   1. For the shadow virtual server, specify

      - Protocol—ANY
      - IP Address*—*
      - Port*—*

      *A required parameter

   2. Bind the firewall services to the shadow virtual server.
5. For each network domain, repeat steps 3 and 4.
6. From the Load Balancing Virtual Servers pane, open the virtual servers that you created and verify the settings.

Use Case 11: Configuring XenDesktop for Load Balancing

Jun 08, 2015

For an improved performance in the delivery of virtual desktop applications, you can integrate the NetScaler appliance with Citrix XenDesktop and use the NetScaler load balancing feature to distribute the load across the Web Interface servers and the Desktop Delivery Controller (DDC) servers.

Generally, you use XenDesktop in situations where applications are not compatible with running on a terminal server or XenApp, or if each virtual desktop has unique requirements. In such cases, you need one desktop host for each user that connects. However, the hosts can be pooled so that you need only one host for each currently connected user.

The core application service deployed for XenDesktop is the Desktop Delivery Controller (DDC). The DDC is installed on a server, and its main function is to register desktop hosts and broker client connections to them.

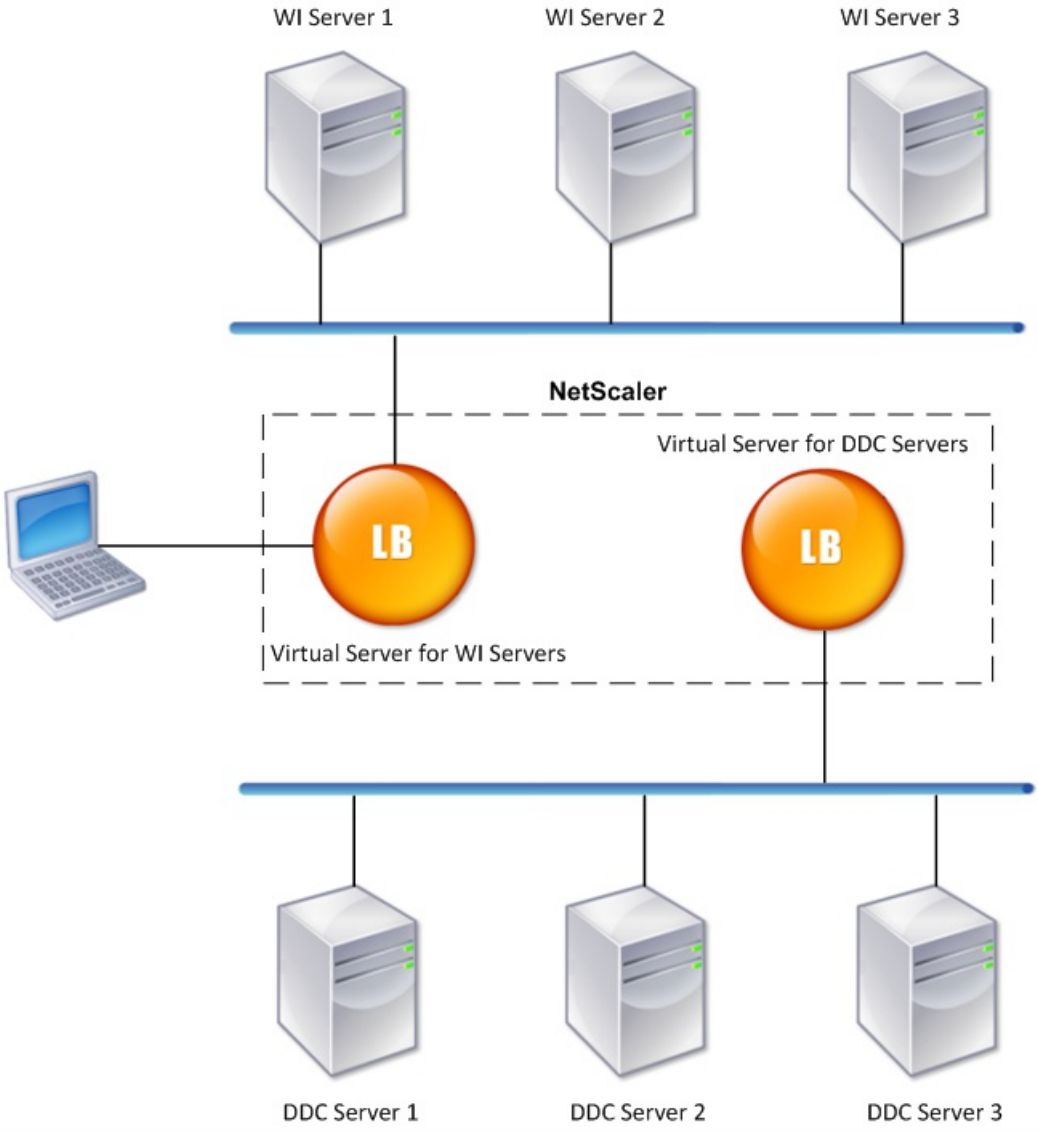
The DDC also authenticates users and manages the assembly of the users' virtual desktop environments by controlling the state of the desktops, and starting and stopping the desktops.

Generally, multiple DDCs are installed to enhance availability.

The Web Interface servers provide secure access to virtual desktops. The Web Interface is the initial connection portal to the Desktop Delivery Controller (DDC). The Web browser on the user's device sends information to the Web server, which communicates with the server farm to provide the user with access to the virtual desktop.

The following figure shows the topology of a NetScaler appliance working with XenDesktop.

Figure 1. **Load Balancing of XenDesktop**



Note: Although you can use the HTTP protocol, Citrix recommends that you use SSL for communication between the client and the NetScaler. You can use the HTTP protocol for communication between the NetScaler and the DDC servers even though you use the SSL protocol for communication with the client.
A wizard is available for configuring basic load balancing in a XenDesktop deployment. You can use the wizard to configure Web interface servers and a virtual server for them, and DDC servers and a virtual server for them. The virtual servers that you configure are bound to services specified as Web Interface services and DDC services. Each virtual server is configured with the default load balancing method, and the default features are enabled. A monitor is created and bound to each virtual server.

The wizard creates a basic setup, with default values for options such as the load balancing method, policies, persistence, and advanced settings. You can change any of the values if necessary.

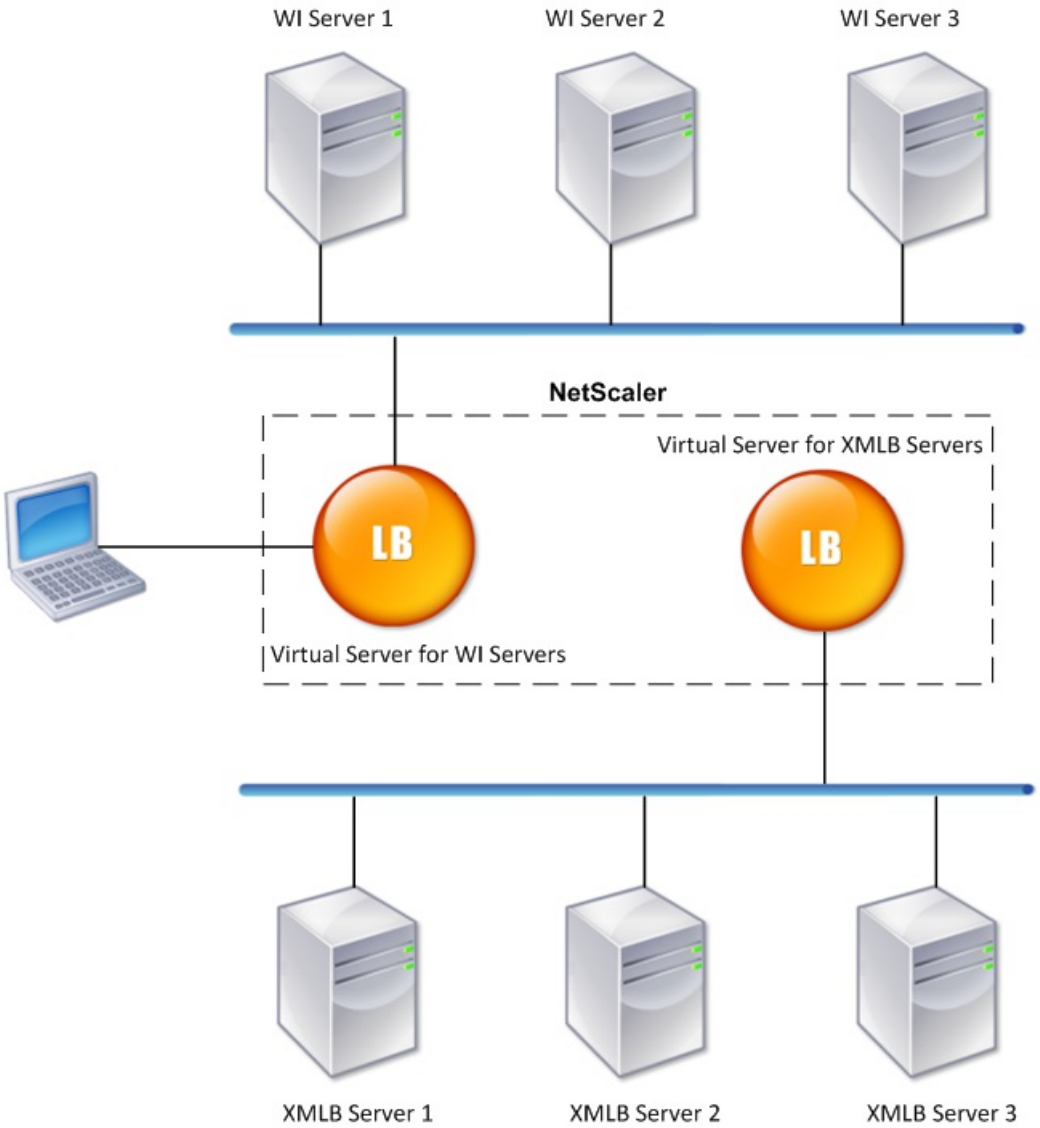
1. Navigate to Traffic Management > Load Balancing.
2. In the Getting Started group, click Load balancing wizard for Citrix XenDesktop.
3. Follow the instructions presented by the wizard.

Use Case 12: Configuring XenApp for Load Balancing

Jun 08, 2015

For efficient delivery of applications, you can integrate the NetScaler appliance with Citrix XenApp and use the NetScaler load balancing feature to distribute the load across the XenApp server farms. The following figure is a topology diagram of such a setup.

Figure 1. Load Balancing of XenApp



The Web Interface servers provide secure access to XenApp application resources through the user's Web browser. The Web Interface client presents to the users all the resources, such as applications, content, and desktops that are made available in the XenApp server farms. Users can access the published resources through a standard Web browser or through the Citrix online plug-in.

The Web browser on the user's device sends information to the Web server, which communicates with the servers on the server farm to provide the user with access to the resources.

The Web Interface and the XML Broker are complementary services. The Web Interface provides users with access to applications, and the XML Broker evaluates the user's permissions to determine which applications appear in the Web

Interface.

The XML service is installed on all the servers in the server farm. The XML service specified in the Web Interface functions as an XML broker. On the basis of the user credentials passed by the Web Interface server, the XML Broker server sends a list of applications accessible to the user.

In large enterprises where multiple Web Interface servers and XML Broker servers are deployed, Citrix recommends load balancing these servers by using NetScaler. Configure one virtual server to load balance all of the Web Interface servers and another for all of the XML Broker servers. The load balancing method and other features can be configured on the virtual server as required.

Note: Although you can use the HTTP protocol, Citrix recommends that you use SSL for communication between the client and the NetScaler. You can use the HTTP protocol for communication between the NetScaler and the WI servers even though you use the SSL protocol for communication with the client.
The configuration utility provides a wizard for setting up basic load balancing for XenApp.

Through this wizard, you can configure Web Interface servers and a virtual server for them, and XML Broker servers and a virtual server for them. You can also specify the site through which the status of Web Interface servers can be monitored and the software application used to monitor the status of the XML Broker servers.

When you complete the wizard, a basic load balancing setup is configured on the NetScaler. The specified virtual servers are created and bound to the services specified as Web Interface services and XML Broker services. Each virtual server is configured with the default load balancing method, and the default features are enabled. A monitor is created and bound to each virtual server.

The wizard creates a basic setup with default values for options such as the load balancing method, policies, persistence, and advanced settings. You can change any of the values if necessary.

1. Navigate to Traffic Management > Load Balancing.
2. In the Getting Started group, click Load balancing wizard for Citrix XenApp.
3. Follow the instructions presented by the wizard.

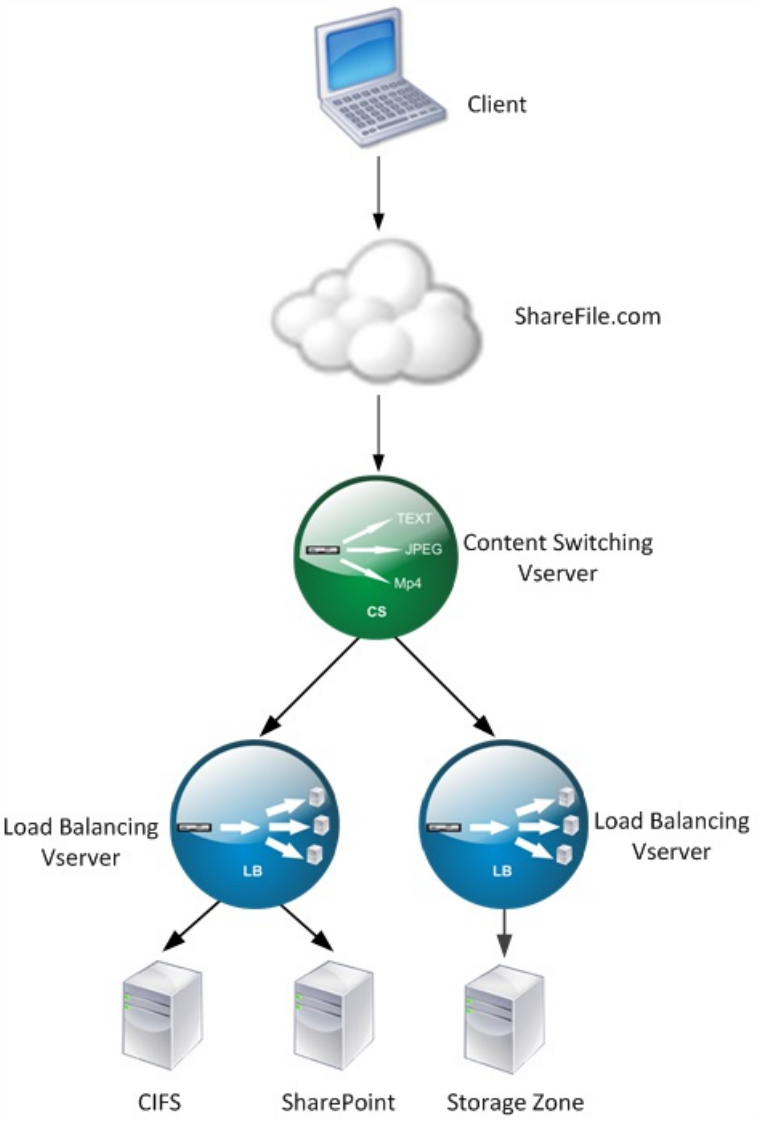
Use Case 13: ShareFile Wizard for Load Balancing Citrix ShareFile

Jun 08, 2015

You can configure load balancing for Citrix ShareFile using the wizard. The Citrix ShareFile wizard helps in setting up load balancing configuration for ShareFile site based on the type of content requested. The content switching server directs the request based on whether it is a StorageZone, CIFS or a SharePoint request. The content switching is based on policies. The wizard auto generates the policies to identify whether the request is for StorageZone, CIFS or SharePoint. The content switching virtual server uses these policies to direct the request to the correct load balancing server.

A typical data flow can be depicted as shown in the diagram below.

Figure 1. ShareFile Data Load Balancing



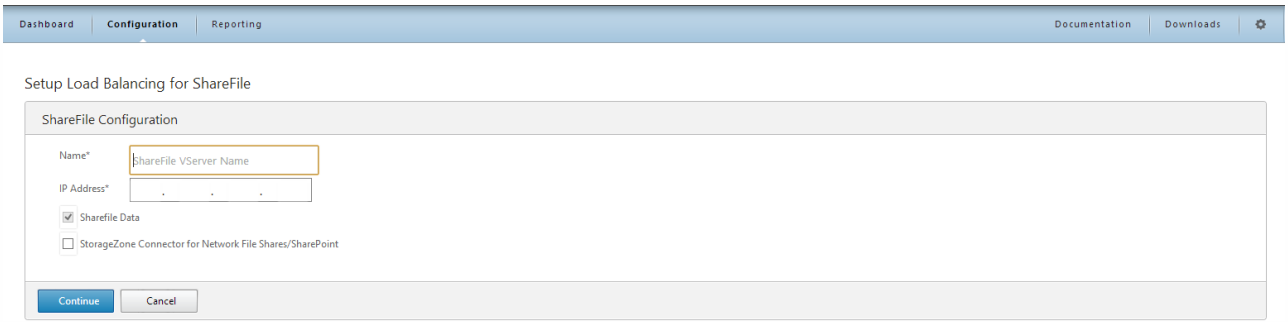
You can view the load balancing virtual servers that the ShareFile wizard creates by navigating to Traffic Management >Virtual Servers and Services > Virtual Servers. You cannot manually remove the virtual servers created using the ShareFile

wizard. Use the wizard to remove the virtual servers.

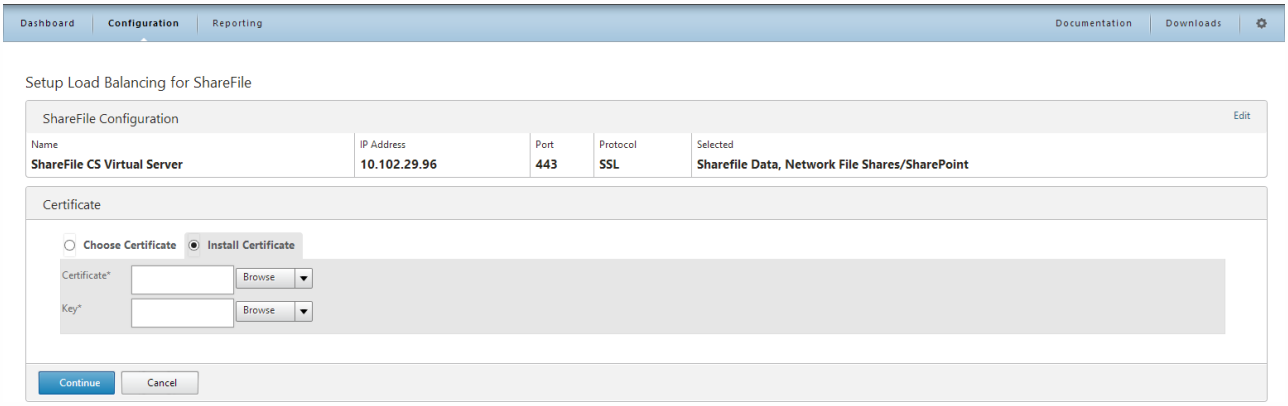
NetScaler uses the LDAP authentication for SharePoint or CIFS request. Hash authentication is used for authenticating requests for StorageZones.

Updated: 2015-06-04

1. In the navigation pane, click Load Balancing.
2. Navigate to Traffic Management > Load Balancing.
3. Under Citrix ShareFile, click Setup NetScaler for ShareFile.
4. On the Setup Load Balancing for ShareFile page, provide the following information:
   - Name: Name of the content switching virtual server.
   - IP Address: IP address of the content switching virtual server.
   - If you want to setup load balancing for CIFS or SharePoint, click the StorageZone Connector for Network File Shares/SharePoint checkbox and then click Continue. By default ShareFile Data checkbox is selected.

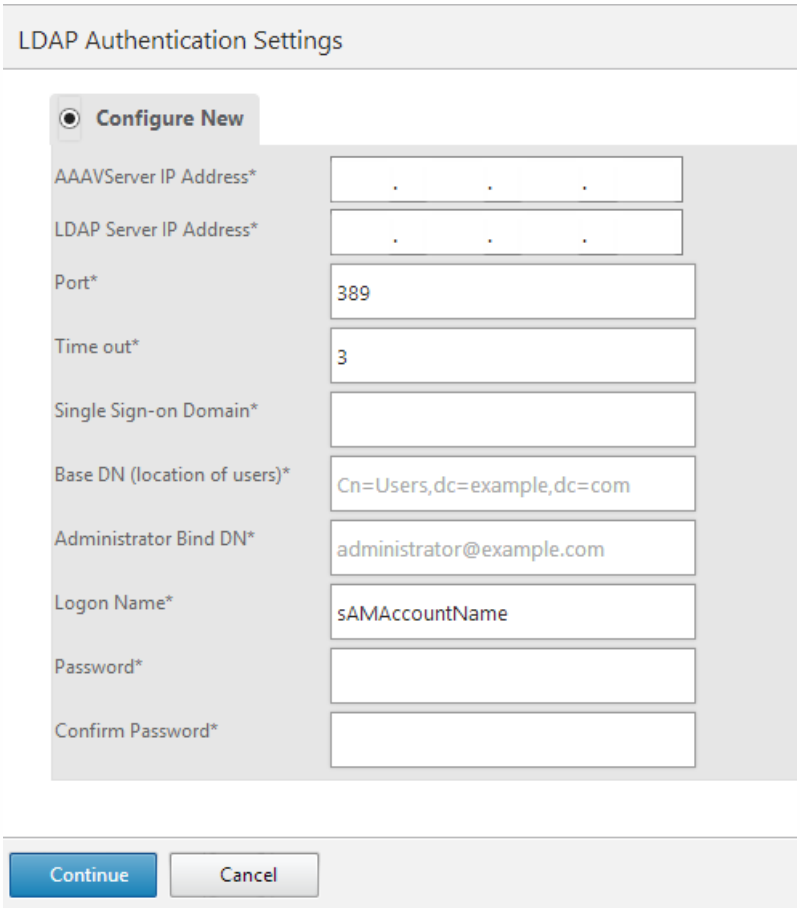


5. Provide a valid certificate. If you have a certificate, click Choose Certificate and from the drop-down list select the certificate. If you have to install a certificate, click Install Certificate and provide the Certificate-Key pair.



6. Click Continue.
7. In the Add New StorageZone Controller dialog box, specify the values of the following parameters:
   - StorageZone Controller IP Address— IP address
   - Port— Port number. The default value is 443.
   - Protocol— Select from HTTPS or HTTP

8. Click Create and then click Done. The wizard automatically creates a service and autogenerate the name of the service.
9. If you chose load balancing for CIFS or SharePoint in step 4.c, then specify the values for LDAP Authentication Settings:
   - AAAVServer IP Address— IP address of AAA virtual server
   - LDAP Server IP Address— IP Address of the LDAP server
   - Port— Port number. The default value is 389
   - Time out— The time out value in minutes
   - Single Sign-on Domain— Single sign-on domain name
   - Base DN— Base domain name
   - Administrator Bind DN— LDAP account name with the domain name, for example, adminstrator@domainname.com
   - Logon Name— Logon name is the sAMAccount name
   - Password and Confirm Password— Enter the password and confirm the password



10. Click Continue and then click Done.

To remove load balancing configuration for ShareFile

1. Click on Configuration > Traffic Management > Load Balancing.

2. On the Load Balancing page, under Citrix ShareFile click on Remove ShareFile Configuration.

Troubleshooting

Aug 01, 2013

If the load balancing does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

Updated: 2013-08-01

For best results, use the following resources to troubleshoot a content switching issue on a NetScaler appliance:

- Latest ns.conf file
- Relevant newnslog files
- Ethereal packet traces recorded on the appliance and relevant client, if possible
- The ns.log file

In addition to the above resources, the following tools expedite troubleshooting:

- A browser add-on tool that can display HTTP headers. This can be used to troubleshoot persistency related issues.
- The Wireshark application customized for the NetScaler trace files.

Updated: 2015-06-11

- Issue
  I created a user script for monitoring, but it is not working.

  Resolution

  Check the number of arguments in the script. The limit is 512. A script with more than 512 arguments might not work properly. Use the nsumon-debug.pl script from the NetScaler command line to debug the script.

- Issue
  I see a lot of monitor probes, and they seem to be increasing the network traffic unnecessarily. Is there a way to turn off the monitor probes?

  Resolution

  You can turn off the monitor probe connections, by disabling the monitor or setting the value of the healthMonitor parameter in the set service command to NO. With the NO option, the appliance shows the service as UP at all times.

- Issue
  I have set up monitors for services, but connections are still directed to servers that are DOWN.

  Resolution

  You probably need to decrease the monitor probe intervals. The NetScaler appliance does not detect the DOWN state until the monitor sends a probe.

- Issue
  A metric bound to the monitor is present in the local and custom metric tables.

Resolution

Add the local prefix to the metric name if the metric is chosen from the local metric table. However, if the metric is chosen from the custom table, you don't need to add any prefix.

- Issue
  The monitor probes to a service are not reaching the service.

  Resolution

  Check whether you have set a limit on the number of connections for a service. If yes, exempt monitor-probe connections from this limit by setting the monitorSkipMaxClient parameter to ENABLED.

- Issue
  I am able to ping the servers, but the state of the services is always shown as DOWN.

  Resolution

  Check the type of monitors configured. For example, if a server is not configured for SSL and you use an HTTPS monitor, the state of the service is marked as DOWN. In this case using a TCP monitor should change the state of the service to UP.

- Issue
  Setting a weight for load monitors does not help in deciding the state of the service.

  Resolution

  Load monitors cannot decide the state of the service. Therefore, setting a weight on the load monitors is inappropriate.

- Issue
  A service is not stable.

  Resolution

  Consider troubleshooting the following components:
  - Verify that a correct server is bound to the service.
  - Verify the type of monitor bound to the service.
  - Verify the reasons for the monitor failures. You can open service from the Services page and verify the details for the number of probes, failures, and last response status for the monitor in the Monitors tab of the Configure service dialog box. To display the details, click the monitor configured.
  - If it is a custom monitor, bind a TCP or ping monitor to the service and verify the status of the monitor. If this resolves the issue, there is some problem with the custom monitor and the monitor requires further investigation.
  - You can record packet traces on the NetScaler appliance and verify the monitor probes and server response for further investigation.

- Issue
  The virtual IP (VIP) address is not stable or its status is displayed as DOWN.

  Resolution

  Consider troubleshooting the following components:
  - Verify that the load balancing feature is licensed.

- Verify that the feature is enabled.
- Verify that an appropriate service is bound to the virtual server.
- If the status of the VIP address is displayed as DOWN, verify that an administrator has enabled the service. If it is not, the status of the service should be Out-Of-Service. In such as case, you must enable the service and verify if the issue is resolved.
- Verify the service(s) bound to the virtual server and complete the troubleshooting steps mentioned for service not stable issue.
- If the VIP address is not stable, all the services bound to the virtual server should fail. Therefore, verify if all the services are failing at the same time. If it is so, there is a network issue between the NetScaler appliance and the servers.

- Issue
  The site is experiencing uneven load balancing.

  Resolution

  Consider troubleshooting the following components:
  - Verify the load balancing method configured on the appliance.
  - Verify weights associated with the services are as expected.
  - If the load balancing method is other than round robin, verify the number of connections to the server logged in the newnslog file. You can run the following command to verify the number on the newnslog file:
    # nsconmsg –K <newnslog_file> -s ConLb=2 –d oldconmsg

    Verify the services for the specific virtual server and check for the Response time, Open Established connections (OE), Hits, Persistent Hits and persistent rate (P) to troubleshoot the issue further.

  - If the load balancing method is round robin, verify the persistent Hits as mentioned in the preceding step. Additionally, verify if the service is not stable. If it is not, complete the troubleshooting steps mentioned for service not stable issue
  - Verify if persistency is configured on the appliance.
  - Verify is any service is not stable. If yes, complete the troubleshooting steps mentioned for service not stable issue.

- Issue
  The service status is displayed as DOWN.

  Resolution

  Consider troubleshooting the following components:
  - Verify whether a SNIP or MIP address is configured.
  - Verify that appropriate monitors are bound to the service.
  - If custom monitors are bound to the service, bind a TCP or ping monitor to the service and verify the status of the monitor. If this resolves the issue, there is some problem with the custom monitor and the monitor requires further investigation.
  - Verify if the status of service is displayed as DOWN for the server that is in another subnet. If yes, verify if Use Subnet IP (USNIP) resolves the issue because this could be due to the MIP address being unable to communicate to the server.

- Issue
  There is an issue with the response time.

  Resolution

Consider troubleshooting the following components:

- Verify the server response time from the service stats either by running the following command:
  # nsconmsg –K <newnslog_file> -s ConLb=2 –d oldconmsg
- Check for service not stable and service status being displayed as DOWN issues.

- Issue
  One of the servers is serving more requests than the other load balanced servers.

  Resolution

  Consider troubleshooting the following components:

  - Verify the load balancing method. Use the round robin method to distribute the client request equally regardless of the load on the servers.
  - Determine whether persistence is enabled for the load balancing configuration. If persistence is enabled, a given servers might be carrying a heavier load to maintain its session, especially If the persistence sessions are long.
  - Verify whether weights are assigned to each service. Assigning proper weights helps in proper load distribution.

- Issue
  Connections to a specific load balanced server are stalled. For example, all connections to one Outlook server might be stalled.

  Resolution

  Consider troubleshooting the following components:
  - Verify the load balance method. If it is round robin, consider changing the method to least connections.
  - Consider reducing the monitor time-out period. A shorter timeout period helps in marking a service as DOWN sooner, which would help in directing the traffic to server which is functional.
  - If the connections are stalled for a long period, surge-queue might build. Consider flushing the surge-queue to avoid a sudden spike in load on the server.
  - If the servers are working at their maximum level, consider adding a new server for better performance.

- Issue
  A majority of the connections are directed to a particular server, even when the least connections method for load balancing is configured.

  Resolution

  Determine whether persistence is configured and is of type source IP. If source IP persistence is configured even with the least connections method, the requests go to a specific server. The server's IP address is required for maintaining the session information. Consider using HTTP Cookies based persistence.

- Troubleshooting Tips
  For other issues, consider following tips to troubleshoot an issue not listed above:
  - If multiple load monitors are bound to a service, the load on the service is the sum of all the values on the load monitors bound to it. For load balancing to work properly, you must bind the same set of monitors to all the services.
  - If you disable a load monitor bound to the service and the service is bound to a virtual server, the virtual server uses the round robin method for load balancing.
  - When you bind a service to a virtual server where the load balancing method is CUSTOMLOAD and the service status is UP, the virtual server uses the initial round robin method for load balancing. It continues to be in round robin if the

service has no custom load monitors, or if status of at least one of the custom load monitors is not UP.

- All the services that are bound to a virtual server where the load balancing method is CUSTOMLOAD, the services must have load monitors bound to them.
- The CUSTOMLOAD load balancing method also follows startup round robin.
- If you disable a metric-based binding and this is the last active metric, the specific virtual server uses the round robin method for load balancing. A metric is disabled by setting the metric threshold to zero.
- When a metric bound to a monitor crosses the threshold value, that particular service is not considered for load balancing. If all the services have reached the threshold, the virtual server uses the round robin method for load balancing and an error message “5xx - server busy error” is displayed.
- A maximum of 10 metrics from a custom table can be bound to the monitor.
- The OIDs must be scalar variables.
- For successful load balancing, the interval must be as low as possible. If the interval is high, the time period for retrieving the load value increases. As a result, load balancing takes place using improper values.
- A user cannot modify the local table.

SSL Offload and Acceleration

Dec 08, 2014

A Citrix® NetScaler® appliance configured for SSL acceleration transparently accelerates SSL transactions by offloading SSL processing from the server. To configure SSL offloading, you configure a virtual server to intercept and process SSL transactions, and send the decrypted traffic to the server (unless you configure end-to-end encryption, in which case the traffic is re-encrypted). Upon receiving the response from the server, the appliance completes the secure transaction with the client. From the client's perspective, the transaction seems to be directly with the server. A NetScaler configured for SSL acceleration also performs other configured functions, such as load balancing.

Configuring SSL offloading requires an SSL certificate and key pair, which you must obtain if you do not already have an SSL certificate. Other SSL-related tasks that you might need to perform include managing certificates, managing certificate revocation lists, configuring client authentication, and managing SSL actions and policies.

A non-FIPS NetScaler appliance stores the server's private key on the hard disk. On a FIPS appliance, the key is stored in a cryptographic module known as a hardware security module (HSM). Only the MPX 9700/10500/12500/15500 appliances support a FIPS card, so other NetScaler models cannot be equipped with an HSM.

Beginning with release 10.5, build 52.1115.e, all NetScaler appliances that do not support a FIPS card (including virtual appliances) support the Thales nShield® Connect external HSM. (MPX 9700/10500/12500/15500 appliances do not support an external HSM.)

Note: FIPS-related options for some of the SSL configuration procedures described in this document are specific to a FIPS-enabled NetScaler.

Configuring SSL Offloading

Jun 03, 2015

To configure SSL offloading, you must enable SSL processing on the NetScaler appliance and configure an SSL based virtual server that will intercept SSL traffic, decrypt the traffic, and forward it to a service that is bound to the virtual server. To enable SSL offloading, you must import a valid certificate and key and bind the pair to the virtual server.

To configure SSL offloading, see the following sections:

- Enabling SSL Processing
- Configuring Services
- Configuring an SSL-Based Virtual Server
- Binding Services to the SSL-Based Virtual Server
- Adding or Updating a Certificate-Key Pair
- Binding the Certificate-Key Pair to the SSL-Based Virtual Server
- Configuring an SSL Virtual Server for Secure Hosting of Multiple Sites
- Importing SSL Files from Remote Hosts

Enabling SSL Processing

Nov 11, 2013

To process SSL traffic, you must enable SSL processing. You can configure SSL based entities, such as virtual servers and services, without enabling SSL processing, but they will not work until SSL processing is enabled.

At the command prompt, type:

- enable ns feature ssl
- show ns feature

Example

```
> enable ns feature SSL
 Done
> show ns feature

      Feature                Acronym          Status
      -------                -------          ------
 1)    Web Logging              WL              OFF
 2)    Surge Protection          SP              ON
 3)    Load Balancing           LB              ON
 .
 .
 .
 9)    SSL Offloading           SSL             ON
 .
 .
 .
 24)   NetScaler Push           push            OFF
Done
```

1. In the navigation pane, expand System, and then click Settings.
2. Under Modes and Features, click Configure basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes. A message appears in the status bar, stating that the feature has been enabled.

Configuring Services

Aug 20, 2013

On the NetScaler appliance, a service represents a physical server or an application on a physical server. Once configured, services are in the disabled state until the appliance can reach the physical server on the network and monitor its status.

At the command prompt, type the following commands to add a service and verify the configuration:

- add service <name> (<IP> | <serverName>) <serviceType> <port>
- show service <serviceName>

Example

```
> add service ssl1 10.102.29.252 HTTP 80
 Done
> show service ssl1
      ssl1 (10.102.29.252:80) - HTTP
      State: UP
      Last state change was at Thu Nov 12 05:26:31 2009
      Time since last state change: 0 days, 00:00:06.750
      Server Name: 10.102.29.252
      Server ID : 0   Monitor Threshold : 0
      Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
      Use Source IP: NO
      Client Keepalive(CKA): NO
      Access Down Service: NO
      TCP Buffering(TCPB): YES
      HTTP Compression(CMP): YES
      Idle timeout: Client: 180 sec   Server: 360 sec
      Client IP: DISABLED
      Cacheable: NO
      SC: OFF
      SP: ON
      Down state flush: ENABLED

1)     Monitor Name: tcp-default
            State: UP       Weight: 1
            Probes: 2       Failed [Total: 0 Current: 0]
            Last response: Success - TCP syn+ack received.
            Response Time: N/A
 Done
```

To modify a service, use the set service command, which is just like using the add service command, except that you enter the name of an existing service. To remove a service, use the rm service command, which accepts only the <name> argument.

1. Navigate to Traffic Management > SSL Offload > Services.
2. In the Details pane, do one of the following:
   - To create a new service, click Add.
   - To modify an existing service, select the service, and then click Open.
3. In the Create Service or Configure Service dialog box, specify values for the following parameters:
   - Service Name*
   - Server*
   - Protocol*
   - Port*

   * A required parameter
4. Click Create or OK, and then click Close. In the Services pane, select the service that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Configuring an SSL-Based Virtual Server

Sep 04, 2014

Secure sessions require establishing a connection between the client and an SSL-based virtual server on the NetScaler appliance. The SSL virtual server intercepts SSL traffic, decrypts it and processes it before sending it to services that are bound to the virtual server.

Note: The SSL virtual server is marked as down on the NetScaler appliance until a valid certificate / key pair and at least one service are bound to it. An SSL based virtual server is a load balancing virtual server of protocol type SSL or SSL_TCP. The load balancing feature must be enabled on the NetScaler.

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- add lb vserver <name> (serviceType) <IPAddress> <port>
- show lb vserver <name>

Example

```
> add lb vserver vssl  SSL 10.102.29.133 443
 Done
> show ssl vserver vssl

        Advanced SSL configuration for VServer vssl:
        DH: DISABLED
        Ephemeral RSA: ENABLED        Refresh Count: 0
        Session Reuse: ENABLED        Timeout: 120 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: DISABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)      Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
 Done
```

To modify the load balancing properties of an SSL virtual server, use the set lb vserver command, which is just like using the add lb vserver command, except that you enter the name of an existing vserver. To modify the SSL properties of an SSL-based virtual server, use the set ssl vserver command. For more information, see Customizing the SSL Configuration.

To remove an SSL virtual server, use the rm lb vserver command, which accepts only the <name> argument.

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.

2. In the Details pane, do one of the following:
   - To create a new virtual server, click Add.
   - To modify an existing virtual server, select the virtual server, and then click Open.
3. In the Create Virtual Server (SSL Offload) or Configure Virtual Server (SSL Offload) dialog box, specify values for the following parameters:
   - Name*
   - IP Address*
   - Protocol*
   - Port*

   * A required parameter
4. Click Create or OK, and then click Close. In the SSL Offload Virtual Servers pane, select the virtual server that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Binding Services to the SSL-Based Virtual Server

Aug 20, 2013

For the NetScaler appliance to forward decrypted SSL data to servers in the network, services representing these physical servers must be bound to the virtual server that receives the SSL data.

Because the link between the NetScaler and the physical server is typically secure, data transfer between the appliance and the physical server does not have to be encrypted. However, you can provide end-to end-encryption by encrypting data transfer between the NetScaler and the server. For details, see Configuring SSL Offloading with End-to-End Encryption.

Note: The Load Balancing feature should be enabled on the NetScaler appliance before you bind services to the SSL based virtual server.

At the command prompt, type the following commands to bind the service to the virtual server and verify the configuration:

- bind lb vserver <name> <serviceName>
- show lb vserver <name>

Example

```
> bind lb vserver vssl ssl1
 Done
> show lb vserver vssl
      vssl (10.102.29.133:443) - SSL  Type: ADDRESS
      State: DOWN[Certkey not bound]
      Last state change was at Thu Nov 12 05:31:17 2009 (+485 ms)
      Time since last state change: 0 days, 00:08:52.130
      Effective State: DOWN
      Client Idle Timeout: 180 sec
      Down state flush: ENABLED
      Disable Primary Vserver On Down : DISABLED
      No. of Bound Services :  1 (Total)      1 (Active)
      Configured Method: LEASTCONNECTION
      Mode: IP
      Persistence: NONE
      Vserver IP and Port insertion: OFF
      Push: DISABLED  Push VServer:
      Push Multi Clients: NO
      Push Label Rule: none

1) ssl1 (10.102.29.252: 80) - HTTP State: UP    Weight: 1
 Done
```

At the command prompt, type the following command:

unbind lb vserver <name> <serviceName>

Example

```
unbind lb vserver vssl ssl1
```

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind the service, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, select the Services tab, and then select the check box in the Active column of the ssl service that you want to bind to the virtual server.
4. Click OK. A message appears in the status bar, stating that the service has been bound successfully

Adding or Updating a Certificate-Key Pair

Feb 16, 2016

For any SSL transaction, the server needs a valid certificate and the corresponding private and public key pair. The SSL data is encrypted with the server's public key, which is available through the server's certificate. Decryption requires the corresponding private key.

Because the NetScaler appliance offloads SSL transactions from the server, the server's certificate and private key must be present on the appliance, and the certificate must be paired with its corresponding private key. This certificate-key pair must then be bound to the virtual server that processes the SSL transactions.

Both the certificate and the key must be in local storage on the NetScaler appliance before they can be added to the appliance. If your certificate or key file is not on the appliance, upload it to the appliance before you create the pair.
Important: Certificates and keys are stored in the /nsconfig/ssl directory by default. If your certificates or keys are stored in any other location, you must provide the absolute path to the files on the NetScaler appliance. The NetScaler FIPS appliances do not support external keys (non-FIPS keys). On a FIPS appliance, you cannot load keys from a local storage device such as a hard disk or flash memory. The FIPS keys must be present in the Hardware Security Module (HSM) of the appliance.
On a NetScaler MPX appliance and a NetScaler FIPS appliance, only RSA private keys are supported. On a VPX virtual appliance, both RSA and DSA private keys are supported. On an SDX appliance if SSL chips are assigned to an instance, then only RSA private keys are supported. However, if SSL chips are not assigned to an instance, then both RSA and DSA private keys are supported. In all the cases, you can bind a CA certificate with either RSA or DSA keys.

Set the notification period and enable the expiry monitor to be prompted before the certificate expires.

Note: A certificate must be signed by using one of the following hash algorithms:
- MD5
- SHA-1
- SHA-224
- SHA-256
- SHA-384
- SHA-512

An MPX appliance supports certificates of 512 or more bits, up to the following sizes:
- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 4096-bit certificate on the back-end server
- 4096-bit client certificate (if client authentication is enabled on the virtual server)

A VPX virtual appliance supports certificates of 512 or more bits, up to the following sizes:
- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate (includes intermediate and root certificates)
- 2048-bit certificate on the back-end server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

> ### Note
>
> A NetScaler SDX appliance supports certificates of 512 or more bits. Each NetScaler VPX instance hosted on the appliance supports the certificate sizes listed above for a VPX virtual appliance. However, if an SSL chip is assigned to an instance, that instance supports the certificate sizes supported by an MPX appliance.

At the command prompt, type the following commands to add a certificate-key pair and verify the configuration:

- add ssl certKey <certkeyName> -cert <string>[(-key <string> [-password]) | -fipsKey <string>] [-inform (DER | PEM)] [<passplain>] [-expiryMonitor (ENABLED | DISABLED) [-notificationPeriod <positive_integer>]]
- show ssl certKey [<certkeyName>]

Example

```
> add ssl certKey sslckey -cert server_cert.pem -key server_key.pem -password ssl -expiryMonitor ENABLED -notificationPeriod 30
 Done
Note: For FIPS appliances, replace -key with -fipskey
> show ssl certKey sslckey
      Name: sslckey         Status: Valid,   Days to expiration:8418
      Version: 3
      Serial Number: 01
      Signature Algorithm: md5WithRSAEncryption
      Issuer:  C=US,ST=SJ,L=SJ,O=NS,OU=NSSSL,CN=www.root.com
      Validity
            Not Before: Jul 15 02:25:01 2005 GMT
            Not After : Nov 30 02:25:01 2032 GMT
      Subject:  C=US,ST=SJ,L=SJ,O=NS,OU=NSSSL,CN=www.server.com
      Public Key Algorithm: rsaEncryption
      Public Key size: 2048
 Done
```

To modify the expiry monitor or notification period in a certificate-key pair, use the set ssl certkey command. To replace the certificate or key in a certificate-key pair, use the update ssl certkey command. The update ssl certkey command has an additional parameter for overriding the domain check. For both commands, enter the name of an existing certificate-key pair. To remove an SSL certificate-key pair, use the rm ssl certkey command, which accepts only the <certkeyName> argument.

1. Navigate to Traffic Management > SSL > Certificates.
2. In the Details pane, do one of the following:
   - To add a new certificate-key pair, click Install.
   - To update an existing certificate-key pair, select a certificate and then, from the Action list, select Update.
3. In the Install Certificate or Update Certificate dialog box, set the following parameters:
   - Certificate-Key Pair Name*
   - Certificate File Name*
   - Private Key File Name
   - Password
   - Certificate Format
   - Notify When Expires
   - Notification Period
   - No Domain Check (Available in the Update Certificate dialog box only)

   * A required parameter
4. Click Install or OK, and then click Close. In the SSL Certificates pane, select the certificate that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Binding the Certificate-Key Pair to the SSL-Based Virtual Server

Aug 20, 2013

An SSL certificate is an integral element of the SSL encryption and decryption process. The certificate is used during an SSL handshake to establish the identity of the SSL server.

The certificate being used for processing SSL transactions must be bound to the virtual server that receives the SSL data. If you have multiple virtual servers receiving SSL data, a valid certificate-key pair must be bound to each of them.

You can use a valid, existing SSL certificate that you have uploaded to the NetScaler appliance. As an alternative for testing purposes, you can create your own SSL certificate on the appliance. Intermediate certificates created by using a FIPS key on the NetScaler cannot be bound to an SSL virtual server.

As a part of the SSL handshake, in the certificate request message during client authentication, the server lists the distinguished names (DNs) of all the certificate authorities (CAs) bound to the server from which it will accept a client certificate. If you do not want the DN name of a specific CA certificate to be sent to the SSL client, set the **skipCA** flag. This setting indicates that the particular CA certificate's distinguished name should not be sent to the SSL client.

For details on how to create your own certificate, see Managing Certificates.

Note: Citrix recommends that you use only valid SSL certificates that have been issued by a trusted certificate authority.

At the command prompt, type the following commands to bind an SSL certificate-key pair to a virtual server and verify the configuration:

- bind ssl vserver <vServerName> -certkeyName <certificate-KeyPairName> -CA -skipCAName
- show ssl vserver <vServerName>

Example

```
> bind ssl vs vs1 -certkeyName cert2 -CA -skipCAName
Done
> sh ssl vs vs1
Advanced SSL configuration for VServer vs1:
DH: DISABLED
Ephemeral RSA: ENABLED Refresh Count: 0
Session Reuse: ENABLED Timeout: 120 seconds
Cipher Redirect: DISABLED
SSLv2 Redirect: DISABLED
ClearText Port: 0
Client Auth: DISABLED
SSL Redirect: DISABLED
Non FIPS Ciphers: DISABLED
SNI: DISABLED
SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
```

```
 Push Encryption Trigger: Always
 Send Close-Notify: YES
 1) CertKey Name: cert1 CA Certificate OCSPCheck: Optional CA_Name Sent
 2) CertKey Name: cert2 CA Certificate OCSPCheck: Optional CA_Name Skipped
 1) Cipher Name: DEFAULT
 Description: Predefined Cipher Alias
Done
```

If you try to unbind a certificate-key pair from a virtual server by using the **unbind ssl certKey <certkeyName>** command, an error message appears because the syntax of the command has changed. At the command prompt, type the following command:

unbind ssl vserver <vServerName> -certkeyName <string>

Example

```
unbind ssl vserver vssl -certkeyName sslckey
```

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to bind the certificate key to, and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click SSL Settings.
4. In the Available pane, select a certificate.
5. Click Add to add the certificate as a server certificate. To add as an SNI certificate, in the Add drop-down list select As SNI. To add as a CA certificate, in the Add drop-down list select As CA.
6. In the Configured pane, to indicate that the CA certificate's CA Name should not be sent to the SSL client, select Skip CA.
7. Click OK. The certificate pair is bound to the virtual server.

Configuring an SSL Virtual Server for Secure Hosting of Multiple Sites

May 13, 2015

Virtual hosting is used by Web servers to host more than one domain name with the same IP address. The NetScaler supports hosting of multiple secure domains by offloading SSL processing from the Web servers using transparent SSL services or virtual server-based SSL offloading. However, when multiple Web sites are hosted on the same virtual server, the SSL handshake is completed before the expected host name is sent to the virtual server. As a result, the NetScaler cannot determine which certificate to present to the client after a connection is established. This problem is resolved by enabling Server Name Indication (SNI) on the virtual server. SNI is a Transport Layer Security (TLS) extension used by the client to provide the host name during handshake initiation. Based on the information provided by the client in the SNI extension, the NetScaler presents the corresponding certificate to the client.

A wildcard SSL Certificate helps enable SSL encryption on multiple subdomains if the domains are controlled by the same organization and share the same second-level domain name. For example, a wildcard certificate issued to a sports network using the common name "*.sports.net" can be used to secure domains, such as "login.sports.net" and "help.sports.net" but not "login.ftp.sports.net."

Note: On a NetScaler appliance, SNI is not supported with a Subject Alternative Name (SAN) extension certificate.
You can bind multiple server certificates to a single SSL virtual server or transparent service using the -SNICert option. These certificates are issued by the virtual server or service if SNI is enabled on the virtual server or service. You can enable SNI at any time.

At the command prompt, type the following commands to configure SNI and verify the configuration:

- set ssl vserver <vServerName>@ [-SNIEnable (ENABLED | DISABLED)]
- bind ssl vserver <vServerName>@ -certkeyName <string> -SNICert
- show ssl vserver <vServerName>

  To bind multiple server certificates to a transparent service by using the NetScaler command line, replace vserver with service and vservername with servicename in the above commands.

  Note: The SSL service should be created with -clearTextPort 80 option.

Example

```
set ssl vserver v1 -snI ENABLED
bind ssl vserver v1 -certkeyName serverabc -SNICert
sh ssl vserver v1
Advanced SSL configuration for VServer v1:
...
SSL Redirect: DISABLED
Non FIPS Ciphers: DISABLED
SNI: ENABLED
```

SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
1)CertKey Name: servercert Server Certificate
1)CertKey Name: abccert Server Certificate for SNI
2)CertKey Name: xyzcert Server Certificate for SNI
3)CertKey Name: startcert Server Certificate for SNI
1)Cipher Name: DEFAULT
Description: Predefined Cipher Alias
Done

1. Navigate to Traffic Management > SSL Offload > Virtual Servers or Traffic Management > SSL Offload > Services.
2. In the details pane, select the virtual server or service on which SNI is to be enabled, and then click Open.
3. In the Configure Virtual Server (SSL Offload) or Configure Service dialog box, on the SSL Settings tab, click SSL Parameters.
4. In the Configure SSL Params dialog box, under Others, select the SNI Enable check box.
5. Click OK.
6. On the SSL Settings tab, under Available, select a certificate.
7. In the Add drop-down list select As SNI.
8. To add more certificates, repeat step 7.
9. Under Configured, verify that the certificate is added as a server certificate for SNI.
10. Click OK.

Enabling Stricter Control on Client Certificate Validation

Jun 19, 2015

The NetScaler appliance accepts valid Intermediate-CA certificates if they are issued by a single Root-CA. That is, if only the Root-CA certificate is bound to the virtual server, and any intermediate certificate sent with the client certificate is validated by that Root-CA, the appliance trusts the certificate chain and the handshake is successful.

However, if a client sends a chain of certificates in the handshake, none of the intermediate certificates can be validated by using a CRL or OCSP responder unless that certificate is bound to the SSL virtual server. Therefore, even if one of the intermediate certificates is revoked, the handshake is successful. As part of the handshake, the SSL virtual server sends the list of CA certificates that are bound to it. For stricter control, you can configure the SSL virtual server to accept only a certificate that is signed by one of the CA certificates bound to that virtual server. To do so, you must enable the ClientAuthUseBoundCAChain setting in the SSL profile bound to the virtual server. The handshake fails if the client certificate is not signed by one of the CA certificates bound to the virtual server.

For example, say two client certificates, clientcert1 and clientcert2, are signed by the intermediate certificates Int-CA-A and Int-CA-B, respectively. The intermediate certificates are signed by the root certificate Root-CA. Int-CA-A and Root-CA are bound to the SSL virtual server. In the default case (ClientAuthUseBoundCAChain disabled), both clientcert1 and clientcert2 are accepted. However, if ClientAuthUseBoundCAChain is enabled, only clientcert1 is accepted by the NetScaler appliance

To enable stricter control on client certificate validation by using the command line

At the NetScaler command prompt, type:

- set ssl profile <name> -ClientAuthUseBoundCAChain Enabled
- set ssl vserver <vServerName> -sslProfile <string>

To enable stricter control on client certificate validation by using the configuration utility

1. Navigate to System > Profiles, select the SSL Profiles tab, and create an SSL profile, or select an existing profile.
2. Select Enable Client Authentication using bound CA Chain.
3. Navigate to Traffic Management > Load Balancing > Virtual Servers, and select an SSL virtual server.
4. In Advanced Settings, select SSL Profiles, and select the profile on which you enabled Enable Client Authentication using bound CA Chain.
5. Click OK, and then click Done.

Managing Certificates

Jun 03, 2015

An SSL certificate, which is an integral part of any SSL transaction, is a digital data form (X509) that identifies a company (domain) or an individual. The certificate has a public key component that is visible to any client that wants to initiate a secure transaction with the server. The corresponding private key, which resides securely on the NetScaler appliance, is used to complete asymmetric key (or public key) encryption and decryption.

You can obtain an SSL certificate and key in either of the following ways:

- From an authorized certificate authority (CA), such as VeriSign
- By generating a new SSL certificate and key on the NetScaler appliance

Alternately, you can use an existing SSL certificate on the appliance.

Caution: Citrix recommends that you use certificates obtained from authorized CAs, such as VeriSign, for all your SSL transactions. Certificates generated on the NetScaler appliance should be used for testing purposes only, not in any live deployment.

To manage certificates, see the following sections:

- Obtaining a Certificate from a Certificate Authority
- Importing Existing Certificates and Keys
- Generating a Self-Signed Certificate
- Adding a Group of SSL Certificates
- Displaying a Certificate Chain
- Generating a Server Test Certificate
- Modifying and Monitoring Certificates and Keys
- Using Global Site Certificates
- Converting the Format of SSL Certificates for Import or Export

Obtaining a Certificate from a Certificate Authority

Mar 30, 2015

A certificate authority (CA) is an entity that issues digital certificates for use in public key cryptography. Certificates issued or signed by a CA are automatically trusted by applications, such as web browsers, that conduct SSL transactions. These applications maintain a list of the CAs that they trust. If the certificate being used for the secure transaction is signed by any of the trusted CAs, the application proceeds with the transaction.

To obtain an SSL certificate from an authorized CA, you must create a private key, use that key to create a certificate signing request (CSR), and submit the CSR to the CA. The only special characters allowed in the file names are underscore and dot.

The private key is the most important part of a digital certificate. By definition, this key is not to be shared with anyone and should be kept securely on the NetScaler appliance. Any data encrypted with the public key can be decrypted only by using the private key.

The appliance supports two encryption algorithms, RSA and DSA, for creating private keys. You can submit either type of private key to the CA. The certificate that you receive from the CA is valid only with the private key that was used to create the CSR, and the key is required for adding the certificate to the NetScaler.

Caution: Be sure to limit access to your private key. Anyone who has access to your private key can decrypt your SSL data.
All SSL certificates and keys are stored in the /nsconfig/ssl folder on the appliance. For added security, you can use the Data Encryption Standard (DES) or triple DES (3DES) algorithm to encrypt the private key stored on the appliance.
Note: The length of the SSL key name allowed includes the length of the absolute path name if the path is included in the key name.

To create an RSA private key by using the command line interface

At the command prompt, type the following command:

create ssl rsakey <keyFile> <bits> [-exponent (3 | F4)] [-keyform (DER | PEM)]

Example

```
> create ssl rsakey Key-RSA-1 2048 -exponent F4 -keyform PEM
```

To create a DSA private key by using the command line interface

At the command prompt, type the following command:

create ssl dsakey <keyfile> <bits> [-keyform (DER | PEM)]

Example

```
> create ssl dsakey Key-DSA-1 2048 -keyform PEM
```

To create an RSA private key by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. In the details pane, under SSL Keys, click Create RSA Key.
3. In the Create RSA Key dialog box, configure the RSA key parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
4. Click Create, and then click Close.

To create an DSA private key by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. In the details pane, under SSL Keys, click Create DSA Key.
3. In the Create DSA Key dialog box, configure the DSA key parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
4. Click Create, and then click Close.

The certificate signing request (CSR) is a collection of information, including the domain name, other important company details, and the private key to be used to create the certificate. To avoid generating an invalid certificate, make sure that the details you provide are accurate.

To create a certificate signing request by using the command line interface

At the command prompt, type the following command:

create ssl certreq <reqFile> -keyFile <input_filename> | -fipsKeyName <string>) [-keyForm (DER | PEM) {-PEMPassPhrase }] -countryName <string> -stateName <string> -organizationName <string> [-organizationUnitName <string>] [-localityName <string>] [-commonName <string>] [-emailAddress <string>] {-challengePassword } [-companyName <string>]

Example

```
create ssl certreq csreq1 -keyfile ramp -keyform PEM -countryName US -stateName Florida -localityName FortLauderdale  -organizationName Citrix -organizationUnitName I
```

To create a certificate signing request by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. In the details pane, under SSL Certificates, click Create CSR (Certificate Signing Request).
3. In the Create CSR (Certificate Signing Request) dialog box, configure the CSR parameters. For a description of a parameter, hover the mouse cursor over the corresponding field.
4. Click Create, and then click Close. The certificate signing request you created is saved on the appliance in the specified location.

Most CAs accept certificate submissions by email. The CA will return a valid certificate to the email address from which you submit the CSR.

Importing Existing Certificates and Keys

Nov 11, 2013

If you want to use certificates and keys that you already have on other secure servers or applications in your network, you can export them, and then import them to the NetScaler appliance. You might have to convert exported certificates and keys before you can import them to the NetScaler appliance.

For the details of how to export certificates from secure servers or applications in your network, see the documentation of the server or application from which you want to export.

Note: For installation on the NetScaler appliance, key and certificate names cannot contain spaces or special characters other than those supported by the UNIX file system. Follow the appropriate naming convention when you save the exported key and certificate.
A certificate and private key pair is commonly sent in the PKCS#12 format. The NetScaler supports PEM and DER formats for certificates and keys. To convert PKCS#12 to PEM or DER, or PEM or DER to PKCS#12, see Converting the Format of SSL Certificates for Import or Export.

The NetScaler appliance does not support PEM keys in PKCS#8 format. However, you can convert these keys to a supported format by using the OpenSSL interface, which you can access from the NetScaler command line or the configuration utility. Before you convert the key, you need to verify that the private key is in PKCS#8 format. Keys in PKCS#8 format typically start with the following text:

-----BEGIN ENCRYPTED PRIVATE KEY-----

leuSSZQZKgrgUQ==

-----END ENCRYPTED PRIVATE KEY-----

1. Open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance by using the administrator credentials.
3. At the command prompt, type shell.
4. At the shell prompt type openssl.

1. Navigate to Traffic Management > SSL.
2. In the details pane, under Tools, click OpenSSL interface.

At the OpenSSL prompt, type one of the following commands, depending on whether the non-supported key format is of type rsa or dsa:

- rsa- in <PKCS#8 Key Filename> -des3 -out <encrypted Key Filename>
- dsa -in <PKCS#8 Key Filename> -des3 -out <encrypted Key Filename>

At the OpenSSL prompt, type the following commands, depending on whether the non-supported key format is of type rsa or dsa:

- rsa -in <PKCS#8 Key Filename> -out <unencrypted Key Filename>
- dsa -in <PKCS#8 Key Filename> -out <unencrypted Key Filename>

Parameters for converting an unsupported key format to a supported key format

<PKCS#8 Key Filename>

The input file name of the incompatible PKCS#8 private key.

<encrypted Key Filename>

The output file name of the compatible encrypted private key in PEM format.

<unencrypted Key Filename>

The output file name of the compatible unencrypted private key in PEM format.

Generating a Self-Signed Certificate

Jun 15, 2015

The NetScaler appliance has a built in CA tools suite that you can use to create self-signed certificates for testing purposes.

Caution: Because these certificates are signed by the NetScaler itself, not by an actual CA, you should not use them in a production environment. If you attempt to use a self-signed certificate in a production environment, users will receive a "certificate invalid" warning each time the virtual server is accessed.
The NetScaler supports creation of the following types of certificates

- Root-CA certificates
- Intermediate-CA certificates
- End-user certificates
  - server certificates
  - client certificates

Before generating a certificate, create a private key and use that to create a certificate signing request (CSR) on the appliance. Then, instead of sending the CSR out to a CA, use the NetScaler CA Tools to generate a certificate.

For details on how to create a private key and a CSR, see Obtaining a Certificate from a Certificate Authority.

1. Navigate to Traffic Management > SSL.
2. In the details pane, under Getting Started, select the wizard for the type of certificate that you want to create.
3. Follow the instructions on the screen.

At the command prompt, type the following command:

create ssl cert <certFile> <reqFile> <certType> [-keyFile <input_filename>] [-keyform (DER | PEM)] [-days <positive_integer>]
Example

```
> create ssl cert certi1 csreq1 ROOT_CERT -keyFile
rsa1 -keyForm PEM -days 365
  Done
```

At the command prompt, type the following command:

create ssl cert <certFile> <reqFile> <certType> [-keyFile <input_filename>] [-keyform (DER | PEM)] [-days <positive_integer>] [-certForm (DER | PEM)] [-CAcert <input_filename>] [-CAcertForm (DER | PEM)] [-CAkey <input_filename>] [-CAkeyForm (DER | PEM)] [-CAserial <output_filename>]
Example

```
> create ssl cert certsy csr1 INTM_CERT -CAcert cert1
-CAkey rsakey1 -CAserial 23
Done
```

1. Navigate to Traffic Management > SSL.
2. Under SSL Certificates, click Create Certificate.
3. In the Create Certificate dialog box, specify values for the following parameters:
   - Certificate File Name*
   - Certificate Format
   - Certificate Type
   - Certificate Request File Name*
   - Key File Name*
   - Key Format
   - PEM Passphrase (For Encrypted Key)—If the key is encrypted, you are prompted to enter the password at run-time on the CLI.
   - Validity Period (Number of Days)

   * A required parameter

   Note: Instead of typing the file name, you can use the browse button to launch the NetScaler file browser and select the file.
4. Click Create, and then click Close. The Root-CA certificate you created is saved on the NetScaler.

1. Navigate to Traffic Management > SSL.
2. Under SSL Certificates, click Create Certificate.
3. In the Create Certificate dialog box, specify values for the following parameters:
   - Certificate File Name*
   - Certificate Format
   - Certificate Type
   - Certificate Request File Name*
   - PEM Passphrase (For Encrypted Key)—If the key is encrypted, you are prompted to enter the password at run-time on the CLI.
   - Validity Period (Number of Days)
   - CA Certificate File Name*
   - CA Certificate File Format
   - CA Key File Name*—CAkey
   - CA Key File Format
   - PEM Passphrase (For Encrypted CA Key)
   - CA Serial Number File*

   * A required parameter

   Note: Instead of typing the file name, you can use the browse button to launch the NetScaler file browser and select the file.
4. Click Create, and then click Close. The Intermediate-CA certificate you created is saved on the NetScaler.

The Diffie-Hellman (DH) key exchange is a way for two parties involved in an SSL transaction that have no prior knowledge of each other to agree upon a shared secret over an insecure channel. This secret can then be converted into cryptographic keying material for mainly symmetric key cipher algorithms that require such a key exchange.

This feature is disabled by default and should be specifically configured to support ciphers that use DH as the key exchange algorithm.
Note: Generating a 2048-bit DH key may take a long time (up to 30 minutes).

To generate a DH key by using the command line interface

At the command prompt, type the following command:

create ssl dhparam <dhFile> [<bits>] [-gen (2 | 5)]

Example

```
create ssl dhparam Key-DH-1 512 -gen 2
```

To generate a DH key by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. Under Tools, click Create Diffe-Hellman (DH) Key.
3. In the Create DH Param dialog box, specify values for the following parameters:
   - DH File Name (with path)*
   - DH Parameter Size (Bits)*
   - DH Generator

   * A required parameter
4. Click OK.

Adding a Group of SSL Certificates

Feb 17, 2017

If the server certificate is issued by an intermediate CA that is not recognized by standard web browsers as a trusted CA, the CA certificate(s) must be sent to the client with the server's own certificate. Otherwise, the browser terminates the SSL session because it fails to authenticate the server certificate.

There are two ways to add the server and intermediate certificates:

- Create a certificate set that contains the chain of certificates.
- Create a chain of certificates manually by adding and linking the certificates individually.

Note: This feature is not supported on the NetScaler FIPS platform and in a cluster setup.
Instead of adding and linking individual certificates, you can now group a server certificate and up to nine intermediate certificates in a single file, and then specify the file's name when adding a certificate-key pair. Before you do so, make sure that the following prerequisites are met.

- The certificates in the file are in the following order:
  - Server certificate (should be the first certificate in the file)
  - Optionally, a server key
  - Intermediate certificate 1 (ic1)
  - Intermediate certificate 2 (ic2)
  - Intermediate certificate 3 (ic3), and so on
    Note: Intermediate certificate files are created for each intermediate certificate with the name "<certificatebundlename>.pem_ic<*n*>" where n is between 1 and 9. For example, bundle.pem_ic1, where bundle is the name of the certificate set and ic1 is the first intermediate certificate in the set.
- Bundle option is selected.
- No more than nine intermediate certificates are present in the file.

The file is parsed and the server certificate, intermediate certificates, and server key (if present) are identified. First, the server certificate and key are added. Then, the intermediate certificates are added, in the order in which they were added to the file, and linked accordingly.

An error is reported if any of the following conditions exist:

- A certificate file for one of the intermediate certificates already exists on the appliance.
- The key is placed before the server certificate in the file.
- An intermediate certificate is placed before the server certificate.
- Intermediate certificates are not in placed in the file in the same order as they are created.
- No certificates are present in the file.
- A certificate is not in the proper PEM format.
- The number of intermediate certificates in the file exceeds nine.

To add a certificate set by using the command line interface

At the command prompt, type the following commands to create a certificate set and verify the configuration:

1. add ssl certKey <certkeyName> -cert <string> -key <string> -bundle (YES | NO)
2. show ssl certKey
3. show ssl certlink

In the following example, the certificate set (bundle.pem) contains the following files:

- server certificate (bundle) linked to bundle_ic1
- First intermediate certificate (bundle_ic1) linked to bundle_ic2
- Second intermediate certificate (bundle_ic2) linked to bundle_ic3
- Third intermediate certificate (bundle_ic3)

```
> add ssl certKey bundle -cert bundle.pem -key bundle.pem -bundle yes

> show ssl certkey

1) Name: bundle
Cert Path: /nsconfig/ssl/bundle.pem
Format: PEM
Status: Valid, Days to expiration:10415
Certificate Expiry Monitor: DISABLED

2) Name: bundle_ic1
Cert Path: /nsconfig/ssl/bundle.pem_ic1
Format: PEM
Status: Valid, Days to expiration:10415
Certificate Expiry Monitor: DISABLED

3) Name: bundle_ic2
Cert Path: /nsconfig/ssl/bundle.pem_ic2
Format: PEM
Status: Valid, Days to expiration:10415
Certificate Expiry Monitor: DISABLED

4) Name: bundle_ic3
Cert Path: /nsconfig/ssl/bundle.pem_ic3
Format: PEM
Status: Valid, Days to expiration:10415
Certificate Expiry Monitor: DISABLED
Done

> show ssl certlink

1) Cert Name: bundle CA Cert Name: bundle_ic1
2) Cert Name: bundle_ic1 CA Cert Name: bundle_ic2
3) Cert Name: bundle_ic2 CA Cert Name: bundle_ic3
Done
```

To add a certificate set by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. In the SSL Certificates pane, click Install.
3. In the Install Certificate dialog box, type the details, such as the certificate and key file name, and then select Certificate Bundle.
4. Click Install, and then click Close.

Updated: 2013-08-20

Instead of using a set of certificates (a single file), you can create a chain of certificates. The chain links the server certificate to its issuer (the intermediate CA). For this approach to work, the intermediate CA certificate file must already be installed on the NetScaler appliance, and one of the certificates in the chain must be trusted by the client application. For example, link Cert-Intermediate-A to Cert-Intermediate-B, where Cert-Intermediate-B is linked to Cert-Intermediate-C, which is a certificate trusted by the client application.

Note: The NetScaler supports sending a maximum of 10 certificates in the chain of certificates sent to the client (one server certificate and nine CA certificates).

To create a certificate chain by using the command line interface

At the command prompt, type the following commands to create a certificate chain and verify the configuration. (Repeat the first command for each new link in the chain.)

- link ssl certkey <certKeyName> <linkCertKeyName>
- show ssl certlink

Example

```
> link ssl certkey siteAcertkey CAcertkey
 Done

> show ssl certlink

linked certificate:
      1) Cert Name: siteAcertkey CA Cert Name: CAcertkey
 Done
```

To create a certificate chain by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. Select the server certificate you want to link, and then click Link.
3. In Link Server Certificate(s), select CA Certificate Name to be linked to.
4. Click OK. The server certificate is now linked to the intermediate certificate.

Generating a Server Test Certificate

Aug 20, 2013

The NetScaler appliance allows you to create a test certificate for server authentication by using a GUI wizard in the configuration utility. A server certificate is used to authenticate and identify a server in an SSL handshake. A server certificate is generally issued by a trusted CA and is sent out by the server to a client who uses it to authenticate the server.

For issuing a server test certificate, the appliance operates as a CA. This certificate can be bound to an SSL virtual server for authentication in an SSL handshake with a client. This certificate is for testing purposes only. It should not be used in a production environment.

You can install the server test certificate on any virtual server that uses the SSL or the SSL_TCP protocol.

1. Navigate to Traffic Management > SSL.
2. Under SSL Certificates, click Create and install a Server Test Certificate.
3. In the Create and install a Server Test Certificate dialog box, specify values for the following parameters:
   - Certificate File Name—name of the server test certificate
   - Fully Qualified Domain Name—the domain for which you want to secure the connection
   - Country—the name of the country or region
4. Click OK.

Modifying and Monitoring Certificates and Keys

Apr 28, 2016

To avoid downtime when replacing a certificate-key pair, you can update an existing certificate. If you want to replace a certificate with a certificate that was issued to a different domain, you must disable domain checks before updating the certificate.

To receive notifications about certificates due to expire, you can enable the expiry monitor.

Updating an Existing Server Certificate

When you remove or unbind a certificate from a configured SSL virtual server, or an SSL service, the virtual server or service becomes inactive until a new valid certificate is bound to it. To avoid downtime, you can use the update feature to replace a certificate-key pair that is bound to an SSL virtual server or an SSL service, without first unbinding the existing certificate.

To update an existing certificate-key pair by using the command line interface

At the command prompt, type the following commands to update an existing certificate-key pair and verify the configuration:

- update ssl certkey <certkeyName> -cert <string> -key <string>
- show ssl certKey <certkeyName>

Example

```
> update ssl certkey siteAcertkey -cert /nsconfig/ssl/cert.pem
     -key /nsconfig/ssl/pkey.pem
  Done

> show ssl certkey siteAcertkey
Name: siteAcertkey      Status: Valid
     Version: 3
     Serial Number: 02
     Signature Algorithm: md5WithRSAEncryption
     Issuer: /C=US/ST=CA/L=Santa Clara/O=siteA/OU=Tech
     Validity
        Not Before: Nov 11 14:58:18 2001 GMT
        Not After: Aug 7 14:58:18 2004 GMT
     Subject: /C=US/ST-CA/L=San Jose/O=CA/OU=Security
     Public Key Algorithm: rsaEncryption
     Public Key size: 2048
  Done
```

To update an existing certificate-key pair by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. Select the certificate you want to update, and then click Update.
3. Use the Browse button next to the Certificate File name and the Key File name and select the new certificate and key

files respectively.

4. If the key in encrypted, in the Password text box, type the password used to encrypt the key.
5. Click OK. In SSL Certificates pane, select the certificate that you just updated and verify that the settings displayed at the bottom of the screen are correct.

Disabling Domain Checks

When an SSL certificate is replaced on the NetScaler, the domain name mentioned on the new certificate should match the domain name of the certificate being replaced. For example, if you have a certificate issued to abc.com, and you are updating it with a certificate issued to def.com, the certificate update fails.

However, if you want the server that has been hosting a particular domain to now host a new domain, you can disable the domain check before updating its certificate.

To disable the domain check for a certificate by using the command line interface

At the command prompt, type the following commands to disable the domain check and verify the configuration:

- update ssl certKey <certkeyName> -noDomainCheck
- show ssl certKey <certkeyName>

Example

```
> update ssl certKey sv -noDomainCheck
 Done
> show ssl certkey sv
 Name: sv
 Cert Path: /nsconfig/ssl/complete/server/server_rsa_512.pem
 Key Path: /nsconfig/ssl/complete/server/server_rsa_512.ky
 Format: PEM
 Status: Valid,  Days to expiration:9349
 Certificate Expiry Monitor: DISABLED
 Done
```

To disable the domain check for a certificate by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. Select the certificate you want to update, and then click Update.
3. Select No Domain Check, and then click OK. The domain check for the certificate is now disabled.

Enabling the Expiry Monitor

An SSL certificate is valid for a specific period of time. A typical deployment includes multiple virtual servers that process SSL transactions, and the certificates bound to them can expire at different times. An expiry monitor configured on the NetScaler appliance creates entries in the appliance's syslog and nsaudit logs when a certificate configured on the appliance is due to expire.

If you want to create SNMP alerts for certificate expiration, you must configure them separately.

To enable an expiry monitor for a certificate by using the command line interface

At the command prompt, type the following commands to enable an expiry monitor for a certificate and verify the configuration:

- set ssl certKey <certkeyName> [-expiryMonitor (ENABLED | DISABLED) [-notificationPeriod <positive_integer>]]
- show ssl certKey <certkeyName>

Example

```
> set ssl certKey sv -expiryMonitor ENABLED –notificationPeriod 60
 Done

> show ssl certkey sv
Name: sv
 Cert Path: /nsconfig/ssl/complete/server/server_rsa_512.pem
 Key Path: /nsconfig/ssl/complete/server/server_rsa_512.ky
 Format: PEM
 Status: Valid,  Days to expiration:9349
 Certificate Expiry Monitor: ENABLED
 Expiry Notification period: 60 days
 Done
```

To enable an expiry monitor for a certificate by using the configuration utility

1. Navigate to Traffic Management > SSL > Certificates.
2. Select the certificate you want to update, and then click Update.
3. Select the Enable option.
4. In the Notification Period text box, type the required notification period value.
   Note: The notification period parameter can be set to any value between 10 and 100 days and the default notification period is 30 days.
5. Click OK. In the SSL Certificates pane, select the certificate that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Using Global Site Certificates

Nov 11, 2013

A global site certificate is a special-purpose server certificate whose key length is greater than 128 bits. A global site certificate consists of a server certificate and an accompanying intermediate-CA certificate. You must import the global site certificate and its key from the server to the NetScaler appliance.

How Global Site Certificates Work

Export versions of browsers use 40-bit encryption to initiate connections to SSL Web-servers. The server responds to connection requests by sending its certificate. The client and server then decide on an encryption strength based on the server certificate type:

- If the server certificate is a normal certificate and not a global site certificate, the export client and server complete the SSL handshake and uses 40-bit encryption for data transfer.
- If the server certificate is a global site certificate (and if the export client feature is supported by the browser), the export client automatically upgrades to 128-bit encryption for data transfer.

If the server certificate is a global site certificate, the server sends its certificate, along with the accompanying intermediate-CA certificate. The browser first validates the intermediate-CA certificate by using one of the Root-CA certificates that are normally included in web browsers. Upon successful validation of the intermediate-CA certificate, the browser uses the intermediate-CA certificate to validate the server certificate. Once the server is successfully validated, the browser renegotiates (upgrades) the SSL connection to 128-bit encryption.

With Microsoft's Server Gated Cryptography (SGC), if the Microsoft IIS server is configured with an SGC certificate, export clients that receive the certificate renegotiate to use128-bit encryption.

Importing a Global Site Certificate

To import a global site certificate, first export the certificate and server key from the Web server. Global site certificates are generally exported in some binary format, therefore, before importing the global site certificate, convert the certificate and key to the PEM format.

To import a global site certificate

1. Using a text editor, copy the server certificate and the accompanying intermediate-CA certificate into two separate files.

   The individual PEM encoded certificate will begin with the header ----- BEGIN CERTIFICATE----- and end with the trailer -----END CERTIFICATE-----.

2. Use an SFTP client to transfer the server certificate, intermediate-CA certificate, and server-key to the NetScaler.
3. Use the following OpenSSL command to identify the server certificate and intermediate-CA certificate from the two separate files.
   Note: You can launch the OpenSSL interface from the configuration utility. In the navigation pane, click SSL. In the details pane, under Tools, click Open SSL interface.

   ```
   > openssl x509 -in >path of the CA cert file< -text
   ```

X509v3 Basic Constraints:
CA:TRUE
X509v3 Key Usage:
Certificate Sign, CRL Sign
Netscape Cert Type:
SSL CA, S/MIME CA

> openssl x509 -in >path of the server certificate file< -text

X509v3 Basic Constraints:
CA:FALSE
Netscape Cert Type:
SSL Server

4. At the FreeBSD shell prompt, enter the following command:

   openssl x509 -in cert.pem -text | more

   Where **cert.pem** is one of the two certificate files.

   Read the **Subject** field in the command output. For example,

   Subject: C=US, ST=Oregon, L=Portland,
   O=mycompany, Inc., OU=IT, CN=www.mycompany.com
   If the CN field in the Subject matches the domain-name of your Web site, then this is the server certificate and the other certificate is the accompanying intermediate-CA certificate.

5. Use the server certificate and its private key) to create a certificate key pair on the NetScaler. For details on creating a certificate-key pair on the NetScaler, see Adding a Certificate Key Pair.
6. Add the intermediate-CA certificate on the NetScaler. Use the server certificate you created in step 4 to sign this intermediate certificate. For details on creating an Intermediate-CA certificate on the NetScaler, see Generating a Self-Signed Certificate.

Converting the Format of SSL Certificates for Import or Export

Aug 20, 2013

A NetScaler appliance supports the PEM and DER formats for SSL certificates. Other applications, such as client browsers and some external secure servers, require various public key cryptography standard (PKCS) formats. The NetScaler can convert the PKCS#12 format (the personal information exchange syntax standard) to PEM or DER format for importing a certificate to the appliance, and can convert PEM or DER to PKCS#12 for exporting a certificate. For additional security, conversion of a file for import can include encryption of the private key with the DES or DES3 algorithm.

Note: If you use the configuration utility to import a PKCS#12 certificate, and the password contains a dollar sign ($), backquote (`), or escape (\) character, the import may fail. If it does, the ERROR: Invalid password message appears. If you must use a special character in the password, be sure to prefix it with an escape character (\) unless all imports are performed by using the NetScaler command line.

To convert the format of a certificate by using the command line interface

At the command prompt, type the following command:

Convert ssl pkcs12 <outfile> [-import [-pkcs12File <inputFilename>] [-des | -des3] [-export [-certFile <inputFilename>] [-keyFile <inputFilename>]] During the operation, you are prompted to enter an import password or an export password. For an encrypted file, you are also prompted to enter a passphrase.

Example

```
convert ssl pkcs12 Cert-Import-1.pem -import -pkcs12File Cert-Import-1.pfx -des

convert ssl pkcs12 Cert-Client-1.pfx -export -certFile Cert-Client-1 -keyFile Key-Client-1
```

To convert the format of a certificate by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. Under Tools, do one of the following
   - To convert a PKCS#12 certificate and key to PEM format, click Import PKCS#12.
   - To convert a certificate and key from PEM to PKCS#12 format, click Export PKCS#12.
3. In the Import PKCS12 or Export PKCS12 dialog box, set the following parameters:
   - Output File Name*
   - PKCS12 File Name*
   - Certificate File Name*
   - Key File Name*
   - Import Password*
   - Export Password*
   - Encoding Format
   - PEM Passphrase

   * A required parameter
4. Click OK.

Managing Certificate Revocation Lists

Jun 03, 2015

A certificate issued by a CA typically remains valid until its expiration date. However, in some circumstances, the CA may revoke the issued certificate before the expiration date (for example, when an owner's private key is compromised, a company's or individual's name changes, or the association between the subject and the CA changes).

A Certificate Revocation List (CRL) identifies invalid certificates by serial number and issuer.

Certificate authorities issue CRLs on a regular basis. You can configure the NetScaler appliance to use a CRL to block client requests that present invalid certificates.

If you already have a CRL file from a CA, add that to the NetScaler. You can configure refresh options. You can also configure the NetScaler to sync the CRL file automatically at a specified interval, from either a web location or an LDAP location. The NetScaler supports CRLs in either the PEM or the DER file format. Be sure to specify the file format of the CRL file being added to the NetScaler.

If you have used the NetScaler as a CA to create certificates that are used in SSL deployments, you can also create a CRL to revoke a particular certificate. This feature can be used, for example, to ensure that self-signed certificates that are created on the NetScaler are not used either in a production environment or beyond a particular date.

Note:
By default, CRLs are stored in the /var/netscaler/ssl directory on the NetScaler appliance.

To manage certificate revocation lists, see the following sections:

- Creating a CRL on the NetScaler
- Adding an Existing CRL to the NetScaler
- Configuring CRL Refresh Parameters
- Synchronizing CRLs
- Performing Client Authentication by using a Certificate Revocation List

Creating a CRL on the NetScaler

Updated: 2013-09-04

Since you can use the NetScaler appliance to act as a certificate authority and create self-signed certificates, you can also revoke certificates that you have created and certificates whose CA certificate you own.

The appliance must revoke invalid certificates before creating a CRL for those certificates. The appliance stores the serial numbers of revoked certificates in an index file and updates the file each time it revokes a certificate. The index file is automatically created the first time a certificate is revoked.

To revoke a certificate or create a CRL by using the command line interface

At the command prompt, type the following command:

create ssl crl <CAcertFile> <CAkeyFile> <indexFile> (-revoke <input_filename> | -genCRL <output_filename>)
Example

```
create ssl crl Cert-CA-1 Key-CA-1 File-Index-1 -revoke Invalid-1

create ssl crl Cert-CA-1 Key-CA-1 File-Index-1 -genCRL CRL-1
```

To revoke a certificate or create a CRL by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. Under Getting Started, click CRL Management.
3. In the CRL Management dialog box, set the following parameters:
   - CA Certificate File Name*
   - CA Key File Name*
   - CA Key File Password—the password used to encrypt the key file. On the CLI, you are prompted to enter this password at run time.
   - Index File Name*
   - Choose Operation-
     - Revoke Certificate
     - Generate CRL

   * A required parameter
4. Click Create, and then click Close.

Adding an Existing CRL to the NetScaler

Updated: 2013-09-05

Before you configure the CRL on the NetScaler appliance, make sure that the CRL file is stored locally on the NetScaler. In the case of an HA setup, the CRL file must be present on both NetScaler appliances, and the directory path to the file must be the same on both appliances.

To add a CRL on the NetScaler by using the command line

At the command prompt, type the following commands to add a CRL on the NetScaler and verify the configuration:

- add ssl crl <crlName> <crlPath> [-inform (DER | PEM)]
- show ssl crl [<crlName>]

Example

```
> add ssl crl crl-one /var/netscaler/ssl/CRL-one -inform PEM
```

```
 Done
> show ssl crl crl-one
        Name: crl-one   Status: Valid,  Days to expiration: 29
        CRL Path: /var/netscaler/ssl/CRL-one
        Format: PEM     CAcert: samplecertkey
        Refresh: DISABLED
        Version: 1
        Signature Algorithm: sha1WithRSAEncryption
        Issuer:  C=US,ST=California,L=Santa Clara,O=NetScaler Inc.,OU=SSL Acceleration,CN=www.ns.com/emailAddress=support@netscaler.com
        Last_update:Jun 15 10:53:53 2010 GMT
        Next_update:Jul 15 10:53:53 2010 GMT

1)      Serial Number: 00
        Revocation Date:Jun 15 10:51:16 2010 GMT
 Done
```

To add a CRL on the NetScaler by using the configuration utility

1. Navigate to Traffic Management > SSL > CRL.
2. In the details pane, click Add.
3. In the Add CRL dialog box, specify values for the following parameters:
   - CRL Name*
   - CRL File*
   - Format
   - CA Certificate

   * A required parameter
4. Click Create, and then click Close. In the CRL pane, select the CRL that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Configuring CRL Refresh Parameters

Updated: 2014-09-29

A CRL is generated and published by a Certificate Authority periodically or, in some cases, immediately after a particular certificate is revoked. Citrix recommends that you update CRLs on the NetScaler appliance regularly, for protection against clients trying to connect with certificates that are not valid.

The NetScaler can refresh CRLs from a web location or an LDAP directory. When you specify refresh parameters and a web location or an LDAP server, the CRL does not have to be present on the local hard disk drive at the time you execute the command. The first refresh stores a copy on the local hard disk drive, in the path specified by the CRL File parameter. The default path for storing the CRL is /var/netscaler/ssl.
Note: In release 10.0 and later, the method for refreshing a CRL is not included by default. You must explicitly specify an HTTP or LDAP method. If you are upgrading from an earlier release to release 10.0 or later, you must add a method and run the command again.

To configure CRL autorefresh by using the command line

At the command prompt, type the following commands to configure CRL auto refresh and verify the configuration the following commands to configure CRL auto refresh and verify the configuration:

- set ssl crl <crlName> [-refresh (ENABLED | DISABLED)] [-CAcert <string>] [-url <URL | -server <ip_addr|ipv6_addr>] [-method HTTP | (LDAP [-baseDN <string>] [-bindDN <string>] [-scope (Base | One)] [-password <string>] [-binary (YES | NO)])] [-port <port>] [-interval <interval>]
- show ssl crl [<crlName>]

Example

```
Set CRL crl1  -refresh enabled -method ldap -inform DER -CAcert ca1 -server 10.102.192.192 -port 389 -scope base -baseDN "cn=cInt_rsa4_multicert_der,ou=eng,o=ns,c=ir

set ssl crl crl1 -refresh enabled -method http -cacert ca1 -port 80 -time 00:10 -url http://10.102.192.192/crl/ca1.crl

> sh crl

1)      Name: crl1      Status: Valid,     Days to expiration: 355
        CRL Path: /var/netscaler/ssl/crl1
        Format: PEM     CAcert: ca1
        Refresh: ENABLED        Method: HTTP
        URL: http://10.102.192.192/crl/ca1.crl              Port:80
        Refresh Time: 00:10
        Last Update: Successful, Date:Tue Jul  6 14:38:13 2010
Done
```

To configure CRL autorefresh using LDAP or HTTP by using the configuration utility

1. Navigate to Traffic Management > SSL > CRL.
2. Select the configured CRL for which you want to update refresh parameters, and then click Open.
3. Select the Enable CRL Auto Refresh option.
4. In the CRL Auto Refresh Parameters group, specify values for the following parameters:
   - Method
   - Binary
   - Scope
   - Server IP
   - Port*
   - URL
   - Base DN*

- Bind DN
- Password
- Interval
- Day(s)
- Time

* A required parameter

Note: If the new CRL has been refreshed in the external repository before its actual update time as specified by the LastUpdate field of the CRL, you should immediately refresh the CRL on the NetScaler.

5. Click Create. In the CRL pane, select the CRL that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Synchronizing CRLs

Updated: 2013-09-03

The NetScaler appliance uses the most recently distributed CRL to prevent clients with revoked certificates from accessing secure resources.

If CRLs are updated often, the NetScaler needs an automated mechanism to fetch the latest CRLs from the repository. You can configure the NetScaler to update CRLs automatically at a specified refresh interval.

The NetScaler maintains an internal list of CRLs that need to be updated at regular intervals. At these specified intervals, the appliance scans the list for CRLs that need to be updated, connects to the remote LDAP server or HTTP server, retrieves the latest CRLs, and then updates the local CRL list with the new CRLs.

Note: If CRL check is set to mandatory when the CA certificate is bound to the virtual server, and the initial CRL refresh fails, all client-authentication connections with the same issuer as the CRL are rejected as REVOKED until the CRL is successfully refreshed.
You can specify the interval at which the CRL refresh should be carried out. You can also specify the exact time.

To synchronize CRL autorefresh by using the command line interface

At the command prompt, type the following command:

set ssl crl <crlName> [-interval <interval>] [-day <integer>] [-time <HH:MM>]
Example

```
set ssl crl CRL-1 -refresh ENABLE -interval
MONTHLY -days 10 -time 12:00
```

To synchronize CRL refresh by using the configuration utility

1. Navigate to Traffic Management > SSL > CRL.
2. Select the configured CRL for which you want to update refresh parameters, and then click Open.
3. Select the Enable CRL Auto Refresh option.
4. In the CRL Auto Refresh Parameters group, specify values for the following parameters:
   - Interval
   - Day(s)
   - Time
5. Click Create. In the CRL pane, select the CRL that you just configured and verify that the settings displayed at the bottom of the screen are correct.

Performing Client Authentication by using a Certificate Revocation List

Updated: 2013-09-03

If a certificate revocation list (CRL) is present on a NetScaler appliance, a CRL check is performed regardless of whether performing the CRL check is set to mandatory or optional.
The success or failure of a handshake depends on a combination of the following factors:

- Rule for CRL check
- Rule for client certificate check
- State of the CRL configured for the CA certificate

The following table lists the results of the possible combinations for a handshake involving a revoked certificate.

Table 1. Result of a Handshake with a Client Using a Revoked Certificate

Rule for CRL Check	Rule for Client Certificate Check	State of the CRL Configured for the CA certificate	Result of a Handshake with a Revoked Certificate
Optional	Optional	Missing	Success
Optional	Mandatory	Missing	Success
Optional	Mandatory	Present	Failure
Mandatory	Optional	Missing	Success
Mandatory	Mandatory	Missing	Failure
Mandatory	Optional	Present	Success
Mandatory	Mandatory	Present	Failure

Rule for CRL Check	Rule for Client Certificate Check	State of the CRL Configured for the CA certificate	Result of a Handshake with a Revoked Certificate
Optional/Mandatory	Optional	Expired	Success
Optional/Mandatory	Mandatory	Expired	Failure

Note:

- The CRL check is optional by default. To change from optional to mandatory or vice-versa, you must first unbind the certificate from the SSL virtual server, and then bind it again after changing the option.
- In the output of the sh ssl vserver command, OCSP check: optional implies that a CRL check is also optional. The CRL check settings are displayed in the output of the sh ssl vserver command only if CRL check is set to mandatory. If CRL check is set to optional, the CRL check details do not appear.

To configure CRL check by using the command line interface

At the command prompt, type the following command:

bind ssl vserver <vServerName> -certkeyName <string> [(-CA -crlCheck (Mandatory | Optional))]

Example

```
bind ssl vs v1 -certkeyName ca -CA -crlCheck mandatory
sh ssl vserver
> sh ssl vs v1

Advanced SSL configuration for VServer v1:

DH: DISABLED
Ephemeral RSA: ENABLED Refresh Count: 0
Session Reuse: ENABLED Timeout: 120 seconds
Cipher Redirect: DISABLED
SSLv2 Redirect: DISABLED
ClearText Port: 0
Client Auth: ENABLED Client Cert Required: Mandatory
SSL Redirect: DISABLED
Non FIPS Ciphers: DISABLED
SNI: DISABLED
SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED
Push Encryption Trigger: Always
Send Close-Notify: YES

1) CertKey Name: ca CA Certificate CRLCheck: Mandatory CA_Name Sent

1) Cipher Name: DEFAULT
Description: Predefined Cipher Alias
Done
```

To configure CRL check by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click SSL Settings.
4. In the Configured pane, in the **Check** drop-down list, select CRL Mandatory.
5. Click OK.

Monitoring Certificate Status with OCSP

Jun 03, 2015

Online Certificate Status Protocol (OCSP) is an Internet protocol that is used to determine the status of a client SSL certificate. NetScaler appliances support OCSP as defined in RFC 2560. OCSP offers significant advantages over certificate revocation lists (CRLs) in terms of timely information. Up-to-date revocation status of a client certificate is especially useful in transactions involving large sums of money and high-value stock trades. It also uses fewer system and network resources. NetScaler implementation of OCSP includes request batching and response caching.

To monitor certificate status with OCSP, see the following sections:

- NetScaler Implementation of OCSP
- OCSP Request Batching
- OCSP Response Caching
- Configuring an OCSP Responder

NetScaler Implementation of OCSP

OCSP validation on a NetScaler appliance begins when the appliance receives a client certificate during an SSL handshake. To validate the certificate, the NetScaler creates an OCSP request and forwards it to the OCSP responder. To do so, the NetScaler uses a locally configured URL. The transaction is in a suspended state until the NetScaler evaluates the response from the server and determines whether to allow the transaction or reject it. If the response from the server is delayed beyond the configured time and no other responders are configured, the NetScaler will allow the transaction or display an error, depending on whether the OCSP check was set to optional or mandatory, respectively.

The NetScaler supports batching of OCSP requests and caching of OCSP responses to reduce the load on the OCSP responder and provide faster responses.

OCSP Request Batching

Each time the NetScaler receives a client certificate, it sends a request to the OCSP responder. To help avoid overloading the OCSP responder, the NetScaler can query the status of more than one client certificate in the same request. For this to work efficiently, a timeout needs to be defined so that processing of a single certificate is not inordinately delayed while waiting to form a batch.

OCSP Response Caching

Caching of responses received from the OCSP responder enables faster responses to the clients and reduces the load on the OCSP responder. Upon receiving the revocation status of a client certificate from the OCSP responder, the NetScaler caches the response locally for a predefined length of time. When a client certificate is received during an SSL handshake, the NetScaler first checks its local cache for an entry for this certificate. If an entry is found that is still valid (within the cache timeout limit), it is evaluated and the client certificate is accepted or rejected. If a certificate is not found, the NetScaler sends a request to the OCSP responder and stores the response in its local cache for a configured length of time.

Configuring an OCSP Responder

Updated: 2013-09-05

Configuring OCSP involves adding an OCSP responder, binding the OCSP responder to a certification authority (CA) certificate, and binding the certificate to an SSL virtual server. If you need to bind a different certificate to an OCSP responder that has already been configured, you need to first unbind the responder and then bind the responder to a different certificate.

To add an OCSP responder by using the command line interface

At the command prompt, type the following commands to configure OCSP and verify the configuration:

- add ssl ocspResponder <name> -url <URL> [-cache (ENABLED | DISABLED)[-cacheTimeout <positive_integer>]] [-batchingDepth <positive_integer>][-batchingDelay <positive_integer>] [-resptimeout <positive_integer>] [-responderCert <string> | -trustResponder] [-producedAtTimeSkew <positive_integer>][-signingCert <string>][-useNonce (YES | NO)][-insertClientCert(YES | NO)]
- bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <positive_integer>]
- bind ssl vserver <vServerName>@ (-certkeyName <string> (CA [-ocspCheck (Mandatory | Optional)]))
- show ssl ocspResponder [<name>]

Example

```
add ssl ocspResponder ocsp_responder1 -url "http:// www.myCA.org:80/ocsp/" -cache ENABLED -cacheTimeout 30 -batchingDepth 8 -batchingDelay 100 -resptimeout 100 -re
bind ssl certKey ca_cert -ocspResponder ocsp_responder1 -priority 1
bind ssl vserver vs1 -certkeyName ca_cert -CA -ocspCheck Mandatory

sh ocspResponder ocsp_responder1
1)Name: ocsp_responder1
URL: http://www.myCA.org:80/ocsp/, IP: 192.128.22.22
Caching: Enabled        Timeout: 30 minutes
Batching: 8 Timeout: 100 mS
HTTP Request Timeout: 100mS
Request Signing Certificate: sign_cert
Response Verification: Full, Certificate: responder_cert
ProducedAt Time Skew: 300 s
Nonce Extension: Enabled
 Client Cert Insertion: Enabled
Done

show certkey ca_cert
Name: ca_cert     Status: Valid,   Days to expiration:8907
Version: 3
...
1)  VServer name: vs1     CA Certificate
1)  OCSP Responder name: ocsp_responder1     Priority: 1
Done
```

```
sh ssl vs vs1
Advanced SSL configuration for VServer vs1:
DH: DISABLED
...
1) CertKey Name: ca_cert CA Certificate OCSPCheck: Mandatory
1) Cipher Name: DEFAULT
  Description: Predefined Cipher Alias
Done
```

To modify an OCSP responder by using the command line interface

You cannot modify the responder name. All other parameters can be changed using the set ssl ocspResponder command.

At the command prompt, type the following commands to set the parameters and verify the configuration:

- set ssl ocspResponder <name> [-url <URL>] [-cache (ENABLED | DISABLED)] [-cacheTimeout <positive_integer>] [-batchingDepth <positive_integer>] [-batchingDelay <positive_integer>] [-resptimeout <positive_integer>] [-responderCert <string> | -trustResponder][-producedAtTimeSkew <positive_integer>][-signingCert <string>] [-useNonce (YES | NO)]
- unbind ssl certKey [<certkeyName>] [-ocspResponder <string>]
- bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <positive_integer>]
- show ssl ocspResponder [<name>]

To configure an OCSP responder by using the configuration utility

1. Navigate to Traffice Management > SSL > OCSP Responder
2. In the details pane, do one of the following:
   - To create a new responder, click Add.
   - To modify an existing responder, select the responder, and then click Open.
3. Click Create or OK, and then click Close.
4. In the OCSP Responder pane, click the responder that you just configured and verify that the settings displayed at the bottom of the screen are correct.
5. In the navigation pane, click Certificates.
6. In the details pane, select a certificate and click OCSP Bindings.
7. To bind a different certificate-key pair, click Unbind OCSP Responder, and then click Insert OCSP Responder and select a name from the OCSP Responder Name drop-down list. Verify that the settings displayed at the bottom of the screen are correct.
8. Click OK.
9. Navigate to Traffic Management > SSL Offload > Virtual Servers.
10. Select the virtual server to bind the certificate key to, and click Open.
11. In the Configure Virtual Server (SSL Offload) dialog box, click SSL Settings.
12. In the Available pane, select a certificate.
13. In the Add drop-down list select As CA.
14. To make OCSP check mandatory, in the Configured pane, in the Check drop-down list, select OCSP Mandatory.
15. Click OK.

Configuring Client Authentication

Jun 03, 2015

In a typical SSL transaction, the client that is connecting to a server over a secure connection checks the validity of the server by checking the server's certificate before initiating the SSL transaction. In some cases, however, you might want to configure the server to authenticate the client that is connecting to it.

With client authentication enabled on an SSL virtual server, the NetScaler appliance asks for the client certificate during the SSL handshake. The appliance checks the certificate presented by the client for normal constraints, such as the issuer signature and expiration date.

Note: For the NetScaler to verify issuer signatures, the certificate of the CA that issued the client certificate must be installed on the NetScaler and bound to the virtual server that the client is transacting with.
If the certificate is valid, the NetScaler allows the client to access all secure resources. But if the certificate is invalid, the NetScaler drops the client request during the SSL handshake.

The NetScaler verifies the client certificate by first forming a chain of certificates, starting with the client certificate and ending with the root CA certificate for the client (for example, VeriSign). The root CA certificate may contain one or more intermediate CA certificates (if the client certificate is not directly issued by the root CA).

Before you enable client authentication on the NetScaler, make sure that a valid client certificate is installed on the client. Then, enable client authentication for the virtual server that will handle the transactions. Finally, bind the certificate of the CA that issued the client certificate to the virtual server on the NetScaler.

Note: The NetScaler appliance supports a certificate-key pair size of 512 to 4096 bits. The certificate must be signed by using one of the following hash algorithms:

- MD5
- SHA-1
- SHA-224
- SHA-256
- SHA-384
- SHA-512

A NetScaler virtual appliance supports certificates of up to the following sizes:

- 4096-bit server certificate on the virtual server
- 4096-bit client certificate on the service
- 4096-bit CA certificate
- 2048-bit certificate on the physical server
- 2048-bit client certificate (if client authentication is enabled on the virtual server)

To configure client authentication, see the following sections:

- Providing the Client Certificate
- Enabling Client-Certificate-Based Authentication
- Binding CA Certificates to the Virtual Server

Providing the Client Certificate

Before you configure client authentication, a valid client certificate must installed on the client. A client certificate includes details about the specific client system that will create secure sessions with the NetScaler appliance. Each client certificate

is unique and should be used by only one client system.

Whether you obtain the client certificate from a CA, use an existing client certificate, or generate a client certificate on the NetScaler appliance, you must convert the certificate to the correct format. On the NetScaler, certificates are stored in either the PEM or DER format and must be converted to PKCS#12 format before they are installed on the client system. After converting the certificate and transferring it to the client, system, make sure that it is installed on that system and configured for the client application that will be part of the SSL transactions (for example, the web browser).

For instructions on how to convert a certificate from PEM or DER format to PKCS#12 format, see Converting SSL Certificates for Import or Export.

For instructions on how to generate a client certificate, see Generating Self-Signed Certificates.

Enabling Client-Certificate-Based Authentication

Updated: 2013-08-20

By default, client authentication is disabled on the NetScaler appliance, and all SSL transactions proceed without authenticating the client. You can configure client authentication to be either optional or mandatory as part of the SSL handshake.

If client authentication is optional, the NetScaler requests the client certificate but proceeds with the SSL transaction even if the client presents an invalid certificate. If client authentication is mandatory, the NetScaler terminates the SSL handshake if the SSL client does not provide a valid certificate.

Caution: Citrix recommends that you define proper access control policies before changing client-certificate-based authentication check to optional.
Note: Client authentication is configured for individual SSL virtual servers, not globally.

To enable client-certificate-based authentication by using the command line interface

At the command prompt, type the following commands to enable the client-certificate-based authentication and verify the configuration:

- set ssl vserver <vServerName> [-clientAuth (ENABLED | DISABLED)] [-clientCert (MANDATORY | OPTIONAL)]
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vssl -clientAuth ENABLED -clientCert Mandatory
 Done
> show ssl vserver vssl

      Advanced SSL configuration for VServer vssl:
      DH: DISABLED
      Ephemeral RSA: ENABLED        Refresh Count: 0
      Session Reuse: ENABLED        Timeout: 120 seconds
      Cipher Redirect: DISABLED
      SSLv2 Redirect: DISABLED
      ClearText Port: 0
```

```
    Client Auth: ENABLED    Client Cert Required: Mandatory
    SSL Redirect: DISABLED
    Non FIPS Ciphers: DISABLED
    SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)    CertKey Name: sslckey   Server Certificate

1)    Policy Name: client_cert_policy  Priority: 0

1)    Cipher Name: DEFAULT
    Description: Predefined Cipher Alias
 Done
```

To enable client-certificate-based authentication by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server for which you want to configure client certificate-based authentication, and then click Open.
3. Click the SSL Settings tab, and then click SSL Parameters.
4. In the Others group, select the Client Authentication check box.
5. In Client Certificate, select Mandatory.

   Note: To configure optional client authentication in Client Certificate, click Optional.
6. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK. The virtual server is now configured for client authentication.

Binding CA Certificates to the Virtual Server

A CA whose certificate is present on the NetScaler appliance must issue the client certificate used for client authentication. You must bind this certificate to the NetScaler virtual server that will carry out client authentication.

You must bind the CA certificate to the SSL virtual server in such a way that the NetScaler can form a complete certificate chain when it verifies the client certificate. Otherwise, certificate chain formation fails and the client is denied access even if its certificate is valid.

You can bind CA certificates to the SSL virtual server in any order. The NetScaler forms the proper order during client certificate verification.

For example, if the client presents a certificate issued by **CA_A**, where **CA_A** is an intermediate CA whose certificate is issued by **CA_B**, whose certificate is in turn issued by a trusted root CA, **Root_CA**, a chain of certificates that contain all three of these certificates must be bound to the virtual server on the NetScaler.

For instructions on binding one or more certificates to the virtual server, see Binding the Certificate-key Pair to the SSL Based Virtual Server.

For instructions on creating a chain of certificates, see Creating a Chain of Certificates.

Customizing the SSL Configuration

Jun 03, 2015

Once your basic SSL configuration is operational, you can customize some of the parameters that are specific to the certificates being used in SSL transactions. You can also enable and disable session reuse and client authentication, and you can configure redirect responses for cipher and SSLv2 protocol mismatches.

You can also customize SSL settings for two NetScaler appliances in a High Availability configuration, and you can synchronize settings, certificates and keys across those appliances.

These settings will depend on your network deployment and the type of clients you expect will connect to your servers.

To customize the SSL configuration, see the following sections:

- Configuring Diffie-Hellman (DH) Parameters
- Configuring Ephemeral RSA
- Configuring Session Reuse
- Configuring Cipher Redirection
- Configuring SSLv2 Redirection
- Configuring SSL Protocol Settings
- Configuring Close-Notify
- Configuring ECDHE Ciphers
- Configuring a Common Name on an SSL Service or Service Group for Server Certificate Authentication
- Configuring Advanced SSL Settings
- Synchronizing Configuration Files in a High Availability Setup
- Managing Server Authentication
- Configuring User-Defined Cipher Groups on the NetScaler Appliance

Configuring Diffie-Hellman (DH) Parameters

Dec 22, 2014

If you are using ciphers on the NetScaler that require a DH key exchange to set up the SSL transaction, enable DH key exchange on the NetScaler and configure other settings based on your network.

To list the ciphers for which DH parameters must be set by using the NetScaler command line, type: sh cipher DH.

To list the ciphers for which DH parameters must be set by using the configuration utility, navigate to Traffic Management > SSL > Cipher Groups, and double-click DH.

For details on how to enable DH key exchange, see Generating a Diffie-Hellman (DH) Key.

To configure DH Parameters by using the command line interface

At the command prompt, type the following commands to configure DH parameters and verify the configuration:

- set ssl vserver <vserverName> -dh <Option> -dhCount <RefreshCountValue> -filepath <string>
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vs-server -dh ENABLED  -dhFile /nsconfig/ssl/ns-server.cert -dhCount 1000
 Done
> show ssl vserver vs-server

      Advanced SSL configuration for VServer vs-server:
      DH: ENABLED
      Ephemeral RSA: ENABLED        Refresh Count: 1000
      Session Reuse: ENABLED        Timeout: 120 seconds
      Cipher Redirect: DISABLED
      SSLv2 Redirect: DISABLED
      ClearText Port: 0
      Client Auth: DISABLED
      SSL Redirect: DISABLED
      Non FIPS Ciphers: DISABLED
      SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)    Cipher Name: DEFAULT
      Description: Predefined Cipher Alias
 Done
```

To configure DH Parameters by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server for which you want to customize SSL settings, and then click **Open**.
3. On the SSL Settings tab, click SSL Parameters.
4. In the Configure SSL Params dialog box, specify values for the following parameters:
   - Enable DH Param*

- Refresh Count
- File Path*

* A required parameter

5. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK. The DH parameters are now configured.

Configuring Ephemeral RSA

Aug 20, 2013

Ephemeral RSA allows export clients to communicate with the secure server even if the server certificate does not support export clients (1024-bit certificate). If you want to prevent export clients from accessing the secure web object and/or resource, you need to disable ephemeral RSA key exchange.

By default, this feature is enabled on the NetScaler appliance, with the refresh count set to zero (infinite use).

Note:
The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted but reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the system restarts.

To configure Ephemeral RSA by using the command line interface

At the command prompt, type the following commands to configure ephemeral RSA and verify the configuration:

- set ssl vserver <vServerName> -eRSA (enabled | disabled) -eRSACount <positive_integer>
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vs-server -eRSA ENABLED -eRSACount 1000
 Done
> show ssl vserver vs-server

      Advanced SSL configuration for VServer vs-server:
      DH: DISABLED
      Ephemeral RSA: ENABLED        Refresh Count: 1000
      Session Reuse: ENABLED        Timeout: 120 seconds
      Cipher Redirect: DISABLED
      SSLv2 Redirect: DISABLED
      ClearText Port: 0
      Client Auth: DISABLED
      SSL Redirect: DISABLED
      Non FIPS Ciphers: DISABLED
      SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)     Cipher Name: DEFAULT
      Description: Predefined Cipher Alias
 Done
```

To configure Ephemeral RSA by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server for which you want to customize SSL settings, and then click Open.
3. On the SSL Settings tab, click SSL Parameters.

4. In the Configure SSL Params dialog box, specify values for the following parameters:
   - Enable Ephemeral RSA*
   - Refresh Count*

   * A required parameter
5. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK. The ephemeral RSA parameters are now configured.

Configuring Session Reuse

Aug 20, 2013

For SSL transactions, establishing the initial SSL handshake requires CPU-intensive public key encryption operations. Most handshake operations are associated with the exchange of the SSL session key (client key exchange message). When a client session is idle for some time and is then resumed, the SSL handshake is typically conducted all over again. With session reuse enabled, session key exchange is avoided for session resumption requests received from the client.

Session reuse is enabled on the NetScaler appliance by default. Enabling this feature reduces server load, improves response time, and increases the number of SSL transactions per second (TPS) that can be supported by the server.

To configure session reuse by using the command line interface

At the command prompt, type the following commands to configure session reuse and verify the configuration:

- set ssl vserver <vServerName> -sessReuse (ENABLED | DISABLED) -sessTimeout <positive_integer>
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vs-ssl -sessreuse enabled -sesstimeout 600
 Done

> show ssl vserver vs-ssl

        Advanced SSL configuration for VServer vs-ssl:
        DH: DISABLED
        Ephemeral RSA: ENABLED        Refresh Count: 1000
        Session Reuse: ENABLED        Timeout: 600 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: DISABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)      CertKey Name: Auth-Cert-1       Server Certificate

1)      Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
 Done
```

To configure session reuse by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server for which you want to customize SSL settings, and then click Open.
3. On the SSL Settings tab, click SSL Parameters.
4. In the Configure SSL Params dialog box, specify values for the following parameters:

- Enable Session Reuse*
- Time-out

* A required parameter

5. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK.

Configuring Cipher Redirection

Aug 20, 2013

During the SSL handshake, the SSL client (usually a web browser) announces the suite of ciphers that it supports, in the configured order of cipher preference. From that list, the SSL server then selects a cipher that matches its own list of configured ciphers.

If the ciphers announced by the client do not match those configured on the SSL server, the SSL handshake fails, and the failure is announced by a cryptic error message displayed in the browser. These messages rarely mention the exact cause of the error.

With cipher redirection, you can configure an SSL virtual server to deliver accurate, meaningful error messages when an SSL handshake fails. When SSL handshake fails, the NetScaler appliance redirects the user to a previously configured URL or, if no URL is configured, displays an internally generated error page.

To configure cipher redirection by using the command line interface

At the command prompt, type the following commands to configure cipher redirection and verify the configuration:

- set ssl vserver <vServerName> -cipherRedirect < ENABLED | DISABLED> -cipherURL < URL>
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vs-ssl -cipherRedirect ENABLED -cipherURL http://redirectURl
 Done
> show ssl vserver vs-ssl

        Advanced SSL configuration for VServer vs-ssl:
        DH: DISABLED
        Ephemeral RSA: ENABLED        Refresh Count: 1000
        Session Reuse: ENABLED        Timeout: 600 seconds
        Cipher Redirect: ENABLED      Redirect URL: http://redirectURl
        SSLv2 Redirect: DISABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)      CertKey Name: Auth-Cert-1       Server Certificate

1)      Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
 Done
```

To configure cipher redirection by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.

2. Select the virtual server for which you want to customize SSL settings, and then click Open.
3. On the SSL Settings tab, click SSL Parameters.
4. In the Configure SSL Params dialog box, specify values for the following parameters:
   - Enable Cipher Redirect
   - Redirect URL
5. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK. The NetScaler is now configured to redirect clients in case of a cipher suite mismatch.

Configuring SSLv2 Redirection

Aug 20, 2013

For an SSL transaction to be initiated, and for successful completion of the SSL handshake, the server and the client should agree on an SSL protocol that both of them support. If the SSL protocol version supported by the client is not acceptable to the server, the server does not go ahead with the transaction, and an error message is displayed.

You can configure the server to display a precise error message (user-configured or internally generated) advising the client on the next action to be taken. Configuring the server to display this message requires that you set up SSLv2 redirection.

To configure SSLv2 redirection by using the command line interface

At the command prompt, type the following commands to configure SSLv2 redirection and verify the configuration:

- set ssl vserver <vServerName> [-sslv2Redirect (ENABLED | DISABLED) [-sslv2URL <URL>]]
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vs-ssl -sslv2Redirect ENABLED -sslv2URL http://sslv2URL
 Done
> show ssl vserver vs-ssl

        Advanced SSL configuration for VServer vs-ssl:
        DH: DISABLED
        Ephemeral RSA: ENABLED        Refresh Count: 1000
        Session Reuse: ENABLED        Timeout: 600 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: ENABLED Redirect URL: http://sslv2URL
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)      CertKey Name: Auth-Cert-1       Server Certificate

1)      Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
 Done
```

To configure SSLv2 redirection by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server for which you want to customize SSL settings, and then click Open.
3. On the SSL Settings tab, click SSL Parameters.
4. In the Configure SSL Params dialog box, specify values for the following parameters:
   - Enable SSLv2 Redirect
   - SSLv2 URL

5. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK. The NetScaler is now configured to redirect clients that only support SSLv2 protocol.

Configuring SSL Protocol Settings

May 20, 2015

The NetScaler appliance supports the SSLv2, SSLv3, TLSv1, TLSv1.1, and TLSv1.2 protocols. Each of these can be set on the appliance as required by your deployment and the type of clients that will connect to the appliance.

Note: Support for TLS protocol versions 1.1 and 1.2 is not available on a FIPS appliance or on a NetScaler virtual appliance.

To configure SSL protocol support by using the command line interface

At the command prompt, type the following commands to configure SSL protocol support and verify the configuration:

- set ssl vserver <vServerName> -ssl2 (ENABLED | DISABLED) -ssl3 (ENABLED | DISABLED) -tls1 (ENABLED | DISABLED) -tls11 (ENABLED | DISABLED) -tls12 (ENABLED | DISABLED)
- show ssl vserver <vServerName>

Example

```
> set ssl vserver vs-ssl -tls11 ENABLED -tls12 ENABLED
 Done
> sh ssl vs vs-ssl

        Advanced SSL configuration for VServer vs-ssl:
        DH: DISABLED
        Ephemeral RSA: ENABLED                  Refresh Count: 0
        Session Reuse: ENABLED                   Timeout: 120 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: DISABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SNI: DISABLED
        SSLv2: DISABLED      SSLv3: ENABLED    TLSv1.0: ENABLED  TLSv1.1: ENABLED  TLSv1.2: ENABLED
        Push Encryption Trigger: Always
        Send Close-Notify: YES

        1 bound certificate:
1)       CertKey Name: mycert  Server Certificate

        1 configured cipher:
1)       Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
Done
```

To configure SSL protocol support by using the configuration Utility

1. In the navigation pane, expand SSL Offload, and then click Virtual Servers.
2. Navigate to Traffic Management > SSL Offload > Virtual Servers.
3. Select the virtual server for which you want to customize SSL settings, and then click Open.
4. On the SSL Settings tab, click SSL Parameters.

5. In the Configure SSL Params dialog box, in the SSL Protocol group, select any of the following protocol options that you want to enable:
   - TLSv1.2
   - TLSv1.1
   - TLSv1
   - SSLv3
   - SSLv2
6. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK.

Configuring Close-Notify

Aug 20, 2013

A close-notify is a secure message that indicates the end of SSL data transmission. A close-notify setting is required at the global level. This setting applies to all virtual servers, services, and service groups. For information about the global setting, see Configuring Advanced SSL Settings.

In addition to the global setting, you can set the close-notify parameter at the virtual server, service, or service group level. You therefore have the flexibility of setting the parameter for one entity and unsetting it for another entity. However, make sure that you set this parameter at the global level. Otherwise, the setting at the entity level does not apply.

To configure close-notify at the entity level by using the command line interface

At the command prompt, type any of the following commands to configure close-notify and verify the configuration:

1. To configure close-notify at the virtual server level, type:
   - set ssl vserver <vServerName> -sendCloseNotify (**YES** | **NO**)
   - show ssl vserver <vServerName>
2. To configure close-notify at the service level, type:
   - set ssl service <serviceName> -sendCloseNotify (**YES** | **NO**)
   - show ssl service <serviceName>
3. To configure close-notify at the service group level, type:
   - set ssl serviceGroup <serviceGroupName> -sendCloseNotify (**YES** | **NO**)
   - show ssl serviceGroup <serviceGroupName>

Example

```
> set ssl vserver sslvsvr -sendCloseNotify YES
 Done
```

To configure close-notify at the entity level by using the configuration utility

1. Navigate to Traffic Management > SSL Offload.
2. Click Virtual Servers or Services or Service Groups.
3. Select the virtual server, service, or service group for which you want to customize SSL settings, and then click Open.
4. On the SSL Settings tab, click SSL Parameter.
5. In the Configure SSL Params dialog box, select Send Close-Notify.
6. Click OK, and in the Configure Virtual Server (SSL Offload) dialog box, click OK.

Configuring a Common Name on an SSL Service or Service Group for Server Certificate Authentication

May 13, 2015

In end-to-end encryption with server authentication enabled, you can include a common name in the configuration of an SSL service or service group. The name that you specify is compared to the common name in the server certificate during an SSL handshake. If the two names match, the handshake is successful. This configuration is especially useful if there are, for example, two servers behind a firewall and one of the servers spoofs the identity of the other. If the common name is not checked, a certificate presented by either server is accepted if the IP address matches.

To configure common-name verification for an SSL service or service group by using the command line interface

At the command prompt, type the following commands to specify server authentication with common-name verification and verify the configuration:

1. To configure common name in a service, type:
   - set ssl service <serviceName> -commonName <string> -serverAuth ENABLED
   - show ssl service <serviceName>
2. To configure common name in a service group, type:
   - set ssl serviceGroup <serviceGroupName> -commonName <string> -serverAuth ENABLED
   - show ssl serviceGroup <serviceGroupName>

Example

```
> set ssl service svc1 -commonName xyz.com -serverAuth ENABLED
 Done
> show ssl service svc1
 Advanced SSL configuration for Back-end SSL Service svc1:
 DH: DISABLED
 Ephemeral RSA: DISABLED
 Session Reuse: ENABLED  Timeout: 300 seconds
 Cipher Redirect: DISABLED
 SSLv2 Redirect: DISABLED
 Server Auth: ENABLED Common Name: www.xyz.com
 SSL Redirect: DISABLED
 Non FIPS Ciphers: DISABLED
 SNI: DISABLED
 SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: cacert CA Certificate  OCSPCheck: Optional

1) Cipher Name: ALL
 Description: Predefined Cipher Alias
 Done
```

To configure common-name verification for an SSL service or service group by using the configuration utility

1. Navigate to Traffic Management > SSL Offload.
2. Click Services or Service Groups.
3. Select the service or service group for which you want to customize SSL settings, and then click Open.
4. On the SSL Settings tab, click SSL Parameters.
5. In the Configure SSL Params dialog box, select Server Authentication, and then in the Common Name field, specify a name for the certificate.
6. Click OK, and in the Configure Service dialog box, click OK.

Configuring Advanced SSL Settings

Sep 20, 2013

Advanced customization of your SSL configuration addresses specific issues. You can use the set ssl parameter command or the configuration utility to specify the following:

- Quantum size to be used for SSL transactions.
- CRL memory size.
- OCSP cache size.
- Deny SSL renegotiation.
- Set the PUSH flag for decrypted, encrypted, or all records.
- Drop requests if the client initiates the handshake for one domain and sends an HTTP request for another domain.
- Set the time after which encryption is triggered.
  Note: The time that you specify applies only if you use the set ssl vserver command or the configuration utility to set timer-based encryption.

To configure advanced SSL settings by using the command line interface

At the command prompt, type the following commands to configure advanced SSL settings and verify the configuration:

- set ssl parameter [-quantumSize <quantumSize>] [-crlMemorySizeMB <positive_integer>] [-strictCAChecks (YES | NO)] [-sslTriggerTimeout <positive_integer>] [-sendCloseNotify (YES | NO)] [-encryptTriggerPktCount <positive_integer>] [-denySSLReneg <denySSLReneg>] [-insertionEncoding (Unicode | UTF-8)] [-ocspCacheSize <positive_integer>][- pushFlag <positive_integer>] [- dropReqWithNoHostHeader (YES | NO)] [-pushEncTriggerTimeout <positive_integer>]
- show ssl parameter

Example

```
> set ssl parameter -quantumSize 8 -crlMemorySizeMB 256 -strictCAChecks no -sslt
iggerTimeout 100 -sendClosenotify no -encryptTriggerPktCount 45 -denySSLReneg no
-insertionEncoding unicode -ocspCacheSize 10 -pushFlag 3 -dropReqWithNoHostHeader YES  -pushEncTriggerTimeout 100 ms
 Done

> show ssl parameter
Advanced SSL Parameters
-----------------------
      SSL quantum size:            8 kB
      Max CRL memory size:         256 MB
      Strict CA checks:            NO
      Encryption trigger timeout     100 mS
      Send Close-Notify            NO
      Encryption trigger packet count:      45
      Deny SSL Renegotiation       NO
      Subject/Issuer Name Insertion Format:   Unicode
      OCSP cache size:      10 MB
      Push flag:     0x3 (On every decrypted and encrypted record)
      Strict Host Header check for SNI enabled SSL sessions:        YES
       PUSH encryption trigger timeout 100 ms
 Done
```

To configure advanced SSL settings by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. In the details pane, under Settings, click Change advanced SSL settings.
3. In the Change advanced SSL settings dialog box, set the following parameters:
   - SSL quantum size (Kbytes)
   - Max CRL memory size (Mbytes)
   - Encryption trigger timeout (10 mS ticks)
   - Encryption trigger packet count

- Deny SSL Renegotiation
- OCSP cache size(Mbytes)
- Encoding type
- PUSH encryption trigger timeout (msec)
- Strict CA checks
- Send Close-Notify
- PUSH Flag Insertion
- Drop requests for SNI enabled SSL sessions if Host header is absent

4. Click OK. The parameters you selected are now enabled on the appliance.

PUSH Flag-Based Encryption Trigger Mechanism

The encryption trigger mechanism that is based on the PSH TCP flag now enables you to do the following:

- Merge consecutive packets in which the PSH flag is set into a single SSL record, or ignore the PSH flag.
- Perform timer-based encryption, in which the time-out value is set globally by using the set ssl parameter -pushEncTriggerTimeout <positive_integer> command.

To configure PUSH flag-based encryption by using the command line interface

At the command prompt, type the following commands to configure PUSH flag-based encryption and verify the configuration:

- set ssl vserver <vServerName> [-pushEncTrigger <pushEncTrigger>]
- show ssl vserver

Example

```
Advanced SSL configuration for VServer v1:
        DH: DISABLED
        Ephemeral RSA: ENABLED                  Refresh Count: 0
        Session Reuse: ENABLED                  Timeout: 120 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: DISABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SNI: DISABLED
        SSLv2: DISABLED         SSLv3: ENABLED          TLSv1: ENABLED
        Push Encryption Trigger: Always
```

To configure PUSH flag-based encryption by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server for which you want to customize PUSH-flag based encryption, and then click Open.
3. On the SSL Settings tab, click SSL Parameters.
4. In the Configure SSL Params dialog box, select a value for the PUSH Encryption Trigger parameter.
5. Click OK and, in the Configure Virtual Server (SSL Offload) dialog box, again click OK. The PSH flag-based encryption trigger is now configured.

Synchronizing Configuration Files in a High Availability Setup

Oct 28, 2013

In a high availability (HA) set up, the primary NetScaler appliance in the HA pair automatically synchronizes with the secondary appliance in the pair. In the synchronization process, the secondary copies the primary's /nsconfig/ssl/ directory, which is the default location for storing the certificates and keys for SSL transactions. Synchronization occurs at one-minute intervals and every time a new file is added to the directory.

To synchronize files in a high availability setup by using the command line interface

At the command prompt, type the following command:

sync HA files [<Mode>]

Example

```
sync HA files SSL
```

To synchronize files in a high availability setup by using the configuration utility

1. Navigate to Traffic Management > SSL.
2. In the details pane, under Tools, click Start file synchronization.
3. In the Start file synchronization dialog box, in the Mode drop-down list, select the appropriate type of synchronization (for example, SSL certificates and Keys), and then click OK.

Managing Server Authentication

Aug 20, 2013

Since the NetScaler appliance performs SSL offload and acceleration on behalf of a web server, the appliance does not usually authenticate the Web server's certificate. However, you can authenticate the server in deployments that require end-to-end SSL encryption.

In such a situation, the NetScaler becomes the SSL client, carries out a secure transaction with the SSL server, verifies that a CA whose certificate is bound to the SSL service has signed the server certificate, and checks the validity of the server certificate.

To authenticate the server, you must first enable server authentication and then bind the certificate of the CA that signed the server's certificate to the SSL service on the NetScaler. When binding the certificate, you must specify the bind as CA option.

To enable (or disable) server certificate authentication by using the command line interface

At the command prompt, type the following commands to enable server certificate authentication and verify the configuration:

- set ssl service <serviceName> -serverAuth (ENABLED | DISABLED)
- show ssl service <serviceName>

Example

```
> set ssl service ssl-service-1 -serverAuth ENABLED
 Done
> show ssl service ssl-service-1

      Advanced SSL configuration for Back-end SSL Service ssl-service-1:
      DH: DISABLED
      Ephemeral RSA: DISABLED
      Session Reuse: ENABLED        Timeout: 300 seconds
      Cipher Redirect: DISABLED
      SSLv2 Redirect: DISABLED
      Server Auth: ENABLED
      SSL Redirect: DISABLED
      Non FIPS Ciphers: DISABLED
      SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)     Cipher Name: ALL
      Description: Predefined Cipher Alias
 Done
```

To enable (or disable) server certificate authentication by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Services.
2. Select the service for which you want to enable server authentication, and then click Open.
3. In Configure Service dialog box, on the SSL Settings tab, click SSL Parameters.

4. In the Others group, select Server Authentication.
5. Click OK. Server authentication is now enabled for the service.

To bind the CA certificate to the service by using the command line interface

At the command prompt, type the following commands to bind the CA certificate to the service and verify the configuration:

- bind ssl service <serviceName> -certkeyName <string> -CA
- show ssl service <serviceName>

Example

```
> bind ssl service ssl-service-1 -certkeyName samplecertkey -CA
 Done
> show ssl service ssl-service-1

        Advanced SSL configuration for Back-end SSL Service ssl-service-1:
        DH: DISABLED
        Ephemeral RSA: DISABLED
        Session Reuse: ENABLED        Timeout: 300 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: DISABLED
        Server Auth: ENABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)     CertKey Name: samplecertkey     CA Certificate        CRLCheck: Optional

1)     Cipher Name: ALL
       Description: Predefined Cipher Alias
 Done
```

Configuring User-Defined Cipher Groups on the NetScaler Appliance

Oct 02, 2013

A cipher group is a set of cipher suites that you bind to an SSL virtual server, service, or service group on the NetScaler appliance. A cipher suite comprises a protocol, a key exchange (Kx) algorithm, an authentication (Au) algorithm, an encryption (Enc) algorithm, and a message authentication code (Mac) algorithm. Your appliance ships with a predefined set of cipher groups. When you create a SSL service or SSL service group, the ALL cipher group is automatically bound to it. However, when you create an SSL virtual server or a transparent SSL service, the DEFAULT cipher group is automatically bound to it. In addition, you can create a user-defined cipher group and bind it to an SSL virtual server, service, or service group.

Note: If your MPX appliance does not have any licenses, then only the EXPORT cipher is bound to your SSL virtual server, service, or service group.

To create a user-defined cipher group, first you create a cipher group and then you bind ciphers or cipher groups to this group. If you specify a cipher alias or a cipher group, all the ciphers in the cipher alias or group are added to the user-defined cipher group. You can also add individual ciphers (cipher suites) to a user-defined group. However, you cannot modify a predefined cipher group. Before removing a cipher group, unbind all the cipher suites in the group.

If you bind a cipher group to an SSL virtual server, service, or service group, the ciphers are appended to the existing ciphers that are bound to the entity. To bind a specific cipher group to the entity, you must first unbind the ciphers or cipher group that is bound to the entity and then bind the specific cipher group. For example, to bind only the AES cipher group to an SSL service, you perform the following steps:

1. Unbind the default cipher group ALL that is bound by default to the service when the service is created.
   `unbind ssl service <service name> -cipherName ALL`
2. Bind the AES cipher group to the service
   `bind ssl service <Service name> -cipherName AE`

If you want to bind the cipher group DES in addition to AES, at the command prompt, type:

- `bind ssl service <service name> -cipherName DES`

Note: The free NetScaler virtual appliance supports only the DH cipher group.

To configure a user-defined cipher group by using the command line interface

At the command prompt, type the following commands to add a cipher group, or to add ciphers to a previously created group, and verify the settings:

- add ssl cipher <cipherGroupName>
- bind ssl cipher <cipherGroupName> -cipherName <string>
- show ssl cipher <cipherGroupName>

Example

```
 > add ssl cipher test
 Done
> bind ssl cipher test -cipherName SSLv2
 Done
> show ssl cipher test
```

```
1)     Cipher Name: SSL2-RC2-CBC-MD5
Description: SSLv2 Kx=RSA     Au=RSA  Enc=RC2(128)  Mac=MD5
2)     Cipher Name: SSL2-RC4-MD5
Description: SSLv2 Kx=RSA     Au=RSA  Enc=RC4(128)  Mac=MD5
3)     Cipher Name: SSL2-DES-CBC3-MD5
Description: SSLv2 Kx=RSA     Au=RSA  Enc=3DES(168) Mac=MD5
4)     Cipher Name: SSL2-DES-CBC-MD5
Description: SSLv2 Kx=RSA     Au=RSA  Enc=DES(56)   Mac=MD5
5)     Cipher Name: SSL2-RC4-64-MD5
Description: SSLv2 Kx=RSA     Au=RSA  Enc=RC4(64)   Mac=MD5
6)     Cipher Name: SSL2-EXP-RC4-MD5
Description: SSLv2 Kx=RSA(512) Au=RSA  Enc=RC4(40)   Mac=MD5  Export
7)     Cipher Name: SSL2-EXP-RC2-CBC-MD5
Description: SSLv2 Kx=RSA(512) Au=RSA  Enc=RC2(40)   Mac=MD5  Export
 Done
```

To unbind ciphers from a cipher group by using the command line interface

At the command prompt, type the following commands to unbind ciphers from a user-defined cipher group, and verify the settings:

- show ssl cipher <cipherGroupName>
- unbind ssl cipher <cipherGroupName> -cipherName <string>
- show ssl cipher <cipherGroupName>

Example

```
> show ssl cipher test
1) Cipher Name: SSL2-RC2-CBC-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=RC2(128) Mac=MD5
2) Cipher Name: SSL2-RC4-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=RC4(128) Mac=MD5
3) Cipher Name: SSL2-DES-CBC3-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=3DES(168) Mac=MD5
4) Cipher Name: SSL2-DES-CBC-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=DES(56) Mac=MD5
5) Cipher Name: SSL2-RC4-64-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=RC4(64) Mac=MD5
6) Cipher Name: SSL2-EXP-RC4-MD5
Description: SSLv2 Kx=RSA(512) Au=RSA Enc=RC4(40) Mac=MD5 Export
7) Cipher Name: SSL2-EXP-RC2-CBC-MD5
Description: SSLv2 Kx=RSA(512) Au=RSA Enc=RC2(40) Mac=MD5 Export
Done

> unbind ssl cipher test -cipherName SSL2-RC2-CBC-MD5

> show ssl cipher test
1) Cipher Name: SSL2-RC4-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=RC4(128) Mac=MD5
2) Cipher Name: SSL2-DES-CBC3-MD5
```

```
Description: SSLv2 Kx=RSA Au=RSA Enc=3DES(168) Mac=MD5
3) Cipher Name: SSL2-DES-CBC-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=DES(56) Mac=MD5
4) Cipher Name: SSL2-RC4-64-MD5
Description: SSLv2 Kx=RSA Au=RSA Enc=RC4(64) Mac=MD5
5) Cipher Name: SSL2-EXP-RC4-MD5
Description: SSLv2 Kx=RSA(512) Au=RSA Enc=RC4(40) Mac=MD5 Export
6) Cipher Name: SSL2-EXP-RC2-CBC-MD5
Description: SSLv2 Kx=RSA(512) Au=RSA Enc=RC2(40) Mac=MD5 Export
Done
```

To remove a cipher group by using the command line interface

Note: You cannot remove a built-in cipher group. Before removing a user-defined cipher group, make sure that the cipher group is empty.
At the command prompt, type the following commands to remove a user-defined cipher group, and verify the configuration:

- rm ssl cipher <userDefCipherGroupName> [<cipherName> ...]
- show ssl cipher <cipherGroupName>

Example

```
> rm ssl cipher test
Done

> sh ssl cipher test
ERROR: No such resource [cipherGroupName, test]
```

To configure a user-defined cipher group by using the configuration utility

1. Navigate to Traffic Management > SSL > Cipher Groups.
2. In the details pane, do one of the following:
   - To create a new cipher group, click Add.
   - To modify an existing cipher group, select the cipher group, and then click Open.
3. If creating a new cipher group, in the Create Cipher Group dialog box, in the Cipher Group Name box, type a name for the new cipher group.
4. In the Create Cipher Group or View Cipher Group dialog box, do any or all of the following:
   - Select a cipher group or alias in the Available Cipher Groups list and click Add to move the group to the Configured Cipher Groups list.
   - Select a cipher group or alias in the Available Cipher Groups list, then select ciphers from the Available Ciphers list, and then click Add to move the selected ciphers to the Configured Ciphers list.
   - To move a cipher group or cipher from the Configured list to the Available list, select the group or cipher and click Remove.
5. Click Create, and then click Close. If you created a new cipher group, it appears in the Cipher Groups pane.

To bind a cipher group to an SSL virtual server, service, or service group by using the command line interface

At the command prompt, type one of the following:

- bind ssl vserver <vServerName> -cipherName <string>
- bind ssl service <serviceName> -cipherName <string>
- bind ssl serviceGroup <serviceGroupName> -cipherName <string>

Examples

```
> bind ssl vserver ssl_vserver_test -cipherName test
Done
bind ssl service  nshttps -cipherName test
Done
> bind ssl servicegroup  ssl_svc  -cipherName test
Done
```

To bind a cipher group to an SSL virtual server, service, or service group by using the configuration utility

1. Navigate to Traffic Management > SSL Offload > Virtual Servers or Traffic Management > SSL Offload > Services or Traffic Management > SSL Offload > Service Groups.
2. In the details pane, select the virtual server, service, or service group to bind the cipher to, and then click Open.
3. In the Configure Virtual Server (SSL Offload), Configure Service, or Configure Service Group dialog box, on the SSL Settings tab, click Ciphers.
4. In the SSL-Offload - Configure Ciphers, Service - Configure Ciphers, or Service Group - Configure Ciphers dialog box, do one or both of the following:
   - To bind a cipher group, select a cipher group or alias from the Available Cipher Groups list, and then click Add. To unbind a group, select the cipher group or alias from the Configured Cipher Groups list, and then click Remove.
   - To bind a cipher, select a cipher group or alias from the Available Cipher Groups list, then select ciphers from the Available Ciphers list, and then click Add. To unbind a cipher. select the cipher from the Configured Ciphers list, and then click Remove.

   Note: To override an existing cipher or cipher group, drag and drop the configured cipher or cipher group to a new location in the Configured Ciphers list or the Configured Cipher Groups list so that it precedes the cipher or cipher group to be overridden.
5. Click OK to close the dialog box, and then click OK again.

Configuring SSL Actions and Policies

Jun 03, 2015

An SSL policy evaluates incoming traffic and applies a predefined action to requests that match a rule (expression). You have to configure the actions before creating the policies, so that you can specify an action when you create a policy. To put a policy into effect, you must either bind it to a virtual server on the appliance, so that it applies only to traffic flowing through that virtual server, or bind it globally, so that it applies to all traffic flowing through the appliance.

SSL actions define SSL settings that you can apply to the selected requests. You associate an action with one or more policies. Data in client connection requests or responses is compared to a rule specified in the policy, and the action is applied to connections that match the rule (expression).

You can configure classic policies with classic expressions and default syntax policies with default syntax expressions for SSL.
Note: Users who are not experienced in configuring policies at the NetScaler command line usually find using the configuration utility to be considerably easier.
You can associate a user-defined action or a built-in action to a default syntax policy. Classic policies allow only user-defined actions. In default syntax policy, you can also group policies under a policy label, in which case they are applied only when invoked from another policy.

Common uses of SSL actions and policies include per-directory client authentication, support for Outlook web access, and SSL-based header insertions. SSL-based header insertions contain SSL settings required by a server whose SSL processing has been offloaded to the NetScaler appliance.

To configure SSL actions and policies, see the following sections:

- Configuring User-Defined Actions for SSL Policies
- Configuring SSL Policies
- Configuring an SSL Default Syntax Policy
- Configuring Built-in Actions for SSL Default Syntax Policies
- Configuring SSL Policy Labels
- Configuring Per-Directory Client Authentication
- Configuring Support for Outlook Web Access
- Configuring SSL-Based Header Insertion
- Binding SSL Policies to a Virtual Server
- Binding SSL Policies Globally

Configuring User-Defined Actions for SSL Policies

Sep 05, 2013

SSL policies require that you create an action before creating a policy, so that you can specify the actions when you create the policies. In SSL default syntax policies, you can also use the built-in actions. For more information about built-in actions, see Configuring Built-in SSL Actions.

At the command prompt, type the following commands to configure an action and verify the configuration:

- add SSL action <name> -clientAuth(DOCLIENTAUTH | NOCLIENTAUTH) -clientCert (ENABLED | DISABLED) certHeader <string> -clientHeader <string> -clientCertSerialNumber (ENABLED | DISABLED) -certSerialHeader <string> **-clientCertSubject** (ENABLED | DISABLED) -certSubjectHeader <string> -clientCertHash (ENABLED | DISABLED) -certHashHeader <string> -clientCertIssuer (ENABLED | DISABLED) -certIssuerHeader <string> -sessionID (ENABLED | DISABLED) -sessionIDheader <string> -cipher (ENABLED | DISABLED) -cipherHeader <string> -clientCertNotBefore (ENABLED | DISABLED) **-certNotBeforeHeader** <string> -clientCertNotAfter (ENABLED | DISABLED) -certNotAfterHeader <string> -OWASupport (ENABLED | DISABLED)
- show ssl action [<name>]

Example

```
> add ssl action Action-SSL-ClientCert -clientCert ENABLED -certHeader "X-Client-Cert"
 Done
> show ssl action Action-SSL-ClientCert
1)     Name: Action-SSL-ClientCert
       Data Insertion Action:
      Cert Header: ENABLED          Cert Tag: X-Client-Cert
 Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. On the Actions tab, in the details pane, click Add.
3. In the Create SSL Action dialog box, set the following parameters:
   - Name*
   - Client Authentication
   - Client Certificate
   - Certificate Tag
   - Client Certificate Serial Number
   - Serial Number Tag
   - Client Certificate Subject (DN)
   - Subject Tag
   - Client Certificate Hash
   - Hash Tag
   - Client Certificate Issuer
   - Issuer Tag
   - Session ID
   - Session ID Tag

- Cipher Suite
- Cipher Tag
- Client Certificate Not Before Date
- Not Before Tag
- Client Certificate Not After Date
- Not After Tag
- Outlook Web Access

* A required parameter

4. Click Create, and then click Close.

Configuring SSL Policies

Sep 26, 2013

Policies on the NetScaler help identify specific connections that you want to process. The processing is based on the actions that are configured for that particular policy. Once you create the policy and configure an action for it, you must either bind it to a virtual server on the NetScaler, so that it applies only to traffic flowing through that virtual server, or bind it globally, so that it applies to all traffic flowing through any virtual server configured on the NetScaler.

The NetScaler SSL feature supports both classic policies and default syntax policies . For a complete description of classic and default syntax expressions, how they work, and how to configure them manually, see Policy Configuration and Reference.

Note: Users who are not experienced in configuring policies at the NetScaler command line will usually find using the configuration utility considerably easier.

Configuring an SSL Default Syntax Policy

Sep 25, 2014

An SSL default syntax policy defines a control or a data action to be performed on requests. SSL policies can therefore be categorized as control policies and data policies:

- **Control policy**. A control policy uses a control action, such as forcing client authentication.
  Note: In release 10.5 or later, deny SSL renegotiation (denySSLReneg) is set, by default, to ALL. However, control policies, such as CLIENTAUTH, trigger a renegotiation handshake. If you use such policies, you must set denySSLReneg to NO.
- **Data policy**. A data policy uses a data action, such as inserting some data into the request.

The essential components of a policy are an expression and an action. The expression identifies the requests on which the action is to be performed. SSL policies use the default expression syntax or the classic expression syntax. For information about expressions and how to configure them, see Policy Configuration and Reference.

You can configure a default syntax policy with a built-in action or a user-defined action. You can configure a policy with a built-in action without creating a separate action. However, to configure a policy with a user-defined action, first configure the action and then configure the policy.

You can specify an additional action, called an UNDEF action, to be performed in the event that applying the expression to a request has an undefined result.

At the command prompt, type:

add ssl policy <name> -rule <expression> -Action <string> [-undefAction <string>] [-comment <string>]

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Policies, and then click Add.
3. In the Create SSL Policy dialog box, set the following parameters:
   - Name*
   - Request Action*
   - Undefined-Result Action
   - Expression
   - Comments

   * A required parameter
4. Click Create, and then click Close.
5. On the Policies tab, verify that the settings displayed for the policy that you just configured are correct.

Configuring Built-in Actions for SSL Default Syntax Policies

Aug 20, 2013

Unless you need only the built-in actions in your policies, you have to create the actions before creating the policies, so that you can specify the actions when you create the policies. The built-in actions are of two types, control actions and data actions. You use control actions in control policies, and data actions in data policies.

The built-in control actions are:

- CLIENTAUTH—Perform client certificate authentication.
- NOCLIENTAUTH—Do not perform client certificate authentication.

The built-in data actions are:

- RESET—Close the connection by sending a RST packet to the client.
- DROP—Drop all packets from the client. The connection remains open until the client closes it.
- NOOP—Forward the packet without performing any operation on it.

You can create user-defined data actions. For example, if you enable client authentication, you can create an SSL action to insert client-certificate data into the request header before forwarding the request to the web server. For more information about user-defined actions, see Configuring User-Defined SSL Actions.

If a policy evaluation results in an undefined state, an UNDEF action is performed. For either a data policy or a control policy, you can specify RESET, DROP, or NOOP as the UNDEF action. For a control policy, you also have the option of specifying CLIENTAUTH or NOCLIENTAUTH.

In the following example, if the client sends a cipher other than an EXPORT category cipher, the NetScaler appliance requests client authentication. The client has to provide a valid certificate for a successful transaction.

```
add ssl policy pol1 -rule CLIENT.SSL.CIPHER_EXPORTABLE.NOT -reqAction CLIENTAUTH
```

The following examples assume that client authentication is enabled.

If the version in the certificate provided by the user matches the version in the policy, no action is taken and the packet is forwarded:

```
add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -reqAction NOOP
```

If the version in the certificate provided by the user matches the version in the policy, the connection is dropped:

```
add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -reqAction DROP
```

If the version in the certificate provided by the user matches the version in the policy, the connection is reset:

```
add ssl policy pol1 -rule CLIENT.SSL.CLIENT_CERT.VERSION.EQ(2) -reqAction RESET
```

Configuring SSL Policy Labels

Aug 20, 2013

Policy labels are holders for policies. A policy label helps in managing a group of policies, called a policy bank, which can be invoked from another policy. SSL policy labels can be control labels or data labels, depending on the type of policies that are included in the policy label. You can add only data policies in a data policy label and only control policies in a control policy label. To create the policy bank, you bind policies to the label and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. At the NetScaler command line, you enter two commands to create a policy label and bind policies to the policy label. In the configuration utility, you select options from a dialog box.

At the command prompt, type:

- add ssl policylabel <labelName> -type (CONTROL | DATA)
- bind ssl policylabel <labelName> <policyName> <priority> [<gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]

Example

```
add ssl policylabel cpl1 -type CONTROL
add ssl policylabel dpl1 -type DATA
bind ssl policylabel cpl1 -policyName ctrlpol -priority 1
bind ssl policylabel dpl1 -policyName datapol -priority 1
```

1. Navigate to Traffic Management > SSL > Policy Labels.
2. In the details pane, click Add.
3. In the Create new SSL Policy Label dialog box, set the following parameters:
   - Name*
   - Type*

   * A required parameter
4. Click Insert Policy, and select from the following:
   - **Policy Name**. The name of an existing policy.
   - **New policy**. Invokes the policy creation editor.
5. Click Create, and then click Close.
6. On the Policies tab, verify that the settings displayed for the policy that you just configured are correct.

Configuring Per-Directory Client Authentication

Aug 20, 2013

If you create an action specifying client-side authentication on a per-directory basis, a client identified by a policy associated with the action is not authenticated as part of the initial SSL handshake. Instead, authentication is carried out every time the client wants to access a specific directory on the web server.

For example, if you have multiple divisions in the company, where each division has a folder in which all its files are stored, and you want to know the identity of each client that tries to access files from a particular directory, such as the finance directory, you can enable per-directory client authentication for that directory.

To enable per-directory client authentication, first configure client authentication as an SSL action, and then create a policy that identifies the directory that you want to monitor. When you create the policy, specify your client-authentication action as the action associated with the policy. Then, bind the policy to the SSL virtual server that will receive the SSL traffic.

At the command prompt, type the following commands to create an SSL action to enable to client authentication and verify the configuration:

- add ssl action <name> [-clientAuth (DOCLIENTAUTH | NOCLIENTAUTH)]
- show ssl action [<name>]
- add ssl policy <name> -rule <expression> [-action <string>] [-undefAction <string>] [-comment <string>]
- show ssl policy [<name>]

Example

```
> add ssl action ssl-action-1 -clientAuth DOCLIENTAUTH
 Done
> show ssl action ssl-action-1
1)     Name: ssl-action-1
       Client Authentication Action: DOCLIENTAUTH
       Hits: 0
       Undef Hits: 0
       Action Reference Count: 1
 Done
> add ssl policy ssl-pol-1 -rule 'REQ.HTTP.METHOD==GET' -reqaction ssl-action-1
> sh ssl policy ssl-pol-1
       Name: ssl-pol-1
       Rule: REQ.HTTP.METHOD == GET
       Action: ssl-action-1
       UndefAction: Use Global
       Hits: 0
       Undef Hits: 0
 Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, set values for the following parameters:
   - Name*
   - Client Authentication

   * A required parameter
4. Click Create, and then click Close.

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Policies tab, click Add.
3. In the Create SSL Policy dialog box, set values for the following parameters:
   - Name*
   - Request Action*

   * A required parameter
4. Click Add Expression to add an expression.
5. Click Create, and then click Close.
6. Navigate to Traffic Management > SSL Offload > Virtual Servers.
7. In the details pane, select a virtual server, and then click Open.
8. In the Configure Virtual Server (SSL Offload) dialog box, click SSL Policies.
9. In the Bind/Unbind SSL Policies dialog box, click Insert Policy, and from the list select the policy that you want to bind to the virtual server.

Configuring Support for Outlook Web Access

Aug 20, 2013

If your SSL configuration is offloading SSL transactions from an Outlook Web Access (OWA) server, you must insert a special header field, FRONT-END-HTTPS: ON, in all HTTP requests directed to the OWA servers. This is required for the OWA servers to generate URL links as https:// instead of http://.

When you enable support for OWA on the NetScaler, the header is automatically inserted into the specified HTTP traffic, and you do not need to configure a specific header insertion. Use SSL policies to identify all traffic directed to the OWA server.

Note: You can enable Outlook Web Access support for HTTP-based SSL virtual servers and services only. You cannot apply it to TCP-based SSL virtual servers and services.
To enable OWA support, first configure OWA support as an SSL action, and then create a policy that identifies the virtual servers or services for which you want to enable OWA support. When you create the policy, specify your OWA support action as the action associated with the policy. Then, bind the policy to the SSL virtual server that will receive the SSL traffic.

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- add ssl action <name> -OWASupport (ENABLED | DISABLED)
- show ssl action [<name>]
- add ssl policy <name> -rule <expression> [-action <string>] [-undefAction <string>] [-comment <string>]
- show ssl policy [<name>]

Example

```
> add ssl action ssl-action-2 -OWASupport ENABLED
 Done
> show ssl action ssl-action-2
1)     Name: ssl-action-2
       Type: Data Insertion
       OWA Support: ENABLED
       Hits: 0
       Undef Hits: 0
       Action Reference Count: 1
 Done
> add ssl policy ssl-pol -rule 'REQ.HTTP.METHOD == GET' -reqaction ssl-action-2
Done
> sh ssl policy ssl-pol
      Name: ssl-pol
      Rule: REQ.HTTP.METHOD == GET
      Action: ssl-action-2
      UndefAction: Use Global
```

```
    Hits: 0
    Undef Hits: 0
Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. On the Actions tab, in the details pane, click Add.
3. In the Create SSL Action dialog box, set the following parameters:
   - Name*
   - Outlook Web Access

   * A required parameter
4. Click Create, and then click Close.
   Note: Outlook Web Access support is applicable only for SSL virtual server based configurations and transparent SSL service based configurations and not for SSL configurations with back-end encryption.

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Policies tab, click Add.
3. In the Create SSL Policy dialog box, set values for the following parameters:
   - Name*
   - Request Action*

   * A required parameter
4. Click Add Expression to add an expression.
5. Click Create, and then click Close.
6. Navigate to Traffic Management > SSL Offload > Virtual Servers.
7. In the details pane, select a virtual server, and then click Open.
8. In the Configure Virtual Server (SSL Offload) dialog box, click SSL Policies.
9. In the Bind/Unbind SSL Policies dialog box, click Insert Policy, and from the list select the policy that you want to bind to the virtual server.

Configuring SSL-Based Header Insertion

Aug 20, 2013

Because the NetScaler appliance offloads all SSL-related processing from the servers, the servers receive only HTTP traffic. In some circumstances, the server needs certain SSL information. For example, security audits of recent SSL transactions require the client subject name (contained in an X509 certificate) to be logged on the server.

Such data can be sent to the server by inserting it into the HTTP header as a name-value pair. You can insert the entire client certificate, if required, or only the specific fields from the certificate, such as the subject, serial number, issuer, certificate hash, SSL session ID, cipher suite, or the not-before or not-after date used to determine certificate validity.

You can enable SSL-based insertion for HTTP-based SSL virtual servers and services only. You cannot apply it to TCP-based SSL virtual servers and services. Also, client authentication must be enabled on the SSL virtual server, because the inserted values are taken from the client certificate that is presented to the virtual server for authentication.

To configure SSL-based header insertion, first create an SSL action for each specific set of information to be inserted, and then create policies that identify the connections for which you want to insert the information. As you create each policy, specify the action that you want associated with the policy. Then, bind the policies to the SSL virtual servers that will receive the SSL traffic.

The following example uses default syntax policies. In the following example, a control policy (ctrlpol) is created to perform client authentication if a request is received for the URL /testsite/file5.html. A data policy (datapol) is created to perform an action (act1) if client authentication is successful, and an SSL action (act1) is added to insert the certificate details and issuer's name in the request before forwarding the request. For other URLs, client authentication is disabled. The policies are then bound to an SSL virtual server (ssl_vserver) that receives the SSL traffic.

Example

```
> add ssl action act1 -clientCert ENABLED -certHeader mycert -clientcertissuer ENABLED -certIssuerHeader myissuer
> add ssl policy datapol -rule HTTP.REQ.URL.EQ(\"/testsite/file5.html\") -action act1
> add ssl policy ctrlpol -rule HTTP.REQ.URL.EQ(\"/testsite/file5.html\") -action CLIENTAUTH
> bind ssl vserver ssl_vserver -policyName ctrlpol -priority 1
> bind ssl vserver ssl_vserver -policyName datapol -priority 1
 Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, set the following parameters:
   - Name*
   - Client Certificate
   - Certificate Tag
   - Client Certificate Issuer
   - Issuer Tag

   * A required parameter
4. Click Create, and then click Close.
5. On the tab, click Add to create a control policy.
6. In the Create SSL Policy dialog box, set the following parameters:
   - Name*
   - Expression
   - Request Action

* A required parameter

7. Click Create, and then click Close.
8. Create a data policy by repeating steps 5 through 7.
9. In the navigation pane, expand SSL Offload, and then click Virtual Servers.
10. In the details pane, from the list of virtual servers, select the virtual server to which you want to bind the SSL policies, and then click Open.
11. In the Configure Virtual Server (SSL Offload) dialog box, click SSL Settings, and then click SSL Policies.
12. In the Bind/Unbind SSL Policies dialog box, click Insert Policy. Under Policy Name, select the policy that you created in steps 5 through 7.
13. Click OK, and then click Close. A message appears in the status bar, stating that the policy has been bound successfully.
14. Repeat steps 12 and 13 and select the policy that you created in step 8.

Binding SSL Policies to a Virtual Server

Aug 20, 2013

The SSL policies that are configured on the NetScaler appliance need to be bound to a virtual server that intercepts traffic directed to the virtual server. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

You can also bind SSL policies globally or to custom bind points on the NetScaler appliance. For more information about binding policies on the appliance, see Policy Configuration and Reference.

At the command prompt, type the following command to bind an SSL policy to a virtual server and verify the configuration:

- bind ssl vserver <vServerName> -policyName <string> [-priority <positive_integer>]
- show ssl vserver <vServerName>

Example

```
> bind ssl vserver vs-server -policyName ssl-policy-1 -priority 10
 Done
> show ssl vserver vs-server

        Advanced SSL configuration for VServer vs-server:
        DH: DISABLED
        Ephemeral RSA: ENABLED        Refresh Count: 1000
        Session Reuse: ENABLED        Timeout: 120 seconds
        Cipher Redirect: DISABLED
        SSLv2 Redirect: DISABLED
        ClearText Port: 80
        Client Auth: DISABLED
        SSL Redirect: ENABLED
        SSL-REDIRECT Port Rewrite: ENABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED  TLSv1: ENABLED

1)     Policy Name: ssl-policy-1       Priority: 10

1)     Cipher Name: DEFAULT
       Description: Predefined Cipher Alias
 Done
```

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, from the list of virtual servers, select the virtual server to which you want to bind the SSL policy, and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the Policies tab, in the details pane, click Insert Policy.
4. Under Policy Name, select the policy that you want to bind to the virtual server.

5. Click OK, and then click Close. A message appears in the status bar, stating that the policy has been bound successfully.

Binding SSL Policies Globally

Aug 20, 2013

Globally bound policies are evaluated after all policies bound to services, virtual servers, or other NetScaler bind points are evaluated.

At the command prompt, type the following command to bind a global SSL policy and verify the configuration:

- bind ssl global - policyName <string> [- priority <positive_integer>]
- show ssl global

Example

```
> bind ssl global -policyName Policy-SSL-2 -priority 90
Done
> sh ssl global
1) Name: Policy-SSL-2 Priority: 90
2) Name: Policy-SSL-1 Priority: 100
Done
```

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Global Bindings.
3. In the Bind/Unbind SSL Policies to Global dialog box, click Insert Policy.
4. In the Policy Name drop-down list, select a policy.
5. Optionally, drag the entry to a new position in the policy bank to automatically update the priority level.
6. Click OK. A message appears in the status bar, stating that the policy has been bound successfully.

Use Case 1: Configuring SSL Offloading with End-to-End Encryption

May 26, 2015

A simple SSL offloading setup terminates SSL traffic (HTTPS), decrypts the SSL records, and forwards the clear text (HTTP) traffic to the back-end web servers. However, the clear text traffic is vulnerable to being spoofed, read, stolen, or compromised by individuals who succeed in gaining access to the back-end network devices or web servers.

You can, therefore, configure SSL offloading with end-to-end security by re-encrypting the clear text data and using secure SSL sessions to communicate with the back-end Web servers.

Additionally, you can configure the back-end SSL transactions so that the NetScaler appliance uses SSL session multiplexing to reuse existing SSL sessions with the back-end web servers, thus avoiding CPU-intensive key exchange (full handshake) operations. This reduces the overall number of SSL sessions on the server, and therefore accelerates the SSL transaction while maintaining end-to-end security.

To configure SSL Offloading with end-to-end encryption, add SSL based services that represent secure servers with which the NetScaler appliance will carry out end-to-end encryption. Then create an SSL based virtual server, and create and bind a valid certificate-key pair to the virtual server. Bind the SSL services to the virtual server to complete the configuration.

For details on adding SSL based services, see Configuring Services.

For details on adding an SSL virtual server, see Configuring an SSL Based Virtual Server.

For details on creating a certificate-key pair, see Adding a Certificate-Key Pair.

For details on binding a certificate-key pair to a virtual server, see Binding the Certificate Key Pair to the SSL Based Virtual Server.

For details on binding services to a virtual server, see Binding Services to the SSL Based Virtual Server.

Example

Create two SSL based services, Service-SSL-1 and Service-SSL-2, with IP addresses 10.102.20.30 and 10.102.20.31 and both using port 443.

Then create an SSL based virtual server, Vserver-SSL-2 with an IP address of 10.102.10.20.

Next, create a certificate-key pair, CertKey-1 and bind it to the virtual server.

Bind the SSL services to the virtual server to complete the configuration.

Table 1. Entities in the SSL Offloading with End-to-End Encryption Example

Entity	Name	Value
SSL Service	Service-SSL-1	10.102.20.30
	Service-SSL-2	10.102.20.31

Entity SSL Based Virtual Server	Name Vserver-SSL-2	Value 10.102.10.20
Certificate - Key Pair	Certkey-1	

Use Case 2: Configuring Transparent SSL Acceleration

May 26, 2015

Note: You need to enable L2 mode on the NetScaler appliance for transparent SSL acceleration to work.
Transparent SSL acceleration is useful for running multiple applications on a secure server with the same public IP, and also for SSL acceleration without using an additional public IP.

In a transparent SSL acceleration setup, the NetScaler appliance is transparent to the client, because the IP address at which the appliance receives requests is the same as the Web server's IP address.

The NetScaler offloads SSL traffic processing from the Web server and sends either clear text or encrypted traffic (depending on the configuration) to the web server. All other traffic is transparent to the NetScaler and is bridged to the Web server. Therefore, other applications running on the server are unaffected.

There are three modes of transparent SSL acceleration available on the NetScaler:

- Service-based transparent access, where the service type can be SSL or SSL_TCP.
- Virtual server-based transparent access with a wildcard IP address (*:443).
- SSL VIP-based transparent access with end-to-end encryption.

Note: An SSL_TCP service is used for non-HTTPS services (for example SMTPS and IMAPS).

To enable transparent SSL acceleration using the SSL service mode, configure an SSL or an SSL_TCP service with the IP address of the actual back-end Web server. Instead of a virtual server intercepting SSL traffic and passing it on to the service, the traffic is now directly passed on to the service, which decrypts the SSL traffic and sends clear text data to the back-end server.

The service-based mode allows you to configure individual services with a different certificate, or with a different clear text port. Also, you can also select individual services for SSL acceleration.

You can apply service-based transparent SSL acceleration to data that uses different protocols, by setting the clear text port of the SSL service to the port on which the data transfer between the SSL service and the back-end server occurs.

To configure service-based transparent SSL acceleration, first enable both the SSL and the load balancing features. Then create an SSL based service and configure its clear text port. After the service is created, create and bind a certificate-key pair to this service.

For details on configuring the clear text port for an SSL based service, see "Configuring Advanced SSL Settings."

For details on creating a certificate-key pair and binding a certificate-key pair to a service, see "Adding a Certificate-Key Pair."

Example

Enable SSL offloading and load balancing.

Create an SSL based service, Service-SSL-1 with the IP address 10.102.20.30 using port 443 and configure its clear text port.

Next, create a certificate-key pair, CertKey-1 and bind it to the SSL service.

Table 1. Entities in the Service-based Transparent SSL Acceleration

Entity	Name	Value
SSL Service	Service-SSL-1	102.20.30
Certificate - Key Pair	Certkey-1	

You can use an SSL virtual server in the wildcard IP address mode if when you want to enable SSL acceleration for multiple servers that host the secure content of a Web site. In this mode, a single-digital certificate is enough for the entire secure Web site, instead of one certificate per virtual server. This results in significant cost savings on SSL certificates and renewals. The wildcard IP address mode also enables centralized certificate management.

To configure global transparent SSL acceleration on the NetScaler appliance, create a *:443 virtual server, which is a virtual server that accepts any IP address associated with port 443. Then, bind a valid certificate to this virtual server, and also bind all services to which the virtual server is to transfer. Such a virtual server can use the SSL protocol for HTTP-based data or the SSL_TCP protocol for non-HTTP-based data.

To configure virtual server-based acceleration with a wildcard IP address

1. Enable SSL, as described in "Enabling SSL Processing."
2. Enable load balancing, as described in "Load Balancing."
3. Add an SSL based virtual server (see "Configuring an SSL-Based Virtual Server" for the basic settings), and set the clearTextPort parameter (described in "Configuring Advanced SSL Settings)."
4. Add a certificate-key pair, as described in "Adding a Certificate-Key Pair."
   Note: The wildcard server will automatically learn the servers configured on the NetScaler, so you do not need to configure services for a wildcard virtual server.

Example

After enabling SSL offloading and load balancing, create an SSL based wildcard virtual server with IP address set to * and port number 443, and configure its clear text port (optional).

If you specify the clear text port, decrypted data will be sent to the backend server on that particular port. Otherwise, encrypted data will be sent to port 443.

Next, create an SSL certificate key pair, CertKey-1 and bind it to the SSL virtual server.

Table 2. Entities in the Virtual Server-based Acceleration with a Wildcard IP Address Example

Entity	Name	IP Address	Port
SSL Based Virtual Server	Vserver-SSL-Wildcard	*	443
Certificate - Key Pair	Certkey-1		

You can use an SSL virtual server for transparent access with end-to-end encryption if you have no clear text port specified. In such a configuration, the NetScaler terminates and offloads all SSL processing, initiates a secure SSL session, and sends the encrypted data, instead of clear text data, to the web servers on the port that is configured on the wildcard virtual server.

Note: In this case, the SSL acceleration feature runs at the back-end, using the default configuration, with all 34 ciphers available.
To configure SSL VIP based transparent access with end-to-end encryption, Follow instructions for Configuring a Virtual Server-based Acceleration with a Wildcard IP Address (*:443), but do not configure a clear text port on the virtual server.

Use Case 3: Configuring SSL Acceleration with HTTP on the Front End and SSL on the Back End

May 26, 2015

In certain deployments, you might be concerned about network vulnerabilities between the NetScaler appliance and the backend servers, or you might need complete end-to-end security and interaction with certain devices that can communicate only in clear text (for example, caching devices).

In such cases, you can set up an HTTP virtual server that receives data from clients that connect to it at the front end and hands the data off to a secure service, which securely transfers the data to the web server.

To implement this type of configuration, you configure an HTTP virtual server on the NetScaler and bind SSL based services to the virtual server. The NetScaler receives HTTP requests from the client on the configured HTTP virtual server, encrypts the data, and sends the encrypted data to the web servers in a secure SSL session.

To configure SSL acceleration with HTTP on the front-end and SSL on the back-end, first enable the load balancing and SSL features on the NetScaler. Then, add SSL based services that represent secure servers to which the NetScaler appliance will send encrypted data. Finally, add an HTTP based virtual server and bind the SSL services to this virtual server.

Example

Enable load balancing and SSL acceleration on the NetScaler.

After enabling load balancing and SSL acceleration, create two SSL based services, Service-SSL-1 and Service-SSL-2, with IP addresses 10.102.20.30 and 10.102.20.31, and both using port 443.

Then create an HTTP based virtual server, Vserver-HTTP-1, with an IP address of 10.102.10.20.

Bind the SSL services to the virtual server to complete the configuration.

Table 1. Entities in the SSL Acceleration with HTTP on the Front End and SSL on the Back End Example

Entity	Name	Value
SSL Service	Service-SSL-1	10.102.20.30
	Service-SSL-2	10.102.20.31
HTTP Based Virtual Server	Vserver-HTTP-1	10.102.10.20

Use Case 4: SSL Offloading with Other TCP Protocols

May 26, 2015

In addition to the secure HTTP (HTTPS) protocol, NetScaler appliances support SSL acceleration for other TCP-based secure protocols. However, only simple requests and response-based TCP application protocols are supported. Applications such as FTPS, that insert the server's IP address and port information in their payloads, are not currently supported.

Note: The STARTTLS feature for SMTP is currently not supported.
The NetScaler supports SSL acceleration for Other TCP protocols with and without end-to-end encryption.

To configure SSL offloading with Other TCP protocols, create a virtual server of type SSL_TCP, bind a certificate-key pair and TCP based services to the virtual server, and configure SSL actions and policies based on the type of traffic expected and the acceleration to be provided.

Follow the instructions in Configuring SSL Offloading, but create an SSL_TCP virtual server instead of an SSL virtual server, and configure TCP services instead of HTTP services.

To configure SSL_TCP-based offloading with end-to-end encryption, both the virtual server that intercepts secure traffic and the services that it forwards the traffic to must be of type SSL_TCP.

Configure SSL_TCP-based offloading as described in Configuring SSL Offloading with End-to-End Encryption, but create an SSL_TCP virtual server instead of an SSL virtual server.

Some deployments might require the NetScaler appliance to encrypt TCP data received as clear text and send the data securely to the back end servers.

To provide SSL acceleration with back-end encryption for clear text TCP traffic arriving from the client, create a TCP based virtual server and bind it to SSL_TCP based services.

To configure end-to-end encryption for TCP-based data, follow the procedure described in Configuring the SSL feature with HTTP on the Front-End and SSL on the Back-End, but create a TCP virtual server instead of an HTTP virtual server.

Use Case 5: Configuring SSL Bridging

May 26, 2015

An SSL bridge configured on the NetScaler appliance enables the appliance to bridge all secure traffic between the SSL client and the SSL server. The appliance does not offload or accelerate the bridged traffic, nor does it perform encryption or decryption. Only load balancing is done by the appliance. The SSL server must handle all SSL-related processing. Features such as content switching, SureConnect, and cache redirection do not work, because the traffic passing through the appliance is encrypted.

Because the appliance does not carry out any SSL processing in an SSL bridging setup, there is no need for SSL certificates.

Citrix recommends that you use this configuration only if an acceleration unit (for example, a PCI-based SSL accelerator card) is installed in the web server to handle the SSL processing overhead.

Before you configure SSL bridging, first enable SSL and load balancing on the appliance. Then, create SSL_Bridge services and bind them to an SSL_Bridge virtual server. Configure the load balancing feature to maintain server persistency for secure requests.

Example

After enabling SSL and load balancing, create two servers, s1 and s2. Create two SSL_Bridge services, sc1 and src2. Create an SSL_Bridge virtual server and bind the SSL_Bridge services to the virtual server to complete the configuration. At the command line, type:

```
enable ns feature SSL LB
add server s1 10.102.1.101
add server s2 10.102.1.102
add service src1 s1 SSL_BRIDGE 443
add service src2 s2 SSL_BRIDGE 443
add lb vserver ssl_bridge_vip SSL_BRIDGE 10.102.1.200 443
bind lb vserver ssl_bridge_vip src1
bind lb vserver ssl_bridge_vip src2
```

Use Case 6: Configuring SSL Monitoring when Client Authentication is Enabled on the Backend Service

May 26, 2015

Consider a scenario in which you need to load balance servers that require SSL client certificates to validate clients. For this deployment, you need to create an SSL service on the NetScaler appliance, add an HTTPS monitor, add a certificate-key pair, bind this certificate-key pair to the SSL service, and then bind the https monitor to this service. You can use this https monitor to perform health checks on the backend services.

1. Open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on the appliance by using the administrator credentials.
3. Add an SSL service. At the command prompt, type:
   add service <name> <serverName> <serviceType> <port>
4. Add an https monitor. At the command prompt, type:
   add lb monitor <name> <type>
5. Add the certificate-key pair that is going to be used as the client cert for that SSL service. At the command prompt, type:
   add ssl certKey <certkeyName> -cert <string> -key <string>
6. Bind this certkey to the SSL service. At the command prompt, type:
   bind ssl service <serviceName> -certkeyName <string>
7. Bind the https monitor to the SSL service. At the command prompt, type:
   bind lb monitor <monitorName> <serviceName>

Now, when the appliance tries to probe the backend service on which client authentication is enabled, the backend service will request a certificate as part of the SSL handshake. When the appliance returns the certificate-key bound in step 6 above, the monitor probe will succeed.

Example

```
add service svc_k 10.102.145.30 SSL 443
add lb monitor sslmon HTTP -respCode 200 -httpRequest "GET /testsite/file5.html" -secure YES
add ssl certKey ctest -cert client_rsa_2048.pem -key client_rsa_2048.ky
bind ssl service svc_k -certkeyName ctest
bind lb monitor sslmon svc_k
> show service svc_k
    svc_k (10.102.145.30:443) - SSL
    State: UP
    Last state change was at Tue Jan 10 13:12:24 2012

Use Case 7: Configuring a Secure Content Switching Server

May 26, 2015

An SSL-based content switching virtual server first decrypts the secure data and then redirects the data to appropriately configured servers as determined by the type of content and the configured content switching policies. The packets sent to the server have a mapped IP address as the source IP address.

The following example shows the steps to configure two address-based virtual servers to perform load balancing on the HTTP services. One virtual server, Vserver-LB-HTML, load balances the dynamic content (cgi, asp), and the other, Vserver-LB-Image, load balances the static content (gif, jpeg). The load-balancing method used is the default, LEASTCONNECTION. A content switching SSL virtual server, Vserver-CS-SSL, is then configured to perform SSL acceleration and switching of HTTPS requests on the basis of configured content switching policies.

Example

```
> enable ns feature lb cs ssl
> add lb vserver Vserver-LB-HTML http 10.1.1.2 80
> add lb vserver Vserver-LB-Image http 10.1.1.3 80
> add service s1 10.1.1.4 http 80
> add service s2 10.1.1.5 http 80
> add service s3 10.1.1.6 http 80
> add service s4 10.1.1.7 http 80
> bind lb vserver Vserver-LB-HTML s1
> bind lb vserver Vserver-LB-HTML s2
> bind lb vserver Vserver-LB-Image s3
> bind lb vserver Vserver-LB-Image s4
> add cs vserver Vserver-CS-SSL ssl 10.1.1.1 443
> add cs policy pol1 -url "*.cgi"
> add cs policy pol2 -url "*.asp"
> add cs policy pol3 -url "*.gif"
> add cs policy pol4 -url "*.jpeg"
> bind cs vserver Vserver-CS-SSL -policyName pol1 Vserver-LB-HTML
> bind cs vserver Vserver-CS-SSL -policyName pol2 Vserver-LB-HTML
> bind cs vserver Vserver-CS-SSL -policyName pol3 Vserver-LB-Image
> bind cs vserver Vserver-CS-SSL -policyName pol4 Vserver-LB-Image
> add certkey mykey -cert /nsconfig/ssl/ns-root.cert -key /nsconfig/ssl/ns-root.key
> bind certkey Vserver-CS-SSL mykey
>
> show cs vserver Vserver-CS-SSL
      Vserver-CS-SSL (10.1.1.1:443) - SSL Type: CONTENT
      State: UP
      Last state change was at Tue Jul 13 02:11:37 2010
      Time since last state change: 0 days, 00:02:12.440
      Client Idle Timeout: 180 sec
      Down state flush: ENABLED
```

```
Disable Primary Vserver On Down : DISABLED
State Update: DISABLED
Default:        Content Precedence: RULE
Vserver IP and Port insertion: OFF
Case Sensitivity: ON
Push: DISABLED  Push VServer:
Push Label Rule: none
```

Ciphers Supported by the NetScaler Appliance

May 13, 2015

Your NetScaler appliance ships with a predefined set of cipher groups. Table 1 lists the ciphers that are part of the DEFAULT cipher group and are therefore bound by default to an SSL virtual server. Table 2 lists the other ciphers currently supported by the NetScaler appliance. To use ciphers that are not part of the DEFAULT cipher group, you have to explicitly bind them to an SSL virtual server. You can also create a user-defined cipher group to bind to the SSL virtual server. For more information about creating a user-defined cipher group, see Configuring User-Defined Cipher Groups on the NetScaler Appliance.

Note:

- On all NetScaler appliances, connection between a NetScaler service and the back end server can be established using TLS protocol version 1.0 or SSLv3 protocol only.
- Support for TLS versions 1.1 and 1.2 is only available on the front end (between client and virtual server) on the following appliances:
  - NetScaler MPX appliances.
  - NetScaler SDX appliances on an instance-by-instance basis. To support TLS protocol versions 1.1 and 1.2 on an SDX appliance, you must assign at least one SSL chip to the instance when you provision it.
- Support for TLS protocol versions 1.1 and 1.2 is not available on a FIPS appliance or on a NetScaler virtual appliance.

Table 1. Ciphers That the NetScaler Appliance Supports by Default

Cipher Suite	Protocol	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm	Hex Code
SSL3-RC4-MD5	SSLv3 TLSv1 TLSv1.1 TLSv1.2	RSA	RSA	RC4(128)	MD5	
SSL3-RC4-SHA	SSLv3 TLSv1 TLSv1.1 TLSv1.2	RSA	RSA	RC4(128)	SHA1	
SSL3-DES-CBC3-SHA	SSLv3 TLSv1 TLSv1.1	RSA	RSA	3DES(168)	SHA1	

Cipher Suite	Protocol	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm	Hex Code
TLS1-AES-256-CBC-SHA	SSLv3 TLSv1 TLSv1.1 TLSv1.2	RSA	RSA	AES(256)	SHA1	
TLS1-AES-128-CBC-SHA	SSLv3 TLSv1 TLSv1.1 TLSv1.2	RSA	RSA	AES(128)	SHA1	
SSL3-EDH-DSS-DES-CBC3-SHA	SSLv3 TLSv1	DH	DSS	3DES(168)	SHA1	
TLS1-DHE-DSS-RC4-SHA	TLSv1	DH	DSS	RC4(128)	SHA1	
TLS1-DHE-DSS-AES-256-CBC-SHA	SSLv3 TLSv1	DH	DSS	AES(256)	SHA1	
TLS1-DHE-DSS-AES-128-CBC-SHA	SSLv3 TLSv1	DH	DSS	AES(128)	SHA1	
SSL3-EDH-RSA-DES-CBC3-SHA	SSLv3 TLSv1 TLSv1.1 TLSv1.2	DH	RSA	3DES(168)	SHA1	
TLS1-DHE-RSA-AES-256-CBC-SHA	SSLv3 TLSv1 TLSv1.1	DH	RSA	AES(256)	SHA1	

Cipher Suite	Protocol	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm	Hex Code
TLS1-DHE-RSA-AES-128-CBC-SHA	TLSv1.2 SSLv3 TLSv1 TLSv1.1 TLSv1.2	DH	RSA	AES(128)	SHA1	

Table 2. Additional Ciphers Supported by the NetScaler Appliance

Cipher Suite	Protocol	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm
SSL3-DES-CBC-SHA	SSLv3 TLSv1 TLSv1.1	RSA	RSA	DES(56)	SHA1
TLS1-EXP1024-RC4-SHA	TLSv1	RSA(1024)	RSA	RC4(56)	SHA1 Export
SSL3-EXP-RC4-MD5	SSLv3 TLSv1	RSA(512)	RSA	RC4(40)	MD5 Export
SSL3-EXP-DES-CBC-SHA	SSLv3 TLSv1	RSA(512)	RSA	DES(40)	SHA1 Export
SSL3-EXP-RC2-CBC-MD5	SSLv3 TLSv1	RSA(512)	RSA	RC2(40)	MD5 Export
SSL2-RC4-MD5	SSLv2	RSA	RSA	RC4(128)	MD5
SSL2-DES-CBC3-MD5	SSLv2	RSA	RSA	3DES(168)	MD5
SSL2-RC2-CBC-MD5	SSLv2	RSA	RSA	RC2(128)	MD5
SSL2-DES-CBC-MD5	SSLv2	RSA	RSA	DES(56)	MD5

Cipher Suite	Protocol	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm
SSL2-RC4-64-MD5	SSLv2	RSA	RSA	RC4(64)	MD5
SSL2-EXP-RC4-MD5	SSLv2	RSA(512)	RSA	RC4(40)	MD5 Export
SSL3-EDH-DSS-DES-CBC-SHA	SSLv3 TLSv1	DH	DSS	DES(56)	SHA1

TLS1-ECDHE-RSA-AES128-SHA	TLSv1 TLSv1.1 TLSv1.2	ECC-DHE	RSA	AES(128)	SHA1

Cipher Suite	Protocol	Key Exchange Algorithm	Authentication Algorithm	Encryption Algorithm (Key Size)	Message Authentication Code (MAC) Algorithm
TLS1-ECDHE-RSA-AES256-SHA	TLSv1 TLSv1.1	ECC-DH2	RSA	AES(256)	SHA1
	TLSv1.2				

On a NetScaler platform that does not have N3 chips and is configured to negotiate EDH ciphers by using TLS version 1.0 with a DH key of 2048 bits, the SSL handshake fails in either of the following scenarios:

- Client authentication is enabled and the appliance receives a client certificate of 4096 bits.
- End-to-end encryption is configured and the appliance receives a server certificate of 4096 bits.

Use the show ns hardware command to find out if your appliance has N3 chips.

Example

```
> sh hardware
        Platform: NSMPX-22000 16*CPU+24*IX+12*E1K+2*E1K+4*CVM N3 2200100
        Manufactured on: 8/19/2013
        CPU: 2900MHZ
        Host Id: 1006665862
        Serial no: ENUK6298FT
        Encoded serial no: ENUK6298FT
 Done
```

FIPS

Jun 09, 2015

The Federal Information Processing Standard (FIPS), issued by the US National Institute of Standards and Technologies, specifies the security requirements for a cryptographic module used in a security system. The NetScaler FIPS appliance complies with the second version of this standard, FIPS-140-2.

Note: Henceforth, all references to FIPS imply FIPS-140-2.
The FIPS appliance is equipped with a tamper-proof (tamper-evident) cryptographic module—and a Cavium CN1620-NFBE3-2.0-G on the MPX 9700/10500/12500/15500 FIPS appliances—designed to comply with the FIPS 140-2 Level-2 specifications. The Critical Security Parameters (CSPs), primarily the server's private-key, are securely stored and generated inside the cryptographic module, also referred to as the Hardware Security Module (HSM). The CSPs are never accessed outside the boundaries of the HSM. Only the superuser (nsroot) can perform operations on the keys stored inside the HSM.

The following table summarizes the differences between standard NetScaler and NetScaler FIPS appliances.

Setting	NetScaler appliance	NetScaler FIPS appliance
Key storage	On the hard disk	On the FIPS card
Cipher support	All ciphers	FIPS approved ciphers
Accessing keys	From the hard disk	Not accessible

Configuring a FIPS appliance involves configuring the HSM immediately after completing the generic configuration process. You then create or import a FIPS key. After creating a FIPS key, you should export it for backup. You might also need to export a FIPS key so that you can import it to another appliance. For example, configuring FIPS appliances in a high availability (HA) setup requires transferring the FIPS key from the primary node to the secondary node immediately after completing the standard HA setup.

You can upgrade the firmware version on the FIPS card from version 4.6.0 to 4.6.1, and you can reset an HSM that has been locked to prevent unauthorized logon. Only FIPS approved ciphers are supported on a NetScaler FIPS appliance.

This section includes the following details:

- Configuring the HSM
- Creating and Transferring FIPS Keys
- Configuring FIPS Appliances in a High Availability Setup
- Resetting a Locked HSM
- FIPS Approved Algorithms and Ciphers

Configuring the HSM

May 07, 2015

Before you can configure the HSM of your NetScaler FIPS appliance, you must complete the initial hardware configuration. For more information, see Initial Configuration.

Configuring the HSM of your NetScaler FIPS appliance erases all existing data on the HSM. To configure the HSM, you must be logged on to the appliance as the superuser (nsroot account). The HSM is preconfigured with default values for the Security Officer (SO) password and User password, which you use to configure the HSM or reset a locked HSM. The maximum length allowed for the password is 14 alphanumeric characters. Symbols are not allowed.
Important: Do not perform the set ssl fips command without first resetting the FIPS card and restarting the MPX FIPS appliance.
Although the FIPS appliance can be used with the default password values, you should modify them before using it. The HSM can be configured only when you log on to the appliance as the superuser and specify the SO and User passwords.

Important: Due to security constraints, the appliance does not provide a means for retrieving the SO password. Store a copy of the password safely. Should you need to reinitialize the HSM, you will need to specify this password as the old SO password.
Before initializing the HSM, you can upgrade to the latest build of the software. To upgrade to the latest build, see Upgrading or Downgrading the System Software.

After upgrading, verify that the /nsconfig/fips directory has been successfully created on the appliance.

After logging on to the appliance as the superuser and completing the initial configuration, at the command prompt, type the following commands to configure the HSM and verify the configuration:

1. show ssl fips
2. reset ssl fips
3. reboot
4. set ssl fips -initHSM Level-2 <newSOpassword> <oldSOpassword> <userPassword> [-hsmLabel <string>]
5. save ns config
6. reboot
7. show ssl fips

Example

```
show fips
FIPS Card is not configured
Done
reset fips
reboot
Are you sure you want to restart NetScaler (Y/N)? [N]:y
set ssl fips -initHSM Level-2 sopin12345 so12345 user123 -hsmLabel cavium
This command will erase all data on the FIPS card. You must save the configuration
(saveconfig) after executing this command.
```

```
Do you want to continue?(Y/N)y
Done
save ns config
reboot
Are you sure you want to restart NetScaler (Y/N)? [N]:y
show fips
      FIPS HSM Info:
HSM Label           : NetScaler FIPS
Initialization      : FIPS-140-2 Level-2
HSM Serial Number   : 2.1G1008-IC000021
HSM State           : 2

Firmware Version    : 1.1
Firmware Release Date  : Jun04,2010

Max FIPS Key Memory   : 3996
Free FIPS Key Memory  : 3994
Total SRAM Memory     : 467348
Free SRAM Memory      : 62564
Total Crypto Cores    : 3
Enabled Crypto Cores  : 1
Done
```

Note: In Release 10.5.e build xx.x and later, the **Firmware Release Date** in the above output is replaced with the **Firmware Build**. For example, Firmware Build : NFBE-FW-2.2-130009.

1. Navigate to Traffic Management > SSL > FIPS.
2. In the details pane, on the FIPS Infotab, click Reset FIPS.
3. In the navigation pane, click System.
4. In the details pane, click Reboot.
5. In the details pane, on the FIPS Info tab, click Initialize HSM.
6. In the Initialize HSM dialog box, specify values for the following parameters:
   - Security Officer (SO) Password*—new SO password
   - Old SO Password*—old SO password
   - User Password*—user password
   - Level—initHSM (Currently set to Level2 and cannot be changed)
   - HSM Label—hsmLabel

   *A required parameter
7. Click OK.
8. In the details pane, click Save.
9. In the navigation pane, click System.
10. In the details pane, click Reboot.
11. Under FIPS HSM Info, verify that the information displayed for the FIPS HSM that you just configured is correct.

Creating and Transferring FIPS Keys

Dec 22, 2014

After configuring the HSM of your FIPS appliance, you are ready to create a FIPS key. The FIPS key is created in the appliance's HSM. You can then export the FIPS key to the appliance's CompactFlash card as a secured backup. Exporting the key also enables you to transfer it by copying it to the /flash of another appliance and then importing it into the HSM of that appliance.

Instead of creating a FIPS key, you can import an existing FIPS key or import an external key as a FIPS key. If you are adding a certificate-key pair of 2048 bits on the MPX 9700/10500/12500/15500 FIPS appliances, make sure that you have the correct certificate and key pair.

Note: If you are planning an HA setup, make sure that the FIPS appliances are configured in an HA setup before creating a FIPS key.

Updated: 2013-08-20

Before creating a FIPS key, make sure that the HSM is configured.

To create a FIPS key by using the configuration utility

1. Navigate to Traffic Management > SSL > FIPS.
2. In the details pane, on the FIPS Keys tab, click Add.
3. In the Create FIPS Key dialog box, specify values for the following parameters:
   - FIPS Key Name*—fipsKeyName
   - Modulus*—modulus
   - Exponent*—exponent

   *A required parameter
4. Click Create, and then click Close.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you just created are correct.

To create a FIPS key by using the command line interface

At the command prompt, type the following commands to create a FIPS key and verify the settings:

- create ssl fipsKey <fipsKeyName> -modulus <positive_integer> [-exponent (3 | F4)]
- show ssl fipsKey [<fipsKeyName>]

Example

```
create fipskey Key-FIPS-1 -modulus 2048 -exponent 3
show ssl fipsKey Key-FIPS-1
FIPS Key Name: Key-FIPS-1 Modulus: 2048  Public Exponent: 3 (Hex: 0x3)
```

Updated: 2013-08-20

Citrix recommends that you create a backup of any key created in the FIPS HSM. If a key in the HSM is deleted, there is no

way to create the same key again, and all the certificates associated with it are rendered useless.

In addition to exporting a key as a backup, you might need to export a key for transfer to another appliance.

The following procedure provides instructions on exporting a FIPS key to the /nsconfig/ssl folder on the appliance's CompactFlash and securing the exported key by using a strong asymmetric key encryption method.

To export a FIPS key by using the command line interface

At the command prompt, type:
export ssl fipsKey <fipsKeyName> -key <string>
Example

```
export fipskey Key-FIPS-1 -key Key-FIPS-1.key
```

To export a FIPS key by using the configuration utility

1. Navigate to Traffic Management > SSL > FIPS
2. In the details pane, on the FIPS Keys tab, click Export.
3. In the Export FIPS key to a file dialog box, specify values for the following parameters:
   - FIPS Key Name*—fipsKeyName
   - File Name*—key (To put the file in a location other than the default, you can either specify the complete path or click the Browse button and navigate to a location.)

   *A required parameter
4. Click Export, and then click Close.

Updated: 2013-11-22

To use an existing FIPS key with your FIPS appliance, you need to transfer the FIPS key from the hard disk of the appliance into its HSM.

Note: To avoid errors when importing a FIPS key, make sure that the name of the key imported is the same as the original key name when it was created.

To import a FIPS key on the MPX 9700/10500/12500/15500 FIPS appliances by using the command line interface

At the command prompt, type the following commands to import a FIPS key and verify the settings:
- import ssl fipsKey <fipsKeyName> -key <string> -inform SIM -exponent (F4 | 3)
- show ssl fipskey <fipsKeyName>

Example

```
import fipskey Key-FIPS-2 -key Key-FIPS-2.key -inform SIM -exponent F4
show ssl fipskey key-FIPS-2
FIPS Key Name: Key-FIPS-2 Modulus: 2048  Public Exponent: F4 (Hex value 0x10001)
```

To import a FIPS key by using the configuration utility

1. Navigate to Traffic Management > SSL > FIPS
2. In the details pane, on the FIPS Keys tab, click Import.

3. In the Import as a FIPS Key dialog box, select FIPS key file and set values for the following parameters:
   - FIPS Key Name*
   - Key File Name*—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.
   - Exponent*

   *A required parameter
4. Click Import, and then click Close.
5. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you just imported are correct.

Updated: 2015-02-09

In addition to transferring FIPS keys that are created within the NetScaler appliance's HSM, you can transfer external private keys (such as those created on a standard NetScaler, Apache, or IIS) to a FIPS NetScaler appliance. External keys are created outside the HSM, by using a tool such as OpenSSL. Before importing an external key into the HSM, copy it to the appliance's flash drive under /nsconfig/ssl.

Importing an external key as a FIPS key on the MPX 9700/10500/12500/15500 FIPS appliances by using the command line interface

On the MPX 9700/10500/12500/15500 FIPS appliances, the -exponent parameter in the import ssl fipskey command is not required while importing an external key. The correct public exponent is detected automatically when the key is imported, and the value of the -exponent parameter is ignored.

The NetScaler FIPS appliance does not support external keys with a public exponent other than 3 or F4.

You do not need a wrap key on the MPX 9700/10500/12500/15500 FIPS appliances.

You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 FIPS appliance. To import the key you need to first decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

openssl rsa -in <EncryptedKey.key> > <DecryptedKey.out>

1. Copy the external key to the appliance's flash drive.
2. If the key is in .pfx format, you must first convert it to PEM format. At the command prompt, type:
   - convert ssl pkcs12 <output file> -import -pkcs12File <input .pfx file name> -password <password>
3. At the command prompt, type the following commands to import the external key as a FIPS key and verify the settings:
   - import ssl fipsKey <fipsKeyName> -key <string> -inform PEM
   - show ssl fipskey<fipsKeyName>

Example

```
convert ssl pkcs12 iis.pem -password 123456 -import -pkcs12File iis.pfx
import fipskey Key-FIPS-2 -key iis.pem -inform PEM
show ssl fipskey key-FIPS-2
FIPS Key Name: Key-FIPS-2 Modulus: 0   Public Exponent: F4 (Hex value 0x10001)
```

Note: The modulus is incorrectly displayed as zero in the above example. The discrepancy does not affect SSL functionality.

To import an external key as a FIPS key to an MPX 9700/10500/12500/15500 FIPS appliance by using the configuration utility

1. If the key is in .pfx format, you must first convert it to PEM format.
   1. Navigate to Traffic Management > SSL.
   2. In the details pane, under Tools, click Import PKCS#12.
   3. In the Import PKCS12 File dialog box, set the following parameters:
      - Output File Name*
      - PKCS12 File Name*—Specify the .pfx file name.
      - Import Password*
      - Encoding Format

      *A required parameter
2. Navigate to Traffic Management > SSL > FIPS
3. In the details pane, on the FIPS Keys tab, click Import.
4. In the Import as a FIPS Key dialog box, select PEM file, and set values for the following parameters:
   - FIPS Key Name*
   - Key File Name*—To put the file in a location other than the default, you can either specify the complete path or click Browse and navigate to a location.

   *A required parameter
5. Click Import, and then click Close.
6. On the FIPS Keys tab, verify that the settings displayed for the FIPS key that you just imported are correct.

Configuring FIPS Appliances in a High Availability Setup

Nov 11, 2013

You can configure two appliances in a high availability (HA) pair as FIPS appliances. For information about configuring an HA setup, see High Availability.

Note: Citrix recommends that you use the configuration utility (GUI) for this procedure. If you use the command line (CLI), make sure that you carefully follow the steps as listed in the procedure. Changing the order of steps or specifying an incorrect input file might cause inconsistency that requires that the appliance be restarted. In addition, if you use the CLI, the create ssl fipskey command is not propagated to the secondary node. When you execute the command with the same input values for modulus size and exponent on two different FIPS appliances, the keys generated are not identical. You have to create the FIPS key on one of the nodes and then transfer it to the other node. But if you use the configuration utility to configure FIPS appliances in an HA setup, the FIPS key that you create is automatically transferred to the secondary node. The process of managing and transferring the FIPS keys is known as secure information management (SIM).
Important: On the MPX 9700/10500/12500/15500 FIPS appliances, the HA setup should be completed within six minutes. If the process takes longer than six minutes, the internal timer of the FIPS card expires and the following error message appears:
ERROR: Operation timed out or repeated, please wait for 10 mins and redo the SIM/HA configuration steps.

If this message appears, restart the appliance or wait for 10 minutes, and then repeat the HA setup procedure.

In the following procedure, appliance A is the primary node and appliance B is the secondary node.

1. **On appliance A**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
2. Log on to the appliance, using the administrator credentials.
3. Initialize appliance A as the source appliance. At the command prompt, type:
   init ssl fipsSIMsource <certFile>
4. Copy this <certFile> file to appliance B, in the /nconfig/ssl folder.
5. **On appliance B**, open an SSH connection to the appliance by using an SSH client, such as PuTTY.
6. Log on to the appliance, using the administrator credentials.
7. Initialize appliance B as the target appliance. At the command prompt, type:
   init ssl fipsSIMtarget <certFile> <keyVector> <targetSecret>
8. Copy this <targetSecret> file to appliance A.
9. **On appliance A**, enable appliance A as the source appliance. At the command prompt, type:
   enable ssl fipsSIMSource <targetSecret> <sourceSecret>
10. Copy this <sourceSecret> file to appliance B.
11. **On appliance B**, enable appliance B as the target appliance. At the command prompt, type:
    enable ssl fipsSIMtarget <keyVector> <sourceSecret>
12. **On appliance A**, create a FIPS key, as described in Creating a FIPS Key.
13. Export the FIPS key to the appliance's hard disk, as described in Exporting a FIPS Key.

14. Copy the FIPS key to the hard disk of the secondary appliance by using a secure file transfer utility, such as SCP.
15. **On appliance B**, import the FIPS key from the hard disk into the HSM of the appliance, as described in Importing an Existing FIPS Key.

1. On the appliance to be configured as the source appliance, navigate to Traffic Management > SSL > FIPS.
2. In the details pane, on the FIPS Info tab, click Enable SIM.
3. In the Enable HA Pair for SIM dialog box, in the Certificate File Name text box, type the file name, with the path to the location at which the FIPS certificate should be stored on the source appliance.
4. In the Key Vector File Name text box, type the file name, with the path to the location at which the FIPS key vector should be stored on the source appliance.
5. In the Target Secret File Name text box, type the location for storing the secret data on the target appliance.
6. In the Source Secret File Name text box, type the location for storing the secret data on the source appliance.
7. Click OK. The FIPS appliances are now configured in HA mode.
8. Create a FIPS key, as described in Creating a FIPS Key. The FIPS key is automatically transferred from the primary to the secondary.

Example

In the following example, source.cert is the certificate on the source appliance, stored in the default directory, /nsconfig/ssl. This certificate must be transferred to the same location (/nsconfig/ssl) on the target appliance. The file target.secret is created on the target appliance and copied to the source appliance. The file source.secret is created on the source appliance and copied to the target appliance.

On the source appliance

```
init fipsSIMsource /nsconfig/ssl/source.cert
```

On the target appliance

```
init fipsSIMtarget /nsconfig/ssl/source.cert /nsconfig/ssl/target.key /nsconfig/ssl/target.secret
```

On the source appliance

```
enable fipsSIMsource /nsconfig/ssl/target.secret /nsconfig/ssl/source.secret
```

On the target appliance

```
enable fipsSIMtarget /nsconfig/ssl/target.key /nsconfig/ssl/source.secret
```

On the source appliance

```
create ssl fipskey fips1 -modulus 2048 -exponent f4
export fipskey fips1 -key /nsconfig/ssl/fips1.key
```

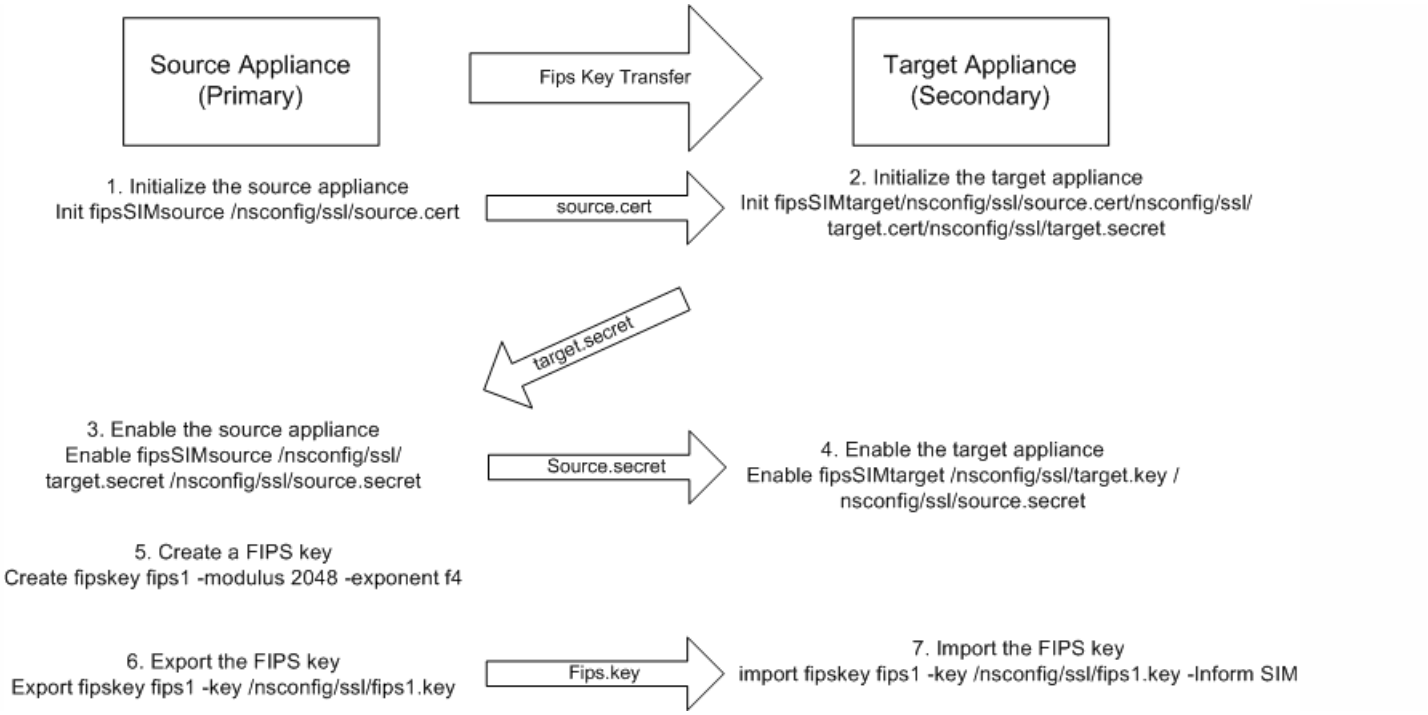
Copy this key into the hard disk of the target appliance.

On the target appliance

```
import fipskey fips1 -key /nsconfig/ssl/fips1.key
```

The following diagram summarizes the transfer process.

Figure 1. Transferring the FIPS Key-Summary



Resetting a Locked HSM

Nov 11, 2013

The HSM becomes locked (no longer operational) if you change the SO password, restart the appliance without saving the configuration, and make three unsuccessful attempts to change the password. This is a security measure for preventing unauthorized access attempts and changes to the HSM settings.

Important: To avoid this situation, save the configuration after initializing the HSM.
If the HSM is locked, you must reset the HSM and restart the appliance to restore the default passwords. You can then use the default passwords to access the HSM and configure it with new passwords. When finished, you must save the configuration and restart the appliance.

Caution: Do not reset the HSM unless it has become locked.

At the command prompt, type the following commands to reset and re-initialize a locked HSM:

- reset ssl fips
- reboot -warm
- set ssl fips -initHSM Level-2 <new SO password> <old SO password> <user password> [-hsmLabel <string>]
- save ns config
- reboot -warm

Example

```
reset fips
reboot -warm
set fips -initHSM Level-2 newsopin123 sopin123 userpin123 -hsmLabel NSFIPS
saveconfig
reboot -warm
```

Note: The SO and User passwords are the default passwords.

1. Navigate to Traffic Management > SSL > FIPS
2. In the details pane, on the FIPS Info tab, click Reset FIPS.
3. Configure the HSM, as described in Configuring the HSM.
4. In the details pane, click Save.

FIPS Approved Algorithms and Ciphers

Mar 21, 2012

The FIPS approved algorithms are:

Key-Exchange algorithms

- RSA

Cipher algorithms

- SSL3-DES-CBC3-SHA
- TLS1-AES-256-CBC-SHA
- TLS1-AES-128-CBC-SHA

Note: RC4 (ARC4) is not a FIPS-approved algorithm.
SSL virtual server is marked UP only when default ciphers (FIPS) are configured.

Troubleshooting

Jul 22, 2013

If the SSL feature does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

Updated: 2013-07-22

For best results, use the following resources to troubleshoot an SSL issue on a NetScaler appliance:

- The relevant ns.log file
- The latest ns.conf file
- The messages file
- The relevant newnslog file
- Trace files
- A copy of the certificate files, if possible
- A copy of the key file, if possible
- The error message, if any

In addition to the above resources, you can use the Wireshark application customized for the NetScaler trace files to expedite troubleshooting.

Updated: 2013-07-22

To troubleshoot an SSL issue, proceed as follows:

- Verify that the NetScaler appliance is licensed for SSL Offloading and load balancing.
- Verify that SSL Offloading and load balancing features are enabled on the appliance.
- Verify that the status of the SSL virtual server is not displayed as DOWN.
- Verify that the status of the service bound to the virtual server is not displayed as DOWN.
- Verify that a valid certificate is bound to the virtual server.
- Verify that the service is using an appropriate port, preferably port 443.

NetScaler Web 2.0 Push

Mar 19, 2012

Modern web applications, also referred to as web 2.0 applications, provide highly responsive interfaces that generate asynchronous updates that can impose an additional load on a server. Typically, asynchronous notifications are sent by using HTTP and server push techniques, such as long-polling and streaming response, which enable servers to push the notifications to clients. These techniques require the servers to maintain a large number of TCP/IP connections, which provides low latency but results in low bandwidth. As the number of clients increases, the servers are overloaded with connections kept open for each client. Further, the large number of connections terminating on the server requires kernel resources and memory for data structures like protocol control blocks, socket descriptors, and socket buffers.

With the NetScaler Web 2.0 push feature, you can use the NetScaler appliance as a proxy server to offload long-lived client TCP connections and maintain relatively fewer, reusable connections to the server. NetScaler Web 2.0 push is application agnostic, with the flexibility to work seamlessly with various technologies and configurations used for asynchronous messaging. It can be extended to co-exist with developing technologies, and it preserves backward compatibility. NetScaler Web 2.0 Push is also scalable, with support for multiple NetScaler appliances.

With the NetScaler Web 2.0 push feature, the NetScaler appliance multiplexes and manages the exchange of data reliably and securely, reducing the number of server-side connections across potentially millions of persistent client connections. For every HTTP, HTTPS, or SSL transaction, the appliance can de-link and rebalance the server farm to distribute client requests across multiple servers.

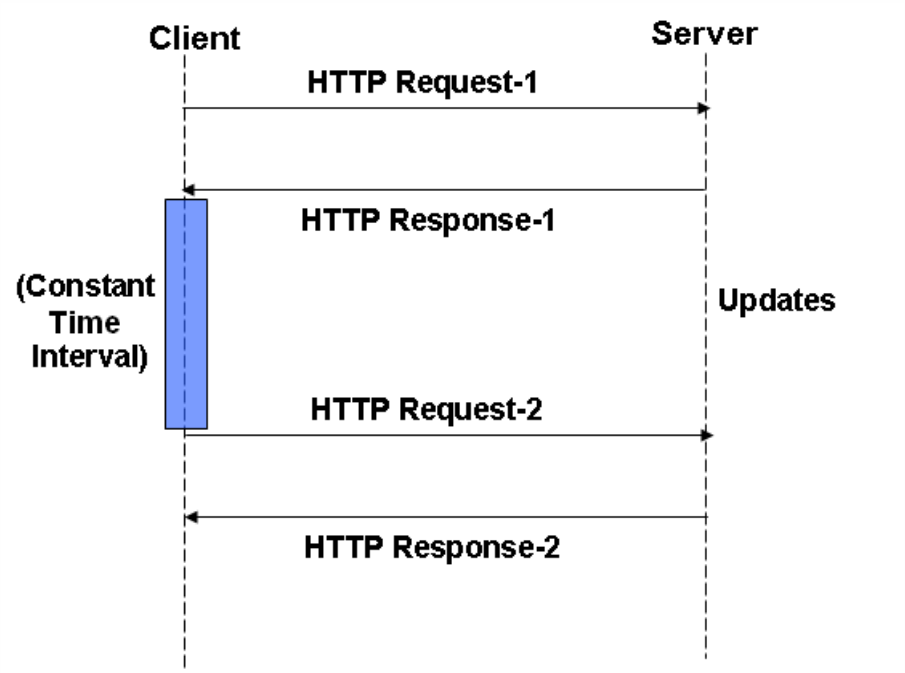
The NetScaler Web 2.0 Push feature reduces the number of server-side connections across millions of persistent client connections.

Web 2.0 Push Applications

Mar 19, 2012

With modern Web applications, termed broadly as Web 2.0 applications, servers use AJAX technologies such as polling to maintain up-to-date information about the client. Polling enables an AJAX application to periodically poll the server for updates. For example, a chat based application can poll a Web server every 10 seconds for any chat updates. To get such updates from the Web server, the client browser periodically opens a connection to the Web server.

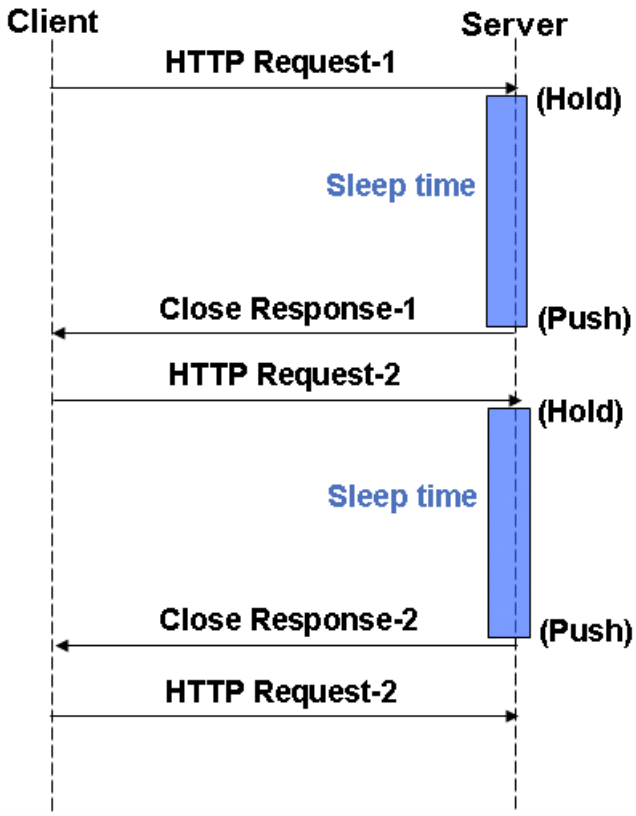
Figure 1. Polling Technique



Such frequent polling can overload the server. Also, if you deploy the AJAX application on a Web server with low resources and a large number of simultaneous users poll the server for updates, the network can become saturated, with significant degradation in the server performance. And if there is no update from the server, the client requests overload the server for a void response.

To avoid such problems, server push technology often uses a long polling technique. Long polling enables the client application to open a persistent connection to the server and wait for the server to push updates when available.

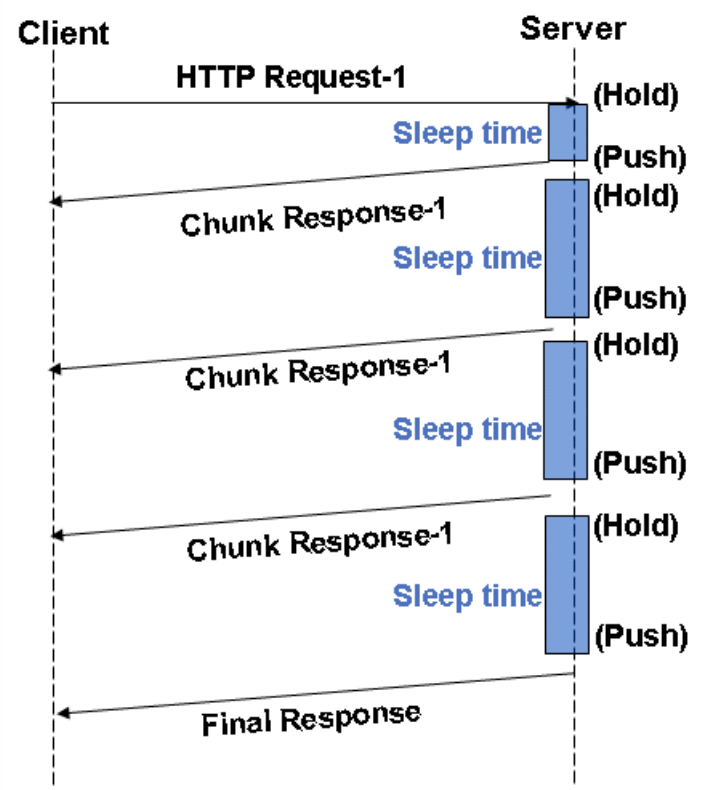
Figure 2. Long Polling Technique



If your server supports asynchronous request processing, long polling is a scalable technique. However, long polling can hold the server connections until updates are available. For example, if 1,000 AJAX applications open one long polled connection, 1,000 threads hold the server while waiting for updates.

Another technique, called HTTP streaming, is identical to the long polling technique except that the connection is not closed after the server pushes the updates. The AJAX application sends a single request and receives chunks of responses (partial responses) over the same connection. With HTTP streaming, the browsers and server do not open or close the connection. Therefore, HTTP streaming significantly reduces the network latency.

Figure 3. HTTP Streaming Technique



In HTTP streaming, as in long polling techniques, if the server frequently pushes updates, the performance of the network and the AJAX applications are significantly degraded and the client may lose the updates. If your AJAX application opens both long polling and HTTP streaming connections to the same Web server, other AJAX applications cannot open connections to the server, because the browser blocks such connections.

NetScaler Web 2.0 push uses connection labeling to overcome the limitations of long polling and HTTP streaming.

How Web 2.0 Push Works

Mar 19, 2012

The NetScaler Web 2.0 push feature enables the server to label a client connection and subsequently identify and send data over that labeled connection. With NetScaler Web 2.0 push enabled, the client first establishes a TCP/IP connection and connects to the NetScaler appliance. The appliance uses the configured load balancing method or content switching policy to select a Web server to which to open a connection and send the client request. The server interacts with the client and uses either authentication or a previously established cookie to identify the client.

When the NetScaler appliance receives a request with push enabled, it initiates the labeling protocol with the Web server. This protocol enables the Web server to label the connection and defer the response. The protocol also enables the server to process other requests without invoking push processing. The Web server (referred to as a *notification server*) uses the label to send updates to the client through the NetScaler appliance when the updates become available. Servers can choose to push multiple updates over a single TCP connection or open one connection per update.

Note: The set of Web servers that respond to requests from the NetScaler does not necessarily include the notification servers that push updates to client.
A central component of a NetScaler Web 2.0 push configuration is a push virtual server, which is a load balancing virtual server with service type PUSH or SSL_PUSH. The NetScaler appliance uses the push virtual server to expose the message push protocol to the Web servers. A server uses the protocol to push asynchronous messages to connected clients. A push virtual server exposes a simple REST interface for posting updates.

Important: For the NetScaler Web 2.0 Push feature to work correctly, you must configure the NetScaler appliance as a proxy for the traffic between the clients and servers. You can use multiple NetScaler appliances to scale up your connection management.
For each transaction, the NetScaler Web 2.0 push feature maintains a state machine, which manages the actions of the transaction. The state machine has the following states:

- Waiting for Request State (Q)-A connection has been established between the client and the NetScaler appliance. The appliance waits in this state until the client sends a request.
- Waiting for Server Response State (R) -A request has been received from the client and forwarded to a Web server. The appliance waits in this state for the server to respond.
- Waiting for Asynchronous Messages State (A) -The appliance is waiting for asynchronous messages that the notification servers push to the push virtual server.

Until the client establishes a connection with the NetScaler appliance's load balancing or content switching virtual server, the initial state of the transaction is Q. When the appliance receives a request, it forwards the request to the server, and the transaction moves to state R.

If the appliance receives a deferred response (also called a *labeled response*), the transaction moves to state A. In this state, if the appliance receives a push message through the message push protocol, it processes the message and forwards the message to the client. If this message is marked as the last message, the appliance closes the transaction and moves to state Q. If not, the transaction remains in state A.

The push virtual server can manage long-polling and streaming responses from the server. Each update that the server sends to the push virtual server has a flag (with query parameters) that indicates whether there are updates from the server. When the flag indicates that the updates from the server are unavailable, the NetScaler appliance performs one of the following functions:

1. If the client uses HTTP 1.1 protocol and multiple updates are received from the server, the appliance sends a chunked response to the client and appends a zero chunk to the final response. If the first response itself has the flag set, the content length itself is sent as the response.
2. If the client uses HTTP 1.0 protocol and multiple updates are received from the server, then just the contents of the chunked response or the body of the content length response is sent to the client and the connection is terminated. If the first response itself has the flag set then, the content length itself is sent as the response.

The appliance sends a content-length response regardless of which HTTP version the client uses. The connection-labeling and message-push protocols, which identify the client and the server connections, provide the basic functionality of the NetScaler Web 2.0 push feature.

Understanding NetScaler Web 2.0 Push Protocol

Mar 19, 2012

For the NetScaler Web 2.0 Push feature to work correctly, the NetScaler appliance must label the client connection and then identify and send the deferred response from the server over the labeled connection. For this purpose, the Web 2.0 push feature uses the connection labeling and the message push protocols.

The connection labeling protocol is used between the server and the NetScaler appliance to label the client connection. After a label is negotiated, the Web server includes the label in the update that is sent to the client.

The appliance forwards a request to the server after adding an X-NS-PUSHVSERVER header containing the IP address and port of the push virtual server. The server either responds to this request with an HTTP response or defers the response. If the server defers the response, it labels the connection with an X-NS-DEFERRABLE header, which indicates that the connection is deferred.

A policy configured on the load balancing or content switching virtual server enables the NetScaler appliance to extract the label from the response. The appliance uses the information in the label to send the push message (update) to the push virtual server, which sends the response on the corresponding client connection.

Note: For any update from the Web server, the NetScaler does not support rewrite and compression.
When a server receives a request that it is deferrable, it sends an HTTP 200 OK response with the X-NS-DEFERRABLE header, which indicates to the NetScaler appliance that the push feature should be applied to the request. The appliance removes the X-NS-DEFERRABLE header, sends the response to the client, and waits for updates. For example:

```
HTTP/1.1 200 OK
Date: Wed, 25 Aug 2010 18:22:47 GMT
Server: Apache/2.0.61 (FreeBSD) PHP/5.2.5 with Suhosin-Patch mod_ssl/2.0.61
OpenSSL/0.9.8e mod_perl/2.0.3 Perl/v5.8.8
X-NS-DEFERRABLE: YES
X-NS-SERVERLABEL: 04c2442bcb7c4b5f826d41a623e374e!
Content-Length: 0
Content-Type: text/plain;charset=UTF-8
```

The message push protocol is used between a notification server and the NetScaler appliance to enable the notification server to send a notification to a previously labeled client connection.

Web servers use the message push protocol to push asynchronous messages to connected clients. The push protocol is built as a REST interface, exposed through the push virtual server on the NetScaler appliance. The server connects to the push virtual server and sends a request to the appliance. The BODY of the request contains the payload to be sent to the client. Additionally, the request identifies the label for the target client connection and the last message of the response.

When the NetScaler appliance receives the deferred response from the server, it sends the response to the client as a single HTTP chunk and sends a 200 OK response with the XML information to the server. If the message is marked as the last message of the response, the NetScaler also closes the HTTP response on the server.

Note: If the NetScaler is aware of the content length, it may send a response specifying the Content-Length, instead of a chunk. This enables the NetScaler to manage both HTTP streaming and long-polling responses.

Notification from Server to Push Server

```
POST /CLIENT/V10/04c2442bcb7c4b5f826d41a623e374e!?MSG_END=0 HTTP/1.1
Host: 10.102.80.66:8080
Content-Length: 6
```

Response from Push vserver to the server

```
HTTP/1.1 200 OK
Content-Type: text/xml; charset="UTF-8"
Content-Length: 130
<?xml version="1.0" encoding="UTF-8"?>
<CLIENTINFO>
 <CLIENT ID="04c2442bcb7c4b5f826d41a623e374e!" INFO="SUCCESS" />
</CLIENTINFO>
```

Configuring Web 2.0 Push

Mar 19, 2012

To configure NetScaler Web 2.0 push, you must first enable the feature. Then, create a push virtual server and associate it with a load balancing or content switching virtual server. Once you have a working configuration, you can customize it to suit your deployment.

You can also monitor the Web 2.0 push configuration by viewing statistics about the push virtual server and the other entities, such as the load balancing or the content switching virtual servers, that are part of the configuration.

Enabling NetScaler Web 2.0 Push

Oct 15, 2013

You have to enable the NetScaler Web 2.0 push feature before you can use it. Before enabling the feature, you must have the appropriate license installed on the NetScaler appliance. With the feature disabled, you can configure NetScaler Web 2.0 push entities, such as the push virtual server, but the entities will not work until the feature is enabled.

At the command prompt, type:

enable ns feature push

If NetScaler Web 2.0 Push is not licensed or disabled, the push virtual server state is DOWN.

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change advanced features.
3. In the Configure advanced features dialog box, select the NetScaler Push check box, and then click OK.
4. At the Enable/Disable Feature(s)? prompt, click Yes.

Creating a NetScaler Web 2.0 Push Virtual Server

Sep 02, 2013

A push virtual server enables the NetScaler appliance to multiplex and manage the exchange of data (server push) reliably, securely, and in a scalable manner. It enables the notification server to send a notification to a previously labeled client connection by using the message push protocol. The notification servers push the out-of-band updates to the push virtual server. When the clients access the load balancing or the content switching virtual servers, the push virtual server uses the labeling protocol to label the deferred clients.

You can add, modify, and remove push virtual servers, however, you cannot bind services to the push virtual server.

At a command prompt, type the following commands to create a push virtual server and verify the configuration:

- add lb vserver <name> <serviceType> <IPAddress> <Port>
- show lb vserver <name>

Example

```
add lb vserver Vserver-Push-1 PUSH 10.102.29.162 80
show lb vserver Vserver-Push-1
```

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, click Add.
3. In the Name, Port, and IP Address text boxes, type a name for the push virtual server, a port, and an IP address (for example, **Vserver-Push-1**, **80**, and **10.102.29.162**).
4. In Protocol, select either SSL_PUSH or PUSH.
5. Click Create, and then click Close. The push virtual server you created appears in the Load Balancing Virtual Servers pane.

To remove a push virtual server, use the rm lb vserver command that takes only the name parameter.

Configuring a Load Balancing or Content Switching Virtual Server

Oct 15, 2013

After creating a push virtual server, you need to associate it with the load balancing or content switching virtual servers. For details about creating a load balancing virtual server, see "Creating a Virtual Server." Also, for details about creating a content switching setup, see "Creating Content Switching Virtual Servers."

Once you have created the load balancing or content switching virtual servers, you must associate them with the push virtual server.

At the command prompt, type the following commands to configure a load balancing virtual server for NetScaler Web 2.0 push. To configure a content switching virtual server, replace set lb vserver with set cs vserver.

set lb vserver <name> <ServiceType> <IPAddress> <Port> -push (ENABLED | DISABLED) -pushVserver <PushVservername> -pushLabel <Expression> -pushMultiClients (YES | NO)

Examples

```
set lb vserver Vserver-LB-1 HTTP 10.102.29.161 80 -push ENABLED - pushVserver PushVserver1 -pushLabel "HTTP.RES.HEADER(\"NSLABEL\").VALUE(0)" –pushMultiClients
```

```
set cs vserver Vserver-CS-1 HTTP 10.102.29.161 80 -push ENABLED - pushVserver PushVserver1 -pushLabel "HTTP.RES.HEADER(\"NSLABEL\").VALUE(0)" –pushMultiClients
```

- To modify a virtual server, type the set lb vserver or set cs vserver command, the name of the virtual server, and the parameters to be changed, with their new values.
- To remove a virtual server, type the rm lb vserver or rm cs vserver command and the name of the load balancing or content switching virtual server.

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure push virtual server (for example, Vserver-LB-1), and click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, click the arrow next to Push to expand it. Then, in the Push VServer list, select the push virtual server and click OK.
   Note: To create a content switching virtual server for NetScaler Web 2.0 Push by using the configuration utility, in the navigation pane, expand Content Switching, click Virtual Servers, Then, perform steps 2 and 3.

Monitoring the Configuration

Sep 02, 2013

To monitor the NetScaler Web 2.0 push configuration, you need to view the statistics of the push virtual servers and load balancing entities. This is useful for troubleshooting.

For instructions on how to display statistics of load balancing entities, see "Load Balancing." Available statistics include labeled connections, push labeled connections, and deferred requests.

At the command prompt, type:

show lb vserver <PushVserverName>

Example

```
show lb vserver Vserver-Push-1
```

Customizing the NetScaler Web 2.0 Push Configuration

Mar 19, 2012

Once your basic Web 2.0 Push configuration is operational, you can customize it by setting a time-out value for idle client connections and configuring URL redirects.

Setting a Time-out Value for Idle Client Connections

Sep 02, 2013

Once a client connects to the push virtual server, you can configure the virtual server to close any idle client connections after a configured time period.

To configure a time-out value, use the cltTimeout parameter, which specifies the time, in seconds, after which the NetScaler appliance closes any idle client connections. The default value is 180sec for HTTP/SSL-based services and 9000sec for TCP-based services.

At the command prompt, type:

set lb vserver <PushVserverName> [-cltTimeout <secs>]

Example

```
set lb vserver Vserver-Push-1 -cltTimeout 100
```

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server for which you want to configure virtual server port insertion (for example, **Vserver-Push-1**), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, click the Advanced tab.
4. In the Client Time-out (secs) text box, type the timeout value (for example, **100**).
5. Click OK.

Redirecting Client Requests to an Alternative URL

Sep 02, 2013

You can configure a URL to which to redirect HTTP or HTTPS client requests when the push virtual server is down or disabled. This URL can be a local or a remote link. The NetScaler appliance uses HTTP 302 redirect to redirect client requests.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only a domain name (relative URL), the incoming URL is appended to the domain configured in the redirect URL.

The domain specified in the redirect URL must not be the same as the domain specified in the domain name argument of a content switching policy. If the same domain is specified in both arguments, the request is redirected continuously to the same unavailable virtual server in the NetScaler appliance, and the user cannot get the requested content.

At the command prompt, type:

set lb vserver <name> -redirectURL URLValue

Example

set lb vserver Vserver-Push-1 -redirectURL http://www.newdomain.com/mysite/maintenance

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the push virtual server for which you want to configure redirect URL (for example, Vserver-Push-1), and then click Open.
3. On the Advanced tab, in the Redirect URL text box, type the URL (for example, **http://www.newdomain.com/mysite/maintenance**).
4. Click OK.

Optimization

Aug 06, 2014

The NetScaler optimization features reduce transaction times between the clients and the servers, and they reduce bandwidth consumption. They also enhance server performance by offloading some tasks and making others more efficient.

Client Keep-Alive	Handles multiple requests on a single client connection. The client does not have to negotiate a new connection for each request to the server.
HTTP Compression	Compresses HTTP responses sent from the servers to compression-aware browsers. The smaller responses reduce download time and save bandwidth.
Integrated Caching	Stores responses to client requests. Subsequent requests for the same content are served from the NetScaler cache instead of being forwarded to the origin server.
Front End Optimization	Reduces the load and render time of web pages by simplifying and optimizing the content served to the client browser. Note: Supported from NetScaler 10.5 onwards.
Content Accelerator	Stores server responses on a Citrix ByteMobile T2100 appliance. Note: Supported from NetScaler 10.1 onwards.
SPDY (Speedy)	Acts as a SPDY gateway between clients and your servers, providing SPDY support without the need to configure/upgrade SPDY on the servers. Note: Supported from NetScaler 10.1 onwards.

Client Keep-Alive

Aug 06, 2014

The client keep-alive feature enables multiple client requests to be sent on a single client connection. This feature helps in a transaction management environment where typically the server closes the client connection after serving the response. The client then opens a new connection for each request and spends more time on the transaction.

Client keep-alive resolves this issue by keeping the connection between the client and the appliance (client-side connection) open even after the server closes the connection with the appliance. This allows sending multiple client requests using a single connection and saves the round trips associated with opening and closing a connection. Client keep-alive is most beneficial in SSL sessions.

Client keep-alive is also useful under either of the following conditions:

- When the server does not support client keep-alive.
- When the server supports client keep-alive but an application on the server does not support client keep-alive.

Note: Client keep-alive is applicable for HTTP and SSL traffic.
Client-keep alive can be configured globally to be able to handle all traffic. It can also be configured to be active only on specific services.

In client keep-alive environment, the configured services intercept the client traffic and the client request is directed to the origin server. The server sends the response and closes the connection between the server and the appliance. If a "Connection: Close" header is present in the server response, the appliance corrupts this header in the client-side response, and the client-side connection is kept open. As a result, the client does not have to open a new connection for the next request; instead, the connection to the server is reopened.

Note: If a server sends back two "Connection: Close" headers, only one is edited. This results in significant delays on the client rendering of the object because a client does not assume that the object has been delivered completely until the connection is actually closed.

Updated: 2014-08-12

Client keep-alive, by default, is disabled on the NetScaler, both globally and at service level. Therefore, you must enable the feature at the required scope.

Note: If you enable client keep-alive globally, it is enabled for all services, regardless of whether you enable it at the service level.
Additionally, if required, you can configure some HTTP parameters to specify the maximum number of HTTP connections retained in the connection reuse pool, enable connection multiplexing, and enable persistence Etag.

Note: When Persistent ETag is enabled, the ETag header includes information about the server that served the content. This ensures that cache validation conditional requests or browser requests, for that content, always reaches the same server.

To configure client keep-alive by using the command line interface

At the command prompt, do the following:

1. Enable client keep-alive on the NetScaler.

- At global level
  enable ns mode cka
- At service level
  set service <name> -CKA YES

  Note: Client keep-alive can be enabled only for HTTP and SSL services.

2. Configure the required HTTP parameters on the HTTP profile that is bound to the service(s).
   set ns httpProfile <name> -maxReusePool <value> -conMultiplex ENABLED -persistentETag ENABLED

   Note: Configure these parameters on the nshttp_default_profile HTTP profile, to make them available globally.

To configure client keep-alive by using the configuration utility

1. Enable client keep-alive on the NetScaler.
   - At global level
     Navigate to System > Settings, click Configure Modes and select Client side Keep Alive.
   - At service level
     Navigate to Traffic Management > Load Balancing > Services, and select the required service. In the Settings grouping, enable Client Keep-Alive.
2. Configure the required HTTP parameters on the HTTP profile that is bound to the service(s).
   Navigate to System > Profiles, and on HTTP Profiles tab, select the required profile and update the required HTTP parameters.

HTTP Compression

May 20, 2015

For websites with compressible content, the NetScaler HTTP compression feature implements lossless compression to alleviate latency, long download times, and other network-performance problems by compressing the HTTP responses sent from servers to compression-aware browsers. You can improve server performance by offloading the computationally intensive compression task from your servers to the NetScaler appliance.

The following table describes the capabilities of the HTTP compression feature:

Functionality	Description
Compression Ratio	Compression ratio depends on the types of files in the responses, but is always significant, noticeably reducing amount of data transmitted over the network.
Browser Awareness	NetScaler serves compressed data to compression aware browsers only, reducing the transaction time between the client and the server. Most modern web browsers support HTTP compression.
Compression blocking	You can define content filters to selectively block compression by applying built-in actions.
Compression Caching	With the integrated caching feature enabled, subsequent requests for the same content are served from the local cache, reducing the number of round trips to the server and improving transaction times.
HTTPS Support	Compression is particularly useful on SSL connections, because it reduces the amount of content that has to be encrypted, either on the server or by the NetScaler appliance, and decrypted by the client.
Intelligent Response Filtering	The NetScaler compression engine intelligently filters server responses on the basis of defined compression parameters. For example, the compression engine detects zero-content-length responses and compressed responses and does not compress them. The detection of compressed responses enables origin sites to use server-based compression in conjunction with the NetScaler compression feature.
Compression Switching	The NetScaler appliance transparently directs requests from compression aware clients to compression capable servers, so that responses to those clients are compressed, and responses to other clients are not delayed by compression processing.

How Compression Works

A NetScaler ADC can compress both static and dynamically generated data. It applies the GZIP or the DEFLATE compression algorithm to remove extraneous and repetitive information from the server responses and represent the original information in a more compact and efficient format. This compressed data is sent to the client's browser and

uncompressed as determined by the browser's supported algorithm or algorithms (GZIP or DEFLATE).

NetScaler compression treats static and dynamic content differently.

- Static files are compressed only once, and a compressed copy is stored in local memory. Subsequent client requests for cached files are serviced from that memory.
- Dynamic pages are dynamically created each time a client requests them.

When a client sends a request to the server:

1. The client request arrives at the NetScaler ADC. The ADC examines the headers and stores information about what kind of compression, if any, the browser supports.
2. The ADC forwards the request to the server and receives the response.
3. The NetScaler compression engine examines the server response for compressibility by matching it against policies.
4. If the response matches a policy associated with a compression action, and the client browser supports a compression algorithm specified by the action, the NetScaler ADC applies the algorithm and sends the compressed response to the client browser.
5. The client applies the supported compression algorithm to decompress the response.

Configuring HTTP Compression

Nov 03, 2015

By default, compression is disabled on the NetScaler ADC. You must enable the feature before configuring it. If the feature is enabled, the ADC compresses server requests specified by compression policies.

To configure HTTP compression, do the following:

- Configure compression actions
- Configure compression policies
- Bind the compression policies to global bind points or to virtual servers
- Optionally, configure global compression parameters

Enabling HTTP Compression

Compression can be enabled for HTTP and SSL services only. You can enable it globally, so that it applies to all HTTP and SSL services, or you can enable it just for specific services.

To enable compression by using the command line interface

At the command prompt, enter one of the following commands to enable compression globally or for a specific service:

- enable ns feature cmp
  OR
- set service <name> -CMP YES

To configure compression by using the configuration utility

Do one of the following:

- To enable compression globally, navigate to **System** > **Settings**, click **Configure Basic Features**, and select **HTTP Compression**.
- To enable compression for a specific service, navigate to **Traffic Management** > **Load Balancing** > **Services**, select the service, and click **Edit**. In the **Settings** group, click the pencil icon and enable **Compression**.

Configuring a Compression Action

A compression action specifies the action to take when a request or response matches the rule (expression) in the policy with which the action is associated. For example, you can configure a compression policy that identifies requests that will be sent to a particular server, and associate the policy with an action that compresses the server's response.

There are four built-in compression actions:

- COMPRESS: Uses the GZIP algorithm to compress data from browsers that support either GZIP or both GZIP and DEFLATE. Uses the DEFLATE algorithm to compress data from browsers that support only the DEFLATE algorithm. If the browser does not support either algorithm, the browser's response is not compressed.
- NOCOMPRESS: Does not compress data.
- GZIP: Uses the GZIP algorithm to compress data for browsers that support GZIP compression. If the browser does not support the GZIP algorithm, the browser's response is not compressed.
- DEFLATE: Uses the DEFLATE algorithm to compress data for browsers that support the DEFLATE algorithm. If the

browser does not support the DEFLATE algorithm, the browser's response is not compressed. After creating an action, you associate the action with one or more compression policies.

To create a compression action by using the command line interface

At the command prompt, enter the following command to create a compression action:

add cmp action <name> <cmpType>

To create a compression action by using the configuration utility

Navigate to **Optimization** > **HTTP Compression** > **Actions** , click **Add** , and create a compression action to specify the type of compression to be performed on the HTTP response.

Configuring a Compression Policy

A compression policy contains a rule, which is a logical expression that enables the NetScaler appliance to identify the traffic that should be compressed.

When the NetScaler ADC receives an HTTP response from a server, it evaluates the built-in compression policies and any custom compression policies to determine whether to compress the response and, if so, the type of compression to apply. Priorities assigned to the policies determine the order in which the policies are matched against the requests.

The following table lists the built-in HTTP compression policies. These policies are activated globally when you enable compression.

Built-in Classic or Default Syntax Policy	**Description**
ns_nocmp_mozilla_47 ns_adv_nocmp_mozilla_47	Prevents compression of CSS files when a request is sent from a Mozilla 4.7 browser.
ns_cmp_mscss ns_adv_cmp_mscss	Compresses CSS files when the request is sent from a Microsoft Internet Explorer browser.
ns_cmp_msapp ns_adv_cmp_msapp	Compresses files that are generated by the following applications:s • Microsoft Office Word • Microsoft Office Excel • Microsoft Office PowerPoint
ns_cmp_content_type ns_adv_cmp_content_type	Compresses data when the response containsContent-Type header and contains text.
ns_nocmp_xml_ie	Prevents compression when a request is sent, from a Microsoft Internet Explorer browser and the response contains a Content-Type header and contains text or xml.

Built-in Classic or Default Syntax Policy	Description
ns_adv_nocmp_xml_ie	

To create a compression policy by using the command line interface

At the command prompt, enter the following command to create a compression policy:

add cmp policy <name> -rule <expression> -resAction <string>

To create a compression policy by using the configuration utility

Navigate to **Optimization** > **HTTP Compression** > **Policies** , click **Add** , and create a compression policy by specifying the condition and the corresponding action to be executed.

Binding a Compression Policy

To put a compression policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler ADC, or to a specific virtual server, so that the policy applies only to requests whose destination is the VIP address of that virtual server.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

To bind a compression policy by using the command line interface

At the command prompt, enter one of the following commands to bind a compression policy globally or to a specific virtual server:

- bind cmp global <policyName> [-priority <positive_integer>] [-state (ENABLED | DISABLED)]...
- bind lb vserver <vserverName> -policyName <policyName> -priority <positive_integer>. Repeat this command for each virtual server to which you want to bind the compression policy.

To bind a compression policy by using the configuration utility

Do one of the following:

- At global level Navigate to **Optimization** > **HTTP Compression** > **Policies**, click **Policy Manager** and bind the required policies by specifying the relevant **Bind Point** and **Connection Type** (Request/Response).
- At virtual server level
  - For load balancing virtual server, Navigate to **Traffic Management** > **Load Balancing** > **Virtual Servers**, select the required virtual server, click **Policies**, and bind the relevant policy.
  - For content switching **virtual server**, Navigate to **Traffic Management** > **Content Switching** > **Virtual Servers**, select the required virtual server, click **Policies**, and bind the relevant policy.

Setting the Global Compression Parameters for Optimal Performance

Many users accept the default values for the global compression parameters, but you might be able provide more effective compression by customizing these settings.

The following table describes the compression parameters that you can set on the NetScaler ADC.

Compression Parameters	Description
Quantum size	Size, in KB, of the buffer maintained for accumulating server responses. The responses are compressed when the buffer size exceeds this value. For example, if you set the quantum size to 50 KB, the NetScaler ADC compresses the buffer's contents when its size becomes larger than 50 KB. Minimum value: 1. Maximum value: 63488. Default: 57344.
Compression level	Level of compression to apply to server responses. Possible values: Best Speed, Best Compression, optimal.
Minimum HTTP response size	Minimum size, in bytes, of an HTTP response that is compressed. Responses smaller than the value specified by this parameter are sent without being compressed.
Bypass compression on CPU usage	NetScaler CPU usage, as a percentage, at or above which no compression is done. Default: 100.
Policy Type*	Type of policies used for compression. Possible values: Classic, Default Syntax. Default: Classic.
Allow Server-side compression	Allow servers to send compressed data to the NetScaler ADC.
Compress push packet	Upon receipt of a packet with a TCP PUSH flag, compress the accumulated packets immediately, without waiting for the quantum buffer to be filled.
External Cache	Issue a private response directive indicating that the response message is intended for a single user and must not be cached by a shared or proxy cache.

To configure global compression parameters by using the command line interface

At the command prompt, enter the following command to configure compression parameters that apply globally:

set cmp parameter -cmpLevel <cmpLevel> -quantumSize <integer>

Note: Vary header parameters are available from NetScaler 10.5 onwards.

To configure global compression parameters by using the configuration utility

Navigate to **Optimization** > **HTTP Compression** , click **Change Compression Settings** , and set the relevant parameters.

Evaluating Your Compression Configuration

Apr 20, 2015

You can view the compression statistics in the dashboard utility or in an SNMP monitor. The dashboard utility displays summary and detailed statistics in a tabular and graphic format.

Optionally, you can also view statistics for a compression policy, including the number of hits that the policy counter increments during the policy based compression.

Note:

- For more information about the statistics and charts, see the Dashboard help on the Citrix NetScaler appliance.
- For more information about SNMP, see SNMP.

To View Compression Statistics by Using the Command Line Interface

At the command prompt, enter the following commands to display the compression statistics:

1. To display compression statistics summary
   stat cmp
   Note: The stat cmp policy command displays statistics for default syntax compression policies only.
2. To display compression policy hits and details
   show cmp policy <name>
3. To display detailed compression statistics
   stat cmp -detail

To View Compression Statistics by Using the Dashboard

In the Dashboard utility, you can display the following types of compression statistics:

- Select Compression to display a summary of the compression statistics.
- To display detailed compression statistics by protocol type, click the Details
- To display the rate of requests processed by the compression feature, click the Graphical View tab.

To View Compression Statistics by Using SNMP

You can view the following compression statistics by using the SNMP network management application.

- Number of compression requests (OID: 1.3.6.1.4.1.5951.4.1.1.50.1)
- Number of compressed bytes transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.2)
- Number of compressible bytes received (OID: 1.3.6.1.4.1.5951.4.1.1.50.3)
- Number of compressible packets transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.4)
- Number of compressible packets received (OID: 1.3.6.1.4.1.5951.4.1.1.50.5)
- Ratio of compressible data received and compressed data transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.6)
- Ratio of total data received to total data transmitted (OID: 1.3.6.1.4.1.5951.4.1.1.50.7)

To View Additional Compression Statistics by Using the Configuration Utility

1. To display HTTP compression statistics:
   Navigate toOptimization > HTTP Compression and click Statistics.
2. To display statistics of a compression policy
   Navigate to Optimization > HTTP Compression > Policies> select the policy, and click Statistics.
3. To display statistics of a compression policy label

Navigate to Optimization > HTTP Compression > Policies> select a policy label, and click Statistics.

Offloading HTTP Compression to the NetScaler ADC

Nov 04, 2015

Performing compression on a server can affect the server's performance. A NetScaler ADC placed in front of your web servers and configured for HTTP compression offloads compression of both static and dynamic content, saving server CPU cycles and resources.

You can offload compression from the Web servers in either of two ways:

- Disable compression on the web servers, enable the NetScaler Compression feature at a global level, and configure services for compression.
- Leave the compression feature enabled on the web servers and configure the NetScaler appliance to remove the "Accept Encoding" header from all HTTP client requests. The servers then send uncompressed responses. The NetScaler ADC compresses the server responses before sending them to the clients.

Note: The second option does not work if the servers automatically compress all responses. The NetScaler ADC does not attempt to compress a response that is already compressed.

The Servercmp parameter enables the Netscaler appliance to handle offload HTTP compression. By default, this parameter is set ON for the server to send compressed data to the Netscaler appliance. To offload HTTP compression, you need to set the servercmp parameter to OFF.

At the command prompt, enter the following commands:

set service <service name> -CMP YES

Repeat this command for each service for which you want to enable compression.

show service <service name>

Repeat this command for each service, to verify that compression is enabled.

Save config

set cmp parameter –serverCmp OFF

Integrated Caching

Oct 28, 2013

The integrated cache provides in-memory storage on the Citrix NetScaler appliance and serves Web content to users without requiring a round trip to an origin server. For static content, the integrated cache requires little initial setup. After you enable the integrated cache feature and perform basic setup (for example, determining the amount of NetScaler appliance memory the cache is permitted to use), the integrated cache uses built-in policies to store and serve specific types of static content, including simple Web pages and image files. You can also configure the integrated cache to store and serve dynamic content that is usually marked as non-cacheable by Web and application servers (for example, database records and stock quotes).

When a request or response matches the rule (logical expression) specified in a built-in policy or a policy that you have created, the NetScaler appliance performs the action associated with the policy. By default, all policies store cached objects in and retrieve them from the Default content group, but you can create your own content groups for different types of content.

To enable the NetScaler appliance to find cached objects in a content group, you can configure selectors, which match cached objects against expressions, or you can specify parameters for finding objects in the content group. If you use selectors (which Citrix recommends), configure them first, so that you can specify selectors when you configure content groups. Next, set up any content groups that you want to add, so that they are available when you configure the policies. To complete the initial configuration, create policy banks by binding each policy to a global bind point or a virtual server, or to a label that can be called from other policy banks.

You can tune the performance of the integrated cache, using methods such as pre-loading cached objects before they are scheduled to expire. To manage the handling of cached data once it leaves the NetScaler appliance, you can configure caching-related headers that are inserted into responses. The integrated cache can also act as a forward proxy for other cache servers.

Note: Integrated caching requires some familiarity with HTTP requests and responses. For information about the structure of HTTP data, see *Live HTTP Headers* at "http://livehttpheaders.mozdev.org/."

How the Integrated Cache Works

Jun 03, 2014

The integrated cache monitors HTTP and SQL requests that flow through the Citrix NetScaler appliance and compares the requests with stored policies. Depending on the outcome, the integrated cache feature either searches the cache for the response or forwards the request to the origin server. For HTTP requests, the integrated cache feature can also serve partial content from the cache in response to single byte-range and multi-part byte-range requests.

Cached data can be compressed if the client accepts compressed content. You can configure expiration times for a content group, and you can selectively expire entries in a content group.

Data that is served from the integrated cache is a cache hit, and data served from the origin is a cache miss, as described in the following table.

Table 1. Cache Hits and Misses

Transaction Type	Specifies
Cache Hit	Responses that the NetScaler appliance serves from the cache, including: • Static objects, for example, image files and static Web pages • 200 OK pages • 203 Non-Authoritative Response pages • 300 Multiple Choices pages • 301 Moved Permanently pages • 302 Found pages • 304 Not Modified pages These responses are known as positive responses. The NetScaler appliance also caches the following negative responses: • 307 Temporary Redirect pages • 403 Forbidden pages • 404 Not Found pages • 410 Gone pages To further improve performance, you can configure the NetScaler appliance to cache additional types of content.
Storable Cache Miss	For a storable cache miss, the NetScaler appliance fetches the response from the origin server, and stores the response in the cache before serving it to the client.
Non-Storable Cache Miss	A non-storable cache miss is inappropriate for caching. By default, any response that contains the following status codes is a non-storable cache miss:

Transaction Type	**Specifies** • 201, 202, 204, 205, 206 status codes • All 4xx codes, except 403, 404 and 410 • 5xx status codes

Note: To integrate dynamic caching with your application infrastructure, use the XML API to issue cache commands remotely. For example, you can configure triggers that expire cached responses when a database table is updated.
To ensure the synchronization of cached responses with the data on the origin server, you configure expiration methods. When the NetScaler appliance receives a request that matches an expired response, it refreshes the response from the origin server.

Note: Citrix recommends that you synchronize the times on the NetScaler appliance and the back-end server(s).

Example of Dynamic Caching

Sep 11, 2014

Dynamic caching evaluates HTTP requests and responses based on parameter-value pairs, strings, string patterns, or other data. For example, suppose that a user searches for Bug 31231 in a bug reporting application. The browser sends the following request on the user's behalf:

```
GET /mybugreportingsystem/mybugreport.dll?IssuePage&RecordId=31231&Template=view&TableId=1000
Host: mycompany.net
User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9) Gecko/2008052906 Firefox/3.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-us,en;q=0.5
. . .
```

In this example, GET requests for this bug reporting application always contain the following parameters:

- IssuePage
- RecordID
- Template
- TableId

GET requests do not update or alter the data, so you can configure these parameters in caching policies and selectors, as follows:

- You configure a caching policy that looks for the string mybugreportingsystem and the GET method in HTTP requests. This policy directs matching requests to a content group for bugs.
- In the content group for bugs, you configure a hit selector that matches various parameter-value pairs, including IssuePage, RecordID, and so on.

Note that a browser can send multiple GET requests based on one user action. The following is a series of three separate GET requests that a browser issues when a user searches for a bug based on a bug ID.

```
GET /mybugreportingsystem/mybugreport.dll?IssuePage&RecordId=31231&Template=view&TableId=1000
GET /mybugreportingsystem/mybugreport.dll?IssuePage&Template=viewbtns&RecordId=31231&TableId=1000
GET /mybugreportingsystem/mybugreport.dll?IssuePage&Template=viewbody&RecordId=31231&tableid=1000
```

To fulfill these requests, multiple responses are sent to the user's browser, and the Web page that the user sees is an assembly of the responses.

If a user updates a bug report, the corresponding responses in the cache should be refreshed with data from the origin server. The bug reporting application issues HTTP POST requests when a user updates a bug report. In this example, you configure the following to ensure that POST requests trigger invalidation in the cache:

- A request-time invalidation policy that looks for the string mybugreportingsystem and the POST HTTP request method, and directs matching requests to the content group for bug reports.
- An invalidation selector for the content group for bug reports that expires cached content based on the RecordID parameter. This parameter appears in all of the responses, so the invalidation selector can expire all relevant items in the cache.

The following excerpt shows a POST request that updates the sample bug report.

```
POST /mybugreportingsystem/mybugreport.dll?TransitionForm HTTP/1.1\r\n
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.0) Opera 7.23 [en]\r\n
Host: mybugreportingsystem\r\n
Cookie:ttSearch.134=%23options%3Afalse%23active%23owner%3Afalse%23unowned%3Afalse%23submitter%3Afalse%23incsub%3Atrue;
Cookie2: $Version=1\r\n
. . .
\r\n
ProjectId=2&RecordId=31231&TableId=1000&TransitionId=1&Action=Update&CopyProjectId=0&ReloadForm=0&State=&RecordLockId=49873+issues+in+HTTP&F43. .
```

When the Citrix NetScaler appliance receives this request, it does the following:

- Matches the request with an invalidation policy.
- Finds the content group that is named in the policy.
- Applies the invalidation selector for this content group and expires all responses that match RecordID=31231.

When a user issues a new request for this bug report, the NetScaler appliance goes to the origin server for updated copies of all the responses that are associated with the report instance, stores the responses in the content group, and serves them to the user's browser, which reassembles the report and displays it.

Setting Up the Integrated Cache

May 20, 2015

To use the integrated cache, you must install the license and enable the feature. After you enable the integrated cache, the Citrix® NetScaler® appliance automatically caches static objects as specified by built-in policies and generates statistics on cache behavior. (Built-in policies have an underscore in the initial position of the policy name.)

Even if the built-in policies are adequate for your situation, you might want to modify the global attributes. For example, you might want to modify the amount of NetScaler appliance memory allocated to the integrated cache.

If you would like to observe cache operation before changing settings, see "Displaying Cached Objects and Cache Statistics."

Note: The NetScaler cache is an in-memory store that is purged when you restart the appliance.
This section includes the following details:

- Installing the Integrated Cache License
- Enabling Integrated Caching
- Configuring Global Attributes for Caching
- Built-in Content Group, Pattern Set, and Policies for the Integrated Cache

Installing the Integrated Cache License

Updated: 2013-10-28

An integrated cache license is required. For information about licenses, see information about obtaining NetScaler licenses at " http://support.citrix.com/article/ctx121062."

To install the license for the Integrated Caching feature

1. Obtain a license code from Citrix, go to the command line interface, and log in.
2. At the command line interface, copy the license file to the /nsconfig/license folder.
3. Reboot the NetScaler appliance by using the following command:

```
reboot
```

Enabling Integrated Caching

Updated: 2015-05-20

When you enable integrated caching, the NetScaler appliance begins caching server responses. If you have not configured any policies or content groups, the built in policies store cached objects in the Default content group.

To enable integrated caching by using the command line interface

At the command prompt, type one of the following commands to enable or disable integrated caching:

```
enable ns feature IC
```

To enable integrated caching by using the configuration utility

Navigate to System > Settings, click Configure Basic Features, and select Integrated Caching.

Configuring Global Attributes for Caching

Updated: 2014-08-08

Global attributes apply to all cached data. You can specify the amount of NetScaler memory allocated to the integrated cache, Via header insertion, a criterion for verifying that a cached object should be served, the maximum length of a POST body permitted in the cache, whether to bypass policy evaluation for HTTP GET requests, and an action to take when a policy cannot be evaluated.

The cache memory capacity is limited only by the memory of the hardware appliance. Also, any packet engine (the central distribution hub of all incoming TCP requests) in the nCore NetScaler appliance is aware of objects cached by other packet engines in the nCore NetScaler appliance.

Note that the default global memory limit is 0. Therefore, even if Integrated Caching is enabled, the NetScaler appliance does not cache any objects. You must explicitly set the global memory limit when integrated caching is enabled.

You can modify the global memory limit configured for caching objects. However, when you update the global memory limit to a value lower than the existing value (for example, from 10 GB to 4 GB), if a higher amount of memory (greater than 4 GB) is already being used to cache objects, the NetScaler continues using that amount of memory.

This means that even though the integrated caching limit is configured to some value, the actual limit used can be higher. This excessive memory is however released when the objects are removed from cache.

The output of the show cache parameter command indicates the configured value (Memory Usage limit) and the actual value being used (Memory usage limit (active value)).

To configure global settings for caching by using the command line interface

At the command prompt, type:

```
set cache parameter [-memLimit <MBytes>] [-via <string>] [-verifyUsing <criterion>] [-maxPostLen <positiveInteger>] [-prefetchMaxPending <positiveInteger>] [-enableBypass (YES | NO)] [-undefAction (NOCACHE | RESET)]
```

To configure global settings for caching by using the configuration utility

Navigate to Optimization > Integrated Caching, click Change Cache Settings, and configure the global settings for caching.

Built-in Content Group, Pattern Set, and Policies for the Integrated Cache

Updated: 2013-08-23

The Citrix NetScaler appliance includes a built-in integrated caching configuration that you can use for caching content. The configuration consists of a content group called ctx_cg_poc, a pattern set called ctx_file_extensions, and a set of integrated cache policies. In the content group ctx_cg_poc, only objects that are 500 KB or smaller are cached. The content is cached for 86000 seconds, and the memory limit for the content group is 512 MB. The pattern set is an indexed array of common file extensions for file-type matching.

The following table lists the built-in integrated caching policies. By default, the policies are not bound to any bind point. You must bind them to a bind point if you want the NetScaler appliance to evaluate traffic against the policies. The policies cache objects in the ctx_cg_poc content group.

Table 1. Built-in Integrated Caching Policies

Integrated caching policy name	Policy rule	Policy action	Description
ctx_images	HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).CONTAINS_INDEX(\"ctx_file_extensions\").BETWEEN(101,150)	CACHE	Check whether the requested file is an image file (by comparing the extension of the requested object with the extensions in ctx_file_extensions, indexes 101 through 150) and then cache the file.
ctx_web_css	HTTP.REQ.URL.ENDSWITH(\".css\")	CACHE	Cache all cascading style sheet content.
ctx_doc_pdf	HTTP.REQ.URL.ENDSWITH(\".pdf\")	CACHE	Cache all PDF content.
ctx_web_JavaScript	HTTP.REQ.URL.ENDSWITH(\".js\")	CACHE	Cache all JSS content.
ctx_web_JavaScript-Res	HTTP.RES.HEADER(\"Content-Type\").CONTAINS(\"application/x-javascript\")	CACHE	Cache all JavaScript content.
ctx_NOCACHE_Cleanup	TRUE	NOCACHE	Do not cache any content.

Configuring Selectors and Basic Content Groups

Aug 26, 2013

You can configure selectors and apply them to content groups. When you add a selector to one or more content groups, you specify whether the selector is to be used for identifying cache hits or identifying cached objects to be invalidated (expired). Selectors are optional. Alternatively, you can configure content groups to use hit parameters and invalidation parameters. However, Citrix recommends that you configure selectors.

After configuring selectors, or deciding to use parameters instead, you are ready to set up a basic content group. After creating the basic content group, you need to decide how objects should be expired from the cache, and configure cache expiration. You can further modify the cache as described in "Improving Cache Performance" and "Configuring Cookies, Headers, and Polling", but you might first want to configure caching policies.

Note: Content group parameters and selectors are used only at request time, and you typically associate them with policies that use MAY_CACHE or MAY_NOCACHE actions.

Advantages of Selectors

Oct 28, 2013

A selector is a filter that locates particular objects in a content group. If you do not configure a selector, the Citrix® NetScaler® appliance looks for an exact match in the content group. This can lead to multiple copies of the same object residing in a content group. For example, a content group that does not have a selector may need to store URLs for host1.domain.com\mypage.htm, host2.domain.com\mypage.htm, and host3.domain.com\mypage.htm. In contrast, a selector can match just the URL (mypage.html, using the expression http.req.url) and the domain (.com, using the expression http.req.hostname.domain), allowing the requests to be satisfied by the same URL.

Selector expressions can perform simple matching of parameters (for example, to find objects that match a few query string parameters and their values). A selector expression can use Boolean logic, arithmetic operations, and combinations of attributes to identify objects (for example, segments of a URL stem, a query string, a string in a POST request body, a string in an HTTP header, a cookie). Selectors can also perform programmatic functions to analyze information in a request. For example, a selector can extract text in a POST body, convert the text into a list, and extract a specific item from the list.

For more information about expressions and what you can specify in an expression, see "Policies and Expressions."

Using Parameters Instead of Selectors

Jul 10, 2013

Although Citrix recommends the use of selectors with a content group, you can instead configure hit parameters and invalidation parameters. For example, suppose that you configure three hit parameters in a content group for bug reports: BugID, Issuer, and Assignee. If a request contains BugID=456, with Issuer=RohitV and Assignee=Robert, the NetScaler appliance can serve responses that match these parameter-value pairs.

Invalidation parameters in a content group expire cached entries. For example, suppose that BugID is ab invalidation parameter and a user issues a POST request to update a bug report. An invalidation policy directs the request to this content group, and the invalidation parameter for the content group expires all cached responses that match the BugID value. (The next time a user issues a GET request for this report, a caching policy can enable the NetScaler appliance to refresh the cached entry for the report from the origin server.)

Note that the same parameter can be used as a hit parameter or an invalidation parameter.

Content groups extract request parameters in the following order:

- URL query
- POST body
- Cookie header

After the first occurrence of a parameter, regardless of where it occurred in the request, all its subsequent occurrences are ignored. For example, if a parameter exists both in the URL query and in the POST body, only the one in the URL query is considered.

If you decide to use hit and invalidation parameters for a content group, configure the parameters when you configure the content group.

Note: Citrix recommends that you use selectors rather than parameterized content groups, because selectors are more flexible and can be adapted to more types of data.

Configuring a Selector

Aug 07, 2014

A content group can use a hit selector to retrieve cache hits or use an invalidation selector to expired cached objects and fetch new ones from the origin server.

A selector contains a name and a logical expression, called an *advanced expression*.

For more information about advanced expressions, see "Policies and Expressions."

To configure a selector, you assign it a name and enter one or more expressions. As a best practice, a selector expression should include the URL stem and host, unless there is a strong reason to omit them.

To configure a selector by using the command line interface

At the command prompt, type:

add cache selector <selectorName> (<rule> ...)

For information about configuring the expression or expressions, see "To configure a selector expression by using the command line interface."

Examples

```
>add cache selector product_selector "http.req.url.query.value(\"ProductId\")" "http.req.url.query.value(\"BatchNum\")" "http.req.url.query.value(\"depotLocation\")"
> add cache selector batch_selector "http.req.url.query.value(\"ProductId\")" "http.req.url.query.value(\"BatchId\")" "http.req.url.query.value(\"depotLocation\")"
> add cache selector product_id_selector "http.req.url.query.value(\"ProductId\")"
> add cache selector batchnum_selector "http.req.url.query.value(\"BatchNum\")" "http.req.url.query.value(\"depotLocation\")"
> add cache selector batchid_selector "http.req.url.query.value(\"depotLocation\")" "http.req.url.query.value(\"BatchId\")"
```

To configure a selector by using the configuration utility

Navigate to Optimization > Integrated Caching > Cache Selectors, and add the cache selector.

About Content Groups

Mar 16, 2012

A content group is a container for cached objects that can be served in a response. When you first enable the integrated cache, cacheable objects are stored in a content group named Default. You can create new content groups that have unique properties. For example, you can define separate content groups for image data, bug reports, and stock quotes, and you can configure the stock quote content group to be refreshed more often than the other groups.

You can configure expiration of an entire content group or selected entries in a content group.

The data in a content group can be static or dynamic, as follows:

- **Static content groups**. Finds an exact match between the URL stem and host name on the request and the URL stem and host name of the response.
- **Dynamic content groups**. Looks for objects that contains particular parameter-value pairs, arbitrary strings, or string patterns. Dynamic content groups are useful when caching data that is updated frequently (for example, a bug report or a stock quote).

Process overview: Serving a hit from a content group

1. A user enters search criteria for an item, such as a bug report, and clicks the Find button in an HTML form.
2. The browser issues one or more HTTP GET requests. These requests contain parameters (for example, the bug owner, bug ID, and so on).
3. When the NetScaler appliance receives the requests, it searches for a matching policy, and if it finds a caching policy that matches these requests, it directs the requests to a content group.
4. The content group looks for appropriate objects in the content group, usually based on criteria that you configure in a selector.
   For example, the content group can retrieve responses that match NameField=username and BugID=ID.
5. If it finds matching objects, the NetScaler appliance can serve them to the user's browser, where they are assembled into a complete response (for example, a bug report).

Example: Invalidating an object in a content group

1. A user modifies data (for example, the user modifies the bug report and clicks the Submit button).
2. The browser sends this data in the form of one or more HTTP requests. For example, it can send a bug report in the form of several HTTP POST requests that contain information about the bug owner and bug ID.
3. The NetScaler appliance matches the requests against invalidation policies. Typically, these policies are configured to detect the HTTP POST method.
4. If the request matches an invalidation policy, the NetScaler appliance searches the content group that is associated with this policy, and expires responses that match the configured criteria for invalidation.
   For example, an invalidation selector can find responses that match NameField=username and BugID=ID.
5. The next time the NetScaler appliance receives a GET request for these responses, it fetches refreshed versions from the origin server, caches the refreshed responses, and serves these responses to the user's browser, where they are assembled into a complete bug report.

Setting Up a Basic Content Group

Aug 07, 2014

By default, all cached data is stored in the default content group. You can configure additional content groups and specify these content groups in one or more policies.

You can configure content groups for static content, and you must configure content groups for dynamic content. You can modify the configuration of any content group, including the default group.

To set up a basic content group by using the command line interface

At the command prompt, type:

add cache contentgroup <name> (-hitSelector <hitSelectorName> -invalSelector <invalidationSelectorName> | -hitParams <hitParamName> -invalParams <invalidationParamName>) -type <type> [-relExpiry <sec> | -relExpiryMilliSec <msec>] [-heurExpiryParam <positiveInteger>]

Examples

```
> add cache contentgroup Products_Details –hitSelector product_selector –invalSelector id_selector
> add cache contentgroup bugrep -hitParams IssuePage RecordID Template TableId -invalParams RecordID -relExpiry 864000
```

To set up a basic content group by using the configuration utility

Navigate to Optimization > Integrated Caching > Content Groups, and create the content group.

Expiring or Flushing Cached Objects

Oct 28, 2013

If a response does not have an Expires header or a Cache-Control header with an expiration time (Max-Age or Smax-Age), you must expire objects in a content group by using one of the following methods:

- Configure content group expiration settings to determine whether and how long to keep the object.
- Configure an invalidation policy and action for the content group. For more information, see "Configuring Policies for Caching and Invalidation."
- Expire the content group or objects within it manually.

After a cached response expires, the NetScaler appliance refreshes it the next time the client issues a request for the response. By default, when the cache is full, the NetScaler appliance replaces the least recently used response first.

The following list describes methods for expiring cached responses using settings for a content group. Typically, these methods are specified as a percent or in seconds:

- **Manual**. Manually invalidate all responses in a content group or all responses in the cache.
- **Response-based**. Specific expiration intervals for positive and negative responses. Response-based expiry is considered only if the Last-Modified header is missing in the response.
- **Heuristic expiry**. For responses that have a Last-Modified header, heuristic expiry is a percentage of the time since the response was modified (calculated as current time minus the Last-Modified time, multiplied by the heuristic expiry value). For example, if a Last-Modified header indicates that a response was updated 2 hours ago, and the heuristic expiry setting is 10%, cached objects expire after 0.2 hours. This method assumes that frequently updated responses need to be expired more often.
- **Absolute or relative**. Specify an exact (absolute) time when the response expires every day, in HH:MM format, local time or GMT. Local time may not work in all time zones.
  Relative expiration specifies a number of seconds or milliseconds from the time a cache miss causes a trip to the origin server to the expiration of the response. If you specify relative expiration in milliseconds, enter a multiple of 10. This form of expiration works for all positive responses. Last-Modified, Expires, and Cache-Control headers in the response are ignored.

  Absolute and relative expiration override any expiration information in the response itself.

- **On download**. The option Expire After Complete Response Received expires a response as soon as it is downloaded. This is useful for frequently updated responses, for example, stock quotes. By default, this option is disabled.
  Enabling both Flash Cache and Expire After Complete Response Received accelerates the performance of dynamic applications. When you enable both options, the NetScaler appliance fetches only one response for a block of simultaneous requests.

  For more information, see "Queuing Requests to the Cache."

- **Pinned**. By default, when the cache is full the NetScaler appliance replaces the least recently used response first. The NetScaler appliance does not apply this behavior to content groups that are marked as pinned.

If you do not configure expiration settings for a content group, the following are additional options for expiring objects in the group:

- Configure a policy with an INVAL action that applies to the content group.

- Enter the names of content groups when configuring a policy that uses an INVAL action.

How Expiration Methods Are Applied

Expiration works differently for positive and negative responses. Positive and negative responses are described in the table, *Expiration of Positive and Negative Responses* mentioned below.

The following are rules of thumb for understanding the expiration method that is applied to a content group:

- You can control whether the NetScaler appliance evaluates response headers when deciding whether to expire an object.
- Absolute and relative expiration cause the NetScaler appliance to ignore the response headers (they override any expiration information in the response).
- Heuristic expiration settings and “Weak Positive” and “Weak Negative” expiration (labeled as **Default** values in the configuration utility) cause the NetScaler appliance to examine the response headers. These settings work together as follows:
  - The value in an Expires or Cache-Control header overrides these content group settings.
  - For positive responses that lack an Expires or Cache-Control header but have a Last-Modified header, the NetScaler appliance compares heuristic expiration settings with the header value.
  - For positive responses that lack an Expires, Cache-Control, or Last-Modified header, NetScaler appliance uses the “weak positive” value.
  - For negative responses that lack an Expires or Cache-Control header, NetScaler appliance uses the “weak negative” value.

For a list of expiration parameters see, "Configuring Periodic Expiration of a Content Group." The following table describes how these methods are applied.

Table 1. Expiration of Positive and Negative Responses

Response Type	Expiration Header Type	Content Group Setting	Period the Object Remains in the Cache
Positive	any header	Expire Content After (relExpiry) with no other settings	Use the value of the Expire Content After setting.
Positive	any header	Expire Content At (absExpiry) with no other settings	Subtract current date from the value of the Expire Content At setting.
Positive	any header	Expire Content After (relExpiry) and Expire content at (absExpiry)	Use the smaller of the two values for the content group settings. See the previous rows in this table.
Positive	Last-Modified (with any other headers)	Heuristic (heurExpiry Param) with any other setting	Subtract the Last-Modified date from the current date, multiply the result by the value of the heuristic expiry setting, and then divide by 100.

Response Type	Expiration Header Tags	Content Group Setting	Period the Object Remains in the Cache
Positive	Last-Modified (with any other headers)	Default (positive) (weakPosRel Expiry) and no other setting	Use the value of the Default (positive) expiry setting.
Positive	Expires or Cache-Control: Max-Age header is present Last-Modified header is absent	Heuristic (heurExpiry Param), Default (positive) (weakPosRel Expiry), or both	Subtract the current date from the Expires or the Cache-Control:Max-Age date.
Positive	no caching headers	Default (positive) (weakPosRel Expiry) and any other expiration setting.	Use the value of the Default (positive) setting.
Positive	no caching headers	Heuristic (heurExpiry Param) is present Default (positive) (weakPosRel Expiry) setting is absent	If the Last-Modified header is absent, the response is not cached or it is cached with an Already Expired status. If the Last-Modified header is present, use the heuristic expiry value.
Negative	Expires or Cache-Control:Max-Age	Expire Content After (relExpiry), Expire Content At (absExpiry), or both settings	Subtract the current date from the value of the Expires header, or use the value of the Cache-Control:Max-Age header.
Negative	Expires or Cache-Control headers are absent	Expire Content After (relExpiry), Expire Content At (absExpiry), or both settings	Response is not cached, or is cached with an Already Expired status.
Negative	Expires or Cache-Control:Max-Age	Any setting	Subtract the current date from the Expires or Cache-Control:Max-Age date.
Negative	Expires and Cache-Control:Max-Age headers are absent	Default (negative) (weakNegRel Expiry)	Use the value of the Default (negative) setting.
Negative	Expires and Cache-Control:Max-Age headers are absent	Any setting other than Default (negative) (weakNegRel Expiry)	Object is not cached or is cached with an Already Expired status.

Expiring a Content Group Manually

Aug 04, 2014

You can manually expire all of the entries in a content group.

To manually expire all responses in a content group by using the command line interface

At the command prompt, type:

expire cache contentGroup <name>

To manually expire all responses in a content group by using the configuration utility

Navigate to Optimization > Integrated Caching > Content Groups, select the content group, and click Invalidate to expire all the responses in a content group.

To manually expire all responses in the cache by using the configuration utility

Navigate to Optimization > Integrated Caching > Content Groups, and click Invalidate All to expire all the responses in cache.

Configuring Periodic Expiration of a Content Group

Aug 08, 2014

You can configure a content group so that it performs selective or full expiration of its entries. The expiration interval can be fixed or relative.

To configure content group expiration by using the command line interface

At the command prompt, type:

set cache contentgroup <name> (-relExpiry | -relExpiryMilliSec | -absExpiry | -absExpiryGMT | -heurExpiryParam | -weakPosRelExpiry | -weakNegRelExpiry | -expireAtLastBye) <expirationValue>

To configure content group expiration by using the configuration utility

Navigate to Optimization > Integrated Caching > Content Groups, select the content group, and specify expiry method.

Expiring Individual Responses

Expiring a response forces the NetScaler appliance to fetch a refreshed copy from the origin server. Responses that do not have validators, for example, ETag or Last-Modified headers, cannot be revalidated. As a result, flushing these responses has the same effect as expiring them.

To expire a cached response in a content group for static data, you can specify a URL that must match the stored URL. If the cached response is part of a parameterized content group, you must specify the group name as well as the exact URL stem. The host name and the port number must be the same as in the host HTTP request header of the cached response. If the port is not specified, port 80 is assumed.

To expire individual responses in a content group by using the command line interface

At the command prompt, type:

expire cache object -url <URL> -host <hostName> [-port <port>] [-groupName <contentGroupName>] [-httpMethod GET | POST]

To expire individual responses in a content group by using the command line interface (selector-based)

At the command prompt, type the following command:

expire cache object -locator <positiveInteger>

To expire a cached response by using the configuration utility

Navigate to Optimization > Integrated Caching > Cached Objects, select the cached response, and expire.

To expire a response by using the Lookup tool (selector-based)

Navigate to Optimization > Integrated Caching > Cached Objects, click Search and, set the search criteria to find the required cached response and expire.

Flushing Responses in a Content Group

You can remove, or flush, all responses in a content group, some responses in a group, or all responses in the cache. Flushing

a cached response frees up memory for new cached responses.

Note: To flush responses for more than one object at a time, use the configuration utility method. The command line interface does not offer this option.

To flush responses from a content group by using the command line interface

At the command prompt, type:

flush cache contentGroup <name> [-query <queryString> | [-selectorValue <selectorExpressionIDList> -host <hostName>]]

To flush responses from a content group by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups.
2. In details pane, flush the responses as follows:
   - To flush all responses in all content groups, click Invalidate All, and flush all the responses.
   - To flush responses in a particular content group, select the content group, click Invalidate, and flush all the responses.

Note: If this content group uses a selector, you can selectively flush responses by entering a string in the Selector value text box, entering a host name in the Host text box. Then click Flush and OK. The Selector value can be a query string of up to 2319 characters that is used for parameterized invalidation.
If the content group uses an invalidation parameter, you can selectively flush responses by entering a string in the Query field.

If the content group uses an invalidation parameter and Invalidate objects belonging to target host is configured, enter strings in the Query and Host fields.

To flush a cached response by using the command line interface

At the command prompt, type:

flush cache object -locator <positiveInteger> | -url <URL> -host <hostName> [-port <port>] [-groupName <contentGroupName>] [-httpMethod GET | POST]

To flush a cached response by using the configuration utility

Navigate to Optimization > Integrated Caching > Cached Objects, select the cached object, and flush.

Deleting a Content Group

You can remove a content group if it is not used by any policy that stores responses in the cache. If the content group is bound to a policy, you must first remove the policy. Removing the content group removes all responses stored in that group.

You cannot remove the Default, BASEFILE, or Deltajs group. The Default group stores cached responses that do not belong in any other content group.

To delete a content group by using the command line interface

At the command prompt, type:

rm cache contentgroup<name>

To delete a content group by using the configuration utility

Navigate to Optimization > Integrated Caching > Contetn Groups, select the content group, and delete.

Configuring Policies for Caching and Invalidation

Aug 30, 2013

Policies enable the integrated cache to determine whether to try to serve a response from the cache or the origin. The Citrix NetScaler appliance provides built-in policies for integrated caching, and you can configure additional policies. When you configure a policy, you associate it with an action. An action either caches the objects to which the policy applies or invalidates (expires) the objects. Typically, you based caching policies on information in GET and POST requests. You typically base invalidation policies on the presence of the POST method in requests, along with other information. You can use any information in a GET or POST request in a caching or an invalidation policy.

You can view some of the built-in policies in the integrated cache's Policies node in the configuration utility. The built-in policy names begin with an underscore (_).

Actions determine what the NetScaler appliance does when traffic matches a policy. The following actions are available:

- **Caching actions**. Policies that you associate with the CACHE action store responses in the cache and serve them from the cache.
- **Invalidation actions**. Policies that you associate with the INVAL action immediately expire cached responses and refresh them from the origin server. Note that for Web-based applications, invalidation policies often evaluate POST requests.
- **"Do not cache" actions**. Policies that you associate with a NOCACHE action never store objects in the cache.
- **"Provisionally cache" actions**. Policies that you associate with a MAYCACHE or MAYNOCACHE action depend on the outcome of additional policy evaluations.

Although the integrated cache does not store objects specified by the LOCK method, you can invalidate cached objects upon receipt of a LOCK request. For invalidation policies only, you can specify LOCK as a method by using the expression `http.req.method.eq("lock")`. Unlike policies for GET and POST requests, you must enclose the LOCK method in quotes because the NetScaler appliance recognizes this method name as a string only.

After you create a policy, you bind it to a particular point in the overall processing of requests and responses. Although you create a policy before binding it, you should understand how the bind points affect the order of processing before you create your policies.

The policies bound to a particular bind point constitute a policy bank. You can use goto expressions to modify the order of execution in a policy bank. You can also invoke policies in other policy banks. In addition, you can create labels and bind policies to them. Such a label is not associated with a processing point, but the policies bound to it can be invoked from other policy banks.

Actions to Associate with Integrated Caching Policies

Mar 16, 2012

The following table describes actions for integrated caching policies.

Table 1. Actions That You Can Associate with an Integrated Caching Policy

Action	Specifies
CACHE	Serves a response from the cache if the response has not expired. If the response must be fetched from the origin server, the NetScaler appliance caches the response before serving it. Even data that is updated and accessed frequently can be cached. For example, stock quotes are updated frequently, but they can be cached so that they can be served quickly to multiple users. If necessary, cached data can be refreshed immediately after it is downloaded. A CACHE action can be overridden by built-in policies.
NOCACHE	Always fetches the response from the origin server and marks the response as non-storable. You typically configure NOCACHE policies for data that is sensitive or personalized.
MAY_CACHE	Used in a request-time policy, this setting provisionally enables a response to be stored in a content group, pending evaluation of response-time policies. The following are possible: • If a matching response-time policy has a CACHE action but does not specify a content group, the response is stored in the Default group unless built-in policies override this policy. • If a matching response-time policy has a CACHE action and specifies the same content group as the one in the request-time policy, the response is stored in the named content group unless built-in policies override this policy. • If a matching response-time policy has a CACHE action but specifies a different content group from the one in the request-time policy, a NOCACHE action is applied. • If a matching response-time policy has a NOCACHE action, perform a NOCACHE action. • If there is no matching response-time policy, a CACHE action is applied, unless a built-in policy overrides this policy.
MAY_NOCACHE	For a request-time policy, this setting provisionally prevents caching the response. At response time, one of following actions is taken: • If no response-time policy matches the request, the final action is NOCACHE. • If a matching response-time policy contains a CACHE action, the final action is CACHE, unless built-in policies override this policy. • If a matching response-time policy contains a NOCACHE action, the final action is NOCACHE. • If a matching response-time policy has a CACHE action but does not specify a content group, the final action is to CACHE the response in the Default content group, unless built-in policies override this policy.

Action	Specifies
INVAL	Expires cached responses. Depending on how the policy and the content group are configured, all responses in one or more content groups are expired, or selected objects in the content group are expired. Note: You can specify INVAL actions in request-time policies only.

Bind Points for a Policy

Oct 28, 2013

You can bind the policy to one of the following bind points:

- **A global policy bank**. These are the request-time default, request-time override, response-time default, and response-time override policy banks, as described in "Order of Policy Evaluation."
- **A virtual server**. Policies that you bind to a virtual server are processed after the global override policies and before the global default policies, as described in "Order of Policy Evaluation." Note that when binding a policy to a virtual server, you bind it to either request-time or response-time processing.
- **An ad-hoc policy label**. A policy label is a name assigned to a policy bank. In addition to the global labels, the integrated cache has two built-in custom policy labels:
  - **_reqBuiltinDefaults**. This policy label, by default, is invoked from the request-time default policy bank.
  - **_resBuiltinDefaults**. This policy label, by default, is invoked from the response-time default policy bank.

  You can also define new policy labels. Policies bound to a user-defined policy label must be invoked from within a policy bank for one of the built-in bind points. For more information about creating a policy label, see "Configuring a Policy Label in the Integrated Cache." For more information about policy label invocation, see "Configuring a Policy Bank for Caching."

Important: You should bind a policy with an INVAL action to a request-time override or a response-time override bind point. To delete a policy, you must first unbind it.

Order of Policy Evaluation

For an advanced policy to take effect, you must ensure that the policy is invoked at some point during the NetScaler appliance's processing of traffic. To specify the invocation time, you associate the policy with a bind point. The following are the bind points, listed in order of evaluation:

- **Request-time override**. If a request matches a request-time override policy, by default request-time policy evaluation ends and the NetScaler appliance stores the action that is associated with the matching policy.
- **Request-time load balancing virtual server**. If policy evaluation cannot be completed after all the request-time override policies are evaluated, the NetScaler appliance processes request-time policies that are bound to load balancing virtual servers. If the request matches one of these policies, evaluation ends and the NetScaler appliance stores the action that is associated with the matching policy.
- **Request-time content switching virtual server**. Policies that are bound to this bind point are evaluated after request-time policies that are bound to load balancing virtual servers.
- **Request-time default**. If policy evaluation cannot be completed after all request-time, virtual server-specific policies are evaluated, the NetScaler appliance processes request-time default policies. If the request matches a request-time default policy, by default request-time policy evaluation ends and the NetScaler appliance stores the action that is associated with the matching policy.
- **Response-time override**. Similar to request-time override policy evaluation.
- **Response-time load balancing virtual server**. Similar to request-time virtual server policy evaluation.
- **Response-time content switching virtual server**. Similar to request-time virtual server policy evaluation.
- **Response-time default**. Similar to request-time default policy evaluation.

You can associate multiple policies with each bind point. To control the order of evaluation of the policies associated with the bind point you configure a priority level. In the absence of any other flow control information, policies are evaluated according to priority level, starting with the lowest numeric priority value.

After all integrated caching policies have been evaluated, if there are conflicting actions specified in request-time and response-time policies, the NetScaler appliance determines the final action as specified in the table, "Actions That You Can Associate with an Integrated Caching Policy."

Note: Request-time policies for POST data or cookie headers must be invoked during request-time override evaluation, because the built-in request-time policies in the integrated cache return a NOCACHE action for POST requests and a MAY_NOCACHE action for requests with cookies. Note that you would associate MAY_CACHE or MAY_NOCACHE actions with a request-time policy that points to a parameterized content group. The response time policy determines whether the transaction is stored in the cache.

Configuring a Policy in the Integrated Cache

Aug 07, 2014

You configure new policies to handle data that the built-in policies cannot process. You configure separate policies for caching, preventing caching from occurring, and for invalidating cached data. Following are the main components of a policy for integrated caching:

- Rule: A logical expression that evaluates an HTTP request or response.
- Action: You associate a policy with an action to determine what to do with a request or response that matches the policy rule.
- Content groups: You associate the policy with one or more content groups to identify where the action is to be performed.

To configure a policy for caching by using the command line interface

At the command prompt, type:

add cache policy <policyName> -rule <expression> -action CACHE | MAY_CACHE | NOCACHE | MAY_NOCACHE [-storeInGroup <contentGroupName>] [-undefAction NOCACHE | RESET]

Examples

```
> add cache policy image_cache -rule "http.req.url.contains(\"jpg\") || http.req.url.contains(\"jpeg\")" -action CACHE -storeingroup myImages_group -undefaction NOCACHE
> add cache policy bugReportPolicy -rule "http.req.url.query.contains(\"IssuePage\")" -action CACHE -storeInGroup bugReportGroup
> add cache policy my_form_policy -rule "http.req.header(\"Host\")contains(\"my.company.com\") && http.req.method.eq(\"GET\") && http.req.url.query.contains(\"v=7\")" -
> add cache policy viewproducts_policy –rule "http.req.url.contains(\"viewproducts.aspx\")" –action CACHE -storeInGroup Product_Details
```

To configure a policy for invalidation by using the command line interface

At the command prompt, type:

add cache policy <policyName> -rule <expression> -action INVAL [-invalObjects "<contentGroupName1>[,<selectorName1>"]. . .]] | [-invalGroup <contentGroupName1>[, <contentGroupName2>. . .]] [-undefAction NOCACHE | RESET]

Examples

```
> add cache policy invalidation_events_policy -rule "http.req.header(\"Host\")contains(\"my.company.com\") && http.req.method.eq(\"GET\") && http.req.url.query.contains
> add cache policy inval_all -rule "http.req.method.eq(\"POST\") && http.req.url.contains(\"jpeg\")" -action INVAL -invalGroups myImages_group myApps_group PDF_group
> add cache policy bugReportInvalidationPolicy -rule "http.req.url.query.contains(\"TransitionForm\")" -action INVAL -invalObjects bugReport
> add cache policy editproducts_policy –rule "http.req.url.contains(\"editproducts.aspx\")" –action INVAL -invalObjects "Product_Details,batchnum_sel" "Products_In_Depo
```

To configure a policy for caching or invalidation by using the configuration utility

Navigate to Optimization > Integrated Caching > Policies, and create the new policy.

Globally Binding an Integrated Caching Policy

Aug 08, 2014

When you globally bind a policy, it is available to all virtual servers on the NetScaler appliance.

To bind an integrated caching policy globally by using the command line interface

At the command prompt, type:

bind cache global <policy> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT] [-gotoPriorityExpression <expression>] [-invoke <labelType> <labelName>]

Example

```
> bind cache global myCachePolicy -priority 100 -type req_default
```

Note that the type argument is optional for globally bound policies, to maintain backward compatibility with policies that you defined using earlier versions of the NetScaler appliance. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. If the rule contains both request time and response time parameters, it is bound to RES_DEFAULT. Following is an example of a binding that omits the type.

```
> bind cache global myCache Policy 200
```

To bind an integrated caching policy globally by using the configuration utility

1. Navigate to Optimization > Integrated Caching.
2. In the details pane, click Cache policy manager.
3. In the Cache Policy Manager dialog box, select a Request or Response bind point, and then select a second level of binding of either Override Global or Default Global. A list of policies appears. These are policies that are bound to this bind point.
4. Click Insert Policy and do one of the following:
   - To configure a new policy, click New Policy and configure the new policy as described in "Configuring a Policy in the Integrated Cache."
   - To bind an existing policy, click the name of the policy.
5. Drag and drop the policy to the position in the policy bank where you want it to be evaluated, or manually enter a priority level, as a positive integer, for this entry in the Priority field.
6. Optionally, to configure a Goto expression as described in the "Policies and expressions", double-click the field in the Goto Expression column, and enter valid priority level, the keywords NEXT or END, or an advanced expression. See "Entries to Control Evaluation Flow in a Policy Bank" for details.
7. Optionally, to invoke an external policy bank, click the field in the Invoke Type column, and select the type of policy bank that you are adding (a global label or a virtual server bank). In the Invoke Name field, enter the label or virtual server name. See "Entries to Control Evaluation Flow in a Policy Bank" for details.
8. Click Apply Changes.

Binding an Integrated Caching Policy to a Virtual Server

Aug 08, 2014

When you bind a policy to a virtual server, it is available only to requests and responses that match the policy and that flow through the relevant virtual server.

When using the configuration utility, you can bind the policy using the configuration dialog box for the virtual server. This enables you to view all of the policies from all NetScaler modules that are bound to this virtual server. You can also use the Policy Manager configuration dialog for the integrated cache. This enables you to view only the integrated caching policies that are bound to the virtual server.

To bind an integrated caching policy to a virtual server by using the command line interface

At the command prompt, type:

- bind lb vserver <name>@ -policyName <policyName> -priority <positiveInteger> -type (REQUEST | RESPONSE)
- bind cs vserver <name>@ -policyName <policyName> -priority <positiveInteger> -type (REQUEST | RESPONSE)

To bind an integrated caching policy to a virtual server by using the configuration utility (virtual server method)

- CS Virtual Server - Navigate toTraffic Management > Content Switching > Virtual Servers, select the virtual server, and bind relevant cache policies.
- LB Virtual Server - Navigate toTraffic Management > Load Balancing > Virtual Servers, select the virtual server, and bind relevant cache policies.

To bind an integrated caching policy to a virtual server by using the configuration utility (Policy Manager method)

1. Navigate to Optimization > Integrated Caching.
2. In the details pane, click Cache policy manager.
3. In the Cache Policy Manager dialog box, select a Request or Response bind point, select a second level of binding of either LB Virtual Server or CS Virtual Server, and then select the name of a virtual server. A list of policies appears. These are integrated caching policies that are bound to this virtual server.
4. Click Insert Policy and do one of the following:
   - To configure a new policy, click New Policy and configure the new policy as described in "Configuring a Policy in the Integrated Cache."
   - To bind an existing policy, click the name of the policy.
5. Drag and drop the policy to the position in the policy bank where you want it to be evaluated, or manually enter a priority level, as a positive integer, for this entry in the Priority field.
6. Optionally, configure a Goto expression as described in "Configuring a Policy Bank for Caching."
7. Optionally, to invoke an external policy bank, click the field in the Invoke Type column, and select the type of policy bank that you are adding (a global label or a virtual server bank). In the Invoke Name field, enter the label or virtual server name. See "Entries to Control Evaluation Flow in a Policy Bank."
8. Click Apply Changes.

Example: Caching Compressed and Uncompressed Versions of a File

Mar 16, 2012

By default, a client that can handle compression can be served uncompressed responses or compressed responses in gzip, deflate, compress, and pack200-gzip format. If the client handles compression, an Accept-Encoding:compression format header is sent in the request. The compression type accepted by the client must match the compression type of the cached object. For example, a cached .gzip file cannot be served in response to a request with an Accept-Encoding:deflate header.

A client that cannot handle compression is served a cache miss if the cached response is compressed.

For dynamic caching, you need to configure two content groups, one for compressed data and one for uncompressed versions of the same data. The following is an example of configuring the selectors, content groups, and policies for serving uncompressed files from the cache to clients that cannot handle compression, and serving compressed versions of the same files to client that can handle compression.

```
add cache selector uncompressed_response_selector http.req.url "http.req.header(\"Host\")"
add cache contentGroup uncompressed_group -hitSelector uncompressed_responst_selector -invalSelector uncomp_resp_sel
add cache policy cache_uncompressed -rule "HTTP.REQ.URL.CONTAINS(\"xyz\") && !HTTP.REQ.HEADER(\"Accept-Encoding\").EXISTS" -action CACHE -storeInGroup uncomp
bind cache global cache_uncompressed -priority 100 -gotoPriorityExpression END -type REQ_OVERRIDE
add cache selector compressed_response_selector HTTP.REQ.URL "HTTP.REQ.HEADER(\"Host\")" "HTTP.REQ.HEADER(\"Accept-Encoding\")"
add cache contentGroup compressed_group -hitSelector compressed_response_selector
add cache policy cache_compressed -rule "HTTP.REQ.URL.CONTAINS(\"xyz\") && HTTP.REQ.HEADER(\"Accept-Encoding\").EXISTS" -action CACHE -storeInGroup compresse
bind cache global cache_compressed -priority 200 -gotoPriorityExpression END -type REQ_OVERRIDE
```

Configuring a Policy Bank for Caching

Aug 08, 2014

All of the policies that are associated with a particular bind point are collectively known as a policy bank. In addition to configuring priority levels for policies in a bank, you can modify the order of evaluation order in a bank by configuring Goto expressions. You can further modify the evaluation order by invoking an external policy bank from within the current policy bank. You can also configure new policy banks, to which you assign your own labels. Because such policy banks are not bound to any point in the processing cycle, they can be invoked only from within other policy banks. For convenience, policy banks whose labels do not correspond to a built-in bind point are called policy labels.

In addition to controlling order of policy evaluation by binding the policy and assigning a priority level, as described in "Binding Policies That Use the Default Syntax", you can establish the flow within a bank of policies by configuring a Goto expression. A Goto expression overrides the flow that is determined by the priority levels. You can also control the evaluation flow by invoking an external policy bank after evaluating an entry in the current bank. Evaluation always returns to the current bank after evaluation has completed for the external bank.

The following table summarizes the entries to control evaluation in a policy bank.

Table 1. Entries to Control Evaluation Flow in a Policy Bank

Attribute	Specifies
Name	The name of a policy, or, to invoke another policy bank without evaluating the policy, the keyword NOPOLICY. You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.
Priority	An integer. The lower the integer, the higher the priority.
Goto Expression	Determines the next policy or policy bank to evaluate. You can provide one of the following values: • **NEXT**: Go to the policy with the next higher priority. • **END**: Stop evaluation. • **USE_INVOCATION_RESULT**: Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT. • **Positive number**: Priority number of the next policy to be evaluated. • **Numeric expression**: Expression that produces the priority number of the next policy to be evaluated. The Goto can only proceed forward in a policy bank. Omitting the Goto expression is the same as specifying END.
Invocation Type	Designates a policy bank type. The value can be one of the following: • **Request Vserver**: Invokes request-time policies that are associated with a virtual server.

Attribute	Specifies
	• **Response Vserver**: Invokes response-time policies that are associated with a virtual server. • **Policy label**: Invokes another policy bank, as identified by the policy label for the bank.
Invocation Name	Name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

The integrated cache has two built-in policy labels, and you can configure additional policy labels:

- **_reqBuiltInDefaults**: This policy label is invoked from the request-time default bind point.
- **_resBuiltInDefaults**: This policy label is invoked from the response-time default bind point.

Note: For information about creating policy labels, see "Configuring a Policy Label in the Integrated Cache."

To invoke a policy label in a caching policy bank by using the command line interface

At the command prompt, type:

bind cache policylabel <labelName> -policname<policyName> -priority<priority> [-gotoPriorityExpression <gotopriorityExpression>] [-invoke <labelType> <labelName>]

To invoke a policy label in a caching policy bank by using the configuration utility

1. Navigate to Optimization > Integrated Caching, click Cache policy manager, and specify the relevant bind point (Override Global or Default Global) and connection type to view the list of policies bound to this bind point.
2. If you want to invoke a policy label without evaluating a policy, click NOPOLICY.
   Note: To invoke an external policy bank, click the field in the Invoke Type column, and select the type of policy bank that you want to invoke at this point in the policy bank. This can be a global label or a virtual server bank. In the Invoke Name field, enter the label or virtual server name. See "Entries to Control Evaluation Flow in a Policy Bank" for details.

To invoke a caching policy label in a virtual server policy bank by using the command line interface

At the command prompt, type:

- bind lb vserver <name>@ -policyName <policyName>|<NOPOLICY-CACHE> -priority <positiveInteger> -gotoPriorityExpression <expression> -type REQUEST|RESPONSE -invoke <labelType> <labelName>
- bind cs vserver <name> -policyName <policyName>|<NOPOLICY-CACHE> -priority <positiveInteger> -gotoPriorityExpression <expression> -type REQUEST|RESPONSE -invoke <labelType> <labelName>

For more information, see "Entries to Control Evaluation Flow in a Policy Bank."

To invoke a caching policy label in a virtual server policy bank by using the configuration utility

1. Navigate to Traffic Management > Load Balancing/Contetn Switching > Virtual Servers, select the virtual server, and click Policies.
2. If you are configuring an existing entry in this bank, skip this step. If you are adding a new policy to this policy bank, or you want to use the “dummy” NOPOLICY entry, click Add, and do one of the following:
   - To configure a new policy, click Cache and configure the new policy as described in "Configuring a Policy in the Integrated Cache."
   - To invoke a policy bank without processing a policy a rule, select the NOPOLICY-CACHE option.

   Note: To invoke an external policy bank, click the field in the Invoke Type column, and select the type of policy bank that you want to invoke at this point in the policy bank. This can be a global label or a virtual server bank. In the Invoke Name

field, enter the label or virtual server name. See "Entries to Control Evaluation Flow in a Policy Bank" for details.

Configuring a Policy Label in the Integrated Cache

Aug 08, 2014

In addition to configuring policies in a policy bank for one of the built-in bind points or a virtual server, you can create caching policy labels and configure banks of policies for these new labels.

A policy label for the integrated cache can be invoked only from one of the bind points that you can view in the Policy Manager in the **Integrated Caching** details pane (request override, request default, response override, or response default) or the built-in policy labels _reqBuiltinDefaults and _resBuiltinDefaults. You can invoke a policy label any number of times unlike a policy, which can only be invoked once.

The configuration utility provides an option to rename a policy label. Renaming a policy label does not affect the process of evaluation of the policies bound to the label.

Note: You can use the NOPOLICY “dummy” policy to invoke any policy label from another policy bank. The NOPOLICY entry is a placeholder that does not process a rule.

To configure a policy label for caching by using the command line interface

At the command prompt, type the following command to create a policy label and verify the configuration:

- add cache policylabel <labelName> -evaluates (REQ | RES)
- show cache policylabel <labelName>

Invoke this policy label from a policy bank. For more information, see "Configuring a Policy Bank for Caching."

To configure a policy label for caching by using the configuration utility

Navigate to Optimization > Integrated Caching > Policy Labels, add a policy label, and bind the cached policies.
Note: To ensure that the NetScaler ADC processes the policy label at the right time, configure an invocation of this label in one of the policy banks that are associated with the built-in bind points

To rename a policy label by using the configuration utility

Navigate to Optimization > Integrated Caching > Policy Labels, select the policy label, and rename.

Unbinding and Deleting an Integrated Caching Policy and Policy Label

Aug 08, 2014

You can unbind a policy from a policy bank, and you can delete it. To delete the policy, you must first unbind it. You can also remove a policy label invocation and delete a policy label. To delete the policy label, you must first remove any invocations that you have configured for the label.

You cannot unbind or delete the labels for the built-in bind points (request default, request override, response default, and response override).

To unbind a global caching policy by using the command line interface

At the command prompt, type:

unbind cache global <policy>

To unbind a virtual server-specific caching policy by using the command line interface

At the command prompt, type:

(unbind lb vserver | unbind cs vserver) <vserverName> -policyName <policyName> -type (REQUEST | RESPONSE)

To delete a caching policy by using the command line interface

At the command prompt, type:

rm cache policy <policyName>

To unbind a caching policy by using the configuration utility

Navigate to Optimization > Integrated Caching, click Cache Policy Manager, and unbind policies by specifying the relevant bind point and connection type (Request/Response).

To delete a policy label invocation by using the configuration utility

1. Navigate to Optimization > Integrated Caching, click Cache policy manager, and specify the relevant bing point (LB virtual server or CS virtual server) and connection type to view the list of cache policies bound to this virtual server.
2. In the policy Invoke column, clear the entry.

Caching Support for Database Protocols

Sep 02, 2013

The integrated cache monitors database requests that flow through the Citrix® NetScaler® appliance and caches them as determined by the cache policies. Users have to configure the cache polices for MYSQL and MSSQL protocols, because the NetScaler does not provide any default policies for these protocols. When configuring the protocols, remember that request based policies currently support CACHE and INVAL actions, while response based policies currently support only NOCACHE action. After configuring the policies, bind them to virtual servers. MYSQL and MSSQL policies, both request and response, can be bound only to virtual servers

Before creating a cache policy, create a cache content group of type MYSQL or MSSQL. When you create a MYSQL or MSSQL cache content group, associate at least one hit selector with it. See "Setting Up a Basic Content Group" for setting up cache content groups.

The following example illustrates the procedure for configuring and verifying cache support for SQL protocols.

```
> enable feature IC
> set cache parameter -memlimit 100
> add cache selector sel1 mssql.req.query.text

> add cache contentgroup cg1  -type "MSSQL" -hitselector "sel1" -invalselector "inval_sel" -relExpiry "500" -maxResSize
 "100"
> add cache policy cp1  -rule "mssql.req.query.command.contains(\"select\")" -action "CACHE" -storeInGroup "cg1"
> add cache policy cp2  -invalObjects "cg1" -rule "mssql.req.query.text.contains(\"insert\")" -action "INVAL"
> add db user user1  -password "Pass1"
> add service svc_sql_1 10.102.147.70 mssql 64834 -healthMonitor "NO" -downstateflush "ENABLED"
> add lb vserver lb_mssql1 mssql 10.102.147.77 1433  -lbmethod "roundrobin"
> bind lb vserver lb_mssql1 svc_sql_1
> bind lb vserver lb_mssql1 -policyName cp1  -type "REQUEST" -priority "2"
> bind lb vserver lb_mssql1 -policyName cp2  -type "REQUEST" -priority "1"

> show cache selector sel1
    Name:sel1
    Expressions:
    1)mssql.req.query.text
> show cache policy cp1
    Name:cp1
    Rule:mssql.req.query.command.contains("select")
    CacheAction:CACHE
    Stored in group: cg1
    UndefAction:Use Global
    Hits:2
    Undef Hits:0
    Policy is bound to following entities
    1) Bound to:
      REQ VSERVER lb_mssql1
      Priority:2
      GotoPriorityExpression: END
```

Note: The methods for reducing flash crowds, as explained in "Reducing Flash Crowds", are not supported for MYSQL and MSSQL protocols.

Configuring Expressions for Caching Policies and Selectors

Oct 28, 2013

A request-time expression examines data in request-time transaction, and a response-time expression examines data in a response-time transaction. In a policy for caching, if an expression matches data in a request or response, the Citrix NetScaler appliance takes the action associated with the policy. In a selector, request-time expressions are used to find matching responses that are stored in a content group.

Before configuring policies and selectors for the integrated cache, you need to know, at minimum, the host names, paths, and IP addresses that appear in HTTP request and response URLs. And you probably need to know the format of entire HTTP requests and responses. Programs such as Live HTTP Headers (http://livehttpheaders.mozdev.org/) or HTTPFox (https://addons.mozilla.org/en-US/firefox/addon/6647) can help you investigate the structure of the HTTP data that your organization works with.

Following is an example of an HTTP GET request for a stock quote program:

```
GET /quote.dll?page=dynamic&mode=data&mode=stock&symbol=CTXS&page=multi&selected=CTXS&random=0.00792039478975548 HTTP/1.1
Host: quotes.mystockquotes.com
User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9) Gecko/2008052906 Firefox/3.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-us,en;q=0.5
Accept-Encoding: gzip,deflate,compress,pack200-gzip
Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7
Keep-Alive: 300
Connection: keep-alive
Referer: http://quotes.mystockquotes.com/quote.dll?mode=stock&symbol=CTXS&page=multi&selected=CTXS
Cookie: __qca=1210021679-72161677-10297606
```

When configuring an expression, note the following limitations:

Table 1. Restrictions on Request-Time and Response-Time Expressions

Expression Type	Restrictions
Request	Do not configure request-time expressions in a policy with a CACHE or NOCACHE action. Use MAY_CACHE or MAY_NOCACHE instead.
Response	Configure response-time expressions in caching policies only. • Selectors can use only request-time expressions. • Do not configure response-time expressions in a policy with an INVAL action. Do not configure response-time expressions in a policy with a CACHE action and a parameterized content group. Use the MAY_CACHE action.

Note: For a comprehensive discussion of advanced expressions, see "Policies and Expression."

Expression Syntax

Following are basic components of the syntax:

- Separate keywords with periods (.), as follows:
  `http.req.url`
- Enclose string values in parentheses and quotes, as follows:
  `http.req.url.query.contains("this")`
- When configuring an expression from the command line, you must escape internal quote marks (the quotes that delimit values in the expression, as opposed to the quotes that delimit the expression). One method is to use a slash, as followings:
  `\"abc\"`

Selector expressions are evaluated in order of appearance, and multiple expressions in a selector definition are joined by a logical AND. Unlike selector expressions, you can specify Boolean operators and modify the precedence in an advanced expression for a policy rule.

Configuring an Expression in a Caching Policy or a Selector

Updated: 2014-08-04

Note that on the command line, the syntax for a policy expression is somewhat different from a selector expression. For a comprehensive discussion of advanced expressions, see "Policies and Expressions."

To configure a policy expression by using the command line interface

1. Start the policy definition as described in "Globally Binding an Integrated Caching Policy."
2. To configure the policy rule, delimit the entire rule in quotes, and delimit string values within the rule in escaped quotes.

   The following is an example:

   ```
   "http.req.url.contains(\"jpg\")"
   ```
3. To add Boolean values, insert &&, ||, or ! operators.

   The following are examples:

   ```
   "http.req.url.contains(\"jpg\") || http.req.url.contains(\"jpeg\")"
   "http.req.url.query.contains(\"IssuePage\")"
   "http.req.header(\"Host\")contains(\"my.company.com\") && http.req.method.eq(\"GET\") && http.req.url.query.contains(\"v=7\")"
   ```
4. To configure an order of evaluation for the constituent parts of a compound

   ```
   "http.req.url.contains(\"jpg\") || (http.req.url.contains(\"jpeg\") && http.req.method.eq(\"GET\"))"
   ```

To configure a selector expression by using the command line interface

1. Start the selector definition as described in "About Content Groups."
2. To configure the selector expression, delimit the entire rule in quotes, and delimit string values within the rule in escaped quotes.

   The following is an example:

   ```
   "http.req.url.contains(\"jpg\")"
   ```
3. You cannot add Boolean values, insert &&, ||, or ! operators. Enter each expression element delimited in quotes. Multiple expressions in the definition are treated as a compound expression joined by logical ANDs.

   The following are examples:

   ```
   "http.req.url.query.value(\"ProductId\")" "http.req.url.query.value(\"BatchNum\")" "http.req.url.query.value(\"depotLocation\")"
   ```

To configure a policy or selector expression by using the configuration utility

1. Start the policy or selector definition as described in "To configure a policy for caching or invalidation by using the configuration utility" or "To configure a selector by using the configuration utility."
2. In the Expression field, you can either manually type the default syntax by clicking Switch to Classic Syntax or create new expression using Expression Editor.
3. To insert an operator between two parts of a compound expression, click the Operators button and select the operator type. The following is an example of a configured expression with a Boolean OR (signaled by double vertical bars, ||):
4. Click Frequently Used Expressions drop-down to insert the commonly used expressions.
5. To test the expression, click the Evaluate. In the Expression Evaluator dialog box, select the Flow Type that matches the expression. In the data field, paste the HTTP request or response that you hope to parse using the expression, and click Evaluate.

Displaying Cached Objects and Cache Statistics

May 19, 2015

You can view particular cached objects, and you can view summary statistics on cache hits, misses, and memory usage. The statistics provide insight on the amount of data that is being served from the cache, what items are responsible for the largest performance benefit, and what you can tune to improve cache performance.

This section includes the following details:

- Viewing Cached Objects
- Finding Particular Cached Responses
- Viewing Cache Statistics

Viewing Cached Objects

Updated: 2014-08-04

After enabling caching, you can view details for cached objects. For example, you can view the following items:

- Response sizes and header sizes
- Status codes
- Content groups
- ETag, Last-Modified, and Cache-Control headers
- Request URLs
- Hit parameters
- Destination IP addresses
- Request and response times

To view a list of cached objects by using the command line interface

At the command prompt, type:

show cache object

Table 1. Properties of Cached Objects

Properties	Specifies
Response size (bytes)	The size of the response header and body.
Response header size (bytes)	The size of the header portion of the response.
Response status code	The status code sent with the response.

Properties	Specifies
ETag	The ETag header inserted in the response. Typically, this header indicates whether the response has changed recently.
Last-Modified	The Last-Modified header inserted in the response. This header indicates the date that the response was last changed.
Cache-Control	The Cache-Control header inserted in the response.
Date	The Date header that indicates when the response was sent.
Contentgroup	The content group where the response is stored.
Complex match	If this object was cached on the basis of parameterized values, this field value is YES.
Host	The host specified in the URL that requested this response.
Host port	The listen port for the host specified in the URL that requested this response.
URL	The URL issued for the stored response.
Destination IP	The IP address of the server from which this response was fetched.
Destination port	The listen port for the destination server.
Hit parameters	If the content group that stores the response uses hit parameters, they are listed in this field.
Hit selector	If this content group uses a hit selector, it is listed in this field.
Inval selector	If this content group uses an invalidation selector, it is listed in this field.
Selector Expressions	If this content group uses a selector, this field displays the expression that defines the selection rule.
Request time	The time in milliseconds since the request was issued.

Response time	Specifies in milliseconds since the cache started to receive the response.
Age	Amount of time the object has been in the cache.
Expiry	Amount of time after which the object is marked as expired.
Flushed	Whether the response has been flushed after expiry.
Prefetch	If Prefetch has been configured for this content group, the amount of time before expiry during which the object is fetched from the origin. Prefetch does not apply to negative objects (for example, 404 "object not found" responses).
Current readers	Approximately the current number of hits being served. When a response with a Content-Length header object is being downloaded, the current misses and the current readers values are each typically 1. When a chunked response object is being downloaded, the current misses value is typically 1, but the current readers value is typically 0, because the chunked response that is served to the client does not come from the integrated caching buffers.
Current misses	The current number of requests that resulted in a cache miss and fetching from the origin server. This value is typically 0 or 1. If Poll Every Time is enabled for a content group, the count can be greater than 1.
Hits	The number of cache hits for this object.
Misses	The number of cache misses for this object.
Compression format	The type of compression applied to this object. Compression formats include gzip, deflate, compress, and pack200-gzip.
HTTP version in response	The version of HTTP that was used to send the response.
Weak etag present in response	Strong etag headers change if the bits of an entity change. Strong headers are based on the octet values of an object. Weak etag headers change if the meaning of an entity changes. Weak etag values are based on semantic identity. Weak etags values start with a "W."
Negative marker cell	A marker object is cacheable, but it does not yet meet all the criteria for being cached. For example, the object may exceed the maximum response size for the content group. A marker cell is created for objects of this type. The next time a user sends a request for this object, a cache miss is served.

Properties	Specifies
Reason marker created	The reason a marker cell was created (for example, “Waiting for minhit,” “Content-length response data is not in group size limit”).
Auto poll every time	If the integrated cache receives an already expired 200 OK response with validators (either the Last-Modified or the ETag response headers) it stores the response and marks it as Auto-PET (automatically poll every time).
NetScaler Etag inserted in response	A variation of the ETag header generated by the NetScaler appliance. A value of YES appears if the NetScaler inserts an Etag in the response.
Full response present in cache	Indicates whether this is a complete response.
Destination IP verified by DNS	Indicates whether DNS resolution was performed when storing the object.
Object stored through a cache forward proxy	Indicates whether this response was stored due to a forward proxy that is configured in the integrated cache.
Object is a Delta basefile	A response that is delta-compressed.
Waiting for minhits	Indicates whether this content group requires a minimum number of origin server hits before caching a response.
Minhit count	If this content group requires a minimum number of origin server hits before caching an object, this field displays a count of the number of hits received so far.
HTTP Request Method	The method, GET or POST, used in the request that obtained this object.
Stored by policy	The name of the caching policy that caused this object to be stored. A value of NOT AVAILABLE indicates that the policy has been deactivated or deleted. A value of NONE indicates that the object did not match a visible policy, but was stored according to internal criteria for caching.

Properties	Specifies
Application firewall metadata exists	This parameter is used when the application firewall and the integrated cache are both enabled. The application firewall analyzes the contents of a response page, stores its metadata (for example, URLs and forms contained in page), and exports the metadata with the response to the cache. The cache stores the page and the metadata, and when the cache serves the page, it sends the metadata back to the request's session.
HTTP callout object, name, type, response	These cells indicate whether this data was stored as a result of an HTTP Callout expression, and provide information about various aspects of the callout and the corresponding response. For more information about HTTP callouts, see "HTTP Callouts".

To view cached objects by using the configuration utility

To view cached objects by using the configuration utility

Navigate to Optimization > Integrated Caching > Cache Objects. You can view all the cached objects and sort them accordingly as per your requirement.

Finding Particular Cached Responses

Updated: 2014-08-08

You can find individual items in the cache based on search criteria. There are different methods for finding cached items, depending on whether the content group that contains the data uses hit and invalidation selectors, as follows:

- If the content group uses selectors, you can only conduct the search using the Locator ID for the cached item.
- If the content group does not use selectors, you conduct the search using criteria such as URL, host, content group name, and so on.

When searching for a cached response, you can locate some items by URL and host. If the response is in a content group that uses a selector, you can find it only by using a Locator number (for example, 0x00000000ad7af00000050). To save a Locator number for later use, right-click the entry and select **Copy**. For more information about selectors, see "Configuring Selectors and Basic Content Groups."

To display cached responses in content groups that do not have a selector by using the command line interface

At the command prompt, type:

show cache object [-locator <positiveInteger>] | [(-url <URL> (-host <hostName> [-port <port>] [-groupName <contentGroupName>] [-httpMethod GET | POST])) | [-httpStatus<positive integer>] | -group <contentGroupName> | -ignoreMarkerObjects (ON | OFF) | -includeNotReadyObjects (ON | OFF)]

To display cached responses in content groups that have a selector by using the command line interface

At the command prompt, type:

show cache object -locator <locatorString> MarkerObjects (ON | OFF) | -includeNotReadyObjects (ON | OFF) | [-

httpStatus<positive integer>]

To display cached responses in content groups that do not have a selector by using the configuration utility

Navigate to Optimization > Integrated Caching > Cache Objects, click Search, and set the search criteria to view the required cached response.
If you have not yet configured any content groups, all of the objects are in the Default group.

To display cached responses in content groups that have a selector by using the configuration utility

Navigate to Optimization > Integrated Caching > Cache Objects, click Search, and set the selector search criteria to view the required cached response.

Viewing Cache Statistics

Updated: 2013-10-28

The following table summarizes the detailed cache statistics that you can view.

Table 2. Integrated Cache Statistics

Counter	Specifies
Hits	Responses that are found in and served from the integrated cache. Includes static objects such as image files, pages with status codes 200, 203, 300, 301, 302, 304, 307, 403, 404, 410, and responses that match a user-defined policy with a CACHE action..
Misses	Intercepted HTTP requests where the response was ultimately fetched from origin server.
Requests	Total cache hits plus total cache misses.
Non-304 hits	If the user requests an item more than once, and the item in the cache is unchanged since the last time the NetScaler appliance served it, the NetScaler appliance serves a 304 response instead of the cached object. This statistic indicates how many items the NetScaler appliance served from the cache, excluding 304 responses.
304 hits	Number of 304 (object not modified) responses the NetScaler appliance served from the cache.
304 hit ratio (%)	Percentage of 304 responses that the NetScaler appliance served, relative to other responses.
Hit ratio (%)	Percentage of responses that the NetScaler appliance served from the cache (cache hits) relative to

Counter	Specifies
	responses that could not be served from the cache.
Origin bandwidth saved (%)	An estimate of the processing capacity that the NetScaler appliance saved on the origin server due to serving responses from the cache.
Bytes served by the NetScaler	Total number of bytes that the NetScaler appliance served from the origin server and the cache.
Bytes served by cache	Total number of bytes that the NetScaler appliance served from the cache.
Byte hit ratio(%)	Percentage of data that the NetScaler appliance served from the cache, relative to all of the data in all served responses.
Compressed bytes from cache	Amount of data, in bytes, that the NetScaler appliance served in compressed form.
Storable misses	If the NetScaler appliance does not find a requested object in the cache, it fetches the object from the origin server. This is known as a cache miss. A storable cache miss can be stored in the cache.
Non-storable misses	A non-storable cache miss cannot be stored in the cache.
Misses	All cache misses.
Revalidations	Max-Age setting in a Cache-Control header determines, in number of seconds, when an intervening cache must revalidate the content with the integrated cache before serving it to the user. For more information, see "Inserting a Cache-Control Header."
Successful revalidations	Number of re-validations that have been performed. For more information, see "Inserting a Cache-Control Header."
Conversions to conditional req	A user-agent request for a cached PET object is always converted to a conditional request and sent to the origin server. For more information, see "Polling the Origin Server Every Time a Request Is Received."

Counter	Specifies
Storable miss ratio (%)	Storable cache misses as a percentage of non-storable cache misses.
Successful reval ratio (%)	Successful revalidations as a percentage of all revalidation attempts. For more information, see "Inserting a Cache-Control Header."
Expire at last byte	Number of times that the cache expired content immediately after receiving the last body byte. Only applicable to positive responses, as described in the table "Cache Hits and Misses." For more information, see "Example of Performance Optimization."
Flashcache misses	If you enable Flash Cache, the cache allows only one request to reach the server, eliminating flash crowds. This statistic indicates the number of Flash Cache requests that were cache misses. For more information, "Queuing Requests to the Cache."
Flashcache hits	Number of Flash Cache requests that were cache hits. For more information, see "Queuing Requests to the Cache."
Parameterized inval requests	Requests that match a policy with an invalidation (INVAL) action and a content group that uses an invalidation selector or parameters to selectively expire cached objects in the group.
Full inval requests	Requests that match an invalidation policy where the invalGroups parameter is configured and expires one or more content groups.
Inval requests	Requests that match an invalidation policy and result in expiration of specific cached responses or entire content groups.
Parameterized requests	Number of cache requests that were processed using a policy with a parameterized content group.
Parameterized non-304 hits	Number of cache requests that were processed using a policy with a parameterized content group, where full cached response was found, and the response was not a 304 (object not updated) response.
Parameterized 304 hits	Number of cache requests that were processed using a policy with a parameterized content group, where the cached object was found, and the object was a 304 (object not updated) response.
Total parameterized hits	Number of cache requests that were processed using a policy with a parameterized content group, where the cached object was found.

Counter	Specifies
Parameterized 304 hit ratio (%)	Percentage of 304 (object not updated) responses that were found using a parameterized policy, relative to all cache hits.
Poll every time requests	If Poll Every Time is enabled, the NetScaler appliance always consults the origin server before serving a stored object. For more information, see "Polling the Origin Server Every Time a Request Is Received."
Poll every time hits	Number of times a cache hit was found using the Poll Every Time method. For more information, see "Polling the Origin Server Every Time a Request Is Received."
Poll every time hit ratio (%)	Percentage of cache hits using the Poll Every Time method, relative to all searches for cached objects using Poll Every Time. For more information, see "Polling the Origin Server Every Time a Request Is Received."
Maximum memory (KB)	Maximum amount of memory in the NetScaler appliance that is allocated to the cache. For more information, see "Configuring Global Attributes for Caching."
Maximum memory active value (KB)	Maximum amount of memory (active value) that will be set after the memory is actually allocated to the cache. For more information, see "How to Configure the Integrated Caching Feature of a NetScaler Appliance for various Scenarios."
Utilized memory (KB)	Amount of memory that is actually being used.
Memory allocation failures	Number of failed attempts to utilize memory for the purpose of storing a response in the cache.
Largest response so far	Largest response in bytes found in either the cache or the origin server and sent to the client.
Cached objects	Number of objects in the cache, including responses that have not yet been fully downloaded and responses that have been expired but not yet flushed.
Marker objects	Marker objects are created when a response exceeds the maximum or minimum response size for the content group, or has not yet received the minimum number of hits for the content group.

Counter	Specifies
Hits being served	Number of hits that have been served from the cache.
Misses being handled	Responses that were fetched from the origin server, stored in the cache, and then served. Should approximate the number for storable misses. Does not include non-storable misses.

To view summary cache statistics by using the command line interface

At the command prompt, type:

stat cache

To view specific cache statistics by using the command line interface

At the command prompt, type:

stat cache -detail [-fullValues] [-ntimes <positiveInteger>] [-logFile <inputFilename>]

To view summary cache statistics by using the configuration utility

1. Click the Dashboard tab at the top of the page.
2. Scroll down to the Integrated Caching section of the window.
3. To see detailed statistics, click the More... link at the bottom of the table.

To view specific cache statistics by using the configuration utility

1. Click the Reporting tab at the top of the page.
2. Under Built-In Reports, expand Integrated Cache, and then click the report with the statistics you want to view.
3. To save the report as a template, click Save As and name the report. The saved report appears under Custom Reports.

Improving Cache Performance

May 19, 2015

You can improve the performance of integrated cache, including handling simultaneous requests for the same cached data, avoiding delays that are associated with refreshing cached responses from the origin server, and ensuring that a response is requested often enough to be worth caching.

This section includes the following details:

- Reducing Flash Crowds
- Caching a Response after a Client Halts a Download
- Requiring a Minimum Number of Server Hits before Caching
- Example of Performance Optimization

Reducing Flash Crowds

Updated: 2015-05-20

Flash crowds occur when many users simultaneously request the same data. All of the requests in a flash crowd can become cache misses if you configured the cache to serve hits only after the entire object is downloaded.

The following techniques can reduce or eliminate flash crowds:

- **PREFETCH**: Refreshes a positive response before it expires to ensure that it never becomes stale or inactive.
  For more information, see "Refreshing a Response Prior to Expiration."
- **Cache buffering**: Starts serving a response to multiple clients as soon as it receives the response header from the origin server, rather than waiting for the entire response to be downloaded.
  The only limit on the number of clients that can download a response simultaneously is the available system resources.

  The Citrix NetScaler appliance downloads and serves responses even if the client that initiated the download halts before the download is complete. If the size of the response exceeds the cache size or if the response is chunked, the cache stops storing the response, but service to the clients is not disrupted.
- **Flash Cache**: Flash Cache queues requests to the cache, and allows only one request to reach the server at a time.
  For more information, see "Queuing Requests to the Cache."

Refreshing a Response Before Expiration

To ensure that a cached response is fresh whenever it is needed, the PREFETCH option refreshes a response before its calculated expiration time. The prefetch interval is calculated after receiving the first client request. From that point onward, the NetScaler appliance refreshes the cached response at a time interval that you configure in the PREFETCH parameter.

This setting is useful for data that is updated frequently between requests. It does not apply to negative responses (for example, 404 messages).

To configure prefetch for a content group by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -prefetch YES [-prefetchPeriod <seconds> | -prefetchPeriodMilliSec <milliseconds>] [-

prefetchMaxPending <positiveInteger>]
To configure prefetch for a content group by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Others tab, in the Flash Crowd and Prefetch group, select Prefetch option, and specify the values in Interval and Maximum number of pending prefetches text boxes.

Queuing Requests to the Cache

The Flash Cache option queues requests that arrive simultaneously (a flash crowd), retrieves the response, and distributes it to all the clients whose requests are in the queue. If, during this process, the response becomes non-cacheable, the NetScaler appliance stops serving the response from the cache and instead serves the origin server's response to the queued clients. If the response is not available, the clients receive an error message.

Flash Cache is disabled by default. You cannot enable Poll Every Time (PET) and Flash Cache on the same content group.

One disadvantage of Flash Cache is if the server replies with an error (for example, a 404 that is quickly remedied), the error is fanned out to the waiting clients.

Note: If Flash Cache is enabled, in some situations the NetScaler appliance is unable to correctly match the Accept-Encoding header in the client request with the Content-Encoding header in the response. The NetScaler appliance can assume that these headers match and mistakenly serve a hit. As a work-around, you can configure Integrated Caching policies to disallow serving hits to clients that do not have an appropriate Accept-Encoding header.
To enable Flash Cache by using the command line interface

At the command prompt, type:

set cache contentgroup <contentGroupName> -flashcache yes
To enable Flash Cache by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Others tab, in the Flash Crowd and Prefetch group, select Prefetch option.

Caching a Response after a Client Halts a Download

Updated: 2014-08-08

You can set the Quick Abort parameter to continue caching a response, even if the client halts a request before the response is in the cache.

If the downloaded response size is less than or equal to the Quick Abort size, the NetScaler appliance stops downloading the response. If you set the Quick Abort parameter to 0, all downloads are halted.

To configure quick abort size by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -quickAbortSize <integerInKBytes>

To configure quick abort size by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Memory tab, set the relevant value in Quick Abort: Continue caching if more than text box.

Requiring a Minimum Number of Server Hits before Caching

Updated: 2015-05-19

You can configure the minimum number of times that a response must be found on the origin server before it can be cached. You should consider increasing the minimum hits if the cache memory fills up quickly and has a lower-than-expected hit ratio.

The default value for the minimum number of hits is 0. This value caches the response after the first request.

To configure the minimum number of hits that are required before caching by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -minhits <positiveInteger>

To configure the minimum number of hits that are required before caching by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Memory tab, set the relevant value in Do not cache, if hits are less than text box.

Example of Performance Optimization

Updated: 2013-10-28

In this example, a client accesses a stock quote. Stock quotes are highly dynamic. You configure the integrated cache to serve the same stock quote to concurrent clients without sending multiple requests to the origin server. The stock quote expires after it is downloaded to all of the clients, and the next request for a quote for the same stock is fetched from the origin server. This ensures that the quote is always up to date.

The following task overview describes the steps to configure the cache for the stock quote application.

Task overview: Configuring caching for a stock quote application

1. Create a content group for stock quotes.
   For more information, see "About Content Groups."

   Configure the following for this content group:

   - On the Expiry Method tab, select the Expire after complete response received check box.
   - On the Others tab, select the Flash Cache check box, and click Create.
2. Add a cache policy to cache the stock quotes.
   For more information, see "Configuring a Policy in the Integrated Cache."

   Configure the following for the policy:

   - In the Action and Store in Group lists, select CACHE and select the group that you defined in the previous step.
   - Click Add, and in the Add Expression dialog box configure an expression that identifies stock quote requests, for example:
     `http.req.url.contains("cgi-bin/stock-quote.pl")`

3. Activate the policy.
   For more information, see "Globally Binding an Integrated Caching Policy." In this example, you bind this policy to request-time override processing and set the priority to a low value.

Configuring Cookies, Headers, and Polling

May 20, 2015

This section describes the procedures to configure how the cache manages cookies, HTTP headers, and origin server polling, including modifying default behavior that causes the cache to diverge from documented standards, overriding HTTP headers that might cause cacheable content to not be stored in the cache, and configuring the cache to always poll the origin for updated content under specialized circumstances.

For details, see the following sections:

- Divergence of Cache Behavior from the Standards
- Removing Cookies from a Response
- Inserting HTTP Headers at Response Time
- Ignoring Cache-Control and Pragma Headers in Requests
- Polling the Origin Server Every Time a Request Is Received
- PET and Client-Specific Content
- PET and Authentication, Authorization, and Auditing

Divergence of Cache Behavior from the Standards

Updated: 2013-10-28

By default, the integrated cache conforms to the following standards:

- RFC 2616, "Hypertext Transfer Protocol HTTP/1.1"
- The caching behaviors described in RFC 2617, "HTTP Authentication: Basic and Digest Access Authentication"
- The caching behavior described in RFC 2965, "HTTP State Management Mechanism"

The built-in policies and the Default content group attributes ensure conformance with most of these standards.

The default integrated cache behavior diverges from the specifications as follows:

- There is limited support for the Vary header.
  By default, any response containing a Vary header is considered to be non-cacheable unless it is compressed. A compressed response contains `Content-Encoding: gzip`, `Content-Encoding: deflate`, or `Content-Encoding: pack200-gzip` and is cacheable even if it contains the `Vary: Accept-Encoding` header.
- The integrated cache ignores the values of the headers `Cache-Control: no-cache` and `Cache-Control: private`.
  For example, a response that contains `Cache-Control: no-cache="Set-Cookie"` is treated as if the response contained `Cache-Control: no-cache`. By default, the response is not cached.
- An image (Content-Type = image/*) is always considered cacheable even if an image response contains Set-Cookie or Set-Cookie2 headers, or if an image request contains a Cookie header.
  The integrated cache removes Set-Cookie and Set-Cookie2 headers from a response before caching it. This diverges from RFC 2965. You can configure RFC-compliant behavior as follows:

  ```
  add cache policy rfc_compliant_images_policy -rule "http.res.header.set-cookie2.exists || http.res.header.set-cookie.exists" -action NOCACHE
  bind cache global rfc_compliant_images_policy -priority 100 -type REQ_OVERRIDE
  ```
- The following Cache-Control headers in a request force an RFC-compliant cache to reload a cached response from the origin server:

  ```
  Cache-control: max-age=0
  Cache-control: no-cache
  ```
  To guard against Denial of Service attacks, this behavior is not the default. For more information, see "Inserting a Cache-Control Header."
- By default, the caching module considers a response to be cacheable unless a response header states otherwise.
  To make this behavior RFC 2616 compliant, set -weakPosRelExpiry and -weakNegResExpiry to 0 for all content groups.

Removing Cookies from a Response

Updated: 2014-08-12

Cookies are often personalized for a user, and typically should not be cached. The Remove Response Cookies parameter removes Set-Cookie and Set-Cookie2 headers before caching a response. By default, the Remove Response Cookies option for a content group prevents caching of responses with Set-Cookie or Set-Cookie2 headers.

Note that when images are cached, the built-in behavior is to remove the Set-Cookie and Set-Cookie2 headers before caching, no matter how the content group is configured.

Note: Citrix recommends that you accept the default Remove Response Cookies for every content group that stores embedded responses, for example, images.

To configure Remove Response Cookies for a content group by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -removeCookies YES

To configure Remove Response Cookies for a content group by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Others tab, in the Settings group, select Remove response cookies option.

Inserting HTTP Headers at Response Time

Updated: 2014-08-12

The integrated cache can insert HTTP headers in responses that result from cache hits. The Citrix® NetScaler® appliance does not alter headers in responses that result from cache misses.

The following table describes headers that you can insert in a response.

Table 1. Different HTTP Headers You Can Insert in a Response That Is Served from the Cache

Header	Specifies
Age	Provides the age of the response in seconds, calculated from the time the response was generated at the origin server. By default, the cache inserts an Age header for every response that is served from the cache.
Via	Lists protocols and recipients between the start and end points for a request or a response. The NetScaler appliance inserts a Via header in every response that it serves from the cache. The default value of the inserted header is “NS-CACHE-9.2:last octet of the NetScaler IP address.” For more information, see "Configuring Global Attributes for Caching."
ETag	The cache supports response validation using Last-Modified and ETag headers to determine if a response is stale. The cache inserts an ETag in a response only if it caches the response and the origin server has not inserted its own ETag header. The ETag value is an arbitrary unique number. The ETag value for a response changes if it is refreshed from the origin server, but it stays the same if the server sends a 304 (object not updated) response. Origin servers typically do not generate validators for dynamic content because dynamic content is considered non-cacheable. You can override this behavior. With ETag header insertion, the cache is permitted to not serve full responses. Instead, the user agent is required to cache the dynamic response sent by the integrated cache the first time. To force a user agent to cache a response, you configure the integrated cache to insert an ETag header and replace the origin-provided Cache-Control header.
Cache-Control	The NetScaler appliance typically does not modify cacheability headers in responses that is serves from the origin server. If the origin server sends a response that is labeled as non-cacheable, the client treats the response as non-cacheable even if the NetScaler appliance caches the response. To cache dynamic responses in a user agent, you can replace Cache-Control headers from the origin server. This applies only to user agents and other intervening caches. They do not affect the integrated cache. For more information, see "Inserting a Cache-Control Header."

Inserting an Age, Via, or ETag Header

The following procedures describe how to insert Age, Via, and ETag headers.

To insert an Age, Via, or Etag header by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -insertVia YES -insertAge YES -insertETag YES
To insert an Age, Via, or Etag header by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Others tab, in the HTTP Header Insertions group, select the Via, Age, or ETag options, as appropriate.
   The values for the other header types are calculated automatically. Note that you configure the Via value in the main settings for the cache.

Inserting a Cache-Control Header

When the integrated cache replaces a Cache-Control header that the origin server inserted, it also replaces the Expires header. The new Expires header contains an expiration time in the past. This ensures that HTTP/1.0 clients and caches (that do not understand the Cache-Control header) do not cache the content.

To insert a Cache-Control header by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -cacheControl <value>
To insert a Cache-Control header by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and
   1. Click Expiry Method tab, clear the heuristic and default expiry settings and set the relevant value in Expire content after text box.
   2. Click Others tab and type the header you want to insert in the Cache-Control text box. Alternatively, click Configure to set the Cache-Control directives in cached responses.

Ignoring Cache-Control and Pragma Headers in Requests

Updated: 2014-08-12

By default, the caching module processes Cache-Control and Pragma headers. The following tokens in Cache-Control headers are processed as described in RFC 2616.

- max-age
- max-stale
- only-if-cached
- no-cache

A Pragma: no-cache header in a request is treated in the same way as a Cache-Control: no-cache header.

If you configure the caching module to ignore Cache-Control and Pragma headers, a request that contains a Cache-Control: No-Cache header causes the NetScaler appliance to retrieve the response from the origin server, but the cached response is not updated. If the caching module processes Cache-Control and Pragma headers, the cached response is refreshed.

The following table summarizes the implications of various settings for these headers and the Ignore Browser's Reload Request setting.

Table 2. Outcome of Settings for Ignoring Reload Requests, Cache-Control, and Pragma Headers

Setting for Ignore Cache-Control and Pragma Headers	Setting for Ignore Browser's Reload Request	Outcome
Yes	Yes or No	Ignore the Cache-Control and Pragma headers from the client, including the Cache-Control: no-cache directive.
No	Yes	The Cache-Control: no-cache header produces a cache miss, but a response that is already in the cache is not refreshed.
No	No	A request that contains a Cache-Control: no-cache header causes a cache miss and the stored response is refreshed.

To ignore Cache-Control and Pragma headers in a request by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -ignoreReqCachingHdrs YES

To ignore browser reload requests by using the command line interface

At the command prompt, type:

set cache contentgroup <name> -ignoreReloadReq NO
Note that by default, the -ignoreReloadReq parameter is set to YES.

To ignore Cache-Control and Pragma headers in a request by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Others tab, in the Settings group, select Ignore Cache-control and Pragma Headers in Requests option.

Example of a Policy to Ignore Cache-Control Headers

In the following example, you configure a request-time override policy to cache responses that contain Content-type: image/* regardless of the Cache-Control header in the response.

To configure a request-time override policy to cache all responses with image/*

1. Flush the cache using the Invalidate All option.

   For more information, see "Flushing Responses in a Content Group."

2. Configure a new cache policy, and direct the policy to a particular content group. For more information, see "Configuring a Policy in the Integrated Cache."
3. Ensure the content group that the policy uses is configured to ignore Cache-Control headers, as described in "Ignoring Cache-Control and Pragma Headers in Requests."
4. Bind the policy to the request-time override policy bank.

   For more information, see "Globally Binding an Integrated Caching Policy."

Polling the Origin Server Every Time a Request Is Received

Updated: 2014-08-12

You can configure the NetScaler appliance to always consult the origin server before serving a stored response. This is known as Poll Every Time (PET). When the NetScaler appliance consults the origin server and the PET response has not expired, a full response from the origin server does not overwrite cached content. This property is useful when serving client-specific content.

After a PET response expires, the NetScaler appliance refreshes it when the first full response arrives from the origin server.

The Poll Every Time (PET) function works as follows:

- For a cached response that has validators in the form of an ETag or a Last-Modified header, if the response expires it is automatically marked PET and cached.
- You can configure PET for a content group.
  If you configure a content group as PET, every response in the content group is marked PET. The PET content group can store responses that do not have validators. Responses that are automatically marked PET are always expired. Responses that belong to a PET content group can expire after a delay, based on how you configure the content group.

Two types of requests are affected by polling:

- **Conditional Requests**: A client issues a conditional request to ensure that the response that it has is the most recent copy.
  A user-agent request for a cached PET response is always converted to a conditional request and sent to the origin server. A conditional request has validators in If-Modified-Since or If-None-Match headers. The If-Modified-Since header contains the time from the Last-Modified header. An If-None-Match header contains the response's ETag header value.

  If the client's copy of the response is fresh, the origin server replies with 304 Not Modified. If the copy is stale, a conditional response generates a 200 OK that contains the entire response.

- **Non-Conditional Requests**: A non-conditional request can only generate a 200 OK that contains the entire response.

The following table summarizes response types based on the origin server's response

Table 3. How Responses Are Affected by Poll Every Time

Origin Server Response	Action
Send the full response	The origin server sends the response as-is to the client. If the cached response has expired, it is refreshed.
304 Not Modified	The following header values in the 304 response are merged with the cached response and the cached response is served to the client: • Date • Expires • Age • Cache-Control header Max-Age and S-Maxage tokens
401 Unauthorized 400 Bad Request 405 Method Not Allowed 406 Not Acceptable	The origin's response is served as-is to the client. The cached response is not changed.

Origin Server Response	Action
407 Proxy Authentication Required	
Any other error response, for example, 404 Not Found	The origin's response is served as-is to the client. The cached response is removed.

Note: The Poll Every Time parameter treats the affected responses as non-storable.

To configure poll every time by using the command line interface

At the command prompt, type:

add cache contentgroup <contentGroupName> -pollEveryTime YES

To configure poll every time by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Content Groups, and select the content group.
2. On Others tab, in the Settings group, select Poll every time (validate cached content with origin for every request) option.

PET and Client-Specific Content

The PET function can ensure that content is customized for a client. For example, a Web site that serves content in multiple languages examines the Accept-Language request header to select the language for the content that it is serving. For a multi-language Web site where English is the predominant language, all English language content can be cached in a PET content group. This ensures that every request goes to the origin server to determine the language for the response. If the response is English, and the content has not changed, the origin server can serve a 304 Not Modified to the cache.

The following example shows commands to cache English responses in a PET content group, configure a named expression that identifies English responses in the cache, and configure a policy that uses this content group and named expression. Bold is used for emphasis:

```
add cache contentgroup EnglishLanguageGroup -pollEveryTime YES
add expression containsENExpression –rule "http.res.header(\"Content-Language\").contains(\"en\")"
add cache policy englishPolicy -rule containsENExpression -action CACHE -storeInGroup englishLanguageGroup
bind cache policy englishPolicy -priority 100 -precedeDefRules NO
```

PET and Authentication, Authorization, and Auditing

Outlook Web Access (OWA) is a good example of dynamically generated content that benefits from PET. All mail responses (*.EML objects) have an ETag validator that enables them to be stored as PET responses.

Every request for a mail response travels to the origin server, even if the response is cached. The origin server determines whether the requestor is authenticated and authorized. It also verifies that the response exists in the origin server. If all results are positive, the origin server sends a 304 Not Modified response.

Configuring the Integrated Cache as a Forward Proxy

Aug 08, 2014

The integrated cache can service as a forward proxy device that passes requests to other NetScaler appliances or to other types of cache servers. You configure the integrated cache as a forward proxy by identifying the IP addresses of the cache server or servers. After configuring the forward proxy, the NetScaler appliance sends requests that contain the configured IP address on to the cache server instead of involving the integrated cache.

To configure the NetScaler as a forward cache proxy by using the command line interface

At the command prompt, type:

add cache forwardProxy <IPAddress> <port>

To configure the NetScaler as a forward cache proxy by using the configuration utility

1. Navigate to Optimization > Integrated Caching > Forward Proxy, and add a forward proxy by specifying the IP address and port number.

Default Settings for the Integrated Cache

Aug 26, 2013

The Citrix NetScaler integrated cache feature provides built-in policies with default settings as well as initial settings for the Default content group. The information in this section defines the parameters for the built-in policies and Default content group.

Default Caching Policies

Updated: 2013-08-26

The integrated cache has built-in policies. The NetScaler appliance evaluates the policies in a particular order, as discussed in the following sections.

You can override these built-in policies with a user-defined policy that is bound to a request-time override or response-time override policy bank.

Note that if you configured policies prior to release 9.0 and specified the -precedeDefRules parameter when binding the policies, they are automatically assigned to override-time bind points during migration.

Viewing the Default Policies

The built-in policy names start with an underscore (_). You can view the built-in policies from the command line and the administrative console using the show cache policy command.

Default Request Policies

You can override the following built-in request time policies by configuring new policies and binding them to the request-time override processing point. In the following policies, note that the MAY_NOCACHE action stipulates that the transaction is cached only when there is a user-configured or built-in CACHE directive at response time.

The following policies are bound to the _reqBuiltinDefaults policy label. They are listed in priority order.

1. Do not cache a response for a request that uses any method other than GET.
   The policy name is **_nonGetReq**. The following is the policy rule:

   ```
   !HTTP.REQ.METHOD.eq(GET)
   ```

2. Set a NOCACHE action for a request with header value that contains If-Match or If-Unmodified-Since.
   The policy name is **_advancedConditionalReq**. The following is the policy rule:

   ```
   HTTP.REQ.HEADER("If-Match").EXISTS || HTTP.REQ.HEADER("If-Unmodified-Since").EXISTS
   ```

3. Set a MAY_NOCACHE action for a request with the following header values: Cookie, Authorization, Proxy-authorization or a request which contains the NTLM or Negotiate header.
   The policy name is **_personalizedReq**. The following is the policy rule:

   ```
   HTTP.REQ.HEADER("Cookie").EXISTS || HTTP.REQ.HEADER("Authorization").EXISTS ||
   HTTP.REQ.HEADER("Proxy-Authorization").EXISTS || HTTP.REQ.IS_NTLM_OR_NEGOTIATE
   ```

Default Response Policies

You can override the following default response-time policies by configuring new policies and binding them to the response-time override processing point.

The following policies are bound to the **_resBuiltinDefaults** policy label and are evaluated in the order in which they are listed:

1. Do not cache HTTP responses unless they are of type 200, 304, 307, 203 or if the types are between 400 and 499 or between 300 and 302.
   The policy name is **_uncacheableStatusRes**. The following is the policy rule:

   !((HTTP.RES.STATUS.EQ(200)) || (HTTP.RES.STATUS.EQ(304)) || (HTTP.RES.STATUS.BETWEEN(400,499)) || (HTTP.RES.STATUS.BETWEEN(300, 302)) || (HTTP.RES.STATUS.EQ(307))|| (HTTP.RES.STATUS.EQ(203)))

2. Do not cache an HTTP response if it has a Vary header with a value of anything other than Accept-Encoding.
   The compression module inserts the Vary: Accept_Encoding header. The name of this expression is **_uncacheableVaryRes**. The following is the policy rule:

   ((HTTP.RES.HEADER("Vary").EXISTS) && ((HTTP.RES.HEADER("Vary").INSTANCE(1).LENGTH > 0) || (!HTTP.RES.HEADER("Vary").STRIP_END_WS.SET_TEXT_MODE(IGNORECASE).eq("Accept-Encoding"))))

3. Do not cache a response if its Cache-Control header value is No-Cache, No-Store, or Private, or if the Cache-Control header is not valid.
   The policy name is **_uncacheableCacheControlRes**. The following is the policy rule:

   ((HTTP.RES.CACHE_CONTROL.IS_PRIVATE) || (HTTP.RES.CACHE_CONTROL.IS_NO_CACHE) || (HTTP.RES.CACHE_CONTROL.IS_NO_STORE) || (HTTP.RES.CACHE_CONTROL.IS_INVALID))

4. Cache responses if the Cache-Control header has one of the following values: Public, Must-Revalidate, Proxy-Revalidate, Max-Age, S-Maxage.
   The policy name is **_cacheableCacheControlRes**. The following is the policy rule:

   ((HTTP.RES.CACHE_CONTROL.IS_PUBLIC) || (HTTP.RES.CACHE_CONTROL.IS_MAX_AGE) || (HTTP.RES.CACHE_CONTROL.IS_MUST_REVALIDATE) || (HTTP.RES.CACHE_CONTROL.IS_PROXY_REVALIDATE) || (HTTP.RES.CACHE_CONTROL.IS_S_MAXAGE))

5. Do not cache responses that contain a Pragma header.
   The name of the policy is **_uncacheablePragmaRes**. The following is the policy rule:

   HTTP.RES.HEADER("Pragma").EXISTS

6. Cache responses that contain an Expires header.
   The name of the policy is **_cacheableExpiryRes**. The following is the policy rule:

   HTTP.RES.HEADER("Expires").EXISTS

7. If the response contains a Content-Type header with a value of Image, remove any cookies in the header and cache it.
   The name of the policy is **_imageRes**. The following is the policy rule:

   HTTP.RES.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).STARTSWITH("image/")

   You could configure the following content group to work with this policy:

```
add cache contentgroup nocookie_group -removeCookies YES
```

8. Do not cache a response that contains a Set-Cookie header.
   The name of the policy is **_ personalizedRes**. The following is the policy rule:

   ```
   HTTP.RES.HEADER("Set-Cookie").EXISTS || HTTP.RES.HEADER("Set-Cookie2").EXISTS
   ```

Restrictions on Default Policies

You cannot override the following built-in request time policies with user-defined policies.

These policies are listed in priority order.

1. Do not cache any responses if the corresponding HTTP request lacks a GET or POST method.
2. Do not cache any responses for a request if the HTTP request URL length plus host name exceeds 1744 byes.
3. Do not cache a response for a request that contains an If-Match header.
4. Do not cache a request that contains an If-Unmodified-Since header.
   Note that this is different from the If-Modified-Since header.
5. Do not cache a response if the server does not set an expiry header.

You cannot override the following built-in response time policies. These policies are evaluated in the order in which they are listed:

1. Do not cache responses that have an HTTP response status code of 201, 202, 204, 205, or 206.
2. Do not cache responses that have an HTTP response status code of 4xx, with the exceptions of status codes 403, 404, and 410.
3. Do not cache responses if the response type is FIN terminated, or the response does not have one of the following attributes: Content-Length, or Transfer-Encoding: Chunked.
4. Do not cache the response if the caching module cannot parse its Cache-Control header.

Initial Settings for the Default Content Group

When you first enable integrated caching, the NetScaler appliance provides one predefined content group named the Default content group. The following table shows the settings for this group.

Table 1. Predefined Settings for the Default Content Group

Parameter	Description	Default Value
Hit parameters	The hit parameters contain the parameter names that are significant for generating a response. In parameterized hit selection, NetScaler appliance matches the URL stem byte-for-byte, matches normalized values of the hit parameters, and matches the target service information.	none
Invalidation Parameters	These parameters mark a cached object as obsolete during parameterized selection. Specific objects, or all objects in a content group, are selected if the values of the	none

Parameter	Description	Default Value
	invalidation parameters in the object and in the request are same after normalization. The invalidation parameters are a subset of the hit parameters.	
Poll Every Time	Poll every time for the objects in this content group.	NO
Ignore reload request	Specifies whether a request can force the system to reload a cached object from the origin. To guard against Denial of Service attacks, you must set this flag to YES. To get RFC-compliant behavior you should set it to NO.	YES
Remove Response Cookies	If this option is disabled for a content group, and if the response contains cookies, the cookies are stored and served with every cache hit. By default, the remove cookies option is enabled for a content group, to prevent the integrated cache from storing any responses with Set-Cookie or Set-Cookie2 headers unless the response is an image.	YES
Prefetch	The Prefetch option refreshes an object when it is about to expire. This ensures that the object remains stale or inactive (and therefore it cannot be served) for a shorter duration of time.	YES
Prefetch period	This duration in seconds during which prefetch should be attempted, immediately before the object's calculated expiry time.	heuristic
Maximum outstanding prefetches	The number of items that can be subjected to a prefetch at a time.	4294967295
Flashcache	Determines whether to enable queuing of client requests and simultaneous distribution of responses to all clients in the queue.	NO
Expire at last byte	Determines whether to expire a cached response immediately after serving it.	NO
Insert Via header	Defines a string to be inserted in a Via header. By default, a Via header is inserted in all responses served from a content group. The Via header is not inserted for responses that are served by the origin server.	YES
Insert Age header	The Age header contains information about the age of the object in seconds as calculated by the integrated cache.	YES
Insert ETag header	With ETag header insertion, the integrated cache does not serve full responses on repeat requests. This is done by forcing the user agent to cache the dynamic response	YES

Parameter	Description	Default Value
	sent by the cache the first time.	
Cache-control header	You can enable caching of dynamic objects in the user agent by replacing the Cache-Control headers that are inserted by the origin server. You must configure the new Cache-Control header to be inserted in the content group.	NONE
Quick abort size	If the size of an object that is being downloaded is less than or equal to the quick abort value, and a client aborts during the download, the cache stops downloading the response. If the object is larger than the quick abort size, the cache continues to download the response.	4194303 KBytes (maximum)
Minimum Response Size	You can control memory use by setting a minimum response size. Cached objects must be larger than the minimum response size.	0 KBytes
Maximum Response Size	You can control memory use by setting a maximum response size. Cached objects must be smaller than the maximum response size.	80 KBytes
Memory usage limit	Sets the maximum amount of memory that the cache can use. The effective limit is based on the available memory of the NetScaler appliance. The minimum value is 0 and the maximum value is unlimited.	UNLIMITED
Ignore caching headers in request	Disregards Cache-Control and Pragma headers in HTTP requests.	YES
MinHits configured	Number of hits that are required to qualify a response for storage in this content group.	0
Always evaluate policies		NO
Pinned	By default, when the cache is full the NetScaler appliance replaces the least recently used response first. The NetScaler appliance does not apply this behavior to content groups that are marked as pinned.	NO
Lazy DNS resolution	If set to YES, DNS resolution is performed for responses only if the destination IP address in the request does not match the destination IP address of the cached response.	YES

Troubleshooting

Jul 22, 2013

If the integrated cache feature does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

Resources for Troubleshooting

Updated: 2013-07-22

For best results, use the following resources to troubleshoot an integrated cache issue on a NetScaler appliance:

- The relevant trace files
- The ns.conf file
- The RFC 2616 document
- A copy of the object, if possible

In addition to the above resources, the following tools expedite troubleshooting:

- The iehttpheaders or a similar utility
- The Wireshark application customized for the NetScaler trace files

Troubleshooting Integrated Caching Issues

Updated: 2013-08-02

The following are effective steps to troubleshoot the objects that are not cached:

1. **Verify that the Integrated Caching feature is enabled.**
   Run the following command to verify the feature is enabled:

   ```
   show ns feature
   ```

   Following is sample output of the above command:

   ```
   show ns feature
       Feature status:
                   Web Logging: OFF
             Surge Protection: OFF
               Load Balancing: ON
           Content Switching: ON
           Cache Redirection: OFF
                Sure Connect: OFF
          Compression Control: OFF
             Priority Queuing: OFF
              SSL Offloading: OFF
    Global Server Load Balancing: OFF
          Http DoS Protection: OFF
            Dynamic Routing: OFF
          Content Filtering: OFF
         Integrated Caching: ON
                  SSL VPN: OFF
   ```

OSPF Routing: OFF
RIP Routing: OFF
BGP Routing: OFF

Done

The entry highlighted in boldface (for reference) in the above output indicates that the integrated caching feature is enabled. If the feature is not enabled, run the following command to enable it:

enable ns feature IC

2. **Make sure that sufficient memory is available on the NetScaler appliance.**
   Depending on the size of the object to be cached, memory available to store the cacheable object might be insufficient. You can set the memory limit for the integrated cache either globally or for individual content groups.

   Run the following command to verify the memory allocated to integrated cache globally:

   show cache parameter

   Following is sample output of the above command:

   show cache parameter
   Integrated cache global configuration:
   Memory usage limit: 256 MBytes
   Via header: NS-CACHE-6.1: 101
   Verify cached object using: HOSTNAME_AND_IP
   Max POST body size to accumulate: 32768
   Current outstanding prefetches: 0
   Max outstanding prefetches: 4294967294
   Treat NOCACHE policies as BYPASS policies: YES

   Done

   The entry highlighted in boldface (for reference) in the preceding output indicates the amount of memory allocated to the integrated cache globally.

   Run the following command to verify the memory allocated to an individual content group:

   show cache contentGroup <Content_Group_Name>

   Following is sample output of the above command:

   show cache contentgroup content1
   Name: content1
   Heuristic expiry time parameter: 10 percent
   Weak relative expiry time - Positive responses: 3600 secs
   Weak relative expiry time - Negative responses: 600 secs
   Hit parameters: NONE
   Invalidation Parameters: NONE
   Invalidation restricted to host: NO
   Ignore parameter value case: NO
   Match Request Cookies: NO
   Poll Every Time: NO
   Ignore reload request: YES

```
Remove Response Cookies: YES
Prefetch: YES
Prefetch period: heuristic
Current outstanding prefetches: 0
Max outstanding prefetches: 4294967294
Flashcache: NO
Expire at last byte: NO
Insert Via header: YES
Insert Age header: YES
Insert ETag header: YES
Cache-control header: NONE
Quick abort size: 4194303 KBytes (MAXIMUM)
Minimum Response Size: 0 KBytes
Maximum Response Size: 80 KBytes
Memory usage: 0 Bytes
Memory usage limit: 64 MBytes
Ignore caching headers in request: YES
Non-304 hits: 0
304 hits: 0
Cached objects: 0
Number of times expired/flushed: 1
MinHits configured: 0
Always evaluate policies: NO
Pinned: NO
 Done
```

The entry highlighted in boldface (for reference) in the above output indicates the amount of memory allocated to the content group.

3. **Verify that cacheable object is small enough to be stored within the configured memory limits.**
   Complete the following procedure to make space for the object to be cached:
   - Run the following command to flush the cache for the content group to which the object belongs:
     `flush cache contentGroup <Content_Group_Name>`
   - Verify that the object is cached. If the object is cached successfully, increase the memory allocated for the content group. Otherwise, run the following command to flush the cache globally:
     `flush cache contentGroup ALL`
   - Verify that the object is cached. If the object is cached successfully, consider increasing the global memory limit. If the object is still not cached, something else is causing the failure to cache the object.

   The memory allocated to the integrated cache depends on the NetScaler appliance model. You can allocate approximately half the available memory to the integrated cache. Similarly, the maximum about to memory you can allocate for a content group cannot be more than the memory allocated for global cache.

   To increase the global memory limit for the integrated cache, run the following command:

   `set cache parameter -memLimit <Integer>`

   To increase the memory limit for a content group, run the following command:

set cache contentgroup <contentgroup name> -memLimit <Integer>

4. **Verify that the cache policy is bound to an appropriate bind point, an appropriate priority is set for the policy, and an appropriateprecedeDefRulesswitch is configured.**
   You must activate a caching policy by binding it globally. To verify that the policy is active, run the following command:

   show cache global

   Following is sample output of the above command:

   ```
   show cache global
   1)    Name: red_pol   State: ACTIVE   Priority: 1
         Rule: URL CONTAINS red
         Action: NOCACHE
         Precede default HTTP rules: YES
         Hits : 10
    Done
   ```

   In the output, verify the following settings:
   - **The policy is bound**: The output should contain all the active cache policies. If the cache policy for the object to be cached is not listed in the output, the policy is not yet bound. Run the following command to bind the policy globally:
     bind cache global <Policy_Name> -priority <Integer> [-precedeDefRules YES|NO]
   - **The policy is Active**: If the policy is bound, verify that the state of the policy is displayed as Active. The entry indicating that the policy in the preceding output is active is the first highlighted entry in the sample output of the show cache global command, above. The policy is active if it is bound globally and an appropriate priority is set. Otherwise, the status of the policy is showed as Passive.
   - **An appropriate priority is assigned to the policy**: The first highlighted entry in the sample output above displays the priority of the policy. If the priority is not set, you can use the bind command to set the priority of the policy. Note that the higher the priority number, the lower the priority. The priority assigned to the policy enables the NetScaler appliance to determine the order in which the policy should be evaluated.
     If evaluation of a particular policy fails, increase the priority of the policy so that it is evaluated before other policies. Caching policies, due to their high granularity, can be very complicated to configure. Therefore, two policies might be contradictory. As a result, only the higher-priority policy takes effect.
   - **The precedeDefRules switch** setting is correct: The second highlighted entry in the sample output of the show cache global command, above, indicates the precedeDefRules switch setting. This setting enables the NetScaler appliance to determine whether the policy should be evaluated before the default built-in policies, which implement the standard HTTP caching behavior, such as basing caching decisions on HTTP header fields (for example, the If-Modified-Since and no-cache fields). You can set this switch when binding the policy.
     For certain types of HTTP(S) transactions, you might have to make sure that the policy precedes default HTTP rules, to force objects to be cached. Especially if requests include header fields, such as If-Modified-Since, or responses contain the No-Cache header field, you might have to make sure that the cache policy overrides the default in order for objects from these transactions to be cached. Force the policy to override default HTTP rules by rebinding the cache policy with the -precedeDefRules YES switch.

5. **Verify the size of the object to be cached.**
   You can configure a content group with minimum, which by default is 0 KB, and maximum, which by default is 80 KB, response sizes for the objects to be cached. The object does not get cached if its size is not within the configured range. Additionally, verify that the cache expiry times are set to an appropriate value. For example, check for a very small

time limit, such as one second.

Run the following command from the command line interface of the appliance to display the size limits and expiry times for a specific content group:

```
show cache contentGroup <Content_Group_Name>
```

Following is an example of this command's output:

```
show cache contentGroup content1
    Name: content1
    Heuristic expiry time parameter: 10 percent
    Weak relative expiry time - Positive responses: 3600 secs
    Weak relative expiry time - Negative responses: 600 secs
    Hit parameters: NONE
    Invalidation Parameters: NONE
    Invalidation restricted to host: NO
    Ignore parameter value case: NO
    Match Request Cookies: NO
    Poll Every Time: NO
    Ignore reload request: YES
    Remove Response Cookies: YES
    Prefetch: YES
    Prefetch period: heuristic
    Current outstanding prefetches: 0
    Max outstanding prefetches: 4294967294
    Flashcache: NO
    Expire at last byte: NO
    Insert Via header: YES
    Insert Age header: YES
    Insert ETag header: YES
    Cache-control header: NONE
    Quick abort size: 4194303 KBytes (MAXIMUM)
    Minimum Response Size: 0 KBytes
    Maximum Response Size: 80 KBytes
    Memory usage: 0 Bytes
    Memory usage limit: UNLIMITED
    Ignore caching headers in request: YES
    Non-304 hits: 0
    304 hits: 0
    Cached objects: 0
    Number of times expired/flushed: 0
    MinHits configured: 0
    Always evaluate policies: NO
    Pinned: NO
 Done
```

In addition to the above steps for troubleshooting integrated caching issues, you can consider using the following troubleshooting techniques:

- Depending on the configuration of a policy, there are virtually an unlimited number of reasons for the policy not getting evaluated. If you have completed the preceding steps to troubleshoot the issue, consider completing the following procedure to troubleshoot the issue further:
  1. Flush the cache.
  2. Verify the value of the hit parameter for the policy by running the following command:
     show cache global
     1) Name: home_pol_1 State: ACTIVE Priority: 99
        Rule: URL CONTAINS home
        Action: NOCACHE
        Precede default HTTP rules: NO
        Hits : 29
  3. Send an HTTP request for the related object from a Web browser.
  4. Run the show cache global command again and verify that the value for the hit parameter has incremented.

  Depending on the policy receiving hits or not, you can determine whether the issue is due to the policy have not been configured correctly or to a more global cache setting.

Content Accelerator

Nov 27, 2015

> **Important**
>
> The content accelerator feature is no longer supported on the NetScaler appliance.

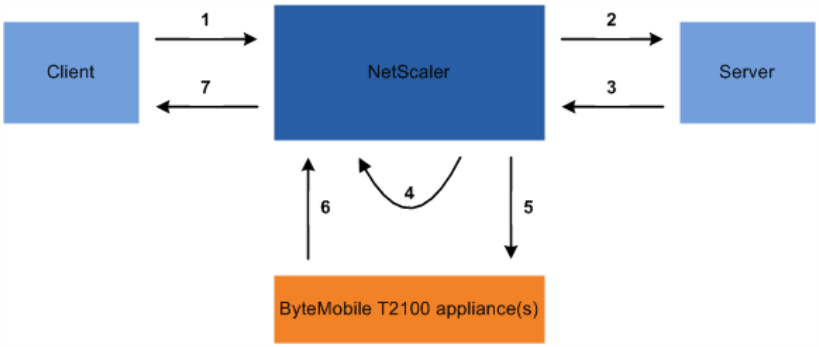
Content accelerator is a NetScaler feature that you can use in a Citrix ByteMobile T1100 deployment, to store data on a Citrix ByteMobile T2100 appliance. For more information about Citrix ByteMobile, see How ByteMobile Works.
Storing data on a T2100 appliance saves bandwidth and provides faster response times, because the NetScaler does not have to connect to the server for repeated requests of the same data.

Note: Content accelerator works with a Citrix ByteMobile platinum license. Contact customer support for more information and for obtaining the license.

How Content Accelerator Works

When a load balancing or content switching virtual server receives a client request, the NetScaler appliance evaluates a content accelerator policy that you have bound to the virtual server. The policy filters the requests to identify the ones to which to apply the content accelerator feature.

Note: For HTTP requests, the content accelerator feature can serve partial content in response to single byte-range requests.
The following figure illustrates the operations that the appliance performs when a client request arrives at a virtual server configured to use the content accelerator feature:



The process flow is as follows:

1. Client sends request.
2. NetScaler forwards the request to the server.
3. Server responds with the predefined size of the response (specified by the accumResSize parameter of the add ca action command).
4. NetScaler computes a hash of the response sent by the server.
5. NetScaler looks up the hash on the T2100 appliance.
6. A successful lookup indicates that the data is available and the T2100 appliance sends the data to the NetScaler.

   Note:
   - When a lookup does not succeed, the NetScaler fetches all of the requested data from the server, and simultaneously serves the data to the client and updates the data on the T2100 appliance.
   - The T2100 appliance can be configured to specify the number of requests after which to cache the data.
7. NetScaler sends the response to the client.

Configuring Content Accelerator

Before configuring the content accelerator feature, you must enable it on the NetScaler appliance.

You can configure the content accelerator feature to use one or multiple T2100 appliances. You must add each T2100 appliance as a service and bind these services to a load balancing virtual server that is dedicated to distributing the load between the configured T2100 appliances.

You must also configure a content accelerator action to lookup the data on the T2100 appliance. The action must also specify the T2100 load balancing virtual server and the size of data (in KB) to be fetched from the server to calculate the hash.

The action must be bound to a content accelerator policy that defines the traffic on which to perform content acceleration. The content accelerator policy must be bound to a content switching or load balancing virtual server that receives client traffic. Alternatively, you can bind the policy globally to be applicable to all virtual servers.

Configuring content accelerator by using the command line interface

At the command prompt, do the following:

1. Enable the content accelerator feature.
   enable ns feature ca

2. Identify the T2100 appliances and add each as a service on the NetScaler appliance.
   add service <name> <IPAddress> <serviceType> <port>

   Example:
   > add service T2100-A 10.102.29.61 HTTP 30
   > add service T2100-B 10.102.29.62 HTTP 40
   > add service T2100-C 10.102.29.63 HTTP 50
   Note: The services must be of type HTTP only.
3. Create a load balancing virtual server for the T2100 appliances. Specify the token load balancing method and the rule shown in the following syntax.
   add lb vserver <name> <serviceType> <IPAddress> <port> -lbMethod TOKEN -rule "http.req.url.after_str(\"/lookup/\") alt http.req.url.path.SKIP(1).PREFIX(64)"

   Example:
   > add lb vserver T2100-lbvserver HTTP 10.102.29.64 99 -lbMethod TOKEN -rule "http.req.url.after_str(\"/lookup/\") alt http.req.url.path.SKIP(1).PREFIX(64)"
4. Bind the T2100 services to the load balancing virtual server that you created for them.
   bind lb vserver <name> <serviceName>

   Example:
   > bind lb vserver T2100-lbvserver T2100-A
   > bind lb vserver T2100-lbvserver T2100-B
   > bind lb vserver T2100-lbvserver T2100-C
5. Define a content accelerator action.
   add ca action <name> -accumResSize <KBytes> -lbvserver <string> -type lookup

   Example:
   > add ca action ca_action1 -type lookup -lbvserver T2100-lbvserver -accumResSize 60
6. Define a content accelerator policy.
   add ca policy <name> -rule <expression> -action <name>

   Example: To create a content accelerator policy that caches all video formats.
   > add ca policy ca_mp4_pol -rule ns_video -action ca_action1
   where ns_video is a built-in expression.

7. Bind the content accelerator policy to either a virtual server that receives traffic or globally to the NetScaler system.

bind lb vserver <name> -policyName <string>

bind cs vserver <name> -policyName <string>

bind ca global -policyName <string> -priority <num> -type <type>

Example: To apply the content accelerator policy to a virtual server named "traf_rec"
> bind lb vserver traf_rec -policyName ca_mp4_pol
Example: To apply the content accelerator policy for all traffic reaching the NetScaler.
> bind ca global -policyName ca_mp4_pol -priority 100 -type RES_DEFAULT

8. Save the configuration.
   save ns config

Configuring content accelerator by using the configuration utility

1. Navigate to System > Settings > Configure Advanced Features and select Content Accelerator.
2. Create a service for each of the T2100 appliances.
   1. Navigate to Traffic Management > Load Balancing > Services.
   2. Click Add and specify the relevant details. In the Server field, make sure you specify the IP address of the T2100 appliance. In the Protocol field select HTTP.
3. Create a virtual server and bind the T2100 services to it.
   1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
   2. Click Add and specify the relevant details.
   3. In the Method and Persistence tab, specify the Method as Token.
   4. In the Policies tab, specify the rule as http.req.url.after_str(\"/lookup/\") alt http.req.url.path.SKIP(1).PREFIX(64).
   5. In the Services tab, select the T2100 services that you want to bind to the virtual server.
4. Create a content accelerator action.
   1. Navigate to Optimization > Content Accelerator > Actions.
   2. Specify the relevant details.
5. Create a content accelerator policy.
   1. Navigate to Optimization > Content Accelerator > Policies.
   2. Click Add, specify the policy rule, and associate the content accelerator action.
6. Bind the content accelerator policy globally or to a virtual server.
   1. Navigate to Optimization > Content Accelerator.
   2. Under the Content Accelerator Policy Manager [REQUEST] or Content Accelerator Policy Manager [RESPONSE] sections, bind the content accelerator policy globally or to a virtual server.

SPDY (Speedy)

May 20, 2015

Note: Supported from NetScaler 10.1 onwards.

SPDY is an open networking experimental protocol developed by Google to reduce the time taken by a client to load a web page in a browser. An application layer protocol, SPDY changes the way in which HTTP requests and responses are handled. SPDY offers the following advantages compared to a regular HTTP transaction:

- Multiplexed requests and responses—In a single SPDY session, multiple requests from the client can be sent over a single TCP connection to the server. This reduces the number of TCP connections and also optimizes usage of each TCP connection.
- Request prioritization—When requesting services from the server, a client can assign a priority to each request.
- Header Compression—SPDY compresses the HTTP request and response headers, saving bandwidth and reducing latency.
- Server push—The server can send data to the client before the client requests it.
- Security—SPDY is secure by design, because SSL is required for SPDY connections.

NetScaler supports the SPDY/2 and SPDY/3 (from NetScaler 10.5 onwards) versions.

Note: SPDY support depends on the browser version being used.

If you use a NetScaler appliance as a SPDY gateway for your servers, the servers do not have to support SPDY. The NetScaler appliance accepts the incoming SPDY requests, converts them, and sends them to the servers as HTTP requests. It also converts the HTTP responses and sends them to the clients as SPDY responses. While the key value of SPDY is reduced bandwidth consumption and faster communication with clients, an additional benefit of the NetScaler solution is that you avoid the time consuming task of upgrading your web servers and applications to support SPDY.

To use a NetScaler appliance as a SPDY gateway, you must enable SPDY on the appliance.

This document includes the following details:

- SPDY Requirements
- How SPDY Works over SSL
- Configuring SPDY on the NetScaler Appliance
- Troubleshooting for SPDY

SPDY Requirements

Both ends of a SPDY connection must support the same version of SPDY. In addition, the clients must meet the following requirements:

- Support ZLIB compression and accept compressed data.
- Support the Next Protocol Negotiation (NPN) TLS extension, because NPN is used in the TLS handshake.

How SPDY Works over SSL

Updated: 2014-03-13

When NetScaler sees an empty NPN extension in the Client Hello message, it responds with a list of the protocols that it supports. If SPDY is enabled on the NetScaler appliance, the appliance advertises HTTP/1.1 and SPDY/2 protocols. The client selects one protocol from this list and negotiates the protocol with the server. Because sending the negotiated protocol in plain text would raise security issues, the client sends the Change Cipher Spec notification which defines the details of the encryption for the session, followed by the Next Protocol message, which contains the encrypted protocol

that the client has chosen. The client then sends the Finished message. The NetScaler appliance decrypts the Next Protocol message, and then sends a Finished message.

A session is then established, and application data can be exchanged.

Note: The NPN extension is not supported on a NetScaler FIPS appliance, and with TLS protocol versions 1.1 and 1.2.

Configuring SPDY on the NetScaler Appliance

Updated: 2014-09-15

By default, SPDY is disabled on the NetScaler appliance. After you enable SPDY, the appliance advertises SPDY/2 and/or SPDY/3 along with HTTP/1.1 during an SSL handshake. To enable SPDY on the NetScaler appliance, you must enable SPDY in the HTTP profile bound to the SSL virtual server.

To configure SPDY by using the command line interface

At the command prompt, do the following:

1. Enable SPDY on a HTTP profile.
   set ns httpProfile <profileName> -SPDY <options>

   Example
   > set ns httpProfile profile1 -SPDY ENABLED
2. Bind the HTTP profile to a SSL virtual server.
   set lb vserver <ssl-vserver-name> -httpProfileName <httpProfile-with-spdy>

   Example
   > set lb vserver SPDY_LB -httpProfileName profile1
   Note: To apply SPDY globally, enable SPDY on the global HTTP profile (nshttp_default_profile).

You can view the statistics by using the following command:

stat protocol http -detail

To configure SPDY by using the configuration utility

1. Navigate to System > Profiles, and in the HTTP Profiles tab, update the profile on which you want to enable SPDY.
2. Navigate to Traffic Management > Load Balancing > Virtual Servers, and associate the HTTP profile to the appropriate SSL virtual server.

Troubleshooting for SPDY

If SPDY sessions are not enabled even after performing the required steps, check the following conditions.

- If the client is using a Chrome browser, SPDY might not work in some scenarios because Chrome sometimes does not initiate TLS handshake.
- If there is a forward-proxy between the client and the NetScaler appliance, and the forward-proxy doesn't support SPDY, SPDY sessions might not be enabled.
- NetScaler does not support NPN over TLS 1.1/1.2. To use SPDY, the client should disable TLS1.1/1.2 in the browser.
- Similarly, if the client wants to use SPDY, SSL2/3 must be disabled on the browser.

Security

May 03, 2013

The following topics cover configuration and installation information for NetScaler security features. Most of these features are policy based.

Authentication, Authorization, Auditing (AAA)	Keeps unauthorized users out of the network, denies users access to tasks for which they are not authorized, and tracks the resources used during user sessions.
Application Firewall	Prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information.
Content Filtering	Blocks inappropriate HTML requests, preventing the requests from reaching the Web servers.
HTTP Denial-of-Service Protection	Prevents hackers from attacking your Web site with large numbers of HTTP requests.
Priority Queuing	Detects high-priority connections and allows those connections to proceed ahead of other connections, guaranteeing unimpeded access to those users.
SureConnect	Services all incoming connections with either the requested content or a custom Web page that displays information about a delay in the request being serviced.
Surge Protection	Detects any rapid rise in connection attempts and adjusts the rate at which connections are allowed to proceed to the server, preventing server overload.

AAA Application Traffic

Sep 18, 2013

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

How AAA Works

Oct 21, 2015

AAA provides security for a distributed Internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of authentication, authorization, and auditing. Authentication enables the NetScaler ADC to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it should allow each user to access. Auditing enables the ADC to keep a record of each user's activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

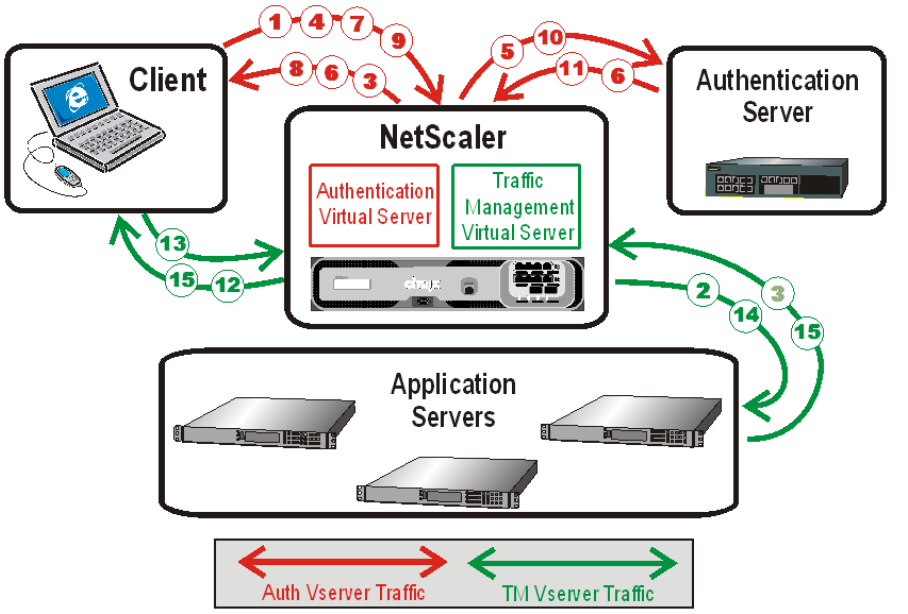
Authentication requires that several entities: the client, the NetScaler appliance, the external authentication server if one is used, and the application server, respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

1. The client sends a GET request for a URL on the application server.
2. The NetScaler appliance's traffic management virtual server redirects the request to the application server.
3. The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
4. The client sends a POST request for /cgi/tm.
5. The NetScaler appliance's authentication virtual server redirects the request to the authentication server.
6. The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
7. The client sends a GET request for /vpn/index.html.
8. The authentication virtual server redirects the client to the authentication server login page.
9. The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.
10. The authentication virtual server redirects the POST request to the authentication server.
11. If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.
12. The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.

13. The client sends a GET request for their initial URL.
14. The traffic management virtual server redirects the GET request to the application server.
15. The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

Figure 1. Authentication Process Traffic Flow



When an authenticated client requests a resource, the ADC, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The ADC handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

AAA-TM handles password changes for users by using the protocol-specific method for the authentication server. For most protocols, neither the user nor the administrator needs to do anything different than they would without AAA-TM. Even when an LDAP authentication server is in use, and that server is part of a distributed network of LDAP servers with a single designated domain administration server, password changes are usually handled seamlessly. When an authenticated client of an LDAP server changes his or her password, the client sends a credential modify request to AAA-TM, which forwards it to the LDAP server. If the user's LDAP server is also the domain administration server, that server responds appropriately and AAA-TM then performs the requested password change. Otherwise, the LDAP server sends AAA-TM an LDAP_REFERRAL response to the domain administration server. AAA-TM follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

When configuring AAA-TM with an LDAP authentication server, the system administrator must keep the following conditions and limitations in mind:

- AAA-TM assumes that the domain administration server in the referral accepts the same bind credentials as the original server.
- AAA-TM only follows LDAP referrals for password change operations. In other cases AAA-TM refuses to follow the referral.
- AAA-TM only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA-TM refuses to

follow the second referral.

The ADC supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

Enabling AAA

Oct 30, 2013

To use the AAA - Application Traffic feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

At the command prompt, type the following commands to enable AAA and verify the configuration:

- enable ns feature AAA
- show ns feature

Example

```
> enable feature AAA
 Done

> show ns feature

      Feature                Acronym          Status
      -------                -------          ------
 1)    Web Logging              WL              OFF
 2)    Surge Protection          SP              ON
 .
 .
 .
 15)   AAA                      AAA              ON
 .
 .
 .
 23)   HTML Injection           HTMLInjection      ON
 24)   NetScaler Push           push             OFF
Done
```

1. Navigate to System > Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
4. Click OK.

Setting up AAA Virtual Servers and DNS

Mar 28, 2012

You can configure AAA by using the built-in wizard, or manually. To use the wizard, in the main AAA pane of the configuration utility, you click AAA - Application Traffic wizard and follow the prompts.

To configure AAA manually, you first configure an authentication virtual server, which involves binding an SSL certificate-key pair. You then associate the authentication virtual server with a new or existing traffic management virtual server. (Either a load balancing virtual server or a content switching virtual server can serve as a traffic management virtual server.) To complete the initial configuration, you configure DNS to assign hostnames to both the authentication virtual server and the traffic management virtual server, and verify that your virtual servers are UP and configured correctly.

Caution: Both virtual servers must have hostnames in the same domain, or the AAA configuration will not work.

Configuring the Authentication Virtual Server

Aug 13, 2014

To configure AAA, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections. For additional information about configuring SSL and creating a certificate-key pair, see the *Citrix NetScaler Traffic Management Guide* at "Traffic Management."

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- add authentication vserver <name> ssl <ipaddress>
- show authentication vserver <name>
- bind ssl certkey <certkeyName>
- show authentication vserver <name>
- set authentication vserver <name> -authenticationDomain <FQDN>
- show authentication vserver <name>

Example

```
> add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: DOWN[Certkey not bound]
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
 Done
> bind ssl certkey Auth-Vserver-2 Auth-Cert-1
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
      Authentication Domain: myCompany.employee.com
 Done
> set authentication vserver Auth-Vserver-2 -AuthenticationDomain myCompany.employee.com
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: DOWN[Certkey not bound]
```

```
    Client Idle Timeout: 180 sec
    Down state flush: DISABLED
    Disable Primary Vserver On Down : DISABLED
    Authentication : ON
    Current AAA Users: 0
    Authentication Domain: myCompany.employee.com
Done
```

1. Navigate to Security > AAA - Application Traffic > Virtual Servers.
2. In the details pane, do one of the following:
   - To create a new authentication virtual server, click Add.
   - To modify an existing authentication virtual server, select the virtual server, and then click Edit.

   The Configuration dialog opens with the Basic Settings area expanded.
3. Specify values for the parameters as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously created virtual server)
   - IP Address*—ipaddress
   - Domain*—authenticationDomain
   - Failed login timeout—failedLoginTimeout (Seconds allowed before login fails and user must start login process again.)
   - Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

   Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out. Any options that are not mentioned are not relevant and should be ignored.
4. Click Continue to display the Certificates area.
5. In the Certificates area, configure any SSL certificates you want to use with this virtual server.
   - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click Save.
   - To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for CA certificate.
6. Click Continue to display the Advanced Authentication Policies area.
7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the Authentication Policy dialog box, choose the policy that you want to bind to the server, set the priority, and then click OK.
8. Click Continue to display the Basic Authentication Policies area.
9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the Policies dialog box, and follow the prompts to configure the policy and bind it to this virtual server.
10. Click Continue to display the 401-Based Virtual Servers area.
11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
    - To bind a load balancing virtual server, click the arrow to the right of LB virtual server to display the LB Virtual Servers dialog box, and follow the prompts.
    - To bind a content switching virtual server, click the arrow to the right of CS virtual server to display the CS Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.
12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.
13. Review your settings, and when you are finished, click Done. The dialog box closes. If you created a new authentication virtual server, it now appears in the Configuration window list.

Configuring a Traffic Management Virtual Server

Aug 19, 2014

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual sever with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix NetScaler Traffic Management Guide* at Traffic Management.

Note: The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication vserver is **tm.xyz.bar.com**, the appliance assigns **xyz.bar.com**. as the authentication domain.

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- set lb vserver <name> –authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
- show lb vserver <name>
- set cs vserver <name> –authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
- show cs vserver <name>

Example

```
> set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com
 Done
> show lb vserver vs-cont-sw
      vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
      State: DOWN
      Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms)
      Time since last state change: 5 days, 20:00:40.290
      Effective State: DOWN
      Client Idle Timeout: 9000 sec
      Down state flush: ENABLED
      Disable Primary Vserver On Down : DISABLED
      No. of Bound Services :  0 (Total)      0 (Active)
      Configured Method: LEASTCONNECTION
      Mode: IP
      Persistence: NONE
      Connection Failover: DISABLED
      Authentication: ON      Host: mywiki.index.com
 Done
```

1. In the navigation pane, do one of the following.
   - Navigate to Traffic Management > Load Balancing > Virtual Servers.
   - Navigate to Traffic Management > Content Switching > Virtual Servers
     The AAA configuration process for either type of virtual server is identical.
   - In the details pane, select the virtual server on which you want to enable authentication, and then click Open.
   - In the Domain text box, type the authentication domain.
   - On the Advanced tab, select the Authentication check box.
   - In the Authentication Host text box, type the fully qualified domain name of the authentication virtual server.
   - Click OK. A message appears in the status bar, stating that the vserver has been configured successfully.

Configuring DNS

Sep 24, 2013

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to the configure DNS address records, see the *Citrix NetScalerTraffic Management Guide* at ".Traffic Management"

Verifying Your Setup for AAA

Sep 18, 2013

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

At the command prompt, type the following command:
show authentication vserver <name>

Example

```
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
      Authentication Domain: myCompany.employee.com
 Done
```

1. Navigate to Security > AAA - Application Traffic > Virtual Servers.
2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

Configuring Users and Groups

Aug 19, 2014

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

At the command prompt, type the following commands to create a local AAA user account and verify the configuration:

- add aaa user <username> [–password <password>]
- show aaa user

Example

```
> add aaa user user-2 -password emptybag
 Done
> show aaa user
1)     UserName: user-1
2)     UserName: user-2
 Done
```

At the command prompt, type the following command and, when prompted, type the new password:
set aaa user <username>
Example

```
> set aaa user user-2
Enter password:
Done
```

1. Navigate to Security > AAA - Application Traffic > Users
2. In the details pane, do one of the following:
   - To create a new user account, click Add.

- To modify an existing user account, select the user account, and then click Open.

3. In the Create AAA User dialog box, in the User Name text box, type a name for the user.
4. If creating a locally authenticated user account, clear the External Authentication check box and provide a local password that the user will use to log on.
5. Click Create or OK, and then click Close. A message appears in the status bar, stating that the user has been configured successfully.

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- add aaa group <groupname>
- show aaa group

Example

```
> add aaa group group-2
Done
> show aaa group
1)     GroupName: group-1
2)     GroupName: group-2
Done
```

- bind aaa group <groupname> -username <username>

Example

```
> bind aaa group group-2 -username user-2
 Done
> show aaa group group-2
       GroupName: group-2

            UserName: user-2
 Done
```

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:
unbind aaa group <groupname> -username <username>
Example

```
> unbind aaa group group-hr -username user-hr-1
 Done
```

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

- rm aaa group <groupname>
- show aaa group

Example

```
> rm aaa group group-hr
 Done
> show aaa group
1)     GroupName: group-1
2)     GroupName: group-finance
 Done
```

1. Navigate to Security > AAA - Application Traffic > Groups
2. In the details pane, do one of the following:
   - To create a new group, click Add.
   - To modify an existing group, select the group, and then click Open.
3. If you are creating a new group, in the Create AAA Group dialog box, in the Group Name text box, type a name for the group.
4. On the Users tab, configure the users assigned to the group.
   1. To add a user to the group, select the user, and then click Add.
   2. To remove a user from the group, select the user, and then click Remove.
   3. To create a new user account and add it to the group, click New, and then follow the instructions in "To configure AAA local users by using the configuration utility."
5. Click Create or OK. The group that you created appears in the AAA Groups page.

Configuring AAA Policies

Sep 18, 2013

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see the *Citrix NetScaler Traffic Management Guide* at "Traffic Management."

Authentication Policies

Aug 19, 2014

The NetScaler ADC can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

LOCAL

Authenticates to the NetScaler by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

RADIUS

Authenticate to an external Radius server.

LDAP

Authenticates to an external LDAP authentication server.

TACACS

Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

After a user authenticates to a TACACS server, the NetScaler ADC connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents delays while the ADC waits for the first TACACS server to time out before resending the authorization request to the second TACACS server.

Note: When authenticating through a TACACS server, AAA-TM logs only successfully executed TACACS commands, to prevent the logs from showing TACACS commands that were entered by users who were not authorized to execute them.

CERT

Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.

NEGOTIATE

Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler uses NTLM authentication.

SAML

Authenticates to a server that supports the Security Assertion Markup Language (SAML).

SAMLIDP

Configures the NetScaler ADC to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).

WEB

Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful.

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

If you do not use LOCAL authentication, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

add authentication tacacsAction <name> -serverip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [...]

Example

```
> add authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812                -authtimeout 15 -tacacsSecret "minotaur" -authorization OFF -accounting
```

To configure an existing authentication action, at the command prompt, type the following command:

set authentication tacacsAction <name> -serverip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [...]

Example

```
> set authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812                -authtimeout 15 -tacacsSecret "minotaur" -authorization OFF -accounting
```

To remove an existing RADIUS action, at the command prompt, type the following command:

rm authentication radiusAction <name>

Example

```
> rm authentication tacacsaction Authn-Act-1  Done
```

Note: In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication.
2. In the details pane, on the Servers tab, do one of the following:
   - To create a new authentication server, click Add.
   - To modify an existing authentication server, select the server, and then click Open.
3. In the Create Authentication Server or Configure Authentication Server dialog box, type or select values for the parameters.
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - IP Address*—serverip <IP>
   - IPV6*—Select the checkbox if the server IP is an IPv6 IP. (No command line equivalent.)
   - Port*—serverPort
   - Time-out (seconds)*—authTimeout
4. Click Create or OK, and then click Close. The policy that you created appears in the Authentication Policies and Servers page.

At the command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- add authentication negotiatePolicy <name> <rule> <reqAction>
- show authentication localPolicy <name>
- bind authentication vserver <name> -policy <policyname> [-priority <priority>] [-secondary]]
- show authentication vserver <name>

Example

```
> add authentication localPolicy Authn-Pol-1 ns_true  Done  > show authentication localPolicy  1)  Name: Authn-Pol-1  Rule: ns_true  Request action: LOCAL
```

At the command prompt, type the following commands to modify an existing authentication policy:
set authentication localPolicy <name> <rule> [-reqaction <action>]
Example

```
> set authentication localPolicy Authn-Pol-1 'ns_true'  Done
```

At the command prompt, type the following command to remove an authentication policy:
rm authentication localPolicy <name>
Example

```
> rm authentication localPolicy Authn-Pol-1  Done
```

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication, and then select the type of policy that you want to create.
2. In the details pane, on the Policies tab, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the action, and then click Open .
3. In the Create Authentication Policy or Configure Authentication Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype
   - Server*—authVsName
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click Create or OK. The policy that you created appears in the Authentication Policies and Servers page.
5. Click the Servers tab, and in the details pane do one of the following:
   - To use an existing server, select it, and then click Open Edit.
   - To create a new server, click Add, and follow the instructions.
6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.
7. Click Insert Policy.
8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
9. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
10. Click OK. A message appears in the status bar, stating that the policy has been configured successfully.

LDAP Authentication Policies

Aug 13, 2014

As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the NetScaler ADC to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the **serverName** parameter instead of the **serverIP** parameter, and substitute the server's FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. You must also make sure that the AD server accepts the same **binddn** credentials that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the NetScaler ADC receives an LDAP_REFERRAL response to a request, AAA follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, AAA looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the **binddn** credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

Note: These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.
For more information about setting up authentication policies in general, see "Authentication Policies". For more information about NetScaler expressions, which are used in the policy rule, see the *Citrix NetScaler Policy Configuration and Reference Guide* at "Policies and Expressions."

At the command prompt, type the following commands:

- set authentication ldapAction <name> -followReferrals ON
- set authentication ldapAction <name> -maxLDAPReferrals <integer>

Example

```
> set authentication ldapAction ldapAction-1 -followReferrals ON
```

```
set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2
```

Note: In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > LDAP.
2. In the details pane, on the Servers tab, select the LDAP server that you want to configure, and then click Edit.
3. In the Configure Authentication Server dialog, scroll down to the Referrals check box, and select it.
4. In the Maximum Referral Level text box, type the maximum number of referrals to allow.
5. Click OK, and then click Close.

RADIUS Authentication Policies

Aug 21, 2014

As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described below.

Normally you configure the NetScaler ADC to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the **serverName** parameter for the **serverIP** parameter.

Before you decide whether to configure the ADC to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

Note: These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.
For more information about setting up authentication policies in general, see "Authentication Policies." For more information about NetScaler expressions, which are used in the policy rule, see the *Citrix NetScaler Policy Configuration and Reference Guide* at "Policies and Expressions."

If you authenticate to a RADIUS server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

add authentication radiusAction <name> [-serverip <IP> | -serverName] <FQDN>] [-serverPort <port>] [-authTimeout <positive_integer>] {-radKey } [-radNASip (ENABLED | DISABLED)] [-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeType <positive_integer>] [-radGroupsPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>] [-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>] [-accounting (ON | OFF)] [-pwdVendorID <positive_integer> [-pwdAttributeType <positive_integer>]] [-defaultAuthenticationGroup <string>] [-callingstationid (ENABLED | DISABLED)]

Example

The following example adds a RADIUS authentication action named **Authn-Act-1**, with the server IP **10.218.24.65**, the server port **1812**, the authentication timeout **15** minutes, the radius key **WareTheLorax**, NAS IP disabled, and NAS ID **NAS1**.

```
> add authentication radiusaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812
        -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
Done
```

The following example adds the same RADIUS authentication action, but using the server FQDN **rad01.example.com** instead of the IP.

```
> add authentication radiusaction Authn-Act-1 -serverName rad01.example.com -serverport 1812
        -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
Done
```

To configure an existing RADIUS action, at the NetScaler command prompt, type the following command:

set authentication radiusAction <name> [-serverip <IP> | -serverName] <FQDN>] [-serverPort <port>] [-authTimeout <positive_integer>] {-radKey } [-radNASip (ENABLED | DISABLED)] [-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeType <positive_integer>] [-radGroupsPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>] [-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>] [-accounting (ON | OFF)] [-pwdVendorID <positive_integer> [-pwdAttributeType <positive_integer>]] [-defaultAuthenticationGroup <string>] [-callingstationid (ENABLED | DISABLED)]

To remove an existing RADIUS action, at the command prompt, type the following command:

rm authentication radiusAction <name>

Example

```
> rm authentication radiusaction Authn-Act-1
Done
```

Note: In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication > Radius.
2. In the details pane, on the Servers tab, do one of the following:
   - To create a new RADIUS server, click Add.
   - To modify an existing RADIUS server, select the server, and then click Edit.
3. In the Create Authentication RADIUS Server or Configure Authentication RADIUS Server dialog, type or select values for the parameters. To fill out parameters that appear beneath Send Calling Station ID, expand Details.
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - Server Name / IP Address*—Choose either Server Name or Server IP
     - Server Name*—serverName <FQDN>
     - IP Address*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
   - Port*—serverPort
   - Time-out (seconds)*—authTimeout
   - Secret Key*—radKey (RADIUS shared secret.)
   - Confirm Secret Key*—Type the RADIUS shared secret a second time. (No command line equivalent.)
   - Send Calling Station ID—callingstationid
   - Group Vendor Identifier—radVendorID
   - Group Attribute Type—radAttributeType
   - IP Address Vendor Identifier—ipVendorID
   - pwdVendorID—pwdVendorID
   - Password Encoding—passEncoding
   - Default Authentication Group—defaultAuthenticationGroup

- NAS ID—radNASid
- Enable NAS IP address extraction—radNASip
- Group Prefix—radGroupsPrefix
- Group Separator—radGroupSeparator
- IP Address Attribute Type—ipAttributeType
- Password Attribute Type—pwdAttributeType
- Accounting—accounting

4. Click Create or OK. The policy that you created appears in the Authentication Policies and Servers page.

SAML Authentication Policies

Sep 09, 2014

The Security Assertion Markup Language (SAML) is an XML-based standard for exchanging authentication and authorization tokens between servers which authenticate users (the *Identity Provider* or *IdP*) and servers that host user applications (*Service Providers*). The NetScaler ADC supports SAML authentication and authorization with HTTP POST-binding, in which the ADC responds to user requests with a 200 OK that contains a form-auto post with the required authentication token.

The NetScaler ADC supports attribute extraction from SAML assertions, and encrypted SAML assertions. The NetScaler implementation of SAML allows signing certificates of less than 2048 bits, but displays a warning message. It also supports the SHA256 hash algorithm for signatures and digests. Citrix recommends that all signing certificates be of at least 2048 bits, and that you use SHA256 as SHA-1 is no longer considered secure.

As with other types of NetScaler authentication policies, a SAML authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a SAML authentication policy has certain special requirements that are described below.

Note: These instructions assume that you are already familiar with the SAML protocol and have already configured your chosen SAML authentication server.
For more information about setting up authentication policies in general, see "Authentication Policies". For more information about NetScaler expressions, which are used in the policy rule, see the *Citrix NetScaler Policy Configuration and Reference Guide* at ""Policies and Expressions"."

If you authenticate to a SAML server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

add authentication samlaction <name> [-samlIdPCertName <string>] [-samlSigningCertName <string>] [-samlRedirectUrl <string>] [-samlACSIndex <positive_integer>] [-samlUserField <string>] [-samlRejectUnsignedAssertion (ON | OFF)] [-samlIssuerName <string>] [-samlTwoFactor (ON | OFF)] [-defaultAuthenticationGroup <string>] [-Attribute1 <string>] [-Attribute2 <string>] [-Attribute3 <string>] [-Attribute4 <string>] [-Attribute5 <string>] [-Attribute6 <string>] [-Attribute7 <string>] [-Attribute8 <string>] [-Attribute9 <string>] [-Attribute10 <string>] [-Attribute11 <string>] [-Attribute12 <string>] [-Attribute13 <string>] [-Attribute14 <string>] [-Attribute15 <string>] [-Attribute16 <string>] [-signatureAlg (RSA-SHA1 | RSA-SHA256)] [-digestMethod (SHA1 | SHA256)]

Example

The following example adds a SAML authentication action named Authn-Act-1.

```
> add authentication samlaction Authn-Act-1 -samlIdPCertName samlcert1
        -samlSigningCertName ssigncert1 -samlRedirectUrl https://login.example.com/logon_fail.html
        -samlUserField userfield1 -samlRejectUnsignedAssertion ON -samlIssuerName Issuer
        -samlTwoFactor ON -defaultAuthenticationGroup group -signatureAlg RSA-SHA256
        -digestMethod SHA256
Done
```

To configure an existing SAML action, at the command prompt, type the following command:

set authentication samlaction <name> [-samlIdPCertName <string>] [-samlSigningCertName <string>] [-samlRedirectUrl <string>] [-samlUserField <string>] [-samlRejectUnsignedAssertion (ON | OFF)] [-samlIssuerName <string>] [-samlTwoFactor (ON | OFF)] [-defaultAuthenticationGroup <string>] [-Attribute1 <string>] [-Attribute2 <string>] [-Attribute3 <string>] [-Attribute4 <string>] [-Attribute5 <string>] [-Attribute6 <string>] [-Attribute7 <string>] [-Attribute8 <string>] [-Attribute9 <string>] [-Attribute10 <string>] [-Attribute11 <string>] [-Attribute12 <string>] [-Attribute13 <string>] [-Attribute14 <string>] [-Attribute15 <string>] [-Attribute16 <string>] [-signatureAlg (RSA-SHA1 | RSA-SHA256)] [-digestMethod (SHA1 | SHA256)]

Example

```
> add authentication samlaction Authn-Act-1 -samlIdPCertName samlcert1
        -samlSigningCertName ssigncert1 -samlRedirectUrl https://login.example.com/logon_fail.html
        -samlUserField userfield1 -samlRejectUnsignedAssertion ON -samlIssuerName Issuer
        -samlTwoFactor ON -defaultAuthenticationGroup group -signatureAlg RSA-SHA256
        -digestMethod SHA256
Done
```

To remove an existing SAML action, at the command prompt, type the following command:

rm authentication samlaction <name>

Example

```
> rm authentication samlaction Authn-Act-1
Done
```

Note: In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to AAA - Application Traffic > Policies > Authentication > SAML.
2. In the details pane, on the Servers tab, do one of the following:
   - To create a new SAML server, click Add.
   - To modify an existing SAML server, select the server, and then click Open.
3. In the Create Authentication Server or Configure Authentication Server dialog box, type or select values for the parameters:
   - Name*—policyname (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to SAML, cannot be changed)
   - IDP Certificate Name*—samlIDPcertname
   - Redirect URL*—samlRedirectUrl
   - User Field—samlUserField
   - Signing Certificate Name—samlSigningcertname
   - Issuer Name—samlIssuerName
   - Default Authentication Group—defaultAuthenticationGroup
   - Two Factor—samlTwoFactor
   - Reject Unsigned Assertion—samlRejectUnsignedAssertion
   - ACS Index—samlACSIndex
   - Attribute 1-Attribute 16—attribute1-attribute16 (Used to extract attributes from the SAML assertion.)
4. Click Create or OK. The policy that you created appears in the Authentication Policies and Servers page.

Authorization Policies

Aug 19, 2014

After you create authentication policies, you next create any authorization policies you need. Authorization policies, like other policies, consist of an expression and action. There are only two actions for authorization policies: ALLOW and DENY. ALLOW permits users to access the specified resource; DENY blocks access. The default setting for authorization when no specific policy exists is to deny access to network resources. This means that a user or group can access a particular resource only if an authorization policy explicitly allows access. For optimum security, the best practice is not to change the default setting and to create specific authorization policies for users who need access to specific resources.

Authorization use both default syntax expressions and classic expressions. These expressions are described in detail in the *Citrix NetScaler Policy Configuration and Reference Guide* at "Policies and Expressions."

After you create an authorization policy, you bind it to the appropriate user accounts or groups to put it into effect.

At the NetScaler command prompt, type the following commands to create an authorization policy and verify the configuration:

- add authorization policy <name> <rule> <action>
- show authorization policy <name>

Example

```
> add authorization policy authz-pol-1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" DENY
 Done
> show authorization policy authz-pol-1
1)     Name: authz-pol-1    Rule: HTTP.REQ.URL.SUFFIX.EQ("gif")
       Action: DENY
 Done
>
```

At the command prompt, type the following command to modify an authorization policy:
set authorization policy <name> [-rule <expression>] -action <action>

Example

```
> set authorization policy authz-pol-1 -rule "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" -action ALLOW
 Done
> show authorization policy authz-pol-1
1)     Name: authz-pol-1    Rule: HTTP.REQ.URL.SUFFIX.EQ("gif")
       Action: ALLOW
 Done
>
```

At the command prompt, type one of the following commands to bind an authorization policy to a user account or group and verify the configuration:

- bind aaa user <userName> [-policy <policyname> [-priority <priority]] [-intranetApplication <appname>] [-urlName

<urlname>] [-intranetIP <intranetip> [<netmask>]]
- show aaa user <userName>
- bind aaa group <groupName> [-policy <policyname> [-priority <priority]] [-intranetApplication <appname>] [-urlName <urlname>] [-intranetIP <intranetip> [<netmask>]]
- show aaa group <name>

Example

```
> bind aaa user user-hr-1 -policy authz-pol-1
 Done
> show aaa user user-hr-1
      UserName: user-hr-1

            Policy: authz-pol-1, Priority: 0
 Done
> bind aaa group group-1 -policy authz-pol-1
 Done
> show aaa group group-1
      GroupName: group-1

            UserName: user-2
            UserName: user-1

            Policy: authz-pol-1, Priority: 0
 Done
```

At the command prompt, type one of the following commands to unbind an authorization policy from a user account or group:
- unbind aaa user <userName> -policy <policyname>
- unbind aaa group <groupName> -policy <policyname>

Example

```
> unbind aaa user aaa-user-1 -policy auth-pol-1
Done
```

First unbind the policy from all user accounts and groups, and then, at the NetScaler command prompt, type the following command to remove an authorization policy:
rm authorization policy <name>

1. Navigate to Security > AAA - Application Traffic > Authorization.
2. In the details pane, do one of the following:
   - To create a new authorization policy, click Add.
   - To modify an existing authorization policy, select the policy, and then click Open.
3. In the Create Authorization Policy or Configure Authorization Policy dialog, type or select values for the parameters.
   - Name*—policyname(Cannot be changed for a previously configured policy.)

- Action*— action
- Expression*—rule (By default, the Expression box accepts default syntax policies. To switch to the classic syntax view, click Switch to Classic Syntax.)

4. Click Create or OK. The policy that you created appears on the Authorization Policies page.
5. To bind an authorization policy to a user account or group, in the navigation pane, under AAA - Application Traffic, click either Users or Groups, as appropriate, and then add that policy to the user account list:
   1. In the details pane, select the appropriate user account, and then click Open.
   2. Click the Authorization tab.
   3. Click Insert Policy.
   4. Select the policy you want to bind to the user account or group.
   5. In the Priority column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   6. Click OK.

   A message appears in the status bar, stating that the policy has been configured successfully.

Auditing Policies

Aug 13, 2014

After you create authentication policies, you next create any auditing policies you need. The NetScaler ADC allows auditing of all states and status information, so you can see the event history for any user in chronological order. When you configure auditing on the ADC, you can choose to store the log files locally on the ADC or to send them to a syslog server.

To put your auditing policies into effect, you bind them globally, to a specific authentication virtual server, or to specific user accounts or groups.

At the command prompt, type the following commands to create an auditing policy and verify the configuration:

- add audit nslogPolicy <name> [-rule <rule>] [-action <action>]
- show audit nslogPolicy

Example

```
> add audit nslogPolicy audit-1 ns_true audit_server
 Done
> show audit nslogPolicy
1)     Name: audit-pol Rule: ns_true
       Action: audit_server
2)     Name: audit-1   Rule: ns_true
       Action: audit_server
 Done
```

At the command prompt, type the following commands to modify an auditing policy and verify the configuration:

- set audit nslogPolicy <name> [-rule <expression>] [-action <string>]
- show audit nslogPolicy

Example

```
> set audit nslogPolicy audit-1 ns_true audit_server
 Done
> show audit nslogPolicy
1)     Name: audit-pol Rule: ns_true
       Action: audit_server
2)     Name: audit-1   Rule: ns_true
       Action: audit_server
 Done
```

At the command prompt, type the following commands to globally bind an auditing policy:
bind tm global [-policyName <string> [-priority <positive_integer>]]

Example

```
> bind tm global -policyName Audit-Pol-1 -priority 1000
Done
```

At the command prompt, type the following commands to bind an auditing policy to an authentication virtual server and verify the configuration:

- bind authentication vserver <name> [-policy <string> [-priority <positive_integer>] [-secondary] [-groupExtraction]]
- show authentication vserver [<name>]

Example

```
> bind authentication Vserver Auth-Vserver-2 -policy Authn-Pol-1
 Done
> show authentication Vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
      Authentication Domain: myCompany.employee.com

1)          Primary authentication policy name: Authn-Pol-1 Priority: 0
 Done
```

At the command prompt, type one of the following commands to bind an auditing policy to a user account or a group:

- bind audit <logtype> user <userName> -policy <policyname> [-priority <priority]
- bind audit <logtype> user <userName> -policy <policyname> [-priority <priority]

Example

```
> bind audit nslogPolicy user aaa-user-1 -policyName Audit-Pol-1 -priority 1000
Done
```

At the command prompt, type the following commands to unbind a globally-bound auditing policy:
unbind audit <logtype> global -policy <policyname>
Example

```
> unbind audit nslogPolicy global -policy Audit-Pol-1
Done
```

At the command prompt, type the following commands to unbind an auditing policy from an authentication virtual server:
unbind authentication vserver <name> [-policy <string> [-secondary][-groupExtraction]]
Example

```
> unbind authentication vserver auth-vserver-1 -policyName Audit-Pol-1
Done
```

At the command prompt, type one of the following commands to unbind an auditing policy from a user account or a group:

- unbind audit <logtype> user <userName> -policy <policyname>
- unbind audit <logtype> group <groupName> -policy <policyname>

Example

```
> unbind audit nslogPolicy group aaa-group-1 -policyName Audit-Pol-1
Done
```

First unbind the policy from all users and groups, and then, at the command prompt, type the following command to remove an auditing policy:
rm audit <logtype> <policyname>

1. Navigate to Security > AAA - Application Traffic > Policies > Auditing.
2. Choose the type of auditing policy that you want to create.
   - To create a policy that logs to syslog, expand Syslog.
   - To create a policy that logs to nslog, expand Nslog.

   Note: The dialogs for the two types of policies are nearly identical.
3. In the details pane, do one of the following:
   - To create a new auditing policy, click Add.
   - To modify an existing auditing policy, select the policy, and then click Edit.
4. In the Create Audit Policy or Configure Audit Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured policy.)
   - Auditing type*—logtype (When creating auditing policies by using the configuration utility, you cannot specify a rule.)
   - Server*—action
5. Click Create or OK. The policy that you created appears in the Auditing Policies page.
6. Click OK.
7. To globally bind an auditing policy, in the details pane, click Global Bindings and fill in the Bind/Unbind Audit Policies to Global dialog box.
   1. Select the name of the audit policy you want to globally bind.
   2. Click OK.

   A message appears in the status bar, stating that the policy has been configured successfully.
8. To bind an auditing policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the authentication policies list.
   1. In the details pane, select the appropriate virtual server, and then click Open.
   2. Click the Policies tab.
   3. Click Insert Policy.
   4. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   5. In the Priority column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   6. Click OK.
9. To bind an auditing policy to a user account or group, in the navigation pane, click Users or Groups, and add that policy to the user account list.

1. In the details pane, select the appropriate user account, and then click Open.
2. Click the Policies tab.
3. Click Insert Policy.
4. Choose the policy you want to bind to the group from the drop-down list.
5. In the Priority column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
6. Click OK.

A message appears in the status bar, stating that the policy has been configured successfully.

Session Settings

Apr 18, 2013

After you configure your authentication, authorization, and auditing profiles, you configure session settings to customize your user sessions. The session settings are:

The session timeout.

Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

The default authorization setting.

Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

The single sign-on setting.

Determines whether the NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

The credential index setting.

Determines whether the NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

Session Profiles

Aug 19, 2014

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

Note: The terms “session profile” and “session action” mean the same thing.

At the command prompt, type the following commands to create a session profile and verify the configuration:

- add tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]
- show tm sessionAction <name>

Example

```
> add tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)     Name: session-profile
       Authorization action : ALLOW
       Session timeout: 30 minutes
 Done
```

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]
- show tm sessionAction

Example

```
> set tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)     Name: session-profile
       Authorization action : ALLOW
       Session timeout: 30 minutes
 Done
```

At the command prompt, type the following command to remove a session profile:

rm tm sessionAction <name>

1. Navigate to Security > AAA - Application Traffic > Session.
2. In the details pane, click the Profiles tab.

3. On the Profiles tab, do one of the following:
   - To create a new session profile, click Add.
4. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Default Authorization Action—defaultAuthorizationAction
   - Single Signon to Web Applications—sso
   - Credential Index—ssocredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity
5. Click Create or OK. The session profile that you created appears in the Session Policies and Profiles pane.

Session Policies

Aug 19, 2014

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

At the command prompt, type the following commands to create a session policy and verify the configuration:

- add tm sessionPolicy <name> <rule> <action>
- show tm sessionPolicy <name>

Example

```
> add tm sessionPolicy session-pol "URL == /*.gif" session-profile
 Done
> show tm sessionPolicy session-pol
1)     Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
 Done
```

At the command prompt, type the following commands to modify a session policy and verify the configuration:

- set tm sessionPolicy <name> [-rule <expression>] [-action <action>]
- show tm sessionPolicy <name>

Example

```
> set tm sessionPolicy session-pol "URL == /*.gif" session-profile
 Done
> show tm sessionPolicy session-pol
1)     Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
 Done
```

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:
bind tm global -policyName <policyname> [-priority <priority>]

Example

```
> bind tm global -policyName session-pol
 Done

> show tm sessionPolicy session-pol
1)     Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
       Policy is bound to following entities
       1) TM GLOBAL    PRIORITY : 0
 Done
```

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:
bind authentication vserver <name> -policy <policyname> [-priority <priority>]
Example

```
> bind authentication vserver auth-vserver-1 -policyName Session-Pol-1 -priority 1000
Done
```

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:
unbind authentication vserver <name> -policy <policyname>
Example

```
> unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
Done
```

At the command prompt, type the following commands to unbind a globally-bound session policy:
unbind tm global -policyName <policyname>
Example

```
> unbind tm global -policyName Session-Pol-1
Done
```

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:
rm tm sessionPolicy <name>
Example

```
> rm tm sessionPolicy Session-Pol-1
Done
```

1. Navigate to Security > AAA - Application Traffic > Session.
2. In the details pane, on the Policies tab, do one of the following:
   - To create a new session policy, click Add.
   - To modify an existing session policy, select the policy, and then click Open.
3. In the Create Session Policy or Configure Session Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

4. Click Create or OK. The policy that you created appears in the details pane of the Session Policies and Profiles page.
5. To globally bind a session policy, in the details pane, click Global Bindings, and fill in the dialog.
    1. Select the name of the session policy you want to globally bind.
    2. Click OK.
6. To bind a session policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.
    1. In the details pane, select the virtual server, and then click Open.
    2. Click the Policies tab.
    3. Click Insert Policy.
    4. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
    5. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
    6. Click OK.

    A message appears in the status bar, stating that the policy has been configured successfully.

Global Session Settings

Aug 13, 2014

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

set tm sessionParameter [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]

Example

```
> set tm sessionParameter -sessTimeout 30
  Done
> set tm sessionParameter -defaultAuthorizationAction DENY
  Done
> set tm sessionParameter -SSO ON
  Done
> set tm sessionParameter -ssoCredential PRIMARY
  Done
```

1. Navigate to Security > AAA - Application Traffic
2. In the details pane, under Settings, click Change global settings.
3. In the Global Session Settings dialog, type or select values for the parameters.
   - Session Time-out—sessTimeout
   - Default Authorization Action—defaultAuthorizationAction
   - Single Sign-on to Web Applications—sso
   - Credential Index—ssoCredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity (minutes)—persistentCookieValidity
   - Home Page—homepage
4. Click OK.

Traffic Settings

Sep 24, 2013

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put you company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

Traffic Profiles

Aug 19, 2014

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

Note: In this feature, the terms “profile” and “action” mean the same thing.

At the command prompt, type:

add tm trafficAction <name> [-appTimeout <mins>] [-SSO (ON | OFF) [-formSSOAction <string>]] [-persistentCookie (ENABLED | DISABLED)] [-InitiateLogout (ON | OFF)]

Example

add tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

At the command prompt, type:

set tm trafficAction <name> [-appTimeout <mins>] [-SSO (ON | OFF) [-formSSOAction <string>]] [-persistentCookie (ENABLED | DISABLED)] [-InitiateLogout (ON | OFF)]

Example

set tm trafficAction Traffic-Prof-1 –appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

At the command prompt, type:

rm tm trafficAction <name>

Example

rm tm trafficAction Traffic-Prof-1

1. Navigate to Security > AAA - Application Traffic > Traffic.
2. In the details pane, click the Profiles tab.
3. On the Profiles tab, do one of the following:
   - To create a new traffic profile, click Add.
   - To modify an existing traffic profile, select the profile, and then click Open.
4. In the Create Traffic Profile or Configure Traffic Profile dialog box, specify values for the parameters.
   - Name*—name (Cannot be changed for a previously configured session action.)
   - AppTimeout—appTimeout
   - Single Sign-On—SSO
   - Form SSO Action—formSSOAction
   - SAML SSO Action—samlSSOAction
   - Enable Persistent Cookie—persistentCookie
   - Initiate Logout—InitiateLogout
5. Click Create or OK. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Traffic Policies

Aug 19, 2014

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

At the command prompt, type:

add tm trafficPolicy <name> <rule> <action>

Example

add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1

At the command prompt, type:

set tm trafficPolicy <name> <rule> <action>

Example

set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1

At the command prompt, type:

bind tm global -policyName <string> [-priority <priority>]

Example

bind tm global -policyName Traffic-Pol-1

At the command prompt, type one of the following commands:

- bind lb vserver <name> -policy <policyName> [-priority <priority>]
- bind cs vserver <name> -policy <policyName> [-priority <priority>]

Example

bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -priority 1000

At the command prompt, type:

unbind tm global -policyName <policyname>

Example

unbind tm global -policyName Traffic-Pol-1

At the command prompt, type one of the following commands:

- unbind lb vserver <name> -policy <policyname>
- unbind cs vserver <name> -policy <policyname>

Example

```
unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
```

First unbind the session policy from global, and then, at the command prompt, type:

rm tm trafficPolicy <name>

Example

```
rm tm trafficPolicy Traffic-Pol-1
```

1. Navigate to Security > AAA - Application Traffic > Traffic.
2. In the details pane, do one of the following:
   - To create a new session policy, click Add.
   - To modify an existing session policy, select the policy, and then click Open.
3. In the Create Traffic Policy or Configure Traffic Policy dialog, specify values for the parameters.
   - Name*—policyName (Cannot be changed for a previously configured session policy.)
   - Profile*—actionName
   - Expression—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click Create or OK. The policy that you created appears in the details pane of the Session Policies and Profiles page.
5. To globally bind a traffic policy, in the details pane, click Global Bindings and fill in the Bind/Unbind Policies to Global dialog box.
   1. Select the name of the traffic policy you want to globally bind.
   2. Click OK.
6. To bind a traffic policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.
   1. In the details pane, select the appropriate virtual server, and then click Open.
   2. Click the Policies tab
   3. Click Insert Policy.
   4. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   5. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   6. Click OK.

Form SSO Profiles

Jun 08, 2015

To enable and configure forms-based SSO, you first create an SSO profile.

Note:

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.

At the command prompt, type:

- add tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>] [-nvtype (STATIC | DYNAMIC)] [-submitMethod (GET | POST)
- show tm formSSOAction [<name>]

Example

```
add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-nameValuePair "loginID passwd" -responsesize "9096"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nvtype STATIC -submitMethod GET
–sessTimeout 10 -defaultAuthorizationAction ALLOW
```

At the command prompt, type:

set tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>] [-nvtype (STATIC | DYNAMIC)] [-submitMethod (GET | POST)

Example

```
set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nameValuePair "loginID passwd" -responsesize "9096"
-nvtype STATIC -submitMethod GET
–sessTimeout 10 -defaultAuthorizationAction ALLOW
```

At the command prompt, type:

rm tm formSSOAction <name>

Example

```
rm tm sessionAction SSO-Prof-1
```

1. Navigate to Security > AAA - Application Traffic > Policies > Traffic.
2. In the details pane, click the Form SSO Profiles tab.
3. On the Form SSO Profiles tab, do one of the following:
   - To create a new form SSO profile, click Add.
   - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the Create Form SSO Profile or Configure Form SSO Profile dialog, specify values for the parameters:
   - Name*—name (Cannot be changed for a previously configured session action.)
   - Action URL*—actionURL
   - User Name Field*—userField
   - Password Field*—passField
   - Expression*—ssoSuccessRule
   - Name Value Pair—nameValuePair
   - Response Size—responsesize
   - Extraction—nvtype
   - Submit Method—submitMethod
5. Click Create or OK, and then click Close. The form SSO profile that you created appears in the Traffic Policies, Profiles, and Form SSO Profiles pane.

SAML SSO Profiles

Jun 12, 2014

To enable and configure SAML-based SSO, you first create a SAML SSO profile.

At the command prompt, type:
add tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF) [-samlIssuerName <string>]

Example

```
add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc."
-assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true"
-sendPassword "ON" -samlIssuerName "Example, Inc."
```

At the command prompt, type:

set tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF) [-samlIssuerName <string>]

Example

```
set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc."
-assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true"
-sendPassword "ON" -samlIssuerName "Example, Inc."
```

At the command prompt, type:

rm tm samlSSOProfile <name>

Example

```
rm tm sessionAction saml-SSO-Prof-1
```

1. Navigate to Security > AAA - Application Traffic > Policies > Traffic.
2. In the details pane, click the SAML SSO Profiles tab.
3. On the SAML SSO Profiles tab, do one of the following:
   - To create a new SAML SSO profile, click Add.
   - To modify an existing SAML SSO profile, select the profile, and then click Open.
4. In the Create SAML SSO Profiles or the Configure SAML SSO Profiles dialog box, set the following parameters:
   - Name*
   - Signing Certificate Name*
   - ACS URL*
   - Relay State Rule*
   - Send Password
   - Issuer Name

5. Click Create or OK, and then click Close. The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

Authenticating with Client Certificates

Aug 13, 2014

Web sites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler ADC must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.

The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the /nsconfig/ssl directory.

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

- add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod>
- bind ssl certKey <certkeyName> -vServer <certkeyName> -CA -crlCheck Mandatory
- show ssl certKey [<certkeyName>]
- set aaa parameter -defaultAuthType CERT
- show aaa parameter
- set aaa certParams -userNameField "Subject:CN"
- show aaa certParams

1. Navigate to Security > AAA - Application Traffic > Virtual Servers.
2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click Edit.
3. On the Configuration page, under Certificates, click the right arrow (>) to open the CA Cert Key installation dialog.
4. In theCA Cert Key dialog box, click Insert.
5. In the CA Cert Key - SSL Certificates dialog box, click Install.
6. In the Install Certificate dialog box, set the following parameters, whose names correspond to the CLI parameter names as shown:
   - Certificate-Key Pair Name*—certkeyName
   - Certificate File Name—certFile
   - Key File Name—keyFile

- Certificate Format—inform
- Password—password
- Certificate Bundle—bundle
- Notify When Expires—expiryMonitor
- Notification Period—notificationPeriod

7. Click Install, and then click Close.
8. In the CA Cert Key dialog box, in the Certificate list, select the root certificate.
9. Click Save.
10. Click Back to return to the main configuration screen.
11. Navigate to Security > AAA - Application Traffic > Policies > Authentication > CERT.
12. In the details pane, select the policy you want to configure to handle client certificate authentication, and then click Edit.
13. In the Configure Authentication CERT Policy dialog, Server drop-down list, select the virtual server you just configured to handle client certificate authentication.
14. Click OK. A message appears in the status bar, stating that the configuration completed successfully.

Configuring AAA with Commonly Used Protocols

Mar 15, 2013

Configuring the NetScaler for Authentication, Authorization, and Auditing (AAA) needs a specific setup on the NetScaler and clients' browsers. The configuration varies with the protocol used for AAA.

For more information about configuring the NetScaler for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.

Handling Authentication, Authorization and Auditing with Kerberos/NTLM

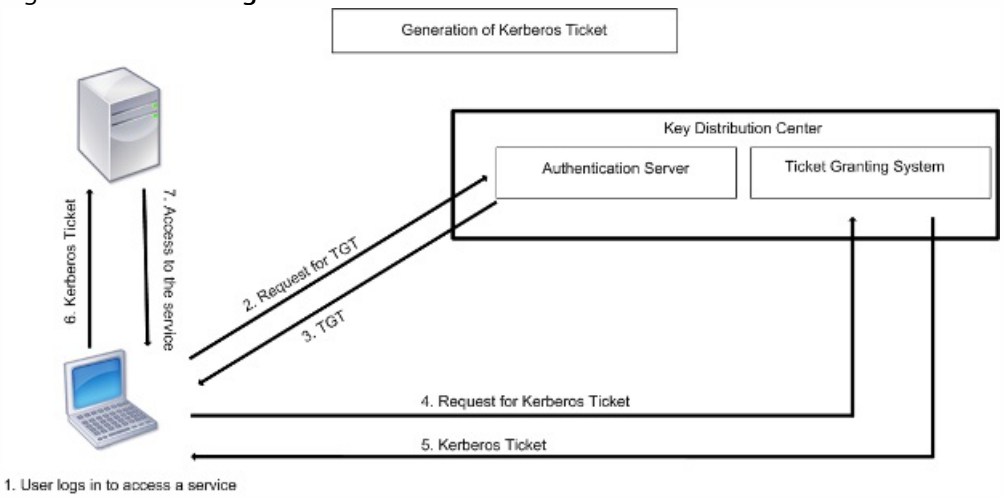
Mar 27, 2012

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other's authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. **Functioning of Kerberos**



Kerberos authentication has the following advantages:

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user's password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

How NetScaler Implements Kerberos Authentication

Jun 12, 2014

Note: Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for AAA traffic management (AAA-TM) virtual servers.

NetScaler handles the components involved in Kerberos authentication in the following way:

Key Distribution Center (KDC)

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

Note: All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

Authentication Service and Protocol Negotiation

A NetScaler appliance supports Kerberos authentication on the AAA-TM authentication virtual servers. If the Kerberos authentication fails, the NetScaler uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for AAA. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler attempts to use the Kerberos protocol for AAA and if the client's browser fails to receive a Kerberos ticket, the NetScaler uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler does not use the data that is present locally on the NetScaler appliance.

Authorization

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

Auditing

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

Supported Environment

Kerberos authentication does not need any specific environment on the NetScaler. The client (browser) must provide support for Kerberos authentication.

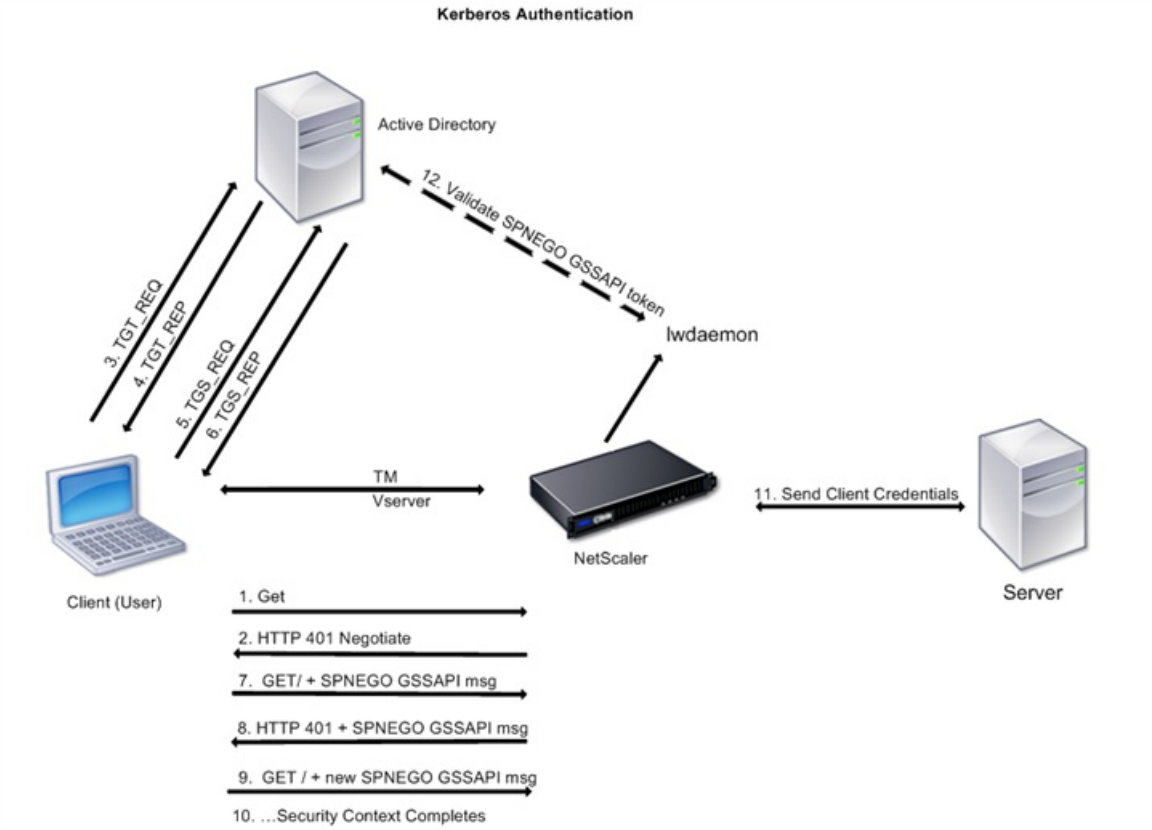
High Availability

In a high availability setup, only the active NetScaler joins the domain. In case of a failover, the NetScaler lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

Kerberos Authentication Process

The following figure shows a typical process for Kerberos authentication in the NetScaler environment.

Figure 1. Kerberos Authentication Process on NetScaler



The Kerberos authentication occurs in the following stages:

Client authenticates itself to the KDC.

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
   - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
   - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

Note: The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

Client requests a service.

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler establishes a security context between the client and the NetScaler. If the NetScaler cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler acts as an HTTP proxy between the client and the physical server.

NetScaler completes the authentication.

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

Kerberos Authentication - Configuration on the NetScaler Appliance

Mar 27, 2012

To configure Kerberos authentication on the NetScaler appliance, perform the following tasks:

1. Enable the Authentication, Authorization, and Auditing (AAA) feature on the NetScaler appliance.
2. On the Active Directory, add a user for Kerberos authentication, map the HTTP service to this user, and generate a keytab file and import it to the NetScaler appliance. You can map more than one service if the Kerberos authentication is required for more than one service. The keytab file should contain entries for every service that is bound to the traffic management virtual server on the NetScaler. The keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. The authentication details of all the services are stored in a single keytab file on the NetScaler.
3. Add a DNS server.
   Note: The NetScaler must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler with a DNS server. A less preferred alternative is to create a static DNS entry.
4. Create an authentication negotiation policy with a negotiation action.
5. Configure an authentication server and bind the authentication policy to the authentication virtual server.
6. Configure an authentication service and a traffic management virtual server, and bind the service to the virtual server. You can use either a load balancing or a content switching virtual server.
7. Verify the configuration.

Enabling AAA on the NetScaler

Oct 30, 2013

Enable authentication of the traffic on the NetScaler appliance.

At the command prompt, type the following commands to enable AAA and verify the configuration:

- enable ns feature AAA
- show ns feature

Example

```
> enable feature aaa
 Done
> show ns feature
 Feature Acronym Status
 ------- ------- ------
1) Web Logging WL ON
 ...
3) Load Balancing LB ON
4) Content Switching CS ON
5) Cache Redirection CR ON
 ...
14) SSL VPN SSLVPN ON
15) AAA AAA ON
 ...
26) CloudBridge CloudBridge OFF
 Done
```

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
4. Click OK.
5. In the confirmation dialog box, click Yes. A message appears in the status bar to indicate that the feature is enabled.

Adding a Keytab file

Nov 14, 2013

The keytab file contains information about services necessary for Kerberos authentication. The keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. You can map more than one service if the Kerberos authentication is required for more than one service. The keytab file should contain entries for every service that is bound to the traffic management virtual server on the NetScaler. The authentication details of all the services are stored in a single keytab file on the NetScaler.

To generate a keytab file and import it to the NetScaler appliance, follow the procedure described below:

Note: You can generate the keytab file and import it onto the NetScaler only from the command line.

1. Log onto the Active Directory server and create a user for Kerberos authentication.
   For example, type the following command:

   ```
   net user Kerb-SVC-Account freebsd!@#456 /add
   ```

2. In the User Properties section, ensure the following settings:
   - The Change password at next logon option is not selected.
   - The Password does not expire option is selected.
3. Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:
   ```
   ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM /pass freebsd!@#456 /mapuser newacp\dummy /ptype KRB5_NT_PRINCIPAL
   ```

   Note: If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.
4. Transfer the keytab file to the NetScaler by using the unix ftp command or any other file transfer utility of your choice.
5. Log onto the NetScaler appliance, and run the ktutil utility to verify the keytab file. The keytab file has an entry for the HTTP service after it is imported.

```
root@ns# ktutil
ktutil: rkt /var/keytabfile
ktutil: list
slot KVNO Principal
----------------------------------------------------------------------

ktutil: wkt /etc/ krb5.keytab
ktutil: list
slot KVNO Principal
---- ---- ---------------------------------------------------------------
1 2 HTTP/owa.newacp.com@NEWACP.COM
ktutil: quit
```

Adding a DNS Server

Oct 30, 2013

The NetScaler appliance should obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler with a DNS server. A less preferred alternative is to create a static DNS entry.

At the command prompt, type the following command:

add dns nameserver <IP>

Note: Alternatively, you can add static host entries or use any other means so that the NetScaler can resolve the FQDN name of the domain controller to an IP address.

Example

```
add dns nameserver 1.2.3.4
```

1. Navigate to Traffic Management > DNS > Name Servers.
2. In the details pane, click Add.
3. In the IP Address box, type the IP address.
4. Click Create, and then Close.
5. Verify that the details pane shows the newly added DNS server.

Creating an Authentication Negotiation Policy

Nov 14, 2013

Create a negotiation policy with a negotiation action for Kerberos authentication of services.

At the command prompt, type the following commands:

- add authentication negotiateAction <name> -domain <domainName> -domainUser <domainUsername> -domainUserPasswd <domainUserPassword> -encrypted
- add authentication negotiatePolicy <name> <rule> <reqAction>

Example

```
add authentication negotiateAction negact -domain newacp.com -domainUser Administrator -domainUserPasswd skp5sep
add authentication negotiatePolicy negopol ns_true negact
```

1. Navigate to Security > AAA-Application Traffic > Policies > Authentication.
2. In the details pane, on the Policies tab, click Add.
3. In the Create Authentication Policy dialog box, set the following parameters:
   - Name
   - Authentication Type - Select NEGOTIATE.
   - Server - Select an existing server from the dropdown list. To add a new authentication server, click New..., and in the Create Authentication Server dialog box, set the following parameters:
     - Domain Name
     - User Name
     - Password
     - Confirm Password - Retype the password.
   - Expression - In the Named Expression list, select General and select True Value from the dropdown list, and then click Add Expression.
4. Click Create, and then click Close.
5. Verify that the policy you created appears in the Authentication Policies and Servers pane.

Creating an Authentication Virtual Server

Oct 30, 2013

Configure an authentication virtual server and bind the authentication negotiation policy to the authentication virtual server.

At the command prompt, type the following commands:

- add authentication vserver <name> SSL <ipAuthVserver> 443 -authenticationDomain <domainName>
- bind authentication vserver <name> -policy <negotiatePolicyName>

Example

```
add authentication vserver authen1 SSL 10.102.113.166 443 -authenticationDomain newacp.com
add ssl certKey cert1 -cert "/nsconfig/ssl/complete/server/server_rsa_2048.pem" -key "/nsconfig/ssl/complete/server/server_rsa_2048.ky"
bind ssl vserver authen1 -certkeyName cert1
bind authentication vserver authen1 -policy negopol
```

1. Navigate to Security > AAA-Application Traffic > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (Authentication) dialog box, set the following parameters:
   - Name
   - IP Address
   - Protocol - Select SSL
   - Domain - Type the fully qualified domain name added while creating the keytab file.

   Note: For AAA, the protocol must be SSL protocol and port must be 443. Therefore, these options are not provided.
4. On the Authentication tab, click Insert Policy. In the Authentication Policies group, from the Policy Name dropdown list, select the negotiate authentication policy you added for Kerberos authentication.
5. On the Certificates tab, select an SSL certificate from the list of available certificates, and then click Add. If the certificate you want to bind is not displayed in the Available Certificates list, click Install..., and then select the certificate file.
6. Click Create, and then click Close. The new authentication virtual server appears in the Authentication Virtual Servers pane.

Configuring a Traffic Management Virtual Server

Oct 30, 2013

Configure an authentication service and a traffic management virtual server, and bind the service to the virtual server. You can use either a load balancing or a content switching virtual server.

At the command prompt, type the following commands:

- add service <name>@ <ipBackendWebserver> HTTP 80
- add lb vserver <name>@ SSL <ipAddressLbVserver> 443 -authn401 ON -authnVsName <authVserverName>
- bind lb vserver <name>@ <serviceName>
  Note: Use a similar procedure for using a content switching virtual server as the traffic management virtual server.

Example

```
add service svc1 10.217.28.92 HTTP 80
 add lb vserver v2 HTTP 10.102.113.164 80 -persistenceType NONE -cltTimeout 180 -authn401 ON -authnVsName authen1
bind lb vserver v2 svc1
```

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, click Add.
3. In the Create Service dialog box, set the following parameters:
   - Service Name
   - Server
   - Protocol - Select HTTP.
   - Port - Select 80.
4. In the navigation pane, expand Load Balancing and click Virtual Servers.
5. In the details pane, click Add.
6. In the Create Virtual Server (Load balancing) dialog box, set values for the following parameters:
   - Name
   - IP Address
   - Protocol
   - Port
7. In the Create Virtual Server (Load balancing) dialog box, on the Services tab, select the service you created in Step 3 to Step 5.
8. In the Create Virtual Server (Load balancing) dialog box, on the Advanced tab, expand Authentication Settings, and then select the 401 Based Authentication check box.
9. Click Create, and then click Close. The new load balancing virtual server appears in the Load Balancing Virtual Servers pane.
10. In the details pane, verify the settings of the virtual server.
    Note: Use a similar procedure to create a content switching virtual server.
    Note: For more information, see Setting up basic load balancing.

Verifying the configuration for Kerberos Authentication

Mar 27, 2012

Ensure that you completed the following tasks and verify whether the configuration is complete and correct.

- Enable the AAA feature
- Import the keytab file
- Configure the DNS server
- Configure negotiation policies and actions
- Configure authentication virtual server
- Configure traffic management virtual server

To verify the configuration:

1. Access the load balancing virtual server, using the FQDN. For example, http://owa.newacp.com.
2. View the AAA session on the NetScaler. show aaa session

```
ClientIp (ClientPort) ->ServerIp(ServerPort)
 ---------------------------------------------
 PE id : 4
 User name: john.smith@NEWACP.COM Session Type: TM
Done
```

Configuration of Kerberos Authentication on a Client

Mar 27, 2012

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

1. In the Tools menu select Internet Options.
2. On the Security tab, click Local Intranet, and then click Sites.
3. In the Local Intranet dialog box, make sure that the Automatically detect intranet network option is selected, and then click Advanced.
4. In the Local Intranet dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler. The specified sites become local intranet sites.
5. Click Close or OK to close the dialog boxes.

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.
   Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

Offloading Kerberos Authentication from Physical Servers

Nov 14, 2013

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the Netscaler authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler release, Kerberos authentication is available only for Authentication, Authorization, and Auditing (AAA) Traffic Management Virtual Servers. Kerberos authentication is not supported for SSL VPN in the NetScaler Gateway Enterprise Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
   - Make sure that you do not select the Change password at next logon option.
   - Be sure to select the Password does not expire option.
2. On the NetScaler appliance, at the CLI command prompt, type:
   - ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerbtabfile.txt

   Note: Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbatabfile.txt file.
3. Upload the kerbatabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.
4. Run the following command to add a DNS server to the NetScaler appliance.
   - add dns nameserver 1.2.3.4

   The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.
5. Switch to the shell prompt and run the following commands from the shell prompt:
   - ktutil # rkt /etc/kerbtabfile.txt
   - # wkt /etc/krb5.keytab
   - # list

     The list command displays the user account details that you created in the Active Directory. A sample screen of the output of the list command is shown below.

     Figure 1. Sample Output of the list Command

```
> shell

Copyright (c) 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992,
        The Regents of the University of California. All righ

root@ns# cd /etc
root@ns# ls -la *.txt
-rw-r--r--  1 root  wheel  82 Apr  4 00:43 kerbtabfile.txt
root@ns# ktutil
ktutil:  rkt /etc/kerbtabfile.txt
ktutil:  wkt /etc/krb5.keytab
ktutil:  list
slot KVNO Principal
---- ---- ---------------------------------------------------
   1    3 HTTP/kerberos.crete.example.com@crete.example.com
ktutil:  quit
root@ns#
```

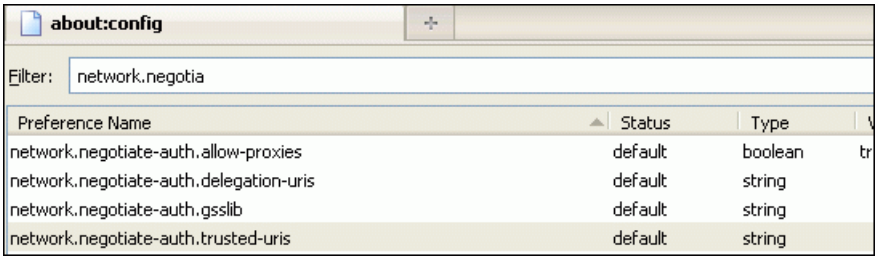
6. Switch to the command line interface of NetScaler.
7. Run the following command to create a Kerberos authentication server:
   - add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser kerbuser -domainUserPasswd Citrix1
8. Run the following command to create a negotiation policy:
   - add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200" KerberosServer
9. Run the following command to create an authentication virtual server.
   - add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.example.com
10. Run the following command to bind the Kerberos policy to the authentication virtual server:
    - bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100
11. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.
    - bind ssl vserver Kerb-Auth -certkeyName ServerTestCert
12. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.
    Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.
13. Run the following command to configure an authentication virtual server:
    - set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth
14. Enter the host name http://www.crete.example.com in the address bar of the Web browser.
    The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

    Note: Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.
15. Configure Kerberos on the Web browser of the client computer.
    - For configuring on Internet Explorer, see "Configuring Internet Explorer for Kerberos authentication."
    - For configuring on Mozilla Firefox, see "Configuring Mozilla Firefox for Kerberos authentication."
16. Verify whether you can access the backend physical server without authentication.

1. Select Internet Options from the Tools menu.
2. Activate the Security tab.
3. Select Local Intranet from the Select a zone to view change security settings section.
4. Click Sites.

5. Click Advanced.
6. Specify the URL, http://www.crete.example.com and click Add.
7. Restart Internet Explorer.

1. Enter about:config in the address bar of the browser.
2. Click the warning disclaimer.
3. Type Network.Negotiate-auth.trusted-uris in the Filter box.
4. Double click Network.Negotiate-auth.trusted-uris. A sample screen is shown below.



5. In the Enter String Value dialog box, specify www.crete.example.com.
6. Restart Firefox.

NetScaler Kerberos Single Sign-On

Oct 11, 2013

NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The NetScaler Kerberos SSO implementation requires the user's password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user's password is not required for Kerberos SSO, although if Kerberos SSO fails and the NetScaler appliance has the user's password, it uses the password to attempt NTLM SSO.

If the user's password is available, the KCD account is configured with a realm, and no delegated user information is present, the NetScaler Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The NetScaler Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user's behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

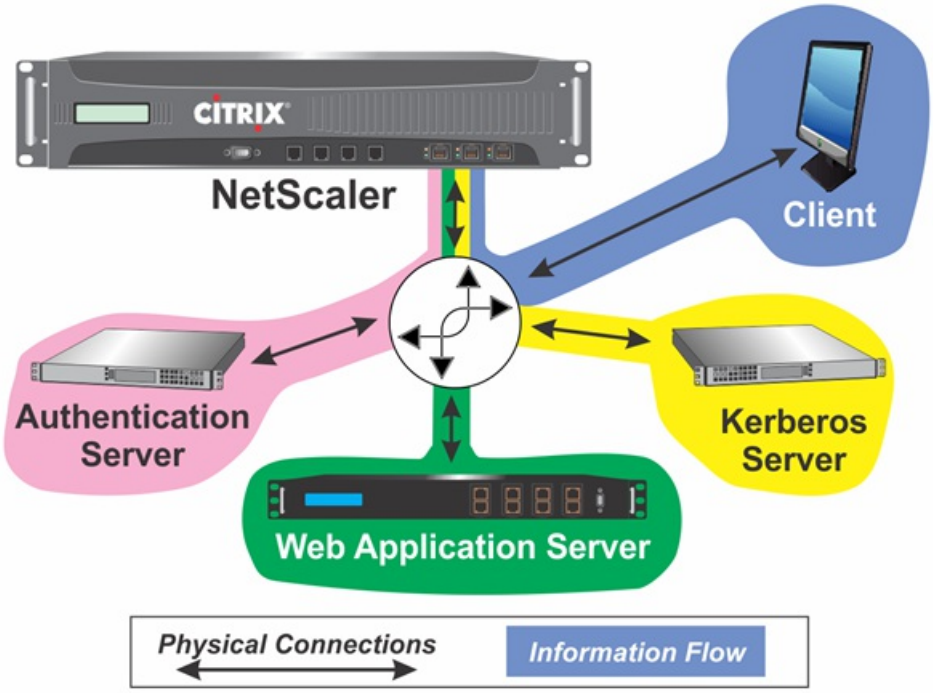
An Overview of NetScaler Kerberos SSO

Oct 14, 2013

To use the NetScaler Kerberos SSO feature does, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user's browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user's browser with a service ticket that provides proof. The browser resends the user's request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

AAA-TM implements this process as shown in the following diagram. The diagram illustrates the flow of information through the NetScaler appliance and AAA-TM, on a secure network with LDAP authentication and Kerberos authorization. AAA-TM environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos



NetScaler AAA-TM authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the NetScaler appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management virtual server.
3. The traffic management virtual server sends the client's request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.

6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user's initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

All AAA-TM authentication mechanisms support NetScaler Kerberos SSO. AAA-TM supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the NetScaler appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the NetScaler appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

Table 1. Supported Authentication Methods

	Basic/Digest/NTLM	Kerberos Constrained Delegation	User Impersonation
CAC (Smart Card): at SSL/TLS Layer		X	X
Forms-Based (LDAP/RADIUS/TACACS)	X	X	X
HTTP Basic (LDAP/RADIUS/TACACS)	X	X	X
Kerberos		X	
NTLM v1/v2		X	X
SAML		X	
SAML Two-Factor	X	X	X
Certificate Two-Factor	X	X	X

Setting up NetScaler SSO

Oct 08, 2013

You can configure NetScaler SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore usually preferable when your configuration allows it. To configure NetScaler SSO by impersonation, you must have the user's user name and password.

To configure NetScaler SSO by delegation, you must have the delegated user's credentials in one of the following formats: the user's user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

Prerequisites

Mar 30, 2015

Before you configure NetScaler SSO, you need to have your NetScaler appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must configure either load balancing or content switching, and then AAA, for these web application servers. You should also verify routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the NetScaler command line. For further assistance, see "Setting Up Basic Load Balancing" and "Setting up AAA Virtual Servers and DNS."

For NetScaler SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the NetScaler appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the NetScaler server entity by specifying the FQDN of the web application server.
- Configure the NetScaler server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

- add server name <serverFQDN>
- add service name serverName serviceType port

For the variables, substitute the following values:

- **serverName**—A name for the NetScaler appliance to use to refer to this server.
- **serverFQDN**—The FQDN of the server. If the server has no domain assigned to it, use the server's IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName**—A name for the NetScaler appliance to use to refer to this service.
- **type**—The protocol used by the service, either HTTP or MSSQLSVC.
- **port**—The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

The following examples add server and service entries on the NetScaler appliance for the web application server **was1.example.com**. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, **was1.example.com**, you would type the following commands:

```
add server was1 was1.example.com
add service was1service was1 HTTP 80
```

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

```
add server WAS1 10.237.64.87
add service was1service WAS1 HTTP 8
```

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

add lb vserver <vserverName> <type> <IP> <port>
For the variables, substitute the following values:

- **vserverName**—A name for the NetScaler appliance to use to refer to this virtual server.
- **type**—The protocol used by the service, either HTTP or MSSQLSVC.
- **IP**—The IP address assigned to the virtual server. This would normally be an IANA-reserved, non-public IP address on your LAN.
- **port**—The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

To add a load balancing virtual server called tmvserver1 to a configuration that manages HTTP traffic on port 80, assigning it a LAN IP address of 10.217.28.20 and then binding the load balancing virtual server to the wasservice1 service, you would type the following commands:

```
add lb vserver tmvserver1 HTTP 10.217.28.20 80
bind lb vserver tmvserv1 wasservice1
```

The authentication virtual server manages authentication traffic between the client and the authentication (LDAP) server. To create an authentication virtual server, at the command prompt type the following commands:

- add authentication vserver <authvserverName> SSL <IP> 443
- set authentication vserver <authvservername> –authenticationdomain <domain>

For the variables, substitute the following values:

- **authvserverName** —A name for the NetScaler appliance to use to refer to this authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command.
- **IP**—The IP address assigned to the authentication virtual server. As with the traffic management virtual server, this address would normally be an IANA-reserved, non-public IP on your LAN.
- **domain**—The domain assigned to the virtual server. This would usually be the domain of your network. It is customary, though not required, to enter the domain in all capitals when configuring the authentication virtual server.

To add an authentication virtual server called authverver1 to your configuration and assign it the LAN IP 10.217.28.21 and the domain EXAMPLE.COM, you would type the following commands:

```
add authentication vserver authvserver1 SSL 10.217.28.21 443
set authentication vserver authvserver1 –authenticationdomain EXAMPLE.COM
```

The authentication virtual server can be configured to handle authentication for a single domain or for multiple domains. If it is configured to support authentication for multiple domains, you must also specify the domain for NetScaler SSO by creating an authentication profile, and then configuring the traffic management virtual server to use that authentication profile.

Note: The traffic management virtual server can be either a load balancing (lb) or content switching (cs) virtual server. The following instructions assume that you are using a load balancing virtual server. To configure a content switching virtual server, simply substitute set cs vserver for set lb vserver. The procedure is otherwise the same.
To create the authentication profile, and then configure the authentication profile on a traffic management virtual server, type the following commands:

- add authentication authnProfile <authnProfileName> {-authvserverName <string>} {-authenticationHost <string>} {-authenticationDomain <string>}
- set lb vserver <vserverName> -authnProfile <authnprofileName>

For the variables, substitute the following values:

- authnprofileName—A name for the authentication profile. Must begin with a letter, number, or the underscore character (_), and must consist of from one to thirty-one alphanumeric or hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.
- authvserverName—The name of the authentication virtual server that this profile uses for authentication.
- authenticationHost—Host name of the authentication virtual server.
- authenticationDomain—Domain for which NetScaler SSO handles authentication. Required if the authentication virtual server performs authentication for more than one domain, so that the correct domain is included when the NetScaler appliance sets the traffic management virtual server cookie.

To create an authentication profile named authnProfile1 for authentication of the example.com domain, and to configure the load balancing virtual server vserver1 to use the authentication profile authnProfile1, you would type the following commands:

```
add authentication authnProfile authnProfile1 -authnvsName authvsesrver1
    -authenticationHost authvsesrver1 -authenticationDomain example.com
set lb vserver vserver1 -authnProfile authnProfile1
```

Configuring SSO

Oct 13, 2013

Configuring NetScaler SSO to authenticate by impersonation is simpler than configuring than SSO to authenticate by delegation, and is therefore usually preferable when your configuration allows it. You just create a KCD account. You can use the user's password.

If you do not have the user's password, you can configure NetScaler SSO to authenticate by delegation. Although somewhat more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user's credentials might not be available to the NetScaler appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

Enabling Integrated Authentication on the Web Application Server

Oct 14, 2013

To set up NetScaler Kerberos SSO on each web application server that Kerberos SSO will manage, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

1. Log on to the IIS server and open Internet Information Services Manager.
2. Select the web site for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings for the Default Web Site. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.
3. Open the Properties dialog box for the default web site or for the individual service, and click the Directory Security tab.
4. Beside Authentication and Access Control, select Edit.
5. Disable anonymous access.
6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication should automatically set protocol negotiation for the web server to **Negotiate, NTLM**, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to **Negotiate, NTLM**.

Setting Up SSO by Impersonation

Mar 18, 2015

You can configure the KCD account for NetScaler SSO by impersonation. In this configuration, the NetScaler appliance obtains the user's username and passwordwhen the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user's name is in UPN format, the appliance obtains the user's realm from UPN. Otherwise, it obtains the user's name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user's realm if the user's realm cannot be obtained from authentication with the Netscaler appliance or from the session profile.

At the command prompt, type the following command:

add aaa kcdaccount <accountname> -realmStr <realm>
For the variables, substitute the following values:

- **accountname**—The KCD account name.
- **realm**—The domain assigned to NetScaler SSO.

Example:

To add a KCD account named **kcdccount1**, and use the keytab named **kcdvserver.keytab**, you would type the following command:

add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab

Configuring SSO by Delegation

Oct 13, 2013

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certificates on the NetScaler appliance and add them to the NetScaler configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service tickets for your protected applications.
- Configure the Active Directory server.

If you are configuring NetScaler SSO with a client certificate, you must copy the matching CA certificate for the client certificate domain (the client CA certificate) to the NetScaler appliance, and then install the CA certificate. To copy the client CA certificate, use the file transfer program of your choice to transfer the certificate and private-key file to the NetScaler appliance, and store the files in **/nsconfig/ssl**.

To install the client CA certificate on the NetScaler appliance

At the command prompt, type the following command:

add ssl certKey <certkeyName> -cert <cert> [(-key <key> [-password]) | -fipsKey <fipsKey>] [-inform (DER | PEM)] [-expiryMonitor (ENABLED | DISABLED | UNSET) [-notificationPeriod <positive_integer>]] [-bundle (YES | NO)]
For the variables, substitute the following values:

- **certkeyName**—A name for the client CA certificate. Must begin with an ASCII alphanumeric or underscore (_) character, and must consist of from one to thirty-one characters. Allowed characters include the ASCII alphanumerics, underscore, hash (#), period(.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cert" or 'my cert').
- **cert**—Full path name and file name of the X509 certificate file used to form the certificate-key pair. The certificate file must be stored on the NetScaler appliance, in the /nsconfig/ssl/ directory.
- **key**—Full path name and file name of the file that contains the private key to the X509 certificate file. The key file must be stored on the NetScaler appliance in the /nsconfig/ssl/ directory.
- **password**—If a private key is specified, the passphrase used to encrypt the private key. Use this option to load encrypted private keys in PEM format.
- **fipsKey**—Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM.
  Note: You can specify either a **key** or a **fipsKey**, but not both.
- **inform**—Format of the certificate and private-key files, either PEM or DER.
- **passplain**—Pass phrase used to encrypt the private key. Required when adding an encrypted private-key in PEM format.
- **expiryMonitor**—Configure the NetScaler appliance to issue an alert when the certificate is about to expire. Possible values: ENABLED, DISABLED, UNSET.
- **notificationPeriod**—If expiryMonitor is ENABLED, number of days before the certificate expires to issue an alert.
- **bundle**—Parse the certificate chain as a single file after linking the server certificate to its issuer's certificate within the file. Possible values: YES, NO.

The following example adds the specified delegated user certificate **customer-cert.pem** to the NetScaler configuration along with the key **customer-key.pem**, and sets the password, certificate format, expiration monitor, and notification period.

To add the delegated user certificate, you would type the following commands:

```
add ssl certKey customer -cert "/nsconfig/ssl/customer-cert.pem"
    -key "/nsconfig/ssl/customer-key.pem" -password "dontUseDefaultPWs!"
    -inform PEM -expiryMonitor ENABLED [-notificationPeriod 14
```

If you are configuring NetScaler SSO by delegation, you can configure the KCD account to use the user's log-on name and password, to use the user's log-on name and keytab, or to use the user's client certificate. If you configure SSO with user name and password, the NetScaler appliance uses the delegated user account to obtain a Ticket Granting Ticket (TGT), and then uses the TGT to obtain service tickets for the specific services that each user requests. If you configure SSO with keytab file, the NetScaler appliance uses the delegated user account and keytab information. If you configure SSO with a delegated user certificate, the NetScaler appliance uses the delegated user certificate.

To create the KCD account for SSO by delegation with a password

At the command prompt, type the following commands:

add aaa kcdaccount <accountname> -delegatedUser root -kcdPassword <password> -realmStr <realm>
For the variables, substitute the following values:

- **accountname**—A name for the KCD account.
- **password**—A password for the KCD account.
- **realm**—The realm of the KCD account, usually the domain for which SSO is active.

To add a KCD account named **kcdaccount1** to the NetScaler appliance configuration with a password of **password1** and a realm of **EXAMPLE.COM**, specifying the delegated user account in UPN format (as root), you would type the following commands:

```
add aaa kcdaccount kcdaccount1 –delegatedUser root
-kcdPassword password1 -realmStr EXAMPLE.COM
```

To add a KCD account named **kcdaccount1** to the NetScaler appliance configuration with a password of **password1** and a realm of **EXAMPLE.COM**, specifying the delegated user account in SPN format, you would type the following commands:

```
add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM
-delegatedUser "host/kcdvserver.example.com" -kcdPassword password1
```

Creating the KCD account for SSO by delegation with a keytab

If you plan to use a keytab file for authentication, first create the keytab. You can create the keytab file manually by logging onto the AD server and using the ktpass utility, or you can use the NetScaler configuration utility to create a batch script, and then run that script on the AD server to generate the keytab file. Next, use FTP or another file transfer program

to transfer the keytab file to the NetScaler appliance and place it in the /nsconfig/krb directory. Finally, configure the KCD account for NetScaler SSO by delegation and provide the path and file name of the keytab file to the NetScaler appliance.

Log on to the AD server command line and, at the command prompt, type the following command:

ktpass /princ <SPN> /ptype KRB5_NT_PRINCIPAL /mapuser <DOMAIN>\<username> /pass <password> -out <File_Path>
For the variables, substitute the following values:

- **SPN**—The service principal name for the KCD service account.
- **DOMAIN**—The domain of the Active Directory server.
- **username**—The KSA account username.
- **password**—The KSA account password.
- **path**— The full path name of the directory in which to store the keytab file after it is generated.

1. Navigate to Security > AAA - Application Traffic
2. In the data pane, under Kerberos Constrained Delegation, click Batch file to generate Keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) Keytab Script dialog box, set the following parameters:
   - **Domain User Name**—The KSA account username.
   - **Domain Password**—The KSA account password.
   - **Service Principal**—The service principal name for the KSA.
   - **Output File Name**—The full path and file name to which to save the keytab file on the AD server.
4. Clear the Create Domain User Account check box.
5. Click Generate Script.
6. Log on to the Active Directory server and open a command line window.
7. Copy the script from the Generated Script window and paste it directly into the Active Directory server command-line window. The keytab is generated and stored in the directory under the file name that you specified as **Output File Name**.
8. Use the file transfer utility of your choice to copy the keytab file from the Active Directory server to the NetScaler appliance and place it in the **/nsconfig/krb** directory.

At the command prompt, type the following command:

add aaa kcdaccount <accountname> –keytab <keytab>
Example:

To add a KCD account named **kcdccount1**, and use the keytab named **kcdvserver.keytab**, you would type the following commands:

add aaa kcdaccount kcdaccount1 –keytab kcdvserver.keytab

To create the KCD account for SSO by delegation with a delegated user cert

At the command prompt, type the following command:

add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <user_name/SPN> -usercert <cert> -cacert <cacert>
For the variables, substitute the following values:

- **accountname**—A name for the KCD account.
- **realmStr**—The realm for the KCD account, usually the domain for which SSO is configured.
- **delegatedUser**—The delegated user name, in SPN format.
- **usercert**—The full path and name of the delegated user certificate file on the NetScaler appliance. The delegated user certificate must contain both the client certificate and the private key, and must be in PEM format. If you use smart card authentication, you might need to create a smart card certificate template to allow certificates to be imported with the private key.
- **cacert**—The full path to and name of the CA certificate file on the NetScaler appliance.

To add a KCD account named **kcdccount1**, and use the keytab named **kcdvserver.keytab**, you would type the following command:

```
add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM
    -delegatedUser "host/kcdvserver.example.com" -usercert /certs/usercert
    -cacert /cacerts/cacert
```

When you configure SSO by delegation, in addition to creating the KCDAccount on the NetScaler appliance, you must also create a matching Kerberos Service Account (KSA) on your LDAP active directory server, and configure the server for SSO. To create the KSA, use the account creation process on the active directory server. To configure SSO on the active directory server, open the properties window for the KSA. In the Delegation tab, enable the following options: Trust this user for delegation to specified services only and Use any Authentication protocol. (The Kerberos only option does not work, because it does not enable protocol transition or constrained delegation.) Finally, add the services that NetScaler SSO will manage.

Note: If the Delegation tab is not visible in the KSA account properties dialog box, before you can configure the KSA as described, you must use the Microsoft **setspn** command-line tool to configure the active directory server so that the tab is visible.

To configure delegation for the Kerberos service account

1. In the LDAP account configuration dialog box for the Kerberos service account that you created, click the Delegation tab.
2. Choose "Trust this user for delegation to the specified services only".
3. Under "Trust this user for delegation to the specified services only," choose "Use any authentication protocol".
4. Under “Services to which this account can present delegated credentials,” click Add.
5. In the Add Services dialog box, click Users or Computers, choose the server that hosts the resources to be assigned to the service account, and then click OK.
   Note: Constrained delegation does not support services hosted in domains other than the domain assigned to the account, even though Kerberos might have a trust relationship with other domains
6. Back in the Add Services dialog box, in the Available Services list, choose the services assigned to the service account. NetScaler SSO supports the HTTP and MSSQLSVC services.
7. Click OK.

Application Firewall

Mar 28, 2012

The following topics cover installation and configuration of the Citrix Application Firewall feature.

Introduction	An overview of web application security and how the application firewall works.
Configuration	How to configure the application firewall to protect a web site, a web service, or a web 2.0 site.
Signatures	A detailed description of the signatures feature and how to configure the signatures, add signatures from a supported vulnerability scanning tool, and define your own signatures, with examples.
Advanced Protections	A detailed description of all of the application firewall security checks, with configuration information and examples.
Profiles	A description of how profiles are configured and used in the application firewall.
Policies	A description of how policies are used when configuring the application firewall, with examples of useful policies.
Imports	A description of how the application firewall uses different types of imported files, and how to import and export files.
Global Configuration	A description of application firewall features that apply to all profiles, and how to configure them.
Use Cases	Extended examples that demonstrate how to set up the application firewall to best protect specific types of more complex web sites and web services.
Logs, Statistics, and Reports	How to access and use the application firewall logs, the statistics, and the reports to assist in configuring the application firewall.

Introduction

Oct 08, 2014

The Citrix NetScaler Application Firewall prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking those that exhibit such activity. Your site is protected not only from common types of attacks, but also from new, as yet unknown attacks. In addition to protecting web servers and web sites from unauthorized access and misuse by hackers and malicious programs, the application firewall provides protection against security vulnerabilities in legacy CGI code or scripts, other web frameworks, web server software, and the underlying operating systems.

The NetScaler Application Firewall is available as a stand-alone appliance, or as a feature on a Citrix NetScaler application delivery controller (ADC) or Citrix NetScaler virtual appliance (VPX). In the application firewall documentation, the term NetScaler ADC refers to the platform on which the application firewall is running, regardless of whether that platform is a dedicated firewall appliance, a NetScaler ADC on which other features have also been configured, or a NetScaler VPX.

To use the application firewall, you must create at least one security configuration to block connections that violate the rules that you set for your protected web sites. The number of security configurations that you might want to create depends on the complexity of your web site. In some cases, a single configuration is sufficient. In other cases, particularly those that include interactive web sites, web sites that access database servers, online stores with shopping carts, you might need several different configurations to best protect sensitive data without wasting significant effort on content that is not vulnerable to certain types of attacks. You can often leave the defaults for the global settings, which affect all security configurations, unchanged. However, you can change the global settings if they conflict with other parts of your configuration or you prefer to customize them.

Web Application Security

Oct 08, 2014

Web application security is network security for computers and programs that communicate by using the HTTP and HTTPS protocols. This is an extremely broad area in which security flaws and weaknesses abound. Operating systems on both servers and clients have security issues and are vulnerable to attack. Web server software and web site enabling technologies such as CGI, Java, JavaScript, PERL and PHP have underlying vulnerabilities. Browsers and other client applications that communicate with web-enabled applications also have vulnerabilities. Web sites that use any technology but the simplest of HTML, including any site that allows interaction with visitors, often have vulnerabilities of their own.

In the past, a breach in security was often just an annoyance, but today that is seldom the case. For example, attacks in which a hacker gained access to a web server and made unauthorized modifications to (defaced) a web site used to be common. They were usually launched by hackers who had no motivation beyond demonstrating their skills to fellow hackers or embarrassing the targeted person or company. Most current security breaches, however, are motivated by a desire for money. The majority attempt to accomplish one or both of the following goals: to obtain sensitive and potentially valuable private information, or to obtain unauthorized access to and control of a web site or web server.

Certain forms of web attacks focus on obtaining private information. These attacks are often possible even against web sites that are secure enough to prevent an attacker from taking full control. The information that an attacker can obtain from a web site can include customer names, addresses, phone numbers, social security numbers, credit card numbers, medical records, and other private information. The attacker can then use this information or sell it to others. Much of the information obtained by such attacks is protected by law, and all of it by custom and expectation. A breach of this type can have extremely serious consequences for customers whose private information is compromised. At best, these customers will have to exercise vigilance to prevent others from abusing their credit cards, opening unauthorized credit accounts in their name, or appropriating their identities outright (identity theft). At worst, the customers may face ruined credit ratings or even be blamed for criminal activities in which they had no part.

Other web attacks are aimed at obtaining control of (or *compromising*) a web site or the server on which it operates, or both. A hacker who gains control of a web site or server can use it to host unauthorized content, act as a proxy for content hosted on another web server, provide SMTP services to send unsolicited bulk email, or provide DNS services to support such activities on other compromised web servers. Most web sites that are hosted on compromised web servers promote questionable or outright fraudulent businesses. For example, the majority of phishing web sites and child exploitation web sites are hosted on compromised web servers.

Protecting your web sites and web services against these attacks requires a multilayered defense capable of both blocking known attacks with identifiable characteristics and protecting against unknown attacks, which can often be detected because they look different from the normal traffic to your web sites and web services.

Updated: 2014-10-08

The first line of defense for your web sites is protection against the large number of attacks that are known to exist and have been observed and analyzed by web security experts. Common types of attacks against HTML-based web sites include:

- **Buffer overflow attacks.** Sending an extremely long URL, extremely long cookie, or other extremely long bit of information to a web server in hopes of causing it or the underlying operating system to hang, crash, or provide the

attacker with access to the underlying operating system. A buffer overflow attack can be used to gain access to unauthorized information, to compromise a web server, or both.

- **Cookie security attacks.** Sending a modified cookie to a web server, usually in hopes of obtaining access to unauthorized content by using falsified credentials.
- **Forceful browsing.** Accessing URLs on a web site directly, without navigating to the URLs by means of hyperlinks on the home page or other common start URLs on the web site. Individual instances of forceful browsing may simply indicate a user who bookmarked a page on your web site, but repeated attempts to access nonexistent content, or content that users should never access directly, often represent an attack on web site security. Forceful browsing is normally used to gain access to unauthorized information, but can also be combined with a buffer overflow attack in an attempt to compromise your server.
- **Web form security attacks.** Sending inappropriate content to your web site in a web form. Inappropriate content can include modified hidden fields, HTML or code in a field intended for alphanumeric data only, an overly long string in a field that accepts only a short string, an alphanumeric string in a field that accepts only an integer, and a wide variety of other data that your web site does not expect to receive in that web form. A web form security attack can be used either to obtain unauthorized information from your web site or to compromise the web site outright, usually when combined with a buffer overflow attack.

Two specialized types of attacks on web form security deserve special mention:

- **SQL injection attacks.** Sending an active SQL command or commands in a web form or as part of a URL, with the goal of causing an SQL database to execute the command or commands. SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a URL or a script on a web page to violate the same-origin policy, which forbids any script from obtaining properties from or modifying any content on a different web site. Since scripts can obtain information and modify files on your web site, allowing a script access to content on a different web site can provide an attacker the means to obtain unauthorized information, to compromise a web server, or both.

Attacks against XML-based web services normally fall into at least one of the following two categories: attempts to send inappropriate content to a web service, or attempts to breach security on a web service. Common types of attacks against XML-based web services include:

- **Malicious code or objects.** XML requests that contain code or objects that can either directly obtain sensitive information or can give an attacker control of the web service or underlying server.
- **Badly-formed XML requests.** XML requests that do not conform to the W3C XML specification, and that can therefore breach security on an insecure web service.
- **Denial of service (DoS) attacks.** XML requests that are sent repeatedly and in high volume, with the intent of overwhelming the targeted web service and denying legitimate users access to the web service.

In addition to standard XML-based attacks, XML web services and Web 2.0 sites are also vulnerable to SQL injection and cross-site scripting attacks, as described below:

- **SQL injection attacks.** Sending an active SQL command or commands in an XML-based request, with the goal of causing an SQL database to execute that command or commands. As with HTML SQL injection attacks, XML SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a script included in an XML based application to violate the same-origin policy, which does not allow any script to obtain properties from or modify any content on a different application. Since scripts can obtain information and modify files by using your XML application, allowing a script access to content belonging to a different application can give an attacker the means to obtain unauthorized information, to compromise the

application, or both.

Known web attacks can usually be stopped by filtering web site traffic for specific characteristics (signatures) that always appear for a specific attack and should never appear in legitimate traffic. This approach has the advantages of requiring relatively few resources and posing relatively little risk of false positives. It is therefore a valuable tool in fighting attacks on web sites and web services, and configuring basic signature protections that intercept most known web attacks is easy to do.

The greatest threat against web sites and applications does not come from known attacks, but from unknown attacks. Most unknown attacks fall into one of two categories: newly-launched attacks for which security firms have not yet developed an effective defense (zero-day attacks), and carefully-targeted attacks on a specific web site or web service rather than many web sites or web services (spear attacks). These attacks, like known attacks, are usually intended to obtain sensitive private information, compromise the web site or web service and allow it to be used for further attacks, or both of those goals.

Zero-day attacks are a major threat to all users. These attacks are usually of the same types as known attacks; zero-day attacks often involve injected SQL, a cross-site script, a cross-site request forgery, or another type of attack similar to known attacks. In most cases, they target vulnerabilities that the developers of the targeted software, web site, or web service either are unaware of or have just learned about. Security firms have therefore usually not developed defenses against these attacks, and even if they have, users have usually not obtained and installed the patches or performed the workarounds necessary to protect against these attacks. The time between discovery of a zero-day attack and availability of a defense (the vulnerability window) is shrinking, but perpetrators can still count on hours or even days in which many web sites and web services lack any specific protection against the attack.

Spear attacks are a major threat, but to a more select group of users. A common type of spear attack, a spear phish, is usually targeted at customers of a specific bank or financial institution, or (less commonly) at employees of a specific company or organization. Unlike other phishes, which are often crudely written forgeries that a user with any familiarity with the actual communications of that bank or financial institution can recognize, spear phishes are letter perfect and extremely convincing. They can contain information specific to the individual that, at first look, no stranger should know or be able to obtain. The spear phisher is therefore able to convince his or her target to provide the requested information, which the phisher can then use to loot accounts, to process illegitimately obtained money from other sources, or to gain access to other, even more sensitive information.

Both of these types of attack have certain characteristics that can usually be detected, although not by using static patterns that look for specific characteristics, as do standard signatures. Detecting these types of attacks requires more sophisticated and more resource-intensive approaches, such as heuristic filtering and positive security model systems. Heuristic filtering looks, not for specific patterns, but for patterns of behaviors. Positive security model systems model the normal behavior of the web site or web service that they are protecting, and then block connections that do not fit within that model of normal use. URL based and web-form based security checks profile normal use of your web sites, and then control how users interact with your web sites, using both heuristics and positive security to block anomalous or unexpected traffic. Both heuristic and positive security, properly designed and deployed, can catch most attacks that signatures miss. However, they require considerably more resources than do signatures, and you must spend some time configuring them properly to avoid false positives. They are therefore usually used, not as the primary line of defense, but as backups to signatures or other less resource-intensive approaches.

By configuring these advanced protections in addition to signatures, you create a hybrid security model, which enables the application firewall to provide comprehensive protection against both known and unknown attacks.

How The Application Firewall Works

Sep 03, 2013

When you install the application firewall, you create an initial security configuration, which consists of a policy, a profile, and a signatures object. The policy is a rule that identifies the traffic to be filtered, and the profile identifies the patterns and types of behavior to allow or block when the traffic is filtered. The simplest patterns, which are called signatures, are not specified within the profile, but in a signatures object that is associated with the profile.

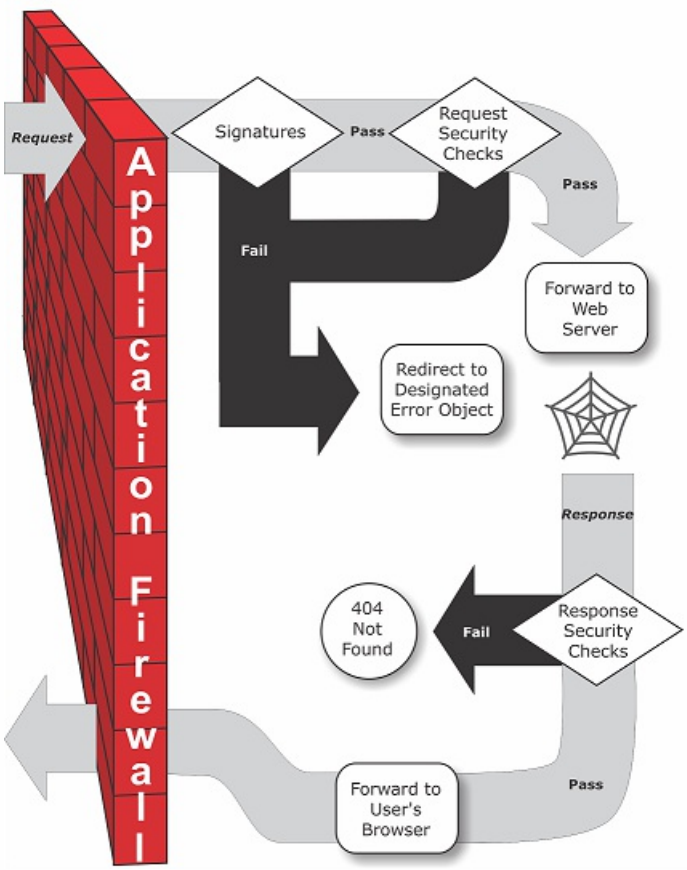
A signature is a string or pattern that matches a known type of attack. The application firewall contains over a thousand signatures in seven categories, each directed at attacks on specific types of web servers and web content. Citrix updates the list with new signatures as new threats are identified. During configuration, you specify the signature categories that are appropriate for the web servers and content that you need to protect. Signatures provide good basic protection with low processing overhead. If your applications have special vulnerabilities or you detect an attack against them for which no signature exists, you can add your own signatures.

The more advanced protections are called security checks. A security check is a more rigorous, algorithmic inspection of a request for specific patterns or types of behavior that might indicate an attack or constitute a threat to your protected web sites and web services. It can, for example, identify a request that attempts to perform a certain type of operation that might breach security, or a response that includes sensitive private information such as a social security number or credit card number. During configuration, you specify the security checks that are appropriate for the web servers and content that you need to protect. The security checks are restrictive. Many of them can block legitimate requests and responses if you do not add the appropriate exceptions (relaxations) when configuring them. Identifying the needed exceptions is not difficult if you use the adaptive learning feature, which observes normal use of your web site and creates recommended exceptions.

The application firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between your servers and your users, usually behind your company's router or firewall. It must be installed in a location where it can intercept traffic between the web servers that you want to protect and the hub or switch through which users access those web servers. You then configure the network to send requests to the application firewall instead of directly to your web servers, and responses to the application firewall instead of directly to your users. The application firewall filters that traffic before forwarding it to its final destination, using both its internal rule set and your additions and modifications. It blocks or renders harmless any activity that it detects as harmful, and then forwards the remaining traffic to the web server. The following figure provides an overview of the filtering process.

Note: The figure omits the application of a policy to incoming traffic. It illustrates a security configuration in which the policy is to process all requests. Also, in this configuration, a signatures object has been configured and associated with the profile, and security checks have been configured in the profile.

Figure 1. A Flowchart of Application Firewall Filtering



As the figure shows, when a user requests a URL on a protected web site, the application firewall first examines the request to ensure that it does not match a signature. If the request matches a signature, the application firewall either displays the error object (a web page that is located on the application firewall appliance and which you can configure by using the imports feature) or forwards the request to the designated error URL (the error page). Signatures do not require as many resources as do security checks, so detecting and stopping attacks that are detected by a signature before running any of the security checks reduces the load on the server.

If a request passes signature inspection, the application firewall applies the request security checks that have been enabled. The request security checks verify that the request is appropriate for your web site or web service and does not contain material that might pose a threat. For example, security checks examine the request for signs indicating that it might be of an unexpected type, request unexpected content, or contain unexpected and possibly malicious web form data, SQL commands, or scripts. If the request fails a security check, the application firewall either sanitizes the request and then sends it back to the NetScaler appliance (or NetScaler virtual appliance), or displays the error object. If the request passes the security checks, it is sent back to the NetScaler appliance, which completes any other processing and forwards the request to the protected web server.

When the web site or web service sends a response to the user, the application firewall applies the response security checks that have been enabled. The response security checks examine the response for leaks of sensitive private information, signs of web site defacement, or other content that should not be present. If the response fails a security check, the application firewall either removes the content that should not be present or blocks the response. If the response passes the security checks, it is sent back to the NetScaler appliance, which forwards it to the user.

Updated: 2013-09-03

The basic application firewall features are policies, profiles, and signatures, which provide a hybrid security model as described in "Known Web Attacks," "Unknown Web Attacks," and "How the Application Firewall Works." Of special note is the learning feature, which observes traffic to your protected applications and recommends appropriate configuration settings for certain security checks.

The imports feature manages files that you upload to the application firewall. These files are then used by the application firewall in various security checks, or when responding to a connection that matches a security check.

You can use the logs, statistics, and reports features to evaluate the performance of the application firewall and identify possible needs for additional protections.

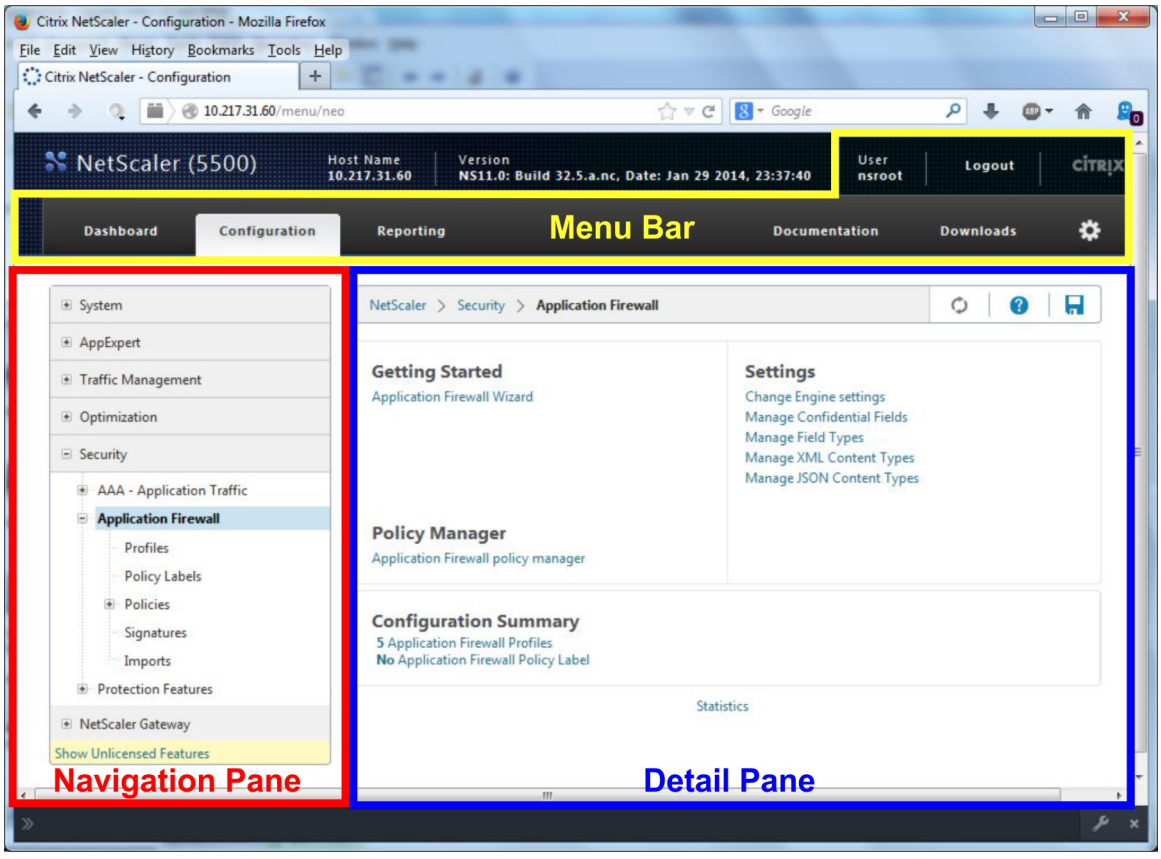
The Application Firewall Configuration Interfaces

Oct 09, 2014

All hardware and virtual versions of the Citrix NetScaler application delivery controller (ADC) can be configured and managed from the Citrix NetScaler command line interface or the web-based configuration utility. All features of most NetScaler features can be configured using either of these tools. The Citrix Application Firewall is an exception: not all application firewall configuration tasks can be performed at the command line. Inexperienced users also find the configuration utility easier to use. In particular, the application firewall wizard considerably reduces the complexity of configuring the application firewall. Unlike most NetScaler wizards, the application firewall wizard can serve as your primary interface to the application firewall.

The command line interface is a modified UNIX shell based on the FreeBSD bash shell. To configure the application firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. For instructions for using the command line interface, see "Command Reference."

The configuration utility is a web-based GUI interface to the ADC. The application firewall configuration section is found under Security > Application Firewall. Figure 1 shows the navigation pane expanded to display the application firewall screens, and in the detail pane the main application firewall screen.



The configuration utility has two main areas on all screens. The panel on the left, called the navigation pane, contains a navigation tree, with which you navigate to the screens on which you configure the features that are installed on your appliance. The screens to which you navigate appear to the right of the navigation pane, in the details pane.

When you access the configuration utility, the details pane displays the System Overview screen. If, in the navigation pane,

you click plus sign next to the application firewall folder, the Application Firewall node expands to include the main application firewall elements that you can configure. If you click the first element, Profiles, the details pane displays the configured profiles, if any profiles have been configured. At the bottom of the details pane, you can click Add to configure a new profile. Other buttons at the bottom of the details pane are grayed out until you select an existing profile. Screens for the other elements work in the same way.

If, instead of expanding the application firewall node, you click the node itself, the details pane displays different options, one of which is the application firewall wizard, as shown in Figure 1. Citrix recommends that you use the wizard for initial configuration, and many users use it almost exclusively. It includes most of the functionality that is available elsewhere in the configuration utility.

For information and instructions on accessing the configuration utility, see "Citrix NetScaler Getting Started Guide."

Configuring the Application Firewall

Oct 09, 2014

You can configure the Citrix Application Firewall (application firewall) by using any of the following methods:

- **Application Firewall Wizard.** A dialog box consisting of a series of screens that step you through the configuration process.
- **Citrix Web Interface AppExpert Template.** A NetScaler AppExpert template (a set of configuration settings) that are designed to provide appropriate protection for web sites. This AppExpert template contains appropriate Application Firewall configuration settings for protecting many web sites.
- **Citrix NetScaler Configuration Utility.** The NetScaler web-based configuration interface.
- **Citrix NetScaler Command Line Interface.** The NetScaler command line configuration interface.

Citrix recommends that you use the Application Firewall Wizard. Most users will find it the easiest method to configure the application firewall, and it is designed to prevent mistakes. If you have a new Citrix NetScaler ADC or VPX that you will use primarily to protect web sites, you may find the Web Interface AppExpert template a better option because it provides a good default configuration, not just for the application firewall, but for the entire appliance. Both the configuration utility and the command line interface are intended for experienced users, primarily to modify an existing configuration or use advanced options.

The application firewall wizard is a dialog box that consists of several screens that prompt you to configure each part of a simple configuration. The application firewall then creates the appropriate configuration elements from the information that you give it. This is the simplest and, for most purposes, the best way to configure the application firewall.

To use the wizard, connect to the configuration utility with the browser of your choice. When the connection is established, verify that the application firewall is enabled, and then run the application firewall wizard, which prompts you for configuration information. You do not have to provide all of the requested information the first time you use the wizard. Instead, you can accept default settings, perform a few relatively straightforward configuration tasks to enable important features, and then allow the application firewall to collect important information to help you complete the configuration.

For example, when the wizard prompts you to specify a rule for selecting the traffic to be processed, you can accept the default, which selects all traffic. When it presents you with a list of signatures, you can enable the appropriate categories of signatures and turn on the collection of statistics for those signatures. For this initial configuration, you can skip the advanced protections (security checks). The wizard automatically creates the appropriate policy, signatures object, and profile (collectively, the security configuration) , and binds the policy to global. The application firewall then begins filtering connections to your protected web sites, logging any connections that match one or more of the signatures that you enabled, and collecting statistics about the connections that each signature matches. After the application firewall processes some traffic, you can run the wizard again and examine the logs and statistics to see if any of the signatures that you have enabled are matching legitimate traffic. After determining which signatures are identifying the traffic that you want to block, you can enable blocking for those signatures. If your web site or web service is not complex, does not use SQL, and does not have access to sensitive private information, this basic security configuration will probably provide adequate protection.

You may need additional protection if, for example, your web site is dynamic. Content that uses scripts may need protection against cross-site scripting attacks. Web content that uses SQL—such as shopping carts, many blogs, and most

content management systems—may need protection against SQL injection attacks. Web sites and web services that collect sensitive private information such as social security numbers or credit card numbers may require protection against unintentional exposure of that information. Certain types of web-server or XML-server software may require protection from types of attacks tailored to that software. Another consideration is that specific elements of your web sites or web services may require different protection than do other elements. Examining the application firewall logs and statistics can help you identify the additional protections that you might need.

After deciding which advanced protections are needed for your web sites and web services, you can run the wizard again to configure those protections. Certain security checks require that you enter exceptions (relaxations) to prevent the check from blocking legitimate traffic. You can do so manually, but it is usually easier to enable the adaptive learning feature and allow it to recommend the necessary relaxations. You can use the wizard as many times as necessary to enhance your basic security configuration and/or create additional security configurations.

The wizard automates some tasks that you would have to perform manually if you did not use the wizard. It automatically creates a policy, a signatures object, and a profile, and assigns them the name that you provided when you were prompted for the name of your configuration. The wizard also adds your advanced-protection settings to the profile, binds the signatures object to the profile, associates the profile with the policy, and puts the policy into effect by binding it to Global.

A few tasks cannot be performed in the wizard. You cannot use the wizard to bind a policy to a bind point other than Global. If you want the profile to apply to only a specific part of your configuration, you must manually configure the binding. You cannot configure the engine settings or certain other global configuration options in the wizard. While you can configure any of the advanced protection settings in the wizard, if you want to modify a specific setting in a single security check, it may be easier to do so on the manual configuration screens in the configuration utility.

For more information on using the Application Firewall Wizard, see "The Application Firewall Wizard."

AppExpert Templates are a different and simpler approach to configuring and managing complex enterprise applications. The AppExpert display in the configuration utility consists of a table. Applications are listed in the left-most column, with the NetScaler features that are applicable to that application appearing each in its own column to the right. (In the AppExpert interface, those features that are associated with an application are called *application units*.) In the AppExpert interface, you configure the interesting traffic for each application, and turn on rules for compression, caching, rewrite, filtering, responder and the application firewall, instead of having to configure each feature individually.

The Web Interface AppExpert Template contains rules for the following application firewall signatures and security checks:

- "Deny URL check." Detects connections to content that is known to pose a security risk, or to any other URLs that you designate.
- "Buffer Overflow check." Detects attempts to cause a buffer overflow on a protected web server.
- "Cookie Consistency check." Detects malicious modifications to cookies set by a protected web site.
- "Form Field Consistency check." Detects modifications to the structure of a web form on a protected web site.
- "CSRF Form Tagging check." Detects cross-site request forgery attacks.
- "Field Formats check." Detects inappropriate information uploaded in web forms on a protected web site.
- "HTML SQL Injection check." Detects attempts to inject unauthorized SQL code.
- "HTML Cross-Site Scripting check." Detects cross-site scripting attacks.

For information on installing and using an AppExpert Template, see "AppExpert Applications and Templates."

The NetScaler configuration utility is a web-based interface that provides access to all configuration options for the application firewall feature, including advanced configuration and management options that are not available from any other configuration tool or interface. Specifically, many advanced Signatures options can be configured only in the configuration utility. You can review recommendations generated by the learning feature only in the configuration utility. You can bind policies to a bind point other than Global only in the configuration utility.

For a description of the configuration utility, see "The Application Firewall Configuration Interfaces." For more information on using the configuration utility to configure the application firewall, see "Manual Configuration By Using the Configuration Utility."

For instructions on configuring the application firewall by using the configuration utility, see "Manual Configuration By Using the Configuration Utility." For information on the Citrix NetScaler Configuration Utility, see "The Application Firewall Configuration Interfaces."

The Citrix NetScaler command line interface is a modified UNIX shell based on the FreeBSD bash shell. To configure the Application Firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. You can configure most parameters and options for the application firewall by using the NetScaler command line. Exceptions are the signatures feature, many of whose options can be configured only by using the configuration utility or the Application Firewall wizard, and the learning feature, whose recommendations can only be reviewed in the configuration utility.

For instructions on configuring the application firewall by using the NetScaler command line, see "Manual Configuration By Using the Command Line Interface."

Enabling the Application Firewall

Oct 09, 2014

Before you can create an application firewall security configuration, you must make sure that the application firewall feature is enabled.

- If you are configuring a dedicated Citrix Application Firewall ADC or are upgrading an existing Citrix NetScaler ADC or VPX, the feature is already enabled. You do not have to perform either of the procedures described here.
- If you have a new NetScaler ADC or VPX, you need to enable the application firewall feature before you configure it.
- If you are upgrading a NetScaler ADC or VPX from a previous version of the NetScaler operating system to the current version, you might need to enable the application firewall feature before you configure it.

Note: If you are upgrading a NetScaler ADC or VPX from a previous version, you might also need to update the licenses on your ADC or VPX before you can enable the application firewall. Check with your Citrix representative or reseller to obtain the correct license.

You can enable the application firewall by using the command line or the configuration utility.

At the command prompt, type the following command:

enable ns feature AppFW

1. Navigate to System > Settings.
2. In the details pane, click Configure Basic Features.
3. In the Configure Basic Features dialog box, check the Application Firewall check box.
4. Click OK.

The Application Firewall Wizard

Oct 01, 2013

Unlike most wizards, the Application Firewall wizard is designed not just to simplify the initial configuration process, but also to modify previously created configurations and to maintain your Application Firewall setup. A typical user runs the wizard multiple times, skipping some of the screens each time.

To run the Application Firewall wizard, first open the configuration utility. Next, in the navigation pane, expand Application Firewall, and then in the details pane click Application Firewall Wizard. (For more information about the configuration utility, see "The Application Firewall User Interfaces.") Then:

1. Navigate to Security > Application Firewall.
2. In the details pane, under Getting Started, click Application Firewall Wizard. The first screen of the wizard appears.
3. To advance to the next screen, click Next.

The Application Firewall wizard displays the following screens, in the following order:

1. **Introduction screen.** Provides an introduction to the Application Firewall wizard. There is nothing that you can configure on this screen.

2. **Specify Name screen.** On this screen, when creating a new security configuration, you specify the name that the wizard is to assign to the configuration. The name can begin with a letter, number, or the underscore symbol, and can consist of from 1 to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols. Choose a name that makes it easy for others to tell what content your new security configuration protects.

   Note: Because the wizard uses this name for both the policy and the profile, it is limited to 31 characters. Manually created policies can have names up to 127 characters in length.
   When creating an existing configuration, you select Modify Existing Configuration and then, in the Name drop-down list, select the name of the existing configuration that you want to modify.

   Note: Only policies that are bound to global or to a bind point appear in this list; you cannot modify an unbound policy by using the Application Firewall wizard. You must either manually bind it to Global or a bind point, or modify it manually. (For manual modification, in the configuration utility's Application Firewall --> Policies --> Firewall pane, select the policy and click Open).
   You also select a profile type on this screen. The profile type determines the types of advanced protection (security checks) that can be configured. Because certain kinds of content are not vulnerable to certain types of security threats, restricting the list of available checks saves time during configuration. The types of Application Firewall profiles are:

   - **Web Application (HTML).** Any HTML-based Web site that does not use XML or Web 2.0 technologies.
   - **XML Application (XML, SOAP).** Any XML-based Web service.
   - **Web 2.0 Application (HTML, XML, REST).** Any Web 2.0 site that combines HTML and XML-based content, such as an ATOM-based site, a blog, an RSS feed, or a wiki.

   Note: If you are unsure which type of content is used on your Web site, you can choose Web 2.0 Application to ensure that you protect all types of Web application content.

3. **Specify Rule screen.** On this screen, you specify the policy rule (*expression*) that defines the traffic to be examined by this security configuration. If you are creating an initial configuration to protect your Web sites and Web services, you can simply accept the default value, **true**, which selects all web traffic .

   If you want this security configuration to examine, not all HTTP traffic that is routed through the appliance, but specific traffic, you can write a policy rule specifying the traffic that you want it to examine. Rules are written in Citrix NetScaler expressions language, which is a fully functional object-oriented programming language.

   - For a simple description of using the NetScaler expressions syntax to create Application Firewall rules, and a list of useful rules, see "Firewall Policies."
   - For a detailed explanation of how to create policy rules in NetScaler expressions syntax, see "Policies and Expressions."

   Note: In addition to the default expressions syntax, for backward compatibility the NetScaler operating system supports the NetScaler classic expressions syntax on NetScaler Classic and nCore appliances and virtual appliances. Classic expressions are not supported on NetScaler Cluster appliances and virtual appliances. Current users who want to migrate their existing configurations to the NetScaler cluster must migrate any policies that contain classic expressions to the default expressions syntax.
4. **Select Signature Protections screen.** On this screen, you select the categories of signatures that you want to use to protect your web sites and web services. The default categories are:

   - **CGI.** Protection against attacks on web sites that use CGI scripts in any language, including PERL scripts, Unix shell scripts, and Python scripts.
   - **Cold Fusion.** Protection against attacks on web sites that use the Adobe Systems® ColdFusion® Web development platform.
   - **FrontPage.** Protection against attacks on web sites that use the Microsoft® FrontPage® Web development platform.
   - **PHP.** Protection against attacks on web sites that use the PHP open-source Web development scripting language.
   - **Client side.** Protection against attacks on client-side tools used to access your protected web sites, such as Microsoft Internet Explorer, Mozilla Firefox, the Opera browser, and the Adobe Acrobat Reader.
   - **Microsoft IIS.** Protection against attacks on Web sites that run the Microsoft Internet Information Server (IIS).
   - **Miscellaneous.** Protection against attacks on other server-side tools, such as Web servers and database servers.

   If you are creating a new security configuration, the signature categories that you select are enabled, and by default they are recorded in a new signatures object. The new signatures object is assigned the same name that you entered on the Specify name screen as the name of the security configuration.

   If you have previously configured signatures objects and want to use one of them as the signatures object associated with the security configuration that you are creating, click Select Existing Signature and select a signatures object from the Signatures list.

   If you are modifying an existing security configuration, you can click Select Existing Signature and assign a different signatures object to the security configuration.

5. **Select Signature Actions screen.** On this screen, you select the actions associated with the signature categories that you selected on the Select signature protections screen. If you are creating an initial configuration, you might want

to accept the defaults, which enable the Log and Stats actions but not the Block action. You can decide later, after reviewing the collected logs and statistics, which signatures you should use to block traffic, and then enable the Block action for those signatures. Signatures are designed to catch specific known attacks on your web sites, and therefore they have extremely low false positive rates. However, with any new configuration, you should probably observe how the settings you chose are working before you use them to block traffic.

If you select More for one of the signature categories, the Configure Actions for Signatures dialog box appears. Its contents are the same as the contents of the Modify Signatures Object dialog box, as described in "To Configure a Signatures Object."

If the signatures object has already logged connections, you can click Logs to display the Syslog Viewer with the logs, as described in "Logs, Statistics, and Reports." If a signature is blocking legitimate access to your protected web site or web service, you can create and implement a relaxation for that signature by selecting a log that shows the unwanted blocking, and then clicking Deploy.

6. **Select Advanced Protections screen.** On this screen, you choose the advanced protections (also called *security checks* or simply *checks*) that you want to use to protect your web sites and web services. The checks are divided into categories. Which categories are available (and which checks are available within a category) depends on the profile type that you chose on the Specify Name screen. All checks are available for Web 2.0 Application profiles. If you chose that profile type, the Select advanced protections screen displays the following categories of security checks:
   - Top--level protections (Some checks appear at the top level, not in any category.)
   - Data Leak Prevention Protections
   - Advanced Form Protections
   - URL Protections
   - XML Protections

   To display the individual checks in a category, click the icon to the left of the category. To apply a security check to your filtered data, select the check box next to the name of the security check. For descriptions of the security checks see "Advanced Protections" and its subtopics.
7. **Select Advanced Actions screen.** On this screen, you configure the actions for the advanced protections that you have enabled.
   Note: If no advanced protections are enabled, the Wizard skips the Advanced Actions screen and goes directly to the Summary screen.
   The actions that you can configure are:
   - **Block.** Block connections that match the signature. Disabled by default.
   - **Log.** Log connections that match the signature for later analysis. Enabled by default.
   - **Stats.** Maintain statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.
   - **Learn.** Observe traffic to this Web site or Web service, and use connections that repeatedly violate this check to generate recommended exceptions to the check, or new rules for the check. Available only for some checks.

   To enable or disable an action for a check, in the list, select or clear the check box for that action to the right of that check.

   To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check. You can also select a check and, at the bottom of the dialog box, click Open to display a dialog box for modifying any of the options for that check. These dialog boxes also vary from check to check. Most of them include a Checks tab and a General tab. If the check supports relaxations, the Checks tab includes an Add button, which opens yet another dialog box, in which you can specify a relaxation for the check. A relaxation is a rule for exempting specified traffic from the check.

For information about the settings available for a check, see the detailed description of that check.

To review the recommendations generated by the learning engine for a specific check, select that check and then click Learned Violations to open the Manage Learned Rules dialog box for that check. For more information on how learning works and how to configure exceptions (relaxations) or deploy learned rules for a check, see "Manual Configuration By Using the Configuration Utility" under To configure and use the learning feature

To view all logs for a specific check, select that check, and then click Logs to display the Syslog Viewer, as described in "Logs, Statistics, and Reports." If a security check is blocking legitimate access to your protected web site or web service, you can create and implement a relaxation for that security check by selecting a log that shows the unwanted blocking, and then clicking Deploy.

8. **Summary screen.** On this screen, you review your configuration choices to verify that they are what you want. If you want to make changes, you click Back until you have returned to the appropriate screen, and make your changes. If the configuration is as you want it, you click Finish to save it , and then click Exit to close the Application Firewall wizard.

Following are four procedures that show how to perform specific types of configuration by using the Application Firewall wizard.

1. Navigate to Security > Application Firewall.
2. In the details pane, under Getting Started, click Application Firewall Wizard.
3. On the Application Firewall wizard, Introduction screen, in the lower right-hand corner, click Next.
4. On the Specify Name screen, in the Name text box, type a name for your new security configuration, and from the Type drop-down list, select the type of security configuration. Then, click Next.
5. On the Specify Rule screen, click Next again.
   Note: The default rule, **true**, protects all Web traffic that is sent via your NetScaler appliance or virtual appliances. You can create specific security configurations to protect specific parts of your Web sites or Web applications later.
6. On the Select Signature Protections screen, select check boxes to specify the groups of signatures that are appropriate for protecting the content on your protected web sites, and then click Next.
   For more information about signatures, see "Signatures."
7. On the Select Signature Actions screen, select or clear the associated check boxes to choose the signature actions that you want for each signature category that you selected in the previous step, and then click Next.
8. On the Select Advanced Protections screen, click Next again.
   You typically do not need to configure the security checks during initial configuration.
9. On the Summary screen, review your choices to verify that they are what you want. Then, click Finish, or click Back to return to a previous screen and make changes. When you are finished, click Exit to close the Application Firewall wizard.

1. Navigate to Security > Application Firewall.
2. In the details pane, under Getting Started, click Application Firewall Wizard.
3. On the Application Firewall wizard, Introduction screen, in the lower right-hand corner, click Next.
4. On the Specify Name screen, select Modify Existing Configuration and, in the Name drop-down list, choose the security configuration that you created during simple configuration, and then click Next.
5. In the Specify Rule screen, click Next again.
6. In the Select Signature Protections screen, click Next again.

7. In the Select Signature Actions screen, enable blocking for your chosen signatures by selecting the Block check box to the left of each of those signature.
   For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see "Signatures."

8. In the Select advanced protections screen, click Next.
9. On the Summary screen, review your choices to verify that they appear correct. Then, click Finish, or click Back to return to the Select Signature Actions screen and make changes. When you are finished, click Exit to close the Application Firewall wizard.

1. Navigate to Security > Application Firewall.
2. In the details pane, under Getting Started, click Application Firewall Wizard.
3. On the Application Firewall wizard, Introduction screen, in the lower right-hand corner, click Next.
4. On the Specify Name screen, select Modify Existing Configuration and, in the Name drop-down list, choose the security configuration that you created during simple configuration. Then, click Next.
5. On the Specify Rule screen, click Next again.
6. On the Select Signature Protections screen, click Next.
7. On the Select Signature Actions screen, click Next again.
8. On the Select advanced protections screen, select the check box beside each security check that you want to enable, and then click Next.
   For information about the security checks, see "Advanced Protections" and its subtopics.

9. On the Select Deep Actions screen, select check boxes to specify the actions that you want the Application Firewall to perform for each security check, and then click Next.
   For general information about the actions, see "Advanced Protections" and its subtopics. For information about the learning feature, which is available for some security checks, see "To configure and use the Learning feature."

10. On the Summary screen, review your choices to verify that they appear correct. Then, click Finish, or click Back to return to the Select Signature Actions screen and make changes. When you are finished, click Exit to close the Application Firewall wizard.

The following procedure describes how to use the Application Firewall wizard to create a specialized security configuration to protect only specific content. In this case, you create a new security configuration instead of modifying the initial configuration. This type of security configuration requires a custom rule, so that the policy applies the configuration to only the selected Web traffic.

1. Navigate to Security > Application Firewall.
2. In the details pane, under Getting Started, click Application Firewall Wizard.
3. On the Application Firewall wizard, Introduction screen, in the lower right-hand corner, click Next.
4. On the Specify Name screen, type a name for your new security configuration in the Name text box, select the type of security configuration from the Type drop-down list, and then click Next.
5. On the Specify Rule screen, enter a rule that matches only that content that you want this Web application to protect, and then click Next.
   For a description of policies and policy rules, see "Policies."

6. On the Select Signature Protections screen, choose the appropriate groups of signatures to protect the content on

your protected web sites by selecting the check box beside each group of signatures, and then click Next.
For detailed information about signatures, see "Signatures."

7. On the Select Signature Actions screen, select or clear the associated check boxes to choose the signature actions that you want for each signature category that you selected in the previous step, and then click Next. For a detailed description of actions, see "Signatures."
8. In the Select Advanced Protections screen, select the check box beside each security check that you want to enable, and then click Next.
   For detailed information about the security checks, see "Advanced Protections" and its subtopics.
9. In the Select Advanced Actions screen, select check boxes to specify the actions that you want the Application Firewall to perform for each security check. Then, click Next.
   For information about each security check to help you determine which actions to enable, see the Advanced Protections section.
10. On the Summary screen, review your choices to verify that they appear correct. Then, click Finish, or click Back to return to the Select Signature Actions screen and make changes. When you are finished, click Exit to close the wizard.

Manual Configuration

Mar 28, 2012

If you want to bind a profile to a bind point other than Global, you must manually configure the binding. Also, certain security checks require that you either manually enter the necessary exceptions or enable the learning feature to generate the exceptions that your Web sites and Web services need. Some of these tasks cannot be performed by using the application firewall wizard.

If you are familiar with how the application firewall works and prefer manual configuration, you can manually configure a signatures object and a profile, associate the signatures object with the profile, create a policy with a rule that matches the web traffic that you want to configure, and associate the policy with the profile. You then bind the policy to Global, or to a bind point, to put it into effect, and you have created a complete security configuration.

For manual configuration, you can use the configuration utility (a graphical interface) or the command line. Citrix recommends that you use the configuration utility. Not all configuration tasks can be performed at the command line. Certain tasks, such as enabling signatures and reviewing learned data, must be done in the configuration utility. Most other tasks are easier to perform in the configuration utility.

Manual Configuration By Using the Configuration Utility

Sep 03, 2013

If you need to configure the Application Firewall feature manually, Citrix recommends that you use the configuration utility. For a description of the configuration utility, see "The Application Firewall User Interfaces."

Before you can configure the signatures, you must create a new signatures object from the appropriate default signatures object template. Assign the copy a new name, and then configure the copy. You cannot configure or modify the default signatures objects directly. The following procedure provides basic instructions for configuring a signatures object. For more detailed instructions, see "Manually Configuring the Signatures Feature." If you need to create your own, user defined signatures, see "The Signatures Editor."

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to use as a template, and then click Add.
   Your choices are:
   - *** Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
   - *** XPath Injection.** Contains all of the items in the * Default Signatures, and in addition contains the XPath injection rules.
3. In the Add Signatures Object dialog box, type a name for your new signatures object, click OK, and then click Close. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (_) symbols.
4. Select the signatures object that you created, and then click Open.
5. In the Modify Signatures Object dialog box, set the Display Filter Criteria options at the left to display the filter items that you want to configure.
   As you modify these options, the results that you specify are displayed in the Filtered Results window at the right. For more information about the categories of signatures, see "Signatures."
6. In the Filtered Results area, configure the settings for a signature by selecting and clearing the appropriate check boxes.
7. When finished, finished, click Close.

Creating an application firewall profile requires that you specify only a few configuration details.

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, click Add.
3. In the Create Application Firewall Profile dialog box, type a name for your profile.
   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.
4. Choose the profile type from the drop-down list.
5. Click Create, and then click Close.

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, select the profile that you want to configure, and then click Open.
3. In the Configure Application Firewall Profile dialog box, on the Security Checks tab, configure the security checks.
   - To enable or disable an action for a check, in the list, select or clear the check box for that action.
   - To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check.
     You can also select a check and, at the bottom of the dialog box, click Open to display the Configure Relaxation dialog box or Configure Rule dialog box for that check. These dialog boxes also vary from check to check. Most of them include a Checks tab and a General tab. If the check supports relaxations or user-defined rules, the Checks tab includes an Add button, which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.) If relaxations have already been configured, you can select one and click Open to modify it.
   - To review learned exceptions or rules for a check, select the check, and then click Learned Violations. In the Manage Learned Rules dialog box, select each learned exception or rule in turn.
     - To edit the exception or rule, and then add it to the list, click Edit & Deploy.
     - To accept the exception or rule without modification, click Deploy.
     - To remove the exception or rule from the list, click Skip.
   - To refresh the list of exceptions or rules to be reviewed, click Refresh.
   - To open the Learning Visualizer and use it to review learned rules, click Visualizer.
   - To review the log entries for connections that matched a check, select the check, and then click Logs. You can use this information to determine which checks are matching attacks, so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see "Logs, Statistics, and Reports."
   - To completely disable a check, in the list, clear all of the check boxes to the right of that check.
4. On the Settings tab, configure the profile settings.
   - To associate the profile with the set of signatures that you previously created and configured, under Common Settings, choose that set of signatures in the Signatures drop-down list.
     Note: You may need to use the scroll bar on the right of the dialog box to scroll down to display the Common Settings section.
   - To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.
     Note: You must first upload the error object that you want to use in the Imports pane. For more information about importing error objects, see "Imports."
   - To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types. ">>More...."
5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile, as described in "Configuring and Using the Learning Feature".
6. Click OK to save your changes and return to the Profiles pane.

Updated: 2014-06-12

You configure two different types of information in this dialog box, depending upon which security check you are configuring. In the majority of cases, you configure an exception (or relaxation) to the security check. If you are configuring the Deny URL check or the Field Formats check, you configure an addition (or rule). The process for either of these is the

same.

To configure a relaxation or rule by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. In the Profiles pane, select the profile you want to configure, and then click Open.
3. In the Configure Application Firewall Profile dialog box, click the Security Checks tab. The Security Checks tab contains the complete list of application firewall security checks, also called *advanced protections* in some places.
4. In the Security Checks tab, click the check that you want to configure, and then click Open. The Modify Check dialog box for the check that you chose is displayed, with the Checks tab selected. The Checks tab contains a list of existing relaxations or rules for this check. The list might be empty if you have not either manually added any relaxations or approved any relaxations that were recommended by the learning engine. Beneath the list is a row of buttons that allow you to add, modify, delete, enable, or disable the relaxations on the list.
5. To add or modify a relaxation or a rule, do one of the following:
   - To add a new relaxation, click Add.
   - To modify an existing relaxation, select the relaxation that you want to modify, and then click Open.

   The Add Check Relaxation or Modify Check Relaxation dialog box for the selected check is displayed. Except for the title, these dialog boxes are identical.
6. Fill in the dialog box as described below. The dialog boxes for each check are different; the list below covers all elements that might appear in any dialog box.
   - **Enabled check box**—Select to place this relaxation or rule in active use; clear to deactivate it.
   - **Attachment Content Type**—The Content-Type attribute of an XML attachment. In the text area, enter a regular expression that matches the Content-Type attribute of the XML attachments to allow.
   - **Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
   - **Cookie**—In the text area, enter a PCRE-format regular expression that defines the cookie.
   - **Field Name**—A web form field name element may be labeled Field Name, Form Field, or another similar name. In the text area, enter a PCRE-format regular expression that defines the name of the form field.
   - **Form Origin URL**—In the text area, enter a PCRE-format regular expression that defines the URL that hosts the web form.
   - **Form Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
   - **Name**—An XML element or attribute name. In the text area, enter a PCRE-format regular expression that defines the name of the element or attribute.
   - **URL**—A URL element may be labeled Action URL, Deny URL, Form Action URL, Form Origin URL, Start URL, or simply URL. In the text area, enter a PCRE-format regular expression that defines the URL.
   - **Format**—The format section contains multiple settings that include list boxes and text boxes. Any of the following can appear:
     - **Type**—Select a field type in the Type drop-down list. To add a new field type definition, click Manage—
     - **Minimum Length**—Type a positive integer that represents the minimum length in characters if you want to force

users to fill in this field. Default: 0 (Allows field to be left blank.)
    - **Maximum length**—To limit the length of data in this field, type a positive integer that represents the maximum length in characters. Default: 65535
- **Location**—Choose the element of the request that your relaxation will apply to from the drop-down list. For HTML security checks, the choices are:
    - FORMFIELD—Form fields in web forms.
    - HEADER—Request headers.
    - COOKIE—Set-Cookie headers.

  For XML security checks, the choices are:
    - ELEMENT—XML element.
    - ATTRIBUE—XML attribute.
- **Maximum Attachment Size**—The maximum size in bytes allowed for an XML attachment.
- **Comments**—In the text area, type a comment. Optional.

  Note: For any element that requires a regular expression, you can type the regular expression, use the Regex Tokens menu to insert regular expression elements and symbols directly into the text box, or click Regex Editor to open the Add Regular Expression dialog box, and use it to construct the expression.

7. To remove a relaxation or rule, select it, and then click Remove.
8. To enable a relaxation or rule, select it, and then click Enable.
9. To disable a relaxation or rule, select it, and then click Disable.
10. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click Visualizer, and use the display tools.

    Note: The Visualizer button does not appear on all check relaxation dialog boxes.
11. To review learned rules for this check, click Learning and perform the steps in "To configure and use the Learning feature."
12. Click OK.

1. Navigate to Security > Application Firewall > Profiles.
2. In the Profiles pane, select the profile, and then click Open.
3. Click the Learning tab. At the top of the Learning tab is list of the security checks that are available in the current profile and that support the learning feature.
4. To configure the learning thresholds, select a security check, and then type the appropriate values in the following text boxes:
    - **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1
    - **Percentage of times threshold.** Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0
5. To remove all learned data and reset the learning feature, so that it must start its observations again from the beginning, click Remove All Learned Data.

Note: This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.

6. To restrict the learning engine to traffic from a specific set of IPs, click Trusted Learning Clients, and add the IP addresses that you want to use to the list.
   1. To add an IP address or IP address range to the Trusted Learning Clients list, click Add.
   2. In the Add Trusted Learning Clients dialog box, Trusted Clients IP list box, type the IP address or an IP address range in CIDR format.
   3. In the Comments text area, type a comment that describes this IP address or range.
   4. Click Create to add your new IP address or range to the list.
   5. To modify an existing IP address or range, click the IP address or range, and then click Open. Except for the name, the dialog box that appears is identical to the Add Trusted Learning Clients dialog box.
   6. To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click Disable or Enable, as appropriate.
   7. To remove an IP address or range completely, click the IP address or range, and then click Remove.
7. Click Close to return to the Configure Application Firewall Profile dialog box.
8. Click Close to close the Configure Application Firewall Profile dialog box, and return to the Application Firewall Profile screen.

1. Navigate to Security > Application Firewall > Policies.
2. In the details pane, do one of the following:
   - To create a new firewall policy, click Add. The Create Application Firewall Policy is displayed.
   - To edit an existing firewall policy, select the policy, and then click Open.

   The Create Application Firewall Policy or Configure Application Firewall Policy is displayed.
3. If you are creating a new firewall policy, in the Create Application Firewall Policy dialog box, Policy Name text box, type a name for your new policy.
   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

   If you are configuring an existing firewall policy, this field is read-only. You cannot modify it.
4. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a new profile to associate with your policy by clicking New, and you can modify an existing profile by clicking Modify.
5. In the Expression text area, create a rule for your policy.
   - You can type a rule directly into the text area.
   - You can click Prefix to select the first term for your rule, and follow the prompts. See "To Create an Application Firewall Rule (Expression)" for a complete description of this process.
   - You can click Add to open the Add Expression dialog box, and use it to construct the rule. See "The Add Expression Dialog Box" for a complete description of this process.
6. Click Create or OK, and then click Close.

The policy rule, also called the *expression*, defines the web traffic that the application firewall filters by using the profile associated with the policy. Like other NetScaler policy rules (or *expressions*), application firewall rules use NetScaler expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the Application Firewall wizard or the NetScaler configuration utility to create your policy rule:
   - If you are configuring a policy in the Application Firewall wizard, in the navigation pane, click Application Firewall, then in the details pane click Application Firewall Wizard, and then navigate to the Specify Rule screen.
   - If you are configuring a policy manually, in the navigation pane, expand Application Firewall, then Policies, and then Firewall. In the details pane, to create a new policy, click Add. To modify an existing policy, select the policy, and then click Open.
2. On the Specify Rule screen, the Create Application Firewall Profile dialog box, or the Configure Application Firewall Profile dialog box, click Prefix, and then choose the prefix for your expression from the drop-down list. Your choices are:
   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

   After you choose a prefix, the application firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.
3. Choose your next term.
   If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The application firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

   When you have decided which term you want, double-click it to insert it into the Expression window.
4. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.
5. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished. Following are some examples of expressions for specific purposes.

   - **Specific web host.** To match traffic from a particular web host:

     HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
     For shopping.example.com, substitute the name of the web host that you want to match.

   - **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

     HTTP.REQ.URL.STARTSWITH("https//www.example.com/folder")
     For www.example.com, substitute the name of the web host. For folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

   - **Specific type of content: GIF images.** To match GIF format images:

     HTTP.REQ.URL.ENDSWITH(".gif")
     To match other format images, substitute another string in place of .gif.

- **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

  HTTP.REQ.URL.STARTSWITH("https//www.example.com/CGI-BIN")
  To match all JavaScripts with .js extensions:

  HTTP.REQ.URL.ENDSWITH(".js")
  For more information about creating policy expressions, see "Policies and Expressions."

Note: If you use the command line to configure a policy, remember to escape any double quotation marks within NetScaler expressions. For example, the following expression is correct if entered in the configuration utility:
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
If entered at the command line, however, you must type this instead:

HTTP.REQ.HEADER(\"Host\").EQ(\"shopping.example.com\")

The Add Expression dialog box (also referred to as the Expression Editor) helps users who are not familiar with the NetScaler expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the Application Firewall wizard or the NetScaler configuration utility:
   - If you are configuring a policy in the Application Firewall wizard, in the navigation pane, click Application Firewall, then in the details pane click Application Firewall Wizard, and then navigate to the Specify Rule screen.
   - If you are configuring a policy manually, in the navigation pane, expand Application Firewall, then Policies, and then Firewall. In the details pane, to create a new policy, click Add. To modify an existing policy, select the policy, and then click Open.
2. On the Specify Rule screen, in the Create Application Firewall Profile dialog box, or in the Configure Application Firewall Profile dialog box, click Add.
3. In the Add Expression dialog box, in the Construct Expression area, in the first list box, choose one of the following prefixes:
   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.
   - **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the application firewall treats requests and associated responses as a single unit and filters both, you do not need to specific responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the Preview Expression window displays your expression.
5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The Preview Expression window updates to display the expression as you have specified it to that point.

6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or additional terms that you added after the term that you modified are cleared.
7. When you have finished constructing your expression, click OK to close the Add Expression dialog box. Your expression is inserted into the Expression text area.

1. Do one of the following:
   - Navigate to Security > Application Firewall, and in the details pane, click Application Firewall policy manager.
   - Navigate to Security > Application Firewall > Policies > Firewall Policies, and in the details pane, click Policy Manager.
2. In the Application Firewall Policy Manager dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:
   - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
   - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
   - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
   - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
   - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
   - **None.** Do not bind the policy to any bind point.
3. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound application firewall policies.
4. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound application firewall policies.
5. Make any additional adjustments to the binding.
   - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
   - To modify the policy expression, double click that field to open the Configure Application Firewall Policy dialog box, where you can edit the policy expression.
   - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
   - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression
6. Repeat steps 3 through 6 to add any additional application firewall policies you want to globally bind.
7. Click OK. A message appears in the status bar, stating that the policy has been successfully bound.

Manual Configuration By Using the Command Line Interface

Dec 17, 2013

You can configure many application firewall features from the NetScaler command line. There are important exceptions, however. You cannot enable signatures from the command line. There are over 1,000 default signatures in seven categories; the task is simply too complex for the command line interface. You can configure the check actions and parameters for security checks from the command line, but cannot enter manual relaxations. While you can configure the adaptive learning feature and enable learning from the command line, you cannot review learned relaxations or learned rules and approve or skip them. The command line interface is intended for advanced users who are thoroughly familiar with the NetScaler appliance and the application firewall feature.

To manually configure the application firewall by using the NetScaler command line, use a telnet or secure shell client of your choice to log on to the NetScaler command line.

At the command prompt, type the following commands:

- add appfw profile <name> [-defaults (**basic** | **advanced**)]
- set appfw profile <name> -type (**HTML** | **XML** | **HTML XML**)
- save ns config

Example

The following example adds a profile named **pr-basic**, with basic defaults, and assigns a profile type of **HTML**. This is the appropriate initial configuration for a profile to protect an HTML Web site.

```
add appfw profile pr-basic -defaults basic
set appfw profile pr-basic -type HTML
save ns config
```

At the command prompt, type the following commands:

- set appfw profile <name> <arg1> [<arg2> ...] where <arg1> represents a parameter and <arg2> represents either another parameter or the value to assign to the parameter represented by <arg1>. For descriptions of the parameters to use when configuring specific security checks, see Advanced Protections and its subtopics. For descriptions of the other parameters, see "Parameters for Creating a Profile."
- save ns config

Example

The following example shows how to configure an HTML profile created with basic defaults to begin protecting a simple HTML-based Web site. This example turns on logging and maintenance of statistics for most security checks, but enables blocking only for those checks that have extremely low false positive rates and require no special configuration. It also turns on transformation of unsafe HTML and unsafe SQL, which prevents attacks but does not block requests to your Web sites. With logging and statistics enabled, you can later review the logs to determine whether to enable blocking for a

specific security check.

```
set appfw profile -startURLAction log stats
set appfw profile -denyURLAction block log stats
set appfw profile -cookieConsistencyAction log stats
set appfw profile -crossSiteScriptingAction log stats
set appfw profile -crossSiteScriptingTransformUnsafeHTML ON
set appfw profile -fieldConsistencyAction log stats
set appfw profile -SQLInjectionAction log stats
set appfw profile -SQLInjectionTransformSpecialChars ON
set appfw profile -SQLInjectionOnlyCheckFieldsWithSQLChars ON
set appfw profile -SQLInjectionParseComments checkall
set appfw profile -fieldFormatAction log stats
set appfw profile -bufferOverflowAction block log stats
set appfw profile -CSRFtagAction log stats
save ns config
```

At the command prompt, type the following commands:

- add appfw policy <name> <rule> <profile>
- save ns config

Example

The following example adds a policy named **pl-blog**, with a rule that intercepts all traffic to or from the host **blog.example.com**, and associates that policy with the profile **pr-blog**. This is an appropriate policy to protect a blog hosted on a specific hostname.

```
add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com")" pr-blog
```

At the command prompt, type the following commands:

- bind appfw global <policyName> <priority>
- save ns config

Example

The following example binds the policy named **pl-blog** and assigns it a priority of **10**.

```
bind appfw global pl-blog 10
save ns config
```

Signatures

May 02, 2013

The application firewall signatures function provides specific, configurable rules that protect your web sites against known attacks. A signature represents a pattern that is a component of a known attack on an operating system, a web server, a web site, an XML-based web service, or any other server that is connected to a web site or web service. A signature can be used to check either requests or responses. A signature can consist of a literal string or a PCRE-compliant regular expression.

To specify how the application firewall is to use signatures, you configure a signatures object, which specifies the signatures to apply to your traffic and the actions to be taken when the signatures match the traffic. A signatures object also contains the SQL injection and cross-site scripting patterns, and may also contain XPath injection patterns. These patterns are not actually signatures but are used by some of the advanced protection checks. The SQL Injection and Cross-Site Scripting patterns contain the SQL special symbols and keywords, the cross-site scripting allowed tags and attributes, and the denied patterns for the HTML and XML SQL Injection and Cross-Site Scripting checks. The XPath injection patterns contain the XPath (XML Path Language) denied patterns.

Note: If you use the wizard to configure signatures, the signatures object is created automatically.
The application firewall examines requests to your protected web sites and web services to determine whether a request matches a signature. Matching requests are handled as you specify when configuring the Signatures actions. By default, matching requests are logged so that you can examine them later. If you enabled blocking, the application firewall displays an error page or error object. If you enabled statistics, the application firewall also includes the request in the statistics that it maintains about requests that match an application firewall signature or security check.

If you want to configure signatures manually, you must create a signatures object from a template or import a signatures object file. There are two default templates that you can use: the *Default Signatures template and the *Xpath Injection template. The *Default Signatures template contains over 1,000 signatures, in addition to the complete list of SQL injection and cross-site scripting allowed and denied patterns. The *Xpath Injection template contains all of those, and in addition contains 57 Xpath keywords and special strings.

In addition to using its native signatures format, the application firewall can create a signatures object by using a built-in template for any supported external signatures format, or by importing an external signatures file in a supported format. The supported formats are as follows:

- **Cenzic**—Signatures files, produced by Cenzic products, that use Cenzic Hailstorm technology.
- **IBM AppScan**—Signatures files produced by IBM AppScan Enterprise and IBM AppScan Standard.
- **Qualys**—Qualys WAS signatures files produced by QualysGuard products. Only Qualys WAS 1.0 files are supported for importing as signatures. WAS 2.0 is not supported.

  Note: Qualys classifies a single SQL special character in a URL as a security threat, even when no SQL keywords are present. The SQL injection check does not consider the presence of a single SQL special character a threat unless an SQL keyword is present. For that reason, a Qualys scanner continues to report such requests as containing SQL injection vulnerabilities, but the application firewall does not detect or block these requests because they pose no actual threat to your protected web sites and web services.
- **Trend Micro**—Signatures files produced by the Trend Micro Vulnerability Scanner (TMVS).

- **Whitehat**—WASC 1.0, WASC 2.0, and best practices signatures produced by Whitehat Sentinel products.

  WASC signatures include information about many vulnerabilities. The application firewall generates blocking signatures from all WASC vulnerabilities. However, only certain vulnerabilities are appropriate for the web application firewall environment. For a list of appropriate Whitehat signatures, see Whitehat WASC Signature Types for WAF Use.

Once you have created a signatures object, you can configure all parts of it, including the signatures rules, the XML SQL Injection and Cross-Site Scripting rules, and the Xpath injection rules. You can manually create and modify your own custom signatures in the signatures editor. You can also add new SQL injection, cross-site scripting, and XPath injection patterns, modify existing patterns, and remove patterns.

Regardless of whether you use the wizard for initial configuration or configure your signatures object manually, you should regularly apply the Citrix updates to keep your signatures current. Citrix regularly updates the default application firewall signatures. You can apply those updates manually, or you can enable automatic signature updates so that the application firewall can update the signatures from the Cloud-based application firewall updates service. You can obtain the correct URL for either type of updates from your Citrix service representative or reseller.

Manually Configuring the Signatures Feature

Sep 03, 2013

To use signatures to protect your web sites, you must review the rules, and enable and configure the ones that you want to apply. The rules are disabled by default. Citrix recommends that you enable all rules that are applicable to the type of content that your web site uses.

To manually configure the signatures feature, use a browser to connect to the configuration utility. Then, create a signatures object from a built-in template, an existing signatures object, or by importing a file. Next, configure the new signatures object.

Note: The following procedures do not address adding user-defined signatures to a signatures object. To create your own signatures, see "The Signatures Editor."

Adding or Removing a Signatures Object

Oct 06, 2014

You can add a new signatures object to the application firewall by:

- Copying a built-in template.
- Copying an existing signatures object.
- Importing a signatures object from an external file.

You must use the configuration utility to copy a template or existing signatures object. You can use either the configuration utility or the command line to import a signatures object. You can also use either the configuration utility or the command line to remove a signatures object.

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to use as a template.
   Your choices are:
   - *** Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
   - *** XPath Injection.** Contains the XPath injection patterns.
   - **Any existing signatures object.**

   Attention: If you do not choose a signatures type to use as a template, the application firewall will prompt you to create signatures from scratch.
3. Click Add.
4. In the Add Signatures Object dialog box, type a name for your new signatures object, and then click OK. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (_) symbols.
5. Click Close.

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, click Add.
3. In the Add Signatures Object dialog box, select the format of the signatures you want to import.
   - To import a NetScaler format signatures file, select the Native Format tab.
   - To import an external signatures format file, select the External Format tab.
4. Choose the file that you want to use to create your new signatures object.
   - To import a native NetScaler format signatures file, in the Import section select either Import from Local File or Import from URL, then type or browse to the path or URL to the file.
   - To import a Cenzic, IBM AppScan, Qualys, or Whitehat format file, in the XSLT section select Use Built-in XSLT File, Use Local File, or Reference from URL. Next, if you chose Use Built-in XSLT File, select the appropriate file format from the drop-down list. If you chose Use Local File or Reference from URL, then type or browse to the path or URL to the file.
5. Click Add, and then click Close.

At the command prompt, type the following commands:

- import appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge] [-sha1 <string>]
- save ns config

Example #1

The following example creates a new signatures object from a file named signatures.xml and assigns it the name MySignatures.

```
import appfw signatures signatures.xml MySignatures
save ns config
```

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to remove.
3. Click Remove.

At the command prompt, type the following commands:

- rm appfw signatures <name>
- save ns config

Configuring or Modifying a Signatures Object

Oct 06, 2014

You configure a signatures object after creating it, or modify an existing signatures object, to enable or disable signature categories or specific signatures, and configure how the application firewall responds when a signature matches a connection.

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to configure, and then click Open.
3. In the Modify Signatures Object dialog box, set the Display Filter Criteria options at the left to display the filter items that you want to configure.
   As you modify these options, the results that you requested are displayed in the Filtered Results window at the right.

- To display only selected categories of signatures, check or clear the appropriate signature-category check boxes. The signature categories are:

Name	Type of Attack that this Signature Protects Against
cgi	CGI scripts. Includes Perl and UNIX shell scripts.
client	Browsers and other clients.
coldfusion	Web sites that use the Adobe Systems ColdFusion application server.
frontpage	Web sites that use Microsoft's FrontPage server.
iis	Web sites that use the Microsoft Internet Information Server (IIS).
misc	Miscellaneous attacks.
php	Web sites that use PHP
web-activex	Web sites that contain ActiveX controls.
web-struts	Web sites that contain Apache struts, which are java-ee based applets.

- To display only signatures that have specific check actions enabled, select the ON check box for each of those actions, clear the ON check boxes for the other actions, and clear all of the OFF check boxes. To display only signatures that have a specific check action disabled, select their respective OFF check boxes and clear all of the ON check boxes. To display signatures regardless of whether they have a check action enabled or disabled, select or clear both the ON and the OFF check boxes for that action. The check actions are:

Criterion	Description
Enabled	The signature is enabled. The application firewall checks only for signatures that are enabled when it processes traffic.
Block	Connections that match this signature are blocked.
Log	A log entry is produced for any connection that matches this signature.
Stats	The application firewall includes any connection that matches this signature in the statistics that it generates for that check.

- To display only signatures that contain a specific string, type the string into the text box under the filter criteria, and then click Search.
- To reset all display filter criteria to the default settings and display all signatures, click Show All.

4. For information about a specific signature, select the signature, and then click the blue double arrow in the More field. The Signature Rule Vulnerability Detail message box appears. It contains information about the purpose of the signature and provides links to external web-based information about the vulnerability or vulnerabilities that this signature addresses. To access an external link, click the blue double arrow to the left of the description of that link.
5. Configure the settings for a signature by selecting the appropriate check boxes.
6. If you want to add a local signature rule to the signatures object, or modify an existing local signature rule, see "The Signatures Editor."
7. If you have no need for SQL injection, cross-site scripting, or Xpath injection patterns, click OK, and then click Close. Otherwise, in the lower left-hand corner of the details pane, click Manage SQL/XSS Patterns.
8. In the Manage SQL/XSS Patterns dialog box, Filtered Results window, navigate to the pattern category and pattern that you want to configure. For information about the SQL injection patterns, see "HTML SQL Injection Check." For information about the cross-site scripting patterns, see "HTML Cross-Site Scripting Check."
9. To add a new pattern:
    1. Select the branch to which you want to add the new pattern.
    2. Click the Add button directly below the lower section of the Filtered Results window.
    3. In the Create Signature Item dialog box, fill in the Element text box with the pattern that you want to add. If you are adding a transformation pattern to the transform rules branch, under Elements, fill in the From text box with the pattern that you want to change and the To text box with the pattern to which you want to change the previous pattern.
    4. Click OK.
10. To modify an existing pattern:
    1. In the Filtered Results window, select the branch that contains the pattern that you want to modify.
    2. In the detail window beneath the Filtered Results window, select the pattern that you want to modify.
    3. Click Modify.
    4. In the Modify Signature Item dialog box, Element text box, modify the pattern. If you are modifying a transformation pattern, you can modify either or both patterns under Elements, in the From and the To text boxes.
    5. Click OK.
11. To remove a pattern, select the pattern that you want to remove, then click the Remove button below the details pane beneath the Filtered Results window. When prompted, confirm your choice by clicking Close.
12. To add the patterns category to the XSS branch:

1. Select the branch to which you want to add the patterns category.
2. Click the Add button directly below the Filtered Results window.
   Note: Currently you can add only one category, named patterns, to the XSS branch, so after you click Add, you must accept the default choice, which is patterns.
3. Click OK.

13. To remove a branch, select that branch, and then click the Remove button directly below the Filtered Results window. When prompted, confirm your choice by clicking OK.
    Note: If you remove a default branch, you remove all of the patterns in that branch. Doing so can disable the security checks that use that information.
14. When you are finished modifying the SQL injection, cross-site scripting, and XPath injection patterns, click OK, and then click Close to return to the Modify Signatures Object dialog box.
15. Click OK at any point to save your changes, and when you are finished configuring the signatures object, click Close.

Updating a Signatures Object

Jul 21, 2015

You should update your signatures objects frequently to ensure that your application firewall is providing protection against current threats. You should regularly update both the default application firewall signatures and any signatures that you import from a supported vulnerability scanning tool.

Citrix regularly updates the default signatures for the application firewall. You can update the default signatures manually or automatically. In either case, ask your Citrix representative or Citrix reseller for the URL to access the updates. You can enable automatic updates of the Citrix native format signatures in the "Engine Settings" and "Signature Auto Update Settings" dialog boxes.

Most makers of vulnerability scanning tools regularly update the tools. Most web sites also change frequently. You should update your tool and rescan your web sites regularly, exporting the resulting signatures to a file and importing them into your application firewall configuration.

Note: When you update the application firewall signatures from the NetScaler command line, you must first update the default signatures, and then issue additional update commands to update each custom signatures file that is based on the default signatures. If you do not update the default signatures first, a version mismatch error prevents updating of the custom signatures files.

At the command prompt, type the following commands:

- update appfw signatures <name> [-mergedefault]
- save ns config

Example

The following example updates the signatures object named MySignatures from the default signatures object, merging new signatures in the default signatures object with the existing signatures. This command does not overwrite any user-created signatures or signatures imported from another source, such as an approved vulnerability scanning tool.

```
update appfw signatures MySignatures -mergedefault
save ns config
```

Updated: 2014-10-06

Citrix regularly updates the signatures for the Application Firewall. You should regularly update the signatures on your Application Firewall to ensure that your Application Firewall is using the most current list. Ask your Citrix representative or Citrix reseller for the URL to access the updates.

To update a signatures object from a Citrix format file by using the command line

At the command prompt, type the following commands:

- update appfw signatures <name> [-mergeDefault]
- save ns config

To update a signatures object from a Citrix format file by using the configuration utility

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to update.
3. In the Action drop-down list, select Merge.
4. In the Update Signatures Object dialog box, choose one of the following options.
   - **Import from URL**—Choose this option if you download signature updates from a web URL.
   - **Import from Local File**—Choose this option if you import signature updates from a file on your local hard drive, network hard drive, or other storage device.
5. In the text area, type the URL, or type or browse to the local file.
6. Click Update. The update file is imported, and the Update Signatures dialog box changes to a format nearly identical to that of the Modify Signatures Object dialog box. The Update Signatures Object dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
7. Review and configure the new and modified signatures.
8. When you are finished, click OK, and then click Close.

Updated: 2014-01-17

Note: Before you update a signatures object from a file, you must create the file by exporting signatures from the vulnerability scanning tool.

To import and update signatures from a vulnerability scanning tool

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to update, and then click Merge.
3. In the Update Signatures Object dialog box, on the External Format tab, Import section, choose one of the following options.
   - **Import from URL**—Choose this option if you download signature updates from a Web URL.
   - **Import from Local File**—Choose this option if you import signature updates from a file on your local or a network hard drive or other storage device.
4. In the text area, type the URL, or browse or type the path to the local file.
5. In the XSLT section, choose one of the following options.
   - **Use Built-in XSLT File**—Choose this option if you want to use a built-in XSLT files.
   - **Use Local File**—Choose this option to use an XSLT file on your local computer.
   - **Reference from URL**—Choose this option to import an XSLT file from a web URL.
6. If you chose Use Built-in XSLT File, in the Built-In XSLT drop-down list choose the built-in XSLT file that you want to use.
   - To use the Cenzic XSLT file, select Cenzic.
   - To use the IBM AppScan Standard XSLT file, select IBM AppScan Standard.
   - To use the IBM AppScan Enterprise XSLT file, select IBM AppScan Enterprise.
   - To use the Qualys XSLT file, select Qualys.
   - To use the Trend Microsystems XSLT file, select Trend Micro.
   - To use the Whitehat XSLT file, select Whitehat.
7. Click Update. The update file is imported, and the Update Signatures dialog box changes to a format nearly identical to that of the Modify Signatures Object dialog box, which is described in "Configuring or Modifying a Signatures Object."

The Update Signatures Object dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.

8. Review and configure the new and modified signatures.
9. When you are finished, click OK, and then click Close.

Exporting a Signatures Object to a File

Oct 06, 2014

You export a signatures object to a file so that you can import it to another NetScaler ADC.

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to configure.
3. In the Actions drop-down list, select Export.
4. In the Export Signatures Object dialog box, Local File text box, type the path and name of the file to which you want to export the signatures object, or use the Browse dialog to designate a path and name.
5. Click OK.

The Signatures Editor

Oct 14, 2014

You can use the signatures editor, which is available in the configuration utility, to add a new user-defined (local) signature rule to an existing signatures object, or to modify a previously configured local signature rule. Except that it is defined by the user (you), a local signature rule has the same attributes as a default signature rule from Citrix, and it functions in the same way. You enable or disable it, and configure the signature actions for it, just as you do for a default signature.

Add a local rule if you need to protect your web sites and services from a known attack that the existing signatures do not match. For example, you might discover a new type of attack and determine its characteristics by examining the logs on your web server, or you might obtain third-party information about a new type of attack.

At the heart of a signature rule are the rule *patterns*, which collectively describe the characteristics of the attack that the rule is designed to match. Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting patterns.

You might want to modify a signature rule by adding a new pattern or modifying an existing pattern to match an attack. For example, you might find out about changes to an attack, or you might determine a better pattern by examining the logs on your web server, or from third-party information.

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select the signatures object that you want to edit, and then click Open.
3. In the Modify Signatures Object dialog box, in the middle of the screen beneath the Filtered Results window, do one of the following:.
   - To add a new local signature rule, click Add.
   - To modify an existing local signature rule, select that rule, and then click Open.
4. In the Add Local Signature Rule or the Modify Local Signature Rule dialog box, configure the actions for a signature by selecting the appropriate check boxes.
   - **Enabled.** Enables the new signature rule. If you do not select this, this new signature rule is added to your configuration, but is inactive.
   - **Block.** Blocks connections that violate this signature rule.
   - **Log.** Logs violations of this signature rule to the NetScaler log.
   - **Stat.** Includes violations of this signature rule in the statistics.
   - **Remove.** Strips information that matches the signature rule from the response. (Applies only to response rules.)
   - **X-Out.** Masks information that matches the signature rule with the letter X. (Applies only to response rules.)
   - **Allow Duplicates.** Allows duplicates of this signature rule in this signatures object.
5. Choose a category for the new signature rule from the Category drop-down list.
   You can also create a new category by clicking the icon to the right of the list and using the Add Signature Rule Category dialog box to add a new category to the list, The rule you are modifying is automatically added to the new category. For instructions, see "To add a signature rule category."
6. In the **LogString** text box, type a brief description of the signature rule to be used in the logs.
7. In the **Comment** text box, type a comment. (Optional)
8. Click More..., and modify the advanced options.
   1. To strip HTML comments before applying this signature rule, in the Strip Comments drop-down list choose All or

Exclude Script Tag.

2. To set CSRF Referer Header checking, in the CSRF Referer Header checking radio button array, select either the If Present or Always radio button.
3. To manually modify the Rule ID assigned to this local signature rule, modify the number in the Rule ID text box. The ID must be a positive integer between 1000000 and 1999999 that has not already been assigned to a local signature rule.
4. To assign a version number to the new signature rule, modify the number in the Version Number text box.
5. To assign a Source ID, modify the string in the Source ID text box.
6. To specify the source, choose Local or Snort from the Source drop-down list, or click the Add icon to the right of the list and add a new source.
7. To assign a harm score to violations of this local signature rule, type a number between 1 and 10 in the Harm Score text box.
8. To assign a severity rating to this local signature rule, in the Severity drop-down list choose High, Medium, or Low, or click the Add icon to the right of the list and add a new severity rating.
9. To assign a violation type to this local signature rule, in the Type drop-down list choose Vulnerable or Warning, or click the Add icon to the right of the list and add a new violation type.

9. In the **Patterns** list, add or edit a pattern.
   - To add a pattern, click Add. In the Create New Signature Rule Pattern dialog box, add one or more patterns for your signature rule, and then click OK.
   - To edit a pattern, select the pattern, and then click Open. In the Edit Signature Rule Pattern dialog box, modify the pattern, and then click OK.

   For more information about adding or editing patterns, see "Signature Rule Patterns."
10. Click OK.

To add a signature rule category

Sep 03, 2013

Putting signature rules into a category enables you to configure the actions for a group of signatures instead of for each individual signature. You might want to do so for the following reasons:

- **Ease of selection.** For example, assume that all of signature rules in a particular group protect against attacks on a specific type of web server software or technology. If your protected web sites use that software or technology, you want to enable them all. If they do not, you do not want to enable any of them.
- **Ease of initial configuration.** It is easiest to set defaults for a group of signatures as a category, instead of one-by-one. You can then make any changes to individual signatures as needed.
- **Ease of ongoing configuration.** It is easier to configure signatures if you can display only those that meet specific criteria, such as belonging to a specific category.

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select that signatures object that you want to configure, and then click Open.
3. In the Modify Signatures Object dialog box, in the middle of the screen, beneath the Filtered Results window, click Add.
4. In the Add Local Signature Rule dialog box, click the icon to the right of the Category drop-down list.
5. In the Add Signature Rule Category dialog box, New Category text box, type a name for your new signature category. The name can consist of from one to 64 characters.
6. Click **OK**.

Signature Rule Patterns

Aug 20, 2014

You can add a new pattern to a signature rule or modify an existing pattern of a signature rule to specify a string or expression that characterizes an aspect of the attack that the signature matches. To determine which patterns an attack exhibits, you can examine the logs on your web server, use a tool to observe connection data in real time, or obtain the string or expression from a third-party report about the attack.

Caution: Any new pattern that you add to a signature rule is in an **AND** relationship with the existing patterns. Do not add a new pattern to an existing signature rule if you do not want a potential attack to have to match all of the patterns in order to match the signature.

Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting pattern. Before you attempt to add a pattern that is based on a regular expression, you should make sure that you understand PCRE-format regular expressions. PCRE expressions are complex and powerful; if you do not understand how they work, you can unintentionally create a pattern that matches something that you did not want (a *false positive*) or that fails to match something that you did want (a *false negative*).

If you are not already familiar with PCRE-format regular expressions, you can use the following resources to learn the basics, or for help with some specific issue:

- *— "Mastering Regular Expressions"*
  , Third Edition. Copyright (c) 2006 by Jeffrey Friedl. O'Reilly Media, ISBN: 9780596528126
- *— "Regular Expressions Cookbook"*
  . Copyright (c) 2009 by Jan Goyvaerts and Steven Levithan. O'Reilly Media, ISBN: 9780596520687
- **PCRE Man page/Specification** (text/official): "http://www.pcre.org/pcre.txt"
- **PCRE Man Page/Specification** (html/gammon.edu.au): "http://www.gammon.com.au/pcre/index.html"
- **Wikipedia PCRE entry**: "http://en.wikipedia.org/wiki/PCRE"
- **PCRE Mailing List** (run by exim.org): "http://lists.exim.org/mailman/listinfo/pcre-dev"

If you need to encode non-ASCII characters in a PCRE-format regular expression, the NetScaler platform supports encoding of hexadecimal UTF-8 codes. For more information, see "PCRE Character Encoding Format."

1. Navigate to Security > Application Firewall > Signatures.
2. In the details pane, select that signatures object that you want to configure, and then click **Open**.
3. In the Modify Signatures Object dialog box, in the middle of the screen beneath the Filtered Results window, either click Add to create a signature rule, or select an existing signature rule and click Open.
   Note: You can modify only signature rules that you added. You cannot modify the default signature rules.
   Depending on your action, either the Add Local Signature Rule or the Modify Local Signature Rule dialog box appears. Both dialog boxes have the same contents.
4. Under the Patterns window in the dialog box, either click Add to add a new pattern, or select an existing pattern from the list beneath the Add button and click Open. Depending on your action, either the Create New Signature Rule Pattern or the Edit Signature Rule Pattern dialog box appears. Both dialog boxes have the same contents.
5. In the Pattern Type drop-down list, choose the type of connection that the pattern is intended to match.
   - If the pattern is intended to match request elements or features, such as injected SQL code, attacks on web forms, cross-site scripts, or inappropriate URLs, choose **Request**.
   - If the pattern is intended to match response elements or features, such as credit card numbers or safe objects,

choose **Response**.

6. In the Location area, define the elements to examine with this pattern.
   The Location area describes what elements of the HTTP request or response to examine for this pattern. The choices that appear in the Location area depend upon the chosen pattern type. If you chose **Request** as the pattern type, items relevant to HTTP requests appear; if you chose **Response**, items relevant to HTTP responses appear.

   In addition, as you choose a value from the Area drop-down list, the remaining parts of the Location area change interactively. Following are all configuration items that might appear in this section.

   Area

   Drop-down list of elements that describe a particular portion of the HTTP connection. The choices are as follows:
   - **HTTP_ANY**. All parts of the HTTP connection.
   - **HTTP_COOKIE**. All cookies in the HTTP request headers after any cookie transformations are performed.
     Note: Does not search HTTP response "Set-Cookie:" headers.
   - **HTTP_FORM_FIELD**. Form fields and their contents, after URL decoding, percent decoding, and removal of excess whitespace. You can use the **<Location>** tag to further restrict the list of form field names to be searched.
   - **HTTP_HEADER**. The value portions of the HTTP header after any cross-site scripting or URL decoding transformations.
   - **HTTP_METHOD**. The HTTP request method.
   - **HTTP_ORIGIN_URL**. The origin URL of a web form.
   - **HTTP_POST_BODY**. The HTTP post body and the web form data that it contains.
   - **HTTP_RAW_COOKIE**. All HTTP request cookie, including the "Cookie:" name portion.
     Note: Does not search HTTP response "Set-Cookie:" headers.
   - **HTTP_RAW_HEADER**. The entire HTTP header, with individual headers separated by linefeed characters (\n) or carriage return/line-feed strings (\r\n).
   - **HTTP_RAW_RESP_HEADER**. The entire response header, including the name and value parts of the response header after URL transformation has been done, and the complete response status. As with HTTP_RAW_HEADER, individual headers are separated by linefeed characters (\n) or carriage return/line-feed strings (\r\n).
   - **HTTP_RAW_SET_COOKIE**. The entire Set-Cookie header after any URL transformations have been performed.
     Note: URL transformation can change both the domain and path parts of the Set-Cookie header.
   - **HTTP_RAW_URL**. The entire request URL before any URL transformations are performed, including any query or fragment parts.
   - **HTTP_RESP_HEADER**. The value part of the complete response headers after any URL transformations have been performed.
   - **HTTP_RESP_BODY**. The HTTP response body.
   - **HTTP_SET_COOKIE**. All "Set-Cookie" headers in the HTTP response headers.
   - **HTTP_STATUS_CODE**. The HTTP status code.
   - **HTTP_STATUS_MESSAGE**. The HTTP status message.
   - **HTTP_URL**. The value portion of the URL in the HTTP headers, excluding any query or fragment ports, after conversion to the UTF-* character set, URL decoding, stripping of whitespace, and conversion of relative URLs to absolute. Does not include HTML entity decoding.

   URL

   Examines any URLs found in the elements specified by the Area setting. Select one of the following settingss.
   - **Any.** Checks all URLs.
   - Literal. Checks URLs that contain a literal string. After you select Literal, a text box is displayed. Type the literal string that you want in the text box.
   - PCRE. Checks URLs that match a PCRE-format regular expression. After you select this choice, the regular expression

window is displayed. Type the regular expression in the window. You can use the **Regex Tokens** to insert common regular expression elements at the cursor, or you can click Regex Editor to display the Regular Expression Editor dialog box, which provides more assistance in constructing the regular expression that you want.

- Expression. Checks URLs that match a NetScaler default expression.

Field Name

Examines any form field names found in the elements specified by the Area selection.

- **Any.** Checks all URLs.
- Literal. Checks URLs that contain a literal string. After you select Literal, a text box is displayed. Type the literal string that you want in the text box.
- PCRE. Checks URLs that match a PCRE-format regular expression. After you select this choice, the regular expression window is displayed. Type the regular expression in the window. You can use the **Regex Tokens** to insert common regular expression elements at the cursor, or you can click Regex Editor to display the Regular Expression Editor dialog box, which provides more assistance in constructing the regular expression that you want.
- Expression. Checks URLs that match a NetScaler default expression.

7. In the Pattern area, define the pattern. A pattern is a literal string or PCRE-format regular expression that defines the pattern that you want to match. The Pattern area contains the following elements:

   Match

   A drop-down list of search methods that you can use for the signature. This list differs depending on whether the pattern type is Request or Response.

   Request Match Types

   - **Literal**. A literal string.
   - **PCRE**. A PCRE-format regular expression.
     NOTE: When you choose PCRE, the regular expression tools beneath the Pattern window are enabled. These tools are not useful for most other types of patterns.
   - **Injection**. Directs the application firewall to look for injected SQL in the specified location. The Pattern window disappears, because the application firewall already has the patterns for SQL injection.
   - **CrossSiteScripting**. Directs the application firewall to look for cross-site scripts in the specified location. The Pattern window disappears, because the application firewall already has the patterns for cross-site scripts.
   - **Expression**. An expression in the NetScaler default expressions language. This is the same expressions language that is used to create application firewall policies and other policies on the NetScaler appliance. Although the NetScaler expressions language was originally developed for policy rules, it is a highly flexible general purpose language that can also be used to define a signature pattern.
     When you choose Expression, the NetScaler Expression Editor appears beneath Pattern window. For more information about the Expression Editor and instructions on how to use it, see "To add a firewall rule (expression) by using the Add Expression dialog box." For more information about NetScaler expressions, see "Policies and Expressions."

   Response Match Types

   - **Literal**. A literal string.
   - **PCRE**. A PCRE-format regular expression.
     NOTE: When you choose PCRE, the regular expression tools beneath the Pattern window are enabled. These tools are not useful for most other types of patterns.
   - **Credit Card**. A built-in pattern to match one of the six supported types of credit card number.

Note: The Expression match type is not available for Response-side signatures.

Pattern Window (unlabeled)

In this window, type the pattern that you want to match, and fill in any additional data.

- **Literal.** Type the string you want to search for in the text area.
- **PCRE.** Type the regular expression in the text area. Use the **Regex Editor** for more assistance in constructing the regular expression that you want, or the Regex Tokens to insert common regular expression elements at the cursor. To enable UTF-8 characters, click UTF-8.
- **Expression.** Type the NetScaler advanced expression in the text area. Use Prefix to choose the first term in your expression, or Operator to insert common operators at the cursor. Click **Add** to open the Add Expression dialog box for more assistance in constructing the regular expression that you want. Click Evaluate to open the Advanced Expression Evaluator to help determine what effect your expression has.
- **Offset.** The number of characters to skip over before starting to match on this pattern. You use this field to start examining a string at some point other than the first character.
- **Depth.** How many characters from the starting point to examine for matches. You use this field to limit searches of a large string to a specific number of characters.
- **Min-Length.** The string to be searched must be at least the specified number of bytes in length. Shorter strings are not matched.
- **Max-Length.** The string to be searched must be no longer than the specified number of bytes in length. Longer strings are not matched.
- **Search method.** A check box labeled fastmatch. You can enable fastmatch only for a literal pattern, to improve performance.

8. Click OK.
9. Repeat the previous four steps to add or modify additional patterns.
10. When finished adding or modifying patterns, click OK to save your changes and return to the Signatures pane.
    Caution: Until you click **OK** in the **Add Local Signature Rule** or **Modify Local Signature Rule** dialog box, your changes are not saved. Do not close either of these dialog boxes without clicking **OK** unless you want to discard your changes.

Overview of Security checks

Sep 03, 2013

The application firewall advanced protections (security checks) are a set of filters designed to catch complex or unknown attacks on your protected web sites and web services. The security checks use heuristics, positive security, and other techniques to detect attacks that may not be detected by signatures alone. You configure the security checks by creating and configuring an application firewall profile, which is a collection of user-defined settings that tell the application firewall which security checks to use and how to handle a request or response that fails a security check. A profile is associated with a signatures object and with a policy to create a security configuration.

The application firewall provides twenty security checks, which differ widely in the types of attacks that they target and how complex they are to configure. The security checks are organized into the following categories:

- **Common security checks.** Checks that apply to any aspect of web security that either does not involve content or is equally applicable to all types of content.
- **HTML security checks.** Checks that examine HTML requests and responses. These checks apply to HTML-based web sites and to the HTML portions of Web 2.0 sites, which contain mixed HTML and XML content.
- **XML security checks.** Checks that examine XML requests and responses. These checks apply to XML-based web services and to the XML portions of Web 2.0 sites.

The security checks protect against a wide range of types of attack, including attacks on operation system and web server software vulnerabilities, SQL database vulnerabilities, errors in the design and coding of web sites and web services, and failures to secure sites that host or can access sensitive information.

All security checks have a set of configuration options, the check actions, which control how the application firewall handles a connection that matches a check. Three check actions are available for all security checks. They are:

- **Block.** Block connections that match the signature. Disabled by default.
- **Log.** Log connections that match the signature, for later analysis. Enabled by default.
- **Stats.** Maintain statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.

A fourth check action, **Learn**, is available for more than half of the check actions. It observes traffic to a protected Web site or web service and uses connections that repeatedly violate the security check to generate recommended exceptions (relaxations) to the check, or new rules for the check. In addition to the check actions, certain security checks have parameters that control the rules that the check uses to determine which connections violate that check, or that configure the application firewall's response to connections that violate the check. These parameters are different for each check, and they are described in the documentation for each check.

To configure security checks, you can use the application firewall wizard, as described in "The Application Firewall Wizard," or you can configure the security checks manually, as described in "Manual Configuration By Using the Configuration Utility." Some tasks, such as manually entering relaxations or rules or reviewing learned data, can be done only by using the configuration utility, not the command line. Using the wizard is usually best configuration method, but in some cases manual configuration might be easier if you are thoroughly familiar with it and simply want to adjust the configuration for a single security check.

Regardless of which method you use to configure the security checks, each security check requires that certain tasks be performed. Many checks require that you specify exceptions (relaxations) to prevent blocking of legitimate traffic before

you enable blocking for that security check. You can do this manually, by observing the log entries after a certain amount of traffic has been filtered and then creating the necessary exceptions. However, it is usually much easier to enable the learning feature and let it observe the traffic and recommend the necessary exceptions.

Top-Level Protections

Oct 01, 2013

Four of the application firewall protections are especially effective against common types of Web attacks, and are therefore more commonly used than any of the others. They are:

- **HTML Cross-Site Scripting.** Examines requests and responses for scripts that attempt to access or modify content on a different Web site than the one on which the script is located. When this check finds such a script, it either renders the script harmless before forwarding the request or response to its destination, or it blocks the connection.
- **HTML SQL Injection.** Examines requests that contain form field data for attempts to inject SQL commands into an SQL database. When this check detects injected SQL code, it either blocks the request or renders the injected SQL code harmless before forwarding the request to the Web server.

  Note: If both of the following conditions apply to your configuration, you should make certain that your Application Firewall is correctly configured:
  - If you enable the HTML Cross-Site Scripting check or the HTML SQL Injection check (or both), and
  - Your protected Web sites accept file uploads or contain Web forms that can contain large POST body data.

  For more information about configuring the Application Firewall to handle this case, see "Configuring the Application Firewall."
- **Buffer Overflow.** Examines requests to detect attempts to cause a buffer overflow on the Web server.
- **Cookie Consistency.** Examines cookies returned with user requests to verify that they match the cookies your Web server set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the Web server.

The Buffer Overflow check is simple; you can usually enable blocking for it immediately. The other three top-level checks are considerably more complex and require configuration before you can safely use them to block traffic. Citrix strongly recommends that, rather than attempting to configure these checks manually, you enable the learning feature and allow it to generate the necessary exceptions.

HTML Cross-Site Scripting Check

Jan 19, 2015

The HTML Cross-Site Scripting check examines both the headers and the POST bodies of user requests for possible cross-site scripting attacks. If it finds a cross-site script, it either modifies (transforms) the request to render the attack harmless, or blocks the request.

To prevent misuse of the scripts on your protected web sites to breach security on your web sites, the HTML Cross-Site Scripting check blocks scripts that violate the same origin rule, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of JavaScript-enhanced web content that violates the same origin rule. If you enable the HTML Cross-Site Scripting check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity.

If you use the wizard or the configuration utility, in the Modify HTML Cross-Site Scripting Check dialog box, on the General tab you can enable or disable the Block, Log, Learn, and Statistics actions, and in addition the following parameters:

- **Transform.** If enabled, the application firewall makes the following changes to requests that match the HTML Cross-Site Scripting check:
  - Left angle bracket (<) to HTML character entity equivalent (<)
  - Right angle bracket (>) to HTML character entity equivalent (>)

  This ensures that browsers do not interpret unsafe html tags, such as **<script>**, and thereby execute malicious code. If you enable both request-header checking and transformation, any special characters found in request headers are also modified as described above. If scripts on your protected web site contain cross-site scripting features, but your web site does not rely upon those scripts to operate correctly, you can safely disable blocking and enable transformation. This configuration ensures that no legitimate web traffic is blocked, while stopping any potential cross-site scripting attacks.
- **Check complete URLs.** If checking of complete URLs is enabled, the application firewall examines entire URLs for HTML cross-site scripting attacks instead of checking just the query portions of URLs.
- **Check Request headers.** If Request header checking is enabled, the application firewall examines the headers of requests for HTML cross-site scripting attacks, instead of just URLs. If you use the configuration utility, you can enable this parameter in the **Settings** tab of the application firewall profile.

If you use the command-line interface, you can enter the following commands to configure the HTML Cross-Site Scripting Check:

- set appfw profile <name> -crossSiteScriptingAction [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -crossSiteScriptingTransformUnsafeHTML ([**ON**] | [**OFF**])
- set appfw profile <name> -crossSiteScriptingCheckCompleteURLs ([**ON**] | [**OFF**])
- set appfw profile <name> -checkRequestHeaders ([**ON**] | [**OFF**])

To specify relaxations for the HTML Cross-Site Scripting check, you must use the configuration utility. On the Checks tab of the Modify HTML Cross-Site Scripting Check dialog box, click Add to open the Add HTML Cross-Site Scripting Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify HTML Cross-Site Scripting Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation, as described in "Manual Configuration By Using the Configuration Utility."

Following are examples of HTML Cross-Site Scripting check relaxations:

Web Form Field Expressions

- **Logon Fields.** The following expression exempts all fields beginning with the string `logon_` followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^logon_[0-9A-Za-z]{2,15}$
  ```
- **Name Fields.** The following expression exempts form fields with names beginning with `Name_` followed by a string beginning with a letter or number and consisting of from one to twenty letters, numbers, or the apostrophe or hyphen symbol:

  ```
  ^Name_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
  ```
- **Name Fields (Special Characters).** If your web site has Turkish-speaking customers whose first names may contain special characters, you might have a form field that begins with the string Turkish-Name_ on their logon page. In addition, the customers may use the same special characters in their names. The special characters in both of these strings must be represented as encoded UTF-8 strings. The following expression exempts form fields beginning with Turkish-Name_ and containing Turkish special characters:

  ```
  ^T\xC3\xBCrk\xC3\xA7e-Name_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$
  ```
- **Session-ID Fields.** The following expression exempts all fields beginning with the string `sessionid-` followed by a ten-digit number:

  ```
  ^sessionid-[0-9]{10,10}$
  ```

URL Expressions

- **URLs using JavaScript.** You can use a single expression to exempt all URLs that end with a filename that follows a specified pattern. The following expression exempts all URLs that end with the string `query_` followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than forty characters long, and ending with the string `.js`:

  ```
  query_[0-9A-Za-z]{2,40}[.]js$
  ```
- **URLs containing a Specified String.** You can use an expression to exempt all URLs that contain a specific string. The following expression exempts all URLs that contain the string `prodinfo`:

  ```
  ^https?://(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])(([0-9A-Za-z_-]|\\x[0-9A-Fa-f]
  [0-9A-Fa-f]+[.])+[a-z]{2,6}/[^<>?]*\?prodinfo[^<>?]*$
  ```
  In the above expression , each character class has been grouped with the string \\x[0-9A-Fa-f][0-9A-Fa-f], which matches all properly constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (\\) is an escaped backslash, which tells the application firewall to interpret it as a literal backslash. If you included only one backslash, the application firewall would interpret the following left square bracket ([) as a literal character instead of as the opening of a character class, which would break the expression.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML Cross-Site Scripting check would otherwise have blocked.

HTML SQL Injection Check

Jul 24, 2015

The HTML SQL Injection check provides special defenses against injection of unauthorized SQL code that might break security. It examines both the headers and the POST bodies of requests for injected SQL code. If the application firewall detects unauthorized SQL code in a user request, it either transforms the request, to render the SQL code inactive, or blocks the request.

Many web applications have web forms that use SQL to communicate with relational database servers. Often, the scripts that pass web form information to the database do not validate the information provided by the user before sending it to the database. Malicious code or a hacker can use the insecure web form to send SQL commands to the web server.

If you use the wizard or the configuration utility, in the Modify HTML SQL Injection Check dialog box, on the General tab you can enable or disable the Block, Log, Statistics, and Learn actions, and the following actions:

- **Transform.** Make the following changes to requests that match the HTML SQL Injection check:
  - Single straight quote (') to double straight quote ('')
  - Backslash (\) to double backslash (\\).
  - Semicolon (;) is dropped completely.

  These three characters (special strings) are necessary to issue commands to an SQL server. Unless an SQL command is prefaced with a special string, most SQL servers ignore that command. For this reason, the changes that the application firewall performs when transformation is enabled prevent an attacker from injecting active SQL. After these changes are made, it is safe to forward the request to your protected web site. When web forms on your protected web site may legitimately contain SQL special strings, but the web form does not rely upon the special strings to operate correctly, you can disable blocking and enable transformation to prevent blocking of legitimate web form data without reducing the protection that the application firewall provides to your protected web sites.

  Note: You normally enable either transformation or blocking, but not both. If you have blocking enabled, enabling transformation is redundant because the application firewall already blocks access to requests that contain injected SQL.
- **Restrict checks to fields containing SQL special characters.** If you configure the application firewall to check only fields that contain SQL special strings, the application firewall skips web form fields that do not contain special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this parameter can significantly reduce the load on the application firewall and speed up processing without placing your protected web sites at risk.

- **SQL comments handling.** By default, the application firewall checks all SQL comments for injected SQL commands. Many SQL servers ignore anything in a comment, however, even if it is preceded by an SQL special character. For faster processing, if your SQL server ignores comments, you can configure the application firewall to skip comments when examining requests for injected SQL. The SQL comments handling options are:
  - **ANSI.** Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases.
  - **Nested.** Skip nested SQL comments, which are normally used by Microsoft SQL Server.
  - **ANSI/Nested.** Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are still checked for injected SQL.
  - **Check all Comments.** Check the entire request for injected SQL, without skipping anything. The default setting.

  Caution: In most cases, you should not choose the Nested or the ANSI/Nested option unless your back-end database runs on Microsoft SQL Server. Most other types of SQL server software do not

recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they may indicate an attempt to breach security on that server.

- **Check Request headers.** Examine the headers of requests for HTML SQL Injection attacks, instead of just URLs. If you use the configuration utility, you can enable this parameter in the **Settings** tab of the application firewall profile.

  Caution: If you enable both request header checking and transformation, any SQL special characters found in headers are also transformed. The Accept, Accept-Charset, Accept-Encoding, Accept-Language, Expect, and User-Agent headers normally contain semicolons (;), so enabling both Request header checking and transformation simultaneously may cause errors.

If you use the command-line interface, you can enter the following commands to configure the HTML SQL Injection Check:

- set appfw profile <name> -SQLInjectionAction [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -SQLInjectionTransformSpecialChars ([**ON**] | [**OFF**])
- set appfw profile <name> -SQLInjectionOnlyCheckFieldsWithSQLChars ([**ON**]|[**OFF**])
- set appfw profile <name> -SQLInjectionParseComments ([**checkall**] | [**ansi**|**nested**] | [**ansinested**])

To specify relaxations for the HTML SQL Injection check, you must use the configuration utility. On the Checks tab of the Modify HTML SQL Injection Check dialog box, click Add to open the Add HTML SQL Injection Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify HTML SQL Injection Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation, as described in "Manual Configuration By Using the Configuration Utility."

Following are examples of HTML SQL Injection check relaxations:

Web Form Field Name Expressions

- **Logon Fields.** The following expression exempts all fields beginning with the string **logon_** followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^logon_[0-9A-Za-z]{2,15}$
  ```
- **Name Fields.** The following expression exempts form fields with names beginning with **Name_** followed by a string beginning with a letter or number and consisting of from one to twenty letters, numbers, or the apostrophe or hyphen symbol:

  ```
  ^Name_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
  ```
- **Name Fields (Special Characters).** If your web site has Turkish-speaking customers whose first names may contain special characters, you might have a form field that begins with the string Turkish-Name_ on their logon page. In addition, the customers may use the same special characters in their names. The special characters in both of these strings must be represented as encoded UTF-8 strings. The following expression exempts form fields beginning with Turkish-Name_ and containing Turkish special characters:

  ```
  ^T\xC3\xBCrk\xC3\xA7e-Name_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$
  ```
- **Session-ID Fields.** The following expression exempts all fields beginning with the string **sessionid-** followed by a ten-digit number:

  ```
  ^sessionid-[0-9]{10,10}$
  ```

Action URL Expressions

- **URLs using JavaScript.** You can use a single expression to exempt all URLs that end with a filename that follows a specified pattern. The following expression exempts all URLs that end with the string query_ followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than forty characters long, and that end with the string .js:

  ```
  query_[0-9A-Za-z]{2,40}[.]js$
  ```

- **URLs containing a Specified String.** You can use an expression to exempt all URLs that contain a specific string. The following expression exempts all URLs that contain the string prodinfo:

  ```
  ^https?://(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])(([0-9A-Za-z_-]|\\x[0-9A-Fa-f]
  [0-9A-Fa-f]+[.])+[a-z]{2,6}/[^<>?]*\?prodinfo[^<>?]*$
  ```

  In the expression above, each character class has been grouped with the string \\x[0-9A-Fa-f][0-9A-Fa-f], which matches all properly constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (\\) is an escaped backslash, which tells the application firewall to interpret it as a literal backslash. If you included only one backslash, the application firewall would interpret the following left square bracket ([) as a literal character instead of as the opening of a character class, which would break the expression.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML SQL Injection check would otherwise have blocked.

Buffer Overflow Check

Feb 03, 2014

The Buffer Overflow check detects attempts to cause a buffer overflow on the web server. If the application firewall detects that the URL, cookies or header are longer than the specified maximum length in a request, it blocks that request because it might be an attempt to cause a buffer overflow.

The Buffer Overflow check prevents attacks against insecure operating-system or web-server software that can crash or behave unpredictably when it receives a data string that is larger than it can handle. Proper programming techniques prevent buffer overflows by checking incoming data and either rejecting or truncating overlong strings. Many programs, however, do not check all incoming data and are therefore vulnerable to buffer overflows. This issue especially affects older versions of web-server software and operating systems, many of which are still in use.

If you use the wizard or the configuration utility, in the Modify Buffer Overflow Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions. On the Checks tab, you can set the following parameters:

- **Maximum URL Length.** The maximum length the application firewall allows in a requested URL. Requests with longer URLs are blocked. Possible Values: 0-65536. Default: 1024
- **Maximum Cookie Length.** The maximum length the application firewall allows for all cookies in a request. Excess cookies are stripped from requests before those requests are forwarded to your protected web server. Possible Values: 0-65536. Default: 4096
- **Maximum Header Length.** The maximum length the application firewall allows for HTTP headers. Requests with longer headers are blocked. Possible Values: 0-65536. Default: 4096

If you use the command-line interface, you can add the following Buffer Overflow Check arguments to the set appfwl profile <profileName> command:

- -bufferOverflowAction [**block**] [**log** | [**stats**]
- -bufferOverflowMaxURLLength <positiveInteger>
- -bufferOverflowMaxCookieLength <positiveInteger>
- -bufferOverflowMaxHeaderLength <positiveInteger>

Cookie Consistency Check

Feb 03, 2014

The Cookie Consistency check examines cookies returned by users, to verify that they match the cookies that your web site set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the web server. You can also configure the Cookie Consistency check to transform all of the server cookies that it processes, by encrypting the cookies, proxying the cookies, or adding flags to the cookies. This check applies to requests and responses.

An attacker would normally modify a cookie to gain access to sensitive private information by posing as a previously authenticated user, or to cause a buffer overflow. The Buffer Overflow check protects against attempts to cause a buffer overflow by using a very long cookie. The Cookie Consistency check focuses on the first scenario.

If you use the wizard or the configuration utility, in the Modify Cookie Consistency Check dialog box, on the General tab you can enable or disable the following actions:

- Block
- Log
- Learn
- Statistics
- Transform. If enabled, the Transform action modifies all cookies as specified in the following settings:
  - **Encrypt Server Cookies.** Encrypt cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list, before forwarding the response to the client. Encrypted cookies are decrypted when the client sends a subsequent request, and the decrypted cookies are reinserted into the request before it is forwarded to the protected web server. Specify one of the following types of encryption:
    - **None.** Do not encrypt or decrypt cookies. The default.
    - **Decrypt only.** Decrypt encrypted cookies only. Do not encrypt cookies.
    - **Encrypt session only.** Encrypt session cookies only. Do not encrypt persistent cookies. Decrypt any encrypted cookies.
    - **Encrypt all.** Encrypt both session and persistent cookies. Decrypt any encrypted cookies.
      Note: When encrypting cookies, the application firewall adds the **HttpOnly** flag to the cookie. This flag prevents scripts from accessing and parsing the cookie. The flag therefore prevents a script-based virus or trojan from accessing a decrypted cookie and using that information to breach security. This is done regardless of the Flags to Add in Cookies parameter settings, which are handled independently of the Encrypt Server Cookies parameter settings.
- **Proxy Server Cookies.** Proxy all non-persistent (session) cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list. Cookies are proxied by using the existing application firewall session cookie. The application firewall strips session cookies set by the protected web server and saves them locally before forwarding the response to the client. When the client sends a subsequent request, the application firewall reinserts the session cookies into the request before forwarding it to the protected web server. Specify one of the following settings:
  - **None.** Do not proxy cookies. The default.
  - **Session only.** Proxy session cookies only. Do not proxy persistent cookies.
    Note: If you disable cookie proxying after having enabled it (set this value to None after it was set to Session only), cookie proxying is maintained for sessions that were established before you disabled it. You can therefore safely disable this feature while the application firewall is processing user sessions.
- **Flags to Add in Cookies**. Add flags to cookies during transformation. Specify one of the following settings:
  - **None.** Do not add flags to cookies. The default.
  - **HTTP only.** Add the HttpOnly flag to all cookies. Browsers that support the HttpOnly flag do not allow scripts to

access cookies that have this flag set.
- **Secure**. Add the Secure flag to cookies that are to be sent only over an SSL connection. Browsers that support the Secure flag do not send the flagged cookies over an insecure connection.
- **All.** Add the HttpOnly flag to all cookies, and the Secure flag to cookies that are to be sent only over an SSL connection.

If you use the command-line interface, you can enter the following commands to configure the Cookie Consistency Check:

- set appfw profile <name> -cookieConsistencyAction [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -cookieTransforms ([**ON**] | [**OFF**])
- set appfw profile <name> -cookieEncryption ([**none**] | [**decryptOnly**] | [**encryptSession**] | [**encryptAll**])
- set appfw profile <name> -cookieProxying ([**none**] | [**sessionOnly**])
- set appfw profile <name> -addCookieFlags ([**none**] | [**httpOnly**] | [**secure**] | [**all**])

To specify relaxations for the Cookie Consistency check, you must use the configuration utility. On the Checks tab of the Modify Cookie Consistency Check dialog box, click Add to open the Add Cookie Consistency Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Cookie Consistency Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of Cookie Consistency check relaxations:

- **Logon Fields.** The following expression exempts all form fields beginning with the string **logon_** followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^logon_[0-9A-Za-z]{2,15}$
  ```
- **Logon Fields (special characters).** The following expression exempts all form fields beginning with the string **türkçe-logon_** followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^t\xC3\xBCrk\xC3\xA7e-logon_[0-9A-Za-z]{2,15}$
  ```
- **Arbitrary strings.** Allow cookies that contain the string **sc-item_**, followed by the ID of an item that the user has added to his shopping cart ([0-9A-Za-z]+), a second underscore (_), and finally the number of these items he wants ([1-9][0-9]?), to be user-modifiable:

  ```
  ^sc-item_[0-9A-Za-z]+_[1-9][0-9]?$
  ```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

Data Leak Prevention Checks

Mar 28, 2012

The data-leak-prevention checks filter responses to prevent leaks of sensitive information, such as credit card numbers and social security numbers, to unauthorized recipients.

Credit Card Check

Feb 03, 2014

The Credit Card check provides special handling for credit card numbers. A web application does not usually send a credit card number in a response to a user request, even when the user supplies a credit card number in the request. The application firewall examines web server responses, including headers, for credit card numbers. If it finds a credit card number in the response, and the administrator has not configured it to allow credit card numbers to be sent, it responds in one of two ways:

- It blocks the response.
- It replaces all but the final group of digits in the credit card with x's. For example, a credit card number of 9876-5432-1234-5678 would be rendered xxxx-xxxx-xxxx-5678.

The Credit Card check prevents attackers from exploiting a security flaw in your web server software or on your web site to obtain credit card numbers of your customers. If your web sites do not have access to credit card information, you do not need to configure this check. If you have a shopping cart or other application that can access credit card numbers, or your web sites have access to database servers that contain credit card numbers, you should configure protection for each type of credit card that you accept.

Note: A web site that does not access an SQL database usually does not have access to sensitive private information such as credit card numbers.

If you use the wizard or the configuration utility, in the Credit Card Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions, and the following actions:

- **X-Out.** Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter "X."
- **Maximum credit cards allowed per page.** Allow up to the specified number of credit card numbers per page in responses without masking the credit card numbers or blocking the response. The Maximum is set to zero (0) by default. Web pages do not usually contain unmasked credit card numbers, but occasionally a web page might legitimately contain a credit card number or even a list of credit card numbers. To allow one or more credit card numbers to appear in a web page before masking the numbers or blocking the response, change the value in the "Maximum credit cards allowed per page" text box to the number of credit cards that you want to allow.

To configure the types of credit cards to be protected, in the Modify Credit Card Check dialog box, select each credit card type that you want to protect, and then click Protect. If you want to cancel protection for a credit card type, select that credit card type and then click Unprotect. You can hold down your Shift or Ctrl key while choosing credit card types, and then enable or disable several credit card types at once by clicking the Protect or Unprotect button while multiple credit card types are selected.

If you use the command-line interface, you can enter the following commands to configure the Credit Card Check:

- set appfw profile <name> -creditCardAction [**block**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -creditCard (**VISA** | **MASTERCARD** | **DISCOVER** | **AMEX** | **JCB** | **DINERSCLUB**)
- set appfw profile <name> -creditCardMaxAllowed <integer>
- set appfw profile <name> -creditCardXOut ([**ON**] | [**OFF**])

Safe Object Check

Feb 03, 2014

The Safe Object check provides user-configurable protection for sensitive business information, such as customer numbers, order numbers, and country-specific or region-specific telephone numbers or postal codes. A user-defined regular expression or custom plug-in tells the application firewall the format of this information and defines the rules to be used to protect it. If a string in a user request matches a safe object definition, the application firewall either blocks the response, masks the protected information, or removes the protected information from the response before sending it to the user, depending on how you configured that particular safe object rule.

The Safe Object check prevents attackers from exploiting a security flaw in your web server software or on your web site to obtain sensitive private information, such as company credit card numbers or social security numbers. If your web sites do not have access to these types of information, you do not need to configure this check. If you have a shopping cart or other application that can access such information, or your web sites have access to database servers that contain such information, you should configure protection for each type of sensitive private information that you handle and store.

Note: A web site that does not access an SQL database usually does not have access to sensitive private information.
The Safe Object Check dialog box is unlike that for any other check. Each safe object expression that you create is the equivalent of a separate security check, similar to the Credit Card check, for that type of information. If you use the wizard or the configuration utility, you add a new expression by clicking Add and configuring the expression in the Add Safe Object dialog box. You modify an existing expression by selecting it, then clicking Open, and then configuring the expression in the Modify Safe Object dialog box.

In the Safe Object dialog box for each safe object expression, you can configure the following:

- **Safe Object Name.** A name for your new safe object. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 255 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
- **Actions.** Enable or disable the Block, Log, and Statistics actions, and the following actions:
  - **X-Out.** Mask any information that matches the safe object expression with the letter “X”.
  - **Remove.** Remove any information that matches the safe object expression.
- **Regular Expression.** Enter a PCRE-compatible regular expression that defines the safe object. You can create the regular expression in one of three ways: by typing the regular expression directly into the text box, by using the **Regex Tokens** menu to enter regular expression elements and symbols directly into the text box, or by opening the Regular Expressions Editor and using it to construct the expression. The regular expression must consist of ASCII characters only. Do not cut and paste characters that are not part of the basic 128-character ASCII set. If you want to include non-ASCII characters, you must manually type those characters in PCRE hexadecimal character encoding format.
  Note: Do not use start anchors (^) at the beginning of Safe Object expressions, or end anchors ($) at the end of Safe Object expressions. These PCRE entities are not supported in Safe Object expressions, and if used, will cause your expression not to match what it was intended to match.
- **Maximum Match Length.** Enter a positive integer that represents the maximum length of the string that you want to match. For example, if you want to match U.S. social security numbers, enter the number eleven (11) in this field. That allows your regular expression to match a string with nine numerals and two hyphens. If you want to match California driver’s license numbers, enter the number eight (8).
  Caution: If you do not enter a maximum match length in this field, the application firewall uses a default value of one (1) when filtering for strings that match your safe object expressions. As a result, most safe object expressions fail to match their target strings.

You cannot use the command-line interface to configure the Safe Object check. You must configure it by using either the application firewall wizard or the configuration utility.

Following are examples of Safe Object check regular expressions:

- Look for strings that appear to be U.S. social security numbers, which consist of three numerals (the first of which must not be zero), followed by a hyphen, followed by two more numerals, followed by a second hyphen, and ending with a string of four more numerals:
  `[1-9][0-9]{2,2}-[0-9]{2,2}-[0-9]{4,4}`
- Look for strings that appear to be California driver's license IDs, which start with a letter and are followed by a string of exactly seven numerals:
  `[A-Za-z][0-9]{7,7}`
- Look for strings that appear to be Example Manufacturing customer IDs which, consist of a string of five hexadecimal characters (all the numerals and the letters A through F), followed by a hyphen, followed by a three-letter code, followed by a second hyphen, and ending with a string of ten numerals:
  `[0-9A-Fa-f]{5,5}-[A-Za-z]{3,3}-[0-9]{10,10}`

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write to ensure that they define exactly the type of string you want to add as a safe object definition, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you did not want or expect, such as blocking access to web content that you did not intend to block.

Advanced Form Protection Checks

Mar 28, 2012

The advanced Form Protection checks examine web form data to prevent attackers from compromising your system by modifying the web forms on your web sites or sending unexpected types and quantities of data to your web site in a form.

Field Formats Check

Feb 05, 2014

The Field Formats check verifies the data that users send to your web sites in a web form. It examines both the length and type of data to ensure that it is appropriate for the form field in which it appears. If the application firewall detects inappropriate web form data in a user request, it blocks the request. This check applies to HTML requests only. It does not apply to XML requests.

By preventing an attacker from sending inappropriate web form data to your web site, the Field Formats check prevents certain types of attacks on your web site and database servers. For example, if a particular field expects the user to enter a phone number, the Field Formats check examines the user's response to ensure that the data matches the format for a phone number. If a particular field expects a first name, the Field Formats check ensures that the data in that field is of a type and length appropriate for a first name. It does the same thing for each form field that you configure it to protect.

The Field Formats check provides a different type of protection than does the Form Field Consistency check. The Form Field Consistency check verifies that the structure of the web forms returned by users is intact, that data format restrictions configured in the HTML are respected, and that data in hidden fields has not been modified. It can do this without any specific knowledge about your web forms other than what it derives from the web form itself. The Field Formats check verifies that the data in each form field matches the specific formatting restrictions that you configured manually, or that the learning feature generated and you approved. In other words, the Form Field Consistency check enforces general web form security, while the Field Formats check enforces the specific rules that you set for your web forms.

Before it can protect your web forms, the Field Formats check requires that you configure the application firewall to recognize the type and length of data expected in each form field on each web form that you want to protect.

If you use the wizard or the configuration utility, in the Modify Field Formats Check dialog box, on the General tab you can enable or disable the Block, Log, Learn, and Statistics actions and the following parameters:

- **Field Type.** Assign a default field type to form fields in web forms that do not have a field type. This parameter is not set by default. You can assign any field type that is defined on your application firewall as the default field type. Caution: If you set a restrictive default field type and do not disable blocking until you are certain that the field types assigned to your form fields are correct, users may be unable to use your web forms.
- **Minimum Length.** The default minimum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 0 by default, which allows the user to leave the field blank. Any higher setting forces users to fill in the field.
- **Maximum Length.** The default maximum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 65535 by default.

If you use the command-line interface, you can enter the following commands to configure the Field Formats Check:

- set appfw profile <name> -fieldFormatAction [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -defaultFieldFormatType <string>
- set appfw profile <name> -defaultFieldFormatMinLength <integer>
- set appfw profile <name> -defaultFieldFormatMaxLength <integer>

To specify relaxations for the Field Formats check, you must use the configuration utility. On the Checks tab of the Modify Field Formats Check dialog box, click Add to open the Add Field Formats Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Field Formats Check Relaxation dialog box. Either dialog box provides the

same options for configuring a relaxation.

Following are examples of Field Formats check relaxations:

- Choose form fields with the name FirstName:

  ```
  ^FirstName$
  ```
- Choose form fields with names that begin with Name_ and are followed by a string beginning with a letter or number and consisting of from one to twenty letters, numbers, or the apostrophe or hyphen symbol:

  ```
  ^Name_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
  ```
- Choose form fields with names that begin with Turkish-FirstName_ and are otherwise the same as the previous expression, except that they can contain Turkish special characters throughout:

  ```
  ^T\xC3\xBCrk\xC3\xA7e-FirstName_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$
  ```
- Choose form field names that begin with a letter or number, consist of a combination of letters and/or numbers only, and that contain the string Num anywhere in the string:

  ```
  ^[0-9A-Za-z]*Num[0-9A-Za-z]*$
  ```

Form Field Consistency Check

Feb 05, 2014

The Form Field Consistency check examines the web forms returned by users of your web site, and verifies that web forms were not modified inappropriately by the client. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The Form Field Consistency check prevents clients from making unauthorized changes to the structure of the web forms on your web site when they fill out and submit a form. It also ensures that the data a user submits meets the HTML restrictions for length and type, and that data in hidden fields is not modified. This prevents an attacker from tampering with a web form and using the modified form to gain unauthorized access to web site, redirect the output of a contact form that uses an insecure script and thereby send unsolicited bulk email, or exploit a vulnerability in your web server software to gain control of the web server or the underlying operating system. Web forms are a weak link on many web sites and attract a wide range of attacks.

The Form Field Consistency check verifies all of the following:

- If a field is sent to the user, the check ensures that it is returned by the user.
- The check enforces HTML field lengths and types.
  Note: The Form Field Consistency check enforces HTML restrictions on data type and length but does not otherwise validate the data in web forms. You can use the Field Formats check to set up rules that validate data returned in specific form fields on your web forms.
- If your web server does not send a field to the user, the check does not allow the user to add that field and return data in it.
- If a field is a read-only or hidden field, the check verifies that the data has not changed.
- If a field is a list box or radio button field, the check verifies that the data in the response corresponds to one of the values in that field.

If a web form returned by a user violates one or more of the Form Field consistency checks, and you have not configured the application firewall to allow that web form to violate the Form Field Consistency checks, the request is blocked.

If you use the wizard or the configuration utility, in the Modify Form Field Consistency Check dialog box, on the General tab you can enable or disable the Block, Log, Learn, and Statistics actions.

You also configure Sessionless Field Consistency in the General tab. If Sessionless Field Consistency is enabled, the application firewall checks only the web form structure, dispensing with those parts of the Form Field Consistency check that depend upon maintaining session information. This can speed the Form Field Consistency check with little security penalty for web sites that use many forms. To use Sessionless Field Consistency on all web forms, select On. To use it only for forms submitted with the HTTP POST method, select postOnly

If you use the command-line interface, you can enter the following command to configure the Form Field Consistency Check:

- set appfw profile <name> -fieldConsistencyAction [**block**] [**learn**] [**log**] [**stats**] [**none**]

To specify relaxations for the Form Field Consistency check, you must use the configuration utility. On the Checks tab of the Modify Form Field Consistency Check dialog box, click Add to open the Add Form Field Consistency Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Form Field Consistency Check Relaxation

dialog box. Either dialog box provides the same options for configuring a relaxation, as described in "Manual Configuration By Using the Configuration Utility."

Following are examples of Form Field Consistency check relaxations:

Form Field Names

- Choose form fields with the name UserType:

  ```
  ^UserType$
  ```
- Choose form fields with names that begin with UserType_ and are followed by a string that begins with a letter or number and consists of from one to twenty-one letters, numbers, or the apostrophe or hyphen symbol:

  ```
  ^UserType_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
  ```
- Choose form fields with names that begin with Turkish-UserType_ and are otherwise the same as the previous expression, except that they can contain Turkish special characters throughout:

  ```
  ^T\xC3\xBCrk\xC3\xA7e-UserType_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$
  ```
  Note: See "PCRE Character Encoding Format" for a complete description of supported special characters and how to encode them properly.
- Choose form field names that begin with a letter or number, consist of a combination of letters and/or numbers only, and that contain the string Num anywhere in the string:

  ```
  ^[0-9A-Za-z]*Num[0-9A-Za-z]*$
  ```

Form Field Action URLs

- Choose URLs beginning with http://www.example.com/search.pl? and containing any string after the query except for a new query:

  ```
  ^http://www[.]example[.]com/search[.]pl\?[^?]*$
  ```
- Choose URLs that begin with http://www.example-español.com and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

  ```
  ^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
  ([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
  ([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)$
  ```
- Choose all URLs that contain the string /search.cgi?:

  ```
  ^[^?<>]*/search[.]cgi\?[^?<>]*$
  ```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

CSRF Form Tagging Check

Feb 05, 2014

The Cross Site Request Forgery (CSRF) Form Tagging check tags each web form sent by a protected web site to users with a unique and unpredictable FormID, and then examines the web forms returned by users to ensure that the supplied FormID is correct. This check protects against cross-site request forgery attacks. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The CSRF Form Tagging check prevents attackers from using their own web forms to send high volume form responses with data to your protected web sites. This check requires relatively little CPU processing capacity compared to certain other security checks that analyze web forms in depth. It is therefore able to handle high volume attacks without seriously degrading the performance of the protected web site or the application firewall itself.

Before you enable the CSRF Form Tagging check, you should be aware of the following:

- You need to enable form tagging. The CSRF check depends on form tagging and does not work without it.
- You should disable the Citrix NetScaler Integrated Caching feature for all web pages containing forms that are protected by that profile. The Integrated Caching feature and CSRF form tagging are not compatible.
- You should consider enabling Referer checking. Referer checking is part of the Start URL check, but it prevents cross-site request forgeries, not Start URL violations. Referer checking also puts less load on the CPU than does the CSRF Form Tagging check. If a request violates Referer checking, it is immediately blocked, so the CSRF Form Tagging check is not invoked.
- The CSRF Form Tagging check does not work with web forms that use different domains in the form-origin URL and form-action URL. For example, CSRF Form Tagging cannot protect a web form with a form-origin URL of `http://www.example.com/` and a form action URL of `http://www.example.org/form.pl`, because `example.com` and `example.org` are different domains.

If you use the wizard or the configuration utility, in the Modify CSRF Form Tagging Check dialog box, on the General tab you can enable or disable the Block, Log, Learn and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the CSRF Form Tagging Check:

- set appfw profile <name> -fieldConsistencyAction [**block**] [**log**] [**learn**] [**stats**] [**none**]

To specify relaxations for the CSRF Form Tagging check, you must use the configuration utility. On the Checks tab of the Modify CSRF Form Tagging Check dialog box, click Add to open the Add CSRF Form Tagging Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify CSRF Form Tagging Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of CSRF Form Tagging check relaxations:

Note: The following expressions are URL expressions that can be used in both the Form Origin URL and Form Action URL roles.

- Choose URLs beginning with http://www.example.com/search.pl? and containing any string after the query, except for a new query:

  `^http://www[.]example[.]com/search[.]pl\?[^?]*$`
- Choose URLs that begin with http://www.example-español.com and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character

and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

```
^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)$
```

- Choose all URLs that contain the string /search.cgi?:

```
^[^?<>]*/search[.]cgi\?[^?<>]*$
```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the check would otherwise have blocked.

Managing CSRF Form Tagging Check Relaxations

Sep 03, 2013

You configure an exception (or relaxation) to the CSRF Form Tagging security check in the Add Cross-Site Request Forgery Tagging Check Relaxation dialog box or the Modify Cross-Site Request Forgery Tagging Check Relaxation dialog box.

1. Navigate to Security > Application Firewall > Profiles.
2. In the Profiles pane, select the profile you want to configure, and then click Open.
3. In the Configure Application Firewall Profile dialog box, click the Security Checks tab. The Security Checks tab contains the list of application firewall security checks.
4. In the Security Checks window, click CSRF Form Tagging, and then click Open. The Modify Cross-Site Request Forgery Tagging Check dialog box is displayed, with the Checks tab selected. The Checks tab contains a list of existing CSRF relaxations. The list might be empty if you have not either manually added any relaxations or approved any relaxations that were recommended by the learning engine. Beneath the list is a row of buttons that allow you to add, modify, delete, enable, or disable the relaxations on the list.
5. To add or modify a CSRF relaxation, do one of the following:
   - To add a new relaxation, click Add.
   - To modify an existing relaxation, select the relaxation that you want to modify, and then click Open.

   The Add Cross-Site Request Forgery Tagging Check Relaxation or Modify Cross-Site Request Forgery Tagging Check Relaxation dialog box is displayed. Except for the title, these dialog boxes are identical.
6. Fill in the dialog box as described below.
   - **Enabled check box**—Select to place this relaxation or rule in active use; clear to deactivate it.
   - **Form Origin URL**—In the text area, enter a PCRE-format regular expression that defines the URL that hosts the form.
   - **Form Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the form is delivered.
   - **Comments**—In the text area, type a comment. Optional.

   Note: For any element that requires a regular expression, you can type the regular expression, use the Regex Tokens menu to insert regular expression elements and symbols directly into the text box, or click Regex Editor to open the Add Regular Expression dialog box, and use it to construct the expression.
7. Click OK. The Add Cross-Site Request Forgery Tagging Check Relaxation or Modify Cross-Site Request Forgery Tagging Check Relaxation dialog box closes and you return to the Modify Cross-Site Request Forgery Tagging Check dialog box.
8. To remove a relaxation or rule, select it, and then click Remove.
9. To enable a relaxation or rule, select it, and then click Enable.
10. To disable a relaxation or rule, select it, and then click Disable.
11. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click Visualizer, and use the display tools.
12. To review and configure learned rules for the CSRF check, click Learning and perform the steps in "To configure and use the Learning feature."
13. Click OK.

URL Protection Checks

Mar 28, 2012

The URL Protection checks examine request URLs to prevent attackers from aggressively attempting to access multiple URLs (forceful browsing) or using a URL to trigger a known security vulnerability in web server software or web site scripts.

Start URL Check

Feb 03, 2014

The Start URL check examines the URLs in incoming requests and blocks the connection attempt if the URL does not meet the specified criteria. To meet the criteria, the URL must match an entry in the Start URL list, unless the Enforce URL Closure parameter is enabled. If you enable this parameter, a user who clicks a link on your Web site is connected to the target of that link.

The primary purpose of the Start URL check is to prevent repeated attempts to access random URLs on a Web site, (forceful browsing). Forceful browsing can be used to trigger a buffer overflow, find content that users were not intended to access directly, or find a back door into secure areas of your Web server.

If you use the wizard or the configuration utility, in the Modify Start URL Check dialog box, on the General tab you can enable or disable Block, Log, Statistics, Learn actions, and the following parameters:

- **Enforce URL Closure.** Allow users to access any web page on your web site by clicking a hyperlink on any other page on your web site. Users can navigate to any page on your web site that can be reached from the home page or any designated start page by clicking hyperlinks.
  Note: The URL closure feature allows any query string to be appended to and sent with the action URL of a web form submitted by using the HTTP GET method. If your protected web sites use forms to access an SQL database, make sure that you have the SQL injection check enabled and properly configured.
- **Sessionless URL Closure.** From the client's point of view, this type of URL closure functions in exactly the same way as standard, session-aware URL Closure, but uses a token embedded in the URL instead of a cookie to track the user's activity, which consumes considerably fewer resources.
  Note: When enabling sessionless (Sessionless URL Closure), you must also enable regular URL closure (Enforce URL Closure) or sessionless URL closure does not work.
- **Validate Referer Header.** Verify that the Referer header in a request that contains web form data from your protected web site instead of another web site. This action verifies that your web site, not an outside attacker, is the source of the web form. Doing so protects against cross-site request forgeries (CSRF) without requiring form tagging, which is more CPU-intensive than header checks. The application firewall can handle the HTTP Referer header in one of the following three ways, depending on which option you select in the drop-down list:
  - **Off.** Do not validate the Referer header.
  - **If-Present.** Validate the Referer header if a Referer header exists. If an invalid Referer header is found, the request generates a referer-header violation. If no Referer header exists, the request does not generate a referer-header violation. This option enables the application firewall to perform Referer header validation on requests that contain a Referer header, but not block requests from users whose browsers do not set the Referer header or who use web proxies or filters that remove that header.
  - **Always.** Always validate the Referer header. If there is no Referer header, or if the Referer header is invalid, the request generates a referer-header violation.

  Note: Although the referer header check and Start URL security check share the same action settings, it is possible to violate the referer header check without violating the Start URL check. The difference is visible in the logs, which log referer header check violations separately from Start URL check violations.

One Start URL setting, Exempt Closure URLs from Security Checks, is not configured in the Modify Start URL Check dialog box, but in the Settings tab of the Configure Application Firewall Profile dialog box. If enabled, this setting directs the application firewall not to run further security checks on URLs that meet the URL Closure criteria.

If you use the command-line interface, you can enter the following commands to configure the Start URL Check:

- set appfw profile <name> -startURLAction [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -startURLClosure ([**ON**] | [**OFF**])
- set appfw profile <name> -sessionlessURLClosure ([**ON**] | [**OFF**])
- set appfw profile <name> -exemptClosureURLsFromSecurityChecks ([**ON**] | [**OFF**])
- set appfw profile <name> -RefererHeaderCheck ([**none**] | [**if-present**] | [**always**])

To specify relaxations for the Start URL check, you must use the configuration utility. On the Checks tab of the Modify Start URL Check dialog box, click Add to open the Add Start URL Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify Start URL Check Relaxation dialog box. Either dialog box provides the same options for configuring a relaxation.

Following are examples of Start URL check relaxations:

- Allow users to access the home page at www.example.com:

^http://www[.]example[.]com$

- Allow users to access all static HTML (.htm and .html), server-parsed HTML (.htp and .shtml), PHP (.php), and Microsoft ASP (.asp) format web pages at www.example.com:

  ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
  [0-9A-Za-z][0-9A-Za-z_.-]*[.](asp|htp|php|s?html?)$
- Allow users to access web pages with pathnames or file names that contain non-ASCII characters at www.example-español.com:

  ^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*
  ([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)$
  Note: In the above expression, each character class has been grouped with the string \\x[0-9A-Fa-f][0-9A-Fa-f], which matches all properly-constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (\\) is an escaped backslash, which tells the application firewall to interpret it as a literal backslash. If you included only one backslash, the application firewall would instead interpret the following left square bracket ([) as a literal character instead of the opening of a character class, which would break the expression.
- Allow users to access all GIF (.gif), JPEG (.jpg and .jpeg), and PNG (.png) format graphics at www.example.com:

  ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
  [0-9A-Za-z][0-9A-Za-z_.-]*[.](gif|jpe?g|png)$
- Allow users to access CGI (.cgi) and PERL (.pl) scripts, but only in the CGI-BIN directory:

  ^http://www[.]example[.]com/CGI-BIN/[0-9A-Za-z][0-9A-Za-z_.-]*[.](cgi|pl)$
- Allow users to access Microsoft Office and other document files in the docsarchive directory:

  ^http://www[.]example[.]com/docsarchive/[0-9A-Za-z][0-9A-Za-z_-.]*[.](doc|xls|pdf|ppt)$

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions that you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the Start URL check would otherwise have blocked.

Deny URL Check

Feb 03, 2014

The Deny URL check examines and blocks connections to URLs that are commonly accessed by hackers and malicious code. This check contains a list of URLs that are common targets of hackers or malicious code and that rarely if ever appear in legitimate requests. You can also add URLs or URL patterns to the list. The Deny URL check prevents attacks against various security weaknesses known to exist in web server software or on many web sites.

The Deny URL check takes priority over the Start URL check, and thus denies malicious connection attempts even when a Start URL relaxation would normally allow a request to proceed.

In the Modify Deny URL Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the Deny URL Check:

- set appfw profile <name> -denyURLAction [**block**] [**log**] [**stats**] [**none**]

To create and configure your own deny URLs, you must use the configuration utility. On the Checks tab of the Modify Deny URL Check dialog box, click Add to open the Add Deny URL dialog box, or select an existing user-defined deny URL and click Open to open the Modify Deny URLdialog box. Either dialog box provides the same options for creating and configuring a deny URL.

Following are examples of Deny URL expressions:

- Do not allow users to access the image server at `images.example.com` directly:

  ```
  ^http://images[.]example[.]com$
  ```
- Do not allow users to access CGI (`.cgi`) or PERL (`.pl`) scripts directly:

  ```
  ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
  [0-9A-Za-z][0-9A-Za-z_.-]*[.](cgi|pl)$
  ```
- Here is the same deny URL, modified to support non-ASCII characters:

  ```
  ^http://www[.]example[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
  ([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
  ([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](cgi|pl)$
  ```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL or pattern that you want to block, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block.

XML Protection Checks

Mar 28, 2012

The XML Protection checks examine requests for XML-based attacks of all types.

Caution: The XML security checks apply only to content that is sent with an HTTP content-type header of text/xml. If the content-type header is missing, or is set to a different value, all XML security checks are bypassed. If you plan to protect XML or Web 2.0 web applications, the webmasters of each web server that hosts those applications should ensure that the proper HTTP content-type header is sent.

XML Format Check

Feb 20, 2014

The XML Format check examines the XML format of incoming requests and blocks those requests that are not well formed or that do not meet the criteria in the XML specification for properly-formed XML documents. Some of those criteria are:

- An XML document must contain only properly-encoded Unicode characters that match the Unicode specification.
- No special XML syntax characters—such as < , > and &—can be included in the document except when used in XML markup.
- All begin, end, and empty-element tags must be correctly nested, with none missing or overlapping.
- XML element tags are case-sensitive. All beginning and end tags must match exactly.
- A single root element must contain all the other elements in the XML document.

A document that does not meet the criteria for well-formed XML does not meet the definition of an XML document. Strictly speaking, it is not XML. However, not all XML applications and web services enforce the XML well-formed standard, and not all handle poorly-formed or invalid XML correctly. Inappropriate handling of a poorly-formed XML document can cause security breaches. The purpose of the XML Format check is to prevent a malicious user from using a poorly-formed XML request to breach security on your XML application or web service.

If you use the wizard or the configuration utility, in the Modify XML Format Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the XML Format Check:

- set appfw profile <name> -xmlFormatAction [**block**] [**log**] [**stats**] [**none**]

You cannot configure exceptions to the XML Format check. You can only enable or disable it.

XML Denial-of-Service Check

Nov 14, 2013

The XML Denial of Service (XML DoS or XDoS) check examines incoming XML requests to determine whether they match the characteristics of a denial-of-service (DoS) attack, and blocks those requests that do. The purpose of the XML DoS check is to prevent an attacker from using XML requests to launch a denial-of-service attack on your web server or web site.

If you use the wizard or the configuration utility, in the Modify XML Denial-of-Service Check dialog box, on the General tab you can enable or disable the Block, Log, Statistics, and Learn actions:

If you use the command-line interface, you can enter the following command to configure the XML Denial-of-Service check:

- set appfw profile <name> -xmlDoSAction [**block**] [**log**] [**learn**] [**stats**] [**none**]

To configure individual XML Denial-of-Service rules, you must use the configuration utility. On the Checks tab of the Modify XML Denial-of-Service Check dialog box, select a rule and click Open to open the Modify XML Denial-of-Service dialog box for that rule. The individual dialog boxes differ for the different rules but are extremely simple. Some only allow you to enable or disable the rule; others allow you to modify a number by typing a new value in a text box.

The individual XML Denial-of-Service rules are:

Maximum Element Depth

Restrict the maximum number of nested levels in each individual element to 256. If this rule is enabled, and the application firewall detects an XML request with an element that has more than the maximum number of allowed levels, it blocks the request. You can modify the maximum number of levels to any value from one (1) to 65,535.

Maximum Element Name Length

Restrict the maximum length of each element name to 128 characters. This includes the name within the expanded namespace, which includes the XML path and element name in the following format:

{http://prefix.example.com/path/}target_page.xml

The user can modify the maximum name length to any value between one (1) character and 65,535.

Maximum # Elements

Restrict the maximum number of any one type of element per XML document to 65,535. You can modify the maximum number of elements to any value between one (1) and 65,535.

Maximum # Element Children

Restrict the maximum number of children (including other elements, character information, and comments) each individual element is allowed to have to 65,535. You can modify the maximum number of element children to any value between one (1) and 65,535.

Maximum # Attributes

Restrict the maximum number of attributes each individual element is allowed to have to 256. You can modify the maximum number of attributes to any value between one (1) and 256.

Maximum Attribute Name Length

Restrict the maximum length of each attribute name to 128 characters. You can modify the maximum attribute name

length to any value between one (1) and 2,048.

Maximum Attribute Value Length

Restrict the maximum length of each attribute value to 2048 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.

Maximum Character Data Length

Restrict the maximum character data length for each element to 65,535. You can modify the length to any value between one (1) and 65,535.

Maximum File Size

Restrict the size of each file to 20 MB. You can modify the maximum file size to any value.

Minimum File Size

Require that each file be at least 9 bytes in length. You can modify the minimum file size to any positive integer representing a number of bytes.

Maximum # Entity Expansions

Limit the number of entity expansions allowed to the specified number. Default: 1024.

Maximum Entity Expansion Depth

Restrict the maximum number of nested entity expansions to no more than the specified number. Default: 32.

Maximum # Namespaces

Limit the number of namespace declarations in an XML document to no more than the specified number. Default: 16.

Maximum Namespace URI Length

Limit the URL length of each namespace declaration to no more than the specified number of characters. Default: 256.

Block Processing Instructions

Block any special processing instructions included in the request. This rule has no user-modifiable values.

Block DTD

Block any document type definitions (DTD) included with the request. This rule has no user-modifiable values.

Block External Entities

Block all references to external entities in the request. This rule has no user-modifiable values.

SOAP Array Check

Enable or disable the following SOAP array checks:

- **Maximum SOAP Array Size.** The maximum total size of all SOAP arrays in an XML request before the connection is blocked. You can modify this value. Default: 20000000.
- **Maximum SOAP Array Rank.** The maximum rank or dimensions of any single SOAP array in an XML request before the connection is blocked. You can modify this value. Default: 16.

XML Cross-Site Scripting Check

Jan 15, 2015

The XML Cross-Site Scripting check examines the user requests for possible cross-site scripting attacks in the XML payload. If it finds a possible cross-site scripting attack, it blocks the request.

To prevent misuse of the scripts on your protected web services to breach security on your web services, the XML Cross-Site Scripting check blocks scripts that violate the same origin rule, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of JavaScript-enhanced web content that violates the same origin rule. If you enable the XML Cross-Site Scripting check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity.

Actions: If you use the wizard or the configuration utility, in the XML Cross-Site Scripting Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.
If you use the command-line interface, you can enter the following command to configure the actions for the XML Cross-Site Scripting Check:

- set appfw profile <name> -XMLXSSAction [**block** [**log**] [**stats**] [**none**]

Relaxations: You can use the configuration utility to specify relaxations for the XML Cross-Site Scripting check. On the Checks tab of the Modify XML Cross-Site Scripting Check dialog box, click Add to open the Add XML Cross-Site Scripting Check Relaxation dialog box, or select an existing relaxation and click Open to open the Modify XML Cross-Site Scripting Check Relaxation dialog box to edit an existing rule. Either dialog box provides the same options for configuring a relaxation, as described in "Manual Configuration By Using the Configuration Utility."

The XML Cross-Site Scripting check relaxation rules have the following parameters :

- **Name**: You can use literal strings or Regular Expressions to configure the name. The following expression exempts all elements beginning with the string name_ followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^name_[0-9A-Za-z]{2,15}$
  ```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the name that you want to add as an exception, and nothing else. Careless use of Regular Expressions can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the XML Cross-Site Scripting check would otherwise have blocked.

- **Location** You can specify the Location of the Cross-site Scripting Check exception in your XML payload. The option ELEMENT is selected by Default. You can change it to select ATTRIBUTE.

- **Comment** This is an optional field. You can use up to a 255 character long string to describe the purpose of this relaxation Rule.

XML SQL Injection Check

Dec 16, 2013

The XML SQL Injection check examines both the headers and the bodies of user requests for possible XML SQL Injection attacks. If it finds injected SQL, it blocks the request.

To prevent misusing the scripts on your protected web services to breach security on your web services, the XML SQL Injection check blocks scripts that violate the same origin rule, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called XML SQL Injection. The reason XML SQL Injection is a security issue is that a web server that allows XML SQL Injection can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of JavaScript-enhanced web content that violates the same origin rule. If you enable the XML SQL Injection check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity. In addition, to prevent blocking of legitimate requests, this check ignores cookies that were set by the server, even if they contain elements that the Cookie Consistency check would otherwise block. You should keep this in mind when configuring this check.

Note: To prevent blocking of legitimate requests, this check ignores cookies that were set by the server, even if they contain elements that the Cookie Consistency check would otherwise block.
If you use the wizard or the configuration utility, in the Modify XML SQL Injection Check dialog box, on the General tab you can enable or disable Block, Log, and Statistics actions, and the following parameters:

- **Restrict checks to fields containing SQL special characters.** If you configure the application firewall to check only fields that contain SQL special strings, the application firewall skips web form fields that do not contain special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this parameter can significantly reduce the load on the application firewall and speed up processing without placing your protected web sites at risk.

- **SQL comments handling.** By default, the application firewall checks all SQL comments for injected SQL commands. Many SQL servers ignore anything in a comment, however, even if it is preceded by an SQL special character. For faster processing, if your SQL server ignores comments, you can configure the application firewall to skip comments when examining requests for injected SQL. The SQL comments handling options are:
  - **ANSI.** Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases.
  - **Nested.** Skip nested SQL comments, which are normally used by Microsoft SQL Server.
  - **ANSI/Nested.** Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are checked for injected SQL.
    Caution: In most cases, you should not choose the Nested or the ANSI/Nested option unless your database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they may indicate an attempt to breach security on that server.
  - **Check all Comments.** Check the entire request for injected SQL, without skipping anything. The default setting.
- **Check Request headers.** If Request header checking is enabled, the application firewall examines the headers of requests for XML SQL Injection attacks, instead of just URLs.

  Caution: If you enable both request header checking and transformation, any SQL special characters found in headers

are also transformed. The Accept, Accept-Charset, Accept-Encoding, Accept-Language, Expect, and User-Agent headers normally contain semicolons (;), so enabling both Request header checking and transformation simultaneously may cause errors.

If you use the command-line interface, you can enter the following commands to configure the XML SQL Injection Check:

- set appfw profile <name> -XMLSQLInjectionAction [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <name> -XMLSQLInjectionOnlyCheckFieldsWithSQLChars (**ON** | **OFF**)]
- set appfw profile <name> -XMLSQLInjectionParseComments ([**checkall**] | [**ansi** | **nested**] | [**ansinested**])

You configure the exceptions to the XML SQL Injection check by opening the Modify XML SQL Injection Check dialog box, Checks tab. An exception can consist of either a literal string or a PCRE-format regular expression. For information about adding, modifying, removing, enabling, or disabling exceptions, see "Manual Configuration By Using the Configuration Utility."

Following are examples of XML SQL Injection check relaxations:

- **Name element or attribute.** The following expression exempts all elements beginning with the string name_ followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^name_[0-9A-Za-z]{2,15}$
  ```
- **URL element or attribute.** The following expression exempts URLs with hostnames of web.example.com, with a path up to four levels deep followed by an optional file name and extension, but no HTML or query symbols :

  ```
  ^https?://web[.]example[.]com(/[^<>?]{1,30}){0,4}(/[^<>?]{1,30})*$
  ```
- **URL element or attribute (special characters).** The following expression exempts URLs with hostnames of web.türkçe-example.com, with the same path and file restrictions as above:

  ```
  ^https?://web[.]t\xC3\xBCrk\xC3\xA7e-example[.]com(/[^<>?]{1,30}){0,4}(/[^<>?]{1,30})*$
  ```

XML Attachment Check

Feb 20, 2014

The XML Attachment check examines incoming requests for malicious attachments, and it blocks those requests that contain attachments that might breach applications security. The purpose of the XML Attachment check is to prevent an attacker from using an XML attachment to breach security on your server.

If you use the wizard or the configuration utility, in the Modify XML Attachment Check dialog box, on the General tab you can enable or disable the Block, Learn, Log, Statistics, and Learn actions:

If you use the command-line interface, you can enter the following command to configure the XML Attachment Check:

- set appfw profile <name> -xmlAttachmentAction [**block**] [**learn**] [**log**] [**stats**] [**none**]

You must configure the other XML Attachment check settings in the configuration utility. In the Modify XML Attachment Check dialog box, on the Checks tab, you can configure the following settings:

- **Maximum Attachment Size.** Allow attachments that are no larger than the maximum attachment size you specify. To enable this option, first select the Enabled check box, and then type the maximum attachment size in bytes in the Size text box.
- **Attachment Content Type.** Allow attachments of the specified content type. To enable this option, first select the Enabled check box, and then enter a regular expression that matches the Content-Type attribute of the attachments that you want to allow.
  - You can type the URL expression directly in the text window. If you do so, you can use the Regex Tokens menu to enter a number of useful regular expressions at the cursor instead of typing them manually.
  - You can click Regex Editor to open the Add Regular Expression dialog box and use it to construct the URL expression.

Web Services Interoperability Check

Oct 30, 2013

The Web Services Interoperability (WS-I) check examines both requests and responses for adherence to the WS-I standard, and blocks those requests and responses that do not adhere to this standard. The purpose of the WS-I check is to block requests that might not interact with other XML appropriately. An attacker can use inconsistencies in interoperability to launch an attack on your XML application.

If you use the wizard or the configuration utility, in the Modify Web Services Interoperability Check dialog box, on the General tab you can enable or disable the Block, Log, Statistics, and Learn actions.

If you use the command-line interface, you can enter the following command to configure the Web Services Interoperability check:

- set appfw profile <name> -xmlWSIAction [**block**] [**log**] [**learn**] [**stats**] [**none**]

To configure individual Web Services Interoperability rules, you must use the configuration utility. On the Checks tab of the Modify Web Services Interoperability Check dialog box, select a rule and click Enable or Disable to enable or disable the rule. You can also click Open to open the Web Services Interoperability Detail message box for that rule. The message box displays read-only information about the rule. You cannot modify or make other configuration changes to any of these rules.

XML Message Validation Check

Feb 20, 2014

The XML Message Validation check examines requests that contain XML messages to ensure that they are valid. If a request contains an invalid XML message, the application firewall blocks the request. The purpose of the XML Validation check is to prevent an attacker from using specially constructed invalid XML messages to breach the security of your application.

If you use the wizard or the configuration utility, in the Modify XML Message Validation Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions.

If you use the command-line interface, you can enter the following command to configure the XML Message Validation Check:

- set appfw profile <name> -xmlValidationAction [**block**] [**log**] [**stats**] [**none**]

You must use the configuration utility to configure the other XML Validation check settings. In the Modify XML Message Validation Check dialog box, on the Checks tab, you can configure the following settings:

- **XML Message Validation.** Use one of the following options to validate the XML message:
  - **SOAP Envelope.** Validate only the SOAP envelope of XML messages.
  - **WSDL.** Validate XML messages by using an XML SOAP WSDL. If you choose WSDL validation, in the WSDL Object drop-down list you must choose a WSDL. If you want to validate against a WSDL that has not already been imported to the application firewall, you can click the Import button to open the Manage WSDL Imports dialog box and import your WSDL. See "WSDL" for more information.
    - If you want to validate the entire URL, leave the Absolute radio button in the End Point Check button array selected. If you want to validate only the portion of the URL after the host, select the Relative radio button.
    - If you want the application firewall to enforce the WSDL strictly, and not allow any additional XML headers not defined in the WSDL, you must clear the Allow additional headers not defined in the WSDL check box.
      Caution: If you uncheck the Allow Additional Headers not defined in the WSDL check box, and your WSDL does not define all XML headers that your protected XML application or Web 2.0 application expects or that a client sends, you may block legitimate access to your protected service.
  - **XML Schema.** Validate XML messages by using an XML schema. If you choose XML schema validation, in the XML Schema Object drop-down list you must choose an XML schema. If you want to validate against an XML schema that has not already been imported to the application firewall, you can click the Import button to open the Manage XML Schema Imports dialog box and import your WSDL. See "WSDL" for more information.
- **Response Validation.** By default, the application firewall does not attempt to validate responses. If you want to validate responses from your protected application or Web 2.0 site, select the Validate Response check box. When you do, the Reuse the XML Schema specified in request validation check box and the XML Schema Object drop-down list are activated.
  - Check the Reuse XML Schema check box to use the schema you specified for request validation to do response validation as well.
    Note: If you check this check box, the XML Schema Object drop-down list is grayed out.
  - If you want to use a different XML schema for response validation, use the XML Schema Object drop-down list to select or upload that XML schema .

XML SOAP Fault Filtering Check

Oct 30, 2013

The XML SOAP Fault Filtering check examines responses from your protected web services and filters out XML SOAP faults. This prevents leaking of sensitive information to attackers.

If you use the wizard or the configuration utility, in the Modify XML SOAP Fault Filtering Check dialog box, on the General tab you can enable or disable the Block, Log, and Statistics actions, and the Remove action, which removes SOAP faults before forwarding the response to the user.

If you use the command-line interface, you can enter the following command to configure the XML SOAP Fault Filtering Check:

set appfw profile <name> -XMLSOAPFaultAction [**block**] [**log**] [**stats**] [**none**]

You cannot configure exceptions to the XML SOAP Fault Filtering check. You can only enable or disable it.

Managing Content Types

Jun 12, 2014

Web servers usually add a Content-Type header that contains a MIME/type definition for the type of content in each file that the web server serves to users. Web servers serve many different types of content. For example, standard HTML is assigned the "text/html" MIME type. JPG images are assigned the "image/jpeg" or "image/jpg" content type. A normal web server can serve dozens or hundreds of different types of content, all defined in the Content Type header by an assigned MIME/type.

Many application firewall filtering rules are designed to filter specific types of content. Because filtering rules that apply to one type of content (such as HTML) are often inappropriate when filtering a different type of content (such as images), the application firewall attempts to determine the content type of requests and responses before it filters them. When a web server or browser does not add a Content-Type header to a request or response, the application firewall applies a default content type to the connection and filters the content accordingly.

The default content type is normally "application/octet-stream", the most generic MIME/type definition.This MIME/type is appropriate for any type of content that a web server is likely to serve, but also does not provide much information to the application firewall to allow it to choose appropriate filtering. If a protected web server on your network is configure to add accurate content type headers to the content it serves, or serves only one type of content, you can create a profile for that web server and assign a different default content type to it to improve both the speed and the accuracy of filtering.

You can also configure a list of allowed response content types for a specific profile. When this feature is configured, if the application firewall filters a response that does not match one of the allowed content types, it blocks the response.

Requests must always be of either the "application/x-www-form-urlencoded" or "multipart/form-data" types. The application firewall bypasses any request that has any other content type designated.

Note: You cannot include the "application/x-www-form-urlencoded" or "multipart/form-data" content types on the allowed response content types list.

To set the default request content type by using the command line interface

At the command prompt, type the following commands:

- set appfw profile <name> -requestContentType <type>
- save ns config

Example

The following example sets the "text/html" content type as the default for the specified profile:

```
set appfw profile profile1 -requestContentType "text/html"
save ns config
```

To remove the user-defined default request content type by using the command line interface

At the command prompt, type the following commands:

- unset appfw profile <name> -requestContentType <type>
- save ns config

Example

The following example unsets the default content type of "text/html" for the specified profile, allowing the type to revert to "application/octet-stream":

```
unset appfw profile profile1 -requestContentType "text/html"
save ns config
```

To set the default response content type by using the command line interface

At the command prompt, type the following commands:

- set appfw profile <name> -responseContentType <type>
- save ns config

Example

The following example sets the "text/html" content type as the default for the specified profile:

```
set appfw profile profile1 -responseContentType "text/html"
save ns config
```

To remove the user-defined default response content type by using the command line interface

At the command prompt, type the following commands:

- unset appfw profile <name> -responseContentType <type>
- save ns config

Example

The following example unsets the default content type of "text/html" for the specified profile, allowing the type to revert to "application/octet-stream":

```
unset appfw profile profile1 -responseContentType "text/html"
save ns config
```

To add a content type to the allowed content types list by using the command line interface

At the command prompt, type the following commands:

- bind appfw profile <name> -ContentType <contentTypeName>
- save ns config

Example

The following example adds the "text/shtml" content type to the allowed content types list for the specified profile:

```
bind appfw profile profile1 -contentType "text/shtml"
save ns config
```

To remove a content type from the allowed content types list by using the command line interface

At the command prompt, type the following commands:

- unbind appfw profile <name> -ContentType <contentTypeName>

- save ns config

Example

The following example removes the "text/shtml" content type from the allowed content types list for the specified profile:

```
unbind appfw profile profile1 -contentType "text/shtml"
save ns config
```

To manage the default and allowed content types by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, select the profile that you want to configure, and then click Open. The Configure Application Firewall Profile dialog box is displayed.
3. In the Configure Application Firewall Profile dialog box, click the Settings tab
4. On the Settings tab, scroll down about halfway to the Content Type area.
5. In the Content Type area, configure the default request or response content type:
   - To configure the default request content type, type the MIME/type definition of the content type you want to use in the Default Request text box.
   - To configure the default response content type, type the MIME/type definition of the content type you want to use in the Default Response text box.
   - To create a new allowed content type, click Add. The Add Allowed Content Type dialog box is displayed.
   - To edit an existing allowed content type, select that content type, and then click Open. The Modify Allowed Content Type dialog box is displayed.
6. To manage the allowed content types, click Manage Allowed Content Types.
7. To add a new content type or modify an existing content type, click Add or Open, and in the Add Allowed Content Type or Modify Allowed Content Type dialog box, do the following steps.
   1. Select/clear the Enabled check box to include the content type in, or exclude it from, the list of allowed content types.
   2. In the Content Type text box, type a regular expression that describes the content type that you want to add, or change the existing content type regular expression.
      Content types are formatted exactly as MIME type descriptions are.

      Note: You can include any valid MIME type on the allowed contents type list. Since many types of document can contain active content and therefore could potentially contain malicious content, you should exercise caution when adding MIME types to this list.
   3. In the Comments text box, add an optional comment that describes the reason for adding this particular MIME type to the allowed contents type list.
   4. Click Create or OK to save your changes.
8. Click Close to close the Manage Allowed Content Types dialog box and return to the Settings tab.
9. Click OK to save your changes.

Profiles

Feb 03, 2014

A profile is a collection of security settings that are used to protect specific types of web content or specific parts of your web site. In a profile, you determine how the application firewall applies each of its filters (or checks) to requests to your web sites, and responses from them. The application firewall supports two types of profile: four built-in (default) profiles that do not require further configuration, and user-defined profiles that do require further configuration.

Built-In Profiles

The four application firewall built-in profiles provide simple protection for applications and web sites that either do not require protection, or that should not be directly accessed by users at all. These profile types are:

- **APPFW_BYPASS.** Skips all application firewall filtering and sends the unmodified traffic to the protected application or web site, or to the client.
- **APPFW_RESET.** Resets the connection, requiring that the client re-establish his or her session by visiting a designated start page.
- **APPFW_DROP.** Drops all traffic to or from the protected application or web site, and sends no response of any kind to the client.
- **APPFW_BLOCK.** Blocks traffic to or from the protected application or web site.

You use the built-in profiles exactly as you do user-defined profiles, by configuring a policy that selects the traffic to which you want to apply the profile and then associating the profile with your policy. Since you do not have to configure a built-in policy, it provides a quick way to allow or block specified types of traffic or traffic that is sent to specific applications or web sites.

User-Defined Profiles

User-defined profiles are profiles that are build and configured by users. Unlike the default profiles, you must configure a user-defined profile before it will be of use filtering traffic to and from your protected applications.

There are three types of user-defined profile:

- **HTML.** Protects HTML-based web pages.
- **XML.** Protects XML-based web services and web sites.
- **Web 2.0.** Protects Web 2.0 content that combines HTML and XML content, such as ATOM feeds, blogs, and RSS feeds.

The application firewall has a number of security checks, all of which can be enabled or disabled, and configured in a number of ways in each profile. Each profile also has a number of settings that control how it handles different types of content. Finally, rather than manually configuring all of the security checks, you can enable and configure the learning feature. This feature observes normal traffic to your protected web sites for a period of time, and uses those observations to provide you with a tailored list of recommended exceptions (*relaxations*) to some security checks, and additional rules for other security checks.

During initial configuration, whether by using the Application Firewall Wizard or manually, you normally create one general purpose profile to protect all content on your web sites that is not covered by a more specific profile. After that, you can create as many specific profiles as you want to protect more specialized content.

The Profiles pane consists of a table that contains the following elements:

Name. Displays all the application firewall profiles configured in the appliance.

Bound signature. Displays the signatures object that is bound to the profile in the previous column, if any.

Policies. Displays the application firewall policy that invokes the profile in the leftmost column of that row, if any.

Comments. Displays the comment associated with the profile in the leftmost column of that row, if any.

Profile Type. Displays the type of profile. Types are Built-In, HTML, XML, and Web 2.0.

Above the table is a row of buttons and a drop-down list that allow you to create, configure, delete, and view information about your profiles:

- **Add.** Add a new profile to the list.
- **Edit.** Edit the selected profile.
- **Delete.** Delete the selected profile from the list.
- **Statistics.** View the statistics for the selected profile.
- **Action.** Drop-down list that contains additional commands. Currently allows you to import a profile that was exported from another application firewall configuration.

Creating Application Firewall Profiles

Jun 12, 2014

You can create an application firewall profile in one of two ways: by using the command line, and by using the configuration utility. Creating a profile by using the command line requires that you specify options on the command line. The process is similar to that of configuring an existing profile, and with a few exceptions the two commands take the same parameters.

Creating a profile by using the configuration utility requires that you specify only two options. You specify basic or advanced *defaults*, the default configuration for the various security checks and settings that are part of a profile, and choose the profile *type* to match the type of content that the profile is intended to protect. You can also, optionally, add a comment. After you create the profile, you must then configure it by selecting it in the data pane, and then clicking Edit.

If you plan to use the learning feature or to enable and configure a large number of advanced protections, you should choose advanced defaults. In particular, if you plan to configure either of the SQL injection checks, either of the cross-site scripting checks, any check that provides protection against Web form attacks, or the cookie consistency check, you should plan to use the learning feature. Unless you include the proper exceptions for your protected Web sites when configuring these checks, they can block legitimate traffic. Anticipating all of the necessary exceptions without creating any that are too broad is difficult. The learning feature makes this task much easier. Otherwise, basic defaults are quick and should provide the protection that your web applications need.

There are three profile types:

- **HTML.** Protects standard HTML-based web sites.
- **XML.** Protects XML-based web services and web sites.
- **Web 2.0 (HTML XML).** Protects sites that contain both HTML and XML elements, such as ATOM feeds, blogs, and RSS feeds.

There are also a few restrictions on the name that you can give to a profile. A profile name cannot be the same as the name assigned to any other profile or action in any feature on the NetScaler appliance. Certain action or profile names are assigned to built-in actions or profiles, and can never be used for user profiles. A complete list of disallowed names can be found in the Application Firewall ProfileSupplemental Information. If you attempt to create a profile with a name that has already been used for an action or a profile, an error message is displayed and the profile is not created.

To create an application firewall profile by using the command line interface

At the command prompt, type the following commands:

- add appfw profile <name> [-defaults (**basic** | **advanced**)]
- set appfw profile <name> -type (**HTML** | **XML** | **HTML XML**)
- set appfw profile <name> -comment "<comment>"
- save ns config

Example

The following example adds a profile named pr-basic, with basic defaults, and assigns a profile type of HTML. This is the appropriate initial configuration for a profile to protect an HTML Web site.

```
add appfw profile pr-basic -defaults basic -comment "Simple profile for web sites."
set appfw profile pr-basic -type HTML
```

save ns config

To create an application firewall profile by using the configuration utility

Creating an application firewall profile requires that you specify only a few configuration details.

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, click Add.
3. In the Create Application Firewall Profile dialog box, type a name for your profile.
   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.
4. Choose the profile type from the drop-down list.
5. Click Create, and then click Close.

Configuring Application Firewall Profiles

Jun 12, 2014

To configure a user-defined application firewall profile, first configure the security checks, which are called *deep protections* or *advanced protections* in the application firewall wizard. Certain checks require configuration if you are to use them at all. Others have default configurations that are safe but limited in scope; your web sites might need or benefit from a different configuration that takes advantage of additional features of certain security checks.

After you have configured the security checks, you can also configure a number of other settings that control the behavior, not of a single security check, but the application firewall feature. The default configuration is sufficient to protect most web sites, but you should review them to make sure that they are right for your protected web sites.

For more information about the application firewall security checks, see "Advanced Protections."

To configure an application firewall profile by using the command line

At the command prompt, type the following commands:

- set appfw profile <name> <arg1> [<arg2> ...]
  where:
  - <arg1> = a parameter and any associated options.
  - <arg2> = a second parameter and any associated options.
  - ... = additional parameters and options.

  For descriptions of the parameters to use when configuring specific security checks, see "Advanced Protections."
- save ns config

Example

The following example shows how to enable blocking for the HTML SQL Injection and HTML Cross-Site Scripting checks in a profile named pr-basic. This command enables blocking for those actions while making no other changes to the profile.

```
set appfw profile pr-basic -crossSiteScriptingAction block
        -SQLInjectionAction block
```

To configure an application firewall profile by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, select the profile that you want to configure, and then click Open.
3. In the Configure Application Firewall Profile dialog box, on the Security Checks tab, configure the security checks.
   - To enable or disable an action for a check, in the list, select or clear the check box for that action.
   - To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check.
     You can also select a check and, at the bottom of the dialog box, click Open to display the Configure Relaxation dialog box or Configure Rule dialog box for that check. These dialog boxes also vary from check to check. Most of them include a Checks tab and a General tab. If the check supports relaxations or user-defined rules, the Checks tab includes an Add button, which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.) If relaxations have already been configured, you can select one and click Open to modify it.

- To review learned exceptions or rules for a check, select the check, and then click Learned Violations. In the Manage Learned Rules dialog box, select each learned exception or rule in turn.
  - To edit the exception or rule, and then add it to the list, click Edit & Deploy.
  - To accept the exception or rule without modification, click Deploy.
  - To remove the exception or rule from the list, click Skip.
- To refresh the list of exceptions or rules to be reviewed, click Refresh.
- To open the Learning Visualizer and use it to review learned rules, click Visualizer.
- To review the log entries for connections that matched a check, select the check, and then click Logs. You can use this information to determine which checks are matching attacks, so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see "Logs, Statistics, and Reports."
- To completely disable a check, in the list, clear all of the check boxes to the right of that check.

4. On the Settings tab, configure the profile settings.
   - To associate the profile with the set of signatures that you previously created and configured, under Common Settings, choose that set of signatures in the Signatures drop-down list.
     Note: You may need to use the scroll bar on the right of the dialog box to scroll down to display the Common Settings section.
   - To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.
     Note: You must first upload the error object that you want to use in the Imports pane. For more information about importing error objects, see "Imports."
   - To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types. ">>More...."
5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile, as described in "Configuring and Using the Learning Feature".
6. Click OK to save your changes and return to the Profiles pane.

Changing an Application Firewall Profile Type

Jun 12, 2014

If you chose the wrong profile type for an application firewall profile, or the type of content on the protected web site has changed, you can change the profile type.

Note: When you change the profile type, you lose all configuration settings and learned relaxations or rules for the features that the new profile type does not support. For example, if you change the profile type from Web 2.0 to XML, you lose any configuration options for Start URL, Form Field Consistency Check, and the other HTML-specific security checks. The configuration for any options that is supported by both the old and the new profile types remains unchanged.

To change an application firewall profile type by using the command line interface

At the command prompt, type the following commands:

- set appfw profile <name> -type (**HTML** | **XML** | **HTML XML**)
- save ns config

Example

The following example changes the type of a profile named pr-basic, from HTML to HTML XML, which is equivalent to the Web 2.0 type in the configuration utility.

```
set appfw profile pr-basic -type HTML XML
save ns config
```

To change an application firewall profile type by using the configuration utility.

1. Navigate to Security > Application Firewall > Policies.
2. In the details pane, click Change Profile Type.
3. In the Change Application Firewall Profile Type dialog box, Profile Type drop-down list, select a new profile type.
4. Click OK to save your changes and return to the Profiles pane.

Exporting and Importing an Application Firewall Profile

Oct 07, 2014

You can export application firewall profiles to your local computer as files, and import previously exported profile files. You might want to configure an application firewall in a test bed configuration and then export the profile or profiles so that you can import the profile configuration to your production NetScaler ADCs. You might also want to export a profile to back up your configuration before making changes so that you can easily roll the configuration back to a know state if necessary.

To export an application firewall profile by using the command line interface

At the command prompt, type the following commands:

- archive appfw profile <name> <archiveName>
  Make the following substitutions:
  - name—Name of the profile to archive.
  - archiveName—Name of the archive file to create.
- export appfw archive <archiveName> <target>
  Make the following substitutions:
  - archiveName—Name of the archive to export. (The same name as in the previous step.)
  - target—Full path and filename of the exported file on your local computer. Enclose in straight double quotation marks if the path or filename contains spaces.

Example

Assuming that your local computer uses the Windows 7 operating system, and you are logged onto your local computer as "jsmith", the following example exports a profile named pr-basic to the home directory.

```
archive appfw profile pr-basic pr-basic.tgz
export appfw pr-basic.tgz "C:\Users\jsmith\Documents\pr-basic.tgz"
```

To export an application firewall profile by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, select a profile to export, and then click Export.
3. Choose the local path and filename for the exported file.
   - You can accept the default choice, which consists of the path to your home directory or folder and a filename of the profile name plus the extension .tgz, which indicates a Unix-style tar archive that is compressed by gzip.
   - You can type a new path and/or file name. The path must exist, and the filename must be a valid filename in your local computer's operating system. If you do not specify the .tgz extension, it is added automatically.
   - You can use the Browse dialog to locate the path and save the file under the default filename. (Recommended)
4. Click Export. The profile is exported and saved to your computer under the path and file name that you designated.

To import an application firewall profile by using the command line interface

At the command prompt, type the following command:

- import appfw archive <source> <archiveName>
  Make the following substitutions:
  - source—Full path and filename of the archive file to be imported from your local computer. Enclose in straight double quotation marks if the path or filename contains spaces.
  - archiveName—Name of the archive file on the NetScaler ADC.
- restore appfw profile <archiveName>

Example

Assuming that your local computer uses the Windows 7 operating system, and you are logged onto your local computer as "jsmith", the following example imports a profile named **pr-basic.tgz**, located in your home directory, to the application firewall and installs it as a profile named pr-basic.

```
import appfw archive "C:\Users\jsmith\Documents\pr-basic.tgz" pr-basic.tgz
restore appfw profile pr-basic.tgz
```

To import an application firewall profile by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. In the details pane, click Import. If you select a profile before you click Actions, the Import button does not appear. Select a different pane (such as Application Firewall > Policies) and then return to Application Firewall > Profiles to deselect the profile.
3. Choose the import type.
   - To import from a URL, accept the default selection, Import from URL.
   - To import a local file, select Import from Local File.
4. Specify the location of the profile to be imported.
   - You can type a URL, or a path and/or file name for the profile to be imported. The URL or path and filename must exist.
   - If you are importing a local file, you can use the Browse dialog to locate the path and filename of the profile to be imported. (Recommended)
5. Click Import. The profile is imported and appears in the Profiles pane.

Configuring and Using the Learning Feature

Jun 12, 2014

The learning feature is a repetitive pattern filter that observes activity on a web site or application protected by the application firewall, to determine what constitutes normal activity on that web site or application. It then generates a list of up to 2,000 suggested rules or exceptions (relaxations) for each security checks that includes support for the learning feature. Users normally find it easier to configure relaxations by using the learning feature than by entering the necessary relaxations manually.

The security checks that support the learning feature are:

- Start URL check
- Cookie Consistency check
- Form Field Consistency check
- Field Formats check
- CSRF Form Tagging check
- HTML SQL Injection check
- HTML Cross-Site Scripting check
- XML Denial-of-Service check
- XML Attachment check
- Web Services Interoperability check

You perform two different types of activities when using the learning feature. First, you enable and configure the feature to use it. You can use learning on all traffic to your protected web applications, or you can configure a list of IPs (called the *Add Trusted Learning Clients* list) from which the learning feature should generate recommendations. Second, after the feature has been enabled and has processed a certain amount of traffic to your protected web sites, you review the list of suggested rules and relaxations (learned rules) and mark each with one of the following designations:

- **Edit & Deploy.** The rule is pulled into the Edit dialog box so that you can modify it, and the modified form is deployed.
- **Deploy.** The unmodified learned rule is placed on the list of rules or relaxations for this security check.
- **Skip.** The learned rule is placed on a list of rules or relaxations that are not deployed, and that should not be learned again.

Although you can use the command line interface for basic configuration of the learning feature, the feature is designed primarily for configuration through the Application Firewall wizard or the configuration utility. You can perform only limited configuration of the learning feature by using the command line.

The wizard integrates configuration of learning features with configuration of the application firewall as a whole, and is therefore the easiest method for configuring this feature on a new NetScaler appliance or when managing a simple application firewall configuration. The configuration utility visualizer and manual interface both provide direct access to all learned rules for all security checks, and are therefore often preferable when you must review learned rules for a large number of security checks.

The learning database is limited to 20 MB in size, which is reached after approximately 2,000 learned rules or relaxations are generated per security check for which learning is enabled. If you do not regularly review and either approve or ignore learned rules and this limit is reached, an error is logged to the NetScaler log and no more learned rules are generated until you review the existing learned rules and relaxations.

If learning stops because the database has reached its size limit, you can restart learning either by reviewing the existing learned rules and relaxations or by resetting the learning data. After learned rules or relaxations are approved or ignored, they are removed from the database. After you reset the learning data, all existing learning data is removed from the database and it is reset to its minimum size. When the database falls below 20 MB in size, learning restarts automatically.

To configure the learning settings by using the command line interface

Specify the application firewall profile to be configured and, for each security check that you want to include in that profile, specify the minimum threshold or the percent threshold. The minimum threshold is an integer representing the minimum number of user sessions that the application firewall must process before it learns a rule or relaxation (default: 1). The percent threshold is an integer representing the percentage of user sessions in which the application firewall must observe a particular pattern (URL, cookie, field, attachment, or rule violation) before it learns a rule or relaxation (default: 0). Use the following commands:

- set appfw learningsettings <profileName> [-startURLMinThreshold <positive_integer>] [-startURLPercentThreshold <positive_integer>] [-cookieConsistencyMinThreshold <positive_integer>] [-cookieConsistencyPercentThreshold <positive_integer>] [-CSRFtagMinThreshold <positive_integer>] [-CSRFtagPercentThreshold <positive_integer>] [-fieldConsistencyMinThreshold <positive_integer>] [-fieldConsistencyPercentThreshold <positive_integer>] [-crossSiteScriptingMinThreshold <positive_integer>] [-crossSiteScriptingPercentThreshold <positive_integer>] [-SQLInjectionMinThreshold <positive_integer>] [-SQLInjectionPercentThreshold <positive_integer>] [-fieldFormatMinThreshold <positive_integer>] [-fieldFormatPercentThreshold <positive_integer>] [-XMLWSIMinThreshold <positive_integer>] [-XMLWSIPercentThreshold <positive_integer>] [-XMLAttachmentMinThreshold <positive_integer>] [-XMLAttachmentPercentThreshold <positive_integer>]
- save ns config

Example

The following example enables and configures the learning settings in the profile pr-basic for the HTML SQL Injection security check. This is an appropriate initial test bed learning configuration, where you have complete control over the traffic that is sent to the application firewall.

```
set appfw learningsettings pr-basic -SQLInjectionMinThreshold 10
set appfw learningsettings pr-basic -SQLInjectionPercentThreshold 70
save ns config
```

To reset learning settings to their defaults by using the command line interface

To remove any custom configuration of the learning settings for the specified profile and security check, and return the learning settings to their defaults, at the command prompt type the following commands:

- unset appfw learningsettings <profileName> [-startURLMinThreshold] [-startURLPercentThreshold] [-cookieConsistencyMinThreshold] [-cookieConsistencyPercentThreshold] [-CSRFtagMinThreshold] [-CSRFtagPercentThreshold] [-fieldConsistencyMinThreshold] [-fieldConsistencyPercentThreshold] [-crossSiteScriptingMinThreshold] [-crossSiteScriptingPercentThreshold] [-SQLInjectionMinThreshold] [-SQLInjectionPercentThreshold] [-fieldFormatMinThreshold] [-fieldFormatPercentThreshold] [-XMLWSIMinThreshold] [-XMLWSIPercentThreshold] [-XMLAttachmentMinThreshold] [-XMLAttachmentPercentThreshold]
- save ns config

To display the learning settings for a profile by using the command line interface

At the command prompt, type the following command:

show appfw learningsettings <profileName>

To display unreviewed learned rules or relaxations for a profile by using the command line interface

At the command prompt, type the following command:

show appfw learningdata <profileName> <securityCheck>

To remove specific unreviewed learned rules or relaxations from the learning database by using the command line interface

At the command prompt, type the following command:

rm appfw learningdata <profileName> (-startURL <expression> | -cookieConsistency <string> | (-fieldConsistency <string> <formActionURL>) | (-crossSiteScripting <string> <formActionURL>) | (-SQLInjection <string> <formActionURL>) | (-fieldFormat <string><formActionURL>) | (-CSRFTag <expression> <CSRFFormOriginURL>) | -XMLDoSCheck <expression> | -XMLWSICheck <expression> | -XMLAttachmentCheck <expression>) [-TotalXMLRequests]

Example

The following example removes all unreviewed learned relaxations for the pr-basic profile, HTML SQL Injection security check, that apply to the LastName form field.

rm appfw learningdata pr-basic -SQLInjection LastName

To remove all unreviewed learned data by using the command line interface

At the command prompt, type the following command:

reset appfw learningdata

To export learning data by using the command line interface

At the command prompt, type the following command:

export appfw learningdata <profileName> <securitycheck>[-target <string>]

Example

The following example exports learned relaxations for the pr-basic profile and the HTML SQL Injection security check to a comma-separated values (CSV) format file in the /var/learnt_data/ directory under the filename specified in the -target parameter.

export appfw learningdata pr-basic SQLInjection -target sqli_ld

To configure the Learning feature by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. In the Profiles pane, select the profile, and then click Open.
3. Click the Learning tab. At the top of the Learning tab is list of the security checks that are available in the current profile and that support the learning feature.
4. To configure the learning thresholds, select a security check, and then type the appropriate values in the following text boxes:
   - **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1

- **Percentage of times threshold.** Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0

5. To remove all learned data and reset the learning feature, so that it must start its observations again from the beginning, click Remove All Learned Data.
   Note: This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.
6. To restrict the learning engine to traffic from a specific set of IPs, click Trusted Learning Clients, and add the IP addresses that you want to use to the list.
   1. To add an IP address or IP address range to the Trusted Learning Clients list, click Add.
   2. In the Add Trusted Learning Clients dialog box, Trusted Clients IP list box, type the IP address or an IP address range in CIDR format.
   3. In the Comments text area, type a comment that describes this IP address or range.
   4. Click Create to add your new IP address or range to the list.
   5. To modify an existing IP address or range, click the IP address or range, and then click Open. Except for the name, the dialog box that appears is identical to the Add Trusted Learning Clients dialog box.
   6. To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click Disable or Enable, as appropriate.
   7. To remove an IP address or range completely, click the IP address or range, and then click Remove.
7. Click Close to return to the Configure Application Firewall Profile dialog box.
8. Click Close to close the Configure Application Firewall Profile dialog box, and return to the Application Firewall Profile screen.

To review learned rules or relaxations by using the configuration utility

1. Navigate to Security > Application Firewall > Profiles.
2. Select the security check for which you want to review learned rules or relaxations, and then click Manage Rules.
3. In the Manage Learned Rules dialog box, choose how you want to review the learned rules.
   - To review the actual learned patterns as displayed in the window, do nothing and proceed to the next step.
   - To review the learned data hierarchically as a branching tree, enabling you to choose general patterns that match many of the learned patterns, click Visualizer.
4. If you have chosen to review actual learned patterns, perform the following steps.
   1. Select the first learned relaxation and choose how to handle it.
      - To modify and then accept the relaxation, click Edit & Deploy, edit the relaxation regular expression, and then click OK.
      - To accept the relaxation without modifications, click Deploy.
      - To remove the relaxation from the list without deploying it, click Skip.
   2. Repeat the previous step to review each additional learned relaxation.
5. If you have chosen to use the Learning Visualizer, perform the following steps.
   1. In the branching hierarchical display, select a node that contains a learned pattern, and choose how to handle it. The screen area beneath the tree structure, under Regex of Selected Node, displays a generalized expression that matches all of the patterns in that node. If you want to display an expression that matches just one of the branches or just one of the leaves, select that branch or leaf.

- To modify and then accept the learned relaxation, click Edit & Deploy, edit the relaxation regular expression, and then click OK.
- To accept the relaxation without modifications, click Deploy.
- To remove the modification from the list without deploying it, click Skip.

2. Repeat the previous step to review other portions of the display.
3. Click Close to return to the Manage Learned Rules dialog box.

6. Click Close to return to the Configure Application Firewall Profile dialog box.
7. Click Close to close the Configure Application Firewall Profile dialog box, and return to the Application Firewall Profile screen.

Supplemental Information about Profiles

Oct 01, 2013

Following is supplemental information about particular aspects of application firewall profiles. This information explains how to include special characters in a security check rule or relaxation, and how to use variables when configuring profiles.

Configuration Variable Support

Instead of using static values, to configure the application firewall's security checks and settings, you can now use standard NetScaler named variables. By creating variables, you can more easily export and then import configurations to new NetScaler appliances, or update existing NetScaler appliances from a single set of configuration files. This simplifies updates when you use a test bed setup to develop a complex application firewall configuration that is tuned for your local network and servers and then transfer that configuration to your production NetScaler appliances.

You create application firewall configuration variables in the same manner as you do any other NetScaler named variables, following standard NetScaler conventions. To create a named expression variable by using the configuration utility, you use the "Add Expression dialog box." To create a named expression variable by using the NetScaler command line, you use the `add expression` command followed by the appropriate parameter.

The following URLs and expressions can be configured with variables instead of static values:

- **Start URL** (-starturl)
- **Deny URL** (-denyurl)
- **Form Action URL** for *Form Field Consistency Check* (-fieldconsistency)
- **Action URL** for *XML SQL Injection Check* (-xmlSQLInjection)
- **Action URL** for X*ML Cross-Site Scripting Check* (-xmlXSS)
- **Form Action URL** for *HTML SQL Injection Check* (-sqlInjection)
- **Form Action URL** for *Field Format Check* (-fieldFormat)
- **Form Origin URL** and **Form Action URL** for *Cross-Site Request Forgery (CSRF) Check* (-csrfTag)
- **Form Action URL** for *HTML Cross-Site Scripting Check* (-crossSiteScripting)
- **Safe Object** (-safeObject)
- **Action URL** for *XML Denial-of-Service (XDoS) check* (-XMLDoS)
- **URL** for *Web Services Interoperability check* (-XMLWSIURL)
- **URL** for *XML Validation check* (-XMLValidationURL)
- **URL** for *XML Attachment check* (-XMLAttachmentURL)

For more information, see "Policies and Expressions."

To use a variable in the configuration, you enclose the variable name between two at (@) symbols and then use it exactly as you would the static value that it replaces. For example, if you are configuring the Deny URL check by using the configuration utility and want to add the named expression variable myDenyURL to the configuration, you would type `@myDenyURL@` into the Add Deny URL dialog box, Deny URL text area. To do the same task by using the NetScaler command line, you would type `add appfw profile <name> -denyURLAction @myDenyURL@`.

PCRE Character Encoding Format

The NetScaler operating system supports direct entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your application firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular

expression.

A number of character types require encoding using a PCRE regular expression if you include them in your application firewall configuration as a URL, form field name, or Safe Object expression. They include:

- **Upper-ASCII characters.** Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.
- **Double-Byte characters.** Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.
- **ASCII control characters.** Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters should never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The NetScaler appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, "English US," the application firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set. This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.
- **Chinese Traditional (Big5).** The application firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.
- **Chinese Simplified (GB2312).** The application firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
- **Japanese (SJIS).** The application firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.
- **Japanese (EUC-JP).** The application firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.
- **Korean (EUC-KR).** The application firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.
- **Turkish (ISO-8859-9).** The application firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.
- **Unicode (UTF-8).** The application firewall supports certain additional characters in the UTF-8 character set, including those used in modern Russian.

When configuring the application firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which are assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8

character set. For example, the exclamation point (!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the application firewall configuration is "\xNN" for ASCII characters; "\xNN\xNN" for non-ASCII characters used in English, Russian, and Turkish; and "\xNN\xNN\xNN" for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in an application firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

Note: Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character's UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as \x20 to avoid confusing certain browsers and web server software.
Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the application firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

  Actual URL: http://www.josénuñez.com

  Encoded URL: ^http://www[.]jos\xC3\xA9nu\xC3\xB1ez[.]com$

- Another URL containing extended ASCII characters.

  Actual URL: http://www.example.de/trömso.html

  Encoded URL: ^http://www[.]example[.]de/tr\xC3\xB6mso[.]html$

- A form field name containing extended ASCII characters.

  Actual Name: nome_do_usuário

  Encoded Name: ^nome_do_usu\xC3\xA1rio$

- A safe object expression containing extended ASCII characters.

  Unencoded Expression [A-Z]{3,6}¥[1-9][0-9]{6,6}

  Encoded Expression: [A-Z]{3,6}\xC2\xA5[1-9][0-9]{6,6}

You can find a number of tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful web site that contains this information is located at the following URL:

http://www.utf8-chartable.de/unicode-utf8-table.pl
For the characters in the table on this web site to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of web pages will be correct.

Inverted PCRE Expressions

In addition to matching content that contains a pattern, you can match content that does not contain a pattern by using an inverted PCRE expression. To invert an expression, you simply include an exclamation point (!) followed by white space as the first character in the expression.

Note: If an expression consists only of an exclamation point with nothing following, the exclamation point is treated as a literal character, not syntax indicating an inverted expression.
The following application firewall commands support inverted PCRE expressions:

- Start URL (URL)
- Deny URL (URL)
- Form Field Consistency (form action URL)
- Cookie Consistency (form action URL)
- Cross Site Request Forgery (CSRF) (form action URL)
- HTML Cross-site Scripting (form action URL)
- Field Format (form action URL)
- Field Type (type)
- Confidential Field (URL)

Note: If the security check contains an isRegex flag or check box, it must be set to YES or checked to enable regular expressions in the field. Otherwise the contents of that field are treated as literal and no regular expressions (inverted or not) are parsed.

Disallowed Names for Application Firewall Profiles

The following names are assigned to built-in actions and profiles on the NetScaler appliance, and cannot be used as names for a user-created application firewall profile.

- AGRESSIVE
- ALLOW
- BASIC
- CLIENTAUTH
- COMPRESS
- CSSMINIFY
- DEFLATE
- DENY
- DNS-NOP
- DROP
- GZIP
- HTMLMINIFY
- IMGOPTIMIZE
- JSMINIFY
- MODERATE
- NOCLIENTAUTH
- NOCOMPRESS
- NONE
- NOOP
- NOREWRITE
- RESET
- SETASLEARNNSLOG_ACT

- SETNSLOGPARAMS_ACT
- SETSYSLOGPARAMS_ACT
- SETTMSESSPARAMS_ACT
- SETVPNPARAMS_ACT
- SET_PREAUTHPARAMS_ACT
- default_DNS64_action
- dns_default_act_Cachebypass
- dns_default_act_Drop
- nshttp_default_profile
- nshttp_default_strict_validation
- nstcp_default_Mobile_profile
- nstcp_default_XA_XD_profile
- nstcp_default_profile
- nstcp_default_tcp_interactive_stream
- nstcp_default_tcp_lan
- nstcp_default_tcp_lan_thin_stream
- nstcp_default_tcp_lfp
- nstcp_default_tcp_lfp_thin_stream
- nstcp_default_tcp_lnp
- nstcp_default_tcp_lnp_thin_stream
- nstcp_internal_apps

Policy Labels

Nov 19, 2013

A policy label consists of a set of policies, other policy labels, and virtual server-specific policy banks. The application firewall evaluates each policy bound to the policy label in order of priority. If the policy matches, it filters the connection as specified in the associated profile. Then it does whatever the Goto parameter specifies, which can be to terminate policy evaluation, go to the next policy, or go to the policy with the specified priority. If the Invoke parameter is set, it terminates processing of the current policy label and begins to process the specified policy label or virtual server.

To create an application firewall policy label by using the command line

At the command prompt, type the following commands:

- add appfw policylabel <labelName> http_req
- save ns config

Example

The following example creates a policy label named **policylbl1**.

```
add appfw policylabel policylbl1 http_req
save ns config
```

To bind a policy to a policy label by using the command line

At the command prompt, type the following commands:

- bind appfw policylabel <labelName> <policyName> <priority> [<gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]
- save ns config

Example

The following example binds the policy **policy1** to the policy label **policylbl1** with a priority of 1.

```
bind appfw policylabel policylbl1 policy1 1
save ns config
```

To configure an application firewall policy label by using the configuration utility

1. Navigate to Security > Application Firewall > Policy Labels.
2. In the details pane, do one of the following:
   - To add a new policy label, click Add.
   - To configure an existing policy label, select the policy label and the click Open.

   The Create Application Firewall Policy Label or the Configure Application Firewall Policy Label dialog box opens. The dialog boxes are nearly identical.
3. If you are creating a new policy label, in the Create Application Firewall Policy Label dialog box, type a name for your new policy label.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

4. Select Insert Policy to insert a new row and display a drop-down list with all existing application firewall policies.
5. Select the policy you want to bind to the policy label, or select New Policy to create a new policy and follow the instructions in To create and configure a policy by using the configuration utility. The policy that you selected or created is inserted into the list of globally bound application firewall policies.
6. Make any additional adjustments.
   - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
   - To modify the policy expression, double click that field to open the Configure Application Firewall Policy dialog box, where you can edit the policy expression.
   - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
   - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression
7. Repeat steps 5 through 7 to bind any additional application firewall policies you want to the policy label.
8. Click Create or OK, and then click Close. A message appears in the status bar, stating that you have successfully created or modified the policy label.

Policies

Mar 28, 2012

The application firewall uses two types of policies: firewall policies and auditing policies. Firewall policies control which traffic is sent to the application firewall. Auditing policies control the log server to which application firewall logs are sent.

Firewall policies can be complex because the policy rule can consist of multiple expressions in the NetScaler expressions language, which is a full-fledged object oriented programming language capable of defining with extreme precision exactly which connections to filter. Because firewall policies operate within the context of the application firewall, they must meet certain criteria that are connected to how the application firewall functions and what traffic is appropriately filtered by it. As long as you keep these criteria in mind, however, firewall policies are similar to policies for other NetScaler features. The instructions here do not attempt to cover all aspects of writing firewall policies, but only provide an introduction to policies and cover those criteria that are unique to the application firewall.

Auditing policies are simple because the policy rule is always ns_true. You need only specify the log server that you want to send logs to, the logging levels that you want to use, and a few other criteria that are explained in detail.

Firewall Policies

Oct 01, 2013

A firewall policy is a rule associated with a profile. The rule is an expression or group of expressions that defines the types of request/response pairs that the application firewall is to filter by applying the profile. Firewall policy expressions are written in the NetScaler expressions language, an object-oriented programming language with special features to support specific NetScaler functions. The profile is the set of actions that the application firewall is to use to filter request/response pairs that match the rule.

Firewall policies enable you to assign different filtering rules to different types of web content. Not all web content is alike. A simple web site that uses no complex scripting and accesses and handles no private data might require only the level of protection provided by a profile created with basic defaults. Web content that contains JavaScript-enhanced web forms or accesses an SQL database probably requires more tailored protection. You can create a different profile to filter that content, and create a separate firewall policy that can determine which requests are attempting to access that content. You then associate the policy expression with a profile you created and globally bind the policy to put it into effect.

The application firewall processes only HTTP connections, and therefore uses a subset of the overall NetScaler expressions language. The information here is limited to topics and examples that are likely to be useful when configuring the application firewall. Following are links to additional information and procedures for firewall policies:

- For procedures that explain how to create and configure a policy, see "Creating and Configuring Application Firewall Policies."
- For a procedure that explains in detail how to create a policy rule (expression), see "To create or configure an Application Firewall rule (expression)."
- For a procedure that explains how to use the Add Expression dialog box to create a policy rule, see "To add a firewall rule (expression) by using the Add Expression dialog box."
- For a procedure that explains how to view the current bindings for a policy, see "Viewing a Firewall Policy's Bindings."
- For procedures that explain how to bind an application firewall policy, see "Binding Application Firewall Policies."
- For detailed information about the NetScaler expressions language, see "Policies and Expressions."

Creating and Configuring Application Firewall Policies

Jun 12, 2014

A firewall policy consists of two elements: a *rule*, and an associated *profile*. The rule selects the HTTP traffic that matches the criteria that you set, and sends that traffic to the application firewall for filtering. The profile contains the filtering criteria that the application firewall uses.

The policy rule consists of one or more expressions in the NetScaler expressions language. The NetScaler expressions syntax is a powerful, object-oriented programming language that enables you to precisely designate the traffic that you want to process with a specific profile. For users who are not completely familiar with the NetScaler expressions language syntax, or who prefer to configure their NetScaler appliance by using a web-based interface, the configuration utility provides two tools: the Prefix menu and the Add Expression dialog box. Both help you to write expressions that select exactly the traffic that you want to process. Experienced users who are thoroughly familiar with the syntax may prefer to use the NetScaler command line to configure their NetScaler appliances.

Note: In addition to the default expressions syntax, for backward compatibility the NetScaler operating system supports the NetScaler classic expressions syntax on NetScaler Classic and nCore appliances and virtual appliances. Classic expressions are not supported on NetScaler Cluster appliances and virtual appliances. Current NetScaler users who want to migrate existing configurations to the NetScaler Cluster must migrate any policies that contain classic expressions to the default expressions syntax.
For detailed information about the NetScaler expressions languages, see "Policies and Expressions."

You can create a firewall policy by using the configuration utility or the NetScaler command line.

To create and configure a policy by using the command line interface

At the command prompt, type the following commands:

- add appfw policy <name> <rule> <profileName>
- save ns config

Example

The following example adds a policy named **pl-blog**, with a rule that intercepts all traffic to or from the host **blog.example.com**, and associates that policy with the profile **pr-blog**. This is an appropriate policy to protect a blog hosted on a specific hostname.

```
add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com")" pr-blog
```

To create and configure a policy by using the configuration utility

1. Navigate to Security > Application Firewall > Policies.
2. In the details pane, do one of the following:
   - To create a new firewall policy, click Add. The Create Application Firewall Policy is displayed.
   - To edit an existing firewall policy, select the policy, and then click Open.

   The Create Application Firewall Policy or Configure Application Firewall Policy is displayed.
3. If you are creating a new firewall policy, in the Create Application Firewall Policy dialog box, Policy Name text box, type a name for your new policy.
   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

If you are configuring an existing firewall policy, this field is read-only. You cannot modify it.

4. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a new profile to associate with your policy by clicking New, and you can modify an existing profile by clicking Modify.
5. In the Expression text area, create a rule for your policy.
   - You can type a rule directly into the text area.
   - You can click Prefix to select the first term for your rule, and follow the prompts. See "To Create an Application Firewall Rule (Expression)" for a complete description of this process.
   - You can click Add to open the Add Expression dialog box, and use it to construct the rule. See "The Add Expression Dialog Box" for a complete description of this process.
6. Click Create or OK, and then click Close.

To create or configure an Application Firewall rule (expression)

The policy rule, also called the *expression*, defines the web traffic that the application firewall filters by using the profile associated with the policy. Like other NetScaler policy rules (or *expressions*), application firewall rules use NetScaler expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the Application Firewall wizard or the NetScaler configuration utility to create your policy rule:
   - If you are configuring a policy in the Application Firewall wizard, in the navigation pane, click Application Firewall, then in the details pane click Application Firewall Wizard, and then navigate to the Specify Rule screen.
   - If you are configuring a policy manually, in the navigation pane, expand Application Firewall, then Policies, and then Firewall. In the details pane, to create a new policy, click Add. To modify an existing policy, select the policy, and then click Open.
2. On the Specify Rule screen, the Create Application Firewall Profile dialog box, or the Configure Application Firewall Profile dialog box, click Prefix, and then choose the prefix for your expression from the drop-down list. Your choices are:
   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

   After you choose a prefix, the application firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.

3. Choose your next term.
   If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The application firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

   When you have decided which term you want, double-click it to insert it into the Expression window.

4. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the

previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.

5. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished. Following are some examples of expressions for specific purposes.

   - **Specific web host.** To match traffic from a particular web host:

     HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
     For shopping.example.com, substitute the name of the web host that you want to match.

   - **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

     HTTP.REQ.URL.STARTSWITH("https//www.example.com/folder")
     For www.example.com, substitute the name of the web host. For folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

   - **Specific type of content: GIF images.** To match GIF format images:

     HTTP.REQ.URL.ENDSWITH(".gif")
     To match other format images, substitute another string in place of .gif.

   - **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

     HTTP.REQ.URL.STARTSWITH("https//www.example.com/CGI-BIN")
     To match all JavaScripts with .js extensions:

     HTTP.REQ.URL.ENDSWITH(".js")
     For more information about creating policy expressions, see "Policies and Expressions."

   Note: If you use the command line to configure a policy, remember to escape any double quotation marks within NetScaler expressions. For example, the following expression is correct if entered in the configuration utility:
   HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
   If entered at the command line, however, you must type this instead:

   HTTP.REQ.HEADER(\"Host\").EQ(\"shopping.example.com\")

To add a firewall rule (expression) by using the Add Expression dialog box

The Add Expression dialog box (also referred to as the Expression Editor) helps users who are not familiar with the NetScaler expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the Application Firewall wizard or the NetScaler configuration utility:
   - If you are configuring a policy in the Application Firewall wizard, in the navigation pane, click Application Firewall, then in the details pane click Application Firewall Wizard, and then navigate to the Specify Rule screen.
   - If you are configuring a policy manually, in the navigation pane, expand Application Firewall, then Policies, and then Firewall. In the details pane, to create a new policy, click Add. To modify an existing policy, select the policy, and then click Open.
2. On the Specify Rule screen, in the Create Application Firewall Profile dialog box, or in the Configure Application Firewall Profile dialog box, click Add.

3. In the Add Expression dialog box, in the Construct Expression area, in the first list box, choose one of the following prefixes:
   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.
   - **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the application firewall treats requests and associated responses as a single unit and filters both, you do not need to specific responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the Preview Expression window displays your expression.
5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The Preview Expression window updates to display the expression as you have specified it to that point.
6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or additional terms that you added after the term that you modified are cleared.
7. When you have finished constructing your expression, click OK to close the Add Expression dialog box. Your expression is inserted into the Expression text area.

Binding Application Firewall Policies

Jun 12, 2014

After you have configured your application firewall policies, you bind them to Global or a bind point to put them into effect. After binding, any request or response that matches an application firewall policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the application firewall feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you configure the application firewall to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you configure the application firewall to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you bind your policies.

For more information about binding policies on the NetScaler appliance, see "Policies and Expressions."

To bind an application firewall policy by using the command line interface

At the command prompt, type the following commands:

- bind appfw global <policyName> <priority>
- save ns config

Example

The following example binds the policy named **pl-blog** and assigns it a priority of **10**.

```
bind appfw global pl-blog 10
save ns config
```

To bind an application firewall policy by using the configuration utility

1. Do one of the following:
   - Navigate to Security > Application Firewall, and in the details pane, click Application Firewall policy manager.
   - Navigate to Security > Application Firewall > Policies > Firewall Policies, and in the details pane, click Policy Manager.
2. In the Application Firewall Policy Manager dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:
   - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
   - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
   - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this

policy.

- **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
- **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
- **None.** Do not bind the policy to any bind point.

3. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound application firewall policies.
4. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound application firewall policies.
5. Make any additional adjustments to the binding.
   - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
   - To modify the policy expression, double click that field to open the Configure Application Firewall Policy dialog box, where you can edit the policy expression.
   - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
   - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression
6. Repeat steps 3 through 6 to add any additional application firewall policies you want to globally bind.
7. Click OK. A message appears in the status bar, stating that the policy has been successfully bound.

Viewing a Firewall Policy's Bindings

Jun 12, 2014

You can quickly check to determine what bindings are in place for any firewall policy by viewing the bindings in the configuration utility.

To view bindings for an application firewall policy

1. Navigate to Security > Application Firewall > Policies > Firewall Policies
2. In the details pane, select the policy that you want to check, and then click Show Bindings. The Binding Details for Policy: Policy message box is displayed, with a list of bindings for the selected policy.
3. Click Close.

Supplemental Information about Application Firewall Policies

Jun 07, 2012

Following is supplemental information about particular aspects of application firewall policies that system administrators who manage the application firewall might need to know.

Correct but Unexpected Behavior

Web application security and modern web sites are complex. In a number of scenarios, a NetScaler policy might cause the application firewall to behave differently in certain situations than a user who is familiar with policies would normally expect. Following are a number of cases where the application firewall may behave in an unexpected fashion.

- **Request with a missing HTTP Host header and an absolute URL.** When a user sends a request, in the majority of cases the request URL is relative. That is, it takes as its starting point the Referer URL, the URL where the user's browser is located when it sends the request. If a request is sent without a Host header, and with a relative URL, the request is normally blocked both because it violates the HTTP specification and because a request that fails to specify the host could under some circumstances constitute an attack. If a request is sent with an absolute URL, however, even if the Host header is missing, the request bypasses the application firewall and is forwarded to the web server. Although such a request violates the HTTP specification, it poses no possible threat because an absolute URL contains the host.

Auditing Policies

Jun 12, 2014

Auditing policies determine the messages that are generated and logged during an Application Firewall session. These messages are logged in SYSLOG format to the local NSLOG server or to an external logging server. Different types of messages are logged on the basis of the level of logging selected.

To create an auditing policy, you must first create either an NSLOG server or a SYSLOG server. After specifying the server, you create the policy and specify the type of log and the server to which logs are sent.

To create an auditing server by using the command line interface

You can create two different types of auditing server: an NSLOG server or a SYSLOG server. The command names are different, but the parameters for the commands are the same.

To create an auditing server, at the NetScaler command prompt, type the following commands:

- add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-dateFormat (**MMDDYYYY** | **DDMMYYYY**)] [-logFacility <logFacility>] [-tcp (**NONE** | **ALL**)] [-acl (**ENABLED** | **DISABLED**)] [-timeZone (**GMT_TIME** | **LOCAL_TIME**)] [-userDefinedAuditlog (**YES** | **NO**)] [-appflowExport (**ENABLED** | **DISABLED**)]
- save ns config

Example

The following example creates a syslog server named syslog1 at IP 10.124.67.91, with loglevels of emergency, critical, and warning, log facility set to LOCAL1, that logs all TCP connections:

```
add audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical warning -logFacility
LOCAL1 -tcp ALL
save ns config
```

To modify or remove an auditing server by using the command line interface

- To modify an auditing server, type the set audit <type> command, the name of the auditing server, and the parameters to be changed, with their new values.
- To remove an auditing server, type the rm audit <type> command and the name of the auditing server.

Example

The following example modifies the syslog server named syslog1 to add errors and alerts to the log level:

```
set audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical warning alert error
-logFacility LOCAL1 -tcp ALL
save ns config
```

To create or configure an auditing server by using the configuration utility

1. Navigate to Security > Application Firewall > Policies > Auditing.
2. In the details pane, click the Server tab.
3. Do one of the following:
   - To add a new auditing server, click Add.
   - To modify an existing auditing server, select the server, and then click Open.

4. In the Create Auditing Server or Configure Auditing Server dialog box, set the following parameters:
   - Name
   - Auditing Type
   - IP Address
   - Port
   - Log Levels
   - Log Facility
   - TCP Logging
   - ACL Logging
   - User-Configurable Log Messages
   - AppFlow Logging
   - Date Format
   - Time Zone
5. Click Create or OK.

To create an auditing policy by using the command line interface

You can create an NSLOG policy or a SYSLOG policy. The type of policy must match the type of server. The command names for the two types of policy are different, but the parameters for the commands are the same.

At the command prompt, type the following commands:

- add audit syslogPolicy <name> [-rule <expression>] [-action <string>]
- save ns config

Example

The following example creates a policy named syslogP1 that logs application firewall traffic to a syslog server named syslog1.

```
add audit syslogPolicy syslogP1 -rule "ns_true" -action syslog1
save ns config
```

To configure an auditing policy by using the command line interface

At the command prompt, type the following commands:

- set audit syslogPolicy <name> [-rule <expression>] [-action <string>]
- save ns config

Example

The following example modifies the policy named syslogP1 to log application firewall traffic to a syslog server named syslog2.

```
set audit syslogPolicy syslogP1 -rule "ns_true" -action syslog2
save ns config
```

To configure an auditing policy by using the configuration utility

1. Navigate to Security > Application Firewall > Policies > Auditing.
2. In the details pane, do one of the following:
   - To add a new policy, click Add.

- To modify an existing policy, select the policy, and then click Open.

3. In the Create Auditing Policy or Configure Auditing Policy dialog box, set the following parameters:
   - Name
   - Auditing Type
   - Server
4. Click Create or OK.

Imports

Mar 28, 2012

Several application firewall features make use of external files that you upload to the application firewall when configuring it. Using the configuration utility, you manage those files in the Imports pane, which has four tabs corresponding to the four types of files you can import: HTML error objects, XML error objects, XML schemas, and Web Services Description Language (WSDL) files. Using the NetScaler command line, you can import these types of files, but you cannot export them.

HTML Error Object

When a user's connection to an HTML or Web 2.0 page is blocked, or a user asks for a non-existent HTML or Web 2.0 page, the application firewall sends an HTML-based error response to the user's browser. When configuring which error response the application firewall should use, you have two choices:

- You can configure a redirect URL, which can be hosted on any Web server to which users also have access. For example, if you have a custom error page on your Web server, `404.html`, you can configure the application firewall to redirect users to that page when a connection is blocked.
- You can configure an HTML error object, which is an HTML-based Web page that is hosted on the application firewall itself. If you choose this option, you must upload the HTML error object to the application firewall. You do that in the Imports pane, on the HTML Error Object tab.

The error object must be a standard HTML file that contains no non-HTML syntax except for application firewall error object customization variables. It cannot contain any CGI scripts, server-parsed code, or PHP code. The customization variables enable you to embed troubleshooting information in the error object that the user receives when a request is blocked. While most requests that the application firewall blocks are illegitimate, even a properly configured application firewall can occasionally block legitimate requests, especially when you first deploy it or after you make significant changes to your protected Web sites. By embedding information in the error page, you provide the user with the information that he or she needs to give to the technical support person so that any issues can be fixed.

The application firewall error page customization variables are:

- `${NS_TRANSACTION_ID}`. The transaction ID that the application firewall assigned to this transaction.
- `${NS_APPFW_SESSION_ID}`. The application firewall session ID.
- `${NS_APPFW_VIOLATION_CATEGORY}`. The specific application firewall security check or rule that was violated.
- `${NS_APPFW_VIOLATION_LOG}`. The detailed error message associated with the violation.
- `${COOKIE("<CookieName>")}`. The contents of the specified cookie. For <CookieName>, substitute the name of the specific cookie that you want to display on the error page. If you have multiple cookies whose contents you want to display for troubleshooting, you can use multiple instances of this customization variable, each with the appropriate cookie name.
  Note: If you have blocking enabled for the Cookie Consistency Check, any blocked cookies are not displayed on the error page because the application firewall blocks them.

To use these variables, you embed them in the HTML or XML of the error page object as if they were an ordinary text string. When the error object is displayed to the user, for each customization variable the application firewall substitutes the information to which the variable refers. An example HTML error page that uses custom variables is shown below.

```
<!doctype html public "-//w3c//dtd html 4.0//en"> <html> <head> <title>Page Not Accessible</title> </head> <body> <h1>Page Not Accessible</h1> <p>The pag
```

To use this error page, copy it into a text or HTML editor. Substitute the appropriate local information for the following variables, which are enclosed in square brackets to distinguish them from the NetScaler variables. (Leave those unchanged.):

- **[homePage]**. The URL for your web site's home page.
- **[helpDeskEmailAddress]**. The email address that you want users to use to report blocking incidents.
- **[helpDeskPhoneNumber]**. The phone number that you want users to call to report blocking incidents.
- **[cookieName]**. The name of the cookie whose contents you want to display on the error page.

XML Error Object

When a user's connection to an XML page is blocked, or a user asks for a nonexistent XML application, the application firewall sends an XML-based error response to the user's browser. You configure the error response by uploading an XML-based error page to the application firewall in the Imports Pane, on the XML Error Object tab. All XML error responses are hosted on the application firewall. You cannot configure a redirect URL for XML applications.

Note: You can use the same customization variables in an XML error object as in an HTML error object.

XML Schema

When the application firewall performs a validation check on a user's request for an XML or Web 2.0 application, it can validate the request against the XML schema or design type document (DTD) for that application and reject any request that does not follow the schema or DTD. Both an XML schema and a DTD are standard XML configuration files that describe the structure of a specific type of XML document.

WSDL

When the application firewall performs a validation check on a user's request for an XML SOAP-based web service, it can validate the request against the web services type definition (WSDL) file for that web service. A WSDL file is a standard XML SOAP configuration file that defines the elements of a specific XML SOAP web service.

Importing and Exporting Files

Oct 02, 2014

You can import HTML or XML error objects, XML schemas, DTDs, and WSDLs to the application firewall by using the configuration utility or the command line. You can edit any of these files in a web-based text area after importing them, to make small changes directly on the NetScaler ADC instead of having to make them on your computer and then reimport them. Finally, you can export any of these files to your computer, or delete any of these files, by using the configuration utility.

Note: You cannot delete or export an imported file by using the command line.

To import a file by using the command line interface

At the command prompt, type the following commands:

- import appfw htmlerrorpage <src> <name>
- save ns config

Example

The following example imports an HTML error object from a file named error.html and assigns it the name HTMLError.

```
import htmlerrorpage error.html HTMLError
save ns config
```

To import a file by using the configuration utility

Before you attempt to import an XML schema, DTD, or WSDL file, or an HTML or XML error object from a network location, verify that the NetScaler ADC can connect to the Internet or LAN computer where the file is located. Otherwise, you cannot import the file or object.

1. Navigate to Security > Application Firewall > Imports.
2. Navigate to Application Firewall > Imports.
3. In the Application Firewall Imports pane, select the tab for the type of file you want to import, and then click Add.
   The tabs are HTML Error Page, XML Error Page, XML Schema or WSDL. The upload process is identical on all four tabs from the user point of view.
4. Fill in the dialog fields.
   - **Name**—A name for the imported object.
   - **Import From**—Choose the location of the HTML file, XML file, XML schema or WSDL that you want to import in the drop-down list:
     - **URL:** A web URL on a website accessible to the ADC.
     - **File:** A file on a local or networked hard disk or other storage device.
     - **Text:** Type or paste the text of the custom response directly into a text field in the configuration utility.

     The third text box changes to the appropriate value. The three possible values are provided below.
   - **URL**—Type the URL into the text box.
   - **File**—Type the path and filename to the HTML file directly, or click Browse and browse to the HTML file.
   - **Text**—The third field is removed, leaving a blank space.
5. Click Continue. The File Contents dialog is displayed. If you chose URL or File, the File Contents text box contains the HTML file that you specified. If you chose Text, the File Contents text box is empty.

6. If you chose Text, type or copy and paste the custom response HTML that you want to import.
7. Click Done.
8. To delete an object, select the object, and then click Delete.

To export a file by using the configuration utility

Before you attempt to export an XML schema, DTD, or WSDL file, or an HTML or XML error object, verify that the application firewall appliance can access the computer where the file is to be saved. Otherwise, you cannot export the file.

1. Navigate to Security > Application Firewall > Imports.
2. In the Application Firewall Imports pane, select the tab for the type of file you want to export.
   The export process is identical on all four tabs from the user point of view.
3. Select the file that you want to export.
4. Click Export.
5. In the dialog box, choose Save File and click OK.
6. In the Browse dialog box, navigate to the local file system and directory where you want to save the exported file, and click Save.

To edit an HTML or XML Error Object in the configuration utility

You edit the text of HTML and XML error objects in the configuration utility without exporting and then reimporting them.

1. Navigate to Security > Application Firewall > Imports, and then select the tab for the type of file that you want to modify.
2. Navigate to Application Firewall > Imports, and then select the tab for the type of file that you want to modify.
3. Select the file that you want to modify, and then click Open.
   The text of the HTML or XML error object is displayed in a browser text area. You can modify the text by using the standard browser-based editing tools and methods for your browser.

   Note: The edit window is designed to allow you to make minor changes to your HTML or XML error object. To make extensive changes, you may prefer to export the error object to your local computer and use standard HTML or XML web page editing tools.
4. Click OK, and then click Close.

Global Configuration

Sep 12, 2013

The application firewall global configuration affects all profiles and policies. The Global Configuration items are:

- **Engine Settings.** A collection of global settings—session cookie name, session time-out, maximum session lifetime, logging header name, undefined profile, default profile, and import size limit—that pertain to all connections that the application firewall processes, rather than to a specific subset of connections.
- **Confidential Fields.** A set of form fields in web forms that contain sensitive information that should not be logged to the application firewall logs. Form fields such as password fields on a logon page or credit card information on a shopping cart checkout form are normally designated as confidential fields.
- **Field Types.** The list of web form field types used by the Field Formats security check. Each of these field types is defined by a PCRE-compliant regular expression that defines the type of data and the minimum/maximum length of data that should be allowed in that type of form field.
- **XML Content Types.** The list of content types recognized as XML and subjected to XML-specific security checks. Each of these content types is defined by a PCRE-compliant regular expression that defines the exact MIME type assigned to that content.
- **JSON Content Types.** The list of content types recognized as JSON and subjected to JSON-specific security checks. Each of these content types is defined by a PCRE-compliant regular expression that defines the exact MIME type assigned to that content.

Engine Settings

Oct 07, 2014

The engine settings affect all requests and responses that the application firewall processes. They include the following items:

- **Cookie name**—The name of the cookie that stores the NetScaler session ID.
- **Session timeout**—The maximum inactive period allowed. If a user session shows no activity for this length of time, the session is terminated and the user is required to reestablish it by visiting a designated start page.
- **Cookie post-encrypt prefix**—The string that precedes the encrypted portion of any encrypted cookies.
- **Maximum session lifetime**—The maximum amount of time, in seconds, that a session is allowed to remain live. After this period is reached, the session is terminated and the user is required to reestablish it by visiting a designated start page. This setting cannot be less then the session timeout. To disable this setting, so that there is no maximum session lifetime, set the value to zero (0).
- **Logging header name**—The name of the HTTP header that holds the Client IP, for logging.
- **Undefined profile**—The profile applied when the corresponding policy action evaluates as undefined.
- **Default profile**—The profile applied to connections that do not match a policy.
- **Import size limit**—The maximum cumulative total byte count of all files imported to the ADC, including signatures, WSDLs, schemas, HTML and XML error pages. During an import, if the size of the imported object would cause the cumulative total sizes of all imported files to exceed the configured limit, the import operation fails and the ADC displays the following error message: *ERROR: Import failed - exceeding the configured total size limit on the imported objects*.
- **Learn message rate limit**—The maximum number of requests and responses per second that the learning engine is to process. Any additional requests or responses over this limit are not sent to the learning engine.
-
- **Log malformed request**—Enable logging of malformed HTTP requests.
- **Use configurable secret key**—Use a configurable secret key for application firewall operations.
- **Manage learned data**—Remove all learned data from the application firewall. Restarts the learning process by collecting fresh data.
- **Signature auto-update settings**—Enable/disable automatic updating of the application firewall default signatures.
- **Signature auto-update URL**—Remove all learned data from the application firewall. Restarts the learning process by collecting fresh data.

Normally, the default values for the application firewall settings are correct. If the default settings cause a conflict with other servers or cause premature disconnection of your users, however, you might need to modify them.

To configure engine settings by using the command line interface

At the command prompt, type the following commands:

- set appfw settings [-sessionCookieName <name>] [-sessionTimeout <positiveInteger>] [-sessionLifetime <positiveInteger>] [-clientIPLoggingHeader <headerName>] [-undefaction <profileName>] [-defaultProfile <profileName>] [-importSizeLimit <positiveInteger>] [-logMalformedReq (ON | OFF)] [-signatureAutoUpdate (ON | OFF)] [-signatureUrl <expression>] [-cookiePostEncryptPrefix <string>] [-useConfigurableSecretKey (ON | OFF)] [-learnRateLimit <positiveInteger>]
- save ns config

Example

```
set appfw settings -sessionCookieName citrix-appfw-id -sessionTimeout 3600
-sessionLifetime 14400 -clientIPLoggingHeader NS-AppFW-Client-IP -undefaction APPFW_RESET
-defaultProfile APPFW_RESET -importSizeLimit 4096
save ns config
```

To configure engine settings by using the configuration utility

1. Navigate to Security > Application Firewall
2. In the details pane, click Change Engine Settings.
3. In the Application Firewall Engine Settings dialog box, set the following parameters:
   - Cookie Name
   - Session Timeout
   - Cookie Post Encrypt Prefix
   - Maximum Session Lifetime
   - Logging Header Name
   - Undefined Profile
   - Default Profile
   - Import Size Limit
   - Learn Messages Rate Limit
   -
   - Entity Decoding
   - Log Malformed Request
   - Use Configurable Secret Key
   - Manage Learned Data
   - Signatures Auto Update
   - Signatures Update URL
4. Click OK.

Confidential Fields

Jun 12, 2014

You can designate web-form fields as confidential to protect the information users type into them. Normally, any information a user types into a web form on one of your protected web servers is logged in the NetScaler logs. The information typed into a web-form field designated as confidential, however, is not logged. That information is saved only where the web site is configured to save such data, normally in a secure database.

Common types of information that you may want to protect with a confidential field designation include:

- Passwords
- Credit card numbers, validation codes, and expiration dates
- Social security numbers
- Tax ID numbers
- Home addresses
- Private telephone numbers

In addition to being good practice, proper use of confidential field designations may be necessary for PCI-DSS compliance on ecommerce servers, HIPAA compliance on servers that manage medical information in the United States, and compliance with other data protection standards.

Important: In the following two cases, the Confidential Field designation does not function as expected:
- If a Web form has either a confidential field or an action URL longer than 256 characters, the field or action URL is truncated in the NetScaler logs.
- With certain SSL transactions, the logs are truncated if either the confidential field or the action URL is longer than 127 characters.

In either of these cases, the application firewall masks a fifteen-character string with the letter "x," instead of the normal eight character string. To ensure that any confidential information is removed, the user must use form field name and action URL expressions that match the first 256, or (in cases where SSL is used) the first 127 characters.

To configure your application firewall to treat a web-form field on a protected web site as confidential, you add that field to the Confidential Fields list. You can enter the field name as a string, or you can enter a PCRE-compatible regular expression specifying one or more fields. You can enable the confidential-field designation when you add the field, or you can modify the designation later.

To add a confidential field by using the command line interface

At the command prompt, type the following commands:

- add appfw confidField <fieldName> <url> [-isRegex (REGEX | NOTREGEX)] [-comment "<string>"] [-state (ENABLED | DISABLED)]
- save ns config

Example

The following example adds all web form fields whose names begin with**Password** to the confidential fields list.

```
add appfw confidField Password "https?://www[.]example[.]com/[^<>]*[^a-z]password[0-9a-z._-]*[.](asp|cgi|htm|html|htp|js|php)" -isRegex REGEX -state ENABLED
save ns config
```

To modify a confidential field by using the command line interface

At the command prompt, type the following commands:

- set appfw confidField <fieldName> <url> [-isRegex (REGEX | NOTREGEX)] [-comment "<string>"] [-state (ENABLED | DISABLED)]
- save ns config

Example

The following example modifies the confidential field designation to add a comment.

```
set appfw confidField Password "https?://www[.]example[.]com/[^<>]*[^a-z]password[0-9a-z._-]*[.](asp|cgi|htm|html|htp|js|php)" -comment "Protect password fields." -isR
save ns config
```

To remove a confidential field by using the command line interface

At the command prompt, type the following commands:

- rm appfw confidField <fieldName> <url>
- save ns config

To configure a confidential field by using the configuration utility

1. Navigate to Security > Application Firewall.
2. In the details pane, under Settings, click Manage Confidential Fields.
3. In the Manage Confidential Fields dialog box, do one of the following:
   - To add a new form field to the list, click Add.
   - To change an existing confidential field designation, select the field, and then click Open.

   The Create Confidential Form Field dialog box or the Configure Confidential Form Field dialog box appears.
   Note: If you select an existing confidential field designation and then click Add, the Create Confidential Form Field dialog box displays the information for that confidential field. You can modify that information to create your new confidential field.
4. In the dialog box, fill out the elements. They are:
   - **Enabled check box.** Select or clear to enable/disable this confidential field designation.
   - **Is form field name a regular expression check box.** Select or clear to enable PCRE-format regular expressions in the form field name.
   - **Field Name.** Enter a literal string or PCRE-format regular expression that either represents a specific field name or that matches multiple fields with names that follow a pattern.
   - **Action URL.** Enter a literal URL or a regular expression that defines one or more URLs of the web page(s) on which the web form(s) that contains the confidential field are located.
   - **Comments.** Enter a comment. Optional.
5. Click Create or OK.
6. To remove a confidential field designation from the confidential fields list, select the confidential field listing you want to remove, then click Remove to remove it, and then click OK to confirm your choice.

7. When you have finished adding, modifying, and removing confidential field designations, click Close.

Examples

Following are some regular expressions that define form field names that you might find useful:

- ^passwd_ (Applies confidential-field status to all field names that begin with the "passwd_" string.)
- ^(([0-9a-zA-Z._-]*||\\x[0-9A-Fa-f][0-9A-Fa-f])+-)?passwd_ (Applies confidential-field status to all field names that begin with the string passwd_, or that contain the string -passwd_ after another string that might contain non-ASCII special characters.)

Following are some regular expressions that define specific URL types that you might find useful. Substitute your own web host(s) and domain(s) for those in the examples.

- If the web form appears on multiple web pages on the web host www.example.com, but all of those web pages are named logon.pl?, you could use the following regular expression:
  https?://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_.-]*/)*logon[.]pl\?
- If the web form appears on multiple web pages on the web host www.example-español.com, which contains the n-tilde (ñ) special character, you could use the following regular expression, which represents the n-tilde special character as an encoded UTF-8 string containing C3 B1, the hexadecimal code assigned to that character in the UTF-8 charset:
  https?://www[.]example-espa\xC3\xB1ol[.]com/([0-9A-Za-z][0-9A-Za-z_.-]*/)* logon[.]pl\?
- If the web form containing query.pl appears on multiple web pages on different hosts within the example.com domain, you could use the following regular expression:
  https?://([0-9A-Za-z][0-9A-Za-z_-.]*[.])*example[.]com/([0-9A-Za-z][0-9A-Za-z_-.]*/)*logon[.]pl\?
- If the web form containing query.pl appears on multiple web pages on different hosts in different domains, you could use the following regular expression:
  https?://([0-9A-Za-z][0-9A-Za-z_-.]*[.])*[0-9A-Za-z][0-9A-Za-z_-.]+[.][a-z]{2,6}/([0-9A-Za-z][0-9A-Za-z_-.]*/)*logon[.]pl\?
- If the web form appears on multiple web pages on the web host www.example.com, but all of those web pages are named logon.pl?, you could use the following regular expression:
  https?://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-.]*/)*logon[.]pl\?

Field Types

Jun 12, 2014

A field type is a PCRE-format regular expression that defines a particular data format and minimum/maximum data lengths for a form field in a web form. Field types are used in the Field Formats check.

The application firewall comes with several default field types, which are:

- integer. A string of any length consisting of numbers only, without a decimal point, and with an optional preceding minus sign (-).
- alpha. A string of any length consisting of letters only.
- alphanum. A string of any length consisting of letters and/or numbers.
- nohtml. A string of any length consisting of characters, including punctuation and spaces, that does not contain HTML symbols or queries.
- any. Anything at all.
  Important: Assigning the any field type as the default field type, or to a field, allows active scripts, SQL commands, and other possibly dangerous content to be sent to your protected web sites and applications in that form field. You should use the any type sparingly, if you use it at all.

You can also add your own field types to the Field Types list. For example, you might want to add a field type for a social security number, postal code, or phone number in your country. You might also want to add a field type for a customer identification number or store credit card number.

To add a field type to the Field Types list, you enter the field name as a literal string or PCRE-format regular expression.

To add a field type by using the command line interface

At the command prompt, type the following commands:

- add appfw fieldType <name> <regex> <priority> [-comment "<string>"]
- save ns config

Example

The following example adds a field type named SSN that matches US Social Security numbers to the Field Types list, and sets its priority to 1.

```
add appfw fieldType SSN "^[1-9][0-9]{2,2}-[0-9}{2,2}-[0-9]{4,4}$" 1
save ns config
```

To modify a field type by using the command line interface

At the command prompt, type the following commands:

- set appfw fieldType <name> <regex> <priority> [-comment "<string>"]
- save ns config

Example

The following example modifies the field type to add a comment.

```
set appfw fieldType SSN "^[1-9][0-9]{2,2}-[0-9}{2,2}-[0-9]{4,4}$" 1 -comment "US Social Security Number"
```

save ns config

To remove a field type by using the command line interface

At the command prompt, type the following commands:

- rm appfw fieldType <name>
- save ns config

To configure a field type by using the configuration utility

1. Navigate to Security > Application Firewall.
2. In the details pane, under Settings, click Manage Field Types.
3. In the Manage Field Types dialog box, do one of the following:
   - To add a new field type to the list, click Add.
   - To change an existing field type, select the field type, and then click Open.

   The Create Field Type dialog box or the Configure Field Type dialog box appears.
   Note: If you select an existing field type designation and then click Add, the dialog box displays the information for that field type. You can modify that information to create your new field type.
4. In the dialog box, fill out the elements. They are:
   - Name
   - Regular Expression
   - Priority
   - Comment
5. Click Create or OK.
6. To remove a field type from the Field Types list, select the field type listing you want to remove, then click Remove to remove it, and then click OK to confirm your choice.
7. When you have finished adding, modifying, and removing field types, click Close.

Examples

Following are some regular expressions for field types that you might find useful:

- ^[1-9][0-9]{2,2}-[0-9}{2,2}-[0-9]{4,4}$ U.S. Social Security numbers
- ^[A-C][0-9]{7,7}$ California driver's license numbers.
- ^+[0-9]{1,3} [0-9() -]{1,40}$ International phone numbers with country codes.
- ^[0-9]{5,5}-[0-9]{4,4}$ U.S. ZIP code numbers.
- ^[0-9A-Za-z][0-9A-Za-z.+_-]{0,25}@([0-9A-Za-z][0-9A-Za-z_-]*[.]){1,4}[A-Za-z]{2,6}$ Email addresses.

XML Content Types

Jun 12, 2014

By default, the application firewall treats files that follow certain naming conventions as XML. You can configure the application firewall to examine web content for additional strings or patterns that indicate that those files are XML files. This can ensure that the application firewall recognizes all XML content on your site, even if certain XML content does not follow normal XML naming conventions, ensuring that XML content is subjected to XML security checks.

To configure the XML content types, you add the appropriate patterns to the XML Content Types list. You can enter a content type as a string, or you can enter a PCRE-compatible regular expression specifying one or more strings. You can also modify the existing XML content types patterns.

To add an XML content type pattern by using the command line interface

At the command prompt, type the following commands:

- add appfw XMLContentType <XMLContenttypevalue> [-isRegex (REGEX | NOTREGEX)]
- save ns config

Example

The following example adds the pattern .*/xml to the XML Content Types list and designates it as a regular expression.

```
add appfw XMLContentType ".*/xml" -isRegex REGEX
```

To remove an XML content type pattern by using the command line interface

At the command prompt, type the following commands:

- rm appfw XMLContentType <XMLContenttypevalue>
- save ns config

To configure the XML content type list by using the configuration utility

1. Navigate to Security > Application Firewall.
2. In the details pane, under Settings, click Manage XML Content Types.
3. In the Manage XML Content Types dialog box, do one of the following:
   - To add a new XML content type, click Add.
   - To modify an existing XML content type, select that type and then click Open.

   The Create XML Content Type or Configure XML Content Type dialog box appears.

   Note: If you select an existing XML content type pattern and then click Add, the dialog box displays the information for that XML content type pattern. You can modify that information to create your new XML content type pattern.
4. In the dialog box, fill out the elements. They are:
   - **Is XML content type a regular expression check box.** Select or clear to enable PCRE-format regular expressions in the form field name.
   - **XML Content Type** Enter a literal string or PCRE-format regular expression that matches the XML content type pattern that you want to add.
5. Click Create.
6. To remove an XML content type pattern from the list, select it, then click Remove to remove it, and then click OK to confirm your choice.

7. When you have finished adding and removing XML content type patterns, click Close.

JSON Content Types

Jun 12, 2014

By default, the application firewall treats files with the content type "application/json" as JSON files.The default setting enables the application firewall to recognize JSON content in requests and responses, and to handle that content appropriately.

You can configure the application firewall to examine web content for additional strings or patterns that indicate that those files are JSON files. This can ensure that the application firewall recognizes all JSON content on your site, even if certain JSON content does not follow normal JSON naming conventions, ensuring that JSON content is subjected to JSON security checks.

To configure the JSON content types, you add the appropriate patterns to the JSON Content Types list. You can enter a content type as a string, or you can enter a PCRE-compatible regular expression specifying one or more strings. You can also modify the existing JSON content types patterns.

To add a JSON content type pattern by using the command line interface

At the command prompt, type the following commands:

- add appfw JSONContentType <JSONContenttypevalue> [-isRegex (REGEX | NOTREGEX)]
- save ns config

Example

The following example adds the pattern .*/json to the JSON Content Types list and designates it as a regular expression.

```
add appfw JSONContentType ".*/json" -isRegex REGEX
```

To configure the JSON content type list by using the configuration utility

1. Navigate to Security > Application Firewall.
2. In the details pane, under Settings, click Manage JSON Content Types.
3. In the Manage JSON Content Types dialog box, do one of the following:
   - To add a new JSON content type, click Add.
   - To modify an existing JSON content type, select that type and then click Open.

   The Create JSON Content Type or Configure JSON Content Type dialog box appears.
   Note: If you select an existing JSON content type pattern and then click Add, the dialog box displays the information for that JSON content type pattern. You can modify that information to create your new JSON content type pattern.
4. In the dialog box, fill out the elements. They are:
   - **Is JSON content type a regular expression check box.** Select or clear to enable PCRE-format regular expressions in the form field name.
   - **JSON Content Type** Enter a literal string or PCRE-format regular expression that matches the JSON content type pattern that you want to add.
5. Click Create or OK.
6. To remove a JSON content type pattern from the list, select it, then click Remove to remove it, and then click OK to confirm your choice.
7. When you have finished adding and removing XML content type patterns, click Close.

Logs, Statistics, and Reports

Sep 03, 2013

The information maintained in the logs and statistics, and displayed in the reports, provides important guidance for configuring and maintaining the application firewall.

The Application Firewall Logs

The logs provide information about the requests and responses that the application firewall has observed while protecting your web sites and applications. Most important, it logs each connection that matches a signature or a security check. You can observe the logs to determine which connections are matching a signature or security check. You can then use this information, along with your own knowledge about your protected web sites and applications, to determine whether the connections that each signature or check is matching are valid (false positives). If they are, you can either remove the signature or check from your configuration, or take appropriate measures to mitigate the false positives before you enable blocking for that signature or security check.

NetScaler Format Logs

When configured to use NetScaler format logs, the application firewall produces logs that follow the same format as other NetScaler features. Each log contains the following fields:

- **Timestamp.** The date and time when the connection occurred.
- **Severity.** The severity level of the log.
- **Module.** The NetScaler module that generated the log entry.
- **Event Type.** The type of event, such as signature violation or security check violation.
- **Event ID.** The ID assigned to the event.
- **Client IP.** The IP address of the user whose connection was logged.
- **Transaction ID**. The ID assigned to the transaction that caused the log.
- **Session ID.** The ID assigned to the user session that caused the log.
- **Message.** The log message. Contains information identifying the signature or security check that triggered the log entry.

You can search on any of these fields, or any combination of information from different fields, to select logs to display, limited only by the capabilities of the tools you use to view the logs. You can observe the signatures by using the application firewall wizard to access the NetScaler syslog viewer, or manually by logging onto the NetScaler appliance or NetScaler virtual appliance.

Viewing the Application Firewall Logs

You can view the logs by using the syslog viewer, or by logging onto the NetScaler appliance, opening a Unix shell, and using the Unix text editor of your choice.

- **Viewing by using the syslog viewer.** You invoke the syslog viewer from one of two locations: the Select Signature Actions page or the Select Advanced Actions page in the Application Firewall Wizard. To invoke the syslog viewer for a signature, in the Select Signature Actions pane click the logs link to the right of that signature. To invoke the syslog viewer for a security check, in the Select Advanced Actions page, security checks list, select that security check, and then beneath the list click the Logs button. Either procedure causes the configuration utility to download the current `ns.log` file and then display the entries that are relevant to that signature or security check.

The syslog viewer contains the following elements:

- *Module list box.* The NetScaler module whose logs you want to view. Always set to APPFW for application firewall logs.
- *Event Type list box.* The type of event. For signatures, this is always APPFW_SIGNATURE_MATCH. For security checks, this is the specific security check that you selected.
- *Severity.* It lets you specify only logs of a specific severity level. Leave blank to see all logs.
- *Find Now button.* Search the nslog.file, using the current criteria, and display the logs that match.
- *Clear button.* Resets your settings to the defaults.
- *Logs display window.* Displays the logs that meet the current criteria. Log information is displayed in several columns that correspond to the log fields for the log format that the application firewall is currently configured to maintain, with an additional column, Deploy, to the extreme left. You can sort the display by clicking a column heading. You can create and implement a relaxation for a signature or security check that is blocking legitimate use of a protected web site or web service by selecting a log that shows the unwanted blocking, and then clicking Deploy.
- *Log directory.* The directory where the logs are stored. If you have archived logs stored in a different directory and want to view those, you can click Browse and browse to that directory to display those logs in the Log files list.
- *Log files list.* A list of the log files in the Log directory. To download and uncompress an archived log file, select the file, and then click Download. To refresh the display, click Refresh.
- *Search in list box.* Searches in a particular section of logs when selecting logs to display in the Logs display window. To search something other than the log message, select a different choice.
- *Search string.* Search for the specified string or regular expression to choose the logs to display in the Logs display window. This field is filled out by the application firewall wizard for you with the appropriate value to display the logs relevant to the signature or security check that you selected. You can modify the string to choose logs based on different criteria.
- *Case Sensitive check box.* Select if the Search string is case sensitive.
- *Regular Expression check box.* Select if the Search string is a regular expression.
- *Clear button.* Resets the syslog viewer to its default settings.
- *Go button.* Uses the new search criteria to search the ns.log file and displays the results in the Logs display window.

For more information about the Application Firewall Wizard, see "The Application Firewall Wizard."

- **Viewing from the command line.** Log onto the application firewall appliance, and then type the following command at the NetScaler command prompt:

  shell

  After the Unix shell is displayed, type the following command to navigate to the directory where the logs are stored:

  cd /var/log

  You can use the vi editor, or any Unix text editor or text search tool of your choice to view and filter the logs for specific entries.

  Note: If the text editor or text search tool is not installed by default on the NetScaler appliance, you must first install it before you can use it to view and filter the logs.

The Application Firewall Statistics

When you enable the statistics action for application firewall signatures or security checks, the application firewall maintains information about connections that match that signature or security check. You can view the accumulated statistics information on the Monitoring tab of the main logon page of your application firewall appliance by selecting one of the following choices in the Select Group list box:

- **Application Firewall.** A summary of all statistics information gathered by your application firewall appliance for all profiles.
- **Application Firewall (per profile).** The same information, but displayed per-profile rather than summarized.

You can use this information to monitor how your application firewall is operating and determine whether there is any abnormal activity or abnormal amounts of hits on a signature or security check. If you see such a pattern of abnormal activity, you can check the logs for that signature or security check, to diagnose the issue, and then take corrective action.

The Application Firewall Reports

The application firewall reports provide information about your application firewall configuration and how it is handling traffic for your protected web sites.

The PCI DSS Report

The Payment Card Industry (PCI) Data Security Standard (DSS), version 1.2, consists of twelve security criteria that most credit card companies require businesses who accept online payments via credit and debit cards to meet. These criteria are designed to prevent identity theft, hacking, and other types of fraud. If an internet service provider or online merchant does not meet the PCI DSS criteria, that ISP or merchant risks losing authorization to accept credit card payments through its web site.

ISPs and online merchants prove that they are in compliance with PCI DSS by having an audit conducted by a PCI DSS Qualified Security Assessor (QSA) Company. The PCI DSS report is designed to assist them both before and during the audit. Before the audit, it shows which application firewall settings are relevant to PCI DSS, how they should be configured, and (most important) whether your current application firewall configuration meets the standard. During the audit, the report can be used to demonstrate compliance with relevant PCI DSS criteria.

The PCI DSS report consists of a list of those criteria that are relevant to your application firewall configuration. Under each criterion, it lists your current configuration options, indicates whether your current configuration complies with the PCI DSS criterion, and explains how to configure the application firewall so that your protected web site(s) will be in compliance with that criterion.

The PCI DSS report is located under System > Reports. To generate the report as an Adobe PDF file, click Generate PCI DSS Report. Depending on your browser settings, the report is displayed in the pop-up window or you are prompted to save it to your hard disk.

Note: To view this and other reports, you must have the Adobe Reader program installed on your computer.
The PCI DSS report consists of the following sections:

- **Description.** A description of the PCI DSS Compliance Summary report.
- **Firewall License and Feature Status.** Tells you whether the application firewall is licensed and enabled on your NetScaler appliance.
- **Executive Summary.** A table that lists the PCI DSS criteria and tells you which of those criteria are relevant to the application firewall.
- **Detailed PCI DSS Criteria Information.** For each PCI DSS criterion that is relevant to your application firewall configuration, the PCI DSS report provides a section that contains information about whether your configuration is currently in compliance and, if it is not, how to bring it into compliance.

- **Configuration.** Data for individual profiles, which you access either by clicking Application Firewall Configuration at the top of the report, or directly from the Reports pane. The Application Firewall Configuration report is the same as the PCI DSS report, with the PCI DSS-specific summary omitted, and is described below.

The Application Firewall Configuration Report

The Application Firewall Configuration report is located under System > Reports. To display it, click Generate Application Firewall Configuration Report. Depending on your browser settings, the report is displayed in the pop-up window or you are prompted to save it to your hard disk.

The Application Firewall Configuration report starts with a Summary page, which consists of the following sections:

- **Application Firewall Policies.** A table that lists your current application firewall policies, showing the policy name, the content of the policy, the action (or profile) it is associated with, and global binding information.
- **Application Firewall Profiles.** A table that lists your current application firewall profiles and indicates which policy each profile is associated with. If a profile is not associated with a policy, the table displays INACTIVE in that location.

To download all report pages for all policies, at the top of the Profiles Summary page click Download All Profiles. You display the report page for each individual profile by selecting that profile in the table at the bottom of the screen. The Profile page for an individual profile shows whether each check action is enabled or disabled for each check, and the other configuration settings for the check.

To download a PDF file containing the PCI DSS report page for the current profile, click Download Current Profile at the top of the page. To return to the Profiles Summary page, click Application Firewall Profiles. To go back to the main page, click Home. You can refresh the PCI DSS report at any time by clicking Refresh in the upper right corner of the browser. You should refresh the report if you make changes to your configuration.

Configuring the Application Firewall Logs

Sep 03, 2013

You can configure the application firewall logs by using the configuration utility or the NetScaler command line. You can configure the application firewall to produce logs in either native NetScaler format, or in Common Event Format (CEF).

To configure the Application Firewall logs by using the command line interface

At the command prompt, type the following commands:

- set appfw settings -CEFLogging (**ON** | **OFF**)
- save ns config

Example

The following example configures the application firewall to use CEF logs.

```
set appfw settings -CEFLogging ON
save ns config
```

The following example disables CEF logs and returns the application firewall configuration to using native NetScaler format logs.

```
set appfw settings -CEFLogging OFF
save ns config
```

Appendices

Sep 30, 2013

The following supplemental material provides additional detail about complex or peripheral application firewall tasks.

PCRE Character Encoding Format

Mar 28, 2012

The NetScaler operating system supports direct entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your application firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular expression.

A number of character types require encoding using a PCRE regular expression if you include them in your application firewall configuration as a URL, form field name, or Safe Object expression. They include:

- **Upper-ASCII characters.** Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.
- **Double-Byte characters.** Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.
- **ASCII control characters.** Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters should never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The NetScaler appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, “English US,” the application firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set. This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.
- **Chinese Traditional (Big5).** The application firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.
- **Chinese Simplified (GB2312).** The application firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
- **Japanese (SJIS).** The application firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.
- **Japanese (EUC-JP).** The application firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.
- **Korean (EUC-KR).** The application firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.
- **Turkish (ISO-8859-9).** The application firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.

- **Unicode (UTF-8).** The application firewall supports certain additional characters in the UTF-8 character set, including those used in modern Russian.

When configuring the application firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which are assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8 character set. For example, the exclamation point (!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the application firewall configuration is "\xNN" for ASCII characters; "\xNN\xNN" for non-ASCII characters used in English, Russian, and Turkish; and "\xNN\xNN\xNN" for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in an application firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

Note: Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character's UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as \x20 to avoid confusing certain browsers and web server software.
Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the application firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

  Actual URL: `http://www.josénuñez.com`

  Encoded URL: `^http://www[.]jos\xC3\xA9nu\xC3\xB1ez[.]com$`

- Another URL containing extended ASCII characters.

  Actual URL: `http://www.example.de/trömso.html`

  Encoded URL: `^http://www[.]example[.]de/tr\xC3\xB6mso[.]html$`

- A form field name containing extended ASCII characters.

  Actual Name: `nome_do_usuário`

  Encoded Name: `^nome_do_usu\xC3\xA1rio$`

- A safe object expression containing extended ASCII characters.

  Unencoded Expression `[A-Z]{3,6}¥[1-9][0-9]{6,6}`

  Encoded Expression: `[A-Z]{3,6}\xC2\xA5[1-9][0-9]{6,6}`

You can find a number of tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful web site that contains this information is located at the following URL:

`http://www.utf8-chartable.de/unicode-utf8-table.pl`

For the characters in the table on this web site to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of web pages will be correct.

Whitehat WASC Signature Types for WAF Use

May 02, 2013

The Citrix NetScaler Application Firewall accepts and generates blocking rules for all vulnerability types that the Whitehat scanners generate. However, certain vulnerabilities are most applicable to a web application firewall. Following are lists of those vulnerabilities, categorized by whether they are addressed by WASC 1.0, WASC 2.0, or best practices signature types.

WASC 1.0 Signature Types

- HTTP Request Smuggling
- HTTP Response Splitting
- HTTP Response Smuggling
- Null Byte Injection
- Remote File Inclusion
- URL Redirector Abuse

WASC 2.0 Signature Types

- Abuse of Functionality
- Brute Force
- Content Spoofing
- Denial of Service
- Directory Indexing
- Information Leakage
- Insufficient Anti-automation
- Insufficient Authentication
- Insufficient Authorization
- Insufficient Session Expiration
- LDAP Injection
- Session Fixation

Best Practices

- Autocomplete Attribute
- Insufficient Cookie Access Control
- Insufficient Password Strength
- Invalid HTTP Method Usage
- Non-HttpOnly Session Cookie
- Persistent Session Cookie
- Personally Identifiable Information
- Secured Cachable HTTP Messages
- Unsecured Session Cookie

Content Filtering

Sep 03, 2013

Content filtering can do some of the same tasks as the Citrix NetScaler Application Firewall, and is a less CPU-intensive tool. It is limited, however, to examining the header portion of the HTTP request or response and to performing a few simple actions on connections that match. If you have a complex Web site that makes extensive use of scripts and accesses back-end databases, the Application Firewall may be the better tool for protecting that Web site. For more information about the Citrix NetScaler Application Firewall, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX132360.

Content filtering is based on regular expressions that you can apply to either HTTP requests or HTTP responses. To block requests from a particular site, for example, you could use an expression that compares each request's URL to the URL specified in the expression. The expression is part of a policy, which also specifies an action to be performed on requests or responses that match the expression. For example, an action might drop a request or reset the connection.

Following are some examples of things you can do with content filtering policies:

- Prevent users from accessing certain parts of your Web sites unless they are connecting from authorized locations.
- Prevent inappropriate HTTP headers from being sent to your Web server, possibly breaching security.
- Redirect specified requests to a different server or service.

To configure content filtering, once you have made sure that the feature is enabled, you configure filtering actions for your servers to perform on selected connections (unless the predefined actions are adequate for your purposes). Then you can configure policies to apply the actions to selected connections. Your policies can use predefined expressions, or you can create your own. To activate the policies you configured, you bind them either globally or to specific virtual servers.

To configure content filtering, do the following:

1. Enabling Content Filtering
2. Configuring a Content Filtering Action
3. Configuring a Content Filtering Policy
4. Binding a Content Filtering Policy

Enabling Content Filtering

Jul 22, 2015

By default, content filtering is enabled on NetScaler appliances running the NetScaler operating system 8.0 or above. If you are upgrading an existing appliance from an operating system version earlier than 8.0, you must update the licenses before you can use content filtering, and you may need to enable the content filtering feature itself manually.

At the command prompt, type the following commands to enable content filtering and verify the configuration:

- enable ns feature ContentFiltering
- show ns feature

Example

```
> enable ns feature ContentFiltering
 Done
> show ns feature

      Feature                Acronym          Status
      -------                -------          ------
 1)    Web Logging              WL               ON
 2)    Surge Protection          SP               OFF
 .
 .
 .
 .
 11)   Http DoS Protection       HDOSP            OFF
 12)   Content Filtering         CF               ON
 .
 .
 23)   HTML Injection            HTMLInjection    ON
 24)   NetScaler Push            push             OFF
Done
```

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Configure basic features in the Modes and Features section.
3. In the Configure Basic Features dialog box, select the Content Filter check box, and then click OK.

Configuring a Content Filtering Action

Jul 22, 2015

After you enable the content filtering feature, you create one or more actions to tell your NetScaler appliance how to handle the connections it receives.

Content filtering supports the following actions for HTTP requests:

Add

Adds the specified HTTP header before sending the request to the Web server.

Reset

Terminates the connection, sending the appropriate termination notice to the user's browser.

Forward

Redirects the request to the designated service.

Drop

Silently deletes the request, without sending a response to the user's browser.

Corrupt

Modifies the designated HTTP header in a manner that prevents it from performing the function it was intended to perform, then sends the request to the server.

Content filtering supports the following actions for HTTP responses:

Add

Adds the specified HTTP header before sending the response to the user's browser.

ErrorCode

Returns the designated HTTP error code to the user's browser.

Corrupt

Modifies the designated HTTP header in a manner that prevents it from performing the function it was intended to perform, then sends the response to the user's browser.

At the command prompt, type the following commands to configure a Content Filtering action and verify the configuration:

- add filter action <name> <qualifier> [<serviceName>] [<value>] [<respCode>] [<page>]
- show filter action <name>

Example

```
> add filter action act_drop Drop
 Done
> show filter action act_drop
1)     Name: act_drop   Filter Type: drop
 Done
```

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, do one of the following:
   - To create a new action, in the Actions tab, click Add.

- To modify an existing action, select the action, and then click Open.

3. In the **Create** Filter Action or Configure Filter Action dialog box, specify values for the parameters:
   - Action Name*—name
   - Qualifier*—qualifier (Determines which of the following parameters you can configure)

     Reset

     Add (HeaderName:Value)

     Corrupt (Header Name)

     Forward (Service Name)

     ErrorCode (Response Code and corresponding Response page)

     Drop

   4. Fill in any other required information. For example, if you are configuring an action to send an HTTP error code, you must choose the appropriate error code from a drop-down list. If necessary, you can then modify the text of the error message, which is displayed beneath the drop-down list.

   Click Create or OK, and then click Close. The Actions list displays the action you configured, and a message in the status bar indicates that your action has been created.

Configuring a Content Filtering Policy

Jul 22, 2015

To implement content filtering, you must configure at least one policy to tell your NetScaler appliance how to distinguish the connections you want to filter. You must first have configured at least one filtering action, because when you configure a policy, you associate it with an action.

Content filtering policies examine a combination of one or more of the following elements to select requests or responses for filtering:

URL

The URL in the HTTP request.

URL query

Only the query portion of the URL, which is the portion after the query (?) symbol.

URL token

Only the tokens in the URL, if any, which are the parts that begin with an ampersand (&) and consist of the token name, followed by an equals sign (=), followed by the token value.

HTTP method

The HTTP method used in the request, which is usually GET or POST, but can be any of the eight defined HTTP methods.

HTTP version

The HTTP version in the request, which is usually HTTP 1.1.

Standard HTTP header

Any of the standard HTTP headers defined in the HTTP 1.1 specification.

Standard HTTP header value

The value portion of the HTTP header, which is the portion after the colon and space (:).

Custom HTTP header

A non-standard HTTP header issued by your Web site or that appears in a user request.

Custom header value

The value portion of the custom HTTP header, which (as with the standard HTTP header) is the portion after the colon and space (:).

Client Source IP

The IP from which the client request was sent.

Content filtering policies use the simpler of two NetScaler expressions languages, called classic expressions. For a complete description of classic expressions, how they work, and how to configure them manually, see "Policies and Expressions."

Note: Users who are not experienced in configuring policies at the NetScaler command line will usually find using the configuration utility considerably easier.

At the command prompt, type the following commands to configure a content filtering policy and verify the configuration:

- add filter policy <name> -rule <expression> (-reqAction <action> | -resAction <string>
- show filter policy <name>

Example

```
> add filter policy cf-pol -rule "REQ.HTTP.URL CONTAINS http://abc.com" -reqaction DROP
 Done
> show filter policy cf-pol
1)     Name: cf-pol    Rule: REQ.HTTP.URL CONTAINS http://abc.com
       Request action: DROP
       Response action:
       Hits: 0
 Done
```

1. Navigate to Security > Protection Features > Filter.
2. Select the **Policies** tab.
3. In the details pane, to create a new policy, click **Add**.
4. If you are creating a new policy, in the Create Filter Policy dialog box, in the ***Filter Name** text box, type a name for your new policy.
5. Select either **Request Action** or **Response Action** to activate the drop-down list to the right of that item.
6. Click the down arrow to the right of the drop-down list and select the action to be performed on the request or response. The default choices are **RESET** and **DROP**. Any other actions you have created will also appear in this list.
   Note: You can also click New to create a new Content Filtering action, or Modify to modify an existing Content Filtering action. You can only modify actions you created; the default actions are read-only.
7. If you want to use a predefined expression (or named expression) to define your policy, choose one from the Named Expressions list.
   1. Click the down arrow to the right of the first **Named Expressions** drop-down list, and choose the category of named expressions that contains the named expression you want to use.
   2. Click the down arrow to the right of the second Named Expressions drop-down list, and choose the named expression you want. As you choose a named expression, the regular expression definition of that named expression appears in the **Preview Expression** pane beneath the **Named Expression** list boxes.
   3. Click Add Expression to add that named expression to the Expression list.

   Note: You should perform either this step or step 7, but not both.
8. If you want to create a new expression to define your policy, use the Expression Editor.
   1. Click the **Add** button. The Add Expression dialog box appears.
   2. In the Add Expression dialog box, choose the type of connection you want to filter. The Flow Type is set to **REQ** by default, which tells the NetScaler appliance to look at incoming connections, or requests. If you want to filter outgoing connections (responses), you click the right arrow beside the drop-down list and choose **RES**.
   3. If the Protocol is not already set to **HTTP**, click the down arrow to the right of the Protocol drop-down list and choose HTTP.
      Note: In the NetScaler classic expressions language, “HTTP” includes HTTPS requests, as well.
   4. Click the down arrow to the right of the Qualifier drop-down list, and then choose a qualifier for your expression. Your choices are:
      METHOD

      The HTTP method used in the request.
      URL

The contents of the URL header.

URLTOKENS

The URL tokens in the HTTP header.

VERSION

The HTTP version of the connection.

HEADER

The header portion of the HTTP request.

URLLEN

The length of the contents of the URL header.

URLQUERY

The query portion of the contents of the URL header.

URLQUERYLEN

The length of the query portion of the URL header.

The contents of the remaining list boxes change to the choices appropriate to the Qualifier you pick. For example, if you choose HEADER, a text field labeled Header Name* appears below the Flow Type list box.

5. Click the down arrow to the right of the Operator drop-down list, and choose an operator for your expression. Your choices will vary depending on the Protocol you chose in the preceding step. The following list includes all of the operators:

   ==

   Matches the following text string exactly.

   !=

   Does not exactly match the following text string.

   >

   Is greater than the following integer.

   CONTAINS

   Contains the following text string.

   CONTENTS

   The contents of the designated header, URL, or URL query.

   EXISTS

   The specified header or query exists.

   NOTCONTAINS

   Does not contain the following text string.

   NOTEXISTS

   The specified header or query does not exist.

6. If the Value text box is visible, type the appropriate string or number. If you are testing a string in any way, type the string into the Value text box. If you are testing an integer in any way, type the integer into the Value text box.
7. If you chose HEADER as the Protocol, type the header you want in the **Header Name*** text box.
8. Click OK to add your expression to the Expressions list.

9. Repeat steps B through H to create any additional expressions you want for your profile.
10. Click Close to close the Expressions Editor.

9. If you created a new expression, in the Expression frame select an option from the Match Any Expression drop-down list. Your choices are:
   - **Match Any Expression.** If a request matches any expression in the Expressions list, the request matches this policy.
   - **Match All Expressions.** If a request matches all expressions in the Expressions list, the request matches this policy. If it does not matchall of them, it does not match this policy.
   - **Tabular Expressions.** Switches the Expressions list to a tabular format with three columns. In the first column you can place a BEGIN [(] operator. The second column contains the expressions you have selected or created. In the third column, you can place any of the other operators in the following list, to create complex policy groups in which each group can be configured for match any expression or match all expressions.
   - **Advanced Free-form.** Advanced Free-Form Switches off the Expressions Editor entirely and modifies the Expressions list into a text area.

     Note: Content Filter uses classic policy infrastructure. RegEx expressions are not valid in classic policies.

     The **AND** [&&] operator tells the appliance to require that are quest match both the current expression and the following expression.

     The **OR** [||] operator tells the appliance to require that arequest match either the current expression or the following expression, or both. Only if the request does not match either expression does it not match the policy.

     The **END** [)] operator tells the appliance that this is the last expression in this expression group or policy.

     Note: The Tabular format allows you to create a complex policy that contains both “Match Any Expression” and “Match All Expressions” on a per-expression basis. You are not limited to just one or the other.

10. Repeat steps 6 through 8 to add any additional expressions you want to the Expressions list. You can mix named expressions and expressions created in the Expressions Editor. To the NetScaler appliance, they are all the same.
11. Click **Create** to create your new policy. Your new policy appears in the Policies pane list.
12. Click Close. To create additional Content Filtering policies, repeat the previous procedure. To remove a Content Filtering policy, select the policy in the Policies tab and click Remove.

Binding a Content Filtering Policy

Oct 31, 2013

You must bind each content filtering policy to put it into effect. You can bind policies globally or to a particular virtual server. Globally bound policies are evaluated each time traffic directed to any virtual server matches the policy. Policies bound to a specific vserver are evaluated only when that vserver receives traffic that matches the policy.

At the command prompt, type the following commands to bind a policy to a virtual server and verify the configuration:

- bind lb vserver <name>@ -policyName <string> -priority <positive_integer>
- show lb vserver <name>

Example

```
> bind lb vserver vs-loadbal -policyName policyTwo -priority 100
 Done
> show lb vserver vs-loadbal
1)      vs-loadbal (10.102.29.20:80) - HTTP      Type: ADDRESS
        State: OUT OF SERVICE
        Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)
        Time since last state change: 2 days, 00:58:03.260
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

 Done
```

At the command prompt, type the following commands to globally bind a policy and verify the configuration:

- bind filter global (<policyName> [-priority <positive_integer>]) [-state (ENABLED | DISABLED)]
- show filter global

Example

```
bind filter global cf-pol -priority 1
Done show filter global
```

1) Policy Name: cf-pol Priority: 1
Done

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select the virtual server to which you want to bind the content filtering policy from the list, and click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab, and then select the check box in the Active column of the filter policy that you want to bind to the virtual server.
4. Click OK. The policies you have bound display a check mark and the word Yes in the Policies Bound column of the Policies tab.

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, in the Policies tab, select the policy that you want to bind, and then click Global Bindings.
3. In the Bind/Unbind Filter Policies dialog box, in the Policy Name drop-down list, select a policy, and then click Add. The policy is added to the Configured list.
   Note: To select multiple policies from the list, press and hold the Ctrl key, then click each policy you want.
4. Click OK, and then click Close. The policies you have bound display a check mark and the word Yes in the Globally Bound column of the Policies tab.

Configuring Content Filtering for a Commonly Used Deployment Scenario

Oct 31, 2013

This example provides instructions for using the configuration utility to implement a content filtering policy in which, if a requested URL contains root.exe or cmd.exe, the content filtering policy filter-CF-nimda is evaluated and the connection is reset.

To configure this content filtering policy, you must do the following:

- Enable content filtering
- Configure content filtering policy
- Bind content filtering policy globally or to a virtual server
- Verify the configuration

Note: Since this example uses a default content filtering action, you do not need to create a separate content filtering action.

1. In the navigation pane, expand System, and click Settings.
2. In the details pane, under Modes & Features, click Change Basic Features.
3. In the Configure Basic Features dialog box, select the Content Filtering check box, and then click OK.
4. In the Enable/Disable feature(s) dialog box, click Yes. A message appears in the status bar, stating that the selected feature is enabled.

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, click Add. The Create Filter Policy dialog box appears.
3. In the Create Filter Policy dialog box, in the Filter Name text box, type the name filter-CF-nimda.
4. Select the Request Action option, and in the drop-down list, select RESET.
5. In the Expression frame, select Match Any Expression from the drop-down list, and then click Add.
6. In the Add Expression dialog box, Expression Type drop-down list, select General.
7. In the Flow Type drop-down list, select REQ.
8. In the Protocol drop-down list, select HTTP.
9. In the Qualifier drop-down list, select URL.
10. In the Operator drop-down list, select CONTAINS.
11. In the Value text box, type cmd.exe, and then click OK. The expression is added in the Expression text box.
12. To create another expression, repeat Steps 7 through 11, but in the Value text box, type root.exe. Then click OK, and finally click Close.
13. Click Create on the Create Filter Policy dialog box. The filter policy filter-CF-nimda appears in the Filter list.
14. Click Close.

1. Navigate to Security > Protection Features > Filter. The Filter page appears in the right pane.
2. In the details pane, Policies tab, select the policy that you want to bind and click Global Bindings. The Bind/Unbind Filter Policies dialog box appears.

3. In the Bind/Unbind Filter Policies dialog box, in the Policy Name drop-down list, select the policy filter-CF-nimda, and click Add. The policy is added to the Configured list.
4. Click OK, and then click Close. The policy you have bound displays a check mark and Yes in the Globally Bound column of the Policies tab.

1. Navigate to Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane virtual servers list, select vserver-CF-1 to which you want to bind the content filtering policy and click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, select the Policies tab.
4. In the Active column, select the check box for the policy filter-CF-nimda, and then click OK. Your content filtering policy is now active, and should be filtering requests. If it is functioning correctly, the Hits counter is incremented every time there is a request for a URL containing either root.exe or cmd.exe. This allows you to confirm that your content filtering policy is working. The content filtering policy is bound to the virtual server.

At the command prompt, type the following command to verify the content filtering configuration:
show filter policy filter-CF-nimda

Example

```
sh filter policy filter-CF-nimda
    Name: filter-CF-nimda   Rule: REQ.HTTP.URL CONTAINS cmd.exe || REQ.HTTP.URL CONTAINS root.exe
    Request action: RESET
    Response action:
    Hits: 0
Done
```

Note: The Hits counter displays an integer that denotes the number of times the filter-CF-nimda policy is evaluated. In the preceding steps, the Hits counter is set to zero because no requests for a URL containing either cmd.exe or root.exe have been made yet. If you want to see the counter increment in real time, you can simply request a URL that contains either of these strings.

1. Navigate to Security > Protection Features > Filter.
2. In the details pane, select the filter policy filter-CF-nimda. The bottom of the pane should display the following:

   Request Action:

   RESET

   Rule:

   REQ.HTTP.URL CONTAINS cmd.exe || REQ.HTTP.URL CONTAINS root.exe

   Hits:

   0

Troubleshooting

Jul 22, 2013

If the content filtering feature does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

Updated: 2013-07-22

You can use the following tools and resources to troubleshoot most Content Filtering issues on a NetScaler appliance:

- The Wireshark application customized for the NetScaler trace files
- Trace files recorded when accessing the resource
- The configuration files
- The ns.log file
- The iehttpheaders, or a Fiddler trace or a similar utility

Updated: 2013-08-02

To troubleshoot a content filtering issue, proceed as follows:

- Verify that the feature is enabled.
- Verify that the content filtering policy is configured correctly. Pay special attention to the expression that evaluates the incoming requests.
  Note: Most content filtering issues are caused by incorrect configuration, and the error is most often in the policy configuration.
- Check the policy's Hits counter to verify that it is incrementing. If it is not, the policy is not getting evaluated.
- If the policy is getting evaluated and the required filtering is still not performed, you need to look into the policy expressions and action.
- If the policy's expression seems valid, test it by assigning a simple NSTRUE value to see if the evaluation of the expression is creating any issue.
- Reevaluate whether the filtering should be based on the request or the response.
- Verify that the action is configured correctly. For example, if a custom action is used to corrupt a header in the request, verify that the header name in the action is correct. If you are not sure about the header name, start a browser with iehttpheaders or a similar utility, and then verify the headers in the request. When this feature is used, you can use nstrace to find out if appropriate action is performed when the packets leave NetScaler appliance.
- An iehttpheaders or Fiddler trace can help you find header options and names, client-side request headers, and response headers recorded on the client.
- To check the modifications made to the request header, record an nstrace on the NetScaler appliance or a Wireshark trace on the server.
- If none of the above measures resolves the issue, verify that the connection has not become untrackable, which can happen in certain circumstances. If a connection becomes untrackable, the appliance does not perform any application-level processing of the requests. In that event, contact Citrix Technical Support.

HTTP Denial-of-Service Protection

Mar 16, 2012

Internet hackers can bring down a site by sending a surge of GET requests or other HTTP-level requests. HTTP Denial-of-Service (HTTP Dos) Protection provides an effective way to prevent such attacks from being relayed to your protected Web servers. The HTTP DoS feature also ensures that a NetScaler appliance located between the internet cloud and your Web servers is not brought down by an HTTP DoS attack.

Most attackers on the Internet use applications that discard responses to reduce computation costs, and minimize their size to avoid detection. The attackers focus on speed, devising ways to send attack packets, establish connections or send HTTP requests as rapidly as possible.

Real HTTP clients such as Internet Explorer, Firefox, or NetScape browsers can understand HTML Refresh meta tags, Java scripts, and cookies. In standard HTTP the clients have most of these features enabled. However, the dummy clients used in DoS attacks cannot parse the response from the server. If malicious clients attempt to parse and send requests intelligently, it becomes difficult for them to launch the attack aggressively.

When the NetScaler appliance detects an attack, it responds to a percentage of incoming requests with a Java or HTML script containing a simple refresh and cookie. (You configure that percentage by setting the Client Detect Rate parameter.) Real Web browsers and other Web-based client programs can parse this response and then resend a POST request with the cookie. DoS clients drop the NetScaler appliance's response instead of parsing it, and their requests are therefore dropped as well.

Even when a legitimate client responds correctly to the NetScaler appliance's refresh response, the cookie in the client's POST request may become invalid in the following conditions:

- If the original request was made before the NetScaler appliance detected the DoS attack, but the resent request was made after the appliance had come under attack.
- When the client's think time exceeds four minutes, after which the cookie becomes invalid.

Both of these scenarios are rare, but not impossible. In addition, the HTTP DoS protection feature has the following limitations:

- Under an attack, all POST requests are dropped, and an error page with a cookie is sent.
- Under an attack, all embedded objects without a cookie are dropped, and an error page with a cookie is sent.

The HTTP DoS protection feature may affect other NetScaler features. Using DoS protection for a particular content switching policy, however, creates additional overhead because the policy engine must find the policy to be matched. There is some overhead for SSL requests due to SSL decryption of the encrypted data. Because most attacks are not on a secure network, though, the attack is less aggressive.

If you have implemented priority queuing, while it is under attack a NetScaler appliance places requests without proper cookies in a low-priority queue. Although this creates overhead, it protects your Web servers from false clients. HTTP DoS protection typically has minimal effect on throughput, since the test JavaScript is sent for a small percentage of requests only. The latency of requests is increased, because the client must re-issue the request after it receives the JavaScript. These requests are also queued

To implement HTTP DoS protection, you enable the feature and define a policy for applying this feature. Then you configure your services with the settings required for HTTP DoS. You also bind a TCP monitor to each service and bind your

policy to each service to put it into effect.

Layer 3-4 SYN Denial-of-Service Protection

Mar 21, 2012

Any NetScaler appliance with system software version 8.1 or later automatically provides protection against SYN DoS attacks.

To mount such an attack, a hacker initiates a large number of TCP connections but does not respond to the SYN-ACK messages sent by the victimized server. The source IP addresses in the SYN messages received by the server are typically spoofed. Because new SYN messages arrive before the half-open connections initiated by previous SYN messages time out, the number of such connections increases until the server no longer has enough memory available to accept new connections. In extreme cases, the system memory stack can overflow.

A NetScaler appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted.

SYN DoS protection on the NetScaler appliance ensures the following:

- The memory of the NetScaler is not wasted on false SYN packets. Instead, memory is used to serve legitimate clients.
- Normal TCP communications with legitimate clients continue uninterrupted, even when the Web site is under SYN flood attack.

In addition, because the NetScaler appliance allocates memory for HTTP connection state only after it receives an HTTP request, it protects Web sites from idle connection attacks.

SYN DoS protection on your NetScaler appliance requires no external configuration. It is enabled by default.

Enabling HTTP DoS Protection

Sep 03, 2013

To configure HTTP DoS protection, you must first enable the feature.

At the command prompt, type the following commands to enable HTTP DoS protection and verify the configuration:

- enable ns feature HttpDoSProtection
- show ns feature

Example

```
> enable ns feature HttpDoSProtection
 Done
> show ns feature

      Feature                 Acronym          Status
      -------                 -------          ------
 1)    Web Logging              WL               ON
 2)    Surge Protection         SP               OFF
 .
 .
 .
 10)   Global Server Load Balancing   GSLB            ON
 11)    Http DoS Protection          HDOSP             ON
 12)   Content Filtering         CF               ON
 .
 .
 23)   HTML Injection           HTMLInjection      ON
 24)   NetScaler Push           push             OFF
Done
>
```

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the HTTP DoS Protection check box.
4. Click OK.

Defining an HTTP DoS Policy

Sep 03, 2013

After you enable HTTP DoS protection, you next create a policy.

Note: Before changing the default setting for Client Detect Rate, see "Tuning the Client Detection/JavaScript Challenge Response Rate."

At the command prompt, type one of the following commands to configure an HTTP DoS policy and verify the configuration:

- add dos policy <name> -qDepth <positive_integer> [-cltDetectRate <positive_integer>]
- set dos policy <name> -qDepth <positive_integer> [-cltDetectRate <positive_integer>]

Example

```
> add dos policy pol-HTTP-DoS  -qDepth 30
 Done
> set dos policy pol-HTTP-DoS  -qDepth 40
 Done
> show dos policy
1)     Policy: pol-HTTP-DoS    QDepth: 40
 Done
>
```

1. Navigate to Security > Protection Features > HTTP DoS.
2. In the details pane, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Open.
3. In the Create HTTP DoS Policy or Configure HTTP DoS Policy dialog box, specify values for the parameters:
   - Name*—name (You cannot change the name of an existing policy.)
   - QDepth*—qdepth
   - Client Detect Rate—cltDetectRate (Before changing the default setting for cltDetectRate, see "Tuning the Client Detection/JavaScript Challenge Response Rate.")
4. Click OK to create your new policy. The policy that you created appears in the details pane, and the status bar displays a message indicating that the DoS policy is successfully configured.

Configuring an HTTP DoS Service

Sep 03, 2013

After you configure an HTTP DoS policy, you must configure a service for your policy. The service accepts HTTP traffic that is protected by the HTTP DoS policy.

At the command prompt, type one of the following commands to configure an HTTP DoS service and verify the configuration:

- add service <name>@ (<IP>@ | <serverName>@) HTTP <port> [-maxClient <positive_integer>] [-maxReq <positive_integer>] -state ENABLED
- set service <name>@ (<IP>@ | <serverName>@) HTTP <port> [-maxClient <positive_integer>] [-maxReq <positive_integer>] -state ENABLED

Example

```
> add service ser-HTTP-Dos1 10.102.29.40 HTTP 87
 Done
> set service ser-HTTP-Dos1 -maxReq 20
 Done
> show service
1)     srv-http-10 (10.102.29.30:80) - HTTP
       State: DOWN
       Last state change was at Wed Jul  8 07:49:52 2009
       Time since last state change: 34 days, 00:48:18.700
       Server Name: 10.102.29.30
       Server ID : 0   Monitor Threshold : 0

SP: OFF
Down state flush: ENABLED
Done
>

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, do one of the following:
   - To create a new service, click Add.
   - To modify an existing service, select the service, and then click Open.
3. In the Create Server or Configure Server dialog box, specify values for the following parameters, which correspond to the descriptions in "Parameters for configuring an HTTP DoS service" as follows (asterisk indicates a required parameter):
   - Service Name*—name (You cannot change the name of an existing service.)
   - Server*—IP or serverName (Specify one or the other, not both.)
   - Port*—port
4. If the Enable Service check box is not selected, select it.
5. Select the Advanced tab, and select the Override Global check box to enable those choices.
6. Specify values for the following parameters.
   - Max Clients*—maxClient
   - Max Requests*—maxReq
7. Click Create or OK, and then click Close. The service appears in the list of services.

Binding an HTTP DoS Monitor and Policy

Sep 03, 2013

To put HTTP DoS protection into effect after you have configured an HTTP DoS service, you must bind the monitor, and then bind the service to the HTTP DoS policy.

At the command prompt, type the following commands to bind the monitor to the service and verify the configuration:

- bind lb monitor <monitorName> <serviceName>
- show lb monitor

Example

```
> bind lb monitor tcp ser-HTTP-DoS
 Done
> show lb monitor
1)  Name.......:  ping-default  Type......:    PING  State....ENABLED
2)  Name.......:   tcp-default  Type......:    TCP  State....ENABLED
3)  Name.......:        ping  Type......:    PING  State....ENABLED
4)  Name.......:         tcp  Type......:    TCP  State....ENABLED
5)  Name.......:        http  Type......:    HTTP  State....ENABLED
 .
 .
 .
17)  Name.......:     ldns-dns  Type......: LDNS-DNS  State....ENABLED
 Done
```

At the command prompt, type the following commands to bind the policy to the service and verify the configuration:

bind service <serviceName> -policyName <policyname>

Example

```
> bind service ser-HTTP-DoS -policyName pol-HTTP-DoS
 Done
> show service
1)    srv-http-10 (10.102.29.30:80) - HTTP
      State: DOWN
      Last state change was at Wed Jul  8 07:49:52 2009
      Time since last state change: 34 days, 01:24:58.510
      Server Name: 10.102.29.30
      Server ID : 0   Monitor Threshold : 0
      Max Conn: 0    Max Req: 0    Max Bandwidth: 0 kbits
      Use Source IP: NO
      Client Keepalive(CKA): NO
      Access Down Service: NO
      TCP Buffering(TCPB): NO
      HTTP Compression(CMP): NO
```

Idle timeout: Client: 180 sec Server: 360 sec
Client IP: DISABLED
Cacheable: NO
SC: OFF
SP: ON
Down state flush: ENABLED
.
.
.

4) ser-HTTP-Dos (10.102.29.18:88) - HTTP
State: DOWN
Last state change was at Tue Aug 11 08:19:45 2009
Time since last state change: 0 days, 00:55:05.40
Server Name: 10.102.29.18
Server ID : 0 Monitor Threshold : 0
Max Conn: 0 Max Req: 0 Max Bandwidth: 0 kbits
Use Source IP: NO
Client Keepalive(CKA): NO
Access Down Service: NO
TCP Buffering(TCPB): NO
HTTP Compression(CMP): YES
Idle timeout: Client: 180 sec Server: 360 sec
Client IP: DISABLED

Cacheable: NO
SC: OFF
SP: OFF
Down state flush: ENABLED

Done
>

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service that you want to bind, and then click Open.
3. In the Configure Service dialog box, select the Monitor tab, click the name of the monitor you want in the Monitors list, and then click Add. The selected monitor is added to the Configured frame.
4. Select the Policies tab, then select the HTTP DoS tab.
5. Select a policy from the Available Policies list, and then click Add. The policy appears in the Configured Policies list.
6. Click OK, and then click Close. A message appears in the status bar, stating that the service has been configured.

Tuning the Client Detection/JavaScript Challenge Response Rate

Sep 03, 2013

After you have enabled and configured HTTP DoS protection, if more than the maximum specified number of clients are waiting in the NetScaler surge queue for the HTTP DoS service, the HTTP DoS protection function is triggered. The default rate of challenged JavaScript responses sent to the client is one percent of the server response rate. The default response rate is inadequate in many real attack scenarios, however, and may need to be tuned.

For example, assume that the Web server is capable of a maximum of 500 responses/sec, but is receiving 10,000 Gets/sec. If 1% of the server responses are sent as JavaScript challenges, responses are reduced to almost none: 5 client (500 *0.01) JavaScript responses, for 10000 waiting client requests. Only about 0.05% of the real clients receive JavaScript challenge responses. However, if the client detection/JavaScript challenge response rate is very high (for example, 10%, generating 1000 challenge JavaScript responses per second), it may saturate the upstream links or harm the upstream network devices. Exercise care when modifying the default **Client Detect Rate** value.

If the configured triggering surge queue depth is, for example, 200, and the surge queue size is toggling between 199 and 200, the NetScaler toggles between the “attack” and “no-attack” modes, which is not desirable. The HTTP DoS feature includes a window mechanism is provided. When the surge queue size reaches the designated queue depth value, triggering “attack” mode, the surge queue size must fall for the NetScaler to enter “no-attack” mode. In the scenario just described, if the value of WINDOW_SIZE is set to 20, the surge queue size must fall below 180 before the NetScaler enters “no-attack” mode. During configuration, you must specify a value more than the WINDOW_SIZE for the **QDepth** parameter when adding a DoS policy or setting a DoS policy.

The triggering surge queue depth should be configured on the basis of previous observations of traffic characteristics. For more information about setting up a correct configuration, see "Guidelines for HTTP DoS Protection Deployment."

Guidelines for HTTP DoS Protection Deployment

Mar 16, 2012

Citrix recommends you to deploy the HTTP DoS protection feature in a tested and planned manner and closely monitor its performance after the initial deployment. Use the following information to fine-tune the deployment of HTTP DoS Protection.

- The maximum number of concurrent connections supported by your servers.
- The average and normal values of the concurrent connections supported by your servers.
- The maximum output rate (responses/sec) that your server can generate.
- The average traffic that your server handles.
- The typical bandwidth of your network.
- The maximum bandwidth available upstream.
- The limits affecting bandwidth (such as external links, a particular router, or other critical devices on the path that may suffer from a traffic surge).
- Whether allowing a greater number of clients to connect is more important than protecting upstream network devices.

To determine the characteristics of a HTTP DoS attack, you should consider the following issues.

- What is the rate of incoming fake requests that you have experienced in the past?
- What types of requests have you received (complete posts, incomplete gets)?
- Did previous attacks saturate your downstream links? If not, what was the bandwidth?
- What types of source IP addresses and source ports did the HTTP requests have (e.g., IP addresses from one subnet, constant IP, ports increasing by one).
- What types of attacks do you expect in future? What type have you seen in the past?
- Any or all information that can help you tune DoS attack protection.

Priority Queuing

Sep 03, 2013

The priority queuing feature lets you filter incoming HTTP traffic on the basis of categories that you create and define, and prioritize those HTTP requests accordingly. Priority queuing directs high-priority requests to the server ahead of low-priority requests, so that users who need resources for important business uses receive expedited access to your protected Web servers.

Note: The priority queuing feature is not supported in NetScaler 9.2 nCore.
To implement priority queuing, you create priority queuing policies that specify a priority, weight, threshold, and implicit action. When an incoming request matches a priority queuing policy, the request is processed as the associated action indicates. For example, you can create a priority queuing policy that places all matching requests above a certain threshold in a surge queue, while giving priority treatment to other requests.

You can bind up to three priority queuing policies to a single load balancing virtual server. The priority levels are:

Level 1

A Level 1 policy processes priority requests.

Level 2

A Level 2 policy processes requests that should receive responses as soon as Level 1 requests have been cleared from the queue.

Level 3

A Level 3 policy processes non-priority requests that receive responses only after requests in the first two queues have been cleared.

You can use weighted queuing to adjust the relative priority of each of these queues. Weights can range from 0 to 101. A weight of 101 tells the NetScaler appliance to clear all requests in that queue before forwarding any requests in the lower-priority queues to the Web server. A weight of 0 tells the appliance to send requests in that queue to the Web server only when there are no requests waiting in any of the other queues.

You must assign a unique name to each priority queuing policy. Policy names can be up to 127 characters. Multiple policies bound to the same load balancing virtual server cannot have the same priority level. No two virtual servers that have one or more common underlying physical services can have priority queuing configured or enabled on both virtual servers simultaneously.

To configure priority queuing the NetScaler, you perform the following steps:

- Enable the load balancing feature
- Define a server and service
- Define a load balancing virtual server
- Bind the service to the load balancing virtual server
- Enable the priority queuing feature
- Create the priority queuing policies
- Bind the priority queuing policies to the load balancing virtual server
- Enable priority queuing on load balancing virtual server

For information about enabling load balancing, creating servers, creating virtual servers and services, and binding these servers and services, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX132359. For

complete information about policies and expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX132362.

Enabling Priority Queuing

Sep 03, 2013

To use the priority queuing feature the NetScaler appliance, you must first enable it.

At the command prompt, type the following commands to enable priority queuing and verify the configuration:

- enable ns feature PriorityQueuing
- show ns feature

Example

```
> enable ns feature PriorityQueuing
 Done
> show ns feature

      Feature                Acronym          Status
      -------                -------          ------
 1)    Web Logging              WL              ON
 2)    Surge Protection          SP              OFF
 3)    Load Balancing           LB              ON
 .
 .
 .
 8)    Priority Queuing          PQ              ON
 .
 23)   HTML Injection           HTMLInjection      ON
 24)   NetScaler Push           push            OFF
 Done
```

1. Navigate to System > Settings.
2. In the details pane, click Configure advanced features.
3. In the Configure Advanced Features dialog box, select the Priority Queuing check box.
4. Click OK.

Configuring a Priority Queuing Policy

Sep 03, 2013

To configure a priority queuing policy, you can use either the configuration utility or the command line.

Note: For more information about using the command line, see "Command Reference."

At the command prompt, type the following command to configure a priority queuing policy and verify the configuration:

add pq policy <policyName> -rule <expression> -priority <positive_integer> [-weight <positive_integer>] [-qDepth <positive_integer> | -polqDepth <positive_integer>]

Example

```
> add pq policy pol_cgibin -rule "URL == '/cgi-bin/'" -priority 1
 Done
> show pq policy pol_cgibin
1)     Policy: pol_cgibin      Rule: URL == '/cgi-bin/'       Priority: 1     Weight: 10
       Hits: 0
 Done
```

1. Navigate to Security > Protection Features > Priority Queuing.
2. In the details pane, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Open.
3. If you are creating a new policy, in the Create PQ Policy dialog box, in the Name text box, type a name for your new policy.
   The name can consist of from one to 127 letters, numbers and the hyphen and underscore symbol.

   If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the Rule text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
   1. In the Create Expression dialog box, click Add.
   2. In the Add Expression dialog box, leave Expression Type set to General, and in the Flow Type drop-down list, select a Flow Type. Your choices are REQ (for requests) and RES (for responses).
   3. In the Protocol drop-down list, select a protocol. If you selected REQ in the previous step, your choices are HTTP (Web-based connections), SSL (secure Web connections), TCP and IP. If you selected RES in the previous step, your choices are HTTP, TCP and IP.
   4. In the Qualifier drop-down list, select a qualifier.
      Your choices depend upon your selections in the previous step. Common choices are HTTP VERSION (the version of the HTTP connection), HTTP HEADER (the specified HTTP header), TCP SOURCEPORT/ DESTPORT (the source or destination port of a TCP connection), and IP SOURCEIP/DESTIP (the source or destination IP of the connection).

      If you choose HTTP HEADER, the Header text box appears beneath the original row of text boxes. You fill in the name of the HTTP header you want.

      For a complete description of the available choices, see "Policies and Expressions."

5. In the Operator drop-down list, select an operator.
   For a complete description of the available choices, see "Policies and Expressions."

6. In the Value text box, type the value you want to test for.
   This may be a text string or a number, depending upon the context. For a complete description of values appropriate to the specific context, see "Policies and Expressions."

7. Click OK. The expression is added in the Expression text box.
8. Click Create. The expression appears in the Rule text box.

5. In the Priority and Weight text boxes, type numeric values, for example, 1 and 30. For more information about Priority and Weight, see "Setting Up Weighted Queuing."
6. Enter a numeric value for either Queue Depth or Policy Queue Depth, for example 234, and click Create.
   - Queue Depth Defines the total number of waiting clients or requests on the virtual server to which the policy is bound.
   - Policy Queue Depth Defines the total number of waiting clients or requests belonging to the policy.

   The policy is created and appears in the Priority Queuing page.
   Note: To create additional priority queuing policies, repeat the procedure in the preceding section, and click Close after you finish.

Binding a Priority Queuing Policy

Sep 03, 2013

After you create a priority queuing policy, you must bind it to the appropriate virtual server to put it into effect.

At the command prompt, type the following commands to bind a policy and verify the configuration:

- bind lb vserver <name> -policyName <policyname>
- show lb vserver <name>

Example

```
> bind lb vserver lbvip -policyname pol_cgibin
 Done
> show lb vserver lbvip
        lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jul 15 05:54:24 2009 (+782 ms)
        Time since last state change: 26 days, 05:44:37.370
        Effective State: DOWN
        Client Idle Timeout: 180 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        Port Rewrite : DISABLED
        No. of Bound Services :  0 (Total)      0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Vserver IP and Port insertion: OFF
        Push: DISABLED  Push VServer:
        Push Multi Clients: NO
        Push Label Rule: none

1)      Policy : ns_cmp_msapp Priority:0

1)      Priority Queuing Policy : pol_cgibin
 Done
>
```

1. In the navigation pane, locate and select the virtual server to which you want to bind the priority queuing policy.
   - To select a load balancing virtual server, expand Traffic Management > Load Balancing > Virtual Servers, then select the load balancing virtual server that you want..
   - To select a content switching virtual server, expand Traffic Management > Content Switching > Virtual Servers, then select the content switching virtual server that you want..
2. In the Configure Virtual Server dialog box, select the Policies tab.

3. Click the double right-arrow (») symbol to display the complete list of policy types, and then select Priority Queuing from the drop-down list.
4. Click Insert Policy.
5. In the Policy Name row, select the policy that you want to bind from the drop-down list.
6. ClickOK to save your changes.

Setting Up Weighted Queuing

Sep 03, 2013

When priority queuing is implemented, lower-priority requests are typically kept on hold while higher-priority requests are served. The lower-priority requests may therefore be delayed if there is a constant flow of higher-priority requests.

To prevent delays for low-priority requests across multiple priority levels, you can configure weighted queuing for serving requests. The default weights for the priorities are:

- Gold - Priority 1 - Weight 3
- Silver - Priority 2 - Weight 2
- Bronze - Priority 3 - Weight 1

You assign the minimum weight, zero (0), to requests that the NetScaler appliance should send to the server only if no requests are stored in any of the other queues. You assign the maximum weight, 101, to requests that the appliance should send to the server immediately, ahead of any requests stored in any of the other queues. Weights between these two set the relative priority of a particular queue in relation to the other queues. Queues with a higher weight are processed first; queues with a lower weight after the others have been processed. To assign the weights, see "Configuring a Priority Queuing Policy."

Note: The weight assigned to a higher-priority queue must be larger than the weight assigned to a lower-priority queue. For example, the weight assigned to The Gold (Priority 1) queue must be greater than the weight assigned to the Silver (Priority 2) queue.

SureConnect

Sep 03, 2013

You can use the SureConnect feature of the Citrix NetScaler appliance to service all incoming connections with either the requested content or a custom Web page that displays information about a delay in the request being serviced.

When servers are overloaded with the requests, the servers might either respond slowly or not at all. The SureConnect feature enables the NetScaler appliance to detect and compensate such conditions by ensuring that every client request gets serviced in some way, such as either a custom Web page or actual content is sent to the client.

SureConnect is activated when the response time or maximum server connections to a client request exceeds a limit that you have set. The SureConnect browser window displays one of the following:

- A progress bar with the amount of time remaining until the requested content will be available.
- Alternate Web content of your choice (alternate page).
- Both a progress bar and alternate page.
- Complete custom content of your choice.

You can configure whether the SureConnect progress bar alone is displayed or both the progress bar and the alternate page are displayed.

When the server becomes responsive again, the original request for content is served. If the user chooses, the alternate content window can remain in focus.

Subsequent requests from the same user within the same session are served immediately. This can be configured using the settings described later in this section.

SureConnect can be activated when a response is delayed, and when the number of user connections to a given URL exceeds a specified threshold.

SureConnect works with all standard browsers, including Microsoft Internet Explorer, Netscape Navigator, and Mozilla Firefox.

SureConnect is advantageous in the following situations:

- **Full server queue**

  The server can respond fast, but there are too many users. This results in the server's queue being full and unable to process additional client requests.

  SureConnect Solution: In this situation, the SureConnect window is displayed, showing the time left until the content will be available. The alternate page is displayed under the progress bar, if an alternate page has been configured.

- **Large response delay**

  The server response is slow. Typically, if a Web server does not respond to a client request quickly, the user will leave the site.

  SureConnect Solution: When the predicted delay reaches a configured time threshold, the SureConnect window displays the progress bar and the optional alternate page in the client browser.

- **Client time-out**

When the client requests content from a very slow Web site, a time-out message displays in the client browser, and the content is not delivered. The user may leave the site.

SureConnect Solution: The appliance stores the request until the server is no longer busy and delivers the requested content to the client.

- **Server experiencing a traffic surge**

  The server typically responds quickly, but the current load of open connections is greater than the server capacity to serve them. Therefore, the server response is delayed.

  SureConnect Solution: A SureConnect window is displayed in the client browser, showing the time left. The alternate page from the server is also displayed if it has been configured.

Installing SureConnect

Mar 21, 2012

SureConnect files must be installed on the alternate content server, which can be the same as the primary server.

On a Windows server, extract the sc_xx.exe file (where xx is the build number), or on a UNIX server, extract the sc_xx.tar file (where xx is the build number).

Note: You must install SureConnect in the default Web root directory.
If the alternate content server is the same as the primary server, place the SureConnect and alternate content files in any directory under the Web root directory. Specify this path when you add a policy to configure SureConnect. By default, SureConnect files are installed in the /Citrix NetScaler appliance directory under the default Web root directory.

If the alternate content server is different than the primary server, the SureConnect and alternate content files must be in a unique directory under the Web root directory. By default, this unique directory is the /Citrix NetScaler system directory. Specify this path when you add a policy to configure SureConnect.

The following files are extracted:

- Alternate content files (progressbar.htm, alternatepage.htm, and barandpage.htm)
- System-Logo.gif
- Customer-Logo.gif
- Sample.gif
- README.txt.

This section describes how to install SureConnect alternate content on a UNIX server. The following are the prerequisites:

- The UNIX server is running the Apache server.
- The shell with the # prompt is in use.
- Apache is installed in the default location.
- The sc_xx.tar file is downloaded from the organization's Web site into the /var/ftp/incoming directory.

To install SureConnect

1. At the command prompt, navigate to the htdocs directory:
   `cd /usr/local/apache/htdocs`
2. Type the following command:
   `tar xvpf/var/ftp/incoming/sc_xx.tar`

The output from the .tar file is displayed. A /Citrix NetScaler system directory is created under the specified path and the SureConnect files are installed.

Updated: 2013-09-03

This section describes how to install SureConnect alternate content on a Windows server. The following are the prerequisites:

- The server is running the Microsoft Internet Information Server.
- The DOS prompt is being used.

- The SureConnect zip (self-extracting) file is downloaded from the organization Web site using FTP into the C:\inetpub\wwwroot directory.

To install SureConnect on Windows

Do one of the following:

- At the command prompt, navigate to the wwwroot directory:
  `cd c:\inetpub\wwwroot`
- Type the name of the executable file:
  `sc_xx.exe`
- Double-click the sc_xx.exe icon from the Microsoft Windows Explorer Web browser, extract from the compressed file into the default path (for example, the c:\inetpub\wwwroot directory).

Output from the zip file is displayed. A /Citrix NetScaler system directory is created under the specified path, and the SureConnect files are installed.

Configuring SureConnect

Sep 03, 2013

The following topics describe how to configure SureConnect for scenarios involving alternate server failure.

- "Configuring the Response for Alternate Server Failure"
- "Configuring the SureConnect Policies"
- "Customizing the Alternate Content File"
- "Configuring SureConnect for Citrix NetScaler Features"

Updated: 2013-09-03

If the alternate server fails, and the primary server cannot immediately deliver the requested content to the client, SureConnect does not display alternate content from the failed alternate server in the client Web browser.

The Citrix NetScaler appliance automatically sends a response to the client browser. You can customize the server response to display information suited to your needs.

The default response is:

Your Request is being processed... Estimated Time: ____ Secs

Customizing the Default Response

The NetScaler appliance automatically sends the response to the client if the alternate server fails, or if the appliance is configured to send the default response.

To customize the default response of the appliance, create a vsr.htm file (a sample is provided in this section) as follows:

- The file can contain any valid HTML statements other than embedded objects.
- The file size cannot exceed 800 bytes.
- The file must reside on the NetScaler appliance. If you have a high availability (HA) setup, the file must reside on the primary and secondary nodes. Any changes made to the file on the primary node must also be applied to the file on the secondary node.
- Put vsr.htm file in the /etc directory.

Change any of the contents between the </HEAD> and </HTML> tags in the vsr.htm file. Following is the sample content from vsr.htm file. The sections that you can edit are in bold text.

```
HTTP/1.1 200 OK
Server: NS_WS3.0
Content-Type: text/html
Cache-control: no-cache
Pragma: no-cache
Set-Cookie: NSC_BPIP=@@SID@@; path=/
<HTML> <HEAD> <META HTTP-EQUIV="Refresh" CONTENT="0">
</HEAD> <font color=blue size=5>Your request is being processed...
```

**
Estimated Delay: @@DELAY@@ Sec ** </HTML>
Note: Include @@DELAY@@ to display the predicted delayed response time in seconds.

SureConnect with In-Memory response (NS action)

Updated: 2013-09-03

When defining the SureConnect policy by using the add sc policy command, you can configure the NetScaler Appliance to serve alternative content to the client.

To enable SureConnect and configure the in-memory response, perform the following tasks:

- Enable the SureConnect feature on the appliance by using the enable feature SC command
- Define the services by using the add service <servicename> <IP address> <servicetype> <port> command. This identifies the original server for which the SureConnect is configured and the types of services.
- Add a SureConnect policy by using the add sc policy command. You can configure a URL-based policy or a rule-based policy. The incoming requests are validated against the URL or rule you specify in the policy.

Note: You can configure the SureConnect feature on a load balancing virtual server. In that case, perform the following additional actions:

- Enable Load Balancing by using the enable feature LB command.
- Enable SureConnect feature on the virtual server by using the set lb vserver <vservername> -sc ON command.
- Bind services to the virtual server by using the bind lb vserver <name> <serviceName> command.
- Bind policies to the virtual server by using the bind lb vserver <name> -policyname <name> command.

The following example illustrates how to configure SureConnect for the load balancing feature so that SureConnect will display alternative content from the NetScaler appliance.

In this example, two physical servers, with IP addresses, 10.101.3.187 and 10.101.3.188 are load balanced by the NetScaler appliance. The appliance has one configured virtual server, vs-NSact, whose IP address is 10.101.3.201. The file that contains the alternative content is vsr.htm. It is copied from the file system into system memory. Services are loaded until the SureConnect policy triggers, and the appliance supplies the alternate content.

```
enable feature SC LB
add service psvc1 10.101.3.187 http 80
add service psvc2 10.101.3.188 http 80
add lb vserver vs-NSact HTTP 10.101.3.201 80
bind lb vserver vs-NSact psvc1
bind lb vserver vs-NSact psvc2
add sc policy policyNS -url /cgi-bin/*.cgi -delay 400000
-action NS
set sc parameter -vsr /nsconfig/ssl/vsr.htm
bind lb vserver vs-NSact -policyName policyNS
set lb vserver vs-NSact -sc ON
save config
```

Table 1. Parameter values used in this example

Service	
Name	psvc1, psvc2

Server	10.101.3.187, 10.101.3.188
Protocol	HTTP
Port	80
Load Balancing Virtual Server	
Name	vs-NSact
IP Address	10.101.3.201
Protocol	HTTP
Port	80
SureConnect Policy	
Name	policyNS
URL	/cgi-bin/*.cgi
Delay(microseconds)	400000
SC Parameter	
VSR File Name	vsr.htm

1. In the In the navigation pane, navigate to System > Settings. In the Modes and Features pane, perform the following actions:
   1. Click Configure Basic Features, select Load Balancing, and Click Go.
   2. Click Configure Advanced Features, select SureConnect, and Click Go.
2. In the navigation pane, navigate to Security > Protection Features > SureConnect. In the details pane, click Parameters. In the Configure SureConnect Parameters window, browse and select the VSR filename.
3. Navigate to Traffic Management > Load Balancing > Services. In the details pane, click Add. In the **Create Services** window, enter the paramter values as shown in Table 5-1, and click **OK**.
4. Navigate to Traffic Management > Load Balancing > Virtual servers. In the details pane, click Add. In the Create Virtual Server (Load Balancing) dialog box, enter the values shown in Table 5.1 for the Load Balancing Virtual Server parameters and click OK.

5. In the navigation pane, navigate to Traffic Management > Load Balancing > Virtual servers. Select the virtual server vs-NSact and click Open in the details pane. The Configure Virtual system (Load Balancing) dialog box, displays the list of configured services. Select services psvc1 and psvc2 and click OK.
6. In the navigation pane, expand Security > Protection Features > SureConnect. In the details pane, click Add. Create the policy with the values as given in the parameters table.
7. In the navigation pane, navigate to Traffic Management > Load Balancing > Virtual servers. Select the virtual server vs-NSact and click Open in the details pane. In the Configure Virtual system (Load Balancing) dialog box, click the Policies tab. Click >> to expand the features. Select **SureConnect**. When the list of SureConnect polices appear, select policyNS and click OK.
8. In the navigation pane, navigate to Traffic Management > Load Balancing > Virtual servers. Select the virtual server vs-NSact and click Open in the details pane. In the Configure Virtual system (Load Balancing) dialog box, on the Advanced tab, select SC and click OK.

You can configure the following SureConnect policies. The NetScaler appliance matches incoming requests in the order the policies are configured:

- Exact URL-based policies
- Wildcard rule-based policies

Configuring Exact URL Based Policies

Updated: 2013-09-03

When you configure an exact URL based policy, the NetScaler appliance matches the incoming request against the URL that has been configured in the policy. URL based policies take precedence over rule based policies.

At the command prompt, type:

add sc policy <name> [-url <URL> | -rule <expression>] [-delay <usecs>] [-maxConn <positive_integer>] [-action (ACS <altContentSvcName> <altContentPath>) | NS | NOACTION)]

1. Navigate to Security > Protection Features > SureConnect.
2. In the details pane, click Add.
3. In the Create SureConnect Policy dialog box, set the following parameters:
   - Name*
   - URL (Make sure that the URL check box is selected)
   - Value*
   - Delay (microseconds)*
   - Maximum Client Connections
   - Action (Select from the Choose Action list.)
   - Alternate Service Name (if you select ACS as the Action)
   - Alternate Content Path (if you select ACS as the Action)

   *A required parameter
4. Click Create, and click Close. The URL based policy appears in the right pane, and a message displays in the status bar that the policy is successfully configured.

Configuring Wildcard Rule-Based Policies

Updated: 2013-09-03

SureConnect matches the incoming requests to a defined rule, if you configure a rule-based policy.

1. Create the expression(s).
   Use the add expression command to create each expression.
2. Create the rule(s).

   Use the add sc policy command with the -rule expression_logic argument to specify the rule(s). In the -rule expression_logic argument, refer to the expression(s) you created in step 1.

   Repeat this command to create and name each rule.

The following example creates a rule “rule = = /*.cgi”:

```
add vserver vs-lb http 1.1.1.1 80
add expression expr1 url == /cgi-bin/*.cgi
add expression expr2 url == /index.html
add sc policy surecpolicy1 -rule (expr1||expr2) -delay 1000000 -action NS
bind lb vserver vs-lb -policyName surecpolicy1
```

To complete the SureConnect configuration, you will need to enter additional commands, beyond those shown in the example.

1. Navigate to Security > Protection Features > SureConnect.
2. In the details pane, click Add.
3. In the Create SureConnect Policy dialog box, in the Name text box, type the name of the policy.
4. Under What to Monitor, click Expression, and then click Configure.
5. In the Create Expression dialog box, click Add.
6. In the Add Expression dialog box, enter an expression. For example, you can select an Expression Type of General, a Flow Type of REQ, a Protocol of HTTP, a Qualifier of URLQUERY, an Operator of CONTAINS, and in the Value text box, type AA. For more information about expressions, see "Policies and Expressions."
7. Click OK, and click Close.
8. In the Create Expression dialog box, click Create.

Examples of wildcard rules:

“/sports/*” matches all URLs under /sports

“/sports*” matches all URLs whose prefix matches “/sports”, starting at the beginning of the URL.

“/*.jsp” matches all URLs whose file extension is “jsp”

When configuring rule-based policies, first add the more specific rule-based policies, before adding more generic rules (for example, add /cgi-bin/sports*.cgi before adding /cgi-bin/*.cgi).

Displaying the Configured SureConnect Policy

To view the SureConnect policy that you have configured, at the NetScaler command prompt, enter the show sc policy

command.

When SureConnect activates, it can display alternate content from one of the following files that you have configured:

- **progressbar.htm.** Displays the progress information.
- **alternatepage.htm.** Displays an alternate page.
- **barandpage.htm.** Displays both the progress information and an alternate page.

The alternate content files are JavaScript files. During SureConnect installation, these files are copied onto the server that contains the alternate content. These files can contain alternate content (including an alternate page) or references to other files that contain the alternate content.

This section describes the changes you can make to the alternate content file provided by the appliance.

```
//**** DEFINE YOUR VALUES HERE ****
var alt_url = "/Citrix NetScaler system /sample.gif";
var alt_url = "http://www.DomainName.com";
var Citrix NetScaler system _logo = "netscaler_logo.gif";
var our_logo = "netscaler_logo.gif";
var height = 450;
var width = 550;
var top = 200;
var left = 200;
var popunder = "no"; //specify yes for pop-under & no for pop-up
var shift_focus = "yes" //if you want to send pop-up to background on getting primary content else specify no
//**** YOUR DEFINITIONS ENDS HERE ****
```

You can make these changes:

- **var alt_url.** Specify the URL for the alternate content if a file provides the alternate content. For example:
  var alt_url = “/Citrix NetScaler system/sports.htm”
  Note: The alternate content file must be present in the /Citrix NetScaler system directory under the documents root of the Web server.
- **var our_logo.** Specify the image file of your organization logo.
- **var height.** Specify the height of the SureConnect window.
- **var width.** Specify the width of the SureConnect window.
- **var top and var left.** Specify the position of the SureConnect window.
- **var popunder.** Specifies the position of the alternate content window. Specify the value as NO to place the alternate content window above the original window. Specify the value as YES to place the alternate content window beneath the original window.
- **var shift_focus.** Specify the focus of the alternate content window. YES places the pop-up window in the background when getting the primary content. NO always keeps the pop-up window in focus, even when getting the primary content.

Note: For more information, see the README.txt file provided by the appliance with other alternate content files.

Updated: 2013-09-03

This section describes how SureConnect works in combination with the load balancing, content switching, cache redirection, and high availability features of the NetScaler appliance.

Configuring SureConnect for Load Balancing

You can use SureConnect in environments where the primary servers use the load balancing feature, with or without alternate servers. If the load balancing virtual server configured for SureConnect fails, the backup virtual server (if there is one) handles the traffic. Backup virtual servers do not support SureConnect policies.

Note: For information about load balancing, see "Load Balancing."

Configuring SureConnect for Cache Redirection

You can use SureConnect in environments where cache redirection is configured. The primary server is a load balancing virtual server bound to the cache redirection virtual server. Regardless of any rules configured for the cache redirection feature:

- You can configure any URL for SureConnect.
- Once SureConnect is activated for a client, requests from the client are always sent to the origin server.

Configuring SureConnect for High Availability

SureConnect is compatible with NetScaler appliances operating in high availability mode.

Note: If the optional vsr.htm file is used, it must be present in both nodes (primary and secondary) and must use the same name and directory.

Activating SureConnect

Sep 03, 2013

You can set the Citrix NetScaler appliance to activate SureConnect if either of two criteria match. Both criteria are arguments to the add sc policy command, as described here:

- -delay <microseconds>

  The first time the client requests the URL, the appliance records how long the server takes to respond. The appliance will not activate SureConnect until the second time the URL is requested. The first and second requests may be from the same or different clients.

  If you set -delay argument, SureConnect will be activated the second time the delay reaches the threshold you set.

- -maxConn <positive_integer>

  When the appliance receives a request, it checks the number of connections to the server for the configured URL. SureConnect is activated if the number of connections is greater than or equal to the value that you set for the -maxConn argument.

  If you will be providing alternate content to be displayed in the client's Web browser, you should configure the -action argument of the add sc policy command. This specifies for the NetScaler appliance whether the alternate content is coming from a dedicated alternate server (-action ACS) or the appliance (-action NS).

  When SureConnect is activated by the –maxConn argument, the SureConnect window and progress bar are displayed in the client's browser (with an alternate page, if configured).

SureConnect Environments

Sep 03, 2013

The following topics describe SureConnect environments.

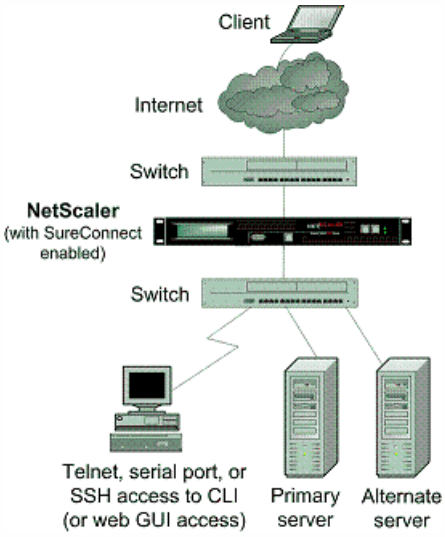
- "Primary and Alternate Servers"
- "Configuration Checklist"
- "Example Configurations"

The SureConnect environment uses a dedicated server to provide alternate content when the requested content is not available. The alternate content may include an alternate page, plus optional components such as frame set, organization logo, and so on. The alternate and primary servers can be the same server.

You can configure SureConnect to display a progress bar when the requested content is not available (or the progress bar and an alternate page).

The following figure illustrates the SureConnect environment.

Figure 1. SureConnect - Primary and Alternate Servers



Updated: 2013-09-03

Complete the following checklist before you start configuration:

Table 1. Configuration Checklist

▫	The same builds are running for the appliance and for the SureConnect files as suggested by appliance staff. Appliance Build Number: _____ SureConnect (sc_xx.exe) Build Number: _____

▫	The latest SureConnect files (style files) are extracted to: • All primary servers (required for NS action). • The alternate content server (required for ACS action).
▫	All customizations to the latest style and vsr.htm files are applied.
▫	The alternate content server is accessible from the Internet (required for ACS action).
▫	If the -redirectURL URL argument of the add vserver CLI command needs to be specified: • The URL is up and running. • This URL is not on the configured servers. • This URL does not match any content in the vserver (that is, do not redirect a missing URL to itself). Redirecting a missing URL to itself can send some browsers into an infinite loop.
▫	All URLs to be configured for SureConnect are top-level URLs only. (Only the URLs that occupy the whole window or frame can be configured, not the embedded objects).

Following are the steps to configure SureConnect in a setup with a primary server and a dedicated alternate server:

- Enable the SureConnect feature
- Add the SureConnect policy
- Bind the SureConnect policy

You can optionally configure the following:

- Redirect the client to another URL if the primary server fails, or send a customized response to the client if the alternate server fails.
- If the servers do not provide alternate content, send a default or customized response.

To redirect the client to another URL

1. Enable the SureConnect feature.
2. Define the primary server and its service.

   You must identify the original server for which SureConnect support is being configured. At the NetScaler command prompt, type the following command:

   ```
   add service <serviceName> <IP> HTTP <port>
   ```

   where <serviceName> assigns a name for the service; <IP> is the server's IP address; and <port> is the port number that the service will use.

   Repeat use of the add service CLI command for each service that is to be added.

   You can also configure SureConnect on a load balancing virtual server. At the NetScaler command prompt, type the following command:

   ```
   add vserver <name> HTTP <IP> <port>
   ```

3. Define and bind the SureConnect policy as follows. If you are configuring a rule-based policy, perform this step as described in "Configuring Wildcard Rule-Based Policies." To configure a URL-based policy, at the NetScaler command prompt, type the following command:

   add sc policy <name> [-url <URL>] [-delay <microsec>] [-maxConn <positiveInteger>]

   For a detailed description of the add sc policy command, see "Command Reference."

   To bind the SureConnect policy, at the NetScaler command prompt, type the following command:

   bind service <serviceName> -policyname <string>
   where <serviceName> is the name of the service defined in step 2, and <string> is the name of the SureConnect policy.

   Repeat the bind service command for each policy created.

   You must include the alternate content page in the altContSvcName argument, and in the altContPath argument of the add sc policy command.

   In the following example, the name of the alternate content file is /Citrix NetScaler system /barandpage.htm, and this file resides in svc2.

4. To save the configuration, at the NetScaler command prompt, type the following command:
   save config

Updated: 2013-09-03

The following examples illustrate various SureConnect configurations.

The examples assume that monitoring of physical services is enabled. If the alternate system is down, SureConnect will deliver the alternate content from the system itself.

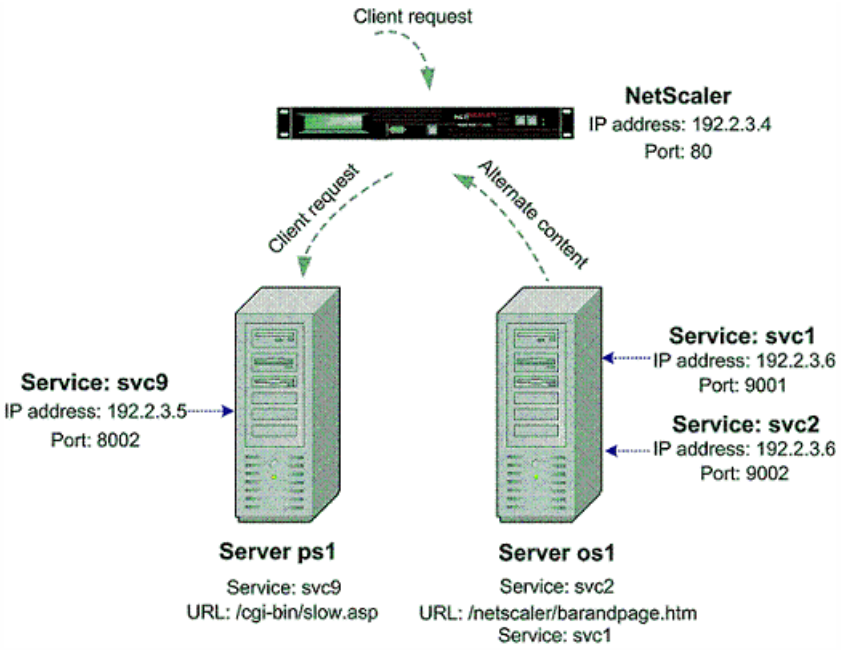
Example 1 - SureConnect Progress Bar and Alternate Page

You can configure SureConnect to display both the progress bar and an alternate page to the user.

To bind a SureConnect policy to a load balancing virtual server, at the command prompt, type the following commands:

bind lb vserver <virtualServerName> -policyName <string>
where <virutalServerName> is the name of the load balancing virtual server defined in step 2 of the configuration process, and <string> is the name of the SureConnect policy defined in step 3.

Figure 2. SureConnect Configuration - Example 1



At the NetScaler command prompt, type the following commands:

```
enable feature SC
show ns info
add service svc2 192.2.3.6 HTTP 9002
show server
show service svc2
add service svc9 192.2.3.5 HTTP 8002
add sc policy policy8 -url /cgi-bin/slow.asp
-delay 3000000 -action ACS svc2 /NetScaler 9000 system barandpage.htm
bind service svc9 -policyname policy8
set service svc9 -sc ON
save config
```

After you configure SureConnect, you can enter commands that show information to verify what you have configured.

Example 2 - SureConnect Progress Bar Only

In this example, SureConnect will display only the progress bar. The server orgsrvr with IP address 10.101.8.187 has service orgsvc. This server is connected to the appliance. The service is bound to the appliance. The progressbar.htm file specifies that only the progress bar will be displayed.

At the NetScaler command prompt, type the following commands:

```
enable feature SC
add service orgsvc 10.101.3.187 HTTP 80
add sc policy policy9 -url /cgi-bin/slow.asp
-delay 4000000 -action ACS orgsvc /NetScaler 9000 system / progressbar.htm
bind service orgsvc -policyname policy9
set service orgsvc -sc ON
save config
```

Example 3 - SureConnect with Load Balancing

This example illustrates how to configure the load balancing feature so that SureConnect will display alternate contents from the primary server. For information about load balancing, see "Load Balancing."

In this example, two physical servers with IP 10.101.3.187 and 10.101.3.188 are being load balanced by the appliance. The name and location of the alternate page file is specified in the file alternatepage.htm, which resides on both servers.

The appliance has one configured virtual server address: 10.101.3.201. At the NetScaler command prompt, type the following commands:

```
enable feature SC LB
add service psvc1 10.101.3.187 HTTP 80
add service psvc2 10.101.3.188 HTTP 80
add vserver vs-SureC HTTP 10.101.3.201 80
bind lb vserver vs-SureC psvc1
bind lb vserver vs-SureC psvc2
add sc policy policy9 -url /cgi-bin/slow.asp -delay 4000000
-action ACS vs-SureC /NetScaler system /alternatepage.htm
bind lb vserver vs-SureC -policyName policy9
set lb vserver vs-SureC -sc ON
save config
```

Example 4 - SureConnect with Load Balancing (ACS Action)

This example illustrates how to configure the NetScaler appliance load balancing feature so that SureConnect will display alternate content from the alternate server. For information about load balancing, see "Load Balancing."

In this case, there are two physical servers, IP 10.101.3.187 and 10.101.3.188. Both are being load balanced by the appliance.

The name and location of the alternate page file are specified in file barandpage.htm, which resides on a third server not being load balanced.

The third server's IP address is 10.101.3.189. Because barandpage.htm is specified, the progress bar and alternate page will both be displayed.

The appliance has one configured virtual server "vsvr" whose IP address (Virtual Server) is 10.101.3.200.

At the NetScaler command prompt, type the following commands:

```
enable feature SC LB
add service psvc1 10.101.3.187 HTTP 80
add service psvc2 10.101.3.188 HTTP 80
add service alt-cont-svc 10.101.3.189 HTTP 80
add vserver vsvr HTTP 10.101.3.200 80
bind lb vserver vsvr psvc1
bind lb vserver vsvr psvc2
add sc policy policy10 -url /cgi-bin/slow.asp
-delay 4000000 -action ACS alt-cont-svc
```

/NetScaler 9000 system /barandpage.htm
bind lb vserver vsvr -policyName policy10
set lb vserver vsvr -sc ON
save config

Example 5 - SureConnect with Content Switching

This example illustrates how to configure SureConnect where the NetScaler content switching and load balancing features are being used. SureConnect is configured on a load balancing virtual server bound to a content switching virtual server.

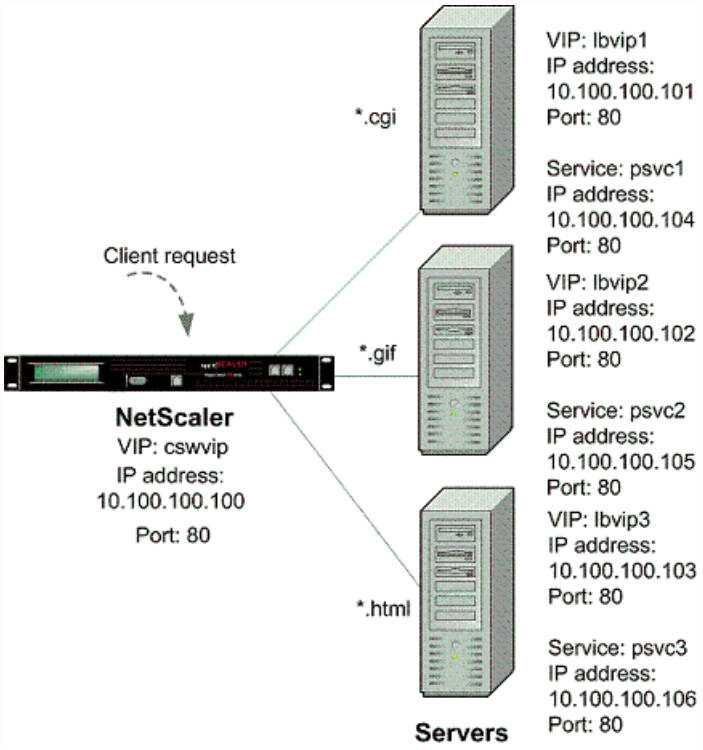
The alternate content is distributed under the content switching virtual server according to the content switching rules. For more information about load balancing and content switching, see "Load Balancing" and "Content Switching."

In this case, three physical services with IP addresses 10.100.100.104, 10.100.100.105, and 10.100.100.106 are bound to three load balancing virtual servers with IP addresses 10.100.100.101, 10.100.100.102, and 10.100.100.103. These three load balancing virtual servers are bound to a content switching virtual server with IP address 10.100.100.100.

In this setup, lbvip1 contains .cgi content, lbvip2 contains .gif content, and .lbvip3 contains .html content.

The name and location of the alternate page file is specified in the file alternatepage.htm, which resides on lbvip3. The embedded objects in this file must be distributed according to the content switching rules (any embedded gif will reside on lbvip2, any embedded htm will reside on lbvip3, and so on).

Figure 3. SureConnect Configuration - Example 5



At the NetScaler command prompt, type the following commands:

enable feature CS LB SC
add vserver cswvip HTTP 10.100.100.100 80 -type CONTENT
add vserver lbvip1 HTTP 10.100.100.101 80 -type ADDRESS

```
add vserver lbvip2 HTTP 10.100.100.102 80 -type ADDRESS
add vserver lbvip3 HTTP 10.100.100.103 80 -type ADDRESS
add service psvc1 10.100.100.104 HTTP 80
add service psvc2 10.100.100.105 HTTP 80
add service psvc3 10.100.100.106 HTTP 80
bind lb vserver lbvip1 psvc1
bind lb vserver lbvip2 psvc2
bind lb vserver lbvip3 psvc3
add cs policy CSWpolicy1 -url /*.cgi
bind cs vserver cswvip lbvip1 -policyName CSWpolicy1
add cs policy CSWpolicy2 -url /*.gif
bind cs vserver cswvip lbvip2 -policyName CSWpolicy2
add cs policy CSWpolicy3 -url /*.htm
bind cs vserver cswvip lbvip3 -policyName CSWpolicy3
add sc policy SCpol -url /cgi-bin/delay.cgi -delay 4000000 -action ACS cswvip /alternatepage.htm
bind lb vserver lbvip1 -policyName SCpol
set lb vserver lbvip1 -sc ON
save config
```

Surge Protection

Mar 21, 2012

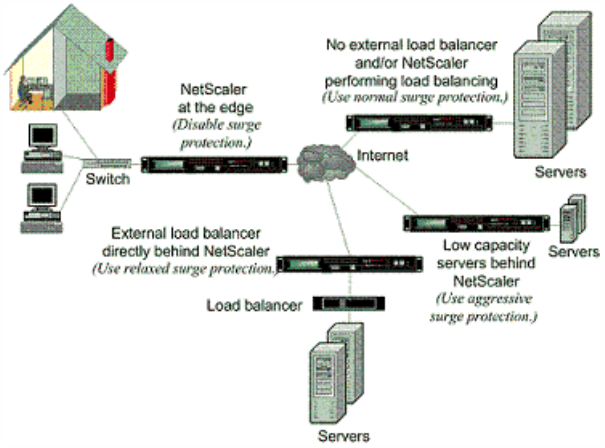
When a surge in client requests overloads a server, server response becomes slow, and the server is unable to respond to new requests. The Surge Protection feature ensures that connections to the server occur at a rate that the server can handle. The response rate depends on how surge protection is configured. The NetScaler appliance also tracks the number of connections to the server, and uses that information to adjust the rate at which it opens new server connections.

Surge protection is enabled by default. If you do not want to use surge protection, as will be the case with some special configurations, you must disable it.

The default surge protection settings are sufficient for most uses, but you can configure surge protection to tune it for your needs. First, you can set the throttle value to tell it how aggressively to manage connection attempts. Second you can set the base threshold value to control the maximum number of concurrent connections that the NetScaler appliance will allow before triggering surge protection. (The default base threshold value is set by the throttle value, but after setting the throttle value you can change it to any number you want.)

The following figure illustrates how surge protection is configured to handle traffic to a Web site.

Figure 1. A Functional Illustration of NetScaler Surge Protection



Note: If the NetScaler appliance is installed at the edge of the network, where it interacts with network devices on the client side of the Internet, the surge protection feature must be disabled. Surge protection must also be disabled if you enable USIP (Using Source IP) mode on your appliance.

The following example and illustration show the request and response rates for two cases. In one case, surge protection is disabled, and in the other it is enabled.

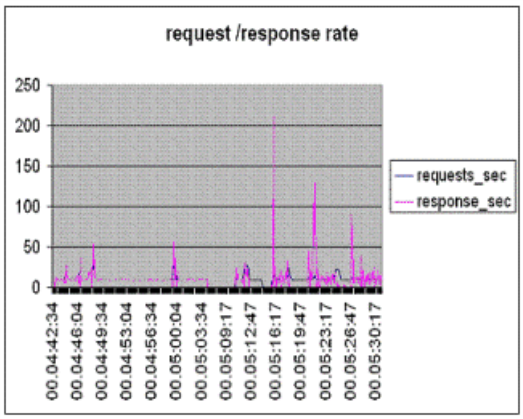
When surge protection is disabled and a surge in requests occurs, the server accepts as many requests as it can process concurrently, and then begins to drop requests. As the server becomes more overloaded, it goes down and the response rate is reduced to zero. When the server recovers from the crash, usually several minutes later, it sends resets for all pending requests, which is abnormal behavior, and also responds to new requests with resets. The process repeats for each surge in requests. Therefore, a server that is under DDoS attack and receives multiple surges of requests can become unavailable to legitimate users.

When surge protection is enabled and a surge in requests occurs, surge protection manages the rate of requests to the server, sending requests to the server only as fast as the server can handle those requests. This enables the server to respond to each request correctly in the order it was received. When the surge is over, the backlogged requests are cleared

as fast as the server can handle them, until the request rate matches the response rate.

The following figure compares the request and response scenarios when surge protection is enabled to that when it is disabled.

Figure 2. Request/Response Rate with and without Surge Protection



Disabling and Reenabling Surge Protection

Sep 03, 2013

The surge protection feature is enabled by default. When surge protection is enabled, it is active for any service that you add.

At the command prompt, type one of the following sets of commands to disable or reenable surge protection and verify the configuration:

- disable ns feature SurgeProtection
- show ns feature

- enable ns feature SurgeProtection
- show ns feature

Example

```
disable ns feature SurgeProtection
 Done show ns feature

      Feature                Acronym          Status
      -------                -------          ------
 1)    Web Logging              WL              ON
 2)    Surge Protection         SP              OFF
 .
 .
 .
 23)   HTML Injection           HTMLInjection     ON
 24)   NetScaler Push           push            OFF
Done
enable ns feature SurgeProtection
Done
> show ns feature

      Feature                Acronym          Status
      -------                -------          ------
 1)    Web Logging              WL              ON
 2)    Surge Protection         SP              ON
 .
 .
 .

 23)   HTML Injection           HTMLInjection     ON
 24)   NetScaler Push           push            OFF
Done
>
```

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Change Advanced Features.
3. In the Configure Advanced Features dialog box, clear the selection from the Surge Protection check box to disable the surge protection feature, or select the check box to enable the feature.
4. Click OK.
5. In the Enable/Disable Feature(s) dialog box, click Yes. A message appears in the status bar, stating that the feature has been enabled or disabled.

1. Navigate to Traffic Management > Load Balancing > Services. The list of configured services is displayed in the details pane.
2. In the details pane, select the service for which you want to disable or reenable the surge protection feature, and then click Open.
3. In the Configure Service dialog box, click the Advanced tab and scroll down.
4. In the Others frame, clear the selection from the Surge Protection check box to disable the surge protection feature, or select the check box to enable the feature.
5. Click OK. A message appears in the status bar, stating that the feature has been enabled or disabled.
   Note: Surge protection works only when both the feature and the service setting are enabled.

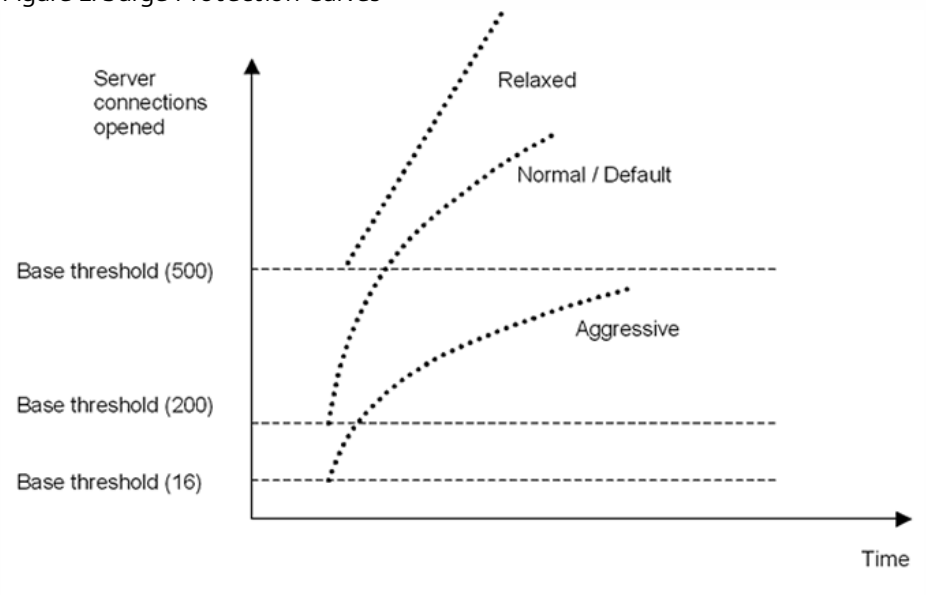
Setting Thresholds for Surge Protection

May 14, 2012

To set the rate at which the NetScaler appliance opens connections to the server, you must configure the threshold and throttle values for surge protection.

The following figure shows the surge protection curves that result from setting the throttle rate to relaxed, normal, or aggressive. Depending on the configuration of the server capacity, you can set base threshold values to generate appropriate surge protection curves.

Figure 1. Surge Protection Curves

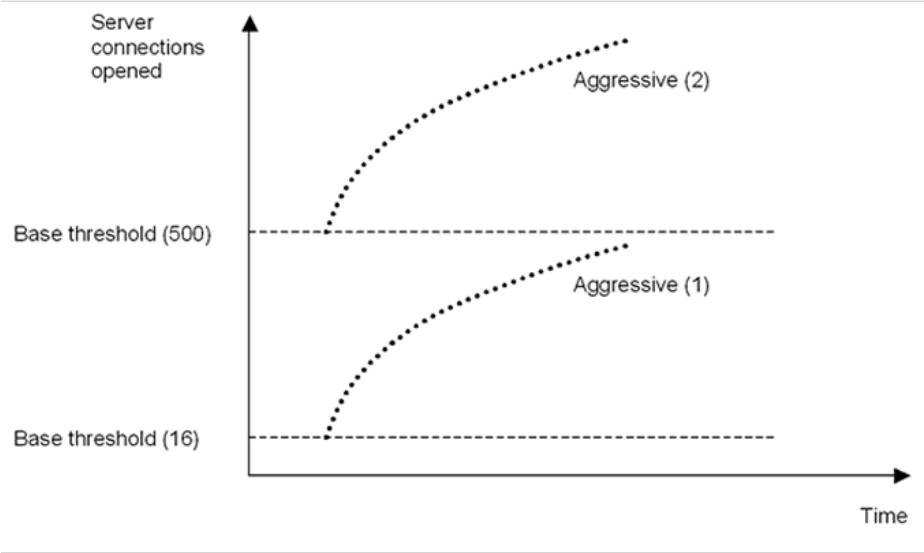


Your configuration settings affect the behavior of surge protection in the following manner:

- If you do not specify a throttle rate, it is set to normal (the default value), and the base threshold is set to 200, as shown in the preceding figure.
- If you specify a throttle rate (aggressive, normal, or relaxed) without specifying a base threshold, the curve reflects the default values of the base threshold for that throttle rate. For example, if you set the throttle rate to relaxed, the resulting curve will have the base threshold value of 500.
- If you specify only the base threshold, the entire surge protection curve shifts up or down, depending on the value you specify, as shown in the figure that follows.
- If you specify both a base threshold and a throttle rate, the resulting surge protection curve is based on the set throttle rate and adjusted according to the value set for the base threshold.

In the following figure, the lower curve (Aggressive 1) results when the throttle rate is set to aggressive but the base threshold is not set. The upper curve (Aggressive 2) results when the base threshold is set to 500, but the throttle rate is not set. The second upper curve (Aggressive 2) also results when the base threshold is set to 500, and the throttle rate is set to aggressive.

Figure 2. Aggressive Rate with the Default or a Set Base Threshold



To set the threshold for surge protection by using the configuration utility

1. In the navigation pane, expand System, and then select Settings.
2. In the details pane, click Global System Settings.
3. If you want to set a base threshold different from the default for the throttle rate, in the Configure Global Settings dialog box, Base Threshold text box, enter the maximum number of concurrent server connections allowed before surge protection is triggered. The base threshold is the maximum number of server connections that can be open before surge protection is activated. The maximum value for this setting is 32,767 server connections. The default setting for this value is controlled by the throttle rate you choose in the next step.
   Note: If you do not set an explicit value here, the default value will be used.
4. In the Throttle drop-down list, select a throttle rate. The throttle is the rate at which the NetScaler appliance allows connections to the server to be opened. The throttle can be set to the following values:
   Aggressive
   Choose this option when the connection-handling and surge-handling capacity of the server is low and the connection needs to be managed carefully. When you set the throttle to aggressive, the base threshold is set to a default value of 16, which means that surge protection is triggered whenever there are 17 or more concurrent connections to the server.
   Normal
   Choose this option when there is no external load balancer behind the NetScaler appliance or downstream. The base threshold is set to a value of 200, which means that surge protection is triggered whenever there are 201 or more concurrent connections to the server. Normal is the default throttle option.
   Relaxed
   Choose this option when the NetScaler appliance is performing load balancing between a large number of Web servers, and can therefore handle a high number of concurrent connections. The base threshold is set to a value of 500, which means that surge protection is triggered only when there are 501 or more concurrent connections to the server.
5. Click OK. A message appears in the status bar, stating that the global settings are configured.

Flushing the Surge Queue

Dec 04, 2013

When a physical server receives a surge of requests, it becomes slow to respond to the clients that are currently connected to it, which leaves users dissatisfied and disgruntled. Often, the overload also causes clients to receive error pages. To avoid such overloads, the NetScaler appliance provides features such as surge protection, which controls the rate at which new connections to a service can be established.

The appliance does connection multiplexing between clients and physical servers. When it receives a client request to access a service on a server, the appliance looks for an already established connection to the server that is free. If it finds a free connection, it uses that connection to establish a virtual link between the client and the server. If it does not find an existing free connection, the appliance establishes a new connection with the server, and establishes a virtual link between client and the server. However, if the appliance cannot establish a new connection with the server, it sends the client request to a surge queue. If all the physical servers bound to the load balancing or content switching virtual server reach the upper limit on client connections (max client value, surge protection threshold or maximum capacity of the service), the appliance cannot establish a connection with any server. The surge protection feature uses the surge queue to regulate the speed at which connections are opened with the physical servers. The appliance maintains a different surge queue for each service bound to the virtual server.

The length of a surge queue increases whenever a request comes for which the appliance cannot establish a connection, and the length decreases whenever a request in the queue gets sent to the server or a request gets timed out and is removed from the queue.

If the surge queue for a service or service group becomes too long, you may want to flush it. You can flush the surge queue of a specific service or service group, or of all the services and service groups bound to a load balancing virtual server. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. For those requests, the client has to make a fresh request.

You can also flush the surge queue of a content switching virtual server. If a content switching virtual server forwards some requests to a particular load balancing virtual server, and the load balancing virtual server also receives some other requests, when you flush the surge queue of the content switching virtual server, only the requests received from this content switching virtual server are flushed; the other requests in the surge queue of the load balancing virtual server are not flushed.

Note: You cannot flush the surge queues of cache redirection, authentication, VPN or GSLB virtual servers or GSLB services.
Note: Do not use the Surge Protection feature if Use Source IP (USIP) is enabled.

The flush ns surgeQ command works in the following manner:

- You can specify the name of a service, service group, or virtual server whose surge queue has to be flushed.
- If you specify a name while executing the command, surge queue of the specified entity will be flushed. If more than one entity has the same name, the appliance flushes surge queues of all those entities.
- If you specify the name of a service group, and a server name and port while executing the command, the appliance flushes the surge queue of only the specified service group member.
- You cannot directly specify a service group member (<serverName> and <port>) without specifying the name of the service group (<name>) and you cannot specify <port> without a <serverName>. Specify the <serverName> and <port> if you want to flush the surge queue for a specific service group member.
- If you execute the command without specifying any names, the appliance flushes the surge queues of all the entities present on the appliance.
- If a service group member is identified with a server name, you must specify the server name in this command; you cannot specify its IP address.

At the command prompt, type:

flush ns surgeQ [-name <name>] [-serverName <serverName> <port>]

Examples

1.
flush ns surgeQ –name SVC1ANZGB –serverName 10.10.10.1 80
The above command flushes the surge queue of the service or virtual server that is named SVC1ANZGB and has IP address as 10.10.10
2.
flush ns surgeQ
The above command flushes all the surge queues on the appliance.

1. Navigate to Traffic Management > Load Balancing.
2. To select an entity, do one of the following:
   - To flush the surge queue of a virtual server, click Virtual Servers, and then select the virtual server.
   - To flush the surge queue of a service, click Services, and then select the service.

- To flush the surge queue of all the members in a service group, click Service Groups, and then select the service group.
- To flush the surge queue of a specific member in a service group, click Service Groups, and in the action pane, click Manage Members. In the Manage Members of a Service Group dialog box, select the service group member.

Note: You can select multiple entities in any window.

Note: To flush the surge queue of a content switching virtual server, in Steps 1 and 2, expand Content Switching, and then select a virtual server.

3. In the action pane, click Flush Surge Queue.
4. Click OK.

Note: On the appliance, if there are other entities with the same name as you selected, you are alerted that the surge queues of those entities would also be flushed. Take an appropriate action.

API

Mar 14, 2012

The following topics provides information on the API support provided for the NetScaler appliance. Intended for application developers who want to configure and monitor a NetScaler appliance programmatically.

NITRO API	Describes the use of the NITRO APIs for the REST, Java, and .NET platforms.
XML API	Describes the properties and use of the XML API.

NITRO API

Jun 03, 2014

The NetScaler NITRO protocol allows you to configure and monitor the NetScaler appliance programmatically.

NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs).

Note: You must have a basic understanding of the NetScaler appliance before using NITRO.
To use the NITRO protocol, the client application needs only the following:

- Access to a NetScaler appliance, version 9.2 or later.
- To use REST interfaces, you must have a system to generate HTTP or HTTPS requests (payload in JSON format) to the NetScaler appliance. You can use any programming language or tool.
- For Java clients, you must have a system where Java Development Kit (JDK) 1.5 or later is available. The JDK can be downloaded from http://www.oracle.com/technetwork/java/javase/downloads/index.html.
- For .NET clients, you must have a system with .NET framework 3.5 or later installed. The .NET framework can be downloaded from http://www.microsoft.com/downloads/en/default.aspx.

Note: You can also use XML APIs to configure the NetScaler appliance programmatically. For more information, see "XML API".

Obtaining the NITRO Package

Jun 03, 2014

The NITRO package is available as a tar file on the Downloads page of the NetScaler appliance's configuration utility. You must download and un-tar the file to a folder on your local system. This folder is referred to as <NITRO_SDK_HOME> in this documentation.

The folder contains the NITRO libraries in the lib subfolder. The libraries must be added to the client application classpath to access NITRO functionality. The <NITRO_SDK_HOME> folder also provides samples and documentation that can help you understand the NITRO SDK.

Note:

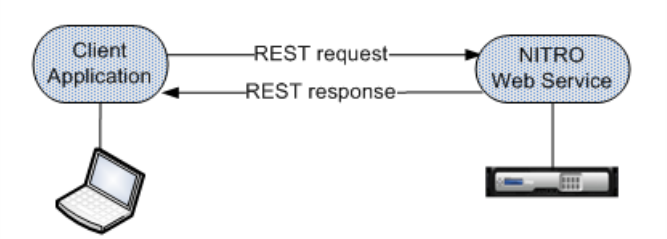
- The REST package contains only documentation for using the REST interfaces.

How NITRO Works

Jun 03, 2014

The NITRO infrastructure consists of a client application and the NITRO Web service running on a NetScaler appliance. The communication between the client application and the NITRO web service is based on REST architecture using HTTP or HTTPS.

Figure 1. NITRO execution flow



As shown in the above figure, a NITRO request is executed as follows:

1. The client application sends REST request message to the NITRO web service. When using the SDKs, an API call is translated into the appropriate REST request message.
2. The web service processes the REST request message.
3. The NITRO web service returns the corresponding REST response message to the client application. When using the SDKs, the REST response message is translated into the appropriate response for the API call.

To minimize traffic on the NetScaler network, you retrieve the whole state of a resource from the server, make modifications to the state of the resource locally, and then upload it back to the server in one network transaction. For example, to update a load balancing virtual server, you must retrieve the object, update the properties, and then upload the changed object in a single transaction.

Note: Local operations on a resource (changing its properties) do not affect its state on the server until the state of the object is explicitly uploaded.
NITRO APIs are synchronous in nature. This means that the client application waits for a response from the NITRO web service before executing another NITRO API.

Java API

Jun 05, 2014

NetScaler NITRO APIs are categorized depending on the scope and purpose of the APIs into system APIs, feature configuration APIs, and feature statistics APIs. Additionally, you can import and export AppExpert applications. You can also troubleshoot NITRO operations.

Note: All NITRO operations are logged in the /var/log/nitro.log file on the appliance.

Tutorials

Nov 05, 2013

These tutorials demonstrate the end-to-end usage of NITRO to achieve the following:

- Create Your First NITRO Application
- Create a NetScaler Cluster

Create Your First NITRO Application

Sep 12, 2012

After completing this tutorial, you will understand and be able to perform the following tasks:

- Integrate NITRO with the IDE
- Log in to the appliance
- Create a load balancing virtual server (lbvserver)
- Retrieve details of an lbvserver
- Delete an lbvserver
- Save the configurations on the appliance
- Log out of the appliance
- Debug the NITRO application

Before you begin, make sure that you have the latest NITRO SDK and that the client application satisfies the prerequisites for using the NITRO SDK.

For the executable code, see the <NITRO_SDK_HOME>/sample/MyFirstNitroApplication.java sample file.

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.
2. Create a new class and name it **MyFirstNitroApplication**.
3. Create an instance of `com.citrix.netscaler.nitro.service.nitro_service` class. This instance is used to perform all operations on the appliance:
   ```
   nitro_service ns_session = new nitro_service("10.102.29.170","HTTP");
   ```
   This code establishes a connection with an appliance that has IP address 10.102.29.170 and uses the HTTP protocol. Replace 10.102.29.170 with the IP address of the NetScaler appliance that you have access to.
4. Use the `nitro_service` instance to log in to the appliance using your credentials:
   ```
   ns_session.login("admin","verysecret");
   ```
   This code logs into the appliance, with user name as `admin` and password as `verysecret`. Replace the credentials with your login credentials.
5. Enable the load balancing feature:
   ```
   String[] features_to_be_enabled = {"lb"};
   ns_session.enable_features(features_to_be_enabled);
   ```
   This code first sets the features to be enabled in an array and then enables the LB feature.
6. Create an instance of the `com.citrix.netscaler.nitro.resource.config.lb.lbvserver` class. You will use this instance to perform operations on the lbvserver.
   ```
   lbvserver new_lbvserver_obj = new lbvserver();
   ```
7. Use the `lbvserver` instance to create a new lbvserver:
   ```
   new_lbvserver_obj.set_name("MyFirstLbVServer");
   new_lbvserver_obj.set_ipv46("10.102.29.88");
   new_lbvserver_obj.set_servicetype("HTTP");
   new_lbvserver_obj.set_port(88);
   new_lbvserver_obj.set_lbmethod("ROUNDROBIN");
   lbvserver.add(ns_session,new_lbvserver_obj);
   ```
   This code first sets the attributes (name, IP address, service type, port, and load balancing method) of the lbvserver locally and then adds it to the appliance by using the corresponding `add()` method.
8. Retrieve the details of the lbvserver you have created:
   ```
   new_lbvserver_obj = lbvserver.get(ns_session,new_lbvserver_obj.get_name());
   System.out.println("Name : " +new_lbvserver_obj.get_name() +"\n" +"Protocol : " +new_lbvserver_obj.get_servicetype());
   ```
   This code first retrieves the details of the lbvserver as an object from the NetScaler, extracts the required attributes (name and service type) from the object, and displays the results.
9. Delete the lbvserver you created in the above steps:
   ```
   lbvserver.delete(ns_session, new_lbvserver_obj.get_name());
   ```

10. Save the configurations:
    ns_session.save_config();
11. Log out of the appliance:
    ns_session.logout();

All NITRO exceptions are captured by the com.citrix.netscaler.nitro.exception.nitro_exception class. For a more detailed description, see Exception Handling.

Create a NetScaler Cluster

Nov 05, 2013

After completing this tutorial you will be able to create a two-node NetScaler cluster. To add more appliances to the cluster you must repeat the procedure that adds and joins the node to the cluster.

For the executable code, see the <NITRO_SDK_HOME>/sample/CreateCluster.java sample file.

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.
2. Create a new class and name it CreateCluster.
3. Log on to one of the appliances that you want to add to the cluster and create a cluster:

```
//Connect to the first appliance that you want to add to the cluster
nitro_service nonClipSession0 = new nitro_service(nsipAddress0,protocol);
nonClipSession0.login(uName,password);

//Create a cluster instance
clusterinstance newClusterInstance = new clusterinstance();
newClusterInstance.set_clid(1);
clusterinstance.add(nonClipSession0,newClusterInstance);

//Add the appliance to the cluster
clusternode ClusterNode0 = new clusternode();
ClusterNode0.set_nodeid(0);
ClusterNode0.set_ipaddress(nsipAddress0);
ClusterNode0.set_state("ACTIVE");
ClusterNode0.set_backplane("0/1/1");
clusternode.add(nonClipSession0,ClusterNode0);

//Add the cluster IP address
nsip newNSIPAddress = new nsip();
newNSIPAddress.set_ipaddress(clipAddress);
newNSIPAddress.set_netmask("255.255.255.255");
newNSIPAddress.set_type("CLIP");
nsip.add(nonClipSession0,newNSIPAddress);

//Enable the cluster instance
clusterinstance.enable(nonClipSession0, newClusterInstance);

//Save the configurations
nonClipSession0.save_config();

//Warm reboot the appliance
nonClipSession0.reboot(true);
```

   The cluster is created and the first node is added to the cluster. This node becomes the initial configuration coordinator of the cluster.

4. Log on to the cluster IP address to add other appliances to the cluster:

```
//Connect to the cluster IP address
nitro_service clipSession = new nitro_service(clipAddress,protocol);
clipSession.login(uName,password);

//Add the node to the cluster
clusternode ClusterNode1 = new clusternode();
ClusterNode1.set_nodeid(1);
ClusterNode1.set_ipaddress(nsipAddress1);
ClusterNode1.set_state("ACTIVE");
ClusterNode1.set_backplane("1/1/1");
clusternode.add(clipSession,ClusterNode1);

//Save the configurations
clipSession.save_config();
```

5. Log on to the appliance that you added in the previous step and join it to the cluster:

```
//Connect to the node that you have just added to the cluster
nitro_service nonClipSession1 = new nitro_service(nsipAddress1,protocol);
nonClipSession1.login(uName,password);

//Join the node to the cluster
cluster newCluster = new cluster();
newCluster.set_clip(clipAddress);
newCluster.set_password(password);
cluster.join(nonClipSession1,newCluster);

//Save the configurations
nonClipSession1.save_config();

//Warm reboot the appliance
nonClipSession1.reboot(true);
```

The second node is now a part of the cluster.

6. Verify the details of the cluster by logging on to the cluster IP address

```
//Retrieving the cluster node details
Long id = new Long(1);
clusternode node= clusternode.get(clipSession, id);
System.out.println("Node ID: "+ node.get_nodeid() + " | Admin state: " + node.get_state() + " | Backplane interface: "+ node.get_backplane());

//Retrieving the cluster instance details
Long id1 = new Long(1);
clusterinstance instance= clusterinstance.get(clipSession, id1);
System.out.println("Cluster instance ID: "+ instance.get_clid() + " | Operational state: " +instance.get_operationalstate());
```

System APIs

Jun 03, 2014

The first step towards using NITRO is to establish a session with the NetScaler appliance and then authenticate the session by using the NetScaler administrator's credentials.

You must create an object of the `com.citrix.netscaler.nitro.service.nitro_service` class by specifying the NetScaler IP (NSIP) address and the protocol to connect to the appliance (HTTP or HTTPS). You then use this object and log on to the appliance by specifying the user name and the password of the NetScaler administrator.

Note: You must have a user account on that appliance. The configuration operations that you perform are limited by the administrative roles assigned to your account.
The following sample code establishes a session with a NetScaler appliance with IP address 10.102.29.60 by using the HTTPS protocol:

```
//Specify the NetScaler appliance IP address and protocol
nitro_service ns_session = new nitro_service("10.102.29.60","https");

//Specify the login credentials
ns_session.login("admin","verysecret");
```

Note: When using HTTPS, you must make sure that the root CA is added to the truststore. By default, NITRO validates the SSL certificate and verifies the hostname. To disable this validation, use the following:

```
ns_session.set_certvalidation(false);
ns_session.set_hostnameverification(false);
```

Note: By default, the connection to the appliance expires after 30 minutes of inactivity. You can modify the timeout period by specifying a new timeout period (in seconds) in the `login` method. For example, to modify the timeout period to 60 minutes:

```
ns_session.login("admin","verysecret",3600);
```

You must use the `nitro_service` object in all further NITRO operations on the appliance. For example to save the configurations on the appliance, you must use the `nitro_service` object as follows:

```
ns_session.save_config();
```

The `nitro_service` class also provides APIs to perform other system-level operations such as enabling and disabling NetScaler features and modes, saving and clearing NetScaler configurations, setting the session timeout, setting the severity of the exceptions to be handled, setting the behavior of bulk operations, and disconnecting from the appliance.

Feature Configuration APIs

Jun 03, 2014

NetScaler resources are organized into a set of packages or namespaces. Each package or namespace corresponds to a NetScaler feature. For example, all load-balancing related resources, such as load balancing virtual server, load balancing group, and load balancing monitor are available in com.citrix.netscaler.nitro.resource.config.lb.

Similarly, all application firewall related resources, such as application firewall policy and application firewall archive are available in com.citrix.netscaler.nitro.resource.config.appfw.

Each NetScaler resource is represented by a class. For example, the class that represents a load balancing virtual server is called lbvserver (in com.citrix.netscaler.nitro.resource.config.lb). The state of a resource is represented by properties of a class. You can set the value for these properties by using the set_<propertyname>() methods provided by the resource class. For example to set the IP address of a load balancing virtual server, the lbvserver class provides the set_ipv46() method. Similarly, you can get the value of these properties by using the get_<propertyname>() methods of the resource class.

Note: The setter and getter properties are always executed locally on the client. They do not involve any network interaction with the NITRO web service. All properties have basic simple types: integer, long, boolean, and string.
A resource class provides APIs to perform the following operations:

Create | Retrieve | Update | Delete | Enable/Disable | Unset | Bind/Unbind | Global bind | Bulk operations

Create

To create a new resource, instantiate the resource class, configure the resource by setting its properties locally, and then upload the new resource instance to the NetScaler appliance.

The following sample code creates a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally
new_lbvserver_obj.set_name("MyFirstLbVServer");
new_lbvserver_obj.set_ipv46("10.102.29.88");
new_lbvserver_obj.set_port(88);
new_lbvserver_obj.set_servicetype("HTTP");
new_lbvserver_obj.set_lbmethod("ROUNDROBIN");

//Upload the resource to NetScaler
lbvserver.add(ns_session,new_lbvserver_obj);
```

Retrieve

To retrieve the properties of a resource, you retrieve the resource object from the NetScaler appliance. Once the object is retrieved, you can extract the required properties of the resource locally, without further network traffic.

The following sample code retrieves the details of a load balancing virtual server:

```
//Retrieve the resource object from the NetScaler
```

```
new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally
System.out.println(new_lbvserver_obj.get_name());
System.out.println(new_lbvserver_obj.get_servicetype());
```

You can also retrieve resources by specifying a filter on the value of their properties by using the `com.citrix.netscaler.nitro.util.filtervalue` class.

For example, you can retrieve all the load balancing virtual servers that have their port set to 80 and servicetype to HTTP:

```
filtervalue[] filter = new filtervalue[2];
filter[0] = new filtervalue("port","80");
filter[1] = new filtervalue("servicetype","HTTP");
lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

You can also retrieve all NetScaler resources of a certain type, such as all services in the NetScaler appliance, by calling the static `get()` method on the service class, without providing a second parameter, as follows:

```
service[] resources = service.get(ns_session);
```

Update

To update the properties of a resource, instantiate the resource class, specify the name of the resource to be updated, configure the resource by updating its properties locally, and then upload the updated resource instance to the NetScaler appliance.

The following sample code updates the service type and load balancing method of a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver update_lb = new lbvserver();

//Specify the name of the lbvserver to be updated
update_lb.set_name("MyFirstLbVServer");

//Specify the updated service type and lb method
update_lb.set_servicetype("https");
update_lb.set_lbmethod("LEASTRESPONSETIME");

//Upload the resource to NetScaler
lbvserver.update(ns_session,update_lb);
```

Note: Some properties in some NetScaler resources are not allowed to be modified after creation. The port number or the service type (protocol) of a load balancing virtual server or a service, are examples of such properties. Even though the update method appears to succeed, these properties retain their original values on the appliance.

Delete

To delete an existing resource, invoke the `delete()` method on the resource class, by passing the name of the resource.

The following sample code deletes a load balancing virtual server with name "MyFirstLbVServer":

```
lbvserver remove_lb = new lbvserver();
remove_lb.set_name("MyFirstLbVServer");
lbvserver.delete(ns_session, remove_lb);
```

Enable/Disable

To enable a resource, invoke the enable() method.

The following sample code enables a load balancing virtual server named "lb_vip":

```
lbvserver obj = new lbvserver();
obj.set_name = "lb_vip";
lbvserver.enable(ns_session, obj);
```

Note: To disable a resource, invoke the disable() method.

```
lbvserver.disable(ns_session,obj);
```

Unset

To unset the value that is set to a parameter, invoke the unset() method on the resource class, by passing the name of the resource and the parameters to be unset. If the parameter has a default value, the value is reset to that value.

The following sample code unsets the load balancing method and the comments of a load balancing virtual server named "lb_123":

```
lbvserver lb1 = new lbvserver();
lb1.set_name("lb_123");
String args[] = {"comment", "lbmethod"};
lbvserver.unset(ns_session, lb1, args);
```

Bind/Unbind

NetScaler resources form relationships with each other through the process of binding. This is how services are associated with a load balancing virtual server (by binding them to it), or how various policies are bound to a load balancing virtual server. Each binding relationship is represented in NITRO by its own class.

To bind one NetScaler resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the lbvserver_service_binding class) and add it to the NetScaler configuration (by using the static add() method on this class).

Binding classes have a property representing the name of each resource in the binding relationship. They can also have other properties related to that relationship (for example, the weight of the binding between a load balancing virtual server and a service).

The following sample code binds a service to a load balancing virtual server, by specifying a certain weight for the binding:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.set_name("MyFirstLbVServer");
bindObj.set_servicename("svc_prod");
bindObj.set_weight(20);
lbvserver_service_binding.add(ns_session,bindObj);
```

Note: To unbind a resource from another, invoke the delete() method from the resource binding class, by passing the name of the two resources.

The following code sample unbinds a service from a server:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.set_name("MyFirstLbVServer");
bindObj.set_servicename("svc_prod");
lbvserver_service_binding.delete(ns_session,bindObj);
```

Global bind

Some NetScaler resources can be bound globally to affect the whole system. For example, a compression policy can be bound to an load balancing virtual server, in which case the policy affects only the traffic on that load balancing virtual server. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

Some NITRO classes can be used to bind resources globally. These classes have names that follow the following pattern: <featurename>global_<resourcetype>_binding.

For example, the class aaaglobal_preauthenticationpolicy_binding is used to bind preauthentication policies globally.

The following sample code creates a preauthentication action and a preauthentication policy that uses that action, and then binds the policy globally at priority 200:

```
aaapreauthenticationaction preauth_act1;
aaapreauthenticationpolicy preauth_pol1;
aaaglobal_aaapreauthenticationpolicy_binding glob_binding;
preauth_act1 = new aaapreauthenticationaction();
preauth_act1.set_name("preauth_act1");
preauth_act1.set_preauthenticationaction("ALLOW");
aaapreauthenticationaction.add(ns_session,preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();
preauth_pol1.set_name("preauth_pol1");
preauth_pol1.set_rule("CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS");
preauth_pol1.set_reqaction("preauth_act1");
aaapreauthenticationpolicy.add(ns_session,preauth_pol1);

glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();
glob_binding.set_policy("preauth_pol1");
glob_binding.set_priority(200);
aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

Bulk operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation. To perform a bulk operation, you instantiate an array of the resource class, configure the properties of all the instances locally, and then upload all the instances to the NetScaler with one command.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors:

- Exit. When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- Rollback. When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- Continue. All the commands in the list are executed even if some commands fail.

Note: You must configure the required behavior while establishing a connection with the appliance.

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");
```

```
ns_session.set_onerror(OnerrorEnum.CONTINUE);
ns_session.login("admin","verysecret");
```

The following sample code creates two load balancing virtual servers:

```
//Create an array of lbvserver instances
lbvserver[] lbs = new lbvserver[2];

//Specify properties of the first lbvserver
lbs[0] = new lbvserver();
lbs[0].set_name("lbvserv1");
lbs[0].set_servicetype("http");
lbs[0].set_ipv46("10.70.136.5");
lbs[0].set_port(80);

//Specify properties of the second lbvserver
lbs[1] = new lbvserver();
lbs[1].set_name("lbvserv2");
lbs[1].set_servicetype("https");
lbs[1].set_ipv46("10.70.136.5");
lbs[1].set_port(443);

//Upload the properties of the two lbvservers to the NetScaler
lbvserver.add(ns_session,lbs);
```

Cluster APIs

Jun 03, 2014

For managing clusters, you can add or remove a cluster instance or an individual node and perform a few other instance or node operations such as viewing instance or node properties. You can also configure the cluster IP address. Other cluster-management tasks include joining a NetScaler appliance to the cluster and configuring a linkset.

Cluster Instance Operations

The com.citrix.netscaler.nitro.resource.config.cluster.clusterinstance class provides APIs to manage a cluster instance.

The following sample code creates a cluster instance with ID 1:

```
clusterinstance new_cl_inst_obj = new clusterinstance();
//Set the properties of the cluster instance locally
new_cl_inst_obj.set_clid(1);
new_cl_inst_obj.set_preemption("ENABLED");

//Upload the cluster instance
clusterinstance.add(ns_session,new_cl_inst_obj);
```

Cluster Node Operations

The com.citrix.netscaler.nitro.resource.config.cluster.clusternode class provides APIs to manage cluster nodes.

The following sample code adds a cluster node with NSIP address 10.102.29.60:

```
clusternode new_cl_node_obj = new clusternode();
//Set the properties of the cluster node locally
new_cl_node_obj.set_nodeid(0);
new_cl_node_obj.set_ipaddress("10.102.29.60");
new_cl_node_obj.set_state("ACTIVE");
new_cl_node_obj.set_backplane("0/1/1");

//Upload the cluster node
clusternode.add(ns_session,new_cl_node_obj);
```

Add a Cluster IP Address

The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as a cluster IP address, you must specify the type as CLIP.

The following sample code configures a cluster IP address on NetScaler appliance with IP address 10.102.29.60:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.set_ipaddress("10.102.29.61");
new_nsip_obj.set_netmask("255.255.255.255");
new_nsip_obj.set_type("CLIP");

//Upload the cluster node
```

```
nsip.add(ns_session,new_nsip_obj);
```

Add a Spotted IP Address

The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as spotted, you must specify the ID of the node that must own the IP address. This configuration must be done on the cluster IP address.

The following sample code configures a spotted SNIP address on a node with ID 1:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.set_ipaddress("10.102.29.77");
new_nsip_obj.set_netmask("255.255.255.0");
new_nsip_obj.set_type("SNIP");
new_nsip_obj.set_ownernode(1);

//Upload the cluster node
nsip.add(ns_session,new_nsip_obj);
```

Join NetScaler Appliance to Cluster

The com.citrix.netscaler.nitro.resource.config.cluster.cluster class provides the join() API to join a NetScaler appliance to the cluster. You must specify the cluster IP address and the nsroot password of the configuration coordinator.

The following sample joins a NetScaler appliance to a cluster:

```
cluster new_cl_obj = new cluster();
//Set the properties of the cluster  locally
new_cl_obj.set_clip("10.102.29.61");
new_cl_obj.set_password("verysecret");

//Upload the cluster
cluster.add(ns_session,new_cl_obj);
```

Linkset Operations

The com.citrix.netscaler.nitro.resource.config.network.linkset class provides the APIs to manage linksets.

To configure a linkset, do the following:

1. Add a linkset by invoking the add() method of the linkset class.
2. Bind the interfaces to the linkset using the add() method of the linkset_interface_binding class.

The following sample code creates a linkset LS/1 and bind interfaces 1/1/2 and 2/1/2 to it:

```
//Create the linkset
linkset new_linkset_obj = new linkset();
new_linkset_obj.set_id("LS/1");
linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset
linkset_interface_binding new_linkif_obj = new linkset_interface_binding();
new_linkif_obj.set_id("LS/1");
```

```
new_linkif_obj.set_ifnum("1/1/2 2/1/2");
linkset_interface_binding.add(ns_session,new_linkif_obj);
```

Feature Statistics APIs

Jun 03, 2014

The NetScaler appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different packages from the configuration APIs.

The APIs to retrieve statistics of NetScaler features are available in packages that have the following pattern: com.citrix.netscaler.nitro.resource.stat.<feature>.

For example, APIs to retrieve statistics of the load balancing virtual server are available in the com.citrix.netscaler.nitro.resource.stat.lb package.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned:

```
lbvserver_stats stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer");
System.out.println(stats.get_curclntconnections());
System.out.println(stats.get_deferredreqrate());
```

Note: Not all NetScaler features and resources have statistic objects associated with them.

AppExpert Application APIs

Jun 03, 2014

To export an AppExpert application, you must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then export the AppExpert application.

The following sample code exports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.set_appname("MyApp1");
myapp.set_apptemplatefilename("myapp_template");
application.export(ns_session,myapp);
```

You can also import an AppExpert application. You must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then import the AppExpert application.

The following sample code imports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.set_appname("MyApp1");
myapp.set_apptemplatefilename("myapp_template");
application.Import(ns_session,myapp);
```

Exception Handling

Jun 03, 2014

The status of a NITRO request is captured in the com.citrix.netscaler.nitro.exception.nitro_exception class. This class provides the following details of the exception:

- **Session ID.** The session in which the exception occurred.
- **Severity.** The severity of the exception: error or warning. By default, only errors are captured. To capture warnings, you must set the warning flag to true, while connecting to the appliance.
- **Error code.** The status of the NITRO request. An error code of 0 indicates that the NITRO request is successful. A non-zero error code indicates an error in processing the NITRO request.
- **Error message.** Provides a brief description of the exception.

For a list of error codes, see the errorlisting.html file available in the <NITRO_SDK_HOME>/doc/api_reference folder.

.NET API

Jun 05, 2014

NetScaler NITRO APIs are categorized depending on the scope and purpose of the APIs into system APIs, feature configuration APIs, and feature statistics APIs. Additionally, you can import and export AppExpert applications. You can also troubleshoot NITRO operations.

Note: All NITRO operations are logged in the /var/log/nitro.log file on the appliance.

Tutorials

Nov 05, 2013

These tutorials demonstrate the end-to-end usage of NITRO to achieve the following:

- Create Your First NITRO Application
- Create a NetScaler Cluster

Create Your First NITRO Application

Sep 12, 2012

After completing this tutorial, you will understand and be able to perform the following tasks:

- Integrate NITRO with the IDE
- Log in to the appliance
- Create a load balancing virtual server (lbvserver)
- Retrieve details of an lbvserver
- Delete an lbvserver
- Save the configurations on the appliance
- Log out of the appliance
- Debug the NITRO application

Before you begin, make sure that you have the latest NITRO SDK and that the client application satisfies the prerequisites for using the NITRO SDK.

Sample Code

For the executable code, see the <NITRO_SDK_HOME>/sample/MyFirstNitroApplication.cs sample file.

To create your first NITRO application:

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.
2. Create a new class and name it **MyFirstNitroApplication**.
3. Create an instance of `com.citrix.netscaler.nitro.service.nitro_service` class. This instance is used to perform all operations on the appliance:
   ```
   nitro_service ns_session = new nitro_service("10.102.29.170", "http");
   ```
   This code establishes a connection with an appliance that has IP address 10.102.29.170 and uses the HTTP protocol. Replace 10.102.29.170 with the IP address of the NetScaler appliance that you have access to.
4. Use the `nitro_service` instance to log in to the appliance using your credentials:
   ```
   ns_session.login("admin","verysecret");
   ```
   This code logs into the appliance, with user name as `admin` and password as `verysecret`. Replace the credentials with your login credentials.
5. Enable the load balancing feature:
   ```
   String[] features_to_be_enabled = {"lb"};
   ns_session.enable_features(features_to_be_enabled);
   ```
   This code enables load balancing on the appliance.
6. Create an instance of the `com.citrix.netscaler.nitro.resource.config.lb.lbvserver` class. You will use this instance to perform operations on the lbvserver.
   ```
   lbvserver new_lbvserver_obj = new lbvserver();
   ```
7. Use the `lbvserver` instance to create a new lbvserver:
   ```
   new_lbvserver_obj.name = "MyFirstLbVServer";
   new_lbvserver_obj.ipv46 = "10.102.29.88";
   new_lbvserver_obj.servicetype = "HTTP";
   new_lbvserver_obj.port = 80;
   new_lbvserver_obj.lbmethod = "ROUNDROBIN";
   lbvserver.add(ns_session,new_lbvserver_obj);
   ```
   This code first sets the attributes (name, IP address, service type, port, and load balancing method) of the lbvserver locally and then adds it to the appliance by using the corresponding `add()` method.
8. Retrieve the details of the lbvserver you have created:
   ```
   lbvserver new_lbvserver_obj1 = lbvserver.get(ns_session,new_lbvserver_obj.name);
   System.Console.Out.WriteLine("Name : " +new_lbvserver_obj1.name +"\n" +"Protocol : " +new_lbvserver_obj1.servicetype);
   ```
   This code first retrieves the details of the lbvserver as an object from the NetScaler, extracts the required attributes (name and service type) from the object, and displays the results.
9. Delete the lbvserver you created in the above steps:
   ```
   lbvserver.delete(ns_session, new_lbvserver_obj.name);
   ```
10. Save the configurations:

```
ns_session.save_config();
```

11. Log out of the appliance:

```
ns_session.logout();
```

Debug the NITRO application

All NITRO exceptions are captured by the `com.citrix.netscaler.nitro.exception.nitro_exception` class. For a more detailed description, see Exception Handling.

Create a NetScaler Cluster

Nov 05, 2013

After completing this tutorial you will be able to create a two-node NetScaler cluster. To add more appliances to the cluster you must repeat the procedure that adds and joins the node to the cluster.

Sample Code

For the executable code, see the <NITRO_SDK_HOME>/sample/CreateCluster.cs sample file.

To create a cluster

1. Copy the libraries from <NITRO_SDK_HOME>/lib folder to the project classpath.
2. Create a new class and name it CreateCluster.
3. Log on to one of the appliances that you want to add to the cluster and create a cluster:

```
//Connect to the first appliance that you want to add to the cluster
nitro_service nonClipSession0 = new nitro_service(nsipAddress0,protocol);
nonClipSession0.login(uName,password);

//Create a cluster instance
clusterinstance newClusterInstance = new clusterinstance();
newClusterInstance.clid = 1;
clusterinstance.add(nonClipSession0,newClusterInstance);

//Add the appliance to the cluster
clusternode ClusterNode0 = new clusternode();
ClusterNode0.nodeid = 0;
ClusterNode0.ipaddress = nsipAddress0;
ClusterNode0.state = "ACTIVE";
ClusterNode0.backplane = "0/1/1";
clusternode.add(nonClipSession0,ClusterNode0);

//Add the cluster IP address
nsip newNSIPAddress = new nsip();
newNSIPAddress.ipaddress = clipAddress;
newNSIPAddress.netmask = "255.255.255.255";
newNSIPAddress.type = "CLIP";
nsip.add(nonClipSession0,newNSIPAddress);

//Enable the cluster instance
clusterinstance.enable(nonClipSession0, newClusterInstance);

//Save the configurations
nonClipSession0.save_config();

//Warm reboot the appliance
nonClipSession0.reboot(true);
```

   The cluster is created and the first node is added to the cluster. This node becomes the initial configuration coordinator of the cluster.

4. Log on to the cluster IP address to add other appliances to the cluster:

```
//Connect to the cluster IP address
nitro_service clipSession = new nitro_service(clipAddress,protocol);
clipSession.login(uName,password);

//Add the node to the cluster
clusternode ClusterNode1 = new clusternode();
ClusterNode1.nodeid = 1;
ClusterNode1.ipaddress = nsipAddress1;
ClusterNode1.state = "ACTIVE";
ClusterNode1.backplane = "1/1/1";
clusternode.add(clipSession,ClusterNode1);

//Save the configurations
```

```
clipSession.save_config();
```

5. Log on to the appliance that you added in the previous step and join it to the cluster:

```
//Connect to the node that you have just added to the cluster
nitro_service nonClipSession1 = new nitro_service(nsipAddress1,protocol);
nonClipSession1.login(uName,password);

//Join the node to the cluster
cluster newCluster = new cluster();
newCluster.clip = clipAddress;
newCluster.password = password;
cluster.join(nonClipSession1,newCluster);

//Save the configurations
nonClipSession1.save_config();

//Warm reboot the appliance
nonClipSession1.reboot(true);
```

The second node is now a part of the cluster.

6. Verify the details of the cluster by logging on to the cluster IP address

```
//Retrieving the cluster node details
uint id = 1;
clusternode node= clusternode.get(clipSession, id);
System.Console.Out.WriteLine("Node ID: " + node.nodeid + " | Admin state: " + node.state + " | Backplane interface: " + node.backplane);

//Retrieving the cluster instance details
uint id1 = 1;
clusterinstance instance= clusterinstance.get(clipSession, id1);
System.Console.Out.WriteLine("Cluster instance ID: "+ instance.clid + " | Operational state: " +instance.operationalstate);
```

System APIs

Jun 03, 2014

The first step towards using NITRO is to establish a session with the NetScaler appliance and then authenticate the session by using the NetScaler administrator's credentials.

You must create an object of the com.citrix.netscaler.nitro.service.nitro_service class by specifying the NetScaler IP (NSIP) address and the protocol to connect to the appliance (HTTP or HTTPS). You then use this object and log on to the appliance by specifying the user name and the password of the NetScaler administrator.

Note: You must have a user account on that appliance. The configuration operations that you perform are limited by the administrative roles assigned to your account.
The following sample code establishes a session with a NetScaler appliance with IP address 10.102.29.60 by using the HTTPS protocol:

```
//Specify the NetScaler appliance IP address and protocol
nitro_service ns_session = new nitro_service("10.102.29.60","https");

//Specify the login credentials
ns_session.login("admin","verysecret");
```

Note: By default, the connection to the appliance expires after 30 minutes of inactivity. You can modify the timeout period by specifying a new timeout period (in seconds) in the login method. For example, to modify the timeout period to 60 minutes:

```
ns_session.login("admin","verysecret",3600);
```

You must use the nitro_service object in all further NITRO operations on the appliance. For example to save the configurations on the appliance, you must use the nitro_service object as follows:

```
ns_session.save_config();
```

The nitro_service class also provides APIs to perform other system-level operations such as enabling and disabling NetScaler features and modes, saving and clearing NetScaler configurations, setting the session timeout, setting the severity of the exceptions to be handled, setting the behavior of bulk operations, and disconnecting from the appliance.

Feature Configuration APIs

Jun 03, 2014

NetScaler resources are organized into a set of packages or namespaces. Each package or namespace corresponds to a NetScaler feature. For example, all load-balancing related resources, such as load balancing virtual server, load balancing group, and load balancing monitor are available in com.citrix.netscaler.nitro.resource.config.lb.

Similarly, all application firewall related resources, such as application firewall policy and application firewall archive are available in com.citrix.netscaler.nitro.resource.config.appfw.

Each NetScaler resource is represented by a class. For example, the class that represents a load balancing virtual server is called lbvserver (in com.citrix.netscaler.nitro.resource.config.lb). The state of a resource is represented by properties of a class. You can get and set the properties of the class.

Note: The setter and getter properties are always executed locally on the client. They do not involve any network interaction with the NITRO web service. All properties have basic simple types: integer, long, boolean, and string.
A resource class provides APIs to perform the following operations:

Create | Retrieve | Update | Delete | Enable/Disable | Unset | Bind/Unbind | Global bind | Bulk operations

Create

To create a new resource, instantiate the resource class, configure the resource by setting its properties locally, and then upload the new resource instance to the NetScaler appliance.

The following sample code creates a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally
new_lbvserver_obj.name = "MyFirstLbVServer";
new_lbvserver_obj.ipv46 = "10.102.29.88";
new_lbvserver_obj.port = 88;
new_lbvserver_obj.servicetype = "HTTP";
new_lbvserver_obj.lbmethod = "ROUNDROBIN";

//Upload the resource to NetScaler
lbvserver.add(ns_session,new_lbvserver_obj);
```

Retrieve

To retrieve the properties of a resource, retrieve the resource object from the NetScaler appliance. Once the object is retrieved, you can extract the required properties of the resource locally, without incurring further network traffic.

The following sample code retrieves the details of a load balancing virtual server:

```
//Retrieve the resource object from the NetScaler
new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally
```

```
Console.WriteLine(new_lbvserver_obj.name);
Console.WriteLine(new_lbvserver_obj.servicetype);
```

You can also retrieve resources by specifying a filter on the value of their properties by using the `com.citrix.netscaler.nitro.util.filtervalue` class.

For example, you can retrieve all the load balancing virtual servers that have their port set to 80 and servicetype to HTTP:

```
filtervalue[] filter = new filtervalue[2];
filter[0] = new filtervalue("port","80");
filter[1] = new filtervalue("servicetype","HTTP");
lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

You can also retrieve all NetScaler resources of a certain type, such as all services in the NetScaler appliance, by calling the static `get()` method on the service class, without providing a second parameter, as follows:

```
service[] resources = service.get(ns_session);
```

Update

To update the properties of a resource, instantiate the resource class, specify the name of the resource to be updated, configure the resource by updating its properties locally, and then upload the updated resource instance to the NetScaler appliance.

The following sample code updates the service type and load balancing method of a load balancing virtual server:

```
//Create an instance of the lbvserver class
lbvserver update_lb = new lbvserver();

//Specify the name of the lbvserver to be updated
update_lb.name = "MyFirstLbVServer";

//Specify the updated service type and lb method
update_lb.servicetype = "https";
update_lb.lbmethod = "LEASTRESPONSETIME";

//Upload the resource to NetScaler
lbvserver.update(ns_session, update_lb);
```

Note: Some properties in some NetScaler resources are not allowed to be modified after creation. The port number or the service type (protocol) of a load balancing virtual server or a service, are examples of such properties. Even though the update method appears to succeed, these properties retain their original values on the appliance.

Delete

To delete an existing resource, invoke the static method delete() on the resource class, by passing the name of the resource.

The following sample code deletes a load balancing virtual server with name "MyFirstLbVServer":

```
lbvserver remove_lb = new lbvserver();
remove_lb.name("MyFirstLbVServer");
lbvserver.delete(ns_session, remove_lb);
```

Enable/Disable

To enable a resource, invoke the `enable()` method.

The following sample code enables a load balancing virtual server named "lb_vip":

```
lbvserver obj = new lbvserver();
obj.name = "lb_vip";
lbvserver.enable(ns_session, obj);
```

Note: To disable a resource, invoke the disable() method.

```
lbvserver.disable(ns_session, obj);
```

Unset

To unset the value that is set to a parameter, invoke the unset() method on the resource class, by passing the name of the resource and the parameters to be unset. If the parameter has a default value, the value is reset to that value.

The following sample code unsets the load balancing method and the comments of a load balancing virtual server named "lb_123":

```
lbvserver obj = new lbvserver();
obj.name = "lb_123";
String[] args = { "lbmethod","comment" };
lbvserver.unset(ns_session, lb1, args);
```

Bind/Unbind

NetScaler resources form relationships with each other through the process of binding. This is how services are associated with a load balancing virtual server (by binding them to it), or how various policies are bound to a load balancing virtual server. Each binding relationship is represented in NITRO by its own class.

To bind one NetScaler resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the lbvserver_service_binding class) and add it to the NetScaler configuration (by using the static add() method on this class).

Binding classes have a property representing the name of each resource in the binding relationship. They can also have other properties related to that relationship (for example, the weight of the binding between a load balancing virtual server and a service).

The following sample code binds a service to a load balancing virtual server, by specifying a certain weight for the binding:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.name = "MyFirstLbVServer";
bindObj.servicename = "svc_prod";
bindObj.weight = 20;
lbvserver_service_binding.add(ns_session,bindObj);
```

Note: To unbind a resource from another, invoke the delete() method from the resource binding class, by passing the name of the two resources.

The following code sample unbinds a service from a server:

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();
bindObj.name("MyFirstLbVServer");
bindObj.servicename("svc_prod");
lbvserver_service_binding.delete(ns_session,bindObj);
```

Global bind

Some NetScaler resources can be bound globally to affect the whole system. For example, a compression policy can be

bound to an load balancing virtual server, in which case the policy affects only the traffic on that load balancing virtual server. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

Some NITRO classes can be used to bind resources globally. These classes have names that follow the following pattern: <featurename>global_<resourcetype>_binding.

For example, the class aaaglobal_preauthenticationpolicy_binding is used to bind preauthentication policies globally.

The following sample code creates a preauthentication action and a preauthentication policy that uses that action, and then binds the policy globally at priority 200:

```
aaapreauthenticationaction preauth_act1;
aaapreauthenticationpolicy preauth_pol1;
aaaglobal_aaapreauthenticationpolicy_binding glob_binding;
preauth_act1 = new aaapreauthenticationaction();
preauth_act1.name = "preauth_act1";
preauth_act1.preauthenticationaction = "ALLOW";
aaapreauthenticationaction.add(ns_session, preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();
preauth_pol1.name = "preauth_pol1";
preauth_pol1.rule = "CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS";
preauth_pol1.reqaction = "preauth_act1";
aaapreauthenticationpolicy.add(ns_session, preauth_pol1);

glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();
glob_binding.policy = "preauth_pol1";
glob_binding.priority = 200;
aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

Bulk operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation. To perform a bulk operation, you instantiate an array of the resource class, configure the properties of all the instances locally, and then upload all the instances to the NetScaler with one command.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors:

- **Exit.** When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- **Rollback.** When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- **Continue.** All the commands in the list are executed even if some commands fail.

Note: You must configure the required behavior while establishing a connection with the appliance.

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");
ns_session.onerror = OnerrorEnum.CONTINUE;
ns_session.login("admin","verysecret");
```

The following sample code creates two load balancing virtual servers:

```
//Create an array of lbvserver instances
lbvserver[] lbs = new lbvserver[2];

//Specify details of first lbvserver
lbs[0] = new lbvserver();
lbs[0].name = "lbvserv1";
lbs[0].servicetype = "http";
lbs[0].ipv46 = "10.70.136.5";
lbs[0].port = 80;

//Specify details of second lbvserver
lbs[1] = new lbvserver();
lbs[1].name = "lbvserv2";
lbs[1].servicetype = "https";
lbs[1].ipv46 = "10.70.136.5";
lbs[1].port = 443;

//upload the details of the lbvservers to the NITRO server
lbvserver.add(ns_session,lbs);
```

Cluster APIs

Nov 05, 2013

For managing clusters, you can add or remove a cluster instance or an individual node and perform a few other instance or node operations such as viewing instance or node properties. You can also configure the cluster IP address. Other cluster-management tasks include joining a NetScaler appliance to the cluster and configuring a linkset.

Cluster Instance Operations

The com.citrix.netscaler.nitro.resource.config.cluster.clusterinstance class provides APIs to manage a cluster instance.

The following sample code creates a cluster instance with ID 1:

```
clusterinstance new_cl_inst_obj = new clusterinstance();
//Set the properties of the cluster instance locally
new_cl_inst_obj.clid = 1;
new_cl_inst_obj.preemption = "ENABLED";

//Upload the cluster instance
clusterinstance.add(ns_session,new_cl_inst_obj);
```

Cluster Node Operations

The com.citrix.netscaler.nitro.resource.config.cluster.clusternode class provides APIs to manage cluster nodes.

The following sample code adds a cluster node with NSIP address 10.102.29.60:

```
clusternode new_cl_node_obj = new clusternode();
//Set the properties of the cluster node locally
new_cl_node_obj.nodeid = 0;
new_cl_node_obj.ipaddress = "10.102.29.60";
new_cl_node_obj.state = "ACTIVE";
new_cl_node_obj.backplane = "0/1/1";

//Upload the cluster node
clusternode.add(ns_session,new_cl_node_obj);
```

Add a Cluster IP Address

The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as a cluster IP address, you must specify the type as CLIP.

The following sample code configures a cluster IP address on NetScaler appliance with IP address 10.102.29.60:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.ipaddress = "10.102.29.61";
new_nsip_obj.netmask = "255.255.255.255";
new_nsip_obj.type = "CLIP";

//Upload the cluster node
```

```
nsip.add(ns_session,new_nsip_obj);
```

Add a Spotted IP Address

The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as spotted, you must specify the ID of the node that must own the IP address. This configuration must be done on the cluster IP address.

The following sample code configures a spotted SNIP address on a node with ID 1:

```
nsip new_nsip_obj = new nsip();
//Set the properties locally
new_nsip_obj.ipaddress = "10.102.29.77";
new_nsip_obj.netmask = "255.255.255.0";
new_nsip_obj.type = "SNIP";
new_nsip_obj.ownernode = 1;

//Upload the cluster node
nsip.add(ns_session,new_nsip_obj);
```

Join NetScaler Appliance to Cluster

The com.citrix.netscaler.nitro.resource.config.cluster.cluster class provides the join() API to join a NetScaler appliance to the cluster. You must specify the cluster IP address and the nsroot password of the configuration coordinator.

The following sample code joins a NetScaler appliance to a cluster:

```
cluster new_cl_obj = new cluster();
//Set the properties of the cluster locally
new_cl_obj.clip = "10.102.29.61";
new_cl_obj.password = "verysecret";

//Upload the cluster node
cluster.add(ns_session,new_cl_node_obj);
```

Linkset Operations

The com.citrix.netscaler.nitro.resource.config.network.linkset class provides the APIs to manage linksets.

To configure a linkset, do the following:

1. Add a linkset by invoking the add() method of the linkset class.
2. Bind the interfaces to the linkset using the add() method of the linkset_interface_binding class.

The following sample code creates a linkset LS/1 and bind interfaces 1/1/2 and 2/1/2 to it:

```
//Create the linkset
linkset new_linkset_obj = new linkset();
new_linkset_obj.id = "LS/1";
linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset
linkset_interface_binding new_linkif_obj = new linkset_interface_binding();
new_linkif_obj.id = "LS/1";
```

```
new_linkif_obj.ifnum = "1/1/2 2/1/2";
linkset_interface_binding.add(ns_session,new_linkif_obj);
```

Feature Statistics APIs

Mar 14, 2012

The NetScaler appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different namespaces from the configuration APIs.

The APIs to retrieve statistics of NetScaler features are available in namespaces that have the following pattern: com.citrix.netscaler.nitro.resource.stat.<feature>.

For example, APIs to retrieve statistics of the load balancing virtual server are available in the com.citrix.netscaler.nitro.resource.stat.lb namespace.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned:

```
lbvserver_stats stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer");
Console.WriteLine(stats.curclntconnections);
Console.WriteLine(stats.deferredreqrate);
```

Note: Not all NetScaler features and resources have statistic objects associated with them.

AppExpert Application APIs

Mar 14, 2012

To export an AppExpert application, you must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then export the AppExpert application.

The following sample code exports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.appname = "MyApp1";
myapp.apptemplatefilename = "myapp_template";
application.export(ns_session,myapp);
```

You can also import an AppExpert application. You must instantiate the `com.citrix.netscaler.nitro.resource.config.app.application` class, configure the properties of the AppExpert locally, and then import the AppExpert application.

The following sample code imports an AppExpert application named "MyApp1":

```
application myapp = new application();
myapp.appname = "MyApp1";
myapp.apptemplatefilename = "myapp_template";
application.Import(ns_session,myapp);
```

Exception Handling

Mar 14, 2012

The status of a NITRO request is captured in the com.citrix.netscaler.nitro.exception.nitro_exception class. This class provides the following details of the exception:

- **Session ID.** The session in which the exception occurred.
- **Severity.** The severity of the exception: error or warning. By default, only errors are captured. To capture warnings, you must set the warning flag to true, while connecting to the appliance.
- **Error code.** The status of the NITRO request. An error code of 0 indicates that the NITRO request is successful. A non-zero error code indicates an error in processing the NITRO request.
- **Error message.** Provides a brief description of the exception.

For a list of error codes, see the errorlisting.html file available in the <NITRO_SDK_HOME>/doc/api_reference folder.

REST Web Services

Jun 05, 2014

REST (REpresentational State Transfer) is an architectural style based on simple HTTP requests and responses between the client and the server. REST is used to query or change the state of objects on the server side. In REST, the server side is modeled as a set of entities where each entity is identified by a unique URL. For example, the load balancing virtual server entity is identified by the URL http://<NSIP>/nitro/v1/config/<lbvserver>/<lbvserver_name>.

Each resource also has a state on which the following operations can be performed:

- **Create.** Clients can create new server-side resources on a "container" resource. You can think of container resources as folders, and child resources as files or subfolders. The calling client provides the state for the resource to be created. The state can be specified in the request by using XML or JSON format. The client can also specify the unique URL that will identify the new object. Alternatively, the server can choose and return a unique URL identifying the created object. The HTTP method used for Create requests is POST.
- **Read.** Clients can retrieve the state of a resource by specifying its URL with the HTTP GET method. The response message contains the resource state, expressed in JSON format.
- **Update.** You can update the state of an existing resource by specifying the URL that identifies that object and its new state in JSON or XML, using the PUT HTTP method.
- **Delete.** You can destroy a resource that exists on the server-side by using the DELETE HTTP method and the URL identifying the resource to be removed.

In addition to these four CRUD operations (Create, Read, Update, and Delete), resources can support other operations or actions. These operations use the HTTP POST method, with the URL specifying the operation to be performed and the request body specifying the parameters for that operation.

NetScaler NITRO APIs are categorized depending on the scope and purpose of the APIs into system APIs, feature configuration APIs, and feature statistics APIs.

Note: All NITRO operations are logged in the /var/log/nitro.log file on the appliance.

Performing System Level Operations

Jun 03, 2014

The first step towards using NITRO is to establish a session with the NetScaler appliance and then authenticate the session by using the NetScaler administrator's credentials. You must specify the username and password in the login object. The session ID that is created must be specified in the request header of all further operations in the session.

Note: You must have a user account on the appliance to log on to it. The configuration operations that you can perform are limited by the administrative roles assigned to your account.

To connect to a NetScaler appliance with NSIP address 10.102.29.60 by using the HTTP protocol:

- **URL.** https://10.102.29.60/nitro/v1/config/login/
- **Method.** POST
- **Request.**
  - **Header.**
    Content-Type:application/vnd.com.citrix.netscaler.login+json
    Note: Content types such as 'application/x-www-form-urlencoded' that were supported in earlier versions of NITRO can also be used. You must make sure that the payload is the same as used in earlier versions. The payloads provided in this documentation are only applicable if the content type is of the form 'application/vnd.com.citrix.netscaler.login+json'.
  - **Payload.**

```
{
   "login":
   {
      "username":"admin",
      "password":"verysecret"
   }
}
```

- **Response.**
  - **Header.**
    HTTP/1.0 201 Created
    Set-Cookie:
    NITRO_AUTH_TOKEN=##87305E9C51B06C848F0942; path=/nitro/v1

Note: By default, the connection to the appliance expires after 30 minutes of inactivity. You can modify the timeout period by specifying a new timeout period (in seconds) in the login object. For example, to modify the timeout period to 60 minutes, the request payload is:

```
{
   "login":
   {
      "username":"admin",
      "password":"verysecret",
      "timeout":3600
   }
}
```

You can also connect to the appliance to perform a single operation, by specifying the username and password in the request header of the operation. For example, to connect to an appliance while adding a load balancing virtual server:

- **URL.** https://10.102.29.60/nitro/v1/config/lbvserver/

- **Method.** POST
- **Request.**
  - **Header.**
    X-NITRO-USER:admin
    X-NITRO-PASS:verysecret
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver
    +json
  - **Payload.**
    ```
    {
     "lbvserver":
     {
       ...
       ...
       ...
    }
    ```
- **Response.**
  - **Header.**
    HTTP/1.0 201 Created

You can also perform other system-level operations such as enabling NetScaler features and modes, saving and clearing NetScaler configurations, setting the session timeout, setting the severity of the exceptions to be handled, setting the behavior of bulk operations, and disconnecting from the appliance.

For more information on the REST messages, see the Configuration node of the <NITRO_SDK_HOME>/index.html file.

Example 1: Enable the load balancing feature

- **URL.** http://10.102.29.60/nitro/v1/config/nsfeature?action=enable
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.nsfeature+json
  - **Payload**
    ```
    {
      "nsfeature":
      {
        "feature":
        [
          "LB",
        ]
      }
    }
    ```

Example 2: Save NetScaler configurations

- **URL.** http://10.102.29.60/nitro/v1/config/nsconfig?action=save
- **HTTP Method.** POST
- **Request.**
  - **Header**

Cookie:NITRO_AUTH_TOKEN=tokenvalue
Content-Type:application/vnd.com.citrix.netscaler.nsconfig+json

- **Payload**

```
{
   "nsconfig":{}
}
```

Example 3: Disconnecting from the appliance

- **URL.** https://10.102.29.60/nitro/v1/config/logout/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.logout+json
  - **Payload**

```
{
   "logout":{}
}
```

Note: Make sure that you have saved the configurations before performing this operation.

Configuring NetScaler Features

Jun 05, 2014

A NetScaler appliance has multiple features, and each feature has multiple resources. Each NetScaler resource, depending on the operation to be performed on it, has a unique URL associated with it. URLs for configuration operations have the format http://<NSIP>/nitro/v1/config/<resource_type>/<resource_name>. For example, to access the lbvserver named MyFirstLbVServer on a NetScaler with IP 10.102.29.60, the URL is http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer.

Using NITRO you can perform the following operations:

Create | Retrieve | Update | Delete | Enable/Disable | Unset | Bind/Unbind | Bulk operations

For more information on the REST messages, see the Configuration node of the <NITRO_SDK_HOME>/index.html file.

Create

To create a new resource (for example, an lbvserver) on the appliance, specify the resource name and other related arguments in the specific resource object. For a lbvserver resource, the object would be an lbvserver object.

To create an lbvserver named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
  - **Payload**

```
{
  "lbvserver":
  {
    "name":"MyFirstLbVServer",
    "servicetype":"http"
  }
}
```

Retrieve

NetScaler resource properties can be retrieved as follows:

- To retrieve details of all resources of a specific type, specify the resource type in the URL.
  URL format: http://<NSIP>/nitro/v1/config/<resource_type>
- To retrieve details of a specific resource on the NetScaler appliance, specify the resource name in the URL.
  URL format: http://<NSIP>/nitro/v1/config/<resource_type>/<resource_name>
- To retrieve specific details of a resource, specify the resource details that you want to view in the URL.
  URL format: http://<NSIP>/nitro/v1/config/<resource_type>/<resource_name>?attrs=<attrib1>, <attrib2>

- To retrieve details of resources on the basis of some filter, specify the filter conditions in the URL.
  URL format: http://<NSIP>/nitro/v1/config/<resource_type>?filter=<attrib1>:<value>,<attrib2>:<value>

- If the request is likely to result in a large number of resources, you can divide the results into pages and retrieve them page by page.
  For example, assume that you have a NetScaler that has 53 lbvservers and you want to retrieve all the lbvservers. So, instead of retrieving all 53 in one response, you can configure the results to be divided into pages of 10 lbvservers each (6 pages total), and retrieve them from the NetScaler page by page.

  URL format: http://<NSIP>/nitro/v1/config/<resource_type>?pageno=<value>&pagesize=<value>

  You specify the page count with the pagesize parameter and the page number that you want to retrieve with the pageno parameter.

- To get the number of resources that are likely to be returned by a request, you can use the count query string parameter to ask for a count of the resources to be returned, rather than the resources themselves.
  URL format: http://<NSIP>/nitro/v1/config/<resource_type>?count=yes

To retrieve the details of an lbvserver named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer/
- **HTTP Method.** GET
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
- **Response.**
  - **Header**
    HTTP/1.0 200 OK
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
  - **Payload**

```
{
  "lbvserver":
  [
    {
      "name":"MyFirstLbVServer",
      "servicetype":"http",
      "insertvserveripport":"OFF",
      "ip":"0.0.0.0",
      "port":80,
      ...
    }
  ]
}
```

Update

To update the details of an existing resource on the NetScaler appliance, specify the resource name, and the arguments to be updated, in the specific resource object.

To change the load balancing method to ROUNDROBIN and update the comment property for a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer/
- **HTTP Method.** PUT
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
  - **Payload**

```
{
   "lbvserver":
   {
      "name":"MyFirstLbVServer",
      "lbmethod":"ROUNDROBIN",
      "comment":"Updated comments"
   }
}
```

Delete

To delete a NetScaler resource, specify the resource name in the URL.

To delete a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/MyFirstLbVServer
- **HTTP Method.** DELETE

Enable/Disable

To enable a resource on the NetScaler appliance, specify the resource name in the specific resource object.

To enable a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver?action=enable
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
  - **Payload**

```
{
   "lbvserver":
   {
      "name":"MyFirstLbVServer"
   }
}
```

Note: To disable a resource, in the URL specify the action as "disable".

Unset

To unset the value that is set to a parameter, specify the action as "unset" and in the payload, specify the parameters to

be unset.

To unset the load balancing method and the comments specified for a load balancing virtual server named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver?action=unset
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
  - **Payload**

```
{
   "lbvserver":
   {
      "name":"MyFirstLbVServer",
      "lbmethod":true,
      "comment":true,
   }
}
```

Bind/Unbind

To bind a resource to another, specify the name of the two resources and specify the weight for the binding.

To bind a service named "svc_prod" to a load balancing virtual server named "MyFirstLbVServer", by specifying a certain weight for the binding:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/
- **HTTP Method.** PUT
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver_service_binding+json
  - **Payload**

```
{
   "lbvserver_service_binding":
   {
      "name":"MyFirstLbVServer",
      "servicename":"svc_prod",
      "weight":111,
   }
}
```

Note: To unbind, specify the arguments in the URL as follows:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/MyFirstLbVServer?args=servicename:svc_prod
- **HTTP Method.** DELETE

Bulk operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For

example, you can add multiple load balancing virtual servers in the same operation. To perform a bulk operation, specify the required parameters in the same request payload.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors:

- **Exit.** When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- **Rollback.** When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- **Continue.** All the commands in the list are executed even if some commands fail.

You must specify the behavior of the bulk operation in the request header using the X-NITRO-ONERROR parameter.

To add two load balancing virtual servers in one operation and continue if one command fails:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver_list+json
    X-NITRO-ONERROR:continue
  - **Payload**

```
{
  "lbvserver":
  [
    {
      "name":"new_lbvserver1",
      "servicetype":"http"
    },

    {
      "name":"new_lbvserver2",
      "servicetype":"http"
    }
  ]
}
```

- **Response**
  - **Header**
    HTTP/1.0 207 Multi Status
  - **Payload**

```
{
  "errorcode":273,
  "message":"Resource already exists",
  "severity":"ERROR",
  "response":
  [
    {
      "errorcode": 0,
```

```
        "message": "Done",
        "severity": "NONE"
      },
      {
        "errorcode": 273,
        "message":"Resource already exists",
        "severity": "ERROR"
      }
    ]
}
```

Binding NetScaler Resources

Feb 06, 2013

NetScaler resources form relationships with each other through the process of binding. This is how services are associated with an lbvserver (by binding them to it), or how various policies are bound to an lbvserver. Each binding relationship is represented by its own object. A binding resource has properties representing the name of each NetScaler resource in the binding relationship. It can also have other properties related to that relationship (for example, the weight of the binding between an lbvserver resource and a service resource).

Note: Unlike for NetScaler entities, you use a PUT HTTP method, instead of POST, for adding new binding resources. For more information on the REST messages, see the Configuration node of the <NITRO_SDK_HOME>/index.html file.

To bind a service to a load balancing virtual server named "MyFirstLbVServer" and specify a weight for the binding:

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/MyFirstLbVServer?action=bind
- **HTTP Method.** PUT
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver_service_binding+json
  - **Payload**

```
{
  "lbvserver_service_binding":
  {
    "servicename":"svc_prod",
    "weight":20,
    "name":"MyFirstLbVServer"
  }
}
```

To retrieve list of all the services bound to a virtual server "lbv1":

- **URL.** http://10.102.29.60/nitro/v1/config/lbvserver_service_binding/lbv1?attrs=servicename
- **HTTP Method.** GET

For more information on retrieving information, see the "Retrieving properties of a resource" section in Configuring NetScaler Features.

Globally Bind Resources

Some NetScaler resources can be bound globally to affect the whole system. For example, if a compression policy is bound to an lbvserver, the policy affects only the traffic on that lbvserver. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

The names of NITRO resources that can be used to bind resources globally have the pattern <featurename>global_<resourcetype>_binding. For example, the object aaaglobal_preauthenticationpolicy_binding is used to bind preauthentication policies globally.

To bind the policy named preautpol1 globally at priority 200:

- **URL.** http://10.102.29.60/nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?action=bind

- **HTTP Method.** PUT
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.aaaglobal_aaapreauthenticationpolicy_binding+json
  - **Payload**

```
{
  "aaaglobal_aaapreauthenticationpolicy_binding":
  {
    "policy":"preautpol1",
    "priority":200
  }
}
```

Configuring a NetScaler Cluster

Nov 05, 2013

You can use NITRO to add or create and manage a NetScaler cluster.

Cluster Instance Operations

All operations on a cluster instance must be performed on the clusterinstance object.

To create a cluster instance with ID 1:

- **URL.** http://10.102.29.60/nitro/v1/config/clusterinstance/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.clusterinstance+json
  - **Payload**

```
{
  "clusterinstance":
  {
    "clid":1,
    "preemption":"ENABLED"
  }
}
```

Cluster Node Operations

All operations on a cluster node must be performed on the clusternode object.

To add a cluster node with NSIP address 10.102.29.60:

- **URL.** http://10.102.29.60/nitro/v1/config/clusternode/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.clusternode+json
  - **Payload**

```
{
  "clusternode":
  {
    "nodeid":1,
    "ipaddress":"10.102.29.60",
    "state":"ACTIVE",
    "backplane":"1/1/2"
  }
}
```

Add a Cluster IP Address

To define a cluster IP address, specify the required parameters in the nsip object.

To configure a cluster IP address on NetScaler appliance with IP address 10.102.29.60:

- **URL.** http://10.102.29.60/nitro/v1/config/nsip/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.nsip+json
  - **Payload**

```
{
  "nsip":
  {
    "ipaddress":"10.102.29.61",
    "netmask":"255.255.255.255",
    "type":"CLIP"
  }
}
```

Add a Spotted IP Address

To configure an IP address as spotted, specify the required parameters in the nsip object. This configuration must be done on the cluster IP address.

To configure a spotted SNIP address on a node with ID 1:

- **URL.** http://10.102.29.60/nitro/v1/config/nsip/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.nsip+json
  - **Payload**

```
{
  "nsip":
  {
    "ipaddress":"10.102.29.77",
    "netmask":"255.255.255.0",
    "type":"SNIP",
    "ownernode":1
  }
}
```

Join NetScaler Appliance to Cluster

To join an appliance to a cluster, specify the required parameters in the cluster object.

To join a NetScaler appliance to a cluster:

- **URL.** http://10.102.29.60/nitro/v1/config/cluster/
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.cluster+json
  - **Payload**

```
{
  "cluster":
  {
    "clip":"10.102.29.61",
    "password":"verysecret"
  }
}
```

Linkset Operations

To configure a linkset, do the following:

1. Create a linkset by specifying the required parameters in the linkset object.
   To add a linkset LS/1:
   - **URL.** http://10.102.29.60/nitro/v1/config/linkset/
   - **HTTP Method.** POST
   - **Request.**
     - **Header**
       Cookie:NITRO_AUTH_TOKEN=tokenvalue
       Content-Type:application/vnd.com.citrix.netscaler.linkset+json
     - **Payload**

```
{
  "linkset":
  {
    "id":"LS/1"
  }
}
```

2. Bind the required interfaces to the linkset by specifying the interfaces in the linkset_interface_binding object.
   To bind interfaces 1/1/2 and 2/1/2 to linkset LS/1:
   - **URL.** http://10.102.29.60/nitro/v1/config/linkset_interface_binding/ LS%2F1?action=bind
   - **HTTP Method.** PUT
   - **Request.**
     - **Header**
       Cookie:NITRO_AUTH_TOKEN=tokenvalue
       Content-Type:application/vnd.com.citrix.netscaler.linkset_interface_binding+json
     - **Payload**

```
{
  "linkset_interface_binding":
  {
```

```
      "id":"LS/1",
      "ifnum":"1/1/2 2/1/2"
    }
  }
```

Retrieving Feature Statistics

Feb 06, 2013

The NetScaler appliance collects statistics about the usage of its features and the corresponding resources. NITRO can retrieve these statistics.

- URL to get statistics of a feature must have the format http://<NSIP>/nitro/v1/stat/<feature_name>.
- URL to get the statistics of a resource must have the format: http://<NSIP>/nitro/v1/stat/<resource_type>/<resource_name>.

For more information on the REST messages, see the Statistics node of the <NITRO_SDK_HOME>/index.html file.

To get the statistics of a lbvserver named "MyFirstLbVServer":

- **URL.** http://10.102.29.60/nitro/v1/stat/lbvserver/MyFirstLbVServer
- **HTTP Method.** GET
- **Request.**
  - **Header.**
    Content-Type:application/vnd.com.citrix.netscaler.lbvserver+json
- **Response.**
  - **Header**
    HTTP/1.0 200 OK
  - **Payload**

```
{
   "lbvserver":
   [
      {
         "name":"MyFirstLbVServer",
         "establishedconn":0,
         "vslbhealth":0,
         "primaryipaddress":"0.0.0.0",
         ...
      }
   ]
}
```

Note: Not all NetScaler features and resources have statistic objects associated with them.

Managing AppExpert Applications

Feb 06, 2013

To export an AppExpert application, specify the parameters needed for the export operation in the apptemplateinfo object. Optionally, you can specify basic information about the AppExpert application template, such as the author of the configuration, a summary of the template functionality, and the template version number, in the template_info object. This information is stored as part of the template file that is created.

To export an AppExpert application named "MyApp1":

- **URL.** http://10.102.29.60/nitro/v1/config/apptemplateinfo?action=export
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.apptemplateinfo+json
  - **Payload**

```
{
  "apptemplateinfo":
  {
    "appname":"MyApp1",
    "apptemplatefilename":"BizAp.xml",
    "template_info":
    {
      "templateversion_major":"2",
      "templateversion_minor":"1",
      "author":"XYZ",
      "introduction":"Intro",
      "summary":"Summary"
    },
  }
}
```

To import an AppExpert application, specify the parameters needed for the import operation in the apptemplateinfo object.

To import an AppExpert application named "MyApp1":

- **URL.** http://10.102.29.60/nitro/v1/config/apptemplateinfo?action=import
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.apptemplateinfo+json
    X-NITRO-ONERROR:rollback
  - **Payload**

```
{
  "apptemplateinfo":
```

```
    {
      "apptemplatefilename":"BizAp.xml",
      "deploymentfilename":"BizAp_deployment.xml",
      "appname":"MyApp1"
    }
  }
```

To import an AppExpert application by specifying different deployment settings:

- **URL.** http://10.102.29.60/nitro/v1/config/apptemplateinfo?action=import
- **HTTP Method.** POST
- **Request.**
  - **Header**
    Cookie:NITRO_AUTH_TOKEN=tokenvalue
    Content-Type:application/vnd.com.citrix.netscaler.apptemplateinfo+json
    X-NITRO-ONERROR:rollback
  - **Payload**

```
{
  "apptemplateinfo":
  {
    "apptemplatefilename":"BizAp.xml",
    "appname":"Myapp2"
     "deploymentinfo":
     {
       "appendpoint":
       [
         {
           "ipv46":"11.2.3.8",
           "port":80,
           "servicetype":"HTTP"
         }
       ],
       "service":
       [
         {
           "ip":"12.3.3.15",
           "port":80,
           "servicetype":"SSL"
         },
         {
           "ip":"14.5.5.16",
           "port":443,
           "servicetype":"SSL"
         }
       ],
    }
  }
}
```

Handling Exceptions

Feb 06, 2013

The response header provides the status of an operation by using HTTP status codes and the response payload provides the requested resource object (for GET method) and error details (for unsuccessful operation). NITRO does not provide a response payload for successful POST, PUT and DELETE methods. For successful GET method, the response payload consists only the requested resource object.

The following table provides the HTTP status codes:

Status	HTTP Status Code	Description
Success	200 OK	Request successfully executed.
	201 CREATED	Entity created.
Failure	400 Bad Request	Incorrect request provided.
	401 unauthorized	Not provided login credentials.
	403 forbidden	User is unauthorized
	404 Not Found	User is trying to access a resource not present in the NetScaler.
	405 Method Not Allowed	User is trying to access request methods not supported by NITRO.
	406 Not Acceptable	None of the values supplied by the user in the Accept header can be satisfied by the server.
	409 Conflict	The resource already exists on the NetScaler.
	503 Service Unavailable	The service is not available.
	599	NetScaler specific error code.
Warning	209 X-NITRO-WARNING	Warnings are captured by specifying the login URL as http://<nsip>/nitro/v1/config/login/?warning=yes.

Status	HTTP Status Code	Description
Combination of success and failure (for bulk operation with X-NITRO-ONERROR set as continue)	207 Multi	Some commands are executed successfully and some have failed.

Note: The content-type in the response header of an unsuccessful operation, consists of error MIME type instead of resource MIME type.
For a more detailed description of the error codes, see the API reference available in the <NITRO_SDK_HOME>/doc folder.

NITRO Changes Across NetScaler Releases

Jul 04, 2014

NetScaler has introduced some changes in the NITRO API since the NetScaler 9.3 release. This could raise some compatibility issues for the following users:

- Users migrating from NetScaler 9.3 to 10.1
- Users migrating from NetScaler 9.3 to 10.5

Note: There are no changes introduced since the NetScaler 10.1 release. Therefore, you should not face any compatibility issues when migrating from NetScaler 10.1 to 10.5.

These NITRO changes from 9.3 to 10.1 or 10.5 are categorized as follows:

- Resources Removed
- APIs Removed
- API Return Type Changed
- Attribute Type Changed
- Attributes Removed
- SDK Specific Changes

Note: Unless otherwise specified, these changes are applicable to both REST and SDKs.

Resource	Replace with...	Comments
lbmonitor_lbmetrictable_binding	lbmonitor_metric_binding	

Resource	API	Comments
vserver	GET	Perform the GET operation on specific virtual server types such as lb/cr/cs.
filterpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.
auditsyslogpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.
auditnslogpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.
authorizationpolicy	POST with "action=unset"	This API is removed as unsetting the attributes('action') of a policy makes it invalid.

Resource	API	Comments
snmpengineid	GET	Return type changed to an array.
nshostname	GET	Return type changed to an array.

Resource	Attribute	Comments
appfwpolicy_lbvserver_binding	activepolicy	Data type changed from Boolean to Integer.
appfwpolicy_appfwglobal_binding	activepolicy	Data type changed from Boolean to Integer.
vlan	portbitmap	Data type changed from uint to ulong.
vlan	tagbitmap	Data type changed from uint to ulong.

Resource	Attribute	Replace with...	Comments
policypatset_pattern_binding	indextype	- NA -	This attribute is moved to 'policypatset' resource as this attribute is applicable at patset level.
system_stats	powersupply1failure	powersupply1status	Change is applicable from NetScaler 9.3 (65.8).
system_stats	powersupply2failure	powersupply2status	Change is applicable from NetScaler 9.3 (65.8).
server_servicegroup_binding	servicetype	svctype	
server_service_binding	servicetype	svctype	
crvserver	hits	- NA -	Hits are calculated per policy binding hence moved this parameter to binding resources.
crvserver	dstvsvr	destinationvserver	
crvserver	destvserver	domain	

Resource	Attribute	Replace with...	Comments
crvserver	dnsvserver	dnsvservername	
appflowpolicylabel	type	policylabeltype	
sslcipher	ciphgrpals	ciphergroupname	This change is applicable for sslcipher_*_binding resources also.
csvserver_cspolicy_binding	targetvserver	targetlbvserver	
csvserver_cspolicy_binding	targetvserver	targetlbvserver	
rewriteaction	allow_unsafe_pi1, allow_unsafe_pi	bypassSafetyCheck	

Class	Method	Replace with...	Comments
Routerbgp	- NA -	- NA -	This class is removed as all router configurations are deprecated in 9.2.
dnsptrrec	get(dnsptrrec obj, nitro_service session)	get(nitro_service session, String reversedomain)	
dnsaddrec	get(dnsaddrec obj, nitro_service session)	get(nitro_service session, String hostname)	
dnsnsrec	get(dnsnsrec obj, nitro_service session)	get(nitro_service session, String domain)	
snmpengineid	unset(nitro_service session, String[] args)	unset(nitro_service session, snmpengineid resource, String[] args)	
arp	arp.get(nitro_service session, String ipaddress)	arp.get(nitro_service session, arp resource)	
nsip	get(nitro_service session, String ipaddress)	get(nitro_service client, nsip resource)	
nsip6	get(nitro_service session, String ipv6address)	get(nitro_service session, nsip6 resource)	
dnsmxrec	dnsmxrec.get(dnsmxrec obj, nitro_service session)	dnsmxrec[] get(nitro_service service, dnsmxrec_args args)	

Unsupported NetScaler Operations

Jul 10, 2013

Some NetScaler operations that are available through the command line interface and through the configuration utility, are not available through NITRO APIs. The following list provides the NetScaler operations not supported by NITRO:

- install API
- diff API on nsconfig resource
- UI-internal APIs (update, unset, and get)
- show ns info
- Application firewall APIs:
  - importwsdl
  - importcustom
  - importxmlschema
  - importxmlerrorpage
  - importhtmlerrorpage
  - rmwsdl
  - rmcustom
  - rmxmlschema
  - rmxmlerrorpage
  - rmhtmlerrorpage
- CLI-specific APIs:
  - ping
  - ping6
  - traceroute
  - traceroute6
  - nstrace
  - scp
  - configaudit
  - show defaults
  - show permission
  - batch
  - source

XML API

Mar 19, 2012

Developers and administrators can use the NetScaler Application Programming Interface (API), nsconfig, to implement customized client applications. The nsconfig API, which mirrors the NetScaler command line interface (CLI), is based on the Web Services Description (WSDL) specification. It includes a filterwsdl command to reduce compilation time and file size. You can secure your API applications at the NetScaler IP address or at the IP address of the subnet on which the NetScaler is deployed.

The following topics describe the properties and use of the API.

Introduction	General information about the API, requirements, and software-version information.
The NS Config Interface	How to use the API.
Examples of API Usage	Basic examples of how to use the API.
The Web Service Description Language (WSDL)	How to use the WSDL-based interface schema to support your client applications, and how to use WSDL Filter to reduce file size and compilation time.
Securing API Access	How to secure API access.

Introduction to the API

Mar 19, 2012

The API enables programmatic communications between client applications and the NetScaler appliance, providing the following benefits:

- Developers can control the NetScaler from a custom application. The API enables the client application to configure and monitor the NetScaler.
- Developers can create client applications easily and quickly, using a language and platform with which they are comfortable.
- The API provides a secure, end-to-end, standards-based framework that integrates into the existing infrastructure.

Based on the Simple Object Access Protocol (SOAP) over HTTP, the API consists of the NSConfig interface. NSConfig includes methods for setting and querying the configuration. These methods allow the client application using the NSConfig interface to perform almost all operations that an administrator would normally perform with the CLI or GUI.

In addition, the NetScaler provides an interface description, based on the Web Services Definition Language (WSDL), that facilitates the development of client applications.

Hardware and Software Requirements

Mar 19, 2012

To work with the API, your system needs to meet the following hardware and software setup and requirements:

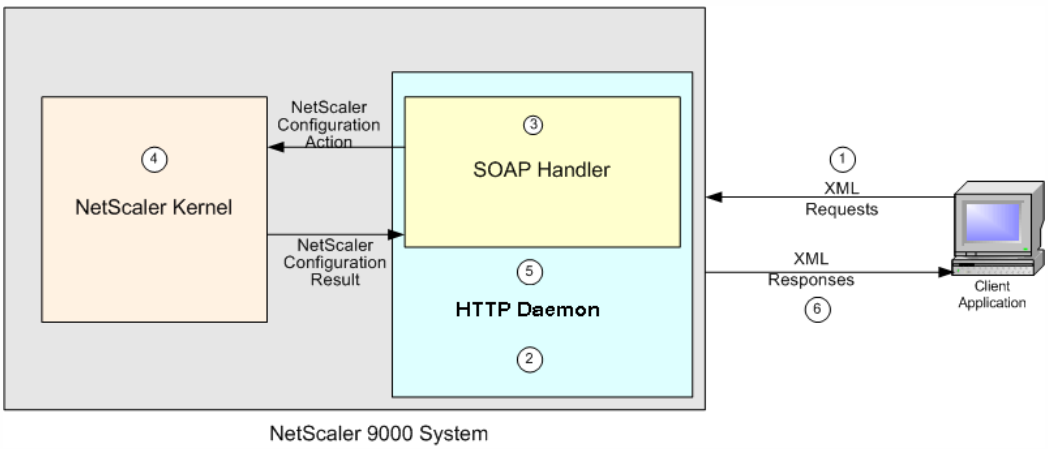
- A client workstation.
- Access to a NetScaler, version 8.0 or higher.
- A SOAP client tool kit (supporting SOAP version 1.1 and above), and the development environment for the tool kit. For example, if you use a Visual Basic tool kit, you must have Visual Basic installed on your system.

API Architecture

Mar 19, 2012

The API architecture is designed to allow NSConfig client requests to be routed, through the HTTP daemon running on the target NetScaler, to a SOAP handler that translates the SOAP request into a call to the (internal) kernel configuration API.

Figure 1. The API Architecture



The order in which the NetScaler processes requests through the API is as follows:

- The client formats a request containing XML conforming to the SOAP protocol and sends it to the NetScaler.
- The HTTPD server instance on the NetScaler routes this request to a SOAP handler.
- The SOAP handler interprets the SOAP headers and maps the enclosed request to an internal configuration function.
- The kernel acts on the request and returns one or more responses.
- The SOAP handler translates the response(s) to a SOAP response message.
- The XML response is sent back to the client in an HTTP response.

The NSConfig Interface

Mar 19, 2012

The NSConfig interface closely mirrors the structure of the NetScaler command line interface (CLI). Administrators and programmers who are familiar with the CLI can easily create and implement custom applications to query or set the configuration on their NetScaler.

The NSConfig interface includes methods for most of the CLI commands. In most cases the method and the command name are the same. See the PortType section of the WSDL for a complete list of methods and their names.

For example, you use the add lb vserver CLI command to create a load balancing virtual server, as follows:

add lb vserver <vServerName> <serviceType> [<IPAddress> <port>]

where:

<vServerName> = A name for the virtual server.

<serviceType> = (HTTP | FTP | TCP | UDP).

<IPAddress> = The IP address used by the virtual server.

<port> = The port that the virtual server listens on.

Following is the corresponding API call, in the C language:

```
int ns__addlbvserver(void *handle,
  string vServerName,
  string serviceType,
  string IPAddress,
  unsignedShort port,
  ns__addlbvserverResponse *out);
```

Note: The exact syntax of the API call depends on the language used to write the client program. The above `ns__addlbvserver` function prototype is similar to the one that would be generated by the gSOAP package at http://www.cs.fsu.edu/~engelen/soap.html.

The result returned for all NSConfig requests consists of:

Rc

An integer return code. The value is zero if the request succeeded. A non-zero value indicates that the request failed.

Message

A string message. Contains meaningful information only if the request fails (rc is non-zero) (for example, “Required argument missing”).

List

A type-specific list of result entities. This element is present only for requests that retrieve information from the NetScaler. For example, the API method names starting with get, which correspond to the CLI show commands, return a list.

Command names in the NetScaler CLI typically consist of three terms, separated by spaces, identifying the operation, the feature that is being operated on, and the specific item that is being operated on. For example, to create a new application firewall profile, you type add appfw profile, followed by the command arguments. The corresponding API methods omit the spaces. For example, the API method for add appfw profile is `addappfwprofile`. The same principle applies to CLI

command names that have only two terms. For example, add monitor becomes addmonitor. The other exceptions to this pattern are as follows:

1. The CLI show command is changed to get in the API, as shown below.
   show lb vserver => getlbvserver

   show service => getservice

2. The following commands are omitted from the API:
   - Commands that apply to the CLI itself (for example, clear CLI prompt).
   - The batch, ping, grep, more, shell, and scp commands.
   - The show router bgp and show router map commands.
   - All stat commands.
3. Message "part" names in the API are the same as the corresponding CLI argument names. As in the CLI, case does not matter, and these names can be abbreviated. For more information, *Citrix NetScaler Command Reference Guide* at
4. The result of a GET method (which corresponds to a show command in the CLI) is always an array of a type defined in the WSDL. The elements of these complex types generally correspond to arguments to the corresponding add/set command/method.
5. Authorization must be performed once, by sending a login request. The response contains a Set-Cookie HTTP header, and the cookie must be sent with each subsequent request. This is addressed in the Perl examples using by HTTP::Cookies. HTTP::Cookies are used for API client authentication purposes (to log into the NetScaler). In Perl, SOAP::Lite cannot perform this authentication process; HTTP::Cookies are used instead.
6. In some programming languages, such as Perl, it is possible to invoke the programming language API without using the WSDL.

Examples of API Usage

Mar 19, 2012

The following examples show how to develop an API call from a standard CLI command, how to generate the SOAP request, and how the NetScaler responds to that request:

Example: Setting the Configuration

Example: Querying the Configuration

Example: Setting the Configuration

Mar 19, 2012

This example shows a CLI command, the corresponding API method, the resulting XML request, and the XML response that is sent back to the client.

Note: The actual API method and the XML SOAP message contents may differ from the example shown below. The XML shown will be encased in a SOAP envelope, which will in turn be carried in an HTTP message. For more information, see the W3C web site at http://www.w3.org/TR/SOAP.

The following CLI command creates a Load Balancing virtual server:

> add lb vserver vipLB1 HTTP 10.100.101.1 80

Following is the corresponding API method:

> ns__addlbvserver (handle, “vipLB1”, “HTTP”, “10.100.101.1”, 80, &out);

The XML generated for this request is as follows.

```
<ns:addlbvserver>
<vServerName xsi:type="xsd:string" >vipLB1</vServerName>
<serviceType xsi:type="ns:vservicetypeEnum>HTTP</ serviceType>
<IPAddress xsi:type="xsd:string">10.100.101.1</IPAddress>
<port xsi:type="xsd:unsignedInt" >80</port>
< /ns:addlbvserver >
```

The XML response to the above request is as follows.

```
<ns:addlbvserverResponse>
<rc xsi:type="xsd:unsignedInt">0</rc>
<message xsi:type="xsd:string">Done</message>
</ns:addlbvserverResponse>
```

Example: Querying the Configuration

Mar 19, 2012

This example shows an API request that queries the configuration and receives a list of entities.

Note: The actual API method and the XML SOAP message contents may differ from the example shown below.
The following CLI command shows the configured Load Balancing virtual servers:

> show lb vservers

Sample output of the show lb vservers command is as follows.

```
> show lb vservers
2 configured virtual servers:
1)  vipLB1 (10.100.101.1:80) - HTTP Type: ADDRESS State:
   DOWN
   Method: LEASTCONNECTION Mode: IP
   Persistence: NONE
2)  vipLB2 (10.100.101.2:80) - HTTP Type: ADDRESS State:
   DOWN
   Method: LEASTCONNECTION Mode: IP
   Persistence: NONE
Done
```

Following is the corresponding API method to show the list of Load Balancing virtual servers.

ns__getlbvserver(handle, NULL, &out)

The XML generated for this request is as follows.

```
<ns:getlbvserver></ns:getlbvserver>
```

The XML response to the above request is as follows.

```
<ns:getlbvserverResponse>
 <rc xsi:type="xsd:unsignedInt">0</rc>
 <message xsi:type="xsd:string">Done</message>
 <List xsi:type="SOAP-ENC:Array"
  SOAP-ENC:arrayType="ns:lbvserver[2]">
  <item xsi:type="ns:lbvserver">
  <vServerName xsi:type="xsd:string>vipLB1
   </vServerName>
   <serviceType xsi:type="xsd:string>HTTP</ serviceType>
   <IPAddress xsi:type="xsd:string >10.100.101.1
   </IPAddress>
  <port xsi:type="xsd:unsignedInt">80</port>
 </item>
 <item xsi:type="ns:lbvserver">
  <vServerName xsi:type="xsd:string>vipLB2
  </vServerName>
  <serviceType xsi:type="xsd:string>HTTP</ serviceType>
```

```
  <IPAddress xsi:type="xsd:string >10.100.101.2
  </IPAddress>
   <port xsi:type="xsd:unsignedInt">80</port>
  </item>
 </List>
</ns:getlbvserverResponse>
```

The Web Service Definition Language (WSDL)

Mar 19, 2012

The NetScaler WSDL describes services for the entire range of NetScaler services. The NetScaler provides two WSDL files:

NSConfig.wsdl

Configuration APIs are defined in this file. The NSConfig.wsdl file is found on the NetScaler at http://<NSIP>/api/NSConfig.wsdl, where <NSIP> is the IP address of your NetScaler. This file is much larger than the NSStat.wsdl file. With the help of a third-party tool (such as gSOAP), developers can use this file to generate client stubs. A custom application can then call the stubs to send requests to the NetScaler. The application can be in any standard programming language that is supported by the third-party tool. Common programming languages for this purpose include Perl, Java, C, and C#. You can use the filterwsdl command to select only the service definitions that are relevant to the API calls made in your script.

NSStat.wsdl

Statistical APIs are defined in this file. The NSStat.wsdl file is found on the NetScaler at http://<NSIP>/api/NSStat.wsdl, where <NSIP> is the IP address of your NetScaler.

Creating Client Applications with the NSConfig.wsdl File

Mar 19, 2012

A client application can be created by importing the NSConfig.wsdl file with the gSOAP WSDL Importer to create a header file with C or C++ declarations of the SOAP methods. The gSOAP compiler is then used to translate this header file into stubs for the client application.

1. Get the NSConfig.h header file from the WSDL file.
   1. Run the wsdl2h program that comes with gSOAP on the WSDL file. The wsdl2h program is in the following location.
      > ./wsdl2h NSConfig.wsdl

      The output of wsdl2h is as follows:
      ```
      ** The gSOAP WSDL parser for C and C++ 1.0.2
      ** Copyright (C) 2001-2004 Robert van Engelen, Genivia, Inc.
      ** All Rights Reserved. This product is provided "as is", without any warranty.
      Saving NSConfig.h
      Reading file 'NSConfig.wsdl'
      Cannot open file 'typemap.dat'
      Problem reading type map file typemap.dat.
      Using internal type definitions for C instead.
      ```
   2. Run the soapcpp2 program to compile the header file and complete the process, as shown below. > soapcpp2 NSConfig.h
2. Generate the XML files and stubs as follows:
   > ./soapcpp2 -c -i NSConfig.h

   Following is sample output for this command:

   ```
   ** The gSOAP Stub and Skeleton Compiler for C and C++ 2.4.1
   ** Copyright (C) 2001-2004 Robert van Engelen, Genivia, Inc.
   ** All Rights Reserved. This product is provided "as is", without any warranty.
   Saving soapStub.h
   Saving soapH.h
   Saving soapC.c
   Saving soapClient.c
   Saving soapServer.c
   Saving soapClientLib.c
   Saving soapServerLib.c
   Using ns1 service name: NSConfigBinding
   Using ns1 service location: http://NetScaler.com/api Using ns1 schema namespace: urn:NSConfig
   Saving soapNSConfigBindingProxy.h client proxy
   Saving soapNSConfigBindingObject.h server object
   Saving NSConfigBinding.addserver.req.xml sample SOAP/XML request
   Saving NSConfigBinding.addserver.res.xml sample SOAP/XML response
   Saving NSConfigBinding.disableserver.req.xml sample SOAP/ XML request
   Saving NSConfigBinding.disableserver.res.xml sample SOAP/ XML response
   ```

```
Saving NSConfigBinding.enableserver.req.xml sample SOAP/XML request
Saving NSConfigBinding.enableserver.res.xml sample SOAP/XML response
[ ... Similar lines clipped ... ]
Saving NSConfigBinding.nsmap namespace mapping table
Compilation successful
```

This creates the stub files soapC.c, soapClient.c and stdsoap2.c.

3. Link the stub files you created with your source code to create a stand-alone binary that invokes the API.

Filter WSDL

Mar 19, 2012

The NetScaler WSDL describes services for the entire range of NetScaler services. When you use the NetScaler API in your scripts, by linking to the WSDL and attempting to compile the application, the entire WSDL is included, unnecessarily increasing compilation time and the size of the program.

Filter WSDL is a tool for selecting only those service definitions from the NetScaler WSDL that are relevant to the API calls made in the script. You can use the filter WSDL tool to filter NSConfig.wsdl and NSStat.wsdl files.

The NetScaler provides two WSDL files, one for the configuration APIs (NSConfig.wsdl) and the other for statistical APIs (NSStat.wsdl). The WSDL file for the configuration API is much larger. Therefore, it is important to use filter WSDL when compiling programs written with the configuration API.

Filter WSDL is a program that works on the Windows, FreeBSD and Linux platforms, and it can be run from the CLI.

The syntax for running filter WSDL is as follows:

filterwsdl <fromwsdl> <pattern>

where:

fromwsdl = The wsdl file that you want to filter

pattern = API method names or patterns that should be filtered

For example, if you want to filter all the service definitions for the API method addlbvserver from the NetScaler WSDL file, NSConfig.wsdl, you can use the command:

> filterwsdl NSConfig.wsdl "addlbvserver"

The output of this command is sent to the screen by default, but it can be redirected to a file on the NetScaler by using the UNIX redirect operator (>). The output of the previous command can be saved into a file called NSConfig-Custom.wsdl by using the command as follows:

> filterwsdl NSConfig.wsdl "addlbvserver" > NSConfig-Custom.wsdl

In this case, the original WSDL file is 1.58 MB, but the filtered WSDL file is 6 KB.

The pattern used in the filterwsdl command can include the + and - operators and the wildcard operator (*) to create more generic filters.

For example, if you want to filter the service definitions for all the available load balancing methods, you can use the following command:

> filterwsdl NSConfig.wsdl "*lb"*

This command will filter all the Load Balancing methods but will also include GSLB methods, because the pattern lb will be matched by all GSLB methods also. To include only LB methods and exclude all GSLB methods, use the command as follows:

> filterwsdl NSConfig.wsdl +"*lb" -"glsb"*

Securing API Access

Mar 19, 2012

Secure access to CLI objects can be based on the NetScaler IP address or on the subnet IP address on which the NetScaler is deployed. To provide secured API access based on the NetScaler IP address, you must configure the NetScaler to use transparent SSL mode with clear text port.

1. Create a loopback SSL service and configure it use transparent SSL mode with clear text port:
   add service secure_xmlaccess 127.0.0.1 SSL 443 -clearTextPort 80
2. Add certificate and key:
   add certkey cert1 –cert /nsconfig/ssl/ssl/cert1024.pem –key /nsconfig/ssl/ssl/rsakey.pem

   Note: You can use an existing certificate and key or use the NetScaler Certificate Authority Tool to create a key and test certificate for secure access.
3. Bind the certificate and key to the service:
   bind certkey secure_xmlaccess cert1 -Service
4. Add a custom TCP monitor to monitor the SSL service you have added:
   add monitor ssl_mon TCP -destport 80
5. Bind the custom TCP monitor to the SSL service:
   bind monitor ssl_mon secure_xmlaccess

1. Create an SSL VIP in the appropriate subnet:
   add vserver <vServerName> SSL <Subnet-IP> 443
2. Create a loopback HTTP service:
   add service <serviceName> 127.0.0.1 HTTP 80
3. Bind the service to the SSL VIP:
   bind lb vserver <vServerName> <serviceName>
4. Add the certificate and the key:
   add certkey cert1 –cert /nsconfig/ssl/ssl/cert1024.pem –key /nsconfig/ssl/ssl/rsakey.pem

   Note: You can use an existing certificate and key or use the NetScaler Certificate Authority Tool to create a key and test certificate.
5. Bind the Certificate and the Key to the SSL VIP:
   bind certkey <vServerName> cert1

Reference Material

Sep 22, 2015

Use the reference information in this section to get an in-depth understanding of the following NetScaler components:

- NetScaler SNMP OIDs - Details of the SNMP OIDs that can be used to obtain information from a NetScaler appliance.
- NetScaler Syslog Messages - Details of the Syslog messages given by the NetScaler appliance.
- NetScaler CLI Commands - Details of the commands that can be used to configure the NetScaler appliance through the CLI. You can also view the details of each command in the NetScaler CLI, by entering the "man <ns-command-name>" command.
- Policy Expressions - Details of the policy expressions available on the NetScaler.
- Quick Start Guides - A reference to quick installation and configuration of your hardware appliance.

Internal Server Error

The server encountered an internal error or misconfiguration and was unable to complete your request.

Please contact the server administrator, webmaster@localhost and inform them of the time the error occurred, and anything you might have done that may have caused the error.

More information about this error may be available in the server error log.

Apache/2.2.31 (Amazon) Server at 10.57.13.146 Port 80

NetScaler Command Reference

Sep 22, 2015

A detailed list of the commands that can be used to configure the NetScaler appliance through the CLI.

- Traffic Management Commands
- Transform Commands
- Tunnel Commands
- Utility Commands
- VPN Commands
- WebInterface Commands

AAA Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- aaa
- aaa certParams
- aaa global
- aaa group
- aaa kcdAccount
- aaa ldapParams
- aaa parameter
- aaa preauthenticationaction
- aaa preauthenticationparameter
- aaa preauthenticationpolicy
- aaa radiusParams
- aaa session
- aaa stats
- aaa tacacsParams
- aaa user

aaa

Sep 22, 2015

The following operations can be performed on "aaa":

Display aaa statistics

stat aaa [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

clearstats

Clear the statsistics / counters

Possible values: basic, full

Authentication successes (authsucc)

Count of authentication successes.

Authentication failures (authfails)

Count of authentication failures.

HTTP authorization successes (atzhtps)

Count of HTTP connections that succeeded authorization.

HTTP authorization failures (atzhtpf)

Count of HTTP connections that failed authorization.

Non HTTP authorization successes (atznonhtps)

Count of non HTTP connections that succeeded authorization.

Non HTTP authorization failures (atznonhtpf)

Count of non HTTP connections that failed authorization.

Current AAA sessions (totcursess)

Count of current AAA sessions.

Total AAA sessions (totsess)

Count of all AAA sessions.

Timed out AAA sessions (totsessto)

Count of AAA sessions that have timed out.

Current ICAOnly sessions (totcuricasess)

Count of current ICA only sessions.

Current ICAOnly Conn (curicaonlyconn)

Count of current ICA only connections.

Current ICA (Smart Access) Conn (curicaconn)

Count of current ICA connections.

Current TM sessions (curTMses)

Count of current AAATM sessions.

TM sessions (totTMses)

Count of all AAATM sessions.

aaa certParams

Sep 22, 2015

The following operations can be performed on "aaa certParams":

set | unset | show

set aaa certParams

Modifies the global configuration settings for certificate policies. The settings that you specify are used for all SSL-VPN virtual servers unless you use authentication policies to create a configuration for a specific SSL-VPN virtual server.

Synopsys

set aaa certParams [-userNameField <string>] [-groupNameField <string>] [-defaultAuthenticationGroup <string>]

Arguments

userNameField

Client certificate field that contains the username, in the format <field>:<subfield>.

groupNameField

Client certificate field that specifies the group, in the format <field>:<subfield>.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

Example

To configure the default certificate parameters: set aaa certparams -userNameField "Subject:CN" -groupNameField "Subject:OU"

---

unset aaa certParams

Use this command to remove aaa certParams settings.Refer to the set aaa certParams command for meanings of the arguments.

Synopsys

unset aaa certParams [-userNameField] [-groupNameField] [-defaultAuthenticationGroup]

---

show aaa certParams

Displays the current client certificate configuration on the NetScaler appliance.

Synopsys

show aaa certParams

Arguments

format

level

Outputs

twoFactor

The state of the two-factor authentication.

userNameField

The field in the certificate from which the username will be extracted.

groupNameField

The field in the certificate from which the group will be extracted.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

aaa global

Sep 22, 2015

The following operations can be performed on "aaa global":

bind | unbind | show

bind aaa global

Binds a policy globally.

Synopsys

bind aaa global [-policy <string> [-priority <positive_integer>]] [-windowsProfile <string>]

Arguments

policy

Name of the policy to bind globally.

windowsProfile

Name of the negotiate profile to bind globally.

Example

```
bind aaa global -pol pol1
```

---

unbind aaa global

Unbind the policy from the global bind point.

Synopsys

unbind aaa global [-policy <string>] [-windowsProfile <string>]

Arguments

policy

Name of the policy to be unbound.

windowsProfile

Name of the negotiate profile to be bound.

---

show aaa global

Displays a list of policies that are currently bound to Global on the NetScaler appliance.

Synopsys

show aaa global

Arguments

summary

fullValues

format

level

Outputs

policy

Name of the policy to be unbound.

windowsProfile

Name of the negotiate profile to be bound.

priority

Priority of the bound policy

bindPolicyType

Bound policy type

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

devno

count

stateflag

aaa group

Sep 22, 2015

The following operations can be performed on "aaa group":

add | rm | bind | unbind | show

add aaa group

Creates a AAA group and verifies the configuration to ensure that it is correct.

Synopsys

add aaa group <groupName>

Arguments

groupName

Name for the group. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the group is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or

single quotation marks (for example, ?my aaa group? or ?my aaa

group).

Example

```
add aaa group group_ad
```

---

rm aaa group

Removes the specified AAA group.

Synopsys

rm aaa group <groupName>

Arguments

groupName

Name of the group that you are removing.

---

bind aaa group

Binds the specified AAA group to the specified resource. The resource can be a user, an Intranet IP address or range, a policy, or an Intranet application.

Synopsys

bind aaa group <groupName> [-userName <string>] [-policy <string> [-priority <positive_integer>]] [-intranetApplication <string>] [-urlName <string>] [-intranetIP <ip_addr> <netmask>]

Arguments

groupName

Name of the group that you are binding.

userName

Bind a AAA group to the specified AAA user.

If the specified user is bound to more than one group, the group expressions are evaluated, upon authorization, to determine the appropriate action.

policy

Bind a policy to the specified AAA group.

intranetApplication

Bind the group to the specified intranet VPN application.

urlName

Bind the group to the specified URL.

intranetIP

Bind the group to the specified IP address or IP block.

Normally you would bind the group to an IP address or range that your users use to access intranet resources.

Example

To bind an Intranet IP to the group engg: bind aaa group engg -intranetip 10.102.10.0 255.255.255.0

---

unbind aaa group

Unbinds the specified AAA group from the specified resource. The resource can be a user, an intranet IP address or range, a policy, or an intranet application.

Synopsys

unbind aaa group <groupName> [-userName <string> ...] [-policy <string>] [-intranetApplication <string>] [-urlName <string>] [-intranetIP <ip_addr> <netmask>]

Arguments

groupName

Name of the group that you are unbinding.

userName

Unbind the specified AAA group from the specified AAA user.

policy

Unbind the specified policy from the specified AAA group.

intranetApplication

Unbind the specified group from the specified intranet VPN application.

urlName

Unbind the specified group from the specified URL.

intranetIP

Unbind the specified group from the specified IP address or IP block.

Example

unbind aaa group engg -intranetip 10.102.10.0 255.255.255.0

---

show aaa group

Displays the current configuration of a AAA group.

Synopsys

show aaa group [<groupName>] [-loggedIn]

Arguments

groupName

Name of the group.

loggedIn

Display only the group members who are currently logged in.

summary

fullValues

format

level

Outputs

userName

The user name.

policy

The policy name.

priority

Priority to assign to the policy, as an integer. A lower number indicates a higher priority.

Required when binding a group to a policy. Not relevant to any other

type of group binding.

intranetApplication

Bind the group to the specified intranet VPN application.

urlName

The intranet url

actType

intranetIP

The Intranet IP(s) bound to the group

netmask

The netmask for the Intranet IP

policySubType

Example

> show aaa group engg GroupName: engg Bound AAA users: UserName: joe UserName: jane In

aaa kcdAccount

Sep 22, 2015

The following operations can be performed on "aaa kcdAccount":

add | rm | set | unset | show

add aaa kcdAccount

Add a Kerberos constrained delegation account.

Synopsys

add aaa kcdAccount <kcdAccount> {-keytab <string>} {-realmStr <string>} {-delegatedUser <string>} {-kcdPassword } {-usercert <string>} {-cacert <string>} [-userRealm <string>]

Arguments

kcdAccount

The name of the KCD account.

keytab

The path to the keytab file. If specified other parameters in this command need not be given

realmStr

Kerberos Realm.

delegatedUser

Username that can perform kerberos constrained delegation.

kcdPassword

Password for Delegated User.

usercert

SSL Cert (including private key) for Delegated User.

cacert

CA Cert for UserCert or when doing PKINIT backchannel.

userRealm

Realm of the user

Example

add aaa kcdaccount my_kcd_acct -keytab /var/mykcd.keytab add aaa kcdaccount my_kcd_acct -keytab The above example adds a Kerberos constrained delegation account

---

rm aaa kcdAccount

Remove the KCD account.

Synopsys

rm aaa kcdAccount <kcdAccount>

Arguments

kcdAccount

The KCD account name.

---

set aaa kcdAccount

Set the KCD account information.

Synopsys

set aaa kcdAccount <kcdAccount> [-keytab <string>] [-realmStr <string>] [-delegatedUser <string>] [-kcdPassword] [-usercert <string>] [-cacert <string>] [-userRealm <string>]

Arguments

kcdAccount

The name of the KCD account.

keytab

The path to the keytab file. If specified other parameters in this command need not be given

realmStr

Kerberos Realm.

delegatedUser

Username that can perform kerberos constrained delegation.

kcdPassword

Password for Delegated User.

usercert

SSL Cert (including private key) for Delegated User.

cacert

CA Cert for UserCert or when doing PKINIT backchannel.

userRealm

Realm of the user

Example

set aaa kcdaccount my_kcd_acct -keytab /var/hiskcd.keytab The above command sets the keytab location for KCD account my_kcd_acct to /var/hiskcd.keytab

---

unset aaa kcdAccount

Unset the KCD account information..Refer to the set aaa kcdAccount command for meanings of the arguments.

Synopsys

unset aaa kcdAccount <kcdAccount> [-usercert <string>] [-cacert <string>] [-userRealm]

---

show aaa kcdAccount

Display KCD accounts.

Synopsys

show aaa kcdAccount [<kcdAccount>]

Arguments

kcdAccount

The KCD account name.

summary

fullValues

format

aaa ldapParams

Sep 22, 2015

The following operations can be performed on "aaa ldapParams":

set | unset | show

set aaa ldapParams

Modifies the global configuration settings for the LDAP server. The settings that you specify are used for all SSL-VPN virtual servers unless you use authentication policies to create a configuration for a specific SSL-VPN virtual server.

Synopsys

set aaa ldapParams [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] [-ldapBase <string>] [-ldapBindDn <string>] {-ldapBindDnPassword } [-ldapLoginName <string>] [-searchFilter <string>] [-groupAttrName <string>] [-subAttributeName <string>] [-secType <secType>] [-svrType (AD | NDS)] [-ssoNameAttribute <string>] [-passwdChange (ENABLED | DISABLED)] [-nestedGroupExtraction (ON | OFF)] [-maxNestingLevel <positive_integer>] [-groupNameIdentifier <string>] [-groupSearchAttribute <string> [-groupSearchSubAttribute <string>]] [-groupSearchFilter <string>] [-defaultAuthenticationGroup <string>]

Arguments

serverIP

IP address of your LDAP server.

serverPort

Port number on which the LDAP server listens for connections.

Default value: 389

Minimum value: 1

authTimeout

Maximum number of seconds that the NetScaler appliance waits for a response from the LDAP server.

Default value: 3

Minimum value: 1

ldapBase

Base (the server and location) from which LDAP search commands should start.

If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.

ldapBindDn

Complete distinguished name (DN) string used for binding to the LDAP server.

ldapBindDnPassword

Password for binding to the LDAP server.

ldapLoginName

Name attribute that the NetScaler appliance uses to query the external LDAP server or an Active Directory.

searchFilter

String to be combined with the default LDAP user search string to form the value to use when executing an LDAP search.

For example, the following values:

vpnallowed=true,

ldaploginame=""samaccount""

when combined with the user-supplied username ""bob"", yield the following LDAP search string:

""(&(vpnallowed=true)(samaccount=bob)""

groupAttrName

Attribute name used for group extraction from the LDAP server.

subAttributeName

Subattribute name used for group extraction from the LDAP server.

secType

Type of security used for communications between the NetScaler appliance and the LDAP server. For the PLAINTEXT setting, no encryption is required.

Possible values: PLAINTEXT, TLS, SSL

Default value: AAA_LDAP_PLAINTEXT

svrType

The type of LDAP server.

Possible values: AD, NDS

Default value: AAA_LDAP_SERVER_TYPE_DEFAULT

ssoNameAttribute

Attribute used by the NetScaler appliance to query an external LDAP server or Active Directory for an alternative username.

This alternative username is then used for single sign-on (SSO).

passwdChange

Accept password change requests.

Possible values: ENABLED, DISABLED

Default value: DISABLED

nestedGroupExtraction

Queries the external LDAP server to determine whether the specified group belongs to another group.

Possible values: ON, OFF

Default value: OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

Example

To configure authentication in the LDAP server running at 192.40.1.2: set aaa ldapparams -serverip 192.40.1.2 -ldapbase "dc=netscaler,dc=com" -ldapBindDN "cn=Mar

---

unset aaa ldapParams

Use this command to remove aaa ldapParams settings.Refer to the set aaa ldapParams command for meanings of the arguments.

Synopsys

unset aaa ldapParams [-serverIP] [-serverPort] [-authTimeout] [-ldapBase] [-ldapBindDn] [-ldapBindDnPassword] [-ldapLoginName] [-searchFilter] [-groupAttrName] [-subAttributeName] [-secType] [-svrType] [-ssoNameAttribute] [-passwdChange] [-nestedGroupExtraction] [-maxNestingLevel] [-groupNameIdentifier] [-groupSearchAttribute] [-groupSearchSubAttribute] [-groupSearchFilter] [-defaultAuthenticationGroup]

---

show aaa ldapParams

Displays the current LDAP configuration on the NetScaler appliance.

Synopsys

show aaa ldapParams

Arguments

format

level

Outputs

serverIP

The IP address of the LDAP server.

serverPort

Port number on which the LDAP server listens for connections.

authTimeout

Maximum number of seconds that the NetScaler appliance waits for a response from the LDAP server.

ldapBindDn

The full distinguished name used to bind to the LDAP server.

ldapLoginName

The name attribute used by the system to query the external LDAP server, or an Active Directory.

ldapBase

The base or node where the ldapsearch should start. If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.

secType

The communication type between the system and the LDAP server.

svrType

LDAP server.

ssoNameAttribute

The attribute used by the system to query the external LDAP server, or an Active Directory, for an alternate username to be used in Single Sign-On.

searchFilter

The String to be combined with the default LDAP user search string to form the value. For example, vpnallowed=true with ldaploginame "samaccount" and the user-supplied username "bob" would yield the LDAP search string "(&(vpnallowed=true)(samaccount=bob)".

groupAttrName

The Attribute name for group extraction from the LDAP server.

subAttributeName

Subattribute name used for group extraction from the LDAP server.

groupAuthName

To associate AAA users with an AAA group, use the command

"bind AAA group ... -username ...".

You can bind different policies to each AAA group. Use the command

"bind AAA group ... -policy ..."

passwdChange

Accept password change requests.

nestedGroupExtraction

Queries the external LDAP server to determine whether the specified group belongs to another group.

maxNestingLevel

Number of levels up to which the system can query nested LDAP groups.

groupNameIdentifier

LDAP-group attribute that uniquely identifies the group. No two groups on one LDAP server can have the same group name identifier.

groupSearchAttribute

LDAP-group attribute that designates the parent group of the specified group. Use this attribute to search for a group?s parent group.

groupSearchSubAttribute

LDAP-group subattribute that designates the parent group of the specified group. Use this attribute to search for a group?s parent group.

groupSearchFilter

Search-expression that can be specified for sending group-search requests to the LDAP server.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Example

```
> show aaa ldapparams Configured LDAP parameters   Server IP: 127.0.0.1   Port: 389  Timeout: 1     BindDn: cn=Manager,dc=florazel,dc=com login: uid     Bas
```

aaa parameter

Sep 22, 2015

The following operations can be performed on "aaa parameter":

set | unset | show

set aaa parameter

Sets the global AAA configuration. Any configuration settings made at this level overrides configuration settings for the authentication server.

Synopsys

set aaa parameter [-enableStaticPageCaching (YES | NO)] [-enableEnhancedAuthFeedback (YES | NO)] [-defaultAuthType <defaultAuthType>] [-maxAAAUsers <positive_integer>] [-maxLoginAttempts <positive_integer> [-failedLoginTimeout <positive_integer>]] [-aaadnatIp <ip_addr|*>]

Arguments

enableStaticPageCaching

The default state of VPN Static Page caching. If nothing is specified, the default value is set to ON.

Possible values: YES, NO

Default value: STATIC_PAGE_CACHING_ENABLED

enableEnhancedAuthFeedback

Enhanced auth feedback provides more information to the end user about the reason for an authentication failure. The default value is set to ON.

Possible values: YES, NO

Default value: ENHANCED_AUTH_FEEDBACK_DISABLED

defaultAuthType

The default authentication server type.

Possible values: LOCAL, LDAP, RADIUS, TACACS, CERT

Default value: LOCAL_AUTH

maxAAAUsers

Maximum number of concurrent users allowed to log on to VPN simultaneously.

Minimum value: 1

maxLoginAttempts

Maximum Number of login Attempts

Minimum value: 1

aaadnatIp

Source IP address to use for traffic that is sent to the authentication server.

Example

set aaa parameter -defaultAuthType RADIUS -maxAAAUSers 100

---

unset aaa parameter

Resets the global AAA parameter settings on the NetScaler appliance. Attributes for which a default value is available revert to their default values. See the set aaa parameter command for descriptions of the parameters..Refer to the set aaa parameter command for meanings of the arguments.

Synopsys

unset aaa parameter [-enableStaticPageCaching] [-enableEnhancedAuthFeedback] [-defaultAuthType] [-maxAAAUsers] [-aaadnatIp] [-maxLoginAttempts]

---

show aaa parameter

Displays the current AAA global configuration.

Synopsys

show aaa parameter

Arguments

format

level

Outputs

enableStaticPageCaching

Indicates if static page caching is enabled or not.

enableEnhancedAuthFeedback

Indicates whether enhanced auth feedback is enabled or not.

defaultAuthType

The default authentication server type.

maxAAAUsers

The maximum number of concurrent users allowed to log into the system at any time.

aaadnatIp

The natIp to be used for the AAA traffic

maxLoginAttempts

Maximum Number of login Attempts

failedLoginTimeout

Failed Login timeout

Example

```
> show aaa parameter Configured AAA parameters        DefaultAuthType: LDAP   MaxAAAUsers: 5  Done >
```

aaa preauthenticationaction

Sep 22, 2015

The following operations can be performed on "aaa preauthenticationaction":

add | rm | set | unset | show

add aaa preauthenticationaction

Adds an action (profile) for endpoint analysis (EPA) clients before authentication.

Synopsys

add aaa preauthenticationaction <name> [<preauthenticationaction>] [-killProcess <string>] [-deletefiles <string>]

Arguments

name

Name for the preauthentication action. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after preauthentication action is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my aaa action? or ?my aaa action).

preauthenticationaction

Allow or deny logon after endpoint analysis (EPA) results.

Possible values: ALLOW, DENY

killProcess

String specifying the name of a process to be terminated by the endpoint analysis (EPA) tool.

deletefiles

String specifying the path(s) and name(s) of the files to be deleted by the endpoint analysis (EPA) tool.

---

rm aaa preauthenticationaction

Removes a preauthentication action. NOTE: A preauthentication action cannot be removed if it is bound to a policy.

Synopsys

rm aaa preauthenticationaction <name>

Arguments

name

Name of the preauthentication action to remove.

---

set aaa preauthenticationaction

Modifies an existing preauthentication action (profile).

Synopsys

set aaa preauthenticationaction <name> [<preauthenticationaction>] [-killProcess <string>] [-deletefiles <string>]

Arguments

name

Name of the preauthentication action to modify.

preauthenticationaction

Allow or deny logon after endpoint analysis (EPA) results.

Possible values: ALLOW, DENY

killProcess

String specifying the name of a process to be terminated by the endpoint analysis (EPA) tool.

deletefiles

String specifying the path(s) and name(s) of the files to be deleted by the endpoint analysis (EPA) tool.

---

unset aaa preauthenticationaction

Use this command to remove aaa preauthenticationaction settings.Refer to the set aaa preauthenticationaction command for meanings of the arguments.

Synopsys

unset aaa preauthenticationaction <name> [-killProcess] [-deletefiles]

---

show aaa preauthenticationaction

Displays details of the specified preauthentication action.

Synopsys

show aaa preauthenticationaction [<name>]

Arguments

name

Name of the preauthentication action.

summary

aaa preauthenticationparameter

Sep 22, 2015

The following operations can be performed on "aaa preauthenticationparameter":

set | unset | show

set aaa preauthenticationparameter

Configures the default end point analysis (EPA) parameters that are applied before authentication.

Synopsys

set aaa preauthenticationparameter [-preauthenticationaction (ALLOW | DENY)] [-rule <expression>] [-killProcess <string>] [-deletefiles <string>]

Arguments

preauthenticationaction

Deny or allow login on the basis of end point analysis results.

Possible values: ALLOW, DENY

rule

Name of the NetScaler named rule, or a default syntax expression, to be evaluated by the EPA tool.

killProcess

String specifying the name of a process to be terminated by the EPA tool.

deletefiles

String specifying the path(s) to and name(s) of the files to be deleted by the EPA tool, as a string of between 1 and 1023 characters.

---

unset aaa preauthenticationparameter

Resets the default end point analysis(EPA) configuration settings on the NetScaler appliance. Attributes for which a default value is available revert to their default values. See the set aaa preauthenticationparameter command for descriptions of the parameters..Refer to the set aaa preauthenticationparameter command for meanings of the arguments.

Synopsys

unset aaa preauthenticationparameter [-rule] [-preauthenticationaction] [-killProcess] [-deletefiles]

---

show aaa preauthenticationparameter

Displays the current preauthentication configuration.

Synopsys

show aaa preauthenticationparameter

Arguments

format

level

Outputs

preauthenticationaction

Deny or allow login after End point analysis results.

rule

Name of the NetScaler named rule, or a default syntax expression, to be evaluated by the EPA tool.

killProcess

Processes to be killed by EPA tool.

deletefiles

Files to be deleted by EPA tool.

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

aaa preauthenticationpolicy

Sep 22, 2015

The following operations can be performed on "aaa preauthenticationpolicy":

add | rm | set | show

add aaa preauthenticationpolicy

Adds a preauthentication policy. The policy defines expressions to be evaluated by the endpoint analysis (EPA) tool.

Synopsys

add aaa preauthenticationpolicy <name> <rule> [<reqAction>]

Arguments

name

Name for the preauthentication policy. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the preauthentication policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my policy? or ?my policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, defining connections that match the policy.

reqAction

Name of the action that the policy is to invoke when a connection matches the policy.

---

rm aaa preauthenticationpolicy

Removes the specified preauthentication policy.

Synopsys

rm aaa preauthenticationpolicy <name>

Arguments

name

Name of the preauthentication policy to remove.

---

set aaa preauthenticationpolicy

Modifies the Request Action of a preauthentication policy.

Synopsys

set aaa preauthenticationpolicy <name> [-rule <expression>] [-reqAction <string>]

Arguments

name

Name of the preauthentication policy to modifiy.

rule

The new rule to be associated with the policy.

reqAction

Name of the action that the policy is to invoke when a connection matches the policy.

---

show aaa preauthenticationpolicy

Displays the properties of either the specified preauthentication policy or (if none is specified) a list of all configured preauthentication policies.

Synopsys

show aaa preauthenticationpolicy [<name>]

Arguments

name

Name of the preauthentication policy whose properties you want to view.

summary

fullValues

format

level

Outputs

rule

The new rule associated with the policy.

reqAction

The Pre-authentication action associated with the policy.

aaa radiusParams

Sep 22, 2015

The following operations can be performed on "aaa radiusParams":

set | unset | show

set aaa radiusParams

Modifies the global configuration settings for the RADIUS server. The settings that you specify are used for all SSL-VPN virtual servers unless you use authentication policies to create a configuration for a specific SSL-VPN virtual server.

Synopsys

set aaa radiusParams [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] {-radKey } [-radNASip (ENABLED | DISABLED)] [-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeType <positive_integer>] [-radGroupsPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>] [-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>] [-accounting (ON | OFF)] [-pwdVendorID <positive_integer>] [-pwdAttributeType <positive_integer>] [-defaultAuthenticationGroup <string>] [-callingstationid (ENABLED | DISABLED)]

Arguments

serverIP

IP address of your RADIUS server.

serverPort

Port number on which the RADIUS server listens for connections.

Default value: 1812

Minimum value: 1

authTimeout

Maximum number of seconds that the NetScaler appliance waits for a response from the RADIUS server.

Default value: 3

Minimum value: 1

radKey

The key shared between the RADIUS server and clients.

Required for allowing the NetScaler appliance to communicate with the RADIUS server.

radNASip

Send the NetScaler IP (NSIP) address to the RADIUS server as the Network Access Server IP (NASIP) part of the Radius protocol.

Possible values: ENABLED, DISABLED

radNASid

Send the Network Access Server ID (NASID) for your NetScaler appliance to the RADIUS server as the nasid part of the Radius protocol.

radVendorID

Vendor ID for RADIUS group extraction.

Minimum value: 1

radAttributeType

Attribute type for RADIUS group extraction.

Minimum value: 1

radGroupsPrefix

Prefix string that precedes group names within a RADIUS attribute for RADIUS group extraction.

radGroupSeparator

Group separator string that delimits group names within a RADIUS attribute for RADIUS group extraction.

passEncoding

Enable password encoding in RADIUS packets that the NetScaler appliance sends to the RADIUS server.

Possible values: pap, chap, mschapv1, mschapv2

Default value: AAA_PAP

ipVendorID

Vendor ID attribute in the RADIUS response.

If the attribute is not vendor-encoded, it is set to 0.

ipAttributeType

IP attribute type in the RADIUS response.

Minimum value: 1

accounting

Configure the RADIUS server state to accept or refuse accounting messages.

Possible values: ON, OFF

pwdVendorID

Vendor ID of the password in the RADIUS response. Used to extract the user password.

Minimum value: 1

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

callingstationid

Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID.

Possible values: ENABLED, DISABLED

Default value: DISABLED

Example

To configure the default RADIUS parameters: set aaa radiusparams -serverip 192.30.1.2 -radkey sslvpn

---

unset aaa radiusParams

Use this command to remove aaa radiusParams settings.Refer to the set aaa radiusParams command for meanings of the arguments.

Synopsys

unset aaa radiusParams [-serverIP] [-serverPort] [-authTimeout] [-radNASip] [-radNASid] [-radVendorID] [-radAttributeType] [-radGroupsPrefix] [-radGroupSeparator] [-passEncoding] [-ipVendorID] [-ipAttributeType] [-accounting] [-pwdVendorID] [-pwdAttributeType] [-defaultAuthenticationGroup] [-callingstationid]

---

show aaa radiusParams

Displays the current RADIUS configuration on the NetScaler appliance.

Synopsys

show aaa radiusParams

Arguments

format

level

Outputs

serverIP

IP address of your RADIUS server.

serverPort

Port number on which the RADIUS server listens for connections.

radKey

The key shared between the client and the server.

groupAuthName

To associate AAA users with an AAA group, use the command

"bind AAA group ... -username ...".

You can bind different policies to each AAA group. Use the command

"bind AAA group ... -policy ..."

authTimeout

Maximum number of seconds that the NetScaler appliance waits for a response from the RADIUS server.

radNASip

The option to send the NetScaler's IP address (NSIP) as the "nasip" (Network Access Server IP) part of the Radius protocol to the server.

radNASid

The nasid (Network Access Server ID). If configured, this string will be sent to the RADIUS server as the "nasid" as part of the Radius protocol.

IPAddress

IP Address.

radVendorID

Vendor ID for RADIUS group extraction.

radAttributeType

Attribute type for RADIUS group extraction.

radGroupsPrefix

Prefix string that precedes group names within a RADIUS attribute for RADIUS group extraction.

radGroupSeparator

Group separator string that delimits group names within a RADIUS attribute for RADIUS group extraction.

passEncoding

Enable password encoding in RADIUS packets that the NetScaler appliance sends to the RADIUS server.

ipVendorID

Vendor ID attribute in the RADIUS response.

If the attribute is not vendor-encoded, it is set to 0.

ipAttributeType

IP attribute type in the RADIUS response.

accounting

The state of the Radius server that will receive accounting messages.

pwdVendorID

Vendor ID of the password in the RADIUS response. Used to extract the user password.

pwdAttributeType

Attribute type of the Vendor ID in the RADIUS response.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

callingstationid

Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID.

Example

> show aaa radiusparams Configured RADIUS parameters Server IP: 127.0.0.2 Port: 1812 key: secret Timeout: 10 Done >

aaa session

Sep 22, 2015

The following operations can be performed on "aaa session":

show | kill

show aaa session

Displays all AAA-TM/VPN connections that are bound to the specified user, group, IP address, or IP range.

Synopsys

show aaa session [-userName <string>] [-groupName <string>] [-intranetIP <ip_addr|*> [<netmask>]]

Arguments

userName

Name of the AAA user.

groupName

Name of the AAA group.

intranetIP

IP address or the first address in the intranet IP range.

Outputs

publicIP

Client's public IP address

publicPort

Client's public port

IPAddress

NetScaler's IP address

port

NetScaler's port

privateIP

Client's private/mapped IP address

privatePort

Client's private/mapped port

destIP

Destination IP address

destPort

Destination port

intranetIP

Specifies the Intranet IP

peId

Core id of the session owner

stateflag

devno

count

Example

> show aaa connection ClintIp (ClientPort) -> ServerIp(ServerPort) ---------- ---------- User Name: Joe 10.102.0.39

---

kill aaa session

Terminates the specified AAA-TM/VPN session.

Synopsys

kill aaa session [-userName <string>] [-groupName <string>] [-intranetIP <ip_addr|*> [<netmask>]] [-all]

Arguments

userName

Terminate AAA-TM/VPN sessions that belong to the specified user.

groupName

Terminate AAA-TM/VPN sessions that belong to any user that is a member of the specified group.

intranetIP

Terminate AAA-TM/VPN sessions that are associated with the specified intranet IP address or with an address in the range specified by the address and subnet mask.

all

Terminate all active AAA-TM/VPN sessions.

Example

```
kill aaa session -user joe
```

aaa stats

Sep 22, 2015

The following operations can be performed on "aaa stats":

show aaa stats

show aaa stats is an alias for stat aaa

Synopsys

show aaa stats - alias for 'stat aaa'

aaa tacacsParams

Sep 22, 2015

The following operations can be performed on "aaa tacacsParams":

set | unset | show

set aaa tacacsParams

Modifies the global configuration settings for the TACACS+ server. The settings that you specify are used for all SSL-VPN virtual servers unless you use authentication policies to create a configuration for a specific SSL-VPN virtual server.

Synopsys

set aaa tacacsParams [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] {-tacacsSecret } [-authorization (ON | OFF)] [-accounting (ON | OFF)] [-auditFailedCmds (ON | OFF)] [-defaultAuthenticationGroup <string>]

Arguments

serverIP

IP address of your TACACS+ server.

serverPort

Port number on which the TACACS+ server listens for connections.

Default value: 49

Minimum value: 1

authTimeout

Maximum number of seconds that the NetScaler appliance waits for a response from the TACACS+ server.

Default value: 3

Minimum value: 1

tacacsSecret

Key shared between the TACACS+ server and clients. Required for allowing the NetScaler appliance to communicate with the TACACS+ server.

authorization

Use streaming authorization on the TACACS+ server.

Possible values: ON, OFF

accounting

Send accounting messages to the TACACS+ server.

Possible values: ON, OFF

auditFailedCmds

The option for sending accounting messages to the TACACS+ server.

Possible values: ON, OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

Example

To configure a TACACS+ server running at 192.168.1.20 set aaa tacacsparams -serverip 192.168.1.20 -tacacssecret secret

---

unset aaa tacacsParams

Use this command to remove aaa tacacsParams settings.Refer to the set aaa tacacsParams command for meanings of the arguments.

Synopsys

unset aaa tacacsParams [-serverIP] [-serverPort] [-authTimeout] [-tacacsSecret] [-authorization] [-accounting] [-auditFailedCmds] [-defaultAuthenticationGroup]

---

show aaa tacacsParams

Displays the NetScaler appliance?s current AAA TACACS+ configuration.

Synopsys

show aaa tacacsParams

Arguments

format

level

Outputs

serverIP

IP address of your TACACS+ server.

serverPort

Port number on which the TACACS+ server listens for connections.

authTimeout

Maximum number of seconds that the NetScaler appliance waits for a response from the TACACS+ server.

tacacsSecret

The key shared between the client and the server.

authorization

The option for the streaming authorization for TACACS+ server.

accounting

The option to send accounting messages to TACACS+ server.

auditFailedCmds

The option to send accounting messages to TACACS+ server.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Example

```
> sh aaa tacacsparams Configured TACACS parameter        Server IP: 192.168.1.20 Port: 49   Timeout: 1 secs Done
```

aaa user

Sep 22, 2015

The following operations can be performed on "aaa user":

add | rm | set | bind | unbind | show

add aaa user

Adds a local AAA user account and verifies the configuration to ensure that it is correct.

Synopsys

add aaa user <userName> {-password }

Arguments

userName

Name for the user. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the user is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or

single quotation marks (for example, "my aaa user" or "my aaa user").

password

Password with which the user logs on. Required for any user account that does not exist on an external authentication server.

If you are not using an external authentication server, all user accounts must have a password. If you are using an external authentication server, you must provide a password for local user accounts that do not exist on the authentication server.

Example

add aaa user johndoe -password abcd add aaa user johndoe -password The above example adds user johndoe with password abcd for first case, password supplied on pror

---

rm aaa user

Removes a local AAA user account and the associated configuration.

Synopsys

rm aaa user <userName>

Arguments

userName

Name of the AAA user account to remove.

---

set aaa user

Configures the password for an existing local AAA user account. This command prompts you for a new password. NOTE: AAA does not request confirmation of the new password, so you might want to test the new password before sending it to the user.

Synopsys

set aaa user <userName>

Arguments

userName

Name of the local AAA user account.

password

Password with which the user logs on. Required for any user account that does not exist on an external authentication server.

If you are not using an external authentication server, all user accounts must have a password. If you are using an external authentication server, you must provide a password for local user accounts that do not exist on the authentication server.

Example

set aaa user johndoe password abcd The above command sets the password for johndoe to abcd

---

bind aaa user

Binds a policy to the specified user account.

Synopsys

bind aaa user <userName> [-policy <string> [-priority <positive_integer>]] [-intranetApplication <string>] [-urlName <string>] [-intranetIP <ip_addr> [<netmask>]]

Arguments

userName

User account to which to bind the policy.

policy

Name for the policy that you are creating. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the policy is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or

single quotation marks (for example, "my policy" or "my policy").

intranetApplication

Name of the intranet VPN application to which the policy applies.

urlName

URL of the intranet application to which you are binding the policy.

intranetIP

IP address of the intranet application to which you are binding the policy.

Example

To bind intranetip to the user joe: bind aaa user joe -intranetip 10.102.1.123

---

unbind aaa user

Unbinds a policy from the specified user account.

Synopsys

unbind aaa user <userName> [-policy <string>] [-intranetApplication <string>] [-urlName <string>] [-intranetIP <ip_addr> [<netmask>]]

Arguments

userName

Name of the user account from which to unbind the policy.

policy

Name of the policy to unbind.

intranetApplication

Name of the intranet VPN application from which you are unbinding the policy.

urlName

URL of the intranet application from which you are unbinding the policy.

intranetIP

Intranet IP address of the application from which you are unbinding the policy.

Example

unbind AAA user joe -intranetip 10.102.1.123

---

show aaa user

Displays the current configuration of a AAA user account.

Synopsys

show aaa user [<userName>] [-loggedIn]

Arguments

userName

Name of the user who has the account.

loggedIn

Show whether the user is logged in or not.

summary

Application Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- application

application

Sep 22, 2015

The following operations can be performed on "application":

import | export | rm

import application

Imports application configuration information from an AppExpert application template file. You can specify a deployment file along with the template file. A template file contains application and variable definitions. A deployment file contains information about the services, service groups, endpoints, and variables that were in the AppExpert application configuration at the time the template file was created. Before you use template and deployment files, make sure that they are present in the /nsconfig/nstemplates/applications/ and /nsconfig/nstemplates/applications/deployment_files directories, respectively. You can transfer the files from your local drive to those directories on the NetScaler appliance by using either FTP or the NetScaler configuration utility. In the configuration utility, you can also import the files and create the application by using a single wizard (AppExpert > Applications > Import > AppExpert Template Wizard).

Synopsys

import application <apptemplateFilename> [-appname <string>] [-deploymentFilename <input_filename>]

Arguments

apptemplateFilename

Name of the AppExpert application template file.

appname

Name to assign to the application on the NetScaler appliance. If you do not provide a name, the appliance assigns the application the name of the template file.

deploymentFilename

Name of the deployment file.

Example

```
import app application sampleapp -apptemplatefilename sampleapp.xml -deploymentfilename deploy.xml
```

---

export application

Exports application configuration information to an AppExpert application template file. A deployment file is created along with the template file. The template file contains application and variable definitions. The deployment file contains information about the services, service groups, endpoints, and variables that are in the AppExpert application configuration. The template and deployment files are exported to the /nsconfig/nstemplates/applications/ and /nsconfig/nstemplates/applications/deployment_files directories, respectively. If you use the configuration utility, you can also export an application to your local hard drive.

Synopsys

export application <appname> [-apptemplateFilename <input_filename>] [-deploymentFilename <input_filename>]

Arguments

appname

Name of the AppExpert application whose configuration you want to export to a template file.

apptemplateFilename

Name with which to save the template file. If you do not specify a name, the template file is saved with the name of the application.

deploymentFilename

Name with which to save the deployment file. If you do not specify a name, a string consisting of an underscore and ?deployment? (_deployment) is automatically appended to the name of the template file to create the name of the deployment file.

---

rm application

Remove application configuration information from a netscaler device. You can specify an application name as input. All the configuration belonging to the specified application will be removed from the device.

Synopsys

rm application <appname>

Arguments

appname

Name of the AppExpert application whose configuration you want to remove from the Netscaler appliance.

AppFlow Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- appflow
- appflow action
- appflow collector
- appflow global
- appflow param
- appflow policy
- appflow policylabel

appflow

Sep 22, 2015

The following operations can be performed on "appflow":

stat appflow

Display AppFlow statistics.

Synopsys

stat appflow [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

AppFlow octets transmitted (aflwOcts)

The total number of AppFlow (IPFIX) octets that the NetScaler has transmitted.

AppFlow flows transmitted (aflwFlws)

The total number of AppFlow (IPFIX) flows that the NetScaler has transmitted.

AppFlow messages transmitted (aflwMsgs)

The total number of AppFlow (IPFIX) messages that the NetScaler has transmitted.

Octets ignored for AppFlow (aflwIgnOct)

The total number of octets that the NetScaler has ignored for AppFlow (IPFIX).

Packets ignored for AppFlow (aflwIgnPkts)

The total number of packets that the NetScaler has ignored for AppFlow (IPFIX).

AppFlow octets not transmitted (aflwNoTxOcts)

The total number of AppFlow (IPFIX) octets that the NetScaler has not transmitted.

AppFlow flows not transmitted (aflwNoTxFlows)

The total number of AppFlow (IPFIX) flows that the NetScaler has not transmitted.

AppFlow packets not transmitted (aflwNoTxPkts)

The total number of AppFlow (IPFIX) packets that the NetScaler has not transmitted.

appflow action

Sep 22, 2015

The following operations can be performed on "appflow action":

add | rm | set | unset | rename | show

add appflow action

Creates an AppFlow action. The action can be associated with an AppFlow policy by using the add appflow policy command.

Synopsys

add appflow action <name> -collectors <string> ... [-comment <string>]

Arguments

name

Name for the action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow action" or 'my appflow action').

collectors

Name(s) of collector(s) to be associated with the AppFlow action.

comment

Any comments about this action. In the CLI, if including spaces between words, enclose the comment in quotation marks. (The quotation marks are not required in the configuration utility.)

Example

```
add appflow action appflow_action_1 -collectors col1 col2
```

---

rm appflow action

Removes a configured AppFlow action. You cannot remove an action that is associated with an AppFlow policy.

Synopsys

rm appflow action <name>

Arguments

name

Name of the action to be removed.

Example

rm appflow action appflow_action_1

---

set appflow action

Modifies the specified parameters of an AppFlow action.

Synopsys

set appflow action <name> [-collectors <string> ...] [-comment <string>]

Arguments

name

Name of the action to be modified.

collectors

Name(s) of collector(s) to be associated with the AppFlow action.

comment

Any comments about this action. In the CLI, if including spaces between words, enclose the comment in quotation marks. (The quotation marks are not required in the configuration utility.)

Example

set appflow action appflow_action_1 -collectors col1 col2 col3

---

unset appflow action

Use this command to remove appflow action settings.Refer to the set appflow action command for meanings of the arguments.

Synopsys

unset appflow action <name> -comment

---

rename appflow action

Renames an AppFlow action.

Synopsys

rename appflow action <name>@ <newName>@

Arguments

name

Existing name of the action.

newName

New name for the AppFlow action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at

(@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow action" or 'my appflow action').

Example

```
rename appflow action old_name new_name
```

---

show appflow action

Displays information about AppFlow action(s), or about the specified AppFlow action.

Synopsys

```
show appflow action [<name>]
```

Arguments

name

Name of the action about which to display information.

summary

fullValues

format

level

Outputs

stateflag

hits

The number of times the action has been taken.

collectors

Name(s) of collector(s) to be associated with the AppFlow action.

referenceCount

The number of references to the action.

description

Description of the action

comment

Comments associated with the AppFlow action.

devno

Example

1. show appflow action 2. show appflow action appflow_action_1

appflow collector

Sep 22, 2015

The following operations can be performed on "appflow collector":

add | rm | rename | show

add appflow collector

Adds a new AppFlow collector. A collector receives the flow records generated by the NetScaler appliance. You can add only four AppFlow collectors to the NetScaler appliance.

Synopsys

add appflow collector <name> -IPAddress <ip_addr> [-port <port>] [-netProfile <string>]

Arguments

name

Name for the collector. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at

(@), equals (=), and hyphen (-) characters.

Only four collectors can be configured.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow collector" or 'my appflow collector').

IPAddress

IPv4 address of the collector.

port

UDP port on which the collector listens.

Default value: 4739

netProfile

Netprofile to associate with the collector. The IP address defined in the profile is used as the source IP address for AppFlow traffic for this collector. If you do not set this parameter, the NetScaler IP (NSIP) address is used as the source IP address.

Example

```
add appflow collector collector1 -IPAddress 192.168.1.40 -port 2055
```

rm appflow collector

Removes an AppFlow collector. You cannot remove a collector if it is associated with an AppFlow action.

Synopsys

rm appflow collector <name>

Arguments

name

Name of the collector to remove.

Example

```
rm appflow collector collector1
```

---

rename appflow collector

Renames an AppFlow collector.

Synopsys

rename appflow collector <name>@ <newName>@

Arguments

name

Existing name of the collector.

newName

New name for the collector. Must begin with an ASCII alphabetic or underscore (_) character, and must

contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at(@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow coll" or 'my appflow coll').

Example

```
rename appflow collector old_name new_name
```

---

show appflow collector

Displays information about all configured AppFlow collectors, or about the specified collector.

Synopsys

show appflow collector [<name>]

Arguments

name

Name of the collector about which to display information.

summary

fullValues

format

level

Outputs

IPAddress

IPv4 address of the collector.

port

UDP port on which the collector listens.

netProfile

Netprofile to associate with the collector. The IP address defined in the profile is used as the source IP address for AppFlow traffic for this collector. If you do not set this parameter, the NetScaler IP (NSIP) address is used as the source IP address.

appflow global

Sep 22, 2015

The following operations can be performed on "appflow global":

bind | unbind | show

bind appflow global

Binds the AppFlow policy to one of the two global lists of AppFlow policies. A policy becomes active only after it is bound.

Synopsys

bind appflow global <policyName> <priority> [<gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <labelName>)]

Arguments

policyName

Name of the AppFlow policy to be bound.

Example

i) bind appflow global pol9 9 ii) bind appflow global pol9 9 120 iii) bind appflow global pol9 9 "HTTP.REQ.HEADER(\\\\"qh3\\\\").TYPECAST_NUM_T(DECIMAL)"

---

unbind appflow global

Unbinds entities from an AppFlow global bind point.

Synopsys

unbind appflow global (<policyName> [-type <type>] [-priority <positive_integer>])

Arguments

policyName

Name of the policy to be unbound.

Example

unbind appflow global pol9

---

show appflow global

Displays the AppFlow global bind points and the number of policies bound to each global bind point, or more detailed information about the specified bind point.

Synopsys

show appflow global [-type <type>]

Arguments

type

Global bind point for which to show detailed information about the policies bound to the bind point.

Possible values: REQ_OVERRIDE, REQ_DEFAULT, OVERRIDE, DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, MSSQL_REQ_OVERRIDE, MSSQL_REQ_DEFAULT, MYSQL_REQ_OVERRIDE, MYSQL_REQ_DEFAULT, ICA_REQ_OVERRIDE, ICA_REQ_DEFAULT, ORACLE_REQ_OVERRIDE, ORACLE_REQ_DEFAULT

summary

fullValues

format

level

Outputs

stateflag

policyName

Name of the AppFlow policy.

priority

Specifies the priority of the policy.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

invoke

Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.

labelType

Type of policy label to invoke. Specify vserver for a policy label associated with a virtual server, or policylabel for a user-defined policy label.

labelName

Name of the label to invoke if the current policy evaluates to TRUE.

numpol

The number of policies bound to the bindpoint.

flowType

Flow type of the bound AppFlow policy.

appflow param

Sep 22, 2015

The following operations can be performed on "appflow param":

set | unset | show

set appflow param

Configures AppFlow parameters.

Synopsys

set appflow param [-templateRefresh <secs>] [-appnameRefresh <secs>] [-flowRecordInterval <secs>] [-udpPmtu <positive_integer>] [-httpUrl (ENABLED | DISABLED)] [-AAAUserName (ENABLED | DISABLED)] [-httpCookie (ENABLED | DISABLED)] [-httpReferer (ENABLED | DISABLED)] [-httpMethod (ENABLED | DISABLED)] [-httpHost (ENABLED | DISABLED)] [-httpUserAgent (ENABLED | DISABLED)] [-clientTrafficOnly (YES | NO)] [-httpContentType (ENABLED | DISABLED)] [-httpAuthorization (ENABLED | DISABLED)] [-httpVia (ENABLED | DISABLED)] [-httpXForwardedFor (ENABLED | DISABLED)] [-httpLocation (ENABLED | DISABLED)] [-httpSetCookie (ENABLED | DISABLED)] [-httpSetCookie2 (ENABLED | DISABLED)] [-connectionChaining (ENABLED | DISABLED)]

Arguments

templateRefresh

Refresh interval, in seconds, at which to export the template data. Because data transmission is in UDP, the templates must be resent at regular intervals.

Default value: 600

Minimum value: 60

Maximum value: 3600

appnameRefresh

Interval, in seconds, at which to send Appnames to the configured collectors. Appname refers to the name of an entity (virtual server, service, or service group) in the NetScaler appliance.

Default value: 600

Minimum value: 60

Maximum value: 3600

flowRecordInterval

Interval, in seconds, at which to send flow records to the configured collectors.

Default value: 60

Minimum value: 60

Maximum value: 3600

udpPmtu

MTU, in bytes, for IPFIX UDP packets.

Default value: 1472

Minimum value: 128

Maximum value: 1472

httpUrl

Include the http URL that the NetScaler appliance received from the client.

Possible values: ENABLED, DISABLED

Default value: DISABLED

AAAUserName

Enable AppFlow AAA Username logging.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpCookie

Include the cookie that was in the HTTP request the appliance received from the client.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpReferer

Include the web page that was last visited by the client.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpMethod

Include the method that was specified in the HTTP request that the appliance received from the client.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpHost

Include the host identified in the HTTP request that the appliance received from the client.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpUserAgent

Include the client application through which the HTTP request was received by the NetScaler appliance.

Possible values: ENABLED, DISABLED

Default value: DISABLED

clientTrafficOnly

Generate AppFlow records for only the traffic from the client.

Possible values: YES, NO

Default value: NO

httpContentType

Include the HTTP Content-Type header sent from the server to the client to determine the type of the content sent.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpAuthorization

Include the HTTP Authorization header information.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpVia

Include the httpVia header which contains the IP address of proxy server through which the client accessed the server.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpXForwardedFor

Include the httpXForwardedFor header, which contains the original IP Address of the client using a proxy server to access the server.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpLocation

Include the HTTP location headers returned from the HTTP responses.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpSetCookie

Include the Set-cookie header sent from the server to the client in response to a HTTP request.

Possible values: ENABLED, DISABLED

Default value: DISABLED

httpSetCookie2

Include the Set-cookie header sent from the server to the client in response to a HTTP request.

Possible values: ENABLED, DISABLED

Default value: DISABLED

connectionChaining

Enable connection chaining so that the client server flows of a connection are linked. Also the connection chain ID is propagated across NetScalers, so that in a multi-hop environment the flows belonging to the same logical connection are linked. This id is also logged as part of appflow record

Possible values: ENABLED, DISABLED

Default value: DISABLED

Example

```
set appflow param -templateRefresh 240
```

---

unset appflow param

Use this command to remove appflow param settings.Refer to the set appflow param command for meanings of the arguments.

Synopsys

unset appflow param [-templateRefresh] [-appnameRefresh] [-flowRecordInterval] [-udpPmtu] [-httpUrl] [-AAAUserName] [-httpCookie] [-httpReferer] [-httpMethod] [-httpHost] [-httpUserAgent] [-clientTrafficOnly] [-httpContentType] [-httpAuthorization] [-httpVia] [-httpXForwardedFor] [-httpLocation] [-httpSetCookie] [-httpSetCookie2] [-connectionChaining]

---

show appflow param

Displays AppFlow parameters.

flowRecordInterval

Interval, in seconds, at which to send flow records to the configured collectors.

udpPmtu

MTU, in bytes, for IPFIX UDP packets.

httpUrl

State of AppFlow HTTP URL logging.

AAAUserName

State of AppFlow AAA User logging.

httpCookie

State of AppFlow HTTP cookie logging.

httpReferer

State of AppFlow HTTP referer logging.

httpMethod

State of AppFlow HTTP method logging.

httpHost

State of AppFlow HTTP host logging.

httpUserAgent

State of AppFlow HTTP user-agent logging.

clientTrafficOnly

Generate AppFlow records for only the traffic from the client.

httpContentType

State of AppFlow HTTP Content-Type header logging

httpAuthorization

State of AppFlow HTTP Authorization header logging

httpVia

State of AppFlow HTTP Via header logging

httpXForwardedFor

State of AppFlow HTTP X-Forwarded-For header logging

httpLocation

State of AppFlow HTTP Location header logging

httpSetCookie

State of AppFlow HTTP Setcookie header logging

httpSetCookie2

State of AppFlow HTTP Setcookie2 header logging

connectionChaining

State of connection-chaining feature

appflow policy

Sep 22, 2015

The following operations can be performed on "appflow policy":

add | rm | set | unset | rename | show

add appflow policy

Adds an Appflow policy. The policy specifies the rule based on which the traffic is evaluated, and the action to be taken if the rule returns "TRUE".

Synopsys

add appflow policy <name> <rule> <action> [-comment <string>]

Arguments

name

Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at

(@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policy" or 'my appflow policy').

rule

Expression or other value against which the traffic is evaluated. Must be a Boolean, default syntax expression. Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the \\ character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

action

Name of the action to be associated with this policy.

comment

Any comments about this policy.

Example

```
add appflow policy appflow_pol "HTTP.REQ.HEADER(\\\"header\\\").CONTAINS(\\\"qh3\\\")" appflow_act
```

---

rm appflow policy

Removes an AppFlow policy. (Cannot remove a policy that is bound to a policy label.)

Synopsys

```
rm appflow policy <name>
```

Arguments

name

Name of the policy to be removed.

Example

```
rm appflow policy appflow_policy_1
```

---

set appflow policy

Modifies the rule and/or action for an existing AppFlow policy. The rule for flow type can be changed only if the associated action is of NEUTRAL flow type.

Synopsys

```
set appflow policy <name> [-rule <expression>] [-action <string>] [-comment <string>]
```

Arguments

name

Name of the policy to modify.

rule

Expression or other value against which the traffic is evaluated. Must be a Boolean, default syntax expression. Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the \\ character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

action

Name of the action to be associated with this policy.

comment

Any comments about this policy.

Example

```
set appflow policy appflow_policy -rule "HTTP.REQ.HEADER(\\\"header\\\").CONTAINS(\\\"qh2\\\")"
```

---

unset appflow policy

Use this command to remove appflow policy settings.Refer to the set appflow policy command for meanings of the arguments.

Synopsys

```
unset appflow policy <name> -comment
```

---

rename appflow policy

Renames an AppFlow policy.

Synopsys

```
rename appflow policy <name>@ <newName>@
```

Arguments

name

Existing name of the policy.

newName

New name for the policy. Must begin with an ASCII alphabetic or underscore (_)character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policy" or 'my appflow policy').

Example

rename appflow policy old_name new_name

---

show appflow policy

Displays information about all configured AppFlow policies, or detailed information about the specified policy.

Synopsys

show appflow policy [<name>]

Arguments

name

Name of the policy about which to display detailed information.

summary

appflow policylabel

Sep 22, 2015

The following operations can be performed on "appflow policylabel":

add | rm | bind | unbind | rename | show

add appflow policylabel

Creates a user-defined AppFlow policy label. You can bind AppFlow policies to the AppFlow policy label.

Synopsys

add appflow policylabel <labelName> [-policylabeltype (HTTP | OTHERTCP)]

Arguments

labelName

Name of the AppFlow policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at

(@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policylabel" or 'my appflow policylabel').

policylabeltype

Type of traffic evaluated by the policies bound to the policy label.

Possible values: HTTP, OTHERTCP

Default value: NS_PLTMAP_APPFLOW_REQ

Example

```
add appflow policylabel appflow_pol_label
```

---

rm appflow policylabel

Removes an AppFlow policy label.

Synopsys

rm appflow policylabel <labelName>

Arguments

labelName

Name of the policy label to be removed.

Example

```
rm appflow policylabel appflow_pol_label
```

---

bind appflow policylabel

Binds an AppFlow policy to an AppFlow policy label.

Synopsys

bind appflow policylabel <labelName> -policyName <string> -priority <positive_integer> [-gotoPriorityExpression <expression>] [-invoke (<labelType> <labelName>)]

Arguments

labelName

Name of the policy label to which to bind the policy.

policyName

Name of the policy to bind to the policy label.

Example

```
bind appflow policylabel appflow_pol_label -policyName appflow_pol -priority 1
```

---

unbind appflow policylabel

Unbinds an AppFlow policy from an AppFlow policy label.

Synopsys

unbind appflow policylabel <labelName> <policyName> [-priority <positive_integer>]

Arguments

labelName

Name of the policy label from which to unbind a policy.

policyName

Name of the policy to unbind.

Example

```
unbind appflow policylabel appflow_pol_label appflow_pol
```

---

rename appflow policylabel

Renames an AppFlow policy label.

Synopsys

rename appflow policylabel <labelName>@ <newName>@

Arguments

labelName

Existing name of the policylabel.

newName

New name for the policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policylabel" or 'my appflow policylabel')

Example

```
rename appflow policylabel old_name new_name
```

---

show appflow policylabel

Displays information about all AppFlow policy labels, or detailed information about the specified policy label.

Synopsys

```
show appflow policylabel [<labelName>]
```

Arguments

labelName

Name of the policy label about which to display detailed information.

Application Firewall Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- appfw
- appfw JSONContentType
- appfw XMLContentType
- appfw archive
- appfw confidField
- appfw customSettings
- appfw fieldType
- appfw global
- appfw htmlerrorpage
- appfw learningdata
- appfw learningsettings
- appfw policy
- appfw policylabel
- appfw profile
- appfw settings
- appfw signatures
- appfw stats
- appfw transactionRecords
- appfw wsdl
- appfw xmlerrorpage
- appfw xmlschema

appfw

Sep 22, 2015

The following operations can be performed on "appfw":

stat appfw

Displays application firewall statistics.

Synopsys

stat appfw [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

total violations (totviols)

Total number of security check violations seen by the Application Firewall.

Recent Ave Response Time (ms) (shortAvgRespTime)

Average backend response time in milliseconds over the last 7 seconds

Long Term Ave Response Time (ms) (longAvgRespTime)

Average backend response time in milliseconds since reboot

requests (reqs)

HTTP/HTTPS requests sent to your protected web servers via the Application Firewall.

Request Bytes (reqBytes)

Number of bytes transfered for requests

responses (resps)

HTTP/HTTPS responses sent by your protected web servers via the Application Firewall.

Response Bytes (resBytes)

Number of bytes transfered for responses

aborts

Incomplete HTTP/HTTPS requests aborted by the client before the Application Firewall could finish processing them.

redirects (redirect)

HTTP/HTTPS requests redirected by the Application Firewall to a different Web page or web server. (HTTP 302)

Traps Dropped (trapsDr)

AppFirewall SNMP traps dropped due to time limit.

start URL (startURL)

Number of Start URL security check violations seen by the Application Firewall.

deny URL (denyURL)

Number of Deny URL security check violations seen by the Application Firewall.

referer header (refererHdr)

Number of Referer Header security check violations seen by the Application Firewall.

buffer overflow (bufovfl)

Number of Buffer Overflow security check violations seen by the Application Firewall.

cookie consistency (cookie)

Number of Cookie Consistency security check violations seen by the Application Firewall.

CSRF form tag (csrf_tag)

Number of Cross Site Request Forgery form tag security check violations seen by the Application Firewall.

HTML Cross-site scripting (xss)

Number of HTML Cross-Site Scripting security check violations seen by the Application Firewall.

HTML SQL injection (sql)

Number of HTML SQL Injection security check violations seen by the Application Firewall.

field format (fieldfmt)

Number of Field Format security check violations seen by the Application Firewall.

field consistency (fieldcon)

Number of Field Consistency security check violations seen by the Application Firewall.

credit card (ccard)

Number of Credit Card security check violations seen by the Application Firewall.

safe object (safeobj)

Number of Safe Object security check violations seen by the Application Firewall.

Signature Violations (sigs)

Number of Signature violations seen by the Application Firewall.

XML Format (wfcViolations)

Number of XML Format security check violations seen by the Application Firewall.

XML Denial of Service (XDoS) (xdosViolations)

Number of XML Denial-of-Service security check violations seen by the Application Firewall.

XML Message Validation (msgvalViolations)

Number of XML Message Validation security check violations seen by the Application Firewall.

Web Services Interoperability (wsIViolations)

Number of Web Services Interoperability (WS-I) security check violations seen by the Application Firewall.

XML SQL Injection (xmlSqlViolations)

Number of XML SQL Injection security check violations seen by the Application Firewall.

XML Cross-Site Scripting (xmlXssViolations)

Number of XML Cross-Site Scripting (XSS) security check violations seen by the Application Firewall.

XML Attachment (xmlAttachmentViolations)

Number of XML Attachment security check violations seen by the Application Firewall.

SOAP Fault Violations (soapflt)

Number of requests returning soap:fault from the backend server

XML Generic Violations (genflt)

Number of requests returning XML generic error from the backend server

HTTP Client Errors (4xx Resp) (4xxResps)

Number of requests returning HTTP 4xx from the backend server

HTTP Server Errors (5xx Resp) (5xxResps)

Number of requests returning HTTP 5xx from the backend server

appfw JSONContentType

Sep 22, 2015

The following operations can be performed on "appfw JSONContentType":

add | rm | show

add appfw JSONContentType

Add JSON content type. This will classify a request/response with the specified content type as JSON

Synopsys

add appfw JSONContentType <JSONContenttypevalue> [-isRegex (REGEX | NOTREGEX)]

Arguments

JSONContenttypevalue

Content type to be classified as JSON

isRegex

Is json content type a regular expression?

Possible values: REGEX, NOTREGEX

Default value: NS_NOTREGEX

---

rm appfw JSONContentType

Remove JSON content type.

Synopsys

rm appfw JSONContentType <JSONContenttypevalue>

Arguments

JSONContenttypevalue

Content type to be classified as JSON

---

show appfw JSONContentType

Display all JSON content types.

Synopsys

show appfw JSONContentType [<JSONContenttypevalue>]

Arguments

JSONContenttypevalue

Content type to be classified as JSON

appfw archive

Sep 22, 2015

The following operations can be performed on "appfw archive":

show | export | import | rm

show appfw archive

Synopsys

show appfw archive

Outputs

response

Example

show appfw archive

---

export appfw archive

Exports the archive file to the specified location

Synopsys

export appfw archive <name> <target>

Arguments

name

Name of tar archive

target

Path to the file to be exported

---

import appfw archive

Imports the archive file from specified location

Synopsys

import appfw archive <src> <name> [-comment <string>]

Arguments

src

Indicates the source of the tar archive file as a URL

of the form

<protocol>://<host>[:<port>][/<path>]

<protocol> is http or https.

<host> is the DNS name or IP address of the http or https server.

<port> is the port number of the server. If omitted, the

default port for http or https will be used.

<path> is the path of the file on the server.

Import will fail if an https server requires client

certificate authentication.

name

Indicates name of archive

comment

Comments associated with this archive.

---

rm appfw archive

Removes the archive created by archive command.

Synopsys

rm appfw archive <name>

Arguments

name

Indicates name of the archive to be removed.

Example

rm appfw archive <name>

---

appfw confidField

Sep 22, 2015

The following operations can be performed on "appfw confidField":

add | rm | set | unset | show

add appfw confidField

Defines the specified web form field as confidential. Form fields designated as confidential have the information that is provided in those fields x'd out in the audit logs.

Synopsys

add appfw confidField <fieldName> <url> [-isRegex (REGEX | NOTREGEX)] [-comment <string>] [-state (ENABLED | DISABLED)]

Arguments

fieldName

Name of the form field to designate as confidential.

url

URL of the web page that contains the web form.

isRegex

Method of specifying the form field name. Available settings function as follows:

* REGEX. Form field is a regular expression.

* NOTREGEX. Form field is a literal string.

Possible values: REGEX, NOTREGEX

Default value: NS_NOTREGEX

comment

Any comments to preserve information about the form field designation.

state

Enable or disable the confidential field designation.

Possible values: ENABLED, DISABLED

Default value: ENABLED

---

rm appfw confidField

Removes a confidential field designation.

Synopsys

rm appfw confidField <fieldName> <url>

Arguments

fieldName

Name of the web form field.

url

URL of the web page that contains the web form in which the field appears.

---

set appfw confidField

Modifies the specified parameters of a confidential field setting. Form fields designated as confidential have the information that is provided in those fields x'd out in the audit logs.

Synopsys

set appfw confidField <fieldName> <url> [-comment <string>] [-state (ENABLED | DISABLED)]

Arguments

fieldName

Name of the field to modify.

url

URL of the web page that contains the web form.

comment

Any comments to preserve information about the form field designation.

state

Enable or disable the confidential field designation.

Possible values: ENABLED, DISABLED

Default value: ENABLED

---

unset appfw confidField

Use this command to remove appfw confidField settings.Refer to the set appfw confidField command for meanings of the arguments.

Synopsys

unset appfw confidField <fieldName> <url> [-comment] [-state]

---

show appfw confidField

Displays the current settings for the specified application firewall confidential field designation. If no confidential field designation is specified, displays a list of all application firewall confidential field designations on the NetScaler appliance.

Synopsys

show appfw confidField [<fieldName> <url>]

Arguments

fieldName

Name of the web form field.

url

URL of the web page that contains the web form with the form field.

summary

fullValues

format

level

Outputs

isRegex

Method of specifying the form field name. Available settings function as follows:

* REGEX. Form field is a regular expression.

* NOTREGEX. Form field is a literal string.

comment

Any comments to preserve information about the form field designation.

state

Enable or disable the confidential field designation.

appfw customSettings

Sep 22, 2015

The following operations can be performed on "appfw customSettings":

export | rm | show | import | update

export appfw customSettings

NOTE: This command is deprecated.Changed CLI commands for Appfw "customSettings" to "signatures"

Synopsys

Arguments

name

target

---

rm appfw customSettings

Removes the object imported by import customsettings. NOTE: This command is deprecated.Changed CLI commands for Appfw "customSettings" to "signatures"

Synopsys

Arguments

name

Indicates name of custom-settings object.

Example

rm customsettings <name>

---

show appfw customSettings

Displays the object imported by import customsettings. NOTE: This command is deprecated.Changed CLI commands for Appfw "customSettings" to "signatures"

Synopsys

Arguments

name

Outputs

response

Example

show appfw customsettings

---

import appfw customSettings

Downloads the Application Firewall Custom Settings XML configuration to the NetScaler Box with the given object name NOTE: This command is deprecated.Changed CLI commands for Appfw "customSettings" to "signatures"

Synopsys

Arguments

src

Indicates the source of the custom settings file as a URL

of the form

<protocol>://<host>[:<port>][/<path>]

<protocol> is http or https.

<host> is the DNS name or IP address of the http or https server.

<port> is the port number of the server. If omitted, the

default port for http or https will be used.

<path> is the path of the file on the server.

Import will fail if an https server requires client

certificate authentication.

name

Indicates name of custom-settings object.

comment

Comments.

overwrite

Overwrites the existing file

xslt

XSLT file URL.

merge

Merges the existing Signature with new signature rules

sha1

File path for sha1 file to validate signature file

Example

```
import customsettings http://www.example.com/ns/customsettings.xml my-settings
```

---

update appfw customSettings

Updates the Application Firewall Custom Settings XML configuration to the NetScaler Box with the given object name NOTE: This command is deprecated.Changed CLI commands for Appfw "customSettings" to "signatures"

Synopsys

Arguments

name

Indicates name of the custom-settings object to update.

mergeDefault

Merges signature file with default signature file.

Example

```
update customsettings my-settings
```

---

appfw fieldType

Sep 22, 2015

The following operations can be performed on "appfw fieldType":

add | rm | set | show

add appfw fieldType

Adds a field type to the list of field types used by the field format security check. A field type is a regular expression defining the type of data that can appear in a web form field. The Learning engine also uses the field types list to generate appropriate field type assignments for the field formats check.

Synopsys

add appfw fieldType <name> <regex> <priority> [-comment <string>]

Arguments

name

Name for the field type.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at \\(\\@\\), equals \\(=\\), colon \\(:\\), and underscore characters. Cannot be changed after the field type is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my field type" or 'my field type'\\).

regex

PCRE - format regular expression defining the characters and length allowed for this field type.

priority

Positive integer specifying the priority of the field type. A lower number specified a higher priority. Field types are checked in the order of their priority numbers.

Maximum value: 64000

comment

Comment describing the type of field that this field type is intended to match.

---

rm appfw fieldType

Removes an application firewall field type.

Synopsys

rm appfw fieldType <name>

Arguments

name

Name of the field type.

---

set appfw fieldType

Modifies the properties of the specified application firewall field type.

Synopsys

set appfw fieldType <name> <regex> <priority> [-comment <string>]

Arguments

name

Name for the field type.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at \\(\\@\\), equals \\(=\\), colon \\(:\\), and underscore characters. Cannot be changed after the field type is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my field type" or 'my field type'\\).

regex

PCRE - format regular expression defining the characters and length allowed for this field type.

---

show appfw fieldType

Displays the regular expression that defines the specified field type and its priority. If no field type is specified, displays all form field types currently configured on the NetScaler appliance.

Synopsys

show appfw fieldType [<name>]

Arguments

name

Name of the field type.

summary

fullValues

format

level

Outputs

regex

PCRE - format regular expression defining the characters and length allowed for this field type.

priority

Positive integer specifying the priority of the field type. A lower number specified a higher priority. Field types are checked in the order of their priority numbers.

comment

Comment describing the type of field that this field type is intended to match.

appfw global

Sep 22, 2015

The following operations can be performed on "appfw global":

bind | unbind | show

bind appfw global

Activates an application firewall policy.

Synopsys

bind appfw global <policyName> <priority> [-state (ENABLED | DISABLED)] [<gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <labelName>)]

Arguments

policyName

Name of the policy.

---

unbind appfw global

Deactivates the specified application firewall policy. See the bind appfw policy command for descriptions of the parameters.

Synopsys

unbind appfw global <policyName> [-type <type>] [-priority <positive_integer>]

Arguments

policyName

Application Firewall policy name.

priority

Priority of the NOPOLICY to be unbound.

Minimum value: 1

Maximum value: 2147483647

---

show appfw global

Displays a list of application firewall policies that are bound to the specified bind point. If no bind point is specified, displays a list of all application firewall policies

Synopsys

show appfw global [-type <type>]

Arguments

type

Bind point to which to policy is bound.

Possible values: REQ_OVERRIDE, REQ_DEFAULT, NONE

summary

fullValues

format

level

Outputs

policyName

Name of the policy.

priority

The priority of the policy.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

invoke

If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.

state

Enable or disable the binding to activate or deactivate the policy.

bindPolicyType

The type of the policy.

policySubType

stateflag

stateflag

labelType

Type of policy label invocation.

labelName

Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.

flowType

flowtype of the bound application firewall policy.

numpol

The number of policies bound to the bindpoint.

appfw htmlerrorpage

Sep 22, 2015

The following operations can be performed on "appfw htmlerrorpage":

rm | show | import | update

rm appfw htmlerrorpage

Removes the specified XML error object.

Synopsys

rm appfw htmlerrorpage <name>

Arguments

name

Name of the XML error object to remove.

Example

rm htmlerrorpage <name>

---

show appfw htmlerrorpage

Displays the specified HTML error object. If no HTML error object is specified, lists all HTML error objects on the NetScaler appliance.

Synopsys

show appfw htmlerrorpage [<name>]

Arguments

name

Name of the HTML error object.

Outputs

response

Example

show appfw htmlerrorpage

---

import appfw htmlerrorpage

Imports the specified HTML error page to the NetScaler appliance and assigns it the specified name.

Synopsys

import appfw htmlerrorpage <src> <name> [-comment <string>] [-overwrite]

Arguments

src

URL (protocol, host, path, and name) for the location at which to store the imported HTML error object.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

name

Name to assign to the HTML error object on the NetScaler appliance.

comment

Any comments to preserve information about the HTML error object.

overwrite

Overwrite any existing HTML error object of the same name.

Example

```
import htmlerrorpage http://www.example.com/errorpage.html my-html-error-page
```

---

update appfw htmlerrorpage

Updates the specified HTML error page object from the source.

Synopsys

update appfw htmlerrorpage <name>

Arguments

name

Name of the HTML error page object to update.

Example

```
update htmlerrorpage my-html-error-page
```

---

appfw learningdata

Sep 22, 2015

The following operations can be performed on "appfw learningdata":

rm | show | reset | export

rm appfw learningdata

Removes unreviewed application firewall learning data for the specified application firewall profile.

Synopsys

rm appfw learningdata <profileName> (-startURL <expression> | -cookieConsistency <string> | (-fieldConsistency <string> <formActionURL>) | (-crossSiteScripting <string> <formActionURL>) | (-SQLInjection <string> <formActionURL>) | (-fieldFormat <string> <formActionURL>) | (-CSRFTag <expression> <CSRFFormOriginURL>) | -XMLDoSCheck <expression> | -XMLWSICheck <expression> | -XMLAttachmentCheck <expression>) [-TotalXMLRequests]

Arguments

profileName

Name of the profile.

startURL

Start URL configuration.

cookieConsistency

Cookie Name.

fieldConsistency

Form field name.

crossSiteScripting

Cross-site scripting.

SQLInjection

Form field name.

fieldFormat

Field format name.

CSRFTag

CSRF Form Action URL

XMLDoSCheck

XML Denial of Service check, one of

data

Learned data.

devno

count

stateflag

---

reset appfw learningdata

Remove all databases. Make transaction count zero

Synopsys

reset appfw learningdata

---

export appfw learningdata

Export appfw learnt data in csv format to the location /var/learnt_data/

Synopsys

export appfw learningdata <profileName> <securityCheck> [-target <string>]

Arguments

profileName

Name of the profile.

securityCheck

Name of the security check.

Possible values: startURL, cookieConsistency, fieldConsistency, crossSiteScripting, SQLInjection, fieldFormat, CSRFtag, XMLDoSCheck, XMLWSICheck, XMLAttachmentCheck, TotalXMLRequests

target

Target filename for data to be exported.

appfw learningsettings

Sep 22, 2015

The following operations can be performed on "appfw learningsettings":

set | unset | show

set appfw learningsettings

Configures the application firewall learning settings for the specified profile.

Synopsys

set appfw learningsettings <profileName> [-startURLMinThreshold <positive_integer>] [-startURLPercentThreshold <positive_integer>] [-cookieConsistencyMinThreshold <positive_integer>] [-cookieConsistencyPercentThreshold <positive_integer>] [-CSRFtagMinThreshold <positive_integer>] [-CSRFtagPercentThreshold <positive_integer>] [-fieldConsistencyMinThreshold <positive_integer>] [-fieldConsistencyPercentThreshold <positive_integer>] [-crossSiteScriptingMinThreshold <positive_integer>] [-crossSiteScriptingPercentThreshold <positive_integer>] [-SQLInjectionMinThreshold <positive_integer>] [-SQLInjectionPercentThreshold <positive_integer>] [-fieldFormatMinThreshold <positive_integer>] [-fieldFormatPercentThreshold <positive_integer>] [-XMLWSIMinThreshold <positive_integer>] [-XMLWSIPercentThreshold <positive_integer>] [-XMLAttachmentMinThreshold <positive_integer>] [-XMLAttachmentPercentThreshold <positive_integer>]

Arguments

profileName

Name of the profile.

startURLMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn start URLs.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

startURLPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular start URL pattern for the learning engine to learn that start URL.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

cookieConsistencyMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn cookies.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

cookieConsistencyPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular cookie pattern for the learning engine to learn that cookie.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

CSRFtagMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn cross-site request forgery (CSRF) tags.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

CSRFtagPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular CSRF tag for the learning engine to learn that CSRF tag.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

fieldConsistencyMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn field consistency information.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

fieldConsistencyPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular field consistency pattern for the learning engine to learn that field consistency pattern.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

crossSiteScriptingMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn HTML cross-site scripting patterns.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

crossSiteScriptingPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular cross-site scripting pattern for the learning engine to learn that cross-site scripting pattern.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

SQLInjectionMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn HTML SQL injection patterns.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

SQLInjectionPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular HTML SQL injection pattern for the learning engine to learn that HTML SQL injection pattern.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

fieldFormatMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn field formats.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

fieldFormatPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular web form field pattern for the learning engine to recommend a field format for that form field.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

XMLWSIMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn web services interoperability (WSI) information.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

XMLWSIPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular pattern for the learning engine to learn a web services interoperability (WSI) pattern.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

XMLAttachmentMinThreshold

Minimum number of application firewall sessions that the learning engine must observe to learn XML attachment patterns.

Default value: AS_LEARNINGSETTINGS_DEFAULT_MINTHRESHOLD

Minimum value: 1

XMLAttachmentPercentThreshold

Minimum percentage of application firewall sessions that must contain a particular XML attachment pattern for the learning engine to learn that XML attachment pattern.

Default value: AS_LEARNINGSETTINGS_DEFAULT_PERCENTTHRESHOLD

Maximum value: 100

---

unset appfw learningsettings

Use this command to remove appfw learningsettings settings.Refer to the set appfw learningsettings command for meanings of the arguments.

Synopsys

unset appfw learningsettings <profileName> [-startURLMinThreshold] [-startURLPercentThreshold] [-cookieConsistencyMinThreshold] [-cookieConsistencyPercentThreshold] [-CSRFtagMinThreshold] [-CSRFtagPercentThreshold] [-fieldConsistencyMinThreshold] [-fieldConsistencyPercentThreshold] [-crossSiteScriptingMinThreshold] [-crossSiteScriptingPercentThreshold] [-SQLInjectionMinThreshold] [-SQLInjectionPercentThreshold] [-fieldFormatMinThreshold] [-fieldFormatPercentThreshold] [-XMLWSIMinThreshold] [-XMLWSIPercentThreshold] [-XMLAttachmentMinThreshold] [-XMLAttachmentPercentThreshold]

---

show appfw learningsettings

Displays the current application firewall learning settings for the specified profile. If no profile is specified, displays the current application firewall settings for all profiles on the NetScaler appliance.

Synopsys

show appfw learningsettings [<profileName>]

Arguments

profileName

Name of the profile.

count

stateflag

appfw policy

Sep 22, 2015

The following operations can be performed on "appfw policy":

add | rm | set | unset | show | stat | rename

add appfw policy

Creates an application firewall policy.

Synopsys

add appfw policy <name> <rule> <profileName> [-comment <string>] [-logAction <string>]

Arguments

name

Name for the policy.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at (@), equals \\(=\\), colon \\(:\\), and underscore characters. Can be changed after the policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my policy" or 'my policy'\\).

rule

Name of the NetScaler named rule, or a NetScaler default syntax expression, that the policy uses to determine whether to filter the connection through the application firewall with the designated profile.

profileName

Name of the application firewall profile to use if the policy matches.

comment

Any comments to preserve information about the policy for later reference.

logAction

Where to log information for connections that match this policy.

---

rm appfw policy

Removes an application firewall policy.

Synopsys

rm appfw policy <name>

Arguments

name

Name of the policy to remove.

---

set appfw policy

Modifies the specified parameters of an application firewall policy.

Synopsys

set appfw policy <name> [-rule <expression>] [-profileName <string>] [-comment <string>] [-logAction <string>]

Arguments

name

Name of the policy to modify.

rule

Name of the NetScaler named rule, or a NetScaler default syntax expression, that the policy uses to determine whether to filter the connection through the application firewall with the designated profile.

profileName

Name of the application firewall profile to use if the policy matches.

comment

Any comments to preserve information about the policy for later reference.

logAction

Where to log information for connections that match this policy.

Example

```
set transform policy pol9 -rule "HTTP.REQ.HEADER(\\\"header\\\").CONTAINS(\\\"qh2\\\")"
```

---

unset appfw policy

Removes the settings of an existing application firewall policy. Attributes for which a default value is available revert to their default values. See the set appfw policy command for a description of the parameters..Refer to the set appfw policy command for meanings of the arguments.

Synopsys

unset appfw policy <name> [-comment] [-logAction]

Example

```
unset transform policy pol9 -undefAction
```

show appfw policy

Displays the current settings for the specified application firewall policy. If no policy name is provided, displays a list of all application firewall policies currently configured on the NetScaler appliance.

Synopsys

show appfw policy [<name>]

Arguments

name

Name of the policy.

summary

fullValues

format

level

Outputs

stateflag

rule

Name of the NetScaler named rule, or a NetScaler default syntax expression, that the policy uses to determine whether to filter the connection through the application firewall with the designated profile.

profileName

Name of the application firewall profile to use if the policy matches.

hits

Number of hits.

piHits

Number of hits.

undefHits

Number of Undef hits.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

comment

Any comments to preserve information about the policy for later reference.

logAction

Where to log information for connections that match this policy.

boundTo

The entity name to which policy is bound

activePolicy

Indicates whether policy is bound or not.

priority

Specifies the priority of the policy.

bindPolicyType

policyType

vserverType

devno

count

---

stat appfw policy

Displays statistics for the specified application firewall policy. If no application firewall policy is specified, displays abbreviated statistics for all application firewall policies.

Synopsys

stat appfw policy [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

name

Name of the application firewall policy.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Policy hits (Hits)

Number of hits on the policy

Policy undef hits (Undefhits)

Number of undef hits on the policy

Example

```
stat appfw policy
```

---

rename appfw policy

Renames an application firewall policy.

Synopsys

```
rename appfw policy <name>@ <newName>@
```

Arguments

name

Existing name of the application firewall policy.

newName

New name for the policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy').

Example

```
rename appfw policy oldname newname
```

appfw policylabel

Sep 22, 2015

The following operations can be performed on "appfw policylabel":

add | rm | bind | unbind | show | stat | rename

add appfw policylabel

Creates a user-defined application firewall policy label.

Synopsys

add appfw policylabel <labelName> <policylabeltype>

Arguments

labelName

Name for the policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the policy label is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy label" or 'my policy label').

policylabeltype

Type of transformations allowed by the policies bound to the label. Always http_req for application firewall policy labels.

Possible values: http_req

Example

```
add appfw policylabel appfw_label http_req
```

---

rm appfw policylabel

Removes the specified application firewall policy label.

Synopsys

rm appfw policylabel <labelName>

Arguments

labelName

Name of the application firewall policy label to remove.

Example

```
rm appfw policylabel appfw_label
```

---

bind appfw policylabel

Binds the specified application firewall policy to the specified policy label.

Synopsys

bind appfw policylabel <labelName> <policyName> <priority> [<gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]

Arguments

labelName

Name of the application firewall policy label.

policyName

Name of the application firewall policy to bind to the policy label.

Example

i) bind appfw policylabel trans_http_url pol_1 1 2 -invoke reqvserver CURRENT ii) bind appfw policylabel trans_http_url pol_2 2

---

unbind appfw policylabel

Unbinds the specified application firewall policy from the specified policy label. See the bind appfw policylabel command for descriptions of the parameters.

Synopsys

unbind appfw policylabel <labelName> <policyName> [-priority <positive_integer>]

Arguments

labelName

Name for the policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the policy label is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy label" or 'my policy label').

policyName

Name of the application firewall policy to bind to the policy label.

priority

Priority of the NOPOLICY to be unbound.

Minimum value: 1

Maximum value: 2147483647

Example

unbind appfw policylabel appfw_label

---

show appfw policylabel

Displays the current settings for the specified application firewall policy label. If no policy label is specified, displays a list of all application firewall policy labels currently configured on the NetScaler appliance.

Synopsys

show appfw policylabel [<labelName>]

Arguments

labelName

Name of the application firewall policy label.

summary

fullValues

format

level

Outputs

stateflag

policylabeltype

Type of transformations allowed by the policies bound to the label. Always http_req for application firewall policy labels.

numpol

Number of polices bound to label.

hits

Number of times policy label was invoked.

policyName

Name of the application firewall policy to bind to the policy label.

priority

Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Must be unique within a group of policies that are bound to the same bind point or label. Policies are evaluated in the order of their priority numbers.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

invoke

If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.

labelType

Type of policy label to invoke if the current policy evaluates to TRUE and the invoke parameter is set. Available settings function as follows:

* reqvserver. Invoke the unnamed policy label associated with the specified request virtual server.

* policylabel. Invoke the specified user-defined policy label.

labelName

Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.

description

Description of the policylabel

flags

policyType

devno

count

Example

i) show appfw policylabel appfw_label ii) show appfw policylabel

---

stat appfw policylabel

Displays statistics for the specified application firewall policy label. If no application firewall policy label is specified, displays abbreviated statistics for all application firewall policy labels.

Synopsys

stat appfw policylabel [<labelName>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

labelName

Name of the application firewall policy label.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Policy Label Hits (Hits)

Number of times policy label was invoked.

---

rename appfw policylabel

Renames an application firewall policy label.

Synopsys

rename appfw policylabel <labelName>@ <newName>@

Arguments

labelName

Existing name of the application firewall policy label.

newName

The new name of the application firewall policylabel.

Example

```
rename appfw policylabel oldname newname
```

appfw profile

Sep 22, 2015

The following operations can be performed on "appfw profile":

add | rm | set | unset | bind | unbind | show | stat | archive | restore

add appfw profile

Creates an application firewall profile, which specifies how the application firewall should protect a given type of web content. (A profile is equivalent to an action in other NetScaler features.)

Synopsys

add appfw profile <name> [-defaults (basic | advanced)] [-startURLAction <startURLAction> ...] [-contentTypeAction <contentTypeAction> ...] [-startURLClosure (ON | OFF)] [-denyURLAction <denyURLAction> ...] [-RefererHeaderCheck <RefererHeaderCheck>] [-cookieConsistencyAction <cookieConsistencyAction> ...] [-cookieTransforms (ON | OFF)] [-cookieEncryption <cookieEncryption>] [-cookieProxying (none | sessionOnly)] [-addCookieFlags <addCookieFlags>] [-fieldConsistencyAction <fieldConsistencyAction> ...] [-CSRFtagAction <CSRFtagAction> ...] [-crossSiteScriptingAction <crossSiteScriptingAction> ...] [-crossSiteScriptingTransformUnsafeHTML (ON | OFF)] [-crossSiteScriptingCheckCompleteURLs (ON | OFF)] [-SQLInjectionAction <SQLInjectionAction> ...] [-SQLInjectionTransformSpecialChars (ON | OFF)] [-SQLInjectionType <SQLInjectionType>] [-SQLInjectionCheckSQLWildChars (ON | OFF)] [-fieldFormatAction <fieldFormatAction> ...] [-defaultFieldFormatType <string>] [-defaultFieldFormatMinLength <positive_integer>] [-defaultFieldFormatMaxLength <positive_integer>] [-bufferOverflowAction <bufferOverflowAction> ...] [-bufferOverflowMaxURLLength <positive_integer>] [-bufferOverflowMaxHeaderLength <positive_integer>] [-bufferOverflowMaxCookieLength <positive_integer>] [-creditCardAction <creditCardAction> ...] [-creditCard <creditCard> ...] [-creditCardMaxAllowed <positive_integer>] [-creditCardXOut (ON | OFF)] [-requestContentType <string>] [-responseContentType <string>] [-XMLDoSAction <XMLDoSAction> ...] [-XMLFormatAction <XMLFormatAction> ...] [-XMLSQLInjectionAction <XMLSQLInjectionAction> ...] [-XMLSQLInjectionType <XMLSQLInjectionType>] [-XMLSQLInjectionCheckSQLWildChars (ON | OFF)] [-XMLSQLInjectionParseComments <XMLSQLInjectionParseComments>] [-XMLXSSAction <XMLXSSAction> ...] [-XMLWSIAction <XMLWSIAction> ...] [-XMLAttachmentAction <XMLAttachmentAction> ...] [-XMLValidationAction <XMLValidationAction> ...] [-XMLErrorObject <string>] [-signatures <string>] [-XMLSOAPFaultAction <XMLSOAPFaultAction> ...] [-useHTMLErrorObject (ON | OFF)] [-errorURL <expression>] [-HTMLErrorObject <string>] [-logEveryPolicyHit (ON | OFF)] [-stripHtmlComments <stripHtmlComments>] [-stripXmlComments (none | all)] [-exemptClosureURLsFromSecurityChecks (ON | OFF)] [-defaultCharSet <string>] [-postBodyLimit <positive_integer>] [-fileUploadMaxNum <positive_integer>] [-canonicalizeHTMLResponse (ON | OFF)] [-enableFormTagging (ON | OFF)] [-sessionlessFieldConsistency <sessionlessFieldConsistency>] [-sessionlessURLClosure (ON | OFF)] [-semicolonFieldSeparator (ON | OFF)] [-excludeFileUploadFromChecks (ON | OFF)] [-SQLInjectionParseComments <SQLInjectionParseComments>] [-invalidPercentHandling <invalidPercentHandling>] [-type (HTML | XML) ...] [-checkRequestHeaders (ON | OFF)] [-comment <string>]

Arguments

name

Name for the profile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_)

characters. Cannot be changed after the profile is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile').

defaults

Default configuration to apply to the profile. Basic defaults are intended for standard content that requires little further configuration, such as static web site content. Advanced defaults are intended for specialized content that requires significant specialized configuration, such as heavily scripted or dynamic content.

CLI users: When adding an application firewall profile, you can set either the defaults or the type, but not both. To set both options, create the profile by using the add appfw profile command, and then use the set appfw profile command to configure the other option.

Possible values: basic, advanced

builtin

Indicates that a profile is a built-in entity.

builtinType

Type of built-in profile. Determines which security checks and settings are used for the profile. (The type specified by the HTML XML setting is also called "Web 2.0.")

CLI users: When adding an application firewall profile, you can set either the defaults or the type, but not both. To set both options, create the profile by using the add appfw profile command, and then use the set appfw profile command to configure the other option.

Possible values: APPFW_NOT_BUILTIN, APPFW_BYPASS, APPFW_BLOCK, APPFW_RESET, APPFW_DROP

startURLAction

One or more Start URL actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -startURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -startURLaction none".

Default value: AS_DEFAULT_DISPOSITION

contentTypeAction

One or more Content-type actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -contentTypeaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -contentTypeaction none".

Default value: AS_DEFAULT_CONTENT_TYPE_DISPOSITION

startURLClosure

Toggle the state of Start URL Closure.

Possible values: ON, OFF

Default value: OFF

denyURLAction

One or more Deny URL actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

NOTE: The Deny URL check takes precedence over the Start URL check. If you enable blocking for the Deny URL check, the application firewall blocks any URL that is explicitly blocked by a Deny URL, even if the same URL would otherwise be allowed by the Start URL check.

CLI users: To enable one or more actions, type "set appfw profile -denyURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -denyURLaction none".

Default value: AS_DEFAULT_DISPOSITION

RefererHeaderCheck

Enable validation of Referer headers.

Referer validation ensures that a web form that a user sends to your web site originally came from your web site, not an outside attacker.

Although this parameter is part of the Start URL check, referer validation protects against cross-site request forgery (CSRF) attacks, not Start URL attacks.

Possible values: OFF, if_present, AlwaysExceptStartURLs, AlwaysExceptFirstRequest

Default value: AS_HEADER_CHECK_OFF

cookieConsistencyAction

One or more Cookie Consistency actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -cookieConsistencyAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -cookieConsistencyAction none".

Default value: AS_NONE

cookieTransforms

Perform the specified type of cookie transformation.

Available settings function as follows:

* Encryption - Encrypt cookies.

* Proxying - Mask contents of server cookies by sending proxy cookie to users.

* Cookie flags - Flag cookies as HTTP only to prevent scripts on user's browser from accessing and possibly modifying them.

CAUTION: Make sure that this parameter is set to ON if you are configuring any cookie transformations. If it is set to OFF, no cookie transformations are performed regardless of any other settings.

Possible values: ON, OFF

Default value: OFF

cookieEncryption

Type of cookie encryption. Available settings function as follows:

* None - Do not encrypt cookies.

* Decrypt Only - Decrypt encrypted cookies, but do not encrypt cookies.

* Encrypt Session Only - Encrypt session cookies, but not permanent cookies.

* Encrypt All - Encrypt all cookies.

Possible values: none, decryptOnly, encryptSessionOnly, encryptAll

Default value: AS_CKI_ENCRYPT_NONE

cookieProxying

Cookie proxy setting. Available settings function as follows:

* None - Do not proxy cookies.

* Session Only - Proxy session cookies by using the NetScaler session ID, but do not proxy permanent cookies.

Possible values: none, sessionOnly

Default value: AS_CKI_PROXY_NONE

addCookieFlags

Add the specified flags to cookies. Available settings function as follows:

* None - Do not add flags to cookies.

* HTTP Only - Add the HTTP Only flag to cookies, which prevents scripts from accessing cookies.

* Secure - Add Secure flag to cookies.

* All - Add both HTTPOnly and Secure flags to cookies.

Possible values: none, httpOnly, secure, all

Default value: AS_ADD_CKI_FLAGS_NONE

fieldConsistencyAction

One or more Form Field Consistency actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -fieldConsistencyaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldConsistencyAction none".

Default value: AS_NONE

CSRFtagAction

One or more Cross-Site Request Forgery (CSRF) Tagging actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -CSRFTagAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -CSRFTagAction none".

Default value: AS_NONE

crossSiteScriptingAction

One or more Cross-Site Scripting (XSS) actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -crossSiteScriptingAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -crossSiteScriptingAction none".

Default value: AS_DEFAULT_DISPOSITION

crossSiteScriptingTransformUnsafeHTML

Transform cross-site scripts. This setting configures the application firewall to disable dangerous HTML instead of blocking the request.

CAUTION: Make sure that this parameter is set to ON if you are configuring any cross-site scripting transformations. If it is set to OFF, no cross-site scripting transformations are performed regardless of any other settings.

Possible values: ON, OFF

Default value: OFF

crossSiteScriptingCheckCompleteURLs

Check complete URLs for cross-site scripts, instead of just the query portions of URLs.

Possible values: ON, OFF

Default value: OFF

SQLInjectionAction

One or more HTML SQL Injection actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -SQLInjectionAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -SQLInjectionAction none".

Default value: AS_DEFAULT_DISPOSITION

SQLInjectionTransformSpecialChars

Transform injected SQL code. This setting configures the application firewall to disable SQL special strings instead of blocking the request. Since most SQL servers require a special string to activate an SQL keyword, in most cases a request that contains injected SQL code is safe if special strings are disabled.

CAUTION: Make sure that this parameter is set to ON if you are configuring any SQL injection transformations. If it is set to OFF, no SQL injection transformations are performed regardless of any other settings.

Possible values: ON, OFF

Default value: OFF

SQLInjectionOnlyCheckFieldsWithSQLChars

Check only form fields that contain SQL special strings (characters) for injected SQL code.

Most SQL servers require a special string to activate an SQL request, so SQL code without a special string is harmless to most SQL servers.

Possible values: ON, OFF

Default value: ON

SQLInjectionType

Available SQL injection types.

-SQLSplChar : Checks for SQL Special Chars

-SQLKeyword : Checks for SQL Keywords

-SQLSplCharANDKeyword : Checks for both and blocks if both are found

-SQLSplCharORKeyword : Checks for both and blocks if anyone is found

Possible values: SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword

Default value: AS_SQLINJECTION_TYPE_CHAR_AND_KEYWORD

SQLInjectionCheckSQLWildChars

Check for form fields that contain SQL wild chars .

Possible values: ON, OFF

Default value: OFF

fieldFormatAction

One or more Field Format actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of suggested web form fields and field format assignments.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -fieldFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldFormatAction none".

Default value: AS_DEFAULT_DISPOSITION

defaultFieldFormatType

Designate a default field type to be applied to web form fields that do not have a field type explicitly assigned to them.

defaultFieldFormatMinLength

Minimum length, in characters, for data entered into a field that is assigned the default field type.

To disable the minimum and maximum length settings and allow data of any length to be entered into the field, set this parameter to zero (0).

Default value: AS_DEFAULTFIELDFORMAT_DEFAULT_MIN_LEN

Minimum value: 0

Maximum value: 65535

defaultFieldFormatMaxLength

Maximum length, in characters, for data entered into a field that is assigned the default field type.

Default value: AS_DEFAULTFIELDFORMAT_DEFAULT_MAX_LEN

Minimum value: 1

Maximum value: 65535

bufferOverflowAction

One or more Buffer Overflow actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -bufferOverflowAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -bufferOverflowAction none".

Default value: AS_DEFAULT_DISPOSITION

bufferOverflowMaxURLLength

Maximum length, in characters, for URLs on your protected web sites. Requests with longer URLs are blocked.

Default value: AS_BUFFEROVERFLOW_DEFAULT_MAX_URL_LEN

Minimum value: 0

Maximum value: 65535

bufferOverflowMaxHeaderLength

Maximum length, in characters, for HTTP headers in requests sent to your protected web sites. Requests with longer headers are blocked.

Default value: AS_BUFFEROVERFLOW_DEFAULT_MAX_HDR_LEN

Minimum value: 0

Maximum value: 65535

bufferOverflowMaxCookieLength

Maximum length, in characters, for cookies sent to your protected web sites. Requests with longer cookies are blocked.

Default value: AS_BUFFEROVERFLOW_DEFAULT_MAX_COOKIE_LEN

Minimum value: 0

Maximum value: 65535

creditCardAction

One or more Credit Card actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -creditCardAction" followed by the actions to be

enabled. To turn off all actions, type "set appfw profile -creditCardAction none".

Default value: AS_NONE

creditCard

Credit card types that the application firewall should protect.

Default value: AS_CCARD_DEFAULT_CARD_TYPE

creditCardMaxAllowed

Maximum number of credit card numbers that can appear on a web page served by your protected web sites. Pages that contain more credit card numbers are blocked, or the credit card numbers are masked.

Maximum value: 255

creditCardXOut

Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter "X."

Possible values: ON, OFF

Default value: OFF

requestContentType

Default Content-Type header for requests.

A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters.

Default value: NS_S_AS_DEFAULT_REQUEST_CONTENT_TYPE

responseContentType

Default Content-Type header for responses.

A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters.

Default value: NS_S_AS_DEFAULT_RESPONSE_CONTENT_TYPE

XMLDoSAction

One or more XML Denial-of-Service (XDoS) actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLDoSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLDoSAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLFormatAction

One or more XML Format actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLFormatAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLSQLInjectionAction

One or more XML SQL Injection actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLSQLInjectionAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSQLInjectionAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLSQLInjectionOnlyCheckFieldsWithSQLChars

Check only form fields that contain SQL special characters, which most SQL servers require before accepting an SQL command, for injected SQL.

Possible values: ON, OFF

Default value: ON

XMLSQLInjectionType

Available SQL injection types.

-SQLSplChar : Checks for SQL Special Chars

-SQLKeyword : Checks for SQL Keywords

-SQLSplCharANDKeyword : Checks for both and blocks if both are found

-SQLSplCharORKeyword : Checks for both and blocks if anyone is found

Possible values: SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword

Default value: AS_SQLINJECTION_TYPE_CHAR_AND_KEYWORD

XMLSQLInjectionCheckSQLWildChars

Check for form fields that contain SQL wild chars .

Possible values: ON, OFF

Default value: OFF

XMLSQLInjectionParseComments

Parse comments in XML Data and exempt those sections of the request that are from the XML SQL Injection check. You must configure the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows:

* Check all - Check all content.

* ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment.

* Nested - Exempt content that is part of a nested (Microsoft-style) comment.

* ANSI Nested - Exempt content that is part of any type of comment.

Possible values: checkall, ansi, nested, ansinested

Default value: AS_CHECKALL

XMLXSSAction

One or more XML Cross-Site Scripting actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLXSSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLXSSAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLWSIAction

One or more Web Services Interoperability (WSI) actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLWSIAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLWSIAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLAttachmentAction

One or more XML Attachment actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLAttachmentAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLAttachmentAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLValidationAction

One or more XML Validation actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLValidationAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLValidationAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLErrorObject

Name to assign to the XML Error Object, which the application firewall displays when a user request is blocked.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at (@), equals \\(=\\), colon \\(:\\), and underscore

characters. Cannot be changed after the XML error object is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my XML error object" or 'my XML error object'\\).

Default value: NS_S_AS_ERROR_OBJECT_DEFAULT

customSettings

Object name for custom settings.

This check is applicable to Profile Type: HTML, XML.

Default value: NS_S_AS_CUSTOM_OBJECT_DEFAULT

signatures

Object name for signatures.

This check is applicable to Profile Type: HTML, XML.

Default value: NS_S_AS_CUSTOM_OBJECT_DEFAULT

XMLSOAPFaultAction

One or more XML SOAP Fault Filtering actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

* Remove - Remove all violations for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLSOAPFaultAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSOAPFaultAction none".

Default value: AS_DEFAULT_DISPOSITION

useHTMLErrorObject

Send an imported HTML Error object to a user when a request is blocked, instead of redirecting the user to the designated Error URL.

Possible values: ON, OFF

Default value: OFF

errorURL

URL that application firewall uses as the Error URL.

Default value: NS_S_AS_ERROR_URL_DEFAULT

HTMLErrorObject

Name to assign to the HTML Error Object.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at (@), equals \\(=\\), colon \\(:\\), and underscore characters. Cannot be changed after the HTML error object is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my HTML error object" or 'my HTML error object'\\).

Default value: NS_S_AS_ERROR_OBJECT_DEFAULT

logEveryPolicyHit

Log every profile match, regardless of security checks results.

Possible values: ON, OFF

Default value: OFF

stripComments

Strip HTML comments.

This check is applicable to Profile Type: HTML.

Possible values: ON, OFF

Default value: OFF

stripHtmlComments

Strip HTML comments before forwarding a web page sent by a protected web site in response to a user request.

Possible values: none, all, exclude_script_tag

Default value: AS_STRIP_COMMENT_NONE

stripXmlComments

Exempt URLs that pass the Start URL closure check from additional security checks.

Possible values: none, all

Default value: AS_STRIP_COMMENT_NONE

exemptClosureURLsFromSecurityChecks

Exempt URLs that pass the Start URL closure check from additional security checks.

Possible values: ON, OFF

Default value: ON

defaultCharSet

Default character set for protected web pages. Web pages sent by your protected web sites in response to user requests are assigned this character set if the page does not already specify a character set. The character sets supported by the application firewall are:

* iso-8859-1 (English US)

* big5 (Chinese Traditional)

* gb2312 (Chinese Simplified)

* sjis (Japanese Shift-JIS)

* euc-jp (Japanese EUC-JP)

* iso-8859-9 (Turkish)

* utf-8 (Unicode)

* euc-kr (Korean)

Default value: NS_S_AS_CHARSET_DEFAULT

Maximum value: 31

postBodyLimit

Maximum allowed HTTP post body size, in bytes.

Default value: AS_DEFAULT_POSTBODYLIMIT

Maximum value: 1000000000

fileUploadMaxNum

Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads.

Default value: AS_DEFAULT_MAX_FILE_UPLOADS

Maximum value: 65535

canonicalizeHTMLResponse

Perform HTML entity encoding for any special characters in responses sent by your protected web sites.

Possible values: ON, OFF

Default value: ON

enableFormTagging

Enable tagging of web form fields for use by the Form Field Consistency and CSRF Form Tagging checks.

Possible values: ON, OFF

Default value: ON

sessionlessFieldConsistency

Perform sessionless Field Consistency Checks.

Possible values: OFF, ON, postOnly

Default value: AS_OFF

sessionlessURLClosure

Enable session less URL Closure Checks.

This check is applicable to Profile Type: HTML.

Possible values: ON, OFF

Default value: OFF

semicolonFieldSeparator

Allow ';' as a form field separator in URL queries and POST form bodies.

Possible values: ON, OFF

Default value: OFF

excludeFileUploadFromChecks

Exclude uploaded files from Form checks.

Possible values: ON, OFF

Default value: OFF

SQLInjectionParseComments

Parse HTML comments and exempt them from the HTML SQL Injection check. You must specify the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows:

* Check all - Check all content.

* ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment.

* Nested - Exempt content that is part of a nested (Microsoft-style) comment.

* ANSI Nested - Exempt content that is part of any type of comment.

Possible values: checkall, ansi, nested, ansinested

Default value: AS_DEFAULT_SQLINJECTIONPARSECOMMENTS

invalidPercentHandling

Configure the method that the application firewall uses to handle percent-encoded names and values. Available settings function as follows:

* apache_mode - Apache format.

* asp_mode - Microsoft ASP format.

* secure_mode - Secure format.

Possible values: apache_mode, asp_mode, secure_mode

Default value: AS_PERCENT_DECODE_SECURE_MODE

type

Application firewall profile type, which controls which security checks and settings are applied to content that is filtered with the profile. Available settings function as follows:

* HTML - HTML-based web sites.

* XML - XML-based web sites and services.

* HTML XML (Web 2.0) - Sites that contain both HTML and XML content, such as ATOM feeds, blogs, and RSS feeds.

Default value: AF_PROFILE_TYPE_HTML

checkRequestHeaders

Check request headers as well as web forms for injected SQL and cross-site scripts.

Possible values: ON, OFF

Default value: OFF

comment

Any comments about the purpose of profile, or other useful information about the profile.

---

rm appfw profile

Removes the specified application firewall profile.

Synopsys

rm appfw profile <name>

Arguments

name

Name of the profile.

set appfw profile

Modifies the specified parameters of the specified application firewall profile.

Synopsys

set appfw profile <name> [-startURLAction <startURLAction> ...] [-contentTypeAction <contentTypeAction> ...] [-startURLClosure (ON | OFF)] [-denyURLAction <denyURLAction> ...] [-RefererHeaderCheck <RefererHeaderCheck>] [-cookieConsistencyAction <cookieConsistencyAction> ...] [-cookieTransforms (ON | OFF)] [-cookieEncryption <cookieEncryption>] [-cookieProxying (none | sessionOnly)] [-addCookieFlags <addCookieFlags>] [-fieldConsistencyAction <fieldConsistencyAction> ...] [-CSRFtagAction <CSRFtagAction> ...] [-crossSiteScriptingAction <crossSiteScriptingAction> ...] [-crossSiteScriptingTransformUnsafeHTML (ON | OFF)] [-crossSiteScriptingCheckCompleteURLs (ON | OFF)] [-SQLInjectionAction <SQLInjectionAction> ...] [-SQLInjectionTransformSpecialChars (ON | OFF)] [-SQLInjectionType <SQLInjectionType>] [-SQLInjectionCheckSQLWildChars (ON | OFF)] [-fieldFormatAction <fieldFormatAction> ...] [-defaultFieldFormatType <string>] [-defaultFieldFormatMinLength <positive_integer>] [-defaultFieldFormatMaxLength <positive_integer>] [-bufferOverflowAction <bufferOverflowAction> ...] [-bufferOverflowMaxURLLength <positive_integer>] [-bufferOverflowMaxHeaderLength <positive_integer>] [-bufferOverflowMaxCookieLength <positive_integer>] [-creditCardAction <creditCardAction> ...] [-creditCard <creditCard> ...] [-creditCardMaxAllowed <positive_integer>] [-creditCardXOut (ON | OFF)] [-requestContentType <string>] [-responseContentType <string>] [-XMLDoSAction <XMLDoSAction> ...] [-XMLFormatAction <XMLFormatAction> ...] [-XMLSQLInjectionAction <XMLSQLInjectionAction> ...] [-XMLSQLInjectionType <XMLSQLInjectionType>] [-XMLSQLInjectionCheckSQLWildChars (ON | OFF)] [-XMLSQLInjectionParseComments <XMLSQLInjectionParseComments>] [-XMLXSSAction <XMLXSSAction> ...] [-XMLWSIAction <XMLWSIAction> ...] [-XMLAttachmentAction <XMLAttachmentAction> ...] [-XMLValidationAction <XMLValidationAction> ...] [-XMLErrorObject <string>] [-signatures <string>] [-XMLSOAPFaultAction <XMLSOAPFaultAction> ...] [-useHTMLErrorObject (ON | OFF)] [-errorURL <expression>] [-HTMLErrorObject <string>] [-logEveryPolicyHit (ON | OFF)] [-stripHtmlComments <stripHtmlComments>] [-stripXmlComments (none | all)] [-exemptClosureURLsFromSecurityChecks (ON | OFF)] [-defaultCharSet <string>] [-postBodyLimit <positive_integer>] [-fileUploadMaxNum <positive_integer>] [-canonicalizeHTMLResponse (ON | OFF)] [-enableFormTagging (ON | OFF)] [-sessionlessFieldConsistency <sessionlessFieldConsistency>] [-sessionlessURLClosure (ON | OFF)] [-semicolonFieldSeparator (ON | OFF)] [-excludeFileUploadFromChecks (ON | OFF)] [-SQLInjectionParseComments <SQLInjectionParseComments>] [-invalidPercentHandling <invalidPercentHandling>] [-type (HTML | XML) ...] [-checkRequestHeaders (ON | OFF)] [-comment <string>]

Arguments

name

Name of the profile that you want to modify.

startURLAction

One or more Start URL actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -startURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -startURLaction none".

Default value: AS_DEFAULT_DISPOSITION

contentTypeAction

One or more Content-type actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -contentTypeaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -contentTypeaction none".

Default value: AS_DEFAULT_CONTENT_TYPE_DISPOSITION

startURLClosure

Toggle the state of Start URL Closure.

Possible values: ON, OFF

Default value: OFF

denyURLAction

One or more Deny URL actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

NOTE: The Deny URL check takes precedence over the Start URL check. If you enable blocking for the Deny URL check, the application firewall blocks any URL that is explicitly blocked by a Deny URL, even if the same URL would otherwise be allowed by the Start URL check.

CLI users: To enable one or more actions, type "set appfw profile -denyURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -denyURLaction none".

Default value: AS_DEFAULT_DISPOSITION

RefererHeaderCheck

Enable validation of Referer headers.

Referer validation ensures that a web form that a user sends to your web site originally came from your web site, not an outside attacker.

Although this parameter is part of the Start URL check, referer validation protects against cross-site request forgery (CSRF) attacks, not Start URL attacks.

Possible values: OFF, if_present, AlwaysExceptStartURLs, AlwaysExceptFirstRequest

Default value: AS_HEADER_CHECK_OFF

cookieConsistencyAction

One or more Cookie Consistency actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -cookieConsistencyAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -cookieConsistencyAction none".

Default value: AS_NONE

cookieTransforms

Perform the specified type of cookie transformation.

Available settings function as follows:

* Encryption - Encrypt cookies.

* Proxying - Mask contents of server cookies by sending proxy cookie to users.

* Cookie flags - Flag cookies as HTTP only to prevent scripts on user's browser from accessing and possibly modifying them.

CAUTION: Make sure that this parameter is set to ON if you are configuring any cookie transformations. If it is set to OFF, no cookie transformations are performed regardless of any other settings.

Possible values: ON, OFF

cookieEncryption

Type of cookie encryption. Available settings function as follows:

* None - Do not encrypt cookies.

* Decrypt Only - Decrypt encrypted cookies, but do not encrypt cookies.

* Encrypt Session Only - Encrypt session cookies, but not permanent cookies.

* Encrypt All - Encrypt all cookies.

Possible values: none, decryptOnly, encryptSessionOnly, encryptAll

Default value: AS_CKI_ENCRYPT_NONE

cookieProxying

Cookie proxy setting. Available settings function as follows:

* None - Do not proxy cookies.

* Session Only - Proxy session cookies by using the NetScaler session ID, but do not proxy permanent cookies.

Possible values: none, sessionOnly

Default value: AS_CKI_PROXY_NONE

addCookieFlags

Add HttpOnly and Secure flags to cookies

Possible values: none, httpOnly, secure, all

Default value: AS_ADD_CKI_FLAGS_NONE

fieldConsistencyAction

One or more Form Field Consistency actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -fieldConsistencyaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldConsistencyAction none".

Default value: AS_NONE

CSRFtagAction

One or more Cross-Site Request Forgery (CSRF) Tagging actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -CSRFTagAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -CSRFTagAction none".

Default value: AS_NONE

crossSiteScriptingAction

One or more Cross-Site Scripting (XSS) actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -crossSiteScriptingAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -crossSiteScriptingAction none".

Default value: AS_DEFAULT_DISPOSITION

crossSiteScriptingTransformUnsafeHTML

Transform cross-site scripts. This setting configures the application firewall to disable dangerous HTML instead of blocking the request.

CAUTION: Make sure that this parameter is set to ON if you are configuring any cross-site scripting transformations. If it is set to OFF, no cross-site scripting transformations are performed regardless of any other settings.

Possible values: ON, OFF

crossSiteScriptingCheckCompleteURLs

Check complete URLs for cross-site scripts, instead of just the query portions of URLs.

Possible values: ON, OFF

SQLInjectionAction

One or more HTML SQL Injection actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -SQLInjectionAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -SQLInjectionAction none".

Default value: AS_DEFAULT_DISPOSITION

SQLInjectionTransformSpecialChars

Transform injected SQL code. This setting configures the application firewall to disable SQL special strings instead of blocking the request. Since most SQL servers require a special string to activate an SQL keyword, in most cases a request that contains injected SQL code is safe if special strings are disabled.

CAUTION: Make sure that this parameter is set to ON if you are configuring any SQL injection transformations. If it is set to OFF, no SQL injection transformations are performed regardless of any other settings.

Possible values: ON, OFF

SQLInjectionOnlyCheckFieldsWithSQLChars

Check only form fields that contain SQL special strings (characters) for injected SQL code.

Most SQL servers require a special string to activate an SQL request, so SQL code without a special string is harmless to most SQL servers.

Possible values: ON, OFF

SQLInjectionType

Available SQL injection types.

-SQLSplChar : Checks for SQL Special Chars

-SQLKeyword : Checks for SQL Keywords

-SQLSplCharANDKeyword : Checks for both and blocks if both are found

-SQLSplCharORKeyword : Checks for both and blocks if anyone is found

Possible values: SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword

SQLInjectionCheckSQLWildChars

Check for form fields that contain SQL wild chars .

Possible values: ON, OFF

fieldFormatAction

One or more Field Format actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of suggested web form fields and field format assignments.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -fieldFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldFormatAction none".

Default value: AS_DEFAULT_DISPOSITION

defaultFieldFormatType

Designate a default field type to be applied to web form fields that do not have a field type explicitly assigned to them.

defaultFieldFormatMinLength

Minimum length, in characters, for data entered into a field that is assigned the default field type.

To disable the minimum and maximum length settings and allow data of any length to be entered into the field, set this parameter to zero (0).

Default value: AS_DEFAULTFIELDFORMAT_DEFAULT_MIN_LEN

Minimum value: 0

Maximum value: 65535

defaultFieldFormatMaxLength

Maximum length, in characters, for data entered into a field that is assigned the default field type.

Default value: AS_DEFAULTFIELDFORMAT_DEFAULT_MAX_LEN

Minimum value: 1

Maximum value: 65535

bufferOverflowAction

One or more Buffer Overflow actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -bufferOverflowAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -bufferOverflowAction none".

Default value: AS_DEFAULT_DISPOSITION

bufferOverflowMaxURLLength

Maximum length, in characters, for URLs on your protected web sites. Requests with longer URLs are blocked.

Default value: AS_BUFFEROVERFLOW_DEFAULT_MAX_URL_LEN

Minimum value: 0

Maximum value: 65535

bufferOverflowMaxHeaderLength

Maximum length, in characters, for HTTP headers in requests sent to your protected web sites. Requests with longer headers are blocked.

Default value: AS_BUFFEROVERFLOW_DEFAULT_MAX_HDR_LEN

Minimum value: 0

Maximum value: 65535

bufferOverflowMaxCookieLength

Maximum length, in characters, for cookies sent to your protected web sites. Requests with longer cookies are blocked.

Default value: AS_BUFFEROVERFLOW_DEFAULT_MAX_COOKIE_LEN

Minimum value: 0

Maximum value: 65535

creditCardAction

One or more Credit Card actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -creditCardAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -creditCardAction none".

Default value: AS_NONE

creditCard

Credit card types that the application firewall should protect.

Default value: AS_CCARD_DEFAULT_CARD_TYPE

creditCardMaxAllowed

Maximum number of credit card numbers that can appear on a web page served by your protected web sites. Pages that contain more credit card numbers are blocked, or the credit card numbers are masked.

Maximum value: 255

creditCardXOut

Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter "X."

Possible values: ON, OFF

requestContentType

Default Content-Type header for requests.

A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters.

Default value: NS_S_AS_DEFAULT_REQUEST_CONTENT_TYPE

responseContentType

Default Content-Type header for responses.

A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters.

Default value: NS_S_AS_DEFAULT_RESPONSE_CONTENT_TYPE

XMLDoSAction

One or more XML Denial-of-Service (XDoS) actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLDoSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLDoSAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLFormatAction

One or more XML Format actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLFormatAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLSQLInjectionAction

One or more XML SQL Injection actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLSQLInjectionAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSQLInjectionAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLSQLInjectionOnlyCheckFieldsWithSQLChars

Check only form fields that contain SQL special characters, which most SQL servers require before accepting an SQL command, for injected SQL.

Possible values: ON, OFF

XMLSQLInjectionType

Available SQL injection types.

-SQLSplChar : Checks for SQL Special Chars

-SQLKeyword : Checks for SQL Keywords

-SQLSplCharANDKeyword : Checks for both and blocks if both are found

-SQLSplCharORKeyword : Checks for both and blocks if anyone is found

Possible values: SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword

XMLSQLInjectionCheckSQLWildChars

Check for form fields that contain SQL wild chars .

Possible values: ON, OFF

XMLSQLInjectionParseComments

Parse comments in XML Data and exempt those sections of the request that are from the XML SQL Injection check. You must configure the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows:

* Check all - Check all content.

* ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment.

* Nested - Exempt content that is part of a nested (Microsoft-style) comment.

* ANSI Nested - Exempt content that is part of any type of comment.

Possible values: checkall, ansi, nested, ansinested

Default value: AS_CHECKALL

XMLXSSAction

One or more XML Cross-Site Scripting actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLXSSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLXSSAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLWSIAction

One or more Web Services Interoperability (WSI) actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLWSIAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLWSIAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLAttachmentAction

One or more XML Attachment actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Learn - Use the learning engine to generate a list of exceptions to this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLAttachmentAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLAttachmentAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLValidationAction

One or more XML Validation actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLValidationAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLValidationAction none".

Default value: AS_DEFAULT_DISPOSITION

XMLErrorObject

Name to assign to the XML Error Object, which the application firewall displays when a user request is blocked.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at (@), equals \\(=\\), colon \\(:\\), and underscore characters. Cannot be changed after the XML error object is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my XML error object" or 'my XML error object'\\).

Default value: NS_S_AS_ERROR_OBJECT_DEFAULT

customSettings

Object name for custom settings.

This check is applicable to Profile Type: HTML, XML.

Default value: NS_S_AS_CUSTOM_OBJECT_DEFAULT

signatures

Object name for signatures.

This check is applicable to Profile Type: HTML, XML.

Default value: NS_S_AS_CUSTOM_OBJECT_DEFAULT

XMLSOAPFaultAction

One or more XML SOAP Fault Filtering actions. Available settings function as follows:

* Block - Block connections that violate this security check.

* Log - Log violations of this security check.

* Stats - Generate statistics for this security check.

* None - Disable all actions for this security check.

* Remove - Remove all violations for this security check.

CLI users: To enable one or more actions, type "set appfw profile -XMLSOAPFaultAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSOAPFaultAction none".

Default value: AS_DEFAULT_DISPOSITION

useHTMLErrorObject

Send an imported HTML Error object to a user when a request is blocked, instead of redirecting the user to the designated Error URL.

Possible values: ON, OFF

errorURL

URL that application firewall uses as the Error URL.

Default value: NS_S_AS_ERROR_URL_DEFAULT

HTMLErrorObject

Name to assign to the HTML Error Object.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at (@), equals \\(=\\), colon \\(:\\), and underscore characters. Cannot be changed after the HTML error object is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my HTML error object" or 'my HTML error object'\\).

Default value: NS_S_AS_ERROR_OBJECT_DEFAULT

logEveryPolicyHit

Log every profile match, regardless of security checks results.

Possible values: ON, OFF

stripComments

Strip HTML comments.

This check is applicable to Profile Type: HTML.

Possible values: ON, OFF

stripHtmlComments

Strip HTML comments before forwarding a web page sent by a protected web site in response to a user request.

Possible values: none, all, exclude_script_tag

stripXmlComments

Exempt URLs that pass the Start URL closure check from additional security checks.

Possible values: none, all

exemptClosureURLsFromSecurityChecks

Exempt URLs that pass the Start URL closure check from additional security checks.

Possible values: ON, OFF

defaultCharSet

Default character set for protected web pages. Web pages sent by your protected web sites in response to user requests are assigned this character set if the page does not already specify a character set. The character sets supported by the application firewall are:

* iso-8859-1 (English US)

* big5 (Chinese Traditional)

* gb2312 (Chinese Simplified)

* sjis (Japanese Shift-JIS)

* euc-jp (Japanese EUC-JP)

* iso-8859-9 (Turkish)

* utf-8 (Unicode)

* euc-kr (Korean)

Default value: NS_S_AS_CHARSET_DEFAULT

Maximum value: 31

postBodyLimit

Maximum allowed HTTP post body size, in bytes.

Default value: AS_DEFAULT_POSTBODYLIMIT

Maximum value: 1000000000

fileUploadMaxNum

Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads.

Default value: AS_DEFAULT_MAX_FILE_UPLOADS

Maximum value: 65535

canonicalizeHTMLResponse

Perform HTML entity encoding for any special characters in responses sent by your protected web sites.

Possible values: ON, OFF

Default value: ON

enableFormTagging

Enable tagging of web form fields for use by the Form Field Consistency and CSRF Form Tagging checks.

Possible values: ON, OFF

Default value: ON

sessionlessFieldConsistency

Perform sessionless Field Consistency Checks.

Possible values: OFF, ON, postOnly

Default value: AS_OFF

sessionlessURLClosure

Enable session less URL Closure Checks.

This check is applicable to Profile Type: HTML.

Possible values: ON, OFF

Default value: OFF

semicolonFieldSeparator

Allow ';' as a form field separator in URL queries and POST form bodies.

Possible values: ON, OFF

Default value: OFF

excludeFileUploadFromChecks

Exclude uploaded files from Form checks.

Possible values: ON, OFF

Default value: OFF

SQLInjectionParseComments

Parse HTML comments and exempt them from the HTML SQL Injection check. You must specify the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows:

* Check all - Check all content.

* ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment.

* Nested - Exempt content that is part of a nested (Microsoft-style) comment.

* ANSI Nested - Exempt content that is part of any type of comment.

Possible values: checkall, ansi, nested, ansinested

Default value: AS_DEFAULT_SQLINJECTIONPARSECOMMENTS

invalidPercentHandling

Configure the method that the application firewall uses to handle percent-encoded names and values. Available settings function as follows:

* apache_mode - Apache format.

* asp_mode - Microsoft ASP format.

* secure_mode - Secure format.

Possible values: apache_mode, asp_mode, secure_mode

Default value: AS_PERCENT_DECODE_SECURE_MODE

type

Application firewall profile type, which controls which security checks and settings are applied to content that is filtered with the profile. Available settings function as follows:

* HTML - HTML-based web sites.

* XML - XML-based web sites and services.

* HTML XML (Web 2.0) - Sites that contain both HTML and XML content, such as ATOM feeds, blogs, and RSS feeds.

Default value: AF_PROFILE_TYPE_HTML

checkRequestHeaders

Check request headers as well as web forms for injected SQL and cross-site scripts.

Possible values: ON, OFF

Default value: OFF

comment

Any comments about the purpose of profile, or other useful information about the profile.

---

unset appfw profile

Use this command to remove appfw profile settings.Refer to the set appfw profile command for meanings of the arguments.

Synopsys

unset appfw profile <name> [-startURLAction] [-contentTypeAction] [-startURLClosure] [-denyURLAction] [-RefererHeaderCheck] [-cookieConsistencyAction] [-cookieTransforms] [-cookieEncryption] [-cookieProxying] [-addCookieFlags] [-fieldConsistencyAction] [-CSRFtagAction] [-crossSiteScriptingAction] [-crossSiteScriptingTransformUnsafeHTML] [-crossSiteScriptingCheckCompleteURLs] [-SQLInjectionAction] [-SQLInjectionTransformSpecialChars] [-SQLInjectionType] [-SQLInjectionCheckSQLWildChars] [-fieldFormatAction] [-defaultFieldFormatType] [-defaultFieldFormatMinLength] [-defaultFieldFormatMaxLength] [-bufferOverflowAction] [-bufferOverflowMaxURLLength] [-bufferOverflowMaxHeaderLength] [-bufferOverflowMaxCookieLength] [-creditCardAction] [-creditCard] [-creditCardMaxAllowed] [-creditCardXOut] [-requestContentType] [-responseContentType] [-XMLDoSAction] [-XMLFormatAction] [-XMLSQLInjectionAction] [-XMLSQLInjectionType] [-XMLSQLInjectionCheckSQLWildChars] [-XMLSQLInjectionParseComments] [-XMLXSSAction] [-XMLWSIAction] [-XMLAttachmentAction] [-XMLValidationAction] [-XMLErrorObject] [-signatures] [-XMLSOAPFaultAction] [-useHTMLErrorObject] [-errorURL] [-HTMLErrorObject] [-logEveryPolicyHit] [-stripHtmlComments] [-stripXmlComments] [-exemptClosureURLsFromSecurityChecks] [-defaultCharSet] [-postBodyLimit] [-fileUploadMaxNum] [-canonicalizeHTMLResponse] [-enableFormTagging] [-sessionlessFieldConsistency] [-sessionlessURLClosure] [-semicolonFieldSeparator] [-excludeFileUploadFromChecks] [-SQLInjectionParseComments] [-invalidPercentHandling] [-type] [-checkRequestHeaders] [-comment]

---

bind appfw profile

Binds the specified exemption (relaxation) or rule to the specified application firewall profile. NOTE: You should not attempt to bind more than one exemption or rule at a time by using this command.

Synopsys

bind appfw profile <name> (-startURL <expression> | -denyURL <expression> | (-fieldConsistency <string> <formActionURL> [-isRegex (REGEX | NOTREGEX)]) | (-cookieConsistency <string> [-isRegex (REGEX | NOTREGEX)]) | (-SQLInjection <string> <formActionURL> [-isRegex (REGEX | NOTREGEX)] [-location <location>]) | (-CSRFTag <expression> <CSRFFormActionURL>) | (-crossSiteScripting <string> <formActionURL> [-isRegex (REGEX | NOTREGEX)] [-location <location>]) | (-fieldFormat <string> <formActionURL> <fieldType> [-fieldFormatMinLength <positive_integer>] [-fieldFormatMaxLength <positive_integer>] [-isRegex (REGEX | NOTREGEX)]) | (-safeObject <string> <expression> <maxMatchLength> [-action <action> ...]) | -trustedLearningClients <ip_addr[/prefix]|ipv6_addr[/prefix]|*> | (-XMLDoSURL <expression> [-XMLMaxElementDepthCheck (ON | OFF) [-XMLMaxElementDepth <positive_integer>]] [-XMLMaxElementNameLengthCheck (ON | OFF) [-XMLMaxElementNameLength <positive_integer>]] [-XMLMaxElementsCheck (ON | OFF) [-XMLMaxElements <positive_integer>]] [-XMLMaxElementChildrenCheck (ON | OFF) [-XMLMaxElementChildren <positive_integer>]] [-XMLMaxAttributesCheck (ON | OFF) [-XMLMaxAttributes <positive_integer>]] [-XMLMaxAttributeNameLengthCheck (ON | OFF) [-XMLMaxAttributeNameLength <positive_integer>]] [-XMLMaxAttributeValueLengthCheck (ON | OFF) [-XMLMaxAttributeValueLength <positive_integer>]] [-XMLMaxCharDATALengthCheck (ON | OFF) [-XMLMaxCharDATALength <positive_integer>]] [-XMLMaxFileSizeCheck (ON | OFF) [-XMLMaxFileSize <positive_integer>]] [-XMLMinFileSizeCheck (ON | OFF) [-XMLMinFileSize <positive_integer>]] [-XMLBlockPI (ON | OFF)] [-XMLBlockDTD (ON | OFF)] [-XMLBlockExternalEntities (ON | OFF)] [-XMLMaxEntityExpansionsCheck (ON | OFF) [-XMLMaxEntityExpansions <positive_integer>]] [-XMLMaxEntityExpansionDepthCheck (ON | OFF) [-XMLMaxEntityExpansionDepth <positive_integer>]] [-XMLMaxNamespacesCheck (ON | OFF) [-XMLMaxNamespaces <positive_integer>]] [-XMLMaxNamespaceUriLengthCheck (ON | OFF) [-XMLMaxNamespaceUriLength <positive_integer>]] [-XMLSOAPArrayCheck (ON | OFF) [-XMLMaxSOAPArraySize <positive_integer>] [-XMLMaxSOAPArrayRank <positive_integer>]]) | (-XMLWSIURL <expression> [-XMLWSIChecks <string>]) | (-XMLValidationURL <expression> (-XMLRequestSchema <string> | (-XMLWSDL <string> [-XMLAdditionalSOAPHeaders (ON | OFF)] [-XMLEndPointCheck (ABSOLUTE | RELATIVE)]) | -XMLValidateSOAPEnvelope (ON | OFF)) [-XMLResponseSchema <string>] [-XMLValidateResponse (ON | OFF)]) | (-XMLAttachmentURL <expression> [-XMLMaxAttachmentSizeCheck (ON | OFF) [-XMLMaxAttachmentSize <positive_integer>]] [-XMLAttachmentContentTypeCheck (ON | OFF) [-XMLAttachmentContentType <expression>]]) | (-XMLSQLInjection <string> [-isRegex (REGEX | NOTREGEX)] [-location (ELEMENT | ATTRIBUTE)]) | (-XMLXSS <string> [-isRegex (REGEX | NOTREGEX)] [-location (ELEMENT | ATTRIBUTE)]) | -contentType <expression> | -excludeResContentType <expression>) [-comment <string>] [-state (ENABLED | DISABLED)]

Arguments

name

Name of the profile to which to bind an exemption or rule.

startURL

Add the specified URL to the start URL list.

Enclose URLs in double quotes to ensure preservation of any embedded spaces or non-alphanumeric characters.

denyURL

Add the specified URL to the deny URL list.

Enclose URLs in double quotes to ensure preservation of any embedded spaces or non-alphanumeric characters.

fieldConsistency

Exempt the specified web form field and form action URL from the form field consistency check, or exempt the specified cookie from the cookie consistency check.

A form field consistency exemption (relaxation) consists of the following items:

* Web form field name. Name of the form field to exempt from this check.

* Form action URL. Action URL for the web form.

* IsRegex flag. The IsRegex flag, followed by YES if the form action URL is a regular expression, or NO if it is a literal string.

cookieConsistency

A cookie consistency exemption (relaxation) consists of the following items:

* Cookie name. Name of the cookie to exempt from this check.

* IsRegex flag. The IsRegex flag, followed by YES if the cookie name is a regular expression, or NO if it is a literal string.

SQLInjection

Exempt the specified HTTP header, web form field and the form action URL, or cookie from the SQL injection check.

An SQL injection exemption (relaxation) consists of the following items:

*Item name. Name of the web form field, cookie, or HTTP header to exempt from this check.

* Form action URL. If the item to be exempted is a web form field, the action URL for the web form.

* IsRegex flag. The IsRegex flag, followed by YES if the name or form action URL is a regular expression, or NO if it is a literal string.

* Location. Location that should be examined by the SQL injection check, either FORMFIELD for web form field, HEADER for HTTP header, or COOKIE for cookie.

CSRFTag

Exempt the specified form field and web form from the cross-site request forgery (CSRF tagging) check.

A CSRF tagging exemption (relaxation) consists of the following items:

* Web form field name. Regular expression that describes the web form field to exempt from this check.

* Form action URL. The action URL for the web form.

crossSiteScripting

Exempt the specified string, found in the specified HTTP header, cookie, or web form, from the cross-site scripting check.

A cross-site scripting check exemption (relaxation) consists of the following items:

* HTML to exempt. The string to exempt from the cross-site scripting check.

* URL. The URL to exempt.

* IsRegex flag. The IsRegex flag, followed by YES if the URL is a regular expression, or NO if it is a literal string.

* location. Location which should be examined by the cross-site scripting check, either FORMFIELD for web form field, HEADER for HTTP header, or COOKIE for cookie.

fieldFormat

Impose the specified format on content returned by users in the specified web form field.

A field format rule consists of the following items:

* Form field name. The name of the form field.

* Form action URL. The form action URL for the web form.

* Field type. The field type (format) to enforce on the specified web form field.

* Field format minimum length. The minimum length allowed for data in the specified field. If 0, field can be left blank.

* Field format maximum length. The maximum length allowed for data in the specified field.

* IsRegex flag. The IsRegex flag, followed by YES if the URL is a regular expression, or NO if it is a literal string.

safeObject

Protect web sites from exposing sensitive private information such as social security numbers, credit card numbers, driver's license numbers, passport numbers, and any other type of private information that can be described by a regular expression.

A safe object consists of the following items:

* Name. A name that describes the type of information that the safe object is to protect.

* Expression. PCRE-format regular expression that describes the information to be protected.

* Maximum match length. Maximum length of a matched string.

* Action. "X-Out" to mask blocked information with the letter X, or "Remove" to remove the information.

trustedLearningClients

Trusted host/network learning IP.

This binding is appilicable to profile Type: HTML, XML.

comment

Any comments about the purpose of profile, or other useful information about the profile.

state

Enabled.

Possible values: ENABLED, DISABLED

Default value: ENABLED

XMLDoSURL

Exempt the specified URL from the specified XML denial-of-service (XDoS) attack protections.

An XDoS exemption (relaxation) consists of the following items:

* URL. PCRE-format regular expression for the URL or URLs to be exempted.

* Maximum-element-depth-check toggle. ON to enable this check, OFF to disable it.

* Maximum-element-depth-check toggle. ON to enable, OFF to disable.

* Maximum-element-depth-check level. Positive integer representing the maximum allowed depth of nested XML elements.

* Maximum-element-name-length-check toggle. ON to enable, OFF to disable.

* Maximum element name length. Positive integer representing the maximum allowed length of XML element names.

* Maximum-number-of-elements-check toggle. ON to enable, OFF to disable.

* Maximum number of elements. Positive integer representing the maximum allowed number of XML elements.

* Maximum-number-of-element-children-check toggle. ON to enable, OFF to disable.

* Maximum number of element children. Positive integer representing the maximum allowed number of XML element children.

* Maximum-number-of-attributes-check toggle. ON to enable, OFF to disable.

* Maximum number of attributes. Positive integer representing the maximum allowed number of XML attributes.

* Maximum-attribute-name-length-check toggle. ON to enable, OFF to disable.

* Maximum attribute name length. Positive integer representing the maximum allowed length of XML attribute names.

* Maximum-attribute-value-length-check toggle. ON to enable, OFF to disable.

* Maximum attribute value length. Positive integer representing the maximum allowed length of XML attribute values.

* Maximum-character-data-length-check toggle. ON to enable, OFF to disable.

* Maximum character-data length. Positive integer representing the maximum allowed length of XML character data.

* Maximum-file-size-check toggle. ON to enable, OFF to disable.

* Maximum file size. Positive integer representing the maximum allowed size, in bytes. of attached or uploaded files.

* Minimum-file-size-check toggle. ON to enable, OFF to disable.

* Minimum file size. Positive integer representing the minimum allowed size, in bytes, of attached or uploaded files.

* Maximum-number-of-entity-expansions-check toggle. ON to enable, OFF to disable.

* Maximum number of entity expansions. Positive integer representing the maximum allowed number of XML entity expansions.

* Maximum-number-of XML-namespaces-check toggle. ON to enable, OFF to disable.

* Maximum number of XML namespaces. Positive integer representing the maximum allowed number of XML namespaces.

* Maximum-XML-namespace-URI-length-check toggle. ON to enable, OFF to disable.

* MaximumXML-namespace URI length. Positive integer representing the maximum allowed length of XML namespace URIs.

* Block-processing-instructions toggle. Block XML processing instructions. ON to enable, OFF to disable.

* Block-DTD toggle. Block design type documents (DTDs). ON to enable, OFF to disable.

* Block-external-XML-entitites toggle. ON to enable, OFF to disable.

* Maximum-SOAP-array-check toggle. ON to enable, OFF to disable.

* Maximum SOAP-array size. Positive integer representing the maximum allowed size of XML SOAP arrays.

* Maximum SOAP-array rank. Positive integer representing the maximum rank (dimensions) of any single XML SOAP array.

XMLWSIURL

Exempt the specified URL from the web services interoperability (WS-I) check. The URL is specified as a PCRE-format regular expression, which can match one or more URLs.

XMLValidationURL

Exempt the specified URL from the XML message validation check.

An XML message validation exemption (relaxation) consists of the following items:

* URL. PCRE-format regular expression that matches the URL(s) to be exempted.

* XML-request-schema toggle. Use the specified XML schema to validate requests. ON to enable, OFF to disable.

* XML request schema. XML schema to use for validating requests.

* XML-response-schema toggle. Use the specified XML schema to validate responses. ON to enable, OFF to disable.

* XML response schema. XML schema to use for validating responses.

* WSDL toggle. Use the specified WSDL to validate. ON to enable, OFF to disable.

* WSDL. WSDL to use for validation.

* SOAP-envelope toggle. Validate against the SOAP envelope. ON to enable, OFF to disable.

* Additional-SOAP-headers toggle. Validate against the extended list of SOAP headers. ON to enable, OFF to disable.

* XML-end-point check. ABSOLUTE to use an absolute end point, RELATIVE to use a relative end point.

XMLAttachmentURL

Exempt the specified URL from the XML attachment check.

An XML attachment exemption (relaxation) consists of the following items:

* URL. PCRE-format regular expression that matches the URL(s) to be exempted.

* Maximum-attachment-size-check toggle. ON to enable, OFF to disable.

* Maximum attachment size. Positive integer representing the maximum allowed size in bytes for each XML attachment.

* Attachment-content-type-check toggle. ON to enable, OFF to disable.

* Attachment content type. PCRE-format regular expression that specifies the list of MIME content types allowed for XML attachments.

XMLSQLInjection

Exempt the specified URL from the XML SQL injection check.

An XML attachment exemption (relaxation) consists of the following items:

* URL. URL to exempt, as a string or a PCRE-format regular expression.

* ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string.

* Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

XMLXSS

Exempt the specified URL from the XML cross-site scripting (XSS) check.

An XML cross-site scripting exemption (relaxation) consists of the following items:

* URL. URL to exempt, as a string or a PCRE-format regular expression.

* ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string.

* Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

contentType

Add the specified content-type to the content-type list.Enclose content-type in double quotes to ensure

preservation of any embedded spaces or non-alphanumeric characters.

excludeResContentType

Add the specified content-type to the response content-type list that are to be excluded from inspection. Enclose content-type in double quotes to ensure preservation

of any embedded spaces or non-alphanumeric characters.

---

unbind appfw profile

Unbinds the specified exemption (relaxation) or rule from the specified application firewall profile. See the bind appfw profile command for a description of the parameters.

Synopsys

unbind appfw profile <name> (-startURL <expression> | -denyURL <expression> | (-fieldConsistency <string> <formActionURL>) | -cookieConsistency <string> | (-SQLInjection <string> <formActionURL> [-location <location>]) | (-CSRFTag <string> <CSRFFormActionURL>) | (-crossSiteScripting <string> <formActionURL> [-location <location>]) | (-fieldFormat <string> <formActionURL>) | -safeObject <string> | -trustedLearningClients <ip_addr[/prefix]|ipv6_addr[/prefix]|*> | -XMLDoSURL <expression> | -XMLWSIURL <expression> | -XMLValidationURL <expression> | -XMLAttachmentURL <expression> | (-XMLSQLInjection <string> [-location (ELEMENT | ATTRIBUTE)]) | (-XMLXSS <string> [-location (ELEMENT | ATTRIBUTE)]) | -contentType <expression> | -excludeResContentType <expression>)

Arguments

name

Name of the exemption (relaxation) or rule that you want to unbind.

startURL

Start URL regular expression.

denyURL

Deny URL regular expression.

fieldConsistency

Form field name.

cookieConsistency

Cookie name.

SQLInjection

Form field, header or cookie name.

CSRFTag

CSRF Form origin URL.

This binding is applicable to Profile Type: HTML.

crossSiteScripting

Form field, header or cookie name.

fieldFormat

Field format name.

safeObject

Safe Object name.

trustedLearningClients

Trusted learning Clients IP

XMLDoSURL

XML DoS URL regular expression.

XMLWSIURL

XML WS-I URL regular expression.

XMLValidationURL

XML Message URL regular expression.

XMLAttachmentURL

XML Attachment URL regular expression.

XMLSQLInjection

Exempt the specified URL from the XML SQL injection check.

An XML attachment exemption (relaxation) consists of the following items:

* URL. URL to exempt, as a string or a PCRE-format regular expression.

* ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string.

* Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

XMLXSS

Exempt the specified URL from the XML cross-site scripting (XSS) check.

An XML cross-site scripting exemption (relaxation) consists of the following items:

* URL. URL to exempt, as a string or a PCRE-format regular expression.

* ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string.

* Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

contentType

content-type regular expression.

excludeResContentType

Response content type regular expression that are to be excluded from inspection.

---

show appfw profile

Displays details of the specified application firewall profile. If no profile is specified, displays a list of all application firewall profiles on the NetScaler appliance.

Synopsys

show appfw profile [<name>]

Arguments

name

Name of the application firewall profile.

summary

fullValues

format

level

Outputs

stateflag

type

The profile type of of this Application Firewall profile. If the profile is of the HTML type, only checks relevant to HTML are applied. If the profile is of the XML type, only checks relevent to XML are applied. if the profile is of the Web 2.0 type, then both types of checks are applied.

defaults

Default configuration to apply to the profile. Basic defaults are intended for standard content that requires little further configuration, such as static web site content. Advanced defaults are intended for specialized content that requires significant specialized configuration, such as heavily scripted or dynamic content.

CLI users: When adding an application firewall profile, you can set either the defaults or the type, but not both. To set both options, create the profile by using the add appfw profile command, and then use the set appfw profile command to configure the other option.

useHTMLErrorObject

Send an imported HTML Error object to a user when a request is blocked, instead of redirecting the user to the designated Error URL.

errorURL

The error page for this profile.

HTMLErrorObject

Name to assign to the HTML Error Object.

Must begin with a letter, number, or the underscore character \\(_\\), and must contain only letters, numbers, and the hyphen \\(-\\), period \\(.\\) pound \\(\\#\\), space \\(\\), at (@), equals \\(=\\), colon \\(:\\), and underscore characters. Cannot be changed after the HTML error object is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks \\(for example, "my HTML error object" or 'my HTML error object'\\).

logEveryPolicyHit

Log every profile match, regardless of security checks results.

stripComments

Tells the Application Firewall to strip HTML comments from responses before sending them to the user.NOTE: This attribute is deprecated.Replaced by a new command that provides an option to exclude comments inside <script> tag from getting stripped.

stripHtmlComments

Tells the Application Firewall to strip HTML comments from responses before sending them to the user.

stripXmlComments

Tells the Application Firewall to strip XML comments from responses before sending them to the user.

defaultCharSet

The default character set. The character set that the Application Firewall uses

for web pages that do not explicitly set a different character set.

postBodyLimit

The maximum body size for an HTTP POST.

fileUploadMaxNum

Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads.

canonicalizeHTMLResponse

Tells the Application Firewall to convert any non-ASCII characters into HTML entities before sending responses to the user. This is called 'canonicalization' of HTML responses.

enableFormTagging

Enables tagging of web forms for form field Consistency checks.

sessionlessFieldConsistency

Enable session less form field consistency checks.

sessionlessURLClosure

Enable session less URL closure checks.

semicolonFieldSeparator

Allow ';' as a form field separator in URL queries and POST form bodies.

excludeFileUploadFromChecks

Excludes uploaded files from all web form checks.

SQLInjectionParseComments

Canonicalizes SQL Comments in form fields.

checkRequestHeaders

Check request headers as well as web forms for injected SQL and cross-site scripts.

comment

Comments associated with this profile.

startURLAction

Start URL action types. (BLOCK | LEARN | LOG | STATS | NONE)

contentTypeAction

Content-type action types. (BLOCK | LOG | NONE)

startURL

A regular expression that designates a URL on the Start URL list.

startURLClosure

Enable Start URL closure. When enabled, this feature allows users to start their session at a designated start URL, then navigate from that start URL to any URL on a protected web site by clicking a link on another web page on that web site. Otherwise, requests to any URL that is not explicitly allowed are blocked.

denyURLAction

Deny URL action types. (BLOCK | LOG | STATS | NONE)

denyURL

A regular expression that designates a URL on the Deny URL list.

RefererHeaderCheck

Enable validation of Referer headers.

Referer validation ensures that a web form that a user sends to your web site originally came from your web site, not an outside attacker.

Although this parameter is part of the Start URL check, referer validation protects against cross-site request forgery (CSRF) attacks, not Start URL attacks.

CSRFtagAction

Cross-site request forgery tagging action types. (BLOCK | LOG | STATS | NONE)

CSRFTag

The web form originating URL.

CSRFFormActionURL

The web form action URL.

crossSiteScriptingAction

Cross-site scripting action types. (BLOCK | LEARN | LOG | STATS | NONE)

crossSiteScriptingTransformUnsafeHTML

Enables transformation of unsafe HTML into safe HTML before forwarding a request to the web server.

crossSiteScriptingCheckCompleteURLs

Tells the Application Firewall to check complete URLs rather than just the query

portion of URLs for cross-site scripting violations.

crossSiteScripting

The web form field name.

isRegex

Is the XML XSS exempted field name a regular expression?

formActionURL

Action URL of the form field to which a field format will be assigned.

exemptClosureURLsFromSecurityChecks

Tells the Application Firewall to exempt closure URLs from security checks.

location

Location of XSS injection exception - XML Element or Attribute.

SQLInjectionAction

SQL injection action types. (BLOCK | LEARN | LOG | STATS | NONE)

SQLInjectionTransformSpecialChars

Enables transformation of SQL special characters found in web forms into safe equivalents.

SQLInjectionOnlyCheckFieldsWithSQLChars

Tells the Application Firewall to check form fields that contain SQL special characters only, rather than all form fields, for SQL injection violations.NOTE: This attribute is deprecated.The same functionality is added to SQLInjectionType . Set SQLInjectionType to "SQLSplCharANDKeyword" to get the same result

SQLInjectionType

Available SQL Injection types.

SQLInjectionCheckSQLWildChars

Check for form fields that contain SQL wild chars .

SQLInjection

The web form field name.

invalidPercentHandling

Configure the method that the application firewall uses to handle percent-encoded names and values. Available settings function as follows:

* apache_mode - Apache format.

* asp_mode - Microsoft ASP format.

* secure_mode - Secure format.

fieldConsistencyAction

Form Field Consistency action types. (BLOCK | LEARN | LOG | STATS | NONE)

fieldConsistency

The web form field name.

cookieConsistencyAction

Cookie consistency action types. (BLOCK | LEARN | LOG | STATS | NONE)

cookieConsistency

The name of the cookie to be checked.

cookieTransforms

Perform the specified type of cookie transformation.

Available settings function as follows:

* Encryption - Encrypt cookies.

* Proxying - Mask contents of server cookies by sending proxy cookie to users.

* Cookie flags - Flag cookies as HTTP only to prevent scripts on user's browser from accessing and possibly modifying them.

CAUTION: Make sure that this parameter is set to ON if you are configuring any cookie transformations. If it is set to OFF, no cookie transformations are performed regardless of any other settings.

cookieEncryption

Type of cookie encryption. Available settings function as follows:

* None - Do not encrypt cookies.

* Decrypt Only - Decrypt encrypted cookies, but do not encrypt cookies.

* Encrypt Session Only - Encrypt session cookies, but not permanent cookies.

* Encrypt All - Encrypt all cookies.

cookieProxying

Proxies server cookies using the Application Firewall session

addCookieFlags

Add the specified flags to cookies. Available settings function as follows:

* None - Do not add flags to cookies.

* HTTP Only - Add the HTTP Only flag to cookies, which prevents scripts from accessing cookies.

* Secure - Add Secure flag to cookies.

* All - Add both HTTPOnly and Secure flags to cookies.

bufferOverflowAction

Buffer overflow action types. (BLOCK | LOG | STATS | NONE)

bufferOverflowMaxURLLength

Maximum allowed length for URLs.

bufferOverflowMaxHeaderLength

Maximum allowed length for HTTP headers.

bufferOverflowMaxCookieLength

Maximum allowed length for cookies.

fieldFormatAction

Field format action types. (BLOCK | LEARN | LOG | STATS | NONE)

defaultFieldFormatType

Name of the default field type, the field type that the Application Firewall will assign to a form field when no specific field type is assigned to that particular form field.

defaultFieldFormatMinLength

Default field type minimum length setting.

defaultFieldFormatMaxLength

Default field type maximum length setting.

fieldFormat

Name of the form field to which a field format will be assigned.

fieldType

The field type you are assigning to this form field.

fieldFormatMinLength

The minimum allowed length for data in this form field.

fieldFormatMaxLength

The maximum allowed length for data in this form field.

creditCardAction

Credit Card action types. (BLOCK | LOG | STATS | NONE)

creditCard

Credit card types. (AMEX | DINERSCLUB| DISCOVER | JBC | MASTERCARD | VISA)

creditCardMaxAllowed

Maximum number of times a credit card number may be seen before action is taken.

creditCardXOut

X-out credit card numbers.

safeObject

Name of the Safe Object.

expression

A regular expression that defines the Safe Object.

maxMatchLength

Maximum match length for a Safe Object expression.

action

Safe Object action types. (BLOCK | LOG | STATS | NONE)

requestContentType

Default content-type for request messages.

responseContentType

Default content-type for response messages.

XMLErrorObject

URL for the xml error page

signatures

Signatures for the profile

XMLFormatAction

XML well-formed request action types. (BLOCK | LOG | STATS | NONE)

XMLDoSAction

XML DOS action types. (BLOCK | LEARN | LOG | STATS | NONE)

XMLSQLInjectionAction

XML SQL Injection action types. (BLOCK | LOG | STATS | NONE)

XMLSQLInjectionOnlyCheckFieldsWithSQLChars

XML flag to check only fields with SQL characters.NOTE: This attribute is deprecated.The same functionality is added to SQLInjectionType. Set XMLSQLInjectionType to "SQLSplCharANDKeyword" to get the same result

XMLSQLInjectionType

Available XML SQL Injection types.

XMLSQLInjectionCheckSQLWildChars

XML flag to check for SQL wild chars.

XMLSQLInjectionParseComments

Canonicalize SQL Comments in XML data.

XMLXSSAction

XML cross-site scripting action types. (BLOCK | LOG | STATS | NONE)

XMLWSIAction

XML WSI action types. (BLOCK | LEARN | LOG | STATS | NONE)

XMLAttachmentAction

XML attachment action types. (BLOCK | LEARN | LOG | STATS | NONE)

XMLValidationAction

XML message validation action types. (BLOCK | LOG | STATS | NONE)

XMLSOAPFaultAction

XML SOAP fault filtering action types. (BLOCK | LOG | STATS | REMOVE | NONE)

XMLDoSURL

XML DoS URL regular expression length.

XMLWSIURL

XML WS-I URL regular expression length.

XMLValidationURL

XML Validation URL regular expression.

XMLAttachmentURL

XML attachment URL regular expression length.

XMLSQLInjection

Exempt the specified URL from the XML SQL injection check.

An XML attachment exemption (relaxation) consists of the following items:

* URL. URL to exempt, as a string or a PCRE-format regular expression.

* ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string.

* Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

XMLXSS

Exempt the specified URL from the XML cross-site scripting (XSS) check.

An XML cross-site scripting exemption (relaxation) consists of the following items:

* URL. URL to exempt, as a string or a PCRE-format regular expression.

* ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string.

* Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

state

Enabled.

XMLMaxElementDepthCheck

State if XML Max element depth check is ON or OFF.

XMLMaxElementDepth

Maximum nesting (depth) of XML elements. This check protects against documents that have excessive hierarchy depths.

XMLMaxElementNameLengthCheck

State if XML Max element name length check is ON or OFF.

XMLMaxElementNameLength

Specify the longest name of any element (including the expanded namespace) to protect against overflow attacks.

XMLMaxElementsCheck

State if XML Max elements check is ON or OFF.

XMLMaxElements

Specify the maximum number of XML elements allowed. Protects against overflow attacks.

XMLMaxElementChildrenCheck

State if XML Max element children check is ON or OFF.

XMLMaxElementChildren

Specify the maximum number of children allowed per XML element. Protects against overflow attacks.

XMLMaxNodesCheck

State if XML Max nodes check is ON or OFF.

XMLMaxNodes

Specify the maximum number of XML nodes. Protects against overflow attacks.

XMLMaxAttributesCheck

State if XML Max attributes check is ON or OFF.

XMLMaxAttributes

Specify maximum number of attributes per XML element. Protects against overflow attacks.

XMLMaxAttributeNameLengthCheck

State if XML Max attribute name length check is ON or OFF.

XMLMaxAttributeNameLength

Specify the longest name of any XML attribute. Protects against overflow attacks.

XMLMaxAttributeValueLengthCheck

State if XML Max atribute value length is ON or OFF.

XMLMaxAttributeValueLength

Specify the longest value of any XML attribute. Protects against overflow attacks.

XMLMaxCharDATALengthCheck

State if XML Max CDATA length check is ON or OFF.

XMLMaxCharDATALength

Specify the maximum size of CDATA. Protects against overflow attacks and large quantities of unparsed data within XML messages.

XMLMaxFileSizeCheck

State if XML Max file size check is ON or OFF.

XMLMaxFileSize

Specify the maximum size of XML messages. Protects against overflow attacks.

XMLMinFileSizeCheck

State if XML Min file size check is ON or OFF.

XMLMinFileSize

Enforces minimum message size.

XMLBlockPI

State if XML Block PI is ON or OFF. Protects resources from denial of service attacks as SOAP messages cannot have processing instructions (PI) in messages.

XMLBlockDTD

State if XML DTD is ON or OFF. Protects against recursive Document Type Declaration (DTD) entity expansion attacks. Also, SOAP messages cannot have DTDs in messages.

XMLBlockExternalEntities

State if XML Block External Entities Check is ON or OFF. Protects against XML External Entity (XXE) attacks that force applications to parse untrusted external entities (sources) in XML documents.

XMLMaxEntityExpansionsCheck

State if XML Max Entity Expansions Check is ON or OFF.

XMLMaxEntityExpansions

Specify maximum allowed number of entity expansions. Protects aganist Entity Expansion Attack.

XMLMaxEntityExpansionDepthCheck

State if XML Max Entity Expansions Depth Check is ON or OFF.

XMLMaxEntityExpansionDepth

Specify maximum entity expansion depth. Protects aganist Entity Expansion Attack.

XMLMaxNamespacesCheck

State if XML Max namespaces check is ON or OFF.

XMLMaxNamespaces

Specify maximum number of active namespaces. Protects against overflow attacks.

XMLMaxNamespaceUriLengthCheck

State if XML Max namespace URI length check is ON or OFF.

XMLMaxNamespaceUriLength

Specify the longest URI of any XML namespace. Protects against overflow attacks.

XMLSOAPArrayCheck

State if XML SOAP Array check is ON or OFF.

XMLMaxSOAPArraySize

XML Max Total SOAP Array Size. Protects against SOAP Array Abuse attack.

XMLMaxSOAPArrayRank

XML Max Individual SOAP Array Rank. This is the dimension of the SOAP array.

XMLWSIChecks

Specify a comma separated list of relevant WS-I rule IDs. (R1140, R1141)

XMLRequestSchema

XML Schema object for request validation .

XMLResponseSchema

XML Schema object for response validation.

XMLWSDL

WSDL object for soap request validation.

XMLAdditionalSOAPHeaders

Allow addtional soap headers.

XMLEndPointCheck

Modifies the behaviour of the Request URL validation w.r.t. the Service URL.

If set to ABSOLUTE, the entire request URL is validated with the entire URL mentioned in Service of the associated WSDL.

eg: Service URL: http://example.org/ExampleService, Request URL: http//example.com/ExampleService would FAIL the validation.

If set to RELAIVE, only the non-hostname part of the request URL is validated against the non-hostname part of the Service URL.

eg: Service URL: http://example.org/ExampleService, Request URL: http//example.com/ExampleService would PASS the validation.

XMLValidateSOAPEnvelope

Validate SOAP Evelope only.

XMLValidateResponse

Validate response message.

XMLMaxAttachmentSizeCheck

State if XML Max attachment size Check is ON or OFF. Protects against XML requests with large attachment data.

XMLMaxAttachmentSize

Specify maximum attachment size.

XMLAttachmentContentTypeCheck

State if XML attachment content-type check is ON or OFF. Protects against XML requests with illegal attachments.

XMLAttachmentContentType

Specify content-type regular expression.

builtin

Indicates that a profile is a built-in entity.

builtinType

Type of built-in profiles

trustedLearningClients

Specify trusted host/network IP

contentType

A regular expression that designates a content-type on the content-types list.

excludeResContentType

A regular expression that represents the content type of the response that are to be excluded from inspection.

devno

count

---

stat appfw profile

Displays statistics for the specified application firewall profile. If no profile is specified, displays abbreviated statistics for all profiles.

Synopsys

stat appfw profile [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

name

Name of the application firewall profile.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

requests (reqs)

HTTP/HTTPS requests sent to your protected web servers via the Application Firewall.

Request Bytes (reqBytes)

Number of bytes transfered for requests

responses (resps)

HTTP/HTTPS responses sent by your protected web

servers via the Application Firewall.

Response Bytes (resBytes)

Number of bytes transfered for responses

aborts

Incomplete HTTP/HTTPS requests aborted by the client before the Application Firewall could finish processing them.

redirects (redirect)

HTTP/HTTPS requests redirected by the Application Firewall to a different Web page or web server. (HTTP 302)

Long Term Ave Response Time (ms) (longAvgRespTimePP)

Average backend response time in milliseconds since reboot

Recent Ave Response Time (ms) (shortAvgRespTimePP)

Average backend response time in milliseconds over the last 7 seconds

start URL (startURL)

Number of Start URL security check violations seen by the Application Firewall.

deny URL (denyURL)

Number of Deny URL security check violations seen by the Application Firewall.

referer header (refererHdr)

Number of Referer Header security check violations seen by the Application Firewall.

buffer overflow (bufovfl)

Number of Buffer Overflow security check violations seen by the Application Firewall.

cookie consistency (cookie)

Number of Cookie Consistency security check violations seen by the Application Firewall.

CSRF form tag (csrf_tag)

Number of Cross Site Request Forgery form tag security check violations seen by the Application Firewall.

HTML Cross-site scripting (xss)

Number of HTML Cross-Site Scripting security check violations seen by the Application Firewall.

HTML SQL injection (sql)

Number of HTML SQL Injection security check violations seen by the Application Firewall.

field format (fieldfmt)

Number of Field Format security check violations seen by the Application Firewall.

field consistency (fieldcon)

Number of Field Consistency security check violations seen by the Application Firewall.

credit card (ccard)

Number of Credit Card security check violations seen by the Application Firewall.

safe object (safeobj)

Number of Safe Object security check violations seen by the Application Firewall.

Signature Violations (sigs)

Number of Signature violations seen by the Application Firewall.

XML Format (wfcViolations)

Number of XML Format security check violations seen by the Application Firewall.

XML Denial of Service (XDoS) (xdosViolations)

Number of XML Denial-of-Service security check violations seen by the Application Firewall.

XML Message Validation (msgvalViolations)

Number of XML Message Validation security check violations seen by the Application Firewall.

Web Services Interoperability (wsIViolations)

Number of Web Services Interoperability (WS-I) security check violations seen by the Application Firewall.

XML SQL Injection (xmlSqlViolations)

Number of XML SQL Injection security check violations seen by the Application Firewall.

XML Cross-Site Scripting (xmlXssViolations)

Number of XML Cross-Site Scripting (XSS) security check violations seen by the Application Firewall.

XML Attachment (xmlAttachmentViolations)

Number of XML Attachment security check violations seen by the Application Firewall.

SOAP Fault Violations (soapflt)

Number of requests returning soap:fault from the backend server

XML Generic Violations (genflt)

Number of requests returning XML generic violation from the backend server

Total Violations (totperpr)

Number of violations seen by the application firewall on per profile basis

HTTP Client Errors (4xx Resp) (4xxResps)

Number of requests returning HTTP 4xx from the backend server

HTTP Server Errors (5xx Resp) (5xxResps)

Number of requests returning HTTP 5xx from the backend server

Example

```
stat appfw profile
```

archive appfw profile

Create archive for the profile.

Synopsys

archive appfw profile <name> <archivename> [-comment <string>]

Arguments

name

Name for the profile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) characters. Cannot be changed after the profile is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile').

archivename

Source for tar archive.

comment

Any comments about the purpose of profile, or other useful information about the profile.

restore appfw profile

Restore configuration from archive file

Synopsys

restore appfw profile <archivename>

Arguments

archivename

Source for tar archive.

appfw settings

Sep 22, 2015

The following operations can be performed on "appfw settings":

set | unset | show

set appfw settings

Modifies the global application firewall settings. The global settings apply to all application firewall profiles.

Synopsys

set appfw settings [-defaultProfile <string>] [-undefAction <string>] [-sessionTimeout <positive_integer>] [-learnRateLimit <positive_integer>] [-sessionLifetime <positive_integer>] [-sessionCookieName <string>] [-clientIPLoggingHeader <string>] [-importSizeLimit <positive_integer>] [-signatureAutoUpdate (ON | OFF)] [-signatureUrl <expression>] [-cookiePostEncryptPrefix <string>] [-logMalformedReq (ON | OFF)] [-CEFLogging (ON | OFF)] [-entityDecoding (ON | OFF)] [-useConfigurableSecretKey (ON | OFF)]

Arguments

defaultProfile

Profile to use when a connection does not match any policy. Default setting is APPFW_BYPASS, which sends unmatched connections back to the NetScaler appliance without attempting to filter them further.

Default value: AS_ENGINESETTINGS_DEFAULT_PROF_DEFAULT

undefAction

Profile to use when an application firewall policy evaluates to undefined (UNDEF).

An UNDEF event indicates an internal error condition. The APPFW_BLOCK built-in profile is the default setting. You can specify a different built-in or user-created profile as the UNDEF profile.

Default value: AS_ENGINESETTINGS_UNDEF_PROF_DEFAULT

sessionTimeout

Timeout, in seconds, after which a user session is terminated. Before continuing to use the protected web site, the user must establish a new session by opening a designated start URL.

Default value: AS_ENGINESETTINGS_SESSIONTIMEOUT_DEFAULT

Minimum value: 1

Maximum value: 65535

learnRateLimit

Maximum number of connections per second that the application firewall learning engine examines to generate new relaxations for learning-enabled security checks. The application firewall drops any connections above this limit from the list of connections used by the learning engine.

Default value: AS_ENGINESETTINGS_LEARN_RATE_LIMIT_DEFAULT

Minimum value: 1

Maximum value: 1000

sessionLifetime

Maximum amount of time (in seconds) that the application firewall allows a user session to remain active, regardless of user activity. After this time, the user session is terminated. Before continuing to use the protected web site, the user must establish a new session by opening a designated start URL.

Default value: AS_ENGINESETTINGS_SESSIONLIFETIME_DEFAULT

Maximum value: 2147483647

sessionCookieName

Name of the session cookie that the application firewall uses to track user sessions.

Must begin with a letter or number, and can consist of from 1 to 31 letters, numbers, and the hyphen (-) and underscore (_) symbols.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cookie name" or 'my cookie name').

Default value: NS_S_AS_DEFAULT_COOKIE_NAME

clientIPLoggingHeader

Name of an HTTP header that contains the IP address that the client used to connect to the protected web site or service.

importSizeLimit

Cumulative total maximum number of bytes in web forms imported to a protected web site. If a user attempts to upload files with a total byte count higher than the specified limit, the application firewall blocks the request.

Default value: AS_ENGINESETTINGS_IMPORTSIZELIMIT_DEFAULT

Minimum value: 1

Maximum value: 134217728

signatureAutoUpdate

Flag used to enable/disable auto update signatures

Possible values: ON, OFF

Default value: OFF

signatureUrl

URL to download the mapping file from server

Default value: AS_ENGINESETTINGS_SIGNATURES_UPDATE_URL

cookiePostEncryptPrefix

String that is prepended to all encrypted cookie values.

Default value: NS_S_AS_DEFAULT_CKI_POST_ENCRYPT_PREFIX

logMalformedReq

Log requests that are so malformed that application firewall parsing doesn't occur.

Possible values: ON, OFF

Default value: ON

CEFLogging

Enable CEF format logs.

Possible values: ON, OFF

Default value: OFF

entityDecoding

Transform multibyte (double- or half-width) characters to single width characters.

Possible values: ON, OFF

Default value: OFF

useConfigurableSecretKey

Use configurable secret key in AppFw operations

Possible values: ON, OFF

Default value: OFF

---

unset appfw settings

Use this command to remove appfw settings settings.Refer to the set appfw settings command for meanings of the arguments.

Synopsys

unset appfw settings [-defaultProfile] [-undefAction] [-sessionTimeout] [-learnRateLimit] [-sessionLifetime] [-sessionCookieName] [-clientIPLoggingHeader] [-importSizeLimit] [-signatureAutoUpdate] [-signatureUrl] [-cookiePostEncryptPrefix] [-logMalformedReq] [-CEFLogging] [-entityDecoding] [-useConfigurableSecretKey]

show appfw settings

Displays the current application firewall global settings.

Synopsys

show appfw settings

Arguments

format

level

Outputs

defaultProfile

Profile to use when a connection does not match any policy. Default setting is APPFW_BYPASS, which sends unmatched connections back to the NetScaler appliance without attempting to filter them further.

undefAction

Profile to use when an application firewall policy evaluates to undefined (UNDEF).

An UNDEF event indicates an internal error condition. The APPFW_BLOCK built-in profile is the default setting. You can specify a different built-in or user-created profile as the UNDEF profile.

sessionTimeout

Session timeout (in seconds).

learnRateLimit

Learn messages rate limit value (in messages per second).

sessionLifetime

Session lifetime (in seconds). Zero means no limit.

sessionCookieName

Name of the session cookie that the application firewall uses to track user sessions.

Must begin with a letter or number, and can consist of from 1 to 31 letters, numbers, and the hyphen (-) and underscore (_) symbols.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cookie name" or 'my cookie name').

clientIPLoggingHeader

Name of header that holds downstream IP address for logging purposes.

importSizeLimit

Cumulative total maximum number of bytes in web forms imported to a protected web site. If a user attempts to upload files with a total byte count higher than the specified limit, the application firewall blocks the request.

signatureAutoUpdate

Flag used to enable/disable auto update signatures

signatureUrl

URL to download the mapping file from server

cookiePostEncryptPrefix

String that is prepended to all encrypted cookie values.

logMalformedReq

Log requests that are so malformed that application firewall parsing doesn't occur.

CEFLogging

Enable CEF format logs.

entityDecoding

Transform multibyte (double- or half-width) characters to single width characters.

useConfigurableSecretKey

Use configurable secret key in AppFw operations

appfw signatures

Sep 22, 2015

The following operations can be performed on "appfw signatures":

rm | show | import | update

Removes the specified signature object from the application firewall.

rm appfw signatures <name>

name

Name of the signature object.

rm signatures <name>

Displays the specified signatures object. If no signatures object is specified, displays all signatures objects defined on the NetScaler appliance.

show appfw signatures [<name>]

name

Name of the signature object.

response

show appfw signatures

Imports the specified signatures object to the NetScaler appliance and assigns it the specified name.

import appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge] [-sha1 <string>]

src

URL (protocol, host, path, and file name) for the location at which to store the imported signatures object.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

name

Name to assign to the signatures object on the NetScaler appliance.

xslt

XSLT file source.

comment

Any comments to preserve information about the signatures object.

overwrite

Overwrite any existing signatures object of the same name.

merge

Merges the existing Signature with new signature rules

sha1

File path for sha1 file to validate signature file

import signatures http://www.example.com/ns/signatures.xml my-signature

---

Updates the specified signatures object from the source.

update appfw signatures <name> [-mergeDefault]

name

Name of the signatures object to update.

mergeDefault

Merges signature file with default signature file.

```
update signatures my-signatures
```

appfw stats

Sep 22, 2015

The following operations can be performed on "appfw stats":

show appfw stats is an alias for stat appfw

show appfw stats - alias for 'stat appfw'

appfw transactionRecords

Sep 22, 2015

The following operations can be performed on "appfw transactionRecords":

Display an application firewall transaction record.

show appfw transactionRecords

httpTransactionId

The http transaction identifier.

packetEngineId

The packet engine identifier.

AppFwSessionId

The session identifier set by the Application Firewall to track the user session.

profileName

Application Firewall profile name.

url

Request URL

clientip

The IP address of client.

destIP

The IP address of destination.

startTime

Conveys time at which request processing started.

endTime

Conveys time at which request processing end.

requestContentLength

The content length of request.

requestYields

The number of times yielded during request processing to send heart beat packets.

requestMaxProcessingTime

The maximum processing time across yields during request processing.

responseContentLength

The content length of response.

responseYields

The number of times yielded during response processing to send heart beat packets.

responseMaxProcessingTime

The maximum processing time across yields during response processing.

flag

Record flags.

devno

count

stateflag

appfw wsdl

Sep 22, 2015

The following operations can be performed on "appfw wsdl":

rm | show | import

Removes the specified imported WSDL file from the application firewall.

rm appfw wsdl <name>

name

Name of the WSDL file to remove.

rm wsdl <name>

Removes the specified imported WSDL file.

show appfw wsdl [<name>]

name

Name of the WSDL file to display.

response

show appfw wsdl

Imports the specified WSDL file to the application firewall.

import appfw wsdl <src> <name> [-comment <string>] [-overwrite]

src

URL (protocol, host, path, and name) of the WSDL file to be imported is stored.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

name

Name to assign to the WSDL on the NetScaler appliance.

comment

Any comments to preserve information about the WSDL.

overwrite

Overwrite any existing WSDL of the same name.

import appfw wsdl http://www.webservicex.net/stockquote.asmx?wsdl stockquote

appfw xmlerrorpage

Sep 22, 2015

The following operations can be performed on "appfw xmlerrorpage":

rm | show | import | update

Removes the object imported by import xmlerrorpage.

rm appfw xmlerrorpage <name>

name

Indicates name of the imported xml error page to be removed.

rm xmlerrorpage <name>

Displays the specified XML error object. If no XML error page object is specified, displays a list of all XML error objects on the NetScaler appliance.

show appfw xmlerrorpage [<name>]

name

Name of the XML error object.

response

show appfw xmlerrorpage

Imports the specified XML error page to the NetScaler appliance and assigns it the specified name.

import appfw xmlerrorpage <src> <name> [-comment <string>] [-overwrite]

src

URL (protocol, host, path, and name) for the location at which to store the imported XML error object.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

name

Name to assign to the XML error object on the NetScaler appliance.

comment

Any comments to preserve information about the XML error object.

overwrite

Overwrite any existing XML error object of the same name.

import xmlerrorpage http://www.example.com/errorpage.xml my-xml-error-page

---

Updates the specified XML error object from the source.

update appfw xmlerrorpage <name>

name

Name of the XML error object.

update xmlerrorpage my-xml-error-page

---

appfw xmlschema

Sep 22, 2015

The following operations can be performed on "appfw xmlschema":

rm | show | import

Removes the specified XML Schema object from the application firewall.

rm appfw xmlschema <name>

name

Name of the XML Schema object to remove.

rm xmlschema <name>

Displays the specified XML Schema object. If no object is specified, displays all XML Schema objects on the NetScaler appliance.

show appfw xmlschema [<name>]

name

Name of the XML Schema object to display.

response

show appfw xmlschema

Imports the specified XML Schema to the NetScaler appliance and assigns it the specified name.

import appfw xmlschema <src> <name> [-comment <string>] [-overwrite]

src

URL (protocol, host, path, and file name) for the location at which to store the imported XML Schema.

NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access.

name

Name to assign to the XML Schema object on the NetScaler appliance.

comment

Any comments to preserve information about the XML Schema object.

overwrite

Overwrite any existing XML Schema object of the same name.

import xmlschema http://schemas.xmlsoap.org/soap/envelope/ soap

AppQoE Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- appqoe
- appqoe CustomResp
- appqoe action
- appqoe parameter
- appqoe policy
- appqoe stats

appqoe

Sep 22, 2015

The following operations can be performed on "appqoe":

Displays statistics of feature AppQoE.

stat appqoe [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

clearstats

Clear the statsistics / counters

Possible values: basic, full

In-Memory responses sent (TotInMemRsp)

Total in-memory responses sent from NS

Faulty cookies received (TotFaultyCookies)

Total faulty cookies received

Valid cookies received (TotValidCookies)

Total valid cookies received

High priority requests served (TotHighPriReq)

Total Requests served from higher priority queue

Medium priority requests served (TotMediumPriReq)

Total Requests served from medium priority queue

Low priority requests served (TotLowPriReq)

Total Requests served from low priority queue

Lowest(Surge) priority requests served (TotLowestPriReq)

Total Requests served from surge priority queue

Alt. server substitution failed (TotAltSvrSubFailed)

Total number of times alternate server substitution failed

HDOS condition triggered (TotDoSTrig)

Total number of times HDOS condition triggered

Valid DOSQ cookies received (TotDOSQValidCookies)

Total DOSQ valid cookies received

Valid DOSH cookies received (TotDOSHValidCookies)

Total DOSH valid cookies received

Valid SID cookies received (TotSIDValidCookies)

Total SID valid cookies received

Valid ONH cookies received (TotONHValidCookies)

Total ONH valid cookies received

Valid PRIQ cookies received (TotPRIQValidCookies)

Total PRIQ valid cookies received

Faulty DOSQ cookies received (TotDOSQFaultyCookies)

Total DOSQ faulty cookies received

Faulty DOSH cookies received (TotDOSHFaultyCookies)

Total DOSH faulty cookies received

Faulty SID cookies received (TotSIDFaultyCookies)

Total SID faulty cookies received

Faulty ONH cookies received (TotONHFaultyCookies)

Total ONH faulty cookies received

Faulty PRIQ cookies received (TotPRIQFaultyCookies)

Total PRIQ faulty cookies received

Requests for valid embedded links (TotPRIEmbedLinks)

Total requests for valid embedded links

Valid SIDQ req. within session (TotSessReq)

Total valid SIDQ requests within session

Requests for alternate contents (TotAltCntReq)

Total requests for alternate contents

In-Memory GET responses sent (TotGETInMemRsp)

Total in-memory GET responses sent from NS

In-Memory POST responses sent (TotPOSTInMemRsp)

Total in-memory POST responses sent from NS

In-Memory response bytes sent (TotInMemRspbytes)

Total in-memory response bytes sent from NS

appqoe CustomResp

Sep 22, 2015

The following operations can be performed on "appqoe CustomResp":

import | rm | show | update

Downloads the input HTML Page to NetScaler Box with the given object name

import appqoe CustomResp [<src>] <name>

src

name

Indicates name of the custom response HTML page to import/update.

import appqoe CustomResp http://10.102.34.25/index.html appqoe_resp

---

Removes the imported HTML object.

rm appqoe CustomResp <name>

name

Indicates name of the custom response HTML page to import/update.

rm appqoe CustomResp appqoe_resp

Displays lists all HTML page objects on the NetScaler appliance.

show appqoe CustomResp

summary

fullValues

name

Indicates name of the custom response HTML page to import/update.

src

devno

count

stateflag

update appqoe CustomResp <name>

name

Indicates name of the custom response HTML page to import/update.

update appqoe CustomResp appqoe_resp

---

appqoe action

Sep 22, 2015

The following operations can be performed on "appqoe action":

add | rm | set | unset | show

Add a new AppQoE action for triggering

add appqoe action <name> [-priority <priority>] [-respondWith (ACS | NS) [<CustomFile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>]] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction (SimpleResponse | HICResponse)]

name

Name for the AppQoE action. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters. This is a mandatory argument

priority

Priority for queuing the request. If server resources are not available for a request that matches the configured rule, this option specifies a priority for queuing the request until the server resources are available again. If priority is not configured then Lowest priority will be used to queue the request.

Possible values: HIGH, MEDIUM, LOW, LOWEST

respondWith

Responder action to be taken when the threshold is reached. Available settings function as follows:

ACS - Serve content from an alternative content service

Threshold : maxConn or delay

NS - Serve from the NetScaler appliance (built-in response)

Threshold : maxConn or delay

Possible values: ACS, NS

CustomFile

name of the HTML page object to use as the response

altContentSvcName

Name of the alternative content service to be used in the ACS

altContentPath

Path to the alternative content service to be used in the ACS

polqDepth

Policy queue depth threshold value. When the policy queue size (number of requests queued for the policy binding this action is attached to) increases to the specified polqDepth value, subsequent requests are dropped to the lowest priority level.

Maximum value: 4294967294

priqDepth

Queue depth threshold value per priorirty level. If the queue size (number of requests in the queue of that particular priorirty) on the virtual server to which this policy is bound, increases to the specified qDepth value, subsequent requests are dropped to the lowest priority level.

Maximum value: 4294967294

maxConn

Maximum number of concurrent connections that can be open for requests that matches with rule.

Minimum value: 1

Maximum value: 4294967294

delay

Delay threshold, in microseconds, for requests that match the policy's rule. If the delay statistics gathered for the matching request exceed the specified delay, configured action triggered for that request, if there is no action then requests are dropped to the lowest priority level

Minimum value: 1

Maximum value: 599999999

dosTrigExpression

Optional expression to add second level check to trigger DoS actions. Specifically used for Analytics based DoS response generation

dosAction

DoS Action to take when vserver will be considered under DoS attack and corresponding rule matches. Mandatory if AppQoE actions are to be used for DoS attack prevention.

Possible values: SimpleResponse, HICResponse

Removes the specified AppQoE action.

rm appqoe action <name>

name

Name of the action to be removed.

Set the argument of specified AppQoE action.

set appqoe action <name> [-priority <priority>] [-altContentSvcName <string>] [-altContentPath <string>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-maxConn <positive_integer>] [-delay <usecs>] [-dosTrigExpression <expression>] [-dosAction (SimpleResponse | HICResponse)]

name

Name for the AppQoE action. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters. This is a mandatory argument

priority

Priority for queuing the request. If server resources are not available for a request that matches the configured rule, this option specifies a priority for queuing the request until the server resources are available again. If priority is not configured then Lowest priority will be used to queue the request.

Possible values: HIGH, MEDIUM, LOW, LOWEST

altContentSvcName

Name of the alternative content service to be used in the ACS

altContentPath

Path to the alternative content service to be used in the ACS

polqDepth

Policy queue depth threshold value. When the policy queue size (number of requests queued for the policy binding this action is attached to) increases to the specified polqDepth value, subsequent requests are dropped to the lowest priority level.

Maximum value: 4294967294

priqDepth

Queue depth threshold value per priorirty level. If the queue size (number of requests in the queue of that particular priorirty) on the virtual server to which this policy is bound, increases to the specified qDepth value, subsequent requests are dropped to the lowest priority level.

Maximum value: 4294967294

maxConn

Maximum number of concurrent connections that can be open for requests that matches with rule.

Minimum value: 1

Maximum value: 4294967294

delay

Delay threshold, in microseconds, for requests that match the policy's rule. If the delay statistics gathered for the matching request exceed the specified delay, configured action triggered for that request, if there is no action then requests are dropped to the lowest priority level

Minimum value: 1

Maximum value: 599999999

dosTrigExpression

Optional expression to add second level check to trigger DoS actions. Specifically used for Analytics based DoS response generation

dosAction

DoS Action to take when vserver will be considered under DoS attack and corresponding rule matches. Mandatory if AppQoE actions are to be used for DoS attack prevention.

Possible values: SimpleResponse, HICResponse

Use this command to remove appqoe action settings.Refer to the set appqoe action command for meanings of the arguments.

unset appqoe action <name> [-priority] [-altContentSvcName] [-altContentPath] [-polqDepth] [-priqDepth] [-maxConn] [-delay] [-dosAction]

Display configured AppQoE action(s).

show appqoe action [<name>]

name

Name for the AppQoE action. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters. This is a mandatory argument

appqoe parameter

Sep 22, 2015

The following operations can be performed on "appqoe parameter":

set | unset | show

Sets the parameters for displaying appqoe information.

set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]

sessionLife

Time, in seconds, between the first time and the next time the AppQoE alternative content window is displayed. The alternative content window is displayed only once during a session for the same browser accessing a configured URL, so this parameter determines the length of a session.

Default value: 300

Minimum value: 1

Maximum value: 4294967294

avgwaitingclient

average number of client connections, that can sit in service waiting queue

Default value: 1000000

Maximum value: 4294967294

MaxAltRespBandWidth

maximum bandwidth which will determine whether to send alternate content response

Default value: 100

Minimum value: 1

Maximum value: 4294967294

dosAttackThresh

average number of client connection that can queue up on vserver level without triggering DoS mitigation module

Default value: 2000

Maximum value: 4294967294

set appqoe parameter -sessionlife 200 -avgwaitingclient 10

Use this command to remove appqoe parameter settings.Refer to the set appqoe parameter command for meanings of the arguments.

unset appqoe parameter [-sessionLife] [-avgwaitingclient] [-MaxAltRespBandWidth] [-dosAttackThresh]

Displays the values of the session life and filename parameters

show appqoe parameter

format

level

sessionLife

appqoe session life (in seconds)

avgwaitingclient

average number of client connections, that can sit in service waiting queue

MaxAltRespBandWidth

maximum bandwidth which will determine whether to send alternate content response

dosAttackThresh

average number of client connection that can queue up on vserver level without triggering DoS mitigation module

show appqos parameter

appqoe policy

Sep 22, 2015

The following operations can be performed on "appqoe policy":

add | rm | set | show | stat

Add a new AppQoE policy for binding rule with action

add appqoe policy <name> -rule <expression> -action <string>

name

rule

Expression or name of a named expression, against which the request is evaluated. The policy is applied if the rule evaluates to true.

action

Configured AppQoE action to trigger

Remove an AppQoE policy.

rm appqoe policy <name>

name

Name of the AppQoE policy to be removed.

---

set appqoe policy <name> [-rule <expression>] [-action <string>]

name

rule

Expression or name of a named expression, against which the request is evaluated. The policy is applied if the rule evaluates to true.

action

Configured AppQoE action to trigger

Display all the configured AppQoE policies.

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

Server TTFB (SvrTTFB)

Server Time-To-First-Byte in milliseconds calculated for this AppQoE policy.

Server TTLB (SvrTTLB)

Server Time-To-Last-Byte in milliseconds

calculated for this AppQoE policy.

Client TTLB (CltTTLB)

Client Time-To-Last-Byte in milliseconds calculated for this AppQoE policy.

Avg. Server TTFB (SvrTTFB)

Average Server Time-To-First-Byte in milliseconds calculated for this AppQoE policy.

Avg. Server TTLB (SvrTTLB)

Average Server Time-To-Last-Byte in milliseconds calculated for this AppQoE policy.

Avg. Client TTLB (CltTTLB)

Average Client Time-To-Last-Byte in milliseconds calculated for this AppQoE policy.

ThroughPut(KBps) (ThroughPut)

Throughput in KBps calculated on this AppQoE policy

Server TCP connections (TotSvr)

Total number of server connections that were established through this AppQoE Policy

Client TCP connections requested (TotClt)

Total number of client connections that were requested through this AppQoE Policy

Requests received (TotReq)

Total number of requests that were requested through this AppQoE policy

Requests bytes received (TotReqBytes)

Total number of requests bytes that were requested through this AppQoE

policy

Responses received (TotRsp)

Total number of responses received by this AppQoE policy

Response bytes received (TotRspBytes)

Total number of response bytes received by this AppQoE policy

Alternate responses sent (TotJSsent)

Total number of in-memory responses sent instead of expected responses through this AppQoE policy

Alternate responses bytes sent (TotJSBytessent)

Total bytes of in-memory responses sent through this AppQoE policy

Policy hits (Hits)

Number of hits on the policy

Client HTTP transactions

Total number of client transactions processed by this AppQoE policy.

Svr HTTP transactions

Total number of server transactions processed by this AppQoE policy.

stat appqos policy

appqoe stats

Sep 22, 2015

The following operations can be performed on "appqoe stats":

show appqoe stats is an alias for stat appqoe Displays global AppQoE statistics.

show appqoe stats - alias for 'stat appqoe'

Audit Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- audit
- audit messageaction
- audit messages
- audit nslogAction
- audit nslogParams
- audit nslogPolicy
- audit stats
- audit syslogAction
- audit syslogParams
- audit syslogPolicy

audit

Sep 22, 2015

The following operations can be performed on "audit":

Display the audit statistics

stat audit [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

clearstats

Clear the statsistics / counters

Possible values: basic, full

Audit logs sent to syslog server(s) (LogSnd)

Syslog messages sent to the syslog server(s).

Audit log messages generated (LogGen)

Syslog messages about to be sent to the syslog server.

NAT allocation failed (Ernatpcb)

NAT allocation failed.

Nsb allocation failed (Ernsb)

Nsb allocation failed.

Memory allocation failed (Ermem)

Failures in allocation of Access Gateway context structure. When an Access Gateway session is established, the NetScaler creates an internal context structure , which identifies the user and the IP address from which the user has logged in.

Port allocation failed (Erport)

Number of times the NetScaler failed to allocate a port when sending a syslog message to the syslog server(s).

NAT lookup failed (Hshmiss)

NAT lookup failed.

Context not found (Ctxntfnd)

Failures in finding the context structure for an Access Gateway session during attempts to send session-specific audit messages.

During an Access Gateway session, audit messages related to the session are queued up in the auditlog buffer for transmission to the audit log server(s). If the session is killed before the messages are sent, the context structure allocated at session creation is removed. This structure is needed for sending the queued auditlog messages. If it is not found, this counter is incremented.

Nsb chain allocation failed (Ernsbchn)

Nsb Chain allocation failed.

Client connect failed (Erclconn)

Failures in establishment of a connection between the NetScaler and the auditserver tool (the Netscaler's custom logging tool).

MP buffer flush command count (flcmdcnt)

Auditlog buffer flushes. In a multiprocessor NetScaler, both the main processor and the co-processor can generate auditlog messages and fill up the auditlog buffers. But only the primary processor can free up the buffers by sending auditlog messages to the auditlog server(s). The number of auditlog buffers is fixed. If the co-processor detects that all the auditlog buffers are full, it issues a flush command to the main processor.

audit messageaction

Sep 22, 2015

The following operations can be performed on "audit messageaction":

add | rm | set | unset | show

Adds an audit message action. The action specifies whether to log the message, and to which log.

add audit messageaction <name> <logLevel> <stringBuilderExpr> [-logtoNewnslog (YES | NO)] [-bypassSafetyCheck (YES | NO)]

name

Name of the audit message action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the message action is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my message action? or ?my message action?).

logLevel

Audit log level, which specifies the severity level of the log message being generated..

The following loglevels are valid:

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

Possible values: EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG

stringBuilderExpr

Default-syntax expression that defines the format and content of the log message.

logtoNewnslog

Send the message to the new nslog.

Possible values: YES, NO

bypassSafetyCheck

Bypass the safety check and allow unsafe expressions.

Possible values: YES, NO

Default value: NO

Removes the specified audit message action and associated configuration.

rm audit messageaction <name>

name

Name of the audit message action to remove.

Modifies the specified parameters of an existing audit message action.

set audit messageaction <name> [-logLevel <logLevel>] [-stringBuilderExpr <string>] [-logtoNewnslog (YES | NO)] [-bypassSafetyCheck (YES | NO)]

name

Name of the audit message action to modify.

logLevel

Audit log level, which specifies the severity level of the log message being generated.

The following loglevels are valid:

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

Possible values: EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG

stringBuilderExpr

Default-syntax expression that defines the format and content of the log message.

logtoNewnslog

Send the message to the new nslog.

Possible values: YES, NO

bypassSafetyCheck

Bypass the safety check and allow unsafe expressions.

Possible values: YES, NO

Default value: NO

Use this command to remove audit messageaction settings.Refer to the set audit messageaction command for meanings of the arguments.

```
unset audit messageaction <name> [-logtoNewnslog] [-bypassSafetyCheck]
```

Displays the current configuration of the specified audit message action. If no audit message action is specified, displays a list of all audit message actions currently configured on the NetScaler appliance.

```
show audit messageaction [<name>]
```

name

Name of the audit message action.

summary

fullValues

format

level

logLevel

stringBuilderExpr

Default-syntax expression that defines the format and content of the log message.

logtoNewnslog

Send the message to the new nslog.

bypassSafetyCheck

Bypass the safety check and allow unsafe expressions.

stateflag

hits

The number of times the action has been taken.

undefHits

The number of times the action resulted in UNDEF.

referenceCount

The number of references to the action.

devno

count

audit messages

Sep 22, 2015

The following operations can be performed on "audit messages":

Displays the most recent audit log messages.

show audit messages [-logLevel <logLevel> ...] [-numOfMesgs <positive_integer>]

logLevel

Audit log level filter, which specifies the types of events to display.

The following loglevels are valid:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

numOfMesgs

Number of log messages to be displayed.

Default value: 20

Minimum value: 1

Maximum value: 256

summary

stateflag

audit nslogAction

Sep 22, 2015

The following operations can be performed on "audit nslogAction":

add | rm | set | unset | show

Adds an nslog action. The action contains a reference to an nslog server and specifies which information to log and how to log that information.

add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-dateFormat <dateFormat>] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]

name

Name of the nslog action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the nslog action is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my nslog action? or ?my nslog action).

serverIP

IP address of the nslog server.

serverPort

Port on which the nslog server accepts connections.

Minimum value: 1

logLevel

Audit log level, which specifies the types of events to log.

Available settings function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY - U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

Possible values: MMDDYYYY, DDMMYYYY, YYYYMMDD

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

Possible values: LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7

tcp

Log TCP messages.

Possible values: NONE, ALL

acl

Log access control list (ACL) messages.

Possible values: ENABLED, DISABLED

timeZone

Time zone used for date and timestamps in the logs.

Available settings function as follows:

* GMT_TIME. Coordinated Universal Time.

* LOCAL_TIME. The server?s timezone setting.

Possible values: GMT_TIME, LOCAL_TIME

userDefinedAuditlog

Log user-configurable log messages to nslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

Possible values: YES, NO

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

Possible values: ENABLED, DISABLED

Removes the specified nslog action and associated configuration. Note: An nslog action cannot be removed if it is bound to an nslog policy.

rm audit nslogAction <name>

name

Name of the nslog action to remove.

Modifies the specified settings of an existing nslog action.

set audit nslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-logLevel <logLevel> ...] [-dateFormat <dateFormat>] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]

name

Name of the nslog action to be modified.

serverIP

IP address of the nslog server.

serverPort

Port on which the nslog server accepts connections.

Minimum value: 1

logLevel

Audit log level, which specifies the types of events to log.

Available settings function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY - U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

Possible values: MMDDYYYY, DDMMYYYY, YYYYMMDD

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

Possible values: LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7

tcp

Log TCP messages.

Possible values: NONE, ALL

acl

Log access control list (ACL) messages.

Possible values: ENABLED, DISABLED

timeZone

Time zone used for date and timestamps in the logs.

Available settings function as follows:

* GMT_TIME. Coordinated Universal Time.

* LOCAL_TIME. The server?s timezone setting.

Possible values: GMT_TIME, LOCAL_TIME

userDefinedAuditlog

Log user-configurable log messages to nslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

Possible values: YES, NO

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

Possible values: ENABLED, DISABLED

Removes the settings of an existing nslog action. Attributes for which a default value is available revert to their default values. See the set audit nslogAction command for descriptions of the parameters..Refer to the set audit nslogAction command for meanings of the arguments.

unset audit nslogAction <name> [-serverPort] [-logLevel] [-dateFormat] [-logFacility] [-tcp] [-acl] [-timeZone] [-userDefinedAuditlog] [-appflowExport]

Displays the current configuration of the specified nslog action. If no nslog action is specified, displays a list of all nslog actions currently configured on the NetScaler appliance.

show audit nslogAction [<name>]

name

Name of the nslog action.

summary

fullValues

format

level

serverIP

IP address of the nslog server.

serverPort

Port on which the nslog server accepts connections.

logLevel

Audit log level, which specifies the types of events to log.

Available settings function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

tcp

Log TCP messages.

acl

Log access control list (ACL) messages.

timeZone

Time zone used for date and timestamps in the logs.

Available settings function as follows:

* GMT_TIME. Coordinated Universal Time.

* LOCAL_TIME. The server?s timezone setting.

stateflag

userDefinedAuditlog

Log user-configurable log messages to nslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

devno

count

audit nslogParams

Sep 22, 2015

The following operations can be performed on "audit nslogParams":

set | unset | show

Modifies the specified nslog parameters. Changes the IP address, the port, or the logging parameters for logs sent to nslog.

set audit nslogParams [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-dateFormat <dateFormat>] [-logLevel <logLevel> ...] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]

serverIP

IP address of the nslog server.

serverPort

Port on which the nslog server accepts connections.

Minimum value: 1

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY - U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

Possible values: MMDDYYYY, DDMMYYYY, YYYYMMDD

logLevel

Types of information to be logged.

Available settings function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

Possible values: LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7

tcp

Configure auditing to log TCP messages.

Possible values: NONE, ALL

acl

Configure auditing to log access control list (ACL) messages.

Possible values: ENABLED, DISABLED

timeZone

Time zone used for date and timestamps in the logs.

Supported settings are:

* GMT_TIME - Coordinated Universal Time.

* LOCAL_TIME - Use the server?s timezone setting.

Possible values: GMT_TIME, LOCAL_TIME

userDefinedAuditlog

Log user-configurable log messages to nslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

Possible values: YES, NO

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

Possible values: ENABLED, DISABLED

Removes the existing nslog parameter settings. Attributes for which a default value is available revert to their default values. See the set audit nslogParams command for a description of the parameters..Refer to the set audit nslogParams command for meanings of the arguments.

unset audit nslogParams [-serverIP] [-serverPort] [-logLevel] [-dateFormat] [-logFacility] [-tcp] [-acl] [-timeZone] [-userDefinedAuditlog] [-appflowExport]

Displays the current nslog parameter settings.

show audit nslogParams

format

level

name

Name of the nslog param.NOTE: This attribute is deprecated.This argument is deprecated since for syslog and nslogparms there is no name.

serverIP

IP address of the nslog server.

serverPort

Port on which the nslog server accepts connections.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY - U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

logLevel

The audit log level.

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

tcp

Configure auditing to log TCP messages.

acl

Configure auditing to log access control list (ACL) messages.

timeZone

Time zone used for date and timestamps in the logs.

Supported settings are:

* GMT_TIME - Coordinated Universal Time.

* LOCAL_TIME - Use the server?s timezone setting.

userDefinedAuditlog

Log user-configurable log messages to nslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

audit nslogPolicy

Sep 22, 2015

The following operations can be performed on "audit nslogPolicy":

add | rm | set | show

Adds a policy that defines which messages to log to the specified nslog server.

add audit nslogPolicy <name> <rule> <action>

name

Name for the policy.

Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the nslog policy is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my nslog policy? or ?my nslog policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that defines the messages to be logged to the nslog server.

action

Nslog server action that is performed when this policy matches.

NOTE: An nslog server action must be associated with an nslog audit policy.

Removes the specified nslog policy and associated configuration.

rm audit nslogPolicy <name>

name

Name of the nslog policy to remove.

Modifies the specified parametrers of an existing nslog policy.

set audit nslogPolicy <name> [-rule <expression>] [-action <string>]

name

Name of the nslog policy to modify.

rule

Name of the NetScaler named rule, or a default syntax expression, that defines the messages to be logged to the nslog server.

action

Nslog server action that is performed when this policy matches.

NOTE: An nslog server action must be associated with an nslog audit policy.

Displays the current configuration of the specified nslog policy. If no nslog policy is specified, displays a list of all nslog policies currently configured on the NetScaler appliance.

show audit nslogPolicy [<name>]

name

Name of the policy.

summary

fullValues

format

level

rule

Name of the NetScaler named rule, or a default syntax expression, that defines the messages to be logged to the nslog server.

action

Nslog server action that is performed when this policy matches.

NOTE: An nslog server action must be associated with an nslog audit policy.

boundTo

The entity name to which policy is bound

activePolicy

priority

bindPolicyType

policyType

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

devno

count

stateflag

audit stats

Sep 22, 2015

The following operations can be performed on "audit stats":

show audit stats

show audit stats is an alias for stat audit

Synopsys

show audit stats - alias for 'stat audit'

audit syslogAction

Sep 22, 2015

The following operations can be performed on "audit syslogAction":

add | rm | set | unset | show

add audit syslogAction

Adds a syslog action. The action contains a reference to a syslog server, and specifies which information to log and how to log that information.

Synopsys

add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-dateFormat <dateFormat>] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]

Arguments

name

Name of the syslog action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the syslog action is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my syslog action? or ?my syslog action).

serverIP

IP address of the syslog server.

serverPort

Port on which the syslog server accepts connections.

Minimum value: 1

logLevel

Audit log level, which specifies the types of events to log.

Available values function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY. -U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

Possible values: MMDDYYYY, DDMMYYYY, YYYYMMDD

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

Possible values: LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7

tcp

Log TCP messages.

Possible values: NONE, ALL

acl

Log access control list (ACL) messages.

Possible values: ENABLED, DISABLED

timeZone

Time zone used for date and timestamps in the logs.

Supported settings are:

* GMT_TIME. Coordinated Universal time.

* LOCAL_TIME. Use the server?s timezone setting.

Possible values: GMT_TIME, LOCAL_TIME

userDefinedAuditlog

Log user-configurable log messages to syslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

Possible values: YES, NO

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

Possible values: ENABLED, DISABLED

---

rm audit syslogAction

Removes the specified syslog action and associated configuration. Note: A syslog action cannot be removed if it is bound to a syslog policy.

Synopsys

rm audit syslogAction <name>

Arguments

name

Name of the syslog action to remove.

---

set audit syslogAction

Modifies the specified parameters of an existing syslog action.

Synopsys

set audit syslogAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-logLevel <logLevel> ...] [-dateFormat <dateFormat>] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]

Arguments

name

Name of the syslog action to be modified.

serverIP

IP address of the syslog server.

serverPort

Port on which the syslog server accepts connections.

Minimum value: 1

logLevel

Audit log level, which specifies the types of events to log.

Available values function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY. -U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

Possible values: MMDDYYYY, DDMMYYYY, YYYYMMDD

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

Possible values: LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7

tcp

Log TCP messages.

Possible values: NONE, ALL

acl

Log access control list (ACL) messages.

Possible values: ENABLED, DISABLED

timeZone

Time zone used for date and timestamps in the logs.

Supported settings are:

* GMT_TIME. Coordinated Universal time.

* LOCAL_TIME. Use the server?s timezone setting.

Possible values: GMT_TIME, LOCAL_TIME

userDefinedAuditlog

Log user-configurable log messages to syslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

Possible values: YES, NO

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

Possible values: ENABLED, DISABLED

---

unset audit syslogAction

Removes the settings of an existing syslog action. Attributes for which a default value is available revert to their default values. See the set audit syslogAction command for a description of the parameters..Refer to the set audit syslogAction command for meanings of the arguments.

Synopsys

unset audit syslogAction <name> [-serverPort] [-logLevel] [-dateFormat] [-logFacility] [-tcp] [-acl] [-timeZone] [-userDefinedAuditlog] [-appflowExport] [-serverIP]

show audit syslogAction

Displays the current configuration of the specified syslog action. If no syslog action is specified, displays a list of all syslog actions currently configured on the NetScaler appliance.

Synopsys

show audit syslogAction [<name>]

Arguments

name

Name of the syslog action.

summary

fullValues

format

level

Outputs

serverIP

IP address of the syslog server.

serverPort

Port on which the syslog server accepts connections.

logLevel

Audit log level, which specifies the types of events to log.

Available values function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY. -U.S. style month/date/year format.

* DDMMYYYY - European style date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

tcp

Log TCP messages.

acl

Log access control list (ACL) messages.

timeZone

Time zone used for date and timestamps in the logs.

Supported settings are:

* GMT_TIME. Coordinated Universal time.

* LOCAL_TIME. Use the server?s timezone setting.

stateflag

userDefinedAuditlog

Log user-configurable log messages to syslog.

Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

appflowExport

Disable export of log messages to AppFlow collectors.

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

devno

count

audit syslogParams

Sep 22, 2015

The following operations can be performed on "audit syslogParams":

set | unset | show

set audit syslogParams

Modifies the syslog parameters. Changes the IP, the port, or the logging parameters for logs sent to syslog.

Synopsys

set audit syslogParams [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-dateFormat <dateFormat>] [-logLevel <logLevel> ...] [-logFacility <logFacility>] [-tcp (NONE | ALL)] [-acl (ENABLED | DISABLED)] [-timeZone (GMT_TIME | LOCAL_TIME)] [-userDefinedAuditlog (YES | NO)] [-appflowExport (ENABLED | DISABLED)]

Arguments

serverIP

IP address of the syslog server.

serverPort

Port on which the syslog server accepts connections.

Minimum value: 1

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY - U.S. style month/date/year format.

* DDMMYYYY. European style -date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

Possible values: MMDDYYYY, DDMMYYYY, YYYYMMDD

logLevel

Types of information to be logged.

Available settings function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

Possible values: LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7

tcp

Log TCP messages.

Possible values: NONE, ALL

acl

Log access control list (ACL) messages.

Possible values: ENABLED, DISABLED

timeZone

Time zone used for date and timestamps in the logs.

Available settings function as follows:

* GMT_TIME - Coordinated Universal Time.

* LOCAL_TIME Use the server?s timezone setting.

Possible values: GMT_TIME, LOCAL_TIME

userDefinedAuditlog

Log user-configurable log messages to syslog.

Setting this parameter to NO causes audit to ignore all user-configured message actions. Setting this parameter to YES causes audit to log user-configured message actions that meet the other logging criteria.

Possible values: YES, NO

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

Possible values: ENABLED, DISABLED

---

unset audit syslogParams

Removes the existing syslog parameter settings. Attributes for which a default value is available revert to their default values. See the set audit syslogParams command for descriptions of the parameters..Refer to the set audit syslogParams command for meanings of the arguments.

Synopsys

unset audit syslogParams [-serverIP] [-serverPort] [-logLevel] [-dateFormat] [-logFacility] [-tcp] [-acl] [-timeZone] [-userDefinedAuditlog] [-appflowExport]

---

show audit syslogParams

Displays the current syslog parameter settings.

Synopsys

show audit syslogParams

Arguments

format

level

Outputs

name

Name.NOTE: This attribute is deprecated.This argument is deprecated since for syslog and nslogparms there is no name.

serverIP

IP address of the syslog server.

serverPort

Port on which the syslog server accepts connections.

dateFormat

Format of dates in the logs.

Supported formats are:

* MMDDYYYY - U.S. style month/date/year format.

* DDMMYYYY. European style -date/month/year format.

* YYYYMMDD - ISO style year/month/date format.

logLevel

Types of information to be logged.

Available settings function as follows:

* ALL - All events.

* EMERGENCY - Events that indicate an immediate crisis on the server.

* ALERT - Events that might require action.

* CRITICAL - Events that indicate an imminent server crisis.

* ERROR - Events that indicate some type of error.

* WARNING - Events that require action in the near future.

* NOTICE - Events that the administrator should know about.

* INFORMATIONAL - All but low-level events.

* DEBUG - All events, in extreme detail.

* NONE - No events.

logFacility

Facility value, as defined in RFC 3164, assigned to the log message.

Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the NetScaler appliance itself, the VPN, or external.

tcp

Log TCP messages.

acl

Log access control list (ACL) messages.

timeZone

Time zone used for date and timestamps in the logs.

Available settings function as follows:

* GMT_TIME - Coordinated Universal Time.

* LOCAL_TIME Use the server?s timezone setting.

userDefinedAuditlog

Log user-configurable log messages to syslog.

Setting this parameter to NO causes audit to ignore all user-configured message actions. Setting this parameter to YES causes audit to log user-configured message actions that meet the other logging criteria.

appflowExport

Export log messages to AppFlow collectors.

Appflow collectors are entities to which log messages can be sent so that some action can be performed on them.

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

audit syslogPolicy

Sep 22, 2015

The following operations can be performed on "audit syslogPolicy":

add | rm | set | show

add audit syslogPolicy

Adds a policy that defines which messages to log to the specified syslog server.

Synopsys

add audit syslogPolicy <name> <rule> <action>

Arguments

name

Name for the policy.

Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the syslog policy is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my syslog policy? or ?my syslog policy).

rule

Name of the NetScaler named rule, or a default syntax expression, that defines the messages to be logged to the syslog server.

action

Syslog server action to perform when this policy matches traffic.

NOTE: A syslog server action must be associated with a syslog audit policy.

---

rm audit syslogPolicy

Removes the specified syslog policy and associated configuration.

Synopsys

rm audit syslogPolicy <name>

Arguments

name

Name of the syslog policy to remove.

---

set audit syslogPolicy

Configures an existing syslog policy.

Synopsys

set audit syslogPolicy <name> [-rule <expression>] [-action <string>]

Arguments

name

Name of the syslog policy to be configured.

rule

Name of the NetScaler named rule, or a default syntax expression, that defines the messages to be logged to the syslog server.

action

Syslog server action to perform when this policy matches traffic.

NOTE: A syslog server action must be associated with a syslog audit policy.

---

show audit syslogPolicy

Displays the current configuration of the specified syslog policy. If no syslog policy is specified, displays a list of all syslog policies currently configured on the NetScaler appliance.

Synopsys

show audit syslogPolicy [<name>]

Arguments

name

Name of the policy.

summary

fullValues

format

level

Outputs

rule

Name of the NetScaler named rule, or a default syntax expression, that defines the messages to be logged to the syslog server.

action

Syslog server action to perform when this policy matches traffic.

NOTE: A syslog server action must be associated with a syslog audit policy.

boundTo

The entity name to which policy is bound

activePolicy

priority

bindPolicyType

policyType

builtin

Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

Authentication Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- authentication authnProfile
- authentication certAction
- authentication certPolicy
- authentication ldapAction
- authentication ldapPolicy
- authentication localPolicy
- authentication negotiateAction
- authentication negotiatePolicy
- authentication radiusAction
- authentication radiusPolicy
- authentication samlAction
- authentication samlPolicy
- authentication tacacsAction
- authentication tacacsPolicy
- authentication vserver

authentication authnProfile

Sep 22, 2015

The following operations can be performed on "authentication authnProfile":

add | rm | set | unset | show

add authentication authnProfile

Creates an authentication profile to hold all authentication related configuration for TM vserver.

Synopsys

add authentication authnProfile <name> {-authnVsName <string>} {-AuthenticationHost <string>} {-AuthenticationDomain <string>} [-AuthenticationLevel <positive_integer>]

Arguments

name

Name for the authentication profile.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the RADIUS action is added.

authnVsName

Name of the authentication vserver at which authentication should be done.

Maximum value: 128

AuthenticationHost

Hostname of the authentication vserver.

Maximum value: 256

AuthenticationDomain

Domain for which TM cookie must to be set. If unspecified, cookie will be set for FQDN.

Maximum value: 256

AuthenticationLevel

---

rm authentication authnProfile

Removes an authentication profile. A profile cannot be removed as long as it is set to a vserver.

Synopsys

rm authentication authnProfile <name>

Arguments

name

Name of the authentication profile to be removed.

---

set authentication authnProfile

Configures an authentication profile.

Synopsys

set authentication authnProfile <name> [-authnVsName <string>] [-AuthenticationHost <string>] [-AuthenticationDomain <string>] [-AuthenticationLevel <positive_integer>]

Arguments

name

Name of the authentication profile.

authnVsName

Name of the authentication vserver at which authentication should be done.

Maximum value: 128

AuthenticationHost

Hostname of the authentication vserver.

Maximum value: 256

AuthenticationDomain

Domain for which TM cookie must to be set. If unspecified, cookie will be set for FQDN.

Maximum value: 256

AuthenticationLevel

---

unset authentication authnProfile

Use this command to remove authentication authnProfile settings.Refer to the set authentication authnProfile command for meanings of the arguments.

Synopsys

unset authentication authnProfile <name> [-AuthenticationDomain] [-AuthenticationLevel]

show authentication authnProfile

Displays the current configuration for the authentication profile specified

Synopsys

show authentication authnProfile [<name>]

Arguments

name

Name of the authentication profile.

summary

fullValues

format

level

Outputs

authnVsName

Name of the authentication vserver at which authentication should be done.

AuthenticationHost

Hostname of the authentication vserver.

AuthenticationDomain

Domain for which TM cookie must to be set. If unspecified, cookie will be set for FQDN.

AuthenticationLevel

devno

count

stateflag

authentication certAction

Sep 22, 2015

The following operations can be performed on "authentication certAction":

add | rm | set | unset | show

add authentication certAction

Adds an action (profile) for a client certificate (cert) authentication server. The profile contains all configuration data necessary to communicate with that client cert authentication server.

Synopsys

add authentication certAction <name> [-twoFactor (ON | OFF)] [-userNameField <string>] [-groupNameField <string>] [-defaultAuthenticationGroup <string>]

Arguments

name

Name for the client cert authentication server profile (action).

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after certifcate action is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication action? or ?my authentication action?).

twoFactor

Enables or disables two-factor authentication.

Two factor authentication is client cert authentication followed by password authentication.

Possible values: ON, OFF

Default value: OFF

userNameField

Client-cert field from which the username is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks).

Format: <field>:<subfield>.

groupNameField

Client-cert field from which the group is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks).

Format: <field>:<subfield>

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

Example

```
add authentication certaction -twoFactor ON -userNameField "Subject:CN" -groupNameField "Subject:OU"
```

---

rm authentication certAction

Removes an existing client cert authentication server profile (action).

Synopsys

```
rm authentication certAction <name>
```

Arguments

name

Name of the profile to be removed.

---

set authentication certAction

Configures a client cert authentication server profile (action).

Synopsys

```
set authentication certAction <name> [-twoFactor ( ON | OFF )] [-userNameField <string>] [-groupNameField <string>] [-defaultAuthenticationGroup <string>]
```

Arguments

name

Name of the client cert server profile.

twoFactor

Enables or disables two-factor authentication.

Two factor authentication is client cert authentication followed by password authentication.

Possible values: ON, OFF

Default value: OFF

userNameField

Client-cert field from which the username is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks).

Format: <field>:<subfield>.

groupNameField

Client-cert field from which the group is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks).

Format: <field>:<subfield>

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

Example

```
set authentication certaction -twoFactor ON -userNameField "Subject:CN" -groupNameField "Subject:OU"
```

---

unset authentication certAction

Use this command to remove authentication certAction settings.Refer to the set authentication certAction command for meanings of the arguments.

Synopsys

```
unset authentication certAction <name> [-twoFactor] [-userNameField] [-groupNameField] [-defaultAuthenticationGroup]
```

---

show authentication certAction

Displays the current configuration settings for the specified client cert authentication server profile (action).

Synopsys

```
show authentication certAction [<name>]
```

Arguments

name

Name of the client cert server profile (action).

summary

fullValues

format

level

Outputs

twoFactor

The state of two factor authentication.

userNameField

The field in the certificate from which the username will be extracted.

groupNameField

The field in the certificate from which the group will be extracted.

authentication certPolicy

Sep 22, 2015

The following operations can be performed on "authentication certPolicy":

add | rm | set | unset | show

add authentication certPolicy

Adds a client certificate (cert) authentication policy. The policy defines the criteria under which the NetScaler appliance attempts to authenticate the user with the specified client cert authentication server.

Synopsys

add authentication certPolicy <name> <rule> [<reqAction>]

Arguments

name

Name for the client certificate authentication policy.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after cert authentication policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the authentication server.

reqAction

Name of the client cert authentication action to be performed if the policy matches.

---

rm authentication certPolicy

Removes a client cert authentication policy.

Synopsys

rm authentication certPolicy <name>

Arguments

name

Name of the client cert policy to remove.

---

set authentication certPolicy

Configures the specified client cert authentication policy.

Synopsys

set authentication certPolicy <name> [-rule <expression>] [-reqAction <string>]

Arguments

name

Name of the client cert policy.

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the authentication server.

reqAction

Name of the client cert authentication action to be performed if the policy matches.

---

unset authentication certPolicy

Use this command to remove authentication certPolicy settings.Refer to the set authentication certPolicy command for meanings of the arguments.

Synopsys

unset authentication certPolicy <name> [-rule] [-reqAction]

---

show authentication certPolicy

Displays the current settings for the specified client cert authentication policy. If no policy name is provided, displays a list of all client cert authentication policies currently configured on the NetScaler appliance.

Synopsys

show authentication certPolicy [<name>]

Arguments

name

Name of the client cert authentication policy.

summary

authentication ldapAction

Sep 22, 2015

The following operations can be performed on "authentication ldapAction":

add | rm | set | unset | show

add authentication ldapAction

Creates an action (profile) for an LDAP server. This profile contains all configuration data needed to communicate with that LDAP server.

Synopsys

add authentication ldapAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] [-ldapBase <string>] [-ldapBindDn <string>] {-ldapBindDnPassword } [-ldapLoginName <string>] [-searchFilter <string>] [-groupAttrName <string>] [-subAttributeName <string>] [-secType <secType>] [-svrType (AD | NDS)] [-ssoNameAttribute <string>] [-authentication (ENABLED | DISABLED)] [-requireUser (YES | NO)] [-passwdChange (ENABLED | DISABLED)] [-nestedGroupExtraction (ON | OFF) [-maxNestingLevel <positive_integer>] [-groupSearchSubAttribute <string>] [-groupSearchFilter <string>]] [-followReferrals (ON | OFF) [-maxLDAPReferrals <positive_integer>]] [-validateServerCert (YES | NO)] [-ldapHostname <string>] [-groupNameIdentifier <string>] [-groupSearchAttribute <string>] [-defaultAuthenticationGroup <string>]

Arguments

name

Name for the new LDAP action.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the LDAP action is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication action? or ?my authentication action?).

serverIP

IP address assigned to the LDAP server.

serverPort

Port on which the LDAP server accepts connections.

Default value: 389

Minimum value: 1

authTimeout

Number of seconds the NetScaler appliance waits for a response from the RADIUS server.

Default value: 3

Minimum value: 1

ldapBase

Base (node) from which to start LDAP searches.

If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.

ldapBindDn

Full distinguished name (DN) that is used to bind to the LDAP server.

Default: cn=Manager,dc=netscaler,dc=com

ldapBindDnPassword

Password used to bind to the LDAP server.

ldapLoginName

LDAP login name attribute.

The NetScaler appliance uses the LDAP login name to query external LDAP servers or Active Directories.

searchFilter

String to be combined with the default LDAP user search string to form the search value. For example, if the search filter ?"vpnallowed=true"? is combined with the LDAP login name ?"samaccount"? and the user-supplied username is ?"bob"?, the result is the LDAP search string ""(&(vpnallowed=true)(samaccount=bob)"" (Be sure to enclose the search string in two sets of double quotation marks; both sets are needed.).

groupAttrName

LDAP group attribute name.

Used for group extraction on the LDAP server.

subAttributeName

LDAP group sub-attribute name.

Used for group extraction from the LDAP server.

secType

Type of security used for communications between the NetScaler appliance and the LDAP server. For the PLAINTEXT setting, no encryption is required.

Possible values: PLAINTEXT, TLS, SSL

Default value: AAA_LDAP_PLAINTEXT

svrType

The type of LDAP server.

Possible values: AD, NDS

Default value: AAA_LDAP_SERVER_TYPE_DEFAULT

ssoNameAttribute

LDAP single signon (SSO) attribute.

The NetScaler appliance uses the SSO name attribute to query external LDAP servers or Active Directories for an alternate username.

authentication

Perform LDAP authentication.

If authentication is disabled, any LDAP authentication attempt returns authentication success if the user is found.

CAUTION! Authentication should be disabled only for authorization group extraction or where other (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary.

Possible values: ENABLED, DISABLED

Default value: ENABLED

requireUser

Require a successful user search for authentication.

Possible values: YES, NO

Default value: YES

passwdChange

Allow password change requests.

Possible values: ENABLED, DISABLED

Default value: DISABLED

nestedGroupExtraction

Allow nested group extraction, in which the NetScaler appliance queries external LDAP servers to determine whether a group is part of another group.

Possible values: ON, OFF

Default value: OFF

maxNestingLevel

If nested group extraction is ON, specifies the number of levels up to which group extraction is performed.

Default value: 2

Minimum value: 2

followReferrals

Setting this option to ON enables following LDAP referrals received from the LDAP server.

Possible values: ON, OFF

Default value: OFF

maxLDAPReferrals

Specifies the maximum number of nested referrals to follow.

Default value: 1

Minimum value: 1

validateServerCert

When to validate LDAP server certs

Possible values: YES, NO

Default value: NO

ldapHostname

Hostname for the LDAP server. If -validateServerCert is ON then this must be the host name on the certificate from the LDAP server.

A hostname mismatch will cause a connection failure.

groupNameIdentifier

Name that uniquely identifies a group in LDAP or Active Directory.

groupSearchAttribute

LDAP group search attribute.

Used to determine to which groups a group belongs.

groupSearchSubAttribute

LDAP group search subattribute.

Used to determine to which groups a group belongs.

groupSearchFilter

String to be combined with the default LDAP group search string to form the search value. For example, the group search filter ""vpnallowed=true"" when combined with the group identifier ""samaccount"" and the group name ""g1"" yields the LDAP search string ""(&(vpnallowed=true)(samaccount=g1)"". (Be sure to enclose the search string

in two sets of double quotation marks; both sets are needed.)

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

---

rm authentication ldapAction

Removes an LDAP profile (action). NOTE: An action cannot be removed if it is bound to a policy.

Synopsys

rm authentication ldapAction <name>

Arguments

name

Name of the LDAP profile (action) to be removed.

---

set authentication ldapAction

Modifies an LDAP server profile (action.) The profile contains all configuration data needed to communicate with that LDAP server.

Synopsys

set authentication ldapAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] [-ldapBase <string>] [-ldapBindDn <string>] {-ldapBindDnPassword } [-ldapLoginName <string>] [-searchFilter <string>] [-groupAttrName <string>] [-subAttributeName <string>] [-secType <secType>] [-svrType (AD | NDS)] [-ssoNameAttribute <string>] [-authentication (ENABLED | DISABLED)] [-requireUser (YES | NO)] [-passwdChange (ENABLED | DISABLED)] [-validateServerCert (YES | NO)] [-ldapHostname <string>] [-nestedGroupExtraction (ON | OFF)] [-maxNestingLevel <positive_integer>] [-groupNameIdentifier <string>] [-groupSearchAttribute <string> [-groupSearchSubAttribute <string>]] [-groupSearchFilter <string>] [-followReferrals (ON | OFF)] [-maxLDAPReferrals <positive_integer>] [-defaultAuthenticationGroup <string>]

Arguments

name

Name of the LDAP profile to modify.

serverIP

IP address assigned to the LDAP server.

serverPort

Port on which the LDAP server accepts connections.

Default value: 389

Minimum value: 1

authTimeout

Number of seconds the NetScaler appliance waits for a response from the RADIUS server.

Default value: 3

Minimum value: 1

ldapBase

Base (node) from which to start LDAP searches.

If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.

ldapBindDn

Full distinguished name (DN) that is used to bind to the LDAP server.

Default: cn=Manager,dc=netscaler,dc=com

ldapBindDnPassword

Password used to bind to the LDAP server.

ldapLoginName

LDAP login name attribute.

The NetScaler appliance uses the LDAP login name to query external LDAP servers or Active Directories.

searchFilter

String to be combined with the default LDAP user search string to form the search value. For example, if the search filter ?"vpnallowed=true"? is combined with the LDAP login name ?"samaccount"? and the user-supplied username is ?"bob"?, the result is the LDAP search string ""(&(vpnallowed=true)(samaccount=bob)"" (Be sure to enclose the search string in two sets of double quotation marks; both sets are needed.).

groupAttrName

LDAP group attribute name.

Used for group extraction on the LDAP server.

subAttributeName

LDAP group sub-attribute name.

Used for group extraction from the LDAP server.

secType

Type of security used for communications between the NetScaler appliance and the LDAP server. For the PLAINTEXT setting, no encryption is required.

Possible values: PLAINTEXT, TLS, SSL

Default value: AAA_LDAP_PLAINTEXT

svrType

The type of LDAP server.

Possible values: AD, NDS

Default value: AAA_LDAP_SERVER_TYPE_DEFAULT

ssoNameAttribute

LDAP single signon (SSO) attribute.

The NetScaler appliance uses the SSO name attribute to query external LDAP servers or Active Directories for an alternate username.

authentication

Perform LDAP authentication.

If authentication is disabled, any LDAP authentication attempt returns authentication success if the user is found.

CAUTION! Authentication should be disabled only for authorization group extraction or where other (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary.

Possible values: ENABLED, DISABLED

Default value: ENABLED

requireUser

Require a successful user search for authentication.

Possible values: YES, NO

Default value: YES

passwdChange

Allow password change requests.

Possible values: ENABLED, DISABLED

Default value: DISABLED

validateServerCert

When to validate LDAP server certs

Possible values: YES, NO

Default value: NO

ldapHostname

Hostname for the LDAP server. If -validateServerCert is ON then this must be the host name on the certificate from the LDAP server.

A hostname mismatch will cause a connection failure.

nestedGroupExtraction

Allow nested group extraction, in which the NetScaler appliance queries external LDAP servers to determine whether a group is part of another group.

Possible values: ON, OFF

Default value: OFF

followReferrals

Setting this option to ON enables following LDAP referrals received from the LDAP server.

Possible values: ON, OFF

Default value: OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

---

unset authentication ldapAction

Use this command to remove authentication ldapAction settings.Refer to the set authentication ldapAction command for meanings of the arguments.

Synopsys

unset authentication ldapAction <name> [-serverIP] [-serverPort] [-authTimeout] [-ldapBase] [-ldapBindDn] [-ldapBindDnPassword] [-ldapLoginName] [-searchFilter] [-groupAttrName] [-subAttributeName] [-secType] [-svrType] [-ssoNameAttribute] [-authentication] [-requireUser] [-passwdChange] [-validateServerCert] [-ldapHostname] [-nestedGroupExtraction] [-maxNestingLevel] [-groupNameIdentifier] [-groupSearchAttribute] [-groupSearchSubAttribute] [-groupSearchFilter] [-followReferrals] [-maxLDAPReferrals] [-defaultAuthenticationGroup]

---

show authentication ldapAction

Displays the current configuration settings for the specified LDAP profile (action).

Synopsys

show authentication ldapAction [<name>]

Arguments

name

Name of the LDAP profile.

summary

fullValues

format

level

Outputs

serverIP

IP address assigned to the LDAP server.

serverPort

Port on which the LDAP server accepts connections.

authTimeout

Number of seconds the NetScaler appliance waits for a response from the RADIUS server.

ldapBindDn

Full distinguished name (DN) that is used to bind to the LDAP server.

Default: cn=Manager,dc=netscaler,dc=com

ldapBindDnPassword

Password used to bind to the LDAP server.

ldapLoginName

LDAP login name attribute.

The NetScaler appliance uses the LDAP login name to query external LDAP servers or Active Directories.

ldapBase

Base (node) from which to start LDAP searches.

If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.

searchFilter

String to be combined with the default LDAP user search string to form the search value.

For example, if the search filter ?"vpnallowed=true"? is combined with the LDAP login name ?"samaccount"? and the user-supplied username is ?"bob"?, the result is the LDAP search string ""(&(vpnallowed=true)(samaccount=bob)"" (Be sure to enclose the search string in two sets of double quotation marks; both sets are needed.).

groupAttrName

LDAP group attribute name.

Used for group extraction on the LDAP server.

subAttributeName

LDAP group sub-attribute name.

Used for group extraction from the LDAP server.

secType

Type of security used for communications between the NetScaler appliance and the LDAP server. For the PLAINTEXT setting, no encryption is required.

svrType

The type of LDAP server.

ssoNameAttribute

LDAP single signon (SSO) attribute.

The NetScaler appliance uses the SSO name attribute to query external LDAP servers or Active Directories for an alternate username.

authentication

Perform LDAP authentication.

If authentication is disabled, any LDAP authentication attempt returns authentication success if the user is found.

CAUTION! Authentication should be disabled only for authorization group extraction or where other (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary.

requireUser

Require a successful user search for authentication.

Success

Failure

stateflag

nestedGroupExtraction

Allow nested group extraction, in which the NetScaler appliance queries external LDAP servers to determine whether a group is part of another group.

maxNestingLevel

If nested group extraction is ON, specifies the number of levels up to which group extraction is performed.

followReferrals

Setting this option to ON enables following LDAP referrals received from the LDAP server.

maxLDAPReferrals

Specifies the maximum number of nested referrals to follow.

validateServerCert

When to validate LDAP server certs

ldapHostname

Hostname for the LDAP server. If -validateServerCert is ON then this must be the host name on the certificate from the LDAP server.

A hostname mismatch will cause a connection failure.

groupNameIdentifier

Name that uniquely identifies a group in LDAP or Active Directory.

groupSearchAttribute

LDAP group search attribute.

Used to determine to which groups a group belongs.

groupSearchSubAttribute

LDAP group search subattribute.

Used to determine to which groups a group belongs.

groupSearchFilter

String to be combined with the default LDAP group search string to form the search value. For example, the group search filter ""vpnallowed=true"" when combined with the group identifier ""samaccount"" and the group name ""g1"" yields the LDAP search string ""(&(vpnallowed=true)(samaccount=g1)"". (Be sure

to enclose the search string in two sets of double quotation marks; both sets are needed.)

passwdChange

Allow password change requests.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

authentication ldapPolicy

Sep 22, 2015

The following operations can be performed on "authentication ldapPolicy":

add | rm | set | unset | show

add authentication ldapPolicy

Adds an LDAP authentication policy. The policy defines the criteria under which the NetScaler appliance attempts to authenticate the user with the specified LDAP server.

Synopsys

add authentication ldapPolicy <name> <rule> [<reqAction>]

Arguments

name

Name for the LDAP policy.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after LDAP policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the LDAP server.

reqAction

Name of the LDAP action to perform if the policy matches.

---

rm authentication ldapPolicy

Removes an LDAP policy.

Synopsys

rm authentication ldapPolicy <name>

Arguments

name

Name of the LDAP policy to remove.

---

set authentication ldapPolicy

Configures the specified LDAP policy.

Synopsys

set authentication ldapPolicy <name> [-rule <string>] [-reqAction <string>]

Arguments

name

Name of the LDAP policy.

rule

The new rule to associate with the policy.

reqAction

The new LDAP action to associate with the policy.

---

unset authentication ldapPolicy

Use this command to remove authentication ldapPolicy settings.Refer to the set authentication ldapPolicy command for meanings of the arguments.

Synopsys

unset authentication ldapPolicy <name> [-rule] [-reqAction]

---

show authentication ldapPolicy

Displays the current settings for the specified LDAP policy. If no policy name is provided, displays a list of all LDAP policies currently configured on the NetScaler appliance.

Synopsys

show authentication ldapPolicy [<name>]

Arguments

name

Name of the LDAP policy.

summary

fullValues

format

level

Outputs

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the LDAP server.

authentication localPolicy

Sep 22, 2015

The following operations can be performed on "authentication localPolicy":

add | rm | set | unset | show

add authentication localPolicy

Adds a policy for the NetScaler appliance to locally authenticate a user. The policy contains criteria that specify when and how to authenticate a user.

Synopsys

add authentication localPolicy <name> <rule>

Arguments

name

Name for the local authentication policy.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after local policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to perform the authentication.

---

rm authentication localPolicy

Removes the specified local authentication policy.

Synopsys

rm authentication localPolicy <name>

Arguments

name

Name of the local policy to remove.

---

set authentication localPolicy

Configures the specified local authentication policy.

Synopsys

set authentication localPolicy <name> -rule <expression>

Arguments

name

Name of the local authentication policy.

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to perform the authentication.

---

unset authentication localPolicy

Use this command to remove authentication localPolicy settings.Refer to the set authentication localPolicy command for meanings of the arguments.

Synopsys

unset authentication localPolicy <name> -rule

---

show authentication localPolicy

Displays the current settings for the specified local authentication policy. If no policy name is provided, displays a list of all local authentication policies currently configured on the NetScaler appliance.

Synopsys

show authentication localPolicy [<name>]

Arguments

name

Name of the local authentication policy.

authentication negotiateAction

Sep 22, 2015

The following operations can be performed on "authentication negotiateAction":

add | rm | set | unset | show

add authentication negotiateAction

Creates an action (profile) for an Active Directory (AD) server that is used as a Kerberos Key Distribution Center (KDC). The profile contains all configuration data necessary to communicate with that AD KDC server.

Synopsys

add authentication negotiateAction <name> {-domain <string>} {-domainUser <string>} {-domainUserPasswd } {-OU <string>} [-defaultAuthenticationGroup <string>] [-keytab <string>]

Arguments

name

Name for the AD KDC server profile (negotiate action).

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after AD KDC server profile is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication action? or ?my authentication action?).

domain

Domain name of the AD KDC server.

domainUser

User name that the NetScaler appliance uses to join the AD KDC server domain.

The NetScaler appliance uses the domain user name to check the health of the AD KDC server.

domainUserPasswd

Password that the NetScaler appliance uses to join the AD KDC server domain.

OU

Active Directory organizational units (OU) attribute.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

keytab

The path to the keytab file

---

rm authentication negotiateAction

Removes an AD KDC server profile (negotiate action). An action cannot be removed if it is bound to a policy.

Synopsys

rm authentication negotiateAction <name>

Arguments

name

Name of the AD KDC server profile to be removed.

---

set authentication negotiateAction

Configures an AD KDC server profile (negotiate action).

Synopsys

set authentication negotiateAction <name> [-domain <string>] [-domainUser <string>] [-domainUserPasswd] [-OU <string>] [-defaultAuthenticationGroup <string>] [-keytab <string>]

Arguments

name

Name of the AD KDC server profile.

domain

Domain name of the AD KDC server.

domainUser

User name that the NetScaler appliance uses to join the AD KDC server domain.

The NetScaler appliance uses the domain user name to check the health of the AD KDC server.

domainUserPasswd

Password that the NetScaler appliance uses to join the AD KDC server domain.

OU

Active Directory organizational units (OU) attribute.

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

keytab

The path to the keytab file

---

unset authentication negotiateAction

Use this command to remove authentication negotiateAction settings.Refer to the set authentication negotiateAction command for meanings of the arguments.

Synopsys

unset authentication negotiateAction <name> [-domain] [-domainUser] [-domainUserPasswd] [-OU] [-defaultAuthenticationGroup]

---

show authentication negotiateAction

Displays the current configuration settings for the specified AD KDC server profile (negotiate action).

Synopsys

show authentication negotiateAction [<name>]

Arguments

name

Name of the AD KDC server profile.

authentication radiusAction

Sep 22, 2015

The following operations can be performed on "authentication radiusAction":

add | rm | set | unset | show

add authentication radiusAction

Creates an action (profile) for a RADIUS server. The profile contains all configuration data necessary to communicate with that RADIUS server.

Synopsys

add authentication radiusAction <name> {-serverIP <ip_addr|ipv6_addr|*>} [-serverPort <port>] [-authTimeout <positive_integer>] {-radKey } [-radNASip (ENABLED | DISABLED)] [-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeType <positive_integer>] [-radGroupsPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>] [-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>] [-accounting (ON | OFF)] [-pwdVendorID <positive_integer> [-pwdAttributeType <positive_integer>]] [-defaultAuthenticationGroup <string>] [-callingstationid (ENABLED | DISABLED)]

Arguments

name

Name for the RADIUS action.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the RADIUS action is added.

serverIP

IP address assigned to the RADIUS server.

serverPort

Port number on which the RADIUS server listens for connections.

Default value: 1812

Minimum value: 1

authTimeout

Number of seconds the NetScaler appliance waits for a response from the RADIUS server.

Default value: 3

Minimum value: 1

radKey

Key shared between the RADIUS server and the NetScaler appliance.

Required to allow the NetScaler appliance to communicate with the RADIUS server.

radNASip

If enabled, the NetScaler appliance IP address (NSIP) is sent to the RADIUS server as the Network Access Server IP (NASIP) address.

The RADIUS protocol defines the meaning and use of the NASIP address.

Possible values: ENABLED, DISABLED

radNASid

If configured, this string is sent to the RADIUS server as the Network Access Server ID (NASID).

radVendorID

RADIUS vendor ID attribute, used for RADIUS group extraction.

Minimum value: 1

radAttributeType

RADIUS attribute type, used for RADIUS group extraction.

Minimum value: 1

radGroupsPrefix

RADIUS groups prefix string.

This groups prefix precedes the group names within a RADIUS attribute for RADIUS group extraction.

radGroupSeparator

RADIUS group separator string

The group separator delimits group names within a RADIUS attribute for RADIUS group extraction.

passEncoding

Encoding type for passwords in RADIUS packets that the NetScaler appliance sends to the RADIUS server.

Possible values: pap, chap, mschapv1, mschapv2

Default value: AAA_PAP

ipVendorID

Vendor ID of the intranet IP attribute in the RADIUS response.

NOTE: A value of 0 indicates that the attribute is not vendor encoded.

ipAttributeType

Remote IP address attribute type in a RADIUS response.

Minimum value: 1

accounting

Whether the RADIUS server is currently accepting accounting messages.

Possible values: ON, OFF

pwdVendorID

Vendor ID of the attribute, in the RADIUS response, used to extract the user password.

Minimum value: 1

pwdAttributeType

Vendor-specific password attribute type in a RADIUS response.

Minimum value: 1

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

callingstationid

Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID.

Possible values: ENABLED, DISABLED

Default value: DISABLED

---

rm authentication radiusAction

Removes a RADIUS profile (action). An action cannot be removed as long as it is bound to a policy.

Synopsys

rm authentication radiusAction <name>

Arguments

name

Name of the action to be removed.

---

set authentication radiusAction

Configures a RADIUS server profile (action). The profile contains all configuration data needed to communicate with that RADIUS server.

Synopsys

set authentication radiusAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] {-radKey } [-radNASip (ENABLED | DISABLED)] [-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeType <positive_integer>] [-radGroupsPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>] [-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>] [-accounting (ON | OFF)] [-pwdVendorID <positive_integer>] [-pwdAttributeType <positive_integer>] [-defaultAuthenticationGroup <string>] [-callingstationid (ENABLED | DISABLED)]

Arguments

name

Name of the RADIUS profile.

serverIP

IP address assigned to the RADIUS server.

serverPort

Port number on which the RADIUS server listens for connections.

Default value: 1812

Minimum value: 1

authTimeout

Number of seconds the NetScaler appliance waits for a response from the RADIUS server.

Default value: 3

Minimum value: 1

radKey

Key shared between the RADIUS server and the NetScaler appliance.

Required to allow the NetScaler appliance to communicate with the RADIUS server.

radNASip

If enabled, the NetScaler appliance IP address (NSIP) is sent to the RADIUS server as the Network Access Server IP (NASIP) address.

The RADIUS protocol defines the meaning and use of the NASIP address.

Possible values: ENABLED, DISABLED

radNASid

If configured, this string is sent to the RADIUS server as the Network Access Server ID (NASID).

radVendorID

RADIUS vendor ID attribute, used for RADIUS group extraction.

Minimum value: 1

radAttributeType

RADIUS attribute type, used for RADIUS group extraction.

Minimum value: 1

radGroupsPrefix

RADIUS groups prefix string.

This groups prefix precedes the group names within a RADIUS attribute for RADIUS group extraction.

radGroupSeparator

RADIUS group separator string

The group separator delimits group names within a RADIUS attribute for RADIUS group extraction.

passEncoding

Encoding type for passwords in RADIUS packets that the NetScaler appliance sends to the RADIUS server.

Possible values: pap, chap, mschapv1, mschapv2

Default value: AAA_PAP

ipVendorID

Vendor ID of the intranet IP attribute in the RADIUS response.

NOTE: A value of 0 indicates that the attribute is not vendor encoded.

ipAttributeType

Remote IP address attribute type in a RADIUS response.

Minimum value: 1

accounting

Whether the RADIUS server is currently accepting accounting messages.

Possible values: ON, OFF

pwdVendorID

Vendor ID of the attribute, in the RADIUS response, used to extract the user password.

Minimum value: 1

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

callingstationid

Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID.

Possible values: ENABLED, DISABLED

Default value: DISABLED

authentication samlAction

Sep 22, 2015

The following operations can be performed on "authentication samlAction":

add | rm | set | unset | show

add authentication samlAction

Creates an action (profile) for a Security Assertion Markup Language (SAML) server. The profile contains all configuration data necessary to communicate with that SAML server.

Synopsys

add authentication samlAction <name> {-samlIdPCertName <string>} {-samlSigningCertName <string>} {-samlRedirectUrl <string>} {-samlUserField <string>} {-samlRejectUnsignedAssertion (ON | OFF)} {-samlIssuerName <string>} {-samlTwoFactor (ON | OFF)} [-defaultAuthenticationGroup <string>]

Arguments

name

Name for the SAML server profile (action).

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after SAML profile is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication action? or ?my authentication action?).

samlIdPCertName

Name of the SAML server as given in that server?s SSL certificate.

samlSigningCertName

Name of the signing authority as given in the SAML server?s SSL certificate.

samlRedirectUrl

URL to which users are redirected after successful authentication.

samlUserField

SAML user ID, as given in the SAML assertion.

samlRejectUnsignedAssertion

Reject unsigned SAML assertions.

Possible values: ON, OFF

Default value: ON

samlIssuerName

The name to be used in requests sent from Netscaler to IdP to uniquely identify Netscaler.

samlTwoFactor

Option to enable second factor after SAML

Possible values: ON, OFF

Default value: NS_OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

---

rm authentication samlAction

Removes a SAML profile (action). An action cannot be removed if it is bound to a policy.

Synopsys

rm authentication samlAction <name>

Arguments

name

Name of the SAML profile to be removed.

---

set authentication samlAction

Modifies the specified parameters of a SAML server profile (action).

Synopsys

set authentication samlAction <name> [-samlIdPCertName <string>] [-samlSigningCertName <string>] [-samlRedirectUrl <string>] [-samlUserField <string>] [-samlRejectUnsignedAssertion (ON | OFF)] [-samlIssuerName <string>] [-samlTwoFactor (ON | OFF)] [-defaultAuthenticationGroup <string>]

Arguments

name

Name of the SAML profile (action) to modify.

samlIdPCertName

Name of the SAML server as given in that server?s SSL certificate.

samlSigningCertName

Name of the signing authority as given in the SAML server?s SSL certificate.

samlRedirectUrl

URL to which users are redirected after successful authentication.

samlUserField

SAML user ID, as given in the SAML assertion.

samlRejectUnsignedAssertion

Reject unsigned SAML assertions.

Possible values: ON, OFF

Default value: ON

samlIssuerName

The name to be used in requests sent from Netscaler to IdP to uniquely identify Netscaler.

samlTwoFactor

Option to enable second factor after SAML

Possible values: ON, OFF

Default value: NS_OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

---

unset authentication samlAction

Use this command to remove authentication samlAction settings.Refer to the set authentication samlAction command for meanings of the arguments.

Synopsys

unset authentication samlAction <name> [-samlIdPCertName] [-samlSigningCertName] [-samlRedirectUrl] [-samlUserField] [-samlRejectUnsignedAssertion] [-samlIssuerName] [-samlTwoFactor] [-defaultAuthenticationGroup]

---

show authentication samlAction

Displays the current configuration settings for the specified SAML server profile (action).

Synopsys

show authentication samlAction [<name>]

Arguments

name

Name of the SAML server profile.

summary

authentication samlPolicy

Sep 22, 2015

The following operations can be performed on "authentication samlPolicy":

add | rm | set | unset | show

add authentication samlPolicy

Adds a SAML authentication policy. The policy defines the criteria under which the NetScaler appliance attempts to authenticate the user with the specified SAML server.

Synopsys

add authentication samlPolicy <name> <rule> <reqAction>

Arguments

name

Name for the SAML policy.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after SAML policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the SAML server.

reqAction

Name of the SAML authentication action to be performed if the policy matches.

---

rm authentication samlPolicy

Removes the specified SAML policy.

Synopsys

rm authentication samlPolicy <name>

Arguments

name

Name of the policy to remove.

---

set authentication samlPolicy

Modifies the specified parameters of a SAML policy.

Synopsys

set authentication samlPolicy <name> [-rule <expression>] [-reqAction <string>]

Arguments

name

Name of the SAML policy to modify.

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the SAML server.

reqAction

Name of the SAML authentication action to be performed if the policy matches.

---

unset authentication samlPolicy

Use this command to remove authentication samlPolicy settings.Refer to the set authentication samlPolicy command for meanings of the arguments.

Synopsys

unset authentication samlPolicy <name> [-rule] [-reqAction]

---

show authentication samlPolicy

Displays the current settings for the specified SAML policy. If no policy name is provided, displays a list of all SAML policies currently configured on the NetScaler appliance.

Synopsys

show authentication samlPolicy [<name>]

Arguments

name

Name of the SAML policy.

summary

authentication tacacsAction

Sep 22, 2015

The following operations can be performed on "authentication tacacsAction":

add | rm | set | unset | show

add authentication tacacsAction

Creates an action (profile) for a TACACS+ server. The profile contains all configuration data necessary to communicate with that TACACS+ server.

Synopsys

add authentication tacacsAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] {-tacacsSecret } [-authorization (ON | OFF)] [-accounting (ON | OFF)] [-auditFailedCmds (ON | OFF)] [-defaultAuthenticationGroup <string>]

Arguments

name

Name for the TACACS+ profile (action).

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after TACACS profile is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication action? or ?my authentication action?).

serverIP

IP address assigned to the TACACS+ server.

serverPort

Port number on which the TACACS+ server listens for connections.

Default value: 49

Minimum value: 1

authTimeout

Number of seconds the NetScaler appliance waits for a response from the TACACS+ server.

Default value: 3

Minimum value: 1

tacacsSecret

Key shared between the TACACS+ server and the NetScaler appliance.

Required for allowing the NetScaler appliance to communicate with the TACACS+ server.

authorization

Use streaming authorization on the TACACS+ server.

Possible values: ON, OFF

accounting

Whether the TACACS+ server is currently accepting accounting messages.

Possible values: ON, OFF

auditFailedCmds

The state of the TACACS+ server that will receive accounting messages.

Possible values: ON, OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

---

rm authentication tacacsAction

Removes a TACACS+ profile (action). A profile cannot be removed as long as it is bound to a policy.

Synopsys

rm authentication tacacsAction <name>

Arguments

name

Name of the profile to be removed.

---

set authentication tacacsAction

Modifies a TACACS+ server profile (action).

Synopsys

set authentication tacacsAction <name> [-serverIP <ip_addr|ipv6_addr|*>] [-serverPort <port>] [-authTimeout <positive_integer>] {-tacacsSecret } [-authorization (ON | OFF)] [-accounting (ON | OFF)] [-auditFailedCmds (ON |

OFF)] [-defaultAuthenticationGroup <string>]

Arguments

name

Name of the TACACS+ profile to modify.

serverIP

IP address assigned to the TACACS+ server.

serverPort

Port number on which the TACACS+ server listens for connections.

Default value: 49

Minimum value: 1

authTimeout

Number of seconds the NetScaler appliance waits for a response from the TACACS+ server.

Default value: 3

Minimum value: 1

tacacsSecret

Key shared between the TACACS+ server and the NetScaler appliance.

Required for allowing the NetScaler appliance to communicate with the TACACS+ server.

authorization

Use streaming authorization on the TACACS+ server.

Possible values: ON, OFF

accounting

Whether the TACACS+ server is currently accepting accounting messages.

Possible values: ON, OFF

auditFailedCmds

The state of the TACACS+ server that will receive accounting messages.

Possible values: ON, OFF

defaultAuthenticationGroup

This is the default group that is chosen when the authentication succeeds in addition to extracted groups.

Maximum value: 64

---

unset authentication tacacsAction

Use this command to remove authentication tacacsAction settings.Refer to the set authentication tacacsAction command for meanings of the arguments.

Synopsys

unset authentication tacacsAction <name> [-serverIP] [-serverPort] [-authTimeout] [-tacacsSecret] [-authorization] [-accounting] [-auditFailedCmds] [-defaultAuthenticationGroup]

---

show authentication tacacsAction

Displays the current configuration settings for the specified TACACS+ profile (action).

Synopsys

show authentication tacacsAction [<name>]

Arguments

name

Name of the TACACS+ profile.

summary

authentication tacacsPolicy

Sep 22, 2015

The following operations can be performed on "authentication tacacsPolicy":

add | rm | set | unset | show

add authentication tacacsPolicy

Adds a TACACS+ authentication policy. The policy defines the criteria under which the NetScaler appliance attempts to authenticate the user with the specified TACACS+ server.

Synopsys

add authentication tacacsPolicy <name> <rule> [<reqAction>]

Arguments

name

Name for the TACACS+ policy.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after TACACS+ policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the TACACS+ server.

reqAction

Name of the TACACS+ action to perform if the policy matches.

---

rm authentication tacacsPolicy

Removes the specified TACACS+ policy.

Synopsys

rm authentication tacacsPolicy <name>

Arguments

name

Name of the TACACS+ policy to remove.

---

set authentication tacacsPolicy

Configures the specified TACACS+ policy.

Synopsys

set authentication tacacsPolicy <name> [-rule <expression>] [-reqAction <string>]

Arguments

name

Name of the TACACS+ policy.

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to determine whether to attempt to authenticate the user with the TACACS+ server.

reqAction

Name of the TACACS+ action to perform if the policy matches.

---

unset authentication tacacsPolicy

Use this command to remove authentication tacacsPolicy settings.Refer to the set authentication tacacsPolicy command for meanings of the arguments.

Synopsys

unset authentication tacacsPolicy <name> [-rule] [-reqAction]

---

show authentication tacacsPolicy

Displays the current settings for the specified TACACS+ policy. If no policy name is provided, displays a list of all TACACS+ policies currently configured on the NetScaler appliance.

Synopsys

show authentication tacacsPolicy [<name>]

Arguments

name

Name of the TACACS+ policy.

summary

authentication vserver

Sep 22, 2015

The following operations can be performed on "authentication vserver":

add | rm | set | unset | bind | unbind | enable | disable | show | stat | rename

add authentication vserver

Creates an authentication virtual server.

Synopsys

add authentication vserver <name> <serviceType> (<IPAddress> [-range <positive_integer>]) <port> [-state (ENABLED | DISABLED)] [-authentication (ON | OFF)] [-AuthenticationDomain <string>] [-comment <string>] [-td <positive_integer>] [-appflowLog (ENABLED | DISABLED)] [-maxLoginAttempts <positive_integer> [-failedLoginTimeout <positive_integer>]]

Arguments

name

Name for the new authentication virtual server.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

serviceType

Protocol type of the authentication virtual server. Always SSL.

Possible values: SSL

Default value: NSSVC_SSL

IPAddress

IP address of the authentication virtual server, if a single IP address is assigned to the virtual server.

port

TCP port on which the virtual server accepts connections.

Minimum value: 1

state

Initial state of the new virtual server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

authentication

Require users to be authenticated before sending traffic through this virtual server.

Possible values: ON, OFF

Default value: ON

AuthenticationDomain

Fully-qualified domain name (FQDN) of the authentication virtual server.

comment

Any comments associated with this virtual server.

td

Traffic Domain ID

Maximum value: 4094

appflowLog

Log AppFlow flow information.

Possible values: ENABLED, DISABLED

Default value: ENABLED

maxLoginAttempts

Maximum Number of login Attempts

Minimum value: 1

Maximum value: 255

Example

The following example creates an authentication vserver named myauthenticationvip which supports SSL portocol and with AAA functionality enabled: vserver myauthent

---

rm authentication vserver

Removes an authentication virtual server.

Synopsys

rm authentication vserver <name>@ ...

Arguments

name

Name of the authentication virtual server to remove.

Example

rm vserver authn_vip

---

set authentication vserver

Modifies the specified parameters of an existing authentication virtual server.

Synopsys

set authentication vserver <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-authentication (ON | OFF)] [-AuthenticationDomain <string>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)] [-maxLoginAttempts <positive_integer>] [-failedLoginTimeout <positive_integer>]

Arguments

name

Name of the virtual server to modify.

IPAddress

IP address of the authentication virtual server, if a single IP address is assigned to the virtual server.

authentication

Require users to be authenticated before sending traffic through this virtual server.

Possible values: ON, OFF

Default value: ON

AuthenticationDomain

Fully-qualified domain name (FQDN) of the authentication virtual server.

comment

Any comments associated with this virtual server.

appflowLog

Log AppFlow flow information.

Possible values: ENABLED, DISABLED

Default value: ENABLED

maxLoginAttempts

Maximum Number of login Attempts

Minimum value: 1

Maximum value: 255

failedLoginTimeout

Failed Login timeout

Minimum value: 1

---

unset authentication vserver

Removes the settings of an existing authentication virtual server. Attributes for which a default value is available revert to their default values. Refer to the set authentication vserver command for descriptions of the parameters..Refer to the set authentication vserver command for meanings of the arguments.

Synopsys

unset authentication vserver <name> [-AuthenticationDomain] [-maxLoginAttempts] [-authentication] [-comment] [-appflowLog]

---

bind authentication vserver

Binds authentication policies to an authentication virtual server.

Synopsys

bind authentication vserver <name> [-policy <string> [-priority <positive_integer>] [-secondary] [-groupExtraction]]

Arguments

name

Name of the authentication virtual server to which to bind the policy.

policy

Name of the policy to bind to the virtual server.

---

unbind authentication vserver

Unbinds the specified policy from the specified authentication virtual server.

Synopsys

unbind authentication vserver <name> [-policy <string> [-secondary] [-groupExtraction]]

Arguments

name

Name of the virtual server.

policy

Name of the policy to be unbound.

---

enable authentication vserver

Enables an authentication virtual server that is disabled. Note: Virtual servers, when added, are normally enabled by default.

Synopsys

enable authentication vserver <name>@

Arguments

name

Name of the virtual server to enable.

Example

enable vserver authentication1

---

disable authentication vserver

Disables an authentication virtual server, taking it out of service.

Synopsys

disable authentication vserver <name>@

Arguments

name

Name of the virtual server to disable.

Notes:

1. The NetScaler appliance still responds to ARP and/or ping requests for the IP address of disabled virtual servers.

2. Because the virtual server configuration still exists on the NetScaler appliance, you can reenable the virtual server.

Example

disable vserver authn_vip

---

show authentication vserver

Displays the configuration of the specified authentication virtual server. If no authentication virtual server is specified, displays a list of all authentication virtual servers that are currently configured on the NetScaler appliance.

Synopsys

show authentication vserver [<name>] show authentication vserver stats - alias for 'stat authentication vserver'

Arguments

name

Name of the authentication virtual server.

summary

fullValues

format

level

Outputs

IPAddress

The IP address of the authentication server.

td

Traffic Domain ID

value

Indicates whether or not the certificate is bound or if SSL offload is disabled.

port

The virtual TCP port of the authentication vserver.

range

The range of authentication vserver IP addresses. The new range of authentication vservers will have IP addresses consecutively numbered, starting with the primary address specified with the <ipaddress> argument.

serviceType

The authentication vserver's protocol type, Currently the only possible value is SSL.

type

The type of Virtual Server, e.g. CONTENT based or ADDRESS based.

state

Initial state of the new virtual server.

status

Whether or not this vserver responds to ARPs and whether or not round-robin selection is temporarily in effect.

cacheType

Virtual server's cache type. The options are: TRANSPARENT, REVERSE and FORWARD.

redirect

The cache redirect policy.

The valid redirect policies are:

l. CACHE - Directs all requests to the cache.

2. POLICY - Applies cache redirection policy to determine whether the request should be directed to the cache or origin. This is the default setting.

3. ORIGIN - Directs all requests to the origin server.

precedence

This argument is used only when configuring content switching on the specified virtual server. This is applicable only

if both the URL and RULE-based policies have been configured on the same virtual server.

It specifies the type of policy (URL or RULE) that takes precedence on the content switching virtual server. The default setting is RULE.

l URL - In this case, the incoming request is matched against the URL-based policies before the rule-based policies.

l RULE - In this case, the incoming request is matched against the rule-based policies before the URL-based policies.

For all URL-based policies, the precedence hierarchy is:

1. Domain and exact URL

2. Domain, prefix and suffix

3. Domain and suffix

4. Domain and prefix

5. Domain only

6. Exact URL

7. Prefix and suffix

8. Suffix only

9. Prefix only

10. Default

redirectURL

The URL where traffic is redirected if the virtual server in system becomes unavailable. WARNING! Make sure that the domain you specify in the URL does not match the domain specified in the -d domainName argument of the ###add cs policy### command. If the same domain is specified in both arguments, the request will be continuously redirected to the same unavailable virtual server in the system. If so, the user may not get the requested content.

authentication

Indicates whether or not authentication is being applied to incoming users to the VPN.

curAAAUsers

The number of current users logged in to this vserver.

AuthenticationDomain

Fully-qualified domain name (FQDN) of the authentication virtual server.

rule

The name of the rule, or expression, if any, that policy for the authentication server is to use. Rules are combinations of Expressions. Expressions are simple conditions, such as a test for equality, applied to operands, such as a URL string or an IP address. Expression syntax is described in the Installation and Configuration Guide. The default rule is ns_true.

policyName

The name of the policy, if any, bound to the authentication vserver.NOTE: This attribute is deprecated.Replaced by Policy field

policy

The name of the policy, if any, bound to the authentication vserver.

serviceName

The name of the service, if any, to which the vserver policy is bound.

weight

Weight for this service, if any. This weight is used when the system performs load balancing, giving greater priority to a specific service. It is useful when the services bound to a virtual server are of different capacity.

cacheVserver

The name of the default target cache virtual server, if any, to which requests are redirected.

backupVServer

The name of the backup vpn virtual server for this vpn virtual server.

cltTimeout

The idle time, if any, in seconds after which the client connection is terminated.

soMethod

VPN client applications are allocated from a block of Intranet IP addresses.

That block may be exhausted after a certain number of connections. This switch specifies the

method used to determine whether or not a new connection will spillover, or exhaust, the allocated block of

Intranet IP addresses for that application. Possible values are CONNECTION or DYNAMICCONNECTION.

CONNECTION means that a static integer value is the hard limit for the spillover threshold. The spillover

threshold is described below. DYNAMICCONNECTION means that the spillover threshold is set according to

the maximum number of connections defined for the vpn vserver.

soThreshold

VPN client applications are allocated from a block of Intranet IP addresses.

That block may be exhausted after a certain number of connections.

The value of this option is number of client connections after which the Mapped IP address is used

as the client source IP address instead of an address from the allocated block of Intranet IP addresses.

soPersistence

Whether or not cookie-based site persistance is enabled for this VPN vserver. Possible values are 'ConnectionProxy', HTTPRedirect, or NONE

soPersistenceTimeOut

The timeout, if any, for cookie-based site persistance of this VPN vserver.

priority

The priority, if any, of the vpn vserver policy.

downStateFlush

Perform delayed clean up of connections on this vserver.

actType

disablePrimaryOnDown

Tells whether traffic will continue reaching backup vservers even after primary comes UP from DOWN state.

Listenpolicy

Listenpolicy configured for authentication vserver

Listenpriority

Priority of listen policy for authentication vserver

tcpProfileName

The name of the TCP profile.

httpProfileName

Name of the HTTP profile.

comment

Any comments associated with this virtual server.

policySubType

stateflag

flags

appflowLog

Log AppFlow flow information.

vstype

Virtual Server Type, e.g. Load Balancing, Content Switch, Cache Redirection

ngname

Nodegroup devno to which this lbvsever belongs to

maxLoginAttempts

Maximum Number of login Attempts

failedLoginTimeout

Failed Login timeout

secondary

Bind the authentication policy to the secondary chain.

Provides for multifactor authentication in which a user must authenticate via both a primary authentication method and, afterward, via a secondary authentication method.

Because user groups are aggregated across authentication systems, usernames must be the same on all authentication servers. Passwords can be different.

groupExtraction

Bind the Authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.

devno

count

Example

show authentication vserver

---

stat authentication vserver

Displays statistics about the specified authentication virtual server. If no authentication virtual server is specified, displays statistics for all authentication virtual servers that are currently configured on the NetScaler appliance.

Synopsys

stat authentication vserver [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

name

Name of the authentication virtual server.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

IP address (IP)

The IP address on which the service is running.

Port (port)

The port on which the service is running.

Vserver protocol (Protocol)

Protocol associated with the vserver

State

Current state of the server. Possible values are UP, DOWN, UNKNOWN, OFS(Out of Service), TROFS(Transition Out of Service), TROFS_DOWN(Down When going Out of Service)

Requests (Req)

Total number of requests received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Responses (Rsp)

Number of responses received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Request bytes (Reqb)

Total number of request bytes received on this service or virtual server.

Response bytes (Rspb)

Number of response bytes received by this service or virtual server.

---

rename authentication vserver

Rename an authentication virtual server.

Synopsys

rename authentication vserver <name>@ <newName>@

Arguments

name

Current name of the authentication virtual server.

newName

New name of the authentication virtual server.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authentication policy? or ?my authentication policy?).

Example

```
rename authentication vserver av1 av_new
```

Authorization Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- authorization action
- authorization policy
- authorization policylabel

authorization action

Sep 22, 2015

The following operations can be performed on "authorization action":

Show details of authorization actions.

show authorization action [<name>]

name

Name of authorization action

summary

fullValues

format

level

devno

count

stateflag

authorization policy

Sep 22, 2015

The following operations can be performed on "authorization policy":

add | rm | set | rename | show

Creates an authorization policy. Authorization policies allow AAA users and AAA groups to access resources through SSL VPN/AAA-TM enabled virtual servers.

add authorization policy <name> <rule> <action>

name

Name for the new authorization policy.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the authorization policy is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authorization policy? or ?my authorization policy?).

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to perform the authentication.

action

Action to perform if the policy matches: either allow or deny the request.

Example: Consider the following authorization policy, "author-policy", add authorization policy author-policy "URL == /*.gif" DENY bind aaa user foo -policy author-pol

---

Removes an authorization policy.

rm authorization policy <name>

name

Name of the authorization policy to be removed.

Configures the specified parameters of an authorization policy.

set authorization policy <name> [-rule <expression>] [-action <string>]

name

Name of the authorization policy to modify.

rule

Name of the NetScaler named rule, or a default syntax expression, that the policy uses to perform the authentication.

action

Action to perform if the policy matches: either allow or deny the request.

Rename a author policy.

rename authorization policy <name>@ <newName>@

name

The name of the author policy.

newName

The new name of the author policy.

rename auth policy oldname newname

Displays the current settings for the specified authorization policy. If no policy name is provided, displays a list of all authorization policies currently configured on the NetScaler appliance.

show authorization policy [<name>]

name

Name of the authorization policy.

summary

fullValues

format

level

rule

Rule of the policy.

action

Authorization action associated with the policy. It can be either ALLOW or DENY.

authorization policylabel

Sep 22, 2015

The following operations can be performed on "authorization policylabel":

add | rm | bind | unbind | rename | show | stat

Creates a user-defined authorization policy label.

add authorization policylabel <labelName>

labelName

Name for the new authorization policy label.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the authorization policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authorization policy label? or ?authorization policy label?).

add authorization policylabel trans_http_url

Removes an authorization policy label.

rm authorization policylabel <labelName>

labelName

Name of the authorization policy label to remove.

rm authorization policylabel trans_http_url

Binds an authorization policy to a label.

bind authorization policylabel <labelName> <policyName> <priority> [<gotoPriorityExpression>] [-invoke (<labelType> <labelName>)]

labelName

Name of the authorization policy label to which to bind the policy.

policyName

Name of the authorization policy to bind to the policy label.

i) bind authorization policylabel trans_http_url pol_1 1 2 -invoke reqvserver CURRENT ii) bind authorization policylabel trans_http_url pol_2 2

Unbinds the specified policy from the specified authorization policy label.

unbind authorization policylabel <labelName> <policyName> [-priority <positive_integer>]

labelName

Name for the new authorization policy label.

Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the authorization policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my authorization policy label? or ?authorization policy label?).

policyName

Name of the authorization policy to bind to the policy label.

priority

Priority of the NOPOLICY to be unbound.

Minimum value: 1

Maximum value: 2147483647

unbind authorization policylabel trans_http_url pol_1

Rename a auth policy label.

rename authorization policylabel <labelName>@ <newName>@

labelName

The name of the auth policy label

newName

The new name of the auth policy label

rename auth policy label oldname newname

Displays the current settings for the specified authorization policy label. If no policy name is provided, displays a list of all authorization policy labels currently configured on the NetScaler appliance.

show authorization policylabel [<labelName>]

labelName

Name of the authorization policy label.

summary

fullValues

format

level

stateflag

numpol

Number of polices bound to label.

hits

Number of times policy label was invoked.

policyName

Name of the authorization policy to bind to the policy label.

priority

Specifies the priority of the policy.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

labelType

Type of invocation. Available settings function as follows:

* reqvserver - Send the request to the specified request virtual server.

* resvserver - Send the response to the specified response virtual server.

* policylabel - Invoke the specified policy label.

labelName

Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.

flowType

Flowtype of the bound authorization policy.

description

Description of the policylabel

flags

devno

count

i) show authorization policylabel trans_http_url ii) show authorization policylabel

---

Displays statistics for the specified authorization policy label. If no authorization policy label is specified, displays a list

of all authorization policy labels.

stat authorization policylabel [<labelName>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

labelName

Name of the authorization policy label.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

Policy Label Hits (Hits)

Number of times policy label was invoked.

AutoScale Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- autoscale action
- autoscale policy
- autoscale profile

autoscale action

Sep 22, 2015

The following operations can be performed on "autoscale action":

add | rm | set | unset | show

Create a AutoScale action.

add autoscale action <name> -type (SCALE_UP | SCALE_DOWN) -profileName <string> -parameters <string> [-vmDestroyGracePeriod <positive_integer>] [-quietTime <positive_integer>] -vServer <string>

name

ActionScale action name.

type

The type of action.

Possible values: SCALE_UP, SCALE_DOWN

profileName

AutoScale profile name.

parameters

Parameters to use in the action

vmDestroyGracePeriod

Time in minutes a VM is kept in inactive state before destroying

Default value: 10

quietTime

Time in seconds no other policy is evaluated or action is taken

Default value: 300

vServer

Name of the vserver on which autoscale action has to be taken.

Remove a AutoScale action.

rm autoscale action <name>

name

ActionScale action name.

Set a AutoScale action.

set autoscale action <name> [-profileName <string>] [-parameters <string>] [-vmDestroyGracePeriod <positive_integer>] [-quietTime <positive_integer>] [-vServer <string>]

name

ActionScale action name.

profileName

AutoScale profile name.

parameters

Parameters to use in the action

vmDestroyGracePeriod

Time in minutes a VM is kept in inactive state before destroying

Default value: 10

quietTime

Time in seconds no other policy is evaluated or action is taken

Default value: 300

vServer

Name of the vserver on which autoscale action has to be taken.

Use this command to remove autoscale action settings.Refer to the set autoscale action command for meanings of the arguments.

unset autoscale action <name> [-vmDestroyGracePeriod] [-quietTime]

Display the autoscale actions.

show autoscale action [<name>]

name

ActionScale action name.

summary

fullValues

format

level

type

The type of action.

profileName

AutoScale profile name.

stateflag

autoscale policy

Sep 22, 2015

The following operations can be performed on "autoscale policy":

add | rm | set | unset | show | stat | rename

Create a autoscale policy.

add autoscale policy <name> -rule <expression> -action <string> [-comment <string>] [-logAction <string>]

name

The name of the autoscale policy.

rule

The rule associated with the policy.

action

The autoscale profile associated with the policy.

comment

Comments associated with this autoscale policy.

logAction

The log action associated with the autoscale policy

Remove a autoscale policy.

rm autoscale policy <name>

name

The name of the autoscale policy.

rm autoscale policy pol

Set a new rule/action/comment for an existing autoscale policy.

set autoscale policy <name> [-rule <expression>] [-action <string>] [-comment <string>] [-logAction <string>]

name

The name of the autoscale policy.

rule

The rule associated with the policy.

action

The autoscale profile associated with the policy.

comment

Comments associated with this autoscale policy.

logAction

The log action associated with the autoscale policy

set autoscaler policy pol -rule true

Unset comment/logaction for existing autoscale policy..Refer to the set autoscale policy command for meanings of the arguments.

unset autoscale policy <name> [-rule <expression>] [-action <string>] [-comment <string>] [-logAction <string>]

unset autoscale policy pol9 -undefAction

Display the autoscale policies.

show autoscale policy [<name>]

name

The name of the autoscale policy.

summary

fullValues

format

level

rule

The rule associated with the policy.

action

The autoscale profile associated with the policy.

comment

Comments associated with this autoscale policy.

- vserver

configstatus

Sep 22, 2015

The following operations can be performed on "configstatus":

Display status of packet engines.

show configstatus

consistent

State of packet engines.

culpritCore

Culprit core id.

core

Core id.

culpritCoreConfString

coreConfString

devno

count

stateflag

show configstatus

dbsMonitors

Sep 22, 2015

The following operations can be performed on "dbsMonitors":

Immediately send DNS queries to resolve the domain names of all the domain-based servers configured on the NetScaler appliance.

restart dbsMonitors

restart dbsMonitors

location

Sep 22, 2015

The following operations can be performed on "location":

add | rm | show

Creates a custom location entry on the NetScaler appliance. Custom locations can be used instead of a static location database if the number of locations you need does not exceed 500. Custom locations can also be used to override incorrect entries in the static database, because the appliance searches the static database before it searches the static location database.

add location <IPfrom> <IPto> <preferredLocation> [-longitude <integer> [-latitude <integer>]]

IPfrom

First IP address in the range, in dotted decimal notation.

IPto

Last IP address in the range, in dotted decimal notation.

preferredLocation

String of qualifiers, in dotted notation, describing the geographical location of the IP address range. Each qualifier is more specific than the one that precedes it, as in continent.country.region.city.isp.organization. For example, "NA.US.CA.San Jose.ATT.citrix".

Note: A qualifier that includes a dot (.) or space ( ) must be enclosed in double quotation marks.

longitude

Numerical value, in degrees, specifying the longitude of the geographical location of the IP address-range.

Note: Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based on the qualifiers specified for the location.

Minimum value: -180

Maximum value: 180

latitude

Numerical value, in degrees, specifying the latitude of the geographical location of the IP address-range.

Note: Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based on the qualifiers specified for the location.

Minimum value: -90

Maximum value: 90

Add location 192.168.100.1 192.168.100.100 *.us.ca.san jose

Removes a custom location entry from the NetScaler appliance.

rm location <IPfrom> <IPto>

IPfrom

First IP address in the range, in dotted decimal notation.

IPto

Last IP address in the range, in dotted decimal notation.

rm location 192.168.100.1 192.168.100.100

Displays all the custom location entries configured on the NetScaler appliance, or just the entry for the specified IP address range.

show location [<IPfrom>]

IPfrom

The qualifiers in dotted notation for the ipaddress. If this value is not specified, all custom entries are displayed.

summary

fullValues

format

level

IPto

The end of the IP address range.

preferredLocation

The qualifiers in dotted notation for the ipaddress range.

q1label

Least specific location qualifier.

q2label

Location qualifier 2.

q3label

Location qualifier 3.

q4label

Location qualifier 4.

q5label

Location qualifier 5.

q6label

Most specific location qualifier.

longitude

Numerical value, in degrees, specifying the longitude of the geographical location of the IP address-range.

Note: Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based on the qualifiers specified for the location.

latitude

Numerical value, in degrees, specifying the latitude of the geographical location of the IP address-range.

Note: Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based on the qualifiers specified for the location.

devno

count

stateflag

show location

locationData

Sep 22, 2015

The following operations can be performed on "locationData":

Clears all location information, including custom and static database entries.

clear locationData

clear locationdata

locationFile

Sep 22, 2015

The following operations can be performed on "locationFile":

add | rm | show

Loads the static location database from the specified file.

add locationFile <locationFile> [-format <format>]

locationFile

Name of the location file, with or without absolute path. If the path is not included, the default path (/var/netscaler/locdb) is assumed. In a high availability setup, the static database must be stored in the same location on both NetScaler appliances.

format

Format of the location file. Required for the NetScaler appliance to identify how to read the location file.

Possible values: netscaler, ip-country, ip-country-isp, ip-country-region-city, ip-country-region-city-isp, geoip-country, geoip-region, geoip-city, geoip-country-org, geoip-country-isp, geoip-city-isp-org

Default value: NSMAP_FORMAT_NETSCALER

```
add locationfile /var/nsmap/locationdb  -format netscaler
```

Removes the currently loaded static location database from the NetScaler appliance.

rm locationFile

```
rm locationfile
```

Displays the name, including the absolute path, and format of the location file currently loaded on the NetScaler appliance.

show locationFile

format

level

locationFile

The name of the location file.

format

The format of the location file.

show locationfile

locationParameter

Sep 22, 2015

The following operations can be performed on "locationParameter":

set | unset | show

Sets the location parameters used for static-proximity based global server load balancing. Location parameters include up to six qualifiers and a context that specifies how the qualifiers must be interpreted. Each qualifier specifies the location of an IP address range and is more specific than the one that precedes it, as in continent.country.region.city.isp.organization. For example, "NA.US.CA.San Jose.ATT.citrix". Note: A qualifier that includes a dot (.) or space ( ) must be enclosed in double quotation marks.

set locationParameter [-context (geographic | custom)] [-q1label <string>] [-q2label <string>] [-q3label <string>] [-q4label <string>] [-q5label <string>] [-q6label <string>]

context

Context for describing locations. In geographic context, qualifier labels are assigned by default in the following sequence: Continent.Country.Region.City.ISP.Organization. In custom context, the qualifiers labels can have any meaning that you designate.

Possible values: geographic, custom

q1label

Label specifying the meaning of the first qualifier. Can be specified for custom context only.

q2label

Label specifying the meaning of the second qualifier. Can be specified for custom context only.

q3label

Label specifying the meaning of the third qualifier. Can be specified for custom context only.

q4label

Label specifying the meaning of the fourth qualifier. Can be specified for custom context only.

q5label

Label specifying the meaning of the fifth qualifier. Can be specified for custom context only.

q6label

Label specifying the meaning of the sixth qualifier. Can be specified for custom context only.

set locationparameter -context custom

Use this command to remove locationParameter settings.Refer to the set locationParameter command for meanings of the arguments.

unset locationParameter [-context] [-q1label] [-q2label] [-q3label] [-q4label] [-q5label] [-q6label]

Displays current values for the location parameters, which are used for static-proximity based load balancing.

show locationParameter

format

level

context

The context in which a static proximity decision must be made.

q1label

The label for the 1st qualifier. These qualifier labels characterize the locations mapped with the IP addresses used to make static proximity decisions.

q2label

Label specifying the meaning of the second qualifier. Can be specified for custom context only.

q3label

Label specifying the meaning of the third qualifier. Can be specified for custom context only.

q4label

Label specifying the meaning of the fourth qualifier. Can be specified for custom context only.

q5label

Label specifying the meaning of the fifth qualifier. Can be specified for custom context only.

q6label

Label specifying the meaning of the sixth qualifier. Can be specified for custom context only.

locationFile

Currently loaded location database file.

format

custom

Number of configured custom locations.

static

Number of configured locations in the database file (static locations).

lines

Number of lines in the databse files

errors

Number of errros encountered while reading the database file.

warnings

Number of warnings encountered while reading the database file.

entries

Number of successfully added entries.

flags

Information needed for display. This argument passes information from the kernel to the user space.

status

This argument displays when the status (success or failure) of database loading.

DatabaseMode

This argument displays the database mode.

flushing

This argument displays the state of flushing.

loading

This argument displays the state of loading.

```
show locationparameter
```

nstrace

Sep 22, 2015

The following operations can be performed on "nstrace":

start | stop | show

Start NetScaler packet capture tool.

start nstrace [-nf <positive_integer>] [-time <positive_integer>] [-size <positive_integer>] [-mode <mode> ...] [-tcpdump (ENABLED | DISABLED)] [-perNIC (ENABLED | DISABLED)] [-fileName <string>] [-fileId <string>] [-filter <expression>] [-link (ENABLED | DISABLED)] [-nodes <positive_integer> ...]

nf

Number of files to be generated in cycle.

Default value: 24

Minimum value: 1

Maximum value: 100

time

Time per file (sec).

Default value: 3600

Minimum value: 1

size

Size of the captured data. Set 0 for full packet trace.

Default value: 164

Maximum value: 1514

mode

Capturing mode for trace. Mode can be any of the following values or combination of these values:

RX Received packets before NIC pipelining

NEW_RX Received packets after NIC pipelining

TX Transmitted packets

TXB Packets buffered for transmission

IPV6 Translated IPv6 packets

C2C Capture C2C message

NS_FR_TX TX/TXB packets are not captured in flow receiver.

Default mode: NEW_RX TXB

Default value: DEFAULT_MODE

tcpdump

Trace is captured in TCPDUMP(.pcap) format. Default capture format is NSTRACE(.cap).

Possible values: ENABLED, DISABLED

Default value: DISABLED

perNIC

Use separate trace files for each interface. Works only with tcpdump format.

Possible values: ENABLED, DISABLED

Default value: DISABLED

fileName

Name of the trace file.

fileId

ID for the trace file name for uniqueness. Should be used only with -name option.

filter

Filter expression for nstrace. Maximum length of filter is 255 and it can be of following format:

<expression> [<relop> <expression>]

<relop> = (&& | ||)

nstrace supports two types of filter expressions:

Classic Expressions:

<expression> = the expression string in the format:

<qualifier> <operator> <qualifier-value>

<qualifier> = SOURCEIP.

<qualifier-value> = A valid IP address

<qualifier> = SOURCEPORT.

<qualifier-value> = A valid port number.

<qualifier> = DESTIP.

<qualifier-value> = A valid IP address.

<qualifier> = DESTPORT.

<qualifier-value> = A valid port number.

<qualifier> = IP.

<qualifier-value> = A valid IP address.

<qualifier> = PORT.

<qualifier-value> = A valid port number.

<qualifier> = SVCNAME.

<qualifier-value> = The name of a service.

<qualifier> = VSVRNAME.

<qualifier-value> = The name of a vserver.

<qualifier> = CONNID

<qualifier-value> = A valid PCB dev number.

<qualifier> = VLAN

<qualifier-value> = A valid VLAN ID.

<qualifier> = INTF

<qualifier-value> = A valid interface id in the form of x/y

(n/x/y in case of cluster interface).

<operator> = (== | eq | != | neq | > | gt

| < | lt | >= | ge | <= | le | BETWEEN)

eg: start nstrace -filter "SOURCEIP == 10.102.34.201 || (SVCNAME != s1 && SOURCEPORT > 80)"

The filter expression should be given in double quotes.

Default Expressions:

<expression> =:

CONNECTION.<qualifier>.<qualifier-method>.(<qualifier-value>)

<qualifier> = SRCIP

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv4 address.

example = CONNECTION.SRCIP.EQ(127.0.0.1)

<qualifier> = DSTIP

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv4 address.

example = CONNECTION.DSTIP.EQ(127.0.0.1)

<qualifier> = IP

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv4 address.

example = CONNECTION.IP.EQ(127.0.0.1)

<qualifier> = SRCIPv6

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv6 address.

example = CONNECTION.SRCIPv6.EQ(2001:db8:0:0:1::1)

<qualifier> = DSTIPv6

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv6 address.

example = CONNECTION.DSTIPv6.EQ(2001:db8:0:0:1::1)

<qualifier> = IPv6

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv6 address.

example = CONNECTION.IPv6.EQ(2001:db8:0:0:1::1)

<qualifier> = SRCPORT

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid port number.

example = CONNECTION.SRCPORT.EQ(80)

<qualifier> = DSTPORT

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid port number.

example = CONNECTION.DSTPORT.EQ(80)

<qualifier> = PORT

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid port number.

example = CONNECTION.PORT.EQ(80)

<qualifier> = VLANID

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid vlan ID.

example = CONNECTION.VLANID.EQ(0)

<qualifier> = CONNID

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid PCB dev number.

example = CONNECTION.CONNID.EQ(0)

<qualifier> = PPEID

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid core ID.

example = CONNECTION.PPEID.EQ(0)

<qualifier> = SVCNAME

<qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH

| ENDSWITH]

<qualifier-value> = A valid text string.

example = CONNECTION.SVCNAME.EQ("name")

<qualifier> = INTF

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid interface id in the

form of x/y.

example = CONNECTION.INTF.EQ("x/y")

eg: start nstrace -filter "CONNECTION.SRCIP.EQ(127.0.0.1) || (CONNECTION.SVCNAME.NE("s1") && CONNECTION.SRCPORT.EQ(80))"

The filter expression should be given in double quotes.

common use cases:

Trace capturing full sized traffic from/to ip 10.102.44.111, excluding loopback traffic

start nstrace -size 0 -filter "CONNECTION.IP.NE(127.0.0.1) && CONNECTION.IP.EQ(10.102.44.111)"

Trace capturing all traffic to (terminating at) port 80 or 443

start nstrace -size 0 -filter "CONNECTION.DSTPORT.EQ(443) || CONNECTION.DSTPORT.EQ(80)"

Trace capturing all backend traffic specific to service service1 along with corresponding client side traffic

start nstrace -size 0 -filter "CONNECTION.SVCNAME.EQ("service1")" -link ENABLED

Trace capturing all traffic through NS interface 1/1

start nstrace -filter "CONNECTION.INTF.EQ("1/1")"

Trace capturing all traffic specific through vlan 2

start nstrace -filter "CONNECTION.VLANID.EQ(2)"

Trace capturing all frontend (client side) traffic specific to lb vserver vserver1 along with corresponding server side traffic

start nstrace -size 0 -filter "CONNECTION.LB_VSERVER.NAME.EQ("vserver1")" -link ENABLED

link

Includes filtered connection's peer traffic.

Possible values: ENABLED, DISABLED

Default value: DISABLED

nodes

Nodes on which tracing is started.

Maximum value: 32

start nstrace -time 10

Stop running NetScaler packet capture tool.

stop nstrace

stop nstrace

Display nstrace parameters set through 'start nstrace' command.

show nstrace

state

Current running state of trace.

scope

Scope of started trace, local or cluster level.

traceLocation

Directory where current trace files are saved.

nf

Number of files to be generated in cycle.

time

Time per file (sec).

size

Size of the captured data. Set 0 for full packet trace.

mode

Capturing mode for trace. Mode can be any of the following values or combination of these values:

RX Received packets before NIC pipelining

NEW_RX Received packets after NIC pipelining

TX Transmitted packets

TXB Packets buffered for transmission

IPV6 Translated IPv6 packets

C2C Capture C2C message

NS_FR_TX TX/TXB packets are not captured in flow receiver.

Default mode: NEW_RX TXB

tcpdump

Trace is captured in TCPDUMP(.pcap) format. Default capture format is NSTRACE(.cap).

perNIC

Use separate trace files for each interface. Works only with tcpdump format.

fileName

Name of the trace file.

fileId

ID for the trace file name for uniqueness. Should be used only with -name option.

filter

Filter expression for nstrace. Maximum length of filter is 255 and it can be of following format:

<expression> [<relop> <expression>]

<relop> = (&& | ||)

nstrace supports two types of filter expressions:

Classic Expressions:

<expression> = the expression string in the format:

<qualifier> <operator> <qualifier-value>

<qualifier> = SOURCEIP.

<qualifier-value> = A valid IP address

<qualifier> = SOURCEPORT.

<qualifier-value> = A valid port number.

<qualifier> = DESTIP.

<qualifier-value> = A valid IP address.

<qualifier> = DESTPORT.

<qualifier-value> = A valid port number.

<qualifier> = IP.

<qualifier-value> = A valid IP address.

<qualifier> = PORT.

<qualifier-value> = A valid port number.

<qualifier> = SVCNAME.

<qualifier-value> = The name of a service.

<qualifier> = VSVRNAME.

<qualifier-value> = The name of a vserver.

<qualifier> = CONNID

<qualifier-value> = A valid PCB dev number.

<qualifier> = VLAN

<qualifier-value> = A valid VLAN ID.

<qualifier> = INTF

<qualifier-value> = A valid interface id in the form of x/y

(n/x/y in case of cluster interface).

<operator> = (== | eq | != | neq | > | gt

| < | lt | >= | ge | <= | le | BETWEEN)

eg: start nstrace -filter "SOURCEIP == 10.102.34.201 || (SVCNAME != s1 && SOURCEPORT > 80)"

The filter expression should be given in double quotes.

Default Expressions:

<expression> =:

CONNECTION.<qualifier>.<qualifier-method>.(<qualifier-value>)

<qualifier> = SRCIP

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv4 address.

example = CONNECTION.SRCIP.EQ(127.0.0.1)

<qualifier> = DSTIP

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv4 address.

example = CONNECTION.DSTIP.EQ(127.0.0.1)

<qualifier> = IP

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv4 address.

example = CONNECTION.IP.EQ(127.0.0.1)

<qualifier> = SRCIPv6

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv6 address.

example = CONNECTION.SRCIPv6.EQ(2001:db8:0:0:1::1)

<qualifier> = DSTIPv6

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv6 address.

example = CONNECTION.DSTIPv6.EQ(2001:db8:0:0:1::1)

<qualifier> = IPv6

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid IPv6 address.

example = CONNECTION.IPv6.EQ(2001:db8:0:0:1::1)

<qualifier> = SRCPORT

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid port number.

example = CONNECTION.SRCPORT.EQ(80)

<qualifier> = DSTPORT

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid port number.

example = CONNECTION.DSTPORT.EQ(80)

<qualifier> = PORT

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid port number.

example = CONNECTION.PORT.EQ(80)

<qualifier> = VLANID

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid vlan ID.

example = CONNECTION.VLANID.EQ(0)

<qualifier> = CONNID

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid PCB dev number.

example = CONNECTION.CONNID.EQ(0)

<qualifier> = PPEID

<qualifier-method> = [EQ | NE | GT | GE | LT | LE]

<qualifier-value> = A valid core ID.

example = CONNECTION.PPEID.EQ(0)

<qualifier> = SVCNAME

<qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH

| ENDSWITH]

<qualifier-value> = A valid text string.

example = CONNECTION.SVCNAME.EQ("name")

<qualifier> = INTF

<qualifier-method> = [EQ | NE]

<qualifier-value> = A valid interface id in the

form of x/y.

example = CONNECTION.INTF.EQ("x/y")

eg: start nstrace -filter "CONNECTION.SRCIP.EQ(127.0.0.1) || (CONNECTION.SVCNAME.NE("s1") && CONNECTION.SRCPORT.EQ(80))"

The filter expression should be given in double quotes.

common use cases:

Trace capturing full sized traffic from/to ip 10.102.44.111, excluding loopback traffic

start nstrace -size 0 -filter "CONNECTION.IP.NE(127.0.0.1) && CONNECTION.IP.EQ(10.102.44.111)"

Trace capturing all traffic to (terminating at) port 80 or 443

start nstrace -size 0 -filter "CONNECTION.DSTPORT.EQ(443) || CONNECTION.DSTPORT.EQ(80)"

Trace capturing all backend traffic specific to service service1 along with corresponding client side traffic

start nstrace -size 0 -filter "CONNECTION.SVCNAME.EQ("service1")" -link ENABLED

Trace capturing all traffic through NS interface 1/1

start nstrace -filter "CONNECTION.INTF.EQ("1/1")"

Trace capturing all traffic specific through vlan 2

start nstrace -filter "CONNECTION.VLANID.EQ(2)"

Trace capturing all frontend (client side) traffic specific to lb vserver vserver1 along with corresponding server side traffic

start nstrace -size 0 -filter "CONNECTION.LB_VSERVER.NAME.EQ("vserver1")" -link ENABLED

link

Includes filtered connection's peer traffic.

nodes

Nodes on which tracing is started.

server

Sep 22, 2015

The following operations can be performed on "server":

add | rm | set | unset | enable | disable | show | rename

Creates a server entry on the NetScaler appliance. The NetScaler appliance supports two types of servers: IP address based servers and domain based servers.

add server <name>@ (<IPAddress>@ | (<domain>@ [-domainResolveRetry <integer>] [-IPv6Address (YES | NO)]) | (-translationIp <ip_addr> -translationMask <netmask>)) [-state (ENABLED | DISABLED)] [-comment <string>] [-td <positive_integer>]

name

Name for the server.

Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

Can be changed after the name is created.

IPAddress

IPv4 or IPv6 address of the server. If you create an IP address based server, you can specify the name of the server, instead of its IP address, when creating a service. Note: If you do not create a server entry, the server IP address that you enter when you create a service becomes the name of the server.

domain

Domain name of the server. For a domain based configuration, you must create the server first.

translationIp

IP address used to transform the server's DNS-resolved IP address.

domainResolveRetry

Time, in seconds, for which the NetScaler appliance must wait, after DNS resolution fails, before sending the next DNS query to resolve the domain name.

Default value: 5

Minimum value: 5

Maximum value: 20939

state

Initial state of the server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

IPv6Address

Support IPv6 addressing mode. If you configure a server with the IPv6 addressing mode, you cannot use the server in the IPv4 addressing mode.

Possible values: YES, NO

Default value: NO

comment

Any information about the server.

td

Traffic Domain Id.

Maximum value: 4094

add server web_serv 10.102.27.150 To add multiple servers you can use the following command: add server serv[1-3] 10.102.27.[151-153] The above command adds thre

---

Removes a server entry from the NetScaler appliance.

rm server <name>@ ...

name

Name of the server entry to remove.

rm server web_svr To remove the servers named serv1, serv2 and serv3 at once you can use the following command: rm server serv[1-3]

Modifies the specified parameters of a server entry.

set server <name>@ [-IPAddress <ip_addr|ipv6_addr|*>@ | -domainResolveRetry <integer> | -translationIp <ip_addr> | -translationMask <netmask> | -domainResolveNow] [-comment <string>]

name

Name of the server whose parameters you are configuring.

IPAddress

Name of the server whose parameters you are configuring.

domainResolveRetry

Time, in seconds, for which the NetScaler appliance must wait, after DNS resolution fails, before sending the next DNS query to resolve the domain name.

Default value: 5

Minimum value: 5

Maximum value: 20939

translationIp

IP address used to transform the server's DNS-resolved IP address.

translationMask

The netmask of the translation ip

domainResolveNow

Immediately send a DNS query to resolve the server's domain name.

comment

Any information about the server.

set server http_svr -IPAddress 10.102.1.112 To set multiple servers IP addresses at onece you can use the following command: setserver serv[1-3] -IPAddress 10.102.27.

Use this command to remove server settings.Refer to the set server command for meanings of the arguments.

unset server <name>@ -comment

Enables all services on the specified server.

enable server <name>@

name

Name of the server to enable.

enable server web_serv To enable all the services configured on servers named serv1, serv2 and serv3 at once, use the following command: enable server serv[1-3]

Disables all services on the server. When a server is disabled, all services on the server are disabled.

disable server <name>@ [<delay>] [-graceFul (YES | NO)]

name

Name of the server to disable.

delay

Time, in seconds, after which all the services configured on the server are disabled.

graceFul

Shut down gracefully, without accepting any new connections, and disabling each service when all of its connections are closed.

Possible values: YES, NO

Default value: NO

disable server web_svr 30 To disable all the services configured on servers named serv1, serv2 and serv3 at once, use the following command: disable server serv[1-3]

Displays the parameters of all the server entries on the appliance, or the parameters of the specified server entry.

show server [<name> | -internal]

name

Name of the server for which to display parameters.

internal

Display names of the servers that have been created for internal use.

---

service

Sep 22, 2015

The following operations can be performed on "service":

add | rm | set | unset | bind | unbind | enable | disable | show | rename | stat

Creates a service on the NetScaler appliance. If the service is domain based, before you create the service, create the server entry by using the add server command. Then, in this command, specify the Server parameter.

add service <name>@ (<IP>@ | <serverName>@) <serviceType> <port> [-clearTextPort <port>] [-cacheType <cacheType>] [-maxClient <positive_integer>] [-healthMonitor (YES | NO)] [-maxReq <positive_integer>] [-cacheable (YES | NO)] [-cip (ENABLED | DISABLED) [<cipHeader>]] [-usip (YES | NO)] [-pathMonitor (YES | NO)] [-pathMonitorIndv (YES | NO)] [-useproxyport (YES | NO)] [-sc (ON | OFF)] [-sp (ON | OFF)] [-rtspSessionidRemap (ON | OFF)] [-cltTimeout <secs>] [-svrTimeout <secs>] [-CustomServerID <string>] [-CKA (YES | NO)] [-TCPB (YES | NO)] [-CMP (YES | NO)] [-maxBandwidth <positive_integer>] [-accessDown (YES | NO)] [-monThreshold <positive_integer>] [-state (ENABLED | DISABLED)] [-downStateFlush (ENABLED | DISABLED)] [-tcpProfileName <string>] [-httpProfileName <string>] [-hashId <positive_integer>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>] [-td <positive_integer>]

name

Name for the service. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the service has been created.

IP

IP to assign to the service.

serverName

Name of the server that hosts the service.

serviceType

Protocol in which data is exchanged with the service.

Possible values: HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, RADIUS, RDP, DIAMETER, SSL_DIAMETER, TFTP

port

Port number of the service.

clearTextPort

Port to which clear text data must be sent after the appliance decrypts incoming SSL traffic. Applicable to transparent SSL services.

Minimum value: 1

cacheType

Cache type supported by the cache server.

Possible values: TRANSPARENT, REVERSE, FORWARD

maxClient

Maximum number of simultaneous open connections to the service.

Maximum value: 4294967294

healthMonitor

Monitor the health of this service. Available settings function as follows:

YES - Send probes to check the health of the service.

NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times.

Possible values: YES, NO

Default value: YES

maxReq

Maximum number of requests that can be sent on a persistent connection to the service.

Note: Connection requests beyond this value are rejected.

Maximum value: 65535

cacheable

Use the transparent cache redirection virtual server to forward requests to the cache server.

Note: Do not specify this parameter if you set the Cache Type parameter.

Possible values: YES, NO

Default value: NO

cip

Before forwarding a request to the service, insert an HTTP header with the client's IPv4 or IPv6 address as its value. Used if the server needs the client's IP address for security, accounting, or other purposes, and setting the Use Source IP parameter is not a viable option.

Possible values: ENABLED, DISABLED

cipHeader

Name for the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If you set the Client IP parameter, and you do not specify a name for the header, the appliance uses the header name specified for the global Client IP Header parameter (the cipHeader parameter in the set ns param CLI command or the Client IP Header parameter in the Configure HTTP Parameters dialog box at System > Settings > Change HTTP parameters). If the global Client IP Header parameter is not specified, the appliance inserts a header with the name "client-ip."

usip

Use the client's IP address as the source IP address when initiating a connection to the server. When creating a service, if you do not set this parameter, the service inherits the global Use Source IP setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the service.

Possible values: YES, NO

pathMonitor

Path monitoring for clustering

Possible values: YES, NO

pathMonitorIndv

Individual Path monitoring decisions

Possible values: YES, NO

useproxyport

Use the proxy port as the source port when initiating connections with the server. With the NO setting, the client-side connection port is used as the source port for the server-side connection.

Note: This parameter is available only when the Use Source IP (USIP) parameter is set to YES.

Possible values: YES, NO

sc

State of SureConnect for the service.

Possible values: ON, OFF

Default value: OFF

sp

Enable surge protection for the service.

Possible values: ON, OFF

rtspSessionidRemap

Enable RTSP session ID mapping for the service.

Possible values: ON, OFF

Default value: OFF

cltTimeout

Time, in seconds, after which to terminate an idle client connection.

Maximum value: 31536000

svrTimeout

Time, in seconds, after which to terminate an idle server connection.

Maximum value: 31536000

CustomServerID

Unique identifier for the service. Used when the persistency type for the virtual server is set to Custom Server ID.

Default value: "None"

serverID

The identifier for the service. This is used when the persistency type is set to Custom Server ID.

CKA

Enable client keep-alive for the service.

Possible values: YES, NO

TCPB

Enable TCP buffering for the service.

Possible values: YES, NO

CMP

Enable compression for the service.

Possible values: YES, NO

maxBandwidth

Maximum bandwidth, in Kbps, allocated to the service.

Maximum value: 4294967287

accessDown

Use Layer 2 mode to bridge the packets sent to this service if it is marked as DOWN. If the service is DOWN, and this parameter is disabled, the packets are dropped.

Possible values: YES, NO

Default value: NO

monThreshold

Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

Maximum value: 65535

state

Initial state of the service.

Possible values: ENABLED, DISABLED

Default value: ENABLED

downStateFlush

Perform delayed clean-up of connections to the service.

Possible values: ENABLED, DISABLED

Default value: ENABLED

tcpProfileName

Name of the TCP profile that contains TCP configuration settings for the service.

httpProfileName

Name of the HTTP profile that contains HTTP configuration settings for the service.

hashId

A numerical identifier that can be used by hash based load balancing methods. Must be unique for each service.

Minimum value: 1

comment

Any information about the service.

appflowLog

Enable logging of AppFlow information.

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

Network profile to use for the service.

td

Traffic Domain Id.

Maximum value: 4094

add service http_svc 10.102.1.112 http 80 The below command adds the service web_svc1 for the server web_serv1, web_svc2 for web_serv2 and web_svc3 for web_serv3.

Removes a service.

rm service <name>@

name

Name of the service.

rm service http_svc To remove services svc1, svc2 and svc3 in one go use the following command: rm service svc[1-3]

Modifies the parameters of an existing service.

set service <name>@ [-IPAddress <ip_addr|ipv6_addr|*>@] [-maxClient <positive_integer>] [-maxReq <positive_integer>] [-cacheable (YES | NO)] [-cip (ENABLED | DISABLED) [<cipHeader>]] [-usip (YES | NO)] [-pathMonitor (YES | NO)] [-pathMonitorIndv (YES | NO)] [-useproxyport (YES | NO)] [-sc (ON | OFF)] [-sp (ON | OFF)] [-rtspSessionidRemap (ON | OFF)] [-healthMonitor (YES | NO)] [-cltTimeout <secs>] [-svrTimeout <secs>] [-CustomServerID <string>] [-CKA (YES | NO)] [-TCPB (YES | NO)] [-CMP (YES | NO)] [-maxBandwidth <positive_integer>] [-accessDown (YES | NO)] [-monThreshold <positive_integer>] [-weight <positive_integer> <monitorName>] [-downStateFlush (ENABLED | DISABLED)] [-tcpProfileName <string>] [-httpProfileName <string>] [-hashId <positive_integer>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>]

name

Name of the service for which to modify parameters.

IPAddress

The new IP address of the service.

maxClient

Maximum number of simultaneous open connections to the service.

Maximum value: 4294967294

maxReq

Maximum number of requests that can be sent on a persistent connection to the service.

Note: Connection requests beyond this value are rejected.

Maximum value: 65535

cacheable

Use the transparent cache redirection virtual server to forward requests to the cache server.

Note: Do not specify this parameter if you set the Cache Type parameter.

Possible values: YES, NO

Default value: NO

cip

Before forwarding a request to the service, insert an HTTP header with the client's IPv4 or IPv6 address as its value. Used if the server needs the client's IP address for security, accounting, or other purposes, and setting the Use Source IP parameter is not a viable option.

Possible values: ENABLED, DISABLED

usip

Use the client's IP address as the source IP address when initiating a connection to the server. When creating a service, if you do not set this parameter, the service inherits the global Use Source IP setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the service.

Possible values: YES, NO

pathMonitor

Path monitoring for clustering

Possible values: YES, NO

pathMonitorIndv

Individual Path monitoring decisions

Possible values: YES, NO

useproxyport

Use the proxy port as the source port when initiating connections with the server. With the NO setting, the client-side connection port is used as the source port for the server-side connection.

Note: This parameter is available only when the Use Source IP (USIP) parameter is set to YES.

Possible values: YES, NO

sc

State of SureConnect for the service.

Possible values: ON, OFF

Default value: OFF

sp

Enable surge protection for the service.

Possible values: ON, OFF

rtspSessionidRemap

Enable RTSP session ID mapping for the service.

Possible values: ON, OFF

Default value: OFF

healthMonitor

Monitor the health of this service. Available settings function as follows:

YES - Send probes to check the health of the service.

NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times.

Possible values: YES, NO

Default value: YES

cltTimeout

Time, in seconds, after which to terminate an idle client connection.

Maximum value: 31536000

svrTimeout

Time, in seconds, after which to terminate an idle server connection.

Maximum value: 31536000

CustomServerID

Unique identifier for the service. Used when the persistency type for the virtual server is set to Custom Server ID.

Default value: "None"

serverID

The identifier for the service. This is used when the persistency type is set to Custom Server ID.

CKA

Enable client keep-alive for the service.

Possible values: YES, NO

TCPB

Enable TCP buffering for the service.

Possible values: YES, NO

CMP

Enable compression for the service.

Possible values: YES, NO

maxBandwidth

Maximum bandwidth, in Kbps, allocated to the service.

Maximum value: 4294967287

accessDown

Use Layer 2 mode to bridge the packets sent to this service if it is marked as DOWN. If the service is DOWN, and this parameter is disabled, the packets are dropped.

Possible values: YES, NO

Default value: NO

monThreshold

Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

Maximum value: 65535

weight

Weight to assign to the monitor-service binding. When a monitor is UP, the weight assigned to its binding with the service determines how much the monitor contributes toward keeping the health of the service above the value configured for the Monitor Threshold parameter.

Minimum value: 1

Maximum value: 100

downStateFlush

Perform delayed clean-up of connections to the service.

Possible values: ENABLED, DISABLED

Default value: ENABLED

tcpProfileName

Name of the TCP profile that contains TCP configuration settings for the service.

httpProfileName

Name of the HTTP profile that contains HTTP configuration settings for the service.

hashId

A numerical identifier that can be used by hash based load balancing methods. Must be unique for each service.

Minimum value: 1

comment

Any information about the service.

appflowLog

Enable logging of AppFlow information.

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

Network profile to use for the service.

set service http_svc -maxClient 100 The following command sets IP address 10.102.27.53 for service svc1, 10.102.27.54 for svc2 and 10.102.27.55 for svc3. set service :

Removes the parameter settings of the specified service. Attributes for which a default value is available revert to their default values..Refer to the set service command for meanings of the arguments.

unset service <name>@ [-maxClient] [-maxReq] [-cacheable] [-cip] [-usip] [-pathMonitor] [-pathMonitorIndv] [-useproxyport] [-sc] [-sp] [-rtspSessionidRemap] [-CustomServerID] [-CKA] [-TCPB] [-CMP] [-maxBandwidth] [-accessDown] [-monThreshold] [-cltTimeout] [-svrTimeout] [-tcpProfileName] [-httpProfileName] [-hashId] [-appflowLog] [-netProfile] [-cipHeader] [-healthMonitor] [-monitorName] [-downStateFlush] [-comment]

unset service http_svc -maxClient To unset maxclients for services svc1, svc2 and svc3, the following command can be used: unset service svc[1-3] -maxClient

---

Binds a policy or a monitor to a service.

bind service <name>@ (-policyName <string> | (-monitorName <string>@ [-monState (ENABLED | DISABLED)] [-weight <positive_integer>] [-passive]))

name

Name of the service to which to bind a policy or monitor.

policyName

Name of the policy to bind to the service.

monitorName

Name of the monitor to bind to the service.

bind service svc1 -policyName pol1 To bind svc1, svc2 and svc3 to the policy pol1 you can use the following command: bind service svc[1-3] -policyName pol1

Unbinds a policy or monitor from the specified service.

unbind service <name>@ (-policyName <string> | -monitorName <string>@)

name

Name of the service from which to unbind a policy or monitor.

policyName

Name of the policy to unbind.

monitorName

Name of the monitor assigned to the service.

unbind service http_svc -policyName pol1 To unbind a policy called pol1 on services svc1, svc2 and svc3, use the following command: unbind service svc[1-3] -policyNam

---

Enables a service.

enable service <name>@

name

Name of the service.

enable service http_svc To enable svc1, svc2 and svc3 in one go use the following command: enable service svc[1-3]

Disables a service.

disable service <name>@ [<delay>] [-graceFul (YES | NO)]

name

Name of the service.

delay

Time, in seconds, allocated to the NetScaler appliance for a graceful shutdown of the service. During this period, new requests are sent to the service only for clients who already have persistent sessions on the appliance. Requests from new clients are load balanced among other available services. After the delay time expires, no requests are sent to the service, and the service is marked as unavailable (OUT OF SERVICE).

graceFul

Shut down gracefully, not accepting any new connections, and disabling the service when all of its connections are closed.

Possible values: YES, NO

Default value: NO

disable service http_svc 10 To disable svc1, svc2 and svc3 in one go use the following command: disable service svc[1-3] 10

Displays a list of all services configured on the NetScaler appliance, or the configuration details of the specified service.

show service [<name> | -all | -internal] show service bindings - alias for 'show svcbindings'

name

Name of the service for which to display configuration details.

all

Display both user-configured and dynamically learned services.

internal

Display only dynamically learned services.

summary

fullValues

format

level

numOfconnections

This will tell the number of client side connections are still open.

serverName

The name of the server for which a service has created.

policyName

The name of the policyname for which this service is bound

serviceType

The type of service

serviceConfTpye

The configuration type of the serviceNOTE: This attribute is deprecated.This will no longer show the correct information. Use the serviceConfType option instead.

serviceConfType

The configuration type of the serviceNOTE: This attribute is deprecated.This will no longer show the correct information. Use the serviceConfType2 option instead.

serviceConfType2

The configuration type of the service (Internal/Dynamic/Configured).

port

Port number of the service.

value

SSL status.

clearTextPort

The clear-text port number where clear-text data is sent. Used with SSL offload service

gslb

The GSLB option for the corresponding virtual server.

cacheType

Cache type supported by the cache server.

maxClient

Maximum number of simultaneous open connections to the service.

maxReq

Maximum number of requests that can be sent on a persistent connection to the service.

Note: Connection requests beyond this value are rejected.

cacheable

Use the transparent cache redirection virtual server to forward requests to the cache server.

Note: Do not specify this parameter if you set the Cache Type parameter.

cip

Before forwarding a request to the service, insert an HTTP header with the client's IPv4 or IPv6 address as its value. Used if the server needs the client's IP address for security, accounting, or other purposes, and setting the Use Source IP parameter is not a viable option.

cipHeader

The client IP header.

usip

The use of client's IP Address option.

pathMonitor

Path monitoring for clustering

pathMonitorIndv

Individual Path monitoring for decisions.

useproxyport

The use of client's Port.

sc

The state of SureConnect for the service.

weight

The weight for the specified monitor.

state

Initial state of the service.

sp

Enable surge protection for the service.

rtspSessionidRemap

Enable RTSP session ID mapping for the service.

failedprobes

Number of the current failed monitoring probes.

cltTimeout

The idle time in seconds after which the client connection is terminated.

totalprobes

The total number of probs sent.

svrTimeout

The idle time in seconds after which the server connection is terminated.

totalfailedprobes

The total number of failed probs.

publicIP

public ip

publicPort

public port

CustomServerID

The identifier for the service. Used when the persistency type is set to Custom Server ID.

serverID

The identifier for the service. This is used when the persistency type is set to Custom Server ID.NOTE: This attribute is deprecated.Instead of integer now serverId will be a string and you can use -customserverid instead of -serverID.

CKA

Enable client keep-alive for the service.

TCPB

Enable TCP buffering for the service.

CMP

Enable compression for the service.

maxBandwidth

The maximum bandwidth in kbps allowed for the service

accessDown

The option to allow access to disabled or down services. If enabled, all packets to the service are bridged; if disabled, they are dropped.

svrState

The state of the service

delay

The remaining time in seconds for the service to be disabled

IPAddress

The IP address of the server.

monitorName

The monitor Names.

monThreshold

Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

monState

The running state of the monitor on this service.

monStatCode

The code indicating the monitor response.

lastresponse

The string form of monstatcode.

responseTime

Response time of this monitor.

monStatParam1

First parameter for use with message code.

monStatParam2

Second parameter for use with message code.

monStatParam3

Third parameter for use with message code.

downStateFlush

Perform delayed clean-up of connections to the service.

stateChangeTimeSec

Time when last state change happened. Seconds part.

stateChangeTimemSec

Time at which last state change happened. Milliseconds part.

timeSinceLastStateChange

Time in milliseconds since the last state change.NOTE: This attribute is deprecated.This will no longer show the correct information. Use the ticksSinceLastStateChange option instead.

ticksSinceLastStateChange

Time in 10 millisecond ticks since the last state change.

StateUpdateReason

Checks state update reason on the secondary node.

ClMonOwner

Tells the mon owner of the service.

ClMonView

Tells the view id of the monitoring owner.

tcpProfileName

Name of the TCP profile.

httpProfileName

Name of the HTTP profile that contains HTTP configuration settings for the service.

hashId

A numerical identifier that can be used by hash based load balancing methods. Must be unique for each service.

graceFul

Indicates graceful shutdown of the service. System will wait for all outstanding connections to this service to be closed before disabling the service.

comment

Comments associated with this service.

monitorTotalProbes

Total number of probes sent to monitor this service.

monitorTotalFailedProbes

Total number of failed probes

monitorCurrentFailedProbes

Total number of currently failed probes

stateflag

stateflag

healthMonitor

Monitor the health of this service. Available settings function as follows:

YES - Send probes to check the health of the service.

NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times.

appflowLog

Enable logging of AppFlow information.

netProfile

Network profile to use for the service.

svccfgFlags

Contains the information about config info like internal/configured service

serviceIPstr

This field has been intorduced to show the dbs services ip

svcMonFlags

to store the flags of monitor bound to it

td

Traffic Domain Id.

passive

Indicates if load monitor is passive. A passive load monitor does not remove service from LB decision when threshold is breached.

devno

count

The following is sample output of the show service -all command: 4 configured services: 1) svc1 (10.124.99.12:80) - HTTP State: UP

Renames a service.

rename service <name>@ <newName>@

name

Existing name of the service to be renamed.

newName

New name for the service. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

rename service svc1 svcnew

Displays statistics that have been collected for the specified service.

stat service [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

name

Name of the service.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

Throughput (Mbps) (Throughput)

Number of bytes received or sent by this service (Mbps).

Average server TTFB (SvrTTFB)

Average TTFB between the NetScaler appliance and the server.TTFB is the time interval between sending the request packet to a service and receiving the first response from the service

IP address (IP)

The IP address on which the service is running.

Port (port)

The port on which the service is running.

Service type (Type)

The service type of this service.Possible values are ADNS, DNS, MYSQL, RTSP, SSL_DIAMETER, ADNS_TCP, DNS_TCP, NNTP, SIP_UDP, SSL_TCP, ANY, FTP, RADIUS, SNMP, TCP, DHCPRA, HTTP, RDP, SSL, TFTP, DIAMETER, MSSQL, RPCSVR, SSL_BRIDGE, UDP

State

Current state of the server. Possible values are UP, DOWN, UNKNOWN, OFS(Out of Service), TROFS(Transition Out of Service), TROFS_DOWN(Down When going Out of Service)

Requests (Req)

Total number of requests received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Responses (Rsp)

Number of responses received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Request bytes (Reqb)

Total number of request bytes received on this service or virtual server.

Response bytes (Rspb)

Number of response bytes received by this service or virtual server.

Current client connections (ClntConn)

Number of current client connections.

Requests in surge queue (SurgeQ)

Number of requests in the surge queue.

Current server connections (SvrConn)

Number of current connections to the actual servers behind the virtual server.

Current Server Est connections (SvrEstConn)

Number of server connections in ESTABLISHED state.

Connections in reuse pool (ReuseP)

Number of requests in the idle queue/reuse pool.

Maximum server connections (MaxConn)

Maximum open connections allowed on this service.

Current load on the service (Load)

Load on the service that is calculated from the bound load based monitor.

Current flags on the service (CurtFlags)

Current flags on the service for internal use in display handlers.

Service hits (Hits)

Number of times that the service has been provided.

ActvTrans

Number of active transactions handled by this service. (Including those in the surge queue.)

Active Transaction means number of transactions currently served by the server including those waiting in the SurgeQ

Total Packets rcvd (PktRx)

Total number of packets received by this service or virtual server.

Total Packets sent (PktTx)

Total number of packets sent.

serviceGroup

Sep 22, 2015

The following operations can be performed on "serviceGroup":

add | rm | set | unset | bind | unbind | enable | disable | show | stat | rename

Creates a service group. You can group similar services into a service group and use them as a single entity.

add serviceGroup <serviceGroupName>@ <serviceType> [-cacheType <cacheType>] [-td <positive_integer>] [-maxClient <positive_integer>] [-maxReq <positive_integer>] [-cacheable (YES | NO)] [-cip (ENABLED | DISABLED) [<cipHeader>]] [-usip (YES | NO)] [-pathMonitor (YES | NO)] [-pathMonitorIndv (YES | NO)] [-useproxyport (YES | NO)] [-healthMonitor (YES | NO)] [-sc (ON | OFF)] [-sp (ON | OFF)] [-rtspSessionidRemap (ON | OFF)] [-cltTimeout <secs>] [-svrTimeout <secs>] [-CKA (YES | NO)] [-TCPB (YES | NO)] [-CMP (YES | NO)] [-maxBandwidth <positive_integer>] [-monThreshold <positive_integer>] [-state (ENABLED | DISABLED)] [-downStateFlush (ENABLED | DISABLED)] [-tcpProfileName <string>] [-httpProfileName <string>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>] [-autoScale <autoScale> -memberPort <port>]

serviceGroupName

Name of the service group. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the name is created.

serviceType

Protocol used to exchange data with the service.

Possible values: HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, RADIUS, RDP, DIAMETER, SSL_DIAMETER, TFTP

cacheType

Cache type supported by the cache server.

Possible values: TRANSPARENT, REVERSE, FORWARD

td

Traffic Domain Id.

Maximum value: 4094

maxClient

Maximum number of simultaneous open connections for the service group.

Maximum value: 4294967294

maxReq

Maximum number of requests that can be sent on a persistent connection to the service group.

Note: Connection requests beyond this value are rejected.

Maximum value: 65535

cacheable

Use the transparent cache redirection virtual server to forward the request to the cache server.

Note: Do not set this parameter if you set the Cache Type.

Possible values: YES, NO

Default value: NO

cip

Insert the Client IP header in requests forwarded to the service.

Possible values: ENABLED, DISABLED

cipHeader

Name of the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If client IP insertion is enabled, and the client IP header is not specified, the value of Client IP Header parameter or the value set by the set ns config command is used as client's IP header name.

usip

Use client's IP address as the source IP address when initiating connection to the server. With the NO setting, which is the default, a mapped IP (MIP) address or subnet IP (SNIP) address is used as the source IP address to initiate server side connections.

Possible values: YES, NO

pathMonitor

Path monitoring for clustering

Possible values: YES, NO

pathMonitorIndv

Individual Path monitoring decisions.

Possible values: YES, NO

useproxyport

Use the proxy port as the source port when initiating connections with the server. With the NO setting, the client-side connection port is used as the source port for the server-side connection.

Note: This parameter is available only when the Use Source IP (USIP) parameter is set to YES.

Possible values: YES, NO

healthMonitor

Monitor the health of this service. Available settings function as follows:

YES - Send probes to check the health of the service.

NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times.

Possible values: YES, NO

Default value: YES

sc

State of the SureConnect feature for the service group.

Possible values: ON, OFF

Default value: OFF

sp

Enable surge protection for the service group.

Possible values: ON, OFF

Default value: OFF

rtspSessionidRemap

Enable RTSP session ID mapping for the service group.

Possible values: ON, OFF

Default value: OFF

cltTimeout

Time, in seconds, after which to terminate an idle client connection.

Maximum value: 31536000

svrTimeout

Time, in seconds, after which to terminate an idle server connection.

Maximum value: 31536000

CKA

Enable client keep-alive for the service group.

Possible values: YES, NO

TCPB

Enable TCP buffering for the service group.

Possible values: YES, NO

CMP

Enable compression for the specified service.

Possible values: YES, NO

maxBandwidth

Maximum bandwidth, in Kbps, allocated for all the services in the service group.

Maximum value: 4294967287

monThreshold

Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

Maximum value: 65535

state

Initial state of the service group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

downStateFlush

Perform delayed clean-up of connections to all services in the service group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

tcpProfileName

Name of the TCP profile that contains TCP configuration settings for the service group.

httpProfileName

Name of the HTTP profile that contains HTTP configuration settings for the service group.

comment

Any information about the service group.

appflowLog

Enable logging of AppFlow information for the specified service group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

Network profile for the service group.

autoScale

Auto scale option for a servicegroup

Possible values: DISABLED, DNS, POLICY

Default value: NSA_AS_DISABLED

add servicegroup http_svc_group http To add service groups sgrp1, sgrp2 and sgrp3 at one go use the following command: add servicegroup sgrp[1-3] http

---

Removes a service group.

rm serviceGroup <serviceGroupName>@

serviceGroupName

Name of the service group.

rm servicegroup http_svc_group To remove multiple servicegroups at once, the following command can be used: rm servicegroup http_svc_group[1-3]

Modifies the specified parameters of a service group.

set serviceGroup <serviceGroupName>@ [(<serverName>@ <port> [-weight <positive_integer>] [-CustomServerID <string>] [-hashId <positive_integer>]) | -maxClient <positive_integer> | -maxReq <positive_integer> | -cacheable (YES | NO) | -cip (ENABLED | DISABLED) | <cipHeader> | -usip (YES | NO) | -useproxyport (YES | NO) | -sc (ON | OFF) | -sp (ON | OFF) | -

rtspSessionidRemap (ON | OFF) | -cltTimeout <secs> | -svrTimeout <secs> | -CKA (YES | NO) | -TCPB (YES | NO) | -CMP (YES | NO) | -maxBandwidth <positive_integer> | -monThreshold <positive_integer> | -downStateFlush (ENABLED | DISABLED)] [-monitorName <string> -weight <positive_integer>] [-healthMonitor (YES | NO)] [-pathMonitor (YES | NO)] [-pathMonitorIndv (YES | NO)] [-tcpProfileName <string>] [-httpProfileName <string>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>]

serviceGroupName

Name of the service group.

serverName

Name of the server to which to bind the service group.

monitorName

Name of the monitor bound to the service group. Used to assign a weight to the monitor.

maxClient

Maximum number of simultaneous open connections for the service group.

Maximum value: 4294967294

maxReq

Maximum number of requests that can be sent on a persistent connection to the service group.

Note: Connection requests beyond this value are rejected.

Maximum value: 65535

healthMonitor

Monitor the health of this service. Available settings function as follows:

YES - Send probes to check the health of the service.

NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times.

Possible values: YES, NO

Default value: YES

cacheable

Use the transparent cache redirection virtual server to forward the request to the cache server.

Note: Do not set this parameter if you set the Cache Type.

Possible values: YES, NO

Default value: NO

cip

Insert the Client IP header in requests forwarded to the service.

Possible values: ENABLED, DISABLED

usip

Use client's IP address as the source IP address when initiating connection to the server. With the NO setting, which is the default, a mapped IP (MIP) address or subnet IP (SNIP) address is used as the source IP address to initiate server side connections.

Possible values: YES, NO

pathMonitor

Path monitoring for clustering

Possible values: YES, NO

pathMonitorIndv

Individual Path monitoring decisions.

Possible values: YES, NO

useproxyport

Use the proxy port as the source port when initiating connections with the server. With the NO setting, the client-side connection port is used as the source port for the server-side connection.

Note: This parameter is available only when the Use Source IP (USIP) parameter is set to YES.

Possible values: YES, NO

sc

State of the SureConnect feature for the service group.

Possible values: ON, OFF

Default value: OFF

sp

Enable surge protection for the service group.

Possible values: ON, OFF

Default value: OFF

rtspSessionidRemap

Enable RTSP session ID mapping for the service group.

Possible values: ON, OFF

Default value: OFF

cltTimeout

Time, in seconds, after which to terminate an idle client connection.

Maximum value: 31536000

svrTimeout

Time, in seconds, after which to terminate an idle server connection.

Maximum value: 31536000

CKA

Enable client keep-alive for the service group.

Possible values: YES, NO

TCPB

Enable TCP buffering for the service group.

Possible values: YES, NO

CMP

Enable compression for the specified service.

Possible values: YES, NO

maxBandwidth

Maximum bandwidth, in Kbps, allocated for all the services in the service group.

Maximum value: 4294967287

monThreshold

Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

Maximum value: 65535

downStateFlush

Perform delayed clean-up of connections to all services in the service group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

tcpProfileName

Name of the TCP profile that contains TCP configuration settings for the service group.

httpProfileName

Name of the HTTP profile that contains HTTP configuration settings for the service group.

comment

Any information about the service group.

appflowLog

Enable logging of AppFlow information for the specified service group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

Network profile for the service group.

set servicegroup http_svc_group -maxClient 100 To set the attribute maxclient for multiple servicegroups at once, use the following command: set servicegroup http_svc

---

Removes the attributes of the specified service group. Attributes for which a default value is available revert to their default values..Refer to the set serviceGroup command for meanings of the arguments.

unset serviceGroup <serviceGroupName>@ [<serverName>@ <port> [-weight] [-CustomServerID] [-hashId]] [-maxClient] [-maxReq] [-cacheable] [-cip] [-usip] [-useproxyport] [-sc] [-sp] [-rtspSessionidRemap] [-cltTimeout] [-svrTimeout] [-CKA] [-TCPB] [-CMP] [-maxBandwidth] [-monThreshold] [-tcpProfileName] [-httpProfileName] [-appflowLog] [-netProfile] [-monitorName] [-weight] [-healthMonitor] [-cipHeader] [-pathMonitor] [-pathMonitorIndv] [-downStateFlush] [-comment]

unset servicegroup http_svc_group -maxClient

Binds a service to a service group.

bind serviceGroup <serviceGroupName> ((<IP>@ <port>) | <serverName>@ | ((-monitorName <string>@ [-monState (ENABLED | DISABLED)] [-passive]) | -CustomServerID <string> | -state (ENABLED | DISABLED) | -hashId <positive_integer> | |)) [-weight <positive_integer>]

serviceGroupName

Name of the service group.

IP

IP address of the server that hosts the service. Mutually exclusive with the Server Name parameter.

serverName

Name of the server that hosts the service. Mutually exclusive with the IP address parameter.

port

Port number of the service. Each service must have a unique port number.

monitorName

The name of the service or a service group to which the monitor is to be bound.

weight

CustomServerID

Unique service identifier. Used when the persistency type for the virtual server is set to Custom Server ID.

Default value: "None"

serverID

The identifier for the service. This is used when the persistency type is set to Custom Server ID.

state

Initial state of the service after binding.

Possible values: ENABLED, DISABLED

Default value: ENABLED

hashId

Unique numerical identifier used by hash based load balancing methods to identify a service.

Minimum value: 1

bind servicegroup http_svc_group 10.102.27.153 80 To bind multiple servers to a servicegroup, following command can be used: bind servicegroup http_svc_group 10.10

Unbinds a service or a monitor from a service group.

unbind serviceGroup <serviceGroupName> ((<IP>@ <port>) | <serverName>@ | -monitorName <string>@)

serviceGroupName

Name of the service group.

IP

IP address of the server that hosts the service. Mutually exclusive with the Server Name parameter.

serverName

Name of the server that hosts the service. Mutually exclusive with the IP Address parameter.

port

Port number of the service.

monitorName

Name of the monitor to bind to the service group.

unbind servicegroup http_svc_group 10.102.27.153 80 To unbind multiple servers following command can be used: unbind servicegroup http_svc_group 10.102.27.[153-1

Enables a service group or a member of the service group.

enable serviceGroup <serviceGroupName>@ [<serverName>@ <port>]

serviceGroupName

Name of the service group.

serverName

Name of the server that hosts the service.

port

Port number of the service to be enabled.

enable servicegroup http_svc_group To enable multiple service groups at one go use the following command: enable servicegroup http_svc_group[1-3]

Disables a service group or a member of a service group. To disable a service group, provide only the service group name. To disable only a member of a service group, in addition to the service group name, provide the name of the server that hosts the service, and the port number of the service.

disable serviceGroup <serviceGroupName>@ [<serverName>@ <port>] [-delay <secs>] [-graceFul (YES | NO)]

serviceGroupName

Name of the service group.

serverName

Name of the server that hosts the service.

port

Port number of the service.

delay

Time, in seconds, allocated for a shutdown of the services in the service group. During this period, new requests are sent to the service only for clients who already have persistent sessions on

the appliance. Requests from new clients are load balanced among other available services. After the delay time expires, no requests are sent to the service, and the service is marked as unavailable (OUT OF SERVICE).

graceFul

Wait for all existing connections to the service to terminate before shutting down the service.

Possible values: YES, NO

Default value: NO

disable servicegroup http_svc_group 10.102.27.153 80 -delay 10 To disable multiple servicegroups use the following command: disable servicegroup http_svc_group[1-3

Displays the specified service group's binding information.

show serviceGroup [<serviceGroupName> | -includeMembers]

serviceGroupName

Name of the service group.

includeMembers

Display the members of the listed service groups in addition to their settings. Can be specified when no service group name is provided in the command. In that case, the details displayed for each service group are identical to the details displayed when a service group name is provided, except that bound monitors are not displayed.

summary

fullValues

format

level

numOfconnections

This will tell the number of client side connections are still open.

serviceType

Protocol used to exchange data with the service.

port

The port number of the service to be enabled.

td

Traffic Domain Id.

serviceConfTpye

serviceConfType

The configuration type of the service group.

value

SSL Status.

cacheType

Cache type supported by the cache server.

maxClient

Maximum number of simultaneous open connections for the service group.

maxReq

Maximum number of requests that can be sent on a persistent connection to the service group.

Note: Connection requests beyond this value are rejected.

cacheable

The state of cache on the service.

cip

Insert the Client IP header in requests forwarded to the service.

cipHeader

CIP Header.

usip

Use client's IP address as the source IP address when initiating connection to the server. With the NO setting, which is the default, a mapped IP (MIP) address or subnet IP (SNIP) address is used as the source IP address to initiate server side connections.

pathMonitor

Path monitoring for clustering

pathMonitorIndv

Individual Path monitoring decisions.

useproxyport

The use of client's Port.

monweight

weight of the monitor that is bound to servicegroup.

sc

Whether SureConnect is enabled on this service or not.

sp

Enable surge protection for the service group.

rtspSessionidRemap

Enable RTSP session ID mapping for the service group.

cltTimeout

Time, in seconds, after which to terminate an idle client connection.

svrTimeout

Time, in seconds, after which to terminate an idle server connection.

CKA

Enable client keep-alive for the service group.

TCPB

Enable TCP buffering for the service group.

CMP

Enable compression for the specified service.

maxBandwidth

Maximum bandwidth, in Kbps, allocated for all the services in the service group.

state

Monitor state.

svrState

The state of the service

delay

The remaning time in seconds for the service to be disabledNOTE: This attribute is deprecated.Changed from positional to keyword to avoid confusion with serverName

IP

IP Address.

serverName

The name of the server to be changed.

monitorName

Monitor name.

monThreshold

Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

monState

The running state of the monitor on this service.

weight

weight of the monitor that is bound to servicegroup.

CustomServerID

The identifier for this IP:Port pair. Used when the persistency type is set to Custom Server ID.

serverID

The identifier for the service. This is used when the persistency type is set to Custom Server ID.NOTE: This attribute is deprecated.Instead of integer now serverId will be a string and you can use -customserverid instead of -serverID.

monStatCode

The code indicating the monitor response.

monStatParam1

First parameter for use with message code.

monStatParam2

Second parameter for use with message code.

monStatParam3

Third parameter for use with message code.

monitorTotalProbes

Total number of probes sent to monitor this service.

monitorTotalFailedProbes

Total number of failed probes

monitorCurrentFailedProbes

Total number of currently failed probes

downStateFlush

Perform delayed cleanup of connections on this vserver.

lastresponse

The string form of monstatcode.

stateChangeTimeSec

Time when last state change occurred. Seconds part.

stateChangeTimemSec

Time when last state change occurred. Milliseconds part.

timeSinceLastStateChange

Time in milliseconds since the last state change.NOTE: This attribute is deprecated.This will no longer show the correct information. Use the ticksSinceLastStateChange option instead.

ticksSinceLastStateChange

Time in 10 millisecond ticks since the last state change.

StateUpdateReason

Checks state update reason on the secondary node.

ClMonOwner

Tells the mon owner of the service.

ClMonView

Tells the view id of the monitoring owner.

groupCount

Servicegroup Count

comment

Any information about the service group.

tcpProfileName

Name of the TCP profile that contains TCP configuration settings for the service group.

httpProfileName

Name of the HTTP profile that contains HTTP configuration settings for the service group.

hashId

The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods.

graceFul

Indicates graceful shutdown of the service. System will wait for all outstanding connections to this service to be closed before disabling the service.

healthMonitor

Monitor the health of this service. Available settings function as follows:

YES - Send probes to check the health of the service.

NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times.

appflowLog

Enable logging of AppFlow information for the specified service group.

netProfile

Network profile for the service group.

autoScale

Auto scale option for a servicegroup

memberPort

member port

serviceIPstr

This field has been intorduced to show the dbs services ip

serviceGroupEntName2

passive

Indicates if load monitor is passive. A passive load monitor does not remove service from LB decision when threshold is breached.

devno

count

stateflag

Displays configuration statistics of the specified service group or all the service groups configured on the appliance.

stat serviceGroup [<serviceGroupName>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

serviceGroupName

Name of the service group for which to display settings.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

State

Current state of the server. Possible values are UP, DOWN, UNKNOWN, OFS(Out of Service), TROFS(Transition Out of Service), TROFS_DOWN(Down When going Out of Service)

Service type (Type)

The service type of this service.Possible values are ADNS, DNS, MYSQL, RTSP, SSL_DIAMETER, ADNS_TCP, DNS_TCP, NNTP, SIP_UDP, SSL_TCP, ANY, FTP, RADIUS, SNMP, TCP, DHCPRA, HTTP, RDP, SSL, TFTP, DIAMETER, MSSQL, RPCSVR, SSL_BRIDGE, UDP

Renames a service group.

rename serviceGroup <serviceGroupName>@ <newName>@

serviceGroupName

Existing name of the service group.

newName

New name for the service group.

rename service svcgrp1 svcgrp-new1

---

serviceGroupMember

Sep 22, 2015

The following operations can be performed on "serviceGroupMember":

stat serviceGroupMember

Display statistics of a service group member.

Synopsys

stat serviceGroupMember <serviceGroupName> (<IP> | <serverName>) <port> [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

serviceGroupName

Displays statistics for the specified service group.Name of the service group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my servicegroup" or 'my servicegroup').

IP

IP address of the service group. Mutually exclusive with the server name parameter.

serverName

Name of the server. Mutually exclusive with the IP address parameter.

port

Port number of the service group member.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Average server TTFB (SvrTTFB)

Average TTFB between the NetScaler appliance and the server.TTFB is the time interval between sending the request packet to a service and receiving the first response from the service

IP address (IP)

The IP address on which the service is running.

Port (port)

The port on which the service is running.

Service type (Type)

The service type of this service.Possible values are ADNS, DNS, MYSQL, RTSP, SSL_DIAMETER, ADNS_TCP, DNS_TCP, NNTP, SIP_UDP, SSL_TCP, ANY, FTP, RADIUS, SNMP, TCP, DHCPRA, HTTP, RDP, SSL, TFTP, DIAMETER, MSSQL, RPCSVR, SSL_BRIDGE, UDP

State

Current state of the server. Possible values are UP, DOWN, UNKNOWN, OFS(Out of Service), TROFS(Transition Out of Service), TROFS_DOWN(Down When going Out of Service)

Requests (Req)

Total number of requests received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Responses (Rsp)

Number of responses received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Request bytes (Reqb)

Total number of request bytes received on this service or virtual server.

Response bytes (Rspb)

Number of response bytes received by this service or virtual server.

Current client connections (ClntConn)

Number of current client connections.

Requests in surge queue (SurgeQ)

Number of requests in the surge queue.

Current server connections (SvrConn)

Number of current connections to the actual servers behind the virtual server.

Current Server Est connections (SvrEstConn)

Number of server connections in ESTABLISHED state.

Connections in reuse pool (ReuseP)

Number of requests in the idle queue/reuse pool.

Maximum server connections (MaxConn)

Maximum open connections allowed on this service.

servicegroupbindings

Sep 22, 2015

The following operations can be performed on "servicegroupbindings":

show servicegroupbindings

Displays servicegroup information followed by vservers bound to it.

Synopsys

show servicegroupbindings <serviceGroupName>

Arguments

serviceGroupName

The name of the service.

Outputs

IPAddress

The IP address of the vserver.

port

The port of the vserver.

state

The state of the service group

svrState

The state of the vserver

vServerName

The name of the vserver.

stateflag

devno

count

svcbindings

Sep 22, 2015

The following operations can be performed on "svcbindings":

show svcbindings

Displays a list of all virtual servers to which the service is bound.

Synopsys

show svcbindings <serviceName>

Arguments

serviceName

The name of the service.

Outputs

IPAddress

The IP address of the vserver.

port

The port of the vserver.

svrState

The state of the vserver

vServerName

The name of the vserver.

stateflag

devno

count

uiinternal

Sep 22, 2015

The following operations can be performed on "uiinternal":

set | unset | show

set uiinternal

set uiinternal data for the entities

Synopsys

set uiinternal <entityType> <name> [-template <string>] [-comment <string>] [-rule <string>]

Arguments

entityType

The entitiy type of UI internal data

Possible values: LBVSERVER, GSLBVSERVER, CRVSERVER, VPNVSERVER, CSVSERVER, AUTHENTICATIONVSERVER, SERVER, SERVICE, SERVICEGROUP, GSLBSERVICE, EXPRESSION, VPNURL

name

The entity name

template

The application template associated with entity

comment

The application template associated with entity

rule

rules associated with entity

Example

```
set uiinternal lbvserver v1 -template app1
```

---

unset uiinternal

unset uiinternal for the entities.Refer to the set uiinternal command for meanings of the arguments.

Synopsys

unset uiinternal <entityType> <name> [-template] [-comment] [-rule] [-all]

Example

unset uiinternal lbvserver v1 -template app1

---

show uiinternal

display all UI internal data information for the entities

Synopsys

show uiinternal [<entityType>] [<name>]

Arguments

entityType

The entitiy type of UI internal data

Possible values: LBVSERVER, GSLBVSERVER, CRVSERVER, VPNVSERVER, CSVSERVER, AUTHENTICATIONVSERVER, SERVER, SERVICE, SERVICEGROUP, GSLBSERVICE, EXPRESSION, VPNURL

name

The entity name

summary

fullValues

format

level

Outputs

template

The template associated with the entity

comment

The comment associated with the entity

uiinfo

The uiinfo associated with the entity

rule

The rule associated with the entity

devno

count

stateflag

Example

show uiinternal LBVSERVER v1

vserver

Sep 22, 2015

The following operations can be performed on "vserver":

rm | set | unset | enable | disable | show

rm vserver

Use this command to remove a virtual server. NOTE: This command is deprecated.This command is deprecated in 10.0, instead you can use commands such as rm lb vserver

Synopsys

Arguments

name

The name of the virtual server to be removed.

Example

```
rm vserver lb_vip  To remove multiple vservers, use the following command:  rm vserver lb_vip[1-3]
```

---

set vserver

Use this command to modify the parameters for an existing virtual server. NOTE: This command is deprecated.This command is deprecated in 10.0, instead you can use commands such as set lb vserver

Synopsys

Arguments

name

The name of the virtual server for which the parameters are to be set.

backupVServer

The name of the backup virtual server for this virtual server.

redirectURL

The URL where traffic is redirected if the virtual server in the system becomes unavailable.

cacheable

Use this option to specify whether a virtual server (used for load balancing or content switching) routes requests to the cache redirection virtual server before sending it to the configured servers.

Possible values: YES, NO

cltTimeout

The timeout value in seconds for idle client connection

Maximum value: 31536000

soMethod

The spillover factor. The system will use this value to determine if it should send traffic to the backupvserver when the main virtual server reaches the spillover threshold.

Possible values: CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE

soPersistence

The state of the spillover persistence.

Possible values: ENABLED, DISABLED

Default value: DISABLED

soPersistenceTimeOut

The spillover persistence entry timeout.

Default value: 2

Minimum value: 2

Maximum value: 1440

soThreshold

The spillver threshold value.

Minimum value: 1

Maximum value: 4294967294

pushVserver

The lb vserver of type PUSH/SSL_PUSH to which server pushes the updates received on the client facing non-push lb vserver.

Example

set vserver lb_vip -backupVServerName bkvip_lbvip To set backup vserver for multiple vservers at once, use the following command: set vserver lb_vip[1-3] -backupVServ

---

unset vserver

Use this command to unset the backup virtual server or the redirectURL that has been set on the virtual server..Refer to the set vserver command for meanings of the arguments.NOTE: This command is deprecated.

Synopsys

Example

unset vserver lb_vip -backupVServer To unset the backup vserver for multiple vservers use the following command: unset vserver lb_vip[1-3] -backupVServer

---

enable vserver

Use this command to enable a virtual server. Note: Virtual servers, when added, are enabled by default. NOTE: This command is deprecated.This command is deprecated in 10.0, instead you can use commands such as enable lb vserver

Synopsys

Arguments

name

The name of the virtual server to be enabled.

Example

enable vserver lb_vip To enable multiple vservers, use the following command: enable vserver lb_vip[1-3]

---

disable vserver

Use this command to disable (take out of service) a virtual server. NOTE: This command is deprecated.This command is deprecated in 10.0, instead you can use commands such as disable lb vserver

Synopsys

Arguments

name

The name of the virtual server to be disabled.

Notes:

1. The system will continue to respond to ARP and/or ping requests for the IP address of this virtual server.

2. As the virtual server is still configured in the system, you can enable the virtual server using the ###enable vserver### command.

Example

disable vserver lb_vip To disable multiple vservers, use the following command: disable vserver lb_vip[1-3]

---

show vserver

Displays information about all virtual servers configured on the appliance.

Synopsys

show vserver

Example

show vserver lb_vip

Cache Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- cache
- cache contentGroup
- cache forwardProxy
- cache global
- cache object
- cache parameter
- cache policy
- cache policylabel
- cache selector
- cache stats

cache

Sep 22, 2015

The following operations can be performed on "cache":

stat cache

Shows Integrated Cache performance statistics.

Synopsys

stat cache [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

Maximum memory(KB) Deprecated (MaxMem)

Largest amount of memory the NetScaler can dedicate to caching, up to 50% of available memory. A 0 value disables caching, but the caching module continues to run.

Recent successful reval ratio(%) (RPSucRev)

Recently recorded percentage of times stored content was successfully revalidated by a 304 response rather than by a full response

Recent storable miss ratio(%) (RPctStMis)

Recently recorded ratio of store-able misses to all misses expressed as percentage.

Recent parameterized 304 hit ratio(%) (RPPHit)

Recently recorded ratio of parameterized 304 hits to all parameterized hits expressed as a percentage

Recent origin bandwidth saved(%) (RPOrBan)

Bytes served from cache divided by total bytes served to client. This ratio can be greater than 1 because of the assumption that all compression has been done in the NetScaler.

Recent hit ratio(%) (RPctHit)

Recently recorded cache hit ratio expressed as percentage

Recent byte hit ratio(%) (RPcByHit)

Recently recorded cache byte hit ratio expressed as percentage. Here we define byte hit ratio as ((number of bytes served from the cache)/(total number of bytes served to the client)). This is the standard definition of Byte Hit

Ratio. If compression is turned ON in NS then this ratio doesn't mean much. This might under or over estimate the origin-to-cache bandwidth saving (depending upon whether bytes served by CMP in NetScaler are more or less than compressed bytes served from the cache). If CMP is turned OFF in NS then this ratio is same as cacheRecentPercentOriginBandwidthSaved.

Recent 304 hit ratio(%) (RPct304Hit)

Recently recorded ratio of 304 hits to all hits expressed as percentage

Utilized memory(KB) (UtiMem)

Amount of memory the integrated cache is currently using.

Maximum memory active value(KB) (MaxMemActive)

Currently active value of maximum memory

Maximum memory(KB) (Max64Mem)

Largest amount of memory the NetScaler can dedicate to caching, up to 50% of available memory. A 0 value disables caching, but the caching module continues to run.

Poll every time hit ratio(%) (PPeHit)

Percentage of cache hits in content groups that have Poll Every Time enabled, relative to all searches of content groups with Poll Every Time enabled.

Poll every time hits (PeHit)

Number of times a cache hit was found during a search of a content group that has Poll Every Time enabled.

Parameterized 304 hit ratio(%) (PP304Hit)

Percentage of parameterized 304 hits relative to all parameterized hits.

Total parameterized hits (PHit)

Parameterized requests resulting in either a 304 or non-304 hit.

Successful reval ratio(%) (PSucRev)

Percentage of times stored content was successfully revalidated by a 304 (Object Not Modifed) response rather than by a full response

Storable miss ratio(%) (PStrMiss)

Responses that were fetched from the origin, stored in the cache, and then served to the client, as a percentage of all cache misses.

Conversions to conditional req (FuToCon)

Number of user-agent requests for a cached Poll Every Time (PET) response that were sent to the origin server as conditional requests.

Successful revalidations (TSucRev)

Total number of times stored content was successfully revalidated by a 304 Not Modified response from the origin.

Revalidations (Reval)

Responses that an intervening cache revalidated with the integrated cache before serving, as determined by a Cache-Control: Max-Age header configurable in the integrated cache

Non-storable misses (NStrMiss)

Cache misses for which the fetched response is not stored in the cache. These responses match policies with a NOCACHE action or are affected by Poll Every Time.

Storable misses (StrMiss)

Cache misses for which the fetched response is stored in the cache before serving it to the client. Storable misses conform to a built-in or user-defined caching policy that contains a CACHE action.

Compressed bytes from cache (CmpBySer)

Number of compressed bytes served from the cache

Byte hit ratio(%) (PByHit)

Bytes served from the cache divided by total bytes served to the client. If compression is On in the NetScaler, this ratio may not reflect the bytes served by the compression module. If the compression is Off, this ratio is the same as cachePercentOriginBandwidthSaved.

Bytes served by cache (BySer)

Total number of bytes served from the integrated cache

Bytes served by NetScaler (RespBy)

Total number of HTTP response bytes served by NetScaler from both the origin and the cache

304 hit ratio(%) (Pct304Hit)

304 responses as a percentage of all responses that the NetScaler served.

Marker objects (NumMark)

Marker objects created when a response exceeds the maximum or minimum size for entries in its content group or has not yet received the minimum number of hits required for items in its content group.

Origin bandwidth saved(%) (POrBan)

Percentage of origin bandwidth saved, expressed as number of bytes served from the integrated cache divided by all bytes served. The assumption is that all compression is done in the NetScaler.

Hit ratio(%) (PctHit)

Cache hits as percentage of the total number of requests

Misses (TotMiss)

Intercepted HTTP requests requiring fetches from origin server.

Hits (TotHit)

Responses served from the integrated cache. These responses match a policy with a CACHE action.

Requests (CacReq)

Total cache hits plus total cache misses.

Cached objects (NumCac)

Responses currently in integrated cache. Includes responses fully downloaded, in the process of being downloaded, and expired or flushed but not yet removed.

Objects saved on disk (NumObjCacDsk)

Cached responses currently saved on disk. Includes responses fully saved to disk, and expired or flushed but not yet removed.

MB read from disk (NumMBReadsDisk)

Total Number of MB read from disk since last reboot.

MB written to disk (NumMBWritesDisk)

Total Number of MB written to disk since last reboot.

Hits being served (CacHit)

This number should be close to the number of hits being served currently.

Misses being handled (CurMiss)

Responses fetched from the origin and served from the cache. Should approximate storable misses. Does not include non-storable misses.

Non-304 hits (Non304Hit)

Total number of full (non-304) responses served from the cache. A 304 status code indicates that a response has not been modified since the last time it was served

304 hits (304Hit)

Object not modified responses served from the cache. (Status code 304 served instead of the full response.)

sql hits (sqlHit)

sql response served from cache

Expire at last byte (ExpLa)

Instances of content expiring immediately after receiving the last body byte due to the Expire at Last Byte setting for the content group.

Flashcache misses (FlMi)

Number of requests to a content group with flash cache enabled that were cache misses. Flash cache distributes the response to all the clients in aqueue.

Flashcache hits (FlHi)

Number of requests to a content group with flash cache enabled that were cache hits. The flash cache setting queues requests that arrive simultaneously and distributes the response to all the clients in the queue.

Parameterized inval requests (PInReq)

Requests matching a policy with an invalidation (INVAL) action and a content group that uses an invalidation selector or parameters.

Full inval requests (NPInReq)

Requests that match an invalidation policy where the invalGroups parameter is configured and expires one or more content groups.

Inval requests (INStrMis)

Requests that match an invalidation policy and result in expiration of specific cached responses or entire content groups.

Parameterized requests (PReq)

Total number of requests where the content group has hit and invalidation parameters or selectors.

Parameterized non-304 hits (PN304Hit)

Parameterized requests resulting in a full response (not status code 304: Object Not Updated) served from the cache.

Parameterized 304 hits (P304Hit)

Parameterized requests resulting in an object not modified (status code 304) response.

Poll every time requests (PeReq)

Requests that triggered a search of a content group that has Poll Every Time (PET) enabled (always consult the origin server before serving cached data).

Memory allocation failures (ErrMem)

Total number of times the cache failed to allocate memory to store responses.

Largest response so far(B) (LarResp)

Size, in bytes, of largest response sent to client from the cache or the origin server.

MB saved on disk (NumMBCacDsk)

Size (MB) of cached responses currently saved on disk. Includes responses fully saved to disk, and expired or flushed but not yet removed.

Compressed bytes transmitted

Number of bytes the NetScaler sends to the client after compressing the response from the server.

Compressible bytes received

Number of bytes that can be compressed, which the NetScaler receives from the server. This gives the content length of the response that the NetScaler receives from server.

Response bytes received (HTRspbRx)

Total number of bytes of HTTP response data received.

cache contentGroup

Sep 22, 2015

The following operations can be performed on "cache contentGroup":

add | rm | set | unset | show | expire | flush

add cache contentGroup

Creates a new content group for grouping cached objects on the basis of some unique property.

Synopsys

add cache contentGroup <name> [-weakPosRelExpiry <secs> | -relExpiry <secs> | -relExpiryMilliSec <msecs> | -absExpiry <HH:MM> ... | -absExpiryGMT <HH:MM> ...] [-heurExpiryParam <positive_integer>] [-weakNegRelExpiry <secs>] [(-hitParams <string> ... [-ignoreParamValueCase (YES | NO) | -hitSelector <string> | -invalSelector <string>] [-matchCookies (YES | NO)])] [-invalParams <string> ... [-invalRestrictedToHost (YES | NO)]] [-pollEveryTime (YES | NO)] [-ignoreReloadReq (YES | NO)] [-removeCookies (YES | NO)] [-prefetch (YES | NO) [-prefetchPeriod <secs> | -prefetchPeriodMilliSec <msecs>]] [-prefetchMaxPending <positive_integer>] [-flashCache (YES | NO)] [-expireAtLastByte (YES | NO)] [-insertVia (YES | NO)] [-insertAge (YES | NO)] [-insertETag (YES | NO)] [-cacheControl <string>] [-quickAbortSize <KBytes>] [-minResSize <KBytes>] [-maxResSize <KBytes>] [-memLimit <MBytes>] [-ignoreReqCachingHdrs (YES | NO)] [-minHits <integer>] [-alwaysEvalPolicies (YES | NO)] [-pinned (YES | NO)] [-lazyDnsResolve (YES | NO)] [-type <type>]

Arguments

name

Name for the content group. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the content group is created.

weakPosRelExpiry

Relative expiry time, in seconds, for expiring positive responses with response codes between 200 and 399. Cannot be used in combination with other Expiry attributes. Similar to -relExpiry but has lower precedence.

Default value: VAL_NOT_SET

Maximum value: 31536000

heurExpiryParam

Heuristic expiry time, in percent of the duration, since the object was last modified.

Default value: VAL_NOT_SET

Maximum value: 100

relExpiry

Relative expiry time, in seconds, after which to expire an object cached in this content group.

Default value: VAL_NOT_SET

Maximum value: 31536000

relExpiryMilliSec

Relative expiry time, in milliseconds, after which to expire an object cached in this content group.

Default value: VAL_NOT_SET

Maximum value: 86400000

absExpiry

Local time, up to 4 times a day, at which all objects in the content group must expire.

CLI Users:

For example, to specify that the objects in the content group should expire by 11:00 PM, type the following command: add cache contentgroup <contentgroup name> -absexpiry 23:00

To specify that the objects in the content group should expire at 10:00 AM, 3 PM, 6 PM, and 11:00 PM, type: add cache contentgroup <contentgroup name> -absexpiry 10:00 15:00 18:00 23:00

absExpiryGMT

Coordinated Universal Time (GMT), up to 4 times a day, when all objects in the content group must expire.

weakNegRelExpiry

Relative expiry time, in seconds, for expiring negative responses. This value is used only if the expiry time cannot be determined from any other source. It is applicable only to the following status codes: 307, 403, 404, and 410.

Default value: VAL_NOT_SET

Maximum value: 31536000

hitParams

Parameters to use for parameterized hit evaluation of an object. Up to 128 parameters can be specified. Mutually exclusive with the Hit Selector parameter.

invalParams

Parameters for parameterized invalidation of an object. You can specify up to 8 parameters. Mutually exclusive with invalSelector.

ignoreParamValueCase

Ignore case when comparing parameter values during parameterized hit evaluation. (Parameter value case is ignored by default during parameterized invalidation.)

Possible values: YES, NO

Default value: VAL_NOT_SET

matchCookies

Evaluate for parameters in the cookie header also.

Possible values: YES, NO

Default value: VAL_NOT_SET

invalRestrictedToHost

Take the host header into account during parameterized invalidation.

Possible values: YES, NO

Default value: VAL_NOT_SET

pollEveryTime

Always poll for the objects in this content group. That is, retrieve the objects from the origin server whenever they are requested.

Possible values: YES, NO

Default value: NO

ignoreReloadReq

Ignore any request to reload a cached object from the origin server.

To guard against Denial of Service attacks, set this parameter to YES. For RFC-compliant behavior, set it to NO.

Possible values: YES, NO

Default value: YES

removeCookies

Remove cookies from responses.

Possible values: YES, NO

Default value: YES

prefetch

Attempt to refresh objects that are about to go stale.

Possible values: YES, NO

Default value: YES

prefetchPeriod

Time period, in seconds before an object's calculated expiry time, during which to attempt prefetch.

Default value: VAL_NOT_SET

Maximum value: 4294967294

prefetchPeriodMilliSec

Time period, in milliseconds before an object's calculated expiry time, during which to attempt prefetch.

Default value: VAL_NOT_SET

Maximum value: 4294967290

prefetchMaxPending

Maximum number of outstanding prefetches that can be queued for the content group.

Default value: VAL_NOT_SET

Maximum value: 4294967294

flashCache

Perform flash cache. Mutually exclusive with Poll Every Time (PET) on the same content group.

Possible values: YES, NO

Default value: NO

expireAtLastByte

Force expiration of the content immediately after the response is downloaded (upon receipt of the last byte of the response body). Applicable only to positive responses.

Possible values: YES, NO

Default value: NO

insertVia

Insert a Via header into the response.

Possible values: YES, NO

Default value: YES

insertAge

Insert an Age header into the response. An Age header contains information about the age of the object, in seconds, as calculated by the integrated cache.

Possible values: YES, NO

Default value: YES

insertETag

Insert an ETag header in the response. With ETag header insertion, the integrated cache does not serve full responses on repeat requests.

Possible values: YES, NO

Default value: YES

cacheControl

Insert a Cache-Control header into the response.

quickAbortSize

If the size of an object that is being downloaded is less than or equal to the quick abort value, and a client aborts during the download, the cache stops downloading the response. If the object is larger than the quick abort size, the cache continues to download the response.

Default value: 4194303

Maximum value: 4194303

minResSize

Minimum size of a response that can be cached in this content group.

Default minimum response size is 0.

Maximum value: 2097151

maxResSize

Maximum size of a response that can be cached in this content group.

Default value: 80

Maximum value: 2097151

memLimit

Maximum amount of memory that the cache can use. The effective limit is based on the available memory of the NetScaler appliance.

Default value: 65536

ignoreReqCachingHdrs

Ignore Cache-Control and Pragma headers in the incoming request.

Possible values: YES, NO

Default value: YES

minHits

Number of hits that qualifies a response for storage in this content group.

alwaysEvalPolicies

Force policy evaluation for each response arriving from the origin server. Cannot be set to YES if the Prefetch

parameter is also set to YES.

Possible values: YES, NO

Default value: NO

pinned

Do not flush objects from this content group under memory pressure.

Possible values: YES, NO

Default value: NO

lazyDnsResolve

Perform DNS resolution for responses only if the destination IP address in the request does not match the destination IP address of the cached response.

Possible values: YES, NO

Default value: YES

hitSelector

Selector for evaluating whether an object gets stored in a particular content group. A selector is an abstraction for a collection of PIXL expressions.

invalSelector

Selector for invalidating objects in the content group. A selector is an abstraction for a collection of PIXL expressions.

type

The type of the content group.

Possible values: HTTP, MYSQL, MSSQL

Default value: NSSVC_HTTP

---

rm cache contentGroup

Removes the specified content group. Before removing, make sure that no cache policy has its storeInGroup attribute set to this group, otherwise the group cannot be removed.

Synopsys

rm cache contentGroup <name>

Arguments

name

Name of the content group to be removed.

---

set cache contentGroup

Modifies the specified attributes of the content group.

Synopsys

set cache contentGroup <name> [-weakPosRelExpiry <secs> | -relExpiry <secs> | -relExpiryMilliSec <msecs> | -absExpiry <HH:MM> ... | -absExpiryGMT <HH:MM> ...] [-heurExpiryParam <positive_integer>] [-weakNegRelExpiry <secs>] [-hitParams <string> ... | -hitSelector <string> | -invalSelector <string>] [-invalParams <string> ...] [-ignoreParamValueCase (YES | NO)] [-matchCookies (YES | NO)] [-invalRestrictedToHost (YES | NO)] [-pollEveryTime (YES | NO)] [-ignoreReloadReq (YES | NO)] [-removeCookies (YES | NO)] [-prefetch (YES | NO)] [-prefetchPeriod <secs> | -prefetchPeriodMilliSec <msecs>] [-prefetchMaxPending <positive_integer>] [-flashCache (YES | NO)] [-expireAtLastByte (YES | NO)] [-insertVia (YES | NO)] [-insertAge (YES | NO)] [-insertETag (YES | NO)] [-cacheControl <string>] [-quickAbortSize <KBytes>] [-minResSize <KBytes>] [-maxResSize <KBytes>] [-memLimit <MBytes>] [-ignoreReqCachingHdrs (YES | NO)] [-minHits <integer>] [-alwaysEvalPolicies (YES | NO)] [-pinned (YES | NO)] [-lazyDnsResolve (YES | NO)]

Arguments

name

Name of the content group to be modified.

weakPosRelExpiry

Relative expiry time, in seconds, for expiring positive responses with response codes between 200 and 399. Cannot be used in combination with other Expiry attributes. Similar to -relExpiry but has lower precedence.

Maximum value: 31536000

heurExpiryParam

Heuristic expiry time, in percent of the duration, since the object was last modified.

Maximum value: 100

relExpiry

Relative expiry time, in seconds, after which to expire an object cached in this content group.

Default value: VAL_NOT_SET

Maximum value: 31536000

relExpiryMilliSec

Relative expiry time, in milliseconds, after which to expire an object cached in this content group.

Default value: VAL_NOT_SET

Maximum value: 86400000

absExpiry

Local time, up to 4 times a day, at which all objects in the content group must expire.

CLI Users:

For example, to specify that the objects in the content group should expire by 11:00 PM, type the following command: add cache contentgroup <contentgroup name> -absexpiry 23:00

To specify that the objects in the content group should expire at 10:00 AM, 3 PM, 6 PM, and 11:00 PM, type: add cache contentgroup <contentgroup name> -absexpiry 10:00 15:00 18:00 23:00

absExpiryGMT

Coordinated Universal Time (GMT), up to 4 times a day, when all objects in the content group must expire.

weakNegRelExpiry

Relative expiry time, in seconds, for expiring negative responses. This value is used only if the expiry time cannot be determined from any other source. It is applicable only to the following status codes: 307, 403, 404, and 410.

Maximum value: 31536000

hitParams

Parameters to use for parameterized hit evaluation of an object. Up to 128 parameters can be specified. Mutually exclusive with the Hit Selector parameter.

invalParams

Parameters for parameterized invalidation of an object. You can specify up to 8 parameters. Mutually exclusive with invalSelector.

ignoreParamValueCase

Ignore case when comparing parameter values during parameterized hit evaluation. (Parameter value case is ignored by default during parameterized invalidation.)

Possible values: YES, NO

matchCookies

Evaluate for parameters in the cookie header also.

Possible values: YES, NO

invalRestrictedToHost

Take the host header into account during parameterized invalidation.

Possible values: YES, NO

pollEveryTime

Always poll for the objects in this content group. That is, retrieve the objects from the origin server whenever they are requested.

Possible values: YES, NO

Default value: NO

ignoreReloadReq

Ignore any request to reload a cached object from the origin server.

To guard against Denial of Service attacks, set this parameter to YES. For RFC-compliant behavior, set it to NO.

Possible values: YES, NO

Default value: YES

removeCookies

Remove cookies from responses.

Possible values: YES, NO

Default value: YES

prefetch

Attempt to refresh objects that are about to go stale.

Possible values: YES, NO

Default value: YES

prefetchPeriod

Time period, in seconds before an object's calculated expiry time, during which to attempt prefetch.

Default value: VAL_NOT_SET

Maximum value: 4294967294

prefetchPeriodMilliSec

Time period, in milliseconds before an object's calculated expiry time, during which to attempt prefetch.

Default value: VAL_NOT_SET

Maximum value: 4294967290

prefetchMaxPending

Maximum number of outstanding prefetches that can be queued for the content group.

Maximum value: 4294967294

flashCache

Perform flash cache. Mutually exclusive with Poll Every Time (PET) on the same content group.

Possible values: YES, NO

Default value: NO

expireAtLastByte

Force expiration of the content immediately after the response is downloaded (upon receipt of the last byte of the response body). Applicable only to positive responses.

Possible values: YES, NO

Default value: NO

insertVia

Insert a Via header into the response.

Possible values: YES, NO

Default value: YES

insertAge

Insert an Age header into the response. An Age header contains information about the age of the object, in seconds, as calculated by the integrated cache.

Possible values: YES, NO

Default value: YES

insertETag

Insert an ETag header in the response. With ETag header insertion, the integrated cache does not serve full responses on repeat requests.

Possible values: YES, NO

Default value: YES

cacheControl

Insert a Cache-Control header into the response.

quickAbortSize

If the size of an object that is being downloaded is less than or equal to the quick abort value, and a client aborts during the download, the cache stops downloading the response. If the object is larger than the quick abort size, the cache continues to download the response.

Maximum value: 4194303

minResSize

Minimum size of a response that can be cached in this content group.

Default minimum response size is 0.

Maximum value: 2097151

maxResSize

Maximum size of a response that can be cached in this content group.

Default value: 80

Maximum value: 2097151

memLimit

Maximum amount of memory that the cache can use. The effective limit is based on the available memory of the NetScaler appliance.

Default value: 65536

ignoreReqCachingHdrs

Ignore Cache-Control and Pragma headers in the incoming request.

Possible values: YES, NO

Default value: YES

minHits

Number of hits that qualifies a response for storage in this content group.

alwaysEvalPolicies

Force policy evaluation for each response arriving from the origin server. Cannot be set to YES if the Prefetch parameter is also set to YES.

Possible values: YES, NO

Default value: NO

pinned

The option for IC from flushing objects from this contentgroup under memory pressure. Set YES for IC to take this state.

Possible values: YES, NO

Default value: NO

lazyDnsResolve

Perform DNS resolution for responses only if the destination IP address in the request does not match the destination IP address of the cached response.

Possible values: YES, NO

Default value: YES

hitSelector

Selector for evaluating whether an object gets stored in a particular content group. A selector is an abstraction for a collection of PIXL expressions.

invalSelector

Selector for invalidating objects in the content group. A selector is an abstraction for a collection of PIXL expressions.

---

unset cache contentGroup

Use this command to remove cache contentGroup settings.Refer to the set cache contentGroup command for meanings of the arguments.

Synopsys

unset cache contentGroup <name> [-weakPosRelExpiry] [-heurExpiryParam] [-relExpiry] [-relExpiryMilliSec] [-absExpiry] [-absExpiryGMT] [-weakNegRelExpiry] [-hitParams] [-invalParams] [-ignoreParamValueCase] [-matchCookies] [-invalRestrictedToHost] [-pollEveryTime] [-ignoreReloadReq] [-removeCookies] [-prefetch] [-prefetchPeriod] [-prefetchPeriodMilliSec] [-prefetchMaxPending] [-flashCache] [-expireAtLastByte] [-insertVia] [-insertAge] [-insertETag] [-cacheControl] [-quickAbortSize] [-minResSize] [-maxResSize] [-memLimit] [-ignoreReqCachingHdrs] [-minHits] [-alwaysEvalPolicies] [-pinned] [-lazyDnsResolve] [-hitSelector] [-invalSelector]

---

show cache contentGroup

Displays information about all content groups, or about the specified content group.

Synopsys

show cache contentGroup [<name>]

Arguments

name

Name of the content group about which to display information.

summary

fullValues

format

level

Outputs

flags

Flags.

type

The type of the content group.

relExpiry

The relative expiry time in seconds.

relExpiryMilliSec

Relative expiry time, in milliseconds, after which to expire an object cached in this content group.

absExpiry

Local time, up to 4 times a day, at which all objects in the content group must expire.

CLI Users:

For example, to specify that the objects in the content group should expire by 11:00 PM, type the following command: add cache contentgroup <contentgroup name> -absexpiry 23:00

To specify that the objects in the content group should expire at 10:00 AM, 3 PM, 6 PM, and 11:00 PM, type: add cache contentgroup <contentgroup name> -absexpiry 10:00 15:00 18:00 23:00

absExpiryGMT

Coordinated Universal Time (GMT), up to 4 times a day, when all objects in the content group must expire.

heurExpiryParam

Heuristic expiry time, in percent of the duration, since the object was last modified.

weakPosRelExpiry

Relative expiry time, in seconds, for expiring positive responses with response codes between 200 and 399. Cannot be used in combination with other Expiry attributes. Similar to -relExpiry but has lower precedence.

weakNegRelExpiry

Relative expiry time, in seconds, for expiring negative responses. This value is used only if the expiry time cannot be determined from any other source. It is applicable only to the following status codes: 307, 403, 404, and 410.

hitParams

Parameters to use for parameterized hit evaluation of an object. Up to 128 parameters can be specified. Mutually exclusive with the Hit Selector parameter.

invalParams

Parameters for parameterized invalidation of an object. You can specify up to 8 parameters. Mutually exclusive with invalSelector.

ignoreParamValueCase

Ignore case when comparing parameter values during parameterized hit evaluation. (Parameter value case is ignored by default during parameterized invalidation.)

matchCookies

Evaluate for parameters in the cookie header also.

invalRestrictedToHost

Take the host header into account during parameterized invalidation.

pollEveryTime

Always poll for the objects in this content group. That is, retrieve the objects from the origin server whenever they are requested.

ignoreReloadReq

Ignore any request to reload a cached object from the origin server.

To guard against Denial of Service attacks, set this parameter to YES. For RFC-compliant behavior, set it to NO.

removeCookies

Remove cookies from responses.

prefetch

Attempt to refresh objects that are about to go stale.

prefetchPeriod

Time period, in seconds before an object's calculated expiry time, during which to attempt prefetch.

prefetchPeriodMilliSec

Time period, in milliseconds before an object's calculated expiry time, during which to attempt prefetch.

prefetchCur

Current outstanding prefetches.

prefetchMaxPending

Maximum number of outstanding prefetches that can be queued for the content group.

flashCache

Perform flash cache. Mutually exclusive with Poll Every Time (PET) on the same content group.

expireAtLastByte

Force expiration of the content immediately after the response is downloaded (upon receipt of the last byte of the response body). Applicable only to positive responses.

insertVia

Insert a Via header into the response.

insertAge

Insert an Age header into the response. An Age header contains information about the age of the object, in seconds, as calculated by the integrated cache.

insertETag

Insert an ETag header in the response. With ETag header insertion, the integrated cache does not serve full responses on repeat requests.

cacheControl

Insert a Cache-Control header into the response.

quickAbortSize

If the size of an object that is being downloaded is less than or equal to the quick abort value, and a client aborts during the download, the cache stops downloading the response. If the object is larger than the quick abort size, the cache continues to download the response.

minResSize

Minimum size of a response that can be cached in this content group.

Default minimum response size is 0.

maxResSize

Maximum size of a response that can be cached in this content group.

memUsage

Current memory usage.

memLimit

Maximum amount of memory that the cache can use. The effective limit is based on the available memory of the NetScaler appliance.

ignoreReqCachingHdrs

Ignore Cache-Control and Pragma headers in the incoming request.

cacheNon304Hits

Cache non 304 hits.

cache304Hits

Cache 304 hits.

cacheCells

Number of cells.

cacheGroupIncarnation

Cache group incarnation.

minHits

Number of hits that qualifies a response for storage in this content group.

alwaysEvalPolicies

Force policy evaluation for each response arriving from the origin server. Cannot be set to YES if the Prefetch parameter is also set to YES.

persist

Setting persist to YES causes IC to save objects in contentgroup to disk.

pinned

Do not flush objects from this content group under memory pressure.

lazyDnsResolve

Perform DNS resolution for responses only if the destination IP address in the request does not match the destination IP address of the cached response.

hitSelector

Selector for evaluating whether an object gets stored in a particular content group. A selector is an abstraction for a collection of PIXL expressions.

invalSelector

Selector for invalidating objects in the content group. A selector is an abstraction for a

collection of PIXL expressions.

policyName

Active cache policies refering to this group.

cacheNumInvalPolicy

Number of active Invalidation policies refering to this group.

markerCells

Numbers of marker cells in this group.

builtin

devno

count

stateflag

---

expire cache contentGroup

Forces expiration of all the objects in the specified content group. The next request for any object in the group is sent to the origin server.

Synopsys

expire cache contentGroup <name>

Arguments

name

Name of the content group whose objects are to be expired.

---

flush cache contentGroup

Flush the objects in the specified content group.

Synopsys

flush cache contentGroup <name> [-query <string> | -selectorValue <string>] [-host <string>]

Arguments

name

Name of the content group from which to flush objects, or "all"

to flush all content groups.

query

Query string specifying individual objects to flush from this group by using parameterized invalidation. If this parameter is not set, all objects are flushed from the group.

host

Flush only objects that belong to the specified host. Do not use except with parameterized invalidation. Also, the Invalidation Restricted to Host parameter for the group must be set to YES.

selectorValue

Value of the selector to be used for flushing objects from the content group. Requires that an invalidation selector be configured for the content group.

cache forwardProxy

Sep 22, 2015

The following operations can be performed on "cache forwardProxy":

add | rm | show

add cache forwardProxy

Allows the cache to act as a forward proxy for other NetScaler appliances or cache servers.

Synopsys

add cache forwardProxy <IPAddress> <port>

Arguments

IPAddress

IP address of the NetScaler appliance or a cache server for which the cache acts as a proxy. Requests coming to the NetScaler with the configured IP address are forwarded to the particular address, without involving the Integrated Cache in any way.

port

Port on the NetScaler appliance or a server for which the cache acts as a proxy

Minimum value: 1

---

rm cache forwardProxy

Removes the forward proxy address from the Integrated Cache. The cache does not act as a proxy to the specified IP address.

Synopsys

rm cache forwardProxy <IPAddress> <port>

Arguments

IPAddress

IP address of the NetScaler appliance or a server for which the cache was as a proxy.

port

Port on the NetScaler appliance or a server for which the cache acts as a proxy

Minimum value: 1

---

show cache forwardProxy

Displays the IP address and the corresponding ports for which the cache acted as a forward proxy.

Synopsys

show cache forwardProxy

Arguments

summary

fullValues

format

level

Outputs

IPAddress

IP address of the NetScaler appliance or a cache server for which the cache acts as a proxy. Requests coming to the NetScaler with the configured IP address are forwarded to the particular address, without involving the Integrated Cache in any way.

port

Forward proxy port.

devno

count

stateflag

cache global

Sep 22, 2015

The following operations can be performed on "cache global":

bind | unbind | show

bind cache global

Binds the cache policy to one of the two global bind points (an unnamed policy label invoked at request time and an unnamed policy label invoked at the response time). The flow type of the policy implicitly determines which label it gets bound to. A policy becomes active only when it is bound. A globally bound policy, it is available to all virtual servers on the NetScaler appliance. All HTTP traffic is evaluated against the global policy labels. Each label contains an ordered list ordered by policies' priority values.

Synopsys

bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] [-type <type>] [-invoke (<labelType> <labelName>)]

Arguments

policy

Name of the policy to bind. (A policy must be created before it can be bound.)

---

unbind cache global

Deactivate the policy by unbinding it from a global bind point.

Synopsys

unbind cache global <policy> [-type <type>] [-priority <positive_integer>]

Arguments

policy

Name of the policy to unbind.

priority

Priority of the NOPOLICY to be unbound. Required only you want to unbind a NOPOLICY that might have been bound to this policy label.

Minimum value: 1

Maximum value: 2147483647

---

show cache global

Displays the global bindings for cache policies.

Synopsys

show cache global [-type <type>]

Arguments

type

The bind point to which policy is bound. When you specify the type, detailed information about that bind point appears.

Possible values: REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT

summary

fullValues

format

level

Outputs

policyName

Name of the cache policy.NOTE: This attribute is deprecated.Replaced by Policy field

policy

Name of the cache policy.

priority

Specifies the priority of the policy.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

invoke

Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority. Applicable only to default-syntax policies.

labelType

Type of policy label to invoke.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE. (To invoke a label associated with a virtual server, specify the name of the virtual server.)

numpol

The number of policies bound to the bindpoint.

flowType

flowtype of the bound cache policy.

rule

The request/response rule that will trigger the given action.NOTE: This attribute is deprecated.

action

The integrated cache action to be applied when the system sees content that matches the rules.NOTE: This attribute is deprecated.

storeInGroup

The content group to store the object when the action directive is CACHE.NOTE: This attribute is deprecated.

invalGroups

The content group(s) to be invalidated when the action directive is INVAL.NOTE: This attribute is deprecated.

invalObjects

The content group(s) whose objects will be invalidated when the action directive is INVAL.

hits

Hits.NOTE: This attribute is deprecated.

flags

Flags.NOTE: This attribute is deprecated.

precedeDefRules

Override the default request/response cacheability rules.NOTE: This attribute is deprecated.

stateflag

devno

count

Example

cache object

Sep 22, 2015

The following operations can be performed on "cache object":

show | expire | flush

show cache object

Displays a list of all cached objects. The list displays the unique locator ID of each cached object along with the content group in which it was cached, and other details. To view more details of a specific cached object, use the -locator parameter along with this command.

Synopsys

show cache object [(-url <URL> (-host <string> [-port <port>] [-groupName <string>] [-httpMethod (GET | POST)])) | -locator <positive_integer> | -httpStatus <positive_integer> | -group <string> | -ignoreMarkerObjects (ON | OFF) | -includeNotReadyObjects (ON | OFF)]

Arguments

url

URL of the particular object whose details is required. Parameter "host" must be specified along with the URL.

locator

ID of the cached object.

httpStatus

HTTP status of the object.

host

Host name of the object. Parameter "url" must be specified.

port

Host port of the object. You must also set the Host parameter.

Default value: 80

Minimum value: 1

groupName

Name of the content group to which the object belongs. It will display only the objects belonging to the specified content group. You must also set the Host parameter.

httpMethod

HTTP request method that caused the object to be stored.

Possible values: GET, POST

Default value: NS_HTTP_METHOD_GET

group

Name of the content group whose objects should be listed.

ignoreMarkerObjects

Ignore marker objects. Marker objects are created when a response exceeds the maximum or minimum response size for the content group or has not yet received the minimum number of hits for the content group.

Possible values: ON, OFF

includeNotReadyObjects

Include responses that have not yet reached a minimum number of hits before being cached.

Possible values: ON, OFF

summary

fullValues

Outputs

cacheResSize

Cache response size of the object.

cacheResHdrSize

Cache response header size of the object.

cacheETag

Cache ETag of the object.

httpStatusOutput

HTTP status of the object.

cacheResLastMod

Value of "Last-modified" header.

cacheControl

Cache-Control header of the object.

cacheResDate

Value of "Date" header

contentGroup

Name of the contentgroup in which it is stored.

destIP

Destination IP.NOTE: This attribute is deprecated.This is no more in use.

destIPV46

Destination IP.

destPort

Destination Port.

cacheCellComplex

The state of the parameterized caching on this cell.

hitParams

Parameterized hit evaluation of an object.

hitValues

Values of hitparams for this object.

cacheCellReqTime

Required time of the cache cell object.

cacheCellResTime

Response time to the cache cell object.

cacheCurAge

Current age of the cache object.

cacheCellExpires

Expiry time of the cache cell object in seconds.

cacheCellExpiresMilliSec

Expiry time of the cache cell object in milliseconds.

flushed

Specifies whether the object is flushed.

prefetch

Specifies whether Integrated Cache should attempt to refresh an object immediately before it goes stale.

prefetchPeriod

The duration in seconds of the period during which prefetch should be attempted, immediately before the object's calculated expiry time.

prefetchPeriodMilliSec

The duration in milliseconds of the period during which prefetch should be attempted, immediately before the object's calculated expiry time.

cacheCellCurReaders

Current readers of the cache cell object.

cacheCellCurMisses

Current misses of the cache cell object.

cacheCellHits

Cache cell hits.

cacheCellMisses

Cache cell misses.

cacheCellDHits

Cache cell disk hits.

cacheCellGzipCompressed

The state of the response being gzip-compressed.NOTE: This attribute is deprecated.we display compression format using nsace_contenc_name

cacheCellDeflateCompressed

The state of the response being deflate-compressed.NOTE: This attribute is deprecated.we display compression format using nsace_contenc_name

cacheCellCompressionFormat

Compression format of this object. Identity means not compressed

cacheCellAppFWMetadataExists

AppFirewall cache object.

cacheCellHttp11

The state of the response to be HTTP/1.1.

cacheCellWeakEtag

The state of the weak HTTP Entity Tag in the cell.

cacheCellResBadSize

The marked state of the cell.

markerReason

Reason for marking the cell.

cacheCellPollEveryTime

The state to poll every time on object.

cacheCellEtagInserted

The state of the ETag to be inserted by IC for this object.

cacheCellReadyWithLastByte

The state of the complete arrived response.

cacheInMemory

The cache data is available in memory.

cacheInDisk

The cache data is available in disk.

cacheDirname

The directory name used if saved.

cacheFilename

The filename used if saved.

cacheCellDestipVerified

The state of DNS verification.

cacheCellFwpxyObj

The state of the object to be stored on a request to a forward proxy.

cacheCellBasefile

The state of delta being used as a basefile.

cacheCellMinHitFlag

The state of the minhit feature on this cell.

cacheCellMinHit

Min hit value for the object.

policy

Policy info for the object.

policyName

Policy which created the object.

selectorName

The hit selector for the object.

rule

Selectors for this object.

selectorValue

The HTTP request method that caused the object to be stored.

cacheUrls

List of cache object URLs.

numurls

Total number of cache object entries returned in cacheUrls field

warnBucketSkip

Bucket skipped warning.

totalObjs

Total objects.

httpCalloutCell

Is it a http callout cell ?

httpCalloutName

Name of the http callout

returnType

Return type of the http callout

httpCalloutResult

First few bytes of http callout response

ceflags

Indicates state and type of cached cell

devno

count

stateflag

---

expire cache object

Forces expiry of a cached object. You have to specify the locator ID of the cached object by using the -locator parameter.

Synopsys

expire cache object (-locator <positive_integer> | (-url <URL> (-host <string> [-port <port>] [-groupName <string>] [-httpMethod (GET | POST)])))

Arguments

locator

ID of the cached object to be expired To view the locator ID of the cached objects, use the show cache object command.

url

The URL of the object to be expired.

host

The host of the object to be expired.

port

The host port of the object to be expired.

Default value: 80

Minimum value: 1

groupName

Name of the content group to which the object belongs.

httpMethod

HTTP request method that caused the object to be stored.

Possible values: GET, POST

Default value: NS_HTTP_METHOD_GET

---

flush cache object

Removes a cached object from memory and from disk (if it has a disk copy). You have to specify the locator ID of the cached object by using the -locator parameter

Synopsys

flush cache object (-locator <positive_integer> | (-url <URL> (-host <string> [-port <port>] [-groupName <string>] [-httpMethod (GET | POST)])))

Arguments

locator

ID of the cached object. To view the locator ID of the cached objects, use the show cache object command.

url

URL of the object to be flushed. You must also set the Host parameter.

host

Host of the object to be flushed. Must provide the "url" parameter along with the host.

port

Host port of the object to be flushed. Must provide the "host" parameter along with the port.

Default value: 80

Minimum value: 1

groupName

Name of the content group to which the object belongs. Must provide the \\"host\\" parameter along with the group name.

httpMethod

HTTP request method that caused the object to be stored. All objects cached by that method will be flushed.

Possible values: GET, POST

Default value: NS_HTTP_METHOD_GET

cache parameter

Sep 22, 2015

The following operations can be performed on "cache parameter":

set | unset | show

set cache parameter

Modifies the global configuration of the integrated cache. You can modify the settings of various parameters.

Synopsys

set cache parameter [-memLimit <MBytes>] [-via <string>] [-verifyUsing <verifyUsing>] [-maxPostLen <positive_integer>] [-prefetchMaxPending <positive_integer>] [-enableBypass (YES | NO)] [-undefAction (NOCACHE | RESET)]

Arguments

memLimit

Amount of memory available for storing the cache objects. In practice, the amount of memory available for caching can be less than half the total memory of the NetScaler appliance.

via

String to include in the Via header. A Via header is inserted into all responses served from a content group if its Insert Via flag is set.

verifyUsing

Criteria for deciding whether a cached object can be served for an incoming HTTP request. Available settings function as follows:

HOSTNAME - The URL, host name, and host port values in the incoming HTTP request header must match the cache policy. The IP address and the TCP port of the destination host are not evaluated. Do not use the HOSTNAME setting unless you are certain that no rogue client can access a rogue server through the cache.

HOSTNAME_AND_IP - The URL, host name, host port in the incoming HTTP request header, and the IP address and TCP port of

the destination server, must match the cache policy.

DNS - The URL, host name and host port in the incoming HTTP request, and the TCP port must match the cache policy. The host name is used for DNS lookup of the destination server's IP address, and is compared with the set of addresses returned by the DNS lookup.

Possible values: HOSTNAME, HOSTNAME_AND_IP, DNS

maxPostLen

Maximum number of POST body bytes to consider when evaluating parameters for a content group for which you have configured hit parameters and invalidation parameters.

Default value: 4096

Maximum value: 131072

prefetchMaxPending

Maximum number of outstanding prefetches in the Integrated Cache.

enableBypass

Evaluate the request-time policies before attempting hit selection. If set to NO, an incoming request for which a matching object is found in cache storage results in a response regardless of the policy configuration.

If the request matches a policy with a NOCACHE action, the request bypasses all cache processing.

This parameter does not affect processing of requests that match any invalidation policy.

Possible values: YES, NO

undefAction

Action to take when a policy cannot be evaluated.

Possible values: NOCACHE, RESET

---

unset cache parameter

Use this command to remove cache parameter settings.Refer to the set cache parameter command for meanings of the arguments.

Synopsys

unset cache parameter [-memLimit] [-via] [-verifyUsing] [-maxPostLen] [-prefetchMaxPending] [-enableBypass] [-undefAction]

---

show cache parameter

Displays the global configuration of the Integrated Cache.

Synopsys

show cache parameter

Arguments

format

level

Outputs

memLimit

The memory limit for the Integrated Cache.

memLimitActive

Active value of the memory limit for the Integrated Cache.

maxMemLimit

The maximum value of the memory limit for the Integrated Cache.

via

The string that is inserted in the "Via" header.

verifyUsing

The criteria for deciding whether a cached object can be served for an incoming HTTP request.

maxPostLen

The maximum POST body size that the IC can accumulate.

prefetchCur

Number of current outstanding prefetches in the IC.

prefetchMaxPending

The maximum number of outstanding prefetches on the content group.

enableBypass

When this value is set to NO, an incoming request will serve a hit if a matching object is found in cache storage, regardless of the cacheability policy configuration. If set to YES, the bound request cacheability policies are evaluated before attempting any hit selection in the cache storage. If the request matches a policy with a NOCACHE action, the request will bypass all cache processing. This flag does not affect processing of requests that match any invalidation policy.

undefAction

Action to take when a policy cannot be evaluated.

enableDiskCache

The disk cache parameter. When this value is set to YES, cache objects can be saved on disk. If set to NO, objects will never be stored in disk.

cache policy

Sep 22, 2015

The following operations can be performed on "cache policy":

add | rm | set | unset | show | stat | rename

add cache policy

Creates an integrated caching policy. The newly created policy is in inactive state. To activate the policy, use the bind cache global command.

Synopsys

add cache policy <policyName> -rule <expression> -action <action> [-storeInGroup <string>] [-invalGroups <string> ...] [-invalObjects <string> ...] [-undefAction (NOCACHE | RESET)]

Arguments

policyName

Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the policy is created.

rule

Expression against which the traffic is evaluated.

Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the \\ character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

action

Action to apply to content that matches the policy.

* CACHE or MAY_CACHE action - positive cachability policy

* NOCACHE or MAY_NOCACHE action - negative cachability policy

* INVAL action - Dynamic Invalidation Policy

Possible values: CACHE, NOCACHE, MAY_CACHE, MAY_NOCACHE, INVAL

storeInGroup

Name of the content group in which to store the object when the final result of policy evaluation is CACHE. The content group must exist before being mentioned here. Use the "show cache contentgroup" command to view the list of existing content groups.

invalGroups

Content group(s) to be invalidated when the INVAL action is applied. Maximum number of content groups that can be specified is 16.

invalObjects

Content groups(s) in which the objects will be invalidated if the action is INVAL.

undefAction

Action to be performed when the result of rule evaluation is undefined.

Possible values: NOCACHE, RESET

---

rm cache policy

Removes the specified caching policy. Make sure that the policy is not bound globally or to a virtual server. A bound policy cannot be removed.

Synopsys

rm cache policy <policyName>

Arguments

policyName

Name of the cache policy to be removed.

---

set cache policy

Modifies the specified attributes of an existing cache policy. The rule, flow type, can be changed only if action and undefAction (if present) are of NEUTRAL flow type.

Synopsys

set cache policy <policyName> [-rule <expression>] [-action <action>] [-storeInGroup <string>] [-invalGroups <string> ...] [-invalObjects <string> ...] [-undefAction (NOCACHE | RESET)]

Arguments

policyName

Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the policy is created.

rule

Expression against which the traffic is evaluated.

Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the \\ character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

action

Action to apply to content that matches the policy.

* CACHE or MAY_CACHE action - positive cachability policy

* NOCACHE or MAY_NOCACHE action - negative cachability policy

* INVAL action - Dynamic Invalidation Policy

Possible values: CACHE, NOCACHE, MAY_CACHE, MAY_NOCACHE, INVAL

storeInGroup

Name of the content group in which to store the object when the final result of policy evaluation is CACHE. The content group must exist before being mentioned here. Use the "show cache contentgroup" command to view the list of existing content groups.

invalGroups

Content group(s) to be invalidated when the INVAL action is applied. Maximum number of content groups that can be specified is 16.

invalObjects

Content groups(s) in which the objects will be invalidated if the action is INVAL.

undefAction

Action to be performed when the result of rule evaluation is undefined.

Possible values: NOCACHE, RESET

Example

```
set cache policy pol9 -rule "http.req.HEADER(\\\"header\\\").CONTAINS(\\\"qh2\\\")"
```

---

unset cache policy

Use this command to remove cache policy settings.Refer to the set cache policy command for meanings of the arguments.

Synopsys

unset cache policy <policyName> [-storeInGroup] [-invalGroups] [-invalObjects] [-undefAction]

---

show cache policy

Displays all configured cache policies. To display details about a particular cache policy, specify the name of the policy. When all caching policies are displayed, the order of the displayed policies within each group is the same as the evaluation order of the policies. There are three groups: request policies, response policies, and dynamic invalidation policies.

Synopsys

show cache policy [<policyName>] show cache policy stats - alias for 'stat cache policy'

Arguments

policyName

Name of the cache policy about which to display details.

summary

fullValues

Outputs

stateflag

rule

The request/response rule that will trigger the specified action.

action

The integrated cache action to be applied when the system sees content that matches the rules.

storeInGroup

The content group that will store the object when the action directive is CACHE.

invalGroups

The content group(s) to be invalidated when the action directive is INVAL.

invalObjects

The content group(s) whose objects will be invalidated when the action directive is INVAL.

priority

Priority.

hits

Hits.

undefAction

A CACHE action, to be used by the policy when the rule evaluation turns out to be undefined.

undefHits

Number of Undef hits.

flags

Flag.

precedeDefRules

Override default request/response cacheability rules.NOTE: This attribute is deprecated.Since pre-builtin, built-in and post-built-in policies are in same policy bank, this is no longer needed

activePolicy

Indicates whether policy is bound or not.

boundTo

Location where policy is bound

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

bindPolicyType

vserverType

builtin

devno

count

---

stat cache policy

Displays a summary of cache policy statistics.

Synopsys

stat cache policy [<policyName>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

policyName

Name of the cache policy for which to display statistics. If you do not set this parameter, statistics are shown for all cache policies.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Policy hits (Hits)

Number of hits on the policy

Policy undef hits (Undefhits)

Number of undef hits on the policy

Example

```
stat cache policy
```

---

rename cache policy

Renames an existing cache policy.

Synopsys

rename cache policy <policyName>@ <newName>@

Arguments

policyName

Existing name of the cache policy.

newName

New name for the cache policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

Example

```
rename cache policy oldname newname
```

cache policylabel

Sep 22, 2015

The following operations can be performed on "cache policylabel":

add | rm | bind | unbind | show | stat | rename

add cache policylabel

Creates a user-defined cache policy label. A policy label is a bind point of a group of policies.

Synopsys

add cache policylabel <labelName> -evaluates <evaluates>

Arguments

labelName

Name for the label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the label is created.

evaluates

When to evaluate policies bound to this label: request-time or response-time.

Possible values: REQ, RES, MSSQL_REQ, MSSQL_RES, MYSQL_REQ, MYSQL_RES

Example

```
add cache policylabel cache_http_url -evaluates REQ
```

---

rm cache policylabel

Removes the specified integrated caching policy label.

Synopsys

rm cache policylabel <labelName>

Arguments

labelName

Name of the label to be removed.

Example

```
rm cache policylabel cache_http_url
```

---

bind cache policylabel

Binds a cache policy to a policy label.

Synopsys

bind cache policylabel <labelName> -policyName <string> -priority <positive_integer> [-gotoPriorityExpression <expression>] [-invoke (<labelType> <labelName>)]

Arguments

labelName

Name of the cache policy label to which to bind the policy.

policyName

Name of the cache policy to bind to the policy label.

Example

i) bind cache policylabel cache_http_url pol_1 1 2 -invoke reqvserver CURRENT ii) bind cache policylabel cache_http_url pol_2 2

---

unbind cache policylabel

Unbinds a policy from a cache-policy label.

Synopsys

unbind cache policylabel <labelName> -policyName <string> [-priority <positive_integer>]

Arguments

labelName

Name of the cache policy label from which to unbind the policy.

policyName

Name of the policy to unbind from the label.

priority

Required only if you want to unbind a NOPOLICY that might have been bound to this policy label.

Minimum value: 1

Maximum value: 2147483647

Example

unbind cache policylabel cache_http_url pol_1

---

show cache policylabel

Displays information about all cache-policy labels or about the specified cache-policy label.

Synopsys

show cache policylabel [<labelName>]

Arguments

labelName

Name of the cache-policy label about which to display information.

summary

fullValues

format

level

Outputs

stateflag

flags

evaluates

When to evaluate policies bound to this label: request-time or response-time.

numpol

Number of polices bound to label.

hits

Number of times policy label was invoked.

policyName

Name of the cache policy to bind to the policy label.

priority

Specifies the priority of the policy.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

invoke

Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next-lower priority.

labelType

Type of policy label to invoke: an unnamed label associated with a virtual server, or user-defined policy label.

labelName

Name of the policy label to invoke if the current policy rule evaluates to TRUE.

flowType

Flowtype of the bound cache policy.

builtin

devno

count

Example

i) show cache policylabel cache_http_url ii) show cache policylabel

---

stat cache policylabel

Displays statistics of cache policy label(s).

Synopsys

stat cache policylabel [<labelName>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

labelName

Name of the cache-policy label for which to display statistics. If you do not set this parameter statistics are shown for all cache-policy labels.

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Policy Label Hits (Hits)

Number of times policy label was invoked.

---

rename cache policylabel

Renames a cache-policy label.

Synopsys

rename cache policylabel <labelName>@ <newName>@

Arguments

labelName

Existing name of the cache-policy label.

newName

New name for the cache-policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

Example

rename cache policylabel oldname newname

---

cache selector

Sep 22, 2015

The following operations can be performed on "cache selector":

add | rm | set | show

add cache selector

Creates an Integrated Cache selector. A selector is an abstraction for a collection of PIXL expressions. After creating a selector, you can use it as a hit selector, invalidation selector, or both. You must specify at least one expression when you create a selector.

Synopsys

add cache selector <selectorName> <rule> ...

Arguments

selectorName

Name for the selector. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

rule

One or multiple PIXL expressions for evaluating an HTTP request or response.

---

rm cache selector

Removes cache selectors. Note: A selector being used as a hit or invalidation selector in any content group cannot be removed without unsetting it from the content group.

Synopsys

rm cache selector <selectorName>

Arguments

selectorName

Name of the selector.

---

set cache selector

Modify the set of PIXL expressions associated with a cache selector.

Synopsys

set cache selector <selectorName> <rule> ...

Arguments

selectorName

Name of the selector to be modified.

rule

One or multiple PIXL expressions for evaluating an HTTP request or response.

---

show cache selector

Displays all cache selectors, or the specified.

Synopsys

show cache selector [<selectorName>]

Arguments

selectorName

Name of the selector to display.

summary

---

cache stats

Sep 22, 2015

The following operations can be performed on "cache stats":

show cache stats

show cache stats is an alias for stat cache

Synopsys

show cache stats - alias for 'stat cache'

CLI Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- alias
- backup
- batch
- cli attribute
- cli mode
- cli prompt
- cls
- config
- exit
- help
- history
- man
- quit
- source
- unalias
- whoami

alias

Sep 22, 2015

The following operations can be performed on "alias":

alias

Create (short) aliases for (long) commands. Aliases are saved across NSCLI sessions. If no argument is specified, the alias command will display existing aliases.

Synopsys

alias [<pattern> [(command)]]

Arguments

pattern

Alias name. (Can be a regular expression.)

Example

```
alias info "show ns info"
```

backup

Sep 22, 2015

The following operations can be performed on "backup":

backup

backup cache object to local disk

Synopsys

backup -pattern <string>

Arguments

pattern

Name of the alias

Example

backup cache object -locator <id>

batch

Sep 22, 2015

The following operations can be performed on "batch":

batch

Use this command to read the contents of a file and execute each line as a separate CLI command. Each command in the file must be on a separate line. Lines starting with # are considered comments.

Synopsys

batch -fileName <input_filename> [-outfile <output_filename>] [-ntimes <positive_integer>]

Arguments

fileName

The name of the batch file.

outfile

The name of the file where the executed batch file will write its output. The default is standard output.

ntimes

The number of times the batch file will be executed.

Default value: 1

Example

batch -f cmds.txt

cli attribute

Sep 22, 2015

The following operations can be performed on "cli attribute":

show cli attribute

Display attributes of the NetScaler CLI

Synopsys

show cli attribute

Outputs

qquote

The construct that is used to quote strings that are to be taken as-is, without interpreting escape sequences like "

".

This construct consists of: a 'q', followed by a delimiter character; the string follows immediately after the delimiter and is terminated by the first matching delimiter character. (The set of possible delimiter characters is listed below.)

For example, q/a

/ will result in a three-character string ('a', '', 'n'); whereas "a

" results in a two-character string ('a' followed by a newline).

qquoteDelimiters

The set of characters that can be used as the delimiter in a q// construct. Characters shown in pairs must be used that way, whereas characters shown singly server as thier own matching delimiter.

For example, q?abc? and q{abc} are valid q// constructs, and evaluate to the string "abc"; q{abc{ is however not a valid q// construct so it will evaluate to the string "q{abc{".

cli mode

Sep 22, 2015

The following operations can be performed on "cli mode":

set | unset | show

set cli mode

Use this command to specify how the CLI should display command output.

Synopsys

set cli mode [-page (ON | OFF)] [-total (ON | OFF)] [-color (ON | OFF)] [-disabledFeatureAction <disabledFeatureAction>] [-timeout <secs>] [-regex (ON | OFF)]

Arguments

page

Determines whether output that spans more than one screen is "paged". Specify ON to pause the display after each screen of ouput.

Possible values: ON, OFF

Default value: OFF

total

Determines whether CLI "show" commands display a total count of objects before displaying the objects themselves.

Possible values: ON, OFF

Default value: OFF

color

Specifies whether output can be shown in color, if the terminal supports it.

Possible values: ON, OFF

Default value: OFF

disabledFeatureAction

Specifies what will happen when a configuration command is issued for a disabled feature. The following values are allowed:

NONE - The action is allowed, and no warning message is issued.;

ALLOW - The action is allowed, but a warning message is issued.;

DENY - The action is not allowed.;

HIDE - Commands that configure disabled features are hidden, and the CLI behaves as if they did not exist.

Possible values: NONE, ALLOW, DENY, HIDE

Default value: NS_ALLOW

timeout

CLI session inactivity timeout, in seconds. Timeout cannot have values in between 1 and 9.

Default value: 300

Maximum value: 100000000

regex

If ON, regular expressions can be used as argument values

Possible values: ON, OFF

Default value: ON

---

unset cli mode

Use this command to remove cli mode settings.Refer to the set cli mode command for meanings of the arguments.

Synopsys

unset cli mode [-page] [-total] [-color] [-disabledFeatureAction] [-timeout] [-regex]

---

show cli mode

Use this command to display the current settings of parameters that can be set with the 'set cli mode' command.

Synopsys

show cli mode

Arguments

format

level

Outputs

page

Determines whether output that spans more than one screen is "paged". Specify ON to pause the display after each screen of ouput.

total

Determines whether CLI "show" commands display a total count of objects before displaying the objects themselves.

color

Specifies whether output can be shown in color, if the terminal supports it.

disabledFeatureAction

Specifies what will happen when a configuration command is issued for a disabled feature. The following values are allowed:

NONE - The action is allowed, and no warning message is issued.;

ALLOW - The action is allowed, but a warning message is issued.;

DENY - The action is not allowed.;

HIDE - Commands that configure disabled features are hidden, and the CLI behaves as if they did not exist.

argMark

mark

noLicenseAction

no licence

diagLevel

diagnostic level

timeout

CLI session inactivity timeout, in seconds. Timeout cannot have values in between 1 and 9.

regex

If ON, regular expressions can be used as argument values

r

regular expression

format

format

stats

serverPort

cli prompt

Sep 22, 2015

The following operations can be performed on "cli prompt":

clear | set | show

clear cli prompt

Use this command to return the CLI prompt to the default (a single '>').

Synopsys

clear cli prompt

---

set cli prompt

Use this command to customize the CLI prompt.

Synopsys

set cli prompt <promptString>

Arguments

promptString

The prompt string. The following special values are allowed:

%! - will be replaced by the history event number

%u - will be replaced by the NetScaler user name

%h - will be replaced by the NetScaler hostname

%t - will be replaced by the current time

%T - will be replaced by the current time (24 hr format)

%d - will be replaced by the current date

%s - will be replaced by the node state

Example

```
> set cli prompt "%h %T"  Done lb-ns1 15:16>
```

---

show cli prompt

Use this command to display the current CLI prompt, with special values like '%h' unexpanded.

Synopsys

show cli prompt

Arguments

format

level

Outputs

promptString

Example

```
10.101.4.22 15:20> sh cli prompt        CLI prompt is set to "%h %T"  Done
```

cls

Sep 22, 2015

The following operations can be performed on "cls":

cls

Clear the screen and reposition cursor at top right.

Synopsys

cls

config

Sep 22, 2015

The following operations can be performed on "config":

config

Enter this command to enter contextual mode.

Synopsys

config

exit

Sep 22, 2015

The following operations can be performed on "exit":

exit

Use this command to back out one level in config mode, or to terminate the CLI when not in config mode.);

Synopsys

exit

help

Sep 22, 2015

The following operations can be performed on "help":

help

Use this command to display help information for a CLI command, for a group of commands, or for all CLI commands.

Synopsys

help [(commandName) | <groupName> | -all]

Arguments

commandName

The name of a command for which you want full usage information.

groupName

The name of a command group for which you want basic usage information.

all

Use this option to request basic usage information for all commands.

Example

1.To view help information for adding a virtual server, enter the following CLI command: help add vserver The following information is displayed: Usage: add vserver <vS

history

Sep 22, 2015

The following operations can be performed on "history":

history

Use this command to see the history of the commands executed on CLI.

Synopsys

history

Example

```
history                1 add snmp trap SPECIFIC 10.102.130.228    2 save config    3 show system session    4 swhell
```

man

Sep 22, 2015

The following operations can be performed on "man":

man

Use this command to invoke the man page for the specified command. You can specify the command in full, or partially, if it is uniquely resolvable.

Synopsys

man [(commandName)]

Arguments

commandName

The name of the command.

Example

man add vs

quit

Sep 22, 2015

The following operations can be performed on "quit":

quit

Use this command to terminate the CLI. Note: typing <Ctrl>+<d> will also terminate the CLI.

Synopsys

quit

source

Sep 22, 2015

The following operations can be performed on "source":

source

Use this command to read the contents of a file and execute each line as a separate CLI command. Each command in the file being read must be on a separate line. Lines starting with # are considered comments.

Synopsys

source <fileName>

Arguments

fileName

The name of the file to be sourced.

Example

source cmds.txt

unalias

Sep 22, 2015

The following operations can be performed on "unalias":

unalias

Remove an alias

Synopsys

unalias <pattern>

Arguments

pattern

Name of the alias

Example

unalias info

whoami

Sep 22, 2015

The following operations can be performed on "whoami":

whoami

Show the current user.

Synopsys

whoami

Outputs

userName

loggedIn

Cluster Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- cluster
- cluster files
- cluster instance
- cluster node
- cluster nodegroup
- cluster sync

cluster

Sep 22, 2015

The following operations can be performed on "cluster":

join cluster

Joins the appliance to the cluster. You must execute this command from the NetScaler IP (NSIP) address of the node that you want to add to the cluster. This command is the second part of the two-step process of adding a cluster node. The first part is adding this node to the cluster by using the add cluster node command from the cluster IP address. This operation is not permitted if any node in the cluster is in the Sync state.

Synopsys

join cluster -clip <ip_addr> {-password }

Arguments

clip

Cluster IP address to which to add the node.

password

Password for the nsroot account of the configuration coordinator (CCO).

cluster files

Sep 22, 2015

The following operations can be performed on "cluster files":

sync cluster files

Synchronizes SSL Certificates, SSL CRL lists, SSL VPN bookmarks, and other files from the configuration coordinator (CCO) to the other cluster nodes. Execute this command from the cluster IP address only. This command is automatically triggered from the CCO when a new node is added to a cluster and periodically triggered to synchronize updated files between the cluster nodes. Note: Files on non-CCO nodes are not deleted if they do no not exist on the CCO.

Synopsys

sync cluster files [<Mode> ...]

Arguments

Mode

The directories and files to be synchronized. The available settings function as follows:

Mode Paths

all /nsconfig/ssl/

/var/netscaler/ssl/

/var/vpn/bookmark/

/nsconfig/dns/

/nsconfig/htmlinjection/

/netscaler/htmlinjection/ens/

/nsconfig/monitors/

/nsconfig/nstemplates/

/nsconfig/ssh/

/nsconfig/rc.netscaler

/nsconfig/resolv.conf

/nsconfig/inetd.conf

/nsconfig/syslog.conf

/nsconfig/snmpd.conf

/nsconfig/ntp.conf

/nsconfig/httpd.conf

/nsconfig/sshd_config

/nsconfig/hosts

/nsconfig/enckey

/var/nslw.bin/etc/krb5.conf

/var/nslw.bin/etc/krb5.keytab

/var/lib/likewise/db/

/var/download/

/var/wi/tomcat/webapps/

/var/wi/tomcat/conf/Catalina/localhost/

/var/wi/java_home/lib/security/cacerts

/var/wi/java_home/jre/lib/security/cacerts

ssl /nsconfig/ssl/

/var/netscaler/ssl/

bookmarks /var/vpn/bookmark/

dns /nsconfig/dns/

htmlinjection /nsconfig/htmlinjection/

imports /var/download/

misc /nsconfig/license/

/nsconfig/rc.conf

all_plus_misc Includes *all* files and /nsconfig/license/ and /nsconfig/rc.conf.

Default value: all

Example

sync cluster files ssl or sync cluster files all

cluster instance

Sep 22, 2015

The following operations can be performed on "cluster instance":

add | rm | set | unset | enable | disable | show | stat

add cluster instance

Adds a cluster instance to the appliance. Execute this command on only the first node that you add to the cluster.

Synopsys

add cluster instance <clId> [-deadInterval <secs>] [-helloInterval <msecs>] [-preemption (ENABLED | DISABLED)]

Arguments

clId

Unique number that identifies the cluster.

Minimum value: 1

Maximum value: 16

deadInterval

Amount of time, in seconds, after which nodes that do not respond to the heartbeats are assumed to be down.

Default value: 3

Minimum value: 3

Maximum value: 60

helloInterval

Interval, in milliseconds, at which heartbeats are sent to each cluster node to check the health status.

Default value: 200

Minimum value: 200

Maximum value: 1000

preemption

Preempt a cluster node that is configured as a SPARE if an ACTIVE node becomes available.

Possible values: ENABLED, DISABLED

Default value: DISABLED

Example

```
add cluster instance 1
```

---

rm cluster instance

Removes the cluster instance from the node. You must execute this command on the NetScaler IP (NSIP) address of the node.

Synopsys

rm cluster instance <clId>

Arguments

clId

Unique number that identifies the cluster.

Minimum value: 1

Maximum value: 16

Example

```
rm cluster instance 1
```

---

set cluster instance

Modifies the specified attributes of a cluster instance.

Synopsys

set cluster instance <clId> [-deadInterval <secs>] [-helloInterval <msecs>] [-preemption (ENABLED | DISABLED)]

Arguments

clId

ID of the cluster instance to be modified.

Minimum value: 1

Maximum value: 16

deadInterval

Amount of time, in seconds, after which nodes that do not respond to the heartbeats are assumed to be down.

Default value: 3

Minimum value: 3

Maximum value: 60

helloInterval

Interval, in milliseconds, at which heartbeats are sent to each cluster node to check the health status.

Default value: 200

Minimum value: 200

Maximum value: 1000

preemption

Preempt a cluster node that is configured as a SPARE if an ACTIVE node becomes available.

Possible values: ENABLED, DISABLED

Default value: DISABLED

Example

```
set cluster instance 1 -preemption ENABLED
```

---

unset cluster instance

Use this command to remove cluster instance settings.Refer to the set cluster instance command for meanings of the arguments.

Synopsys

unset cluster instance <clId> [-deadInterval] [-helloInterval] [-preemption]

---

enable cluster instance

Enables a cluster instance.

Synopsys

enable cluster instance <clId>

Arguments

clId

ID of the cluster instance that you want to enable.

Minimum value: 1

Maximum value: 16

Example

```
enable cluster instance 1
```

---

disable cluster instance

Disables a cluster instance.

Synopsys

disable cluster instance <clId>

Arguments

clId

ID of the cluster instance that you want to disable.

Minimum value: 1

Maximum value: 16

Example

disable cluster instance 1

---

show cluster instance

Displays information about the cluster instance and its nodes.

Synopsys

show cluster instance [<clId>]

Arguments

clId

Unique number that identifies the cluster.

Minimum value: 1

Maximum value: 16

summary

fullValues

format

level

Outputs

deadInterval

Amount of time, in seconds, after which nodes that do not respond to the heartbeats are assumed to be down.

helloInterval

Interval, in milliseconds, at which heartbeats are sent to each cluster node to check the health status.

preemption

Preempt a cluster node that is configured as a SPARE if an ACTIVE node becomes available.

adminstate

Cluster Admin State.

propState

Enable/Disable the execution of commands on the cluster. This will not impact the execution of commands on individual cluster nodes by using the NSIP.

nodeId

The unique number that identiies a cluster.

IPAddress

The IP Address of the node.

flags

The flags for this entry.

masterState

Master state.

health

Node Health state.

clusterHealth

Node clusterd state.

effectiveState

Node effective health state.

state

Active, Spare or Passive. An active node serves traffic. A spare node serves as a backup for active nodes. A passive node does not serve traffic. This may be useful during temporary maintenance activity where it is desirable that the node takes part in the consensus protocol, but not serve traffic.

flag

Cluster Flag.

operationalstate

Cluster Operational State.

status

Cluster Operational State.

isConfigurationCoordinator

This argument is used to determine whether the node is configuration coordinator (CCO).

isLocalnode

This argument is used to determine whether it is local node.

RSSKeyMismatch

This argument is used to determine if there is a RSS key mismatch at cluster instance level.

LicenseMismatch

This argument is used to determine if there is a License mismatch at cluster instance level.

NodeRSSKeyMismatch

This argument is used to determine if there is a RSS key mismatch at cluster node level.

NodeLicenseMismatch

This argument is used to determine if there is a License mismatch at cluster node level.

stateflag

State Flag.

operationalPropState

Cluster Operational Propagation State.

devno

count

Example

An example of the command's output is as follows: 1)Cluster ID: 1 Dead Interval: 3 secs Hello Interval: 200 msecs Preemption:

---

stat cluster instance

Displays statistics for a cluster instance.

Synopsys

stat cluster instance [<clId>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

clId

ID of the cluster instance for which to display statistics.

Minimum value: 1

Maximum value: 16

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Cluster size (CLNumNodes)

Number of nodes in the cluster.

Cluster status (CLCurEnable)

State of the cluster.

Configuration coordinator (CLViewLeader)

NSIP address of the Configuration Coordinator of the cluster.

Total steered packets (TotSteeredPkts)

Total number of packets steered on the cluster backplane.

Traffic received (Bkplane Rx)

Traffic received on backplane (in mbits)

Traffic transmitted (Bkplane Tx)

Traffic transmitted from backplane (in mbits)

Dropped steered packets (DFDdropPkts)

Number of steered packets that are dropped.

Propagation timeout (propTimeout)

Number of times the update to the client timed-out.

cluster node

Sep 22, 2015

The following operations can be performed on "cluster node":

add | set | unset | rm | show | stat

add cluster node

Adds a NetScaler appliance to a cluster.

Synopsys

add cluster node <nodeId>@ <IPAddress>@ [-state <state>] [-backplane <interface_name>@] [-priority <positive_integer>]

Arguments

nodeId

Unique number that identifies the cluster node.

Maximum value: 31

IPAddress

NetScaler IP (NSIP) address of the appliance to add to the cluster. Must be an IPv4 address.

state

Admin state of the cluster node. The available settings function as follows:

ACTIVE - The node serves traffic.

SPARE - The node does not serve traffic unless an ACTIVE node goes down.

PASSIVE - The node does not serve traffic, unless you change its state. PASSIVE state is useful during temporary maintenance activities in which you want the node to take part in the consensus protocol but not to serve traffic.

Possible values: ACTIVE, SPARE, PASSIVE

Default value: NSACL_NODEST_PASSIVE

backplane

Interface through which the node communicates with the other nodes in the cluster. Must be specified in the three-tuple form n/c/u, where n represents the node ID and c/u refers to the interface on the appliance.

Minimum value: 1

priority

Preference for selecting a node as the configuration coordinator. The node with the lowest priority value is selected as the configuration coordinator.

When the current configuration coordinator goes down, the node with the next lowest priority is made the new configuration coordinator. When the original node comes back up, it will preempt the new configuration coordinator and take over as the configuration coordinator.

Note: When priority is not configured for any of the nodes or if multiple nodes have the same priority, the cluster elects one of the nodes as the configuration coordinator.

Default value: 31

Maximum value: 31

Example

```
add cluster node 1 1.1.1.1 -backplane 1/1/1 -state ACTIVE
```

---

set cluster node

Modifies the attributes of a cluster node.

Synopsys

set cluster node <nodeId>@ [-state <state>] [-backplane <interface_name>@] [-priority <positive_integer>]

Arguments

nodeId

ID of the cluster node to be modified.

Maximum value: 31

state

Admin state of the cluster node. The available settings function as follows:

ACTIVE - The node serves traffic.

SPARE - The node does not serve traffic unless an ACTIVE node goes down.

PASSIVE - The node does not serve traffic, unless you change its state. PASSIVE state is useful during temporary maintenance activities in which you want the node to take part in the consensus protocol but not to serve traffic.

Possible values: ACTIVE, SPARE, PASSIVE

Default value: NSACL_NODEST_PASSIVE

backplane

Interface through which the node communicates with the other nodes in the cluster. Must be specified in the three-tuple form n/c/u, where n represents the node ID and c/u refers to the interface on the appliance.

Minimum value: 1

priority

Preference for selecting a node as the configuration coordinator. The node with the lowest priority value is selected as the configuration coordinator.

When the current configuration coordinator goes down, the node with the next lowest priority is made the new configuration coordinator. When the original node comes back up, it will preempt the new configuration coordinator and take over as the configuration coordinator.

Note: When priority is not configured for any of the nodes or if multiple nodes have the same priority, the cluster elects one of the nodes as the configuration coordinator.

Default value: 31

Maximum value: 31

Example

```
set cluster node 1 -state PASSIVE
```

---

unset cluster node

Use this command to remove cluster node settings.Refer to the set cluster node command for meanings of the arguments.

Synopsys

```
unset cluster node <nodeId>@ [-state] [-backplane] [-priority]
```

---

rm cluster node

Removes a node from the cluster and removes the cluster instance from the node. You must execute this command on the cluster IP address.

Synopsys

```
rm cluster node <nodeId>
```

Arguments

nodeId

ID of the cluster node to be removed from the cluster.

Maximum value: 31

Example

```
rm cluster node 1
```

---

show cluster node

Displays information about the cluster node.

Synopsys

```
show cluster node [<nodeId>@]
```

Arguments

nodeId

ID of the cluster node for which to display information. If an ID is not provided, information about all nodes is shown.

Default value: 255

Maximum value: 31

summary

fullValues

format

level

Outputs

IPAddress

The IP Address of the node.

flags

The flags for this entry.

clusterHealth

Node clusterd state.

effectiveState

Node effective health state.

operationalSyncState

Node Operational Reconciliation state.

masterState

Node Master state.

health

Node Health state.

state

Active, Spare or Passive.

backplane

Interface through which the node communicates with the other nodes in the cluster. Must be specified in the three-tuple form n/c/u, where n represents the node ID and c/u refers to the interface on the appliance.

priority

Preference for selecting a node as the configuration coordinator. The node with the lowest priority value is selected as the configuration coordinator.

When the current configuration coordinator goes down, the node with the next lowest priority is made the new configuration coordinator. When the original node comes back up, it will preempt the new configuration coordinator and take over as the configuration coordinator.

Note: When priority is not configured for any of the nodes or if multiple nodes have the same priority, the cluster elects one of the nodes as the configuration coordinator.

isConfigurationCoordinator

This argument is used to determine whether the node is configuration coordinator (CCO).

isLocalnode

This argument is used to determine whether it is local node.

NodeRSSKeyMismatch

This argument is used to determine if there is a RSS key mismatch at cluster node level.

NodeLicenseMismatch

This argument is used to determine if there is a License mismatch at cluster node level.

stateflag

nodeList

Nodelist for displaying Heartbeat not seen interfaces on a cluster node

ifacesList

Interface list corresponding to nodelist for Heartbeat not seen interfaces on a cluster node

enabledIfaces

Enabled Interfaces on a cluster node.

disabledIfaces

Disabled Interfaces on a cluster node.

partialFailIfaces

Partial Failure Interfaces on a cluster node.

hamonIfaces

Hamon Interfaces on a cluster node.

ifaces

Interfaces status on cluster node.

devno

count

Example

An example of the command's output is as follows: 1 cluster node: 1)Node ID: 1 IP: 1.1.1.1* Backplane:

---

stat cluster node

Displays statistics for a cluster node.

Synopsys

stat cluster node [<nodeId>@] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

Arguments

nodeId

ID of the cluster node for which to display statistics. If an ID is not provided, statistics are shown for all nodes.

Maximum value: 31

clearstats

Clear the statsistics / counters

Possible values: basic, full

Outputs

count

devno

stateflag

Outputs

Sync state (Sync State)

Sync state of the cluster node.

Health

Health of the cluster node.

Node IP (NodeIP)

NSIP address of the cluster node.

Operational state (OpState)

Operational state of the cluster node.

Heartbeats transmitted (HB Sent)

Number of heartbeats sent. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

Heartbeats received (HB Rcvd)

Number of heartbeats received. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

Current node-node connections (NNMCurConn)

Number of connections open for node-to-node communication.

Node-node messages transmitted (NNMTotConnTx)

Number of node-to-node messages sent. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

Node-node messages received (NNMTotConnRx)

Number of node-to-node messages received. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

PTP operational state (PTP State)

PTP state of the node. This state is Master for one node and Slave for the rest. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows UNKNOWN. When executed from the cluster IP address, shows all the statistics.

PTP packets transmitted (PTP Tx)

Number of PTP packets transmitted by the node. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

PTP packets received (PTP Rx)

Number of PTP packets received on the node. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

Multicast/Broadcast send errors (NNMErrMsend)

Number of errors in sending node-to-node multicast/broadcast messages. When executed from the NSIP address, shows the statistics for local node only. For remote node it shows a value of 0. When executed from the cluster IP address, shows all the statistics.

(Health)

Health of the node in the cluster.

CH State

Health State of the node with respect to sync in the cluster.

cluster nodegroup

Sep 22, 2015

The following operations can be performed on "cluster nodegroup":

add | show | set | unset | bind | unbind | rm

add cluster nodegroup

Adds a nodegroup to the cluster. A nodegroup is a set of cluster nodes to which entities can be bound. Entities that are bound to a specific nodegroup are active on all the nodes of the group and not active on the nodes that are not part of the group.

Synopsys

add cluster nodegroup <name>@ [-strict (YES | NO)]

Arguments

name

Name of the nodegroup. The name uniquely identifies the nodegroup on the cluster.

strict

Specifies whether cluster nodes, that are not part of the nodegroup, will be used as backup for the nodegroup.

* Enabled - When one of the nodes goes down, no other cluster node is picked up to replace it. When the node comes up, it will continue being part of the nodegroup.

* Disabled - When one of the nodes goes down, a non-nodegroup cluster node is picked up and acts as part of the nodegroup. When the original node of the nodegroup comes up, the backup node will be replaced.

Possible values: YES, NO

Default value: NO

Example

```
add cluster nodegroup ng1 -strict yes
```

---

show cluster nodegroup

Displays information about the available nodegroups.

Synopsys

show cluster nodegroup [<name>]

Arguments

name

Name of the nodegroup to be displayed. If a name is not provided, information about all nodegroups is displayed.

format

level

Outputs

node

Nodes in the nodegroup

strict

Specifies whether cluster nodes, that are not part of the nodegroup, will be used as backup for the nodegroup.

* Enabled - When one of the nodes goes down, no other cluster node is picked up to replace it. When the node comes up, it will continue being part of the nodegroup.

* Disabled - When one of the nodes goes down, a non-nodegroup cluster node is picked up and acts as part of the nodegroup. When the original node of the nodegroup comes up, the backup node will be replaced.

vServer

vserver that need to be bound to this nodegroup.

currentNodeMask

Bitmap of current nodes in this nodegroup

backupNodeMask

Bitmap of backup nodes in this nodegroup

boundedEntitiesCntFromPE

Count of bounded entities to this nodegroup accoding to PE

activeList

Active node list of this nodegroup

backupList

Backup node list of this nodegroup

identifierName

stream identifier and rate limit identifier that need to be bound to this nodegroup.

stateflag

devno

count

---

set cluster nodegroup

Modifies the attributes of a cluster nodegroup.

Synopsys

set cluster nodegroup <name>@ [-strict (YES | NO)]

Arguments

name

Name of the nodegroup to be modified.

strict

Specifies whether cluster nodes, that are not part of the nodegroup, will be used as backup for the nodegroup.

* Enabled - When one of the nodes goes down, no other cluster node is picked up to replace it. When the node comes up, it will continue being part of the nodegroup.

* Disabled - When one of the nodes goes down, a non-nodegroup cluster node is picked up and acts as part of the nodegroup. When the original node of the nodegroup comes up, the backup node will be replaced.

Possible values: YES, NO

Default value: NO

Example

```
set cluster nodegroup ng1 -strict yes
```

---

unset cluster nodegroup

Unset nodes from the given nodegroup or unset strict option.Refer to the set cluster nodegroup command for meanings of the arguments.

Synopsys

unset cluster nodegroup <name>@ [-strict]

Example

```
unset cluster nodegroup ng1 -strict
```

---

bind cluster nodegroup

Binds a cluster node or an entity to the given nodegroup. A node can be bound to more than one nodegroup.

Synopsys

bind cluster nodegroup <name> (-node <positive_integer>@ | -vServer <string> | -identifierName <string>)

Arguments

name

Name of the nodegroup to which you want to bind a cluster node or an entity.

node

ID of the node to be bound to the nodegroup.

Default value: VAL_NOT_SET

Maximum value: 31

vServer

Name of the virtual server to be bound to the nodegroup.

identifierName

Name of stream or limit identifier to be bound to the nodegroup.

Example

```
bind cluster nodegroup ng1 -vserver v1
```

---

unbind cluster nodegroup

Unbinds a cluster node or an entity from a given nodegroup.

Synopsys

unbind cluster nodegroup <name> (-node <positive_integer>@ | -vServer <string> | -identifierName <string>)

Arguments

name

Name of the nodegroup from which you want to unbind a cluster node or an entity.

node

ID of the node to be unbound from the nodegroup.

Default value: VAL_NOT_SET

Maximum value: 31

vServer

Name of the virtual server to be unbound from the nodegroup.

identifierName

Name of stream or limit identifier to be unbound from the nodegroup.

Example

```
unbind cluster nodegroup ng1 -vserver v1
```

---

rm cluster nodegroup

Removes a nodegroup from the cluster.

Synopsys

```
rm cluster nodegroup <name>@
```

Arguments

name

Name of the nodegroup to be removed.

Example

```
rm cluster nodegroup ng1
```

---

cluster sync

Sep 22, 2015

The following operations can be performed on "cluster sync":

force cluster sync

Synchronize the configurations of a cluster node from the configuration coordinator (CCO). This command must be executed from the NSIP of the node that is to be synchronized.

Synopsys

force cluster sync

Example

force cluster sync

Compression Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- cmp
- cmp action
- cmp global
- cmp parameter
- cmp policy
- cmp policylabel
- cmp stats

cmp

Sep 22, 2015

The following operations can be performed on "cmp":

Display compression statistics.

stat cmp [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

clearstats

Clear the statsistics / counters

Possible values: basic, full

Bandwidth saving (%) (DlBndSav)

Bandwidth saving from delta compression expressed as percentage.

Delta compression ratio (DlCmpRt)

Ratio of compressible data received to compressed data transmitted.If this ratio is one (uncmp:1.0) that means compression is disabled or we are not able to compress even a single compressible packet.

Decompression ratio (DTCmpRt)

Ratio of decompressed data transmitted to compressed data received.

Bandwidth saving (%) (DBndSav)

Bandwidth saving from TCP compression expressed as percentage.

TCP compression ratio (TCmpRt)

Ratio of compressible data received to compressed data transmitted.If this ratio is one (uncmp:1.0) that means compression is disabled or we are not able to compress even a single compressible packet.

TCP Bandwidth saving (%) (BndSav)

Bandwidth saving from TCP compression expressed as percentage.

Total HTTP compression ratio

Ratio of total HTTP data received to total HTTP data transmitted.

HTTP Bandwidth saving (%) (HttpBndSav)

Bandwidth saving from TCP compression expressed as percentage.

HTTP compression ratio

Ratio of the compressible data received from the server to the compressed data sent to the client.

HTTP compression requests

Number of HTTP compression requests the NetScaler receives for which the response is successfully compressed. For example, after you enable compression and configure services, if you send requests to the NetScaler with the following header information: ?Accept-Encoding: gzip, deflate?, and NetScaler compresses the corresponding response, this counter is incremented.

Compressible bytes received

Number of bytes that can be compressed, which the NetScaler receives from the server. This gives the content length of the response that the NetScaler receives from server.

Compressed bytes transmitted

Number of bytes the NetScaler sends to the client after compressing the response from the server.

Compressible packets received

Number of HTTP packets that can be compressed, which the NetScaler receives from the server.

Compressed packets transmitted

Number of HTTP packets that the NetScaler sends to the client after compressing the response from the server.

Compressible bytes received (TCmpRxB)

Number of bytes that can be compressed, which the NetScaler receives from the server. This gives the content length of the response that the NetScaler receives from server.

Compressible packets received (TCmpRxP)

Total number of compressible packets received by NetScaler.

Compressed bytes transmitted (TCmpTxB)

Number of bytes that the NetScaler sends to the client after compressing the response from the server.

Compressed packets transmitted (TCmpTxP)

Number of TCP packets that the NetScaler sends to the client after compressing the response from the server.

Quantum compression (TCmpQuan)

Number of times the NetScaler compresses a quantum of data. NetScaler buffers the data received from the server till it reaches the quantum size and then compresses the buffered data and transmits to the client.

Push flag compression (TCmpPush)

Number of times the NetScaler compresses data on receiving a TCP PUSH flag from the server. The PUSH flag

ensures that data is compressed immediately without waiting for the buffered data size to reach the quantum size.

End Of Input compression (TCmpEoi)

Number of times the NetScaler compresses data on receiving End Of Input (FIN packet). When the NetScaler receives End Of Input (FIN packet), it compresses the buffered data immediately without waiting for the buffered data size to reach the quantum size.

Timer compression (TCmpTmr)

Number of times the NetScaler compresses data on expiration of data accumulation timer. The timer expires if the server response is very slow and consequently, the NetScaler does not receive response for a certain amount of time. Under such a condition, the NetScaler compresses the buffered data immediately without waiting for the buffered data size to reach the quantum size.

Compressed bytes received (DCmpTRxB)

Total number of compressed bytes received by NetScaler.

Compressed packets received (DCmpTRxP)

Total number of compressed packets received by NetScaler.

Decompressed bytes transmitted (DCmpTTxB)

Total number of decompressed bytes transmitted by NetScaler.

Decompressed packets transmitted (DCmpTTxP)

Total number of decompressed packets transmitted by NetScaler.

Wrong data (DCmpErrD)

Number of data errors encountered while decompressing.

Less Data (DCmpErrL)

Number of times NetScaler received less data than declared by protocol.

More Data (DCmpErrM)

Number of times NetScaler received more data than declared by protocol.

Memory failures (DCmpMem)

Number of times memory failures occurred while decompressing.

Unknown (DCmpErrU)

Number of times unknown errors occurred while decompressing.

Delta compression requests (DlCmpRx)

Total number of delta compression requests received by NetScaler.

Delta compression applied (DlDone)

Total number of delta compressions done by NetScaler.

Compressible bytes received (DlCmpRxB)

Total number of delta-compressible bytes received by NetScaler.

Compressed bytes transmitted (DlCmpTxB)

Total number of delta-compressed bytes transmitted by NetScaler.

First-time access (DlCmpFAc)

Total number of delta compression first accesses.

Compressible packets received (DlCmpRxP)

Number of delta-compressible packets received.

Compressed packets transmitted (DlCmpTxP)

Total number of delta-compressed packets transmitted by NetScaler.

Basefile requests served (DlCBSrv)

Total number of basefile requests served by NetScaler.

Basefile bytes transmitted (DlCBTxB)

Number of basefile bytes transmitted by NetScaler.

Delta compression bypassed (DlCmpEBy)

Number of times delta-compression bypassed by NetScaler.

Basefile write header failed (DlCmpEBW)

Number of times basefile could not be updated in NetScaler cache.

Basefile no-store miss (DlCmpENM)

Number of times basefile was not found in NetScaler cache.

Request information too big (DlCmpERB)

Number of times basefile request URL was too large.

Request info alloc failed (DlCmpERF)

Number of times requested basefile could not be allocated.

Session allocation failed (DlCmpESF)

Number of times delta compression session could not be allocated.

Response bytes received (HTRspbRx)

Total number of bytes of HTTP response data received.

cmp action

Sep 22, 2015

The following operations can be performed on "cmp action":

add | rm | show | rename

Creates a compression action. Note: User-defined compression actions supplement the built-in compression actions. The built-in compression actions, NOCOMPRESS, COMPRESS, GZIP, and DEFLATE, are always available. Available settings functions as follows: * NOCOMPRESS - Disables compression for data that matches the associated policy. * COMPRESS - Enable GZIP or DEFLATE compression, depending on which is supported by the browser. * GZIP - Enable GZIP compression. For browsers that do not support GZIP, compression is disabled. * DEFLATE - Enable DEFLATE compression for a specific policy. For browsers that do not support DEFLATE, compression is disabled.

add cmp action <name> <cmpType>

name

Name of the compression action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the action is added.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp action" or 'my cmp action').

cmpType

Type of compression performed by this action.

Available settings function as follows:

* COMPRESS - Apply GZIP or DEFLATE compression to the response, depending on the request header. Prefer GZIP.

* GZIP - Apply GZIP compression.

* DEFLATE - Apply DEFLATE compression.

* NOCOMPRESS - Do not compress the response if the request matches a policy that uses this action.

Possible values: compress, gzip, deflate, nocompress

deltaType

The type of delta action (if delta type compression action is defined).

Possible values: PERURL, PERPOLICY

Default value: NS_ACT_CMP_DELTA_TYPE_PERURL

```
add cmp action nocmp NOCOMPRESS
```

Removes the specified compression action.

rm cmp action <name>

name

Name of the action to be removed.

```
rm cmp action cmp_action_name
```

Displays information about all the built-in and user-defined compression actions, or detailed information about the specified action.

show cmp action [<name>]

name

Name of the action for which to display detailed information.

summary

fullValues

format

level

cmpType

Type of compression performed by this action.

Available settings function as follows:

* COMPRESS - Apply GZIP or DEFLATE compression to the response, depending on the request header. Prefer GZIP.

* GZIP - Apply GZIP compression.

* DEFLATE - Apply DEFLATE compression.

* NOCOMPRESS - Do not compress the response if the request matches a policy that uses this action.

deltaType

The type of delta action if compression type is delta compression.NOTE: This attribute is deprecated.Deprecating delta action in cmp policies

stateflag

flags

builtin

Flag to determine whether compression is default or not

isDefault

A value of true is returned if it is a default policy

devno

count

Example 1 The following example shows output from the show cmp action command when no custom cmp actions have been de

---

Renames a compression action.

rename cmp action <name>@ <newName>@

name

Existing name of the action.

newName

New name for the compression action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at

(@), equals (=), and hyphen (-) characters.

Choose a name that can be correlated with the function that the action performs.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp action" or 'my cmp action').

rename cmp policy oldname newname

---

cmp global

Sep 22, 2015

The following operations can be performed on "cmp global":

bind | unbind | show

Binds (activates) the compression policy globally. Note that the compression feature requires a compression license. When you enable the compression feature, all of the built-in compression policies are bound globally.

bind cmp global <policyName> [-priority <positive_integer>] [-state (ENABLED | DISABLED)] [-gotoPriorityExpression <expression>] [-type <type>] [-invoke (<labelType> <labelName>)]

policyName

Name of the policy to bind globally.

add cmp policy pdf_cmp -rule "RES.HTTP.HEADER Content-Type CONTAINS application/pdf" -resAction COMPRESS After creating the above compression policy, you mus

---

Deactivates a globally bound HTTP compression policy.

unbind cmp global <policyName> [-type <type> [-priority <positive_integer>]]

policyName

Name of the compression policy to unbind.

To view the globally active compression policies, enter the following command: > show cmp global 5 Globally Active Compression Policies: 1) Policy Name: ns_cm

---

Displays the globally bound HTTP compression policies.

show cmp global [-type <type>]

type

Bind point to which the policy is bound.

Possible values: REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT

summary

fullValues

format

level

stateflag

policyName

The name of the globally bound HTTP compression policy.

priority

Positive integer specifying the priority of the policy. The lower the number, the higher the priority. By default, polices within a label are evaluated in the order of their priority numbers.

In the configuration utility, you can click the Priority field and edit the priority level or drag the entry to a new position in the list. If you drag the entry to a new position, the priority level is updated automatically.

state

The current state of the policy binding. This attribute is relevant only for CLASSIC policies.

numpol

The number of policies bound to the bindpoint.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE

invoke

Invoke flag. This attribute is relevant only for ADVANCED policies

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

policyType

Policy type (Classic/Advanced) to be bound.Used for display.

devno

count

> show cmp global 4 Globally Active Compression Policies: 1) Policy Name: ns_cmp_content_type Priority: 0 2) Policy

cmp parameter

Sep 22, 2015

The following operations can be performed on "cmp parameter":

set | unset | show

Configures the compression parameters.

set cmp parameter [-cmpLevel <cmpLevel>] [-quantumSize <positive_integer>] [-serverCmp (ON | OFF)] [-minResSize <positive_integer>] [-cmpBypassPct <positive_integer>] [-cmpOnPush (ENABLED | DISABLED)] [-policyType (CLASSIC | ADVANCED)] [-addVaryHeader (ENABLED | DISABLED)] [-externalCache (YES | NO)]

cmpLevel

Specify a compression level. Available settings function as follows:

* Optimal - Corresponds to a gzip GZIP level of 5-7.

* Best speed - Corresponds to a gzip level of 1.

* Best compression - Corresponds to a gzip level of 9.

Possible values: optimal, bestspeed, bestcompression, spdy

Default value: NSCMPLVL_OPTIMAL

quantumSize

Minimum quantum of data to be filled before compression begins.

Default value: 57344

Minimum value: 8

Maximum value: 63488

serverCmp

Allow the server to send compressed data to the NetScaler appliance. With the default setting, the NetScaler appliance handles all compression.

Possible values: ON, OFF

Default value: ON

heurExpiry

Heuristic basefile expiry.

Possible values: ON, OFF

Default value: OFF

heurExpiryThres

Threshold compression ratio for heuristic basefile expiry, multiplied by 100. For example, to set the threshold ratio to 1.25, specify 125.

Default value: 100

Minimum value: 1

Maximum value: 1000

heurExpiryHistWt

For heuristic basefile expiry, weightage to be given to historical delta compression ratio, specified as percentage. For example, to give 25% weightage to historical ratio (and therefore 75% weightage to the ratio for current delta compression transaction), specify 25.

Default value: 50

Minimum value: 1

Maximum value: 100

minResSize

Smallest response size, in bytes, to be compressed.

cmpBypassPct

NetScaler CPU threshold after which compression is not performed. Range: 0 - 100

Default value: 100

Maximum value: 100

cmpOnPush

NetScaler appliance does not wait for the quantum to be filled before starting to compress data. Upon receipt of a packet with a PUSH flag, the appliance immediately begins compression of the accumulated packets.

Possible values: ENABLED, DISABLED

Default value: DISABLED

policyType

Type of policy. Available settings function as follows:

* Classic - Classic policies evaluate basic characteristics of traffic and other data.

* Advanced - Advanced policies (which have been renamed as default syntax policies) can perform the same type of evaluations as classic policies. They also enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

Possible values: CLASSIC, ADVANCED

Default value: NS_EXPR_TYPE_CLASSIC

addVaryHeader

Add the Vary header to HTTP responses being compressed. To HTTP 1.1 responses, add a Vary: User-Agent, Accept-Encoding header. Intermediate caches store different versions of the response for different values of the headers present in the Vary response header.

Possible values: ENABLED, DISABLED

Default value: DISABLED

externalCache

Enable insertion of Cache-Control: private response directive to indicate response message is intended for a single user and must not be cached by a shared or proxy cache.

Possible values: YES, NO

Default value: NO

```
set cmp param -cmpLevel bestspeed -quantumSize 20480
```

Use this command to remove cmp parameter settings.Refer to the set cmp parameter command for meanings of the arguments.

```
unset cmp parameter [-cmpLevel] [-quantumSize] [-serverCmp] [-minResSize] [-cmpBypassPct] [-cmpOnPush] [-policyType] [-addVaryHeader] [-externalCache]
```

Displays the values of the compression parameters. Example: > show cmp parameter Configured compression parameters: Compression level: optimal Quantum size: 4555 Server-side compression: ON Minimum HTTP response size for compression: 0 CPU load at which to bypass compression: 100% Compression on PUSH: DISABLED Compression policy type: CLASSIC Vary header insertion: DISABLED Disable external cache: NO

show cmp parameter

format

level

cmpLevel

Specify a compression level. Available settings function as follows:

* Optimal - Corresponds to a gzip GZIP level of 5-7.

* Best speed - Corresponds to a gzip level of 1.

* Best compression - Corresponds to a gzip level of 9.

quantumSize

Minimum quantum of data to be filled before compression begins.

serverCmp

Compression enabled/disabled at back-end server.

heurExpiry

Heuristic basefile expiry.NOTE: This attribute is deprecated.Deprecating delta action in cmp policies

heurExpiryThres

Threshold compression ratio for heuristic basefile expiry, multiplied by 100. For example, to set the threshold ratio to 1.25, specify 125.NOTE: This attribute is deprecated.Deprecating delta action in cmp policies

heurExpiryHistWt

For heuristic basefile expiry, weightage to be given to historical delta compression ratio, specified as percentage. For example, to give 25% weightage to historical ratio (and therefore 75% weightage to the ratio for current delta compression transaction), specify 25.NOTE: This attribute is deprecated.Deprecating delta action in cmp policies

minResSize

Smallest response size, in bytes, to be compressed.

cmpBypassPct

NetScaler CPU threshold after which compression is not performed. Range: 0 - 100

cmpOnPush

NetScaler appliance does not wait for the quantum to be filled before starting to compress data. Upon receipt of a packet with a PUSH flag, the appliance immediately begins compression of the accumulated packets.

policyType

Type of policy. Available settings function as follows:

* Classic - Classic policies evaluate basic characteristics of traffic and other data.

* Advanced - Advanced policies (which have been renamed as default syntax policies) can perform the same type of evaluations as classic policies. They also enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

addVaryHeader

Add the Vary header to HTTP responses being compressed. To HTTP 1.1 responses, add a Vary: User-Agent, Accept-Encoding header. Intermediate caches store different versions of the response for different values of the headers present in the Vary response header.

externalCache

Enable insertion of Cache-Control: private response directive to indicate response message is intended for a single user and must not be cached by a shared or proxy cache.

cmp policy

Sep 22, 2015

The following operations can be performed on "cmp policy":

add | rm | set | show | stat | rename

Creates a classic or default syntax HTTP compression policy. When the policy matches an HTTP request or response, the action specified in the policy is performed on the transaction. The policy can be bound globally or to an entity. For the policy to have an effect, compression must be enabled on the service.

add cmp policy <name> -rule <expression> -resAction <string>

name

Name of the HTTP compression policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

Can be changed after the policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policy" or 'my cmp policy').

rule

Expression that determines which HTTP requests or responses match the compression policy. Can be a classic expression or a default-syntax expression.

Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the \\ character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

resAction

The built-in or user-defined compression action to apply to the response when the policy matches a request or response.

Example 1: add cmp policy pdf_cmp -rule "RES.HTTP.HEADER Content-Type CONTAINS application/pdf" -resAction COMPRESS After creating the above compression poli

---

Removes a user-defined HTTP compression policy.

rm cmp policy <name>

name

Name of the HTTP compression policy to be removed.

rm cmp policy cmp_policy_name The "show cmp policy" command shows all currently defined HTTP compression policies.

Modifies the specified parameters of an HTTP compression policy. Note: Use the show cmp policy command to view all configured HTTP compression policies.

set cmp policy <name> [-rule <expression>] [-resAction <string>]

name

Name of the HTTP compression policy to be modified.

rule

New rule to be associated with the HTTP compression policy. You can modify the existing rule or create a new rule.

resAction

The built-in or user-defined compression action to be associated with the policy.

Example 1: add cmp policy pdf_cmp -rule "RES.HTTP.HEADER Content-Type CONTAINS application/pdf" -resAction COMPRESS After creating the above compression poli

---

Displays details of all HTTP compression policies.

show cmp policy [<name>] show cmp policy stats - alias for 'stat cmp policy'

name

Name of the HTTP compression policy for which to display details.

summary

fullValues

format

level

stateflag

expressionType

Type of policy (Classic/Advanced)

rule

The request/response rule that will trigger the specified compression action.

reqAction

The compression action to be performed on requests.

resAction

The compression action to be performed on responses.

hits

Number of hits.

txbytes

Number of bytes transferred.

rxbytes

Number of bytes received.

clientTTLB

Total client TTLB value.

clientTransactions

Number of client transactions.

serverTTLB

Total server TTLB value.

serverTransactions

Number of server transactions.

piHits

Number of hits.

piTxBytes

Number of bytes transferred.

piRxBytes

Number of bytes received.

piCltTTLB

Total client TTLB value.

piCltTransactions

Number of client transactions.

piSvrTTLB

Total server TTLB value.

piSvrTransactions

Number of server transactions.

boundTo

The name of the entity to which the policy is bound.

activePolicy

priority

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

description

Description of the policy

bindPolicyType

policyType

vserverType

builtin

Flag to determine if compression policy is builtin or not

isDefault

A value of true is returned if it is a default policy

devno

count

```
> show cmp policy      4 Compression policies: 1)    Name: ns_cmp_content_type     Rule: ns_c
```

Displays compression statistics for all advanced compression policies, or for only the specified policy.

```
stat cmp policy [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-
clearstats ( basic | full )]
```

name

Name of the advanced compression policy for which to display statistics. If no name is specified, statistics for all advanced compression polices are shown.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

Policy hits (Hits)

Number of hits on the policy

Policy undef hits (Undefhits)

Number of undef hits on the policy

stat cmp policy

Renames a compression policy.

rename cmp policy <name>@ <newName>@

name

Existing name of the policy.

newName

New name for the compression policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

Choose a name that reflects the function that the policy performs.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policy" or 'my cmp policy').

rename cmp policy oldname newname

---

cmp policylabel

Sep 22, 2015

The following operations can be performed on "cmp policylabel":

add | rm | bind | unbind | show | stat | rename

Creates a user-defined HTTP compression policy label for default-syntax policies. Policies that you bind to the label are evaluated only if you call the label from another policy.

add cmp policylabel <labelName> -type (REQ | RES)

labelName

Name of the HTTP compression policy label. Must begin with a letter, number, or the underscore character (_). Additional characters allowed, after the first character, are the hyphen (-), period (.) pound sign (#), space ( ), at sign (@), equals (=), and colon (:). The name must be unique within the list of policy labels for compression policies. Can be renamed after the policy label is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policylabel" or 'my cmp policylabel').

type

Type of packets (request packets or response) against which to match the policies bound to this policy label.

Possible values: REQ, RES

```
add cmp policylabel cmp_pol_label -type REQ
```

Removes an HTTP compression policy label.

rm cmp policylabel <labelName>

labelName

Name of the HTTP compression policy label to be removed.

```
rm cmp policylabel cmp_pol_label
```

Binds a default-syntax HTTP compression policy to an HTTP compression policy label.

```
bind cmp policylabel <labelName> -policyName <string> -priority <positive_integer> [-gotoPriorityExpression <expression>] [-invoke (<labelType> <labelName>) ]
```

labelName

Name of the HTTP compression policy label to which to bind the policy.

policyName

Name of the compression policy to bind to the label.

```
bind cmp policylabel cmp_pol_label -policyName cmp_pol -priority 1
```

Unbinds a default-syntax HTTP compression policy from an HTTP compression policy label.

```
unbind cmp policylabel <labelName> <policyName> [-priority <positive_integer>]
```

labelName

Name of the HTTP compression policy label from which to unbind the policy.

policyName

Name of the HTTP compression policy to unbind from the policy label.

priority

Priority of the NOPOLICY to unbind. Required only to unbind a NOPOLICY, if it has been bound to this policy label.

Minimum value: 1

Maximum value: 2147483647

```
unbind cmp policylabel cmp_pol_label cmp_pol
```

Displays details of configured HTTP compression policy labels.

```
show cmp policylabel [<labelName>]
```

labelName

Name of the HTTP compression policy label for which to display details.

summary

fullValues

format

level

stateflag

type

Type of packets (request packets or response) against which to match the policies bound to this policy label.

numpol

Number of polices bound to label.

hits

Number of times policy label was invoked.

policyName

The compression policy name.

priority

Specifies the priority of the policy.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

invoke

Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next higher priority number in the original label.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy evaluates to TRUE.

flowType

Flowtype of the bound compression policy.

rename cmp policylabel oldname newname

---

cmp stats

Sep 22, 2015

The following operations can be performed on "cmp stats":

show cmp stats is an alias for stat cmp Displays compression statistics.

```
show cmp stats - alias for 'stat cmp'
```

CO Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- co parameter
- co policy

co parameter

Sep 22, 2015

The following operations can be performed on "co parameter":

Use this command to remove co parameter settings.Refer to the set co parameter command for meanings of the arguments.

unset co parameter [-cacheMaxage] [-imgType] [-JpegQualityPercent] [-inlineCssThresSize] [-inlineJsThresSize] [-inlineImgThresSize]

co policy

Sep 22, 2015

The following operations can be performed on "co policy":

Use this command to remove co policy settings.Refer to the set co policy command for meanings of the arguments.

```
unset co policy <name> [-rule] [-action]
```

Cache Redirection Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- cr policy
- cr vserver

cr policy

Sep 22, 2015

The following operations can be performed on "cr policy":

add | rm | set | show

Creates a cache redirection policy. To associate the new policy with a cache redirection virtual server, use the bind cr vserver command.

add cr policy <policyName> -rule <expression>

policyName

Name for the cache redirection policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my policy? or ?my policy?).

rule

Expression, or name of a named expression, against which traffic is evaluated. Written in the classic syntax.

Note:Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: "<string of 255 characters>" + "<string of 245 characters>"

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the \\ character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

builtin

Removes a cache redirection policy. You can delete a user-defined cache redirection policy that is not bound to a cache

redirection virtual server. If the policy is bound to a virtual server, you must first unbind the policy, and then remove it.

rm cr policy <policyName>

policyName

Name of the cache redirection policy to remove.

Changes the specified parameters of an existing cache redirection policy.

set cr policy <policyName> -rule <expression>

policyName

Name of the cache redirection policy to change.

rule

Expression, or name of a named expression, against which traffic is evaluated. Written in the classic syntax.

Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator.

For example, you can create a 500-character string as follows: "<string of 255 characters>" + "<string of 245 characters>"

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

Displays all existing cache redirection policies, or just the specified policy.

show cr policy [<policyName>]

policyName

Name of the cache redirection policy to display. If this parameter is omitted, details of all the policies are displayed.

summary

count

stateflag

cr vserver

Sep 22, 2015

The following operations can be performed on "cr vserver":

add | rm | set | unset | bind | unbind | enable | disable | show | stat | rename

Creates a cache redirection virtual server.

add cr vserver <name> [-td <positive_integer>] <serviceType> [<IPAddress> <port> [-range <positive_integer>]] [-cacheType <cacheType>] [-redirect <redirect>] [-onPolicyMatch (CACHE | ORIGIN)] [-redirectURL <URL>] [-cltTimeout <secs>] [-precedence (RULE | URL)] [-arp (ON | OFF)] [-map (ON | OFF)] [-format (ON | OFF)] [-via (ON | OFF)] [-dnsVserverName <string>] [-destinationVServer <string>] [-domain <string>] [-soPersistenceTimeOut <positive_integer>] [-soThreshold <positive_integer>] [-reuse (ON | OFF)] [-state (ENABLED | DISABLED)] [-downStateFlush (ENABLED | DISABLED)] [-backupVServer <string>] [-disablePrimaryOnDown (ENABLED | DISABLED)] [-l2Conn (ON | OFF)] [-backendssl (ENABLED | DISABLED)] [-Listenpolicy <expression> [-Listenpriority <positive_integer>]] [-tcpProfileName <string>] [-httpProfileName <string>] [-comment <string>] [-srcIPExpr <expression>] [-originUSIP (ON | OFF)] [-usePortRange (ON | OFF)] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>] [-icmpVsrResponse (PASSIVE | ACTIVE)]

name

Name for the cache redirection virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the cache redirection virtual server is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my server? or ?my server?).

td

Traffic Domain ID

Maximum value: 4094

serviceType

Protocol (type of service) handled by the virtual server.

Possible values: HTTP, SSL, NNTP

IPAddress

IPv4 or IPv6 address of the cache redirection virtual server. Usually a public IP address. Clients send connection

requests to this IP address.

Note: For a transparent cache redirection virtual server, use an asterisk (*) to specify a wildcard virtual server address.

cacheType

Mode of operation for the cache redirection virtual server. Available settings function as follows:

* TRANSPARENT - Intercept all traffic flowing to the appliance and apply cache redirection policies to determine whether content should be served from the cache or from the origin server.

* FORWARD - Resolve the hostname of the incoming request, by using a DNS server, and forward requests for non-cacheable content to the resolved origin servers. Cacheable requests are sent to the configured cache servers.

* REVERSE - Configure reverse proxy caches for specific origin servers. Incoming traffic directed to the reverse proxy can either be served from a cache server or be sent to the origin server with or without modification to the URL.

Possible values: TRANSPARENT, REVERSE, FORWARD

Default value: CRD_TRANSPARENT

redirect

Type of cache server to which to redirect HTTP requests. Available settings function as follows:

* CACHE - Direct all requests to the cache.

* POLICY - Apply the cache redirection policy to determine whether the request should be directed to the cache or to the origin.

* ORIGIN - Direct all requests to the origin server.

Possible values: CACHE, POLICY, ORIGIN

Default value: CRD_POLICY

onPolicyMatch

Redirect requests that match the policy to either the cache or the origin server, as specified.

Note: For this option to work, you must set the cache redirection type to POLICY.

Possible values: CACHE, ORIGIN

Default value: CRD_ORIGIN

redirectURL

URL of the server to which to redirect traffic if the cache redirection virtual server configured on the NetScaler appliance becomes unavailable.

cltTimeout

Time-out value, in seconds, after which to terminate an idle client connection.

Maximum value: 31536000

precedence

Type of policy (URL or RULE) that takes precedence on the cache redirection virtual server. Applies only to cache redirection virtual servers that have both URL and RULE based policies. If you specify URL, URL based policies are applied first, in the following order:

1. Domain and exact URL

2. Domain, prefix and suffix

3. Domain and suffix

4. Domain and prefix

5. Domain only

6. Exact URL

7. Prefix and suffix

8. Suffix only

9. Prefix only

10. Default

If you specify RULE, the rule based policies are applied before URL based policies are applied.

Possible values: RULE, URL

Default value: CS_PRIORITY_RULE

arp

Use ARP to determine the destination MAC address.

Possible values: ON, OFF

ghost

map

Obsolete.

Possible values: ON, OFF

format

via

Insert a via header in each HTTP request. In the case of a cache miss, the request is redirected from the cache server to the origin server. This header indicates whether the request is being sent

from a cache server.

Possible values: ON, OFF

Default value: ON

cacheVserver

Name of the default cache virtual server to which to redirect requests (the default target of the cache redirection virtual server).

dnsVserverName

Name of the DNS virtual server that resolves domain names arriving at the forward proxy virtual server.

Note: This parameter applies only to forward proxy virtual servers, not reverse or transparent.

destinationVServer

Destination virtual server for a transparent or forward proxy cache redirection virtual server.

domain

Default domain for reverse proxies. Domains are configured to direct an incoming request from a specified source domain to a specified target domain. There can be several configured pairs of source and target domains. You can select one pair to be the default. If the host header or URL of an incoming request does not include a source domain, this option sends the request to the specified target domain.

soPersistenceTimeOut

Time-out, in minutes, for spillover persistence.

Minimum value: 2

Maximum value: 24

soThreshold

For CONNECTION (or) DYNAMICCONNECTION spillover, the number of connections above which the virtual server enters spillover mode. For BANDWIDTH spillover, the amount of incoming and outgoing traffic (in Kbps) before spillover. For HEALTH spillover, the percentage of active services (by weight) below which spillover occurs.

Minimum value: 1

reuse

Reuse TCP connections to the origin server across client connections. Do not set this parameter unless the Service Type parameter is set to HTTP. If you set this parameter to OFF, the possible settings of the Redirect parameter function as follows:

* CACHE - TCP connections to the cache servers are not reused.

* ORIGIN - TCP connections to the origin servers are not reused.

* POLICY - TCP connections to the origin servers are not reused.

If you set the Reuse parameter to ON, connections to origin servers and connections to cache servers are reused.

Possible values: ON, OFF

Default value: ON

state

Initial state of the cache redirection virtual server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

downStateFlush

Perform delayed cleanup of connections to this virtual server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

backupVServer

Name of the backup virtual server to which traffic is forwarded if the active server becomes unavailable.

disablePrimaryOnDown

Continue sending traffic to a backup virtual server even after the primary virtual server comes UP from the DOWN state.

Possible values: ENABLED, DISABLED

Default value: DISABLED

l2Conn

Use L2 parameters, such as MAC, VLAN, and channel to identify a connection.

Possible values: ON, OFF

backendssl

Decides whether the backend connection made by NS to the origin server will be HTTP or SSL. Applicable only for SSL type CR Forward proxy vserver.

Possible values: ENABLED, DISABLED

Default value: DISABLED

Listenpolicy

String specifying the listen policy for the cache redirection virtual server. Can be either an in-line expression or the name of a named expression.

Default value: "none"

Listenpriority

Priority of the listen policy specified by the Listen Policy parameter. The lower the number, higher the priority.

Default value: 101

Maximum value: 100

tcpProfileName

Name of the profile containing TCP configuration information for the cache redirection virtual server.

httpProfileName

Name of the profile containing HTTP configuration information for cache redirection virtual server.

comment

Comments associated with this virtual server.

srcIPExpr

Expression used to extract the source IP addresses from the requests originating from the cache. Can be either an in-line expression or the name of a named expression.

originUSIP

Use the client?s IP address as the source IP address in requests sent to the origin server.

Note: You can enable this parameter to implement fully transparent CR deployment.

Possible values: ON, OFF

Default value: OFF

usePortRange

Use a port number from the port range (set by using the set ns param command, or in the Create Virtual Server (Cache Redirection) dialog box) as the source port in the requests sent to the origin server.

Possible values: ON, OFF

Default value: OFF

appflowLog

Enable logging of AppFlow information.

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

Name of the network profile containing network configurations for the cache redirection virtual server.

icmpVsrResponse

Criterion for responding to PING requests sent to this virtual server. If ACTIVE, respond only if the virtual server is available. If PASSIVE, respond even if the virtual server is not available.

Possible values: PASSIVE, ACTIVE

Default value: NS_VSR_PASSIVE

Removes a virtual server.

rm cr vserver <name>@ ...

name

Name of the virtual server to be removed.

rm vserver cr_vip

Changes the specified settings of the cache redirection virtual server.

set cr vserver <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-redirect <redirect>] [-onPolicyMatch (CACHE | ORIGIN)] [-precedence (RULE | URL)] [-arp (ON | OFF)] [-via (ON | OFF)] [-dnsVserverName <string>] [-destinationVServer <string>] [-domain <string>] [-reuse (ON | OFF)] [-backupVServer <string>] [-disablePrimaryOnDown (ENABLED | DISABLED)] [-redirectURL <URL>] [-cltTimeout <secs>] [-downStateFlush (ENABLED | DISABLED)] [-l2Conn (ON | OFF)] [-backendssl (ENABLED | DISABLED)] [-Listenpolicy <expression>] [-Listenpriority <positive_integer>] [-tcpProfileName <string>] [-httpProfileName <string>] [-

netProfile <string>] [-comment <string>] [-srcIPExpr <expression>] [-originUSIP (ON | OFF)] [-usePortRange (ON | OFF)] [-appflowLog (ENABLED | DISABLED)] [-icmpVsrResponse (PASSIVE | ACTIVE)]

name

Name of the cache redirection virtual server.

IPAddress

New IPv4 or IPv6 address of the cache redirection virtual server. Usually a public IP address. Clients send connection requests to this IP address.

redirect

Type of server to which to redirect HTTP requests. Available settings function as follows: * CACHE - Direct all requests to the cache.* POLICY - Apply the cache redirection policy to determine whether the request should be directed to the cache or to the origin.* ORIGIN - Direct all requests to the origin server.

Possible values: CACHE, POLICY, ORIGIN

Default value: CRD_POLICY

onPolicyMatch

Redirect requests that match the policy to either the cache or the origin server, as specified.

Note: For this option to work, you must set the cache redirection type to POLICY.

Possible values: CACHE, ORIGIN

Default value: CRD_ORIGIN

precedence

Type of policy (URL or RULE) that takes precedence on the cache redirection virtual server. You can use this argument only when configuring cache redirection on the specified virtual server. It applies only if both URL and RULE based policies have been configured on the same virtual server. Available settings function as follows:URL - The incoming request is matched against the URL-based policies before it is matched against the rule-based policies.

For URL based policies, the precedence hierarchy is:

1. Domain and exact URL

2. Domain, prefix and suffix

3. Domain and suffix

4. Domain and prefix

5. Domain only

6. Exact URL

7. Prefix and suffix

8. Suffix only

9. Prefix only

10. Default

RULE - The incoming request is matched against the rule-based policies before it is matched against the URL-based policies.

Possible values: RULE, URL

Default value: CS_PRIORITY_RULE

arp

Use ARP to determine the destination MAC address. Specify OFF to use the incoming destination MAC address, or ON to use ARP to determine the destination MAC address.

Possible values: ON, OFF

via

Insert a via header in each HTTP request. In the case of a cache miss, the request is redirected from the cache server to the origin server. This header indicates whether the request is being sent from a cache server.

Possible values: ON, OFF

Default value: ON

cacheVserver

Name of the default target cache virtual server to which to redirect requests.

dnsVserverName

Name of the DNS virtual server that resolves domain names arriving at the forward proxy virtual server.

Note: This parameter applies only to forward proxy virtual servers, not reverse or transparent.

destinationVServer

Destination virtual server for a transparent or forward proxy cache redirection virtual server.

domain

Default domain for reverse proxies. Domains are configured to direct incoming requests from a specified source domain to a specified target domain. There can be several configured pairs of source and target domains. You can select one pair to be the default. If the host header or URL of an incoming request does not include a source domain, this option sends the request to the specified target domain.

reuse

Reuse TCP connections to the origin server across client connections

Possible values: ON, OFF

Default value: ON

backupVServer

Name of the backup virtual server to which traffic is forwarded if the active server becomes unavailable.

disablePrimaryOnDown

Continue sending traffic to a backup virtual server even after the primary virtual server comes UP from the DOWN state.

Possible values: ENABLED, DISABLED

Default value: DISABLED

redirectURL

URL of the server to which to redirect traffic if the cache redirection virtual server in the NetScaler becomes unavailable.

cltTimeout

Time-out value, in seconds, after which an idle client connection is terminated.

Maximum value: 31536000

downStateFlush

Perform delayed cleanup of connections to this virtual server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

l2Conn

Use L2 parameters, such as MAC, VLAN, and channel to identify a connection.

Possible values: ON, OFF

backendssl

Decides whether the backend connection made by NS to the origin server will be HTTP or SSL. Applicable only for SSL type CR Forward proxy vserver.

Possible values: ENABLED, DISABLED

Default value: DISABLED

Listenpolicy

String specifying the listen policy for the cache redirection virtual server. Can be either an in-line expression

or the name of a named expression.

Default value: "none"

Listenpriority

Priority of the listen policy specified by the Listen Policy parameter. The lower the number, higher the priority.

Default value: 101

Maximum value: 100

tcpProfileName

Name of the profile containing TCP configuration information for the cache redirection virtual server.

httpProfileName

Name of the profile containing HTTP configuration information for cache redirection virtual server.

netProfile

Name of the network profile containing network configurations for the cache redirection virtual server.

comment

Comments associated with this virtual server.

srcIPExpr

Expression used to extract the source IP addresses from the requests originating from the cache. Can be either an in-line expression or the name of a named expression.

originUSIP

Use the client?s IP address as the source IP address in requests sent to the origin server.

Note: You can enable this parameter to implement fully transparent CR deployment.

Possible values: ON, OFF

Default value: OFF

usePortRange

Use a port number from the port range (set by using the set ns param command, or in the Create Virtual Server (Cache Redirection) dialog box) as the source port in the requests sent to the origin server.

Possible values: ON, OFF

Default value: OFF

appflowLog

Enable logging of AppFlow information.

Possible values: ENABLED, DISABLED

Default value: ENABLED

icmpVsrResponse

Criterion for responding to PING requests sent to this virtual server. If ACTIVE, respond only if the virtual server is available. If PASSIVE, respond even if the virtual server is not available.

Possible values: PASSIVE, ACTIVE

Default value: NS_VSR_PASSIVE

Restores the specified parameters of a cache redirection virtual server to their default values. To unset all except the Name parameter, do not specify a value for any other parameter. Refer to the set cr vserver command for a description of the parameters..Refer to the set cr vserver command for meanings of the arguments.

unset cr vserver <name> [-dnsVserverName] [-destinationVServer] [-domain] [-backupVServer] [-cltTimeout] [-redirectURL] [-l2Conn] [-backendssl] [-originUSIP] [-usePortRange] [-srcIPExpr] [-tcpProfileName] [-httpProfileName] [-appflowLog] [-netProfile] [-icmpVsrResponse] [-redirect] [-onPolicyMatch] [-precedence] [-arp] [-via] [-reuse] [-disablePrimaryOnDown] [-downStateFlush] [-Listenpolicy] [-Listenpriority] [-comment]

Binds a cache redirection policy to a cache redirection virtual server.

bind cr vserver <name> [-lbvserver <string> | (-policyName <string> [-priority <positive_integer>]) | <targetVserver>]

name

Name of the cache redirection virtual server to which to bind the cache redirection policy.

lbvserver

Name of the virtual server to which content is forwarded. Applicable only if the policy is a map policy and the cache redirection virtual server is of type REVERSE.

policyName

Name of the cache redirection policy that you are binding.

Unbinds a cache redirection policy from a cache redirection virtual server.

unbind cr vserver <name> [-policyName <string> | -lbvserver <string>]

name

Name of the cache redirection virtual server from which to unbind the policy.

policyName

Name of the cache redirection policy that you are unbinding.

lbvserver

The virtual server name (created with the add lb vserver command) to which content will be switched.

Default value: "default_lb"

Enables a cache redirection virtual server. Note: Virtual servers, when added, are enabled by default.

enable cr vserver <name>@

name

Name of the cache redirection virtual server to be enabled.

```
enable vserver cr_vip
```

Disables a cache redirection virtual server.

disable cr vserver <name>@

name

Name of the cache redirection virtual server to be disabled. (Because the virtual server is still configured, you can reenable it.)

Note: The appliance still responds to ARP and ping requests sent to the IP address of this virtual server.

```
disable vserver cr_vip
```

Displays cache redirection virtual server information. To display information about all configured cache redirection virtual servers, do not include a parameter. To display detailed information about a specific virtual server, use the name parameter to specify the name of the virtual server.

```
show cr vserver [<name>]
```

name

Name of a cache redirection virtual server about which to display detailed information.

summary

fullValues

format

level

IPAddress

The IP address of the virtual server.

td

Traffic Domain ID

stateflag

value

The ssl card status for the transparent ssl cr vserver.

port

Port number of the virtual server.

range

Number of consecutive IP addresses, starting with the address specified by the IP Address parameter, to include in a range of addresses assigned to this virtual server.

serviceType

Protocol (type of service) handled by the virtual server.

ngname

Nodegroup devno to which this crvserver belongs to

type

Virtual server type.

vsvrcfgflags

Contains the config info of vserver to be used at validation

state

Initial state of the cache redirection virtual server.

status

Status.

cacheType

Mode of operation for the cache redirection virtual server. Available settings function as follows:

* TRANSPARENT - Intercept all traffic flowing to the appliance and apply cache redirection policies to determine whether content should be served from the cache or from the origin server.

* FORWARD - Resolve the hostname of the incoming request, by using a DNS server, and forward requests for non-cacheable content to the resolved origin servers. Cacheable requests are sent to the configured cache servers.

* REVERSE - Configure reverse proxy caches for specific origin servers. Incoming traffic directed to the reverse proxy can either be served from a cache server or be sent to the origin server with or without modification to the URL.

redirect

Type of cache server to which to redirect HTTP requests. Available settings function as follows:

* CACHE - Direct all requests to the cache.

* POLICY - Apply the cache redirection policy to determine whether the request should be directed to the cache or to the origin.

* ORIGIN - Direct all requests to the origin server.

onPolicyMatch

Redirect requests that match the policy to either the cache or the origin server, as specified.

Note: For this option to work, you must set the cache redirection type to POLICY.

precedence

Type of policy (URL or RULE) that takes precedence on the cache redirection virtual server. Applies only to cache redirection virtual servers that have both URL and RULE based policies. If you specify URL, URL based policies are applied first, in the following order:

1. Domain and exact URL

2. Domain, prefix and suffix

3. Domain and suffix

4. Domain and prefix

5. Domain only

6. Exact URL

7. Prefix and suffix

8. Suffix only

9. Prefix only

10. Default

If you specify RULE, the rule based policies are applied before URL based policies are applied.

redirectURL

URL of the server to which to redirect traffic if the cache redirection virtual server configured on the NetScaler appliance becomes unavailable.

authentication

Authentication.

homePage

Home page.

dnsVserverName

Name of the DNS virtual server that resolves domain names arriving at the forward proxy virtual server.

Note: This parameter applies only to forward proxy virtual servers, not reverse or transparent.

domain

Default domain for reverse proxies. Domains are configured to direct an incoming request from a specified source domain to a specified target domain. There can be several configured pairs of source and target domains. You can select one pair to be the default. If the host header or URL of an incoming request does not include a source domain, this option sends the request to the specified target domain.

rule

Rule.

policyName

Policies bound to this vserver.

hits

Number of hits.

serviceName

Service name.

weight

Weight for this service.

cacheVserver

Name of the default cache virtual server to which to redirect requests (the default target of the cache redirection virtual server).NOTE: This attribute is deprecated.The functionality is intact, but we advise to use bind command to do default binding for CR

targetVserver

The CSW target server names.

backupVServer

Name of the backup virtual server to which traffic is forwarded if the

active server becomes unavailable.

priority

The priority for the policy.

cltTimeout

Time-out value, in seconds, after which to terminate an idle client connection.

soMethod

The spillover factor. When the main virtual server reaches this spillover threshold, it will give further traffic to the backupvserver.

soPersistence

The state of spillover persistence.

soPersistenceTimeOut

The spillover persistence entry timeout.

soThreshold

The spillover threshold value.

reuse

Reuse TCP connections to the origin server across client connections. Do not set this parameter unless the Service Type parameter is set to HTTP. If you set this parameter to OFF, the possible settings of the Redirect parameter function as follows:

* CACHE - TCP connections to the cache servers are not reused.

* ORIGIN - TCP connections to the origin servers are not reused.

* POLICY - TCP connections to the origin servers are not reused.

If you set the Reuse parameter to ON, connections to origin servers and connections to cache servers are reused.

arp

destinationVServer

Destination virtual server for a transparent or forward proxy cache redirection virtual server.

via

Insert a via header in each HTTP request. In the case of a cache miss, the request is redirected from the cache server to the origin

server. This header indicates whether the request is being sent from a cache server.

downStateFlush

Perform delayed clean up of connections on this vserver.

disablePrimaryOnDown

Tells whether traffic will continue reaching backup vservers even after primary comes UP from DOWN state.

l2Conn

Use L2 parameters, such as MAC, VLAN, and channel to identify a connection.

backendssl

Decides whether the backend connection made by NS to the origin server will be HTTP or SSL. Applicable only for SSL type CR Forward proxy vserver.

comment

Comments associated with this virtual server.

Listenpolicy

The string is listenpolicy configured for CR vserver

Listenpriority

This parameter is the priority for listen policy of CR Vserver.

tcpProfileName

Name of the profile containing TCP configuration information for the cache redirection virtual server.

httpProfileName

Name of the profile containing HTTP configuration information for cache redirection virtual server.

srcIPExpr

Expression used to extract the source IP addresses from the requests originating from the cache. Can be either an in-line expression or the name of a named expression.

originUSIP

Use the client?s IP address as the source IP address in requests

sent to the origin server.

Note: You can enable this parameter to implement fully transparent CR deployment.

usePortRange

Use a port number from the port range (set by using the set ns param command, or in the Create Virtual Server (Cache Redirection) dialog box) as the source port in the requests sent to the origin server.

appflowLog

Enable logging of AppFlow information.

netProfile

Name of the network profile containing network configurations for the cache redirection virtual server.

icmpVsrResponse

Criterion for responding to PING requests sent to this virtual server. If ACTIVE, respond only if the virtual server is available. If PASSIVE, respond even if the virtual server is not available.

lbvserver

The Default target server name.

inherited

On State describes that policy bound is inherited from global binding.

devno

count

Displays statistics for all cache redirection virtual servers or for the cache redirection virtual server specified by the name parameter.

stat cr vserver [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

name

Name of a specific cache redirection virtual server.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

IP address (IP)

The IP address on which the service is running.

Port (port)

The port on which the service is running.

Vserver protocol (Protocol)

Protocol associated with the vserver

State

Current state of the server. Possible values are UP, DOWN, UNKNOWN, OFS(Out of Service), TROFS(Transition Out of Service), TROFS_DOWN(Down When going Out of Service)

Requests (Req)

Total number of requests received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Responses (Rsp)

Number of responses received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Request bytes (Reqb)

Total number of request bytes received on this service or virtual server.

Response bytes (Rspb)

Number of response bytes received by this service or virtual server.

Renames a cache redirection virtual server.

rename cr vserver <name>@ <newName>@

name

Existing name of the cache redirection virtual server.

newName

New name for the cache redirection virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ? my name? or ?my name?).

rename cr vserver vscr1 vscrnew

Content Switching Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- cs action
- cs parameter
- cs policy
- cs policylabel
- cs vserver

cs action

Sep 22, 2015

The following operations can be performed on "cs action":

add | rm | set | unset | show | rename

Creates an action that indicates the target load balancing virtual server. This action is used to specify the target load balancing virtual server while defining a policy to support multiple policy bind support.

add cs action <name> (-targetLBVserver <string> | -targetVserverExpr <expression>) [-comment <string>]

name

Name for the content switching action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the content switching action is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my action? or ?my action?).

targetLBVserver

Name of the load balancing virtual server to which the content is switched.

targetVserverExpr

Information about this content switching action.

comment

Comments associated with this cs action.

```
add cs action -targetLBVserver act1 lb1
```

Removes a content switching action.

rm cs action <name>

name

Name of the cs action.

```
rm cs action act_before
```

Modifies the configuration settings of a content switching action.

```
set cs action <name> (-targetLBVserver <string> | -targetVserverExpr <expression>) [-comment <string>]
```

name

Name for the content switching action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the content switching action is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my action? or ?my action?).

targetLBVserver

Name of the load balancing virtual server to which the content is switched.

targetVserverExpr

Information about this content switching action.

comment

Comments associated with this cs action.

```
set cs action act1 -targetLBVserver lb2 -comment 'for url'
```

Use this command to remove cs action settings.Refer to the set cs action command for meanings of the arguments.

unset cs action <name> -comment

Displays the configuration settings of the specified content switching action or lists all the content switching actions configured on the appliance.

show cs action [<name>]

name

Name of the content switching action.

summary

fullValues

format

level

stateflag

targetLBVserver

Target LB vserver name.

targetVserverExpr

Target LB vserver expression.

hits

The number of times the action has been taken.

show cs action

Renames a content switching action.

rename cs action <name>@ <newName>@

name

Existing name of the content switching action.

newName

New name for the content switching action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my name? or ?my name?).

rename cs action oldname newname

---

cs parameter

Sep 22, 2015

The following operations can be performed on "cs parameter":

set | unset | show

Sets the status of the state update parameter for the server. By default, the content switching virtual server is always UP, regardless of the state of the load balancing virtual servers bound to it. This command enables the virtual server to check the status of the attached load balancing server for state information.

set cs parameter -stateupdate (ENABLED | DISABLED)

stateupdate

Specifies whether the virtual server checks the attached load balancing server for state information.

Possible values: ENABLED, DISABLED

Default value: DISABLED

```
set cs parameter -stateupdate (ENABLED|DISABLED)
```

Use this command to remove cs parameter settings.Refer to the set cs parameter command for meanings of the arguments.

```
unset cs parameter -stateupdate
```

Show CS parameters

show cs parameter

format

level

stateupdate

Specifies whether the virtual server checks the attached load balancing server for state information.

show cs parameter

cs policy

Sep 22, 2015

The following operations can be performed on "cs policy":

add | rm | set | unset | show | rename

Creates a new content switching policy. You use this policy to manage content switching on a virtual server.

add cs policy <policyName> [-url <string> | -rule <expression> | -action <string>] [-domain <string>] [-logAction <string>]

policyName

Name for the content switching policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after a policy is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my policy? or ?my policy?).

url

URL string that is matched with the URL of a request. Can contain a wildcard character. Specify the string value in the following format: [[prefix] [*]] [.suffix].

rule

Expression, or name of a named expression, against which traffic is evaluated. Written in the classic or default syntax.

Note:

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

The following requirements apply only to the NetScaler CLI:

* If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

* If the expression itself includes double quotation marks, escape the quotations by using the character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

domain

The domain name. The string value can range to 63 characters.

action

Content switching action that names the target load balancing virtual server to which the traffic is switched.

logAction

The log action associated with the content switching policy

To match the requests that have URL "/", you would enter the following command: add cs policy <policyName> -url / To match with all URLs that start with "/sports/", you

---

Removes a content switching policy. You can delete a user-defined content switching policy that is not bound to a content switching virtual server. If the policy is bound to a virtual server, you must first unbind the policy, and then remove it.

rm cs policy <policyName>

policyName

Name of the content switching policy to be removed.

Changes an existing content switching policy.

set cs policy <policyName> [-url <string> | -rule <expression>] [-domain <string>] [-action <string>] [-logAction <string>]

policyName

Name of the content switching policy.

url

The URL, with wildcards.

rule

The condition for applying this policy.

domain

The domain name.

action

The content switching action name.

logAction

The log action associated with the content switching policy

Unset logaction for existing content swtching policy..Refer to the set cs policy command for meanings of the arguments.

unset cs policy <policyName> [-logAction] [-url] [-rule] [-domain] [-action]

unset cs policy pol9 -logAction

Displays all existing content switching policies, or just the specified policy.

show cs policy [<policyName>]

policyName

Name of the content switching policy to display. If this parameter is omitted, details of all the policies are displayed.

rename cs policy oldname newname

---

cs policylabel

Sep 22, 2015

The following operations can be performed on "cs policylabel":

add | rm | bind | unbind | show | rename

Adds a content switching policy label.

add cs policylabel <labelName> <cspolicylabeltype>

labelName

Name for the policy label. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters.

The label name must be unique within the list of policy labels for content switching.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, \\?my label\\? or \\?my policylabel\\?).

cspolicylabeltype

Protocol supported by the policy label. All policies bound to the policy label must either match the specified protocol or be a subtype of that protocol. Available settings function as follows:

* HTTP - Supports policies that process HTTP traffic. Used to access unencrypted Web sites. (The default.)

* SSL - Supports policies that process HTTPS/SSL encrypted traffic. Used to access encrypted Web sites.

* TCP - Supports policies that process any type of TCP traffic, including HTTP.

* SSL_TCP - Supports policies that process SSL-encrypted TCP traffic, including SSL.

* UDP - Supports policies that process any type of UDP-based traffic, including DNS.

* DNS - Supports policies that process DNS traffic.

* ANY - Supports all types of policies except HTTP, SSL, and TCP.

* SIP_UDP - Supports policies that process UDP based Session Initiation Protocol (SIP) traffic. SIP initiates, manages, and terminates multimedia communications sessions, and has emerged as the standard for Internet telephony (VoIP).

* RTSP - Supports policies that process Real Time Streaming Protocol (RTSP) traffic. RTSP provides delivery of multimedia and other streaming data, such as audio, video, and other types of streamed media.

* RADIUS - Supports policies that process Remote Authentication Dial In User Service (RADIUS) traffic. RADIUS supports combined authentication, authorization, and auditing services for network management.

* MYSQL - Supports policies that process MYSQL traffic.

* MSSQL - Supports policies that process Microsoft SQL traffic.

Possible values: HTTP, TCP, RTSP, SSL, SSL_TCP, UDP, DNS, SIP_UDP, ANY, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, FTP

```
add cs policylabel trans_http_url HTTP
```

Removes a content switching policy label.

rm cs policylabel <labelName>

labelName

Name of the label to be removed.

```
rm cs policylabel trans_http_url
```

Binds a content switching policy to a content switching policy label.

bind cs policylabel <labelName> <policyName> <priority> [-targetVserver <string> | (-invoke (<labelType> <labelName>))] [-gotoPriorityExpression <expression>]

labelName

Name of the policy label to which to bind a content switching policy.

policyName

Name of the content switching policy to bind to the content switching policy label.

priority

Unsigned integer that determines the priority of the policy relative to other policies in this policy label. Smaller the number, higher the priority.

Minimum value: 1

Maximum value: 2147483647

targetVserver

Name of the virtual server to which to forward requests that match the policy.

gotoPriorityExpression

Expression or other value specifying the priority of the next policy to be evaluated if the current policy rule evaluates to TRUE. Alternatively, you can specify one of the following values:

* NEXT - Go to the policy with the next higher priority.

* END - End evaluation. (This is the default. Evaluation stops if the gotoPriorityExpression parameter is not set.)

* USE_INVOCATION_RESULT - Applicable if this entry invokes another policy label. If the final goto in the invoked policy label has a value of END, evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT.

If you specify an expression, its result must be a number. In that case, the next action is determined as follows:

* If the expression evaluates to the priority of a policy with a lower priority (larger priority number) than the current policy, that policy is evaluated next.

* If the expression evaluates to a priority of the current policy, policy with the next highest priority is evaluated.

An UNDEF event is triggered if:

* The expression cannot be evaluated.

* The expression evaluates to a number that is smaller than the highest priority in the policy bank but is not same as any policy's priority.

* The expression evaluates to a number that is smaller than the current policy's priority.

invoke

Invoke other policy labels. After evaluating the policies in the invoked policy label, the appliance continues to evaluate policies that are bound to the current policy label (the selected bind point).

i) bind cs policylabel cs_lab lbvs_1 pol_cs 1 2

Unbinds a content switching policy from a content switching policy label.

unbind cs policylabel <labelName> <policyName>

labelName

Name of the policy label from which to unbind a content switching policy.

policyName

Name of the content switching policy to unbind from the label.

```
unbind cs policylabel cs_lab pol_cs
```

Displays all the content switching policy labels, or just the specified policy label.

```
show cs policylabel [<labelName>]
```

labelName

Name of the content switching policy label to display.

summary

fullValues

format

level

cspolicylabeltype

Protocol supported by the policy label. All policies bound to the policy label must either match the specified protocol or be a subtype of that protocol. Available settings function as follows:

* HTTP - Supports policies that process HTTP traffic. Used to access unencrypted Web sites. (The default.)

* SSL - Supports policies that process HTTPS/SSL encrypted traffic. Used to access encrypted Web sites.

* TCP - Supports policies that process any type of TCP traffic, including HTTP.

* SSL_TCP - Supports policies that process SSL-encrypted TCP traffic, including SSL.

* UDP - Supports policies that process any type of UDP-based traffic, including DNS.

* DNS - Supports policies that process DNS traffic.

* ANY - Supports all types of policies except HTTP, SSL, and TCP.

* SIP_UDP - Supports policies that process UDP based Session Initiation Protocol (SIP) traffic.

SIP initiates, manages, and terminates multimedia communications sessions, and has emerged as the standard for Internet telephony (VoIP).

* RTSP - Supports policies that process Real Time Streaming Protocol (RTSP) traffic. RTSP provides delivery of multimedia and other streaming data, such as audio, video, and other types of streamed media.

* RADIUS - Supports policies that process Remote Authentication Dial In User Service (RADIUS) traffic. RADIUS supports combined authentication, authorization, and auditing services for network management.

* MYSQL - Supports policies that process MYSQL traffic.

* MSSQL - Supports policies that process Microsoft SQL traffic.

cs vserver

Sep 22, 2015

The following operations can be performed on "cs vserver":

add | rm | set | unset | bind | unbind | enable | disable | show | stat | rename

Creates a content switching virtual server.

add cs vserver <name> [-td <positive_integer>] <serviceType> ((<IPAddress> [-range <positive_integer>]) | (-IPPattern <ippat> -IPMask <ipmask>)) <port> [-state (ENABLED | DISABLED)] [-stateupdate (ENABLED | DISABLED)] [-cacheable (YES | NO)] [-redirectURL <URL>] [-cltTimeout <secs>] [-precedence (RULE | URL)] [-caseSensitive (ON | OFF)] [-soMethod <soMethod>] [-soPersistence (ENABLED | DISABLED)] [-soPersistenceTimeOut <positive_integer>] [-soThreshold <positive_integer>] [-soBackupAction <soBackupAction>] [-redirectPortRewrite (ENABLED | DISABLED)] [-downStateFlush (ENABLED | DISABLED)] [-backupVServer <string>] [-disablePrimaryOnDown (ENABLED | DISABLED)] [-insertVserverIPPort <insertVserverIPPort> [<vipHeader>]] [-rtspNat (ON | OFF)] [-AuthenticationHost <string>] [-Authentication (ON | OFF)] [-Listenpolicy <expression> [-Listenpriority <positive_integer>]] [-authn401 (ON | OFF)] [-authnVsName <string>] [-push (ENABLED | DISABLED)] [-pushVserver <string>] [-pushLabel <expression>] [-pushMultiClients (YES | NO)] [-tcpProfileName <string>] [-httpProfileName <string>] [-dbProfileName <string>] [-comment <string>] [-mssqlServerVersion <mssqlServerVersion>] [-l2Conn (ON | OFF)] [-mysqlProtocolVersion <positive_integer>] [-mysqlServerVersion <string>] [-mysqlCharacterSet <positive_integer>] [-mysqlServerCapabilities <positive_integer>] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>] [-icmpVsrResponse (PASSIVE | ACTIVE)] [-authnProfile <string>]

name

Name for the content switching virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters.

Cannot be changed after the CS virtual server is created.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, \\?my server\\? or \\?my server\\?).

td

Traffic Domain ID

Maximum value: 4094

serviceType

Protocol used by the virtual server.

Possible values: HTTP, SSL, TCP, FTP, RTSP, SSL_TCP, UDP, DNS, SIP_UDP, ANY, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER

IPAddress

IP address of the content switching virtual server.

IPPattern

IP address pattern, in dotted decimal notation, for identifying packets to be accepted by the virtual server. The IP Mask parameter specifies which part of the destination IP address is matched against the pattern. Mutually exclusive with the IP Address parameter.

For example, if the IP pattern assigned to the virtual server is 198.51.100.0 and the IP mask is 255.255.240.0 (a forward mask), the first 20 bits in the destination IP addresses are matched with the first 20 bits in the pattern. The virtual server accepts requests with IP addresses that range from 198.51.96.1 to 198.51.111.254. You can also use a pattern such as 0.0.2.2 and a mask such as 0.0.255.255 (a reverse mask).

If a destination IP address matches more than one IP pattern, the pattern with the longest match is selected, and the associated virtual server processes the request. For example, if the virtual servers, vs1 and vs2, have the same IP pattern, 0.0.100.128, but different IP masks of 0.0.255.255 and 0.0.224.255, a destination IP address of 198.51.100.128 has the longest match with the IP pattern of vs1. If a destination IP address matches two or more virtual servers to the same extent, the request is processed by the virtual server whose port number matches the port number in the request.

range

Number of consecutive IP addresses, starting with the address specified by the IP Address parameter, to include in a range of addresses assigned to this virtual server.

Default value: 1

Minimum value: 1

Maximum value: 254

port

Port number for content switching virtual server.

Minimum value: 1

state

Initial state of the load balancing virtual server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

stateupdate

Enable state updates for a specific content switching virtual server. By default, the Content Switching virtual server is always UP, regardless of the state of the Load Balancing virtual servers bound to it. This parameter interacts with the global setting as follows:

Global Level | Vserver Level | Result

ENABLED ENABLED ENABLED

ENABLED DISABLED ENABLED

DISABLED ENABLED ENABLED

DISABLED DISABLED DISABLED

If you want to enable state updates for only some content switching virtual servers, be sure to disable the state update parameter.

Possible values: ENABLED, DISABLED

Default value: DISABLED

cacheable

Use this option to specify whether a virtual server, used for load balancing or content switching, routes requests to the cache redirection virtual server before sending it to the configured servers.

Possible values: YES, NO

Default value: NO

redirectURL

URL to which traffic is redirected if the virtual server becomes unavailable. The service type of the virtual server should be either HTTP or SSL.

Caution: Make sure that the domain in the URL does not match the domain specified for a content switching policy. If it does, requests are continuously redirected to the unavailable virtual server.

cltTimeout

Idle time, in seconds, after which the client connection is terminated. The default values are:

180 seconds for HTTP/SSL-based services.

9000 seconds for other TCP-based services.

120 seconds for DNS-based services.

120 seconds for other UDP-based services.

Default value: VAL_NOT_SET

Maximum value: 31536000

precedence

Type of precedence to use for both RULE-based and URL-based policies on the content switching virtual server. With the default (RULE) setting, incoming requests are evaluated against the rule-based content switching policies. If none of the rules match, the URL in the request is evaluated against the URL-based content switching policies.

Possible values: RULE, URL

Default value: CS_PRIORITY_RULE

caseSensitive

Consider case in URLs (for policies that use URLs instead of RULES). For example, with the ON setting, the URLs /a/1.html and /A/1.HTML are treated differently and can have different targets (set by content switching policies). With the OFF setting, /a/1.html and /A/1.HTML are switched to the same target.

Possible values: ON, OFF

Default value: ON

soMethod

Type of spillover used to divert traffic to the backup virtual server when the primary virtual server reaches the spillover threshold. Connection spillover is based on the number of connections. Bandwidth spillover is based on the total Kbps of incoming and outgoing traffic.

Possible values: CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE

soPersistence

Maintain source-IP based persistence on primary and backup virtual servers.

Possible values: ENABLED, DISABLED

Default value: DISABLED

soPersistenceTimeOut

Time-out value, in minutes, for spillover persistence.

Default value: 2

Minimum value: 2

Maximum value: 1440

soThreshold

Depending on the spillover method, the maximum number of connections or the maximum total bandwidth (Kbps) that a virtual server can handle before spillover occurs.

Minimum value: 1

Maximum value: 4294967287

soBackupAction

Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists

Possible values: DROP, ACCEPT, REDIRECT

redirectPortRewrite

State of port rewrite while performing HTTP redirect.

Possible values: ENABLED, DISABLED

Default value: DISABLED

downStateFlush

Perform delayed cleanup of connections on this vserver.

Possible values: ENABLED, DISABLED

Default value: ENABLED

backupVServer

Name of the backup virtual server that you are configuring. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the backup virtual server is created. You can assign a different backup virtual server or rename the existing virtual server.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks.

disablePrimaryOnDown

Continue forwarding the traffic to backup virtual server even after the primary server comes UP from the DOWN state.

Possible values: ENABLED, DISABLED

Default value: DISABLED

insertVserverIPPort

Insert the virtual server's VIP address and port number in the request header. Available values function as follows:

VIPADDR - Header contains the vserver's IP address and port number without any translation.

OFF - The virtual IP and port header insertion option is disabled.

V6TOV4MAPPING - Header contains the mapped IPv4 address corresponding to the IPv6 address of the vserver and the port number. An IPv6 address can be mapped to a user-specified IPv4 address using the set ns ip6 command.

Possible values: OFF, VIPADDR, V6TOV4MAPPING

rtspNat

Enable network address translation (NAT) for real-time streaming protocol (RTSP) connections.

Possible values: ON, OFF

Default value: OFF

AuthenticationHost

FQDN of the authentication virtual server. The service type of the virtual server should be either HTTP or SSL.

Authentication

Authenticate users who request a connection to the content switching virtual server.

Possible values: ON, OFF

Default value: OFF

Listenpolicy

String specifying the listen policy for the content switching virtual server. Can be either the name of an existing expression or an in-line expression.

Default value: "none"

Listenpriority

Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server the virtual server whose listen policy has the highest priority (the lowest priority number) accepts the request.

Default value: 101

Maximum value: 100

authn401

Enable HTTP 401-response based authentication.

Possible values: ON, OFF

Default value: OFF

authnVsName

Name of authentication virtual server that authenticates the incoming user requests to this content switching virtual server.

push

Process traffic with the push virtual server that is bound to this content switching virtual server (specified by the Push VServer parameter). The service type of the push virtual server should be either HTTP or SSL.

Possible values: ENABLED, DISABLED

Default value: DISABLED

pushVserver

Name of the load balancing virtual server, of type PUSH or SSL_PUSH, to which the server pushes updates received on the client-facing load balancing virtual server.

pushLabel

Expression for extracting the label from the response received from server. This string can be either an existing rule name or an inline expression. The service type of the virtual server should be either HTTP or SSL.

Default value: "none"

pushMultiClients

Allow multiple Web 2.0 connections from the same client to connect to the virtual server and expect updates.

Possible values: YES, NO

Default value: NO

tcpProfileName

Name of the TCP profile containing TCP configuration settings for the virtual server.

httpProfileName

Name of the HTTP profile containing HTTP configuration settings for the virtual server. The service type of the virtual server should be either HTTP or SSL.

dbProfileName

Name of the DB profile.

comment

Information about this virtual server.

mssqlServerVersion

The version of the MSSQL server

Possible values: 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012

Default value: TDS_PROT_2008B

l2Conn

Use L2 Parameters to identify a connection

Possible values: ON, OFF

mysqlProtocolVersion

The protocol version returned by the mysql vserver.

Default value: 10

mysqlServerVersion

The server version string returned by the mysql vserver.

Default value: NSA_MYSQL_SERVER_VER_DEFAULT

mysqlCharacterSet

The character set returned by the mysql vserver.

Default value: 8

mysqlServerCapabilities

The server capabilities returned by the mysql vserver.

Default value: 41613

appflowLog

Enable logging appflow flow information

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

The name of the network profile.

icmpVsrResponse

Can be active or passive

Possible values: PASSIVE, ACTIVE

Default value: NS_VSR_PASSIVE

authnProfile

Name of the authentication profile to be used when authentication is turned on.

1. You can use precedence when certain client attributes (e.g., browser type) require to be served with different content. All other clients can then be served from conten

---

Removes a content switching virtual server.

rm cs vserver <name>@ ...

name

Name of the virtual server to be removed.

rm vserver cs_vip

Modifies the configuration of a content switching virtual server.

set cs vserver <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-IPPattern <ippat>] [-IPMask <ipmask>] [-stateupdate (ENABLED | DISABLED)] [-precedence (RULE | URL)] [-caseSensitive (ON | OFF)] [-backupVServer <string>] [-redirectURL <URL>] [-cacheable (YES | NO)] [-cltTimeout <secs>] [-soMethod <soMethod>] [-soPersistence (ENABLED | DISABLED)] [-soPersistenceTimeOut <positive_integer>] [-soThreshold <positive_integer>] [-soBackupAction <soBackupAction>] [-redirectPortRewrite (ENABLED | DISABLED)] [-downStateFlush (ENABLED | DISABLED)] [-disablePrimaryOnDown (ENABLED | DISABLED)] [-insertVserverIPPort <insertVserverIPPort> [<vipHeader>]] [-rtspNat (ON | OFF)] [-AuthenticationHost <string>] [-Authentication (ON | OFF)] [-Listenpolicy <expression>] [-Listenpriority <positive_integer>] [-authn401 (ON | OFF)] [-authnVsName <string>] [-push (ENABLED | DISABLED)] [-pushVserver <string>] [-pushLabel <expression>] [-pushMultiClients (YES | NO)] [-tcpProfileName <string>] [-httpProfileName <string>] [-dbProfileName <string>] [-comment <string>] [-l2Conn (ON | OFF)] [-mssqlServerVersion <mssqlServerVersion>] [-mysqlProtocolVersion <positive_integer>] [-mysqlServerVersion <string>] [-mysqlCharacterSet <positive_integer>] [-mysqlServerCapabilities <positive_integer>] [-appflowLog (ENABLED | DISABLED)] [-netProfile <string>] [-authnProfile <string>] [-icmpVsrResponse (PASSIVE | ACTIVE)]

name

Identifies the virtual server name (created with the add cs vserver command).

IPAddress

The new IP address of the virtual server.

IPPattern

IP address pattern, in dotted decimal notation, for identifying packets to be accepted by the virtual server. The IP Mask parameter specifies which part of the destination IP address is matched against the pattern. Mutually exclusive with the IP Address parameter.

For example, if the IP pattern assigned to the virtual server is 198.51.100.0 and the IP mask is 255.255.240.0 (a forward mask), the first 20 bits in the destination IP addresses are matched with the first 20 bits in the pattern. The virtual server accepts requests with IP addresses that range from 198.51.96.1 to 198.51.111.254. You can also use a pattern such as 0.0.2.2 and a mask such as 0.0.255.255 (a reverse mask).

If a destination IP address matches more than one IP pattern, the pattern with the longest match is selected, and the associated virtual server processes the request. For example, if the virtual servers, vs1 and vs2, have the same IP pattern, 0.0.100.128, but different IP masks of 0.0.255.255 and 0.0.224.255, a destination IP address of 198.51.100.128 has the longest match with the IP pattern of vs1. If a destination IP address matches two or more virtual servers to the same extent, the request is processed by the virtual server whose port number matches the port number in the request.

IPMask

IP mask, in dotted decimal notation, for the IP Pattern parameter. Can have leading or trailing non-zero octets (for example, 255.255.240.0 or 0.0.255.255). Accordingly, the mask specifies whether the first n bits or the last n bits of the destination IP address in a client request are to be matched with the corresponding bits in the IP pattern. The former is called a forward mask. The latter is called a reverse mask.

stateupdate

Enable state updates for a specific content switching virtual server. By default, the Content Switching virtual server is always UP, regardless of the state of the Load Balancing virtual servers bound to it. This parameter interacts with the global setting as follows:

Global Level | Vserver Level | Result

ENABLED ENABLED ENABLED

ENABLED DISABLED ENABLED

DISABLED ENABLED ENABLED

DISABLED DISABLED DISABLED

If you want to enable state updates for only some content switching virtual servers, be sure to disable the state update parameter.

Possible values: ENABLED, DISABLED

Default value: DISABLED

precedence

The precedence on the content switching virtual server between rule-based and URL-based policies. The default precedence is set to RULE.

If the precedence is configured as RULE, the incoming request is applied against the content switching policies created with the -rule argument. If none of the rules match, then the URL in the request is applied against the content switching policies created with the -url option.

For example, this precedence can be used if certain client attributes (such as a specific type of browser) need to be served different content and all other clients can be served from the content distributed among the servers.

If the precedence is configured as URL, the incoming request URL is applied against the content switching policies created with the -url option. If none of the policies match, then the request is applied against the content switching policies created with the -rule option.

Also, this precedence can be used if some content (such as images) is the same for all clients, but other content (such as text) is different for different clients. In this case, the images will be served to all clients, but the text will be served to specific clients based on specific attributes, such as Accept-Language.

Possible values: RULE, URL

Default value: CS_PRIORITY_RULE

caseSensitive

The URL lookup case option on the content switching vserver.

If case sensitivity of a content switching virtual server is set to 'ON', the URLs /a/1.html and /A/1.HTML are treated differently and may have different targets (set by content switching policies).

If case sensitivity is set to 'OFF', the URLs /a/1.html and /A/1.HTML are treated the same, and will be switched to the same target.

Possible values: ON, OFF

Default value: ON

backupVServer

Name of the backup virtual server that you are configuring. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the backup virtual server is created. You can assign a different backup virtual server or rename the existing virtual server.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks.

redirectURL

The redirect URL for content switching.

cacheable

The option to specify whether a virtual server used for content switching will route requests to the cache redirection virtual server before sending it to the configured servers.

Possible values: YES, NO

Default value: NO

cltTimeout

Client timeout in seconds.

Default value: VAL_NOT_SET

Maximum value: 31536000

soMethod

The spillover factor. When traffic on the main virtual server reaches this threshold, additional traffic is sent to the backupvserver.

Possible values: CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE

soPersistence

Maintain source-IP based persistence on primary and backup virtual servers.

Possible values: ENABLED, DISABLED

Default value: DISABLED

soPersistenceTimeOut

The spillover persistency entry timeout.

Default value: 2

Minimum value: 2

Maximum value: 1440

soThreshold

Depending on the spillover method, the maximum number of connections or the maximum total bandwidth (Kbps) that a virtual server can handle before spillover occurs.

Minimum value: 1

Maximum value: 4294967287

soBackupAction

Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists

Possible values: DROP, ACCEPT, REDIRECT

redirectPortRewrite

SSL redirect port rewrite.

Possible values: ENABLED, DISABLED

Default value: DISABLED

downStateFlush

Perform delayed clean up of connections on this vserver.

Possible values: ENABLED, DISABLED

Default value: ENABLED

disablePrimaryOnDown

Continue forwarding the traffic to backup virtual server even after the primary server comes UP from the DOWN state.

Possible values: ENABLED, DISABLED

Default value: DISABLED

insertVserverIPPort

The virtual IP and port header insertion option for the vserver.

* VIPADDR - Header contains the vserver's IP address and port number without any translation.

* OFF - The virtual IP and port header insertion option is disabled.

* V6TOV4MAPPING - Header contains the mapped IPv4 address that corresponds to the IPv6 address of the vserver and the port number. An IPv6 address can be mapped to a user-specified IPv4 address using the set ns ip6 command.

Possible values: OFF, VIPADDR, V6TOV4MAPPING

rtspNat

Enable network address translation (NAT) for real-time streaming protocol (RTSP) connections.

Possible values: ON, OFF

Default value: OFF

AuthenticationHost

FQDN of the authentication virtual server. The service type of the virtual server should be either HTTP or SSL.

Authentication

Authenticate users who request a connection to the content switching virtual server.

Possible values: ON, OFF

Default value: OFF

Listenpolicy

String specifying the listen policy for the content switching virtual server. Can be either the name of an existing expression or an in-line expression.

Default value: "none"

Listenpriority

Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server the virtual server whose listen policy has the highest priority (the lowest priority number) accepts the request.

Default value: 101

Maximum value: 100

authn401

Enable HTTP 401-response based authentication.

Possible values: ON, OFF

Default value: OFF

authnVsName

Name of authentication virtual server that authenticates the incoming user requests to this content switching virtual server.

push

Process traffic with the push virtual server that is bound to this content switching virtual server (specified by the Push VServer parameter). The service type of the push virtual server should be either HTTP or SSL.

Possible values: ENABLED, DISABLED

Default value: DISABLED

pushVserver

Name of the load balancing virtual server, of type PUSH or SSL_PUSH, to which the server pushes updates received on the client-facing load balancing virtual server.

pushLabel

Expression for extracting the label from the response received from server. This string can be either an existing rule name or an inline expression. The service type of the virtual server should be either HTTP or SSL.

Default value: "none"

pushMultiClients

Allow multiple Web 2.0 connections from the same client to connect to the virtual server and expect updates.

Possible values: YES, NO

Default value: NO

tcpProfileName

Name of the TCP profile containing TCP configuration settings for the virtual server.

httpProfileName

Name of the HTTP profile containing HTTP configuration settings for the virtual server. The service type of the virtual server should be either HTTP or SSL.

dbProfileName

Name of the DB profile.

comment

Information about this virtual server.

l2Conn

Use L2 Parameters to identify a connection

Possible values: ON, OFF

mssqlServerVersion

The version of the MSSQL server

Possible values: 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012

Default value: TDS_PROT_2008B

mysqlProtocolVersion

The protocol version returned by the mysql vserver.

Default value: 10

mysqlServerVersion

The server version string returned by the mysql vserver.

Default value: NSA_MYSQL_SERVER_VER_DEFAULT

mysqlCharacterSet

The character set returned by the mysql vserver.

Default value: 8

mysqlServerCapabilities

The server capabilities returned by the mysql vserver.

Default value: 41613

appflowLog

Enable logging appflow flow information

Possible values: ENABLED, DISABLED

Default value: ENABLED

netProfile

The name of the network profile.

authnProfile

Name of the authentication profile to be used when authentication is turned on.

icmpVsrResponse

Can be active or passive

Possible values: PASSIVE, ACTIVE

Default value: NS_VSR_PASSIVE

Unset the parameters of a content switching virtual server..Refer to the set cs vserver command for meanings of the arguments.

unset cs vserver <name> [-caseSensitive] [-backupVServer] [-cltTimeout] [-redirectURL] [-authn401] [-Authentication] [-AuthenticationHost] [-authnVsName] [-pushVserver] [-pushLabel] [-tcpProfileName] [-httpProfileName] [-dbProfileName] [-l2Conn] [-mysqlProtocolVersion] [-mysqlServerVersion] [-mysqlCharacterSet] [-mysqlServerCapabilities] [-appflowLog] [-netProfile] [-icmpVsrResponse] [-authnProfile] [-stateupdate] [-precedence] [-cacheable] [-soMethod] [-soPersistence] [-soPersistenceTimeOut] [-soThreshold] [-soBackupAction] [-redirectPortRewrite] [-downStateFlush] [-disablePrimaryOnDown] [-insertVserverIPPort] [-vipHeader] [-rtspNat] [-Listenpolicy] [-Listenpriority] [-push] [-pushMultiClients] [-comment] [-mssqlServerVersion]

Binds a content switching virtual server to a content switching policy.

bind cs vserver <name> [-lbvserver <string> | (-policyName <string> [-targetLBVserver <string>] [-priority <positive_integer>] [-gotoPriorityExpression <expression>] [-type (REQUEST | RESPONSE)] [-invoke (<labelType> <labelName>)])]

name

Name of the content switching virtual server to which the content switching policy applies.

lbvserver

Name of the default Load Balancing vserver bound. If for a particular content none of the Content Switching policies is evaluated to TRUE, that traffic is switched to default Load Balancing vserver. .

Example: bind cs vserver cs1 -lbvserver lb1

Note: Use this parameter for default binding only.

policyName

Name of the content switching policy to bind to the content switching virtual server Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after a policy is created.

To bind a content switching policy, you need a content-based virtual server (content switching virtual server) and an address-based virtual server (load balancing virtual server). You can assign multiple policies to the virtual server pair.

Note: When binding a CS virtual server to a default LB virtual server, the Policy Name parameter is optional.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my policy? or ?my policy?).

targetVserver

The virtual server name (created with the add lb vserver command) to which content will be switched.

```
i) bind cs vserver csw-vip1 -policyname csw-policy1 -priority 13 ii) bind cs vserver csw-vip2 -policyname csw-ape-policy2 -priority 14 -gotoPriorityExpression NEXT iii)
```

Unbinds the virtual server from the content switching policy.

```
unbind cs vserver <name> [(-policyName <string> [-type ( REQUEST | RESPONSE )]) | -lbvserver <string>] [-priority <positive_integer>]
```

name

Name of the virtual server to unbind from the policy.

policyName

Name of the policy from which to unbind the content switching virtual server. Note: To unbind the content switching virtual server from the default policy, do not specify a value for this parameter.

lbvserver

The virtual server name (created with the add lb vserver command) to which content will be switched.

Default value: "default_lb"

Enables a content switching virtual server.

```
enable cs vserver <name>@
```

name

Name of the content switching virtual server to enable.

Note: Virtual servers, when added, are enabled by default.

```
enable vserver cs_vip
```

Disables a content switching virtual server.

disable cs vserver <name>@

name

Name of the virtual server to be disabled.

disable vserver cs_vip

Displays all existing content switching virtual servers, or just the specified virtual server.

show cs vserver [<name>] show cs vserver stats - alias for 'stat cs vserver'

name

Name of a content switching virtual server for which to display information, including the policies bound to the virtual server. To display a list of all configured Content Switching virtual servers, do not specify a value for this parameter.

summary

fullValues

format

level

insertVserverIPPort

The virtual IP and port header insertion option for the vserver.

vipHeader

The name of virtual IP and port header.

IPAddress

IP address of the content switching virtual server.

td

Traffic Domain ID

IPPattern

The IP address of the virtual server.

IPMask

The IP address mask of the virtual server.

stateflag

value

The ssl card status for the transparent ssl cs vserver.

port

Port number for content switching virtual server.

range

Number of consecutive IP addresses, starting with the address specified by the IP Address parameter, to include in a range of addresses assigned to this virtual server.

serviceType

Protocol used by the virtual server.

ngname

Nodegroup devno to which this csvserver belongs to

type

The bindpoint to which the policy is bound

vsvrcfgflags

Contains the config info of vserver to be used at validation

state

Initial state of the load balancing virtual server.

sc

The state of SureConnect the specified virtual server.

stateupdate

Enable state updates for a specific content switching virtual server. By default, the Content Switching virtual server is always UP, regardless of the state of the Load Balancing virtual servers bound to it. This parameter interacts with the global setting as follows:

Global Level | Vserver Level | Result

ENABLED ENABLED ENABLED

ENABLED DISABLED ENABLED

DISABLED ENABLED ENABLED

DISABLED DISABLED DISABLED

If you want to enable state updates for only some content switching virtual servers, be sure to disable the state update parameter.

status

Status.

cacheType

Cache type.

redirect

Redirect URL string.

precedence

Type of precedence to use for both RULE-based and URL-based policies on the content switching virtual server. With the default (RULE) setting, incoming requests are evaluated against the rule-based content switching policies. If none of the rules match, the URL in the request is evaluated against the URL-based content switching policies.

redirectURL

The redirect URL for content switching.

Authentication

Authentication.

authn401

HTTP 401 response based authentication.

authnVsName

Name of authentication virtual server that authenticates the incoming user requests to this content switching virtual server.

caseSensitive

Consider case in URLs (for policies that use URLs instead of RULES). For example, with the ON setting, the URLs /a/1.html and /A/1.HTML are treated differently and can have different targets (set by content switching policies). With the OFF setting, /a/1.html and /A/1.HTML are switched to the same target.

homePage

Home page.

dnsVserverName

DNS vserver name.

domain

Domain.

rule

Rule.

policyName

Policies bound to this vserver.

hits

Number of hits.

piPolicyhits

Number of hits.

serviceName

Service name.

weight

Weight for this service.

cacheVserver

Cache vserver name.

targetVserver

target vserver name.

backupVServer

Name of the backup virtual server that you are configuring. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the backup virtual server is created. You can assign a different backup virtual server or rename the existing virtual server.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks.

priority

Priority for the policy.

cltTimeout

Idle time, in seconds, after which the client connection is terminated. The default values are:

180 seconds for HTTP/SSL-based services.

9000 seconds for other TCP-based services.

120 seconds for DNS-based services.

120 seconds for other UDP-based services.

Listenpolicy

The string is listenpolicy configured for lb vserver

Listenpriority

This parameter is the priority for listen policy of LB Vserver.

soMethod

Type of spillover used to divert traffic to the backup virtual server when the primary virtual server reaches the spillover threshold. Connection spillover is based on the number of connections. Bandwidth spillover is based on the total Kbps of incoming and outgoing traffic.

soPersistence

Maintain source-IP based persistence on primary and backup virtual servers.

soPersistenceTimeOut

Time-out value, in minutes, for spillover persistence.

soThreshold

Depending on the spillover method, the maximum number of connections or the maximum total bandwidth (Kbps) that a virtual server can handle before spillover occurs.

soBackupAction

Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists

cacheable

The state of caching.

url

URL string.

gotoPriorityExpression

Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

redirectPortRewrite

Redirect port rewrite.

downStateFlush

Perform delayed clean up of connections on this vserver.

disablePrimaryOnDown

Tells whether traffic will continue reaching backup vservers even after primary comes UP from DOWN state.

invoke

Invoke flag.

labelType

The invocation type.

labelName

Name of the label invoked.

gt2GB

This argument has no effect.

stateChangeTimeSec

Time when last state change happened. Seconds part.

stateChangeTimemSec

Time at which last state change happened. Milliseconds part.

ticksSinceLastStateChange

Time in 10 millisecond ticks since the last state change.

rtspNat

Enable network address translation (NAT) for real-time streaming protocol (RTSP) connections.

AuthenticationHost

FQDN of the authentication virtual server. The service type of the virtual server should be either HTTP or SSL.

push

Process traffic with the push virtual server that is bound to this content switching virtual server (specified by the Push VServer parameter). The service type of the push virtual server should be either HTTP or SSL.

pushVserver

Name of the load balancing virtual server, of type PUSH or SSL_PUSH, to which the server pushes updates received on the client-facing load balancing virtual server.

pushLabel

Expression for extracting the label from the response received from server. This string can be either an existing rule name or an inline expression. The service type of the virtual server should be either HTTP or SSL.

pushMultiClients

Allow multiple Web 2.0 connections from the same client to connect to the virtual server and expect updates.

tcpProfileName

Name of the TCP profile containing TCP configuration settings for the virtual server.

httpProfileName

Name of the HTTP profile containing HTTP configuration settings for the virtual server. The service type of the virtual server should be either HTTP or SSL.

dbProfileName

Name of the DB profile.

comment

Information about this virtual server.

appfwPolicyFlag

flags

policySubType

oracleServerVersion

Oracle server version

mssqlServerVersion

The version of the MSSQL server

l2Conn

Use L2 Parameters to identify a connection

mysqlProtocolVersion

The protocol version returned by the mysql vserver.

mysqlServerVersion

The server version string returned by the mysql vserver.

mysqlCharacterSet

The character set returned by the mysql vserver.

mysqlServerCapabilities

The server capabilities returned by the mysql vserver.

appflowLog

Enable logging appflow flow information

netProfile

The name of the network profile.

icmpVsrResponse

Can be active or passive

lbvserver

Name of the default lb vserver bound. Use this param for Default binding only. For Example: bind cs vserver cs1 -lbvserver lb1

targetLBVserver

target vserver name.

contentVsvrFlag

authnProfile

Name of the authentication profile to be used when authentication is turned on.

devno

count

Displays statistics of all content switching virtual servers, or statistics for just the specified content switching virtual server.

stat cs vserver [<name>] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

name

Name of the content switching virtual server for which to display statistics. To display statistics for all configured Content Switching virtual servers, do not specify a value for this parameter.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

Current Client Est connections (ClntEstConn)

Number of client connections in ESTABLISHED state.

IP address (IP)

The IP address on which the service is running.

Port (port)

The port on which the service is running.

Vserver protocol (Protocol)

Protocol associated with the vserver

State

Current state of the server. Possible values are UP, DOWN, UNKNOWN, OFS(Out of Service), TROFS(Transition Out of Service), TROFS_DOWN(Down When going Out of Service)

Vserver hits (Hits)

Total vserver hits

Requests (Req)

Total number of requests received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Responses (Rsp)

Number of responses received on this service or virtual server. (This applies to HTTP/SSL services and servers.)

Request bytes (Reqb)

Total number of request bytes received on this service or virtual server.

Response bytes (Rspb)

Number of response bytes received by this service or virtual server.

Total Packets rcvd (PktRx)

Total number of packets received by this service or virtual server.

Total Packets sent (PktTx)

Total number of packets sent.

Current client connections (ClntConn)

Number of current client connections.

Current server connections (SvrConn)

Number of current connections to the actual servers behind the virtual server.

Spill Over Threshold (SOThresh)

Spill Over Threshold set on the VServer.

Spill Over Hits (NumSo)

Number of times vserver experienced spill over.

Labeled Connection (LblConn)

Number of Labeled connection on this vserver

Push Labeled Connection (PushLbl)

Number of labels for this push vserver.

Deferred Request (DefReq)

Number of deferred request on this vserver

Invalid Request/Response (IvldReqRsp)

Number invalid requests/responses on this vserver

Invalid Request/Response Dropped (IvldReqRspDrp)

Number invalid requests/responses dropped on this vserver

Current Server Est connections (SvrEstConn)

Number of server connections in ESTABLISHED state.

Renames a content switching virtual server.

rename cs vserver <name>@ <newName>@

name

Existing name of the content switching virtual server.

newName

New name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters.

The following requirement applies only to the NetScaler CLI:

If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, ?my name? or ?my name?).

rename cs vserver cs1 cs2

DB Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- db dbProfile
- db user

db dbProfile

Sep 22, 2015

The following operations can be performed on "db dbProfile":

add | rm | set | unset | show

Add a new DB profile on the Netscaler

add db dbProfile <name> [-interpretQuery (YES | NO)] [-stickiness (YES | NO)] [-kcdAccount <string>] [-conMultiplex (ENABLED | DISABLED)] [-enableCachingConMuxOFF (ENABLED | DISABLED)]

name

Name of the DB profile

interpretQuery

Enables/Disables Interpret Query

Possible values: YES, NO

Default value: YES

stickiness

Enables/Disables Stickyness of Query

Possible values: YES, NO

Default value: NO

kcdAccount

Enables/Disables KCD account

conMultiplex

Reuse server connections for requests from more than one client connections.

Possible values: ENABLED, DISABLED

Default value: ENABLED

enableCachingConMuxOFF

Enable Caching With Connection Multiplexing OFF.

Possible values: ENABLED, DISABLED

Default value: DISABLED

add dbprofile <profile name> -interpretQuery YES -stickyness YES -kcdaccount account

---

Remove a DB profile on the Netscaler

rm db dbProfile <name>

name

Name of the DB profile

rm dbprofile <profile name>

Set/modify DB profile values

set db dbProfile <name> [-interpretQuery (YES | NO)] [-stickiness (YES | NO)] [-kcdAccount <string>] [-conMultiplex (ENABLED | DISABLED)] [-enableCachingConMuxOFF (ENABLED | DISABLED)]

name

Name of the DB profile

interpretQuery

Enables/Disables Interpret Query

Possible values: YES, NO

Default value: YES

stickiness

Enables/Disables Stickyness of Query

Possible values: YES, NO

Default value: NO

kcdAccount

Enables/Disables KCD account

conMultiplex

Reuse server connections for requests from more than one client connections.

Possible values: ENABLED, DISABLED

Default value: ENABLED

enableCachingConMuxOFF

Enable Caching With Connection Multiplexing OFF.

Possible values: ENABLED, DISABLED

Default value: DISABLED

```
set dbprofile <profile name> -interpretQuery YES -stickyness YES
```

Unset DB profile values.Refer to the set db dbProfile command for meanings of the arguments.

```
unset db dbProfile <name> [-interpretQuery] [-stickiness] [-kcdAccount] [-conMultiplex] [-enableCachingConMuxOFF]
```

Display all the configured DB profiles in the system. If a name is specified, then only that profile is shown.

```
show db dbProfile [<name>]
```

name

Name of the DB profile.

db user

Sep 22, 2015

The following operations can be performed on "db user":

add | rm | set | show

Adds a database user. The user name and password that you specify in this command are added to the nsconfig file and used to authenticate the user.

add db user <userName> {-password }

userName

Name of the database user. Must be the same as the user name specified in the database.

password

Password for logging on to the database. Must be the same as the password specified in the database.

add db user johndoe -password secret

Removes a database user from the NetScaler appliance. Requests from the user are no longer authenticated or routed to the database server.

rm db user <userName>

userName

Name of the database user to remove.

Modifies the password of an existing database user.

set db user <userName>

userName

Name of the database user.

password

The database users password. If you use the CLI, you are prompted for this password after specifying the user name.

set db user johndoe The above command sets the password for johndoe to abcd (Password to be suplied on prompt)

Displays the specified database user or, if no user is specified, all the database users configured on the appliance.

show db user [<userName>] [-loggedIn]

userName

Name of the database user.

loggedIn

Display the names of all database users currently logged on to the NetScaler appliance.

summary

dns

Sep 22, 2015

The following operations can be performed on "dns":

Displays DNS statistics.

stat dns [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

clearstats

Clear the statsistics / counters

Possible values: basic, full

Dns queries (Q)

Total number of DNS queries received.

Multi queries (MtQ)

Total number of Multi Query request received.

Dns responses (Rsp)

Total number of DNS responses received.

Server responses (SvrRsp)

Total number of Server responses received.

Total Record updates (TotRecUp)

Total number of record updates.

Auth answers (AuthAns)

Number of queries which were authoritatively answered.

Server queries (SvrQ)

Total number of Server queries sent.

Cache flush called (CaFsh)

Total number of times cache was flushed.

Cache entries flushed (CaEntFsh)

Total number of cache entries flushed.

Non-authoritative entries (PxyEnt)

Total number of non-authoritative entries.

Authoritative entries (AthEnt)

Total number of authoritative entries.

Nonexistent domain (NoDomain)

Number of queries for which no record was found.

Response class unsupported (RspClsEr)

Total number of responses for which response types were unsupported.

Invalid query format (InQFmt)

Total number of queries whose format was invalid.

Stray answers (StryRsp)

Total number of stray answers.

Incorrect RD length (BadRDlen)

Number of DNS responses received with invalid resoure data length.

Requests refused (ReqRefused)

Number of DNS requests refused.

NULL Attack (NullAttack)

Total number of queries received where all the counts are 0.

Response type unsupported (RspNoSup)

Total number of responses for which response type requested was unsupported.

Query class unsupported (QClsEr)

Total number of queries for which query class was unsupported.

Invalid response format (InRspFmt)

Total number of responses for which there was a format error.

No answer responses (NoAnswer)

Number of DNS responses received without answer.

Multi queries disabled (MtQErr)

Total number of times a multi query was disabled and received a multi query.

Other errors (OtherErr)

Total number of other errors.

DNS64 queries

Total number of DNS64 queries recieved.

DNS64 answers

Total number of DNS64 answers served.

DNS64 rewrite answers

Total number of DNS64 answers served after rewriting the response.

DNS64 responses

Total number of responses recieved from backend in DNS64 context.

DNS64 GSLB Queries

Total number of DNS64 queries for GSLB domain

DNS64 GSLB Answers

Total number of DNS64 queries served.

DNS64 Total truncated answers

Total number of Answers served with TC bit set in DNS64 context.

DNS64 Total A queries to server

Total number of Queries sent by DNS64 module to backend.

DNS64 Total times AAAA query bypassed

Total number of times AAAA query has been bypassed in DNS64 trnsaction.

DNS64 Total TCP queries

Total number of dns64 queries over TCP

DNS64 Total Active policies

Total number of active dns64 policies

DNS64 Total NODATA Responses

Total number of responses recieved from backend with ancount 0

NS queries (NSQ)

Total number of NS queries received.

SOA queries (SOAQ)

Total number of SOA queries received.

PTR queries (PTRQ)

Total number of PTR queries received.

SRV queries (SRVQ)

Total number of SRV queries received.

A responses (ARsp)

Total number of A responses received.

CNAME responses (CNRsp)

Total number of CNAME responses received.

MX responses (MXRsp)

Total number of MX responses received.

ANY responses (ANYRsp)

Total number of ANY responses received.

NS updates (NSUp)

Total number of NS record updates.

SOA updates (SOAUp)

Total number of SOA record updates.

PTR updates (PTRUp)

Total number of PTR record updates.

SRV updates (SRVUp)

Total number of SRV record updates.

AAAA queries (AAAAQ)

Total number of AAAA queries received.

A queries (AQ)

Total number of A queries received.

CNAME queries (CNQ)

Total number of CNAME queries received.

MX queries (MXQ)

Total number of MX queries received.

ANY queries (ANYQ)

Total number of ANY queries received.

AAAA responses (AAAARsp)

Total number of AAAA responses received.

NS responses (NSRsp)

Total number of NS responses received.

SOA responses (SOARsp)

Total number of SOA responses received.

PTR responses (PTRRsp)

Total number of PTR responses received.

SRV responses (SRVRsp)

Total number of SRV responses received.

AAAA updates (AAAAUp)

Total number of AAAA record updates.

A updates (AUp)

Total number of A record updates.

MX updates (MXUp)

Total number of MX record updates.

CNAME updates (CNUp)

Total number of CNAME record updates.

AAAA records (AAAARec)

Total number of AAAA records.

A records (ARec)

Total number of A records.

MX records (MXRec)

Total number of MX records.

CNAME records (CNRec)

Total number of CNAME records.

NS records (NSRec)

Total number of NS records.

SOA records (SOARec)

Total number of SOA records.

PTR records (PTRRec)

Total number of PTR records.

SRV records (SRVRec)

Total number of SRV records.

No AAAA records (NoAAAARec)

Total number of times AAAA record lookup failed.

No A records (NoARec)

Total number of times A record lookup failed.

No MX records (NoMXRec)

Total number of times MX record lookup failed.

No PTR records (NoPTRRec)

Total number of times PTR record lookup failed.

No NS records (NoNSRec)

Total number of times NS record lookup failed.

No CNAME records (NoCNRec)

Total number of times CNAME record lookup failed.

No SOA records (NoSOARec)

Total number of times SOA record lookup failed.

No SRV records (NoSRVRec)

Total number of times SRV record lookup failed.

No ANY records (NoANYrec)

Total number of times ANY query lookup failed.

Unsupported queries (NotSupQ)

Total number of requests for which query type requested was unsupported.

dns aaaaRec

Sep 22, 2015

The following operations can be performed on "dns aaaaRec":

add | rm | show

Creates a AAAA address record for the specified domain name. You cannot modify a AAAA address record.

add dns aaaaRec <hostName> <IPv6Address> ... [-TTL <secs>]

hostName

Domain name.

IPv6Address

One or more IPv6 addresses to assign to the domain name.

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

add dns aaaarec www.mynw.com 3::4:5 -ttl 10

Removes an IPv6 address from a AAAA address record. The associated domain name must be specified. If no IPv6 address is specified, all AAAA records that belong to the specified domain name are removed.

rm dns aaaaRec <hostName> [<IPv6Address> ...]

hostName

Domain name.

IPv6Address

IPv6 address(es) of the AAAA record(s) to remove from the specified domain name.

rm dns aaaarec www.mynw.com

Displays the AAAA (IPv6) address record for the specified host name. If a hostname is not specified, all configured AAAA records are shown.

show dns aaaaRec [<hostName> | -type <type>] [<IPv6Address>]

hostName

Domain name.

IPv6Address

One or more IPv6 addresses to assign to the domain name.

type

Type of records to display. Available settings function as follows:

* ADNS - Display all authoritative address records.

* PROXY - Display all proxy address records.

* ALL - Display all address records.

Possible values: ALL, ADNS, PROXY

dns action

Sep 22, 2015

The following operations can be performed on "dns action":

add | rm | set | unset | show

Add a dns action.

add dns action <actionName> <actionType> [-IPAddress <ip_addr|ipv6_addr> ... | -viewName <string> | -preferredLocList <string> ...] [-TTL <secs>]

actionName

Name of the dns action.

actionType

The type of DNS action that is being configured.

Possible values: ViewName, GslbPrefLoc, Drop, Cache_Bypass, Rewrite_Response

IPAddress

List of IP address to be returned in case of rewrite_response actiontype. They can be of IPV4 or IPV6 type.

In case of set command We will remove all the IP address previously present in the action and will add new once given in set dns action command.

TTL

Time to live, in seconds.

Default value: 3600

Maximum value: 2147483647

viewName

The view name that must be used for the given action.

preferredLocList

The location list in priority order used for the given action.

add dns action <actionName> <actionType> (-IPAddress <ip_addr|ipv6_addr> ... | -viewName <string> | -preferredLocList <string> ...) [-TTL <secs>] add dns action a

---

Removes a dns Action.

rm dns action <actionName>

actionName

Name of the dns action.

rm dns action action1

Set a dns Action. Use this command to set the values for Ip address and TTL, If Ipaddress is given in set dns action command we will discard the previous set and will apply this new set of ipaddress given.

set dns action <actionName> [-IPAddress <ip_addr|ipv6_addr> ...] [-TTL <secs>] [-viewName <string>] [-preferredLocList <string> ...]

actionName

Name of the dns action.

IPAddress

List of IP address to be returned in case of rewrite_response actiontype. They can be of IPV4 or IPV6 type.

In case of set command We will remove all the IP address previously present in the action and will add new once given in set dns action command.

TTL

Time to live, in seconds.

The following operations can be performed on "dns action64":

add | rm | set | unset | show

Add a dns64 action.

add dns action64 <actionName> -Prefix <ipv6_addr|*> [-mappedRule <expression>] [-excludeRule <expression>]

actionName

Name of the dns64 action.

Prefix

The dns64 prefix to be used if the after evaluating the rules

mappedRule

The expression to select the criteria for ipv4 addresses to be used for synthesis.

Only if the mappedrule is evaluated to true the corresponding ipv4 address is used for synthesis using respective prefix,

otherwise the A RR is discarded

excludeRule

The expression to select the criteria for eliminating the corresponding ipv6 addresses from the response.

add dns dns64action <actionName> -prefix f23d:f43e::0/32 [-mappedRule <expr>] [-excludeRule <expr>]

Removes a dns64 Action.

rm dns action64 <actionName>

actionName

Name of the dns64 action.

rm dns dns64action action1

Set a DNS64 Action

set dns action64 <actionName> [-Prefix <ipv6_addr|*>] [-mappedRule <expression>] [-excludeRule <expression>]

actionName

Name of the dns64 action.

Prefix

The dns64 prefix to be used if the after evaluating the rules

mappedRule

The expression to select the criteria for ipv4 addresses to be used for synthesis.

Only if the mappedrule is evaluated to true the corresponding ipv4 address is used for synthesis using respective prefix,

otherwise the A RR is discarded

excludeRule

policyName

Name of the DNS policy to bind globally.

bind dns global pol9 9

Unbinds the specified DNS policy from the global bind point.

unbind dns global <policyName>

policyName

Name of the DNS policy to unbind.

unbind dns global pol9

Displays the DNS policies bound to the specified global bind point. If a global bind point is not specified, the command displays the global bind points that have policies bound to them, and the number of policies bound to each of those bind points.

show dns global [-type <type>]

type

Type of global bind point for which to show bound policies.

Possible values: REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT

summary

fullValues

format

level

stateflag

policyName

Name of the dns policy.

priority

Specifies the priority of the policy with which it is bound. Maximum allowed priority should be less than 65535

gotoPriorityExpression

Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values:

* NEXT - Evaluate the policy with the next higher priority number.

* END - End policy evaluation.

* USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT.

* A default syntax expression that evaluates to a number.

If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows:

* If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next.

* If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next.

* If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends.

An UNDEF event is triggered if:

* The expression is invalid.

* The expression evaluates to a priority number that is numerically lower than the current policy's priority.

* The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.

invoke

Invoke flag.

labelType

Type of policy label invocation.

labelName

Name of the label to invoke if the current policy rule evaluates to TRUE.

numpol

The number of policies bound to the bindpoint.

flowType

flowtype of the bound rewrite policy.

flags

upgraded

It is internally used to tell that the policy is a upgraded policy.

builtin

Flag to determine whether DNS policy binding is default or not

dns key

Sep 22, 2015

The following operations can be performed on "dns key":

add | create | set | unset | rm | show

Adds a DNS key to the zone that is specified in the key file.

add dns key <keyName> <publickey> <privatekey> [-expires <positive_integer> [<units>]] [-notificationPeriod <positive_integer> [<units>]] [-TTL <secs>]

keyName

Name of the public-private key pair to publish in the zone.

publickey

File name of the public key.

privatekey

File name of the private key.

expires

Time period for which to consider the key valid, after the key is used to sign a zone.

Default value: 120

Minimum value: 1

Maximum value: 32767

notificationPeriod

Time at which to generate notification of key expiration, specified as number of days, hours, or minutes before expiry. Must be less than the expiry period. The notification is an SNMP trap sent to an SNMP manager. To enable the appliance to send the trap, enable the DNSKEY-EXPIRY SNMP alarm.

Default value: 7

Minimum value: 1

Maximum value: 32767

TTL

Time to Live (TTL), in seconds, for the DNSKEY resource record created in the zone. TTL is the time for which the record must be cached by the DNS proxies. If the TTL is not specified, either the DNS zone's minimum TTL or the default value of 3600 is used.

Default value: 3600

Maximum value: 2147483647

add dns key secure.example.zsk -public secure.example-rsasha1-1024.key -private /nsconfig/dns/secure.example-rsasha1-1024.private

---

Creates a public-private key pair to use for signing a DNS zone. The keys are created in the /nsconfig/dns/ directory on the NetScaler appliance. The private, pubic, and DS key files are created with names having the format <prefix>.<key/private/ds>.

create dns key -zoneName <string> -keyType <keyType> -algorithm RSASHA1 -keySize <positive_integer> -fileNamePrefix <string>

zoneName

Name of the zone for which to create a key.

keyType

Type of key to create.

Possible values: KSK, KeySigningKey, ZSK, ZoneSigningKey

Default value: NS_DNSKEY_ZSK

algorithm

Algorithm to generate for zone signing.

Possible values: RSASHA1

Default value: NS_DNSKEYALGO_RSASHA1

keySize

Size of the key, in bits.

Default value: 512

fileNamePrefix

Common prefix for the names of the generated public and private key files and the Delegation Signer (DS) resource record. During key generation, the .key, .private, and .ds suffixes are appended automatically to the file name prefix to produce the names of the public key, the private key, and the DS record, respectively.

create dns key -zone dnssec.bar -algorithm RSASHA1 -keySize 1024

Modifies the specified parameters of a DNS key. Note: If you change the expiry time period of a key, the NetScaler appliance, using the modified key, automatically re-signs all the resource records in the zone, provided that the zone is currently signed with the particular key.

set dns key <keyName> [-expires <positive_integer> [<units>]] [-notificationPeriod <positive_integer> [<units>]] [-TTL <secs>]

keyName

Name of the public-private key pair.

expires

Time period for which to consider the key valid, after the key is used to sign a zone.

Default value: 120

Minimum value: 1

Maximum value: 32767

notificationPeriod

Time at which to generate notification of key expiration, specified as number of days, hours, or minutes before expiry. Must be less than the expiry

period. The notification is an SNMP trap sent to an SNMP manager. To enable the appliance to send the trap, enable the DNSKEY-EXPIRY SNMP alarm.

Default value: 7

Minimum value: 1

Maximum value: 32767

TTL

Time to Live (TTL), in seconds, for the DNSKEY resource record created in the zone. TTL is the time for which the record must be cached by the DNS proxies. If the TTL is not specified, either the DNS zone's minimum TTL or the default value of 3600 is used.

Default value: 3600

Maximum value: 2147483647

```
add dns key secure.example.zsk  -public secure.example-rsasha1-1024.key -private /nsconfig/dns/secure.example-rsasha1-1024.private
```

Use this command to remove dns key settings.Refer to the set dns key command for meanings of the arguments.

```
unset dns key <keyName> [-expires] [-units] [-notificationPeriod] [-units] [-TTL]
```

Removes a DNS key.

```
rm dns key <keyName>
```

keyName

Name of the public-private key pair.

```
rm dns key secure.example.zsk
```

Displays the parameters of the specified DNS key. If no DNS key name is specified, all configured DNS keys are shown. Note: You cannot view the parameters of a public/private key file. You can view the parameters of a key after you have published it in a DNS zone by using either the add dns key command or the DNS > Zones > Sign/Unsign DNS Zone dialog box.

```
show dns key [<keyName>]
```

keyName

Name of the public-private key pair.

summary

fullValues

format

level

publickey

File name of the public key.

privatekey

File name of the private key.

expires

Number of days since signing with this key, when the key expires.

units

Units for the notification period.

notificationPeriod

Time at which to generate notification of key expiration, specified as number of days, hours, or minutes before expiry. Must be less than the expiry period. The notification is an SNMP trap sent to an SNMP manager. To enable the appliance to send the trap, enable the DNSKEY-EXPIRY SNMP alarm.

TTL

Time to Live (TTL), in seconds, for the DNSKEY resource record created in the zone. TTL is the time for which the record must be cached by the DNS proxies. If the TTL is not specified, either the DNS zone's minimum TTL or the default value of 3600 is used.

dns mxRec

Sep 22, 2015

The following operations can be performed on "dns mxRec":

add | rm | set | unset | show

Creates a mail exchange (MX) record for the specified domain name.

add dns mxRec <domain> -mx <string> -pref <positive_integer> [-TTL <secs>]

domain

Domain name for which to add the MX record.

mx

Host name of the mail exchange server.

pref

Priority number to assign to the mail exchange server. A domain name can have multiple mail servers, with a priority number assigned to each server. The lower the priority number, the higher the mail server's priority. When other mail servers have to deliver mail to the specified domain, they begin with the mail server with the lowest priority number, and use other configured mail servers, in priority order, as backups.

Maximum value: 65535

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

Removes the specified mail exchange (MX) record from the specified domain.

rm dns mxRec <domain> <mx>

domain

Domain name.

mx

Host name of the mail exchange server.

Modifies the priority number and TTL of the mail exchange (MX) record.

set dns mxRec <domain> -mx <string> [-pref <positive_integer>] [-TTL <secs>]

domain

Domain of the MX record to be modified.

mx

Host name of the mail exchange server to be modified.

pref

Priority number to assign to the mail exchange server. A domain name can have multiple mail servers, with a priority number assigned to each server. The lower the priority number, the higher the mail server's priority. When other mail servers have to deliver mail to the specified domain, they begin with the mail server with the lowest priority number, and use other configured mail servers, in priority order, as backups.

Maximum value: 65535

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

Use this command to remove dns mxRec settings.Refer to the set dns mxRec command for meanings of the arguments.

unset dns mxRec <domain> -mx <string> -TTL

Displays the mail exchange (MX) records for the specified domain. If no domain name is specified, all configured mail exchange records are shown.

show dns mxRec [<domain> | -type <type>]

domain

Domain name.

type

Type of records to display. Available settings function as follows:

* ADNS - Display all authoritative address records.

* PROXY - Display all proxy address records.

* ALL - Display all address records.

Possible values: ALL, ADNS, PROXY

Default value: NSDNS_AUTH_HOST

dns nameServer

Sep 22, 2015

The following operations can be performed on "dns nameServer":

add | rm | enable | disable | show

Adds a name server to the appliance. Following are the two types of name servers that can be added: * IP address-based name server - An external name server to contact for domain name resolution. If multiple IP address-based name servers are configured on the appliance, and the local parameter is not set on any of them, incoming DNS queries are load balanced across all the name servers, in round robin fashion. * Virtual server-based name server - A DNS virtual server configured in the NetScaler appliance. If you want more fine-grained control on how external DNS name servers are load balanced (for example, you want a load balancing method other than round robin), you configure a DNS virtual server on the appliance, bind the external name servers as its services, and then specify the name of the virtual server in this command.

add dns nameServer ((<IP> [-local]) | <dnsVserverName>) [-state (ENABLED | DISABLED)] [-type <type>]

IP

IP address of an external name server or, if the Local parameter is set, IP address of a local DNS server (LDNS).

dnsVserverName

Name of a DNS virtual server. Overrides any IP address-based name servers configured on the NetScaler appliance.

local

Mark the IP address as one that belongs to a local recursive DNS server on the NetScaler appliance. The appliance recursively resolves queries received on an IP address that is marked as being local. For recursive resolution to work, the global DNS parameter, Recursion, must also be set.

If no name server is marked as being local, the appliance functions as a stub resolver and load balances the name servers.

state

Administrative state of the name server.

Possible values: ENABLED, DISABLED

Default value: ENABLED

type

Protocol used by the name server. UDP_TCP is not valid if the name server is a DNS virtual server configured on the appliance.

Possible values: UDP, TCP, UDP_TCP

Default value: NSA_UDP

Adding an-IP based nameserver IP: add nameserver 10.102.4.1, Adding a vserver-based name server: add nameserver dns_vsvr where dns_vsvr is the name of a DNS vser

---

Removes a name server from the NetScaler appliance. If the name server is an IP-address based external name server, the name server entry is removed. If the name server is a DNS virtual server on the appliance, the virtual server is not removed, but it is no longer used to resolve domain names.

rm dns nameServer (<IP> | <dnsVserverName>)

IP

IP address of the name server.

dnsVserverName

Name of the DNS virtual server.

Deleting an IP-based nameserver: rm nameserver 10.102.4.1, Deleting a vserver-based nameserver: rm nameserver dns_vsvr

---

Enables a name server.

enable dns nameServer (<IP> | <dnsVserverName>)

IP

IP address of the name server.

dnsVserverName

Name of the DNS virtual server.

```
enable dns nameserver 10.14.43.149
```

Disables a name server.

disable dns nameServer (<IP> | <dnsVserverName>)

IP

IP address of the name server.

dnsVserverName

Name of the DNS virtual server.

```
disable dns nameserver 10.14.43.149
```

Displays the name servers configured on the NetScaler appliance, along with their administrative states.

show dns nameServer [<IP> | <dnsVserverName>]

IP

IP address of the name server.

dnsVserverName

Name of the DNS virtual server.

summary

dns parameter

Sep 22, 2015

The following operations can be performed on "dns parameter":

set | unset | show

Modifies global DNS parameters on the NetScaler appliance.

set dns parameter [-retries <positive_integer>] [-minTTL <secs>] [-maxTTL <secs>] [-cacheRecords (YES | NO)] [-nameLookupPriority (WINS | DNS)] [-recursion (ENABLED | DISABLED)] [-resolutionOrder <resolutionOrder>] [-dnssec (ENABLED | DISABLED)] [-maxPipeline <positive_integer>] [-dnsRootReferral (ENABLED | DISABLED)] [-dns64Timeout <msecs>]

retries

Maximum number of retry attempts when no response is received for a query sent to a name server. Applies to end resolver and forwarder configurations.

Default value: 5

Minimum value: 1

Maximum value: 5

minTTL

Minimum permissible time to live (TTL) for all records cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is lower than the value configured for minTTL, the TTL of the record is set to the value of minTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed.

Maximum value: 604800

maxTTL

Maximum time to live (TTL) for all records cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is higher than the value configured for maxTTL, the TTL of the record is set to the value of maxTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed.

Default value: 604800

Minimum value: 1

Maximum value: 604800

cacheRecords

Cache resource records in the DNS cache. Applies to resource records obtained through proxy configurations only. End resolver and forwarder configurations always cache records in the DNS cache, and you cannot disable this behavior. When you disable record caching, the appliance stops caching server responses. However, cached records are not flushed. The appliance does not serve requests from the cache until record caching is enabled again.

Possible values: YES, NO

Default value: YES

nameLookupPriority

Type of lookup (DNS or WINS) to attempt first. If the first-priority lookup fails, the second-priority lookup is attempted. Used only by the SSL VPN feature.

Possible values: WINS, DNS

Default value: NS_WINSFIRST

recursion

Function as an end resolver and recursively resolve queries for domains that are not hosted on the NetScaler appliance. Also resolve queries recursively when the external name servers configured on the appliance (for a forwarder configuration) are unavailable. When external name servers are unavailable, the appliance queries a root server and resolves the request recursively, as it does for an end resolver configuration.

Possible values: ENABLED, DISABLED

Default value: DISABLED

resolutionOrder

Type of DNS queries (A, AAAA, or both) to generate during the routine functioning of certain NetScaler features, such as SSL VPN, cache redirection, and the integrated cache. The queries are sent to the external name servers that are configured for the forwarder function. If you specify both query types, you can also specify the order. Available settings function as follows:

* OnlyAQuery. Send queries for IPv4 address records (A records) only.

* OnlyAAAAQuery. Send queries for IPv6 address records (AAAA records) instead of queries for IPv4 address records (A records).

* AThenAAAAQuery. Send a query for an A record, and then send a query for an AAAA record if the query for the A record results in a NODATA response from the name server.

* AAAAThenAQuery. Send a query for an AAAA record, and then send a query for an A record if the query for the AAAA record results in a NODATA response from the name server.

Possible values: OnlyAQuery, OnlyAAAAQuery, AThenAAAAQuery, AAAAThenAQuery

Default value: NS_FOUR

dnssec

Enable or disable the Domain Name System Security Extensions (DNSSEC) feature on the appliance. Note: Even when the DNSSEC feature is enabled, forwarder configurations (used by internal NetScaler features such as SSL VPN and Cache Redirection for name resolution) do not support the DNSSEC OK (DO) bit in the EDNS0 OPT header.

Possible values: ENABLED, DISABLED

Default value: ENABLED

maxPipeline

Maximum number of concurrent DNS requests to allow on a single client connection, which is identified by the <clientip:port>-<vserver ip:port> tuple. A value of 0 (zero) applies no limit to the number of concurrent DNS requests allowed on a single client connection.

Default value: NSNATPCB_MAXPIPELINE

dnsRootReferral

Send a root referral if a client queries a domain name that is unrelated to the domains configured/cached on the NetScaler appliance. If the setting is disabled, the appliance sends a blank response instead of a root referral. Applicable to domains for which the appliance is authoritative. Disable the parameter when the appliance is under attack from a client that is sending a flood of queries for unrelated domains.

Possible values: ENABLED, DISABLED

Default value: DISABLED

dns64Timeout

While doing DNS64 resolution, this parameter specifies the time to wait before sending an A query if no response is received from backend DNS server for AAAA query.

Default value: VAL_NOT_SET

Maximum value: 10000

Use this command to remove dns parameter settings.Refer to the set dns parameter command for meanings of the arguments.

unset dns parameter [-retries] [-minTTL] [-maxTTL] [-cacheRecords] [-nameLookupPriority] [-recursion] [-resolutionOrder] [-dnssec] [-maxPipeline] [-dnsRootReferral] [-dns64Timeout]

Displays the global DNS parameters.

show dns parameter

format

level

retries

Maximum number of retry attempts when no response is received for a query sent to a name server. Applies to end resolver and forwarder configurations.

minTTL

Minimum permissible time to live (TTL) for all records cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is lower than the value configured for minTTL, the TTL of the record is set to the value of minTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed.

maxTTL

Maximum time to live (TTL) for all records cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is higher than the value configured for maxTTL, the TTL of the record is set to the value of maxTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed.

nameLookupPriority

Type of lookup (DNS or WINS) to attempt first. If the first-priority lookup fails, the second-priority lookup is attempted. Used only by the SSL VPN feature.

cacheRecords

Cache resource records in the DNS cache. Applies to resource records obtained through proxy configurations only. End resolver and forwarder configurations always cache records in the DNS cache, and you cannot disable this behavior. When you disable record caching, the appliance stops caching server responses. However, cached records are not flushed. The appliance does not serve requests from the cache until record caching is enabled again.

recursion

Function as an end resolver and recursively resolve queries for domains that are not hosted on the

NetScaler appliance. Also resolve queries recursively when the external name servers configured on the appliance (for a forwarder configuration) are unavailable. When external name servers are unavailable, the appliance queries a root server and resolves the request recursively, as it does for an end resolver configuration.

resolutionOrder

Type of DNS queries (A, AAAA, or both) to generate during the routine functioning of certain NetScaler features, such as SSL VPN, cache redirection, and the integrated cache. The queries are sent to the external name servers that are configured for the forwarder function. If you specify both query types, you can also specify the order. Available settings function as follows:

* OnlyAQuery. Send queries for IPv4 address records (A records) only.

* OnlyAAAAQuery. Send queries for IPv6 address records (AAAA records) instead of queries for IPv4 address records (A records).

* AThenAAAAQuery. Send a query for an A record, and then send a query for an AAAA record if the query for the A record results in a NODATA response from the name server.

* AAAAThenAQuery. Send a query for an AAAA record, and then send a query for an A record if the query for the AAAA record results in a NODATA response from the name server.

dnssec

Enable or disable the Domain Name System Security Extensions (DNSSEC) feature on the appliance. Note: Even when the DNSSEC feature is enabled, forwarder configurations (used by internal NetScaler features such as SSL VPN and Cache Redirection for name resolution) do not support the DNSSEC OK (DO) bit in the EDNS0 OPT header.

maxPipeline

Maximum value of the concurrent DNS pipeline. A setting of zero makes the pipeline infinite

dnsRootReferral

Send a root referral if a client queries a domain name that is unrelated to the domains configured/cached on the NetScaler appliance. If the setting is disabled, the appliance sends a blank response instead of a root referral. Applicable to domains for which the appliance is authoritative. Disable the parameter when the appliance is under attack from a client that is sending a flood of queries for unrelated domains.

dns64Timeout

While doing DNS64 resolution, this parameter specifies the time to wait before sending an A query if no response is received from backend DNS server for AAAA query.

dns policy

Sep 22, 2015

The following operations can be performed on "dns policy":

add | rm | set | show

Creates a DNS policy.

add dns policy <name> <rule> <actionName>

name

Name for the DNS policy.

rule

Expression against which DNS traffic is evaluated. Written in the default syntax.

Note:

* On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks.

* If the expression itself includes double quotation marks, you must escape the quotations by using the character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

Example: CLIENT.UDP.DNS.DOMAIN.EQ("domainname")

viewName

The view name that must be used for the given policy.

preferredLocation

The location used for the given policy. This is deprecated attribute. Please use -prefLocList

preferredLocList

The location list in priority order used for the given policy.

drop

The dns packet must be dropped.

Possible values: YES, NO

cacheBypass

By pass dns cache for this.

Possible values: YES, NO

actionName

Name of the DNS action to perform when the rule evaluates to TRUE. The built in actions function as follows:

* dns_default_act_Drop. Drop the DNS request.

* dns_default_act_Cachebypass. Bypass the DNS cache and forward the request to the name server.

You can create custom actions by using the add dns action command in the CLI or the DNS > Actions > Create DNS Action dialog box in the NetScaler configuration utility.

add dns policy pol1 "dns.req.question.type.ne(aaaa)" -actionName act1 add dns policy pol2 "CLIENT.IP.SRC.IN_SUBNET(1.1.1.1/24)" -actionName action1 add dns policy

---

Removes a DNS policy.

rm dns policy <name>

name

Name of the DNS policy to remove.

Modifies the parameters of the specified DNS policy.

set dns policy <name> [<rule>] [-actionName <string>]

name

Name of the DNS policy.

rule

Expression against which DNS traffic is evaluated. Written in the default syntax.

Note:

* On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks.

* If the expression itself includes double quotation marks, you must escape the quotations by using the character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

Example: CLIENT.UDP.DNS.DOMAIN.EQ("domainname")

viewName

The view name that must be used for the given policy

preferredLocation

The location used for the given policy. This is deprecated attribute. Please use -prefLocList

preferredLocList

The location list in priority order used for the given policy.

drop

The dns packet must be dropped.

Possible values: YES, NO

cacheBypass

By pass dns cache for this.

Possible values: YES, NO

actionName

Name of the DNS action to perform when the rule evaluates to TRUE. The built in actions function as follows:

* dns_default_act_Drop. Drop the DNS request.

* dns_default_act_Cachebypass. Bypass the DNS cache and forward the request to the name server.

You can create custom actions by using the add dns action command in the CLI or the DNS > Actions > Create DNS Action dialog box in the NetScaler configuration utility.

set dns policy pol1 -rule "dns.req.question.type.ne(aaaa)" set dns policy pol2 -rule "CLIENT.IP.SRC.IN_SUBNET(1.1.1.1/24)" set dns policy pol1 -rule dns.res.header.rcod

---

Displays the parameters of the specified DNS policy or, if no policy name is specified, all configured DNS policies.

dns policy64

Sep 22, 2015

The following operations can be performed on "dns policy64":

add | rm | set | show

Creates a DNS64 Policy.

add dns policy64 <name> -rule <expression> -action <string>

name

Name for the DNS64 policy.

rule

Expression against which DNS traffic is evaluated. Written in the default syntax.

Note:

* On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks.

* If the expression itself includes double quotation marks, you must escape the quotations by using the character.

* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'

Example: CLIENT.IP.SRC.IN_SUBENT(23.34.0.0/16)

action

Name of the DNS64 action to perform when the rule evaluates to TRUE. The built in actions function as follows:

* A default dns64 action with prefix <default prefix> and mapped and exclude are any

You can create custom actions by using the add dns action command in the CLI or the DNS64 > Actions > Create DNS64 Action dialog box in the NetScaler configuration utility.

```
add dns64 policy pol1 "client.ip.src.in_subnet(23.43.0.0/16)" -action act1
```

Removes a DNS64 Policy.

rm dns policy64 <name>

name

Name of the DNS64 policy to be removed.

Modifies the parameters of the specified DNS64 policy.

set dns policy64 <name> [-rule <expression>] [-action <string>]

name

Name of the DNS policy.

rule

Expression against which DNS traffic is evaluated. Written in the default syntax.

dns proxyRecords

Sep 22, 2015

The following operations can be performed on "dns proxyRecords":

Flushes all the proxy records from the DNS cache on the NetScaler appliance.

flush dns proxyRecords

dns ptrRec

Sep 22, 2015

The following operations can be performed on "dns ptrRec":

add | rm | show

Creates a pointer (PTR) record for the specified reverse domain name.

add dns ptrRec <reverseDomain> <domain> ... [-TTL <secs>]

reverseDomain

Reversed domain name representation of the IPv4 or IPv6 address for which to create the PTR record. Use the "in-addr.arpa." suffix for IPv4 addresses and the "ip6.arpa." suffix for IPv6 addresses.

domain

Domain name for which to configure reverse mapping.

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

add dns ptrrec 1.1.1.in-addr.arpa. abc.com

Removes a pointer (PTR) record for the specified domain name and reverse domain name.

rm dns ptrRec <reverseDomain> [<domain> ...]

reverseDomain

Reverse domain name of the PTR record.

domain

Domain name for which to remove reverse mapping.

rm dns ptrrec 1.1.1.1.in-addr.arpa. ptr.com

Displays the pointer (PTR) record for the specified reverse domain name and domain name.

show dns ptrRec [<reverseDomain> | -type <type>]

reverseDomain

Reversed domain name representation of the IPv4 or IPv6 address for which to create the PTR record. Use the "in-addr.arpa." suffix for IPv4 addresses and the "ip6.arpa." suffix for IPv6 addresses.

type

Type of records to display. Available settings function as follows:

* ADNS - Display all authoritative address records.

* PROXY - Display all proxy address records.

* ALL - Display all address records.

Possible values: ALL, ADNS, PROXY

Total number of cache misses

Current records (curRec)

Current number of DNS Records

dns soaRec

Sep 22, 2015

The following operations can be performed on "dns soaRec":

add | rm | set | unset | show

Creates a Start of Authority (SOA) record. Note: You can set the SOA parameters that are associated with zone transfers. However, the NetScaler appliance currently does not support zone transfers.

add dns soaRec <domain> -originServer <string> -contact <string> [-serial <positive_integer>] [-refresh <secs>] [-retry <secs>] [-expire <secs>] [-minimum <secs>] [-TTL <secs>]

domain

Domain name for which to add the SOA record.

originServer

Domain name of the name server that responds authoritatively for the domain.

contact

Email address of the contact to whom domain issues can be addressed. In the email address, replace the @ sign with a period (.). For example, enter domainadmin.example.com instead of domainadmin@example.com.

serial

The secondary server uses this parameter to determine whether it requires a zone transfer from the primary server.

Default value: 100

Maximum value: 4294967294

refresh

Time, in seconds, for which a secondary server must wait between successive checks on the value of the serial number.

Default value: 3600

Maximum value: 4294967294

retry

Time, in seconds, between retries if a secondary server's attempt to contact the primary server for a zone refresh fails.

Default value: 3

Maximum value: 4294967294

expire

Time, in seconds, after which the zone data on a secondary name server can no longer be considered authoritative because all refresh and retry attempts made during the period have failed. After the expiry period, the secondary server stops serving the zone. Typically one week. Not used by the primary server.

Default value: 3600

Maximum value: 4294967294

minimum

Default time to live (TTL) for all records in the zone. Can be overridden for individual records.

Default value: 5

Maximum value: 2147483647

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

Removes the Start of Authority (SOA) record for the specified domain name.

rm dns soaRec <domain>

domain

Domain name of the SOA record.

Modifies the parameters of the specified Start Of Authority (SOA) record.

set dns soaRec <domain> [-originServer <string>] [-contact <string>] [-serial <positive_integer>] [-refresh <secs>] [-retry <secs>] [-expire <secs>] [-minimum <secs>] [-TTL <secs>]

domain

Domain of the SOA record to be modified.

originServer

Domain name of the name server that responds authoritatively for the domain.

contact

Email address of the contact to whom domain issues can be addressed. In the email address, replace the @ sign with a period (.). For example, enter domainadmin.example.com instead of domainadmin@example.com.

serial

The secondary server uses this parameter to determine whether it requires a zone transfer from the primary server.

Default value: 100

Minimum value: 1

Maximum value: 4294967294

refresh

Time, in seconds, for which a secondary server must wait between successive checks on the value of the serial number.

Default value: 3600

Maximum value: 4294967294

retry

Time, in seconds, between retries if a secondary server's attempt to contact the primary server for a zone refresh fails.

Default value: 3

Maximum value: 4294967294

expire

Time, in seconds, after which the zone data on a secondary name server can no longer be considered authoritative because all refresh and retry attempts made during the period have failed. After the expiry period, the secondary server stops serving the zone. Typically one week. Not used by the primary server.

Default value: 3600

Maximum value: 4294967294

minimum

Default time to live (TTL) for all records in the zone. Can be overridden for individual records.

Default value: 5

Maximum value: 2147483647

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

Use this command to remove dns soaRec settings.Refer to the set dns soaRec command for meanings of the arguments.

unset dns soaRec <domain> [-serial] [-refresh] [-retry] [-expire] [-minimum] [-TTL]

Displays the parameters of the specified Start of Authority (SOA) record. If no domain name is specified, all SOA records are displayed.

show dns soaRec [<domain> | -type <type>]

domain

The domain name.

type

Type of records to display. Available settings function as follows:

* ADNS - Display all authoritative address records.

* PROXY - Display all proxy address records.

dns srvRec

Sep 22, 2015

The following operations can be performed on "dns srvRec":

add | rm | set | unset | show

Creates a service (SRV) record for the service offered by the specified target host, in the specified domain.

add dns srvRec <domain> <target> -priority <positive_integer> -weight <positive_integer> -port <positive_integer> [-TTL <secs>]

domain

Domain name, which, by convention, is prefixed by the symbolic name of the desired service and the symbolic name of the desired protocol, each with an underscore (_) prepended. For example, if an SRV-aware client wants to discover a SIP service that is provided over UDP, in the domain example.com, the client performs a lookup for _sip._udp.example.com.

target

Target host for the specified service.

priority

Integer specifying the priority of the target host. The lower the number, the higher the priority. If multiple target hosts have the same priority, selection is based on the Weight parameter.

Maximum value: 65535

weight

Weight for the target host. Aids host selection when two or more hosts have the same priority. A larger number indicates greater weight.

Maximum value: 65535

port

Port on which the target host listens for client requests.

Maximum value: 65535

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the

specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

Removes, from the specified domain, the SRV record created for the service provided by the specified target host.

rm dns srvRec <domain> <target> ...

domain

Domain name of the SRV record.

target

Target host for the specified service.

Modifies the parameters of the specified service (SRV) record.

set dns srvRec <domain> <target> [-priority <positive_integer>] [-weight <positive_integer>] [-port <positive_integer>] [-TTL <secs>]

domain

Name of the SRV record to be modified.

target

Target of the SRV record to be modified.

priority

Integer specifying the priority of the target host. The lower the number, the higher the priority. If multiple target hosts have the same priority, selection is based on the Weight parameter.

Maximum value: 65535

weight

Weight for the target host. Aids host selection when two or more hosts have the same priority. A larger number indicates greater weight.

Maximum value: 65535

port

Port on which the target host listens for client requests.

Maximum value: 65535

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

Use this command to remove dns srvRec settings.Refer to the set dns srvRec command for meanings of the arguments.

unset dns srvRec <domain> <target> -TTL

Displays the service (SRV) record configured for the specified target host and domain. If the domain name is not specified, all of the SRV records are shown.

show dns srvRec [(<domain> [<target>]) | -type <type>]

domain

Domain name for which to display the SRV record.

target

Target host for the specified service.

type

Type of records to display. Available settings function as follows:

* ADNS - Display all authoritative address records.

* PROXY - Display all proxy address records.

* ALL - Display all address records.

Possible values: ALL, ADNS, PROXY

summary

dns txtRec

Sep 22, 2015

The following operations can be performed on "dns txtRec":

add | rm | show

Creates a text (TXT) record for the specified domain name. Each resource record is stored with a unique, internally generated record ID, which you can view and use to delete the record. You cannot modify a TXT resource record.

add dns txtRec <domain> <string> ... [-TTL <secs>]

domain

Name of the domain for the TXT record.

string

Information to store in the TXT resource record. Enclose the string in single or double quotation marks. A TXT resource record can contain up to six strings, each of which can contain up to 255 characters. If you want to add a string of more than 255 characters, evaluate whether splitting it into two or more smaller strings, subject to the six-string limit, works for you.

TTL

Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the NetScaler appliance uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

Default value: 3600

Maximum value: 2147483647

add dns txtRec spf.m.test. "v=spf1 ip4:1.2.3.0/24 ip4:1.3.4.0/24 ?all" add dns txtRec comments.m.test. "This is a CHARSTR" "This is another CHARSTR"

Removes the specified TXT record from the specified domain.

rm dns txtRec <domain> (<string> ... | -recordId <positive_integer>@)

domain

Name of the domain for the TXT record.

string

Complete set of text strings in the TXT record, entered in the order in which they are stored in the record. Mutually exclusive with the record ID parameter.

recordId

Unique, internally generated record ID. View the details of the TXT record to obtain its record ID. Mutually exclusive with the string parameter.

Minimum value: 1

Maximum value: 65535

rm dns txtRec spf.m.test. "v=spf1 ip4:1.2.3.0/24 ip4:1.3.4.0/24 ?all" rm dns txtRec comments.m.test. "This is a CHARSTR" "This is another CHARSTR" rm dns txtRec co

---

Displays TXT records owned by the specified domain. If no domain name is specified, all configured TXT records are shown.

show dns txtRec [<domain> | -type <type>]

domain

Name of the domain for the TXT record.

type

Type of records to display. Available settings function as follows:

* ADNS - Display all authoritative address records.

* PROXY - Display all proxy address records.

* ALL - Display all address records.

Possible values: ALL, ADNS, PROXY

Default value: NSDNS_AUTH_HOST

dns view

Sep 22, 2015

The following operations can be performed on "dns view":

add | rm | show

Creates a DNS view. A DNS view is used in global server load balancing (GSLB) to return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy.

add dns view <viewName>

viewName

Name for the DNS view.

add dns view privateview

Removes a DNS view.

rm dns view <viewName>

viewName

Name for the DNS view.

rm dns view privateview

Displays the specified DNS view or, if no DNS view name is specified, all the DNS views configured on the NetScaler appliance.

show dns view [<viewName>]

viewName

Name of the view to display.

dns zone

Sep 22, 2015

The following operations can be performed on "dns zone":

add | set | unset | rm | sign | unsign | show

Creates a DNS zone on the NetScaler appliance. Mandatory if you want to use the appliance to implement Domain Name Security Extensions (DNSSEC) for the zone. When you add a DNS resource record, if the domain name of the record belongs to the zone, the record is automatically added to the zone.

add dns zone <zoneName> -proxyMode (YES | NO) [-dnssecOffload (ENABLED | DISABLED) [-nsec (ENABLED | DISABLED)]]

zoneName

Name of the zone to create.

proxyMode

Deploy the zone in proxy mode. Enable in the following scenarios:

* The load balanced DNS servers are authoritative for the zone and all resource records that are part of the zone.

* The load balanced DNS servers are authoritative for the zone, but the NetScaler appliance owns a subset of the resource records that belong to the zone (partial zone ownership configuration). Typically seen in global server load balancing (GSLB) configurations, in which the appliance responds authoritatively to queries for GSLB domain names but forwards queries for other domain names in the zone to the load balanced servers.

In either scenario, do not create the zone's Start of Authority (SOA) and name server (NS) resource records on the appliance.

Disable if the appliance is authoritative for the zone, but make sure that you have created the SOA and NS records on the appliance before you create the zone.

Possible values: YES, NO

Default value: ENABLED

add dns zone foo.bar -proxyMode NO -dnssec ENABLED

Modifies the parameters of the specified DNS zone.

set dns zone <zoneName> [-proxyMode (YES | NO)] [-dnssecOffload (ENABLED | DISABLED)] [-nsec (ENABLED | DISABLED)]

zoneName

Name of the zone.

proxyMode

Deploy the zone in proxy mode. Enable in the following scenarios:

* The load balanced DNS servers are authoritative for the zone and all resource records that are part of the zone.

* The load balanced DNS servers are authoritative for the zone, but the NetScaler appliance owns a subset of the resource records that belong to the zone (partial zone ownership configuration). Typically seen in global server load balancing (GSLB) configurations, in which the appliance responds authoritatively to queries for GSLB domain names but forwards queries for other domain names in the zone to the load balanced servers.

In either scenario, do not create the zone's Start of Authority (SOA) and name server (NS) resource records on the appliance.

Disable if the appliance is authoritative for the zone, but make sure that you have created the SOA and NS records on the appliance before you create the zone.

Possible values: YES, NO

Default value: ENABLED

set dns zone foo.bar -proxyMode NO -dnssec ENABLED

Use this command to remove dns zone settings.Refer to the set dns zone command for meanings of the arguments.

unset dns zone <zoneName> [-proxyMode] [-dnssecOffload] [-nsec]

Removes a DNS zone from the NetScaler appliance.

rm dns zone <zoneName>

zoneName

Name of the zone to remove.

Signs a DNS zone with a DNS key. Before you sign a zone, make sure that you've enabled DNSSEC by setting the global DNS parameter "Enable DNSSEC extension."

sign dns zone <zoneName> [-keyName <string> ...]

zoneName

Name of the zone.

keyName

Name of the public/private DNS key pair with which to sign the zone. You can sign a zone with up to four keys.

sign dns zone abc.com. -keyname abc.com.zsk abc.com.ksk

Unsigns the specified DNS zone with the specified DNS key.

unsign dns zone <zoneName> [-keyName <string> ...]

zoneName

Name of the zone.

keyName

Name of the public-private DNS key pair with which to unsign the zone.

unsign dns zone abc.com. -keyname abc.com.zsk abc.com.ksk

Displays the parameters of the specified DNS zone, along with information about the types of resource records available for each domain name in the zone. If no zone name is specified, just the parameters are shown, for all configured zones.

show dns zone [<zoneName> | -type <type>]

zoneName

Name of the zone. Mutually exclusive with the type parameter.

type

Type of zone to display. Mutually exclusive with the DNS Zone (zoneName) parameter. Available settings function as follows:

* ADNS - Display all the zones for which the NetScaler appliance is authoritative.

* PROXY - Display all the zones for which the NetScaler appliance is functioning as a proxy server.

* ALL - Display all the zones configured on the appliance.

Possible values: ALL, ADNS, PROXY

DOS Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- dos
- dos policy
- dos stats

dos

Sep 22, 2015

The following operations can be performed on "dos":

Displays DoS protection statistics.

stat dos [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

clearstats

Clear the statsistics / counters

Possible values: basic, full

DOS condition triggered (CndMatch)

Number of times the NetScaler appliance triggered the DOS JavaScript due to a condition match.

Valid DOS clients (ValidClt)

Number of clients from whom the NetScaler appliance received a valid DOS cookie.

DOS priority clients (DosPriCl)

Number of valid clients that were given DOS priority.

dos policy

Sep 22, 2015

The following operations can be performed on "dos policy":

add | rm | set | unset | show | stat

Adds a DoS protection policy to the appliance. Note: To apply DoS protection to a service, bind the DoS policy to the service by using the bind service command.

add dos policy <name> -qDepth <positive_integer> [-cltDetectRate <positive_integer>]

name

Name for the HTTP DoS protection policy. Must begin with a letter, number, or the underscore character (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters.

qDepth

Queue depth. The queue size (the number of outstanding service requests on the system) before DoS protection is activated on the service to which the DoS protection policy is bound.

Minimum value: 21

cltDetectRate

Client detect rate. Integer representing the percentage of traffic to which the HTTP DoS policy is to be applied after the queue depth condition is satisfied.

Maximum value: 100

add dos policy dospol -qdepth 100 -cltDetectRate 90

Removes a DoS protection policy from the appliance.

rm dos policy <name>

name

Name of the DoS protection policy to be removed.

rm dos policy dospol

Modifies the attributes of a DoS protection policy.

set dos policy <name> [-qDepth <positive_integer>] [-cltDetectRate <positive_integer>]

name

Name of the DoS protection policy to be modified.

qDepth

Queue depth. The queue size (the number of outstanding service requests on the system) before DoS protection is activated on the service to which the DoS

protection policy is bound.

Minimum value: 21

cltDetectRate

Client detect rate. Integer representing the percentage of traffic to which the HTTP DoS policy is to be applied after the queue depth condition is satisfied.

Minimum value: 1

Maximum value: 100

```
set dos policy dospol -qdepth 1000
```

Use this command to remove dos policy settings.Refer to the set dos policy command for meanings of the arguments.

```
unset dos policy <name> -cltDetectRate
```

Displays information about a DoS protection policy.

```
show dos policy [<name>]
```

name

Name of the DoS protection policy about which to display information. If a name is not provided, information about all DoS protection policies is shown.

summary

stateflag

Client detect rate (ClDtRate)

Current ratio of JavaScript send rate to the server response rate (Client detect rate)

Physical service IP (SvcIP)

IP address of the service to which this policy is bound.

Physical service port (SvcPort)

Port address of the service to which this policy is bound.

Current server queue size (CurQSize)

Current queue size of the server to which this policy is bound.

DOS transactions (DosTrans)

Total number of DoS JavaScript transactions performed for this policy.

Client detect rate mismatch (JsRefusd)

Number of times the DoS JavaScript was not sent because the set JavaScript rate was not met for this policy.

Valid clients (TotValCl)

Total number of valid DoS cookies received for this policy.

DOS JavaScript bytes served (JsBytSnt)

Total number of DoS JavaScript bytes sent for this policy.

Non GET, POST requests

Number of non-GET and non-POST requests for which DOS JavaScript was sent.

DOS JavaScript send rate (JSRate)

Current rate at which JavaScript is being sent in response to client requests.

Server response rate (RespRate)

Current rate at which the server to which this policy is bound is responding.

dos stats

Sep 22, 2015

The following operations can be performed on "dos stats":

show dos stats is an alias for stat dos Displays DoS protection statistics.

show dos stats - alias for 'stat dos'

Filter Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- filter action
- filter global
- filter htmlinjectionparameter
- filter htmlinjectionvariable
- filter policy
- filter postbodyInjection
- filter prebodyInjection

filter action

Sep 22, 2015

The following operations can be performed on "filter action":

add | rm | set | unset | show

Creates a content filtering action. This action can be associated with a content filtering policy that is created with the add filter policy command. Note: The following content filtering actions are available by default: * RESET - Sends a TCP reset for the HTTP requests. * DROP - Drops the HTTP requests silently, without sending a TCP FIN for closing the connection.

add filter action <name> <qual> [<serviceName>] [<value>] [<respCode>] [<page>]

name

Name for the filtering action. Must begin with a letter, number, or the underscore character (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at sign (@), equals (=), and colon (:) characters. Choose a name that helps identify the type of action. The name of a filter action cannot be changed after it is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action').

qual

Qualifier, which is the action to be performed. The qualifier cannot be changed after it is set. The available options function as follows:

ADD - Adds the specified HTTP header.

RESET - Terminates the connection, sending the appropriate termination notice to the user's browser.

FORWARD - Redirects the request to the designated service. You must specify either a service name or a page, but not both.

DROP - Silently deletes the request, without sending a response to the user's browser.

CORRUPT - Modifies the designated HTTP header to prevent it from performing the function it was intended to perform, then sends the request/response to the server/browser.

ERRORCODE. Returns the designated HTTP error code to the user's browser (for example, 404, the standard HTTP code for a non-existent Web page).

Possible values: reset, add, corrupt, forward, errorcode, drop

serviceName

Service to which to forward HTTP requests. Required if the qualifier is FORWARD.

value

String containing the header_name and header_value. If the qualifier is ADD, specify <header_name>:<header_value>. If the qualifier is CORRUPT, specify only the header_name

respCode

Response code to be returned for HTTP requests (for use with the ERRORCODE qualifier).

Minimum value: 1

page

HTML page to return for HTTP requests (For use with the ERRORCODE qualifier).

add filter action bad_url_action errorcode 400 "<HTML>Bad URL.</HTML>" add filter action forw_action FORWARD service1 add filter action add_header_action add "HI

Removes a content filtering action.

rm filter action <name>

name

Name of the content filter action to be removed.

rm filter action filter_action_name

Modifies an existing content filtering action.

set filter action <name> [-serviceName <string>] [-value <string>] [-respCode <positive_integer>] [-page <string>]

name

Name of the content filtering action to be modified.

serviceName

Service to which to forward HTTP requests. Required if the qualifier is FORWARD.

value

String containing the header_name and header_value. If the qualifier is ADD, specify <header_name>:<header_value>. If the qualifier is CORRUPT, specify only the header_name

respCode

Response code to be returned for HTTP requests (for use with the ERRORCODE qualifier).

Minimum value: 1

page

HTML page to return for HTTP requests (For use with the ERRORCODE qualifier).

set filter action bad_url_action -respcode 400 -page "<HTML>Bad URL.</HTML>" set filter action forw_action -serviceName service1 set filter action add_header_action

---

Use this command to remove filter action settings.Refer to the set filter action command for meanings of the arguments.

unset filter action <name> -page

Displays information about available filtering actions.

show filter action [<name>]

name

Name of the content filtering action to be displayed. If a name is not provided, information about all filter actions is shown.

filter htmlinjectionparameter

Sep 22, 2015

The following operations can be performed on "filter htmlinjectionparameter":

set | unset | show

Sets the HTML injection parameters.

set filter htmlinjectionparameter [-rate <positive_integer>] [-frequency <positive_integer>] [-strict (ENABLED | DISABLED)] [-htmlsearchlen <positive_integer>]

rate

For a rate of x, HTML injection is done for 1 out of x policy matches.

Default value: 1

Minimum value: 1

frequency

For a frequency of x, HTML injection is done at least once per x milliseconds.

Default value: 1

Minimum value: 1

strict

Searching for <html> tag. If this parameter is enabled, HTML injection does not insert the prebody or postbody content unless the <html> tag is found.

Possible values: ENABLED, DISABLED

Default value: ENABLED

htmlsearchlen

Number of characters, in the HTTP body, in which to search for the <html> tag if strict mode is set.

Default value: 1024

Minimum value: 1

set htmlinjection parameter -rate 10 -frequency 1

Removes the HTML injection settings..Refer to the set filter htmlinjectionparameter command for meanings of the arguments.

unset filter htmlinjectionparameter [-rate] [-frequency] [-strict] [-htmlsearchlen]

a) unset htmlinjectionparameter -rate b) unset htmlinjectionparameter -frequency c) unset htmlinjectionparameter -rate -frequency

Displays the HTML injection parameters.

show filter htmlinjectionparameter

format

level

htmlsearchlen

Number of characters, in the HTTP body, in which to search for the <html> tag if strict mode is set.

rate : 10

filter htmlinjectionvariable

Sep 22, 2015

The following operations can be performed on "filter htmlinjectionvariable":

add | rm | set | unset | show

Creates an HTML injection variable.

add filter htmlinjectionvariable <variable> [-value <string>]

variable

Name for the HTML injection variable to be added.

value

Value to be assigned to the new variable.

varId

ID of the system variable. Used only in builtins.

Possible values: IID, UTIME, XID, PAGEID, REQRTBEG, REQRTEND, REQSTBEG, REQSTEND, RESRTBEG, RESRTEND, RESSTBEG, RESSTEND, CLTRTT, CTYPE, TRANSID, SYSVSVR, SYSSERV

add htmlinjectionvariable EDGESIGHT_SERVER_IP -value 1.1.1.1

Removes an HTML injection variable.

rm filter htmlinjectionvariable <variable>

variable

Name of the HTML injection variable to be removed.

rm htmlinjectionvariable EDGESIGHT_SERVER_IP

Modifies the value of an HTML injection variable.

set filter htmlinjectionvariable <variable> [-value <string>]

variable

Name of the HTML injection variable to be modified.

value

Value to be assigned to the new variable.

set htmlinjectionvariable EDGESIGHT_SERVER_IP -value 2.2.2.2

Use this command to remove filter htmlinjectionvariable settings.Refer to the set filter htmlinjectionvariable command for meanings of the arguments.

unset filter htmlinjectionvariable <variable> -value

Displays information about HTML injection variables.

show filter htmlinjectionvariable [<variable>]

variable

Name of the HTML injection variable to be displayed. If a name is not provided, information about all the HTML injection variables is shown.

filter policy

Sep 22, 2015

The following operations can be performed on "filter policy":

add | rm | set | show

Creates a content filtering policy.

add filter policy <name> -rule <expression> (-reqAction <string> | -resAction <string>)

name

Name for the filtering action. Must begin with a letter, number, or the underscore character (_). Other characters allowed, after the first character, are the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and colon (:) characters. Choose a name that helps identify the type of action. The name cannot be updated after the policy is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy').

rule

NetScaler classic expression specifying the type of connections that match this policy.

reqAction

Name of the action to be performed on requests that match the policy. Cannot be specified if the rule includes condition to be evaluated for responses.

resAction

The action to be performed on the response. The string value can be a filter action created filter action or a built-in action.

Example 1: add policy expression e1 "sourceip == 66.33.22.0 -netmask 255.255.255.0" add policy expression e2 "URL == /admin/account.asp" add filter policy ip_filter

---

Removes a filter policy.

rm filter policy <name>

name

Name of the filter policy to be removed.

rm filter policy filter_policy_name The "show filter policy" command shows all filter policies that are currently defined.

Modifies a filter policy.

set filter policy <name> [-rule <expression>] [-reqAction <string> | -resAction <string>]

name

Name of the filter policy to be modified.

rule

NetScaler classic expression specifying the type of connections that match this policy.

reqAction

Name of the action to be performed on requests that match the policy. Cannot be specified if the rule includes condition to be evaluated for responses.

resAction

The action to be performed on the response. The string value can be a filter action created filter action or a built-in action.

Example 1: A filter policy to allow access of URL /foo/secure.asp only from 65.186.55.0 network can be created using below command: add filter policy url_filter -rule "URI

Displays information about the filter policies.

filter postbodyInjection

Sep 22, 2015

The following operations can be performed on "filter postbodyInjection":

set | unset | show

Specifies the file to be used for postbody injection.

set filter postbodyInjection <postbody>

postbody

Name of file whose contents are to be inserted after the response body.

set filter postbodyInjection ens/postbody.js

Removes the setting that specifies the file used for postbody injection..Refer to the set filter postbodyInjection command for meanings of the arguments.

unset filter postbodyInjection [-postbody]

unset filter postbodyInjection

Displays the name of the file used for postbody injection.

show filter postbodyInjection

format

level

postbody

The name of the postbody file.

systemIID

The system IID of the current NetScaler system.

filter prebodyInjection

Sep 22, 2015

The following operations can be performed on "filter prebodyInjection":

set | unset | show

Specifies the file to be used for prebody injection.

set filter prebodyInjection <prebody>

prebody

Name of file whose contents are to be inserted before the response body.

set filter prebodyInjection ens/prebody.js

Removes the setting that specifies the file used for prebody injection..Refer to the set filter prebodyInjection command for meanings of the arguments.

unset filter prebodyInjection [-prebody]

unset filter prebodyInjection

Displays the name of the file used for prebody injection.

show filter prebodyInjection

format

level

prebody

The name of the prebody file.

systemIID

The system IID of the current NetScaler system.

GSLB Commands

Sep 22, 2015

The entities on which you can perform NetScaler CLI operations:

- gslb action
- gslb config
- gslb domain
- gslb ldnsentries
- gslb ldnsentry
- gslb parameter
- gslb policy
- gslb runningConfig
- gslb service
- gslb site
- gslb syncStatus
- gslb vserver

gslb action

Sep 22, 2015

The following operations can be performed on "gslb action":

add | rm | set | show

Add GSLB action used in the GSLB policy NOTE: This command is deprecated.

name

The name of the GSLB action

preferredLocation

The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard `*' is accepted as a valid qualifier token.

```
add gslb action pref_site -preferredlocation NorthAmerica.US.*.*.*.*
```

Remove the gslb action configured in the system NOTE: This command is deprecated.

name

The name of the action to be removed

```
rm gslb action redirect_asia
```

Change the preferredlocation of the given gslb action NOTE: This command is deprecated.

name

The name of the GSLB action

preferredLocation

The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard `*' is accepted as a valid qualifier token.

set gslb action pref_site -preferredlocation NorthAmerica.US.*.*.*.*

Display the GSLB actions configured NOTE: This command is deprecated.

name

The name of the action.

format

level

preferredLocation

The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard `*' is accepted as a valid qualifier token.

gslb config

Sep 22, 2015

The following operations can be performed on "gslb config":

Synchronizes the GSLB running configuration on all NetScaler appliances participating in the GSLB setup. The appliance on which this command is run is considered the master node. All GSLB sites configured on the master node and not having a parent site are synchronized with the master node.

sync gslb config [-preview | -forceSync <string> | -command <string> | -nowarn | -saveconfig] [-debug]

preview

Do not synchronize the GSLB sites, but display the commands that would be applied on the slave node upon synchronization. Mutually exclusive with the Save Configuration option.

debug

Generate verbose output when synchronizing the GSLB sites. The Debug option generates more verbose output than the sync gslb config command in which the option is not used, and is useful for analyzing synchronization issues.

forceSync

Force synchronization of the specified site even if a dependent configuration on the remote site is preventing synchronization or if one or more GSLB entities on the remote site have the same name but are of a different type. You can specify either the name of the remote site that you want to synchronize with the local site, or you can specify All Sites in the configuration utility (the string all-sites in the CLI). If you specify All Sites, all the sites in the GSLB setup are synchronized with the site on the master node.

Note: If you select the Force Sync option, the synchronization starts without displaying the commands that are going to be executed.

nowarn

Suppress the warning and the confirmation prompt that are displayed before site synchronization begins. This option can be used in automation scripts that must not be interrupted by a prompt.

saveconfig

Save the configuration on all the nodes participating in the synchronization process, automatically. The master saves its configuration immediately before synchronization begins. Slave nodes save their configurations after the process of synchronization is complete. A slave node saves its configuration only if the configuration difference was successfully applied to it. Mutually exclusive with the Preview option.

command

Run the specified command on the master node and then on all the slave nodes. You cannot use this option with the force sync and preview options.

sync gslb config

gslb domain

Sep 22, 2015

The following operations can be performed on "gslb domain":

Displays the statistics associated with a global server load balancing (GSLB) domain.

stat gslb domain [<name> [-dnsRecordType <dnsRecordType>]] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-clearstats (basic | full)]

name

Name of the GSLB domain for which to display statistics. If you do not specify a name, statistics are shown for all configured GSLB domains.

clearstats

Clear the statsistics / counters

Possible values: basic, full

count

devno

stateflag

domainHits (Hits)

Total number of DNS queries received.

Dns Record Type (Rec_Type)

Type of DNS record returned

gslb ldnsentries

Sep 22, 2015

The following operations can be performed on "gslb ldnsentries":

clear | show

Clears all the local DNS (LDNS) entries created on the NetScaler appliance. LDNS entries store network metrics for RTT learned from the packets exchanged with LDNS servers.

clear gslb ldnsentries

Displays the local DNS (LDNS) entries created on the NetScaler appliance. LDNS entries store network metrics for RTT learned from the packets exchanged with LDNS servers.

show gslb ldnsentries

summary

fullValues

siteName

The GSLB site name

numsites

Specifies the number of gslb sites

IPAddress

IP address of the LDNS server

TTL

TTL value of the LDNS entry

name

Monitor that is currently being used to monitor the LDNS ip..

rtt

RTT value of the LDNS entry for all gslb sites

devno

count

stateflag

show gslb ldnsentries

gslb ldnsentry

Sep 22, 2015

The following operations can be performed on "gslb ldnsentry":

Removes the LDNS entry for the specified LDNS IP address.

rm gslb ldnsentry <IPAddress>

IPAddress

IP address of the LDNS server.

rm gslb ldnsentry 10.102.27.226

gslb parameter

Sep 22, 2015

The following operations can be performed on "gslb parameter":

set | unset | show

Sets various global GSLB parameters.

set gslb parameter [-ldnsEntryTimeout <secs>] [-RTTTolerance <msecs>] [-ldnsMask <netmask>] [-v6ldnsmasklen <positive_integer>] [-ldnsProbeOrder <ldnsProbeOrder> ...] [-dropLdnsReq (ENABLED | DISABLED)]

ldnsEntryTimeout

Time, in seconds, after which an inactive LDNS entry is removed.

Default value: 180

Maximum value: 65534

RTTTolerance

Tolerance, in milliseconds, for newly learned round-trip time (RTT) values. If the difference between the old RTT value and the newly computed RTT value is less than or equal to the specified tolerance value, the LDNS entry in the network metric table is not updated with the new RTT value. Prevents the exchange of metrics when variations in RTT values are negligible.

Default value: 5

Minimum value: 1

Maximum value: 100

ldnsMask

The IPv4 network mask with which to create LDNS entries.

Default value: 0xFFFFFFFF

v6ldnsmasklen

Mask for creating LDNS entries for IPv6 source addresses. The mask is defined as the number of leading bits to consider, in the source IP address, when creating an LDNS entry.

Default value: 128

Minimum value: 1

Maximum value: 128

ldnsProbeOrder

Order in which monitors should be initiated to calculate RTT.

Possible values: PING, DNS, TCP

Default value: ARRAY(0x97d6208)

dropLdnsReq

Drop LDNS requests if round-trip time (RTT) information is not available.

Possible values: ENABLED, DISABLED

Default value: DISABLED

set gslb parameter -ldnsMask 255.255.0.0

Use this command to remove gslb parameter settings.Refer to the set gslb parameter command for meanings of the arguments.

unset gslb parameter [-ldnsEntryTimeout] [-RTTTolerance] [-ldnsMask] [-v6ldnsmasklen] [-ldnsProbeOrder] [-dropLdnsReq]

Displays the global GSLB parameters.

show gslb parameter

format

level

flags

State of the GSLB parameter.

ldnsEntryTimeout

Time, in seconds, after which an inactive LDNS entry is removed.

RTTTolerance

Tolerance, in milliseconds, for newly learned round-trip time (RTT) values. If the difference between the old RTT value and the newly computed RTT value is less than or equal to the specified tolerance value, the LDNS entry in the network metric table is not updated with the new RTT value. Prevents the exchange of metrics when variations in RTT values are negligible.

ldnsMask

The IPv4 network mask with which to create LDNS entries.

v6ldnsmasklen

Mask for creating LDNS entries for IPv6 source addresses. The mask is defined as the number of leading bits to consider, in the source IP address, when creating an LDNS entry.

ldnsProbeOrder

The order in which monitors should be initiated to calculate RTT

dropLdnsReq

Drop LDNS requests if round-trip time (RTT) information is not available.

show gslb parameter

gslb policy

Sep 22, 2015

The following operations can be performed on "gslb policy":

add | rm | set | show

Add GSLB policy NOTE: This command is deprecated.

name

The name of the GSLB policy

reqRule

The expression rule

action

The GSLB action to be used when the reqrule is matched

```
add gslb policy gslb_redirect -reqRule client_Japan -action pref_site
```

Remove the gslb policy configured in the system NOTE: This command is deprecated.

name

The name of the policy to be removed

```
rm gslb policy gslb_redirect
```

Change the action for the given gslb policy NOTE: This command is deprecated.

name

The name of the gslb policy.

action

The action to be taken for the given gslb policy

set gslb policy gslb_redirect -action redirect_asia

Display the configured GSLB policy NOTE: This command is deprecated.

name

The name of the GSLB policy.

format

level

reqRule

The expression rule

action

The action taken for the given gslb policy.

hits

Number of policy hits for the gslb policy.

devno

count

stateflag

show gslb policy

gslb runningConfig

Sep 22, 2015

The following operations can be performed on "gslb runningConfig":

Displays the complete GSLB configuration running on the NetScaler appliance. In addition to the saved configuration, the running configuration includes GSLB settings that have not yet been saved to the NetScaler configuration file (ns.conf).

show gslb runningConfig

response

gslb sync status as text blob

gslb service

Sep 22, 2015

The following operations can be performed on "gslb service":

add | rm | set | unset | bind | unbind | show | stat | rename

Creates a global server load balancing (GSLB) service.

add gslb service <serviceName> [-cnameEntry <string> | <IP> | <serverName> | <serviceType> | <port> | -publicIP <ip_addr|ipv6_addr|*> | -publicPort <port> | -sitePersistence <sitePersistence> | -sitePrefix <string>] [-maxClient <positive_integer>] [-healthMonitor (YES | NO)] [-siteName <string>] [-state (ENABLED | DISABLED)] [-cip (ENABLED | DISABLED) [<cipHeader>]] [-cookieTimeout <mins>] [-cltTimeout <secs>] [-svrTimeout <secs>] [-maxBandwidth <positive_integer>] [-downStateFlush (ENABLED | DISABLED)] [-maxAAAUsers <positive_integer>] [-monThreshold <positive_integer>] [-hashId <positive_integer>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)]

serviceName

Name for the GSLB service. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the GSLB service is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my gslbsvc" or 'my gslbsvc').

cnameEntry

Canonical name of the GSLB service. Used in CNAME-based GSLB.

IP

IP address for the GSLB service. Should represent a load balancing, content switching, or VPN virtual server on the NetScaler appliance, or the IP address of another load balancing device.

serverName

Name of the server hosting the GSLB service.

serviceType

Type of service to create.

Possible values: HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, RADIUS, RDP, RTSP, MYSQL, MSSQL

Default value: NSSVC_SERVICE_UNKNOWN

port

Port on which the load balancing entity represented by this GSLB service listens.

Minimum value: 1

publicIP

The public IP address that a NAT device translates to the GSLB service's private IP address. Optional.

publicPort

The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional.

maxClient

The maximum number of open connections that the service can support at any given time. A GSLB service whose connection count reaches the maximum is not considered when a GSLB decision is made, until the connection count drops below the maximum.

Maximum value: 4294967294

healthMonitor

Monitor the health of the GSLB service.

Possible values: YES, NO

Default value: YES

siteName

Name of the GSLB site to which the service belongs.

state

Enable or disable the service.

Possible values: ENABLED, DISABLED

Default value: ENABLED

cip

In the request that is forwarded to the GSLB service, insert a header that stores the client's IP address. Client IP header insertion is used in connection-proxy based site persistence.

Possible values: ENABLED, DISABLED

Default value: DISABLED

cipHeader

Name for the HTTP header that stores the client's IP address. Used with the Client IP option. If client IP header

insertion is enabled on the service and a name is not specified for the header, the NetScaler appliance uses the name specified by the cipHeader parameter in the set ns param command or, in the GUI, the Client IP Header parameter in the Configure HTTP Parameters dialog box.

sitePersistence

Use cookie-based site persistence. Applicable only to HTTP and SSL GSLB services.

Possible values: ConnectionProxy, HTTPRedirect, NONE

cookieTimeout

Timeout value, in minutes, for the cookie, when cookie based site persistence is enabled.

Maximum value: 1440

sitePrefix

The site's prefix string. When the service is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound service-domain pair by concatenating the site prefix of the service and the name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the NetScaler appliance redirects GSLB requests to GSLB services by using their site domains.

cltTimeout

Idle time, in seconds, after which a client connection is terminated. Applicable if connection proxy based site persistence is used.

Maximum value: 31536000

svrTimeout

Idle time, in seconds, after which a server connection is terminated. Applicable if connection proxy based site persistence is used.

Maximum value: 31536000

maxBandwidth

Integer specifying the maximum bandwidth allowed for the service. A GSLB service whose bandwidth reaches the maximum is not considered when a GSLB decision is made, until its bandwidth consumption drops below the maximum.

downStateFlush

Flush all active transactions associated with the GSLB service when its state transitions from UP to DOWN. Do not enable this option for services that must complete their transactions. Applicable if connection proxy based site persistence is used.

Possible values: ENABLED, DISABLED

maxAAAUsers

Maximum number of SSL VPN users that can be logged on concurrently to the VPN virtual server that is

represented by this GSLB service. A GSLB service whose user count reaches the maximum is not considered when a GSLB decision is made, until the count drops below the maximum.

Maximum value: 65535

monThreshold

Monitoring threshold value for the GSLB service. If the sum of the weights of the monitors that are bound to this GSLB service and are in the UP state is not equal to or greater than this threshold value, the service is marked as DOWN.

Maximum value: 65535

hashId

Unique hash identifier for the GSLB service, used by hash based load balancing methods.

Minimum value: 1

comment

Any comments that you might want to associate with the GSLB service.

appflowLog

Enable logging appflow flow information

Possible values: ENABLED, DISABLED

Default value: ENABLED

```
add gslb service sj_svc 203.12.123.12 http 80 -site san_jos
```

Removes a global server load balancing (GSLB) service configured on the appliance.

```
rm gslb service <serviceName>
```

serviceName

Name of the GSLB service.

```
rm gslb service sj_svc
```

Modifies the specified parameters of a global server load balancing (GSLB) service.

set gslb service <serviceName> [-IPAddress <ip_addr|ipv6_addr|*>] [-publicIP <ip_addr|ipv6_addr|*>] [-publicPort <port>] [-cip (ENABLED | DISABLED) [<cipHeader>]] [-sitePersistence <sitePersistence>] [-sitePrefix <string>] [-maxClient <positive_integer>] [-healthMonitor (YES | NO)] [-maxBandwidth <positive_integer>] [-downStateFlush (ENABLED | DISABLED)] [-maxAAAUsers <positive_integer>] [-viewName <string> <viewIP>] [-monThreshold <positive_integer>] [-weight <positive_integer> <monitorName>] [-hashId <positive_integer>] [-comment <string>] [-appflowLog (ENABLED | DISABLED)]

serviceName

Name of the GSLB service.

IPAddress

The new IP address of the service.

publicIP

The public IP address that a NAT device translates to the GSLB service's private IP address. Optional.

publicPort

The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional.

Minimum value: 1

cip

In the request that is forwarded to the GSLB service, insert a header that stores the client's IP address. Client IP header insertion is used in connection-proxy based site persistence.

Possible values: ENABLED, DISABLED

Default value: DISABLED

sitePersistence

Use cookie-based site persistence. Applicable only to HTTP and SSL GSLB services.

Possible values: ConnectionProxy, HTTPRedirect, NONE

sitePrefix

The site's prefix string. When the service is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound service-domain pair by concatenating the site prefix of the service and the name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site

persistence, the NetScaler appliance redirects GSLB requests to GSLB services by using their site domains.

maxClient

The maximum number of open connections that the service can support at any given time. A GSLB service whose connection count reaches the maximum is not considered when a GSLB decision is made, until the connection count drops below the maximum.

Maximum value: 4294967294

healthMonitor

Monitor the health of the GSLB service.

Possible values: YES, NO

Default value: YES

maxBandwidth

Maximum bandwidth.

downStateFlush

Flush all active transactions associated with the GSLB service when its state transitions from UP to DOWN. Do not enable this option for services that must complete their transactions. Applicable if connection proxy based site persistence is used.

Possible values: ENABLED, DISABLED

Default value: ENABLED

maxAAAUsers

Maximum number of SSL VPN users that can be logged on concurrently to the VPN virtual server that is represented by this GSLB service. A GSLB service whose user count reaches the maximum is not considered when a GSLB decision is made, until the count drops below the maximum.

Maximum value: 65535

viewName

Name of the DNS view of the service. A DNS view is used in global server load balancing (GSLB) to return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy.

monThreshold

Monitoring threshold value for the GSLB service. If the sum of the weights of the monitors that are bound to this GSLB service and are in the UP state is not equal to or greater than this threshold value, the service is marked as DOWN.

Maximum value: 65535

weight

Weight to assign to the monitor-service binding. A larger number specifies a greater weight. Contributes to the monitoring threshold, which determines the state of the service.

Minimum value: 1

Maximum value: 100

hashId

Unique hash identifier for the GSLB service, used by hash based load balancing methods.

Minimum value: 1

comment

Any comments that you might want to associate with the GSLB service.

appflowLog

Enable logging appflow flow information

Possible values: ENABLED, DISABLED

Default value: ENABLED

```
set gslb service sj_svc  -sitePersistence ConnectionProxy
```

Use this command to remove gslb service settings.Refer to the set gslb service command for meanings of the arguments.

```
unset gslb service <serviceName> [-publicIP] [-publicPort] [-cip] [-cipHeader] [-sitePersistence] [-sitePrefix] [-maxClient] [-healthMonitor] [-maxBandwidth] [-downStateFlush] [-maxAAAUsers] [-viewIP] [-monThreshold] [-monitorName] [-hashId] [-comment] [-appflowLog]
```

Binds a DNS view or a monitor to a global server load balancing (GSLB) service.

```
bind gslb service <serviceName> ((-viewName <string> <viewIP>) | (-monitorName <string>@ [-monState ( ENABLED | DISABLED )] [-weight <positive_integer>]))
```

serviceName

Name of the GSLB service.

viewName

Name of the DNS view of the service. A DNS view is used in global server load balancing (GSLB) to return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy.

monitorName

Name of the monitor to bind to the GSLB service.

bind gslb service -viewName privateview 1.2.3.4

Unbinds a DNS view or a monitor from a global server load balancing (GSLB) service.

unbind gslb service <serviceName> (-viewName <string> | -monitorName <string>@)

serviceName

Name of the GSLB service.

viewName

Name of the DNS view of the service. A DNS view specifies the IP address that must be returned to clients accessing the service from a specific location.

monitorName

Name of the monitor to unbind.

unbind gslb service -viewName privateview

Displays the parameters of all the global server load balancing (GSLB) services configured on the appliance, or the parameters of just the specified service, and statistics related to the service. To display the parameters of all the GSLB services, do not specify a service name.

show gslb service [<serviceName>] show gslb service stats - alias for 'stat gslb service'

serviceName

Name of the GSLB service.

summary

fullValues

format

level

gslb

IPAddress

IP address of the service

Port number of the service.

publicIP

Public ip of the service

publicPort

Public port of the service

maxClient

Maximum number of clients.

maxAAAUsers

Maximum number of SSL VPN users that can be logged on concurrently to the VPN virtual server that is represented by this GSLB service. A GSLB service whose user count reaches the maximum is not considered when a GSLB decision is made, until the count drops below the maximum.

siteName

Name of the site to which the service belongs.

svrState

Server state.

svrEffGslbState

Effective state of the gslb svc

gslbthreshold

Indicates if gslb svc has reached threshold

gslbsvcStats

Indicates if gslb svc has stats of the primary or the whole chain

state

Enable or disable the service.

monitorName

Monitor name.

monState

The running state of the monitor on this service.

cip

Indicates if Client IP option is enabled

cipHeader

The client IP header used in the HTTP request.

sitePersistence

Indicates the type of cookie persistence set

sitePrefix

The site prefix string.

cltTimeout

Client timeout in seconds.

svrTimeout

Server timeout in seconds.

totalfailedprobes

The total number of failed probs.

preferredLocation

Prefered location.

maxBandwidth

Maximum bandwidth.

downStateFlush

Flush all active transactions associated with the GSLB service when its state transitions from UP to DOWN. Do not enable this option for services that must complete their transactions. Applicable if connection proxy based site persistence is used.

cnameEntry

Canonical name of the GSLB service. Used in CNAME-based GSLB.

viewName

Name of the DNS view of the service. A DNS view is used in global server load balancing (GSLB) to return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy.

viewIP

IP address to be used for the given view

weight

The Weight of monitor

monThreshold

Monitoring threshold value for the GSLB service. If the sum of the weights of the monitors that are bound to this GSLB service and are in the UP state is not equal to or greater than this threshold value, the service is marked as DOWN.

failedprobes

Number of the current failed monitoring probes.

monStatCode

The code indicating the monitor response.

monStatParam1

First parameter for use with message code.

monStatParam2

Second parameter for use with message code.

monStatParam3

Third parameter for use with message code.

responseTime

Response time of this monitor.

hashId

Unique hash identifier for the GSLB service, used by hash based load balancing methods.

comment

Any comments that you might want to associate with the GSLB service.

stateflag

stateflag

healthMonitor

Monitor the health of the GSLB service.
