the cluster IP address and do the following:
   add cluster node 1 10.102.29.70 -state ACTIVE -backplane 1/1/1
   add cluster node 2 10.102.29.80 -state ACTIVE -backplane 2/1/1
3. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.
   join cluster -clip 10.102.29.61 -password nsroot
   save ns config
   reboot -warm

   As seen in the above commands the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

2. On the cluster IP address, create VLANs for the backplane, client, and server interfaces.

```
//For the backplane interfaces
add vlan 10
bind vlan 10 0/1/1 1/1/1 2/1/1

//For the client-side interfaces
add vlan 20
bind vlan 20 0/1/2 1/1/2 2/1/2

//For the server-side interfaces
add vlan 30
bind vlan 30 0/1/3 1/1/3 2/1/3
```

3. On the switch, create VLANs for the interfaces corresponding to the backplane interfaces and the client and server interfaces. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

```
//For the backplane interfaces. Repeat for each interface...
interface Ethernet2/47
switchport access vlan 100
switchport mode access
end

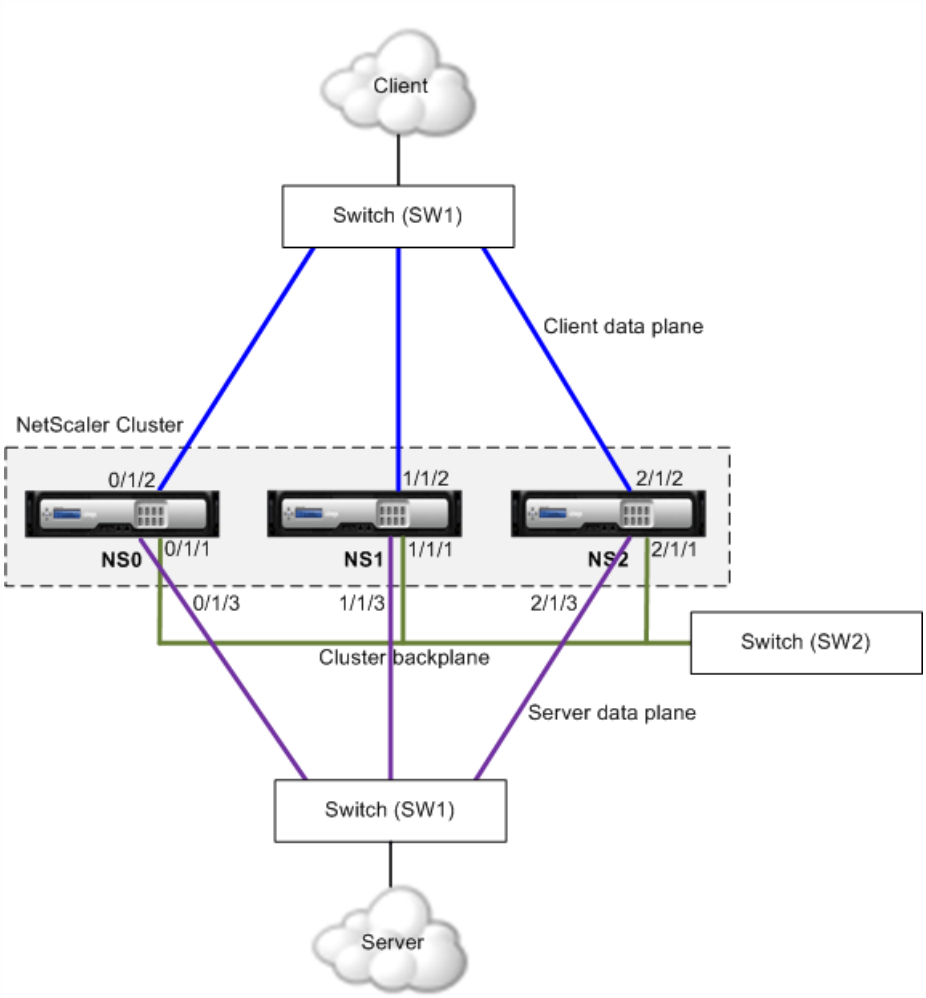
//For the client interfaces. Repeat for each interface...
interface Ethernet2/48
switchport access vlan 200
switchport mode access
end

//For the server interfaces. Repeat for each interface...
interface Ethernet2/49
switchport access vlan 300
switchport mode access
end
```

Common Switch for Client and Server and Dedicated Switch for Backplane

Feb 17, 2015

In this deployment, the clients and servers use different interfaces on the same switch to communicate with the NetScaler cluster. The cluster backplane uses a dedicated switch for inter-node communication.



NS0 - nodeId: 0, NSIP: 10.102.29.60

NS1 - nodeId: 1, NSIP: 10.102.29.70

NS2 - nodeId: 2, NSIP: 10.102.29.80

To deploy a cluster with the same switch for the clients and servers and a different switch for the cluster backplane

1. Create a cluster of nodes NS0, NS1, and NS2.
   1. Log on to the first node that you want to add to the cluster and do the following:
      ```
      create cluster instance 1
      add cluster node 0 10.102.29.60 -state ACTIVE -backplane 0/1/1
      ```

```
enable cluster instance 1
add ns ip 10.102.29.61 255.255.255.255 -type CLIP
save ns config
reboot -warm
```

2. Log on to the cluster IP address and do the following:

```
add cluster node 1 10.102.29.70 -state ACTIVE -backplane 1/1/1
add cluster node 2 10.102.29.80 -state ACTIVE -backplane 2/1/1
```

3. Log on to the nodes 10.102.29.70 and 10.102.29.80 to join the nodes to the cluster.

```
join cluster -clip 10.102.29.61 -password nsroot
save ns config
reboot -warm
```

As seen in the above commands the interfaces 0/1/1, 1/1/1, and 2/1/1 are configured as the backplane interfaces of the three cluster nodes.

2. On the cluster IP address, create VLANs for the backplane, client, and server interfaces.

```
//For the backplane interfaces
add vlan 10
bind vlan 10 0/1/1 1/1/1 2/1/1

//For the client-side interfaces
add vlan 20
bind vlan 20 0/1/2 1/1/2 2/1/2

//For the server-side interfaces
add vlan 30
bind vlan 30 0/1/3 1/1/3 2/1/3
```

3. On the switch, create VLANs for the interfaces corresponding to the backplane interfaces and the client and server interfaces. The following sample configurations are provided for the Cisco® Nexus 7000 C7010 Release 5.2(1) switch. Similar configurations must be performed on other switches.

```
//For the backplane interfaces. Repeat for each interface...
interface Ethernet2/47
switchport access vlan 100
switchport mode access
end

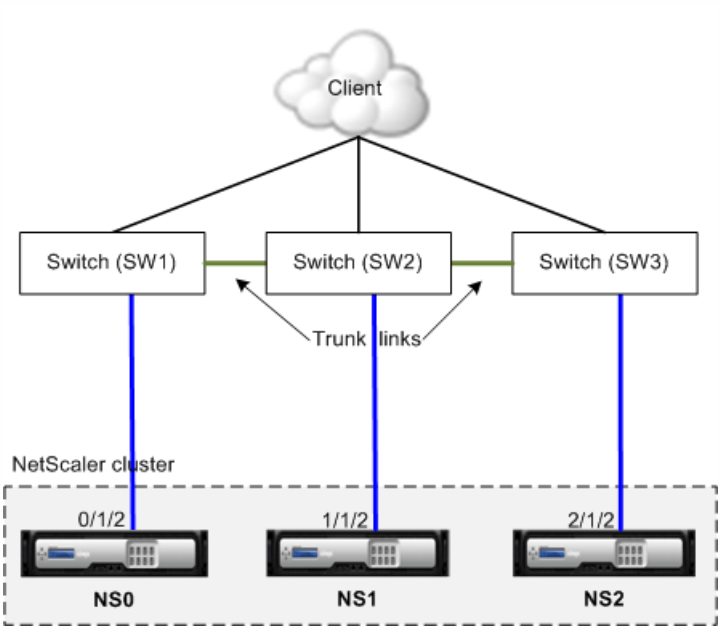
//For the client interfaces. Repeat for each interface...
interface Ethernet2/48
switchport access vlan 200
switchport mode access
end

//For the server interfaces. Repeat for each interface...
interface Ethernet2/49
switchport access vlan 300
switchport mode access
end
```

Different Switch for Every Node

Feb 17, 2015

In this deployment, each cluster node is connected to a different switch and trunk links are configured between the switches.



The cluster configurations will be the same as the other deployments scenarios. Most of the client-side configurations will be done on the client-side switches.

Sample Cluster Configurations

Feb 09, 2015

The following example can be used to configure a four-node cluster with ECMP, cluster LA, or Linksets.

1. Create the cluster.
   1. Log on to first node.
   2. Add the cluster instance.
      ```
      add cluster instance 1
      ```
   3. Add the first node to the cluster.
      ```
      add cluster node 0 10.102.33.184 -backplane 0/1/1
      ```
   4. Enable the cluster instance.
      ```
      enable cluster instance 1
      ```
   5. Add the cluster IP address.
      ```
      add ns ip 10.102.33.185 255.255.255.255 -type CLIP
      ```
   6. Save the configurations.
      ```
      save ns config
      ```
   7. Warm reboot the appliance.
      ```
      reboot -warm
      ```
2. Add the other three nodes to the cluster.
   1. Log on to cluster IP address.
   2. Add the second node to the cluster.
      ```
      add cluster node 1 10.102.33.187 -backplane 1/1/1
      ```
   3. Add the third node to the cluster.
      ```
      add cluster node 2 10.102.33.188 -backplane 2/1/1
      ```
   4. Add the fourth node to the cluster.
      ```
      add cluster node 3 10.102.33.189 -backplane 3/1/1
      ```
3. Join the added nodes to the cluster. This step is not applicable for the first node.
   1. Log on to each newly added node.
   2. Join the node to the cluster.
      ```
      join cluster -clip 10.102.33.185 -password nsroot
      ```
   3. Save the configuration.
      ```
      save ns config
      ```
   4. Warm reboot the appliance.
      ```
      reboot -warm
      ```
4. Configure the NetScaler cluster through the cluster IP address.
   ```
   // Enable load balancing feature
   enable ns feature lb

   // Add a load balancing virtual server
   add lb vserver first_lbvserver http
   ....
   ....
   ```
5. Configure any one of the following (ECMP, cluster LA, or Linkset) traffic distribution mechanisms for the cluster.
   - ECMP
     1. Log on to the cluster IP address.

2. Enable the OSPF routing protocol.
   enable ns feature ospf
3. Add a VLAN.
   add vlan 97
4. Bind the interfaces of the cluster nodes to the VLAN.
   bind vlan 97 -ifnum 0/1/4 1/1/4 2/1/4 3/1/4
5. Add a spotted SNIP on each node and enable dynamic routing on it.
   add ns ip 1.1.1.10 255.255.255.0 -ownerNode 0 -dynamicRouting ENABLED
   add ns ip 1.1.1.11 255.255.255.0 -ownerNode 1 -dynamicRouting ENABLED
   add ns ip 1.1.1.12 255.255.255.0 -ownerNode 2 -dynamicRouting ENABLED
   add ns ip 1.1.1.13 255.255.255.0 -ownerNode 3 -dynamicRouting ENABLED
6. Bind one of the SNIP addresses to the VLAN.
   bind vlan 97 -ipAddress 1.1.1.10 255.255.255.0
7. Configure the routing protocol on ZebOS by using vtysh shell.

- **Static cluster LA**

  1. Log on to the cluster IP address.
  2. Add a cluster LA channel.
     add channel CLA/1 -speed 1000
  3. Bind the interfaces to the cluster LA channel.
     bind channel CLA/1 0/1/5 1/1/5 2/1/5 3/1/5
  4. Perform equivalent configuration on the switch.

- **Dynamic cluster LA**

  1. Log on to the cluster IP address.
  2. Add the interfaces to the cluster LA channel.
     set interface 0/1/5 -lacpmode active -lacpkey 5 -lagtype cluster
     set interface 1/1/5 -lacpmode active -lacpkey 5 -lagtype cluster
     set interface 2/1/5 -lacpmode active -lacpkey 5 -lagtype cluster
     set interface 3/1/5 -lacpmode active -lacpkey 5 -lagtype cluster
  3. Perform equivalent configuration on the switch.

- **Linksets.** Assume that the node with nodeId 3 is not connected to the switch. You must configure a linkset so that the unconnected node can use the other node interfaces to communicate with the switch.

  1. Log on to the cluster IP address.
  2. Add a linkset.
     add linkset LS/1
  3. Bind the connected interfaces to the linkset.
     bind linkset LS/1 -ifnum 0/1/6 1/1/6 2/1/6

6. Update the state of the cluster nodes to ACTIVE.
   set cluster node 0 -state ACTIVE
   set cluster node 1 -state ACTIVE
   set cluster node 2 -state ACTIVE
   set cluster node 3 -state ACTIVE

Upgrading or Downgrading the NetScaler Cluster

May 20, 2015

All the nodes of a NetScaler cluster must be running the same software version. Therefore, to upgrade or downgrade the cluster, you must upgrade or downgrade each NetScaler appliance of the cluster, one node at a time.

A node that is being upgraded or downgraded is not removed from the cluster. The node continues to be a part of the cluster and serves traffic uninterrupted, except for the down-time when the node reboots after it is upgraded or downgraded. However, due to software version mismatch among the cluster nodes, configuration propagation is disabled on the cluster and is enabled only after all the cluster nodes are of the same version. Since configuration propagation is disabled during upgrading on downgrading a cluster, you cannot perform any configurations through the cluster IP address during this time.

Points to note before upgrading or downgrading the cluster

- You cannot add cluster nodes while upgrading or downgrading the cluster software version.
- You can perform node-level configurations through the NSIP address of individual nodes, but you must make sure that you perform the same configurations on all the nodes to maintain them in synch.
- You cannot execute the start nstrace command from the cluster IP address when the cluster is being upgraded. However, you can get the trace of individual nodes by performing this operation on individual cluster nodes through their NetScaler IP (NSIP) address.
- Configurations can be lost during the downgrade of the cluster.
- Owing to changes in cluster licensing that were made in NetScaler 10.5 Build 52.11 (see license requirements), look into the following:
  - If the cluster is setup in a build prior to NetScaler 10.5 Build 52.11, the cluster will work with the separate cluster license file. No changes are required.
  - If the cluster is setup in NetScaler 10.5 Build 52.11 or later releases and then downgraded to a build prior to NetScaler 10.5 Build 52.11, the downgraded cluster will not work as it now expects a separate cluster license file.
- While upgrading from any NetScaler 10.1 build to a later release, syncookie must be disabled on all TCP profiles (using the "set ns tcpProfile <name> -synCookie DISABLED" command) and after that a striped SNIP must be added on the CLIP subnet. Once upgraded, syncookie can be enabled again.
- While upgrading the NetScaler appliance from a NetScaler 10.1 build to a NetScaler 10.5 build, do not execute the "show audit messages" command as this can cause the NetScaler appliance to crash.
- NetScaler 10.5 54.x and 55.x builds are not suitable for cluster deployment. This is because, for services that need probing, SYN packets are processed locally (on the flow receiver) even though syncookie is disabled.
- When a cluster is being upgraded, it is possible that the upgraded nodes have some additional features activated that are not available on the nodes that are not upgraded. This results in a license mismatch warning while the cluster is being upgraded. This warning will be automatically resolved when all the cluster nodes are upgraded.

To upgrade or downgrade the software of the cluster nodes

1. Make sure the cluster is stable and the configurations are synchronized on all the nodes.
2. For each cluster node perform the following:
   Note: Citrix recommends that you wait for the previous node to become active before upgrading or downgrading the next node.
   1. Upgrade or downgrade the cluster node. For detailed information about upgrading and downgrading the software of an appliance, see "Upgrading or Downgrading the System Software".
   2. Save the configurations.

3. Reboot the appliance.

3. Repeat step 2 for each of the other cluster nodes.

Operations Supported on Individual Cluster Nodes

Mar 20, 2015

As a rule, NetScaler appliances that are a part of a cluster cannot be individually configured from their NSIP address. However, there are some operations that are an exception to this rule. These operations, when executed from the NSIP address, are not propagated to other cluster nodes.

The operations are:

- cluster instance (set | rm | enable | disable)
- cluster node (set | rm)
- nstrace (start | show | stop)
- interface (set | enable | disable)
- force cluster sync
- sync cluster files
- disable ntp sync
- save ns config
- reboot
- shutdown

For example, when you execute the command disable interface 1/1/1 from the NSIP address of a cluster node, the interface is disabled only on that node. Since the command is not propagated, the interface 1/1/1 remains enabled on all the other cluster nodes.

FAQs

Feb 04, 2016

Click here for clustering FAQs for NetScaler versions 11.0, 10.5, and 10.1.

Troubleshooting the NetScaler Cluster

Feb 09, 2015

If a failure occurs in a NetScaler cluster, the first step in troubleshooting is to get information on the cluster instance and the cluster nodes by running the show cluster instance <clId> and show cluster node <nodeId> commands respectively.

If you are not able to find the issue by using the above two approaches, you can use one of the following:

- **Isolate the source of the failure.** Try bypassing the cluster to reach the server. If the attempt is successful, the problem is probably with the cluster setup.
- **Check the commands recently executed.** Run the history command to check the recent configurations performed on the cluster. You can also review the ns.conf file to verify the configurations that have been implemented.
- **Check the ns.log files.** Use the log files, available in the /var/log/ directory of each node, to identify the commands executed, status of commands, and the state changes.
- **Check the newnslog files.** Use the newnslog files, available in the /var/nslog/ directory of each node, to identify the events that have occurred on the cluster nodes. You can view multiple newnslog files as a single file, by copying the files to a single directory, and then running the following command:
  nsconmsg -K newnslog-node<id> -K newnslog.node<id> -d current

If you still cannot resolve the issue, you can try tracing the packets on the cluster or use the show techsupport -scope cluster command to send the report to the technical support team.

Tracing the Packets of a NetScaler Cluster

Feb 09, 2015

The NetScaler operating system provides a utility called *nstrace* to get a dump of the packets that are received and sent out by an appliance. The utility stores the packets in trace files. You can use these files to debug problems in the flow of packets to the cluster nodes. The trace files must be viewed with the Wireshark application.

Some salient aspects of the nstrace utility are:

- Can be configured to trace packets selectively by using classic expressions and default expressions.
- Can capture the trace in multiple formats: nstrace format (.cap) and TCP dump format (.pcap).
- Can aggregate the trace files of all cluster nodes on the configuration coordinator.
- Can merge multiple trace files into a single trace file (only for .cap files).

You can use the nstrace utility from the NetScaler command line or the NetScaler shell.

Run the start nstrace command on the appliance. The command creates trace files in the /var/nstrace/<date-timestamp> directory. The trace file names are of the form nstrace<id>.cap.

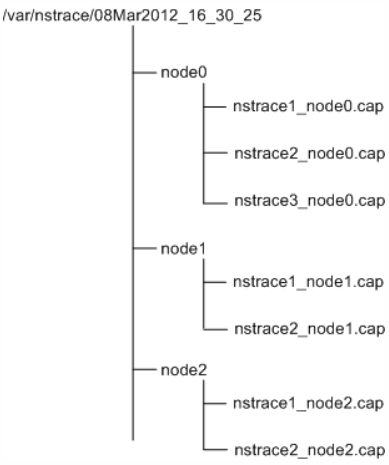
You can view the status by executing the show nstrace command. You can stop tracing the packets by executing the stop nstrace command.

Note: You can also run the nstrace utility from the NetScaler shell by executing the nstrace.sh file. However, it is recommended that you use the nstrace utility through the NetScaler command line interface.

You can trace the packets on all the cluster nodes and obtain all the trace files on the configuration coordinator.

Run the start nstrace command on the cluster IP address. The command is propagated and executed on all the cluster nodes. The trace files are stored in individual cluster nodes in the /var/nstrace/<date-timestamp> directory. The trace file names are of the form nstrace<id>_node<id>.cap.

You can use the trace files of each node to debug the nodes operations. But if you want the trace files of all cluster nodes in one location, you must run the stop nstrace command on the cluster IP address. The trace files of all the nodes are downloaded on the cluster configuration coordinator in the /var/nstrace/<date-timestamp> directory as follows:



You can prepare a single file from the trace files (supported only for .cap files) obtained from the cluster nodes. The single trace files gives you a cumulative view of the trace of the cluster packets. The trace entries in the single trace file are sorted based on the time the packets were received on the cluster.

To merge the trace files, at the NetScaler shell, type:

nstracemerge.sh -srcdir <DIR> -dstdir <DIR> -filename <name> -filesize <num>

where,

- srcdir is the directory from which the trace files are merged. All trace files within this directory are merged into a single file.
- dstdir is the directory where the merged trace file are created.

- filename is the name of the trace file that is created.
- filesize is the size of the trace file.

Following are some examples of using the nstrace utility to filter packets.

- To trace the packets on the backplane interfaces of three nodes:
  Using classic expressions:

  start nstrace -filter "INTF == 0/1/1 && INTF == 1/1/1 && INTF == 2/1/1"
  Using default expressions:

  start nstrace -filter "CONNECTION.INTF.EQ("0/1/1") && CONNECTION.INTF.EQ("1/1/1") && CONNECTION.INTF.EQ("2/1/1")"
- To trace the packets from a source IP address 10.102.34.201 or from a system whose source port is greater than 80 and the service name is not "s1":
  Using classic expressions

  start nstrace -filter "SOURCEIP == 10.102.34.201 || (SVCNAME != s1 && SOURCEPORT > 80)"
  Using default expressions

  start nstrace -filter "CONNECTION.SRCIP.EQ(10.102.34.201) || (CONNECTION.SVCNAME.NE("s1") && CONNECTION.SRCPORT.GT(80))"

Troubleshooting Common Issues

Feb 09, 2015

While joining a node to the cluster, I get the following message, "ERROR: Invalid interface name/number." What must I do to resolve this error?

This error occurs if you provided an invalid or incorrect backplane interface while using the add cluster node command to add the node. To resolve this error, verify the interface you provided while adding the node. Make sure that you have not specified the appliance's management interface as the backplane interface, and that the <nodeId> bit of the interface is the same as the node's Id. For example, if the nodeId is 3, the backplane interface must be 3/<c>/<u>.

While joining a node to the cluster, I get the following message, "ERROR: Clustering cannot be enabled, because the local node is not a member of the cluster." What must I do to resolve this error?

This error occurs when you try to join a node without adding the node's NSIP to the cluster. To resolve this error, you must first add the node's NSIP address to the cluster by using the add cluster node command and then execute the join cluster command.

While joining a node to the cluster, I get the following message, "ERROR: Connection refused." What must I do to resolve this error?

This error can occur due to the following reasons:

- **Connectivity problems.** The node cannot connect to the cluster IP address. Try pinging the cluster IP address from the node that you are trying to join.
- **Duplicate cluster IP address.** Check to see if the cluster IP address exists on some non-cluster node. If it does, create a new cluster IP address and try re-joining the cluster.

While joining a node to the cluster, I get the following message, "ERROR: License mismatch between the configuration coordinator and the local node." What must I do to resolve this error?

The appliance that you are joining to the cluster must have the same licenses as the configuration coordinator. This error occurs when the licenses on the node you are joining do not match the licenses on the configuration coordinator. To resolve this error, run the following commands on both the nodes and compare the outputs.

From the command line:

- show ns hardware
- show ns license

From the shell:

- nsconmsg -g feature -d stats
- ls /nsconfig/license
- View the contents of the /var/log/license.log file

What must I do when the configurations of a cluster node are not in synch with the cluster configurations?

In most cases, the configurations are automatically synchronized between all the cluster nodes. However, if you feel that the configurations are not synchronized on a specific node, you must force the synchronization by executing the force cluster sync command from the node that you want to synchronize. For more information, see "Synchronizing Cluster

Configurations".

When configuring a cluster node, I get the following message, "ERROR: Session is read-only; connect to the cluster IP address to modify the configuration."

All configurations on a cluster must be done through the cluster IP address and the configurations are propagated to the other cluster nodes. All sessions established through the NetScaler IP (NSIP) address of individual nodes are read-only.

Why does the node state show "INACTIVE" when the node health shows "UP"?

A healthy node can be in the INACTIVE state for a number of reasons. A scan of ns.log or error counters can help you determine the exact reason.

How can I resolve the health of a node when its health shows "NOT UP"?

Node health "**Not UP**" indicates that there are some issues with the node. To know the root cause, you must run the show cluster node command. This command displays the node properties and the reason for the node failure.

What must I do when the health of a node shows as "NOT UP" and the reason indicates that configuration commands have failed on a node?

This issue arises when some commands are not executed on the cluster nodes. In such cases, you must make sure that the configurations are synchronized using one of the following options:

- If some of the cluster nodes are in this state, you must perform the force cluster synchronization operation on those nodes. For more information, see "Synchronizing Cluster Configurations".
- If all cluster nodes are in this state, you must disable and then enable the cluster instance on all the cluster nodes.

When I run the set vserver command, I get the following message, "No such resource." What must I do to resolve this issue?

The set vserver command is not supported in clustering. The unset vserver, enable vserver, disable vserver, and rm vserver commands are also not supported. However, the show vserver command is supported.

I cannot configure the cluster over a Telnet session. What must I do?

Over a telnet session, the cluster IP address can be accessed only in read-only mode. Therefore, you cannot configure a cluster over a telnet session.

I notice a significant time difference across the cluster nodes. What must I do to resolve this issue?

When PTP packets are dropped due to backplane switch or if the physical resources are over-committed in a virtual environment, the time will not get synchronized.
To synchronize the times, you must do the following on the cluster IP address:

1. Disable PTP.

   set ptp -state disable

2. Configure Network Time Protocol (NTP) for the cluster. For more information, see "Setting up Clock Synchronization".

What must I do, if there is no connectivity to the cluster IP address and the NSIP address of a cluster node?

If you cannot access to the cluster IP address or the NSIP of a cluster node, you must access the appliance through the serial console. For more information, see "Using the Command Line Interface".
If the NSIP address is reachable, you can SSH to the cluster IP address from the shell by executing the following command at the shell prompt:

```
# ssh nsroot@<cluster IP address>
```

What must I do to recover a cluster node that has connectivity issues?

To recover a node that has connectivity issues:

1. Disable the cluster instance on that node (since you cannot execute commands from the NSIP of a cluster node).
2. Execute the commands required to recover the node.
3. Enable the cluster instance on that node.

Some nodes of the cluster have two default routes. How can I remove the second default route from the cluster node?

To delete the additional default route, do the following on each node that has the extra route:

1. Disable the cluster instance.
   disable cluster instance <clId>
2. Remove the route.
   rm route <network> <netmask> <gateway>
3. Enable the cluster instance.
   enable cluster instance <clId>

The cluster functionality gets affected when an existing cluster node comes online. What must I do to resolve this issue?

If RPC password of node is changed from the cluster IP address when that node is out of the cluster, then, when the node comes online, there is a mismatch in rpc credentials and this could affect cluster functionality. To solve this issue, use the set ns rpcNode command to update the password on the NSIP of the node which has come online.

CloudBridge Connector

Oct 20, 2015

The CloudBridge Connector feature of the Citrix NetScaler appliance connects enterprise datacenters to external clouds and hosting environments, making the cloud a secure extension of your enterprise network. Cloud-hosted applications appear as though they are running on one contiguous enterprise network. With Citrix CloudBridge Connector, you can augment your datacenters with the capacity and efficiency available from cloud providers.

The CloudBridge Connector enables you to move your applications to the cloud to reduce costs and increase reliability.

In addition to using CloudBridge Connector between a datacenter and a cloud, you can use it to connect two datacenters for a high-capacity secure and accelerated link.

Understanding CloudBridge Connector

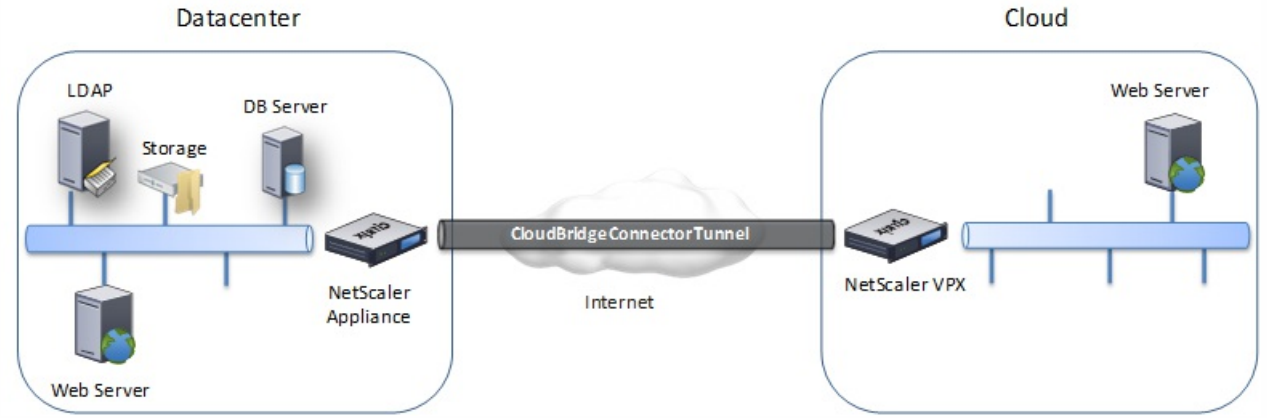
Updated: 2014-04-14

To implement the Citrix CloudBridge Connector solution, you connect a datacenter to another datacenter or an external cloud by setting up a tunnel called the CloudBridge Connector tunnel.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between two NetScaler appliances, one in each datacenter.

To connect a datacenter to an external cloud (for example, Amazon AWS cloud), you set up a CloudBridge Connector tunnel between a NetScaler appliance in the datacenter and a virtual appliance (VPX) that resides in the Cloud. The remote end point can be a CloudBridge Connector or a NetScaler VPX with platinum license.

The following illustration shows a CloudBridge Connector tunnel set up between a datacenter and an external cloud.



The appliances between which a CloudBridge Connector tunnel is set up are called the *end points* or *peers* of the CloudBridge Connector tunnel.

A CloudBridge Connector tunnel uses the following protocols:

- Generic Routing Encapsulation (GRE) protocol
- Open-standard IPSec Protocol suite, in transport mode

The GRE protocol provides a mechanism for encapsulating packets, from a wide variety of network protocols, to be

forwarded over another protocol. GRE is used to:

- Connect networks running non-IP and non-routable protocols.
- Bridge across a wide area network (WAN).
- Create a transport tunnel for any type of traffic that needs to be sent unchanged across a different network.

The GRE protocol encapsulates packets by adding a GRE header and a GRE IP header to the packets.

The Internet Protocol security (IPSec) protocol suite secures communication between peers in the CloudBridge Connector tunnel.

In a CloudBridge Connector tunnel, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the transport mode in which the GRE encapsulated packet is encrypted. The encryption is done by the Encapsulating Security Payload (ESP) protocol. The ESP protocol ensures the integrity of the packet by using a HMAC hash function, and ensures confidentiality by using an encryption algorithm. After the packet is encrypted and the HMAC is calculated, an ESP header is generated. The ESP header is inserted after the GRE IP header and, an ESP trailer is inserted at the end of the encrypted payload.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version (IKE) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

- The two peers mutually authenticate with each other, using one of the following authentication methods:
  - **Pre-shared key authentication**. A text string called a pre-shared key is manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
  - **Digital certificates authentication**. The initiator (sender) peer signs message interchange data by using its private key, and the other receiver peer uses the sender's public key to verify the signature. Typically, the public key is exchanged in messages containing an X.509v3 certificate. This certificate provides a level of assurance that a peer's identity as represented in the certificate is associated with a particular public key.
- The peers then negotiate to reach agreement on:
  - An encryption algorithm.
  - Cryptographic keys for encrypting data in one peer and decrypting the data in the other.

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when two peers, CB1 and CB2, are communicating through a Connector tunnel, CB1 has two Security Associations. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets.

SAs expire after a specified length of time, which is called the *lifetime*. The two peers use the Internet Key Exchange (IKE)

protocol (part of the IPSec protocol suite) to negotiate new cryptographic keys and establish new SAs. The purpose of the limited lifetime is to prevent attackers from cracking a key.

Configuring CloudBridge Connector Tunnel between two Datacenters

Aug 02, 2013

You can configure a CloudBridge Connector tunnel between two different datacenters to extend your network without reconfiguring it, and leverage the capabilities of the two datacenters. Having a CloudBridge Connector tunnel configured between the two geographically separated datacenters enables you to implement redundancy and safeguard your setup from failure. The CloudBridge Connector tunnel helps achieve optimal utilization of infrastructure and resources across two datacenters. The applications available across the two datacenters appear as local to the user.

To connect a datacenter to another datacenter, you set up a CloudBridge Connector tunnel between a NetScaler appliance that reside in one datacenter and another NetScaler appliance that reside in the other datacenter.

As an illustration of CloudBridge Connector tunnel between two different datacenters, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance NS_Appliance-1 in datacenter DC1 and NetScaler appliance NS_Appliance-2 in datacenter DC2.

Both NS_Appliance-1 and NS_Appliance-2 function in L2 and L3 mode. They enable communication between private networks in datacenters DC1 and DC2. In L3 mode, NS_Appliance-1 and NS_Appliance-2 enable communication between client CL1 in the datacenter DC1 and server S1 in the datacenter DC2 through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

Because client CL1 and server S1 are on different private networks, L3 mode is enabled on NS_Appliance-1 and NS_Appliance-2 and routes are updated as the following:

- CL1 have a route to NS_Appliance-1 for reaching S1
- NS_Appliance-1 have a route to NS_Appliance-2 for reaching S1
- S1 should have a route to NS_Appliance-2 for reaching CL1
- NS_Appliance-2 have a route to NS_Appliance-1 for reaching CL1

The following table lists the settings on NetScaler appliance NS_Appliance-1 in datacenter DC1.

Entity	Name	Details
The NSIP address		198.51.100.12
SNIP address		198.51.100.15
CloudBridge Connector tunnel	Cloud_Connector_DC1-DC2	• Local endpoint IP address of the CloudBridge Connector tunnel = 198.51.100.15 • Remote endpoint IP address of the CloudBridge Connector tunnel = 203.0.113.133

		GRE Tunnel Details • Name = Cloud_Connector_DC1-DC2 IPSec Profile Details • Name = Cloud_Connector_DC1-DC2 • Encryption algorithm = AES • Hash algorithm = HMAC SHA1

The following table lists the settings on NetScaler appliance NS_Appliance-2 in datacenter DC2.

Entity	Name	Details
The NSIP address		203.0.113.131
SNIP address		203.0.113.133
CloudBridge Connector tunnel	Cloud_Connector_DC1-DC2	• Local endpoint IP address of the CloudBridge Connector tunnel = 203.0.113.133 • Remote endpoint IP address of the CloudBridge Connector tunnel = 198.51.100.15 GRE Tunnel Details • Name = Cloud_Connector_DC1-DC2 IPSec Profile Details • Name = Cloud_Connector_DC1-DC2 • Encryption algorithm = AES • Hash algorithm = HMAC SHA1

Following is the traffic flow in the CloudBridge Connector tunnel:

1. Client CL1 sends a request to server S1.
2. The request reaches NetScaler appliance NS-Appliance-1.
3. NS_Appliance-1, checks its routing table and finds that the destination IP address of the request packet belongs to a subnet in datacenter DC2. The appliance decides to forward the packet to be sent across the CC-DC1-DC2 tunnel.
4. NS_Appliance-1 uses the GRE protocol to encapsulate each of the request packets by adding a GRE header and a GRE IP header to the packet. The GRE IP header has the destination IP address set to the IP address of the CloudBridge tunnel (CC-DC1-DC2) end point in DC2 side. This IP Address is a public SNIP address configured on the NetScaler instance running on the NetScaler appliance NS_Appliance-2.
5. For CloudBridge Connector tunnel CC-DC1-DC2, NS_Appliance-1 checks the stored IPSec security association (SA) parameters for processing outbound packets, as agreed between NS_Appliance-1 and NS_Appliance-2 . The IPSec Encapsulating Security Payload (ESP) protocol in NS_Appliance-1 uses these SA parameters for outbound packets, to encrypt the payload of the GRE encapsulated packet.
6. The ESP protocol ensures the packet's integrity and confidentiality by using the HMAC hash function and the encryption algorithm specified for the CloudBridge Connector tunnel CC-DC1-DC2 . The ESP protocol, after encrypting the GRE

payload and calculating the HMAC, generates an ESP header and an ESP trailer and inserts them before and at the end of the encrypted GRE payload, respectively.
7. The resulting packet is sent to NS_Appliance-2.
8. NS_Appliance-2 checks the stored IPSec security association (SA) parameters for processing inbound packets, as agreed between NS_Appliance-1 and NS_Appliance-2 for the CloudBridge Connector tunnel CC-DC1-DC2 . The IPSec ESP protocol on NS_Appliance-2 uses these SA parameters for inbound packets, and the ESP header of the request packet, to decrypt the packet.
9. NS_Appliance-2 then decapsulates the packet by removing the GRE header.
10. The resulting packet is the same packet as the one received by NS_Appliance-1 in step 2. This packet has the destination IP address set to the IP address of server S1. NS_Appliance-2 forwards this packet to server S1.
11. S1 processes the request packet and sends out a response packet. The destination IP address in the response packet is the IP address of client CL1, and the source IP address is the IP address of server S1.
12. The response packet reaches NS_Appliance-2.
13. NS_Appliance-2 encapsulates and encrypts the response packet in the same way that NS_Appliance-1 did with the request packet in steps 3-6.
14. NS_Appliance-2 sends the resulting packet to NS_Appliance-1.
15. NS_Appliance-1, upon receiving the packet from NS_Appliance-2, decrypts and decapsulates the packet in the same way that NS_Appliance-2 did with the request packet in steps 9-11.

Prerequisites for Configuring a CloudBridge Connector tunnel between two Datacenters

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Deploy and set up a NetScaler appliance in each of the two datacenters.
2. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

Configuration Steps

To set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in one datacenter and another NetScaler appliance that resides in the other datacenter, use the configuration utility or the command line interface of one of the NetScaler appliance.

When you use the configuration utility, the CloudBridge Connector tunnel configuration created on the first NetScaler appliance, is automatically pushed to the other endpoint (the other NetScaler appliance) of the CloudBridge Connector tunnel. Therefore, you do not have to access the configuration utility of the other NetScaler appliance to create the corresponding CloudBridge Connector tunnel configuration on it.

The CloudBridge Connector tunnel configuration on each of the NetScaler appliance consists of the following entities:

- **IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **GRE tunnel**. An IP tunnel specifies the local IP address (a public SNIP address configured on the local NetScaler appliance), remote IP address (a public SNIP address configured on the remote NetScaler appliance), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.
- **Create a PBR rule and associate the IP tunnel with it**—A PBR entity specifies a set of conditions and an IP tunnel entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range and the destination IP address range to specify the subnet whose traffic is to traverse the CloudBridge Connector tunnel. For example, consider a request packet that originates from a client on the subnet in the

first datacenter and is destined to a server on the subnet in the second datacenter. If this packet matches the source and destination IP address range of the PBR entity on the NetScaler appliance in the first datacenter, it is sent across the CloudBridge Connector tunnel associated with the PBR entity.

To create an IPSEC profile by using the command line interface

At the command prompt, type:

add ipsec profile <name> [-**ikeVersion** (V1 | V2)] [-**encAlgo** (AES | 3DES) ...] [-**hashAlgo** <hashAlgo> ...] [-**lifetime** <positive_integer>] (-**psk** | (-**publickey** <string> -**privatekey** <string> -**peerPublicKey**<string>)) [-**livenessCheckInterval** <positive_integer>] [-**replayWindowSize** <positive_integer>] [-**ikeRetryInterval** <positive_integer>] [-**retransmissiontime** <positive_integer>]

Example

add ipsec profile Cloud_Connector_DC1-DC2 -encAlgo AES -hashAlgo HMAC_SHA1

To create an IP tunnel and bind the IPSEC profile to it by using the command line interface

At the command prompt, type:

add ipTunnel <name> <remote> <remoteSubnetMask> <local> [-**protocol** <protocol>] [-**ipsecProfileName**<string>]

Example

add ipTunnel Cloud_Connector_DC1-DC2 203.0.113.133 255.255.255.0 198.51.100.15 –protocol GRE -ipsecProfileName Cloud_Connector_DC1-DC2

To create a PBR rule and bind the IPSEC tunnel to it by using the command line interface

At the command prompt, type:

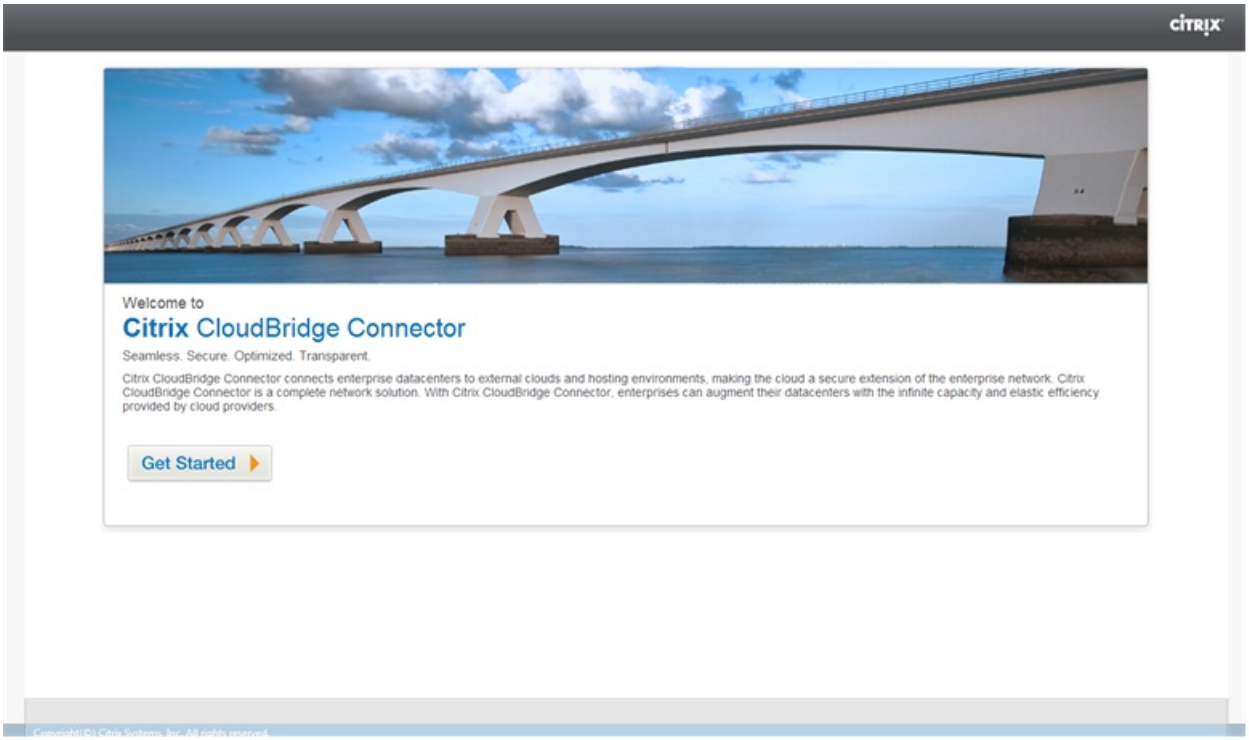
- **add ns pbr** <pbr_name> ALLOW -**srcIP** = <local_subnet_range> -**destIP** = <remote_subnet_range> -**ipTunnel** <tunnel_name>
- **apply ns pbrs**

Example

- add ns pbr PBR-DC1-DC2 ALLOW –srcIP 198.51.100.15 –destIP 203.0.113.133 ipTunnel Cloud_Connector_DC1-DC2
- apply ns pbrs

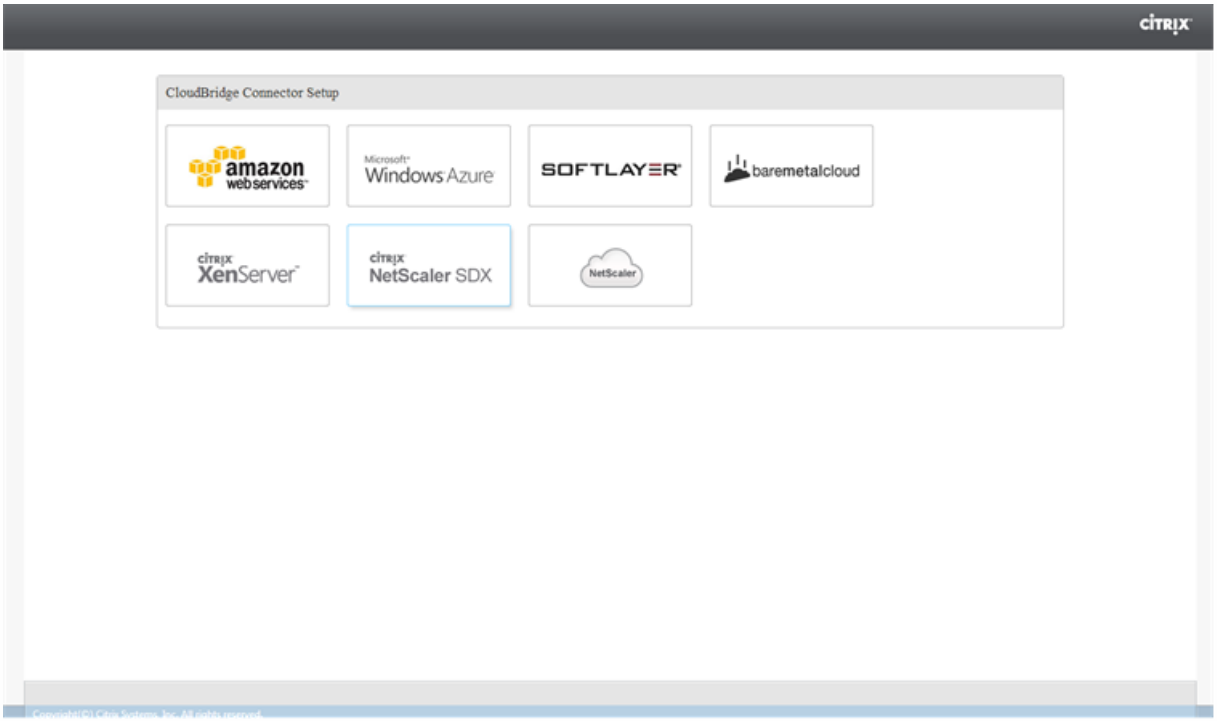
To configure a CloudBridge Connector tunnel in a NetScaler appliance by using the configuration utility

1. Type the NSIP address of a NetScaler appliance in the address line of a web browser.
2. Log on to the configuration utility of the NetScaler appliance by using your account credentials for the appliance.
3. Navigate to **System** > **CloudBridge Connector**.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
5. Click **Get Started.**



Note: If you already have any CloudBridge Connector tunnel configured on the NetScaler appliance, this screen does not appear, and you are taken to the **CloudBridge Connector Setup** pane.

6. In the **CloudBridge Connector Setup** pane, click **NetScaler**.



7. In the **NetScaler** pane, provide your account credentials for the remote NetScaler appliance. Click **Continue**.
8. In the **CloudBridge Connector Setting** pane, set the following parameter:
   - **CloudBridge Connector Name**— Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the

CloudBridge Connector configuration is created.

9. Under **Local Setting**, set the following parameter:
   - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel. Must be a public IP address of type SNIP.
10. Under **Remote Setting**, set the following parameter:
    - **Subnet IP**—IP address of the peer endpoint of the CloudBridge Connector tunnel. Must be a public IP address of type SNIP.
11. Under **PBR Setting**, set the following parameters:
    - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
    - **Source IP Low***—Lower source IP address to match against the source IP address of an outgoing IPv4 packet.
    - **Source IP High**—Higher source IP address to match against the source IP address of an outgoing IPv4 packet.
    - **Operation**—Either the equals (=) or does not equal (!=) logical operator.
    - **Destination IP Low***—Lower destination IP address to match against the destination IP address of an outgoing IPv4 packet.
    - **Destination IP High**—Higher destination IP address to match against the destination IP address of an outgoing IPv4 packet.
12. (Optional) Under **Security Settings**, set the following IPSec protocol parameters to be used by the IPSec protocol in the CloudBridge Connector tunnel:
    - **Encryption Algorithm**—Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Hash Algorithm—**Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Key**— Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
      - **Auto Generate Key**— Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for authentication.
      - **Specific Key—**Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
        - **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
      - **Upload Certificates**—Authentication based on digital certificates.
        - **Public Key**—A local digital certificate to be used to authenticate the local NetScaler appliance to the peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
        - **Private Key**—Private key of the local digital certificate.
        - **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.
13. Click **Done**.

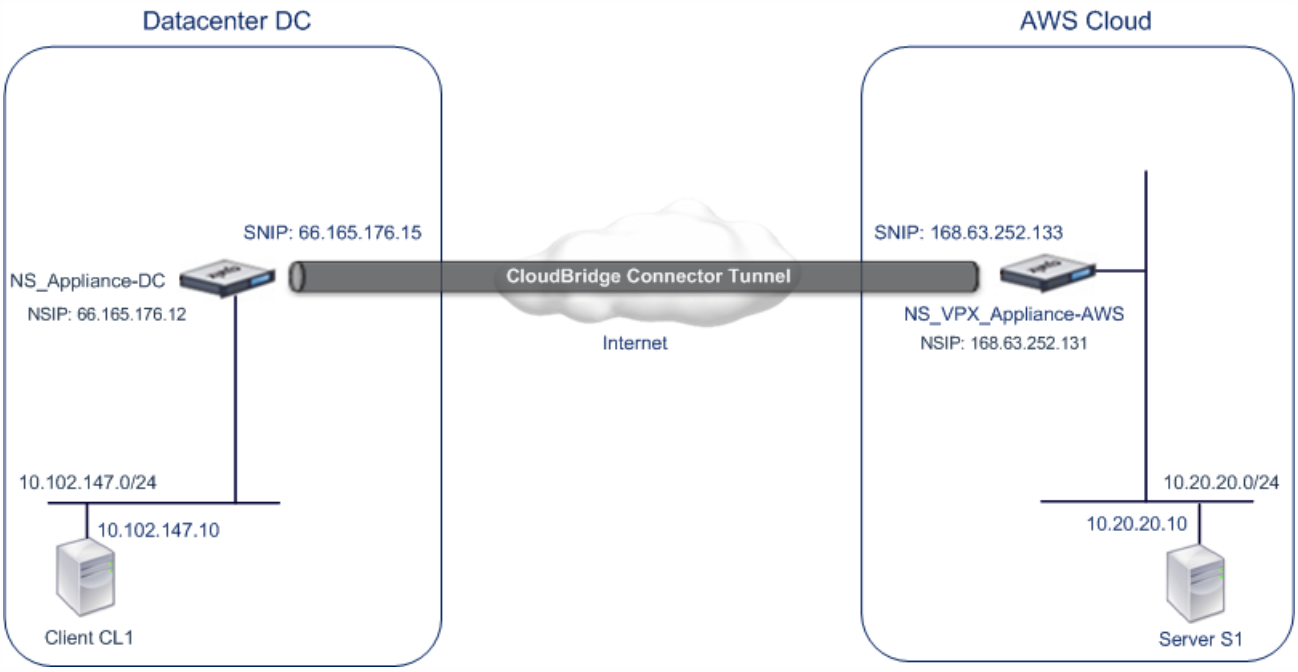
The new CloudBridge Connector tunnel configuration on both the NetScaler appliances appears on the Home tab of the respective configuration utility. The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge Connectors pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

Configuring CloudBridge Connector between Datacenter and AWS Cloud

Jan 28, 2011

You can configure a CloudBridge Connector tunnel between a datacenter and AWS cloud to leverage the infrastructure and computing capabilities of the data center and the AWS cloud. With AWS, you can extend your network without initial capital investment or the cost of maintaining the extended network infrastructure. You can scale your infrastructure up or down, as required. For example, you can lease more server capabilities when the demand increases.
To connect a datacenter to AWS cloud, you set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in the datacenter and a NetScaler virtual appliance (VPX) that resides in AWS cloud.

As an illustration of a CloudBridge Connector tunnel between a datacenter and Amazon AWS cloud, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance NS_Appliance-DC, in datacenter DC, and NetScaler virtual appliance (VPX) NS_VPX_Appliance-AWS.



Both NS_Appliance-DC and NS_VPX_Appliance-AWS function in L3 mode. They enable communication between private networks in datacenter DC and the AWS cloud. NS_Appliance-DC and NS_VPX_Appliance-AWS enable communication between client CL1 in datacenter DC and server S1 in the AWS cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

Note: AWS does not support L2 mode, hence it is necessary to have only L3 mode enabled on both the endpoints.
For proper communication between CL1 and S1, L3 mode is enabled on NS_Appliance-DC and NS_VPX_Appliance-AWS and routes are updated as such:

- CL1 have a route to NS_Appliance-DC for reaching S1
- NS_Appliance-DC have a route to NS_VPX_Appliance-AWS for reaching S1
- S1 should have a route to NS_VPX_Appliance-AWS for reaching CL1
- NS_VPX_Appliance-AWS have a route to NS_Appliance-DC for reaching CL1

The following table lists the settings on NetScaler appliance NS_Appliance-DC in datacenter DC.

Entity	Name	Details
The NSIP address		66.165.176.12
SNIP address		66.165.176.15
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	• Local endpoint IP address of the CloudBridge Connector tunnel =66.165.176.15 • Remote endpoint IP address of the CloudBridge Connector tunnel =168.63.252.133 **GRE Tunnel Details** • Name= CC_Tunnel_DC-AWS **IPSec Profile Details** • Name= CC_Tunnel_DC-AWS • Encryption algorithm= AES • Hash algorithm= HMAC SHA1

The following table lists the settings on NetScaler VPX NS_VPX_Appliance-AWS on AWS cloud.

Entity	Name	Details
NSIP address		10.102.25.30
Public EIP address mapped to the NSIP address		168.63.252.131
SNIP address		10.102.29.30
Public EIP address mapped to the SNIP address		168.63.252.133
CloudBridge Connector tunnel	CC_Tunnel_DC-AWS	• Local endpoint IP address of the CloudBridge Connector tunnel =168.63.252.133 • Remote endpoint IP address of the CloudBridge Connector tunnel = 66.165.176.15 **GRE Tunnel Details** • Name= CC_Tunnel_DC-AWS **IPSec Profile Details** • Name= CC_Tunnel_DC-AWS • Encryption algorithm= AES • Hash algorithm= HMAC SHA1

Prerequisites

Updated: 2015-06-01

Before setting up a CloudBridge Connector tunnel, verify that the following tasks have been completed:

1. Install, configure, and launch an instance of NetScaler Virtual appliance (VPX) on AWS cloud. For instructions on installing NetScaler VPX on AWS, see http://support.citrix.com/proddocs/topic/netscaler-vpx-10-5/nsvpx-aws-ns-vpxaws-con.html.

2. Deploy and configure a NetScaler physical appliance, or provisioning and configuring a NetScaler virtual appliance (VPX) on a virtualization platform in the datacenter.
   - For instructions on installing NetScaler vitrual appliances on Xenserver, see http://support.citrix.com/proddocs/topic/netscaler-vpx-10-5/ns-vpx-install-wrapper-con.html.
   - For instructions on installing NetScaler vitrual appliances on VMware ESX or ESXi, see http://support.citrix.com/proddocs/topic/netscaler-vpx-10-5/ns-vpx-install-on-esx-wrapper-con.html.
   - For instructions on installing NetScaler vitrual appliances on Microsoft Hyper-V, see http://support.citrix.com/proddocs/topic/netscaler-vpx-10-5/ns-vpx-install-on-msft-hyperv-wrapper-con.html.
3. Make sure that the CloudBridge Connector tunnel end-point IP addresses are accessible to each other.

NetScaler VPX License

After the initial instance launch, NetScaler VPX for AWS requires a license. If you are bringing your own license (BYOL), see the VPX Licensing Guide at: http://support.citrix.com/article/CTX122426.

You have to:
1. Use the licensing portal within MyCitrix to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

Configuration Steps

To set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in a datacenter and a NetScaler virtual appliance (VPX) that resides on the AWS cloud, use the configuration utility of the NetScaler appliance.

When you use the configuration utility, the CloudBridge Connector tunnel configuration created on the NetScaler appliance, is automatically pushed to the other endpoint or peer (the NetScaler VPX on AWS) of the CloudBridge Connector tunnel. Therefore, you do not have to access the configuration utility (GUI) of the NetScaler VPX on AWS to create the corresponding CloudBridge Connector tunnel configuration on it.

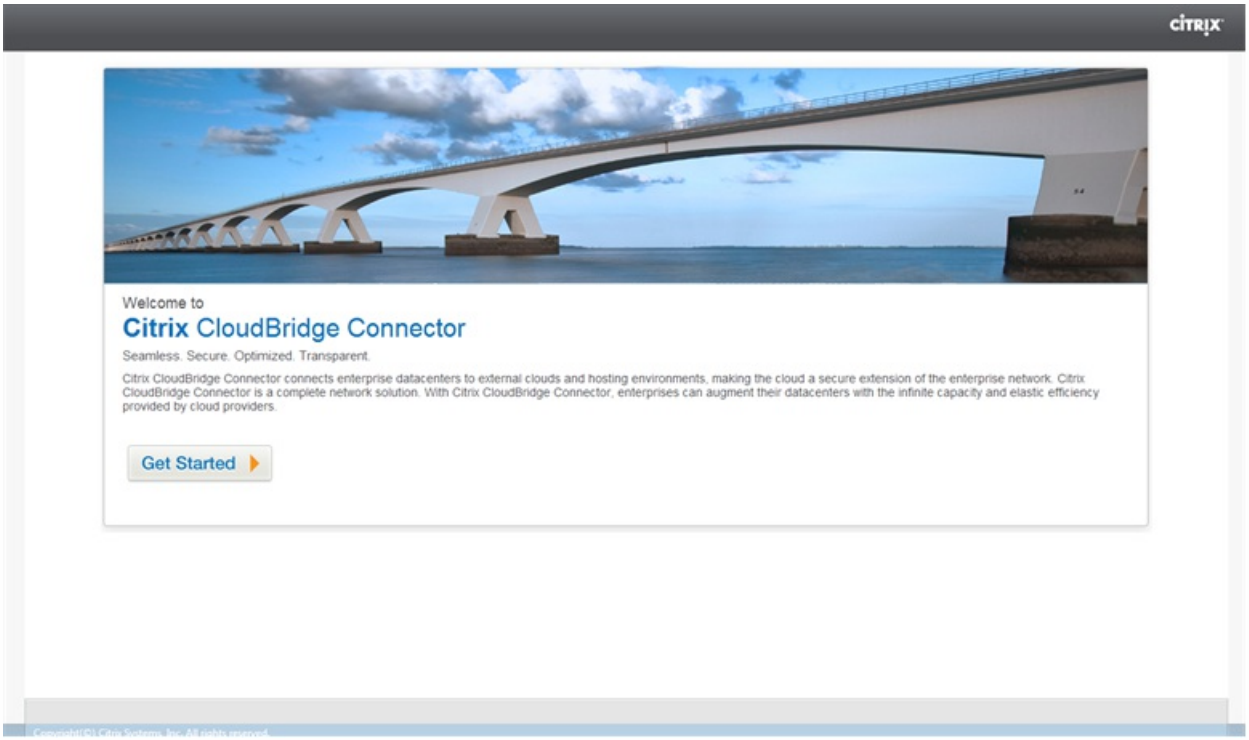
The CloudBridge Connector tunnel configuration on both peers (the NetScaler appliance that resides in the datacenter and the NetScaler virtual appliance (VPX) that resides on the AWS cloud) consists of the following entities:
- **IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in both the peers of the CloudBridge Connector tunnel.
- **GRE tunnel**. An IP tunnel specifies a local IP address (a public SNIP address configured on the local peer), remote IP address (a public SNIP address configured on the remote peer), protocol (GRE) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity.

- **Netbridge**. A logical container that holds or represents the CloudBridge Connector tunnel configuration on each of the peers. A GRE tunnel entity is associated with the netbridge. A particular CloudBridge Connector tunnel configuration on a peer is identified by the name of the netbridge entity.

To configure a CloudBridge Connector tunnel in a NetScaler appliance by using the configuration utility

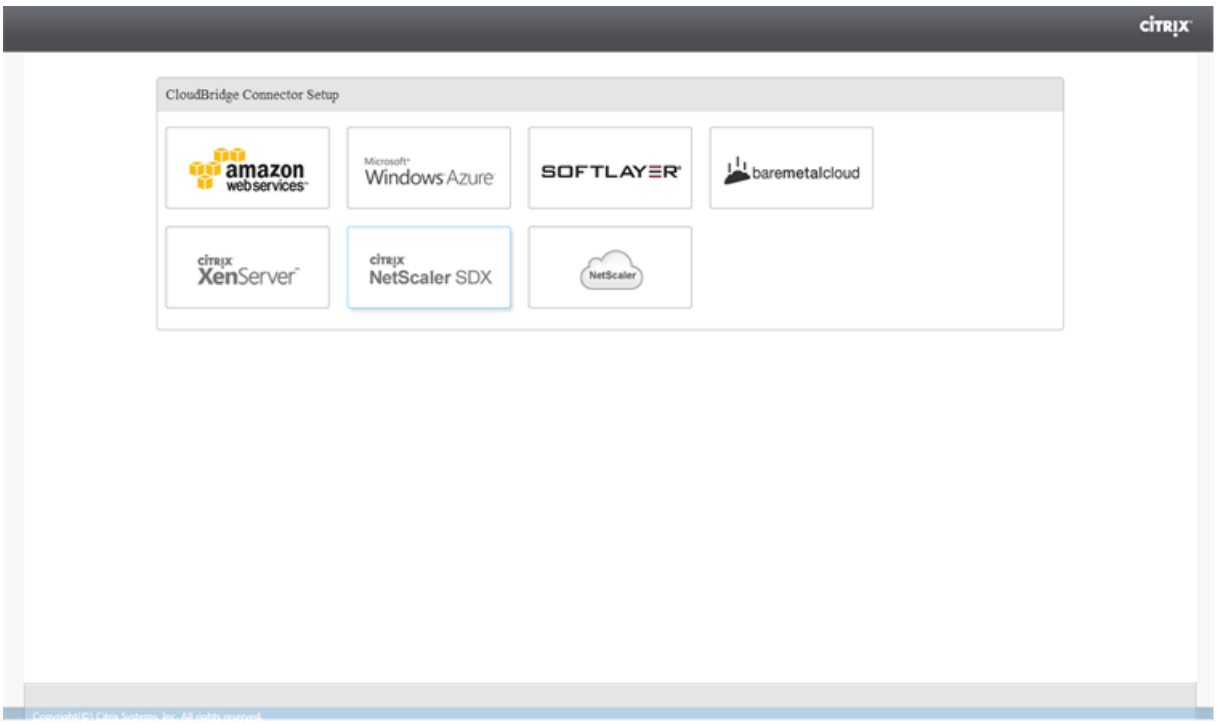
1. Type the NSIP address of a NetScaler appliance in the address line of a web browser.
2. Log on to the configuration utility of the NetScaler appliance by using your account credentials for the appliance.

3. Navigate to System > CloudBridge Connector.
4. In the right pane, under **Getting Started**, click **Create/Monitor CloudBridge**.
5. Click **Get Started**.



Note: If you already have any CloudBridge Connector tunnel configured on the NetScaler appliance, this screen does not appear, and you are taken to the **CloudBridge Connector Setup** pane.

6. In the **CloudBridge Connector Setup** pane, click **amazon web services**.



7. In the **Amazon** pane, provide your AWS account credentials: AWS Access Key ID and AWS Secret Access Key. You can obtain these access keys from the AWS GUI console. Click **Continue**.
8. In the **NetScaler** pane, select the NSIP address of the NetScaler virtual appliance running on AWS. Then, provide your account credentials for the NetScaler virtual appliance. Click **Continue**.
9. In the **CloudBridge Connector Setting** pane, set the following parameter:
   - **CloudBridge Connector Name**— Name for the CloudBridge Connector configuration on the local appliance. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CloudBridge Connector configuration is created.
10. Under **Local Setting**, set the following parameter:
    - **Subnet IP**—IP address of the local endpoint of the CloudBridge Connector tunnel. Must be a public IP address of type SNIP.
11. Under **Remote Setting**, set the following parameter:
    - **Subnet IP**— IP address of the CloudBridge Connector tunnel end point on the AWS side. Must be an IP address of type SNIP on the NetScaler VPX instance on AWS.
    - **NAT**—Public IP address (EIP) in AWS that is mapped to the SNIP configured on the NetScaler VPX instance on AWS.
12. (Optional) Under **Security Settings**, set the following IPSec protocol parameters to be used by the IPSec protocol in the CloudBridge Connector tunnel:
    - **Encryption Algorithm**— Encryption algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Hash Algorithm—**Hash algorithm to be used by the IPSec protocol in the CloudBridge tunnel.
    - **Key**— Select one of the following IPSec authentication methods to be used by the two peers to mutually authenticate.
      - **Auto Generate Key**— Authentication based on a text string, called a pre-shared key (PSK), generated automatically by the local appliance. The PSKs keys of the peers are matched against each other for

authentication.

- **Specific Key—**Authentication based on a manually entered PSK. The PSKs of the peers are matched against each other for authentication.
  - **Pre Shared Security Key**—The text string entered for pre-shared key based authentication.
- **Upload Certificates**—Authentication based on digital certificates.
  - **Public Key**—A local digital certificate to be used to authenticate the local peer to the remote peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the peer.
  - **Private Key**—Private key of the local digital certificate.
  - **Peer Public Key**—Digital certificate of the peer. Used to authenticate the peer to the local end point before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the peer.

13. Click **Done**.

The new CloudBridge Connector tunnel configuration on the NetScaler appliance in the datacenter appears on the Home tab of the configuration utility.

The corresponding new CloudBridge Connector tunnel configuration on the NetScaler VPX appliance in the AWS cloud appears on the configuration utility.

The current status of the CloudBridge connector tunnel is indicated in the Configured CloudBridge pane. A green dot indicates that the tunnel is up. A red dot indicates that the tunnel is down.

Configuring a CloudBridge Connector Tunnel Between a Datacenter and Azure Cloud

Sep 30, 2015

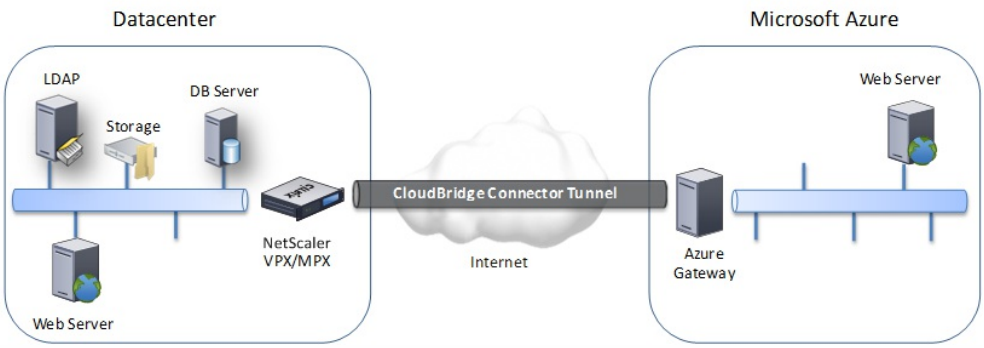
The NetScaler appliance provides connectivity between your enterprise datacenters and the Microsoft cloud hosting provider, Azure, making Azure a seamless extension of the enterprise network. NetScaler encrypts the connection between the enterprise datacenter and Azure cloud so that all data transferred between the two is secure.

This section includes the following:

- How CloudBridge Connector Tunnel Works
- Example of CloudBridge Connector Tunnel Configuration and Data Flow
- Points to Consider for a CloudBridge Connector tunnel Configuration
- Configuring the CloudBridge Connector Tunnel
- Monitoring the CloudBridge Connector Tunnel

How CloudBridge Connector Tunnel Works

To connect a datacenter to AWS cloud, you set up a CloudBridge Connector tunnel between a NetScaler appliance that resides in the datacenter and a gateway that resides in the Azure cloud. The NetScaler appliance in the datacenter and the gateway in Azure cloud are the end points of the CloudBridge Connector tunnel and are called peers of the CloudBridge Connector tunnel.



A CloudBridge Connector tunnel between a datacenter and Azure cloud uses the open-standard Internet Protocol security (IPSec) protocol suite, in tunnel mode, to secure communications between peers in the CloudBridge Connector tunnel. In a CloudBridge Connector tunnel, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

IPSec uses the tunnel mode in which the complete IP packet is encrypted and then encapsulated. The encryption uses the Encapsulating Security Payload (ESP) protocol, which ensures the integrity of the packet by using a HMAC hash function and ensures confidentiality by using an encryption algorithm. The ESP protocol, after encrypting the payload and calculating the HMAC, generates an ESP header and inserts it before the encrypted IP packet. The ESP protocol also generates an ESP trailer and inserts it at the end of the packet.

The IPSec protocol then encapsulates the resulting packet by adding an IP header before the ESP header. In the IP header, the destination IP address is set to the IP address of the CloudBridge Connecter peer.

Peers in the CloudBridge Connector tunnel use the Internet Key Exchange version 1 (IKEv1) protocol (part of the IPSec protocol suite) to negotiate secure communication, as follows:

1. The two peers mutually authenticate with each other, using pre-shared key authentication, in which the peers exchange a text string called a pre-shared key (PSK). The pre-shared keys are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.
2. The peers then negotiate to reach agreement on:
   - An encryption algorithm
   - Cryptographic keys for encrypting data on one peer and decrypting it on the other.

   This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one-way (simplex). For example, when a CloudBridge Connector tunnel is set up between a NetScaler appliance in a datacenter and a gateway in an Azure cloud, both the datacenter appliance and the Azure gateway have two SAs. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets. SAs expire after a specified interval of time, which is called the lifetime.

Example of CloudBridge Connector Tunnel Configuration and Data Flow

As an illustration of CloudBridge Connector Tunnel, consider an example in which a CloudBridge Connector tunnel is set up between NetScaler appliance CB_Appliance-1 in a datacenter and gateway Azure_Gateway-1 in Azure cloud.

CB_Appliance-1 also functions as an L3 router, which enables a private network in the datacenter to reach a private network in the Azure cloud through the CloudBridge Connector tunnel. As a router, CB_Appliance-1 enables communication between client CL1 in the datacenter and server S1 in the Azure cloud through the CloudBridge Connector tunnel. Client CL1 and server S1 are on different private networks.

On CB_Appliance-1, the CloudBridge Connector tunnel configuration includes an IPSec profile entity named CB_Azure_IPSec_Profile, a CloudBridge Connector tunnel entity named CB_Azure_Tunnel, and a policy based routing (PBR) entity named CB_Azure_Pbr.

The IPSec profile entity CB_Azure_IPSec_Profile specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, and hash algorithm, to be used by the IPSec protocol in the CloudBridge Connector tunnel. CB_Azure_IPSec_Profile is bound to IP tunnel entity CB_Azure_Tunnel.

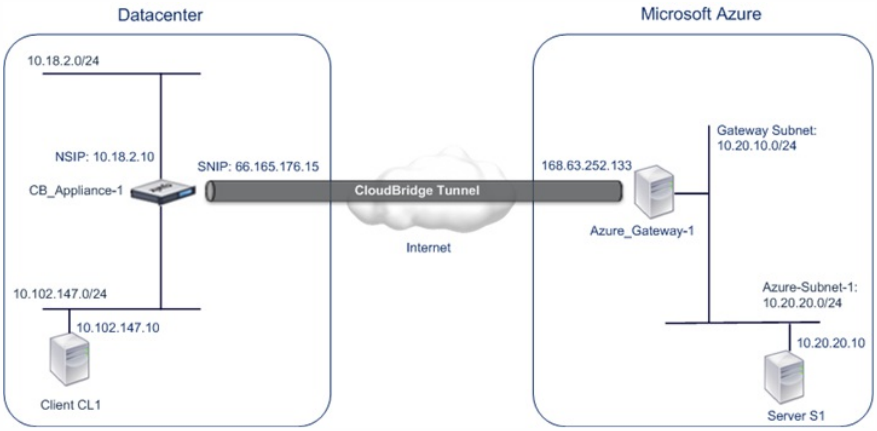
CloudBridge Connector tunnel entity CB_Azure_Tunnel specifies the local IP address (a public IP (SNIP) address configured on the NetScaler appliance), the remote IP address (the IP address of the Azure_Gateway-1), and the protocol (IPSec) used to set up the CloudBridge Connector tunnel. CB_Azure_Tunnel is bound to the PBR entity CB_Azure_Pbr.

The PBR entity CB_Azure_Pbr specifies a set of conditions and a CloudBridge Connector tunnel entity (CB_Azure_Tunnel). The source IP address range and the destination IP address range are the conditions for CB_Azure_Pbr. The source IP address range and the destination IP address range are specified as a subnet in the datacenter and a subnet in the Azure cloud, respectively. Any request packet originating from a client in the subnet in the datacenter and destined to a server in the subnet on the Azure cloud matches the conditions in CB_Azure_Pbr. This packet is then considered for CloudBridge processing and is sent across the CloudBridge Connector tunnel (CB_Azure_Tunnel) bound to the PBR entity.

On Microsoft Azure, the CloudBridge Connector tunnel configuration includes a local network entity named My-Datacenter-Network, a virtual network entity named Azure-Network-for-CloudBridge-Tunnel, and a gateway named Azure_Gateway-1.

The local (local to Azure) network entity My-Datacenter-Network specifies the IP address of the NetScaler appliance on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network entity Azure-Network-for-CloudBridge-Tunnel defines a private subnet named Azure-Subnet-1 in Azure. The traffic of the subnet traverses the CloudBridge Connector tunnel. The server S1 is provisioned in this subnet.

The local network entity My-Datacenter-Network is associated with the virtual network entity Azure-Network-for-CloudBridge-Tunnel. This association defines the remote and local network details of the CloudBridge Connector tunnel configuration in Azure. Gateway Azure_Gateway-1 was created for this association to become the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel.



The following table lists the settings used in this example.

Entity	Name	Details
Settings highlight of the CloudBridge Connector tunnel setup		
IP address of the CloudBridge Connector tunnel end point (CB_Appliance-1) in the datacenter side	66.165.176.15	
IP address of the CloudBridge Connector tunnel end point (Azure_Gateway-1) in the Azure	168.63.252.133	
Datacenter Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.102.147.0/24	
Azure Subnet, the traffic of which is to traverse the CloudBridge Connector tunnel	10.20.0.0/16	

Entity	Name	Details
Settings on NetScaler appliance CB_Appliance-1 in Datacenter		
	SNIP1(for reference purposes only)	66.165.176.15
IPSec profile	CB_Azure_IPSec_Profile	• IKE version = v1 • Encryption algorithm = AES • Hash algorithm = HMAC SHA1
CloudBridge Connector tunnel	CB_Azure_Tunnel	• Remote IP = 168.63.252.133 • Local IP= 66.165.176.15 • Tunnel protocol = IPSec • IPSec profile= CB_Azure_IPSec_Profile
Policy based route	CB_Azure_Pbr	• Source IP range = Subnet in the datacenter =10.102.147.0-10.102.147.255 • Destination IP range =Subnet in Azure =10.20.0.0-10.20.255.255 • IP Tunnel = CB_Azure_Tunnel
Settings on Microsoft Azure		
Public IP Address of the Azure_Gateway-1		168.63.252.133
Local Network	My-Datacenter-Network	• VPN Device IP address =SNIP address of the NetScaler appliance = 66.165.176.15 • Address space= Subnet in datacenter =10.102.147.0/24
Virtual Network	Azure-Network-for-CloudBridge-Tunnel	• Address Space= 10.20.0.0/16 • Subnet in Azure=Azure-Subnet-1= 10.20.20.0/24 • Local Network=My-Datacenter-Network • Gateway Subnet=10.20.10.0/24

Following is the traffic flow in the CloudBridge Connector tunnel:

1. Client C1 sends a request to server S1.
2. The request reaches NetScaler appliance CB_Appliance-1.
3. The request packet in CB_Appliance-1 matches the condition specified in the PBR entity CB_Azure_Pbr as the source IP address and the destination IP address of the request packet belonging to the source IP range and destination IP range, respectively, set in CB_Azure_Pbr.
4. Because CloudBridge Connector tunnel entity CB_Azure_Tunnel is bound to CB_Azure_Pbr, the appliance prepares the packet to be sent across the CB_Azure_Tunnel.
5. For CloudBridge Connector tunnel CB_Azure_Tunnel, CB_Appliance-1 checks the stored IPSec security association (SA) parameters for processing outbound packets, as agreed between CB_Appliance-1 in the datacenter and Azure_Gateway-1 in the Azure cloud. The IPSec Encapsulating Security Payload (ESP) protocol in the NetScaler appliance uses these SA parameters for outbound packets to encrypt the request packet.
6. The ESP protocol ensures the packet's integrity by using a HMAC hash function and the packet's confidentiality by using the AES encryption algorithm. The ESP protocol, after encrypting the request packet and calculating the HMAC, generates an ESP header and then inserts it before the encrypted IP packet. The ESP protocol also generates an ESP trailer and then inserts it at the end of the encrypted IP packet.
7. The IPSec protocol encapsulates the resulting packet by adding an IP header before the ESP header. The destination address in the IP header is the IP address of Azure-gateway-1, and the source address is the SNIP2 address.
8. The resulting packet is sent to Azure_Gateway-1. There is
9. Azure-gateway-1, upon receiving the packet from CB_Appliance-1, decapsulates the packet by removing the IPSec IP header.
10. Azure-gateway-1 then checks the stored IPSec security association (SA) parameters for processing inbound packets, as agreed between CB_Appliance-1 and Azure_Gateway-1. The IPSec ESP protocol on Azure_Gateway-1 uses these SA parameters for inbound packets, and the ESP header of the decapsulated request packet, to decrypt the packet.

11. The resulting packet is the same packet as the one received by CB_Appliance-1 in step 2. This packet has the destination IP address set to the IP address of server S1. Azure_Gateway-1 forwards this packet to server S1.
12. S1 processes the request packet and sends out a response packet. The destination IP address in the response packet is the IP address of client CL1, and source IP address is the IP address of server S1.
13. The response packet reaches Azure_Gateway-1. Microsoft Azure checks the stored IPSec security association (SA) parameters for processing outbound packets, as agreed between CB_Appliance-1 and Azure_Gateway-1. Microsoft Azure encrypts and encapsulates the response packet in the same way that CB_Appliance-1 encrypted and encapsulated the request packet in steps 5, 6, and 7.
14. Azure_Gateway-1 sends the resulting packet to CB_Appliance-1.
15. CB_Appliance-1, upon receiving the packet from Azure_Gateway-1, decapsulates and decrypts the packet in the same way that Azure_Gateway-1 decapsulated and decrypted the request packet in steps 9 and 10.
16. The resulting packet is the same packet that was received by Azure_Gateway-1 in step 13. This response packet has the destination IP address set to the IP address of server CL1. CB_Appliance-1 forwards the response packet to client CL1.

Points to Consider for a CloudBridge Connector tunnel Configuration

Updated: 2014-04-15

Before configuring a CloudBridge Connector tunnel between a NetScaler appliance in datacenter and Microsoft Azure, consider the following points:

1. The NetScaler appliance must have a public facing IPv4 address (type SNIP) to use as a tunnel end-point address for the CloudBridge Connector tunnel. Also, the NetScaler appliance should not be behind a NAT device.
2. Azure supports the following IPSec settings for a CloudBridge Connector tunnel. Therefore, you must specify the same IPSec settings while configuring the NetScaler for the CloudBridge Connector tunnel.
   - IKE version = v1
   - Encryption algorithm = AES
   - Hash algorithm = HMAC SHA1
3. You must configure the firewall in the datacenter edge to allow the following.
   - Any UDP packets for port 500
   - Any UDP packets for port 4500
   - Any ESP (IP protocol number 50) packets
4. IKE re-keying, which is renegotiation of new cryptographic keys between the CloudBridge Connector tunnel end points to establish new SAs, is not supported. When the Security Associations (SAs) expire, the tunnel goes into the DOWN state. Therefore, you must set a very large value for the lifetimes of SAs.
5. You must configure Microsoft Azure before specifying the tunnel configuration on the NetScaler, because the public IP address of the Azure end (gateway) of the tunnel, and the PSK, are automatically generated when you set up the tunnel configuration in Azure. You need this information for specifying the tunnel configuration on the NetScaler.

Configuring the CloudBridge Connector Tunnel

Updated: 2014-04-15

For setting up a CloudBridge Connector tunnel between your datacenter and Azure, you must install CloudBridge VPX/MPX in your datacenter, configure Microsoft Azure for the CloudBridge Connector tunnel, and then configure the NetScaler appliance in the data center for the CloudBridge Connector tunnel.

Configuring a CloudBridge Connector tunnel between a NetScaler appliance in datacenter and Microsoft Azure consists of the following tasks:

1. **Setting up the NetScaler appliance in the datacenter**. This task involves deploying and configuring a NetScaler physical appliance (MPX), or provisioning and configuring a NetScaler virtual appliance (VPX) on a virtualization platform in the datacenter.
2. **Configuring Microsoft Azure for the CloudBridge Connector tunnel**. This task involves creating local network, virtual network, and gateway entities in Azure. The local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the NetScaler appliance) on the datacenter side, and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel. The virtual network defines a network on Azure. Creating the virtual network includes defining a subnet whose traffic is to traverse the CloudBridge Connector tunnel to be formed. You then associate the local network with the virtual network. Finally, you create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel.
3. **Configuring the NetScaler appliance in the datacenter for the CloudBridge Connector tunnel**. This task involves creating an IPSec profile, an IP tunnel entity, and a PBR entity in the NetScaler appliance in datacenter. The IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used in the CloudBridge Connector tunnel. The IP tunnel specifies the IP address of both the CloudBridge Connector tunnel end points (the NetScaler appliance in datacenter and the gateway in Azure) and the protocol to be used in the CloudBridge Connector tunnel. You then associate the IPSec profile entity with the IP tunnel entity. The PBR entity specifies the two subnets, in the datacenter and in the Azure cloud, that are to communicate with each other through the CloudBridge Connector tunnel. You then associate the IP tunnel entity with the PBR entity.

Configuring Microsoft Azure for the CloudBridge Connector tunnel

Updated: 2014-04-15

To create a CloudBridge Connector tunnel configuration on Microsoft Azure, use the Microsoft Windows Azure Management Portal, which is a web based graphical interface for creating and managing resources on Microsoft Azure.

Before you begin the CloudBridge Connector tunnel configuration on Azure cloud, make sure that:

- You have a user account for Microsoft Azure.
- You have a conceptual understanding of Microsoft Azure.
- You are familiar with the Microsoft Windows Azure Management Portal.

Note: The procedures for configuring Microsoft Azure for a CloudBridge Connector tunnel might change over time, depending on the Microsoft Azure release cycle. Citrix recommends the following Microsoft Azure documentation for the latest procedures.

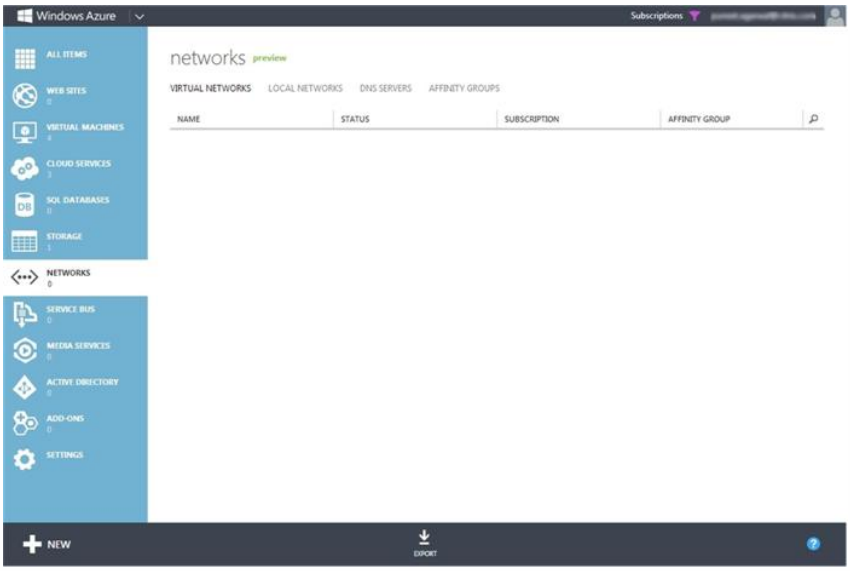
- http://www.windowsazure.com/en-us/manage/services/networking/cross-premises-connectivity/

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on Microsoft Azure by using the Microsoft Windows Azure Management Portal:

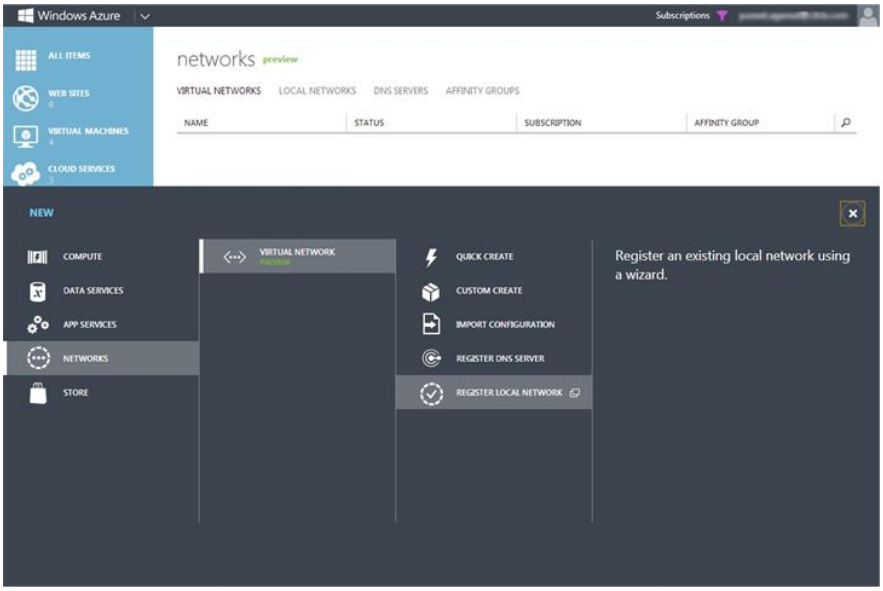
- **Create a local network entity**. Create a local network entity in Windows Azure for specifying the network details of the datacenter. A local network entity specifies the IP address of the CloudBridge Connector tunnel end point (the NetScaler) on the datacenter side and the datacenter subnet whose traffic is to traverse the CloudBridge Connector tunnel.
- **Create a Virtual Network**. Create virtual network entity that defines a network on Azure. This task includes defining a private address space, where you provide a range of private addresses and subnets belonging to the range specified in the address space. The traffic of the subnets will traverse the CloudBridge Connector tunnel. You then associate a local network entity with the virtual network entity. This association lets Azure create a configuration for a CloudBridge Connector tunnel between the virtual network and the data center network. A gateway (to be created) in Azure for this virtual network will be the CloudBridge end point at the Azure end of the CloudBridge Connector tunnel. You then define a private subnet for the gateway to be created. This subnet belongs to the range specified in the address space in the virtual network entity.
- **Create a gateway in Windows Azure**. Create a gateway that becomes the end point at the Azure end of the CloudBridge Connector tunnel. Azure, from its pool of public IP addresses, assigns an IP address to the gateway created.
- **Gather the public IP address of the gateway and the pre-shared key.** For a CloudBridge Connector tunnel configuration on Azure, the public IP address of the gateway and the pre-shared Key (PSK) are automatically generated by Azure. Make a note of this information. You will need it for configuring the CloudBridge Connector tunnel on the NetScaler in datacenter.

To specify a local network by using the Microsoft Windows Azure Management Portal

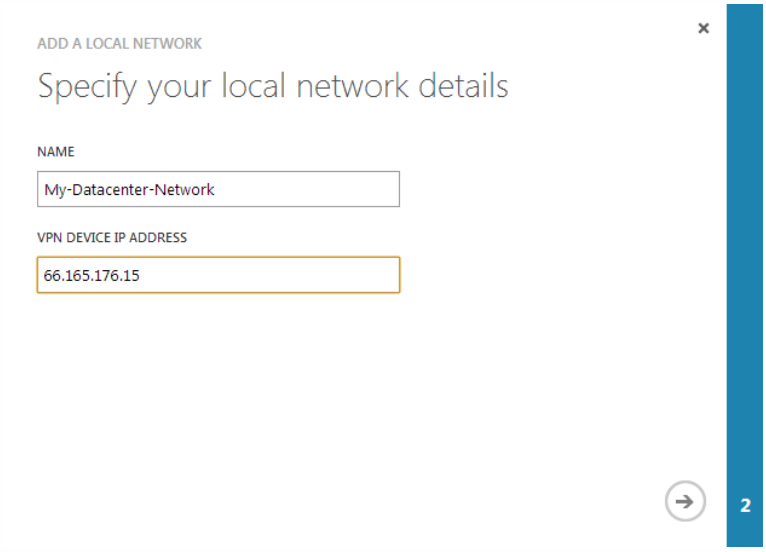
1. In the left pane, click NETWORKS.
2. In the lower left-hand corner of the screen, click + NEW.



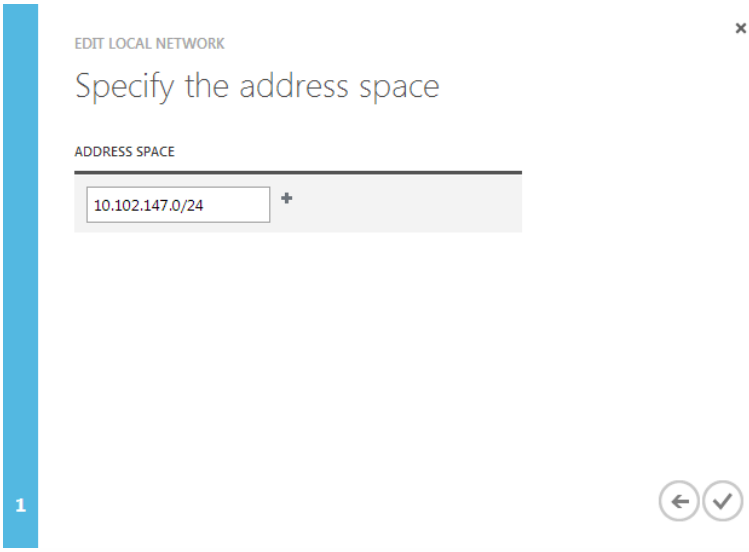
3. In the NEW navigation pane, click NETWORK, then click VIRTUAL NETWORK, and then click REGISTER LOCAL NETWORK.



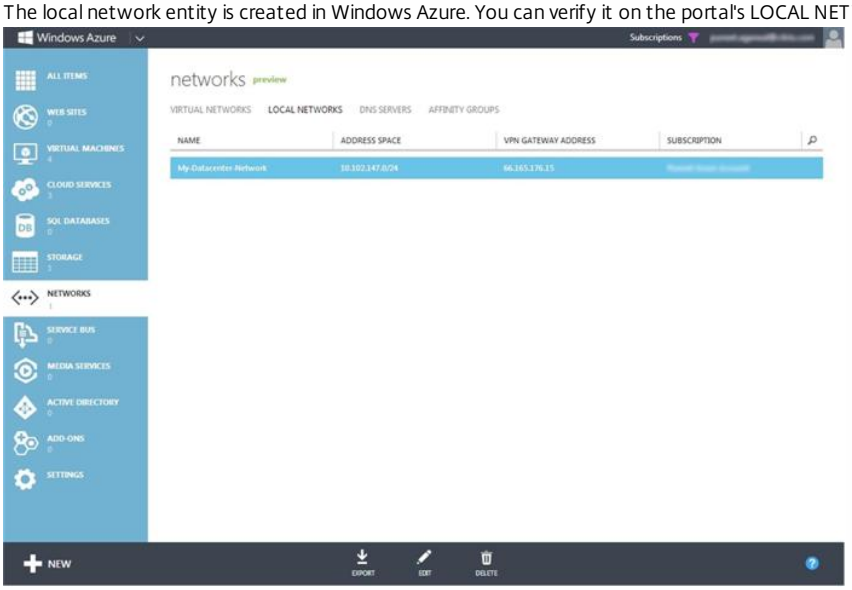
4. In the ADD A LOCAL NETWORK wizard, in the specify your local network details screen, set the following parameters:
   - NAME
   - VPN DEVICE IP ADDRESS



5. In the lower right corner of the screen, click -> (forward arrow mark).
6. On the Specify the address space screen, set the following parameter:
   - ADDRESS SPACE

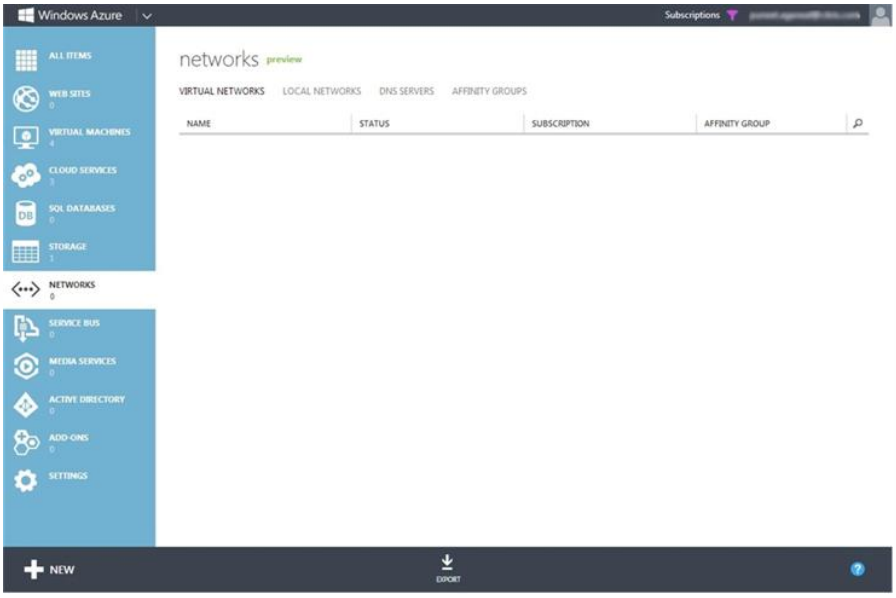


7. In the lower right corner of the screen, click the check mark.
8. The local network entity is created in Windows Azure. You can verify it on the portal's LOCAL NETWORK tab.

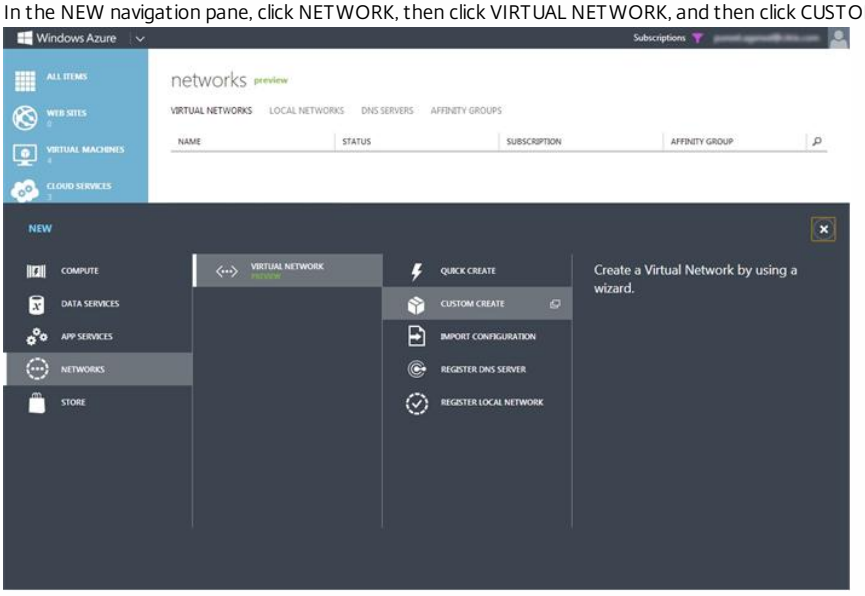


To create a virtual network in Azure by using the Microsoft Windows Azure Management Portal

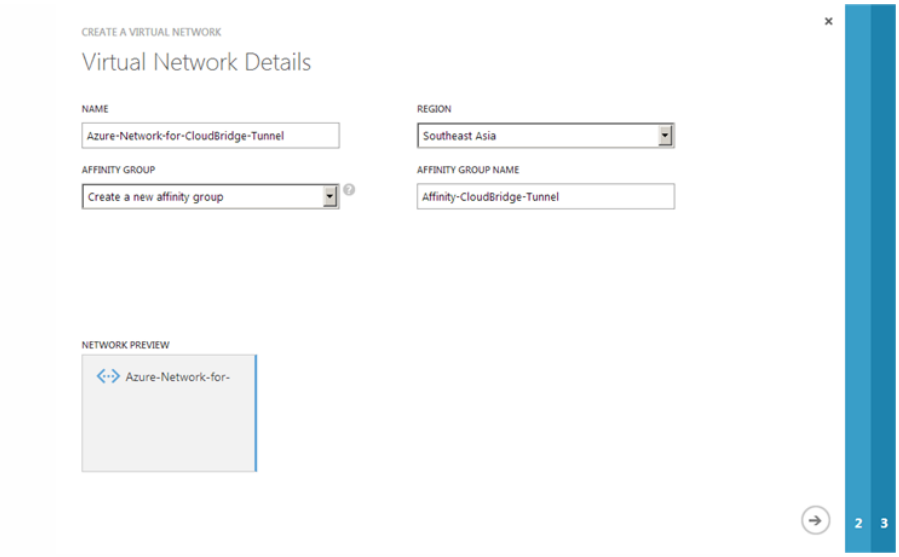
1. In the left pane, click NETWORKS.
2. In the lower left-hand corner of the screen, click + New.



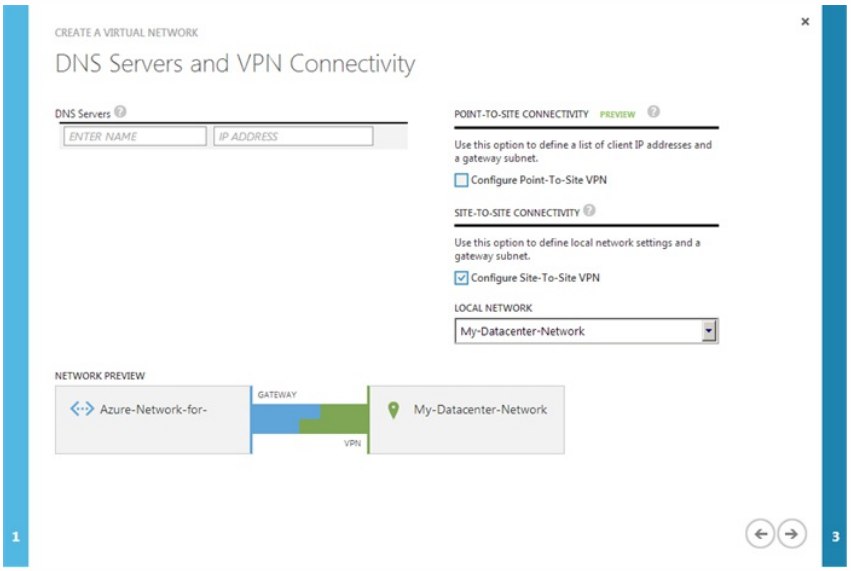
3. In the NEW navigation pane, click NETWORK, then click VIRTUAL NETWORK, and then click CUSTOM CREATE.



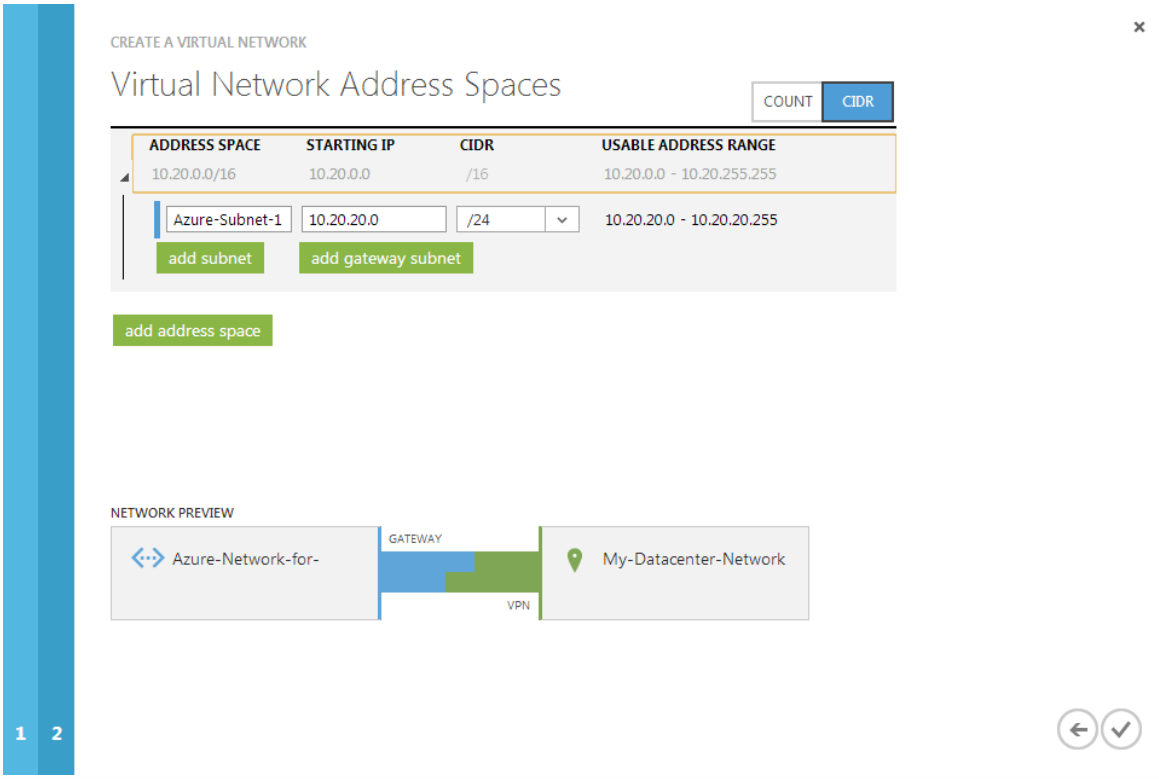
4. In the CREATE A VIRTUAL NETWORK wizard, in the Virtual Network Details screen, set the following parameters:
   - NAME
   - AFFINITY GROUP
   - REGION
   - AFFINITY GROUP NAME

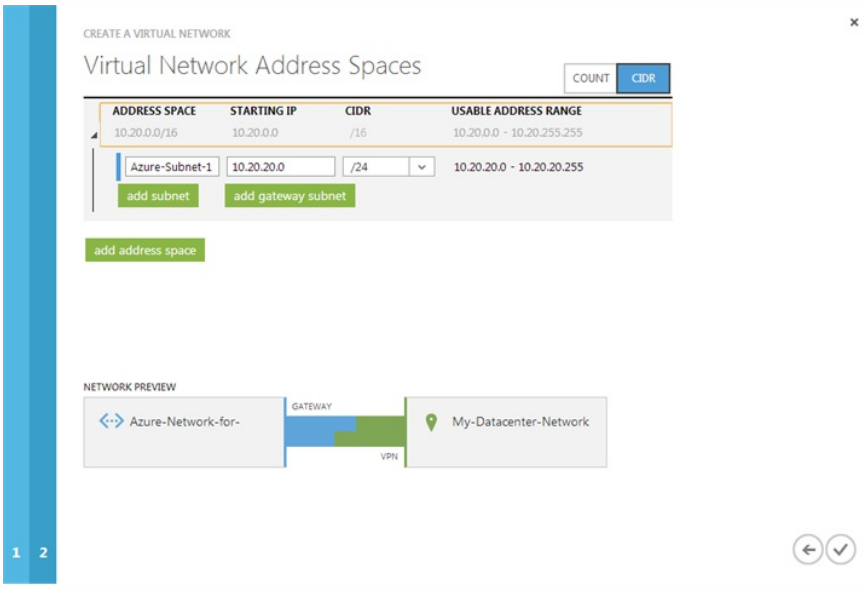


5. Click -> (forward arrow mark) in the lower right-hand corner of the screen.
6. In the DNS Servers and VPN Connectivity screen, in SITE-TO-SITE CONNECTIVITY, select Configure Site-To-Site VPN and set the following parameter:
   - LOCAL NETWORK

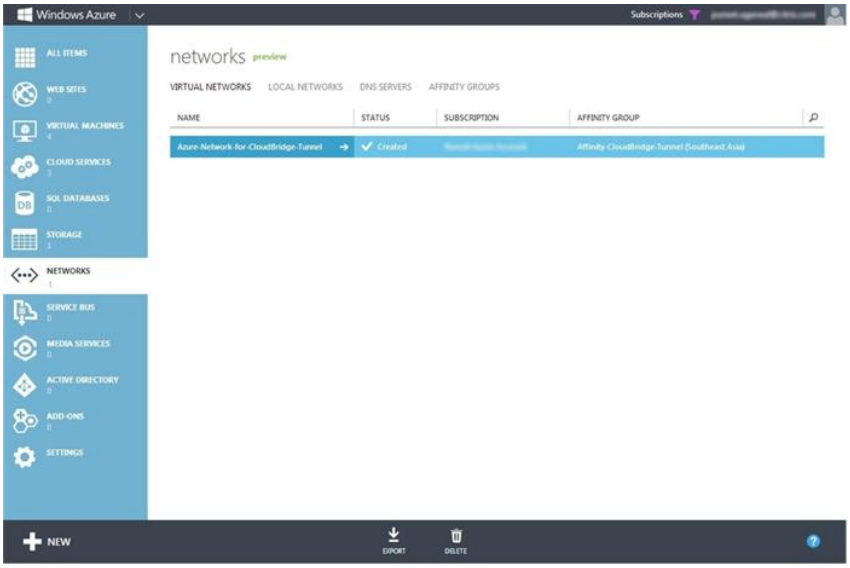


7. In the Address Space and Subnets screen, set the following parameters:
   - ADDRESS SPACE
   - SUBNETS
   - Gateway



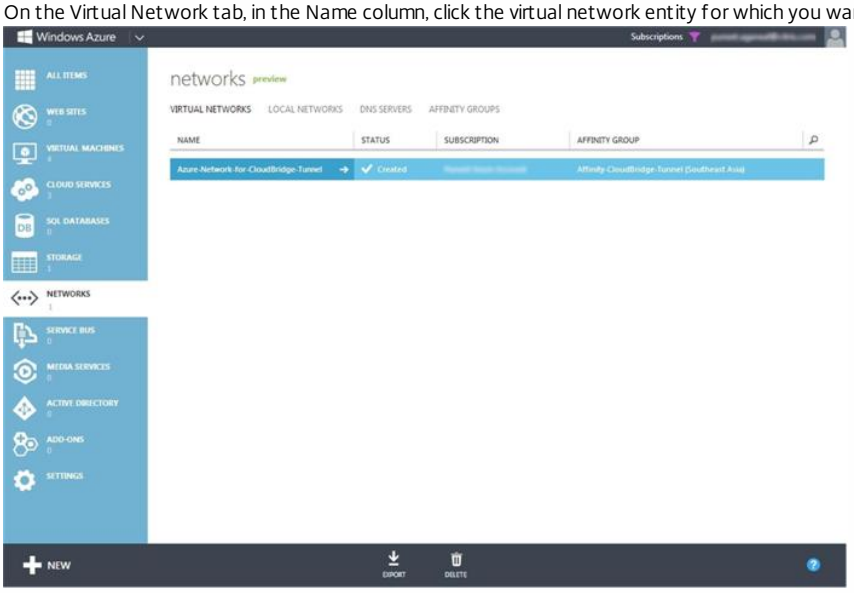


8. Click the check mark in the lower right-hand corner of the screen.
9. The virtual network is created in Windows Azure and is listed on the VIRTUAL NETWORK tab.

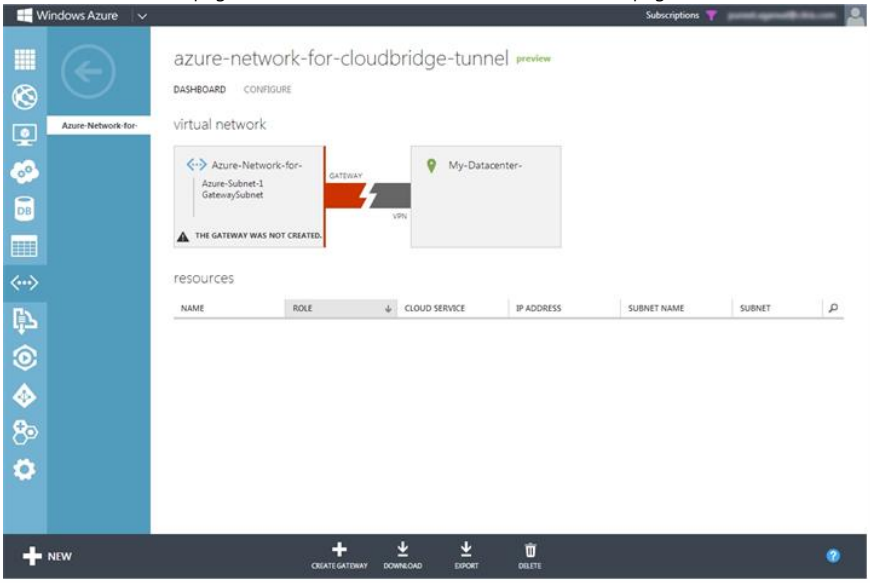


To create a gateway by using the Microsoft Windows Azure Management Portal

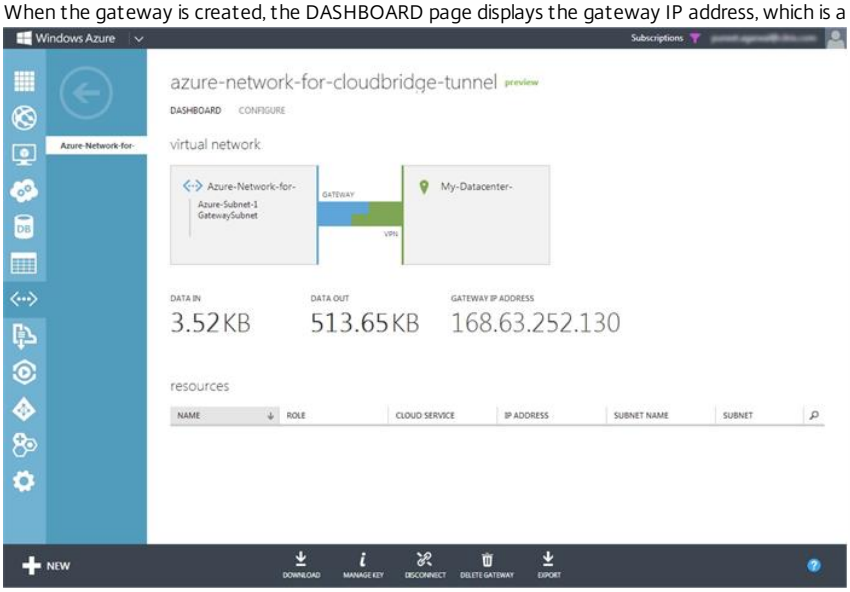
1. In the left pane, click NETWORKS.
2. On the Virtual Network tab, in the Name column, click the virtual network entity for which you want to create a gateway.



3. On the DASHBOARD page of the virtual network, at the bottom of the page, click + Create Gateway.

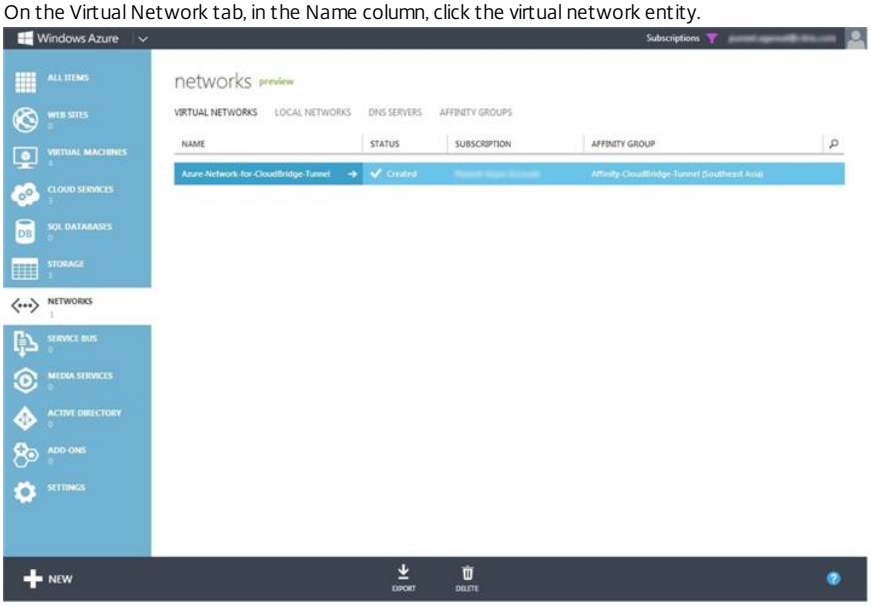


4. When prompted to confirm you want the gateway created, click YES. Creating the gateway can take up to 15 minutes.
5. When the gateway is created, the DASHBOARD page displays the gateway IP address, which is a public IP address.

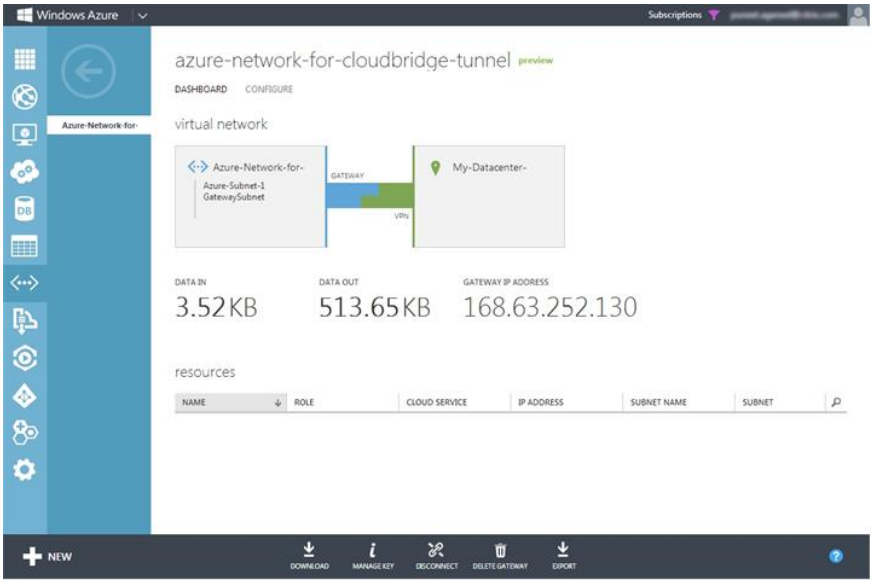


To gather public IP address of the gateway and the pre-shared key information by using the Microsoft Windows Azure Management Portal

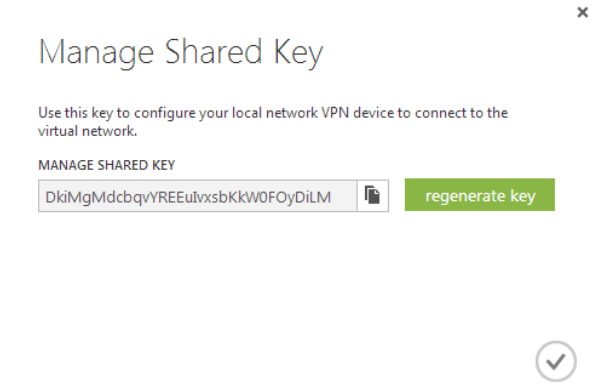
1. In the left pane, click NETWORKS.
2. On the Virtual Network tab, in the Name column, click the virtual network entity.



3. On the DASHBOARD page of the virtual network, copy the Gateway IP Address.



4. For the Pre Shared Key (PSK), at the bottom of the page, click MANAGE KEY.
5. In the MANAGE SHARED KEY dialog box, copy the SHARED KEY.



Configuring the NetScaler Appliance in the Datacenter for the CloudBridge Connector Tunnel

Updated: 2014-04-15

To configure a CloudBridge Connector tunnel between a datacenter and an Azure cloud, perform the following tasks on the NetScaler in the datacenter. You can use either the NetScaler command line or the configuration utility:

- **Create an IPSec profile**. An IPSec profile entity specifies the IPSec protocol parameters, such as IKE version, encryption algorithm, hash algorithm, and PSK, to be used by the IPSec protocol in the CloudBridge Connector tunnel.
- **Create an IP tunnel with IPSec protocol and associate the IPSec profile to it**. An IP tunnel specifies the local IP address (a public SNIP address configured on the NetScaler appliance), remote IP address (the public IP address of the gateway in Azure), protocol (IPSec) used to set up the CloudBridge Connector tunnel, and an IPSec profile entity. The created IP tunnel entity is also called the CloudBridge Connector tunnel entity.
- **Create a PBR rule and associate the IP tunnel to it**. A PBR entity specifies a set of conditions and an IP tunnel (CloudBridge Connector tunnel) entity. The source IP address range and the destination IP range are the conditions for the PBR entity. You must set the source IP address range to specify the datacenter subnet whose traffic is to traverse the tunnel, and the destination IP address range to specify the Azure subnet whose traffic is to traverse the CloudBridge Connector tunnel. Any request packet originated from a client in the subnet on the datacenter and destined to a server in the subnet on the Azure cloud matches the source and destination IP range of the PBR entity. This packet is then considered for CloudBridge Connector tunnel processing and is sent across sent across the CloudBridge Connector tunnel associated with the PBR entity.

The configuration utility combines all these tasks in a single wizard called the CloudBridge Connector wizard.

To create an IPSEC profile by using the NetScaler command line

At the Command prompt, type:

- `add ipsec profile <name> -psk <string> -ikeVersion v1`

To create an IPSEC tunnel and bind the IPSEC profile to it by using the NetScaler command line

At the Command prompt, type:

- add ipTunnel <name> <remote> <remoteSubnetMask> <local> -protocol IPSEC –ipsecProfileName <string>

To create a PBR rule and bind the IPSEC tunnel to it by using the NetScaler command line

At the Command prompt, type:

- add pbr <pbrName> ALLOW –srcIP <subnet-range> -destIP <subnet-range> -ipTunnel <tunnelName>
- apply pbrs

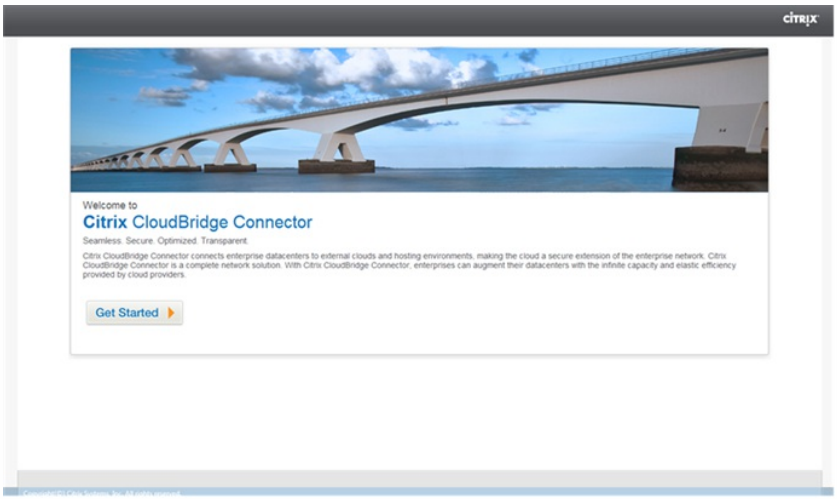
Sample Configuration

The following commands create all settings of NetScaler appliance CB_Appliance-1 used in "Example of CloudBridge Connector Configuration and Data Flow".

```
> add ipsec profile CB_Azure_IPSec_Profile -psk DkiMgMdcbqvYREEuIvxsbKkW0FOyDiLM -ikeVersion v1 –lifetime 31536000
Done
> add iptunnel CB_Azure_Tunnel 168.63.252.133 255.255.255.255 66.165.176.15 –protocol IPSEC –ipsecProfileName CB_Azure_IPSec_Profile
 Done
> add pbr CB_Azure_Pbr-srcIP 10.102.147.0-10.102.147.255 –destIP 10.20.0.0-10.20.255.255 –ipTunnelCB_Azure_Tunnel
 Done
> apply pbrs
Done
```

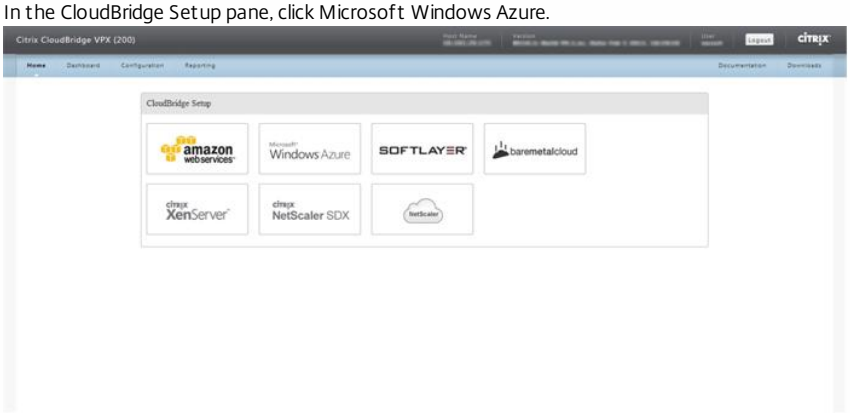
To configure a CloudBridge Connector tunnel in a NetScaler appliance by using the configuration utility

1. Access the configuration utility by using a web browser to connect to the IP address of the NetScaler appliance in the datacenter.
2. Navigate to System > CloudBridge Connector.
3. In the right pane, under Getting Started, click Create/Monitor CloudBridge.
4. Click Get Started.

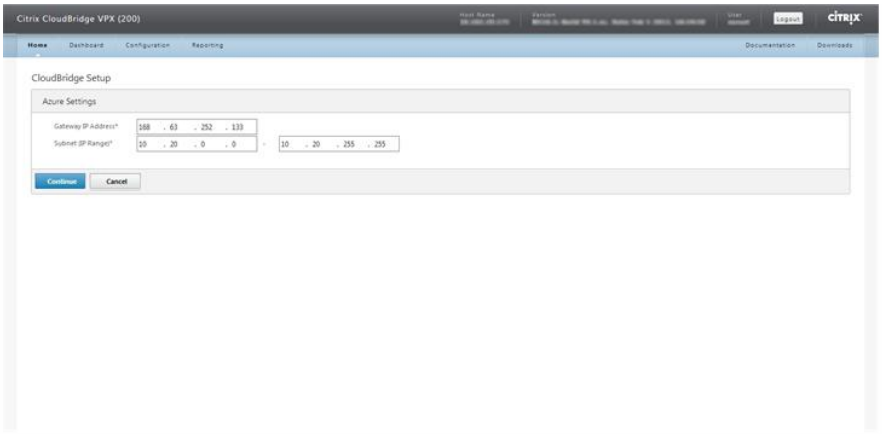


Note: If you already have any CloudBridge Connector tunnel configured on the NetScaler appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.

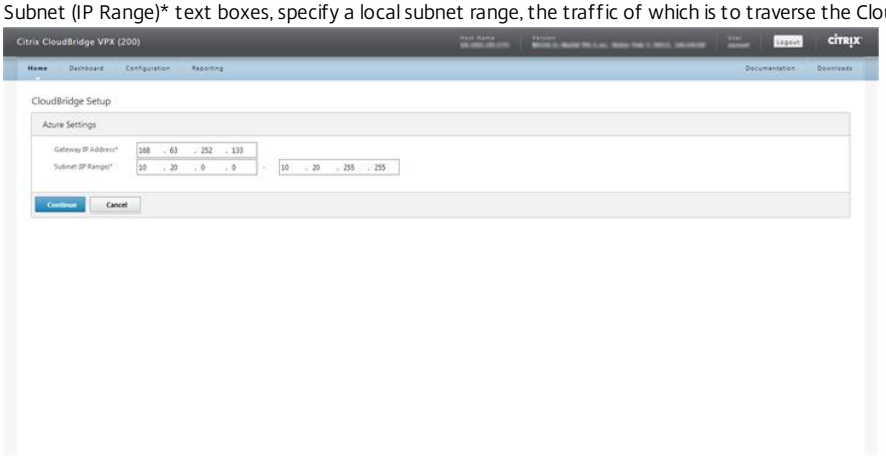
5. In the CloudBridge Setup pane, click Microsoft Windows Azure.



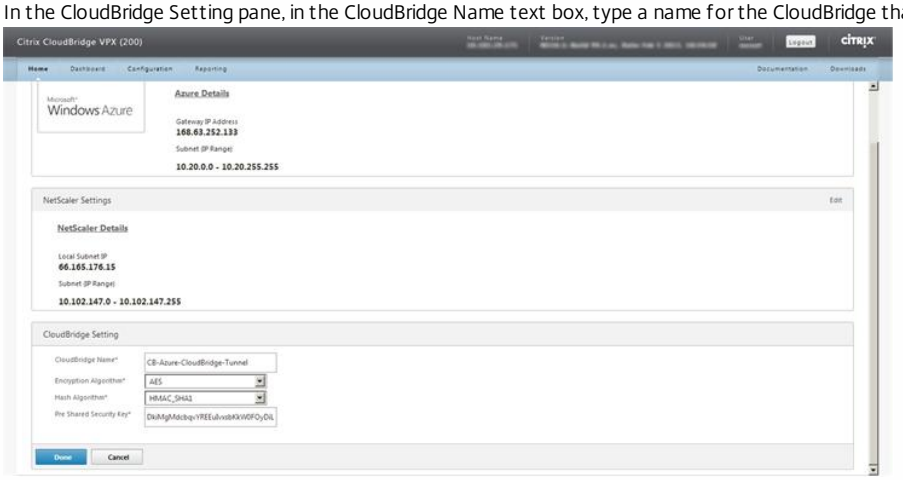
6. In the Azure Settings pane, in the Gateway IP Address* field, type the IP address of the Azure gateway. The CloudBridge Connector tunnel is then set up between the NetScaler appliance and the gateway. In the Subnet (IP Range)* text boxes, specify a subnet range (in Azure cloud), the traffic of which is to traverse the CloudBridge Connector tunnel. Click Continue.



7. In the NetScaler Settings pane, from the Local Subnet IP* drop-down list, select a publicly accessible SNIP address configured on the NetScaler appliance. In Subnet (IP Range)* text boxes, specify a local subnet range, the traffic of which is to traverse the CloudBridge Connector tunnel. Click Continue.



8. In the CloudBridge Setting pane, in the CloudBridge Name text box, type a name for the CloudBridge that you want to create.



9. From the Encryption Algorithm and Hash Algorithm drop-down lists, select the AES and HMAC_SHA1 algorithms, respectively. In the Pre Shared Security Key text box, type the security key.
10. Click Done.

Monitoring the CloudBridge Connector Tunnel

Updated: 2014-04-15

You can view statistics for monitoring the performance of a CloudBridge Connector tunnel between the NetScaler appliance in the datacenter and Microsoft Azure. To view CloudBridge Connector tunnel statistics on the NetScaler appliance, use the configuration utility or the NetScaler command line. To view CloudBridge Connector tunnel statistics in Microsoft Azure, use the Microsoft Windows Azure Management Portal.

Displaying CloudBridge Connector tunnel Statistics in the NetScaler appliance

The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels on a NetScaler appliance.

Statistical counter	Specifies
Bytes Received	Total number of bytes received by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Bytes Sent	Total number of bytes sent by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Received	Total number of packets received by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.
Packets Sent	Total number of packets sent by the NetScaler appliance through all the configured CloudBridge Connector tunnels since the appliance was last started.

All these counters are reset to 0 when the NetScaler appliance is restarted. They do not increment during the following phases:

- Internet Key Exchange (IKE) authentication (pre-shared key) phase on any configured CloudBridge Connector tunnel.
- IKE Security Association (SA) establishment phase on any configured CloudBridge Connector tunnel.

To display CloudBridge Connector tunnel statistics by using the NetScaler command line

At the command prompt, type:

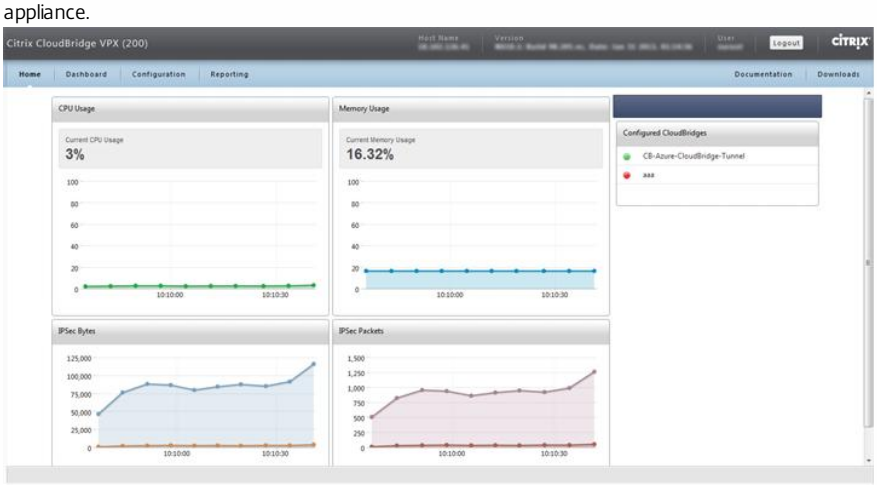
- stat ipsec counters

Example

```
> stat ipsec counters
Secure tunnel(s) summary
            Rate (/s)           Total
Bytes Received  0  2811248
Bytes Sent  0  157460630
Packets Received 0  56787
Packets Sent      0  200910
Done
>
```

To display CloudBridge Connector tunnel statistics by using the Configuration utility

1. Access the configuration utility by using a web browser to connect to the IP address of the NetScaler appliance.
2. On the Home tab, the IPSec Bytes and IPSec Packets charts display the statistics of all the CloudBridge Connector tunnels configured on the NetScaler appliance.



Displaying CloudBridge Connector tunnel Statistics in Microsoft Azure

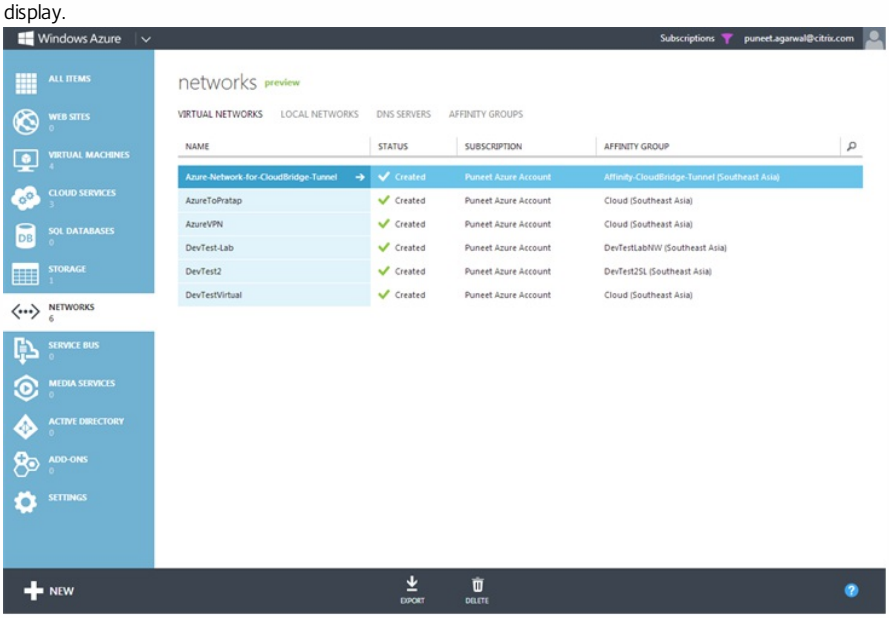
The following table lists the statistical counters available for monitoring CloudBridge Connector tunnels in Microsoft Azure.

Statistical counter	Specifies
DATA IN	Total number of kilobytes received by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.
DATA OUT	Total number of kilobytes sent by the Azure gateway through the CloudBridge Connector tunnel since the gateway was created.

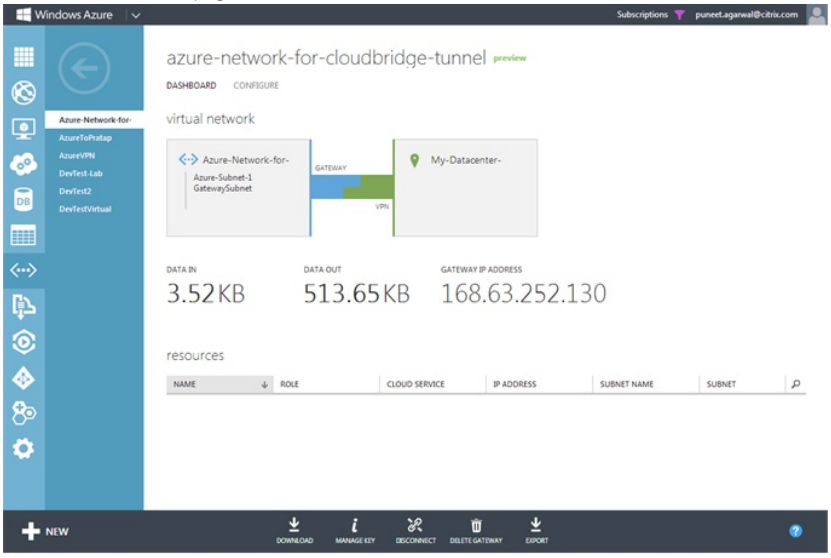
Statistical counter	Specifies

To display CloudBridge Connector tunnel statistics by using the Microsoft Windows Azure Management Portal

1. Log on to the Windows Azure Management Portal (https://manage.windowsazure.com/) by using your Microsoft Azure account credentials.
2. In the left pane, click NETWORKS.
3. On the Virtual Network tab, in the Name column, select the virtual network entity associated with a CloudBridge Connector tunnel whose statistics you want to display.



4. On the DASHBOARD page of the virtual network, view the DATA IN and DATA OUT counters for the CloudBridge Connector tunnel.



Configuring CloudBridge Connector Tunnel between Datacenter and SoftLayer Enterprise Cloud

Jan 31, 2014

The configuration utility includes a wizard that helps you to easily configure a CloudBridge Connector tunnel between a NetScaler appliance in a datacenter and NetScaler VPX instances on the SoftLayer enterprise cloud.

When you use the wizard of the NetScaler appliance in the datacenter, the CloudBridge Connector tunnel configuration created on the NetScaler appliance, is automatically pushed to the other endpoint or peer (the NetScaler VPX on SoftLayer) of the CloudBridge Connector tunnel.

Using the wizard of the NetScaler appliance in the datacenter, you perform the following steps to configure a CloudBridge Connector tunnel.

1. Connect to the Softlayer enterprise cloud by providing the user log on credentials.
2. Select the Citrix XenServer that is running the NetScaler VPX appliance.
3. Select the NetScaler VPX appliance.
4. Provide CloudBridge Connector tunnel parameters to:
   - Configure a GRE Tunnel.
   - Configure IPsec on the GRE tunnel.
   - Create a netbridge, which is a logical representation of the CloudBridge connector, by specifying a name.
   - Bind the GRE Tunnel to the netbridge.

To configure a CloudBridge Connector tunnel by using the configuration utility

1. Log on to the configuration utility of the NetScaler appliance in the datacenter by using your account credentials for the appliance.
2. Navigate to System > CloudBridge Connector .
3. In the right pane, under Getting Started, click Create/Monitor CloudBridge Connector.
4. Click Get Started.
   Note: If you already have any CloudBridge Connector tunnel configured on the NetScaler appliance, this screen does not appear, and you are taken to the CloudBridge Connector Setup pane.
5. In the CloudBridge Connector Setup pane, click Softlayer, and then follow the instructions in the wizard.

High Availability

Mar 19, 2012

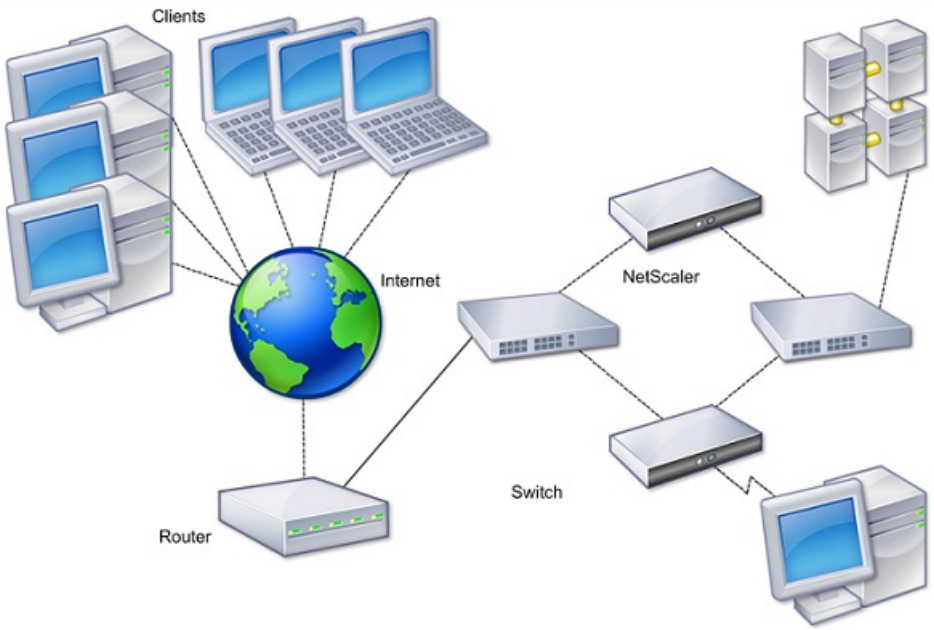
A high availability (HA) deployment of two Citrix® NetScaler® appliances can provide uninterrupted operation in any transaction. With one appliance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

The secondary node monitors the primary by sending periodic messages (often called heartbeat messages or health checks) to determine whether the primary node is accepting connections. If a health check fails, the secondary node retries the connection for a specified period, after which it determines that the primary node is not functioning normally. The secondary node then takes over for the primary (a process called failover).

After a failover, all clients must reestablish their connections to the managed servers, but the session persistence rules are maintained as they were before the failover.

With Web server logging persistence enabled, no log data is lost due to the failover. For logging persistence to be enabled, the log server configuration must carry entries for both systems in the log.conf file.

The following figure shows a network configuration with an HA pair.
Figure 1. NetScaler Appliances in a High Availability Configuration



To configure HA, you might want to begin by creating a basic setup, with both nodes in the same subnet. You can then customize the intervals at which the nodes communicate health-check information, the process by which nodes maintain synchronization, and the propagation of commands from the primary to the secondary. You can configure fail-safe mode to prevent a situation in which neither node is primary. If your environment includes devices that do not accept NetScaler gratuitous ARP messages, you should configure virtual MAC addresses. When you are ready for a more complex configuration, you can configure HA nodes in different subnets.

To improve the reliability of your HA setup, you can configure route monitors and create redundant links. In some situations, such as when troubleshooting or performing maintenance tasks, you might want to force a node to fail over (assign primary

status to the other node), or you might want to force the secondary node to stay secondary or the primary node to stay primary.

Considerations for a High Availability Setup

Mar 19, 2012

Note the following requirements for configuring systems in an HA setup:

- In an HA configuration, the primary and secondary NetScaler appliances should be of the same model. Different NetScaler models are not supported in an HA pair (for example, you cannot configure a 10010 model and a 7000 model as an HA pair).
- In an HA setup, both nodes must run the same version of NetScaler, for example, nCore/nCore or classic/classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, prop and sync are not supported during the migration process. Once migration is complete, prop and sync are auto-enabled. The same applies if you migrate from NetScaler nCore to NetScaler classic.
- Entries in the configuration file (ns.conf) on both the primary and the secondary system must match, with the following exceptions:
  - The primary and the secondary systems must each be configured with their own unique NetScaler IP addresses (NSIPs.)
  - In an HA pair, the node ID and associated IP address of one node must point to the other node. For example, if you have nodes NS1 and NS2, you must configure NS1 with a unique node ID and the IP address of NS2, and you must configure NS2 with a unique node ID and the IP address of NS1.
- If you create a configuration file on either node by using a method that does not go directly through the GUI or the CLI (for example, importing SSL certificates, or changing to startup scripts), you must copy the configuration file to the other node or create an identical file on that node.
- Initially, all NetScaler appliances are configured with the same RPC node password. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. For security, you should change the default RPC node passwords.

  One RPC node exists on each NetScaler. This node stores the password, which is checked against the password provided by the contacting system. To communicate with other systems, each NetScaler requires knowledge of those systems, including how to authenticate on those systems. RPC nodes maintain this information, which includes the IP addresses of the other systems, and the passwords they require for authentication.

  RPC nodes are implicitly created when adding a node or adding a Global Server Load Balancing (GSLB) site. You cannot create or delete RPC nodes manually.

  Note: If the NetScaler appliances in a high availability setup are configured in one-arm mode, you must disable all system interfaces except the one connected to the switch or hub.
- For an IPv6 HA configuration, the following considerations apply:
  - You must install the IPv6PT license on both NetScaler appliances.
  - After installing the IPv6PT license, enable the IPv6 feature by using the configuration utility or the command line interface.
  - Both NetScaler appliances require a global NSIP IPv6 address. In addition, network entities (for example, switches and routers) between the two nodes must support IPv6.

Configuring High Availability

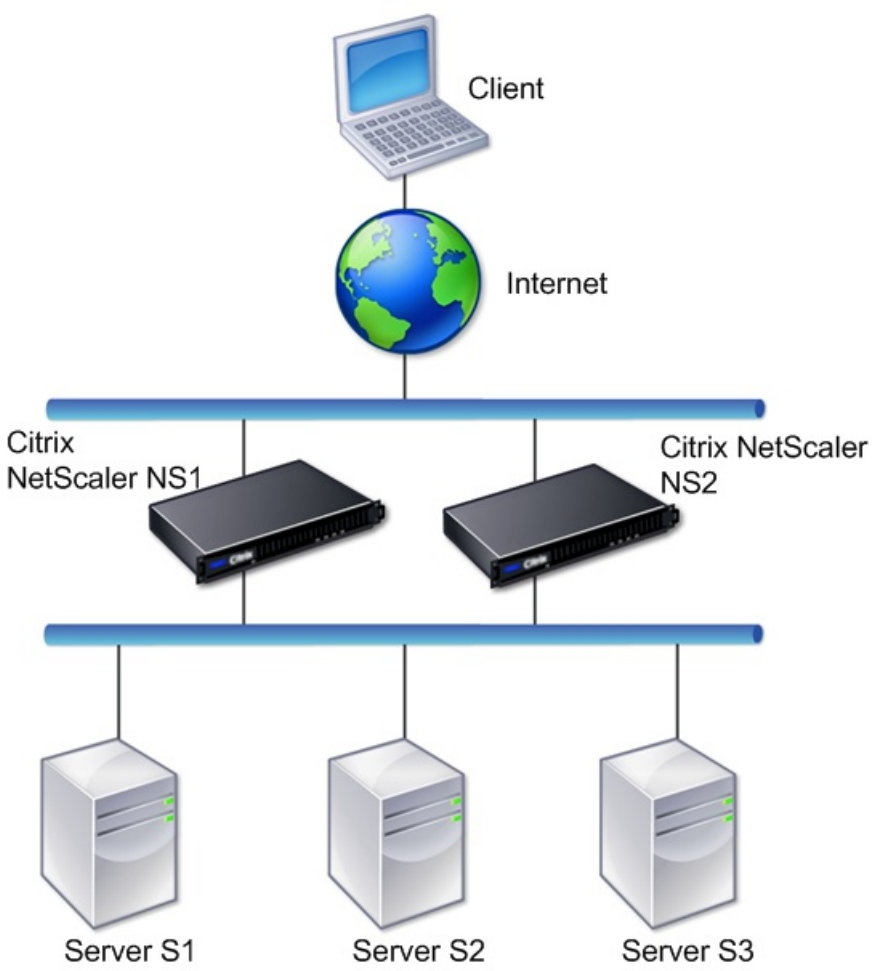
Mar 19, 2012

To set up a high availability configuration, you create two nodes, each of which defines the other's NetScaler IP (NSIP) address as a remote node. Begin by logging on to one of the two NetScaler appliances that you want to configure for high availability, and add a node. Specify the other appliance's NetScaler IP (NSIP) address as the address of the new node. Then, log on to the other appliance and add a node that has the NSIP address of the first appliance. An algorithm determines which node becomes primary and which becomes secondary.

Note: The configuration utility provides an option that avoids having to log on to the second appliance.

The following figure shows a simple HA setup, in which both nodes are in same subnet.

Figure 1. Two NetScaler Appliances Connected in a High Availability Configuration



Adding a Remote Node

To add a remote NetScaler appliance as a node in a high availability setup, you specify a unique node ID and the appliance's NSIP. The maximum number of node IDs in an HA setup is 64. When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

Note: To ensure that each node in the high availability configuration has the same settings, you should synchronize your SSL certificates, startup scripts, and other configuration files with those on the primary node.

To add a node by using the command line interface

At the command prompt, type:

- add ha node <id> <IPAddress>
- show ha node

Example

```
> add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
```

To disable an HA monitor by using the command line interface

At the command prompt, type:

- set interface <ifNum> [-haMonitor (**ON** | **OFF**)]
- show interface <ifNum>

Example

```
> set interface 1/3 -haMonitor OFF
 Done
```

To add a remote node by using the configuration utility

Navigate to System > High Availability and, on the Nodes tab, add a new remote node, or edit an existing node.

Disabling or Enabling a Node

Updated: 2013-08-28

You can disable or enable only a secondary node. When you disable a secondary node, it stops sending heartbeat messages to the primary node, and therefore the primary node can no longer check the status of the secondary. When you enable a node, the node takes part in the high availability configuration.

To disable or enable a node by using the command line interface

At the command prompt, type one of the following commands:

- set ha node -hastatus DISABLED
- set ha node -hastatus ENABLED

To disable or enable a node by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, open the node.
2. In the High Availability Status list, select ENABLED (Actively Participate in HA) or DISABLED (Do not participate in HA).

Removing a Node

Updated: 2013-08-28

If you remove a node, the nodes are no longer in high availability configuration.

To remove a node by using the command line interface

At the command prompt, type:

rm ha node <id>

Example

```
> rm ha node 2
  Done
```

To remove a node by using the configuration utility

Navigate to System > High Availability and, on the Nodes tab, delete the node.

Note: You can use the Network Visualizer to view the NetScaler appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks. For more information, see "Using the Network Visualizer."

Configuring the Communication Intervals

Mar 19, 2012

The hello interval is the interval at which the heartbeat messages are sent to the peer node. The dead interval is the time interval after which the peer node is marked DOWN if heartbeat packets are not received. The heartbeat messages are UDP packets sent to port 3003 of the other node in an HA pair.

To set the hello and dead intervals by using the command line interface

At the command prompt, type:

- set HA node [-helloInterval <msecs>] [-deadInterval <secs>]
- show HA node <id>

To set the hello and dead intervals by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, open the node.
2. Set the following parameters:
   - Hello Interval (msecs)
   - Dead Interval (secs)

Configuring Synchronization

Mar 19, 2012

Synchronization is a process of duplicating the configuration of the primary node on the secondary node. The purpose of synchronization is to ensure that there is no loss of configuration information between the primary and the secondary nodes, regardless of the number of failovers that occur. Synchronization uses port 3010.

Synchronization is triggered by either of the following circumstances:

- The secondary node in an HA setup comes up after a restart.
- The primary node becomes secondary after a failover.

Automatic synchronization is enabled by default. You can also force synchronization.

Disabling or Enabling Synchronization

Updated: 2013-08-28

Automatic HA synchronization is enabled by default on each node in an HA pair. You can enable or disable it on either node.

To disable or enable automatic synchronization by using the command line interface

At the command prompt, type:

- set HA node -haSync DISABLED
- set HA node -haSync ENABLED

To disable or enable synchronization by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, open the node.
2. Under HA Synchronization, clear or select the Secondary node will fetch the configuration from Primary option.

Forcing the Secondary Node to Synchronize with the Primary Node

Updated: 2013-08-28

In addition to automatic synchronization, the NetScaler supports forced synchronization. You can force the synchronization from either the primary or the secondary node. When you force synchronization from the secondary node, it starts synchronizing its configuration with the primary node.

However, if synchronization is already in progress, forced synchronization fails and the system displays a warning. Forced synchronization also fails in any of the following circumstances:

- You force synchronization on a standalone system.
- The secondary node is disabled.
- HA synchronization is disabled on the secondary node.

To force synchronization by using the command line interface

At the command prompt, type:

force HA sync

To force synchronization by using the configuration utility

1. Navigate to System > High Availability.
2. On the Nodes tab, in the Action list, click Force Synchronization.

Synchronizing Configuration Files in a High Availability Setup

Sep 05, 2013

In a high availability setup, you can synchronize various configuration files from the primary node to the secondary node.

To perform the synchronization, you can use the command line interface or the configuration utility at either the primary or the secondary node. Files located on the secondary that are specific to the secondary (not present on the primary) are not deleted during the synchronization.

To synchronize files in a high availability setup by using the command line interface

At the command prompt, type:

sync HA files <mode>

Example

```
> sync HA files all
 Done
```

To synchronize files in a high availability setup by using the configuration utility

Navigate to System > Diagnostics and, in the Utilities group, click Start HA files synchronization.

Configuring Command Propagation

Aug 28, 2013

In an HA setup, any command issued on the primary node propagates automatically to, and is executed on, the secondary before it is executed on the primary. If command propagation fails, or if command execution fails on the secondary, the primary node executes the command and logs an error. Command propagation uses port 3010.

In an HA pair configuration, command propagation is enabled by default on both the primary and secondary nodes. You can enable or disable command propagation on either node in an HA pair. If you disable command propagation on the primary node, commands are not propagated to the secondary node. If you disable command propagation on the secondary node, commands propagated from the primary are not executed on the secondary node.

Note: After reenabling propagation, remember to force synchronization.
If synchronization occurs while you are disabling propagation, any configuration-related changes that you make before the disabling of propagation takes effect are synchronized with the secondary node. This is also true for cases where propagation is disabled while synchronization is in progress.

To disable or enable command propagation by using the command line interface

At the command prompt, type:

- set HA node -haProp DISABLED
- set HA node -haProp ENABLED

To disable or enable command propagation by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, open the node.
2. Clear or select the Primary node will propagate configuration to the Secondary option.

Configuring Fail-Safe Mode

Aug 28, 2013

In an HA configuration, fail-safe mode ensures that one node is always primary when both nodes fail the health check. This is to ensure that when a node is only partially available, backup methods are enabled to handle traffic as best as possible. The HA fail-safe mode is configured independently on each node.

The following table shows some of the fail-safe cases. The NOT_UP state means that the node failed the health check yet it is partially available. The UP state means that the node passed the health check.

Table 1. Fail-Safe Mode Cases

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP(failed last)	NOT_UP (failed first)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
NOT_UP (failed first)	NOT_UP(failed last)	A (Secondary), B (Secondary)	A(Secondary), B(Primary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
UP	UP	A (Primary), B (Secondary)	A (Primary), B (Secondary)	If both nodes pass the health check, no change in behavior with fail-safe enabled.
UP	NOT_UP	A(Primary), B(Secondary)	A (Primary), B (Secondary)	If only the secondary node fails, no change in behavior with fail-safe enabled.
NOT_UP	UP	A(Secondary), B(Primary)	A(Secondary), B(Primary)	If only the primary fails, no change in behavior with fail-safe enabled.
NOT_UP	UP (STAYSECONDARY)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If the secondary is configured as STAYSECONDARY, the primary remains primary even if it fails.

To enable fail-safe mode by using the command line interface

At the command prompt, type:

set HA node [-failSafe (**ON** | **OFF**)]

Example

```
set ha node -failsafe ON
```

To enable fail-safe mode by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, open the node.
2. Under Fail-Safe Mode, select the Maintain one Primary node even when both nodes are unhealthy option.

Configuring Virtual MAC Addresses

Mar 19, 2012

A Virtual MAC address (VMAC) is a floating entity shared by the primary and the secondary nodes in an HA setup.

In an HA setup, the primary node owns all of the floating IP addresses, such as the MIPs, SNIPs, and VIPs. The primary node responds to Address Resolution Protocol (ARP) requests for these IP addresses with its own MAC address. As a result, the ARP table of an external device (for example, an upstream router) is updated with the floating IP address and the primary node's MAC address.

When a failover occurs, the secondary node takes over as the new primary node. It then uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it acquired from the primary. However, the MAC address that the new primary advertises is the MAC address of its own interface.

Some devices (notably a few routers) do not accept the GARP messages generated by the NetScaler appliance. As a result, some external devices retain the old IP to MAC mapping advertised by the old primary node. This can result in a site going down.

You can overcome this problem by configuring a VMAC on both nodes of an HA pair. Both nodes then possess identical MAC addresses. Therefore, when failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

To create a VMAC, you need to first create a Virtual Router ID (VRID) and bind it to an interface. (In an HA setup, you need to bind the VRID to the interfaces on both nodes.) Once the VRID is bound to an interface, the system generates a VMAC with the VRID as the last octet.

This section includes the following details:

- Configuring IPv4 VMACs
- Configuring IPv6 VMAC6s

Configuring IPv4 VMACs

When you create a IPv4 VMAC address and bind it to a interface, any IPv4 packet sent from the interface uses the VMAC address that is bound to the interface. If there is no IPv4 VMAC bound to an interface, the interface's physical MAC address is used.

The generic VMAC is of the form 00:00:5e:00:01:<VRID>. For example, if you create a VRID with a value of 60 and bind it to an interface, the resulting VMAC is 00:00:5e:00:01:3c, where 3c is the hex representation of the VRID. You can create 255 VRIDs with values from 1 to 255.

Creating or Modifying an IPv4 VMAC

Updated: 2013-08-28

You create an IPv4 virtual MAC by assigning it a virtual router ID. You can then you bind the VMAC to an interface. You cannot bind multiple VRIDs to the same interface. To verify the VMAC configuration, you should display and examine the VMACs and the interfaces bound to the VMACs.
To add a VMAC by using the command line interface

At the command prompt, type:

- add vrID <id>
- bind vrid <id> -ifnum <interface_name>
- show vrID

Example

```
> add vrID 100
 Done
> bind vrid 100 -ifnum 1/1 1/2 1/3
 Done
```

To unbind interfaces from a VMAC by using the command line interface

At the command prompt, type:

- unbind vrid <id> -ifnum <interface_name>
- show vrID

To configure a VMAC by using the configuration utility

Navigate to System > Network > VMAC and, on the VMAC tab, add a new VMAC, or edit an existing VMAC.

Removing an IPv4 VMAC

Updated: 2013-08-28

To remove an IPv4 virtual MAC, you delete its virtual router ID.
To remove an IPv4 VMAC by using the command line interface

At the command prompt, type:
rm vrid <id>
Example

```
rm vrid 100s
```

To remove an IPv4 VMAC by using the configuration utility

Navigate to System > Network > VMAC and, on the VMAC tab, delete the IPv4 VMAC.

Configuring IPv6 VMAC6s

The NetScaler supports VMAC6 for IPv6 packets. You can bind any interface to a VMAC6, even if an IPv4 VMAC is bound to the interface. Any IPv6 packet sent from the interface uses the VMAC6 bound to that interface. If there is no VMAC6 bound to an interface, an IPv6 packet uses the physical MAC.

Creating or Modifying a VMAC6

Updated: 2013-08-28

You create an IPv6 virtual MAC by assigning it an IPv6 virtual router ID. You can then you bind the VMAC to an interface. You cannot bind multiple IPv6 VRIDs to an interface. To verify the VMAC6 configuration, you should display and examine the VMAC6s and the interfaces bound to the VMAC6s.
To add a VMAC6 by using the command line interface

At the command prompt, type:

- add vrID6 <id>
- bind vrID6 <id> -ifnum <interface_name>
- show vrID6

Example

```
> add vrID6 100
Done
> bind vrID6 100 -ifnum 1/1 1/2 1/3
 Done
```

To unbind interfaces from a VMAC6 by using the command line interface

At the command prompt, type:

- unbind vrID6 <id> -ifnum <interface_name>
- show vrID6

To configure a VMAC6 by using the configuration utility

Navigate to System > Network > VMAC and, on the VMAC6 tab, add a new VMAC6, or edit an existing VMAC6.

Removing a VMAC6

Updated: 2013-08-28

To remove an IPv4 virtual MAC, you delete its virtual router ID.
To remove a VMAC6 by using the command line interface

At the command prompt, type:
rm vrid6 <id>
Example

```
rm vrid6 100s
```

To remove a VMAC6 by using the configuration utility

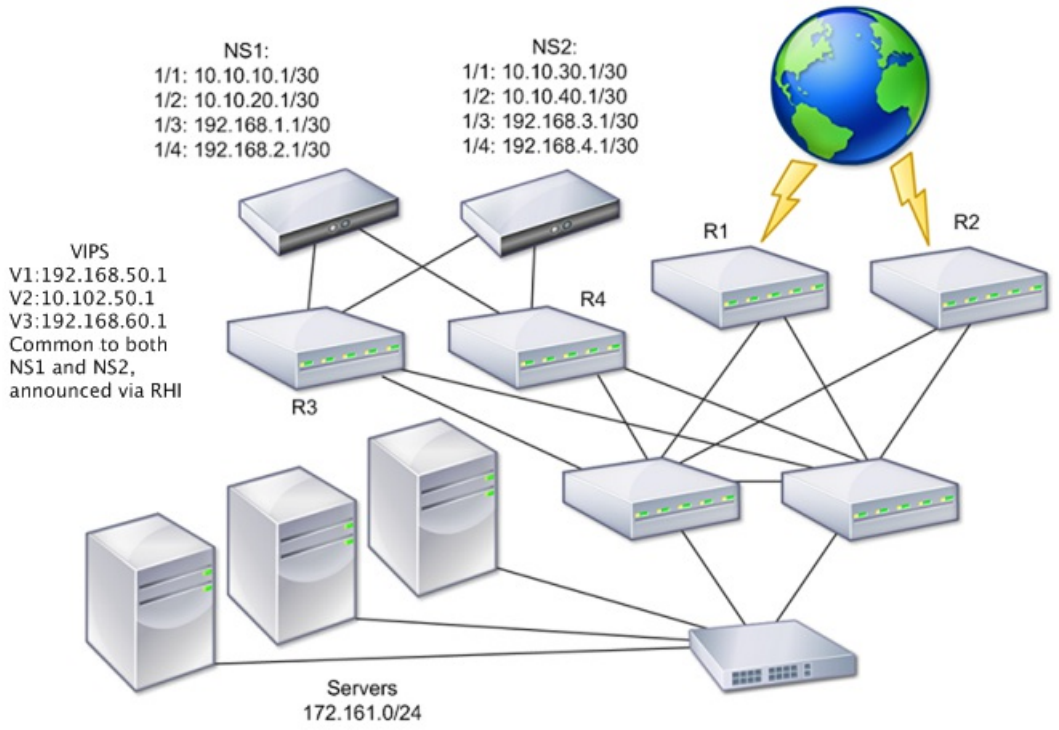
Navigate to System > Network > VMAC and, on the VMAC6 tab, delete the virtual router ID.

Configuring High Availability Nodes in Different Subnets

Mar 19, 2012

The following figure shows an HA deployment with the two systems located in different subnets:

Figure 1. High Availability over a Routed Network



In the figure, the systems NS1 and NS2 are connected to two separate routers, R3 and R4, on two different subnets. The NetScaler appliances exchange heartbeat packets through the routers. This configuration could be expanded to accommodate deployments involving any number of interfaces.

Note: If you use static routing on your network, you must add static routes between all the systems to ensure that heartbeat packets are sent and received successfully. (If you use dynamic routing on your systems, static routes are unnecessary.)

If the nodes in an HA pair reside on two separate networks, the primary and secondary node must have independent network configurations. This means that nodes on different networks cannot share entities such as MIPs, SNIPs, VLANs, and routes. This type of configuration, where the nodes in an HA pair have different configurable parameters, is known as Independent Network Configuration (INC) or Symmetric Network Configuration (SNC).

The following table summarizes the configurable entities and options for an INC, and shows how they must be set on each node.

Table 1. Behavior of NetScaler Entities and Options in an Independent Network Configuration

NetScaler entities	Options

NetScaler entities	Options
IPs (NSIP/MIP/SNIPs)	Node-specific. Active only on that node.
VIPs	Floating.
VLANs	Node-specific. Active only on that node.
Routes	Node-specific. Active only on that node. Link load balancing routes are floating.
ACLs	Floating (Common). Active on both nodes.
Dynamic routing	Node-specific. Active only on that node. The secondary node should also run the routing protocols and peer with upstream routers.
L2 mode	Floating (Common). Active on both nodes.
L3 mode	Floating (Common). Active on both nodes.
Reverse NAT (RNAT)	Node-specific. RNAT with VIP, because NATIP is floating.

As in configuring HA nodes in the same subnet, to configure HA nodes in different subnets, you log on to each of the two NetScaler appliances and add a remote node representing the other appliance.

Adding a Remote Node

When two nodes of an HA pair reside on different subnets, each node must have a different network configuration. Therefore, to configure two independent systems to function as an HA pair, you must specify INC mode during the configuration process.

When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

To add a node by using the command line interface

At the command prompt, type:

- add ha node <id> <IPAddress> -inc ENABLED
- show ha node

Example

```
> add ha node 3 10.102.29.170 -inc ENABLED
 Done
> add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
```

Done

To disable an HA monitor by using the command line interface

At the command prompt, type:

- set interface <ifNum> [-haMonitor (**ON** | **OFF**)]
- show interface <ifNum>

Example

```
> set interface 1/3 -haMonitor OFF
 Done
```

To add a remote node by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, add a new remote node.
2. Make sure to select the Turn off HA monitor on interfaces/channels that are down and Turn on INC (Independent Network Configuration) mode on self mode options.

Removing a Node

Updated: 2013-08-28

If you remove a node, the nodes are no longer in high availability configuration.

To remove a node by using the command line interface

At the command prompt, type:

rm ha node <id>

Example

```
> rm ha node 2
 Done
```

To remove a node by using the configuration utility

Navigate to System > High Availability and, on the Nodes tab, delete the node.

Note: You can use the Network Visualizer to view the NetScaler appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks. For more information, see "Using the Network Visualizer."

Configuring Route Monitors

Sep 06, 2013

You can use route monitors to make the HA state dependent on the internal routing table, whether or not the table contains any dynamically learned or static routes. In an HA configuration, a route monitor on each node watches the internal routing table to make sure that a route entry for reaching a particular network is always present. If the route entry is not present, the state of the route monitor changes to DOWN.

When a NetScaler appliance has only static routes for reaching a network, and you want to create a route monitor for the network, you must enable monitored static routes (MSR) for the static routes. MSR removes unreachable static routes from the internal routing table. If MSR is disabled on static routes, an unreachable static route can remain in the internal routing table, defeating the purpose of having the route monitor.

Route Monitors are supported both in non-INC and INC mode.

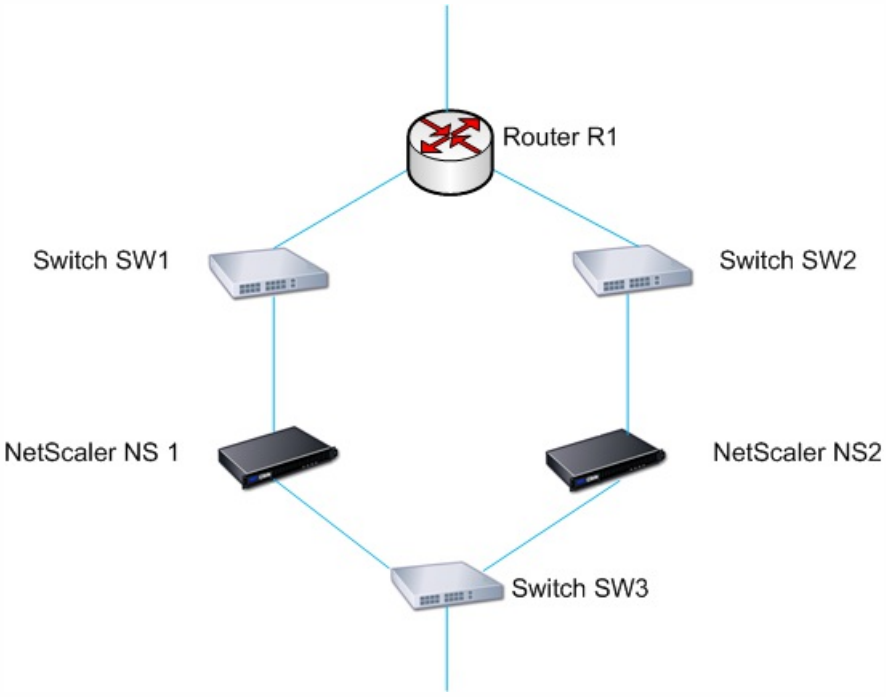
Route Monitors in HA in non-INC mode	**Route Monitors in HA in INC mode**
Route monitors are propagated by nodes and exchanged during synchronization.	Route monitors are neither propagated by nodes nor exchanged during synchronization.
Route monitors are active only in the current primary node.	Route monitors are active on both the primary and the secondary node.
The NetScaler appliance always displays the state of a route monitor as UP irrespective of the whether the route entry is present or not in the internal routing table.	The NetScaler appliance displays the state of the route monitor as DOWN if the corresponding route entry is not present in the internal routing table.
A route monitor starts monitoring its route after 180 seconds in the following cases [This is done to allow dynamic routes to get learnt, which may take 180 secs]: • reboot • failover • set route6 command for v6 routes • set route msr enable/disable command for v4 routes. • adding a new route monitor	-

Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

Consider an example of a non-Inc mode HA setup in a two-arm topology that has NetScaler appliances NS1 and NS2 in the same subnet, with router R1 and switches SW1, SW2, and SW3.

Because R1 is the only router in this setup, you want the HA setup to failover whenever R1 is not reachable from the current primary node. You can configure a route monitor (say, RM1 and RM2, respectively) on each of the nodes to monitor the reachability of R1 from that node.

Figure 1.



With NS1 as the current primary node, the execution flow is as follows:

1. Route monitor RM1 on NS1 monitors NS1's internal routing table for the presence of a route entry for router R1. NS1 and NS2 exchange heartbeat messages through switch SW1 or SW3 at regular intervals.
2. If switch SW1 goes down, the routing protocol on NS1 detects that R1 is not reachable and therefore removes the route entry for R1 from the internal routing table. NS1 and NS2 exchanges heartbeat messages through switch SW3 at regular intervals.
3. Detecting that the route entry for R1 is not present in the internal routing table, RM1 initiates a failover. If route to R1 is down from both NS1 and NS2, failover happens every 180 seconds till one of the appliances is able to reach R1 and restore the connectivity.

Adding a Route Monitor to a High Availability Node

A single procedure creates a route monitor and binds it to an HA node.

To add a route monitor by using the command line interface

At the command prompt, type:

- bind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])
- show HA node

Example

```
> bind HA node 0 -routeMonitor 10.102.71.0 255.255.255.0
 Done
> bind HA node 0 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
 Done
```

To add a route monitor by using the configuration utility

Navigate to System > High Availability and, on the Route Monitors tab, click Configure.

Removing Route Monitors

Updated: 2013-08-28

To remove a route monitor by using the command line interface

At the command prompt, type:

- unbind HA node <id> (-routeMonitor <ip_addr|ipv6_addr> [<netmask>])
- show ha node

Example

```
unbind HA node 3 -routeMonitor 10.102.71.0 255.255.255.0
unbind HA node 3 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b
```

To remove a route monitor by using the configuration utility

Navigate to System > High Availability and, on the Route Monitors tab, delete the route monitor.

Limiting Failovers Caused by Route Monitors in non-INC mode

Aug 28, 2013

In an HA configuration in non-INC mode, if route monitors fail on both nodes, failover happens every 180 seconds until one of the nodes is able to reach all of the routes monitored by the respective route monitors.

However, for a node, you can limit the number of failovers for a given interval by setting the Maximum Number of Flips and Maximum Flip Time parameters on the nodes. When either limit is reached, no more failovers occur, and the node is assigned as primary even if any route monitor fails on that node. If the node is then able to reach all of the monitored routes, the next monitor failure triggers resetting of the Maximum Number of Flips and Maximum Flip Time parameters on the node and starting the time specified in the Maximum Flip Time parameter.

These parameters are set independently on each node and therefore are neither propagated nor synchronized.

Parameters for limiting the number of failovers

Maximum Number of Flips (maxFlips)

Maximum number of failovers allowed, within the Maximum Flip Time interval, for the node in HA in non INC mode, if the failovers are caused by route-monitor failure.

Maximum Flip Time (maxFlipTime)

Amount of time, in seconds, during which failovers resulting from route-monitor failure are allowed for the node in HA in non INC mode.

To limit the number of failovers by using the command line interface

At the command prompt, type:

- set HA node [-maxFlips < positive_integer>] [-maxFlipTime <positive_integer>]
- show HA node [< id>]

Example

```
> set ha node -maxFlips 30 -maxFlipTime 60
 Done
> sh ha node
1) Node ID: 0
 IP: 10.102.169.82 (NS)
 Node State: UP
 Master State: Primary
 Fail-Safe Mode: OFF
 INC State: DISABLED
 Sync State: ENABLED
 Propagation: ENABLED
 Enabled Interfaces : 1/1
 Disabled Interfaces : None
 HA MON ON Interfaces : 1/1
```

```
 Interfaces on which heartbeats are not seen :None
 Interfaces causing Partial Failure:None
 SSL Card Status: NOT PRESENT
 Hello Interval: 200 msecs
 Dead Interval: 3 secs
 Node in this Master State for: 0:4:24:1
 (days:hrs:min:sec)
2) Node ID: 1
 IP: 10.102.169.81
 Node State: UP
 Master State: Secondary
 Fail-Safe Mode: OFF
 INC State: DISABLED
 Sync State: SUCCESS
 Propagation: ENABLED
 Enabled Interfaces : 1/1
 Disabled Interfaces : None
 HA MON ON Interfaces : 1/1
 Interfaces on which heartbeats are not seen : None
 Interfaces causing Partial Failure: None
 SSL Card Status: NOT PRESENT

Local node information:
 Configured/Completed Flips: 30/0
 Configured Flip Time: 60
 Critical Interfaces: 1/1

Done
```

To limit the number of failovers by using the configuration utility

1. Navigate to System > High Availability and, on the Nodes tab, open the local node.
2. Set the following parameters:
   - Maximum Number of Flips
   - Maximum Flip Time

Configuring Failover Interface Set

Mar 19, 2012

A Failover Interface Set (FIS) is a logical group of interfaces. In an HA configuration, using a FIS is a way to prevent failover by grouping interfaces so that, when one interface fails, other functioning interfaces are still available. A FIS can also be configured for the nodes of a NetScaler cluster.

HA MON interfaces that are not bound to an FIS are known as critical interfaces (CI) because if any of them fails, failover is triggered.

> **Note**
>
> An FIS does not create an active and standby Interfaces or channels. It also does not prevent bridging loops when connecting to links to the same VLAN.

Creating or Modifying an FIS

To add an FIS and bind interfaces to it by using the command line interface

At the command prompt, type:

- add fis <name>
- bind fis <name> <ifnum> ...
- show fis <name>

Example

```
> add fis fis1
 Done
> bind fis fis1 1/3 1/5
 Done
```

An unbound interface becomes a critical interface (CI) if it is enabled and HA MON is on.

To unbind an interface from an FIS by using the command line interface

At the command prompt, type:

- unbind fis <name> <ifnum> ...
- show fis <name>

Example

```
> unbind fis fis1 1/3
 Done
```

To configure an FIS by using the configuration utility

Navigate to System > High Availability and, on the Failover Interface Set tab, add a new FIS, or edit an existing FIS.

Removing an FIS

Updated: 2013-08-28

When the FIS is removed, its interfaces are marked as critical interfaces.

To remove an FIS by using the command line interface

At the command prompt, type:

rm fis <name>

Example

```
> rm fis fis1
  Done
```

To remove an FIS by using the configuration utility

Navigate to System > High Availability and, on the Failover Interface Set tab, delete the FIS.

Understanding the Causes of Failover

Sep 30, 2013

The following events can cause failover in an HA configuration:

1. If the secondary node does not receive a heartbeat packet from the primary for a period of time that exceeds the dead interval set on the secondary. (See Note: 1.)
2. The primary node experiences a hardware failure of its SSL card.
3. The primary node does not receive any heartbeat packets on its network interfaces for three seconds.
4. On the primary node, a network interface that is not part of a Failover Interface Set (FIS) or a Link Aggregation (LA) channel and has the HA Monitor (HAMON) enabled, fails. (See Note: 2.)
5. On the primary node, all interfaces in an FIS fail. (See Note: 2.)
6. On the primary node, an LA channel with HAMON enabled fails. (See Note: 2.)
7. On the primary node, all interfaces fail (see Note: 2). In this case, failover occurs regardless of the HAMON configuration.
8. On the primary node, all interfaces are manually disabled. In this case, failover occurs regardless of the HAMON configuration.
9. You force a failover by issuing the force failover command on either node.
10. A route monitor that is bound to the primary node goes DOWN.

    Note: 1. For more information about setting the dead interval, see Configuring the Communication Intervals. Possible causes for a node not receiving heartbeat packets from a peer node include:

    - A network configuration problem prevents heartbeats from traversing the network between the HA nodes.
    - The peer node experiences a hardware or software failure that causes it to freeze (hang), reboot, or otherwise stop processing and forwarding heartbeat packets.

    Note: 2. In this case, fail means that the interface was enabled but goes to the DOWN state, as can be seen from the show interface command or from the configuration utility. Possible causes for an enabled interface to be in the DOWN state are LINK DOWN and TXSTALL.

Forcing a Node to Fail Over

Mar 19, 2012

You might want to force a failover if, for example, you need to replace or upgrade the primary node. You can force failover from either the primary or the secondary node. A forced failover is not propagated or synchronized. To view the synchronization status after a forced failover, you can view the status of the node.

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.

The NetScaler appliance displays a warning message if it detects a potential issue when you run the force failover command. The message includes the information that triggered the warning, and requests confirmation before proceeding.

You can force a failover on a primary node, secondary node, and when nodes are in listen mode.

- **Forcing Failover on the Primary Node**.
  If you force failover on the primary node, the primary becomes the secondary and the secondary becomes the primary. Forced failover is possible only when the primary node can determine that the secondary node is UP.

  If the secondary node is DOWN, the force failover command returns the following error message: "Operation not possible due to invalid peer state. Rectify and retry."

  If the secondary system is in the claiming state or inactive, it returns the following error message: "Operation not possible now. Please wait for system to stabilize before retrying."

- **Forcing Failover on the Secondary Node**.
  If you run the force failover command from the secondary node, the secondary node becomes primary and the primary node becomes secondary. A force failover can occur only if the secondary node's health is good and it is not configured to stay secondary.

  If the secondary node cannot become the primary node, or if secondary node was configured to stay secondary (using the STAYSECONDARY option), the node displays the following error message: "Operation not possible as my state is invalid. View the node for more information."

- **Forcing Failover When Nodes Are in Listen Mode**.
  When the two nodes of an HA pair are running different versions of the system software, the node running the higher version switches to the listen mode. In this mode, neither command propagation nor synchronization works.

  Before upgrading the system software on both nodes, you should test the new version on one of the nodes. To do this, you need to force a failover on the system that has already been upgraded. The upgraded system then takes over as the primary node, but neither command propagation or synchronization occurs. Also, all connections need to be re-established.

To force failover on a node by using the command line interface

At the command prompt, type:

force HA failover

To force failover on a node by using the configuration utility

Navigate to System > High Availability and, on the Nodes tab, select the node, in the Action list, select Force Failover.

Forcing the Secondary Node to Stay Secondary

Aug 28, 2013

In an HA setup, the secondary node can be forced to stay secondary regardless of the state of the primary node.

For example, suppose the primary node needs to be upgraded and the process will take a few seconds. During the upgrade, the primary node may go down for a few seconds, but you do not want the secondary node to take over; you want it to remain the secondary node even if it detects a failure in the primary node.

When you force the secondary node to stay secondary, it will remain secondary even if the primary node goes down. Also, when you force the status of a node in an HA pair to stay secondary, it does not participate in HA state machine transitions. The status of the node is displayed as STAYSECONDARY.

Forcing the node to stay secondary works on both standalone and secondary nodes. On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node continues to function as the primary node, and the new node becomes the secondary node.

Note: When you force a system to remain secondary, the forcing process is not propagated or synchronized. It affects only the node on which you run the command.

To force the secondary node to stay secondary by using the command line interface

At the command prompt, type:

set ha node -hastatus STAYSECONDARY

To force the secondary node to stay secondary by using the configuration utility

Navigate to System > High Availability, on the Nodes tab, open the local node, and select STAY SECONDARY.

Forcing the Primary Node to Stay Primary

Aug 28, 2013

In an HA setup, you can force the primary node to remain primary even after a failover. You can enable this option either on a primary node in an HA pair or on a standalone system.

On a standalone system, you must run this command before you can add a node to create an HA pair. When you add the new node, it becomes the primary node. The existing node stops processing traffic and becomes the secondary node in the HA pair.

To force the primary node to stay primary by using the command line interface

At the command prompt, type:

set ha node -hastatus STAYPRIMARY

To force the primary node to stay primary by using the configuration utility

Navigate to System > High Availability, on the Nodes tab, open the local node, and select STAY PRIMARY.

Understanding the High Availability Health Check Computation

Mar 19, 2012

The following table summarizes the factors examined in a health check computation:

- State of the CIs
- State of the FISs
- State of the route monitors

The following table summarizes the health check computation.

Table 1. High Availability Health Check Computation

FIS	CI	Route monitor	Condition
N	Y	N	If the system has any CIs, all of those CIs must be UP.
Y	Y	N	If the system has any FISs, all of those FISs must be UP.
Y	Y	Y	If the system has any route monitors configured, all monitored routes must be present in the FIS.

High Availability FAQs

Jul 16, 2013

What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?

In an HA configuration, both nodes use the following ports to exchange HA related information:

- UDP Port 3003, to exchange heartbeat packets.
- Port 3010, for synchronization and command propagation.

What are the conditions that trigger synchronization?

Synchronization is triggered by any of the following conditions:

- The incarnation number of the primary node, received by the secondary, does not match that of the secondary node. Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node's configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number is not incremented for the following commands:
  1. All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
  2. All Interface related commands. For example, set interface and unset interface.
  3. All channel-related commands. For example, add channel, set channel, and bind channel.
- The secondary node comes up after a restart.
- The primary node becomes secondary after a failover.

What configurations are not synced or propagated in an HA configuration in INC or non-INC mode?

The following commands are neither propagated nor synced to the secondary node:

- All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
- All Interface related configuration commands. For example, set interface and unset interface.
- All channel related configuration commands. For example, add channel, set channel, and bind channel.

What configurations are not synced nor propagated in an HA configuration in INC mode?

The following configurations are not synced or propagated. Each node has its own.

- MIPs
- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations.

Does a configuration added to the secondary node get synchronized on the primary?

No, a configuration added to the secondary node is not synchronized to the primary.

What could be the reason for both nodes claiming to be the primary in an HA configuration?

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem could be with the network between the nodes.

Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

Different system-clock settings on the two nodes can cause the following issues:

- The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
- After a failover, you might have problems with any type of cookie based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
- Similar considerations apply to any time related decisions on the nodes.

What are the conditions for failure of the *force HA sync* command?

Forced synchronization fails in any of the following circumstances:

- You force synchronization when synchronization is already in progress.
- You force synchronization on a standalone NetScaler appliance.
- The secondary node is disabled.
- HA synchronization is disabled on the current secondary node.
- HA propagation is disabled on the current primary node and you force synchronization from the primary.

What are the conditions for failure of the *sync HA files* command?

Synchronizing configuration files fail in either of the following circumstances:

- On a standalone system.
- With the secondary node disabled.

In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the *force failover* command.

What are the conditions for failure of the *force failover* command?

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.
- The primary node is configured to remain primary.
- The state of the peer node is unknown.

Troubleshooting High Availability Issues

Jul 29, 2013

The most common high availability issues involve the high availability feature not working at all, or working only intermittently. Following are common high availability issues, and probable causes and resolutions.

- **Issue**
  The inability of the NetScaler appliances to pair the NetScaler appliances in a high availability setup.
  - **Cause**
    Network connectivity

    Resolution

    Verify that both the appliances are connected to the switch and the interfaces are enabled.

  - **Cause**
    Mismatch in the Password for the default Administrator account

    Resolution

    Verify that the password on both the appliances is the same.

  - **Cause**
    IP conflict

    Resolution

    Verify that both the appliances have unique NetScaler IP (NSIP) address. The appliances should not have the same NSIP address.

  - **Cause**
    Node ID mismatch

    Resolution

    Verify that the Node ID Configuration on both the appliances is unique. The appliances should not have the same Node ID configuration. Additionally, you must assign value for a Node ID between 1 and 64.

  - **Cause**
    Mismatch in the password of the RPC node

    Resolution

    Verify that both the nodes have the same RPC node password.

  - **Cause**
    An administrator has disabled the remote node

    Resolution

    Enable the remote node.

- **Cause**
  The Firewall application has blocked the heartbeat packets

  Resolution

  Verify that the UDP port 3003 is allowed.

- **Issue**
  Both the appliances claim to be the primary appliance.
  - **Cause**
    Missing heartbeat packets between the appliances

    Resolution

    Verify that the UDP port 3003 is not blocked for communication between the appliances.

- **Issue**
  The NetScaler appliance is not able to synchronize the configuration.
  - **Cause**
    A Firewall application is blocking the required port.

    Resolution

    Verify that the UDP port 3010 (or UDP port 3008 with secure synchronization) is not blocked for communication between the appliances.

  - **Cause**
    An administrator has disabled synchronization.

    Resolution

    Enable synchronization on the appliance that has the issue.

  - **Cause**
    Different NetScaler releases or builds are installed on appliances.

    Resolution

    Upgrade the appliances to the same NetScaler release or build.

- **Issue**
  Command propagation fails between the appliances.
  - **Cause**
    A Firewall application is blocking the port.

    Resolution

    Verify that the UDP port 3011 (or UDP port 3009 with secure propagation) is not blocked for communication between the appliances.

  - **Cause**
    An administrator has disabled command propagation.

Resolution

Enable command propagation on the appliance that has the issue.

- **Cause**
  Different NetScaler releases or builds are installed on appliances.

  Resolution

  Upgrade the appliances to the same NetScaler release or build.

- **Issue**
  The NetScaler appliances in the high availability pair are unable to run the force failover process.
  - **Cause**
    The Secondary node is disabled.

    Resolution

    Enable the secondary node.

  - **Cause**
    The Secondary node is configured to stay secondary.

    Resolution

    Set the secondary high availability status of the secondary node to Enable from Stay Secondary.

- **Issue**
  The secondary appliance does not receive any traffic after the failover process.
  - **Cause**
    The upstream router does not understand GARP messages of NetScaler appliance.

    Resolution

    Configure Virtual MAC (VMAC) address on the secondary appliance.

Networking

Sep 30, 2013

The following topics provide a conceptual reference and instructions for configuring the various networking components on the NetScaler appliance.

IP Addressing	Learn the various types of NetScaler-owned IP addresses and how to create, customize, and remove them.
Interfaces	Configure some of the basic network configurations that must be done to get started.
Access Control Lists (ACLs)	Configure the different types of Access Control Lists and how to create, customize, and remove them.
IP Routing	Learn and configure the routing functionality of the NetScaler appliance, both static and dynamic.
Internet Protocol version 6 (IPv6)	Learn how the NetScaler appliance supports IPv6.
Traffic Domains	Learn and configure traffic domains to segment network traffic for different applications.

IP Addressing

Aug 28, 2013

Before you can configure the NetScaler appliance, you must assign the NetScaler IP Address (NSIP), also known as the Management IP address. You can also create other NetScaler-owned IP addresses for abstracting servers and establishing connections with the servers. In this type of configuration, the appliance serves as a proxy for the abstracted servers. You can also proxy connections by using network address translations (INAT and RNAT). When proxying connections, the appliance can behave either as a bridging (Layer 2) device or as a packet forwarding (Layer 3) device. To make packet forwarding more efficient, you can configure static ARP entries. For IPv6, you can configure neighbor discovery (ND).

This document includes the following information:

Configuring NetScaler-Owned IP Addresses

Mar 20, 2012

The NetScaler-owned IP Addresses—NetScaler IP Address (NSIP), Virtual IP Addresses (VIPs), Subnet IP Addresses (SNIPs), Mapped IP Addresses (MIPs), and Global Server Load Balancing Site IP Addresses (GSLBIPs)—exist only on the NetScaler appliance. The NSIP uniquely identifies the NetScaler on your network, and it provides access to the appliance. A VIP is a public IP address to which a client sends requests. The NetScaler terminates the client connection at the VIP and initiates a connection with a server. This new connection uses a SNIP or a MIP as the source IP address for packets forwarded to the server. If you have multiple data centers that are geographically distributed, each data center can be identified by a unique GSLBIP.

You can configure some NetScaler-owned IP addresses to provide access for management applications.

This document includes the following information:

- Configuring the NetScaler IP Address (NSIP)
- Configuring and Managing Virtual IP (VIP) Addresses
- Configuring ARP response Suppression for Virtual IP addresses (VIPs)
- Configuring Subnet IP Addresses (SNIPs)
- Configuring Mapped IP Addresses (MIPs)
- Configuring GSLB Site IP Addresses (GSLBIP)
- Removing a NetScaler-Owned IP Address
- Configuring Application Access Controls

Configuring the NetScaler IP Address (NSIP)

Aug 28, 2013

The NetScaler IP (NSIP) address is the IP address at which you access the NetScaler for management purposes. The NetScaler can have only one NSIP, which is also called the Management IP address. You must add this IP address when you configure the NetScaler for the first time. If you modify this address, you must reboot the NetScaler. You cannot remove an NSIP address. For security reasons, NSIP should be a non-routable IP address on your organization's LAN.

Note: Configuring the NetScaler IP address is mandatory.

To create the NetScaler IP address by using the command line interface

At the command prompt, type:

- set ns config [-IPAddress <ip_addr> -netmask <netmask>]
- show ns config

Example

```
> set ns config -ipaddress 10.102.29.170 -netmask 255.255.255.0
 Done
```

To configure the NetScaler IP address by using the configuration utility

1. In the navigation pane, click System.
2. On the System Information tab, click Setup Wizard.
3. In the Setup Wizard dialog box, click Next.
4. Under System Configuration, set the following parameters:
   - IP Address
   - Netmask
5. Follow the instructions in the Setup Wizard to complete the configuration.

Configuring and Managing Virtual IP (VIP) Addresses

Nov 23, 2015

Configuration of a virtual server IP (VIP) address is not mandatory during initial configuration of the NetScaler ADC. When you configure load balancing, you assign VIP addresses to virtual servers.

For more information about configuring a load balancing setup, see "Load Balancing."

In some situations, you need to customize VIP attributes or enable or disable a VIP address. A VIP address is usually associated with a virtual server, and some of the VIP attributes are customized to meet the requirements of the virtual server. You can host the same virtual server on multiple NetScaler appliances residing on the same broadcast domain, by using ARP and ICMP attributes. After you add a VIP (or any IP address), the NetScaler sends, and then responds to, ARP requests. VIPs are the only NetScaler-owned IP addresses that can be disabled. When a VIP address is disabled, the virtual server using it goes down and does not respond to ARP, ICMP, or L4 service requests.

As an alternative to creating VIP addresses one at a time, you can specify a consecutive range of VIP addresses.

To create a VIP address by using the command line interface

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.59 255.255.255.0 -type VIP
 Done
```

To create a range of VIP addresses by using the command line interface

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.[60-64] 255.255.255.0 -type VIP
ip "10.102.29.60" added
ip "10.102.29.61" added
ip "10.102.29.62" added
ip "10.102.29.63" added
ip "10.102.29.64" added
 Done
```

To configure a VIP address by using the configuration utility

Navigate to System > Network > IPs > IPV4s, and add a new IP address or edit an existing address.

To create a range of VIP addresses by using the configuration utility

1. Navigate to System > Network > IPs > IPV4s.
2. In the Action list, select Add Range.

To enable or disable an IPv4 VIP address by using the command line interface

At the command prompt, type one of the following sets of commands to enable or disable a VIP and verify the configuration:

- enable ns ip <IPAddress>
- show ns ip <IPAddress>
- disable ns ip <IPAddress>
- show ns ip <IPAddress>

Example

```
> enable ns ip 10.102.29.79
 Done
> show ns ip 10.102.29.79

      IP: 10.102.29.79
      Netmask: 255.255.255.255
      Type: VIP
      state: Enabled
      arp: Enabled
      icmp: Enabled
      vserver: Enabled
      management access: Disabled
        telnet: Disabled
        ftp: Disabled
        ssh: Disabled
        gui: Disabled
        snmp: Disabled
      Restrict access: Disabled
      dynamic routing: Disabled
      hostroute: Disabled
 Done
> disable ns ip 10.102.29.79
 Done
> show ns ip 10.102.29.79

      IP: 10.102.29.79
      Netmask: 255.255.255.255
      Type: VIP
      state: Disabled
      arp: Enabled
      icmp: Enabled
      vserver: Enabled
      management access: Disabled
        telnet: Disabled
```

```
    ftp: Disabled
    ssh: Disabled
    gui: Disabled
    snmp: Disabled
  Restrict access: Disabled
  dynamic routing: Disabled
  hostroute: Disabled

 Done
```

To enable or disable a VIP address by using the configuration utility

1. Navigate to **System** > **Network** > **IPs** > **IPV4s**.
2. Do one of the following:
   - Select a VIP address.
   - Hold down the **Ctrl** key and select multiple address entries.
   - Hold down the **Shift** key and select a range of address entries.
   - Select all the address entries by selecting the check box on the left side of the header row.
3. Fom the **Action** list, select **Disable** or **Enable**.

Configuring ARP response Suppression for Virtual IP addresses (VIPs)

Aug 28, 2013

You can configure the NetScaler appliance to respond or not respond to ARP requests for a Virtual IP (VIP) address on the basis of the state of the virtual servers associated with that VIP.

For example, if virtual servers V1, of type HTTP, and V2, of type HTTPs, share VIP address 10.102.29.45 on a NetScaler appliance, you can configure the appliance to not respond to any ARP request for VIP 10.102.29.45 if both V1 and V2 are in the DOWN state.

The following three options are available for configuring ARP-response suppression for a virtual IP address.

- **NONE**. The NetScaler appliance responds to any ARP request for the VIP address, irrespective of the state of the virtual servers associated with the address.
- **ONE VSERVER**. The NetScaler appliance responds to any ARP request for the VIP address if at least one of the associated virtual servers is in UP state.
- **ALL VSERVER**. The NetScaler appliance responds to any ARP request for the VIP address if all of the associated virtual servers are in UP state.

Following table shows the sample behavior of NetScaler appliance for a VIP configured with two virtual servers:

Associated virtual servers for a VIP	**STATE 1**	**STATE 2**	**STATE 3**	**STATE 4**
NONE				
V1	UP	UP	DOWN	DOWN
V2	UP	DOWN	UP	DOWN
Respond to an ARP request for this VIP?	Yes	Yes	Yes	Yes
ONE VSERVER				
V1	UP	UP	DOWN	DOWN
V2	UP	DOWN	UP	DOWN
Respond to an ARP request for this VIP?	Yes	Yes	Yes	No
ALL VSERVER				
V1	UP	UP	DOWN	DOWN

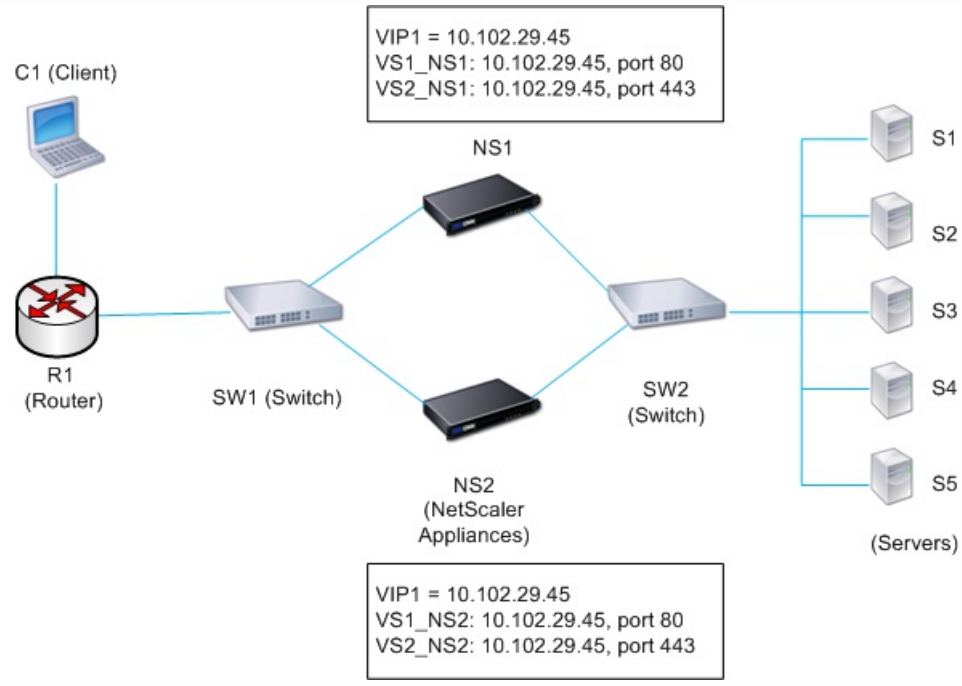
Associated virtual servers for a VIP	STATE 1	STATE 2	STATE 3	STATE 4
Respond to an ARP request for this VIP?	Yes	No	No	No

Consider an example where you want to test the performance of two virtual servers, V1 and V2, which have the same VIP address but are of different types and are each configured on NetScaler appliances NS1 and NS2. Let's call the shared VIP address *VIP1*.

V1 load balances servers S1, S2, and S3. V2 load balances servers S4 and S5.

On both NS1 and NS2, for VIP1, the ARP suppression parameter is set to ALL_VSERVER. If you want to test the performance of V1 and V2 on NS1, you must manually disable V1 and V2 on NS2, so that NS2 does not respond to any ARP request for VIP1.

Figure 1.



The execution flow is as follows:

1. Client C1 sends a request to V1. The request reaches R1.
2. R1 does not have an APR entry for the IP address (VIP1) of V1, so R1 broadcasts an ARP request for VIP1.
3. NS1 replies with source MAC address MAC1 and source IP address VIP1. NS2 does not reply to the ARP request.
4. SW1 learns the port for VIP1 from the ARP reply and updates its bridge table, and R1 updates the ARP entry with MAC1 and VIP1.
5. R1 forwards the packet to address VIP1 on NS1.
6. NS1's load balancing algorithm selects server S2, and NS1 opens a connection between one of its SNIP or MIP addresses and S2. When S2 sends a response to the client, the response returns by the same path.
7. Now you want to test the performance of V1 and V2 on NS2, so you enable V1 and V2 on NS2 and disable them on NS1. NS2 now broadcasts an ARP message for VIP1. In the message, MAC2 is the source MAC address and VIP1 is the source IP address.

8. SW1 learns the port number for reaching MAC2 from the ARP broadcast and updates its bridge table to send subsequent client requests for VIP1 to NS2. R1 updates its ARP table.
9. Now suppose the ARP entry for VIP1 times out in the ARP table of R1, and client C1 sends a request for V1. Because R1 does not have an APR entry for VIP1, it broadcasts an ARP request for VIP1.
10. NS2 replies with a source MAC address and VIP1 as the source IP address. NS1 does not reply to the ARP request.

To configure ARP response suppression by using the command line interface

At the command prompt, type:

- set ns ip -arpResponse <arpResponse>]
- show ns ip <IPAddress>

Example

```
> set ns ip 10.102.29.96 -arpResponse ALL_VSERVERS
 Done
```

To configure ARP response suppression by using the configuration utility

1. Navigate to System > Network > IPs > IPV4s.
2. Open an IP address entry and select the type of ARP Response.

Configuring Subnet IP Addresses (SNIPs)

May 23, 2014

A subnet IP address (SNIP) is a NetScaler owned IP address that is used by the NetScaler ADC to communicate with the servers.

The NetScaler ADC uses the subnet IP address as a source IP address to proxy client connections to servers. It also uses the subnet IP address when generating its own packets, such as packets related to dynamic routing protocols, or to send monitor probes to check the health of the servers.

Depending on your network topology, you might have to configure one or more SNIPs for different scenarios. Following are three typical scenarios in which you have to configure SNIPs:

- Using SNIPs for a Directly Connected Server Subnet
- Using SNIPs for Server Subnets Connected through a Router
- Using SNIPs for Multiple Server Subnets (VLANs) on an L2 Switch

To configure a SNIP address on a NetScaler ADC, you add the SNIP address and then enable global Use Subnet IP (USNIP) mode.

As an alternative to creating SNIPs one at a time, you can specify a consecutive range of SNIPs.

To configure a SNIP address by using the command line interface

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type SNIP
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.203 255.255.255.0 -type SNIP
 Done
```

To create a range of SNIP addresses by using the command line interface

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type SNIP
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.[205-209] 255.255.255.0 -type SNIP
ip "10.102.29.205" added
ip "10.102.29.206" added
ip "10.102.29.207" added
ip "10.102.29.208" added
ip "10.102.29.209" added
 Done
```

To enable or disable USNIP mode by using the command line interface

At the command prompt, type one of the following commands:

- enable ns modeUSNIP
- disable ns modeUSNIP

To configure a SNIP address by using the configuration utility

Navigate to System > Network > IPs > IPV4s, and add a new SNIP address or edit an existing address.

To create a range of SNIP addresses by using the configuration utility

1. Navigate to System > Network > IPs > IPV4s.
2. In the Action list, select Add Range.

To enable or disable USNIP mode by using the command line interface

At the command prompt, type one of the following commands:

- enable ns mode USNIP
- disable ns mode USNIP

To enable or disable USNIP mode by using the configuration utility

1. Navigate to System > Settings, in Modes and Features group, click Change modes.
2. Select or clear the Use Subnet IP option.

Using SNIPs for a Directly Connected Server Subnet

Updated: 2014-05-23

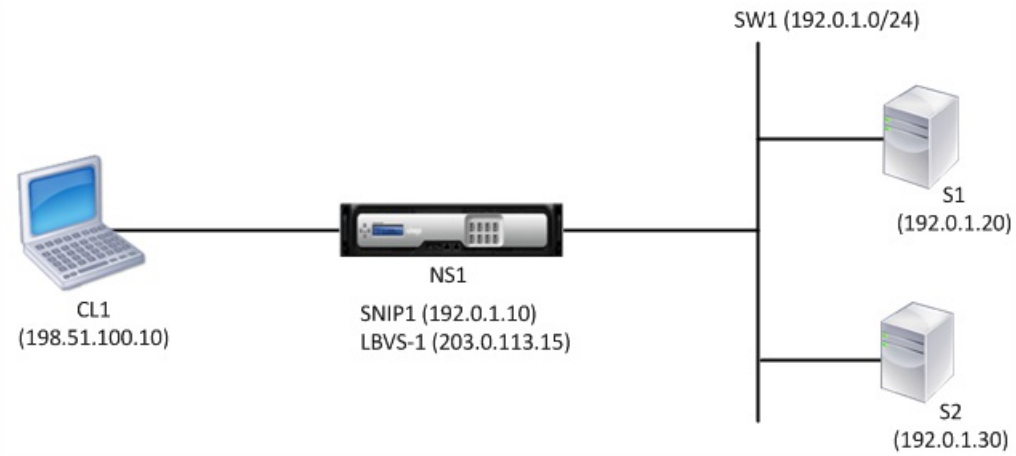
To enable communication between the NetScaler and a server that is either connected directly to the NetScaler or connected through only an L2 switch, you must configure a subnet IP address that belongs to the subnet of the server. You must configure at least one subnet IP address for each directly connected subnet, except for the directly connected management subnet that is connected through NSIP.

Consider an example of a load balancing setup in which load balancing virtual server LBVS1 on NetScaler ADC NS1 is used to load balance servers S1 and S2, which are connected to NS1 through L2 switch SW1. S1 and S2 belong to the same subnet.

SNIP address SNIP1, which belongs to the same subnet as S1 and S2, is configured on NS1. As soon as SNIP1 is configured, NS1 broadcasts ARP packets for SNIP1.

Services SVC-S1 and SVC-S2 on NS1 represent S1 and S2. As soon as these services are configured, NS1 broadcasts ARP requests for S1 and S2 to resolve IP-to-MAC mapping. After S1 and S2 respond, NS1 sends them monitoring probes at regular intervals, from address SNIP1, to check their health.

For more information about configuring load balancing on a NetScaler ADC, see Load Balancing.



Following is the traffic flow in this example:

1. Client C1 sends a request packet to LBVS-1. The request packet has:
   - Source IP = IP address of the client (198.51.100.10)
   - Destination IP = IP address of LBVS-1 (203.0.113.15)
2. LBVS1 of NS1 receives the request packet.
3. LBVS1's load balancing algorithm selects server S2.
4. Because S2 is directly connected to NS1, and SNIP1 (192.0.1.10) is the only IP address on NS1 that belongs to the same subnet as S2, NS1 opens a connection between SNIP1 and S2.
5. NS1 sends the request packet to S2 from SNIP1. The request packet has:
   - Source IP = SNIP1 (192.0.1.10)
   - Destination IP = IP address of S2 (192.0.1.30)
6. S2's response returns by the same path.

Using SNIPs for Server Subnets Connected through a Router

Updated: 2014-05-23

To enable communication between the NetScaler ADC and servers in subnets connected through a router, you must configure at least one subnet IP address that belongs to the subnet of the directly connected interface to the router. The ADC uses this subnet IP address to communicate with servers in subnets that can be reached through the router.

Consider an example of a load balancing setup in which load balancing virtual server LBVS1 on NetScaler ADC NS1 is used to load balance servers S1, S2, S3, and S4, which are connected to NS1 through router R1.

S1 and S2 belong to same subnet, 192.0.2.0/24, and are connected to R1 through L2 switch SW1. S3 and S4 belong to a different subnet, 192.0.3.0/24, and are connected to R1 through L2 switch SW2.

NetScaler ADC NS1 is connected to router R1 through subnet 192.0.1.0/24. SNIP address SNIP1, which belongs to the same subnet as the directly connected interface to the router (192.0.1.0/24), is configured on NS1. NS1 uses this address to communicate with servers S1 and S2, and with servers S3 and S4.

For more information about configuring load balancing on a NetScaler ADC, see Load Balancing.

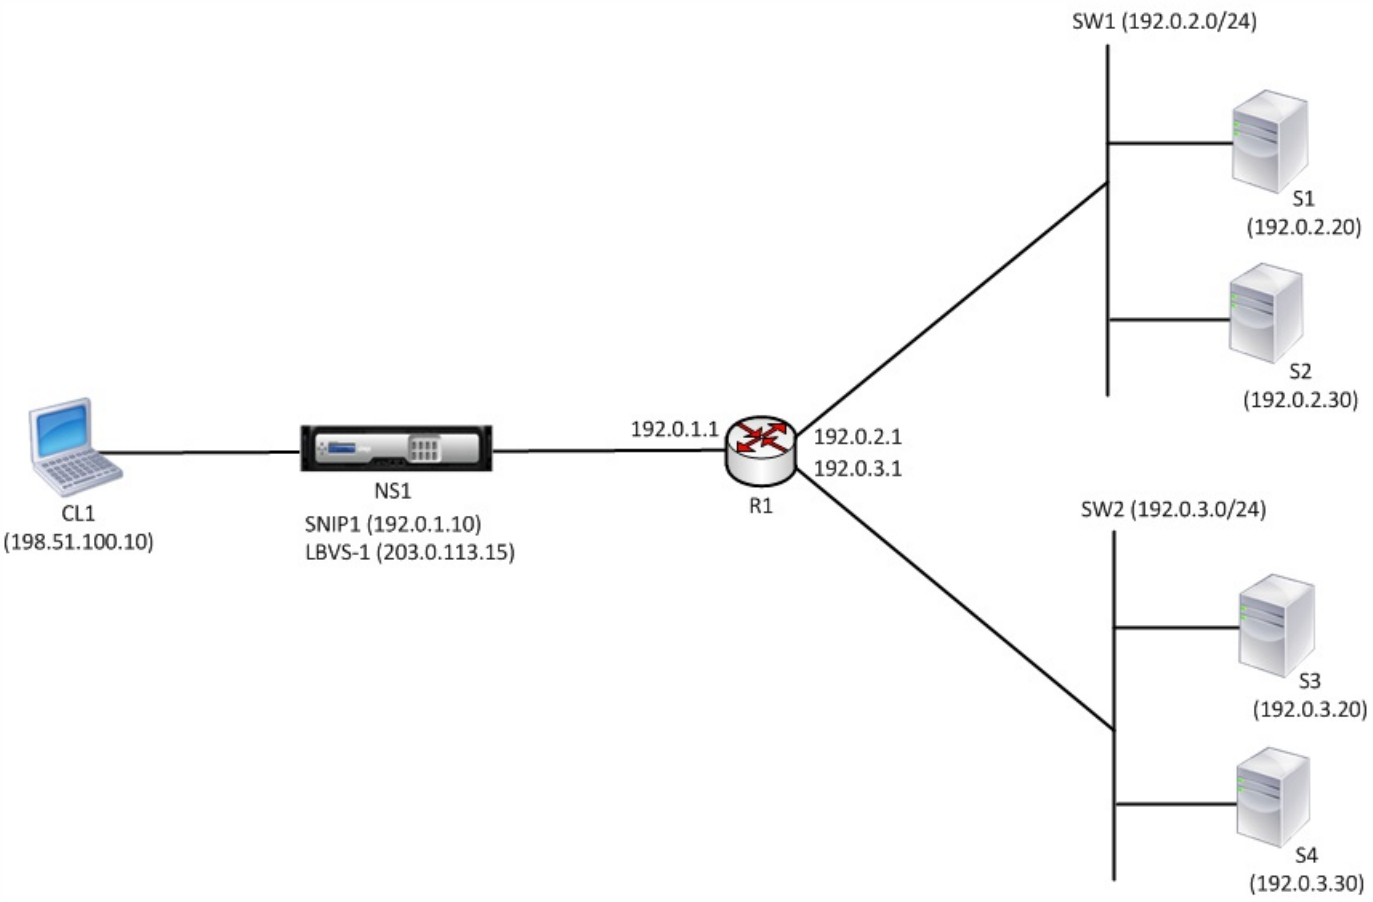
As soon as address SNIP1 is configured, NS1 broadcasts ARP announcement packets for SNIP1.

NS1's routing table consists of route entries for S1, S2, S3, and S4 through R1. These route entries are either static route entries or advertised by R1 to NS1, using dynamic routing protocols.

Services SVC-S1, SVC-S2, SVC-S3, and SVC-S4 on NS1 represent servers S1, S2, S3, and S4. NS1 finds, in its routing tables,

that these servers are reachable through R1. NS1 sends them monitoring probes at regular intervals, from address SNIP1, to check their health.

For more information about IP routing on a NetScaler ADC, see IP Routing.



Following is the traffic flow in this example:

1. Client C1 sends a request packet to LBVS-1. The request packet has:
   - Source IP = IP address of the client (198.51.100.10)
   - Destination IP = IP address of LBVS-1 (203.0.113.15)
2. LBVS1 of NS1 receives the request packet.
3. LBVS1's load balancing algorithm selects server S3.
4. NS1 checks its routing table and finds that S3 is reachable through R1. SNIP1 (192.0.1.10) is the only IP address on NS1 that belongs to the same subnet as router R1, NS1 opens a connection between SNIP1 and S3 through R1.
5. NS1 sends the request packet to R1 from SNIP1. The request packet has:
   - Source IP address = SNIP1 (192.0.1.10)
   - Destination IP address = IP address of S3 (192.0.3.20)
6. The request reaches R1, which checks its routing table and forwards the request packet to S3.
7. S3's response returns by the same path.

Using SNIPs for Multiple Server Subnets (VLANs) on an L2 Switch

Updated: 2014-05-23

When you have multiple server subnets (VLANs) on an L2 switch that is connected to a NetScaler ADC, you must configure at least one SNIP address for each of the server subnets, so that the NetScaler ADC can communicate with these server subnets.

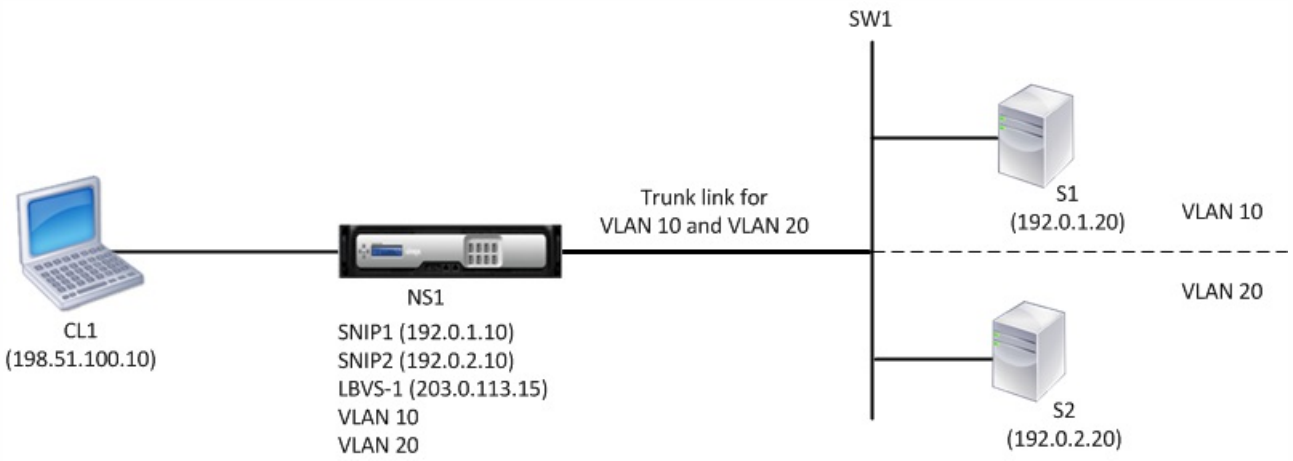
Consider an example of a load balancing setup in which load balancing virtual server LBVS1 on NetScaler ADC NS1 is used to load balance servers S1 and S2, which are connected to NS1 through L2 switch SW1. S1 and S2 belong to different subnets and are part of VLAN 10 and VLAN20, respectively. The link between NS1 and SW1 is a trunk link and is shared by VLAN10 and VLAN20.

For more information about configuring load balancing on a NetScaler ADC, see Load Balancing.

Subnet IP addresses SNIP1 (for reference purposes only) and SNIP2 (for reference purposes only) are configured on NS1. NS1 uses SNIP1 (on VLAN 10) to communicate with server S1, and SNIP2 (on VLAN 20) to communicate with S2. As soon as SNIP1 and SNIP2 are configured, NS1 broadcasts ARP announcement packets for SNIP1 and SNIP2.

For more information about configuring VLANs on a NetScaler ADC, see Configuring a VLAN.

Services SVC-S1 and SVC-S2 on NS1 represent servers S1 and S2. As soon as these services are configured, NS1 broadcasts ARP requests for them. After S1 and S2 respond, NS1 sends them monitoring probes at regular intervals to check their health. NS1 sends monitoring probes to S1 from address SNIP1, and to S2 from address SNIP2.



Following is the traffic flow in this example:

1. Client C1 sends a request packet to LBVS-1. The request packet has:
   - Source IP = IP address of the client (198.51.100.10)
   - Destination IP = IP address of LBVS-1 (203.0.113.15)
2. LBVS1 of NS1 receives the request packet.
3. LBVS1's load balancing algorithm selects server S2.
4. Because S2 is directly connected to NS1, and SNIP2 (192.0.2.10) is the only IP address on NS1 that belongs to the same subnet as S2, NS1 opens a connection between SNIP2 and S2.
   Note: If S1 is selected, NS1 opens a connection between SNIP1 and S1.
5. NS1 sends the request packet to S2 from SNIP2. The request packet has:
   - Source IP = SNIP1 (192.0.2.10)
   - Destination IP = IP address of S2 (192.0.2.20)
6. S2's response returns by the same path.

Configuring Mapped IP Addresses (MIPs)

Sep 30, 2013

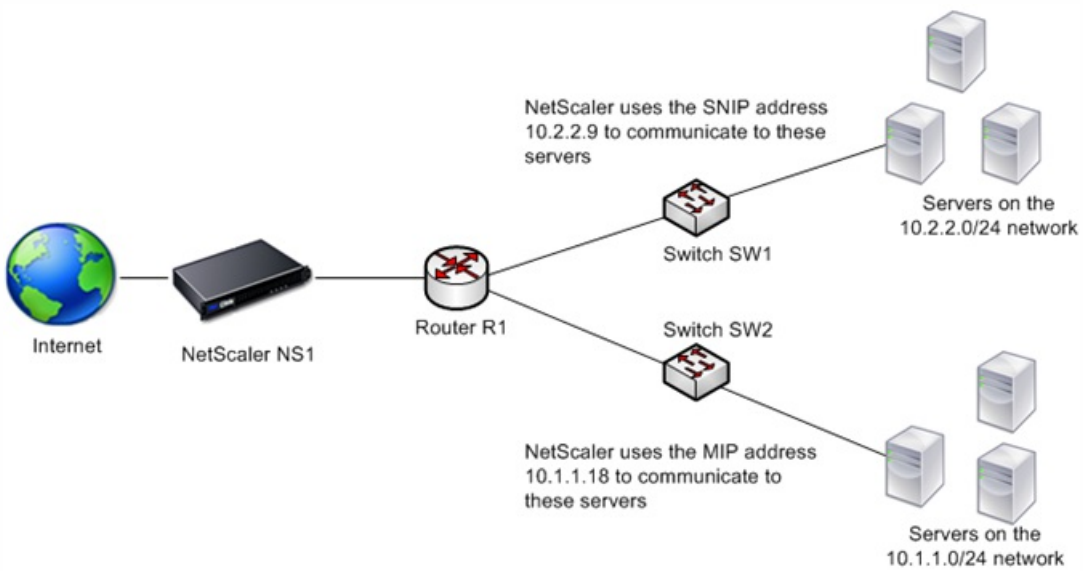
Mapped IP addresses (MIP) are used for server-side connections. A MIP can be considered a default Subnet IP (SNIP) address, because MIPs are used when a SNIP is not available or Use SNIP (USNIP) mode is disabled.

If the mapped IP address is the first in the subnet, the NetScaler appliance adds a route entry, with this IP address as the gateway to reach the subnet. You can create or delete a MIP during run time without rebooting the appliance.

As an alternative to creating MIPs one at a time, you can specify a consecutive range of MIPs.

The following diagram shows the use of the MIP and SNIP addresses in a NetScaler appliance that connects to the backend servers across the subnets.

Figure 1. MIP and SNIP addresses



In the setup, if the NetScaler appliance and the backend servers are in the 10.1.1.0/24 subnet, then the appliance uses the MIP address to communicate to the servers. However, if the setup has backend servers on additional subnets, such as 10.2.2.0/24, and there is no router between the NetScaler appliance and the subnet, then you can configure a SNIP address that has a range of 10.2.2.x/24, such as 10.2.2.9 in this case, to communicate to the additional subnet.

You can enable to NetScaler appliance to use MIP to communicate the additional subnet. However, if the setup has a Firewall application between the appliance and the server, then the Firewall might prevent the traffic other than 10.2.2.0/24. In such cases, you need a SNIP address to communicate to the servers.

To create a MIP address by using the command line interface

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.171 255.255.255.0 -type MIP
 Done
```

To create a range of MIP addresses by using the command line interface

At the command prompt, type:

- add ns ip <IPAddress> <netmask> -type <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.[173-175] 255.255.255.0 -type MIP
ip "10.102.29.173" added
ip "10.102.29.174" added
ip "10.102.29.175" added
Done
```

To configure a MIP address by using the configuration utility

Navigate to System > Network > IPs > IPV4s, and add a new MIP address or edit an existing address.

To create a range of MIP addresses by using the configuration utility

1. Navigate to System > Network > IPs > IPV4s.
2. In the Action list, select Add Range.

Configuring GSLB Site IP Addresses (GSLBIP)

Aug 28, 2013

A GSLB site IP (GSLBIP) address is an IP address associated with a GSLB site. It is not mandatory to specify a GSLBIP address when you initially configure the NetScaler appliance. A GSLBIP address is used only when you create a GSLB site.

For more information about creating a GSLB site IP address, see "Global Server Load Balancing."

Removing a NetScaler-Owned IP Address

Aug 28, 2013

You can remove any IP address except the NSIP. The following table provides information about the processes you must follow to remove the various types of IP addresses. Before removing a VIP, remove the associated virtual server.

Table 1. Implications of Removing a NetScaler-Owned IP Address

IP address type	Implications
Subnet IP address (SNIP)	If IP address being removed is the last IP address in the subnet, the associated route is deleted from the route table. If the IP address being removed is the gateway in the corresponding route entry, the gateway for that subnet route is changed to another NetScaler-owned IP address.
Mapped IP address (MIP)	If a SNIP exists, you can remove the MIPs. The NetScaler uses NSIP and SNIPs to communicate with the servers when the MIP is removed. Therefore, you must also enable use SNIP (USNIP) mode. For information about enabling and disabling USNIP mode, see "Configuring Subnet IP Addresses (SNIPs)."
Virtual Server IP address (VIP)	Before removing a VIP, you must first remove the vserver associated with it. For information about removing the vserver, see "Load Balancing."
GSLB-Site-IP address	Before removing a GSLB site IP address, you must remove the site associated with it. For information about removing the site, see "Global Server Load Balancing."

To remove an IP address by using the command line interface

At the command prompt, type:

rm ns ip <IPaddress>

Example

```
rm ns ip 10.102.29.54
```

To remove an IP address by using the configuration utility

Navigate to System > Network > IPs > IPV4s, delete the IP address.

Configuring Application Access Controls

Sep 30, 2015

Application access controls, also known as management access controls, form a unified mechanism for managing user authentication and implementing rules that determine user access to applications and data. You can configure MIPs and SNIPs to provide access for management applications. Management access for the NSIP is enabled by default and cannot be disabled. You can, however, control it by using ACLs.

For information about using ACLs, see "Access Control Lists (ACLs)."

The NetScaler appliance does not support management access to VIPs.

The following table provides a summary of the interaction between management access and specific service settings for Telnet.

Management Access	Telnet (State Configured on the NetScaler)	Telnet (Effective State at the IP Level)
Enable	Enable	Enable
Enable	Disable	Disable
Disable	Enable	Disable
Disable	Disable	Disable

The following table provides an overview of the IP addresses used as source IP addresses in outbound traffic.

Application/ IP	NSIP	MIP	SNIP	VIP
ARP	Yes	Yes	Yes	No
Server side traffic	No	Yes	Yes	No
RNAT	No	Yes	Yes	Yes
ICMP PING	Yes	Yes	Yes	No
Dynamic routing	Yes	No	Yes	Yes

The following table provides an overview of the applications available on these IP addresses.

Application/ IP	NSIP	MIP	SNIP	VIP

Application/ IP	NSIP	MIP	SNIP	VIP
SNMP	Yes	Yes	Yes	Yes
System access	Yes	Yes	Yes	No

You can access and manage the NetScaler by using applications such as Telnet, SSH, GUI, and FTP.

Note: Telnet and FTP are disabled on the NetScaler for security reasons. To enable them, contact the customer support. After the applications are enabled, you can apply the controls at the IP level.
To configure the NetScaler to respond to these applications, you need to enable the specific management applications. If you disable management access for an IP address, existing connections that use the IP address are not terminated, but no new connections can be initiated.

Also, the non-management applications running on the underlying FreeBSD operating system are open to protocol attacks, and these applications do not take advantage of the NetScaler appliance's attack prevention capabilities.

You can block access to these non-management applications on a MIP, SNIP, or NSIP. When access is blocked, a user connecting to a NetScaler by using the MIP, SNIP, or NSIP is not be able to access the non-management applications running on the underlying operating system.

To configure management access for an IP address by using the command line interface

At the command prompt, type:

set ns ip <IPAddress> -mgmtAccess <value> -telnet <value> -ftp <value> -gui <value> -ssh <value> -snmp <value> -restrictAccess (ENABLED | DISABLED)
Example

```
> set ns ip 10.102.29.54 -mgmtAccess enabled -restrictAccess ENABLED
Done
```

To enable management access for an IP address by using the configuration utility

1. Navigate to System > Network > IPs > IPV4s.
2. Open an IP address entry, and select the Enable Management Access control to support the below listed applications option.

How the NetScaler Proxies Connections

Aug 28, 2013

When a client initiates a connection, the NetScaler appliance terminates the client connection, initiates a connection to an appropriate server, and sends the packet to the server. The appliance does not perform this action for service type UDP or ANY.

For more information about service types, see "Load Balancing."

You can configure the NetScaler to process the packet before initiating the connection with a server. The default behavior is to change the source and destination IP addresses of a packet before sending the packet to the server. You can configure the NetScaler to retain the source IP address of the packets by enabling Use Source IP mode.

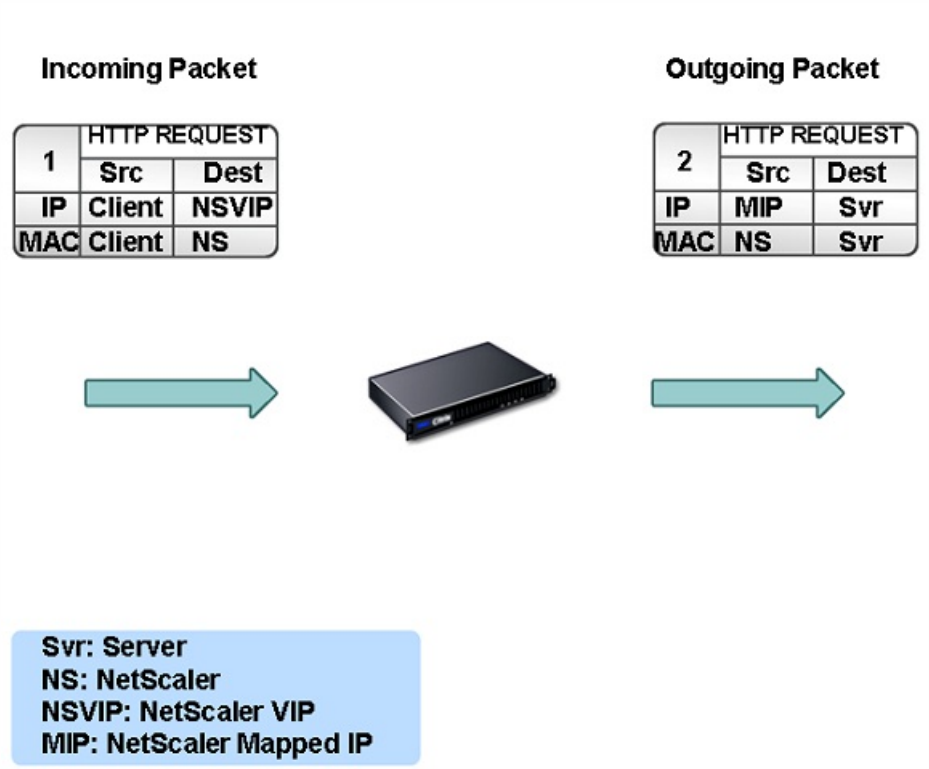
This section includes the following details:

- How the Destination IP Address Is Selected
- How the Source IP Address Is Selected

How the Destination IP Address Is Selected

Traffic sent to the NetScaler appliance can be sent to a virtual server or to a service. The appliance handles traffic to virtual servers and services differently. The NetScaler terminates traffic received at a virtual server IP (VIP) address and changes the destination IP address to the IP address of the server before forwarding the traffic to the server, as shown in the following diagram.

Figure 1. Proxying Connections to VIPs



Packets destined for a service are sent directly to the appropriate server, and the NetScaler does not modify the

destination IP addresses. In this case, the NetScaler functions as a proxy.

How the Source IP Address Is Selected

When the NetScaler appliance communicates with the physical servers or peer devices, by default, it does not use the IP address of the client. NetScaler maintains a pool of mapped IP addresses (MIPs) and subnet IP addresses (SNIPs), and selects an IP address from this pool to use as the source IP address of a connection to the physical server. Depending on the subnet in which the physical server is placed, NetScaler decides whether a MIP should be used or SNIP.

Note: If the Use Source IP (USIP) option is enabled, NetScaler uses the IP address of the client.

Enabling Use Source IP Mode

Dec 16, 2013

When the NetScaler appliance communicates with the physical servers or peer devices, by default, it uses one of its own IP addresses as the source IP. The appliance maintains a pool of mapped IP addresses (MIPs) and subnet IP addresses (SNIPs), and selects an IP address from this pool to use as the source IP address for a connection to the physical server. The decision of whether to select a MIP or a SNIP depends on the subnet in which the physical server resides.

If necessary, you can configure the NetScaler appliance to use the client's IP address as source IP. Some applications need the actual IP address of the client. The following use cases are a few examples:

- Client's IP address in the web access log is used for billing purposes or usage analysis.
- Client's IP address is used to determine the country of origin of the client or the originating ISP of the client. For example, many search engines such as Goggle provide content relevant to the location to which the user belongs.
- The application must know the client's IP address to verify that the request is from a trustworthy source.
- Sometimes, even though an application server does not need the client's IP address, a firewall placed between the application server and the NetScaler may need the client's IP address for filtering the traffic.

Enable Use Source IP mode (USIP) mode if you want NetScaler to use the client's IP address for communication with the servers. By default, USIP mode is disabled. USIP mode can be enabled globally on the NetScaler or on a specific service. If you enable it globally, USIP is enabled by default for all subsequently created services. If you enable USIP for a specific service, the client's IP address is used only for the traffic directed to that service.

As an alternative to USIP mode, you have the option of inserting the client's IP address (CIP) in the request header of the server-side connection for an application server that needs the client's IP address.

In earlier NetScaler releases, USIP mode had the following source-port options for server-side connections:

- Use the client's port. With this option, connections cannot be reused. For every request from the client, a new connection is made with the physical server.
- Use proxy port. With this option, connection reuse is possible for all requests from the same client. Before NetScaler release 8.1 this option imposed a limit of 64000 concurrent connections for all server-side connections.

In the later NetScaler releases , if USIP is enabled, the default is to use a proxy port for server-side connections and not reuse connections. Not reusing connections may not affect the speed of establishing connections.

By default, the Use Proxy Port option is enabled if the USIP mode is enabled.

For more information about the Use Proxy Port option, see "Using the Client Port When Connecting to the Server."

Note: If you enable the USIP mode, it is recommended to enable the Use Proxy Port option.
The following figure shows how the NetScaler uses IP addresses in USIP mode.

Figure 1. IP Addressing in USIP Mode

Recommended Usage

Enable USIP in the following situations:

- Load balancing of Intrusion Detection System (IDS) servers
- SMTP load balancing
- Stateless connection failover
- Sessionless load balancing
- If you use the Direct Server Return (DSR) mode

Note: When USIP is enabled, you must set server's gateway to one of the NetScaler owned IP addresses (either of type Subnet IP (SNIP) or mapped IP (MIP)) so that server's response always go through the NetScaler appliance. For more information about NetScaler owned IP addresses, see "Configuring NetScaler owned IP addresses."

- If you enable USIP, set the idle timeout for server connections to a value lower than the default value, so that idle connections are cleared quickly on the server side.
  For more information about setting an idle time-out value, "Load Balancing."
- For transparent cache redirection, if you enable USIP, enable L2CONN also.
- Because HTTP connections are not reused when USIP is enabled, a large number of server-side connections may accumulate. Idle server connections can block connections for other clients. Therefore, set limits on maximum number of connections to a service. Citrix also recommends setting the HTTP server time-out value, for a service on which USIP is enabled, to a value lower than the default, so that idle connections are cleared quickly on the server side.

To globally enable or disable USIP mode by using the command line interface

At the command prompt, type one of the following commands:

- enable ns mode USIP
- disable ns mode USIP

To enable USIP mode for a service by using the command line interface

At the command prompt, type:

set service <name>@ -usip (**YES** | **NO**)
Example

set service Service-HTTP-1 -usip YES

To globally enable or disable USIP mode by using the configuration utility

1. Navigate to System > Settings, in Modes and Features group, click Change modes.
2. Select or clear the Use Source IP option.

To enable USIP mode for a service by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to enable the USIP mode, and then click Open.
3. In the Configure Service dialog box, click the Advanced tab.
4. Under Settings, select the Use Source IP check box.
5. Click OK.

Configuring Network Address Translation

Jul 05, 2013

Network address translation (NAT) involves modification of the source and/or destination IP addresses and/or the TCP/UDP port numbers of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your networks source IP addresses when data passes through the NetScaler. Also, with the help of NAT entries, your entire private network can be represented by a few shared public IP addresses. The NetScaler supports the following types of network address translation:

- Inbound NAT (INAT), in which the NetScaler replaces the destination IP address in the packets generated by the client with the private IP address of the server.
- Reverse NAT (RNAT), in which the NetScaler replaces the source IP address in the packets generated by the servers with the public NAT IP addresses.

This document includes the following information:

Configuring INAT

Aug 28, 2013

When a client sends a packet to a NetScaler appliance that is configured for Inbound Network Address Translation (INAT), the appliance translates the packet's public destination IP address to a private destination IP address and forwards the packet to the server at that address.

The following configurations are supported:

- **IPv4-IPv4 Mapping**: A public IPv4 address on the NetScaler appliance listens to connection requests on behalf of a private IPv4 server. The NetScaler appliance translates the packet's public destination IP address to the destination IP address of the server and forwards the packet to the server at that address.
- **IPv4-IPv6 Mapping**: A public IPv4 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance creates an IPv6 request packet with the IP address of the IPv6 server as the destination IP address.
- **IPv6-IPv4 Mapping**: A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv4 server. The NetScaler appliance creates an IPv4 request packet with the IP address of the IPv4 server as the destination IP address.
- **IPv6-IPv6 Mapping**: A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance translates the packet's public destination IP address to the destination IP address of the server and forwards the packet to the server at that address.

When the appliance forwards a packet to a server, the source IP address assigned to the packet is determined as follows:

- If use subnet IP (USNIP) mode is enabled and use source IP (USIP) mode is disabled, the NetScaler uses a subnet IP address (SNIP) as the source IP address.
- If USNIP mode is disabled and USIP mode is disabled, the NetScaler uses a mapped IP address (MIP) as the source IP address.
- If USIP mode is enabled, and USNIP mode is disabled the NetScaler uses the client IP (CIP) address as the source IP address.
- If both USIP and USNIP modes are enabled, USIP mode takes precedence.
- You can also configure the NetScaler to use a unique IP address as the source IP address, by setting the proxyIP parameter.
- If none of the above modes are enabled and a unique IP address has not been specified, the NetScaler attempts to use a MIP as the source IP address.
- If both USIP and USNIP modes are enabled and a unique IP address has been specified, the order of precedence is as follows: USIP-unique IP-USNIP-MIP-Error.

To protect the NetScaler from DoS attacks, you can enable TCP proxy. However, if other protection mechanisms are used in your network, you may want to disable them.

You can create, modify, or remove an INAT entry.

To create an INAT entry by using the command line interface

At the command prompt, type the following commands to create an INAT entry and verify its configuration:

- add inat <name> <publicIP> <privateIP> [-tcpproxy (ENABLED | DISABLED)] [-ftp (ENABLED | DISABLED)] [-usip (ON | OFF)] [-usnip (ON | OFF)] [-proxyIP <ip_addr|ipv6_addr>]

- show inat [<name>]

Example

```
> add inat ip4-ip4 172.16.1.2 192.168.1.1 -proxyip 10.102.29.171
 Done
```

To modify an INAT entry by using the command line interface

To modify an INAT entry, type the set inat command, the name of the entry, and the parameters to be changed, with their new values.

To remove an INAT configuration by using the command line interface

At the command prompt, type:

rm inat <name>

Example

```
> rm inat ip4-ip4
 Done
```

To configure an INAT entry by using the configuration utility

Navigate to System > Network > Routes > INAT, and add a new INAT entry or edit an existing INAT entry.

To remove an INAT configuration by using the configuration utility

Navigate to System > Network > Routes > INAT, delete the INAT configuration.

Coexistence of INAT and Virtual Servers

Mar 20, 2012

If both INAT and RNAT are configured, the INAT rule takes precedence over the RNAT rule. If RNAT is configured with a network address translation IP (NAT IP) address, the NAT IP address is selected as the source IP address for that RNAT client.

The default public destination IP in an INAT configuration is the virtual IP (VIP) address of the NetScaler device. Virtual servers also use VIPs. When both INAT and a virtual server use the same IP address, the Vserver configuration overrides the INAT configuration.

Following are a few sample configuration setup scenarios and their effects.

Case	Result
You have configured a virtual server and a service to send all data packets received on a specific NetScaler port to the server directly. You have also configured INAT and enabled TCP. Configuring INAT in this manner sends all data packets received through a TCP engine before sending them to the server.	All packets received on the NetScaler, except those received on the specified port, pass through the TCP engine.
You have configured a virtual server and a service to send all data packets of service type TCP, that are received on a specific port on the NetScaler, to the server after passing through the TCP engine. You have also configured INAT and disabled TCP. Configuring INAT in this manner sends the data packets received directly to the server.	Only packets received on the specified port pass through the TCP engine.
You have configured a virtual server and a service to send all data packets received to either of two servers. You are attempting to configure INAT to send all data packets received to a different server.	The INAT configuration is not allowed.
You have configured INAT to send all received data packets directly to a server. You are attempting to configure a virtual server and a service to send all data packets received to two different servers.	The vserver configuration is not allowed.

Stateless NAT46 Translation

Aug 28, 2013

The stateless NAT46 feature enables communication between IPv4 and IPv6 networks through IPv4 to IPv6 packet translation, and vice versa, without maintaining any session information on the NetScaler appliance.

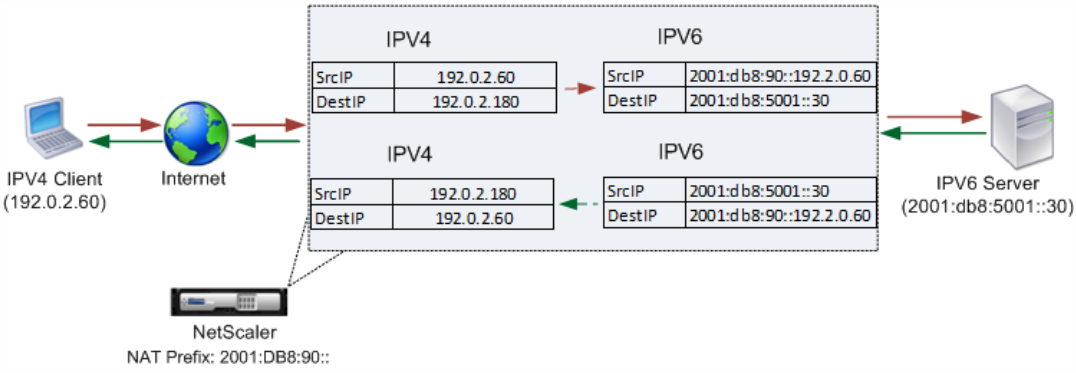
For a stateless NAT46 configuration, the appliance translates an IPv4 packet to IPv6 or an IPv6 packet to IPv4 as defined in RFCs 6145 and 2765.

Note: This feature is supported only on NetScaler 10.e and later.
A stateless NAT46 configuration on the NetScaler appliance has the following components:

- **IPv4-IPv6 INAT entry**—An INAT entry defining a 1:1 relationship between an IPv4 address and an IPv6 address. In other words, an IPv4 address on the appliance listens to connection requests on behalf of an IPv6 server. An IPv4 request packet for this IPv4 address is translated into an IPv6 packet, and then the IPv6 packet is sent to the IPv6 server.
  The appliance translates an IPv6 response packet into an IPv4 response packet with its source IP address field set as the IPv4 address specified in the INAT entry. The translated packet is then sent to the client.

- **NAT46 IPv6 prefix**—A global IPv6 prefix of length 96 bits (128-32=96) configured on the appliance. During IPv4 packet to IPv6 packet translation, the appliance sets the source IP address of the translated IPv6 packet to a concatenation of the NAT46 IPv6 prefix [96 bits] and the IPv4 source address [32 bits] that was received in the request packet.
  During IPv6 packet to IPv4 packet translation, the appliance sets the destination IP address of the translated IPv4 packet to the last 32 bits of the destination IP address of the IPv6 packet.

Consider an example in which an enterprise hosts site www.example.com on server S1, which has an IPv6 address. To enable communication between IPv4 clients and IPv6 server S1, NetScaler appliance NS1 is deployed with a stateless NAT46 configuration that includes an IPv4-IPv6 INAT entry for server S1, and a NAT46 Prefix. The INAT entry includes an IPv4 address at which the appliance listens to connection requests from IPv4 clients on behalf of the IPv6 server S1.



The following table lists the settings used in this example:

Entities	Name	Value
IP address of the client	Client_IPv4 (for reference purposes only)	192.0.2.60
IPv6 address of the server	Sevr_IPv6 (for reference purposes only)	2001:DB8:5001::30
IPv4 address defined in the INAT entry for IPv6 server S1	Map-Sevr-IPv4 (for reference purposes only)	192.0.2.180
IPv6 prefix for NAT 46 translation	NAT46_Prefix (for reference purposes only)	2001:DB8:90::

Following is the traffic flow in this example:

1. IPv4 Client CL1 sends a request packet to the Map-Sevr-IPv4 (192.0.2.180) address on the NetScaler appliance.
2. The appliance receives the request packet and searches the NAT46 INAT entries for the IPv6 address mapped to the Map-sevr-IPv4 (192.0.2.180) address. It finds the Sevr-IPv6 (2001:DB8:5001::30) address.
3. The appliance creates a translated IPv6 request packet with:
   - Destination IP address field = Sevr-IPv6 = 2001:DB8:5001::30
   - Source IP address field = Concatenation of NAT Prefix (First 96 bits) and Client_IPv4 (last 32 bits) = 2001:DB8:90::192.0.2.60
4. The appliance sends the translated IPv6 request to Sevr-IPv6.
5. The IPv6 server S1 responds by sending an IPv6 packet to the NetScaler appliance with:
   - Destination IP address field = Concatenation of NAT Prefix (First 96 bits) and Client_IPv4 (last 32 bits)= 2001:DB8:90::192.0.2.60
   - Source IP address field = Sevr-IPv6 = 2001:DB8:5001::30
6. The appliance receives the IPv6 response packet and verifies that its destination IP address matches the NAT46 prefix configured on the appliance. Because the destination address matches the NAT46 prefix, the appliance searches the NAT46 INAT entries for the IPv4 address associated with the Sevr-IPv6 address (2001:DB8:5001::30). It finds the Map-Sevr-IPv4 address (192.0.2.180).
7. The appliance creates an IPv4 response packet with:
   - Destination IP address field = The NAT46 prefix stripped from the destination address of the IPv6 response = Client_IPv4 (192.0.2.60)
   - Source IP address field = Map-Sevr-IPv4 address (192.0.2.180)
8. The appliance sends the translated IPv4 response to client CL1.

This section includes the following details:

- Configuring Stateless NAT46
- Setting Global Parameters for Stateless NAT46
- Limitations of Stateless NAT46

Configuring Stateless NAT46

Updated: 2013-09-04

Creating the required entities for stateless NAT46 configuration on the NetScaler appliance involves the following procedures:

1. Create an IPv4-IPv6 mapping INAT entry with stateless mode enabled.
2. Add a NAT46 IPv6 prefix.

To configure an INAT mapping entry by using the command line interface

At the command prompt, type:

- add inat <name> <publicIPv4> <privateIPv6> -mode STATELESS
- show inat <name>

To add an NAT46 prefix by using the command line interface

At the command prompt, type:

- set inatparam -nat46v6Prefix <ipv6_addr|*>
- show inatparam

Example

```
 > add inat exmpl-com-stls-nat46 192.0.2.180
2001:DB8:5001::30 -mode stateless
Done

> set inatparam -nat46v6Prefix 2001:DB8:90::/96
Done
```

To configure an INAT mapping entry by using the configuration utility

1. Navigate to System > Network > Routes > INAT.
2. Add a new INAT entry, or edit an existing INAT entry.
3. Set the following parameters:

- Name*
- Public IP Address*
- Private IP Address* (Select the IPv6 check box and enter the address in IPv6 format.)
- Mode (Select Stateless from the drop down list.)

* A required parameter

To add a NAT46 prefix by using the configuration utility

Navigate to System > Network, in the Settings group, click Configure INAT Parameters, and set the Prefix parameter.

Setting Global Parameters for Stateless NAT46

The appliance provides some optional global parameters for stateless NAT46 configurations.

To set global parameters for stateless NAT46 by using the command line interface

At the command prompt, type:

- set inatparam [-nat46IgnoreTOS (YES | NO)] [-nat46ZeroCheckSum (ENABLED | DISABLED)] [-nat46v6Mtu <positive_integer>] [-nat46FragHeader (ENABLED | DISABLED)]
- show inatparam

Example

```
> set inatparam -nat46IgnoreTOS YES -nat46ZeroCheckSum DISABLED -nat46v6Mtu 1400 -nat46FragHeader DISABLED
 Done
```

To set global parameters for stateless NAT46 by using the configuration utility

Navigate to System > Network, in the Settings group, click Configure INAT Parameters.

Limitations of Stateless NAT46

The following limitations apply to stateless NAT46:

- Translation of IPv4 options is not supported.
- Translation of IPv6 routing headers is not supported.
- Translation of hop-by-hop extension headers of IPv6 packets is not supported.
- Translation of ESP and EH headers of IPv4 packets is not supported.
- Translation of multicast packets is not supported.
- Translation of destination option headers and source routing headers is not supported.
- Translation of fragmented IPv4 UDP packets that do not contain UDP checksum is not supported.

DNS64

Feb 23, 2014

The NetScaler DNS64 feature responds with a synthesized DNS AAAA record to an IPv6 client sending an AAAA request for an IPv4-only domain. The DNS64 feature is used with the NAT64 feature to enable seamless communication between IPv6-only clients and IPv4-only servers. DNS64 enables discovery of the IPv4domain by the IPV6 only clients, and NAT64 enables communication between the clients and servers.

For synthesizing an AAAA record, the NetScaler appliance fetches a DNS A record from a DNS server. The DNS64 prefix is a 96-bit IPv6 prefix configured on the NetScaler appliance. The NetScaler appliance synthesizes the AAAA record by concatenation of the DNS64 Prefix (96 bits) and the IPv4 address (32 bits).

For enabling communication between IPv6 clients and IPv4 servers, a NetScaler appliance with DNS64 and NAT64 configuration can deployed either on the IPv6 client side or on the IPv4 server side. In both cases, the DNS64 configuration on the NetScaler appliance is similar and includes a load balancing virtual server acting as a proxy server for DNS servers. If the NetScaler appliance is deployed on the client side, the load balancing virtual server must be specified, on the IPv6 client, as the nameserver for a domain.

Consider an example where a NetScaler appliance with DNS64 and NAT64 configuration is configured on the IPv4 side. In this example, an enterprise hosts site www.example.com on server S1, which has an IPv4 address. To enable communication between IPv6 clients and IPv4 server S1, NetScaler appliance NS1 is deployed with a DNS64 and stateful NAT64 configuration.

The DNS64 configuration includes DNS load balancing virtual server LBVS-DNS64-1, on which the DNS64 option is enabled. A DNS64 policy named DNS64-Policy-1, and an associated DNS64 action named DNS64-Action-1, are also configured on NS1, andDNS64-Policy-1 is bound to LBVS-DNS64-1. LBVS-DNS64-1 acts as a DNS proxy server for DNS servers DNS-1 and DNS-2.

When traffic arriving at LBVS-DNS64-1 matches the conditions specified in DNS64-Policy-1, the traffic is processed according to the settings in DNS64-Action-1. DNS64-Action-1 specifies the DNS64 prefix used, with the A record received from a DNS server, to synthesize an AAAA record.

The global DNS parameter cacherecords is enabled on the NetScaler appliance, so the appliance caches DNS records. This setting is necessary for the DNS64 to work properly.

The following table lists the settings used in the above example:

Entity	Name	Value
IPv6 client	CL1 (for reference purposes only)	• IP address = 2001:DB8:5001::30
DNS64 Prefix		• 2001:DB8:300::
Service on NS representing DNS server DNS-1	SVC-DNS-1	• IP address = 203.0.113.50 • Port = 53

Service on NS representing DNS server DNS-2	SVC-DNS-2	• IP address = 203.0.113.60 • Port = 53
DNS64 action	DNS64-Action-1	• DNS64 Prefix=2001:DB8:300::
DNS64 policy	DNS64-Policy-1	• DNS64 action = DNS64-Action-1 • Rule= CLIENT.IP.SRC.IN_SUBNET(2001:DB8:5001::/64)
DNS load balancing virtual server	LBVS-DNS64-1	• IP address=2001:DB8:9999::99 • Bound DNS services= SVC-DNS-1, SVC-DNS-2 • DNS64=Enabled • Bound DNS64 policy= DNS64-Policy-1

Following is the traffic flow in this example:

1. IPv6 client CL1 sends a DNS AAAA request for the IPv6 address of the site www.example.com.
2. The request is received by the DNS load balancing virtual server LBVS-DNS64-1 on NetScaler appliance NS1.
3. NS1 checks its DNS cache records for the requested AAAA record and finds that AAAA record for the site www.example.com does not exist in the DNS cache.
4. LBVS-DNS64-1's load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
5. Because the site www.example.com is hosted on an IPv4 server, the DNS server DNS-1 does not have any AAAA record for the site www.example.com.
6. DNS-1 sends either an empty DNS AAAA response or an error message to LBVS-DNS64-1.
7. Because DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS1 sends a DNS A request to DNS-1 for the IPv4 address of www.example.com.
8. DNS-1 responds by sending the DNS A record for www.example.com to LBVS-DNS64-1. The A record includes the IPv4 address for www.example.com.
9. NS1 synthesizes an AAAA record for the site www.example.com with:
   - IPv6 address for site www.example.com = Concatenation of DNS64 Prefix (96 bits) specified in the associated DNS64action, and IPv4 address of DNS A record (32 bits) = 2001:DB8:300::192.0.2.60
10. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

This section includes the following details:

- Points to Consider for a DNS64 Configuration
- Configuration Steps

Points to Consider for a DNS64 Configuration

Before configuring DNS64 on a NetScaler appliance, consider the following points:

- The DNS64 feature of the NetScaler appliance is compliant with RFC 6174.
- The DNS64 feature of the NetScaler appliance does not support DNSSEC. The NetScaler appliance does not synthesize an AAAA record from a DNSSEC response received from a DNS server. A response is classified as a DNSSEC response, only if it contains RRSIG records.

- The NetScaler appliance supports DNS64 prefix of length of only 96 bits.
- Though the DNS64 feature is used with the NAT64 feature, the DNS64 and NAT64 configurations are independent on the NetScaler appliance. For a particular flow, you must specify the same IPv6 prefix value for the DNS64 prefix and the NAT64 prefix parameters, so that the synthesized IPv6 addresses received by the client are routed to the particular NAT64 configuration. For more information on configuring NAT64 on a NetScaler appliance, see "Stateful NAT64."
- The following are the different cases of DN64 processing by the NetScaler appliance:
  - If the AAAA response from the DNS server includes AAAA records, then each record in the response is checked for the set of exclusion rule configured on the NetScaler appliance for the particular DNS64 configuration. The NetScaler removes the IPv6 addresses, whose prefix matches the exclusion rule, from the response. If the resulting response includes at least one IPv6 record, the NetScaler appliance forwards this response to the client, else, the appliance synthesizes a AAAA response from the A record of the domain and sends it to the IPv6 client.
  - If the AAAA response from the DNS server is an empty answer response, the appliance requests for A resource records with the same domain name or searches in its own records if the appliance is an authentic domain name server for the domain. If the request results in an empty answer or error, the same is forwarded to the client.
  - If the response from the DNS server includes RCODE=1 (format error), the NetScaler appliance forwards the same to the client. If there is no response before the timeout, the NetScaler appliance sends a response with RCODE=2 (server failure) to the client.
  - If the response from the DNS server includes a CNAME, the chain is followed until the terminating A or AAAA record is reached. If the CNAME does not have any AAAA resource records, the NetScaler appliance fetches the DNS A record to be used for synthesizing AAAA record. The CNAME chain is added to the answer section along with the synthesized AAAA record and then sent to the client.
- The DNS64 feature of the NetScaler appliance also supports responding to PTR request. When a PTR request for a domain of an IPv6 address is received on the appliance and the IPv6 address matches any of the configured DNS64 prefix, the appliance creates a CNAME record mapping the IP6-ARPA domain into the corresponding IN-ADDR.ARPA domain and the newly formed IN-ADDR.ARPA domain is used for resolution. The appliance searches the local PTR records and if the records are not present, the appliance sends a PTR request for IN-ADDR.ARPA domain to the DNS server. The NetScaler appliance uses the response from the DNS server to synthesize response for the initial PTR request.

Configuration Steps

Updated: 2013-09-30

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

- **Add DNS services.** DNS services are logical representation of DNS servers for which the NetScaler appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see "Load Balancing".
- **Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy.** A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude rule and mapped rule settings.
- **Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it.** The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see "Load Balancing".
  Note: The command line interface has separate commands for these two tasks, but the configuration utility combines them in a single dialog box.

- **Enable caching of DNS records.** Enable the global parameter for the NetScaler appliance to cache DNS records, which are obtained through DNS proxy operations. For more information on enabling caching of DNS records, see "Enabling Caching of DNS Records".

To create a service of type DNS by using the command line interface

At the command prompt, type:

- add service <name> <IP> <serviceType> <port> ...

To create a DNS64 action by using the command line interface

At the command prompt, type:

- add dns action64 <actionName> -Prefix <ipv6_addr|*> [-mappedRule <expression>] [-excludeRule <expression>]

To create a DNS64 policy by using the command line interface

At the command prompt, type:

- add dns policy64 <name> -rule <expression> -action <string>

To create a DNS load balancing virtual server by using the command line interface

At the command prompt, type:

- add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED) [-bypassAAAA (YES | NO)] ...

To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

- bind lb vserver <name> <serviceName> ...
- bind lb vserver <name> -policyName <string> -priority <positive_integer> ...

Example

```
 > add service SVC-DNS-1 203.0.113.50 DNS 53
 Done

> add service SVC-DNS-2 203.0.113.60 DNS 53
 Done

> add dns Action64 DNS64-Action-1 -Prefix 2001:DB8:300::/96
 Done

> add dns Policy64 DNS64-Policy-1 -rule "CLIENT.IPv6.SRC.IN_SUBNET(2001:DB8:5001::/64)"
-action DNS64-Action-1
 Done

> add lb vserver LBVS-DNS64-1 DNS 2001:DB8:9999::99 53 -dns64 ENABLED
 Done

> bind lb vserver LBVS-DNS64-1 SVC-DNS-1
 Done

> bind lb vserver LBVS-DNS64-1 SVC-DNS-2
 Done
```

```
> bind lb vserver LBVS-DNS64-1 -policyname DNS64-Policy-1 -priority 2
 Done
```

To create a service of type DNS by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Services, and add a new service.
2. Set the following parameters:
   - Service Name*
   - Server*
   - Protocol* (Select DNS from the drop down list.)
   - Port*

To create a DNS64 action by using the configuration utility

Navigate to Traffic Management > DNS > Actions, on the DNS Actions64 tab, add a new DNS64 action.

To create a DNS64 policy by using the configuration utility

Navigate to Traffic Management > DNS > Policies, on the DNS Policies64 tab, add a new DNS64 policy.

To create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it by using the configuration utility

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, and add a new virtual server.
2. Set the following parameters:
   - Name*
   - IP Address*
   - Protocol* (Select DNS from the drop down list.)
   - Port*
3. Select the Enable DNS64 option.
4. In the Services pane, bind the service to the virtual server.
5. In the Policies pane, bind the policy to the virtual server.

Stateful NAT64 Translation

May 11, 2012

The stateful NAT64 feature enables communication between IPv6 clients and IPv4 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance.

A stateful NAT64 configuration on the NetScaler appliance has the following components:

- **NAT64 rule**— An entry consisting of an ACL6 rule and a netprofile, which consists of a pool of NetScaler owned SNIP Addresses.
- **NAT64 IPv6 Prefix**— A global IPv6 prefix of length 96 bits (128-32=96) configured on the appliance.
  Note: Currently the NetScaler appliance supports only one prefix to be used commonly with all NAT 64 rules.

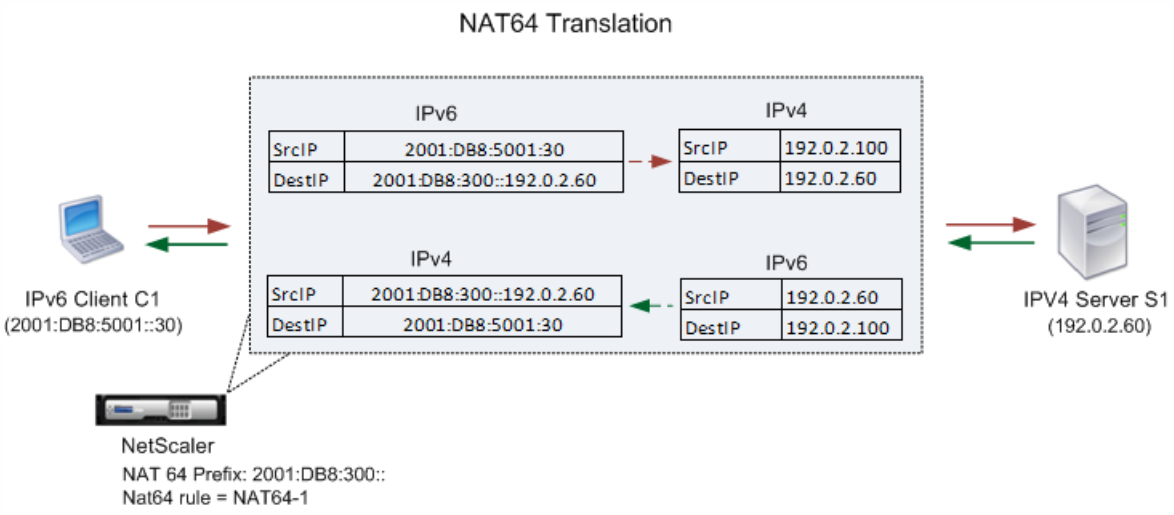
The NetScaler appliance considers an incoming IPv6 packet for NAT64 translation when all of the following conditions are met:

- The incoming IPv6 packet matches the ACL6 rule bound to a NAT64 rule.
- The destination IP address of the IPv6 packet matches the NAT64 IPv6 prefix.

When an IPv6 request packet received by the NetScaler appliance matches an ACL6 defined in a NAT64 rule and the destination IP of the packet matches the NAT64 IPv6 prefix, the NetScaler appliance considers the IPv6 packet for translation.

The appliance translates this IPv6 packet to an IPv4 packet with a source IP address matching one of the IP address bound to the netprofile defined in the NAT64 rule, and a destination IP address consisting of the last 32 bits of the destination IPv6 address of the IPv6 request packet. The NetScaler appliance creates a NAT64 session for this particular flow and forwards the packet to the IPv4 server. Subsequent responses from the IPv4 server and requests from the IPv6 client are translated accordingly by the appliance, on the basis of information in the particular NAT64 session.

Consider an example in which an enterprise hosts site www.example.com on server S1, which has an IPv4 address. To enable communication between IPv6 clients and IPv4 server S1, NetScaler appliance NS1 is deployed with a stateful NAT64 configuration that includes a NAT64 rule and a NAT64 prefix. A mapped IPv6 address of server S1 is formed by concatenating the NAT64 IPv6 prefix [96 bits] and the IPv4 source address [32 bits]. This mapped IPv6 address is then manually configured in the DNS servers. The IPv6 clients get the mapped IPv6 address from the DNS servers to communicate withIPv4 server S1.



The following table lists the settings used in this example:

Entities	Name	Value
IPv6 address of client CL1	Client_IPv6 (for reference purposes only)	2001:DB8:5001::30
IPv4 address of server S1	Sevr_IPv4 (for reference purposes only)	192.0.2.60
IPv6 prefix for NAT64 translation	NAT64_Prefix (for reference purposes only)	2001:DB8:300::
Mapped IPv6 address (NAT64_Prefix + Sevr_IPv4) of server S1 for IPv6 clients to reach server S1	Map-Sevr-IPv6 (for reference purposes only)	2001:DB8:300::192.0.2.60
ACL6 rule	ACL6-1	• Action = ALLOW • Source IP address =2001:DB8:5001::30
IPset	IPset-1	IP addresses bound (of type SNIPs) = 192.0.2.100 and 192.0.2.102
Netprofile	Netprofile-1	Source IP address = IPset-1
NAT64 rule	NAT64-1	ACL6 rule = ACL6-1 Netprofile = Netprofile-1

Following is the traffic flow in this example:

1. IPv6 client CL1 sends a request packet to Map-Sevr-IPv6 (2001:DB8:300::192.0.2.60) address.
2. The NetScaler appliance receives the request packet. If the request packet matches the ACL6 defined in the NAT64 rule, and the destination IP address of the packet matches the NAT64 IPv6 prefix, the NetScaler considers the IPv6 packet for translation.
3. The appliance creates a translated IPv4 request packet with:
   - Destination IP address field containing the NAT64 prefix stripped from the destination address of the IPv6 request (Sevr_IPv4 = 192.0.2.60)
   - Source IP address field containing one of the IPv4 address bound to Netprofile-1(in this case, 192.0.2.100)
4. The NetScaler appliance creates a NAT64 session for this flow and sends the translated IPv4 request to server S1.
5. IPv64 server S1 responds by sending an IPv4 packet to the NetScaler appliance with:
   - Destination IP address field containing 192.0.2.100
   - Source IP address field containing the address ofSevr_IPv4(192.0.2.60)
6. The appliance receives the IPv4 response packet, searches all the session entries, and finds that the IPv6 response packet matches the NAT64 session entry created in step 4. The appliance considers the IPv4 packet for translation.

7. The appliance creates a translated IPv6 response packet with:
   - Destination IP address field=Client_IPv6=2001:DB8:5001::30
   - Source IP address field = Concatenation of NAT64 Prefix (First 96 bits) and Sevr_IPv4 (last 32 bits) =2001:DB8:300::192.0.2.60
8. The appliance sends the translated IPv6 response to client CL1.

This section includes the following details:

- Limitations of Statelful NAT64
- Configuring Stateful NAT64

Limitations of Statelful NAT64

The following limitations apply to stateful NAT64 translation:

- Translation of IPv4 options is not supported.
- Translation of IPv6 routing headers is not supported.
- Translation of hop-by-hop extension headers of IPv6 packets is not supported.
- Translation of ESP and EH headers of IPv6 packets is not supported.
- Translation of multicast packets is not supported.
- Packets of Stream Control Transmission Protocol (SCTP), Datagram Congestion Control Protocol (DCCP), and IPSec, are not translated.

Configuring Stateful NAT64

Updated: 2013-10-31

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

1. Add an ACL6 rule with action ALLOW.
2. Add an ipset, which binds multiple IP addresses.
3. Add a netprofile and bind the ipset to it. If you want to bind only one IP address, you need not create an ipset entity. In that case, bind the IP address directly to the netprofile.
4. Add a NAT64 rule, which includes binding the ACl6 rule and the netprofile to the NAT 64 rule.
5. Add a NAT64 IPv6 prefix.

To add an ACL6 rule by using the command line interface

At the command prompt, type:

- add ns acl6 <acl6name> <acl6action> ...

To add an IPset and bind multiple IPs to it by using the command line interface

At the command prompt, type:

- add ipset <name>
- bind ipset <name> <IPaddress ...>

To add a netprofile by using the command line interface

At the command prompt, type:

- add netprofile <name> -srcIP <IPaddress or IPset>

To add a NAT64 rule by using the command line interface

At the command prompt, type:

- add nat64 <name> <acl6name> -netProfile <string>

To add a NAT64 prefix by using the command line interface

At the command prompt, type:

- set ipv6 -natprefix <ipv6_addr|*>

Example

```
 > add acl6 ACL6-1 ALLOW -srcIPv6 2001:DB8:5001::30
 Done

> apply acls6
 Done

> add ip 192.0.2.100 255.255.255.0 –type SNIP
 Done

> add ip 192.0.2.102 255.255.255.0  –type SNIP
 Done

> add ipset IPset-1
 Done

> bind ipset IPset-1 192.0.2.100 192.0.2.102
IPAddress "192.0.2.100" bound
IPAddress "192.0.2.102" bound
 Done

> add netprofile Netprofile-1 -srcIP IPset-1
 Done

> add nat64 NAT64-1 ACL6-1 -netprofile Netprofile-1
 Done

> set ipv6 -natprefix 2001:DB8:300::/96
 Done
```

To add a NAT64 rule by using the configuration utility

Navigate to System > Network > Routes > NAT64, and a new NAT64 rule, or edit an existing rule.

To add a NAT64 prefix by using the configuration utility

Navigate to System > Network, in the Settings group, click Configure INAT Parameters, and set the Prefix parameter.

Configuring RNAT

May 11, 2012

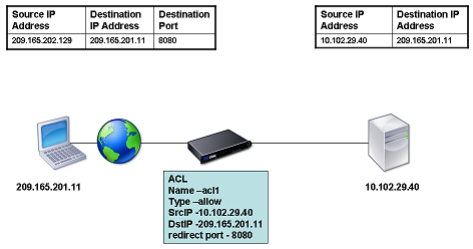
In Reverse Network Address Translation (RNAT), the NetScaler appliance replaces the source IP addresses in the packets generated by the servers with public NAT IP addresses. By default, the appliance uses a Mapped IP address (MIP) as the NAT IP address. You can also configure the appliance to use a unique NAT IP address for each subnet. You can also configure RNAT by using Access Control Lists (ACLs). Use Source IP (USIP), Use Subnet IP (USNIP), and Link Load Balancing (LLB) modes affect the operation of RNAT. You can display statistics to monitor RNAT.

Note: The ephemeral port range for RNAT on the NetScaler appliance is 1024-65535.
You can use either a network address or an extended ACL as the condition for an RNAT entry:

- **Using a Network address.** When you use a network address, RNAT processing is performed on all of the packets coming from the specified network.
- **Using Extended ACLs.** When you use ACLs, RNAT processing is performed on all packets that match the ACLs. To configure the NetScaler appliance to use a unique IP address for traffic that matches an ACL, you must perform the following three tasks:
  1. Configure the ACL.
  2. Configure RNAT to change the source IP address and Destination Port.
  3. Apply the ACL.

  The following diagram illustrates RNAT configured with an ACL.

  Figure 1. RNAT with an ACL

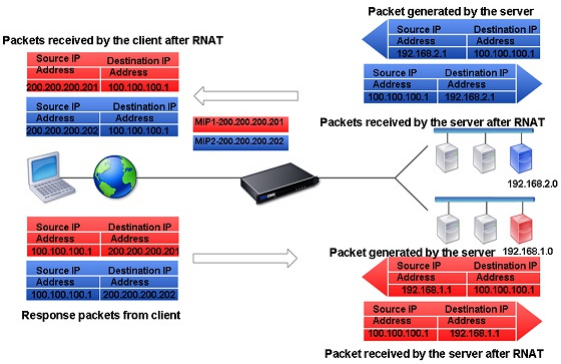


You have the following basic choices for the type of NAT IP address:

- **Using a MIP or SNIP as the NAT IP Address.** When using a MIP as the NAT IP address, the NetScaler appliance replaces the source IP addresses of server-generated packets with the a MIP. Therefore, the MIP address must be a public IP address. If Use Subnet IP (USNIP) mode is enabled, the NetScaler can use a subnet IP address (SNIP) as the NAT IP address.
- **Using a Unique IP Address as the NAT IP Address.** When using a unique IP address as the NAT IP address, the NetScaler appliance replaces the source IP addresses of server-generated packets with the unique IP address specified. The unique IP address must be a public NetScaler-owned IP address. If multiple NAT IP addresses are configured for a subnet, NAT IP selection uses the round robin algorithm.

  This configuration is illustrated in the following diagram.

  Figure 2. Using a Unique IP Address as the NAT IP Address



This section includes the following details:

- Creating an RNAT Entry
- Monitoring RNAT
- RNAT in USIP, USNIP, and LLB Modes
- Configuring RNAT for IPv6 Traffic

Creating an RNAT Entry

Updated: 2013-08-28

The following instructions provide separate command-line procedures for creating RNAT entries that use different conditions and different types of NAT IP addresses. In the configuration utility, all of the variations can be configured in the same dialog box, so there is only one procedure for configuration utility users.

To create an RNAT entry by using the command line interface

At the command prompt, type one the following commands to create, respectively, an RNAT entry that uses a network address as the condition and a MIP or SNIP as the NAT IP address, an RNAT entry that uses a network address as the condition and a unique IP address as the NAT IP address, an RNAT entry that uses an ACL as the condition and a MIP or SNIP as the NAT IP address, or an RNAT entry that uses an ACL as a condition and a unique IP address as the NAT IP address:

- set rnat <IPAddress> <netmask>
- set rnat IPAddress <netMask> -natip <NATIPAddress>
- set rnat <aclname> [-redirectPort <port>]
- set rnat <aclname> [-redirectPort <port>] -natIP <NATIPAddress>

Use the following command to verify the configuration:

- show rnat

Examples

A network address as the condition and a MIP or SNIP as the NAT IP address:

```
> set rnat 192.168.1.0 255.255.255.0
 Done
```

A network address as the condition and a unique IP address as the NAT IP address:

```
> set rnat 192.168.1.0 255.255.255.0 -natip 10.102.29.50
 Done
```

If instead of a single NAT IP address you specify a range, RNAT entries are created with all the NetScaler-owned IP addresses, except the NSIP, that fall within the range sp

```
> set rnat 192.168.1.0 255.255.255.0  -natIP 10.102.29.[50-110]
 Done
```

An ACL as the condition and a MIP or SNIP as the NAT IP address:

```
> set rnat acl1
 Done
```

An ACL as a condition and a unique IP address as the NAT IP address:

```
> set rnat acl1  -natIP 209.165.202.129
Done
```

If instead of a single NAT IP address you specify a range, RNAT entries are created with all the NetScaler-owned IP addresses, except the NSIP, that fall within the range sp

```
> set rnat acl1  -natIP 10.102.29.[50-70]
 Done
```

To create an RNAT entry by using the configuration utility

1. Navigate to System > Network > Routes > RNAT.
2. In the Action list, select Configure RNAT.

Monitoring RNAT

Updated: 2013-09-27

You can display RNAT statistics to troubleshoot issues related to IP address translation.

To view RNAT statistics by using the command line interface

At the command prompt, type:

stat rnat

Example

```
> stat rnat

RNAT summary
                        Rate (/s)          Total
Bytes Received                0                0
Bytes Sent                    0                0
Packets Received              0                0
Packets Sent                  0                0
Syn Sent                      0                0
Current RNAT sessions         --               0
 Done
>
```

The following tables describes the statistics associated with RNAT and RNAT IP.

Table 1. RNAT Statistics

Statistic	Description
Bytes received	Bytes received during RNAT sessions

Statistic	Description
Bytes sent	Bytes sent during RNAT sessions
Packets received	Packets received during RNAT sessions
Packets sent	Packets sent during RNAT sessions
Syn sent	Requests for connections sent during RNAT sessions
Current sessions	Currently active RNAT sessions

To monitor RNAT by using the configuration utility

Navigate to System > Network > Routes > RNAT, and click Statistics.

RNAT in USIP, USNIP, and LLB Modes

Updated: 2013-12-18

Before configuring a RNAT rule, consider the following points:

- When RNAT and Use Source IP (USIP) are both configured on the NetScaler appliance, RNAT takes precedence. In other words, the source IP address of the packets, which matches a RNAT rule, is replaced according to the setting in the RNAT rule.
- When RNAT and Use SNIP (USNIP) are configured on the NetScaler appliance, selection of the source IP address is based on the state of USNIP, as follows:
  - If USNIP is off, the NetScaler appliance uses the mapped IP addresses.
  - If USNIP is on, the NetScaler uses a SNIP address as the NAT IP address.

This behavior does not apply when a unique NAT IP address is used.

In a topology where the NetScaler appliance performs both Link Load Balancing (LLB) and RNAT for traffic originating from the server, the appliance selects the source IP address based on the router. The LLB configuration determines selection of the router. For more information about LLB, see "Link Load Balancing."

Configuring RNAT for IPv6 Traffic

Updated: 2013-10-31

Reverse Network Address Translation (RNAT) rules for IPv6 packets are called RNAT6s. When an IPv6 packet generated by a server matches the conditions specified in the RNAT6 rule, the appliance replaces the source IPv6 address of the IPv6 packet with a configured NAT IPv6 address before forwarding it to the destination. The NAT IPv6 address is one of the NetScaler owned SNIP6 or VIP6 addresses.

When configuring an RNAT6 rule, you can specify either an IPv6 prefix or an ACL6 as the condition:

- **Using a IPv6 network address**. When you use an IPv6 prefix, the appliance performs RNAT processing on those IPv6 packets whose IPv6 address matches the prefix.
- **Using ACL6s**. When you use an ACL6, the appliance performs RNAT processing on those IPv6 packets that match the conditions specified in the ACL6.

You have one of the following options to set the NAT IP address:

- Specify a set of NetScaler owned SNIP6 and VIP6 addresses for an RNAT6 rule. The NetScaler appliance uses any one of the IPv6 addresses from this set as a NAT IP address for each session. The selection is based on the round robin algorithm and is done for each session.
- Do not specify any NetScaler owned SNIP6 or VIP6 address for an RNAT6 rule. The NetScaler appliance uses any one of the NetScaler owned SNIP6 or VIP6 addresses as a NAT IP address. The selection is based on the next hop network to which an IPv6 packet that matches the RNAT rule is destined.

To create an RNAT6 rule by using the command line interface

At the command prompt, to create the rule and verify the configuration, type:

- add rnat6 <name> (<network> | (<acl6name> [-redirectPort <port>]))
- bind rnat6 <name> <natIP6>@ ...
- show rnat6

To modify or remove an RNAT6 rule by using the command line interface

- To modify an RNAT6 rule whose condition is an ACL6, type the set rnat6 <name> command, followed by a new value for the redirectPort parameter.
- To remove an RNAT6 rule, type the clear rnat6 <name> command.
- show rnat6

To configure an RNAT6 rule by using the configuration utility

Navigate to System > Network > Routes > RNAT6, and add a new RNAT6 rule, or edit an existing rule.

Configuring Prefix-Based IPv6-IPv4 Translation

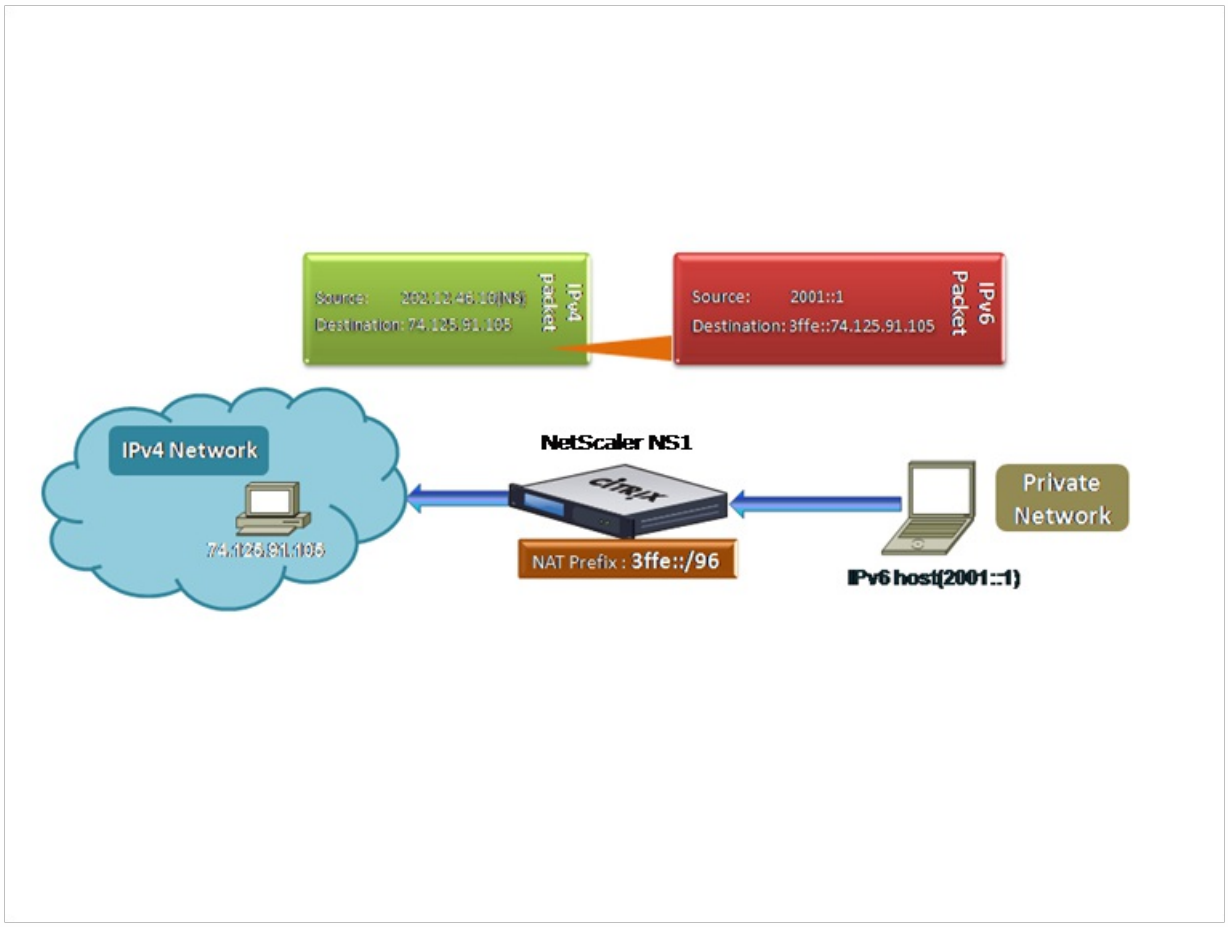
Aug 28, 2013

Prefix-based translation is a process of translating packets sent from private IPv6 servers into IPv4 packets, using an IPv6 prefix configured in the NetScaler appliance. This prefix has a length of 96 bits (128-32=96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix.

The NetScaler appliance compares the first 96 bits of the destination IP address of all the incoming IPv6 packets to the configured prefix. If there is a match, the NetScaler appliance generates an IPv4 packet and sets the destination IP address as the last 32 bits of the destination IP address of the matched IPv6 packet. IPv6 packets addressed to this prefix have to be routed to the NetScaler so that the IPv6-IPv4 translation is done by the NetScaler.

In the following diagram, 3ffe::/96 is configured as the IPv6 NAT prefix on NetScaler NS1. The IPv6 host sends an IPv6 packet with destination IP address 3ffe::74.125.91.105. NS1 compares the first 96 bits of the destination IP address of all the incoming IPv6 packets to the configured prefix, and they match. NS1 then generates an IPv4 packet and sets the destination IP address as 74.125.91.105.

Figure 1. IPv6-IPv4 Prefix-Based Translation



To configure prefix-based IPv6-IPv4 translation by using the command line interface

At the command prompt, type the following commands to set a NAT prefix and verify its configuration:

- set ipv6 [-natprefix <ipv6_addr|*>]
- show ipv6

Example

```
> set ipv6 -natprefix 3ffe::/96
 Done
```

To configure prefix-based IPv6-IPv4 translation by using the configuration utility

Navigate to System > Network, in the Settings group, click Configure INAT Parameters, and set the Prefix parameter.

Configuring Static ARP

Aug 28, 2013

You can add static ARP entries to and remove static ARP entries from the ARP table. After adding an entry, you should verify the configuration. If the IP address, port, or MAC address changes after you create a static ARP entry, you must remove or manually adjust the static entry. Therefore, creating static ARP entries is not recommended unless necessary.

To add a static ARP entry by using the command line interface

At the command prompt, type:

- add arp -IPAddress <ip_addr> -mac<mac_addr> -ifnum <interface_name>
- show arp <IPAddress>

Example

```
> add arp -ip 10.102.29.6 -mac 00:24:e8:73:ca:ec -ifnum 1/1
 Done
```

To remove a static ARP entry by using the command line interface

At the command prompt, type the rm arp command and the IP address.

To add a static ARP entry by using the configuration utility

Navigate to System > Network > ARP Table, and a new ARP entry.

Setting the Timeout for Dynamic ARP Entries

Aug 28, 2013

You can globally set an aging time (time-out value) for dynamically learned ARP entries. The new value applies only to ARP entries that are dynamically learned after the new value is set. Previously existing ARP entries expire after the previously configured aging time.

You can specify an ARP time-out value of from 1 through 1200 seconds.

To set the time-out for dynamic ARP entries by using the command line interface

At the command prompt, type the following commands to set the time-out for dynamic ARP entries and verify its configuration:

- set arpparam -timeout <positive_integer>]
- show arpparam

Example

```
> set arpparam -timeout 500
 Done
```

To set the time-out for dynamic ARP entries to its default value by using the command line interface

At the command prompt, type the following commands to set the time-out for dynamic ARP entries to its default value and verify its configuration:

- unset arpparam
- show arpparam

Example

```
> unset arpparam
 Done
```

To set the time-out for dynamic ARP entries by using the configuration utility

Navigate to System > Network, in the Settings group, click Configure ARP Global Parameters, and set the ARP Table Entry Timeout parameter.

Configuring Neighbor Discovery

May 10, 2012

Neighbor discovery (ND) is one of the most important protocols of IPv6. It is a message-based protocol that combines the functionality of the Address Resolution Protocol (ARP), Internet Control Message Protocol (ICMP), and Router Discovery. ND allows nodes to advertise their link layer addresses and obtain the MAC addresses or link layer addresses of the neighboring nodes. This process is performed by the Neighbor Discovery protocol (ND6).

Neighbor discovery can perform the following functions:

Router Discovery

Enables a host to discover the local routers on an attached link and automatically configure a default router.

Prefix Discovery

Enables the host to discover the network prefixes for local destinations.
Note: Currently, the NetScaler does not support Prefix Discovery.

Parameter Discovery

Enables a host to discover additional operating parameters, such as MTU and the default hop limit for outbound traffic.

Address Autoconfiguration

Enables hosts to automatically configure IP addresses for interfaces both with and without stateful address configuration services such as DHCPv6. The NetScaler does not support Address Autoconfiguration for Global IPv6 addresses.

Address Resolution

Equivalent to ARP in IPv4, enables a node to resolve a neighboring node's IPv6 address to its link-layer address.

Neighbor Unreachability Detection

Enables a node to determine the reachability state of a neighbor.

Duplicate Address Detection

Enables a node to determine whether an NSIP address is already in use by a neighboring node.

Redirect

Equivalent to the IPv4 ICMP Redirect message, enables a router to redirect the host to a better first-hop IPv6 address to reach a destination.

Note: The NetScaler does not support IPv6 Redirect.
To enable neighbor discovery, you create entries for the neighbors.

This section includes the following details:

- Adding IPv6 Neighbors
- Removing IPv6 Neighbors

Adding IPv6 Neighbors

Updated: 2013-08-28

Adding IPv6 neighbors enables neighbor discovery.

To add an IPv6 neighbor by using the command line interface

At the command prompt, type:

- add nd6 <neighbor> <mac> <ifnum> [-vlan <integer>]
- show nd6

Example

```
> add nd6 2001::1 00:04:23:be:3c:06 1/1 –vlan 1
 Done
> show nd6
   Neighbor             MAC-Address(Vlan, Interface)      State       TIME
   --------             ----------------------------      -----     --------
1) ::1                   00:d0:68:0b:58:da(   1,  LO/1)   REACHABLE    PERMANENT
2) fe80::2d0:68ff:fe0b:58da 00:d0:68:0b:58:da(   1,  LO/1)   REACHABLE    PERMANENT
3) 2001::1               00:04:23:be:3c:06(   1,   1/1)   REACHABLE      STATIC
 Done
```

To add an IPv6 neighbor by using the configuration utility

Navigate to System > Network > IPv6 Neighbors, and add a new IPv6 neighbor.

Removing IPv6 Neighbors

Updated: 2013-08-28

To remove a neighbor discovery entry by using the command line interface

At the command prompt, type:

rm nd6 <Neighbor> -vlan <VLANID>

Example

```
 rm nd6 3ffe:100:100::1 -vlan 1
```

To remove all neighbor discovery entries by using the command line interface

At the command prompt, type:

clear nd6

To remove a neighbor discovery entry by using the configuration utility

Navigate to System > Network > IPv6 Neighbors, delete the IPv6 neighbor.

To remove all neighbor discovery entries by using the configuration utility

Navigate to System > Network > IPv6 Neighbors, and click Clear.

Configuring IP Tunnels

Mar 20, 2012

An IP Tunnel is a communication channel, that can be created by using encapsulation technologies, between two networks that do not have a routing path. Every IP packet that is shared between the two networks is encapsulated within another packet and then sent via the tunnel.

The NetScaler appliance implements IP Tunneling in the following ways:

- NetScaler as an Encapsulator (Load Balancing with DSR mode)
- NetScaler as a Decapsulator

NetScaler as an Encapsulator (Load Balancing with DSR Mode)

Consider an organization that has multiple data centers across different countries, where the NetScaler maybe at one location and the back-end servers are located in a different country. In essence, the NetScaler and the back-end servers are on different networks and are connected via a router.

When you configure Direct Server Return (DSR) on this NetScaler, the packet sent from the source subnet is encapsulated by the NetScaler and sent via a router and tunnel to the appropriate back-end server. The back-end server decapsulates the packet and responds directly to the client, without allowing the packet to pass via the NetScaler.

NetScaler as a Decapsulator

Consider an organization having multiple data centers each having NetScalers and back-end servers. When a packet is sent from data center A to data center B it is usually sent via an intermediary, say a router or another NetScaler. The NetScaler processes the packet and then forwards the packet to the back-end server. However, if an encapsulated packet is sent, the NetScaler must be able to decapsulate the packet before sending it to the back-end servers. To enable the NetScaler to function as a decapsulator, a tunnel is added between the router and the NetScaler. When the encapsulated packet, with additional header information, reaches the NetScaler, the data packet is decapsulated i.e. the additional header information is removed, and the packet is then forwarded to the appropriate back-end servers.

The NetScaler can also be used as a decapsulator for the Load Balancing feature, specifically in scenarios when the number of connections on a vserver exceeds a threshold value and all the new connections are then diverted to a back-up vserver.

This section includes the following details:

- Creating IP Tunnels
- Customizing IP Tunnels Globally

Creating IP Tunnels

Updated: 2013-10-31

To create an IP tunnel by using the command line interface

At the command prompt type:

- add iptunnel <name> <remote> <remoteSubnetMask> <local> -type -protocol (ipoverip | GRE) -ipsecprofile <name>
- show iptunnel

Note: While configuring an IP tunnel in a cluster setup, the local IP address must be a striped SNIP or MIP address.

To remove an IP tunnel by using the command line interface

To remove an IP tunnel, type the rm iptunnel command and the name of the tunnel.

To create an IP Tunnel by using the configuration utility

Navigate to System > Network > IP Tunnels, add a new IP tunnel.

To create an IPv6 tunnel by using the command line interface

At the command prompt type:

- add ip6tunnel <name> <remoteIp> <local>
- show ip6tunnel

To remove an IPv6 tunnel by using the command line interface

To remove an IPv6 tunnel, type the rm ip6tunnel command and the name of the tunnel.

To create an IPv6 Tunnel by using the configuration utility

Navigate to System > Network > IP Tunnels > IPv6 Tunnels, and add a new IPv6 tunnel.

Customizing IP Tunnels Globally

Updated: 2013-10-31

By globally specifying the source IP address, you can assign a common source IP address across all tunnels. Also, because fragmentation is CPU-intensive, you can globally specify that the NetScaler appliance drop any packet that requires fragmentation. Alternatively, if you would like to fragment all packets as long as a CPU threshold value is not reached, you can globally specify the CPU threshold value.

To globally customize IP tunnels by using the command line interface

At the command prompt, type the following commands to globally customize IP tunnels and verify the configuration:

- set ipTunnelParam -srcIP <sourceIPAddress> -srcIPRoundRobin (YES | NO)-dropFrag [YES | NO] -dropFragCpuThreshold <Positive integer>
- show ipTunnelParam

Example

```
> set iptunnelparam –srcIP 12.12.12.22 -dropFrag Yes –dropFragCpuThreshold 50
 Done
> set iptunnelparam -srcIPRoundRobin YES -dropFrag Yes –dropFragCpuThreshold 50
 Done
```

Note: To create a new MIP or SNIP address to use as the global source IP address, use the add ns ip command before you type the set iptunnelparam command.

To globally customize IP tunnels by using the configuration utility

Navigate to System > Network, in the Settings group, click IPv4 Tunnel Global Settings.

1. Navigate to System > Network.
2. In the details pane, in the Settings group, click IPv4 Tunnel Global Settings.
3. In the Configure IP Tunnel Global Parameters dialog box, set the parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
4. Click OK and then click Close.

To globally customize IPv6 tunnels by using the command line interface

At the command prompt, type the following commands to globally customize IPv6 tunnels and verify the configuration:

- set ip6tunnelparam -srcIP <IPv6Address> -srcIPRoundRobin (YES | NO)-dropFrag [YES | NO] -dropFragCpuThreshold <Positive integer>
- show ip6tunnelparam

Note: To create a new VIP6 or SNIP6 address to use as the global source IP address, use the add ns ip6 command before you type the set ip6tunnelparam command.

To globally customize IPv6 tunnels by using the configuration utility

Navigate to System > Network, in the Settings group, click IPv6 Tunnel Global Settings.

Interfaces

Nov 13, 2015

Before you begin configuring interfaces, decide whether your configuration can use MAC-based forwarding mode, and either enable or disable this system setting accordingly. The number of interfaces in your configuration is different for the different models of the Citrix NetScaler appliance. In addition to configuring individual interfaces, you can logically group interfaces, using VLANs to restrict data flow within a set of interfaces, and you can aggregate links into channels. In a high availability setup, you can configure a virtual MAC (VMAC) address if necessary. If you use L2 mode, you might want to modify the aging of the bridge table.

When your configuration is complete, decide whether you should enable the system setting for path MTU discovery. NetScaler appliances can be deployed in active-active mode using VRRP. An active-active deployment, in addition to preventing downtime, makes efficient use of all the NetScaler appliances in the deployment. You can use the Network Visualizer tool to view the network configuration of a NetScaler deployment and configure interfaces, channels, VLANs, and bridge groups.

This document includes the following information:

- Configuring MAC-Based Forwarding
- Configuring Network Interfaces
- Configuring Forwarding Session Rules
- Understanding VLANs
- Configuring a VLAN
- Configuring NSVLAN
- Configuring Bridge Groups
- Configuring VMACs
- Configuring Link Aggregation

Configuring MAC-Based Forwarding

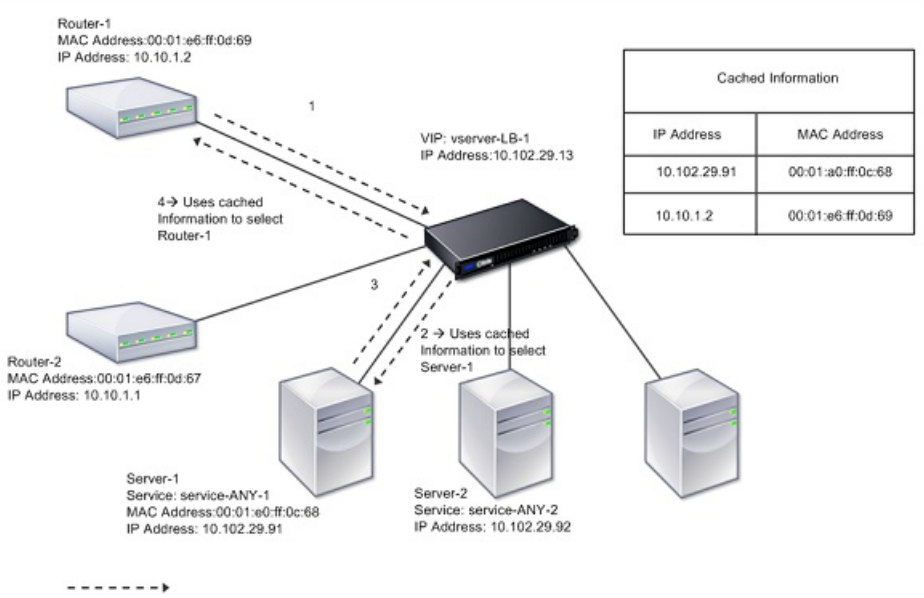
Oct 31, 2013

With MAC-based forwarding (MBF) enabled, when a request reaches the NetScaler appliance, the appliance remembers the source MAC address of the frame and uses it as the destination MAC address for the resulting replies. MAC-based forwarding can be used to avoid multiple-route/ARP lookups and to avoid asymmetrical packet flows. MAC-based forwarding may be required when the NetScaler is connected to multiple stateful devices, such as VPNs or firewalls, because it ensures that the return traffic is sent to the same device that the initial traffic came from.

MAC-based forwarding is useful when you use VPN devices, because it guarantees that all traffic flowing through a VPN passes back through the same VPN device.

The following topology diagram illustrates the process of MAC-based forwarding.

Figure 1. MAC-Based Forwarding Mode



When MAC-based forwarding (MBF) is enabled, the NetScaler caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server replies through the NetScaler appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when the NetScaler initiates a connection, it uses the route and ARP tables for the lookup function. In a direct server return configuration, you must enable MAC-based forwarding.

For more information about direct server return configurations, see "Load Balancing."

Some deployment topologies may require the incoming and outgoing paths to flow through different routers. MAC-based forwarding would break this topology design.

MBF should be disabled in the following situations:

- **When you configure link load balancing.** In this case, asymmetric traffic flows are desirable because of link costs.
- **When a server uses network interface card (NIC) teaming without using LACP (802.1ad Link Aggregation).** To enable MAC-based forwarding in this situation, you must use a layer 3 device between the NetScaler and server.
  Note: MBF can be enabled when the server uses NIC teaming with LACP, because the virtual interface uses one MAC address.
- When firewall clustering is used. Firewall clustering assumes that ARP is used to resolve the MAC address for inbound traffic. Sometimes the inbound MAC address can be a non-clustered MAC address and should not be used for inbound packet processing.

When MBF is disabled, the NetScaler uses L2 or L3 connectivity to forward the responses from servers to the clients. Depending on the route table, the routers used for outgoing connection and incoming connection can be different. In the case of reverse traffic (response from the server):

- If the source and destination are on different IP subnets, the NetScaler uses the route lookup to locate the destination.
- If the source is on the same subnet as the destination, the NetScaler looks up the ARP table to locate the network interface and forwards the traffic to it. If the ARP table does not exist, the NetScaler requests the ARP entries.

To enable or disable MAC-based forwarding by using the command line interface

At the command prompt, type:

- enable ns mode MBF
- disable ns mode MBF

To enable or disable MAC-based forwarding by using the configuration utility

1. Navigate to System > Settings, in the Modes and Features group, click Configure modes.
2. Select or clear the MAC-based forwarding option.

Configuring Network Interfaces

Nov 13, 2015

Network interfaces in the NetScaler appliance are numbered in <slot>/<port> notation. After configuring your interfaces, you should display the interfaces and their settings to verify the configuration. You can also display this information to troubleshoot a problem in the configuration.

To manage the network interfaces, you might have to enable some interfaces and disable others. You can reset an interface to renegotiate its settings. You can clear the accumulated statistics for an interface. To verify the configuration, you can display the interface settings. You can display the statistics for an interface to evaluate its health.

Setting the Network Interface Parameters

Updated: 2013-09-06

The network interface configuration is neither synchronized nor propagated. For an HA pair, you must perform the configuration on each unit independently.

Network interface parameters include Link Aggregate Control Protocol (LACP) settings. For more information about Link Aggregate Control Protocol (LACP), see "Configuring Link Aggregation Using the Link Aggregate Channel Protocol."

To set the network interface parameters by using the command line interface

At the command prompt, type:

- set interface <id> [-speed <speed>] [-duplex <duplex>] [-flowControl <flowControl>] [-autoneg (DISABLED | ENABLED)] [-haMonitor (ON | OFF)] [(ON | OFF)] [-tagall (ON | OFF)] [-lacpMode <lacpMode>] [-lacpKey<positive_integer>] [-lacpPriority <positive_integer>] [-lacpTimeout (LONG | SHORT)] [-ifAlias <string>] [-throughput <positive_integer>][-bandwidthHigh <positive_integer> [-bandwidthNormal <positive_integer>]]
- show interface [<id>]

Example

```
> set interface 1/8 -duplex full
 Done
```

To set the network interface parameters by using the configuration utility

Navigate to System > Network > Interfaces, select the network interface that you want to modify (for example, 1/8), click OpenEdit, and then set the parameters.

Enabling and Disabling Network Interfaces

Updated: 2013-08-29

By default, the network interfaces are enabled. You must disable any network interface that is not connected to the network, so that it cannot send or receive packets. Disabling a network interface that is connected to the network in a high availability setup can cause failover.

For more information about high availability, see "High Availability."

To enable or disable a network interface by using the command line interface

At the command prompt, type one of the following pairs of commands to enable or disable an interface and verify the setting:

- enable interface <interface_num>
- show interface <interface_num>
- disable interface <interface_num>
- show interface <interface_num>

Example

```
> enable interface 1/8
 Done
> show interface 1/8
      Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
      flags=0x4004000 <ENABLED, DOWN, BOUND to LA/1, down, autoneg, 802.1q>
      MTU=1514, MAC=00:d0:68:15:fd:3d, downtime 906h58m40s
      Requested: media UTP, speed AUTO, duplex FULL, fctl OFF, throughput 0
      RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
      TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
      NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
      Bandwidth thresholds are not set.
Done
```

To enable or disable a network interface by using the configuration utility

1. Navigate to System > Network > Interfaces.
2. Select the network interface and, in the Action list, select Enable or Disable.

Resetting Network Interfaces

Updated: 2013-09-30

Network interface settings control properties such as duplex and speed. To renegotiate the settings of a network interface, you must reset it.

To reset a network interface by using the command line interface

At the command prompt, type the following commands to reset an interface and verify the setting:

- reset interface <interface_num>
- show interface <interface_num>

Example

```
> reset interface 1/8
 Done
```

To reset a network interface by using the configuration utility

1. Navigate to System > Network > Interfaces.
2. Select the network interface and, in the Action list, select Reset Interface.

Monitoring a Network Interface

Updated: 2013-08-29

You can display network interface statistics to monitor parameters such as packets sent and packets received, throughput, Link Aggregate Control Protocol (LACP) data units, and errors, and use the information to check the health of the network interface. You can clear the statistics of a network interface to monitor its statistics from the time the statistics are cleared.

To display the statistics of the network interfaces by using the command line interface

At the command prompt, type:

stat interface <interface_num>

To display the statistics of an Interface by using the configuration utility

Navigate to System > Network > Interfaces, select the network interface, and click StatisticsInterface Statistics.

To clear a network interface's statistics by using the command line interface

At the command prompt, type:

clear interface <interface_num>

Example

```
> clear interface 1/8
 Done
```

To clear a network interface's statistics by using the configuration utility

1. Navigate to System > Network > Interfaces.
2. Select the network interface and, in the Action list, select Clear Statistics.

Configuring Forwarding Session Rules

Jun 11, 2014

By default, the NetScaler appliance does not create session entries for traffic that it only forwards (L3 mode). For a case in which a client request that the appliance forwards to a server results in a response that has to return by the same path, you can create a forwarding-session rule. A forwarding-session rule creates forwarding-session entries for traffic that originates from or is destined for a particular network and is forwarded by the NetScaler. You can create forwarding session rules for IPv4 traffic as well as IPv6 traffic.

When configuring an IPv4 forwarding-session rule, you can specify either an IPv4 network address or an extended ACL as the condition for identifying IPv4 traffic for which to create a forwarding-session entry:

- **Network address**. When you specify an IPv4 network address, the appliance creates forwarding sessions for IPv4 traffic whose source or destination matches the network address.
- **Extended ACL rule**. When you specify an extended ACL rule, the appliance creates forwarding sessions for IPv4 traffic that matches the conditions specified in the extended ACL rule.

When configuring an IPv6 forwarding-session rule, you can specify either an IPv6 prefix or an ACL6 as the condition for identifying IPv6 traffic for which to create a forwarding-session entry:

- **IPv6 prefix**. When you specify an IPv6 prefix, the appliance creates forwarding sessions for IPv6 traffic whose source or destination matches the IPv6 prefix.
- **ACL6 rule**. When you specify an ACL6 rule, the appliance creates forwarding sessions for IPv6 traffic that matches the conditions specified in the ACL6 rule.

To create an IPv4 forwarding session rule by using the command line interface

At the command prompt, type the following commands to create a forwarding-session rule and verify the configuration:

- add forwardingSession <name> [<network> <netmask>] | [-aclname <string>] -connfailover (ENABLED | DISABLED)
- show forwardingSession

Example

A network address as the condition:

```
> add forwardingSession fs-nw-1 10.102.105.51 255.255.255.255
 Done
```

An ACL as the condition:

```
> add forwardingSession fs-acl-1 acl1
 Done
```

To configure an IPv4 forwarding session rule by using the configuration utility

Navigate to System > Network > Forwarding Sessions, add a new IPv4 forwarding session, or edit an existing forwarding session.

To create an IPv6 forwarding session rule by using the command line interface

At the command prompt, type the following commands to create a forwarding-session rule and verify the configuration:

- add forwardingSession <name> [<IPv6 prefix>] | [-acl6name <string>]

- show forwardingSession

Example

An IPv6 prefix as the condition:

```
> add forwardingSession fsv6-pfx-1 3ffe::/64
 Done
```

An ACL6 rule as the condition:

```
> add forwardingSession fsv6-acl6-1 –acl6name ACL6-FS
 Done
```

To configure an IPv6 forwarding session rule by using the configuration utility

Navigate to System > Network > Forwarding Sessions, add a new IPv6 forwarding session, or edit an existing forwarding session.

Understanding VLANs

Mar 19, 2012

A NetScaler appliance supports Layer 2 port and IEEE 802.1q tagged VLANs. VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface as a part of multiple VLANs by using IEEE 802.1q tagging.

You can configure VLANs and bind them to IP subnets. The NetScaler then performs IP forwarding between these VLANs (if it is configured as the default router for the hosts on these subnets).

The NetScaler supports the following types of VLANs:

Port-Based VLANs. The membership of a port-based VLAN is defined by a set of network interfaces that share a common, exclusive Layer 2 broadcast domain. You can configure multiple port-based VLANs. By default, all network interfaces on the NetScaler are members of VLAN 1.

If you apply 802.1q tagging to the port, the network interface belongs to a port-based VLAN. Layer 2 traffic is bridged within a port-based VLAN, and Layer 2 broadcasts are sent to all members of the VLAN if Layer 2 mode is enabled. When you add an untagged network interface as a member of a new VLAN, it is removed from its current VLAN.

Default VLAN. By default, the network interfaces on the NetScaler are included in a single, port-based VLAN as untagged network interfaces. This VLAN is the default VLAN. It has a VLAN ID (VID) of 1. This VLAN exists permanently. It cannot be deleted, and its VID cannot be changed.

When you add a network interface to a to a different VLAN as an untagged member, the network interface is automatically removed from the default VLAN. If you unbind a network interface from its current port-based VLAN, it is added to the default VLAN again.

Tagged VLANs. 802.1q tagging (defined in the IEEE 802.1q standard) allows a networking device (such as the NetScaler) to add information to a frame at Layer 2 to identify the VLAN membership of the frame. Tagging allows network environments to have VLANs that span multiple devices. A device that receives the packet reads the tag and recognizes the VLAN to which the frame belongs. Some network devices do not support receiving both tagged and untagged packets on the same network interface—in particular, Force10 switches. In such cases, you need to contact customer support for assistance.

The network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of one VLAN only (its native VLAN). This network interface transmits the frames for the native VLAN as untagged frames. A network interface can be a part of more than one VLAN if the other VLANs are tagged.

When you configure tagging, be sure to match the configuration of the VLAN on both ends of the link. The port to which the NetScaler connects must be on the same VLAN as the NetScaler network interface.

Note: This VLAN configuration is neither synchronized nor propagated, therefore you must perform the configuration on each unit in an HA pair independently.

Applying Rules to Classify Frames

VLANs have two types of rules for classifying frames:

Ingress rules. Ingress rules classify each frame as belonging only to a single VLAN. When a frame is received on a network interface, the following rules are applied to classify the frame:

- If the frame is untagged, or has a tag value equal to 0, the VID of the frame is set to the port VID (PVID) of the receiving interface, which is classified as belonging to the native VLAN. (PVIDs are defined in the IEEE 802.1q standard.)
- If frame has a tag value equal to FFF, the frame is dropped.
- If the VID of the frame specifies a VLAN of which the receiving network interface is not a member, the frame is dropped. For example, if a packet is sent from a subnet associated with VLAN ID 12 to a subnet associated with VLAN ID 10, the packet is dropped. If an untagged packet with VID 9 is sent from the subnet associated with VLAN ID 10 to a network interface PVID 9, the packet is dropped.

Egress Rules. The following egress rules are applied:
- If the VID of the frame specifies a VLAN of which the transmission network interface is not a member, the frame is discarded.
- During the learning process (defined by the IEEE 802.1q standard), the Src MAC and VID are used to update the bridge lookup table of the NetScaler.
- A frame is discarded if its VID specifies a VLAN that does not have any members. (You define members by binding network interfaces to a VLAN.)

VLANs and Packet Forwarding on the NetScaler

The forwarding process on the NetScaler appliance is similar to that on any standard switch. However, the NetScaler performs forwarding only when Layer 2 mode is on. The key features of the forwarding process are:
- Topology restrictions are enforced. Enforcement involves selecting each network interface in the VLAN as a transmission port (depending on the state of the network interface), bridging restrictions (do not forward on the receiving network interface), and MTU restrictions.
- Frames are filtered on the basis of information in the bridge table lookup in the forwarding database (FDB) table of the NetScaler. The bridge table lookup is based on the destination MAC and the VID. Packets addressed to the MAC address of the NetScaler are processed at the upper layers.
- All broadcast and multicast frames are forwarded to each network interface that is a member of the VLAN, but forwarding occurs only if L2 mode is enabled. If L2 mode is disabled, the broadcast and multicast packets are dropped. This is also true for MAC addresses that are not currently in the bridging table.
- A VLAN entry has a list of member network interfaces that are part of its untagged member set. When forwarding frames to these network interfaces, a tag is not inserted in the frame.
- If the network interface is a tagged member of this VLAN, the tag is inserted in the frame when the frame is forwarded.

When a user sends any broadcast or multicast packets without the VLAN being identified, that is, during duplicate address detection (DAD) for NSIP or ND6 for the next hop of the route, the packet is sent out on all the network interfaces, with appropriate tagging based on either the Ingress and Egress rules. ND6 usually identifies a VLAN, and a data packet is sent on this VLAN only. Port-based VLANs are common to IPv4 and IPv6. For IPv6, the NetScaler supports prefix-based VLANs.

Configuring a VLAN

May 26, 2015

You can implement VLANs in the following environments:

- Single subnet
- Multiple subnets
- Single LAN
- VLANs (no tagging)
- VLANs (802.1q tagging)

If you configure VLANs that have only untagged network interfaces as their members, the total number of possible VLANs is limited to the number of network interfaces available in the NetScaler. If more IP subnets are required with a VLAN configuration, 802.1q tagging must be used.

When you bind a network interface to a VLAN, the network interface is removed from the default VLAN. If the network interfaces need to be a part of more than one VLAN, you can bind the network interfaces to the VLANs as tagged members.

You can configure the NetScaler to forward traffic between VLANs at Layer 3. In this case, a VLAN is associated with a single IP subnet. The hosts in a VLAN that belong to a single subnet use the same subnet mask and one or more default gateways connected to that subnet. Configuring Layer 3 for a VLAN is optional. Layer 3 is used for IP forwarding (inter-VLAN routing). Each VLAN has a unique IP address and subnet mask that define an IP subnet for the VLAN. In an HA configuration, this IP address is shared with the other NetScaler appliances. The NetScaler forwards packets between configured IP subnets (VLANs).

When you configure the NetScaler, you must not create overlapping IP subnets. Doing so impedes Layer 3 functionality.

Each VLAN is a unique Layer 2 broadcast domain. Two VLANs, each bound to separate IP subnets, cannot be combined into a single broadcast domain. Forwarding traffic between two VLANs requires a Layer 3 forwarding (routing) device, such as the NetScaler appliance.

Configuring VLANs in an HA Setup

VLAN configuration for a high-availability setup requires that the NetScaler appliances have the same hardware configuration, and the VLANs configured on them must be mirror images.

The correct VLAN configuration is implemented automatically when the configuration is synchronized between the NetScaler appliances. The result is identical actions on all the appliances. For example, adding network interface 0/1 to VLAN2 adds this network interface to VLAN 2 on all the appliances participating in the high-availability setup.

Note: If you use network-interface-specific commands in an HA setup, the configurations you create are not propagated to the other NetScaler appliance. You must perform these commands on each appliance in an HA pair to ensure that the configuration of the two appliances in the HA pair remains synchronized.

Creating or Modifying a VLAN

Updated: 2013-08-29

To configure a VLAN, you create a VLAN entity, and then bind network interfaces and IP addresses to the VLAN. If you remove a VLAN, its member interfaces are added to the default VLAN.

To create a VLAN by using the command line interface

At the command prompt, type:

add vlan <id> [-aliasName <string>] [-ipv6DynamicRouting (ENABLED | DISABLED)]
Example

```
> add vlan 2 –aliasName “Network A”  Done
```

To bind an interface to a VLAN by using the command line interface

At the command prompt, type:

bind vlan <id> -ifnum <slot/port>
Example

```
> bind vlan 2 -ifnum 1/8  Done
```

To bind an IP address to a VLAN by using the command line interface

At the command prompt, type:

bind vlan <id> -IPAddress <IPAddress> <netMask>
Example

```
> bind vlan 2 -IPAddress 10.102.29.54 255.255.255.0  Done
```

To remove a VLAN by using the command line interface

At the command prompt, type:

rm vlan <id>

To configure a VLAN by using the configuration utility

1. Navigate to System > Network > VLANs, add a new VLAN, or edit an existing VLAN.
2. To bind an IP address to a VLAN, under IP Bindings, select the Active option corresponding to the IP address that you want to bind to the VLAN (for example, 10.102.29.54). The Type column displays the IP address type (such as mapped IP, virtual IP, or subnet IP) for each IP address in the IP Address column.
3. To bind a network interface to a VLAN, under Interface Bindings, select the Active option corresponding to the interface that you want to bind to the VLAN.

Monitoring VLANS

Updated: 2013-08-29

You can display VLAN statistics such as packets received, bytes received, packets sent, and bytes sent, and use the information to identify anomalies and or debug a VLAN.

To view the statistics of a VLAN by using the command line interface

At the command prompt, type:

stat vlan <vlanID>
Example

```
stat vlan 2
```

To view the statistics of a VLAN by using the configuration utility

1. Navigate to System > Network > VLANs.
2. Select the VLAN, and click Statistics.

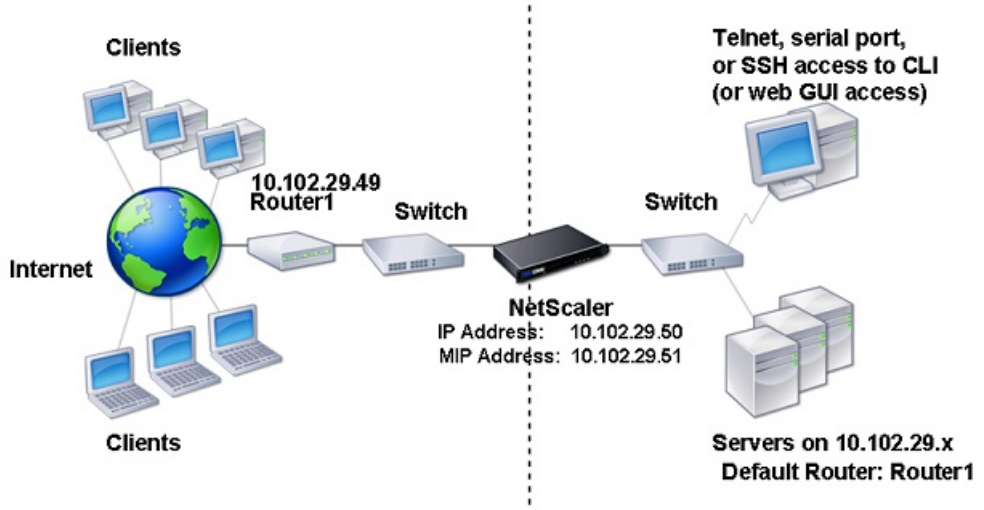
Configuring VLANs on a Single Subnet

Aug 29, 2013

Before configuring a VLAN on a single subnet, make sure that Layer 2 Mode is enabled.

The following figure shows a single subnet environment

Figure 1. VLAN on a Single Subnet



In the above figure:

1. The default router for the NetScaler and the servers is Router 1.
2. Layer 2 mode must be enabled on the NetScaler for the NetScaler to have direct access to the servers.
3. For this subnet, a virtual server can be configured for load balancing on the NetScaler appliance.

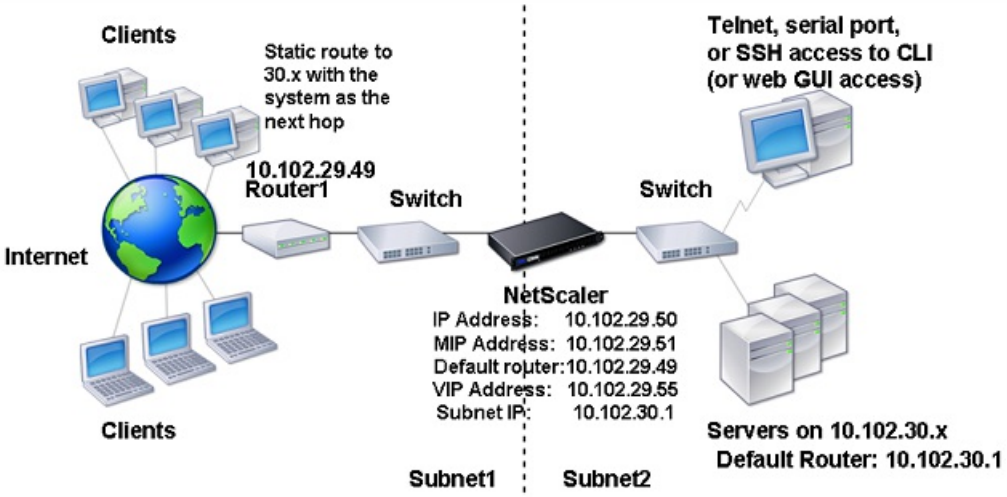
To configure a VLAN on a single subnet, follow the procedures described in "Creating or Modifying a VLAN" in Configuring a VLAN. VLAN configuration parameters are not required, because the network interfaces are members of this VLAN.

Configuring VLANs on Multiple Subnets

Aug 29, 2013

To configure a single VLAN across multiple subnets, you must add a VIP for the VLAN and configure the routing appropriately. The following figure shows a single VLAN configured across multiple subnets.

Figure 1. Multiple Subnets in a Single VLAN



To configure a single VLAN across multiple subnets, perform the following tasks:

1. Disable Layer 2 mode. For the procedure to disable Layer 2 mode, see "Enabling and Disabling Layer 2 Mode."
2. Add a VIP.

   For the procedure to add a VIP, see "Configuring and Managing Virtual IP Addresses (VIPs)."
3. Configure RNAT ID.

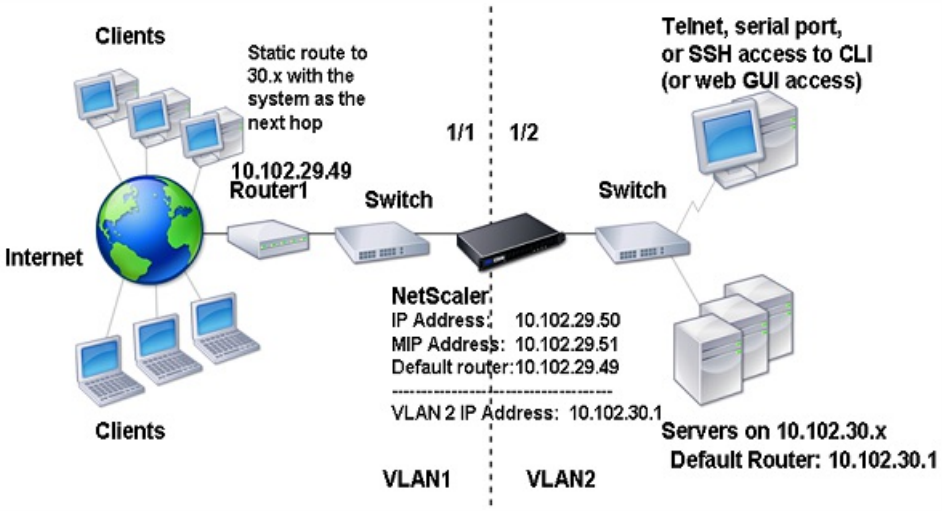
   For the procedure to configure the RNAT ID, see "Configuring RNAT."

Configuring Multiple Untagged VLANs across Multiple Subnets

Aug 29, 2013

In environments with multiple untagged VLANs across multiple subnets, a VLAN is configured for each IP subnet. A network interface is bound to one VLAN only. The following figure shows this configuration.

Figure 1. Multiple Subnets with VLANs - No Tagging



To implement the configuration shown in the above figure, perform the following tasks:

1. Add VLAN 2.

   For the procedure to create a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

2. Bind the 1/2 network interface of the NetScaler to VLAN 2 as an untagged network interface.

   For the procedure to bind a network interface to a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

3. Bind the IP address and subnet mask to VLAN 2.

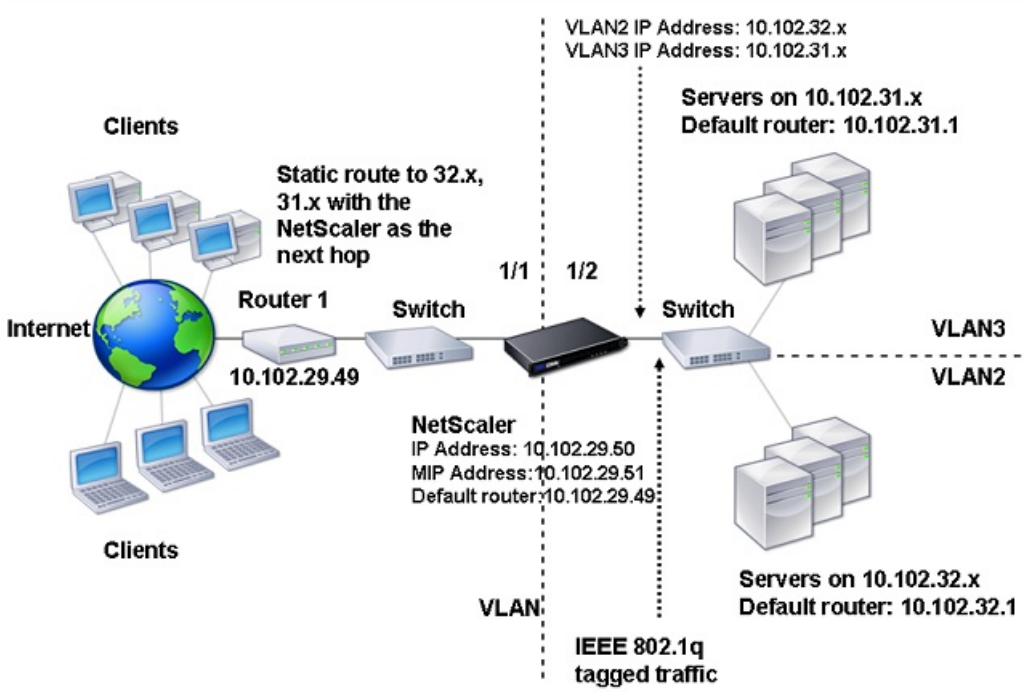
   For the procedure to bind a network interface to a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

Configuring Multiple VLANs with 802.1q Tagging

Aug 29, 2013

For multiple VLANs with 802.1q tagging, each VLAN is configured with a different IP subnet. Each network interface is in one VLAN. One of the VLANs is set up as tagged. The following figure shows this configuration.

Figure 1. Multiple VLANs with IEEE 802.1q Tagging



To implement the configuration shown in the above figure, perform the following tasks:

1. Add VLAN 2.

   For the procedure to create a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

2. Bind the 1/2 network interface of the NetScaler to VLAN 2 as an untagged network interface.

   For the procedure to bind a network interface to a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

3. Bind the IP address and netmask to VLAN 2.

   For the procedure to bind an IP address to a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

4. Add VLAN 3.

   For the procedure to create a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

5. Bind the 1/2 network interface of the NetScaler to VLAN 3 as a tagged network interface.

   For the procedure to bind a network interface to a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

   For the procedure to bind a tagged network interface, see "Creating or Modifying a VLAN" in Configuring a VLAN.

6. Bind the IP address and netmask to VLAN 3.

For the procedure to bind an IP address to a VLAN, see "Creating or Modifying a VLAN" in Configuring a VLAN.

Configuring NSVLAN

Jul 05, 2013

NSVLAN is a VLAN to which the NetScaler management IP (NSIP) address's subnet is bound. The NSIP subnet is available only on interfaces that are associated with NSVLAN. By default, NSVLAN is VLAN1, but you can designate a different VLAN as NSVLAN. If you do so, you must reboot the NetScaler appliance for the change to take effect. After the reboot, NSIP subnet traffic is restricted to the new NSVLAN.

The traffic from the NetScaler IP subnet can be tagged (802.1q) with the VLAN ID specified for NSVLAN. You must configure the attached switch interface to tag and allow this same VLAN ID on the connected interface.

If you remove your NSVLAN configuration, the NSIP subnet is automatically bound to VLAN1, restoring the default NSVLAN.

To configure NSVLAN by using the command line interface

At the command prompt, type:

- set ns config -nsvlan <positive_integer> -ifnum <interface_name> ... [-tagged (YES | NO)]
- show ns config

Note: The configuration takes effect after the NetScaler appliance is rebooted.

Example

```
> set ns config -nsvlan 300 -ifnum 1/1 1/2 1/3 -tagged NO
 Done

> save config
 Done
```

To restore the default NSVLAN configuration by using the command line interface

At the command prompt, type:

- unset ns config -nsvlan
- show ns config

Example

```
> unset ns config -nsvlan
 Done
```

To configure NSVLAN by using the configuration utility

Navigate to System > Settings, in the Settings group, click Change NSVLAN Settings.

Configuring Bridge Groups

Aug 29, 2013

Typically, when you want to merge two or more VLANs into a single domain, you change the VLAN configuration on all the devices in the separate domains. This can be a tedious task. To more easily merge multiple VLANs into a single broadcast domain, you can use bridge groups.

The bridge groups feature works the same way as a VLAN. Multiple VLANS can be bound to a single bridge group, and all VLANs bound to same bridge group form a single broadcast domain. You can bind only Layer 2 VLANs to a bridge group. For Layer 3 functionality, you must assign an IP address to a bridge group.

In Layer 2 mode, a broadcast packet received on an interface belonging to a particular VLAN is bridged to other VLANs that belong to the same bridge group. In the case of a unicast packet, the NetScaler appliance searches its bridge table for the learned MAC addresses of all the VLANs belonging to same bridge group.

In Layer 3 forwarding mode, an IP subnet is bound to a bridge group. The NetScaler accepts incoming packets belonging to the bound subnet and forwards the packets only on VLANs that are bound to the bridge group.

IPv6 routing can be enabled on a configured bridge group.

To add a bridge group and bind VLANs by using the command line interface

To add a bridge group and bind VLANs and verify the configuration, type the following commands:

- add bridgegroup <id> [-ipv6DynamicRouting (ENABLED | DISABLED)]
- show bridgegroup <id>
- bind bridgegroup <id> -vlan <positive_integer>
- show bridgegroup <id>

Example

```
> add bridgegroup 12
 Done
```

To remove a bridge group by using the command line interface

At the command prompt, type:

rm bridgegroup <id>

Example

```
 rm bridgegroup 12
```

To configure a bridge group by using the configuration utility

Navigate to System > Network > Bridge Groups, add a new bridge group, or edit an existing bridge group.

Configuring VMACs

Aug 29, 2013

The primary and secondary nodes in a high availability (HA) setup share the Virtual MAC address (VMAC) floating entity. The primary node owns the floating IP addresses (such as MIP, SNIP, and VIP) and responds to ARP requests for these IP addresses with its own MAC address. Therefore, the ARP table of an external device, such as an upstream router, is updated with the floating IP address and the MAC address of the primary node.

When a failover occurs, the secondary node takes over as the new primary node. The former secondary node uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it had learned from the old primary node. The MAC address that the new primary node advertises is the MAC address of its own network interface. Some devices (a few routers) do not accept these GARP messages. Therefore, these external devices retain the IP address-to-MAC address mapping that the old primary node had advertised. This can result in a GSLB site going down.

Therefore, you must configure a VMAC on both nodes of an HA pair. This means that both nodes have identical MAC addresses. When a failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

For the procedures to configure a VMAC, see "High Availability."

Configuring Link Aggregation

Sep 06, 2013

Link aggregation combines data coming from multiple ports into a single high-speed link. Configuring link aggregation increases the capacity and availability of the communication channel between the NetScaler appliance and other connected devices. An aggregated link is also referred to as a "channel." You can configure the channels manually, or you can use Link Aggregation Control Protocol (LACP). You cannot apply LACP to a manually configured channel, nor can you manually configure a channel created by LACP.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. (That is, the network interface parameters are ignored.) A network interface can be bound only to one channel.

When a network interface is bound to a channel, it drops its VLAN configuration. When network interfaces are bound to a channel, either manually or by LACP, they are removed from the VLANs that they originally belonged to and added to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you bind the network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then bind them to a channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them back to VLAN 2.

This section includes the following details:

- Configuring Link Aggregation Manually
- Configuring Link Aggregation by Using the Link Aggregation Control Protocol
- Configuring Link Redundancy using LACP channels

Configuring Link Aggregation Manually

Updated: 2013-08-29

When you create a link aggregation channel, its state is DOWN until you bind an active interface to it. You can modify a channel at any time. You can remove channels, or you can enable/disable them.

To create a link aggregation channel by using the command line interface

At the command prompt, type:

- add channel <id> [-ifnum <interfaceName> ...] [-state (ENABLED | DISABLED)] [-speed <speed>] [-flowControl <flowControl>] [-haMonitor (ON | OFF)][-tagall (ON | OFF)] [-ifAlias <string>] [-throughput <positive_integer>] [-bandwidthHigh <positive_integer> [-bandwidthNormal <positive_integer>]]
- show channel

Example

```
add channel LA/1 -ifnum 1/8
show channels
```

To bind an interface to or unbind an interface from an existing link aggregation channel by using the command line interface

At the command prompt, type one of the following commands:

- bind channel <id> <interfaceName>
- unbind channel <id> <interfaceName>

Example

```
bind channel LA/1 1/8
```

To modify a link aggregation channel by using the command line interface

At the command prompt, type the set channel command, the channel ID, and the parameters to be changed, with their new values.

To configure a link aggregation channel by using the configuration utility

Navigate to System > Network > Channels, add a new channel, or edit an existing channel.

To remove a link aggregation channel by using the command line interface

Important: When a channel is removed, the network interfaces bound to it induce network loops that decrease network performance. You must disable the network interfaces before you remove the channel.
At the command prompt, type:

rm channel <id>
Example

```
> rm channel LA/1
 Done
```

To remove a link aggregation channel by using the configuration utility

Important: When a channel is removed, the network interfaces bound to it induce network loops that decrease network performance. You must disable the network interfaces before you remove the channel.
Navigate to System > Network > Channels, select the channel that you want to remove and click Remove.

Configuring Link Aggregation by Using the Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) enables network devices to exchange link aggregation information by exchanging LACP Data Units (LACPDUs). Therefore, you cannot enable LACP on network interfaces that are members of a channel that you created manually.

When using LACP to configure link aggregation, you use different commands and parameters for modifying link aggregation channels than you do for creating link aggregation channels. To remove a channel, you must disable LACP on all interfaces that are part of the channel.

Note: In an High Availability configuration, LACP configurations are neither propagated nor synchronized.

Configuring the LACP System Priority

Updated: 2013-10-01

The LACP system priority determines which peer device of an LACP LA channel can have control over the LA channel. This number is globally applied to all LACP channels on the appliance. The lower the value, the higher the priority.

To configure the LACP system priority by using the command line interface

At the command prompt, type the following commands to set the priority for a standalone appliance and verify the configuration:

- set lacp -sysPriority <positive_integer>
- show lacp

Example:

```
set lacp -sysPriority 50
```

To set the priority for a specific cluster node, log on to the cluster IP address and at the command prompt, type the following commands:

- set lacp -sysPriority <positive_integer> -ownerNode <positive_integer>
- show lacp

Example:

```
set lacp -sysPriority 50 -ownerNode 2
```

To configure the LACP system priority by using the configuration utility

1. Navigate to System > Network > Interfaces and, in the Action list, select Set LACP.
2. Specify the system priority and the owner node (applicable only for a cluster setup).

Creating Link Aggregation Channels

Updated: 2013-08-29

For creating a link aggregation channel by using LACP, you need to enable LACP and specify the same LACP key on each interface that you want to be the part of the channel. For example, if you enable LACP and set the LACP Key to 3 on interfaces 1/1 and 1/2, a link aggregation channel LA/3 is created and interfaces 1/1 and 1/2 are automatically bound to it.

Note: When enabling LACP on a network interface, you must specify the LACP Key.
By default, LACP is disabled on all network interfaces.

To create an LACP channel by using the command line interface

At the command prompt, type:

- set interface <id> [-lacpMode <lacpMode>] [-lacpKey<positive_integer>] [-lacpPriority <positive_integer>] [-lacpTimeout (LONG | SHORT)]
- show interface [<id>]

To create an LACP channel by using the configuration utility

Navigate to System > Network > Interfaces, open the network interface, and set the parameters.

Modifying Link aggregation Channels

Updated: 2013-08-29

After you have created an LACP channel by specifying interfaces, you can modify properties of the channel.

To modify an LACP channel using the command line interface

At the command prompt, type:

- set channel <id> [-ifnum <interfaceName> ...] [-state (ENABLED | DISABLED)] [-speed <speed>] [-flowControl

<flowControl>] [-haMonitor (ON | OFF)] [-ifAlias <string>] [-throughput <positive_integer>] [-tagall (ON | OFF)] [-bandwidthHigh <positive_integer> [-bandwidthNormal <positive_integer>]]

- show channel

Example

```
> set channel LA/3 -state ENABLED -speed 10000
 Done
```

To modify an LACP channel by using the configuration utility

Navigate to System > Network > Channels, and modify an existing LACP channel.

Removing a Link Aggregation Channel

Updated: 2013-08-29

To remove a link aggregation channel that was created by using LACP, you need to disable LACP on all the interfaces that are part of the channel.

To remove an LACP channel by using the command line interface

At the command prompt, type:

- set interface <id> -lacpMode Disable
- show interface [<id>]

To remove an LACP channel by using the configuration utility

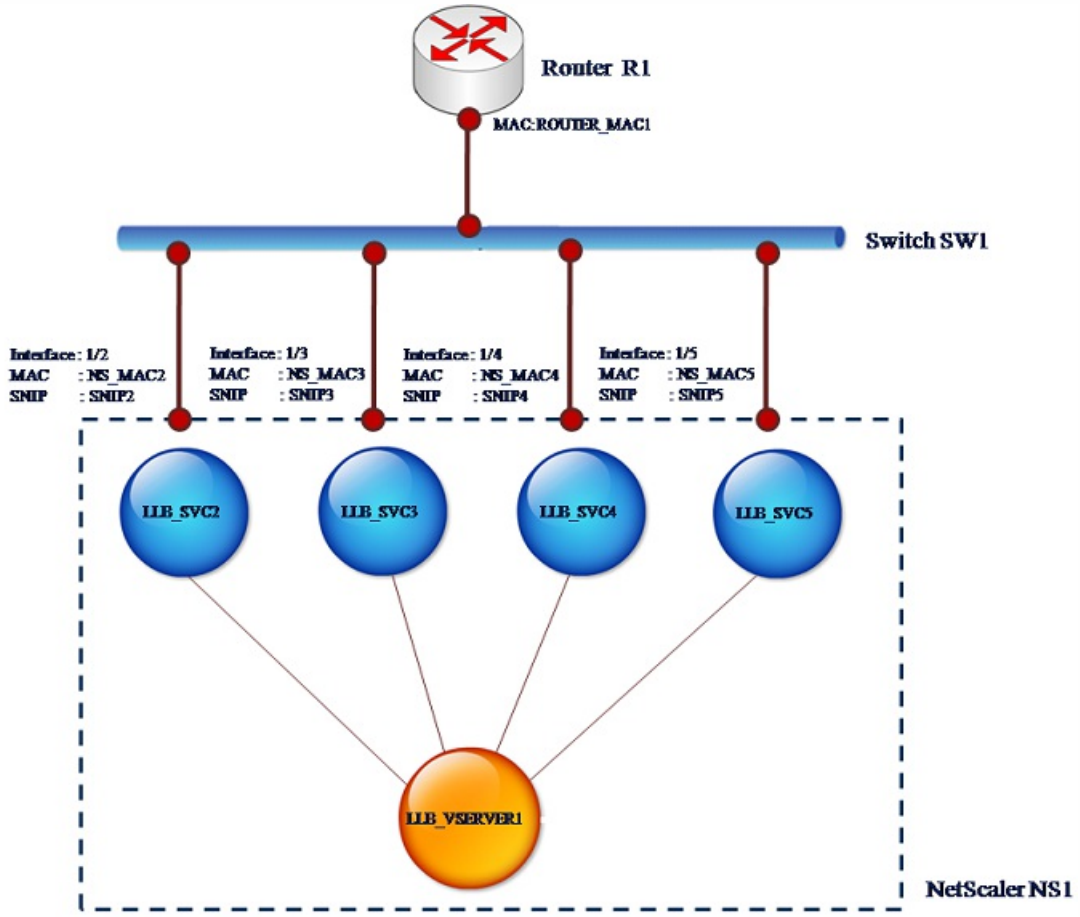
Navigate to System > Network > Interfaces, open the network interface, and clear the Enable LACP option.

Binding an SNIP address to an Interface

Aug 29, 2013

You can now bind a NetScaler owned SNIP address to an interface without using Layer 3 VLANs. Any packets related to the SNIP address will go only through the bound interface.

This feature can be useful in a scenario where the upstream switch does not support Link Aggregation channels and you want the NetScaler appliance to load balance traffic, originated from a server, across the four links to the upstream switch as shown in the following illustration.



The following tables describe the example settings for the scenario:

Entity	Name	Value
SNIP addresses on NS1	SNIP2 (for reference purpose only)	10.10.10.2
	SNIP3 (for reference purpose only)	10.10.10.3
	SNIP4 (for reference purpose only)	10.10.10.4

Entity	Name	Value
	SNIP5 (for reference purpose only)	10.10.10.5
LLB virtual server on NS1	LLB_VSERVER1	-
Transparent monitor on NS1	TRANS_MON	-
LLB services on NS1	LLB_SVC2	10.10.10.240
	LLB_SVC3	10.10.10.120
	LLB_SVC4	10.10.10.60
	LLB_SVC5	10.10.10.30
MAC address of interface 1/2 on NS1	NS_MAC_2 (for reference purpose only)	00:e0:ed:0f:bc:e0
MAC address of interface 1/3 on NS1	NS_MAC_3 (for reference purpose only)	00:e0:ed:0f:bc:df
MAC address of interface 1/4 on NS1	NS_MAC_4 (for reference purpose only)	00:e0:ed:0f:bc:de
MAC address of interface 1/5 on NS1	NS_MAC_5 (for reference purpose only)	00:e0:ed:1c:89:53
IP address of Router R1	Router_IP (for reference purpose only)	10.10.10.1
MAC address of interface of R1	ROUTER_MAC1 (for reference purpose only)	00:21:a1:2d:db:cc

To configure the example settings

1. Add four different SNIPs in different subnet ranges. This is for ARP to be resolved on four different links. For more information on creating a SNIP address, see "Configuring Subnet IP Addresses (SNIPs)."
   Command Line Interface example

```
> add ns ip 10.10.10.2 255.255.255.0 -type SNIP
 Done
> add ns ip 10.10.10.3 255.255.255.128 –type SNIP
Done
> add ns ip 10.10.10.4 255.255.255.192 –type SNIP
Done
> add ns ip 10.10.10.5 255.255.255.224 –type SNIP
Done
```

2. Add four different dummy services in the added SNIP subnets. This is to ensure that the traffic is sent out with source IP as one of the four configured SNIPs. For more information on creating a service, see "Configuring Services."
   Command Line Interface example

   ```
   > add service LLB_SVC2 10.10.10.240 any *
    Done
   > add service LLB_SVC3 10.10.10.120 any *
    Done
   > add service LLB_SVC4 10.10.10.60 any *
    Done
   > add service LLB_SVC5 10.10.10.30 any *
    Done
   ```
3. Add a transparent ping monitor for monitoring the gateway. Bind the monitor to each of the configured dummy services. This is to make the state of the services as UP. For more information on creating a transparent monitor, see "Creating and Binding a Transparent Monitor."
   Command Line Interface example

   ```
   > add monitor TRANS_MON ping -destIP 10.10.10.1 -transparent YES
    Done
   > bind monitor TRANS_MON LLB_SVC2
    Done
   > bind monitor TRANS_MON LLB_SVC3
    Done
   > bind monitor TRANS_MON LLB_SVC4
    Done
   > bind monitor TRANS_MON LLB_SVC5
    Done
   ```
4. Add a link load balancing (LLB) virtual server and bind the dummy services to it. For more information on creating an LLB virtual server, see "Configuring an LLB Virtual Server and Binding a Service."
   Command Line Interface example

   ```
   > add lb vserver LLB_VSERVER1 any
    Done
   > set lb vserver LLB_VSERVER1 -lbmethod ROUNDROBIN
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   ```
5. Add the LLB virtual server as the default LLB route. For more information on creating an LLB route see "Configuring an

LLB Route."

Command Line Interface example

```
> add lb route 0.0.0.0 0.0.0.0  LLB_VSERVER1
 Done
```

6. Add an ARP entry for each of the dummy services with the MAC address of the gateway. This way the gateway is reachable through these dummy services. For more information on adding an ARP entry, see "Configuring Static ARP."

Command Line Interface example

```
> add arp -ipaddress 10.10.10.240 -mac 00:21:a1:2d:db:cc -ifnum 1/2
 Done
> add arp -ipaddress 10.10.10.120 -mac 00:21:a1:2d:db:cc -ifnum 1/3
 Done
> add arp -ipaddress 10.10.10.60 -mac 00:21:a1:2d:db:cc -ifnum 1/4
 Done
> add arp -ipaddress 10.10.10.30 -mac 00:21:a1:2d:db:cc -ifnum 1/5
 Done
```

7. Bind a specific interface to an SNIP by adding an ARP entry for each of these SNIPs. This is to ensure that the response traffic will reach the same interface through which the request went out. For more information on adding an ARP entry, see "Configuring Static ARP."

Command Line Interface example

```
> add arp -ipAddress 10.10.10.2 -mac 00:e0:ed:0f:bc:e0 -ifnum 1/2
 Done
> add arp -ipAddress 10.10.10.3 -mac 00:e0:ed:0f:bc:df -ifnum 1/3
 Done
> add arp -ipAddress 10.10.10.4 -mac 00:e0:ed:0f:bc:de -ifnum 1/4
 Done
> add arp -ipAddress 10.10.10.5 -mac 00:e0:ed:1c:89:53 -ifnum 1/5
 Done
```

Monitoring the Bridge Table and Changing the Aging time

Aug 29, 2013

NetScaler appliance bridges frames on the basis of bridge table lookup of the destination MAC address and the VLAN ID. However, the appliance performs forwarding only when Layer 2 mode is enabled.

The bridge table is dynamically generated, but you can display it, modify the aging time for the bridge table, and view bridging statistics.

All the MAC entries in the bridge table are updated with the aging time.

To change the aging time by using the command line interface

At the command prompt, type:

- set bridgetable -bridgeAge <positive_integer>
- show bridgetable

Example

```
> set bridgetable -bridgeage 70
 Done
```

To change the aging time by using the configuration utility

1. Navigate to System > Network > Bridge Table.
2. Click Change Ageing Time, and set the Ageing Time (seconds) parameter.

To view the statistics of a bridge table by using the command line interface

At the command prompt, type:

```
stat bridge
```

To view the statistics of a bridge table by using the configuration utility

Navigate to System > Network > Bridge Table, select the MAC address, and click Statistics.

Understanding NetScaler Appliances in Active-Active Mode Using VRRP

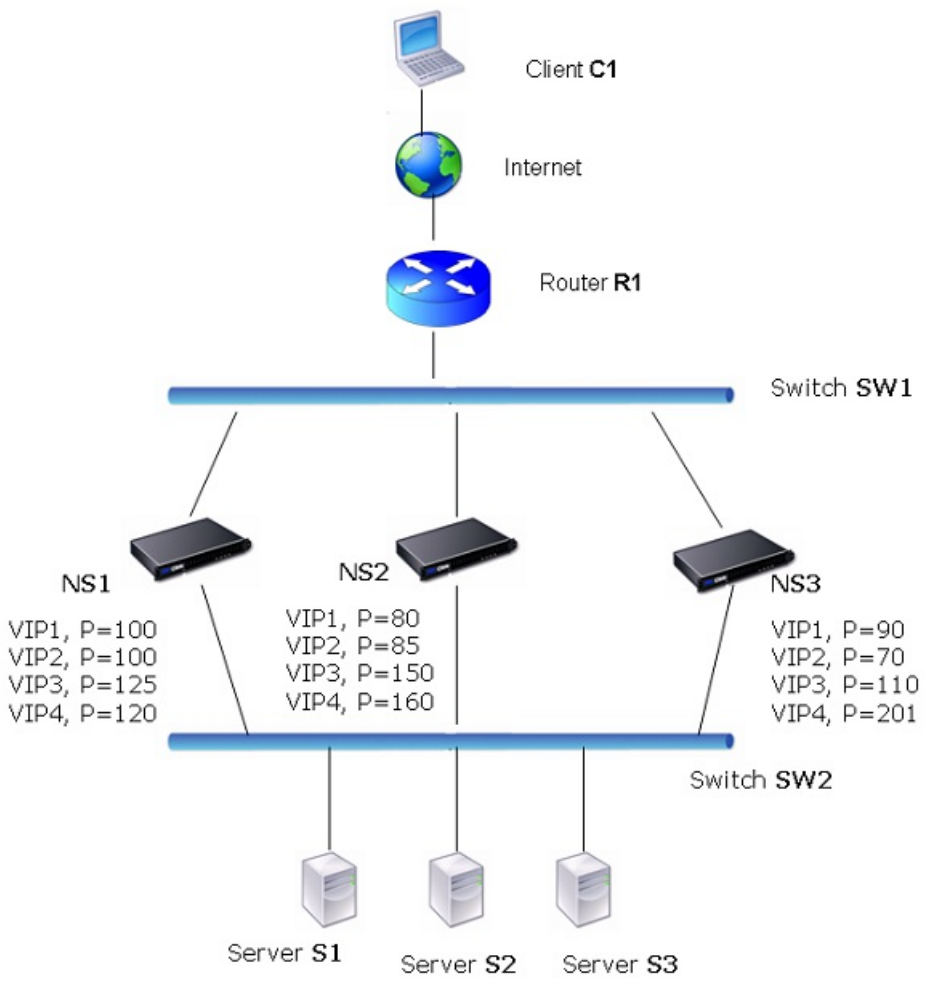
Aug 29, 2013

An active-active deployment, in addition to preventing downtime, makes efficient use of all the NetScaler appliances in the deployment. In active-active deployment mode, the same VIPs are configured on all NetScaler appliances in the configuration, but with different priorities, so that a given VIP can be active on only one appliance at a time.

Note: This feature is supported only on NetScaler nCore builds.
The active VIP is called the master VIP, and the corresponding VIPs on the other NetScaler appliances are called the backup VIPs. If a master VIP fails, the backup VIP with the highest priority takes over and becomes the master VIP. All the NetScaler appliances in an active-active deployment use the Virtual Router Redundancy Protocol (VRRP) protocol to advertise their VIPs and the corresponding priorities at regular intervals.

NetScaler appliances in active-active mode can be configured so that no NetScaler is idle. In this configuration, different sets of VIPs are active on each NetScaler. For example, in the following diagram, VIP1, VIP2, VIP3, and VIP4 are configured on appliances NS1, NS2, and NS3. Because of their priorities, VIP1 and VIP 2 are active on NS1, VIP3 is active on NS2 and VIP 4 is active on NS3. If, for example, NS1 fails, VIP1 on NS3 and VIP2 on NS2 become active.

Figure 1. An Active-Active Configuration



The NetScaler appliances in the above diagram process traffic as follows:

1. Client C1 sends a request to VIP1. The request reaches R1.
2. R1 does not have an APR entry for VIP1, so it broadcasts an ARP request for VIP1.
3. VIP1 is active in NS1, so NS1 replies with a source MAC address as the VMAC (for example VMAC1) associated with VIP1, and VIP1 as the source IP address.
4. SW1 learns the port for VIP1 from the ARP reply and updates its bridge table.
5. R1 updates the ARP entry with VMAC1 and VIP1.
6. R1 forwards the packet to the VIP1 on NS1.
7. NS1's load balancing algorithm selects server S2, and NS1 opens a connection between one of its SNIP or MIP addresses and S2.
8. S2 replies to the SNIP or MIP on the NetScaler.
9. NS1 sends S2's reply to the client. In the reply, NS1 inserts MAC address of the physical interface as the source MAC address and VIP1 as the source IP address.
10. Should NS1 fail, the NetScaler appliances use the VRRP protocol to select the VIP1 with the highest priority. In this case, VIP1 on NS3 becomes active, and the following two steps update the active-active configuration.
11. NS3 broadcasts a GARP message for VIP1. In the message, VMAC1 is the source MAC address and VIP1 is the source IP address.
12. SW1 learns the new port for VMAC1 from the GARP broadcast and updates its bridge table to send subsequent client requests for VIP1 to NS3. R1 updates its ARP table.

The priority of a VIP can be modified by health tracking. If you enable health tracking, you should make sure that preemption is also enabled, so that a VIP whose priority is lowered can be preempted by another VIP.

In some situations, traffic might reach a backup VIP. To avoid dropping such traffic, you can enable sharing, on a per-node basis, as you create an active-active configuration. Or you can enable the global send to master option. On a node on which sharing is enabled, it takes precedence over send to master.

Health Tracking

Base priority (BP-range 1-255) ordinarily determines which VIP is the master VIP, but effective priority (EP) can also affect the determination.

For example, if a VIP on NS1 has a priority of 101 and same VIP on NS2 has a priority of 99, the VIP on NS1 is active. However, if two vservers are using the VIP on NS1 and one of them goes DOWN, health tracking can reduce the EP of VIP on NS1. VRRP then makes the VIP on NS2 the active VIP.

Following are the health tracking options for modifying EP:

- **NONE.** No tracking. EP = BP
- **ALL.** If all virtual servers are UP, then EP = BP. Otherwise, EP = 0.
- **ONE.** If at least one virtual server is UP, then EP = BP. Otherwise, EP = 0.
- **PROGRESSIVE.** If ALL virtual servers are UP, then EP = BP. If ALL virtual servers are DOWN then EP = 0. Otherwise EP = BP (1 - K/N), where N is the total number of virtual servers associated with the VIP and k is the number of virtual servers that are down.

Note: If you specify a value other than NONE, preemption should be enabled, so that the backup VIP with the highest priority becomes active if the priority of the master VIP is downgraded.

Preemption

Preemption of an active VIP by another VIP that attains a higher priority is enabled by default, and normally should be enabled. In some cases, however, you may want to disable it. Preemption is a per-node setting for each VIP.

Preemption can occur in the following situations:

- An active VIP goes down and a VIP with a lower priority takes its place. If the VIP with the higher priority comes back online, it preempts the currently active VIP.
- Health tracking causes the priority of a backup VIP to become higher than that of the active VIP. The backup VIP then preempts the active VIP.

Sharing

In the event that traffic reaches a backup VIP, the traffic is dropped unless the sharing option is enabled on the backup VIP. This behavior is a per node setting for each VIP and is disabled by default.

In the figure "An Active-Active Configuration," VIP1 on NS1 is active and VIP1 VIPs on NS2 and NS3 are backups. Under certain circumstances, traffic may reach VIP1 on NS2. If Sharing is enabled on NS2, this traffic is processed instead of dropped.

Configuring Active-Active Mode

Mar 19, 2012

On each NetScaler appliance that you want to deploy in active-active mode, you must add a VMAC and bind the VMAC to a VIP. The VMAC for a given VIP must be same on each appliance. For example, if VIP 10.102.29.5, is created on the appliances, a virtual router ID must be created on each NetScaler and bound to VIP 10.102.29.5 on each NetScaler. When you bind a VMAC to a VIP, the NetScaler sends VRRP advertisements to each VLAN that is bound to that VIP. The VMAC can be shared by different VIPs configured on the same NetScaler.

This section includes the following details:

- Adding a VMAC
- Configuring Send to Master
- Configuring VRRP Communication Intervals
- Changing the Priority of a VIP Address Automatically in Active-Active Configuration (VRRP)
- An Active-Active Deployment Scenario

Adding a VMAC

Updated: 2013-08-29

To add a VMAC for an active-active configuration, you create a virtual router ID. To bind a VMAC to a VIP, you associate the VMAC's virtual router ID with the VIP.

To add a VMAC by using the command line interface

At the command prompt, type:

add vrID <value> -priority <value> -preemption (ENABLED | DISABLED) -sharing (ENABLED | DISABLED) -tracking (NONE | ONE | ALL | PROGRESSIVE)

Example

```
add vrID 125 -priority 100 -sharing ENABLED -tracking ONE
```

To add a VMAC by using the configuration utility

1. Navigate to System > Network > VMACNetwork > VMAC, on the VMAC tab, add a new VMAC, or edit an existing VMAC.
2. Set the following parameters:
   - Virtual Router ID
   - Priority
   - Tracking
   - Preemption
   - Sharing

To bind a VMAC by using the command line interface

At the command prompt, type:

set ns ip <VIP address> -vrid <value>

Example

```
set ns ip 10.102.29.5 -vrid 125
```

To bind a VMAC to a VIP by using the NetScaler configuration utility

1. Navigate to System > Network > IPs, on the IPV4s tab, open the VIP address that you want to bind to a VMAC.
2. In the Virtual Router Id drop down box, select a virtual router ID.

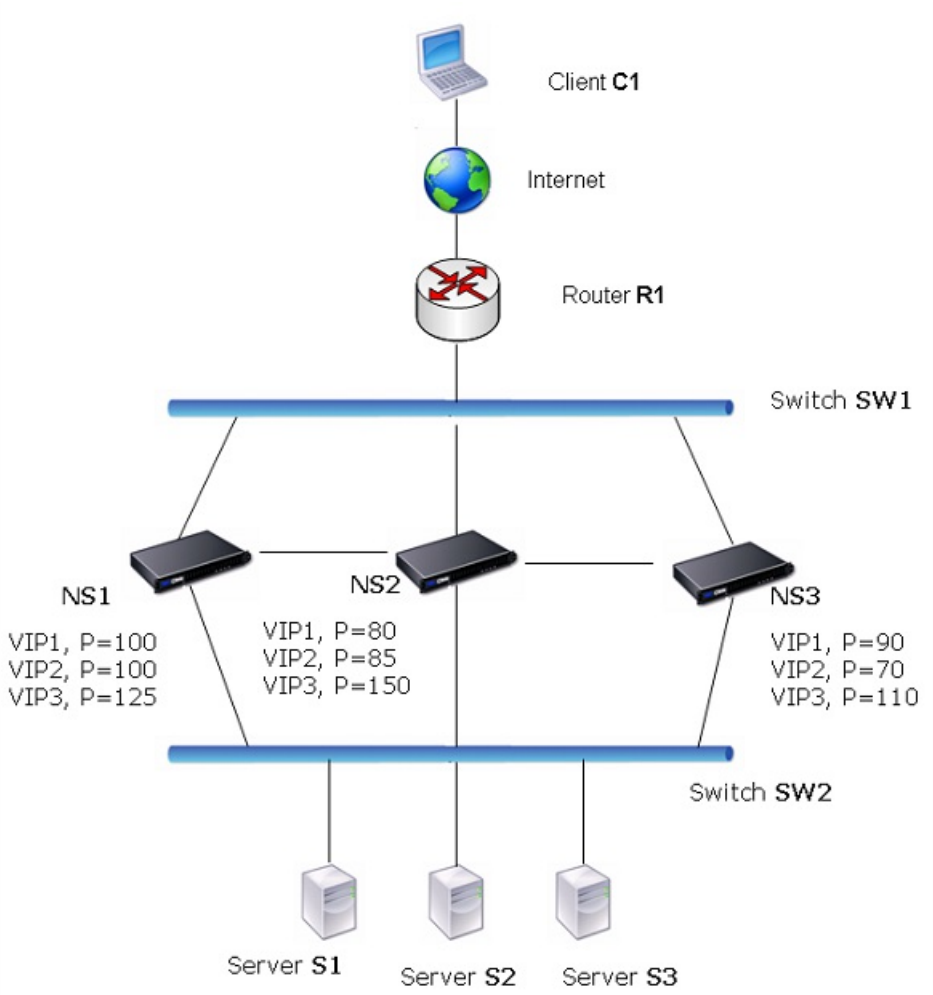
Configuring Send to Master

Updated: 2013-08-29

Usually, the traffic destined to a VIP reaches the NetScaler appliance on which the VIP is active, because an ARP request with the VIP and a VMAC on that appliance has reached the upstream router. But in some cases, such as static routes configured on the upstream router for the VIP subnet, or a topology that blocks this route, the traffic can reach a NetScaler appliance on which the VIP is in backup state. If you want this appliance to forward the data packets to the appliance on which the VIP is active, you need to enable the send to master option. This behavior is a per node setting and is disabled by default.

For example, in the following diagram, VIP1 is configured on NS1, NS2, and NS3 and is active on NS1. Under certain circumstances, traffic for VIP1 (active on NS1) may reach VIP1 on NS3. When the send to master option is enabled on NS3, NS3 forwards the traffic to NS1 through NS2 by using route entries for NS1.

Figure 1. An Active-Active Configuration with Send to Master Option Enabled



To enable send to master by using the command line interface

At the command prompt, type:

set vrIDParam -sendToMaster (ENABLED | DISABLED)

Example

```
> set vrIDParam -sendToMaster ENABLED
 Done
```

To enable send to master by using the configuration utility

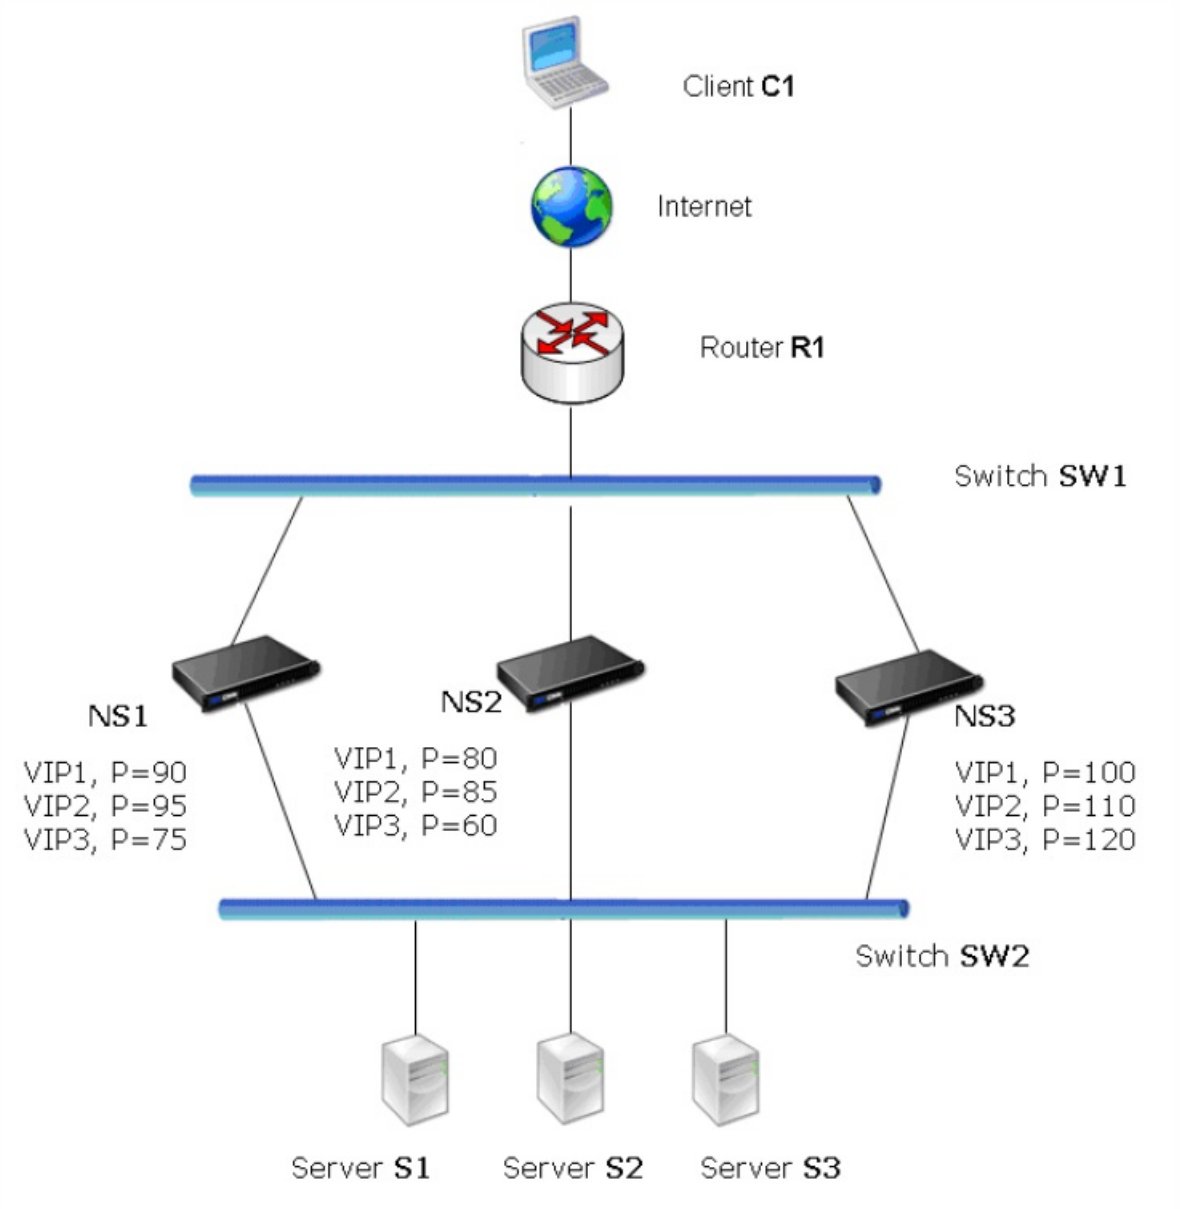
1. Navigate to System > Network, in the Settings group, click Virtual Router Parameters.
2. Select the Send to Master option.

An Active-Active Deployment Scenario

Following is an example of a possible active-active deployment scenario.

In the following diagram, VIP1, VIP 2 and VIP3 are configured on all three appliances, NS1, NS2, and NS3. Base Priorities for each VIPs are as shown in the diagram. Health tracking is disabled for each VIP. The priorities of VIPs are set so that VIP1, VIP2, and VIP3 are active on NS3. If NS3 fails, VIP1, VIP2, and VIP3 become active on NS1.

Figure 2. An Active-Active Deployment Scenario



Using the Network Visualizer

Aug 29, 2013

The Network Visualizer is a tool that you can use to view the network configuration of a NetScaler node, including the network configuration of the nodes in a high availability (HA) deployment. You can also modify the configuration of VLANs, interfaces, channels, and bridge groups, and perform HA configuration tasks.

In an HA deployment, you can both view and configure network entities on the node to which you are logged on, but you can view the details of only the network entities that are configured on the peer node. However, you can perform certain tasks, such as viewing details and statistics of the peer node and forcing a failover.

When you are logged on to a standalone appliance, you can use the Network Visualizer to do the following:

- View a consolidated graphical summary of key network components, such as VLANs, interfaces, channels, and bridge groups. You can also view the individual details of various network components.
- Modify appliance settings.
- Add, modify, and enable and disable interfaces and channels that are configured on the NetScaler appliance.
- Add and modify VLANs and bridge groups.
- Configure an HA deployment (add a node).
- View node details, node statistics, and statistics for VLANs and interfaces.
- Copy the properties of a network entity to a document or spreadsheet.

When you are logged on to an appliance in an HA deployment, you can perform the above tasks only on the appliance to which you are logged on. Following are additional tasks that you can perform in the Network Visualizer when you are logged on to one of the appliances in an HA pair:

- View the configuration details and high availability details of both nodes in an HA pair.
- Perform HA configuration tasks, such as synchronization and force failover.
- Remove the peer node from the HA configuration.
- View statistics for the peer node.
- Copy the properties of the peer node to a document or spreadsheet.

To open the Network Visualizer

1. Navigate to System > Network.
2. In Monitor Connections, click Network Visualizer.

To locate a VLAN or bridge group in the Visualizer

1. Open the Network Visualizer, and then do the following:

   - To locate a VLAN or bridge group, in the Search text field, begin typing the ID of the VLAN or the bridge group that you want to locate.
     Alternatively, begin typing the IP address of a bound subnet or the ID of a bound interface. The VLANs or bridge groups whose names match the typed characters are highlighted.

     To highlight multiple entities simultaneously, separate the IDs and IP addresses with white spaces. Entities whose IDs or IP addresses match any of the typed IDs and IP addresses are highlighted.

   - To clear the Search field, click the x adjacent to the field.

To modify the network settings of the appliance by using the Visualizer

1. Open the Network Visualizer and click the icon representing the appliance to which you are logged on.
2. In Related Tasks, click Open.

To add a channel by using the Visualizer

1. Open the Network Visualizer and click a network interface.
2. In Related Tasks, click Add Channel.

To add a VLAN by using the Visualizer

1. Open the Network Visualizer, click the appliance to which you are logged on, and then do one of the following:
   - Click an existing VLAN, and then, in Related Tasks, click Add.
   - Click an existing bridge group, and then, in Related Tasks, click Add VLAN.

To add a bridge group by using the Visualizer

1. Open the Network Visualizer, click the appliance to which you are logged on, and then do one of the following:
   - Click an existing bridge group, and then, in Related Tasks, click Add.
   - Click an existing VLAN, and then, in Related Tasks, click Add Bridge Group.

To modify the settings of an interface or channel by using the Visualizer

1. Open the Network Visualizer and click the interface whose settings you want to modify.
2. In Related Tasks, click Open.

To enable or disable an interface or channel by using the Visualizer

1. Open the Network Visualizer and click the interface or channel that you want to enable or disable.
2. In Related Tasks, do one of the following.
   - To enable the interface or channel, click Enable.
   - To disable the interface or channel, click Disable.

To remove a configured channel, VLAN, or bridge group by using the Visualizer

1. Open the Network Visualizer and click the channel, VLAN, or bridge group that you want to remove from the configuration.
2. In Related Tasks, click Remove.

To view statistics for a node, channel, interface, or VLAN by using the Visualizer

1. Open the Network Visualizer and click the node, interface, or VLAN whose statistics you want to view.
2. In Related Tasks, click Statistics.

To set up an HA deployment by using the Visualizer

1. Open the Network Visualizer and click the appliance.
2. In Related Tasks, click HA Setup.

To force the secondary node to take over as the primary by using the Visualizer

1. Open the Network Visualizer and click one of the nodes.
2. In Related Tasks, click Force Failover.

To synchronize the secondary node's configuration with the primary node by using the Visualizer

1. Open the Network Visualizer and click one of the nodes.
2. In Related Tasks, click Force Synchronization.

To remove the peer node from the HA configuration

1. Open the Network Visualizer and click the peer node.
2. In Related Tasks, click Remove.

To copy the properties of a node or network entity by using the Visualizer

1. Open the Network Visualizer and click the appliance or network entity whose properties you want to copy to a document or spreadsheet.
2. In Related Tasks, click Copy Properties.

Access Control Lists

May 10, 2012

Access Control Lists (ACLs) filter IP traffic and secure your network from unauthorized access. An ACL is a set of conditions that the NetScaler ADC evaluates to determine whether to allow access. For example, the Finance department probably does not want to allow its resources to be accessed by other departments, such as HR and Documentation, and those departments want to restrict access to their data.

When the NetScaler ADC receives a data packet, it compares the information in the data packet with the conditions specified in the ACL and allows or denies access. The administrator of the organization can configure ACLs to function in the following processing modes:

- ALLOW—Process the packet.
- BRIDGE—Bridge the packet to the destination without processing it. The packet is directly sent by Layer 2 and Layer 3 forwarding.
- DENY—Drop the packet.

ACL rules are the first level of defense on the NetScaler ADC.

NetScaler supports the following types of ACLs:

- **Simple ACLs** filter packets on the basis of their source IP address and, optionally, their protocol, destination port, or traffic domain. Any packet that has the characteristics specified in the ACL is dropped.
- **Extended ACLs** filter data packets on the basis of various parameters, such as source IP address, source port, action, and protocol. An extended ACL defines the conditions that a packet must satisfy for the NetScaler ADC to process the packet, bridge the packet, or drop the packet.

Nomenclature

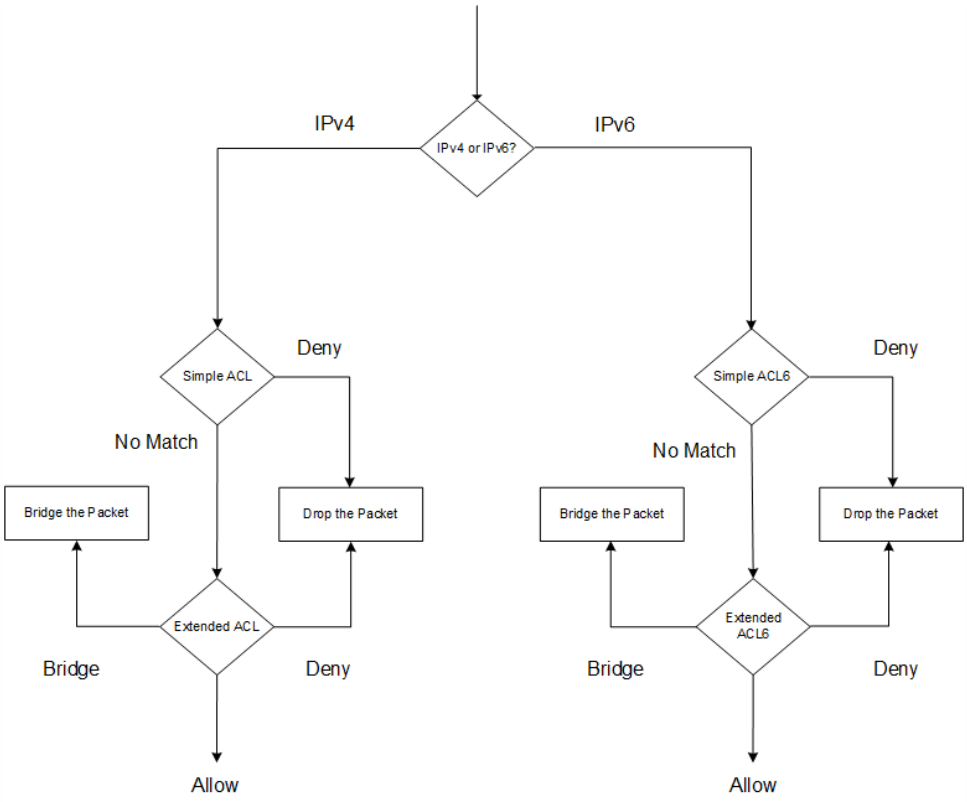
In the NetScaler user interfaces, the terms simple ACL and extended ACL refer to ACLs that process IPv4 packets. An ACL that processes IPv6 packets is called a simple ACL6 and or extended ACL6. When discussing both types, this documentation sometimes refers to both of them as simple ACLs or extended ACLs.

ACL Precedence

If both simple and extended ACLs are configured, incoming packets are compared to the simple ACLs first.

The NetScaler ADC first determines whether the incoming packet is an IPv4 or an IPv6 packet, and then compares the packet's characteristics to either simple ACLs or simple ACL6s. If a match is found, the packet is dropped. If no match is found, the packet is compared to extended ACLs or extended ACL6s. If that comparison results in a match, the packet is handled as specified in the ACL. The packet can be bridged, dropped, or allowed. If no match is found, the packet is allowed.

Figure 1. Simple and Extended ACLs Flow Sequence



Simple ACLs and Simple ACL6s

May 21, 2015

A simple ACL or simple ACL6 uses few parameters and can be configured only to drop IP packets. Packets can be dropped on the basis of their source IP address and, optionally, their protocol, destination port, or traffic domain.

When creating a simple ACL or simple ACL6, you can specify a time to live (TTL), in seconds, after which the ACL expires. ACLs with TTLs are not saved when you save the configuration. You can display simple ACLs and simple ACL6s to verify their configuration, and you can display their statistics.

This section includes the following details:

- Configuring Simple ACLs and Simple ACL6s
- Displaying Simple ACL and Simple ACL6 Statistics
- Terminating Established Connections

Configuring Simple ACLs and Simple ACL6s

Configuring a simple ACL or simple ACL6 on a NetScaler ADC can include the following tasks.

- Create simple ACLs or simple ACL6s to drop (deny) packets on the basis of their source IP address and, optionally, their protocol, destination port, or traffic domain.
- Remove simple ACLs or simple ACL6s. These ACLs cannot be modified once created. If you need to modify a simple ACL or simple ACL6, you must remove it and create a new one.

To create a simple ACL by using the command line interface

At the command prompt, type the following commands to add an ACL and verify the configuration:

- **add ns simpleacl** <aclname> DENY -**srcIP** <ip_addr> [-**destPort**<port> -**protocol** (TCP | UDP)] [-**TTL** <positive_integer>]
- **show ns simpleacl** [<aclname>]

Example

```
> add simpleacl rule1 DENY -srcIP 10.102.29.5 -TTL 600
Done
```

To create a simple ACL6 by using the command line interface

At the command prompt, type the following commands to add a simple ACL6 and verify the configuration:

- **add ns simpleacl6** <aclname> DENY -**srcIPv6** <ipv6_addr|null> [-**destPort**<port> -**protocol** (TCP | UDP)] [-**TTL** <positive_integer>]
- **show ns simpleacl6** [<aclname>]

Example

```
>  add ns simpleacl6 rule1 DENY –srcIPv6 3ffe:192:168:215::82 -destPort 80 -Protocol TCP -TTL 9000
 Done
```

To remove a single simple ACL by using the command line interface

At the command prompt, type:

- **rm ns simpleacl** <aclname>
- **show ns simpleacl**

To remove a single simple ACL6 by using the command line interface

At the command prompt, type:

- **rm ns simpleacl6**<aclname>
- **show ns simpleacl6**

To remove all simple ACLs by using the command line interface

At the command prompt, type:

- **clear ns simpleacl**
- **show ns simpleacl**

To remove all simple ACL6s by using the command line interface

At the command prompt, type:

- **clear ns simpleacl6**
- **show ns simpleacl6**

To create a simple ACL by using the configuration utility

Navigate to System > Network > ACLs and, on the **Simple ACLs** tab, add a new simple ACL.

To create a simple ACL6 by using the configuration utility

Navigate to System > Network > ACLs and, on the **Simple ACL6s** tab, add a new simple ACL6.

To remove a single simple ACL by using the configuration utility

Navigate to System > Network > ACLs and, on the **Simple ACLs** tab, delete the simple ACL.

To remove a single simple ACL6 by using the configuration utility

Navigate to System > Network > ACLs and, on the **Simple ACL6s** tab, delete the simple ACL6.

To remove all simple ACLs by using the configuration utility

1. Navigate to System > Network > ACLs.
2. On the **Simple ACLs** tab, in the **Action** list, click **Clear**.

To remove all simple ACL6s by using the configuration utility

1. Navigate to System > Network > ACLs.
2. On the **Simple ACL6s** tab, in the **Action** list, click **Clear**.

Displaying Simple ACL and Simple ACL6 Statistics

You can display the simple ACL (or simple ACL6) statistics, which include the number of hits, the number of misses, and the number of simple ACLs configured.

The following table describes statistics you can display for simple ACLs and simple ACL6s.

Statistic	Indicates
ACL hits	Packets matching an ACL
ACL misses	Packets not matching any ACL
ACL count	Number of ACLs configured

To display simple ACL statistics by using the command line interface

At the command prompt, type:

stat ns simpleacl
Example

```
> stat ns simpleacl

SimpleACL Statistics

                          Rate (/s)          Total
SimpleACL hits                    0              0
SimpleACL misses                  0          51872
SimpleACLs count                 --              2
Done
```

To display simple ACL6 statistics by using the command line interface

At the command prompt, type:

stat ns simpleacl6

To display simple ACL statistics by using the configuration utility

Navigate to System > Network > ACLs and, on the **Simple ACLs** tab, select the ACL and click **Statistics**.

To display simple ACL6 statistics by using the configuration utility

Navigate to System > Network > ACLs and, on the **Simple ACL6s** tab, select the simple ACL6 and click **Statistics**.

Terminating Established Connections

For a simple ACL or simple ACL6, the NetScaler ADC blocks any new connections that match the conditions specified in the ACL. Packets related to existing connections that were established before the ACL was created are not blocked. To terminate previously established connections that match an existing ACL, you can run a flush operation from the command

line interface or the configuration utility.

Flush can be useful in the following cases:

- You receive a list of blacklisted IP addresses and want to completely block those IP addresses from accessing the NetScaler ADC. In this case, you create simple ACLs or simple ACL6s to block any new connections from these IP addresses, and then flush any existing connections associated with those addresses.
- You want to terminate a large number of connections from a particular network without taking the time to terminate them one by one.

When you run flush, the NetScaler ADC searches through all of its established connections and terminates those that match conditions specified in any of the simple ACLs configured on the ADC.

Note: If you plan to create more than one simple ACL and flush existing connections that match any of them, you can minimize the effect on performance by first creating all of the simple ACLs and then running flush only once.

To terminate all established IPv4 connections that match any of your configured simple ACLs by using the command line interface

At the command prompt, type:

flush simpleacl -estSessions

To terminate all established IPv6 connections that match any of your configured simple ACL6s by using the command line interface

At the command prompt, type:

flush simpleacl6 -estSessions

To terminate all established IPv4 connections that match any of your configured simple ACLs by using the configuration utility

1. Navigate to System > Network > ACLs.
2. On the **Simple ACLs** tab, in the **Action** list, click **Flush**.

To terminate all established IPv6 connections that match any of your configured simple ACL6s by using the configuration utility

1. Navigate to System > Network > ACLs.
2. On the **Simple ACL6s** tab, in the **Action** list, click **Flush**.

Extended ACLs and ACL6s

Jan 31, 2011

Extended ACLs and extended ACL6s provide parameters and actions not available with simple ACLs. You can filter data on the basis of parameters such as source IP address, source port, action, and protocol. You can specify tasks to allow a packet, deny a packet, or bridge a packet.

Extended ACLs and ACL6s can be modified after they are created, and you can renumber their priorities to specify the order in which they are evaluated.

Note: If you configure both simple and extended ACLs, simple ACLs take precedence over extended ACLs.
The following actions can be performed on extended ACLs and ACL6s: Modify, Apply, Disable, Enable, Remove, and Renumber (the priority). You can display extended ACLs and ACL6s to verify their configuration, and you can display their statistics.

You can configure the NetScaler ADC to log details for packets that match an extended ACL. However, you cannot log details of packets that match an ext

Applying Extended ACLs and ACL6s

Unlike simple ACLs and ACL6s, extended ACLs and ACL6s created on the NetScaler ADC do not work until they are applied. Also, if you make any modifications to an extended ACL or ACL6, such as disabling the ACLs, changing a priority, or deleting the ACLs, you must reapply the extended ACLs or ACL6s. You must also reapply them after enabling logging. The procedure to apply extended ACLs or ACL6s reapplies all of them. For example, if you have applied extended ACL rules 1 through 10, and you then create and apply rule 11, the first 10 rules are applied afresh.

If a session has a DENY ACL related to it, that session is terminated when you apply the ACLs.

Extended ACLs and ACL6s are enabled by default. When they are applied, the NetScaler ADC starts comparing incoming packets against them. However, if you disable them, they are not used until you reenable them, even if they are reapplied.

Renumbering the priorities of Extended ACLs and ACL6s

Priority numbers determine the order in which extended ACLs or ACL6s are matched against a packet. An ACL with a lower priority number has a higher priority. It is evaluated before ACLs with higher priority numbers (lower priorities), and the first ACL to match the packet determines the action applied to the packet.

When you create an extended ACL or ACL6, the NetScaler ADC automatically assigns it a priority number that is a multiple of 10, unless you specify otherwise. For example, if two extended ACLs have priorities of 20 and 30, respectively, and you want a third ACL to have a value between those numbers, you might assign it a value of 25. If you later want to retain the order in which the ACLs are evaluated but restore their numbering to multiples of 10, you can use the renumber procedure.

This section includes the following details:

- Configuring Extended ACLs and ACL6s
- Logging Extended ACLs (IPv4 Only)
- Displaying Extended ACL and ACL6s Statistics
- Sample Configurations

Configuring Extended ACLs and ACL6s

Configuring an extended ACL or ACL6 on a NetScaler ADC consists of the following tasks.

- Create an extended ACL or ACL6 to either allow, deny, or bridge a packet. You can specify an IP address or range of IP addresses to match against the source or destination IP addresses of the packets. You can specify a protocol to match against the protocol of incoming packets.
- (Optional) You can modify extended ACLs or ACL6s that you previously created. Or, if you want to temporarily take one out of use you can disable it, and later reenable it.
- Apply extended ACLs or ACL6s. After you create, modify, disable or reenable, or delete an extended ACL or ACL6, you must apply the extended ACLs or ACL6s to activate them.
- (Optional) Renumber the priorities of extended ACLs or ACL6s. If you have configured ACLs with priorities that are not multiples of 10 and want to restore the numbering to multiples of 10, use the renumber procedure.

To create an extended ACL by using the command line interface

At the command prompt, type:

- **add ns acl** <aclname> <aclaction> [-**srcIP** [<operator>] <srcIPVal>] [-**srcPort** [<operator>] <srcPortVal>] [-**destIP** [<operator>] <destIPVal>] [-**destPort** [<operator>] <destPortVal>] [-**TTL** <positive_integer>] [-**srcMac** <mac_addr>] [(-**protocol** <protocol> [-established]) | -**protocolNumber** <positive_integer>] [-**vlan** <positive_integer>] [-**interface** <interface_name>] [-**icmpType** <positive_integer> [-**icmpCode** <positive_integer>]] [-**priority** <positive_integer>] [-**state** (ENABLED | DISABLED)] [-**logstate** (ENABLED | DISABLED) [-**ratelimit** <positive_integer>]]
- **show ns acl** [<aclName>]

Example

```
> add ns acl restrict DENY -srcport 45-1024 -destIP 192.168.1.1 -protocol TCP
 Done
```

To create an extended ACL6 by using the command line interface

At the command prompt, type:

- **add ns acl6** <acl6name> <acl6action> [-**srcIPv6** [<operator>] <srcIPv6Val>] [-**srcPort** [<operator>] <srcPortVal>] [-**destIPv6** [<operator>] <destIPv6Val>] [-**destPort** [<operator>] <destPortVal>] [-**TTL** <positive_integer>] [-**srcMac** <mac_addr>] [(-**protocol** <protocol> [-established]) | -**protocolNumber** <positive_integer>] [-**vlan** <positive_integer>] [-**interface** <interface_name>] [-**icmpType** <positive_integer> [-icmpCode <positive_integer>]] [-**priority** <positive_integer>] [-**state** (ENABLED | DISABLED)]
- **show ns acl6** [<aclName>]

Example

```
> add ns acl6 rule6  DENY -srcport 45-1024 -destIPv6 2001::45 -protocol TCP
 Done
```

To modify an extended ACL by using the command line interface

To modify an extended ACL, type the **set ns acl** command, the name of the extended ACL, and the parameters to be changed, with their new values.

To modify an extended ACL6 by using the command line interface

To modify an extended ACL6, type the **set ns acl** command, the name of the extended ACL6, and the parameters to be changed, with their new values.

To disable or enable an extended ACL by using the command line interface

At the command prompt, type one of the following commands:

- **disable ns acl** <aclname>
- **enable ns acl** <aclname>

To disable or enable an extended ACL6 by using the command line interface

At the command prompt, type one of the following commands:

- **disable ns acl6** <aclname>
- **enable ns acl6**<aclname>

To apply extended ACLs by using the command line interface

At the command prompt, type:

apply ns acls

To apply extended ACL6s by using the command line interface

At the command prompt, type:

apply ns acls6

To renumber the priorities of extended ACLs by using the command line interface

At the command prompt, type:

renumber ns acls

To renumber the priorities of extended ACL6s by using the command line interface

At the command prompt, type:

renumber ns acls6

To configure an extended ACL by using the configuration utility

Navigate to **System** > **Network** > **ACLs** and, on the **Extended ACLs** tab, add a new extended ACL or edit an existing extended ACL. To enable or disable an existing extended ACL, select it, and then select **Enable** or **Disable** from the **Action** list.

To configure an extended ACL6sACL6s by using the configuration utility

Navigate to **System** > **Network** > **ACLs** and, on the **ACL6s** tab, add a new extended ACL6 or edit an existing extended ACL6. To enable or disable an existing extended ACL6, select it, and then select **Enable** or **Disable** from the **Action** list.

To apply extended ACLs by using the configuration utility

Navigate to **System** > **Network** > **ACLs** and, on the **Extended ACLs** tab, in the **Action** list, click **Apply**.

To apply extended ACL6sACL6s by using the configuration utility

Navigate to **System** > **Network** > **ACLs** and, on the **ACL6s** tab, in the **Action** list, click **Apply**.

To renumber the priorities of extended ACLs by using the configuration utility

Navigate to **System** > **Network** > **ACLs** and, on the **Extended ACLs** tab, in the **Action** list, click **Renumber Priority (s)**.

To renumber the priorities of extended ACL6sACL6s by using the configuration utility

Navigate to **System** > **Network** > **ACLs** and, on the **ACL6s** tab, in the **Action** list, click **Renumber Priority (s)**.

Logging Extended ACLs (IPv4 Only)

You can configure the NetScaler ADC to log details for packets that match extended ACLs.

Note: You cannot enable logging for extended ACL6s.
In addition to the ACL name, the logged details include packet-specific information such as the source and destination IP addresses. The information is stored either in the syslog file or in the nslog file, depending on the type of global logging (syslog or nslog) enabled.

Logging must be enabled at both the global level and the ACL level. The global setting takes precedence. For more information about enabling logging globally, see "Audit Logging."

To optimize logging, when multiple packets from the same flow match an ACL, only the first packet's details are logged, and the counter is incremented for every packet that belongs to the same flow. A flow is defined as a set of packets that have the same values for the source IP address, destination IP address, source port, destination port, and protocol parameters. To avoid flooding of log messages, the NetScaler ADC performs internal rate limiting so that packets belonging to the same flow are not repeatedly logged. The total number of different flows that can be logged at any given time is limited to 10,000.

Note: You must apply ACLs after you enable logging.

To configure extended ACL Logging by using the command line interface

At the command prompt, type the following commands to configure logging and verify the configuration:

- **set ns acl** <aclName> [-**logState** (ENABLED | DISABLED)] [-**rateLimit** <positive_integer>]
- **show ns acl** [<aclName>]

Example

```
> set ns acl restrict -logstate ENABLED -ratelimit 120
Warning: ACL modified, apply ACLs to activate change
```

To configure extended ACL Logging by using the configuration utility

1. Navigate to System > Network > ACLs and, on the **Extended ACLs** tab, open the extended ACL.
2. Set the following parameters:
   - **Log State**—Enable or disable logging of events related to the extended ACL rule. The log messages are stored in the configured syslog or auditlog server.
   - **Log Rate Limit**—Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter.

Displaying Extended ACL and ACL6s Statistics

You can display statistics of extended ACLs and ACL6s.

The following table lists the statistics associated with extended ACLs and ACL6s, and their descriptions.

Statistic	Specifies
Allow ACL hits	Packets matching ACLs with processing mode set to ALLOW. The NetScaler ADC processes these packets.
NAT ACL hits	Packets matching a NAT ACL, resulting in a NAT session.
Deny ACL hits	Packets dropped because they match ACLs with processing mode set to DENY.
Bridge ACL hits	Packets matching a bridge ACL, which in transparent mode bypasses service processing.
ACL hits	Packets matching an ACL.
ACL misses	Packets not matching any ACL.

To display the statistics of all extended ACLs by using the command line interface

At the command prompt, type:

stat ns acl

To display the statistics of all extended ACL6s by using the command line interface

At the command prompt, type:

stat ns acl6

To display the statistics of an extended ACL by using the configuration utility

Navigate to System > Network > ACLs, on the **Extended ACLs** tab, select the extended ACL, and click **Statistics**.

To display the statistics of an extended ACL6 by using the configuration utility

Navigate to System > Network > ACLs, on the **Extended ACL6s** tab, select the extended ACL, and click **Statistics**.

Sample Configurations

The following table shows examples of configuring extended ACL rules through the command line interface.

Action - ALLOW	
Tasks	**Steps**

Create an extended ACL rule to allow a particular host to access the servers.	>add ns acl allow-client ALLOW -srcIP = 40.40.40.1 Done
Create an extended ACL rule to allow a particular network to access the servers.	>add ns acl allow-client-net ALLOW -srcIP = 40.40.40.0-40.40.40.255 Done
Create extended ACL rules to allow HTTP, TFTP, and ICMP traffic.	>add acl allow-http ALLOW -protocol tcP -destport 80 Done Done >add acl allow-tftp ALLOW -protocol udp -destport 69 Done >add acl allow-icmp ALLOW -protocol icmp Done
Create an extended ACL rule to allow access to a particular destination/network.	>add acl allow-dest-access ALLOW -destip 20.20.20.0-20.20.20.255 Done
Create an extended ACL rule to allow traffic coming from a particular VLAN.	>add acl allow-vlan ALLOW -vlan 3000 Done
Action - DENY	
Tasks	**Steps**
Create an extended ACL rule to deny access to the servers by a particular host.	>add ns acl deny-client DENY -srcIP = 50.50.50.1 Done
Create an extended ACL rule to deny access to the servers from a particular network.	> add ns acl deny-client-net DENY -srcIP = 50.50.50.0-50.50.50.255 Done
Create extended ACL rules to deny Telnet and FTP traffic.	>add ns acl deny-client-Telnet DENY -protocol TCP -destPort 23

	Done > add ns acl deny-client-FTP DENY -protocol TCP -destPort 20-21 Done
Create an extended ACL rule to deny TCP traffic to port 80 from a particular host/network.	>add ns acl deny-client-TCP DENY -protocol TCP -destPort 80 -destIP 20.20.20.0-20.20.20.255 Done
Create an extended ACL rule to deny traffic from a particular VLAN.	> add acl deny-vlan DENY -vlan 2000 Done
Action - BRIDGE	
Tasks	**Steps**
Create an extended ACL rule to bridge FTP traffic.	>add ns acl bridge-ftp BRIDGE -protocol TCP -destport 21 Done >add ns acl bridge-ftp-data BRIDGE -protocol TCP -destport 21 Done
Create an extended ACL rule to bridge all traffic from a particular VLAN.	>add ns acl bridge-client-vlan BRIDGE -vlan 1000 Done
MAC Address Filtering	
Tasks	**Steps**
Create an extended ACL rule to allow traffic from a particular MAC address to a particular host.	>add ns acl allow-mac-host ALLOW -srcMAC 2a:c1:69:92:a0:7b -destIP 10.10.10.1 Done
ACL with RNAT (Typically, RNAT is used to allow servers configured with private non-routable IP addresses to initiate connections to the Internet.)	

Tasks	Steps
Create an RNAT rule for a particular host.	>add ns acl rnat-acl-host ALLOW -srcIP 40.40.40.1 Done >apply ns acls Done >set rnat rnat-acl Done
Create an RNAT rule for a particular network.	>add ns acl rnat-acl-network ALLOW -srcIP 40.40.40.0-40.40.40.255 Done >set rnat rnat-acl-network -NATIP 5.5.5.1 Done
ACL with Forwarding Session	
Create a forwarding session rule for a case in which a client request forwarded to a server results in a response that has to return by the same path.	>add ns acl forward-acl-host ALLOW -srcIP 20.20.20.1 Done >add forwardingSession fs -aclname forward-acl-host Done

IP Routing

Sep 06, 2013

NetScaler appliances support both dynamic and static routing. Because simple routing is not the primary role of a NetScaler, the main objective of running dynamic routing protocols is to enable route health injection (RHI), so that an upstream router can choose the best among multiple routes to a topographically distributed virtual server.

Most NetScaler implementations use some static routes to reduce routing overhead. You can create backup static routes and monitor routes to enable automatic switchover in the event that a static route goes down. You can also assign weights to facilitate load balancing among static routes, create null routes to prevent routing loops, and configure IPv6 static routes. You can configure policy based routes (PBRs), for which routing decisions are based on criteria that you specify.

This document includes the following information:

- Configuring Dynamic Routes
- Configuring Static Routes
- Configuring Policy-Based Routes
- Troubleshooting Routing Issues

Configuring Dynamic Routes

Sep 30, 2015

When a dynamic routing protocol is enabled, the corresponding routing process monitors route updates and advertises routes. Routing protocols enable an upstream router to use the equal cost multipath (ECMP) technique to load balance traffic to identical virtual servers hosted on two standalone NetScaler appliances. Dynamic routing on a NetScaler appliance uses three routing tables. In a high-availability setup, the routing tables on the secondary appliance mirror those on the primary.

For command reference guides and unsupported commands on dynamic routing protocol, see Dynamic Routing Protocol Command Reference Guides and Unsupported Commands.

The NetScaler supports the following protocols:

- Routing Information Protocol (RIP) version 2
- Open Shortest Path First (OSPF) version 2
- Border Gateway Protocol (BGP)
- Routing Information Protocol next generation (RIPng) for IPv6
- Open Shortest Path First (OSPF) version 3 for IPv6
- ISIS Protocol

You can enable more than one protocol simultaneously.

Routing Tables in the NetScaler

In a NetScaler appliance, the NetScaler kernel routing table, the FreeBSD kernel routing table, and the NSM FIB routing table each hold a different set of routes and serve a different purpose. They communicate with each other by using UNIX routing sockets. Route updates are not automatically propagated from one routing table to another. You must configure propagation of route updates for each routing table.

NS Kernel Routing Table

The NS kernel routing table holds subnet routes corresponding to the NSIP and to each SNIP and MIP. Usually, no routes corresponding to VIPs are present in the NS kernel routing table. The exception is a VIP added by using the **add ns ip** command and configured with a subnet mask other than 255.255.255.255. If there are multiple IP addresses belonging to the same subnet, they are abstracted as a single subnet route. In addition, this table holds a route to the loopback network (127.0.0.0) and any static routes added through the command line interface (CLI). The entries in this table are used by the NetScaler in packet forwarding. From the NetScaler CLI, they can be inspected with the **show route** command.

FreeBSD Routing Table

The sole purpose of the FreeBSD routing table is to facilitate initiation and termination of management traffic (telnet, ssh, etc.). In a NetScaler appliance, these applications are tightly coupled to FreeBSD, and it is imperative for FreeBSD to have the necessary information to handle traffic to and from these applications. This routing table contains a route to the NSIP subnet and a default route. In addition, FreeBSD adds routes of type WasCloned(W) when the NetScaler establishes connections to hosts on local networks. Because of the highly specialized utility of the entries in this routing table, all other route updates from the NS kernel and NSM FIB routing tables bypass the FreeBSD routing table. Do not modify it with the **route** command. The FreeBSD routing table can be inspected by using the **netstat** command from any UNIX shell.

Network Services Module (NSM) FIB

The NSM FIB routing table contains the advertisable routes that are distributed by the dynamic routing protocols to their peers in the network. It may contain:

Connected routes

IP subnets that are directly reachable from the NetScaler. Typically, routes corresponding to the NSIP subnet and subnets over which routing protocols are enabled are present in NSM FIB as connected routes.

Kernel routes

All the VIP addresses on which the -hostRoute option is enabled are present in NSM FIB as kernel routes if they satisfy the required RHI Levels. In addition, NSM FIB contains any static routes configured on the NetScaler CLI that have the -advertise option enabled. Alternatively, if the NetScaler is operating in Static Route Advertisement (SRADV) mode, all static routes configured on the NetScaler CLI are present in NSM FIB. These static routes are marked as kernel routes in NSM FIB, because they actually belong to the NS kernel routing table.

Static routes

Normally, any static route configured in VTYSH is present in NSM FIB. If administrative distances of protocols are modified, this may not always be the case. An important point to note is that these routes can never get into the NS kernel routing table.

Learned routes

If the NetScaler is configured to learn routes dynamically, the NSM FIB contains routes learned by the various dynamic routing protocols. Routes learned by OSPF, however, need special processing. They are downloaded to FIB only if the fib-install option is enabled for the OSPF process. This can be done from the router-config view in VTYSH.

High Availability Setup

In a high availability setup, the primary node runs the routing process and propagates routing table updates to the secondary node. The routing table of the secondary node mirrors the routing table on the primary node.

Non-Stop Forwarding

After failover, the secondary node takes some time to start the protocol, learn the routes, and update its routing table. But this does not affect routing, because the routing table on the secondary node is identical to the routing table on the primary node. This mode of operation is known as non-stop forwarding.

Black Hole Avoidance Mechanism

After failover, the new primary node injects all its VIP routes into the upstream router. However, that router retains the old primary node's routes for 180 seconds. Because the router is not aware of the failover, it attempts to load balance traffic between the two nodes. During the 180 seconds before the old routes expire, the router sends half the traffic to the old, inactive primary node, which is, in effect, a black hole.

To prevent this, the new primary node, when injecting a route, assigns it a metric that is slightly lower than the one specified by the old primary node.

Interfaces for Configuring Dynamic Routing

To configure dynamic routing, you can use either the configuration utility or a command-line interface. The NetScaler supports two independent command-line interfaces: the NetScaler CLI and the Virtual Teletype Shell (VTYSH). The

NetScaler CLI is the appliance's native shell. VTYSH is exposed by ZebOS. The NetScaler routing suite is based on ZebOS, the commercial version of GNU Zebra.

Note: Citrix recommends that you use VTYSH for all commands except those that can be configured only on the NetScaler CLI. Use of the NetScaler CLI should generally be limited to commands for enabling the routing protocols, configuring host route advertisement, and adding static routes for packet forwarding.

Dynamic Routing Protocol Command Reference Guides and Unsupported Commands

The following table lists command reference guide links, for various dynamic routing protocols, and unsupported commands on the NetScaler appliance:

Dynamic Routing Protocol	Command Reference Guide	Unsupported Commands
OSPF	OSPF Command Reference	• Domain-id command • Graceful restart related commands • OSPF-TE related commands • OSPF-VPN related commands • CSPF-TE related commands • ip ospf resync-timeout command • capability opaque command • enable ext-ospf-multi-inst command
IPv6 OSPF (OSPFv3)	OSPF Command Reference	• Graceful restart related commands • OSPF-TE related commands
BGP	BGP Command Reference	• VPN/VRF related commands • Graceful restart related commands • MPLS related commands • 6PE commands (IPv6 provider edge) • MD5 authentication related commands • Multicast options • set-overload-bit command
IS-IS	IS-IS Command Reference	• capability cspf command • enable-cspf command • mpls traffic-eng command • mpls traffic-eng router-id command • multi-topology for ipv6 address family related commands
RIP and IPv6 RIP (RIPng)	-	• neighbor command

Configuring RIP

Mar 20, 2012

Routing Information Protocol (RIP) is a Distance Vector protocol. The NetScaler supports RIP as defined in RFC 1058 and RFC 2453. RIP can run on any subnet.

After enabling RIP, you need to configure advertisement of RIP routes. For troubleshooting, you can limit RIP propagation. You can display RIP settings to verify the configuration.

Enabling and Disabling RIP

Updated: 2013-08-30

Use either of the following procedures to enable or disable RIP. After you enable RIP, the NetScaler appliance starts the RIP process. After you disable RIP, the appliance stops the RIP process.

To enable or disable RIP routing by using the command line interface

At the command prompt, enter one of the following commands to enable or disable RIP:

- enable ns feature RIP
- disable ns feature RIP

To enable or disable RIP routing by using the configuration utility

1. Navigate to System > Settings, in Modes and Features group, click Change advanced features.
2. Select or clear the RIP Routing option.

Advertising Routes

Updated: 2013-08-30

RIP enables an upstream router to load balance traffic between two identical virtual servers hosted on two standalone NetScaler appliances. Route advertisement enables an upstream router to track network entities located behind the NetScaler.

To configure RIP to advertise routes by using the VTYSH command line

At the command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router rip	Start the RIP routing process and enter configuration mode for the routing process.

Command	Specifies
redistribute static	Redistribute static routes.
redistribute kernel	Redistribute kernel routes.

Example:

```
>VTYSH
NS# configure terminal
NS(config)# router rip
NS(config-router)# redistribute static
NS(config-router)# redistribute kernel
```

Limiting RIP Propagations

Updated: 2013-08-30

If you need to troubleshoot your configuration, you can configure listen-only mode on any given interface.

To limit RIP propagation by using the VTYSH command line

At the command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router rip	Start the RIP routing process and enter configuration mode for the routing process.
passive-interface < vlan_name>	Suppress routing updates on interfaces bound to the specified VLAN.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router rip
NS(config-router)# passive-interface VLAN0
```

Verifying the RIP Configuration

Updated: 2013-08-30

You can display the routing table and other RIP settings.

To view the RIP settings by using the VTYSH command line

At the command prompt, type the following commands in the following order:

Command	Specifies
VTYSH	Display VTYSH command prompt.
sh rip	Display updated RIP routing table.
sh rip interface <vlan_name>	Displays RIP information for the specified VLAN.

Example

```
NS# VTYSH
NS# sh rip
NS# sh rip interface VLAN0
```

Configuring OSPF

Feb 07, 2014

The NetScaler supports Open Shortest Path First (OSPF) Version 2 (RFC 2328). The features of OSPF on the NetScaler are:

- If a vserver is active, the host routes to the vserver can be injected into the routing protocols.
- OSPF can run on any subnet.
- Route learning advertised by neighboring OSPF routers can be disabled on the NetScaler.
- The NetScaler can advertise Type-1 or Type-2 external metrics for all routes.
- The NetScaler can advertise user-specified metric settings for VIP routes. For example, you can configure a metric per VIP without special route maps.
- You can specify the OSPF area ID for the NetScaler.
